Prominent features, distribution, and relationships.—*Cuniculotinus* is distinguished by its herbaceous annual stems arising from a woody caudex; leaves relatively broad, nearly glabrous, with a prominent midvein and 1–2 pairs of collateral veins; capitula discoid, racemosely disposed; phyllaries multiseriate, imbricate, mostly chartaceous, often truncate to emarginate and mucronately-tipped that when fresh are marked with a conspicuous, green, apical patch. Its only known species, *C. gramineus*, occurs in Clark and Nye counties, Nevada, and adjacent Inyo County, California, where it grows as an uncommon, understory element in yellow pine savanna communities at relatively high elevations. Sequence-based phylogenies show it in a relatively isolated position, with *Sericocarpus* as its closest kin; alternatively, it occupies a position between *Sericocarpus* and *Ericameria* (Roberts & Urbatsch 2004; Beck et al. 2004). *Sericocarpus*, with two species in the western United States and three in the east, also exhibits an herbaceous perennial life form and has coriaceous, green-tipped, multiseriate, phyllaries.

Cuniculotinus gramineus (H.M. Hall) Urbatsch, R.P. Roberts, & Neubig, comb. nov. BASIONYM: *Chrysothamnus gramineus* H.M. Hall, Muhlenbergia 2:342. 1916. *Ericameria graminea* (H.M. Hall) L.C. Anderson, Great Basin Naturalist 55:86. 1995. *Petradoria discoidea* L.C. Anderson, nom. nov., Trans. Kans. Acad. Sci. 65:676. 1964. [*non Petradoria graminea* Wooton & Standley, Contr. U.S. Natl. Herb. 16:183. 1913. *Petradoria pumila* Greene var. *graminea* (Wooton & Standley) S.L. Welsh, Great Basin Naturalist 43:324. 1983]. TYPE: U.S.A. NEVADA. Clark Co.: Charleston Mountains, head of Lee Canyon, alt. 2450 m, 4 Aug 1913, *A.A. Heller 11075* (HOLOTYPE: UC 175597).

Discussion.—The relationship of *Chrysothamnus gramineus* has puzzled systematists since its discovery and publication by Hall (1916). Hall and Clements (1923) noted the anomalous nature of the species relative to other *Chrysothamnus* but justified their placement of it by reference to its striate achenes, which are similarly seen in members of *Chrysothamnus* sect. *Pulchelli* and in *C. vaseyi*. Potential kinship with the monotypic *Petradoria* and with *Hesperodoria scopulorum* were also suggested but dismissed due to morphological discordance (Hall & Clements 1923). Anderson (1964a) concluded that anatomical and morphological evidence supported the placement of *C. gramineus* in *Petradoria*, a genus previously containing but one species, *P. pumila* (Nutt.) Greene. The published name *Petradoria graminea* Wooton & Standley for a different taxon necessitated creating the epithet *P. discoidea* L.C. Anderson for *C. gramineus*. Anderson (1983) noted similarities in habit and other features of *P. discoidea* to *C. eremobius* L.C. Anderson, also from Nevada, subsequent to the discovery and publication of the latter. Shortly thereafter, he reevaluated the status of these species and reinstated *P. discoidea* within *Chrysothamnus*, accommodating both it and *C. eremobius* in his newly proposed *Chrysothamnus* sect. *Gramini* (Anderson 1986a). Molecular-based studies have shown *Cuniculotinus* to be distant from its earlier hypothesized congeners and its treatment as a distinct genus is warranted (Roberts & Urbatsch 2004).

Lorandersonia Urbatsch, R.P. Roberts, & Neubig, gen. nov. TYPE: *Linosyris pulchella* A. Gray, Pl. Wright. 1:96. 1852. *Lorandersonia pulchella* (A. Gray) Urbatsch, R.P. Roberts, & Neubig, combination made herein. *Chrysothamnus* Nutt., Trans. Amer. Philos. Soc. ser. 2, 7:323. 1840, in part. *Hesperodoria* Greene, Leafl. Bot. Observ. Crit. 1:173. 1906, in part. *Tonestus* A. Nelson, Bot. Gaz. 37:262. 1904, in part.

Plantae frutices vel suffrutices; caules erecti ad ascendentes; folia plerumque sempervirentia linearia ad oblonga vel lanceolata ad anguste oblanceolata, costis prominentibus aliquando cum 1–2 nervae collaterales; involucri valde gradati vel subaequales 3–6-seriati; phyllaria imbricatia vel verticalia ordinata; capitula discoidea vel radiata, flosculi radii (1–)6–8 pistillati fertiles, corollis flavis; flosculi disci 4–15, corollis coloratis similibus flosculis radiis; pappi setae albidi 10–80+ subaequalis similes in flosculi radii et disci.

Plants suffrutescent or shrubs to 3.5 m. Stems erect to ascending, often fastigiately or intricately branched; bark typically tan, becoming white to gray when older; twigs usually greenish, glabrous to scabrous, often resinous, punctate in one species. Leaves mostly evergreen, cauline, often crowded, appressed or ascending to spreading, becoming deflexed in one species, laminar, linear to oblong or lanceolate to narrowly oblanceolate, 4–75 × 0.5–8 mm, sessile or short-petiolate, blades planar to concave, margins entire or edged with trichomes, apices acute, glabrous to scabrous, sometimes punctate, often ± resin-coated, sometimes resin-dotted; midvein prominent, 1–2 pairs of collateral veins sometimes present. Capitulescences usually congested, rounded compound cymes to corymbose, occasionally racemose. Involucres cylindric to obconic or hemispheric, 4–15 × 1.5–6 mm. Phyllaries in 3–6 series, imbricate to vertically aligned, strongly graduated or subequal, green to tan, ovate to oblong or lanceolate, to oblanceolate, 0.5–7 × 0.5–1.3 mm, apices acute, acuminate, cuspidate, obtuse, erect or slightly spreading, often resinous; midvein obscure to evident, sometimes enlarged subapically and glandular; lowermost sometimes herbaceous or herbaceous-tipped, otherwise mostly chartaceous. Capitula discoid or radiate in *L. microcephala* (rays have also been observed in *L. spathulata*), flowers 4–22. Ray flowers (1–)6–8, pistillate, fertile, ranging from pale to darker yellow; laminae elliptic to obovate, 3.5–5 × ±1 mm. Disc flowers 4–15, bisexual, corollas same color as ray corollas, 3.5–14 mm, lobes erect to spreading or reflexed, 0.5–2.2 mm. Style branches 1.7–4.6 mm, appendages lanceolate or attenuate to subulate, 0.7–2.2 mm. Cypselae mostly tan to brownish, usually prismatic, oblong to obconic, 1.5–7 mm, glabrous to densely pubescent. Pappi similar in ray and disk flowers, whitish-tan, 20–80+, subequal, setose bristles, 3–12 mm. $x = 9$.

Etymology.—*Lorandersonia* is named for Loran C. Anderson, Professor of Biological Sciences, Florida State University, Tallahassee, Florida, who has dedicated much of his professional career to the study of *Chrysothamnus* and related Astereae and has significantly increased our knowledge of these taxa.

Prominent features, distribution, and relationships.—Features diagnostic for the genus include the following: shrubs with leafy stems; stems annual in *L. microcephala* and *L. peirsonii* from a woody caudex; leaves ascending, often parallel to the stem but not appressed, sessile to subsessile, laminar, oblanceolate to narrowly so, margins entire to ciliate, remotely serrate in *L. peirsonii*, apices attenuate, obtuse in *L. peirsonii*, and blades relatively thin, midvein conspicuous, collateral veins arising proximally often evident; capitula usually numerous, small, congested, organized into rounded cymes, forming corymboid capitulescences, monocephalous in *L. peirsonii*; phyllaries in 3–6 series, typically strongly graduated, chartaceous except for an apical or subapical, often narrow, diamond-shaped green patch, median vein mostly evident, sometimes somewhat thickened distally, phyllaries subequal in *L. peirsonii*; ray flowers absent except in *L. microcephala* and *L. peirsonii*, rarely present in *L. spathulata*. Evenly spaced gland-tipped hairs occur at least on young stems and emergent leaves, especially those transitional from leaves to phyllaries. The glandular portion is soon deciduous in most species but is persistent in *L. peirsonii*.

The southern Rocky Mountains is the center of diversity for this genus, but its entire range includes central Coahuila and northern Chihuahua, Mexico, northward to southwestern Kansas, southern Montana, and central Utah, with one outlyer in Inyo and Mono counties, California. Species in this genus occupy a considerable altitudinal range, 300–3600 meters, and are adapted to various arid habitats ranging from sand dunes to stony soils and rock crevices.

Basal to *Lorandersonia* in our gene trees are *Oreochrysum parryi* (A. Gray) Rydberg, *Tonestus pygmaeus* (Torrey & A. Gray) A. Nelson, and *Eastwoodia elegans* Brandegee. Sister to the just named taxa is a grade, although not always fully resolved, consisting of three species of *Tonestus*, *Acamptopappus*, and *Amphipappus fremontii* Torrey & A. Gray var. *spinosus* A. Nelson, crowned with *Chrysothamnus* sensu stricto. See Fig. 1 for more details and Roberts and Urbatsch (2004) for additional discussion.

Lorandersonia baileyi (Wooton & Standley) Urbatsch, R.P. Roberts, & Neubig, comb. nov. Basionym: *Chrysothamnus baileyi* Wooton & Standley, Contr. U.S. Natl. Herb. 16:181. 1913. *C. pulchellus* (A. Gray) Greene subsp. *baileyi* (Wooton & Standley) Hall & Clements. Phylog. Method Taxon., 194. 1923. *Chrysothamnus pulchellus* Greene var. *baileyi* (Wooton & Standley) S.F. Blake, J. Washington Acad. Sci. 30:467. 1940. *Ericameria pulchella* subsp. *baileyi* (Wooton & Standley) L.C. Anderson, Great Basin Naturalist 55:86. 1995. Type: U.S.A. New Mexico: N end of Guadalupe Mountains, 4 Sep 1902, *V.O. Bailey 490* "number provided in protologue is *498* compared to *490* on specimen" (holotype: US 00443565).

Distribution, ecology, and relationships.—This taxon has been documented for the states of Chihuahua and Coahuila, Mexico and for Arizona, Colorado, Kansas, New Mexico, Oklahoma, Texas, and Utah. It grows in open prairies typically in deep, sandy soils at elevations 1350–2350 m and flowers from late summer to fall. *Lorandersonia baileyi* is often treated as a subspecies of *L. pulchella*, and the two are very similar in habit, leaf form and in having involucres composed of relatively long, vertically aligned phyllaries. Ciliate leaf margins and young stems with evenly spaced trichomes distinguish *L. baileyi* from the glabrous *L. pulchella*. In our best resolved phylogenies, *L. bailey* and *L. salicina* are sister taxa, with *L. linifolia* basal (Roberts & Urbatsch 2004). Presence of gland-tipped hairs on young stems and young leaves transitional to phyllaries is a feature seen in *L. baileyi* and to a lesser extent in other taxa with the exception of *L. peirsonii*, which is covered throughout with similar appearing indumentum.

Lorandersonia linifolia (Greene) Urbatsch, R.P. Roberts, & Neubig, comb. nov. BASIONYM: *Chrysothamnus linifolius* Greene, Pittonia 3:24. 1896. *Bigelowia linifolia* A. Nelson, Wyoming Agric. Exp. Sta. Bull. 28:123. 1896. *Chrysothamnus viscidiflorus* (Hook.) Nutt. subsp. *linifolius* (Greene) Hall & Clements, Phylog. Method Taxon. 184. 1923. *Chrysothamnus viscidiflorus* var. *linifolius* (Greene) Kittell in Tidestrom & Kittell, Fl. Arizona and New Mexico, 395. 1941. *Ericameria linifolia* (Greene) L.C. Anderson, Great Basin Naturalist 55:86. 1995. TYPE: U.S.A. WYOMING: in moist, alkaline soil, plentiful along a streamlet near Rock Springs, 9 Aug 1895, *E.L. Greene s.n.* (HOLOTYPE: NDG).

Distribution, ecology, and relationships.—This species is often locally abundant and widespread, ranging from Arizona and New Mexico northward to Utah, Montana, and Wyoming. It occupies alkaline moist sites along rivers, stream banks, and drainage areas at elevations from 1200 to 2400 meters and flowers late summer and fall. Growing to over 3 meters tall, it is the largest member of the genus. It superficially resembles *L. spathulata* but may be distinguished from that species by its leaf shape, glabrous to glabrate shoots, and densely pubescent achenes. A population sampled in Mesa County, Colorado, differed from the norm in having numerous spreading trichomes on its young twigs and capitulescence branches, and trichome-edged leaves with more noticeable resin dots. *Lorandersonia linifolia* is basal to *L. baileyi* and *L. salicina* in our gene-based trees (Roberts & Urbatsch 2004) and combines some features of both species. This is especially true for the Mesa County population, whose foliage is conspicuously resin-dotted and which has pubescent achenes typical of *L. salicina*. Its pubescent stems and trichome-edged leaves, however, are characteristic of *L. baileyi*.

Lorandersonia microcephala (Cronquist) Urbatsch, R.P. Roberts, & Neubig, comb. nov. BASIONYM: *Haplopappus microcephalus* Cronquist, Madroño 11:186. 1951. *Tonestus microcephalus* (Cronquist) G.L. Nesom & D.R. Morgan, Phytologia 68:178. 1990. TYPE: U.S.A. NEW MEXICO. Taos Co.: Tres Piedras, crevices of granitic rocks in open yellow pine forest, altitude 8200 ft., 8 Jul 1950, *Ripley & Barneby 10316* (HOLOTYPE: WS; ISOTYPE: CAS).

Distribution, ecology, and relationships.—*Lorandersonia microcephala* grows on thin soils and cracks in granite outcrops at elevations from 2400 to 2700 meters and flowers from July to September. Its distribution is restricted to a few sites in northern New Mexico and southern Colorado where it is uncommon and of special conservation concern. Cronquist (1951) discussed this species obscure affinities and regarded it as *Haplopappus* after considering *Petradoria* and *Hesperodoria* as possible congeners. The species was transferred to *Tonestus* by Nesom and Morgan (1990). Lane et al. (1996) based on limited sampling noted that *L. microcephalus* shared more DNA characters with their cpDNA constituted

Petradoria group than with *Tonestus*. In our ETS/ITS based trees this species is basal in *Lorandersonia* and quite remote from *Petradoria*. *Tonestus* as constituted by Nesom and Morgan (1990) is highly polyphyletic with *L. peirsonii* the only *Tonestus* placed in the *Lorandersonia* clade. As with *L. baileyi*, *L. microcephala* has glandular trichomes on its young stems and leaves, especially those transitional to phyllaries, as abundantly seen in on all aerial parts of *L. peirsonii*. Besides sharing similar trichomes types, the latter two taxa have herbaceous stems from woody caudices with persistent leaves and especially leaf bases, congested internodes, radiate capitula, and both grow on granite outcrops and at high elevations. *Lorandersonia microcephala* closely resembles other species in the genus in leaf form and capitulum size, shape, number, and arrangement.

Lorandersonia peirsonii (D.D. Keck) Urbatsch, R.P. Roberts, & Neubig, comb. nov. BASIONYM: *Haplopappus eximius* H.M. Hall subsp. *peirsonii* D.D. Keck, Madroño 5:169. 1940. *Haplopappus* (*Aplopappus*) *peirsonii* (D.D. Keck) J.T. Howell, Leafl. Western Bot. 6:86. 1950. *Tonestus peirsonii* (D.D Keck) G.L. Nesom & D.R. Morgan, Phytologia 68:178. 1990. TYPE: U.S.A. CALIFORNIA. Inyo Co.: Transverse Ridge, Upper Rock Creek Lake Basin, NW corner of Inyo County, 3380 m, 5 Aug 1933, *F.W. Peirson* (HOLOTYPE: UC, ISOTYPE: JEPS).

Distribution, ecology, and relationships.—*Lorandersonia peirsonii* is a morphologically divergent species in an otherwise relatively uniform genus. It grows in the High Sierra Province in California rather than the Rocky Mountains and nearby plains. Its shoots are densely and uniformly covered with glandular trichomes, leaf margins are remotely and conspicuously serrate, and its capitulescence monocephalous. Nevertheless, as noted in the discussion of *L. baileyi* and *L. microcephala*, there are some similarities to other *Lorandersonia* species. That this species is convergent in DNA sequence for the ETS/ITS region is yet untested. All sequences for *L. peirsonii* taken from different specimens at different times with different stock reagents yielded identical results, except for one or two base pairs, but all samples were taken from herbarium specimens and the possibility of contamination needs to be unequivocally eliminated.

Even more puzzling than *Lorandersonia peirsonii*'s overall dissimilarity to other *Lorandersonia* is its great similarity to *Tonestus eximius* (H.M. Hall) A. Nelson & J.F. Macbride. Keck (1940) treated *L. peirsonii* as a subspecies of the latter in its original publication. Howell (1950) raised it to specific rank. In their reinstatement of *Tonestus*, Nesom & Morgan (1990) grouped the two species together, along with *T. alpinus* (L.C. Anderson & Goodrich) G.L.Nesom & D.R. Morgan, based on morphological similarities. The technical features that distinguish *T. eximius* include its narrower capitula, fewer phyllaries with more obtuse apices, fewer ray flowers, and shorter disk corollas. Yet the two species differ by several basepairs in their ETS/ITS sequences. *Tonestus eximius* is associated with a grade of taxa just below *Chrysothamnus* sensu stricto, several nodes removed from *Lorandersonia* (Fig. 1). DNA sequences obtained from freshly collected leaves of *T. eximius* were virtually identical to samples obtained from herbarium specimens and reported by Roberts and Urbatsch (2004). Here, too, molecular variation unrelated to phylogeny is suspected. These two species and *Tonestus*, in general poses many questions for further investigation. Most species of *Tonestus* sensu Nesom and Morgan (1990) are generally restricted rocky outcrops at high elevations. Perhaps the genetic potential to converge into high elevation life forms exists in several lineages of Astereae. Brouillet et al. (2004) provided such evidence by demonstrating, based on ETS/ITS sequence data, that *T. kingii* and *T. aberrans* are allied to the phyletically distant Eurybioid/Machaerantherinae clade and that their similarity to other *Tonestus* is superficial.

Lorandersonia pulchella (A. Gray) Urbatsch, R.P. Roberts, & Neubig, comb. nov. BASIONYM: *Linosyris pulchella* A. Gray, Pl. Wright. 1:96. 1852. *Chrysothamnus pulchellus* Greene, Erythea 3:93. 1895. *Chrysothamnus pulchellus* Greene subsp. *typicus* Hall & Clements, Phylog. Method Taxon. 194. 1923. *Ericameria pulchella* (A. Gray) L.C. Anderson, Great Basin Naturalist 55:86. 1995. TYPE: U.S.A. TEXAS: prairies below El Paso, Oct 1849, *Wright 287* (HOLOTYPE: GH; ISOTYPE: US).

Chrysothamnus elatior Standley, Proc. Biol. Soc. Washington 26:118. 1913. *Chrysothamnus pulchellus* (A. Gray) Greene subsp. *elatior* (Standley) H.M. Hall & Clements, Phylog. Method Taxon. 194. 1923. TYPE: U.S.A. NEW MEXICO: Dona Ana Co.: San Andreas Mountains, sandhills N of Goldenbergs Ranch, 12 Oct 1912, *E.O. Wooton s.n.* (HOLOTYPE: US).

Distribution, ecology, and relationships.—This species occurs in Chihuahua, Mexico, and in New Mexico and Texas, where it grows on dry hills and plains, often in sandy soils, at elevations from 1500–2000 meters. Its similarities and differences to *L. baileyi* are noted in the discussion of that species. In our sequence-based trees, *L. pulchellus* is sister to *L. spathulatus* (Roberts & Urbatsch 2004), from which it differs in several morphological characters, involucral features being the most notable.

Lorandersonia salicina (S.F. Blake) Urbatsch, R.P. Roberts, & Neubig, comb. nov. BASIONYM: *Haplopappus salicinus* S.F. Blake, Proc. Biol. Soc. Washington 48:171. 1935. *Hesperodoria salicina* (S.F. Blake) G.L. Nesom, Phytologia 71:245. 1991. TYPE: U.S.A. ARIZONA: Coconino Co.: Grand Canyon, Bright Angel Trail, 22 Oct 1905, *A. Eastwood 10* (HOLOTYPE: US 00619950).

Distribution, ecology, and relationships.—This species is restricted to a few sites in northern Arizona and is of conservation concern. Its habitat consists of rocky cliff faces and stony soils from 300 to 950 meters. What became the type specimen for *Haplopappus salicinus* (*Eastwood 10*) was earlier considered by Hall (1928) to be *Haplopappus scopulorum* in sect. *Hesperodoria*. Blake (1935) noted its distinctive nature when describing it as a new species but still allied it to *H. scopulorum*. So did Nesom (1991), who further noted numerous similarities and differences between the two species. Combining *Hesperodoria*, *Vanclevea*, and *Petradoria* into a single genus or broadening *Chrysothamnus* to encompass these species were also proposed (Nesom 2000). In our gene-trees *L. salicina* is sister to *L. baileyi*, with *L. linifolia* basal (Roberts & Urbatsch 2004). Among the lorandersonias, *L. salicina* is most like *L. linifolia* in often having resin-dotted leaves that are similar in size and form, relatively short involucres, and achenes pubescent with long ascending hairs. The adaxial, often copious resin coating of the emerging leaves of *L. salicina* is characteristic of *L. baileyi*, *L. linifolia*, and perhaps some of its other congeners as well. *Lorandersonia salicina* is differentiated from *L. linfolia* by its much smaller stature, resin-coated to resin-dotted stems, absence of the uniformly spaced, spreading trichomes, and its few-headed, loosely corymboid capitulescences.

Lorandersonia spathulata (L.C. Anderson) Urbatsch, R.P. Roberts, & Neubig, comb. nov. BASIONYM: *Chrysothamnus spathulatus* L.C. Anderson, Madroño 17:226. 1964. *Ericameria spathulata* (L.C. Anderson) L.C. Anderson, Great Basin Naturalist 55:86. 1995. TYPE: U.S.A. NEW MEXICO. Otero Co.: Upper Burro Flats, 6000 ft, between LaLuz and LaBorcita canyons, 7 mi NE by road from town of LaLuz, T15S, R19E, sec 14 & 15, 14 Oct 1961, *L.C. Anderson 2052* (HOLOTYPE: UC; ISOTYPES: KSC, MSC, NMC, US, UTC).

Distribution, ecology, and relationships.—*Lorandersonia spathulata* is known from south-central New Mexico and nearby areas in Texas, where it grows on loamy soils associated with piñon, juniper, and oak woodlands from around 1700 to 2200 meters. Anderson (1964b) noted its similarity to *C. viscidiflorus* (Hook.) Nutt. subsp. *lanceolatus* (Nutt.) Hall & Clements in corolla shape and style branch size, apparently regarding this as some measure of relatedness. He maintained *L. spathulata* in sect. *Chrysothamnus* in his (1986a) synopsis. This species is robustly supported within the *Lorandersonia* clade, and as noted previously, is sister to *L. pulchella*.

Chrysothamnus Nutt., Trans. Amer. Philos. Soc. ser. 2, 7:323. 1840. TYPE: *Chrysothamnus pumilus* Nutt. (typ. cons.). = *Chrysothamnus viscidiflorus* (Hook.) Nutt. *Chrysothamnus* sect. *Gramini* L.C. Anderson, Proc. Symp. Biol. *Artemisia* and *Chrysothamnus*. 29. 1986, in part. *Chrysothamnus* sect. *Pulchelli* Hall & Clements, Publ. Carnegie Inst. Washington 326:175. 1923. in part. *Hesperodoria* Greene, Leafl. Bot. Observ. Crit. 1:173. 1906, in part.

Vanclevea Greene, Pittonia 4:50. 1899.

Discussion.—*Chrysothamnus* in the traditional sense has long been considered a difficult genus due to complex infraspecific variation in *Chrysothamnus nauseosa*, *C. parryi*, and *C. viscidiflorus* (Hook.) Nutt. and also because of uncertainty concerning its monophyly (Hall & Clements 1923; Anderson 1986b). Species in sect. *Punctati* and *C. albidus*, in particular, have been noted for their anomalies relative to others in the genus and for their similarities to species elsewhere in tribe Astereae (Hall & Clements 1923). Sequence-based phylogenetic investigations have been invaluable in addressing questions concerning generic circumscription and interspecific species relationships, as discussed in the present paper and elsewhere (Roberts & Urbatsch 2004; Suh 1989; Morgan 1990). Such data also have added a new level of complexity and have posed new hypotheses concerning the circumscription of *Chrysothamnus*.

Acamptopappus, *Amphipappus*, and *Vanclevea* are closely associated with or are included in *Chrysothamnus* in our sequence-based clade (Fig. 1). *Acamptopappus* is supported as part of a polytomy that also includes *Amphipappus fremontii* var. *spinosus* and *Chrysothamnus* (Fig. 1). Three taxa traditionally regarded as other genera are supported within *Chrysothamnus* (Fig. 1). Among these, *Hesporodoria scopulorum* and *Vanclevea stylosa* can readily be placed in *Chrysothamnus* because they exhibit no morphologically incongruous characteristics. Their affinities to one another (Anderson & Weberg 1974) and to *Chrysothamnus* had been noted (Nesom 1997, 2000) and sequence data support these hypotheses (Roberts & Urbatsch 2004). The presence of *Amphipappus fremontii* within the *Chrysothamnus* clade is perplexing because *A. fremontii* var. *spinosus* is placed several nodes below. Functionally staminate disk florets and 1–2 pistillate ray florets, features unknown for other taxa in this investigation except in *Petradoria*, characterize *Amphipappus*. There is some evidence for intergradation between the two varieties of *A. fremontii* (Nesom 2005), and the pubescence characters, their major distinguishing feature, are regarded as technical and perhaps trivial. Although Nelson (1934) recognized *A. spinosus* as a distinct species, he noted its strong similarity to the typical taxon. Furthermore, some years earlier (Nelson 1909), he described the same variant as a variety of *A. fremontii* based on a different type.

Lane (1988) hypothesized that *Acamptopappus*, *Amphipappus*, *Chrysothamnus*, *Vanclevea*, *Ericameria*, and others share a common ancestral stock. Sequence data support certain aspects of her hypothesis and her generalized statement is brought to a finer focus. *Chrysothamnus* is paraphyletic since it includes typical *Amphipappus fremontii*. Because of its distinctive floret morphology, the possibility of convergence among ETS/ITS sequences, and possible analytic problems such as long branch attraction or sample contamination, incorporation of *Amphipappus* into *Chrysothamnus* should be delayed until hypotheses posed herein are tested further. *Acamptopappus* is also maintained as a distinct genus because of its morphological cohesiveness and monophyly robustly supported by sequence data (Roberts & Urbatsch 2004).

Chrysothamnus scopulorum (M.E. Jones) Urbatsch, R.P. Roberts, & Neubig, comb. nov. BASIONYM: *Bigelowia menziesii* var. *scopulorum* M.E. Jones, Proc. Calif. Acad. Sci. ser. 2, 5:692. 1895. *Haplopappus scopulorum* (M.E. Jones) S.F. Blake, Contr. U.S. Natl. Herb. 25:542, 546. 1925. *Hesperodoria scopulorum* (M.E. Jones) Greene, Leafl. Bot. Observ. Chrysothamnus scopulorum var. **canonis** (S.L. Welch) Urbatsch, R.P. Roberts, & Neubig, comb. nov. BASIONYM: *Haplopappus scopulorum* (M.E. Jones) S.F. Blake var. *canonis* S.L. Welsh, Utah Flora (ed. 3), 200. 2003. TYPE: U.S.A. UTAH. Naturalist Cove, base of N facing cliffs, east of The Neck, Canyonlands National Park, n.d., *S.L. Welsh 8813* (HOLOTYPE: BRY).

Distribution, ecology, and relationships.—Chrysothamnus scopulorum grows on brushy mountain slopes and in the understory of ponderosa pine in Arizona and Utah between 1200 and 2200 m. Features diagnostic for this species include its compact clusters of 20± capitula on long peduncular branches bearing widely spaced, distally reduced leaves/bracts, 5–6 seriate involucres, imbricate phyllaries, relatively large capitula of 10–16(–20) florets, and pubescent achenes. In our gene tree (Fig. 1), it is one of seven basal polytomic branches, its sister relationships unresolved. Within *Chrysothamnus* it closely resembles *C. stylosus* but is readily differentiated from that taxon by its non-glutinous involucres, smaller capitula, and terete pappus bristles. It is the type for the ditypic *Hesperodoria*, earlier regarded as a section within *Haplopappus* (sensu Hall 1928). As noted in the discussion of *Lorandersonia*, similarities between *C. scopulorum* and *L. salicina* (*H. salicina*) are convergent.

Chrysothamnus stylosus (Eastwood) Urbatsch, R.P. Roberts, & Neubig, comb. nov. BASIONYM: *Grindelia stylosa* Eastwood, Proc. Calif. Acad. Sci. ser. 2, 6:293. 1896. *Vanclevea stylosa* (Eastwood) Greene, Pittonia 4. 51. 1899. TYPE: U.S.A. UTAH: 13 Jul 1895, *A. Eastwood 36* (HOLOTYPE: CAS).

Distribution, ecology, and relationships.—Chrysothamnus stylosus is endemic to the Colorado Plateau and has been documented for at least six counties in southern Utah and in adjacent Arizona, where it inhabits dunes and sandy soil at elevations from 1100–1700 meters. It is readily diagnosed by its glutinous shoots and involucres, relatively broad, spreading to deflexed, falcate leaves with acute apices, 3–5-seriate involucres, graduated, acuminate-tipped phyllaries, 20 or more flowers per head, and numerous, flattened pappus bristles. Previously treated in the monotypic genus *Vanclevea*, its similarity to *Hesperodoria* (as suggested by Anderson and Weberg 1974) and to *Chrysothamnus* (Nesom 1997, 2000) is supported in part by ETS/ITS sequence data (Roberts & Urbatsch 2004). Within *Chrysothamnus*, it and five other taxa, plus a branch bearing several other species, form a basal polytomy (Fig. 1). As in other studies of this nature (Roberts & Urbatsch 2003, 2004), low levels of sequence variation provide little resolution within genera.

The following is key to taxa within and related to Cuniculotinus, *Chrysothamnus*, and *Lorandersonia* based ETS/ITS sequence data (Fig. 1). A key to the genera *Chrysothamnus*, and *Lorandersonia* is not possible due to apparent convergence among various species. Therefore, taxa in these two genera appear at various places in the key.

KEY TO TAXA IN THE *CHRYSOTHAMNUS* AND *LORANDERSONIA* CLADES

1. Disk flowers 3–7, functionally staminate; ray flowers 1–2, pistillate, ligule apices distinctly 2–3 lobed; pappus of crinkly bristles, 2 to several fused at base **Amphipappus**

1. Disk flowers hermaphroditic, often many more than 7 per capitulum; rays 0 to numerous; ligule apices rounded or irregularly notched or toothed; pappus of separate bristles or scales, not conspicuously contorted.

  2. Rays 0; florets, at least the outer several series, associated with readily deciduous paleae, much longer than achenes; pappus of 5–8 narrowly deltate scales; capitula with 30 or more florets **Eastwoodia**

  2. Rays 0–several; palea lacking, relatively short, conic projections present in certain taxa; pappus of 10 or more bristles; capitula may contain fewer or more than 30 florets.

    3. Phyllaries graduated, mid-level ones obovate, more than 2 mm wide distally, apices retuse to emarginate, notch conspicuously cuspiate, lower or outermost chartaceous **Cuniculotinus**

    3. Phyllaries graduated or subequal, rarely more than 2 mm wide distally, but if so, apices obtuse to rounded, never notched, lower or outermost often herbaceous.

      4. Receptacles with persistent, sharp, conic projections; phyllaries 2–3 seriate; involucres hemispheric to nearly spheric; desert shrubs of the southwestern U.S. with disk flowers 14 or more; rays present in one species, absent in another **Acamptopappus**

      4. Receptacles without sharp, conic; phyllaries (2–)3–6+ seriate; involucres cylindric, turbinate, or campanulate; disk flowers 15 or fewer in most species except for certain low growing, montane, herbaceous-stemmed taxa with 15 or more ray florets per capitulum.

        5. Ray flowers 5 or more per capitulum.

          6. Capitula in compact corymbiform clusters; disk flowers 15 or fewer **Lorandersonia microcephala**

          6. Capitula solitary; disk flowers 40 or more.

            7. Leaf margins entire rarely with a few apical teeth; shoots and phyllaries pubescent with spreading and mostly gland-tipped hairs **Tonestus lyallii**

            7. Leaf margins saliently toothed; shoots and phyllaries pubescent with shaggy, crisped hairs, or with gland-tipped hairs.

              8. Many-stemmed, tap-rooted perennial herbs from an underground, branching caudex; stems and involucres pubescence of eglandular, shaggy, crisped hairs; Rocky Mountain alpine meadows **Tonestus pygmaeus**

              8. Mat-forming herbaceous perennials from underground, branching caudices and deep-seated rhizomes; stems and involucres with abundant, gland-tipped hairs; mountains of east-central California and adjacent Nevada **Lorandersonia eximius**

        5. Ray flowers 0; reported for *L. spathulata* but rare.

          9. Disk flowers 8 or more per capitulum.

            10. Disk flowers 30 or more; involucres and often stems distally glutinous **Chrysothamnus stylosa**

10. Disk flowers 20 or fewer; involucres and stems may be resin dotted but not glutinous.
    11. Basal leaves and lower cauline leaves bearing 1–3 pairs of salient teeth; shoots and involucres pubescent with relatively long gland-tipped hairs ________ **Tonestus graniticus**
    11. Leaf margins entire; shoots resin-dotted or pubescent with short, conic, eglandular hairs.
        12. Stems and leaves resin-dotted; involucres 3–6 seriate ________ **Lorandersonia salicina**
        12. Stems and leaves pubescent with spreading, eglandular hairs; involucres 6+–seriate ________ **Chrysothamnus scopulorum**

9. Disk flowers fewer than 8 per capitulum (the highly variable *C. viscidiflorus* subsp. *viscidiflorus* is known to have up to 14 flowers per head, but it may be distinguished by its leaves twisted on their long axes).
    13. Leaves 10 or more mm wide, strongly veined; stems annual ________ **Chrysothamnus eremobius**
    13. Leaves less than 10 mm wide, midvein often evident, collateral veins 0 or inconspicuous; stems perennial.
        14. Leaves twisted about long axis ________ **Chrysothamnus viscidiflorus**
        14. Leaves flat, not twisted.
            15. Achenes glabrous to sparsely pubescent throughout or distally only, sometimes with glistening atomiferous trichomes.
                16. Stems and leaves glabrous or uniformly pubescent with short, spreading conic trichomes; distal portion of achenes usually with glistening atomiferous trichomes and sometimes a few elongated hairs or glabrous throughout.
                    17. Stems and leaves uniformly and abundantly pubescent with short, spreading, conic trichomes; distal portion of achenes usually with glistening atomiferous trichomes and sometimes a few elongated hairs or glabrous throughout; disk corollas 7–11 mm long ________ **Chrysothamnus depressus**
                    17. Stems uniformly and abundantly pubescent with short, spreading, conic trichomes or glabrous; leaves glabrous or ciliolate margined; achenes glabrous; disk corollas 9 mm or more long.
                        18. Margins of leaves ciliolate; widespread in New Mexico and adjacent states ________ **Lorandersonia baileyi**
                        18. Margins of leaves glabrous; central New Mexico and adjacent Texas ________ **Lorandersonia pulchella**
                16. Stems and leaves uniformly predominantly pubescent with gland-tipped trichomes, short, spreading conic trichomes if present sparsely so;

achenes glabrous or distal portion with a few elongated hairs; disk corollas 7 or more mm long.
    19. Stems and leaves mainly pubescent with gland-tipped trichomes, eglandular ones may also be present _______ **Chrysothamnus molesta**
    19. Achene apices with a few elongated hairs or glabrous throughout; leaves resin dotted _______ **Chrysothamnus vaseyi**
15. Achenes pubescent to densely so with elongated trichomes; atomiferous spheres typically lacking.
  20. Leaves or capitulescence bracts extending to apices of the involucres or far beyond; leaves often resin dotted _______ **Chrysothamnus humilis**
  20. Leaves or capitulescence bracts not extending to the level of the involucres.
    21. Leaves 1–2 mm wide or narrower, glabrous or remotely scaberulous; phyllary apices acuminate or cuspidate with a slender tip.
      22. Leaves 1(–2) mm wide or narrower, glabrous or remotely scaberulous; phyllary apices acuminate or cuspidate with a slender tip _______ **Chrysothamnus greenei**
      22. Leaves 1–2 mm wide, glabrous; phyllary apices acute to rounded, somewhat thickened apically _______ **Chrysothamnus viscidiflorus** subsp. **planifolius**
    21. Leaves (2–)3 mm or more wide; phyllary apices acuminate, acute, or rounded.
      23. Cypselae densely pubescent; twigs glabrous or nearly so; leaves lanceolate, widest point nearer the leaf base, glabrous, often resin dotted; northeastern New Mexico and northward _______ **Lorandersonia linifolia**
      23. Cypselae sparsely pubescent; twigs scabrous; leaves oblanceolate to spatulate, widest point nearer the leaf apex, scabrous, lacking resin dots; southern New Mexico and adjacent Texas _______ **Lorandersonia spathulata**

ACKNOWLEDGMENTS

The authors thank the curators and staff personnel of ASC, ASU, BRY, CAS, DH, RM, UNLV, US, UT, and WTU for specimen loans on which this and related research was based. We thank Yalma L. Vargas-Rodriguez for preparing the Spanish abstract and Guy Nesom for a thorough and most helpful review on a very short notice.

ABSTRACT

Morphology and molecular phylogenetic data show that *Eurybia pygmaea* is not a member of *Eurybia* but belongs in *Symphyotrichum*, close to *S. yukonense* of subg. *Virgulus* section *Grandiflori*. Therefore, we transfer the species to that genus, as *Symphyotrichum pygmaeum* (Lindl.) Brouillet & S. Selliah.

RESUMEN

Los datos filogenéticos morfológicos y moleculares muestran que *Eurybia pygmaea* no es un miembro de *Eurybia* sino que pertenece a *Symphyotrichum*, próximo a *S. yukonense* del subg. *Virgulus* section *Grandiflori*. Por ello, transferimos la especie a ese género como *Symphyotrichum pygmaeum* (Lindl.) Brouillet & S. Selliah.

Eurybia pygmaea (Lindl.) G.L. Nesom, the pygmy aster, is endemic to the western Canadian Arctic and northeastern arctic Alaska. Described initially as *Aster pygmaeus* Lindley, it was later placed in synonymy of the morphologically similar *Eurybia sibirica* (L.) G.L. Nesom (*A. sibiricus* L. subsp. *pygmaeus* (Lindl.) Löve & Löve or *A. sibiricus* var. *pygmaeus* (Lindl.) Cody). *Eurybia sibirica* is a primarily western, boreal montane species that reaches the western North American Arctic and crosses into Eurasia, the only species of genus *Eurybia* to do so. This species clearly belongs to the eurybioid grade (Brouillet et al. 2004).

In his work on the North American species of asters, Nesom (1994) accepted the hypothesis of a close relationship between *A. pygmaeus* and *A. sibiricus*, and therefore transferred the former to *Eurybia* at the rank of species, *E. pygmaea* (Lindl.) G.L. Nesom. Hultén (1968) and Porsild and Cody (1980), however, had drawn attention to the similarity of *E. pygmaea* (as *A. pygmaeus*) to another species, *Aster yukonense* Cronquist, an endemic of interior Yukon and Alaska, and of the Mackenzie drainage of the Northwest Territories. Nesom (1994) transferred *A. yukonense* to another North American segregate of *Aster*, *Symphyotrichum*, as *S. yukonense* (Cronquist) G.L. Nesom, as a member of subgenus *Virgulus*. He did not discuss the possible relationships of *E. pygmaea* to *S. yukonense*. Scoggan (1978–1979) underlined the similarity of *S. yukonense* to *S. campestre*. Subgenus *Virgulus* is characterized by its chromosome base number of x = 5, while *Eurybia* has x = 9. The chromosome number of *E. pygmaea* is yet unknown.

In a molecular-based (nr DNA ITS and ETS) phylogenetic analysis of the eurybioid grade with respect to other North American Astereae (subsequent to Brouillet et al. 2004), *Eurybia pygmaea* did not group with other species of the genus, but was found embedded within the Symphyotrichinae with members of *Symphyotrichum* subg. *Virgulus*, in a clade comprising *S. novae-angliae* (ITS dataset, which did not include *S. yukonense*) or *S. novae-angliae*, *S. fendleri* and *S. yukonense* (ETS dataset) (S. Selliah and L. Brouillet, unpublished). In the latter, *E. pygmaea* is sister to *S. yukonense*. Forcing *E. pygmaea* to *Eurybia* results in much longer trees and is therefore less parsimonious. Furthermore, genus *Eurybia* is characterized by a synapomorphic deletion of 9 bp in the *trnL* intron (cpDNA), a deletion not found in the closely related *Oreostemma*, *Herrickia*, *Triniteurybia* or Machaerantherinae, nor in any other North American Astereae investigated so far, including members of the Symphyotrichinae (M. Lauzé, pers. comm.). These data indicate that *E. pygmaea* is not a member of *Eurybia*, but instead belongs to *Symphyotrichum* subenus *Virgulus*, section *Grandiflori*. This hypothesis would be easily tested by counting the chromosome number of *E. pygmaea*: a count based on x = 5 (with a distinctive karyotype, Semple & Brouillet 1980) would confirm membership in the *Virgulus* group of *Symphyotrichum*.

Morphologic examination of herbarium specimens reveals the striking similarity of *Eurybia pygmaea* to *Symphyotrichum yukonense*, to the point that a problem of a transition between the two species may be perceived (D. Murray, pers. comm.). Indeed, smaller, single-headed individuals of *S. yukonense* could be easily mistaken for the former. Both species have wiry caudices, stems short, branched, purplish, simple, brittle, villous, leaves yellowish-green, narrow, more or less clasping, entire (occasionally subserrate in *E. pygmaea*), sparsely villous or strigose to glabrate, marginally ciliate or villous-ciliate, capitulescences few-headed and paniculiform or single-headed, and campanulate heads with phyllaries subequal, often purplish, not or little basally scarious, leafy, lanceolate to linear-lanceolate, more or less villous, rays 8 to 30, purple, 5–11 mm long, disc corollas weakly ampliate or funnelform, nerved cypselae with sordid or purplish, acute, barbellate bristles. Observation of the phyllary tips of *E. pygmaea* further revealed the presence of a few short-glandular hairs, which are absent from *E. sibirica* but typical of the *Grandiflori* and of *S. yukonense*. This needs to be confirmed by examination of live material to ensure that the small hairs observed are indeed glandular and similar to those of *S. yukonense*. Overall, similarities between *E. pygmaea* and *S. yukonense* are greater than those perceived between the former and *E. sibirica*.

Within the framework of preparing treatments for *Eurybia* and *Symphyotrichum* for the Flora of North America project, we are therefore proposing the transfer of *Eubyria pygmaea* to *Symphyotrichum*.

Symphyotrichum pygmaeum (Lindl.) Brouillet & S. Selliah, comb. nov. Basionym: *Aster pygmaeus* Lindley in W.J. Hooker, Fl. Bor.-Amer. 2:6. 1834. *Aster sibiricus* L. subsp. *pygmaeus* (Lindley) Löve & Löve, Bot. Not. 128:521. 1975 (1976). *Aster sibiricus* L. var. *pygmaeus* (Lindley) W. J. Cody, Canad. Field-Naturalist 68: 117. 1954. *Eurybia pygmaea* (Lindl.) G.L. Nesom, Phytologia 77:261. 1994 (1995).

ACKNOWLEDGMENTS

The authors wish to thank D. Murray (University of Alaska Fairbanks) for information concerning this problem and for constructive comments on the manuscript, Guy Nesom (Botanical Research Institute of Texas) for comments on the manuscript, the curators of ALA and MT for the loan of specimens, and M. Lauzé (Université de Montréal) for the chloroplast DNA data.

BOOK REVIEW

Ricard Solé and Brian Goodwin. 2000. **Signs of Life: How Complexity Pervades Biology.** (ISBN 0-465-01928-5, pbk.). Basic Books, 387 Park Avenue South, New York, NY 10016, U.S.A. (**Orders:** 212-340-8100, 212-340-8115 fax; www.basicbooks.com). $17.50, 322 pp., b/w figures, charts, notes, index, 6" × 9 1/4".

The book *Signs of Life* addresses the concept of complexity in biology. To completely appreciate this text, readers should have a strong background in mathematics, physics, biology and if possible systems modeling. Such a foundation is helpful in understanding the many mathematical equations that the reader is presented with during the authors' discussions. The vocabulary of this book is advanced; I found it necessary to look up words and theory references either in a dictionary or online. The language and terminology choices in the text are much more involved than the back cover description would lead you to believe In fact, the writing style and vocabulary choices used in this book will likely discourage, if not exasperate, most readers.

The first chapter serves as an overview of the book, which this reader found too mathematically/physics intensive (i.e. technically term laden) to get a good foothold on the examples and messages the authors were attempting to convey. A number of topics relating to nonlinearity, chaos and emergence were discussed in chapter one; some explained and some not, including: Lorenz attractors, Navier-Stokes equations, excitable media, slime mold life cycle, Bernard cells, bifurcation, and convection.

The second chapter focused on order, complexity and disorder. Although heavy on the physics and math, this chapter was understandable The chapter discusses the Ising model, which was initially explained with magnetic attractor changes at extreme temperatures. The Ising model was carried into examples of fire spread, sandpile shape, and discussion of critical limits in various biological and physical systems.

Chapter three centered on the topics of genetic networks and what processes control cell differentiation and genetic development. Items discussed included the ideas of rate limiting steps, isologous diversification and gene regulation of metabolic activities

My initial interest and excitement about this book arose from both the title and description on the back. That interest was quickly replaced with frustration after the continual exposure to advanced mathematics, physics terminology and equations, and I stopped reading after chapter three. Additional chapter titles include: Brain Dynamics, Ants, Brains & Chaos, Baroque of Nature, Life on the Edge of Catastrophe, Evolution & Extinction, Fractal Cities, and Market Crashes. I am sure that readers more familiar or comfortable with the many theories and equations referenced in this book will be able to glean a wealth of knowledge and interesting relationships included by the authors.

The book *Signs of Life* covers the topic of complexity in biology. The authors have included many "boxes" within the text that offer readers an in-depth mathematical equation, chart, graph or mathematical analysis related to the topics discussed. Each chapter also has a references area for those readers who wish to learn more or read specific source material. Unfortunately the authors' use of extremely technical terminology and verbose writing style, make understanding complexity in biology very complex itself.—*Lee Luckeydoo, Herbarium, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

ABSTRACT

Two combinations are proposed: *Artemisia arbuscula* subsp. *longiloba* (Osterhout) Shultz and *Artemisia globularia* subsp. *lutea* (Hultén) Shultz. *Artemisia globularia* subsp. *lutea* is lectotypified.

RESUMEN

Se proponen dos combinaciones (*Artemisia arbuscula* subsp. *longiloba* y *Artemisia globularia* subsp. *lutea*) y se lectotipifica *Artemisia globularia* subsp. *lutea*.

Taxa for which new combinations are here proposed are included in the forthcoming treatment of *Artemisia* in the Flora of North America North of Mexico (Shultz 2005). Both combinations already exist at varietal rank but they are made here at subspecific rank for better consistency with traditional usage in the genus (e.g., Shultz 1983, 1987) and with the FNA treatment.

Artemisia arbuscula Nutt. subsp. **longiloba** (Osterhout) Shultz, comb. nov. BASIONYM: *Artemisia spiciformis* Osterhout var. *longiloba* Osterhout, Muhlenbergia 4:69. 1908. *Artemisia longiloba* (Osterhout) Beetle, Rhodora 61:84. 1959. *Artemisia arbuscula* var. *longiloba* (Osterhout) Dorn, Vasc. Pl. Wyoming 295. 1988. *Seriphidium arbusculum* (Nutt.) W.A. Weber subsp. *longilobum* (Osterhout) W.A. Weber, Phytologia 55:7. 1984. TYPE: U.S.A. COLORADO. Grand Co.: Sulphur Springs, *Osterhout 3592* (HOLOTYPE: GH!).

Artemisia arbuscula is one of the more perplexing species in *Artemisia* subg. *Tridentatae*. Anatomic and morphologic characteristics (leaf phenology and size of heads) suggest multiple hybrid origins and different parental taxa for the subspecies (Shultz 1987). The phenology of leaves on flowering plants in an otherwise evergreen species suggests a hybrid origin involving species of the *A. tridentata* and *A. cana* lineages. In most instances, populations of *A. arbuscula* appear to be stable and self-reproducing from fully fertile seeds.

Artemisia arbuscula occurs throughout western North America, primarily as isolated populations in California, Colorado, Idaho, Montana, Nevada, Oregon, Utah, Washington, and Wyoming. *Artemisia arbuscula* subsp. *longiloba* differs from other subspecies of *A. arbuscula* by its distinctive leaf lobing and early blooming time. It is the only member of the Tridentatae complex to begin flowering as soon as snow melts in early spring and it is ecologically distinguished from other subspecies by its occurrence at lower elevations, in finegrained clay soils. Morphological characteristics that separate subsp. *longiloba* from subsp. *arbuscula* are its smaller heads (2–3 mm diam. as opposed to 3–4.5 mm); subsp. *longiloba* is separated from subsp. *thermopola* by its shallowly lobed leaves (less than 1/2 their lengths) as opposed to deeply cleft leaves (more than 1/2 their lengths).

I proposed the taxonomic status adopted here in my doctoral dissertation (Shultz 1983). Osterhout first recognized the 'longiloba' morphological form; he considered it a variant of *Artemisia spiciformis*, a species that also appears to be of hybrid origin. Because *A. arbuscula* subsp. *longiloba* occurs sporadically in the Intermountain west and exhibits a broad range of morphological variation, I have hesitated to formalize its status. Twenty years of additional field work have helped to confirm my belief that this taxon should be recognized but with the *caveat* that it may be derived from different taxonomic lineages (at subspecific rank) in different parts of its range. The taxon described as *A. arbuscula* subsp. *longicaulis* A.H. Winward & E.D. McArthur (1995) may be a polyploid derivative of the *Artemisia arbuscula* complex. This complex continues to present an interesting puzzle that in all likelihood represents a pattern of reticulate evolution.

Artemisia globularia Chamisso ex Besser subsp. **lutea** (Hultén) Shultz, comb. nov. BASIONYM: *Artemisia globularia* var *lutea* Hultén, Acta Univ. Lund 2, 46.1567 1950. *Artemisia globularia* f. *lutea* (Hulten) B. Boivin, Naturaliste Canad. 94:632. 1967. TYPE: U.S.A. ALASKA: St. Matthew Island, 16 Jul 1938, *J.P. Anderson 4007* (LECTOTYPE: S, here formally designated). Selected by D.F. Murray in 1981, who studied all the material available to Hultén at S. The Anderson collection is the only one of the syntypes in Hultén's herbarium and thus the only one he could have had before him at the time of writing the description.

As currently circumscribed, *Artemisia globularia* subsp. *lutea* is known only from Alaska. It is common on St. Mathew Island, infrequent on surrounding islands, and of conservation concern. The bright yellow corollas with orange glands distinguish it from subsp. *globularia*, which has reddish-black, eglandular corollas. It is unusual to have such distinguishing characteristics at the subspecies level. Elven et al. (2004) documented multiple chromosome races within *A. globularia*, suggesting need for further study to determine relationships of this taxon.

ACKNOWLEDGMENTS

This research has been supported, in part, by a grant to the author from the USDA Forest Service. Special thanks are extended to David F. Murray, Kanchi Gandhi, and two journal reviewers for comments on this manuscript, and to Luc Brouillet for his comments on the draft manuscript for Flora of North America North of Mexico. Curators of the Gray Herbarium (GH) of Harvard University, the Intermountain Herbarium (UTC) of Utah State University, the

Swedish Museum of Natural History (S), and the Rocky Mountain Herbarium (RM) of the University of Wyoming provided access to collections and databases.

BOOK REVIEW

MARK FLANAGAN and TONY KIRKHAM. 2005. **Plants From the Edge of the World: New Explorations in the Far East.** (ISBN 0-88192-676-0, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. and Timber Press, 2 Station Rd, Swavsey, Cambridge CB4 5QJ, U.K. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $39.95, 312 pp., color maps, numerous color photos, 7 1/4" × 9 /14".

This engaging book chronicles the authors' plant-collecting expeditions in the Far East in the aftermath of the Great Storm (Hurricane Hugo) of October 1987, which devastated Royal Botanic Gardens, Kew, London and Wakehurst Place in West Sussex. During the subsequent assessment of damage and inventory of the collections, it became clear that there were large gaps in both the taxonomic and geographic representation of the world's temperate woodlands, especially those from the edge of eastern Asia. A plant collecting program was developed targeting areas of the world that were underrepresented in Kew's collections. Joint expeditions to Sichuan, China were mounted by others; the authors found themselves in charge of expeditions to some very remote areas in Korea, Taiwan, eastern Russia and Japan.

Plants and hunting them form the heart of the book, but the story is as much an adventure tale as one about botany. Well written, never dry, often exciting, sometimes hilarious, the book allows the reader to experience events in an immediate way through the use of first-person narrative. From their eight-hour climb to a Korean mountain top to crossing a storm-swollen river in Russia hand-in-hand, the authors keep the reader's attention. They eat sandpiper stew, but pass on pigs' ears. They savor beer in several memorable places. They look more kindly on Spam after days in Todong where the smell of drying squid permeates the air. And on every page they describe the plants they are hunting and the way they are hunting them. They pursue their goals though rain, hail, heat, cold and dark of night, always with a sense of humor. Think of Michael Palin crossed with a postman-botanist and you get the idea.

The final chapter details what has happened at Kew and Wakehurst Place as the collections have been planted and grown. The book also includes homage to those who went before them at Kew, notably E.H. Wilson, in whose footsteps the authors found themselves walking as they gathered seed in the species-rich temperate forests on the "edge of the world."

Mark Flanagan is currently Keeper of the Gardens in Windsor Great Park, with responsibilities for the world-renowned Savill and Valley Gardens and the gardens at Frogmore. Tony Kirkham is Head of the Arboretum and Horticultural Services at the Royal Botanic Garden, Kew, where he cares for the existing heritage landscape and woody plant collections and maintains the integrity and development of the living scientific plant collections. Both travel extensively for plant collecting trips, lecture and publish.—*Penny McCook, volunteer, Botanical Research institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

NEW COMBINATION IN *CONOCLINIUM* (ASTERACEAE: EUPATORIEAE)

ABSTRACT

Conoclinium betonicifolium (P. Miller) King & H. Robinson var. **integrifolium** (A. Gray) T.F. Patterson is an inland taxon that has mostly oblanceolate to ovate leaf blades.

RESUMEN

Conoclinium betonicifolium (P. Miller) King & H. Robinson var. **integrifolium** (A. Gray) T.F. Patterson es un taxon del interior que usualmente tiene limbos foliares de oblanceolados a ovados.

A study of the genus *Conoclinium* DC. (Patterson 1994) reaffirmed an earlier observation by Asa Gray that a bimodal pattern of variation exists within *Conoclinium betonicifolium* (Miller) King & H. Robinson. The inland taxon, which has distinctive leaf morphology, is formally treated here at varietal rank. The distributions of the two varieties in Texas were mapped by Turner et al. (2003).

Conoclinium betonicifolium (Miller) King & H. Robinson, Phytologia 19:300. 1970. *Eupatorium betonicifolium* Miller, Gard. Dict. ed. 8, *Eupatorium* no. 9. 1768.

1. Leaf blades mostly oblong to oblong-lanceolate (commonly subauriculate), bases truncate to cordate, margins crenate; coastal habitats ______________ **a.** var. **betonicifolium**
1. Leaf blades mostly oblanceolate to ovate (commonly attenuate), bases obtuse, truncate, or cordate, margins crenate or entire; inland habitats along streams and around lakes ____ **b.** var. **integrifolium**

a. Conoclinium betonicifolium (P. Miller) King & H. Robinson var. **betonicifolium**

Conoclinium betonicum DC., Prodr. 5:135. 1836. *Eupatorium betonicum* (DC.) Hemsley, Biol. Cent.-Amer., Bot. 2(7):93. 1881.

Flowering Apr–Jun, Sep–Oct. Gulf coast, dunes, beaches, sandy loam, roadside ditches, edge of woods, salt marshes; 0–10 m; Texas; Mexico (Tamaulipas, Veracruz, southward along Gulf coast).

b. Conoclinium betonicifolium (P. Miller) King & H. Robinson var. **integrifolium** (A. Gray) T.F. Patterson, comb. nov. BASIONYM: *Conoclinium betonicum* DC. var. *integrifolium* A. Gray, Smithsonian Contr. Knowl. 3(5):88. 1852. *Conoclinium integrifolium* (A. Gray) Small, Fl. S.E. U.S. 1170. 1903. TYPE: U.S.A. TEXAS. MAVERICK CO.: Rio Grande and Escondida Creek, 1848, *C. Wright s.n.* (HOLOTYPE: GH!; ISOTYPES: GH!, US!).

Flowering Jun–Sep. Inland along streams, around lakes, marsh edges, saline soil near irrigation, old fields; 50–1000 m; Texas; Mexico (Chihuahua, Coahuila, Jalisco, Nuevo León, Puebla, San Luis Potosí, Tamaulipas).

ACKNOWLEDGMENTS

I thank Guy Nesom (BRIT) and John Strother (UC) for their assistance with this paper.

A NEW COMBINATION IN THE GENUS *PACKERA* (ASTERACEAE: SENECIONEAE)

Debra K. Trock

Herbarium, Botany Department
California Academy of Sciences
875 Howard Street
San Francisco, California 94103-3009, U.S.A.

ABSTRACT

The following new combination in *Packera* is made: *Packera musiniensis* (S.L. Welsh) Trock.

RESUMEN

Se hace la siguiente nueva combinación en *Packera*: *Packera musiniensis* (S.L. Welsh) Trock.

Packera (Asteraceae: Senecioneae) is represented in North America north of Mexico by fifty-four species. During preparation of the treatment of *Packera* for the Flora of North America, the need for the following new combination was recognized.

Packera musiniensis (S.L. Welsh) Trock, comb. nov. BASIONYM: *Senecio musiniensis* S.L. Welsh, Rhodora 95:400. 1993 (HOLOTYPE: BRY).

Packera musiniensis is a distinctive high elevation dwarf species known only from Musinea Peak and from the Wasatch Plateau (Welsh 1993) in Sanpete County, Utah. Its affinities within *Packera* are uncertain, but Welsh believes it to be closely related to either *P. cana* (Hook.) W.A. Weber & Á. Löve, *P. multilobata* (Torr. & A. Gray) W.A. Weber & Á. Löve, or both.

ACKNOWLEDGMENTS

I would like to thank Kanchi Gandhi for his assistance with the nomenclature and Alan Prather for providing valuable comments.

BOOK NOTICES

Timber Press

D.J. Callaway and M.B. Callaway (Eds.). 2000. **Breeding Ornamental Plants.** (ISBN 0-88192-482-2, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $34.95, 359 pp., 88 color photos, 10 b/w photo, 26 line drawings, 26 tables, 6" × 9".

The authors have succeeded in their goal of producing a book "useful to gardeners interested in plant breeding, .. presented in an interesting and easily understandable format." It is remarkably condensed, but plenty of references are at hand for whoever might want to dig more deeply. The first two chapters are by the Calloways: "Genetics and its applications," a brief and gentle introduction to Mendelian genetics, quantitative genetics, and polyploidy, and "Plant breeding—practical matters," an overview of how one might approach a 'back-yard' breeding program Short sections on "naming selections" and "plant protection and trademarks" are especially interesting (to me). Then, from various authors, a series of chapters follows on particular plant genera and groups. daylilies, daffodils, Siberian *Iris*, hostas, ornamental aroids, African violets, gesneriads, *Amaryllis*, *Penstemon*, rhododendrons and azaleas, *Kalmia* and relatives, camellias, lilacs, magnolias, and oaks. These are nicely edited for consistency of format and all include sections on "important traits and breeding objectives," "hybridization mechanics," and "propagation," in addition to topics particular to the plant group.

Even if not interested in breeding, many gardeners and botanical enthusiasts will enjoy reading sections of this book related to plants of their special interest. For example, find important mutations in African violets and the date on which each was first recorded, and read about the history of daylily hybridizing, vegetative propagation in camellias by cuttings and grafting, and key groups and breeding lines in daffodils.—*Guy Nesom, Botanical Research Institute of Texas, Fort Worth, TX, 76102-4060, U.S.A.*

Paul Cappiello and Don Shadow. 2005. **Dogwoods: the Genus *Cornus*.** (ISBN 0-88192-679-5, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. and 2 Station Road, Swavesey, Cambridge CB4 5QJ, U.K. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $39.95, 224 pp., color photos, b/w drawings, 7 1/2" × 11".

This is primarily an overview of all dogwoods of horticultural merit. Obviously some species are left out. About 31 species are included out of a possible 45–65 reported for the genus by the author. A key to species treated would have been a nice addition. In spite of having no key, this book is filled with an enormous amount of horticultural information on choice selections and hybrids available to the dogwood lover. The author provides in excess of 200 excellent photos.—*Barney Lipscomb, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

CORRECT AUTHOR CITATION FOR *CIRSIUM EATONII* VAR. *ERIOCEPHALUM* (ASTERACEAE: CARDUEAE): ERRATUM FOR SIDA 21:212. 2004

David J. Keil

Biological Sciences Department
California Polytechnic State University
San Luis Obispo, California 93407, U.S.A.
dkeil@calpoly.edu

In a recent paper (Keil 2004) I proposed the new combination *Cirsium eatonii* (A. Gray) B.L. Rob. var. *eriocephalum* (A. Nelson) D.J. Keil. I attributed the authorship of the varietal epithet *eriocephalum* to Nelson (Coulter and Nelson 1909) because *Cirsium eriocephalum* A. Gray, Proc. Acad. Nat. Sci. Philad. 1863:69, 1864, was a later homonym. However, a colleague pointed out to me that Gray (1874) had validly published the epithet as *Cnicus eriocephalus* A. Gray, and that Nelson (Coulter and Nelson 1909) had cited Gray's *Cnicus eriocephalus* when he published *Cnicus hookerianus* Nutt. [var.] *eriocephalus*. My attribution of the epithet to Nelson was therefore incorrect. The combination is republished here with the corrected authorship and basionym.

Cirsium eatonii (A. Gray) B.L. Rob. var. **eriocephalum** (A. Gray) D.J. Keil, comb. nov. BASIONYM: *Cnicus eriocephalus* A. Gray, Proc. Amer. Acad. Arts 10:46. 1874.

BOOK NOTICES

Timber Press

PETER GOLDBLATT, JOHN MANNING, and GARY DUNLOP. Illustrations by AURIOL BATTEN. 2005. ***Crocosmia* and *Chasmanthe*.** (ISBN 0-88192-651-5, hbk.). Royal Horticultural Society Plant Collector Guide. Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. and 2 Station Road, Swavesey, Cambridge CB4 5QJ, U.K. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $29.95, 219 pp., 15 watercolor plates, b/w drawings, 7 1/4" × 9 1/4".

Crocosmia and *Chasmanthe* are in the Iridaceae family. A key to species for both genera is a nice addition as are the beautiful watercolor plates.

T.M.E. BRANNEY. 2005. **Hardy Gingers: Including *Hedychium*, *Roscoea*, and *Zingiber*.** (ISBN 0-88192-677-9, hbk.). Royal Horticultural Society Plant Collector Guide. Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. and 2 Station Road, Swavesey, Cambridge CB4 5QJ, U.K. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $34.95, 267 pp., color photos, 7" × 9".

This book is specifically about gingers that are perfectly at home in the temperate garden. The eight chapters in the book are: **1)** Botany, **2)** Ecology, **3)** Cultivation, **4)** Propagation, **5)** Culinary and Medicinal Uses, **6)** Cut Flower Uses, **7)** Landscaping Uses, and **8)** A–Z of Hardy Gingers.

TORSTEN ULMER and JOHN M. MACDOUGAL. Drawings by BETTINA ULMER. 2004. ***Passiflora*: Passion Flowers of the World.** (ISBN 0-88192-648-5, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. and 2 Station Road, Swavesey, Cambridge CB4 5QJ, U.K. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $44.95, 430 pp., 343 color photos, 258 b/w line drawings, 7 1/2" × 10 1/2".

Ulmer and MacDougal with the help of artist Bettina Ulmer have made a significant contribution to botany and horticulture with their *Passiflora* book. It is full of good descriptive information and is beautifully illustrated with excellent line drawings and color photos. There are 19 chapters that discuss everything from history, systematics, morphology, and cultivation to butterflies and diseases.

NESTOTUS AND *TOIYABEA*, TWO NEW GENERA OF ASTERACEAE: ASTEREAE FROM THE WESTERN UNITED STATES AND CANADA

ABSTRACT

Nestotus is described as a new ditypic genus from the western United States and the Yukon Territory, Canada, to accommodate *Stenotus macleanii* (Brandegee) A. Heller and *Stenotus stenophyllus* (A. Gray) Greene, resulting in two new combinations ***N. macleanii*** and ***N. stenophyllus***. Sequence-based phylogenetic investigations consistently demonstrate and robustly support the relatedness of these two taxa and their distinctiveness from the type species, *S. acaulis* (Nutt.) Nutt., and other taxa placed in *Stenotus*. ***Toiyabea*** is described as a monotypic genus from Nevada to accommodate *Tonestus alpinus* (L.C. Anderson & S. Goodrich) G.L. Nesom & D.R. Morgan, resulting in the new combination ***Toiyabea alpina***. This species, *Petradoria*, plus *S. acaulis* and *S. armerioides* Nutt. constitute a well-supported polytomy sister to *Solidago* and related taxa in our molecular-based phylogeny.

RESUMEN

Se describe ***Nestotus*** como un género ditípico nuevo del oeste de los Estados Unidos y del territorio de Yukón en Canadá para ubicar a *Stenotus macleanii* (Brandegee) A. Heller y a *Stenotus stenophyllus* (A.Gray) Greene con las consecuentes combinaciones nuevas ***N. macleanii*** y ***N. stenophyllus.*** La relación entre estas dos especies y las diferencias entre ellas, y la especie tipo, *S. acaulis* (Nutt.) Nutt., y otras especies de *Stenotus* es demostrada consistentemente con un alto apoyo en las investigaciones basadas en secuencias de ADN. Adicionalmente se describe ***Taiyabea*** como un género monotípico de Nevada para ubicar a *Tonestus alpinus* (L.C. Anderson & S. Goodrich) G.L. Nesom & D.R. Morgan con la consecuente nueva combination ***Toiyabea alpina.*** Esta especie, *Petradoria*, junto con *S. acaulis* y *S. armeroides* Nutt. constituyen en nuestra filogenia molecular una politomía con alto apoyo, la cual es hermana de *Solidago* y los táxones emparentados.

INTRODUCTION

The sequence-based investigations of Roberts (2002) and Roberts and Urbatsch (2004) focused on sorting out relationships among several genera of the tribe Astereae. The patterns of relationship unveiled by the sequence-based investigations are in many cases incongruent with those inferred from morphology. Among the taxa included in those investigations were the six species of *Stenotus*

Nutt. and the eight known species of *Tonestus* A. Nelson. Those investigations (Roberts 2002; Roberts & Urbatsch 2004) revealed that *Stenotus* as defined by Morse (1998) and *Tonestus* as defined by Nesom and Morgan (1990) are not monophyletic. A single species, *S. armerioides*, clustered with *S. acaulis*, the type of the genus (Fig. 1), while the other species of *Stenotus* either were more closely aligned with other genera rather than with their congeners or their relationships were not fully resolved. Species of *Tonestus* included in the sequence-based investigations were also not closely aligned with each other. Three species including the type, *T. lyallii* (A. Gray) A. Nelson, were part of a grade under the *Chrysothamnus/Acamptopappus* lineage, whereas the other five species were associated with other lineages (Fig. 1). Here we address the cladistic relationship of three taxa: *Stenotus macleanii* (Brandegee) A. Heller, *S. stenophyllus* (A. Gray) Greene, and *Tonestus alpinus* (L.C. Anderson & S. Goodrich) G.L. Nesom & D.R. Morgan. The specifics of other species previously treated in *Stenotus* and *Tonestus* are addressed elsewhere (Brouilet et al. 2004; Urbatsch et al. 2005) or will be the subject of further investigation. In the sequence-based investigation summarized in Figure 1, *S. macleanii* and *S. stenophyllus* were consistently resolved with robust bootstrap and Bayesian support as sister taxa in all trees, though their relationship to other taxa included in the study was not fully resolved (Roberts 2002; Roberts & Urbatsch 2004). These taxa were also sister in the morphological study of the genus *Stenotus* by Morse (1998). Morse (1998) proposed that these taxa were closely related to *S. lanuginosus* (A. Gray) Greene and indicated that they are united by characteristics that include thin, stipitate-glandular leaves and herbaceous, stipitate-glandular phyllaries of equal lengths in two series. The sequence-based investigations of Roberts (2002) and Roberts and Urbatsch (2004) were inconclusive in reference to this proposition because the relationship of the *S. macleanii* /*S. stenophyllus* clade to *S. lanuginosus* was not fully resolved on all phylograms. Both clades typically were part of a large polytomy (Fig. 1). As a result of the consistent, strong, sequence-based support of *S. macleanii* and *S. stenophyllus* and their morphological distinctness from other *Stenotus* (sensu Morse 1998) and all other taxa included in the molecular investigation, we describe the genus ***Nestotus*** to accommodate these two species.

Toiyabea is proposed to accommodate one species, *Tonestus alpinus*, which was previously placed in *Haplopappus* by Anderson (1980) and subsequently transferred to *Tonestus* by Nesom and Morgan (1990) in their reinstatement of that genus. The proposition of this new genus necessitates the combination *Toiyabea alpina*. In the sequence-based investigations (Roberts 2002; Roberts & Urbatsch 2004), *Tonestus alpinus* was most often placed in a lineage with *Petradoria pumila* (Nutt.) Greene, *Stenotus acaulis*, and *S. armerioides*. The position and relationships among the four taxa in that lineage were not congruent across analytical methods or data sets. Bayesian analysis of the ITS and combined

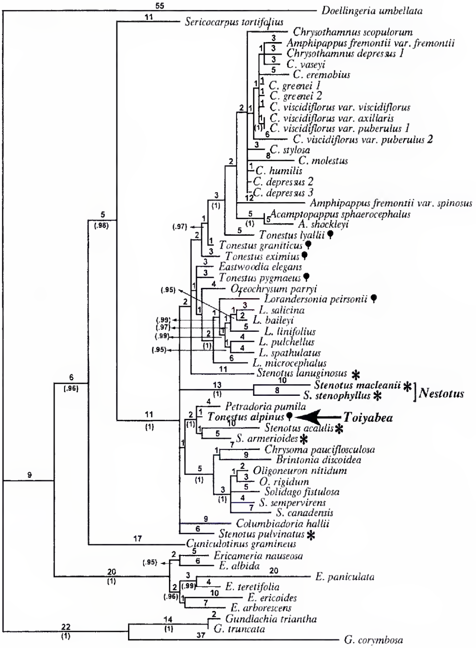

Fig. 1. Fifty percent majority rule consensus tree resulting from Bayesian analysis of combined ETS and ITS data sets is shown. Taxa regarded as *Stenotus* (sensu Morse 1998) are marked with the asterisk "*" symbol. The ⚲ symbol indicates species of *Tonestus* (sensu Nesom & Morgan 1990). Not included in the figure but part of our investigations were *T. aberrans* and *T. kingii* which proved to be aligned with subtribe Machaerantherinae (Brouillet et al. 2004). The large arrow indicates taxa treated herein as *Toiyabea;* the bracket marks those considered *Nestotus*. This figure is modified from one published in Roberts and Urbatsch (2004). More details and a discussion of results from this and other analyses based on these sequence data are also given in that publication.

data sets supported a trichotomy composed of *Petradoria*, *Tonestus alpinus*, plus a weakly supported clade consisting of *Stenotus acaulis* and *S. armerioides* as shown in Fig. 1 (Roberts & Urbatsch 2004). In both analyses this lineage was sister to a clade containing *Solidago* and taxa representing three other genera. In the Bayesian analysis of the ETS data, *Petradoria* was sister to the *Solidago* lineage whereas *Tonestus alpinus*, *Stenotus acaulis* and *S. armerioides* were part of a polytomy basal to *Petradoria*. Unlike the previous two situations, analyses employing parsimony and maximum likelihood of the combined ETS/ITS data matrices resulted in phylograms in which the four taxa under consideration formed an unresolved lineage with weak to moderate bootstrap support (Roberts & Urbatsch 2004). This clade was a weakly supported sister to the *Solidago* lineage in the maximum likelihood analysis, but part of a large polytomy above *Sericocarpus* in the parsimony analysis.

The proposed close relationship of *Tonestus alpinus* to *T. eximius* (Anderson 1980) is not supported by the nrDNA data. Instead, this taxon is apparently closely aligned to *Petradoria* and the two species of *Stenotus*. The two species of *Stenotus* are morphologically distinctive from *Petradoria* and merit continued recognition at generic rank. We propose *Toiyabea* to accommodate *Tonestus alpinus* because of its distinctiveness from *Petradoria* and *Stenotus* and its failure to aggregate with any specific taxon in the sequence-based analyses.

NOMENCLATURAL TREATMENT

Nestotus R.P. Roberts, Urbatsch & Neubig, gen. nov. TYPE: *Haplopappus stenophyllus* A. Gray in Torrey, Wilkes, U.S. Expl. Exped. 17:347. 1874 = *Nestotus stenophyllus* (A. Gray in Torrey) R.P. Roberts, Urbatsch & Neubig, combination made herein. *Stenotus* Nutt., in part, Trans. Amer. Philos. Soc. ser. 2. 7:334. 1840. *Stenotus stenophyllus* (A. Gray in Torrey) Greene, Erythea 2:72. 1894.

Plantae suffrutices tegetes formantes; caules ad 12 cm plures e caudice lignoso ramoso; folia caulina ut videtur fasciculata marcescentia; pedunculi 1–5 cm; involucri 2-seriati vel raro 3-seriati; flosculi disci 9–27, rami stylorum lanceolati; pappi setae albidae 30–50.

Mat-forming subshrubs. Stems to 12 cm, several arising from a branching, woody caudex, prostrate to upright, bark becoming dark brown to gray, flaky to fibrous when older; twigs, mostly ascending, whitish tan to purplish, mostly 1–4 cm, generally pubescent and often stipitate glandular. Leaves cauline, crowded, appearing fascicular, ascending to spreading, often marcescent, linear to narrowly spatulate, 3–21 × 0.3–2.0 mm, ± clasping, often whitish basally, glabrous to scabrous or villous, often stipitate-glandular, margins scabrous with short, spreading-ascendant cilia, apices, acute to obtuse, often minutely mucronate, generally 1-nerved. Capitulescences solitary, peduncles 1–5 cm, usually pubescent, often stipitate glandular. Involucres campanulate to hemispherical 5–10. Phyllaries ±imbricate, 2 or rarely 3 seriate, outer linear or narrowly oblong to oblanceolate, inner narrowly oblanceolate, stipitate-glandular abaxially, chartaceous proximally, herbaceous and pliable distally, sometimes weakly keeled, margins scarious, 1-nerved (rarely weakly 3-nerved). Capitula radiate, florets 20–30. Ray florets 5–11, pistillate, fertile, corollas yellow, laminae elliptical to oblong, 4.5–12 × 1.3–5.5 mm. Disk florets 9–27, bisexual, fertile, corollas narrowly or broadly vase-shaped, 4.5–7.3 mm, lobes 0.8–2 mm, tubes glabrous to pubescent. Style-branches lanceolcate, 1.2–2.5 mm, appendages 0.6–1.3 mm. Cypselae, 3.7–5 mm, pubescent. Pappi whitish, ±30–50, setose bristles, to 6.0 mm, same on ray and disk florets. $x = 9$.

Etymology.—*Nestotus* is an anagram derived from the generic name *Stenotus*, in which the two species in this genus have previously resided.

Prominent features, distribution, and relationships.—Phylogenetic studies (Roberts 2002; Roberts & Urbatsch 2003, 2004; Urbatsch et al. 2004) indicate that the two species placed together in this genus deserve taxonomic distinction. They are both mat-forming subshrubs from the northwestern United States and Yukon Territory, Canada, characterized by crowded, linear, prominently uninervate leaves. The two can be distinguished from each other by leaf pubescence features and geographic distribution (Morse 1998). Morse (1998) also indicated a close relationship with *S. lanuginosus*, which is not supported by the nuclear ribosomal data of Roberts and Urbatsch (2004). The relationship of this genus to others investigated is not fully resolved and is in need of further study.

Morse (1998) observed that *Stenotus acaulis* and *S. armerioides* intergrade in regions of sympatry and he suggested this might be due to interspecific hybridization. On the other hand, *S. stenophyllus* (*Nestotus stenophyllus*) and *S. acaulis* do not appear to intergrade or hybridize where they are sympatric. These observations are consistent with the relationships shown by sequence data that support a close relationship between *S. acaulis* and *S. armerioides* and a more distant affinity of these species with *Nestotus* (Fig. 1).

Nestotus macleanii (Brandegee) R.P. Roberts, Urbatsch & Neubig, comb. nov. BASIONYM: *Haplopappus macleanii* Brandegee, Bot. Gaz. 27:448. 1899. *Stenotus macleanii* (Brandegee) A. Heller, Muhlenbergia 1:7. 1900. *Stenotopsis macleanii* (Brandegee) A. Nelson, Bot. Gaz. 37:261. 1904. TYPE: CANADA. YUKON TERRITORY: near Dawson, 1848, *J. MacLean s.n.* (HOLOTYPE: US, fragment UC).

Stenotus borealis Rydb., Bull. N.Y. Bot. Gard. 2:184. 1901. TYPE: CANADA. YUKON TERRITORY: foot of Lake Lebarge, 23 Jun 1899, *J.B. Tarleton 51* (HOLOTYPE: US, fragment UC).

Distribution, ecology, and relationships.—This taxon has been reported only from the Yukon River drainage in southwestern Yukon Territory, Canada (Morse 1998). It inhabits rocky slopes, grasslands, and river bluffs. *Nestotus macleanii* is the more northern of the two species in the genus. It is found at elevations ranging from 450–850 meters and flowers in late spring. The close relationship of *N. macleanii* to *N. stenophyllus* was highlighted by Hall (1928) and Morse (1998) and is confirmed by the sequence-based investigations. The two taxa are very similar morphologically but can be distinguished by differences in pubescence and geographic distribution, as highlighted in the key to species at the end of this treatment.

Nestotus stenophyllus (A. Gray in Torrey) R.P. Roberts, Urbatsch & Neubig, comb. nov. BASIONYM: *Haplopappus stenophyllus* A. Gray in Torrey, Wilkes, U.S. Expl. Exped. 17:347. 1874. *Aster stenophyllus* (A. Gray in Torrey) Kuntze, Revis. Gen. Pl. 1:318. 1891. *Stenotus stenophyllus* (A. Gray in Torrey) Greene, Erythea 2:72. 1894. *Hoorebekia stenophylla* (A. Gray in Torrey) Piper, Contr. U.S. Natl. Herb. 11:561. 1906. TYPE: UNITED STATES. [Washington] "WASHINGTON TERRITORY." [Yakima or Kittitas Co.]. Spipen (Naches) River to the north fork of the Columbia River, 1838–1842, *Pickering & Brackenridge s.n.* (HOLOTYPE: GH).

Distribution, ecology, and relationships.—*Nestotus stenophyllus* is found in California, Idaho, Nevada, Oregon, and Washington. It inhabits sagebrush steppe on basaltic, rhyolitic, or granitic soils at elevations of 900–2300 meters. Flowering occurs mid to late spring. Its close relationship to *N. macleanii* has been previously discussed and affinities to other taxa are uncertain at this time.

Toiyabea R.P. Roberts, Urbatsch & Neubig, gen. nov. TYPE: *Haplopappus alpinus* L.C. Anderson & S. Goodrich, Great Basin Naturalist 40:73. 1980 = *Toiyabea alpina* (L.C. Anderson & S. Goodrich) R.P. Roberts, Urbatsch & Neubig, combination made herein. *Tonestus alpinus* (L.C. Anderson & S. Goodrich) G.L. Nesom & D.R. Morgan, Phytologia 68:177. 1990.

Herbae perennes et lignosae 0.5–2.0 dm altae; caules valde glandulosi; folia in basi obovata vel oblanceolata serrata vel dentata 3–7 cm longa 10–36 mm lata, folia caulina angustiora et serrata 3–5.5 cm longa 8–18 mm lata; capitula discoidea solitaria vel in cymis; involucra 10–12 mm longa circa 7 mm lata; phyllaria 21–28, exterioribus ovatis et folio similibus et glandulosis, interioribus angustis; flosculi 29–55 flavi, corollis 5.8–7.1 mm longis, lobis circa 1.3 mm longis; cypselae 4–5 mm longae et pubescentiae.

Perennial herbs, short rhizomatous, woody only at base, to 1.0(–2.0) dm tall. Stems several arising from caudex, typically unbranched, green, densely pubescent, hairs stipitate glandular. Leaves basal and cauline; ascending to spreading, both types similar, the latter somewhat reduced distally and sessile, spatulate to obovate or oblanceolate, 30–70 × 8–36 mm, herbaceous; bases attenuate to cuneate, clasping, more so distally; margins of distal half of blades coarsely dentate to serrate, apices acute to attenuate; midvein prominent, 1–2 pairs of smaller, ± parallel collateral veins often evident, both surfaces densely stipitate glandular, also often bearing resinous globules. Capitulescences usually monocephalous or with up to 5 capitula in an elongate or flat-topped cyme. Capitula discoid. Involucres campanulate to hemispheric, 10–12 × 7–10 mm. Phyllaries 2–3 seriate, 21–28, subequal, imbricate, outermost leaflike, broadly ovate, 3-nerved, stipitate glandular, slightly spreading, apices obtuse with small mucro, inner bracts narrower, lanceolate-spatulate, margins finely ciliate, apices acuminate-cuspidate. Receptacles convex, alveolate. Ray florets 0. Disk florets (29–)35–50(55), bisexual, corollas golden-yellow, (5.8–)6.4–7.1(–7.6) mm, lobes (1–)1.3(–1.6) mm, lanceolate, slightly spreading to recurved. Anthers yellow, about 2.6 mm. Style branches 1.8–2.5 mm, appendages narrowly lanceolate, 1.2–1.7 mm.

Cypselae cylindric to fusiform, 4–5 mm, pubescent. Pappi tannish, ca. 25 setose bristles, 6–7 mm. $x = 9$.

Etymology.—Named for the Toiyabe Mountain Range, Nevada. Toiyabe is said to be a Shoshone Indian word meaning "Black Mountains."

Prominent features, distribution, and relationships.—*Toiyabea* is monotypic and is known from the Toiyabe and Toquima mountains of southern Nevada. This species was originally described as *Haplopappus* (Anderson 1980) and later transferred to *Tonestus* (Nesom & Morgan 1990). Analyses based on DNA sequence data fail to support the monophyly of *Tonestus* sensu Nesom & Morgan (Roberts 2002; Roberts & Urbatsch 2004; Brouillet et al. 2004). Close affinity of *Toiyabea alpina* to *Tonestus eximius* (H.M. Hall) A. Nelson & Macbride and to *Tonestus peirsonii* (Keck) Nesom & Morgan suggested by morphological similarity is likewise not supported by sequence data (Roberts & Urbatsch 2004). Evolutionary affinities of *Toiyabea* appear to be with *Petradoria* and the clade composed of *Stenotus acaulis* and *S. armerioides* (Fig. 1).

Toiyabea alpina (L.C. Anderson & S. Goodrich) R.P. Roberts, Urbatsch & Neubig, comb. nov. BASIONYM: *Haplopappus alpinus* L.C. Anderson & S. Goodrich, Great Basin Naturalist 40:73. 1980. *Tonestus alpinus* (L.C. Anderson & S. Goodrich) G.L. Nesom & D.R. Morgan, Phytologia 68:177. 1990. TYPE: UNITED STATES. NEVADA. [Nye Co.]: granitic rocks at 10,600 ft on 11,077 ft peak on Toiyabe Crest between Washington Creek and Aiken Creek, 24 air mi SSW of Austin, 1979, *L.C. Anderson 4885* (HOLOTYPE: BRY).

Distribution, ecology, and relationships.—*Toiyabea alpina* inhabits rocky terrain near and above the tree line on the Toiyabe and Toquima mountains of southern Lander and Nye counties, Nevada (Anderson 1980). This taxon occurs infrequently on various substrates and might be of conservation concern. It is found in association with several other species of Asteraceae and other alpine endemics of Nevada, including *Draba arida* C.L. Hitchc. and *Geranium toquimense* N.H. Holmgren & A.H. Holmgren (Anderson 1980). Plants of this species flower from mid-summer into the fall. In his description of the species, Anderson (1980) highlighted vegetative and reproductive features that suggested a close relationship with *Tonestus* (*Haplopappus*) *aberrans* (A. Nelson) G.L. Nesom & D.R. Morgan and *T.* (*Haplopappus*) *eximius* A. Nelson & J.F. Macbr. The sequence-based investigations did not confirm these relationships. Instead, *Tonestus aberrans* was assessed to be more closely aligned with the *Machaerantherinae*, resulting in the description of the genus *Triniteurybia* to accommodate that taxon (Brouillet et al. 2004). In addition, the position of *Tonestus eximius* was either not fully resolved or else weakly aligned in a grade below *Chrysothamnus* sensu Urbatsch et al. (2005). *Toiyabea alpina*, for the most part, received moderate to strong support in a clade in which it was unresolved with *Petradoria pumila* and *Stenotus acaulis*/*S. armerioides* (Roberts 2002; Roberts & Urbatsch 2004). *Toiyabea alpina* can be distinguished from the two species of *Stenotus* by its similar basal and cauline leaves, leaf-like outer phyllaries, and discoid capitula. Its closest evolutionary affinities appear to be with *Petradoria*, from which it is distinguished by its densely stipitate-glandular pubescent, spatulate, ovate or oblanceolate leaves with coarsely toothed margins, foliaceous phyllaries, and eradiate capitula producing 35 or more bisexual disc florets.

KEY TO *NESTOTUS*, *PETRADORIA*, *STENOTUS*, *TOIYABEA*, AND RELATED TAXA

1. Capitula in a densely corymbiform capitulescence, 5 or more per cluster; involucres cylindric to turbinate, up to 3 mm broad, phyllaries strongly graduated; disk flowers 2–4 per capitulum, functionally staminate, ray flowers 1–3 ____ **Petradoria**
1. Capitula solitary or capitulescence at most with 4 per cluster, scapose; involucres campanulate to hemispheric, more than 3 mm broad, phyllaries subequal to graduated; disk flowers 12+ per capitulum, bisexual, ray flowers 0 or 5–17.
    2. Leaf margins coarsely toothed, cauline (peduncular) leaves well-developed and similar to basal leaves; phyllaries wholly foliaceous; Lander and Nye counties, Nevada ____ **Toiyabea**
    2. Leaf margins entire, cauline (peduncular) leaves much reduced or absent; phyllaries chartaceous at least proximally; not known from Lander and Nye counties (except for *S. acaulis*).
        3. Capitula discoid; Sierra de San Pedro Mártir, Baja California ____ **Stenotus pulvinatus**
        3. Capitula radiate; western U.S.A. and Canada.
            4. Shoots villous to lanate with long, crinkly hairs and stipitate, glandular trichomes; taproots poorly developed ____ **Stenotus lanuginosus**
            4. Shoots with short, straight or arching conic hairs, glandular hairs sometimes also present; taproots usually well-developed,
                5. Phyllaries weakly imbricate, phyllary apices acute, green portion much longer than broad often extending full length of phyllaries; leaves generally bearing short, gland-tipped hairs; intergrades with *S. armerioides* occur in Colorado and eastern Wyoming ____ **Stenotus acaulis**
                5. Phyllaries regularly imbricate, phyllary apices obtuse to rounded, green portion about as long as broad and generally restricted to the distal one-third; leaves viscid or viscid dotted, stalked hairs not evident ____ **Stenotus armerioides**

KEY TO SPECIES OF *NESTOTUS*

1. Leaf surfaces glabrous, margins often ciliate; Yukon River drainage, Yukon Territory, Canada ____ **N. macleanii**
1. Leaf surfaces and margins abundantly pubescent with gland-tipped trichomes; northwestern U.S.A. ____ **N. stenophyllus**

ACKNOWLEDGMENTS

The authors thank the curators and staff personnel of ASC, ASU, BRY, CAS, DH, RM, UNLV, US, UT, and WTU for specimen loans on which this and related research is based. We thank Mario Blanco and Lorena Endara for preparing the Spanish abstract and Guy Nesom and others for their helpful comments.

BOOK NOTICES

Timber Press

ROBBIN C. MORAN. 2004. **A Natural History of Ferns.** (ISBN 0-88192-667-1, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. and 2 Station Road, Swavesey, Cambridge CB4 5QJ, U.K. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $29.95, 301 pp., 26 color plates, 145 b/w line drawings, 6 1/4" × 9 1/4".

Robbin Moran's new book, *A Natural History of Ferns*, is a delight. This book is not a field guide to the identification of ferns. The author is quick to point out, "...—there are plenty of those [field guides] available. Instead, it picks up where field guides leave off, examining the biology of these plants—how they grow and develop, reproduce and disperse, adapt and evolve." If you are into ferns then you will delight in this book.

BILL MCCLAREN. 2004. **Encyclopedia of Dahlias.** (ISBN 0-88192-658-2, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. and 2 Station Road, Swavesey, Cambridge CB4 5QJ, U.K. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $39.95, 211 pp., 800+ color photos, 8 1/2" × 11".

Dahlias are beautiful and if nothing else you would enjoy this as a 'coffee table' book. About 700 selections are included with notes on their history, awards and cultural peculiarities. Thirteen chapters cover about every aspect of *Dahlia* including dahlia care and propagation, wild species of dahlia, hybridizing, and classification

TONI LAWSON-HALL and BRIAN ROTHERA. 2004. **Hydrangeas: A Gardener's Guide. Revised Edition.** (ISBN 0-88192-669-8, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $34.95, 176 pp., color photos, b/w drawings, 7 1/2" × 10 3/4".

From the Dustjacket.—This book is in two sections. In the first chapter, The Genus *Hydrangea*, the history and natural distribution of hydrangeas are outlined, and the general characteristics explained. The 14 speices mostly commonly grown in cultivation are described in detail, with special reference to the naming problems of *H. macrophylla*. The second section describes 100 cultivars in detail.

CHROMOSOME NUMBERS OF *GLANDULARIA* (VERBENACEAE) FROM CENTRAL AND TRANS-PECOS, TEXAS

ABSTRACT

Meiotic chromosome counts for 66 populations of the genus *Glandularia* (sensu Umber 1979) are reported, all from the state of Texas. These include counts for the following taxa: *G. bipinnatifida* var. *bipinnatifida* ($n = 15$ pairs); *G. bipinnatifida* var. *brevispicata* ($n = 15$ pairs); *G. pumila* ($n = 10$ pairs); *G. quadrangulata* ($n = 10$ pairs); *G. racemosa* ($n = 10$ pairs); *G verecunda* ($n = 10$ pairs); and *G. wrightii* ($n = 10$ pairs). The taxonomic import of these data is discussed.

RESUMEN

Se publican los recuentos cromosomáticos en meiosis de 66 poblaciones del género *Glandularia* (sensu Umber 1979), todos del estado de Texas. Se incluyen recuentos de los siguientes taxa: *G. bipinnatifida* var. *bipinnatifida* ($n = 15$); *G. bipinnatifida* var. *brevispicata* ($n = 15$); *G. pumila* ($n = 10$); *G. quadrangulata* ($n = 10$); *G. racemosa* ($n = 10$); *G verecunda* ($n = 10$); y *G. wrightii* ($n = 10$). Se discute la importancia taxonómica de estos datos.

Glandularia is a difficult genus, as well noted by Umber (1979) in his systematic treatment of the group, and by both Henrickson (2003) and Turner (2003) in their running accounts of several taxa. In his efforts to utilize cytological data in evaluating taxonomic groupings, Umber summarized previous counts for the genus, this amounting to 47 reports for 20 species, including 10 of his own. Subsequently, few additionally counts have been forthcoming, although Poggio et al. (1993), without reference to Umber's work, noted that the genus is amphitropical in distribution, those of South America possessing mostly diploid taxa ($2n = 10$ or $2x = 5$), those of North America mostly hexaploid ($2n = 30$ or $6x = 30$). Actually, of the North American taxa of *Glandularia* counted to date (ca. 20 species), half are tetraploids ($4x = 20$), and half are hexaploids ($6x = 30$); no diploids have been reported, suggesting a South American origin for the group, as first noted by Schnack (1964).

In the present account we provide chromosome counts for an additional 66 populations from six species, all of these from Texas, as summarized in Table 1. We subsequently discuss the import of these data according to the treatment of Umber.

TABLE 1. Chromosome counts of *Glandularia* (sensu Umber 1979).

Glandularia bipinnatifida (Nutt.) Nutt. var. **bipinnatifida**: all counts $n = 15$ pairs.

- Presidio Co.: ca. 23 mi S of Marfa, *Turner 24-289* (SRSC, TEX).

Glandularia bipinnatifida var. bipinnatifida

Umber reported chromosome counts for 18 collections of this taxon from over a broad range. Fifteen of these were listed as $n = 15$ pairs; three with $n = 10$ pairs. The latter counts, as noted below, perhaps relate to *G. wrightii*. We report herein counts for an additional 26 collections of *G. b.* var. *bipinnatifida*, all with $n = 15$ pairs.

Glandularia bipinnatifida var. breviscapa

Umber reported a single collection (the Type) of this taxon as $n = 15$ pairs. We have added three additional counts from the Guadalupe Mts. of Culberson Co., Texas, all with $n = 15$ pairs.

Glandularia pumila

Umber reported only two counts for this taxon, both by Lewis and Oliver (1961) from Central Texas, and both with $n = 10$ pairs. We report here two additional counts from western Texas, both having the same number.

Glandularia quadrangulata

Umber listed a single count of $n = 10$ pairs for this taxon, as first reported by Lewis and Oliver (1961) from a population in southern Texas. We report two additional collections, both with $n = 10$ pairs.

Glandularia racemosa

Umber reported counts of only two collections of this taxon, an unvouchered count of $n = 15$ pairs by Derman (1936), and a count of $n = 15$ pairs by Umber himself, the latter from Pecos Co., Texas. On the basis of these two reports Umber reckoned the taxon to be a hexaploid ($6x = 30$). We present here counts from eight Texas populations, including the populational site from which Umber obtained his count of $n = 15$ pairs. All proved to be tetraploids ($4x = 40$).

It would appear that *G. racemosa* is not a hexaploid as previously reported; both Umber (1979) and Henrickson (2003) used such data to bolster their acceptance of *G. racemosa* as a valid species, as opposed to its submergence under *G. quadrangulata* as originally proposed by Turner (1998). Actually, morphological characters alone will serve to distinguish *G. racemosa* from *G. quadrangulata* (Turner, in prep.).

Glandularia wrightii

Umber reported counts of three collections of this taxon, all with $n = 10$ pairs. He acknowledged its close relationship to *G. bipinnatifida* (so far as known a hexaploid) but noted its consistently tetraploid chromosome number, and seeming restriction to the higher portions of the Chisos, Davis, and Franklin mountains of Trans-Pecos, Texas. The only exceptional counts for *G. bipinnatifida* (i.e., $n = 10$ pairs) reported by Umber are three: two from Texas (El Paso and Pecos counties) and one from Arizona (Apache Co.). Interestingly, two of the latter were identified by their collectors as *G. wrightii*. Regardless, we present here counts for 17 collections of *G. wrightii*, all tetraploid with $n = 10$ pairs. The species often grows in close proximity to *G. bipinnatifida* without showing signs of hybridization, although putative first generation hybrids would be exceedingly difficult to detect without cytological data. Nevertheless, field observations and chromosomal data assembled by the present authors strongly suggest that *G. wrightii* is a good biological species, contrary to the views of Turner (1998) who treated it as synonymous with his concept of *G. bipinnatifida* var. *ciliata* (Benth.) B.L.Turner.

MATERIALS AND METHODS

All counts were obtained from meiotic material collected in the field; preservation and staining procedures follow the methods outlined by Powell and Weedin (2001).

ACKNOWLEDGMENTS

We are grateful to Joselyn Fenstermacher for the collection of buds from Big Bend National Park, and to Matt Turner for buds from El Paso Co. Ray Umber provided helpful review comments.

BOOK REVIEW

A. Michael Powell and James F. Weedin. 2004. **Cacti of the Trans-Pecos & Adjacent Areas.** (ISBN 0-89672-531-6, hbk). Texas Tech University Press, Box 41037, Lubbock, TX 79409-1037, U.S.A. (**Orders:** www.ttup.ttu.edu, 1-800-832-4042). $60.00, 509 pp, 313 color figs, b/w drawings and maps, 7" × 10".

A book written by two experts on the cacti in the Chihuahuan Desert Region (CDR) of North America. The focus of this book being the Cactaceae in the Trans-Pecos region of west Texas and the reconciliation of the nomenclatural/taxonomic confusion that has evolved in the literature over the years. The authors have meticulously put together a complete synopsis of the taxonomy, biology, ecology, evolution, and ethnobotanical history of this very complex and controversial family of plants.

Western Texas does have the unique claim of being the host to more species of cacti than any other state in the US. This fact has given the authors, Dr. A.M. Powell, professor emeritus at Sul Ross State University, and Dr. J.F. Weedin professor of biology at the Community College of Aurora, Colorado, the opportunity to spend a career studying these plants out in the field, and in the labs, test gardens and greenhouses at Sul Ross and the Chihuahuan Desert Research Institute. The authors have given the readers numerous paths to follow when it comes to identifying taxa.

The book includes very detailed Trans-Pecos distribution maps, as well as a continental distribution map for each taxon. The color photography that the authors have included shows the wide variety of habitat in the region. The readers are also given very detailed photographs of mature plants at anthesis as well as plants with mature fruits. Photographs combined with the several levels of keys given in the work, have made the daunting task of correctly identifying cacti much less of a challenge.

The detailed information that is given in the description and discussion of each taxon provides the readers, whether scientist or layperson, with information, and resources that leave no questions unanswered or unaddressed. This book covers the entire history of the study of CDR cacti and mentions numerous opportunities for future study. Apparently there are many taxa that need further study and this book will function as a solid foundation for that work, for many years to come. The authors also mention, to some degree, numerous other taxa that occur outside the Trans-Pecos region, giving the readers a well rounded piece of botanical literature for the Cactaceae in the southwestern US. With the selected glossary and extensive bibliography (literature cited) included, it is obvious this very fine book has been a long time in the making.

These authors have now provided the world with the much needed scientific clarification on this family of succulent plants that humans have loved and hated for thousands of years.—*Justin W. Allison, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

DOCUMENTED CHROMOSOME NUMBERS 2005: 1. MISCELLANEOUS COUNTS FROM WESTERN TEXAS, MOSTLY TRANS-PECOS

ABSTRACT

Twenty-seven meiotic chromosome counts are reported for 20 species in nine families of plants from western Texas, mostly the Trans-Pecos region. The counts for *Packera texensis*, *Chamaesyce stictospora*, *Astragalus argillophilus*, *A. bigelovii*, and *A. marcidus* are first reports.

RESUMEN

Se publican veintisiete recuentos cromosomáticos en meiosis de 20 especies de nueve familias de plantas del Oeste de Texas, la mayoría de la región de Trans-Pecos. Los recuentos de *Packera texensis*, *Chamaesyce strictospora*, *Astragalus argillophilus*, *A. bigelovii*, y *A. marcidus* son los primeros realizados.

Bud collections were obtained and the following chromosome number determinations were made during the course of floristic fieldwork in Trans-Pecos, Texas, and nearby areas of the state. Meiotic chromosome counts were produced by the first author, or in some cases initiated by the collector cited and verified by AMP, using techniques described in Turner and Johnston (1961); the second author also verified many of the counts. We acknowledge the collections and chromosomal observations of E.F. McRae, W. Jacobs, D. Foster, and S.A. Powell. Vouchers are in SRSC and/or TEX.

Asteraceae

Bahia absinthifolia Benth. $2n = 24$ II. Brewster Co.: 11.2 km ENE of Lajitas along Hwy 170, *B.L. Turner 24-45.*

Packera texensis O'Kennon & Trock. $2n = 23$ II. Gillespie Co.: 2.4 km N of Keese-Sagebeil Road, ca. 1.3 km N of type locality, *B.L. Turner 24-75.*

Psathyrotopsis scaposa (A. Gray) H. Rob. $2n = 19$ II. Hudspeth Co.: ca. 5.1 km SE of intersect. of Hwy 192 (to Indian Hot Springs) with Quitman Pass road, *B.L. Turner 24-358.*

Solidago gigantea Aiton. $2n = 9$ II. Presidio Co.: ca. 3.5 km NNE of Ruidosa, *B.L. Turner 23-181.*

Brassicaceae

Streptanthus playtcarpus A. Gray. $2n = 14$ II. Crockett Co.: ca. 12.9 km E of Sheffield, roadside park along U.S. 90, where it drops off into Pecos River Valley, *B.L. Turner 21-202.*

Cactaceae

Opuntia macrocentra Engelm. $2n = 11$ II. Culberson Co.: 3.2 km N of Kent, *B.L. Turner s.n.*

SIDA 21(3): 1663–1664. 2005

Euphorbiaceae

Chamaesyce stictospora (Engelm.) Small. $2n = 6$ II. Pecos Co.: 40 km N of U.S. 67 and U.S. 90 junct., along U.S. 90, *E.F. McRae 14*.

Chamaesyce theriaca (L.C. Wheeler) Shinners. $2n = 14$ II. Presidio Co.: 1.9 km W of Redford, *E.F. McRae 37*.

Fabaceae

Astragalus argillophilus Cory. $2n = 11$ II. Reagan Co.: ca. 1.9 km S of Big Lake, *B.L. Turner 24-41*.

Astragalus bigelovii A. Gray. $2n = 11$ II. Hudspeth Co.: ca. 12.9 km W of Sierra Blanca, *B.L. Turner 24-12*.

Astragalus marcidus Greene ex Rydb. $2n = 11$ II. Presidio Co.: N of Marfa, 5.9 km S of Jeff Davis Co. line, *B.L. Turner 24-134*; near head of Pinto Canyon, 48 km SW of Marfa, *B.L. Turner 24-104*.

Astragalus mollissimus Torr. var. *earlei* (Greene ex Rydb.) Tidestr. $2n = 11$ II. Hudspeth Co.: ca. 3.2 km E of Sierra Blanca, *B.L. Turner 24-26*.

Hydrophyllaceae

Phacelia coerula Greene. $2n = 11$ II. Hudspeth Co.: ca. 12.9 km W of Sierra Blanca, *B.L. Turner 24-13*.

Phacelia integrifolia Torr. $2n = 11$ II. Crane Co.: 16.4 km W of Crane, *B.L. Turner 24-61*.

Phacelia popei Torr. & A. Gray. $2n = 11$ II. Brewster Co.: ca. 8 km along Agua Fria road from Hwy 118, *B.L. Turner 21-34*.

Phacelia robusta (J.F. Macbr.) I.M. Johnst. $2n = 11$ II. Brewster Co.: ca. 12 km along Agua Fria road from Hwy 118, *B.L. Turner 21-36*.

Liliaceae

Schoenocaulon texanum Scheele. $2n = 8$ II. Pecos Co.: Glass Mts., R. Warnock Park, ca. 43 km S of Fort Stockton, *B.L. Turner 24-170*.

Ranunculaceae

Delphinium wootonii Rydb. $2n = 8$ II. Brewster Co.: 4.2 km S of Alpine, *A.M. Powell 6427*.

Solanaceae

Chamaesaracha coniodes Britton. $2n = 24$ II. Brewster Co.: Alpine, above Kokernot Lodge, *A.M. Powell* and *S.A. Powell 6281, 6282, 6283* (counts from three individual plants).

Chamaesaracha sordida (Dunal) A. Gray. $2n = 12$ II. Brewster Co.: Sul Ross State University campus, *W. Jacobs* and *D. Foster 6*; sidewalk above Kokernot Springs, *B.L. Turner 99-95*; Alpine, near Kokernot Lodge, *A.M. Powell* and *S.A. Powell 6279, 6280* (counts from two individual plants); 14.5 km SE of Alpine, *A.M. Powell* and *S.A. Powell 5548*.

ABSTRACT

Sixty-four chromosome counts are reported for 27 taxa, mostly of western Texas, and most of them are opuntioid cacti (51 counts) of the Trans-Pecos region. Meiotic configurations suggest that Jeff Davis and Presidio county populations of *O. davisii* are triploid. Among the *Opuntia* reports are 11 diploid and two tetraploid counts attributed to *O. macrocentra*, and seven counts documenting a tetraploid taxon here referred to *O. mackensenii* var. *minor*. Three meiotic and two pollen stainability observations indicate that at least some plants of *O. schottii* var. *schottii* are partially or completely sterile.

RESUMEN

Se publican sesenta y cuatro recuentos cromosomáticos de 27 taxa, la mayoría del Oeste de Texas, y la mayoría de ellos son cactus opuntioides (51 recuentos) de la región de Trans-Pecos. Las configuraciones meioticas sugieren que las poblaciones de los condados de Jeff Davis y Presidio de *O. davisii* son triploides. Entre los recuentos de *Opuntia* 11 son diploides y dos tetraploides atribuidos a *O. macrocentra*, y siete recuentos que documentan un taxon tetraploide los referimos aquí a *O. mackensenii* var. *minor*. Tres observaciones meioticas y dos tinciones de polen indican que al menos algunas plantas de *O. schottii* var. *schottii* son parcial o completamente estériles.

Most of the chromosome counts presented below are the product of long-term investigations of Cactaceae in Trans-Pecos Texas and adjacent areas (cf. Weedin & Powell 1978; Powell & Weedin 2001; 2004). Two counts are from New Mexico, and one is from Colorado. Meiotic chromosome numbers were determined by the first author, following the techniques in Turner and Johnston (1961). The two pollen stainability tests with flowers of *O. schottii* were conducted after crushing anthers in Cotton Blue in lactophenol (Powell et al. 1991). For Cactaceae, buds were obtained from plants in the field, or buds were ultimately secured from cultivated stem cuttings. Miscellaneous counts of the non-cactus taxa were initiated by the respective collectors of voucher specimens, from field-collected buds, and verified by the first author. Amy Causey-Slover collected and contributed the buds of *Opuntia davisii* and *O. tunicata* (with M. Rodriguez). We thank G. Kliem-Pendley and S. Tripp for the non-cactus counts. We are grateful to L. Hedges, G. Raun, G. Kliem-Pendley, P. Griffith, B. L. Turner, S.A. Powell, J. Brady, D. Ferguson, and P. Manning for providing cactus plants, buds, or *Opuntia* stem cuttings; P. Manning also nurtured and helped to relocate living vouchers. Herbarium specimen vouchers are at SRSC. An asterisk (*) denotes chromosome counts also listed in Pendley (2001).

Asteraceae

Berlandiera lyrata Benth., $2n = 15$ II. Brewster Co.: Alpine, *G.M. Kliem 283*; *S. Tripp 12*.

Engelmannia peristenia (Raf.) Goodman & C. A. Lawson, $2n = 9$ II. Brewster Co.: Alpine, *S. Tripp 1*.

Xanthisma spinulosum (Pursh) D. R. Morgan & R. L. Hartm. var. *spinulosum*, $2n = 4$ II. Brewster Co.: Alpine, *S. Tripp 3*; Alpine, Old Mosley Lane main gate off hyw. 90, *G.M. Kliem 246*.

Psilostrophe tagetina (Nutt.) Greene, $2n = 16$ II. Brewster Co.: Alpine, *S. Tripp 8*.

Senecio flaccidus Less., $2n = 20$ II. Brewster Co.: Lizard Mt. Ranch, W of Alpine, *G.M. Kliem 313*.

Cactaceae

Ancistrocactus brevihamatus (Engelm.) Britton & Rose var. *pallidus* A.D. Zimmerman ex A.M. Powell, $2n = 11$ II. Brewster Co.: Marathon, *P.R. Manning 1016*.

Ancistrocatus brevihamatus var. *brevihamatus*, $2n = 11$ II. Val Verde Co.: Devils River State Natural Area, *L. Hedges s.n.*

Echinocereus dasyacanthus Engelm., $2n =$ ca. 44 (meiotic configurations show mostly II's, possibly some multivalents; also $2n =$ ca. 44, somatic count by J.F. Weedin). Brewster Co.: Big Bend Natl. Park, W slopes of the Chisos Mts., below the Window, *A.M. Powell* and *S.A. Powell 6307*; plants in this population morphologically approach *E. pectinatus* (Scheidw.) Engelm. var. *ctenoides* (Engelm.) Weniger ex G. Frank, or *E. ctenoides* (Engelm.) Rumpler. So far as known, *E. pectinatus* is always diploid ($2n = 11$ II; Powell & Weedin 2004).

Opuntia atrispina Griffiths, $2n = 11$ II. Val Verde Co.: Pecos River high bridge, *A.M. Powell* and *S.A. Powell 6246*.

Opuntia cf. *atrispina* Griffiths, $2n = 11$ II. Val Verde Co.: Pecos River high bridge, *A.M. Powell* and *S.A. Powell 6243*; buds collected from more than one plant; meiocytes from one bud showed $2n = 11$ II; meiocytes from a second bud showed $2n = 22$ II.

Opuntia azurea Rose var. *diplopurpurea* A.M. Powell & J.F. Weedin, $2n = 11$ II. Presidio Co.: 17.5 km SE of Ruidosa, *A.M. Powell* and *S.A. Powell 6295*. Brewster Co.: Lizard Mt., W of Alpine, *G. Kliem 385** (no voucher); Big Bend Natl. Park, Maxwell Road jct., *A.M. Powell* and *M.P. Griffith 6310*; Big Bend Natl. Park, Sotol Vista, *A.M. Powell* and *M.P. Griffith 6311*.

Opuntia azurea Rose var. *parva* A.M. Powell & J.F. Weedin, $2n = 11$ II. Brewster Co.: Big Bend Natl. Park, 6.5 km S on Maxwell Road, "Fins" of Fire Exhibit, *G. Kliem 131**, 21.6 km S on Maxwell Road, *G. Kliem 132** (no voucher); *136**; Black Gap, just inside N border, near paved road, *G. Kliem 133**; Big Bend Natl. Park, K-Bar camping area, *G. Kliem 143**.

Opuntia cf. *camanchica* Engelm. & J.M. Bigelow, $2n = 33$ II. Brewster Co.: Big Bend Natl. Park., Persimmon Gap, *A.M. Powell* and *S.A. Powell 6080*; $2n =$ ca. 66 (meiotic configurations suggest numerous multivalents), Big Bend Natl. Park, Rattlesnake Mts., *G.G. Raun 95-44*; $2n =$ ca. 66 (meiotic configurations indicate probable multivalents). Val Verde Co.: Pecos River high bridge, *A.M. Powell* and *S.A. Powell 6247*.

Opuntia camanchica Engelm. & J.M. Bigelow, $2n =$ ca. 33 II. Hudspeth Co.: N of Sierra Blanca, *A.M. Powell* and *S.A. Powell 6238*.

Opuntia cymochila Engelm. & J.M. Bigelow, $2n =$ ca. 66 (meiotic configurations suggest numerous multivalents). COLORADO. Arapahoe Co.: *J.F. Weedin 1706*; $2n =$ ca. 33 II. TEXAS. Moore Co.: Cactus, *J.F. Weedin 1671*.

Opuntia davisii Engelm. & J.M. Bigelow, $2n = 22$ II. NEW MEXICO. Chaves Co.: Roswell, *A. Causey 18*. *Opuntia davisii*, $2n =$ ca. 33 (meiotic configurations suggest II's, I's, and multivalents, as though $3x$; some tetrads with micronuclei). TEXAS. Jeff Davis Co.: just W of Fort Davis, *A.*

Causey 3. Presidio Co.: 4 km S of Marfa, *A. Causey 9*. Meiotic observations of *O. davisii* support a taxonomic distinction between populations in New Mexico and Trans-Pecos Texas (Powell & Weedin 2001, 2004). Amy Causey-Slover is studying the biology of *O. davisii*.

Opuntia engelmannii Salm-Dyck ex Engelm. var. *engelmannii* (cf. *O. valida* Griffiths, D.J. Ferguson, pers. comm.), $2n = 33$ II. Pecos Co.: 19.3 km WNW of Fort Stockton, *A.M. Powell* and *S.A. Powell 6009*.

Opuntia engelmannii var. *lindheimeri* (Engelm.) B.D. Parfitt & Pinkava, $2n = 33$ II. Uvalde Co.: ca. 1.6 km N of jct. of hwys 236 and 90, *J.F. Weedin 1670*.

Opuntia mackensenii Rose var. *mackensenii* (*O. gilvescens* Griffiths, D.J. Ferguson, pers. comm.), $2n = 22$ II. Terrell Co.: 6.5 km W of the Pecos River, along hwy 90, *S. Lee 29*.

Opuntia cf. *mackensenii* var. *mackensenii*, $2n =$ ca. 55 (meiotic configurations show possible II's, I's, and multivalents, 22-28 per pole in anaphase I; $5x$). Terrell Co.: 25.8 km W of Sanderson near Longfellow, *A.M. Powell* and *S.A. Powell 6220*.

Opuntia mackensenii Rose var. *minor* (M.S. Anthony) A.M. Powell & J.F. Weedin, $2n = 22$ II. Presidio Co.: 1.62 km E of Marfa, *A.M. Powell* and *S.A. Powell 6334*. Pecos Co.: 22.5 km E of Fort Stockton, *A.M. Powell* and *S.A. Powell 6318*. Brewster Co.: 21 km E of Marathon, *A.M. Powell* and *S.A. Powell 6326*. Terrell Co.: 22.5 km W of Dryden, *G.G. Raun 98-14b*. Val Verde Co.: Langtry, *A.M. Powell* and *S.A. Powell 6249*; $2n =$ ca. 22 II. Ward Co.: 21 km S of Monahans, *A.M. Powell* and *S.A. Powell 6316*. Brewster Co.: Alpine, *A.M. Powell* and *S.A. Powell 6050*.

Opuntia macrocentra Engelm., $2n = 11$ II. Hudspeth Co.: W of Sierra Blanca, Lasca Road, *J. Brady s.n.*; ca. 13 km W of Sierra Blanca, *M.P. Griffith 101; 102*. Culberson Co.: ca. 4.8 km N of Van Horn, along hwy 54, *P.R. Manning 2063; 2064*; between the Delaware and Apache mts, along FM 2185, ca. 48 km N of Van Horn, *G. Kliem 165**; *306**; *309**; *310**; 32 km N of Van Horn, along FM 2185, *G. Kliem 307**; *312**.

Opuntia macrocentra Engelm., $2n = 22$ II. El Paso Co.: Fabens cemetery, *J.F. Weedin 2177*. Culberson Co.: 37 km N of Van Horn, along hwy 54, *P.R. Manning 2069*. The diploid ($2n = 11$ II) and tetraploid ($2n = 22$ II) counts here attributed to the purple prickly pear *O. macrocentra* provide additional distributional information about the two morphologically similar cytotypes (Powell & Weedin 2001; 2004). It appears that the tetraploids occur from southeast Arizona across southern New Mexico (Pinkava et al. 1992; 1998), into the Trans-Pecos in El Paso County (Pinkava et al. 1985), and in the northern halves of Hudspeth and Culberson counties (Powell & Weedin 2001). The diploids that most resemble *O. macrocentra* tetraploids appear to be confined to southern Hudspeth and Culberson counties, but may extend farther southeast into Pecos, Jeff Davis, Presidio, and Brewster counties, and even farther northwest into El Paso County or beyond. For the most part, the purple or purplish prickly pears in the Big Bend Region of Trans-Pecos Texas, sometimes included with *O. violacea* Engelm. (Benson 1982) or *O. macrocentra*, have recently been aligned with *O. azurea* Rose (Powell & Weedin 2004). The type locality for *O. macrocentra* is near El Paso.

Opuntia phaeacantha Engelm. var. *phaeacantha*, $2n =$ ca. 66 (meiotic observations indicate possible multivalents and I's). NEW MEXICO. Santa Fe Co.: E Cochiti Reservation near Santa Fe, type locality, *D.J. Ferguson s.n.*

Opuntia polyacantha Haw. var. *trichophora* (Engelm. & J.M. Bigelow) J.M. Coult., $2n = 11$ II. Hudspeth Co.: S of Dell City, *S. Lee 11*.

Opuntia (= *Grusonia*) *schottii* Engelm. var. *schottii*, $2n =$ ca. 44 (mieotic observations show possible multivalents). Brewster Co.: Heath Canyon, *A.M. Powell* and *S.A. Powell 6152* (pollen stainability 47 %). Terrell Co.: Sanderson, *G.G. Raun 98-40*, no chromosome count possible, only abnormal meiocytes observed in anthers of flower buds. Val Verde Co.: Langtry, *A.M. Powell* and *S.A. Powell 6248*, no chromosome count possible, only abnormal meiocytes observed in poorly developed anthers (pollen stainability 0 %).

Opuntia strigil Engelm., $2n = 11$ II. Terrell Co.: 67 km E of Marathon, *P.R. Manning 1064*; W of Dryden, *G.G. Raun 98-14a*.

Opuntia tunicata (Lehm.) Pfeiff., $2n = 11$ II. Pecos Co.: Glass Mts., Gap Tank, *A. Causey 28*.

Opuntia sp., $2n = 11$ II. Brewster Co.: Big Bend Natl. Park, Boquillas overlook, *A.M. Powell* and *S.A. Powell 6276* [same morphotype as that reported in Powell and Weedin (2001), as *Opuntia* sp., *B.G. Hughes 800*], suspected hybrid between *O. rufida* Engelm. and *O. azurea* var. *parva*.

Loasaceae

Cevallia sinuata Lag., $2n = 13$ II. Brewster Co.: Lizard Mt. Ranch W of Alpine, *G.M. Kliem 249*.

Solanaceae

Solanum elaeagnifolium Cav., $2n = 12$ II. Brewster Co.: Alpine, *G.M. Kliem 245*.

Solanum rostratum Dunal, $2n = 12$ II. Gillespie Co.: 50 km E of intersect. I-10 and hwy 290 between Fredricksburg and Junction, *S. Tripp 5*.

DOCUMENTED CHROMOSOME NUMBERS 2005: 3. CHROMOSOME NUMBERS IN NORTH AMERICAN SPECIES OF *SILENE* AND *STELLARIA* (CARYOPHYLLACEAE)

J.K. Morton

Department of Biology
University of Waterloo
Waterloo, Ontario, CANADA N2L 3G1

ABSTRACT

Chromosome numbers are reported for 44 collections of *Silene* and 74 collections of *Stellaria* (Caryophyllaceae) from continental North America. First published reports include those for *Silene drummondii* Hook. subsp. *striata* (Rydberg) J.K. Morton $2n = 72$, *S. hitchguirei* Bocquet $2n = 24$, *S. uralensis* (Rupr.) Bocquet subsp. *ogilviensis* (A.E. Porsild) D.F. Brunton $2n = 48$, *Stellaria fontinalis* (Short & Peter) B.L. Robinson $2n = 26$, *S. nitens* Nuttall $2n = 20$ & 40 and *S. parva* Pederson $2n = 34$.

First published reports for material of North American origin include *Silene dichotoma* Ehrhart $2n = 24$, *S. dioica* (L.) Clairville $2n = 24$, *S. flos-cuculi* (L.) Clairville $2n = 24$, *Stellaria alsine* Grimm $2n = 24$, *S. cuspidata* Willd. ex Schltdl. subsp. *prostrata* J.K. Morton $2n = 26$, *S. neglecta* Weihe $2n = 20$ & 22 and *S. palustris* Retz. $2n =$ ca. 198.

RESUMEN

Se publican los números cromosomáticos de 44 colecciones de *Silene* y 74 colecciones de *Stellaria* (Caryophyllaceae) de Norte América continental. Entre los primeros recuentos publicados se encuentran los de *Silene drummondii* Hook. subsp. *striata* (Rydberg) J.K. Morton $2n = 72$, *S. hitchguirei* Bocquet $2n = 24$, *S. uralensis* (Rupr.) Bocquet subsp. *ogilviensis* (A.E. Porsild) D.F. Brunton $2n = 48$, *Stellaria fontinalis* (Short & Peter) B.L. Robinson $2n = 26$, *S. nitens* Nuttall $2n = 20$ & 40 y *S. parva* Pederson $2n = 34$.

Los primeros recuentos en material originario de Norte América son *Silene dichotoma* Ehrhart $2n = 24$, *S. dioica* (L.) Clairville $2n = 24$, *S. flos-cuculi* (L.) Clairville $2n = 24$, *Stellaria alsine* Grimm $2n = 24$, *S cuspidata* Willd. ex Schltdl. subsp. *prostrata* J.K. Morton $2n = 26$, *S. neglecta* Weihe $2n = 20$ & 22 y *S. palustris* Retz. $2n =$ ca. 198.

INTRODUCTION

The purpose of this paper is to put on record previously unpublished data on chromosome numbers in the species of *Silene* and *Stellaria*, both native and introduced, occurring in continental North America.

METHODS AND MATERIALS

The methods used in obtaining these chromosome counts are described in Morton 2002. Voucher specimens are retained in the author's research collections and partial sets of duplicates have been distributed to WAT, MICH, DAO and VDB. Collection numbers prefixed with NA are J.K. Morton or J.K. Morton and Joan M. Venn collections.

SIDA 21(3): 1669–1674. 2005

DISCUSSION

Many of these chromosome counts confirm those from previous workers. However, the following appear to be the first published accounts for their respective taxa:- *Silene drummondii* subsp. *striata* $2n = 72$, *S. hitchguirei* $2n = 24$, *S. uralensis* subsp. *ogiliviensis* $2n = 48$, *Stellaria fontinalis* $2n = 26$, *S. nitens* $2n = 20$ & 40 and *S. parva* $2n = 34$.

The following chromosome counts appear to be the first published counts for North American material of these taxa:- *Silene dichotoma* $2n = 24$, *S. dioica* $2n = 24$, *S. flos-cuculi* $2n = 24$, *Stellaria alsine* $2n = 24$, *S. cuspidata* subsp. *prostrata* $2n = 26$, *S. neglecta* $2n = 20$ & 22 and *S. palustris* $2n =$ ca. 198.

Polyploidy is prevalent in the genus *Silene*, both within single species and between closely related taxa. Examples from the current study include *Silene ostenfeldii* with $2n = 24$, 48 & 72; *S. drummondii* subsp. *drummondii* with $2n = 24$ (Cronquist 1991) & 48, and subsp. *striata* with $2n = 72$; *S. menziesii* with $2n = 24$ & 48 and the closely allied *S. williamsii* with $2n = 48$; *S. repens* with $2n = 24$ & 48; *S. uralensis* subsp. *uralensis* with $2n = 24$ (Packer & McPherson 1974), subsp. *ogilviensis* $2n = 48$ and subsp. *porsildii* $2n = 48$ (Knaben 1968).

Stellaria graminea has diploid ($2n = 26$) and tetraploid ($2n = 52$) cytotypes in Europe where it is a native species. All the populations that have been examined from North America, where it is an aggressive introduced rhizomatous weed, are tetraploid with the exception of a sterile triploid ($2n = 39$) colony in Newfoundland. Only the diploid cytotype is known to occur in the British Isles (Blackburn & Morton 1957; Stace 1997). Its absence from North America is surprising in view of the close links between Britain, Newfoundland and the New England states.

The chromosome counts for the broad-leaved form of *Stellaria borealis* are the first reports for this variant. These counts are for plants referable to subspecies *sitchana*. The name var. *latifolia* cannot correctly be applied to these plants because it was originally given to a similar broad-leaved form of *S. borealis* subsp. *borealis* as *S. calycantha* var. *latifolia* B. Boivin (1951). The broad-leaved forms of subsp. *sitchana* retain their characters under cultivation. It appears that this variant is associated with rivers and streams at mid elevations (1200–2100 m) on the forested slopes of the Sierra Nevada Mountains of California.

ACKNOWLEDGMENTS

I am indebted to Joan M. Venn for technical assistance during this study and for her help in preparing the manuscript for publication. I also want to thank Dale Johnson for reviewing an earlier draft of this paper.

RESUMEN

Se caracterizó la morfología cualitativa y cuantitativa de tricomas foliares en *S. acerifolium* Dun., *S. agrarium* Sendtn., *S. capsicoides* All. y *S. mammosum* L. (sección *Acanthophora* Dun.). Se seleccionaron 5–10 hojas frescas en máxima expansión foliar, procedentes de 3–5 individuos, que luego fueron preservadas en FAA 70%; también se utilizó a razón de 4–5 hojas rehidratas en lactofenol por cada espécimen de herbario. Se hicieron montajes microscópicos, utilizando la porción media de la lámina foliar y del pecíolo; además se hicieron montajes de lámina foliar aclarada. La diversidad morfológica de tricomas permitió separarlos en tres tipos básicos: simples, estrellados y glandulares, con varios subtipos. Se describen 11 subtipos en *S. agrarium* y 7 en la restantes especies. A cada subtipo se le determinó su ubicación en las distintas partes de la hoja. Se presenta una clave basada en rasgos tricomáticos y las ilustraciones de los tricomas descritos. La diversidad de los tricomas en las especies estudiadas, prueba ser un criterio taxonómico de alto valor para distinción de miembros del género *Solanum*.

ABSTRACT

The qualitative and quantitative morphology of foliar trichomes in *S. acerifolium* Dun., *S. agrarium* Sendtn., *S. capsicoides* All. and *S. mammosum* L. (section *Acanthophora* Dun.) where characterized. Five to ten fresh, fully expanded leaves from 3–5 individuals, were preserved in FAA 70%. Herbarium specimens were also used (4–5 leaves from each specimen). Fragments of fresh material (middle portion of leaf and petiole) and herbarium material for microscope examination. The diversity of the morphological trichomes studied separate into three basic types: simple, glandular, and estellate, with several subtypes. Eleven subtypes are described in *S. agrarium* and seven in the other species. A key fixed on trichomatic features and the illustrations of the described trichomes is presented. The diversity of trichome types and morphology of trichomes are useful characters in identifying species of the genus *Solanum*.

INTRODUCCIÓN

La sección *Acanthophora* Dun. conforma, con otras 26 secciones, al subgénero *Leptostemonum* (Dunal) Bitter del género *Solanum* (D'Arcy 1991). Comprende *ca.* 18 especies de América tropical y subtropical; algunas de las cuales, como *Solanum aculeatissimum* Jacq., *S. capsicoides* All., *S. mammosum* L., y *S. viarium* Dun., fueron introducidas en el viejo mundo (Nee 1991, 1999). Esta sección fue descrita por Dunal (1813), teniendo a *S. mammosum* L., como especie tipo. Posteriormente, en 1852, este mismo autor redefine el grupo e incluye las 53 especies hasta el momento conocidas, distribuidas en dos subgrupos denominados "*Psilocarpa*" y "*Lasiocarpa*." En 1962, Seithe estudió ampliamente la pubescencia en *Solanum* y señaló para la Sectio *Simplicipilum* Bitt. (section *Acanthophora* Dun.) tricomas estrellados, espinosos y porrectos; de una a varias células alargadas. Posteriormente la misma autora en 1979, reúne la pubescencia de *Solanum* en ocho tipos básicos de tricomas, describe sus variaciones y otros aspectos sobre el desarrollo ontogenético.

Dada la relevancia de las características asociadas al indumento en miembros solanáceos, identificamos y describimos los tricomas foliares en especies de *Solanum* secc. *Acanthophora*. Igualmente, se determinaron las dimensiones morfométricas de los tipos descritos y la ubicación de cada uno de ellos, en las distintas partes de la hoja.

MATERIALES Y MÉTODOS

En este estudio se usó material vegetal fresco y de herbario (Cuadro 1). El material fresco se preservó en FAA 70% y se seleccionaron de 5–10 hojas adultas, del tercio medio de la planta y procedentes de tres o más individuos. El material de herbario se re-hidrató en lactofenol durante 1–2 meses (Peña y Saralegui 1982), y se tomaron 3–4 hojas por espécimen. De las hojas se extrajeron la parte media de la lámina foliar (0.5 cm de ancho y 1cm de largo) y el pecíolo (0.5 cm de largo); y se seccionaron transversalmente a mano libre. Los cortes se tiñeron con azul de toluidina 0.5% o safranina acuosa 1%, e inmediatamente se montaron en agua-glicerina (v:v) para preparaciones semipermanentes.

Para obtener preparaciones permanentes (Roth 1964), las porciones vegetales incluidas en parafina se cortaron con un micrótomo de rotación con un espesor 15 µm. Los cortes se tiñeron con azul de toluidina acuosa 1% (Sakai 1973) y posteriormente se desparafinaron y montaron en Bálsamo de Canadá.

Para observar las epidermis de la hoja en vista frontal, se elaboraron aclarados de la lámina foliar, siguiendo las metodologías de Shobe y Lerten (1967) y Dizeo de Strittmatter (1973), con algunas modificaciones (Granada-Chacón y Benítez de Rojas 2005). Los materiales foliares frescos fijado en FAA 70% y el rehidratado en lactofenol, se cortaron en segmentos de 1 cm^2 y se colocaron en etanol al 96% durante 15 min a 60° C. Luego se transfirieron a una solución 1:1 de etanol 96% e hidróxido de sodio 5% en solución acuosa, durante 15 min a 60°C. Seguidamente, el material se lavó con agua destilada 3 veces y se colocó en una solución de hipoclorito de sodio al 5.25%, hasta que el tejido se tornó translúcido, lo que ocurrió en 3 min en *S. accrifolium* y *S. mammosum*, y en 3–5 min en las especies restantes. Después el material se lavó con agua destilada 5 veces durante 3 min. Finalmente las secciones se tiñeron con azul de toluidina

	Granada, W. 73	400	Carabobo	Maleza en potreros

al 0.5% o con safranina al 1%. En el primer caso el tejido se mantuvo inmerso en el colorante durante 1 min, y en el segundo durante 5-15 seg.

Para identificar y describir los tipos de tricomas, se observaron con un microscopio óptico (Biomed-Leiz) las preparaciones en sección transversal y aclarados de las porciones vegetales seleccionadas. Así, se identificaron los tipos básicos y las variantes en cada uno de ellos, seleccionándose como formas consistentes, aquellas que ocurrían regularmente en cada espécimen analizado por especie. Simultáneamente, se consideró la localización topográfica de cada uno de los tipos tricomáticos según: superficies adaxial y abaxial de la lámina foliar, nervadura principal y pecíolo. Las partes componentes en cada tipo tricomático, se midieron con ayuda de un ocular calibrado a una escala de referencia, determinándose la longitud del tricoma, largo y ancho de sus células componentes y diámetro de la base en aquellos tipos con base pluricelular.

La determinación de las dimensiones morfométricas en los tipos tricomáticos, se llevó a cabo por separado en cada material analizado por especie (Cuadro 1). En cada estructura se hicieron 20-30 mediciones, para establecer un intervalo de variación en cada caso. Las fotografías de los tricomas se tomaron con una cámara incorporada al microscopio; también se elaboraron dibujos a escala de los tipos tricomáticos. Los tipos básicos de tricomas son nombrados según Roe (1971) y la terminología de las descripciones está apoyada en Font Quer (1953), Stearn (1992) y Harris y Woolf Harris (1994).

Las características cualitativas del indumento, se observaron en los aclarados de lámina foliar y en especimenes de los herbarios CAR, MER, MERF, MY, MYF y VEN (Holmgren et al. 1990); el material desecado se examinó con un microscopio estereoscópico Leica MS5.

RESULTADOS Y DISCUSIÓN

A. Caracterización morfológica de los tricomas.—Los tricomas están constituidos por: (a) la base, una estructura unicelular o pluricelular dispuesta e inmersa en el tejido epidérmico y (b) el cuerpo, constituido por la célula o grupos de éstas dispuestas sobre la base. En tricomas simples, el cuerpo incluye las células dispuestas sobre la base; mientras que en tricomas simples glandulares, el cuerpo se diferenció en pie y cabeza. El primer término se aplica a la célula o grupo de células que sostienen una estructura apical (unicelular o pluricelular y generalmente globosa u ovoide) que representa la cabeza.

Tricomas en *Solanum acerifolium*

1. Simples:

- **A.** Base de 1–2 células, cuadrangulares o rectangulares. Cuerpo unicelular cónico, ancho en la base. (Figs. 1:1A y 2:D).
- **B.** Base de 1–2 células. Cuerpo acicular, de 1–3 células uniseriadas, de tamaño desigual y de paredes delgadas. A veces se observaron tricomas con el cuerpo de 2 células, con la apical corta, ligeramente triangular y obtusa. (Fig. 1:1B).
  Variaciones raras: ocasionalmente ocurren tricomas simples del subtipo 1B, con un radio lateral reducido originándose de la base.
- **C.** Base pluricelular de células cuadrangulares a redondeadas. Cuerpo en forma acicular, de 3–4 células uniseridas. (Figs. 1:1C, 2:E, 2:F y 2:G).

2. Estrellados:

- **A.** Base generalmente de 4 células pequeñas, cortas. Cuerpo mayormente de 4 radios laterales, ocasionalmente 3, equidistantes, unicelulares, aciculares, de tamaño ligeramente desigual, porrectos o levantados hacia el radio central en ángulo ligeramente menor a 45° Un radio central unicelular de longitud mayor a los laterales. (Figs. 1:2A, 2:A, 2:B y 2:C).

3. Glandulares:

Cortos

- **A.** Base unicelular redondeada, en ocasiones sobresale de la epidermis. Cuerpo: a) Pie de 1–2 células, en caso de 2 células la anterior a la cabeza es corta y ligeramente más ancha en la zona de conexión con la cabeza. b) Cabeza de 4 o más células, generalmente globosa a subglobosa u ovoidea, con la parte angosta conectada al pie. (Figs. 1:3A y 2:J).

Largos

- **A.** Base de 1–2 células, prolongándose aproximadamente unos 15 mμ sobre la epidermis. Cuerpo: a) Pie de 2 células, la primera ligeramente lageniforme, la segunda corta y pequeña. b) Cabeza de 3 células, globosas y con contenido denso. (Figs. 1:3B y 2:H).
- **B.** Base de 1–2 células, en ocasiones las células de la base presentan mayor grosor que las células epidérmicas típicas, por lo que se prolongan sobre la epidermis 7–15 mμ. Cuerpo: a) Pie de 3 células de tamaño desigual. b) Cabeza generalmente unicelular, ovoidea con contenido denso. (Figs. 1:3B y 2:I)

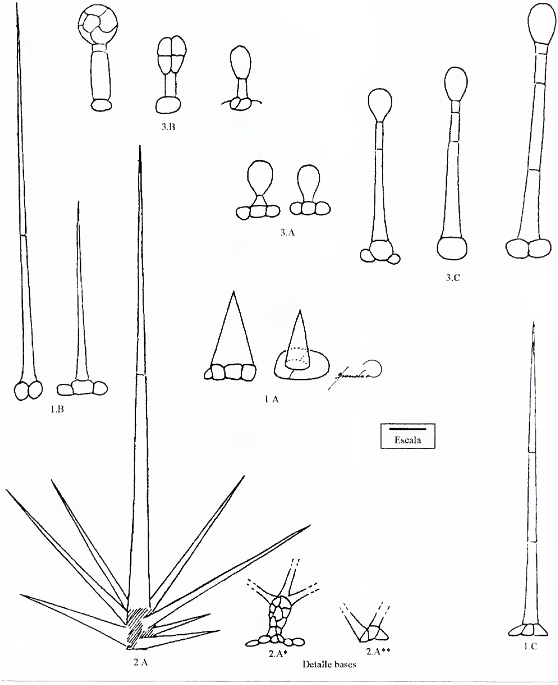

Fig. 1. Tipos de tricomas en *S. acerifolium*. **1)** Simples, subtipos: A, B y C. **2)** Estrellado, subtipo: A. **3)** Glandulares, subtipos: A, B y C. Escala: 1C: 30 µm. 1A, 1B, 3A, 3B, 3C: 50 µm. 2A: 100 µm.

Tricomas en *Solanum agrarium*

1. Simples:

- **A.** Base unicelular redondeada; cuerpo acicular o ligeramente cónico, de 1–2 células; cuando dos, éstas de diferente longitud, generalmente la primera más larga. (Figs. 3:1A y 4:J).
- **B.** Base unicelular obtusa piriforme (lageniforme), notablemente proyectada sobre la epidermis; cuerpo acicular, de 1–2 células. (Fig. 3:1B).

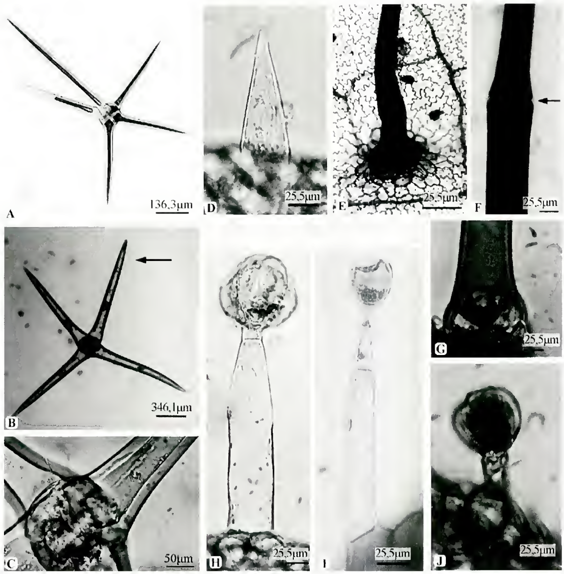

Fig. 2. Tricomas en *S. acerifolium*. Tricomas estrellados: A) De cuatro radios laterales. B) De tres radios laterales, el radio central señalado con la flecha. C) Detalle de la zona de origen de los radios laterales. Tricomas simples: D) Subtipo 1A. E) Detalle de la base pluricelular en tricoma subtipo 1C. F) Señalado con la flecha, se muestra en detalle la zona de unión de las células del cuerpo de un tricoma subtipo 1C. G) Detalle en sección transversal de la base pluricelular de tricoma subtipo 1C. Glandulares: H) Subtipo 3B. I) Subtipo 3C. J) Subtipo 3A.

C. Base unicelular cuadrangular; cuerpo alargado, grueso y formado por 4 células cortas, con paredes ligeramente gruesas. (Fig. 3:1C).

D. Base pluricelular, prolongándose ligeramente por encima de la epidermis; cuerpo acicular, de 2–4 células. (Figs. 3:1D, 4:G y 4:H).

2. Estrellados:

A. Cuerpo de 3 radios laterales, a veces 4 o 5, originándose de un punto común y colocados equidistantemente, unicelulares, aciculares, de tamaño desigual y porrectos. Un radio central unicelular ligeramente más largo que los laterales. (Figs. 3:2A, 4:A, 4:B y 4:C).

B. Cuerpo de 3 radios laterales, aciculares, unicelulares, de tamaño ligeramente desigual,

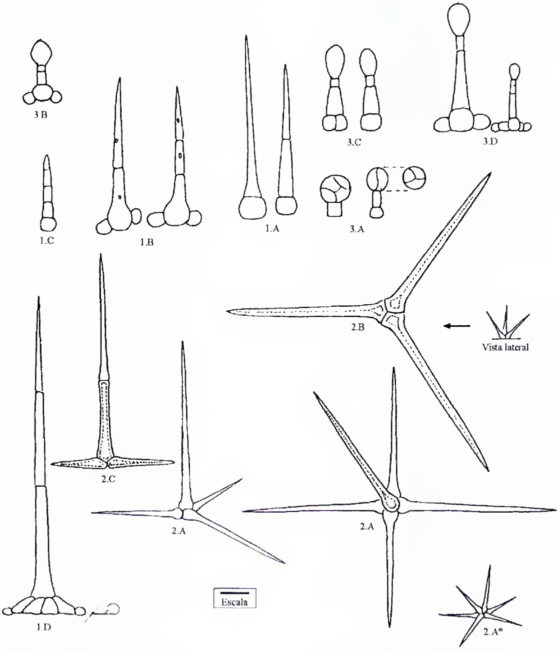

Fig. 3. Tipos de tricomas en *S. agrarium*. 1) Simples, subtipos A, B, C, y D. 2) Estrellados, subtipos A, B, y C. 3) Glandulares, Subtipos A, B, C, y D. Escala: 1A, 1B, 1C, 1D, 3A, 3B, 3C y 3D: 50 µm. 2A, 2B y 2C: 100 µm. 2A*: 200 µm.

originándose de un punto común y dispuestos en ángulo de unos 45° respecto al plano de la epidermis. (Figs. 3:2B y 4:D).

Muy raras veces se observó para el subtipo 2B, un pedícelo alargado de 1-2 células, que levanta notablemente los radios sobre la epidermis. Otra variación muy poco frecuente, es el subtipo 2B con numerosos radios laterales, finísimos y un radio central, ligeramente más grueso.

C. Cuerpo de 2 radios laterales unicelulares originándose de un punto común, aciculares, de tamaño ligeramente desigual, porrectos, rara vez ligeramente oblicuos; un radio central acicular, más largo que los radios laterales, de 1-2 células, cuando 2 la primera con paredes ligeramente gruesas. (Figs. 3:2C, 2:E y 2:I).

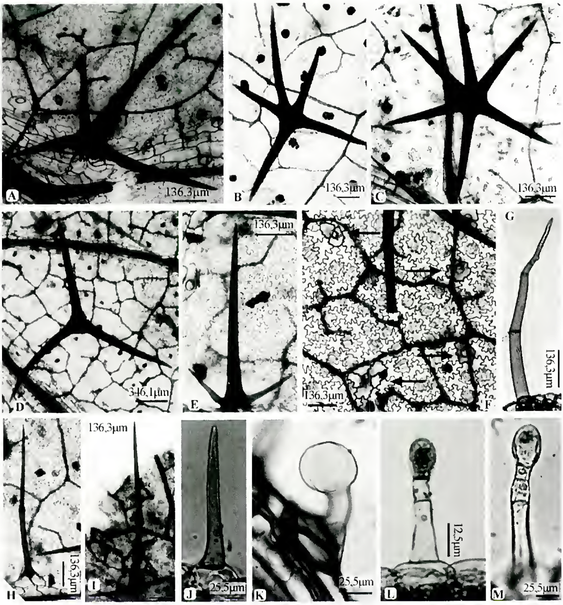

Fig. 4. Tricomas en *S. agrarium*. Tricomas estrellados: **A)** Subtipo 2A, con tres radios laterales. **B)** Subtipo 2A, con cuatro radios laterales. **C)** Subtipo 2A, con 5 radios laterales. **D)** Sub tipo 2B. **E)** Subtipo 2C, con el radio central unicelular. **I)** Subtipo 2C, con el radio central bicelular. Tricomas simples: **G)** Subtipo 1D. **H)** Subtipo 1A. **J)** Subtipo 1A. Tricomas glandulares: **K)** Subtipo 3A. **L)** Subtipo 3D. **M)** Subtipo 3D. **F)** Epidermis abaxial (VF) se muestra señalado con las flechas, bases de tricomas de 1,2 y 5 células.

3. Glandulares:

Cortos y medianos

A. Base unicelular. Cuerpo: a) Pie unicelular cilíndrico, corto a ligeramente alargado. b) Cabeza de 1–4 células. (Figs. 3.3A y 4 K)

B. Base unicelular. Cuerpo: a) Pie de 2 células, la primera célula alargada y ligeramente ancha hacia la base, luego una célula pequeña cuadrangular. b) Cabeza unicelular aovada a romboide ligeramente aguda hacia el ápice (Fig. 3.3B).

Largos

- **A.** Base de 1-2 células. Cuerpo: a) Pie de 2 células, la primera alargada, más ancha en la base, la segunda corta y ligeramente rectangular. b) Cabeza unicelular, aovada y alargada. (Fig. 3:3C).
- **B.** Base unicelular, a veces muy desarrollada y sobresale de la epidermis. Cuerpo: a) Pie de 2-3 células de tamaño diferente, la célula próxima a la cabeza, corta. b) Cabeza unicelular aovada y angosta hacia la parte inferior. (Figs. 3:3D. 4:L, 4:M).

Tricomas en *Solanum capsicoides*

1. Simples:

- **A.** Base unicelular grande, prolongándose ligeramente sobre la epidermis. Cuerpo unicelular de forma cónica-alargada, casi acicular hacia la parte superior. (Figs. 5:1A y 6:A).
- **B.** Base con 2-3 células, cuerpo cónico, de 3 células con paredes ligeramente gruesas y con un ligero engrosamiento de la pared celular, en las zonas de unión de las células. (Figs. 5:1B y 6:C).
- **C.** Base pluricelular. Cuerpo acicular de hasta 6 células, de longitud desigual; la primera algo ancha hacia la zona de unión con la base del tricoma. (Fig. 5:1C).
- **D.** Base pluricelular de 3 capas, prolongándose notablemente sobre la epidermis. Cuerpo delgado en forma de "látigo," de 4-5 células alargadas. (Figs. 5:1D y 6:A).

2. Glandulares:

Cortos y medianos

- **A.** Base unicelular redondeada. Cuerpo. a) Pie unicelular, alargado-rectangular o corto-cuadrangular. b) Cabeza de 1-2 células, aovada. (Figs. 5:2A y 7:B).
- **B.** Base de 1-2 células cuadrangulares. Cuerpo: a) Pie alargado-rectangular o ligeramente-ancho hacia la base, de 1-2 células; cuando 2 la anterior a la cabeza es más corta. B) Cabeza globosa, grande, de 4 o más células, a veces con un angostamiento en la zona de unión con el pie. (Figs. 5:2B. 7:A, 7:B y 7:C).

Largos

- **A.** Base de 1-2 células, prolongándose ligeramente sobre la epidermis. Cuerpo: a) Pie generalmente de 2 células o unicelular; cuando 2 células, la segunda corta y cuadrangular. b) Cabeza uni ó pluricelular. (Figs. 5:2C, 7:D y 7:E).

Tricomas en *Solanum mammosum*

1. Simples:

- **A.** Base de 1-3 ligeramente de la epidermis. Cuerpo acicular generalmente de 3-4 células. (Fig. 8:1C).

2. Estrellados:

- **A.** Base pluricelular corta o alargada, pedicelada, formando una estructura a modo de papila (Fig. 8:2A*), rara vez la base no pedicelada (Figs. 8:2A** y 9:C). Radios laterales hasta 8, unicelulares, de longitud desigual y originándose de diferentes puntos; rara vez radios laterales bicelulares. El radio central acicular generalmente de 2 células, la primera más larga y de paredes ligeramente engrosadas. (Figs. 8:2A, 9:A y 9:B).

3. Glandulares:

Cortos

- **A.** Base unicelular de células redondeadas. Cuerpo: a) Pie generalmente ausente; cuando presente, muy corto, unicelular, ancho en la zona de unión con la base y estrecho en la zona de unión con la cabeza. b) Cabeza unicelular, ovoide y grande. (Figs. 8:3A).

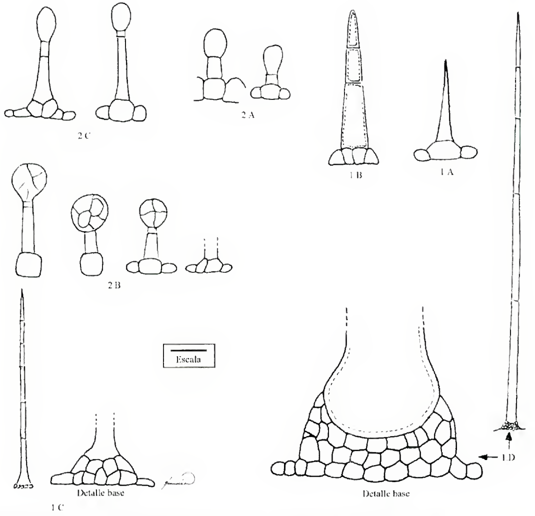

Fig. 5. Tipos de tricomas en *S. capsicoides*. 1) Simples, subtipos A, B, C y D. 2) Glandulares, subtipo: A, B y C. Escala: 1A, 1B, 2A, 2B, 2C y detalle base de 1D: 50 µm. 1C y 1D: 500 µm. Detalles base de 1C: 100 µm.

B. Base de 1-2 células. Cuerpo: a) Pie 1-2 células, ligeramente ancho. B) Cabeza de 1-5 células o más, ovoide a globosa. (Figs. 8:3B, 9.I y 9.F).

Largo

A. Base de 1-3 células redondeadas, a veces prolongándose sobre la epidermis. Cuerpo. a) Pie de 2-4 células; cuando 4 la última es estrecha en su parte inferior y ligeramente más ancha en la zona de unión con la cabeza. b) Cabeza de 1-varias células, ovoide a ligeramente alargada (Figs. 8.3C, 9:G y 9:H).

B. Caracterización cuantitativa de los tipos tricomáticos y su ubicación topográfica en la hoja.—Las dimensiones de los tricomas determinadas para cada una de las especies tratadas (Cuadros 2, 3, 4 y 5) están referidas a la longitud de los diferentes tipos de tricomas, grosor en sección transversal (ST) de la base, diámetro en vista frontal (VF) en bases pluricelulares, longitud del cuerpo del pie o de los radios y longitud de la cabeza en tricomas glandulares.

Igualmente para cada tipo tricomático se señala la ubicación topográfica,

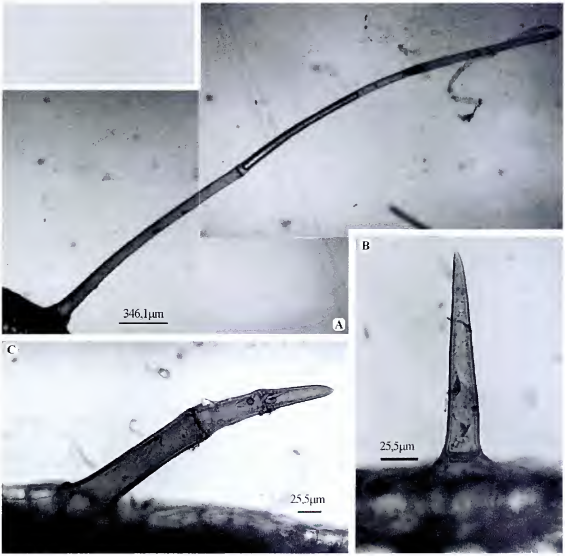

Fig. 6. **Tricomas en *S. capsicoides*. Tricomas simples: A) Subtipo 1D. B) Subtipo 1A. C) Subtipo 1B.**

según su ocurrencia en la lámina foliar: superficie adaxial y abaxial, nervadura media y pecíolo.

La familia Solanaceae y en especial el género *Solanum* exhiben una amplia riqueza de tricomas, rasgo importante en la sistemática de este grupo (Solereder 1908; Metcalfe y Chalk 1950; Seithe 1962). En correspondencia con ello, para cada una de las especies estudiadas se identificaron patrones consistentes de diferentes formas de tricomas.

Las especies estudiadas mostraron tricomas estrellados de pocos radios y ocurriendo sólo en la cara abaxial de la hoja (excepto en *S. capsicoides*); igualmente presentaron tricomas simples de pocas células, hialinos o translúcidos y a veces tricomas simples con radios vestigiales en la base, como se observó en *S. acerifolium*. Todos estos rasgos se han mencionados para el indumento en especies de la secc. *Acanthophora* (Nee 1991).

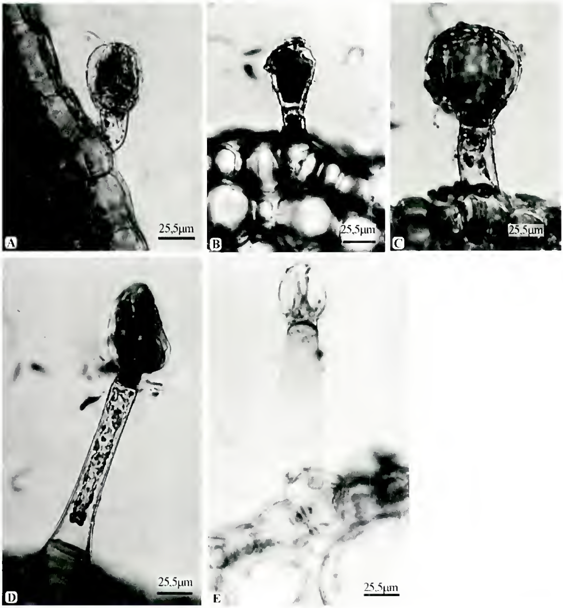

Fig. 7. Tricomas en *S. capsicoides*. Tricomas glandulares: A) y B) Subtipo 2A. C) Subtipo 2B. D) y E) Subtipo 2C.

De las especies aquí tratadas, *S. acerifolium* presenta menor variabilidad en el tipo de tricoma estrellado con respecto a *S. agrarium*, en la que ocurren 3 subtipos, de los cuales uno carece de radio central (Fig. 3:2B y Fig. 4:D). En esta última especie destaca igualmente, el tricoma simple de base lageniforme en la nervadura principal (Fig. 3:1B). *Solanum capsicoides* se diferencia del resto de las especies, porque carece de tricomas estrellados; siendo la única especie de la sección con esta característica (Nee 1991). Asimismo, en esta especie se encontró un tricoma simple en forma de látigo (Fig. 5:1D y Fig. 6:A), que resalta por sus dimensiones (5.9–6 mm de largo), por su base pluricelular y por ocurrir exclusivamente en la epidermis del pecíolo.

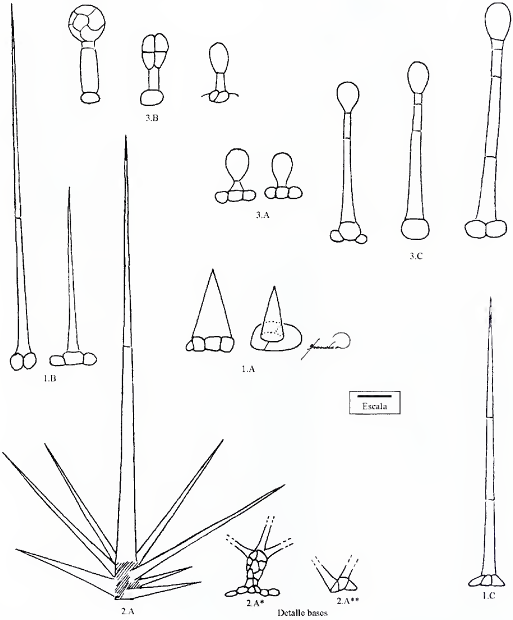

Fig. 8. Tipos de tricomas en *S. mammosum*. 1) Simples, subtipos. A, B, y C. **2)** Estrellado, subtipo: A, con dos variantes para la base según 2.A* y 2.A**. **3)** Glandulares, subtipos: A, B y C. Escala: 1A, 1B, 2A**, 3A, 3B, y 3C: 50µm. 1C y 2A*: 100 µm. 2A: 125µm.

D. Características generales del indumento foliar.—Los tricomas estrellados ocurren en 3 de las especies analizadas (*S. acerifolium*, *S. agrarium* y *S. mammosum*) exclusivamente en la superficie abaxial de la hoja, por su parte, *S. capsicoides*, que carece de este tipo de tricoma. Igualmente otro rasgo generalizado, es la presencia de tricomas simples y glandulares.

El indumento registrado cualitativamente para las especies es:
Solanum acerifolium: indumento velloso en hojas jóvenes, luego puberuloso hasta

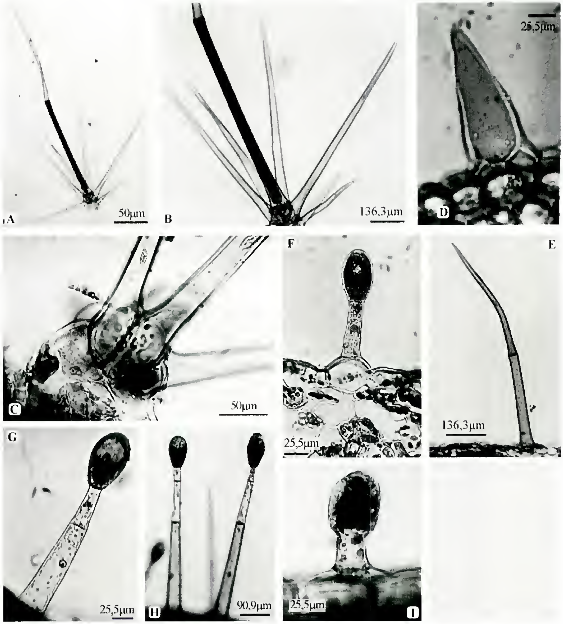

Fig. 9. Tricomas en *S. mammosum*. Tricomas Estrellados: A) Vista lateral del Subtipo 2A. B) Detalle de los radios laterales y la primera célula del radio central. C) Detalle en sección transversal de una base ancha y no pedicelada. Tricomas simples: D) Subtipo 1A. E) Subtipo 1C. Tricomas glandulares: F) G) y H) Subtipo 3C. I) Subtipo 3B.

pubescente, los tricomas simples con densidad más o menos constante en ambas caras; los estrellados dispersos con tendencia a concentrase en el tercio basal de la lámina.

Solanum agrarium: indumento pubéruloso hasta velloso, con mayor densidad sobre los nervios; tricomas estrellados de 3 y 4 radios laterales, menos común de 2 y 5 radios laterales. Los tricomas estrellados con tendencia a ubicarse con mayor densidad hacia los tercios basal y apical de la hoja.

Solanum capsicoides: indumento de tricomas simples, pubéruloso hasta velloso,

ABSTRACT

Herbaria with significant historical collections are critical to tracking floristic changes such as the introduction and spread of non-native plant species. To explore the importance of herbarium specimen data for understanding floristic changes in the central Great Plains, we utilized the Kansas State University Herbarium (KSC), known for its rich historical collections dating from the late 1800s. A list of all angiosperm plant taxa introduced to Kansas was obtained, and collection data (collector, number, year and county) were recorded for all in-state specimens (excluding cultivated material). A total of 6,565 specimens were recorded, comprising 314 species, 201 genera and 50 families, and dating from 1869. Of the recognized introduced species, 153 are represented by KSC collections made in Kansas prior to 1900, and 243 prior to 1940. All Kansas counties are well-represented by the early KSC material (1890s), bolstering our ability to infer floristic changes since that time. While 988 different collectors are represented, 14 collectors account for 52% of the specimens of introduced species. Peak collecting at KSC occurred in the 1890s and 1930s, and assessment of biases suggest that our data are a reasonably accurate representation of the presence and distribution of introduced species in Kansas at those times. Species not represented by pre-1900 KSC material were likely not established or even introduced in the state at the time; if a species was not documented prior to 1940 it was likely still not well established by then. This study demonstrates the utility of data housed at KSC, and by extension in other historical collections, for the study of regional floristic changes.

RESUMEN

Los herbarios con colecciones históricas significativas son críticos para rastrear los cambios florísticos tales como la introducción y la extensión de las especies de plantas que no son nativas. Para explorar la importancia de datos de especímenes de herbario para entender los cambios florísticos en las llanuras centrales de Norteamérica, nosotros utilizamos el Herbario de Kansas State University (KSC), conocido por sus colecciones históricas ricas en datos desde el final de los 1800. Se obtuvo una lista de todas las angiospermas introducidas en Kansas, y los datos de la colección (el coleccionista, número, año y condado) fueron registrados para todos los especímenes del estado (excluyendo el material cultivado). Se registró un total de 6565 especímenes, que se incluyen en 314 especies, 201 géneros y 50 familias, que datan desde 1869. De las especies introducidas que se reconocieron, 153 son representadas por colecciones de KSC hechas en Kansas antes de 1900, y 243 antes de 1940. Todos los condados de Kansas están bien representados por el material inicial de KSC (1890s), reforzando nuestra habilidad de inferir los cambios florísticos desde ese tiempo. De los 988 colectores diferentes existentes, 14 de ellos son responsables del 52% de los especímenes de especies introducidas. Los puntos máximos de recolección en KSC ocurrieron en los 1890 y los 1930, y la evaluación de los sesgos sugiere que nuestros datos son una representación razonablemente precisa de la presencia y la distribución de las especies introducidas en Kansas en esos tiempos. Las especies no representadas en el material de KSC antes de 1900 probablemente no estaban establecidas ni habían sido introducidas aún en el estado en ese tiempo; si una especie no se documentó antes de 1940, es probable que todavía no estuviese bien establecida. Este estudio demuestra la utilidad de los datos de KSC, y por extensión de otras colecciones históricas, para el estudio de cambios florísticos regionales.

INTRODUCTION

Many non-native plants in North America were introduced decades and even centuries ago through agriculture, horticulture, shipping, and tainted seed imports, among other avenues (Mack & Lonsdale 2001; Reichard & White 2001; Costello & McAusland 2003; Cox 2004). After initial colonization, some introduced species became established and even spread in their new environments, at times altering the landscape profoundly (D'Antonio & Vitousek 1992; Gordon 1998; Callaway & Aschehoug 2000; Lavoie et al. 2003). The necessity of understanding the biological processes of establishment, spread, and invasion of introduced species has come into acute focus in recent decades as introduced species have caused immense economic and environmental damage (Pimentel et al. 2000; Naylor 2000; Zavaleta 2000). New associations with seed dispersers, pollinators, microorganisms, herbivores, pathogens, and other plants sometimes inhibit the spread of alien plant species, and sometimes foster their proliferation (Richardson et al. 2000a; Klironomos 2002; Siemann & Rogers 2003; Parker & Haubensak 2002; Callaway et al. 2004; Cox 2004; Kellogg & Bridgham 2004). As the number of introduced species has grown, so has the complexity of their ecological interactions in their adventive environments (Daehler 1994; Daehler & Strong 1997; Gordon 1998; Simberloff & Von Holle 1999; Callaway & Aschehoug 2000; Vilá et al. 2000; Daehler 2003; Brooks et al. 2004).

Given that many introductions into North America occurred well over a century ago, studies of the distributional history of non-native species can provide us with the knowledge of temporal and spatial data (e.g. earliest locations, patterns of colonization, rates of spread, etc.) to understand past introductions more completely (Mack 2000; Meekins et al. 2001; Novak & Mack 2001). A better understanding of the establishment, distributional changes, and community associations of introduced taxa over time is vital to making informed decisions in managing existing introductions and in predicting future invasions (Ricciardi et al. 2000; Kolar & Lodge 2001; Lambrinos 2001; Lavoie et al. 2003; Dybos 2004; Simpson 2004).

The most reliable resources for historical research of biological distributions are natural history collections (Soberón et al. 2000; Ter Steege et al. 2000; Prather et al. 2004a, 2004b). As repositories of well-preserved plant specimens complete with spatial and temporal data, herbaria provide indisputable documentation of plant species occurrence, and form the very basis of floristic and plant taxonomic science as well as biodiversity studies (Prather et al. 2004b; Suarez & Tsutsui 2004). Herbarium specimens have been used effectively to document plant distributional changes such as species declines (Laughlin 2003; Lavoie et al. 2003) and spread of introduced plant species (Sheeley & Raynal 1996; Pyšek et al. 1998; Weber 1998; Lambrinos 2001; Novak & Mack 2001; Mihulka & Pyšek 2001; Pyšek et al. 2001; Delisle et al. 2003; Lavoie et al. 2003). Given that natural history collections contain inherent temporal and spatial inconsistencies, floristic analyses based on herbarium data must take into account collection biases (Soberón et al. 1996; Mack 2000; Mihulka & Pyšek 2001; Delisle et al. 2003). For instance, the date of first record of a species in an herbarium may accurately represent its approximate time of arrival in the region; alternatively, the date of first record may occur long after a particular species first appeared in the flora due to sparse collecting prior to documentation.

The Kansas State University Herbarium (KSC), founded in 1877, holds an extensive collection of significant historical specimens from the Great Plains of central North America. Indeed, an estimated 40% of its ca. 180,000 specimens of vascular plants were collected prior to 1900 (Barnard 2003), largely in association with the efforts of the distinguished botanist, A. S. Hitchcock, an early KSC curator who directed the herbarium from 1890 to 1901. Hitchcock promoted extensive collecting among his students and colleagues, and as a result, he and his protégés deposited a rich record of Kansas plant specimens at KSC prior to 1900 (Barkley 1965). Since then, KSC has been maintained and enhanced by numerous dedicated and productive curators (e.g., F.C. Gates, who directed KSC from 1919–1955; L.C. Hulbert, 1955–1961; and T.M. Barkley, 1961–1998). The result is an outstanding resource for researching historical floristic changes.

To explore the importance of herbarium specimen data for understanding floristic changes in the central Great Plains as represented by Kansas, we inventoried all specimens of non-native flowering plants collected in the state that are housed at KSC, identifying first records and subsequent temporal data for each species. Earliest date of collection for each species was also cross-referenced with data at the R.L. McGregor Herbarium of the University of Kansas (KANU). To enable more robust floristic inferences, we determined collecting biases based on the KSC material, ascertaining collecting activity levels across time periods, spatial collecting patterns and effects of major collectors. These patterns demonstrate the utility of the historical component of the collections within the KSC herbarium and, moreover, the general importance of natural history collections as tools for understanding the dynamics of biological history.

METHODS

An initial list of introduced flowering plant species occurring in Kansas was obtained from the PLANTS Database (USDA National Resources Conservation Service; plants.usda.gov). *Introduced* or *non-native* species (also synonymous with *alien*, *exotic* and *nonindigenous* species) are here defined as those originating on other continents that are present in North America due to human activity. While there are certainly cases of native North American taxa that have been introduced into Kansas from other regions, our definition enabled us to analyze data for the vast majority of species not native to Kansas and it minimized ambiguity regarding geographic origins. We aimed to include in this analysis species recognized as *naturalized plants* (sensu Nesom 2000; Richardson et al. 2000b), and we also included species documented as *waifs* and *persisting* (Nesom 2000; the *casual alien plants* of Richardson et al. 2000b; when in doubt about persistence, we included material).

KSC was then inventoried for these species, and the following data were obtained for each specimen: species, year of collection, county, collector(s), and collection number. KSC material is generally filed following *Flora of the Great Plains* (FGP: Great Plains Flora Association 1986). Thus, when a PLANTS name was encountered that was updated or otherwise differentially recognized over FGP, the herbarium holdings were consulted for material potentially filed under the name recognized by PLANTS and the corresponding synonym(s) in FGP. Differences in taxonomy as represented by PLANTS relative to FGP were reconciled prior to analyses.

Because our goal was to count collections, we deleted duplicates when we knew of them (e.g., same collector with all other data present and matching). However, there may be early collection duplicates that are not deleted because they could not be identified as such (e.g., Hitchcock did not use collection numbers). Because of this ambiguity, we herein use the term *specimen* to refer to what was counted, i.e., each sheet representing—to the best of our knowledge—one collection. In addition, specimens were excluded if they lacked temporal data (year) or clearly represented cultivated material. The determination of whether or not a specimen represented cultivated material was occasionally difficult, particularly for historical collections with limited label data. With regard to taxon identification, we generally depended on the well-curated status of the collection, only checking identifications when the investigators had questions or when preliminary analysis pointed to potential problems.

Temporal patterns were determined by conducting searches of the database for material corresponding to each decade. We defined a decade as beginning with the year ending in "0" and ending with the year ending in "9"; for example, the 1890s corresponds to material collected from 1 January 1890 to 31 December 1899. We also used a KSC data set from a related study (Prather et al. 2004a; on general temporal trends in collecting in the United States) to analyze temporal collecting patterns for a sample of Kansas specimens of native species relative to our data for introduced species. Additionally, we compared our data on timing of first collection for each species to the earliest records housed at KANU based on the KANU specimen database.

Spatial collecting patterns were mapped to the county level (ArcGIS version 9.0, ESRI) to explore numbers of species and specimens documented by the KSC collection by the end of major collecting peaks. Specimens lacking clear county information were excluded from spatial analysis. To assess spatial biases, we compared the spatial collecting patterns to population centers (defined as counties that have or have had a population of 30,000 or greater at any time since 1900, based on data from the Kansas Census Bureau; www.census.gov/population/cencounts/ks190090.text; www.census.gov/popest/counties/tables/CO-EST2003-01-20.pdf), and present locations of four year colleges and universities (Kansas on the Net; www.kotn.org/colleges.html).

To study biases due to particular collectors, we identified major collectors for this study (defined as individuals who contributed 100 or more of the Kansas specimens in our sample), and examined their collecting time frames, numbers of collections, and numbers of counties covered.

RESULTS

Specimens of non-native taxa in the KSC collection.—A total of 6,565 specimens of introduced flowering plants were recorded from KSC, comprising 314 species, 201 genera and 50 families (App. 1). Of the 412 species on the initial list obtained from PLANTS, 80 were excluded from our study because 1) they are in fact native species contrary to their listing in PLANTS as introduced, 2) we considered them to occur only under cultivation and not to persist in the Kansas flora as defined above, or 3) we found no vouchers at KSC or KANU (some of these were cited in previous literature but do not actually occur in Kansas; others may in fact occur or have occurred but are not vouchered at KSC or KANU and warrant further investigation). Twenty-four introduced species were added to the list because 1) they are in fact introduced species contrary to their listing in PLANTS as native, 2) they were discussed as additional taxa for Kansas by Freeman et al. (1998), 3) taxon recognition at the species level is favored over recognition at the subspecific level in PLANTS, or 4) we were aware of their

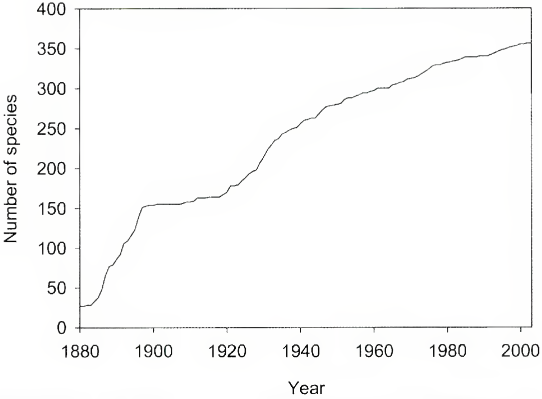

Fig. 1. Cumulative number of introduced species recorded at both KSC and KANU per year. The sharp rise shown in the number of species on record between 1880 and 1900 is what would be expected as a result of high collecting activity (Figs. 2, 4) and an initial documentation period during which time species that perhaps had long existed in the flora were initially collected. The low rate of increase from 1900 to 1930 corresponds with low collecting activity generally at both institutions (Prather et al., 2004a). The rate rose again in the early 1930s, only to slow later in the decade, despite it being a time of peak collecting activity at KSC, suggesting that most introduced species present in the flora at that time were, in fact, accounted for then. We expect that most introduced species present today are documented, because collecting activity in the latter half of the 20th century at KANU was relatively strong (Prather et al., 2004a).

presence in the Kansas flora. The changes made relative to the PLANTS list, with notes, are provided in Appendix 2.

Temporal collecting patterns.—A total of 1,994 Kansas KSC specimens representing 153 introduced species pre-date 1900. By 1940, 3,737 specimens and 243 species were represented (Figs. 1, 2a). Peaks in collection of introduced species in Kansas occurred in the 1890s and 1930s, with relatively reduced collecting activity in the 1900s, 1910s and 1970s (Fig. 2a). These results are highly congruent with collecting patterns for KSC inferred from a sample of native species (Fig. 2b; Prather et al. 2004a).

Of the 356 introduced species vouchered at KSC and/or KANU, the first or concurrent first records for 76% reside at KSC; for the time period prior to 1940 (251 species total), 94% of the earliest collections reside at KSC; and for the time period prior to 1900 (154 species), 95% of the earliest collections reside at KSC (App. 1). Based on both the KSC and KANU data of first records, 43% of the

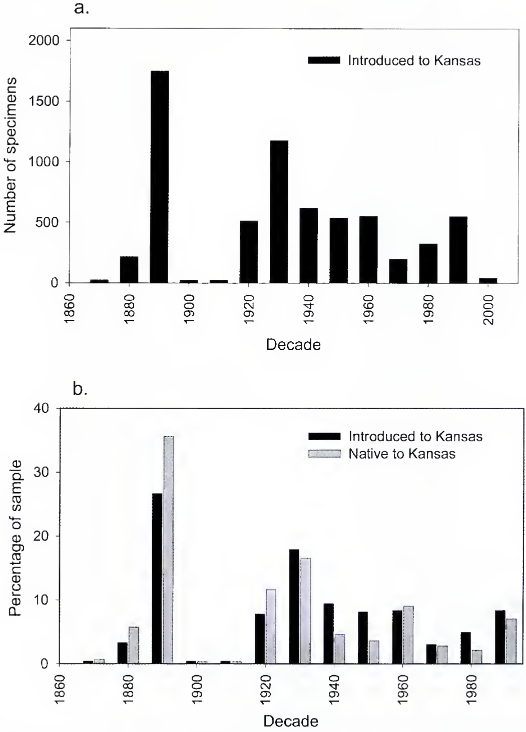

FIG. 2. Temporal patterns of plant collecting at KSC. **a)** The number of introduced specimens from Kansas collected in each decade of the herbarium's history. **b)** Comparison of collecting patterns based on introduced specimens at KSC (this study) and the overall KSC collecting pattern based on a sample of native taxa (Prather et al. 2004a); within each data set, we transformed numbers to percentages of each total sample (e.g., 27% of all Kansas KSC specimens of introduced plants were collected in the 1890s; 36% of the sample of KSC specimens studied by Prather et al. was collected in the 1890s). The results of both studies are highly congruent, suggesting they are generally representative of overall KSC collecting patterns. Minor differences suggest that the native collection was acquired prior to 1930 at a slightly higher rate than the introduced collection, whereas the trend was reversed after 1930.

currently recognized non-native species were collected in Kansas prior to 1900; and 71% were present by 1940. Moreover, examination of data for particular species shows that several problematic weeds and/or invasives (Stubbendieck et al. 1994; Division of Plant Health 2003) were established prior to 1900 (Fig. 3).

Spatial collecting patterns.—Kansas non-native flora prior to 1900 is well documented at KSC with representation from all 105 counties. Spatial mapping of species and specimens over time demonstrates a widely distributed collecting pattern at the level of counties prior to 1900 (Fig. 4a,b), with an increasing bias over time toward educational and population centers (Fig. 4c), although statewide collecting continued. The most thorough collecting over the course of the 20th century was from four counties in central and eastern Kansas: Cloud, Neosho, Riley and Saline. Not surprisingly, the county in which KSC resides, Riley County, is represented by the highest number of specimens of introduced plants: 1,025 (15.6% of the total).

Major collectors.—Fourteen collectors each contributed over 100 specimens of introduced plants to the KSC holdings, and together their activity accounts for 3,405 specimens (52% of the material studied). Figure 5a shows, for each major collector, the number of specimens deposited and the number of counties represented by those specimens; Figure 5b illustrates the time period in which each major collector actively contributed to KSC based on the material studied. Of the four major collectors who collected introduced species broadly (from over 33% of Kansas counties), Hitchcock and G.L. Clothier acquired most of their specimens prior to 1900, Gates in the early to mid 1900s, and Hulbert in the mid to late 1900s (Fig. 5). Of the ten most active collectors who collected from less than 10% of Kansas counties, only one of these collected prior to 1900, while four were active in the early to mid 1900s and five in the mid to late 1900s (Fig. 5). Three of the four counties best represented in this study correspond with the primary collecting area for particular major contributors: S.V. Fraser in Cloud County, J. Hancin in Saline County, and W.W. Holland in Neosho County.

DISCUSSION

The flora of the Great Plains has changed radically with the introduction of non-native species, and many of these floristic shifts are documented in the Kansas State University Herbarium. With 153 species of introduced flowering plants established in Kansas prior to 1900 based on KSC records (1,994 specimens), it is clear that the Great Plains had already undergone significant change by the turn of the last century. For example, Figure 3 shows many species currently considered noxious or agronomically important weeds and/or invasive species (Stubbendieck et al. 1994; Division of Plant Health, 2003) were well-established within the state by 1900: *Cirsium arvense* (Asteraceae); *Cardaria draba* (Brassicaceae); *Convolvulus arvensis* (Convolvulaceae); *Abutilon theophrasti*

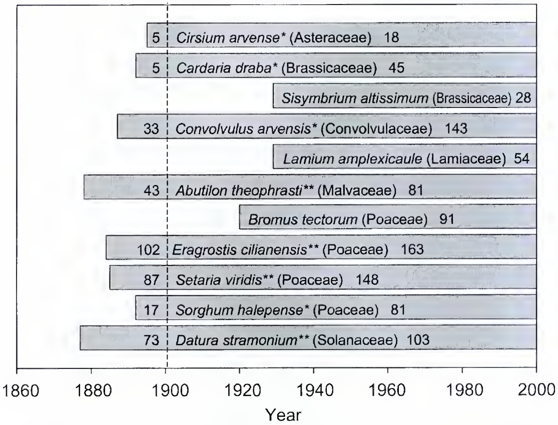

Fig. 3. Documentation of early arrival of some species of interest. Timelines begin with first records, whether housed at KSC or KANU (App. 1). Number of KSC specimens recorded prior to 1900 is shown just to the left of the vertical line, and total number of KSC specimens for each species is listed at the end of each line. Single asterisks indicate species included on the Kansas noxious weed list (Division of Plant Health 2003), and double asterisks denote Great Plains invasive species according to Stubbendieck et al. (1994). Other species are prevalent today yet not documented in Kansas until after the turn of the 20th century.

(Malvaceae); *Eragrostis cilianensis* (Poaceae); *Setaria viridis* (Poaceae); *Sorghum halepense* (Poaceae); *Datura stramonium* (Solanaceae). Equally intriguing is the fact that many notable introduced species prevalent in Kansas today are not documented until the 1920s or 1930s (Fig. 3), such as *Sisymbrium altissimum* (Brassicaceae), *Lamium amplexicaule* (Lamiaceae) and *Bromus tectorum* (Poaceae). Given that a lack of documentation via herbarium specimens does not necessarily indicate a species was absent from the flora at the time, inferences regarding the general timing of introduction of such species must be based on careful analysis of collecting patterns and biases for the herbaria examined, and eventually compared to introduction records for adjacent states.

In the case of KSC, we found the collecting of introduced species prior to 1900 and during the 1930s remarkably extensive (Figs. 1, 2, 4), and the congruence we found in overall collecting pattern between our study and that of Prather et al. (2004a) corroborates these collecting "peaks." The historical na-

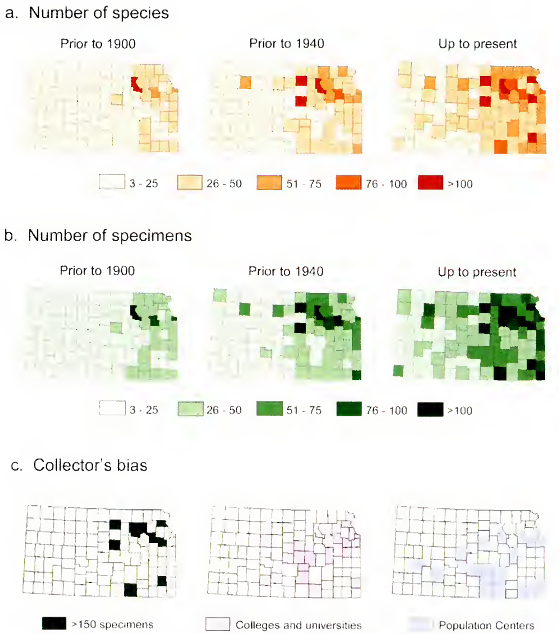

Fig. 4. Spatial patterns of collecting of introduced species at KSC. **a, b)** Number of species and specimens, respectively, collected in each county over time. The counties with higher numbers of species correspond closely with the counties from which higher numbers of specimens were recorded; thus, the greater number of species documented in these counties is likely a result of collecting bias rather than a demonstrated difference in actual species richness. **c)** Comparison of counties represented by over 150 specimens (left) to counties with four-year colleges or universities (middle) and to counties that have recorded a population greater than 30,000 at any census since 1900 (right). Six of the nine counties with large specimen counts correspond to educational or population centers, or both. Two of the others (Cloud and Neosho) had strong individual collectors sampling from those counties almost exclusively (see text), and the third (Pottawatomie) is adjacent to the home county of KSC.

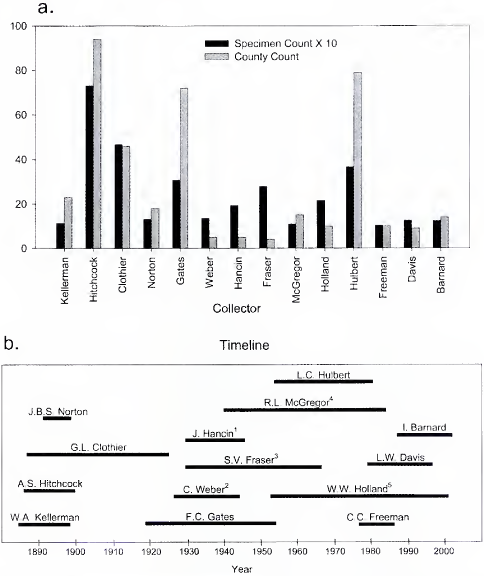

Fig. 5. Major collectors of introduced species at KSC. a) Specimen count and county count for each collector contributing more than 100 specimens of introduced plants. Collectors are in general chronological order, left to right, based on their activity at KSC. b) Timeline representing the active periods of collecting for each collector based on these data. Institutional affiliation for the time period indicated is KSC unless otherwise indicated in footnotes (note that some collectors have been and/or are active at other times elsewhere; e.g., Hitchcock moved to US; Freeman is currently at KANU). Hitchcock, Clothier, Gates and Hulbert stand out as the most prolific and even collectors based on species and county counts. While also prolific, Fraser and Hancin concentrated their activities in six and four counties, respectively. In total, the 14 major collectors contributed 52% of the material studied.

---

[1] A collector working in Saline County whose specimens were mainly deposited at Bethany College, Lindsborg, Kansas. The herbarium of Bethany College was incorporated into KSC in 1990.

[2] Affiliation presumed to be KSC (labels indicate Kansas State University, but we have little information about this collector).

[3] A reverend working in Cloud County whose collection was deposited at Marymount College, Salina, Kansas; the Marymount College Herbarium was incorporated into KCS in 1992.

[4] KANU Curator, 1954–present (1988–, Curator Emeritus).

[5] A doctor of veterinary medicine who works independently in Neosho County.

ture of the KSC collection in the region is underscored by the finding that KSC houses the overwhelming majority of earliest records of introduced species in relation to KANU.

Spatially, collecting at KSC was more evenly distributed across the state prior to 1900, and less so in more recent decades. Indeed, over time KSC shows an increasing bias (based on specimens of introduced plants) toward counties with four-year colleges and universities, and/or population centers (Fig. 4c), suggesting that many collectors focus their collecting efforts in areas that are easily accessed (e.g., near home and work). Other researchers have noted similar biases (in Mexico, Soberón 1996; in Texas, B. Lipscomb, Botanical Research Institute of Texas, pers. comm.), emphasizing a need for increased collecting in remote areas. Eastern and central Kansas, which include most of the population and educational centers, show far greater representation in our study than western Kansas, especially after 1940.

This study does not address the question of differences in species richness of introduced plants across Kansas, an interesting avenue for future research. The observed patterns in this study document collecting bias at the county level as indicated by the correlation of higher species numbers with higher numbers of collections (Fig. 2a, 2b). A demonstration that the number of species for particular unit areas is fairly stable regardless of increased collecting activity (over some moderate level) could enable exploration of geographical differences in species richness. We suggest that an intriguing investigation of species richness of native and introduced taxa could be accomplished within the region by drawing on the data housed within the network of Great Plains herbaria, provided that collecting biases were carefully taken into account.

The role of individual collectors is highlighted by this study. Those who collected widely provided KSC with a broad, spatially distributed collection. For example, the prolific and broad collecting in the 1890s suggests that Hitchcock and his protégés worked systematically to obtain, at a minimum, a specimen of each species present in each county. Collecting patterns during the 1930s also indicate relatively thorough and even collecting, accomplished largely through the efforts of Gates and numerous less prolific collectors (many cited as County Agricultural Extension Agents). Alternatively, those individuals who collected abundantly in limited regions (e.g., Fraser, Hancin, Holland) provided KSC with a very thorough sampling of particular counties. Although collecting continued throughout the state, the most active collecting after 1925 was concentrated in four counties: Cloud, Neosho, Riley and Saline, due in large part to specific individuals. This results in KSC having excellent documentation over an extended time within these areas.

It should be noted that the major collectors as determined by this study likely do not correspond entirely with major collectors overall for KSC, as many botanists and taxonomists focus on certain groups of plants and, in many cases, native species. Undoubtedly, some of the major collectors discussed here were generalists in their collecting (e.g., Hitchcock collected both native and introduced species widely). On the other hand, some workers, perhaps especially at agricultural universities such as Kansas State University, are particularly interested in weeds [e.g., L.W. Davis' collecting (Fig. 5) took place while she was researching weeds of the region, culminating in *Weed Seeds of the Great Plains* (1993)]. Broader comparisons of KSC collector data will be feasible once the entire herbarium holdings are databased.

Based on our analyses of the strengths and biases of the KSC material, we are confident that the records from the 1890s and the 1930s represent a reasonably accurate account of the presence and distribution in Kansas of introduced species at those times (although we acknowledge that some species and areas may have been missed by collectors). If an introduced species is not represented by pre-1900 KSC material, it most likely was not established in Kansas by then, and probably not even introduced to Kansas. If a species was not documented prior to 1940, it likely was still not well-established in Kansas by that time. Appropriate floristic inferences for Kansas made in reference to periods post-1940 must utilize complementary herbaria such as KANU.

We encourage researchers to utilize the KSC collection more extensively, incorporating the collection biases identified here to form accurate floristic inferences. Although the temporal data for particular plant species presented in Appendix 1 are a primary result of this study, we hope that others will improve the taxonomic and distributional data to a more refined level. Looking to the future, increased collecting activity is fundamental to the goal of better understanding and managing plant introductions.

This study underscores the critical importance of natural history collections as resources for investigations in distributional changes of species—in this case, of introduced plants. Given the understanding of collecting biases and strengths of a particular collection, floristic changes can be rigorously studied. The increased use of information technology such as databasing and georeferencing, as well as analytical techniques that account for biases (Weber 1998; Soberón et al. 2000; Ter Steege et al. 2000; Mihulka & Pyšek 2001; Delisle et al. 2003) will continue to highlight the value of herbaria in accurately tracking the establishment and spread of introduced plant species, and changes in community associations. Ironically, just at a point when natural history collections are becoming more widely recognized as critical research infrastructure, drastic funding cuts threaten the very existence and curation of some collections (Dalton 2003; Gropp 2003; Suarez & Tsutsui 2004). Despite these setbacks, the increasing accessibility of herbarium specimen data online and the linking of these databases (via Distributed Generic Information Retrieval, DiGIR, sourceforge.net/projects/digir; e.g., the National Biological Information Infrastructure of the Global Biodiversity Information Facility, gbif.nbii.gov/search/

search.html) are beginning to enable inter-collection data-mining with great opportunities for tracking floristic patterns on a large scale. As new technologies emerge, we expect to see the wealth of data in natural history collections yielding exciting new information for different geographical regions. Indeed, as the Natural Science Collections Alliance (2004) states, "... we are just embarking on the Golden Age of collections research."

APPENDIX 1

Species included in analyses, with general historical temporal information on specimens (see text). Taxonomy is alphabetical, with family recognition following the APG system (Angiosperm Phylogeny Group 2003) and taxa listed to species following the PLANTS Database (USDA NRCS, see text)[1,2,3]. Additional information is provided below the name only when necessary to reference the taxon in *Flora of the Great Plains* (FGP; Great Plains Flora Association 1986; i.e., when the species is treated under a different name there and the currently accepted name is not mentioned as a synonym or otherwise discussed, or, in some cases, where additional information is necessary to clarify treatment here relative to FGP). Note that some of the species here were mentioned but not described in FGP (usually because they were considered waifs, cultivated taxa not considered to escape or persist long, or uncommon species very similar to described taxa). A single asterisk denotes a species that was added to the FGP in the supplement accompanying the second printing (Brooks 1991), and is therefore not referenced in the regular index of that treatment. A double asterisk denotes a species that was not referenced at all in FGP.

[1] Taxa were recognized only to the species level, with one exception: when infraspecfic taxa of a species differ with respect to nativity (native versus introduced) and the introduced taxon occurs in Kansas, the infraspecific name was included in the list (we had only one such case, *Achillea millefolium* var. *millefolium*).

[2] Changes relative to the PLANTS list are outlined in Appendix 2.

APPENDIX 2

Revisions to the list generated by PLANTS for angiosperms introduced to Kansas.

Excluded names:

Native species listed erroneously in PLANTS as introduced:

Amaranthus blitoides S. Watson [see Mosyakin and Robertson 2003], *Amaranthus retroflexus* L. [see Mosyakin and Robertson 2003], *Datura quercifolia* Kunth, *Euphorbia davidii* R. Subils [see Mayfield 1997]

Cultivated species, not persisting in the Kansas flora:

Allium cepa L., *Alopecurus myosuroides* Huds., *Alopecurus pratensis* L., *Amaranthus caudatus* L., *Anethum graveolens* L., *Arachis hypogaea* L., *Armoracia rusticana* P. G. Gaertn., B. Mey. & Scherb., *Arrhenatherum elatius* (L.) P. Beauv. ex J. Presl & C. Presl, *Berberis vulgaris* L., *Calamagrostis epigeios* (L.) Roth, *Canavalia ensiformis* (L.) DC., *Carthamus tinctorius* L., *Celosia cristata* L., *Centaurea iberica* Trevir. ex Spreng., *Cicer arietinum* L., *Citrullus lanatus* (Thunb.) Matsumura & Nakai, *Convallaria majalis* L., *Cucumis melo* L., *Cucumis sativus* L., *Cucurbita pepo* L., *Forsythia suspensa* (Thunb.) Vahl, *Forsythia viridissima* Lindl., *Gypsophila elegans* M. Bieb., *Gypsophila paniculata* L., *Ipomoea batatas* (L.) Lam., *Ipomoea quamoclit* L., *Lobularia maritima* (L.) Desv., *Lycium chinense* Mill., *Malus pumila* Mill., *Melissa officinalis* L., *Nicotiana tabacum* L., *Pennisetum glaucum* (L.) R. Br.[1], *Periploca graeca* L., *Petroselinum crispum* (Mill.) Nyman, *Petunia atkinsiana* D. Don ex Loud., *Physalis philadelphica* Lam., *Pisum sativum* L., *Potentilla argentea* L., *Prunus domestica* L., *Reseda lutea* L., *Rheum rhabarbarum* L., *Solanum lycopersicum* L., *Sorghum bicolor* (L.) Moench, *Spergula arvensis* L., *Spinacia oleracea* L., *Triticum aestivum* L., *Ulmus glabra* Huds., *Ulmus procera* Salisb., *Zea mays* L.

Species for which we found no vouchers of non-cultivated material at KSC or in the KANU database (some do not occur in Kansas; some may occur and may be naturalized, but require further study and documentation; cultivated species are indicated):

Agropyron desertorum (Fisch. ex Link) Schult. [cult./crop], *Arctium vulgare* (Hill) A. H. Evans, *Artemisia absinthium* L., *Artemisia vulgaris* L., *Balsamita major* Desf., *Berteroa mutabilis* (Vent.) DC., *Bromus arvensis* L., *Bromus racemosus* L., *Bromus squarrosus* L., *Camelina sativa* (L). Crantz[2], *Cardaria pubescens* (C A. Mey.) Jarm [voucher was misidentified], *Consolida orientalis* (J. Gay) R. Schrödinger [cult.], *Dianthus deltoides* L., *Eriochloa villosa* (Thunb.) Kunth, *Euphorbia agraria* M. Bieb., *Euphorbia helioscopia* L, *Geranium rotundifolium* L., *Matthiola longipetala* (Vent.) DC. [cult.], *Nigella damascena* L., *Raphanus raphanistrum* L., *Rosa canina* L. [cult.], *Syringa vulgaris* L. [cult.], *Tragopogon pratensis* L., *Trifolium arvense* L., *Tripleurospermum perforata* (Merat) M. M. Laínz, *Trisetum flavescens* (L.) P. Beauv., *Veronica agrestis* L.

Additions (authorities listed in App. 1):

Introduced species listed erroneously in PLANTS as native:

Continued from page 1719.

[3] The name *Malva pusilla* here replaces *M. rotundifolia* L., nom rej. (Greuter et al. 2000).

[4] Assessment of the impact of each species (e.g., relatively benign, agricultural weed, ecological invasive, etc.) and determination of particular geographical origin was beyond the scope of the present study, and the reader is referred to other sources (e.g., the PLANTS database; Great Plains Flora Association 1986) for this information

[5] For the 20 cases for which simultaneous first records (by year) are present at both KSC and KANU ("same"), 10 are apparent cases of duplicate collections between the two institutions, with the biggest contributor to the duplicate set being McGregor (KANU) with three records.

[6] KSC material of *Agrostis gigantea* (considered a synonym of *A. stolonifera* in FGP) has not been recently studied and annotated, and it is possible some of the KSC specimens counted here as *A. gigantea* may truly represent *A. stolonifera*.

Agrostis stolonifera, *Camelina rumelica* [see Brooks 1991]

Additional taxa for Kansas discussed by Freeman et al. (1998):

Alyssum desertorum, *Atriplex prostrata*, *Chenopodium pumilio*, *Digitalis lanata*, *Elaeagnus umbellata*, *Euonymus fortunei*, *Lespedeza bicolor*, *Malus floribunda*, *Polygonum caespitosum*, *Rhamnus cathartica*, *Trifolium incarnatum*, *Veronica biloba*, *Veronica hederifolia*, *Veronica persica*

Taxa recognized at the species level, rather than the infraspecific level:

Stellaria pallida[3]

Additional taxa for Kansas recognized here[4]:

×*Aegilotriticum sancti-andreae*, *Crepis capillaris*, *Leontodon hispidus*, *Melilotus alba* [Great Plains Flora Association 1986], *Setaria pumila*[1], *Themeda quadrivalvis* [see Towne and Barnard 2000], *Viola patrini*

ACKNOWLEDGMENTS

This study grew out of a class project in collaboration with faculty members CJF (instructor) and MHM. We are grateful to Craig Freeman and Caleb Morse, University of Kansas, for input regarding KANU specimens and assistance with database queries, and we gratefully acknowledge the use of specimen data from KANU. Joanne Whittier was generous in her expertise for development of the ArcView maps, and we are indebted to her. We extend our appreciation to Walter Dodds, Lorena Passarelli and Jason Graves for technical assistance. We thank Alan Prather, Craig Freeman, Robert Kaul, Mark Ungerer and Harmony Dalgleish, for providing valuable comments on the manuscript. We also thank the Konza Prairie LTER program for in-kind support. This is publication number 05-244-J of the Kansas Agricultural Experiment Station.

---

[1] *Setaria pumila* ssp. *pumila* is the correct name for plants treated as *S. glauca* (L.) P. Beauv. in FGP, and later as *Pennisetum glaucum* in PLANTS (see draft treatment of *Setaria* by J. M. Rominger for *Flora of North America North of Mexico*; herbarium.usu.edu/treatments/Setaria.htm).

[2] There is actually one KANU specimen of *Camelina sativa* that is equivocal with regard to cultivated status; however, the specimen apparently lacks temporal data (no year, and no locality data, in addition) and therefore was not included in this study (see Methods).

[3] In one case, a taxon recognized at the subspecific level in PLANTS is here recognized at the specific level, following the preference of regional floristics workers: *Stellaria media* ssp. *pallida* (Dumort.) Asch. & Graebn. = *S. pallida* (Freeman et al. 1998; App. 1).

[4] In some cases inclusion is based on small numbers of KSC specimens examined (App. 1), and may well be refined by future workers; in the case of *Melilotus alba*, a different taxonomic concept is favored. Relevant references are provided where available.

ABSTRACT

The Serra do Teimoso, in southern Bahia, Brazil, is a mountain reaching 850 m at the transition from tropical moist forest to tropical semideciduous forest. A floristic survey of a 200 ha reserve established on the mountain was carried out and a checklist of the vascular flora produced. The survey was conducted by random collecting efforts and the sampling of all specimens ≥ 5 cm diameter within a one hectare plot. The flora of the Serra do Teimoso Reserve (STR) comprised 727 species in 400 genera and 119 families. The angiosperms comprised 667 species in 363 genera and 100 families and the pteridophytes included 60 species in 37 genera and 19 families. Floristic relationships of the STR flora were discussed with regard to some florest types of eastern Brazil, especially those found at southern Bahia.

RESUMEN

La Serra do Teimoso, en el sur de Bahia, Brasil, es una montaña alcanzando 850 m en la transición de los bosques tropicales húmedos hacia los bosques tropicales semideciduales. Un inventario florístico de una reserva forestal con ca. 200 ha establecida en la montaña fue hecho y un checklist producido. El levantamiento fue conducido por medio de esfuerzos de coleta aleatorios y el muestro de todos los espécimens ≥ 5 cm DAP dentro de um plot de uma hectárea. La flora de plantas vasculares da la Reserva Serra do Teimoso (STR) incluió 727 especies en 400 géneros y 119 familias. Las angiospermas incluiron 667 especies en 363 géneros y 100 familias, y las pteridofitas incluiron 60 especies en 37 géneros y 19 familias. Relacciones florísticas de la flora de STR fueran discutidos con base en algunos tipos de bosques del este de Brasil, en especial aquellos localizados en el sur de Bahia.

SIDA 21(3): 1727–1752. 2005

INTRODUCTION

Brazil's Atlantic coastal forest originally stretched some 3,500 kilometers from the state of Rio Grande do Norte to Rio Grande do Sul. In southern Bahia, the coastal forests occupied a zone approximately 100–200 km wide along the Atlantic coast. The forests gradually become drier inland, changing from tropical moist forest ("mata higrófila") to tropical semideciduous forest ("mata mesófila") to tropical deciduous forest ("mata de cipó"). Each of these forest types occupies a narrow zone up to 50 km wide within the coastal forest belt and varies in floristic composition depending on elevation, soils, and drainage (Gouvêa et al. 1976).

Only about 7.6 percent of the original coastal forest remains standing (Morellato & Haddad 2000; Myers et al. 2000). In southern Bahia, for example, the forest has been reduced to 3.5 percent of its original extent (Thomas et al. 1998) with most of the deforestation due to logging, clearing for pastures, or planting of cocoa.

The few existing floristic or ecological studies of southern Bahian forests are of moist forest and confirm the uniqueness of these forests (Mori et al. 1983; Sambuichi 2002; Amorim et al. in press; Thomas et al. 1998, in press). Recent collections continue to reveal new species and augment the known distributions of many species.

In the Neotropics, seasonal, dry forests are comparatively more threatened, less studied, and less conserved than evergreen, moist forests (Janzen 1988; Gentry 1997; Pennington et al. 2000). In Bahia, the dry forests were cleared earlier and more completely than the moist forests (Mendonça et al. 1994) and now support large areas of pasture and coffee plantations (Vinha et al. 1976; Mori & Mattos Silva 1979). There are no federal protected areas in Bahia's coastal dry forests.

The Serra do Teimoso Reserve (STR) is situated in the transition between the moist forest and the semideciduous forest. The study of its flora offered us the opportunity to learn about the species of this transitional zone and their affinities.

Study Site

The Serra do Teimoso, in Jussari, Bahia (Fig. 1), is one of the easternmost ridges of the Serra da Ouricana and reaches ca. 850 m elevation (Fig. 2). At 15°12'S, 39°29'W, it is the source of the Água Preta River, an important component of the Rio Cachoeira Basin (CEI 1993).

As the Portuguese colonists moved into the interior of Bahia in the region of Jussari, they displaced members of the indigenous Botocudo tribe (Maximiliano 1940). The Berbert family moved to the Jussari region and acquired the Serra do Teimoso. The persistence of the squatters who were living on the mountain in returning after they had been forcibly removed led to the mountain being called the Serra do Teimoso ("teimoso" means stubborn in Portuguese). In 1997, 200 ha, or 40 percent of the Berbert farm was officially recognized by Brazil as a private reserve, here called the Serra do Teimoso Reserve (STR), offi-

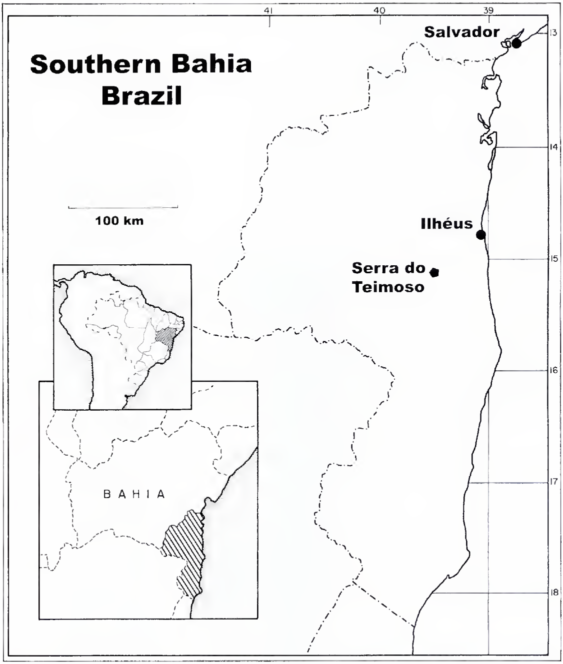

Fig. 1. Serra do Teimoso Reserve and its location in southern Bahia, Brazil and South America.

cially known as the "Reserva Particular do Patrimônio Natural Serra do Teimoso" established by IBAMA decree n° 93/97-N.

As a consequence of Teimoso's geological basement of granites and moderate rains, the soils of the STR are fertile and have low acidity (Gonçalves 1975). In the higher regions the soils are red-yellow laterites and on the mid-slopes they are shallow lithosols with gneiss outcrops (Carvalho Filho et al. 1987).

The median annual temperature of the STR varies from 23–24°C and the

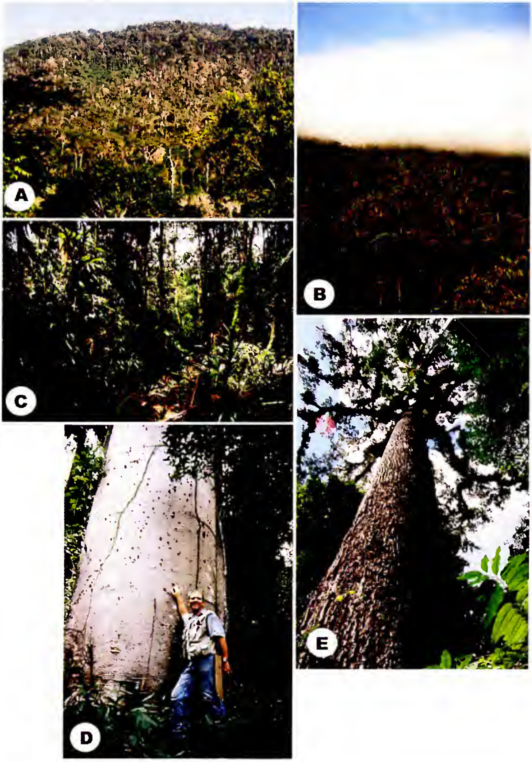

FIG. 2. Vegetation of the Serra do Teimoso Reserve. **A.** View of the forested mountainside. **B.** View of the mountainside with the uppermost forest hidden by the clouds. **C.** Interior of montane forest at the top of the mountain. **D.** Trunk of a large *Cavanillesia arborea*, one of the species characteristic of semideciduous forests. **E.** *Cariniana legalis*, one of the emergent species, with 45 m tall. All photos by W.W. Thomas.

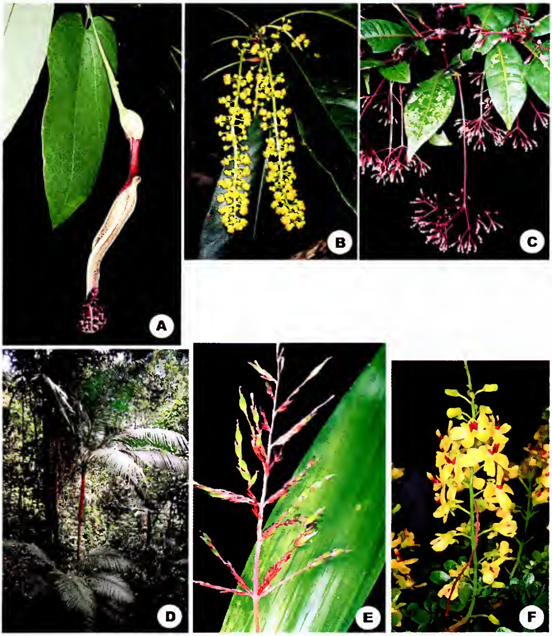

Fig. 3. Some plants characteristic of the Serra do Teimoso Reserve. **A.** *Aristolochia longispathulata* (WT 11741), a species recently described from this forest. **B.** *Quiina glaziovii* (WT 11727), a tree species endemic to the Atlantic coastal forest. **C.** *Guapira laxiflora* (WT 11885), a shrub endemic to the Atlantic coastal forest. **D.** *Euterpe edulis* (JJ 3902), from which Palm Hearts are harvested, is an Atlantic coastal forest endemic and is an indicator of humid forests. **E.** *Sucrea monophylla* (AC 6821), an herbaceous bamboo and is one of many bamboos endemic to southern Bahia. **F.** The inflorescence of *Caesalpinia echinata* (JP 343), the Brazil-wood, another Atlantic coastal forest endemic, and the tree that gave rise to the name of the country. All photos by W.W. Thomas.

annual precipitation averages 1250–1500 mm with two to three dry months a year (Roeder 1975). Thus, the climate can be categorized as Am (a transitional type between Af and Aw) in Köppen's (1948) classification.

Edaphic and climatic factors present a gradient from warmer and drier at the base of the mountain (about 350 m elevation) to cooler and moister at the summit. This difference is expressed in the vegetation, which changes from a forest with elements of semideciduous forest at the base to submontane moist forest near the summit (Gouvêa et al. 1976; Vinha et al. 1976; Mori & Silva 1979; Brazão & Araújo 1981).

Because of the efforts of its owners, the STR still has a remarkable number of striking species (Fig. 3). In this forest fragment, we found mature trees of species sought-after for their valuable wood, such as *Brosimum guianense* ("oiticica"), *Caesalpinia echinata* ("pau-brasil"), *Cariniana legalis* ("jequitibá"), *Cedrela odorata* ("cedro-rosa"), *Copaifera lucens* ("pau-óleo"), *Hymenaea* spp. ("jatobá"), *Lecythis pisonis* ("sapucaia"), *Tabebuia billbergii* ("pau-d'arco"), *Plathymenia reticulata* ("vinhático"), *Peltogyne pauciflora* ("pau-roxo"), *Pouteria procera* ("mucuri"), and *Virola gardneri* ("bicuíba-vermelha"). Some individuals are very large, reaching over 50 m in height. These emergents include *Cariniana* spp. (Lecythidaceae), *Cavanillesia arborea* and *Sterculia curiosa* (Malvaceae), *Goniorrhachis marginata* and *Hymenaea* spp. (Fabaceae), and *Virola gardneri* (Myristicaceae).

Research on the diversity of the fauna of the STR has revealed two endangered primates, *Callicebus melanochir* ("guigó") and *Leonthophitecus chrysomelas* ("mico-leão-de-cara-dourada") (Oliver & Santos 1991); 243 species of birds (J.F. Pacheco, pers. comm.); 123 species of arachnids (A. B. Brescovit & R. Bertani, pers. comm.); and 79 species of ants, including several species new to science (J. H. Delabie, pers. comm.).

METHODS

The floristic inventory was generated by repeated visits between 1997 and 2004 to the STR during which fertile plants were collected, both on and off the Reserve's trails. In addition, a quantitative inventory of woody plants ≥ 5 cm diameter at breast height was carried out, during which many vouchers (mostly sterile) were collected and identified. Also, collections made in the 1980's in an adjacent property whose forest is contiguous with the STR were included resulting in a total of 2028 voucher collections.

Vouchers of the collections are stored at CEPEC and NY with all unicates at CEPEC. Exceptions to this are some pteridophytes which are found only at BHCB and some Orchidaceae which are stored only at HUEFS. While duplicates of some collections were sent to specialists for identification, the majority of the collections were identified by the authors using the well-documented collections at CEPEC and specific bibliography.

All of the species documented through collections were included in a checklist of the whole Reserve. In the checklist, the angiosperms are arranged alphabetically by family, genus, and species, with the families circumscribed according to the system proposed by the Angiosperm Phylogeny Group (2003). The pteridophytes are organized according to Moran (1995). Authors of species are abbreviated according to Brummit and Powell (1992). Occasionally a specimen was identifiable only to genus or family, but was clearly distinct from all other members of that taxon. These were included in the list as "sp." or where there were more than one, "sp. 1," "sp. 2" and so on.

RESULTS

The vascular plant flora of the STR is represented by 727 species in 400 genera and 119 families (Appendix 1). The angiosperms comprised 667 species in 363 genera and 100 families and the pteridophytes included 60 species in 37 genera and 19 families. Of the total number of species, 571 were identified to species, 132 identified to genus (but distinct from all other species of the genus) and 24 only to family (but differing from all other species in the family).

Several species collected during this study were or are being described as new by specialists. These include: *Aristolochia longispathulata* (Aristolochiaceae), *Discocarpus pedicellatus* (Phyllanthaceae), *Heteropterys nordestina* (Malpighiaceae), and *Lymania spiculata* (Bromeliaceae). Ten others have been indicated by specialists as being new, but have not yet been described, including species of: *Daphnopsis* (Thymelaeaceae—L. Rossi, pers. comm.), *Heteropterys* (Malpighiaceae—A. Amorim, pers. comm.), *Hiraea* (Malpighiaceae—W. Anderson, pers. comm.), *Nematanthus* (Gesneriaceae—A. Chautems, pers. comm.), *Neoraputia* (Rutaceae—J. Kallunki, pers. comm.), *Pleurostachys* (Cyperaceae—W. Thomas & M. Alves, pers. comm.), *Pleiochiton* (Melastomataceae—R. Goldenberg, pers. comm.), *Rosenbergiodendron* (Rubiaceae—J. Jardim, pers. comm.), and *Thelypteris* (Thelypteridaceae—A. Salino, pers. comm.).

Some genera and species are the first known collections from northeastern Brazil or just from state of Bahia. For northeastern Brazil, these include: *Ampelocera glabra* (Cannabaceae), *Casearia melliodora* (Salicaceae), *Edmundoa lindenii* (Bromeliaceae), *Faramea oligantha* and *F. rivularis* (Rubiaceae), *Heteropterys bicolor* and *Tetrapterys crispa* (Malpighiaceae), and *Pleiochiton* sp. nov. (Melastomataceae). For the state of Bahia, they include: *Agonandra excelsa* (Opiliaceae), *Mandevilla permixta* (Apocynaceae), *Picrasma crenata* (Simaroubaceae), and *Rosenbergiodendron* sp. nov. (Rubiaceae).

Species occurring in the STR that are rarely collected in Bahia include *Andradea floribunda* and *Ramisia brasiliensis* (Nyctaginaceae), *Banisteriopsis patula* and *Byrsonima cacaophila* (Malpighiaceae), *Bracteanthus atlanticus* (Siparunaceae), *Chrysophyllum subespinosum* (Sapotaceae), *Citronella paniculata* (Icacinaceae), *Coussapoa curranii* (Urticaceae), *Licania naviculistipula*

(Chrysobalanaceae), *Naucleopsis oblongifolia* and *Pseudolmedia macrophylla* (Moraceae), *Meriania tetramera* (Melastomataceae), and *Porcelia macrocarpa* (Annonaceae).

The most diverse families were Fabaceae (52 species), Myrtaceae (39), Rubiaceae (31), Orchidaceae (25), Sapotaceae and Solanaceae (24), Bromeliaceae (23), and Araceae, Rutaceae and Sapindaceae (19). These ten families comprised 37.8 percent of the Teimoso Reserve flora. The most species-rich genera were *Eugenia* (20), *Solanum* (16), *Pouteria*, *Trichilia* (12), and *Peperomia* (10).

As mentioned above, the forest of STR becomes more and more humid as one goes up the slope. At the bottom, the forest includes species characteristic of semideciduous forest. Some of the species commonly found and characteristic of this zone are *Averrhoidium gardnerianum* (Sapindaceae), *Byrsonima cacaophila* and *Mascagnia sepium* (Malpighiaceae), *Cavanillesia arborea* (Malvaceae), *Celtis iguanaea* (Cannabaceae), *Chrysophyllum subspinosum* (Sapotaceae), *Discocarpus pedicellatus* (Phyllanthaceae), and *Raddia* spp. and *Sucrea monophylla* (Poaceae). Near the top of the slope, the forest is characterized by elements of montane tropical moist forest (Veloso 1992) and includes *Bathysa cuspidata* and *Simira glaziovii* (Rubiaceae), *Bertolonia carmoi* (Melastomataceae), *Cyathea* spp. (Cyatheaceae), *Dalbergaria sanguinea* and *Sinningia barbata* (Gesneriaceae), *Diplazium* spp. (Woodsiaceae), *Euterpe edulis* (Arecaceae), *Huperzia mandiocana* (Lycopodiaceae), and *Prunus sellowii* (Rosaceae).

At all elevations, the subcanopy is dominated by Rubiaceae, Rutaceae, and Solanaceae. Among the herbs, the most diverse families are the Bromeliaceae, Marantaceae, Orchidaceae, and Piperaceae, as well as the pteridophytes—these groups together comprise 18.8 percent of the flora. The most diverse families of lianas include Bignoniaceae, Fabaceae and Malpighiaceae.

Along the forest edges, disturbed areas and areas under cultivation (e.g. areas where *Theobroma cacao* L. is grown, as well as pastures), weedy species such as *Centropogon cornutus* (Campanulaceae), *Euphorbia heterophylla* (Euphorbiaceae), *Lablab purpureus* (Fabaceae), *Lantana camara* (Verbenaceae), *Maclura tinctoria* (Moraceae), *Momordica charantia* (Cucurbitaceae), *Thunbergia alata* (Acanthaceae), and *Triumfetta semitriloba* (Malvaceae) can be found.

DISCUSSION

Endemism

Of the 515 species of angiosperms identified at the STR, 7.3 percent are endemic to southern Bahia and northern Espírito Santo according with Thomas et al. (2003). This percentage is much lower than the estimates made by Thomas et al. (1998) for the tropical moist forests of the Una Biological Reserve (28.1%) and the Serra Grande forest (26.5%). Nevertheless, the STR is home to *Aristolochia longispathulata* (Aristolochiaceae), *Bracteanthus atlanticus* (Siparunaceae), *Byrsonima cacaophylla* (Malpighiaceae), *Chrysophyllum subspinosum*

(Sapotaceae), *Conchocarpus diadematus* (Rutaceae), *Discocarpus pedicellatus* (Phyllanthaceae), *Licania naviculistipula* (Chrysobalanaceae), *Sucrea monophylla* (Poaceae), and *Trichilia florbranca* (Meliaceae), all of these being examples of local endemics not found in either of the two forests studied by Thomas et al. (1998).

Floristic Relationships

A comparison of the STR checklist with lists from other tropical moist forests in southern Bahia reveals a high number of genera and species in common. One hundred ninety-three genera are shared with the flora of the Una Biological Reserve (Amorim et al. in press) and 214 with that of the Serra do Conduru State Park (Martini et al. 2004).

Nevertheless, 122 genera found in the STR have not been encountered at either the Una Reserve or the Serra do Conduru. Some of these (e.g. *Allophylus, Bougainvillea, Clavija, Diplazium, Huperzia, Pachystroma, Pseudolmedia, Sarcaulus, Scyphonychium,* and *Sucrea*) are quite common in the Teimoso Reserve in the lower elevation, drier portion of the forest and may be genera characteristic of southern Bahian seasonal submontane semideciduous forests (Veloso 1992; Thomas & Barbosa, In press).

The STR has both moist and semideciduous forests, the moist forests being found at higher elevations where orographic effects augment rainfall, especially during the dry season. The juxtaposition and gradual transition from moist to seasonal dry forests in southern Bahia can be explained by the region's varied topography and elevational gradients. In contrast, to the south, the abrupt change from flat, lowland forest to very steep mountainside moist forests in the mountains of Serra do Mar clearly delimit these formations (Oliveira-Filho & Fontes 2000).

Oliveira-Filho & Fontes (2000) analyzed the relationship between climate and species composition in the Atlantic coastal forest. They compared submontane and lowland forests, as well moist and semideciduous forests using TWINSPAN analysis. Their results are discussed in the following floristic comparisons with the STR.

Comparison with Tropical Moist Forests.—Some of the indicator tree species associated with "eastern low-altitude semideciduous coastal forests" of Oliveira-Filho & Fontes (2000) are present in the STR: *Acacia polyphylla, Chrysophyllum gonocarpum, Eugenia moraviana, Guarea guidonia, G. kunthiana, Maytenus aquifolium, Ocotea puberula, Prunus sellowii, Trichilia casaretti,* and *T. elegans.* In addition, some of their indicator species for "northern low-altitude rain forests" (tropical moist lowland and submontane forests) are found at STR: *Brosimum guianense, Campomanesia guaviroba, Carpotroche brasiliensis, Cedrela odorata, Chrysophyllum lucentifolium, Ecclinusa ramiflora, Gallesia integrifolia, Inga edulis, I. striata, Jacaranda puberula, Jacaratia heptaphylla, Lecythis pisonis, Metrodorea *nigra*, *Mouriri chamissoana*, *Ocotea elegans*, *O. indecora*, *O. puberula*, *Protium warmingianum*, *Pterocarpus rohrii*, *Schizolobium parahyba*, *Solanum swartzianum*, *Tabebuia roseo-alba*, *Tetrastylidium grandifolium*, and *Virola gardneri*.

Comparison with Seasonal Dry Forests.—The seasonal dry forests of South America have been suggested as a new phytogeographic unit based on a distinct floristic composition (Prado 2000). These forests are found in areas subjected to a distinct seasonality, like the Chaco and Cerrado (Prado 1993a, 1993b; Ratter et al. 1996). On the other hand, Oliveira-Filho & Fontes (2000) demonstrated that the seasonal semideciduous forests of southeastern Brazil are a part of the same floristic block as the coastal forests, even though these are subjected to a well-defined dry season.

The flora of the STR is composed of species clearly distinct from those mentioned as characteristic of the Seasonal Dry Tropical Forests (SDTF) by Pennington et al. (2000). Indeed, out of the 33 genera endemic from SDTF (Prado 2000), only *Brasiliopuntia* was documented at STR, this one being also very common in the Restinga Forests of Southern Bahia and Espírito Santo (Taylor & Zappi 2004).

The floristic similarity of the STR forest with the moist forests from southeastern Brazil and those from southern Bahia corroborates the widely accepted view that the Atlantic forests should encompass all forest physiognomies east of the dry corridor (Prado & Gibbs 1993, Prado 2000). As stated by Oliveira-Filho & Fontes (2000), these semideciduous forests should be viewed simply as a "physionomic and floristic expression of a single great Atlantic Forest domain", and not as an evidence of floristic connection with the Seasonal Dry Tropical Forests.

Disturbed Areas.—The forest margins and tree fall gaps in the STR are characterized by species quite different from those in the gaps and margins of the lowland moist forest of many areas in southern Bahia (Amorim et al. in press; Martini et al. in press), where species characteristic of disturbed areas include *Baccharis calvescens* DC., *Cyrtocymura scorpioides* (Lam.) H. Rob. and *Vernonanthura diffusa* (Less.) H. Rob. (Asteraceae), *Henriettea succosa* (Aubl.) DC. and *Miconia mirabilis* (Aubl.) L.O. Williams (Melastomataceae), *Schefflera morototoni* (Aubl.) Maguire, Steyermark & Frodin (Araliaceae), *Scleria secans* (L.) Urban (Cyperaceae), and *Tapirira guianensis* Aubl. (Anacardiaceae). In contrast, *Caesalpinia pluviosa* var. *paraensis* (Fabaceae), *Dicella bracteosa* and *Heteropterys bicolor* (Malpighiaceae), *Celtis iguanaea* and *Trema micrantha* (Cannabaceae), and *Maclura tinctoria* (Moraceae) are not found in the disturbed areas of the Una Biological Reserve or adjacent areas.

Taxonomic Difficulties

A high number of collections were not identifiable to species. This is a result of the high diversity of the region's flora and the difficulty of identifying Neotropical plants in general. Identification is particularly problematic in diverse or poorly studied families such as Fabaceae, Lauraceae, Meliaceae, Myrtaceae, Sapindaceae and Sapotaceae—over 37.6 percent of the unidentified species belonged to one of these six families. The high number of sterile samples of trees also limited identification to species. The collection of sterile specimens of unusual plants, however, documents potentially new species or new distribution records. These can be re-collected at a later date in flower or fruit for more precise identification.

APPENDIX 1

Checklist of the vascular plants in the Serra do Teimoso Reserve, Jussari, Bahia, Brazil. Voucher collections are listed for each species using the initials of the primary collector and the collector´s number. Voucher collections are deposited at CEPEC with a second set at NY. Full name of collectors are as follows: **AA** = André M. Amorim, **AC** = André M. de Carvalho, **AS** = Alexandre Salino, **EL** = Elton Leme, **ES** = Eric C. Smidt, **FJ** = Fabrício S. Juchum, **FF** = Flávio França, **FN** = Fabiana R. Nonato, **HP** = Harvey Pengel, **IF** = Irene Fernandes, **JJ** = Jomar G. Jardim, **JK** = Jacquelyn Kallunki, **LM** = Luiz Alberto Mattos Silva, **MS** = Milene M. Silva, **PF** = Pedro Fiaschi, **RF** = Rafaela C. Forzza, **RO** = Reyjane P. Oliveira, **SS** = Sérgio C. Sant´Ana, and **WT** = Wm. Wayt Thomas. A collection number followed by an asterisk (*) is one that is a voucher for a forest inventory plot in the Teimoso Reserve.

ANGIOSPERMS

ACANTHACEAE

Aphelandra blanchetiana (Nees) Hook.—WT 11815, 13353

Aphelandra nitida Nees & Mart.—AA 2584; PF 1091; WT 11926

Jacobinia paniculata (Nees) Oerst.—AA 2291; AC 6825; JJ 1729

Justicia clausseniana (Nees) Profice—AA 2474; JJ 3915; PF 1578

Lophostachys nemoralis Mart.ex Nees—AA 2899; JJ 1707, 1757

Mendoncia sp.—JJ 2346*

Sebastiania brasiliensis Spreng.—AA 2694, JJ 1879; PF 1074

FABACEAE

Fabaceae sp. 1—JJ 1671*
Fabaceae sp. 2—JJ 1926*
Fabaceae sp. 3—JJ 1583a*
Acacia adhaerans Benth.—JJ 1519, 1585*
Acacia polyphylla DC. var. *giganticarpa* G.P. Lewis—AA 3784; JJ 1530; JP 209
Albizia polycephala (Benth.) Killip—JJ 1584*, 1615*
Andira sp.—AA 2213*, 2220*
Andira fraxinifolia Benth.—AA 2296
Andira lewisii R.T. Penn.—JJ 1637*, 1920*
Bauhinia sp.—WT 13361
Bauhinia aff. *forficata* Link subsp. *forficata*—AA 2462; PF 1096; WT 13141
Bauhinia grandifolia (Bong.) Steud.—JJ 1580*
Bauhinia integerrima Mart. ex Benth.—AA 2592; AC 6838; JJ 1533
Caesalpinia echinata Lam.—AA 2228*; JP 343
Caesalpinia ferrea Mart.—AA 4269
Caesalpinia pluviosa DC. var. *paraensis* (Ducke) G.P. Lewis—AA 4136; JP 215; WT 12134
Caesalpinia pluviosa DC. var. *peltophoroides* (Benth.) G.P. Lewis—JP 201
Canavalia sp.—AA 2450; AC 6852; JP 347
Centrolobium tomentosum Guillem. ex Benth.—LM 2377; WT 11906
Chamaecrista sp.—JJ 1509
Copaifera lucens Dwyer—JJ 1672*, 2393*, 2449*
Cratylia hypargyrea Mart. ex Benth.—AA 2925; AC 6865
Crotalaria retusa L.—MS 533
Exostyles venusta Schott—AA 2248*; JJ 2399*
Goniorrhachis marginata Taub. var. *bahiana* Cowan—AA 2288; JJ 1540; PF 1931
Hymenaea sp.—JJ 1544*, 2375*, 3786*
Hymenaea oblongifolia Huber var. *latifolia* Lee & Langenheim—JJ 1645*, 1911*; PF 1933
Inga sp.—JJ 3829*, 3886*
Inga capitata Desv.—JJ 1610*, 2388*, 3853*
Inga edulis Mart.—JJ 3893*
Inga marginata Willd.—JJ 1521, 1954*, 3839*
Inga striata Benth.—AA 3760; JJ 1590*, 1938*
Inga tenuis (Vell.) Mart.—JJ 3899*
Lablab purpureus (L.) Sweet—WT 12391
Lonchocarpus cultratus (Vell.) H. C. Lima—WT 11790*
Machaerium sp. 1—JP 217; LM 2382
Machaerium sp. 2—WT 11775*, 11778*
Machaerium angustifolium Vog.—AC 6706
Mucuna urens (L.) DC.—PF 1641
Peltogyne pauciflora Benth.—AA 2231*; JJ 1595*
Piptadenia sp.—JJ 3828*, 3865*
Piptadenia killipi J.F. Macbr. var. *cacaophila* G.P. Lewis—JJ 3802*
Piptadenia moniliformis Benth.—JJ 1682*
Platycyamus regnellii Benth.—AA 3718; JJ 1644*, 2372*
Pterocarpus rohrii Vahl—JJ 1679*, 3785*, 3793*
Plathymenia reticulata Benth.—AA 4270
Pseudopiptadenia bahiana G.P. Lewis & M. P. Lima—JJ 3741*, 3753*
Schizolobium parahyba (Vell.) Blake—JJ 2333*
Senna macranthera (Collad.) H. S. Irwin & Barneby—AA 2911; JJ 3907*; JP 340
Swartzia macrostachya Benth. var. *riedelii* R.S. Cowan—AA 2210*, 2924; JJ 3727
Swartzia simplex (Sw.) Spreng. var. *ochnacea* (DC.) R.S. Cowan—AA 3713; JJ 2448*; PF 1205
Zollernia sp.—AA 2227*; JJ 3804*

GESNERIACEAE

Codonanthe sp.—PF 1644
Dalbergaria sanguinea (Pers.) Steud.—AA 2308, 2912
Nematanthus sp. nov.—AA 2913
Sinningia barbata (Nees & Mart.) Nichols—AA 2352; JJ 2091; WT 11747

HELICONIACEAE

Heliconia aemygdiana Burle-Marx subsp. *aemygdiana*—HP 27; SS 1018; WT 13364

Heliconia episcopalis Vell.—AC 6847; WT 11899, 12138
Heliconia psittacorum L. f.—AA 3721
Heliconia spathocircinata Aristeg.—HP 02; JJ 3924; WT 12136

ICACINACEAE

Citronella paniculata (Mart.) R. A. Howard—AA 2892; LM 2396; PF 1206

LAMIACEAE

Lamiaceae sp.—AA 2576
Ocimum gratissimum L.—AA 3750; LM 2398
Vitex orinocensis H.B.K.—JJ 1593*, 2446*

LAURACEAE

Lauraceae sp. 1—JJ 3906*
Lauraceae sp. 2—JJ 3769*
Lauraceae sp. 3—JJ 2473*
Aniba firmula (Nees & Mart.) Mez—AA 2347; JJ 1945*, 2336*
Cryptocarya aschersoniana Mez—AA 2226*; JJ 2104, 2351*
Ocotea sp. 1—JJ 1694*
Ocotea sp. 2—AA 2887; JJ 3824*
Ocotea sp. 3—JJ 2466*
Ocotea divaricata (Nees) Mez—LM 2378
Ocotea elegans Mez—JJ 1668*, 3808*
Ocotea indecora (Schott) Mez—JJ 1935*, 3789*; WT 11884
Ocotea macrophylla (Meisn.) Mez—JJ 2392*
Ocotea puberula (Rich.) Nees—JJ 2454*

LECYTHIDACEAE

Cariniana sp.—PF 1182
Cariniana legalis (Mart.) Kuntze—JJ 1630*, 1527, 2421*
Lecythis pisonis Cambess.—JJ 1622*

LILIACEAE

Hagenbachia brasiliensis (Nees & Mart.) Ravenna—JJ 2094

LOASACEAE

Loasa parviflora Schrad.—JJ 3931; WT 11820, 11913

LOGANIACEAE

Strychnos sp.—PF 1649

LORANTHACEAE

Struthanthus sp.—AA 2632

LYTHRACEAE

Cuphea sp.—AA 4146

MALPIGHIACEAE

Malpighiaceae sp. 1—JJ 1687*
Malpighiaceae sp. 2—AA 2215*
Banisteriopsis patula B.Gates—AA 3722; JJ 3934; JP 189
Byrsonima cacaophila W.R. Anderson—AA 2286; JJ 1499; PF 1217
Dicella bracteosa (A. Juss.) Griseb.—AA 2703, 3217; PF 1989
Heteropterys sp. nov.—AA 3218; JJ 1893
Heteropterys bicolor A. Juss.—AA 2710; JJ 1883, 3978
Heteropterys coleoptera A. Juss.—JJ 1560*; PF 1932
Heteropterys leschenaultiana A. Juss.—WT 12199
Heteropterys nordestina Amorim—AA 2199*
Hiraea sp. nov.—JJ 3878*; PF 1668
Mascagnia rigida (A. Juss.) Griseb.—AA 4127; WT 11954
Mascagnia sepium (A. Juss.) Griseb.—PF 1869
Stigmaphyllon cavernulosum C. Anderson—AA 2469, 2921; PF 1930
Tetrapterys acutifolia Cav.—AA 2699; JJ 1880; PF 1963
Tetrapterys crispa A. Juss.—AA 2919

MALVACEAE

Byttneria catalpaefolia Jacq.—JP 341; PF 1948
Cavanillesia arborea (Willd.) K.Schum.—AA 2467; JJ 1653*
Ceiba ventricosa (Nees & Mart.) Ravenna—AA 2373; JJ 2472*, 3740*
Eriotheca macrophylla (K. Schum.) A. Robyns—AA 3765*; JJ 3809*, 3831*
Guazuma ulmifolia Lam.—JJ 1508
Luehea cymulosa Spruce ex Benth.—AA 3768*; JJ 3838*, 3882*
Quararibea penduliflora K.Schum.—AA 2908; HP 23; JJ 2443*
Sterculia curiosa (Vell.) Taroda—AA 2222*, 2229*
Triumfetta semitriloba Jacq.—JP 344
Urena lobata L.—AA 4140; PF 1867

MARANTACEAE

Calathea sp. 1—WT 13336
Calathea sp. 2—PF 1952
Calathea brasiliensis Körn.—AA 2897; PF 1959
Calathea oblonga (Mart.) Körn.—AA 3745; JJ 4047; PF 1093
Calathea cf. *rotundifolia* Poepp. & Endl.—AA 3705

Calathea cf. *rufibarba* Fenzl—AA 2470; JJ 3921; PF 1582
Calathea zebrina Lindl.—PF 1986; WT 11810
Ctenanthe sp.—AC 7139
Maranta arundinacea L.—AA 4145; JJ 1739, 2088
Maranta bicolor Ker Gawl.—AA 2356, 2895; WT 11880
Stromanthe porteana Griseb.—JJ 1700; WT 13373
Stromanthe schottiana (Körn.) Eichler—AA 2293; PF 1085, 1993

MELASTOMATACEAE

Bertolonia carmoi Baumgratz—AA 2318; JK 439; WT 10232
Leandra ionopogon (Mart.) Cogn.—AA 2325; WT 11824, 13325
Leandra reversa (DC.) Cogn.—AA 2324; WT 13344
Miconia sp.—JJ 3885*
Miconia calvescens DC.—JJ 2457*, 3912*
Miconia centrodesma Naudin—AA 2889
Miconia nervosa (Sm.) Triana—JJ 1495
Meriania cf. *tetramera* Wurdack—JJ 3929
Mouriri chamissoana Cogn.—AA 2891
Pleiochiton sp. nov.—JJ 3916

MELIACEAE

Meliaceae sp.—JJ 1669*, 3751*
Cedrela odorata L.—JJ 2475*
Guarea guidonia (L.) Sleumer—JJ 3909*
Guarea kunthiana A. Juss.—AA 2247*; JJ 1572, 2337*
Guarea macrophylla Vahl subsp. *pachycarpa* (C. DC.) T. D. Penn.—AA 2681*; JJ 1732; JP 188
Trichilia sp. 1—JJ 1692*, 3783*; JP 199
Trichilia sp. 2—JJ 3817*, 3864*
Trichilia sp. 3—JJ 1640*, 3813*
Trichilia sp. 4—PF 1216
Trichilia blanchetii C. DC.—WT 11964
Trichilia casaretti C. DC.—JJ 1865; WT 11875, 13133
Trichilia elegans A. Juss. subsp. *richardiana* (A. Juss.) T. D. Penn.—JP 350; PF 1973; WT 11912
Trichilia florbranca T. D. Penn.—AA 2583; PF 1666, 1927
Trichilia martiana C. DC.—JP 349; WT 11952, 11732
Trichilia pleeana (A. Juss.) D. DC.—AA 2295; JJ 2401*; JP 167
Trichilia pseudostipularis (A. Juss.) C. DC.—AA 2241*, 2372; HP 09
Trichilia silvatica C. DC.—AA 2674*; JJ 3742*; WT 11733

MENISPERMACEAE

Menispermaceae sp.—PF 1587
Chondodendron microphyllum (Eichler) Moldenke—AA 2888; PF 1090, 1662
Odontocarya sp.—PF 1089
Orthomene schomburgkii (Miers) Barneby & Krukoff—WT 12197

MOLLUGINACEAE

Mollugo verticillata L.—WT 11883

MONIMIACEAE

Mollinedia sp.—PF 1200
Mollinedia selloi (Spreng.) A. DC.—WT 13333

MORACEAE

Brosimum cf. glaziovii Taub.—WT 11752*
Brosimum guianense (Aubl.) Huber—JJ 1627*, 1946*
Clarisia ilicifolia (Spreng.) Lanj. & Rossberg—JJ 1479, 3891*; PF 1204
Clarisia racemosa Ruiz & Pav.—JJ 1589*, 1609*; WT 11794a*
Dorstenia bahiensis Fisch. & C.A. Mey.—JJ 1537; PF 1657; WT 11739
Dorstenia cayapia Vell. subsp. *cayapia*—AC 6710; WT 11957
Dorstenia contensis Carauta & C. C. Berg—WT 11908
Dorstenia turneraefolia Fisch. & C.A. Mey.—AC 6851; JJ 1706; PF 1648
Ficus sp.—JJ 2341*
Ficus gomelleira Kunth & Bouché—AA 2280*; JJ 1534
Ficus mexiae Standl.—JJ 3870*
Ficus nymphaeifolia Mill.—JJ 3760*
Maclura tinctoria (L.) Steud.—JJ 1887; JP 214; PF 1645
Naucleopsis oblongifolia (Kuhlm.) Carauta—JJ 1555*, 1658*, 2432*
Pseudolmedia macrophylla Trécul—JJ 1899*, 1941*, 2389*
Sorocea guilleminiana Gaudich.—JP 212; LM 2141; PF 1577

MYRISTICACEAE

Virola gardneri (A. DC.) Warb.—AA 3786; JP 170, 203

MYRSINACEAE

Ardisia semicrenata Mart.—LM 2136

Cybianthus sp.—AA 2317
Myrsine umbellata Mart.—JJ 2381*, 2397*, 2470*

MYRTACEAE

Myrtaceae sp. 1—AA 2665*
Myrtaceae sp. 2—JJ 2438*
Calyptranthes sp.—JJ 1586*, 3764*; PF 1076
Campomanesia guaviroba (DC.) Kiaersk.—JP 208

Plinia grandifolia (Mattos) Sobral—JJ 2361*, 3752*, 3854*
Plinia rivularis (Cambess.) Rotman—AA 2626

NYCTAGINACEAE

Andradea floribunda Allemao—AA 2294; JJ 1686*
Bougainvillea spectabilis Willd.—PF 1655
Guapira laxiflora (Choisy) Lundell—AA 2311; WT 11885, 13323
Guapira opposita (Vell.) Reitz—AA 2253*; JJ 1674*, 3777*
Guapira venosa (Choisy) Lundell—JJ 1567*, 1611*, 3823*
Ramisia brasiliensis Oliv.—JJ 1507; JP 216; WT 6822

OCHNACEAE

Ouratea decipiens Tiegh.—HP 33; PF 1966

OLACACEAE

Heisteria perianthomega (Vell.) Sleumer—AA 2675*; JJ 2464*; PF 1185
Tetrastylidium grandifolium (Baill.) Sleumer—JJ 1516; JP 168; PF 1072

OLEACEAE

Chionanthus sp.—JJ 1652*, 2459*

OPILIACEAE

Agonandra excelsa Griseb.—AA 2598; JJ 2476*; PF 1647

ORCHIDACEAE

Acianthera sp.—ES 307
Anathallis rubens (Lindl.) Pridgeon & M. W. Chase—ES 303
Bulbophyllum sp. 1—ES 309
Bulbophyllum aff. *ipanemense* Hoehne—JJ 1480
Catasetum luridum (Link) Lindl.—PF 1988
Cattleya warneri T. Moore ex Warner—PF 1870
Chytroglossa marileoniae Rchb. f.—PF 1656
Cyclopogon congestus (Vell.) Hoehne—AA 3698
Lockhartia aff. *lunifera* (Lindl.) Rchb. f.—PF 1212
Gongora quinquenervis Ruiz & Pav.—JJ 4051
Microchilus lamprophyllus (Linden & Rchb. f.) Ormerod—JJ 3733, 4044; PF 1580
Miltonia flavescens Lindl.—AA 4137; JP 68
Notylia hemitricha Barb. Rodr.—AA 2609
Octomeria sp.—JP 50

Oeceoclades maculata (Lindl.) Lindl.—AA 2357; AC 6824
Oncidium barbatum Lindl.—JJ 3738
Phymatidium tillandsioides Barb. Rodr.—WT 11804
Pleurothallis sp.—PF 1865
Pleurothallis hypnicola Lindl.—JJ 1703, 1747; WT 11896
Prosthechea aemula (Lindl.) W.E. Higgins—AA 4138
Prosthechea fragrans (Sw.) W.E. Higgins—JJ 1482, 1740
Sarcoglottis grandiflora Klotzsch—PF 1661; RO 743
Schomburgkia crispa Lindl.—JJ 4262
Stanhopea sp.—WT 13349
Xylobium variegatum (Ruíz & Pav.) Garay & Dunst.—JJ 1524

OXALIDACEAE

Oxalis alata Mart. ex Zucc.—AA 2303; JJ 1857; PF 1081
Oxalis debilis Kunth—AA 4144

PASSIFLORACEAE

Passiflora sp.—JJ 2106
Passiflora contracta Vitta—JP 174; WT 11720, 13351

PHYLLANTHACEAE

Discocarpus pedicellatus Fiaschi & Cordeiro—AA 2682*; PF 1672; WT 11750*
Margaritaria nobilis L. f.—AA 3699; WT 10852, 11914

PHYTOLACCACEAE

Gallesia integrifolia (Spreng.) Harms—JJ 3877*; LM 2402; WT 11770*
Hilleria latifolia (Lam.) H.Walter—AA 3780; HP 11; PF 1101
Petiveria alliacea L.—HP 04; JJ 1749
Phytolacca dioica L.—JP 206; JJ 1665*, 1693*
Rivina humilis L.—AA 2289

PICRAMNIACEAE

Picramnia glazioviana Engl.—WT 11902
Picramnia ramiflora Planch.—AC 6690; JJ 1515, 1705

PIPERACEAE

Peperomia sp. 1—JJ 1761
Peperomia sp. 2—JJ 1760; PF 1210
Peperomia alata Ruiz & Pav.—AA 2623; PF 1965
Peperomia gardneriana Miq.—AA 2290; AC 6857; PF 1983
Peperomia glabella (Sw.) A. Dietr.—JJ 1730; WT 13347
Peperomia magnoliifolia (Jacq.) A.Dietr.—JJ 1754
Peperomia rhombea Ruiz & Pav.—AA 2465, 3746; JJ 1875
Peperomia serpens (Sw.) Loudon—JJ 1763
Peperomia trichocarpa Miq.—AA 2445
Peperomia urocarpa Fisch. & C.A. Mey.—AA 2355, 2448; PF 1183
Piper amalago L.—PF 1946; WT 13372
Piper amplum Kunth—AA 2302; HP 25; JP 166
Piper caldense C. DC.—WT 11827; 13345
Piper dilatatum Rich.—PF 1651
Piper miquelianum C. DC.—AA 2591, 4123; PF 1922
Piper obliquum Ruiz & Pav.—WT 11826, 13324
Piper umbellatum L.—AA 2376; PF 1658; WT 11725

POACEAE

Atractantha sp. 1—WT 11903
Atractantha sp. 2—WT 13334
Digitaria ciliaris (Retz.) Koeler—WT 11951
Eremitis sp.—JJ 4041
Ichnanthus hirtus (Raddi) Chase—WT 11901, 13380
Ichnanthus umbraphilus Renvoize—WT 11726, 11905, 13376
Lasiacis ligulata Hitchc. & Chase—AA 2607
Merostachys sp. 1—WT 11800
Merostachys sp. 2—WT 13330
Olyra latifolia L.—JJ 1860; WT 11744, 12394
Oplismenus hirtellus (L.) P. Beauv.—JJ 3730
Pharus latifolius L.—AA 2893
Pharus lappulaceus Aubl.—WT 11907
Raddia brasiliensis Bertol.—JJ 2089
Raddia portoi Kuhlm.—WT 11942
Sucrea monophylla Soderstr.—AC 6821; JJ 1487

POLYGONACEAE

Coccoloba sp.—AA 2263*
Coccoloba declinata (Vell.) Mart.—AA 2709, 3747; JJ 2453*
Coccoloba oblonga Lindau—JJ 1489
Ruprechtia sp. 1—JJ 3759*, 3820*, 3825*
Ruprechtia sp. 2—AA 2618

PROTEACEAE

Roupala sp.—JJ 3911*

PUTRANJIVACEAE

Drypetes sessiliflora Allemão—AA 2292, 2581; JJ 1955

QUIINACEAE

Quiina glaziovii Engl.—WT 11727

RAFFLESIACEAE

Pilostyles sp.—AA 2898

ROSACEAE

Prunus sellowii Koehne—AA 2274*; JJ 3910*; PF 1586

RUBIACEAE

Alseis floribunda Schott—AA 2605; LM 2394

Amaioua sp.—JJ 3888*

Amaioua guianensis Aubl.—WT 11816

Bathysa cuspidata (A. St.-Hil.) Hook.f.—AA 2886; JP 191; WT 13366

Borreria pulchristipula (Bremek.) Bacigalupo & E. L. Cabral—JJ 3933

Coussarea bahiensis Müll. Arg.—AA 2329, 2350; JJ 3919, 4046

Faramea hyacinthina Mart.—AA 3711; JJ 3977; PF 1991

Faramea oligantha Müll. Arg.—AA 3735; JJ 4049; PF 1863

Faramea rivularis Gardner—AA 2906; JJ 4043

Guettarda viburnoides Cham. & Schltdl.—JJ 3830*

ACKNOWLEDGMENTS

We thank the National Science Foundation (NSF 9972116 to Thomas, Carvalho and Amorim), the Beneficia Foundation, The National Geographic Society, and the John D. and Catherine T. MacArthur Foundation for financial support for this research. We are grateful to Henrique F. Berbert de Carvalho and Lucélia de Melo Berbert, owners of the Serra do Teimoso Reserve, for their hospitality and helpfulness. We thank José Lima da Paixão, Rondineli Q. Nascimento, and Sergio C. Sant'Ana for invaluable assistance in the field. While we take full responsibility for all names listed here, we are indebted to the many botanists who assisted us by identifying specimens or collecting at the Teimoso Reserve; these include Reyjane P. Oliveira (Poaceae), Marcos Sobral (Myrtaceae), Jacquelyn Kallunki and José. R. Pirani (Rutaceae), Maria de Fátima Agra (Solanaceae), Cássio van den Berg and Eric C. Smidt (Orchidaceae), Renato Goldenberg (Melastomataceae), Alexandre Salino (pteridophytes). We thank Flávio Leopoldino, Pablo Vilanueva and Raquel Moura for their help in suggesting useful literature.

ABSTRACT

Rattlesnake Falls is located in the dissected Western Highland Rim Escarpment of Maury County, Tennessee. The central feature of this site is the largest known waterfall on the escarpment which falls 18 m over two ledges into a large splash pool at the head of a narrow, wooded gorge. The waterfall is surrounded by a 62.5 ha tract of rugged, mostly forested land, in which a botanical survey was conducted from February 2000 to August 2001. Six hundred twenty-seven taxa representing 348 genera and 107 families were found; 81 taxa (13%) were introduced. Families with the largest numbers of species were Asteraceae, Poaceae, and Fabaceae. County records (294) increased the number of plant taxa of Maury County to 915. Rare taxa included the federally threatened species *Helianthus eggertii* and tentatively, *Apios priceana*. Species listed at the state level as threatened were *Lilium michiganense* and *Juglans cinerea*, and as special concern were *Castanea dentata*, *Parnassia grandifolia*, *Phlox pilosa* ssp. *ozarkana*, and *Symphyotrichum oolentangiense*. Compared to 13 other floristic studies in various physiographic regions of Tennessee, Rattlesnake Falls had the second highest numbers of native and rare taxa per ha but also the second highest number of nonnative taxa per ha.

RESUMEN

Las Rattlesnake Falls se localizan en el Western Highland Rim Escarpment del condado de Maury, Tennessee. La característica principal de este lugar es la gran cascada que cae 18 m por dos repisas en un gran estanque de salpicadura en la cabecera de una garganta boscosa estrecha. La cascada está rodeada por una extensión de tierra accidentada de 62.5 ha en su mayoría forestal, en la que se realizó un estudio botánico desde febrero de 2000 hasta agosto 2001. Se encontraron seiscientos veintisiete taxa de 348 géneros y 107 familias; 81 taxa (13%) eran introducidos. Las familias con mayor número de especies fueron Asteraceae, Poaceae, y Fabaceae. Las citas del condado (294) incrementaron el número de taxa vegetales del condado de Maury a 915. Los taxa raros incluidos en las especies federalmente amenazadas son *Helianthus eggertii* y tentativamente, *Apios priceana*. Las especies listadas a nivel estatal como amenazadas son *Lilium michiganense* y *Juglans cinerea*, y con especial preocupación *Castanea dentata*, *Parnassia grandifolia*, *Phlox pilosa* ssp. *ozarkana*, y *Symphyotrichum oolentangiense*. Comparado con otros 13 estudios florísticos en varias regiones fisiográficas de Tennessee, las Rattlesnake Falls tienen el segundo mayor número de taxa nativos y raros por hectárea, pero sólo el segundo número más alto de taxa no nativos por hectárea.

SIDA 21(3): 1753–1780. 2005

INTRODUCTION

Rattlesnake Falls, with its encompassing tract of rugged, mostly forested land, is located in southwestern Maury County, Tennessee. Since the late 1800s, it has been a popular recreational landmark (Garrett 1966). In 1874, the name of the waterfall was changed to Antoinette Falls in honor of the Columbian socialite Antoinette Polk, daughter of the wealthy Civil War blockade-runner Captain Andrew Jackson Polk (Turner 1955). However, the name Rattlesnake Falls was too firmly entrenched and the new name was soon discarded. The original name apparently was reasonable given the abundance of snakes reported from the area (Garrett 1966).

Quarterman and Powell (1978) listed Rattlesnake Falls as a potential geological and ecological landmark of the Interior Low Plateaus Physiographic Province. Ecologically, they noted that the ravine was the "best" one they had surveyed on the Western Highland Rim and was nationally significant. Moreover, Rattlesnake Falls is one of the tallest waterfalls (ca. 18 m) in this region of Middle Tennessee (Tennessee Valley Authority 1938).

The purpose of the present study was to document the vascular flora of the tract of land surrounding Rattlesnake Falls. Communities were qualitatively described. The community and relative abundance were recorded for each taxon. In particular, the presence and status of rare plants, their habitat, and potential threats to their continued existence, were determined in order to augment the evaluation of the site as an important natural area deserving protection.

STUDY AREA

Rattlesnake Falls is located ca. 27 km southwest of Columbia, near Summertown, in Maury County, Tennessee (centered 35°27'00" N, 87°15'38" W). The study unit included 62.5 ha (Fig. 1). It was bound by United States Highway 43 on the west, at about mid-slope on the eastern side of Falls Creek, and in major ravines north and south of Rattlesnake Falls Creek Gorge. The major tributary is an unnamed stream (hereafter referred to as Rattlesnake Falls Creek) formed by three streams merging approximately 300 m upstream from the Falls. Elevations within the study site range from 243 m along Falls Creek, to 304 m above mean sea level, at the ridgetops (Marcher & Lounsberry 1966).

Encompassing Rattlesnake Falls Gorge are two narrow ridges that roughly parallel one another in a west-east direction. Rattlesnake Falls Creek bisects these ridges, resulting in a deep, narrow gorge with steep-sided slopes descending directly to the margin of Rattlesnake Falls Creek in most places. Throughout the gorge, these steep slopes have rugged rock outcrops and small bluffs, and only in a few places adjacent to the creek may level to slightly sloping alluvial deposits be found. Two small caves are located on the north side of Rattlesnake Falls Creek near its confluence with Falls Creek. A cave spring occurs on

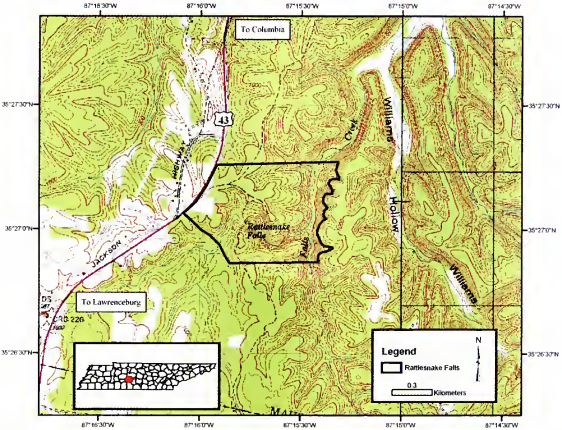

Fig. 1. Location of Rattlesnake Falls, and boundaries of the study area (Summertown USGS topographic quad).

the north side of Rattlesnake Falls Creek approximately 100 m upstream from Rattlesnake Falls.

The site is within the Highland Rim Escarpment portion of the Duck River Basin Subsection, Central Basin Section of the Interior Low Plateaus Physiographic Province (Quarterman & Powell 1978). This area represents the interface of the Western Highland Rim (71f) and the Outer Nashville Basin (71h) of Griffith et al. (1998). Strata of the Mississippian-aged Fort Payne Formation underlie most of the study area. The Fort Payne Formation consists of limestone with cherty and siltstone facies. Only along Falls Creek is limestone of Ordovician-aged Leipers and Catheys Formations exposed (Marcher & Lounsbury 1966; Quarterman & Powell 1978).

Four land/soil types are found in the study area (Harmon et al. 1959): Riverwash, Rockland, Bodine series, and Mountview series. Riverwash is in a very narrow band along Rattlesnake Falls Creek and Falls Creek. This land type mostly occurs along swift, forested streams and contains a mixture of chert, other rock fragments, and soil particles that have washed down from adjacent slopes. The steep Rockland land type of Harmon et al. (1959) is found along the edges of Rattlesnake Falls Gorge and ascends from the bottom nearly to the ridge-tops in some localities and varies in slope from 12–60% with occasional vertical rock cliffs present on lower slopes of the gorge. The Rockland type is characterized by well-drained shallow soil. Portions of the slopes of the gorge below Rattlesnake Falls and of the small ravines, as well as the narrow ridgetops, are composed of cherty silt loam of the Bodine series. These soils have slopes that vary from 4–60%, and are strongly to very strongly acid, well drained, and cherty. The Mountview series occurs in the highest elevated areas of the study site. This soil series is a silt loam or silty clay loam, has slopes that range from 0–12%, and soils that are low in fertility and highly acidic (Harmon et al. 1959).

The study site is in Köppen's Cfa climatic type, i.e., a mild rainy climate with hot summers but without a distinct dry season (Ackerman 1941). In Maury County, the average growing season is 192 days and extends from April 12 to October 21. The mean annual temperature is 15.3°C. July is typically the hottest month with an average temperature of 25.6°C, while January is the coldest with an average temperature of 4.9°C. Annual precipitation totals 128.6 cm. Snowfall is about 20.1 cm. January and March are the wettest months, while September and October are the driest (Harmon et al. 1959).

The study site lies within Braun's (1950) Western Mesophytic Forest Region and Küchler's (1964) Oak-Hickory Vegetation Type. Generally, ridge and slope forests are oak-dominated and ravines contain forests characterized as mesophytic (Bryant et al. 1993; Chester 1995).

METHODS

The study site was regularly sampled from late February 2000 to mid-November 2000 and from March 2001 to August 2001 with about three visits per month. Ten trips also were made during 1998 and 1999, prior to the beginning of the project. Thus, the site was visited during 55 trips over the entire study period. The area sampled included the gorge that contains Rattlesnake Falls, the ridges adjacent to the falls and associated ravines, a section along Falls Creek, the access road and trails leading to the falls, and an upland field near the northern edge of the study site. Vouchers for all but 14 species encountered during fieldwork were collected.

Identifications were made using standard manuals: Small (1933), Fernald (1950), Radford et al. (1968), Cronquist (1980), Isely (1990), Gleason and Cronquist (1991), and Yatskievych (1999). County records were determined using Chester et al. (1993, 1997). Specimens were deposited in herbaria of the University of Tennessee-Knoxville (TENN), Vanderbilt University (VDB) now housed at the Botanical Research Institute of Texas (BRIT), and/or Austin Peay State University (APSC). Element occurrence records for federal and state-listed rare species were provided to the Tennessee Division of Natural Heritage and to the Natural Resources Division of the Tennessee Valley Authority to aid in the protection of rare plant populations within the study area.

A literature search was performed to compile a list of other floristic studies from Tennessee; 13 of these were selected for comparison with Rattlesnake Falls. The numbers of native and nonnative taxa were calculated, and the floristic lists examined for rare species (cf. Tennessee Natural Heritage Program 2001). The numbers of taxa were converted to an area basis according to the area published in the study.

RESULTS AND DISCUSSION

Floristic Summary

Based on 938 collections, a total of 627 species and infraspecific taxa from 348 genera and 107 families comprise the known vascular flora of Rattlesnake Falls. Families containing the largest number of taxa were the Asteraceae (94), Poaceae (69), and Fabaceae (44). These families also are among the largest in the flora of Tennessee (Wofford & Kral 1993). Trees, shrubs, and woody vines accounted for 135 species (21% of the flora), with the greatest numbers of taxa in the following genera: *Quercus* (11), *Carya* (5), and *Rubus* (5). The following genera each had four woody taxa: *Cornus*, *Smilax*, *Ulmus*, *Vaccinium*, and *Vitis*. *Acer*, *Celtis*, *Crataegus*, *Hypericum*, *Rhododendron*, *Rhus*, *Rosa*, and *Salix* each had three taxa. There were 492 (78%) herbaceous species in the flora. The largest genera of herbaceous plants (15%) were *Carex* (19), *Solidago* (14), *Dichanthelium* (11), *Desmodium* (9), *Lespedeza* (9), *Symphyotrichum* (9), *Eupatorium* (7), *Polygonum* (7), and *Viola* (7). Twenty-seven (4%) ferns and fern-allies were present. Ten state rare taxa, including two federally listed species, were found. Five hundred forty-six taxa were native (87%) and 81 taxa (13%) were not native. County records (294) increased the number of plant species and subspecific taxa in Maury County from 621 to 915.

Plant Communities

Six communities were recognized at Rattlesnake Falls, delineated mostly along topographical contours and physical aspect. The most extensive, comprising approximately 50% (31 ha) of the study area, and least floristically diverse was the oak-hickory forest of the upland ridgetops and upper slopes of ridges. Ravine forest, occupying 43% (27 ha), was the most floristically diverse. An old field at the western edge of the site was about 1 ha (2%). The remaining three communities, representing ca. 5% (2 ha) of the study area, included bluff or rock outcrop areas, calcareous seeps, and disturbed sites.

Oak-Hickory Forests.—The canopy of the oak-hickory forest was dominated primarily by *Quercus alba*, *Q. coccinea*, *Q. prinus*, *Q. stellata*, and *Q. velutina* and by *Carya alba* and *C. glabra*. On xeric slopes and ridgetops, individuals of *Q. marilandica*, *Pinus echinata* and *P. virginiana* were present. The subcanopy and shrub layer were dominated by *Amelanchier arborea*, *Nyssa sylvatica*, and various ericaceous species. *Smilax* spp. and *Toxicodendron radicans* were common woody vines. Notable herbaceous species included *Antennaria plantaginifolia*, *Aureolaria pectinata*, *Carex picta*, *Cunila origanoides*, *Desmodium rotundifolium*, *Ionactis linariifolius*, *Lechea tenuifolia*, *Lespedeza procumbens*, *Spiranthes tuberosa*, and *Viola hirsutula*.

Ravine Forests.—A much greater abundance and diversity of plants distinguished the ravine forest from the oak-hickory forest. The difference in floristic diversity and composition was most likely correlated with moisture availability. The dominant canopy species in the ravine forest included a wider representation of genera than in the oak-hickory forest. Common species were *Acer saccharum*, *Liriodendron tulipifera*, and *Quercus muehlenbergii*. Small trees and shrubs that comprised the understory included *Asimina triloba*, *Carpinus caroliniana*, *Cornus alternifolia*, *Hamamelis virginiana*, *Hydrangea cinerea*, *Lindera benzoin*, and *Staphylea trifolia*. The diversity and abundance of herbaceous species was particularly impressive in the portion of the gorge just downstream from the waterfall. Notable representatives included *Actaea pachypoda*, *Geranium maculatum*, *Maianthemum racemosum*, *Phlox divaricata*, *Solidago curtisii*, *Waldsteinia fragarioides*, and *Valeriana pauciflora*. More than 20 species of ferns and fern-allies were found. The bryoflora also was noted for its significance and diversity, particularly in the gorge near the waterfall (Quarterman & Powell 1978; P. Davison, pers. comm.).

Old Fields.—The floristic composition of the old field exhibited some characteristics of barrens (DeSelm 1994; Baskin et al. 1994): areas dominated by perennial grasses that are successional but maintained as open communities by anthropogenic disturbances. In fact, Rattlesnake Falls is located in the portion of southwestern Maury County that was included in the "barrens of the Southwestern Rim" floristic region by Shanks (1958; DeSelm 1988). The field was maintained by occasional mowing. Important grass species were *Andropogon virginicus*, *Dichanthelium* spp., *Panicum anceps*, *Saccharum alopecuroidum*, *Schizachyrium scoparium*, and *Tridens flavus*. Forbs were well represented by numerous species of *Desmodium*, *Helianthus*, *Lespedeza*, *Solidago*, and *Symphyotrichum*. The field was undergoing succession with low-statured, dense growth of *Ceanothus americanus* and *Rhus copallinum*. Much of the field also contained invasive species like *Lespedeza bicolor*, *L. cuneata*, *Lolium arundinaceum*, *Lonicera japonica*, and *Rubus bifrons*.

Bluffs and Rock Outcrops.—Large boulders and rock promontories covered with shallow soil and open sparse vegetation characterized the bluff and rock outcrop community. The largest and best-developed section was located on the north side of Rattlesnake Falls Creek, downstream from the waterfall. Other bluff and rock outcrop communities were present throughout Rattlesnake Falls Gorge and along Falls Creek. Noteworthy species included *Hypericum frondosum*, *Philadelphus hirsutus*, *Aquilegia canadensis*, *Asclepias verticillata*, *Heuchera villosa* var. *macrorhiza*, *Parietaria pensylvanica*, *Schizachyrium* *scoparium, Sisyrinchium albidum, Asplenium resiliens, Cheilanthes lanosa,* and *Cystopteris bulbifera.*

Calcareous Seeps.—The calcareous seep community was characterized by an open canopy and gravelly, continuously waterlogged, substrate. Two types of seeps were found in the study area. The most common type was dominated by *Impatiens capensis.* A large *Impatiens* dominated seep was present on the steep slope adjacent to Rattlesnake Falls, and a few other ones were found along Falls Creek. The other type of seep was dominated by *Parnassia grandifolia.* One rather extensive *Parnassia* dominated seep was found on a steep slope on the eastern side of Falls Creek. Frequent species found in both seep types were *Alnus serrulata, Chelone glabra, Cuscuta compacta, Juncus coriaceus, Oxypolis rigidior, Phlox glaberrima, Rudbeckia fulgida* var. *umbrosa,* and *Solidago patula.*

Disturbed Areas.—Examples of disturbed areas included access (dirt) roads, trails, a campsite, and a recently constructed utility substation. They were subjected to regular human disturbance and often had higher numbers of non-native species compared to areas less frequented and affected by humans. Some of the common species included exotics, such as *Albizia julibrissin, Carduus nutans, Ligustrum sinense, Lolium arundinaceum, Lonicera japonica, Microstegium vimineum, Paulownia tomentosa,* and *Rosa multiflora.* In Tennessee, these species are considered severe or significant threats to native plant communities (Tennessee Exotic Pest Plant Council 2002).

Rare Plants

Apios priceana is listed as federally threatened and as endangered in Tennessee (Tennessee Natural Heritage Program 2001). Unfortunately, the plants at Rattlesnake Falls did not flower during the period of study, and the morphology of the flowers is the diagnostic identification feature. Vegetative characteristics and habitat were used to tentatively determine the identity of the plants (US Fish and Wildlife Service 1993; E.W. Chester, pers. comm.). About five clumps were found in two types of habitat in Rattlesnake Falls Gorge: a moist semi-open streambank and on a rocky wooded hillside. The individuals along the streambank were located close to a trail, and trampling might impact the population. Associated taxa included *Carya cordiformis, Quercus alba, Ostrya virginiana, Parthenocissus quinquefolius, Agrimonia rostellata, Dioscorea quaternata,* and *Passiflora lutea.*

Helianthus eggertii is listed as federally and state threatened (Tennessee Natural Heritage Program 2001). Many individuals were found along a dirt road as well as in the adjacent upland field. The area along the road was subjected to infrequent disturbance by vehicular traffic until a gate was erected at the road entrance in 1999. Consequently, the road margins where *H. eggertii* occurs are becoming overgrown. Moreover, the plants in the field may be shaded out due to encroachment of woody species if periodic mowing or prescribed fire is not implemented. Prolonged absence of mowing has allowed the growth of *Lespedeza bicolor, Lonicera japonica, Rhus copallinum, Rubus bifrons,* and *Sassafras albidum.* Jones (1994) considered competition from weedy species, shading due to succession of habitat to woodland, and major soil disturbance events such as bulldozing to be the leading factors in population declines or extirpations of *H. eggertii.* In addition to the woody competitors mentioned above, other associated species, some of which Jones (1994) listed as typically occurring with *H. eggertii,* were found. These included *Coreopsis tripteris, Eurybia hemispherica, Helianthus hirsutus, Lespedeza virginica, Rudbeckia hirta, Silphium mohrii, Solidago ulmifolia, Symphyotrichum patens, Andropogon virginicus, Schizachyrium scoparium,* and *Tridens flavus.*

Lilium michiganense is listed as threatened in Tennessee (Tennessee Natural Heritage Program 2001). Three plants, only one in flower, were found upstream of Rattlesnake Falls and an additional five vegetative individuals were found downstream. The flowering specimen occurred along Rattlesnake Falls Creek on a wet bank with *Alnus serrulata, Impatiens capensis, Lycopus rubellus,* and *Oxypolis rigidior.* The remaining seven plants were found on a rich streambank and on a wooded alluvial flat. Associates included *Arundinaria gigantea, Corallorhiza wisteriana, Lindera benzoin, Phegopteris hexagonoptera, Platanthera peramoena,* and *Polystichum acrostichoides.*

Juglans cinerea is threatened in Tennessee (Tennessee Natural Heritage Program 2001) due to the fungal pathogen, *Sirococcus clavigignenti-juglandacearum,* or Butternut Canker. This disease has caused a dramatic decline of the species throughout its range in eastern North America (Ostry 1997). Butternut was occasionally found in the ravine forests of the study area. Many older specimens showed signs of disease, but there were a few apparently healthy saplings.

Symphyotrichum oolentangiense is listed as special concern in Tennessee (Tennessee Natural Heritage Program 2001). The species previously was reported from two counties in the Coastal Plain physiographic region of Tennessee, and the collection from Rattlesnake Falls was the first from the Western Highland Rim of Tennessee (Chester et al. 1997). The plant was collected in low density oak-hickory woods on a xeric slope above Rattlesnake Falls.

Parnassia grandifolia is listed as special concern in Tennessee (Tennessee Natural Heritage Program 2001). Hundreds of plants were found growing densely in one calcareous seep with an area of approximately 25 m^2. Associated species included *Alnus serrulata, Apios americana, Impatiens capensis, Salix caroliniana, Oxypolis rigidior, Phlox glaberrima, Rudbeckia fulgida* var. *umbrosa, Solidago patula,* and *Osmunda regalis* var. *spectabilis.*

Phlox pilosa ssp. ***ozarkana*** is listed as special concern in Tennessee (Tennessee Natural Heritage Program 2001). Only a few individuals were found in the upland field and edges adjacent to US Highway 43. The plants were growing with *Helianthus eggertii* and with *H. eggertii's* previously mentioned associates.

The major threat to the population of this phlox at Rattlesnake Falls would be woody plant encroachment.

Panax quinquefolius is listed as special concern in Tennessee as a result of commercial exploitation (Tennessee Natural Heritage Program 2001). About 20 individuals were found in cherty, humus-rich soil of moist woods at scattered localities in Rattlesnake Falls Gorge and adjacent ravines.

Hydrastis canadensis is listed as special concern in Tennessee as a result of commercial exploitation (Tennessee Natural Heritage Program 2001). The population consisted of about 30 individuals located in three separate forested ravines.

***Castanea dentata*,** once a prominent forest tree, is listed as special concern in Tennessee (Tennessee Natural Heritage Program 2001). It was found mostly in oak-hickory forests on dry ridges in the study area. Most of the specimens were small, with only a couple 5–15 cm in diameter. *Quercus alba*, *Q. coccinea*, *Q. prinus*, *Q. velutina*, *Carya alba*, *C. glabra*, *Nyssa sylvatica*, *Smilax rotundifolia*, *Toxicodendron radicans*, *Vitis aestivalis* var. *aestivalis*, and *Vitis rotundifolia* were common associates.

Comparison to Other Floristic Studies

Rattlesnake Falls had approximately 8.7 native and 1.3 nonnative taxa per ha, and 0.16 rare plants (Table 1). Compared to 13 other areas in Tennessee, Rattlesnake Falls had the second largest numbers of native, rare, and nonnative taxa per ha. Barnett Woods in Montgomery County, Tennessee had the largest numbers of native, rare, and nonnative taxa per ha. The average numbers of native, rare, and nonnative taxa per ha among these 13 studies were 0.63, 0.01, and 0.11, respectively.

ANNOTATED CHECKLIST

The following vascular plants represent the known flora of Rattlesnake Falls. They are arranged alphabetically by family within six groups: Lycopodiophyta, Equisetophyta, Polypodiophyta, Pinophyta, and Magnoliophyta, including the Magnoliopsida and Liliopsida. Nomenclature mostly follows Kartesz (1999) except for ferns, fern allies, and gymnosperms which follow the Flora of North America Editorial Committee (1993); recently described species follow Campbell (2000) and Naczi et al. (2001, 2002). Also, we depart from Kartesz (1999) in recognizing *Melilotus alba*, in accordance with the USDA, NRCS (2004), and *Dichanthelium dichotomum* var. *ramulosum* and *D. yadkinense* based on LeBlond (2001). The acceptance of *Heuchera villosa* var. *macrorhiza* is based on Fernald (1950). County records are denoted by a cross (†) and non-native taxa are indicated by an asterisk (*). Species native to portions of Tennessee but not to the study area are indicated by two asterisks (**). Rare taxa are listed in **bold** type. Collection numbers are those of the senior author. For 14 specimens

not collected, the words "not collected" are listed in parenthesis. Although several specimens were collected for many of the species and given separate collection numbers, only one number is given per taxon in this checklist. Unless otherwise indicated voucher specimens are deposited at TENN. A brief description of the habitat in which each species was collected is given. A qualitative assessment of the relative abundance of each taxon in their characteristic habitat was made, and classified as follows (Murrell & Wofford 1987):

Very rare —a single locale, few individuals
Rare —one or two localities, generally small populations
Scarce —several localities or scattered small populations
Infrequent —scattered localities throughout
Occasional —well-distributed but not anywhere abundant
Frequent —generally encountered
Common —characteristic and dominant

LYCOPODIOPHYTA

SELAGINELLACEAE

Selaginella apoda (L.) Spring, wet rocks under waterfall; rare (00576).

EQUISETOPHYTA

EQUISETACEAE

†*Equisetum hyemale* L. ssp. *affine* (Engelm.) Calder & Roy L.Taylor, wooded streambank; rare (00302).

POLYPODIOPHYTA

ASPLENIACEAE

Asplenium platyneuron (L.) B.S.P., woods; frequent (00498).

Asplenium resiliens Kunze, limestone bluffs; very rare (03502).

Asplenium rhizophyllum L., limestone bluffs; frequent (01007).

DENNSTAEDTIACEAE

Pteridium aquilinum (L.) Kuhn var. *latiusculum* (Desvaux) L.Underwood ex A.Heller, old field and upland woods; occasional (01172).

DRYOPTERIDACEAE

Athyrium filix-femina (L.) Mertens var. *asplenioides* (Michx.) Farw., wooded ravines; common (00539).

Cystopteris bulbifera (L.) Bernh., limestone bluffs and boulders; frequent (00515).

Cystopteris protrusa (Weatherby) Blasdell, rich wooded ravine; very rare (01879).

†*Deparia acrostichoides* (Sw.) M.Kato, rich wooded ravines; rare (01356).

Diplazium pycnocarpon (Spreng.) Broun, rich wooded ravines; scarce (01355).

†*Dryopteris celsa* (W.Palmer) Knowlt., Palmer, & Pollard, calcareous seeps and moist streambank; scarce (01367).

†*Onoclea sensibilis* L., streambank; very rare (00891).

Polystichum acrostichoides (Michx.) Schott. var. *acrostichoides*, woods and ravines; common (00444).

Woodsia obtusa (Spreng.) Torr. ssp. *obtusa*, limestone bluff; scarce (02673).

OPHIOGLOSSACEAE

Botrychium dissectum Spreng., rich alluvial terrace; rare (01504).

Botrychium virginianum (L.) Sw., woods and ravines; frequent (00729).

†*Ophioglossum vulgatum* L., rich alluvial terrace; rare (01838).

OSMUNDACEAE

Osmunda cinnamomea L., rich wooded ravine; very rare (00537).

Osmunda regalis L. var. *spectabilis* (Willd.) A.Gray, calcareous seep and rich wooded ravine; rare (02532).

POLYPODIACEAE

Pleopeltis polypodioides (L.) Andrews & Windham ssp. *michauxiana* (Weath.) Andrews & Windham, limestone bluffs and boulders; infrequent (00319).

PTERIDACEAE

Adiantum pedatum L., rich wooded ravines; frequent (00482).

Cheilanthes lanosa (Michx.) D.C. Eaton, dry limestone bluffs; rare (00742).

Pellaea atropurpurea (L.) Link, dry limestone bluffs; scarce (00892).

THELYPTERIDACEAE

Phegopteris hexagonoptera (Michx.) Fée, rich wooded ravines; frequent (00538).

†*Thelypteris noveboracensis* (L.) Nieuwl., rich wooded ravine; very rare (01352).

Thelypteris palustris Schott var. *pubescens* (Lawson) Fernald, calcareous seeps; very rare (01245).

PINOPHYTA

CUPRESSACEAE

Juniperus virginiana L., dry limestone bluff and margin of old field; scarce (00633).

PINACEAE

†*Pinus echinata* Mill., dry, thin upland woods; scarce (02677).

†***Pinus taeda* L., old field margin; very rare (01487).

†*Pinus virginiana* Mill., dry wooded slope; very rare (00441).

MAGNOLIOPHYTA

MAGNOLIOPSIDA

ACANTHACEAE

†*Ruellia caroliniensis* (J.F.Gmel.) Steud., old field and dry woods; occasional (00870).

ACERACEAE

Acer negundo L., rich wooded ravine; very rare (01159).

†*Acer rubrum* L. var. *trilobum* Torr. & A. Gray ex K.Koch, upland woods; frequent (00534).

Acer saccharum Marshall var. *saccharum*, rich wooded ravines; frequent (00013).

ANACARDIACEAE

Rhus aromatica Aiton, dry wooded bluff; rare (01241).

Rhus copallinum L. var. *latifolia* Engl., old field; common (00616).

†*Rhus glabra* L., woodland clearing; rare (00690).

†*Toxicodendron pubescens* Mill., dry woods; rare (00686).

†*Toxicodendron radicans* (L.) Kuntze, woods and old field; common (00737).

ANNONACEAE

Asimina triloba (L.) Dunal, rich woods and streambanks; frequent (01363).

APIACEAE

Angelica venenosa (Greenway) Fernald, old field; scarce (00634).

Chaerophyllum procumbens (L.) Crantz, rich wooded streambank; infrequent (05976).

Cryptotaenia canadensis (L.) DC., rich woods; frequent (01023).

**Daucus carota* L., old field; frequent (00724).

Ligusticum canadense (L.) Britton, rich woods; rare (02465).

†*Osmorhiza claytonii* (Michx.) C.B.Clarke, rich woods; frequent (00728).

Oxypolis rigidior (L.) Raf., calcareous seeps; common (01115).

Sanicula canadensis L. var. *canadensis*, woods; common (00754).

†*Sanicula smallii* E.P.Bicknell, dry upland woods; scarce (00620).

†*Sanicula trifoliata* E.P.Bicknell, rich wooded slope; very rare (00727).

Thaspium trifoliatum (L.) A.Gray var. *aureum* Britton, rich woods and streambanks; common (00526).

†*Thaspium trifoliatum* (L.) A.Gray var. *trifoliatum*, rich woods; rare (02215 VDB).

**Torilis arvensis* (Huds.) Link var. *arvensis*, disturbed site and old field; scarce (00709).

APOCYNACEAE

†*Apocynum cannabinum* L., dry upland woods; very rare (02551).

ARALIACEAE

†*Aralia racemosa* L., rich woods; very rare (00853).

†*Aralia spinosa* L., edge of old field and woods; rare (01543).

†***Panax quinquefolius*** L., rich woods; scarce (00739).

ARISTOLOCHIACEAE

†*Aristolochia serpentaria* L., rich woods; scarce (00736).

Asarum canadense L., rich woods; frequent (04291).

ASCLEPIADACEAE

†*Asclepias exaltata* L., rich wooded streambank; very rare (02605).

Asclepias quadrifolia Jacq., rocky wooded bank; rare (02155).

Asclepias tuberosa L. ssp. *interior* Woodson, old field; scarce (00759).

Asclepias variegata L., old field; scarce (02230).

Asclepias verticillata L., dry rocky wooded bluffs; very rare (02675).

ASTERACEAE

**Achillea millefolium* L., old field; frequent (00871, 02228).

†*Ageratina altissima* (L.) R.M.King & H.Rob. var. *altissima*, old field and woods; occasional (01232).

Ambrosia artemsiifolia L., old field and disturbed site; occasional (01212).

†*Ambrosia trifida* L. var. *trifida*, old field and disturbed site; scarce (01214).

Antennaria plantaginifolia (L.) Richardson, upland woods; frequent (01819).

†*Antennaria solitaria* Rydb., upland woods; infrequent (01841).

†*Arnoglossum atriplicifolium* (L.) H.Rob., rich woods; occasional (01231).

†*Arnoglossum muehlenbergii* (Schultz-Bip) H.Rob., rich woods; rare (02587).

†**Baccharis halimifolia* L., disturbed site; very rare (not collected).

†*Bidens aristosa* (Michx.) Britton, old field; infrequent (01215).

Bidens frondosa L., old field, disturbed site, and streambanks; occasional (01218).

**Carduus nutans* L., disturbed site; rare (00710).

†*Chrysopsis mariana* (L.) Elliott, dry upland woods; scarce (01221).

Cirsium discolor (Muhl. ex Willd.) Spreng., old field; occasional (01096).

†*Cirsium muticum* Michx., calcareous seeps and wet streambanks; infrequent (01236).

Conoclinium coelestinum (L.) DC., streambanks and old field; infrequent (01230).

Conyza canadensis (L.) Cronquist var. *canadensis*, old field and disturbed site; occasional (01106).

†*Coreopsis major* Walter, old field; frequent (00692).

Coreopsis tripteris L., old field; occasional (01079).

Eclipta prostrata (L.) L., disturbed site; very rare (01410).

Elephantopus carolinianus Raeusch., woods, roadsides, and trails; occasional (00880).

†*Elephantopus tomentosus* L., dry upland woods; infrequent (02536).

Erechtites hieraciifolia (L.) Raf. ex DC., old field, disturbed site, and dry burned-over woods; frequent (01210).

Erigeron annuus (L.) Pers., old field; infrequent (00723).

†*Erigeron philadelphicus* L. var. *philadelphicus*, disturbed site; infrequent (02014).

†*Erigeron pulchellus* Michx. var. *pulchellus*, rocky wooded streambanks; infrequent (01840).

Erigeron strigosus Muhl. ex Willd. var. *strigosus*, old field; occasional (00644).

†*Eupatorium capillifolium* (Lam.) Small, old field; infrequent (01402).

†*Eupatorium fistulosum* Barratt, streambanks; infrequent (01116).

†*Eupatorium hyssopifolium* L., old field; common (01175).

†*Eupatorium perfoliatum* L., old field; very rare (02961).

†*Eupatorium rotundifolium* L. var. *ovatum* (Bigelow) Torr., old field; common (00625).

†*Eupatorium serotinum* Michx., disturbed site; rare (01297).

Eupatorium sessilifolium L., old field; occasional (00875).

†*Eurybia hemispherica* (Alexander) Nesom, dry wooded slopes and old field; occasional (01293).

†*Eurybia macrophylla* (L.) Cass., rich wooded streambank; very rare (01122 VDB).

†*Gamochaeta purpurea* (L.) Cabrera, disturbed site; infrequent (01008).

†*Helianthus divaricatus* L., dry bluffs; very rare (02579).

Helianthus eggertii Small, old field and edge of oak-hickory forest; infrequent (00643).

†*Helianthus hirsutus* Raf., old field and margins; frequent (00863).

Helianthus microcephalus Torr. & A. Gray, woods and margins; infrequent (01217).

Heliopsis helianthoides (L.) Sweet, rich woods and ravines; occasional (00903).

Hieracium gronovii L., dry woods; occasional (02680).

†**Hypochaeris radicata* L., grassy bank; very rare (01396).

†*Ionactis linariifolius* (L.) Greene, dry wooded slopes; rare (01466).

Krigia biflora (Walter) Blake, upland woods; frequent (00541).

†*Krigia caespitosa* (Raf.) Chambers, disturbed site; rare (04516).

†*Krigia virginica* (L.) Willd., upland woods and disturbed site; rare (04508).

†*Lactuca canadensis* L., old field; infrequent (00886).

†*Lactuca floridana* (L.) Gaertn., woods and old field; infrequent (01125).

†**Lactuca serriola* L., disturbed site; rare (01084).

**Leucanthemum vulgare* Lam., old field and disturbed site; occasional (00721).

Packera anonyma (Wood) W.A.Weber & A.Löve, old field; common (00218).

†*Packera glabella* (Poir.) C.Jeffrey, streambanks, wet soil; rare (00440).

Packera obovata (Muhl. ex Willd.) W.A.Weber & A.Löve, upland woods and rocky banks; scarce (not collected).

Polymnia canadensis L., rich wooded ravines among boulders and on bluffs; common (02468).

†*Prenanthes altissima* L., rich woods and bluffs; occasional (01361).

†*Pseudognaphalium obtusifolium* (L.) Hilliard & Burtt., old field; frequent (01216).

Pyrrohopappus carolinianus (Walter) DC., old field; frequent (00867).

Rudbeckia fulgida Aiton var. *umbrosa* (Boynton & Beadle) Cronquist, calcareous seeps and streambanks; common (01123).

†*Rudbeckia hirta* L. var. *pulcherimma* Farw., old field; frequent (00574).

Rudbeckia triloba L. var. *triloba*, old field; rare (01108).

†*Sericocarpus linifolius* (L.) B.S.P., old field; rare (02545).

Silphium asteriscus L. var. *asteriscus*, slope in woods; infrequent (00682).

Silphium mohrii Small, old field and disturbed site; rare (01081).

†*Smallanthus uvedalius* (L.) Mack. ex Small, rich woods; infrequent (01281).

†*Solidago altissima* L., old field; frequent (01404).

Solidago arguta Aiton var. *caroliniana* A.Gray, old field and dry woods; occasional (01061).

Solidago caesia L., rich woods and bluffs; frequent (01167).

†*Solidago curtisii* Torr. & A. Gray, rich woods; infrequent (01362 VDB).

†*Solidago erecta* Pursh, dry upland woods; frequent (01511).

†*Solidago gigantea* Aiton, streambanks, mesic clearings, and old field; infrequent (01104).

Solidago hispida Muhl. ex Willd., dry upland woods and rocky banks; infrequent (01058).

Solidago juncea Aiton, old field; common (01102).

†*Solidago missouriensis* Nutt. var. *fasciculata* Holz., old field; infrequent (00866).

†*Solidago nemoralis* Aiton, old field; common (01401).

†*Solidago odora* Aiton, old field; occasional (01219).

Solidago patula Muhl. ex Willd., calcareous seeps and streambanks; frequent (01364).

†*Solidago rugosa* Mill. ssp. *aspera* (Aiton) Cronquist, woods and streambanks; occasional (01062).

Solidago ulmifolia Muhl. ex Willd., upland woods; common (01090).

**Sonchus asper* (L.) Hill, disturbed site; rare (02240).

Symphyotrichum cordifolium (L.) Nesom, rich woods; infrequent (01490).

†*Symphyotrichum dumosum* (L.) Nesom, old field and dry woods; frequent (01376).

Symphyotrichum lateriflorum (L.) A. & D. Löve, woods and streambanks; frequent (01372).

†***Symphyotrichum oolentangiense*** (Riddell) Nesom, dry woods; very rare (number unavailable VDB).

Symphyotrichum patens (Aiton) Nesom, old field; frequent (01398).

Symphyotrichum pilosum (Willd.) Nesom var. *pilosum*, old field and disturbed site; occasional (01380).

Symphyotrichum shortii (Lindl.) Nesom, woods; frequent (01369).

†*Symphyotrichum undulatum* (L.) Nesom, dry field; infrequent (02967 VDB).

†*Symphyotrichum urophyllum* (Lindl.) Nesom, rich woods and rocky banks; frequent (00638).

†**Taraxacum officinale* G.H.Weber ex Wiggers, disturbed site; scarce (02219).

Verbesina alternifolia (L.) Britton ex Kearney, rich wooded streambank; very rare (01168).

Verbesina virginica L., old field; rare (01242).

Vernonia gigantea (Walter) Trel., old field; occasional (01044).

BALSAMINACEAE

†*Impatiens capensis* Meerb., calcareous seeps and streambanks; common (01114).

BERBERIDACEAE

Podophyllum peltatum L., rich wooded stream terrace; scarce (00400).

BETULACEAE

Alnus serrulata (Aiton) Willd., streambanks and seeps; occasional (not collected).

Carpinus caroliniana Walter ssp. *virginiana* (Marsh.) Furlow, rich wooded ravines and streambanks; occasional (00481).

Corylus americana Walter, woods and streambanks; common (00489).

Ostrya virginiana (Mill.) K.Koch, rocky upland woods; occasional (01368).

BIGNONIACEAE

Bignonia capreolata L., woods; occasional (00005).

Campsis radicans (L.) Seem.ex Bureau, disturbed site; very rare (01551).

***Catalpa* cf. *speciosa* (Warder) Warder ex Engelm., disturbed site; very rare (05974).

BORAGINACEAE

†*Cynoglossum virginanum* L., upland woods; frequent (01270).

Myosotis macrosperma Engelm., woods; occasional (01887).

BRASSICACEAE

Arabis laevigata (Muhl. ex Willd.) Poir. var. *laevigata*, rich rocky woods, boulders, and bluffs; frequent (00814).

†*Barbarea vulgaris* Ait.f., disturbed site; rare (01977).

†*Cardamine angustata* O.E.Schulz., woods; frequent (00451).

Cardamine bulbosa (Schreb. ex Muhl.) B.S.P., seeps and streambanks; infrequent (01883).

Cardamine concatenata (Michx.) Sw., rich woods; infrequent (00327).

**Cardamine hirsuta* L., woods, bluffs, and disturbed site; frequent (00301).

†*Cardamine parviflora* L., dry rocks; rare (01010).

Cardamine pensylvanica Muhl. ex Willd., calcareous seeps; scarce (01999).

**Rorippa nasturtium-aquaticum* (L.) Hayek, streams; infrequent (00522).

BUXACEAE

Pachysandra procumbens Michx., rich wooded ravines and streambanks; common (not collected).

CALLITRICHACEAE

Callitriche heterophylla Pursh. ssp. *heterophylla*, swift, shallow stream; very rare (00480).

†*Callitriche terrestris* Raf., disturbed site; very rare (04511).

CAMPANULACEAE

†*Lobelia cardinalis* L., streambanks and seeps; infrequent (01112).

†*Lobelia inflata* L., upland woods and disturbed site; occasional (00902).

Lobelia puberula Michx., old field; frequent (01087).

Lobelia siphilitica L., streambanks and seeps; occasional (01165).

CAPRIFOLIACEAE

**Lonicera japonica* Thunb., old field and woods; common in old field, occasional elsewhere (00046).

Lonicera sempervirens L., dry, rocky wooded slopes; rare (00090).

†*Sambucus nigra* L. ssp. *canadensis* (L.) R.Bolli, moist openings and streambanks; infrequent (01580).

Symphoricarpos orbiculatus Moench, dry upland woods and edge of old field; infrequent (00978).

Triosteum angustifolium L., dry upland thicket; very rare (00889).

Viburnum rufidulum Raf., dry rocky wooded banks; infrequent (00676).

CARYOPHYLLACEAE

**Cerastium brachypetalum* Desp. ex Pers. ssp. *brachypetalum*, disturbed site; rare (02227 VDB).

†*Cerastium brachypodum* (Engelm. ex A. Gray) B.L.Rob., dry rock outcrops; rare (00815).

**Cerastium glomeratum* Thuill., disturbed site; rare (04510).

Cerastium nutans Raf., rocky woods; infrequent (00387).

†**Cerastium pumilum* W.Curtis, disturbed site; rare (01821 VDB).

†*Silene stellata* (L.) Ait.f., upland wooded ravines and streambanks; scarce (00843).

Silene virginica L., wooded banks and rocky slopes; frequent (01028).

**Stellaria media* (L.) Vill., disturbed site, gravel bars in streams, and moist creek banks; occasional (00396).

†*Stellaria pubera* Michx., rich ravines and streambanks; frequent (00071).

CELASTRACEAE

†*Euonymus americana* L., woods and streambanks; frequent (00525).

Euonymus atropurpurea Jacq., rich wooded stream terrace; very rare (not collected).

CHENOPODIACEAE

**Chenopodium album* L., disturbed site; rare (01379).

CISTACEAE

†*Lechea mucronata* Raf., old field; rare (01405).

†*Lechea tenuifolia* Michx., dry wooded slope; rare (01069).

CLUSIACEAE

†*Hypericum drummondii* (Grev. & Hook.) Torr. & A. Gray, old field; scarce (01579).

Hypericum frondosum Michx., dry bluffs; rare (02471).

†*Hypericum hypericoides* (L.) Crantz. ssp. *hypericoides*, dry upland woods; occasional (00857).

†*Hypericum hypericoides* (L.) Crantz ssp. *multicaule* (Michx. ex Willd.) Robson, dry upland oak-hickory forest; common (01512).

†*Hypericum mutilum* L., disturbed site; very rare (03495).

Hypericum punctatum Lam., old field and along edge of woods; frequent (00888).

CONVOLVULACEAE

†*Calystegia catesbeiana* Pursh, dry upland thicket; very rare (02154).

Ipomoea pandurata (L.) G.Mey., dry woods; scarce (00905).

CORNACEAE

Cornus alternifolia L.f., rich woods and streambanks; frequent (00075).

Cornus amomum Mill., streambanks and seeps; rare (00738).

Cornus drummondii C.A.Mey., upland woods; very rare (01170).

†*Cornus florida* L., woods; common (00105).

Nyssa sylvatica Marsh., upland woods; common (00544).

CRASSULACEAE

†*Sedum ternatum* Michx., Moist rocks by stream; very rare (01493).

CUCURBITACEAE

Sicyos angulatus L., Moist opening along streambank; very rare (02459).

CUSCUTACEAE

†*Cuscuta compacta* Juss. ex Choisy, streambanks and calcareous seeps; infrequent (01223).

†*Cuscuta gronovii* Willd. ex Schult. Calcareous seep; very rare (01235).

Cuscuta pentagona Engelm., at edge of woods and old field; very rare (01107).

EBENACEAE

Diospyros virginiana L., upland woods and thickets; very rare (00548).

ELAEAGNACEAE

†**Elaeagnus umbellata* Thunb., upland woods; very rare (00839).

ERICACEAE

†*Kalmia latifolia* L., dry upland slopes and rocky banks; frequent (00530).

Oxydendrum arboreum (L.) DC., dry woods and slopes; common (01489).

Rhododendron alabamense Rehder, dry to moist wooded banks and terraces; frequent (01164).

Rhododendron canescens (Michx.) Sweet, dry woods and banks; occasional (00684).

Rhododendron periclymenoides (Michx.) Shinners, upland woods; rare (01498).

†*Vaccinium arboreum* Marsh., dry woods and slopes; frequent (00488).

†*Vaccinium corymbosum* L., wooded bank; very rare (00508).

Vaccinium pallidum Aiton, dry woods; common (00540).

Vaccinium stamineum L., dry woods and rocky banks; occasional (00617).

EUPHORBIACEAE

†*Acalypha gracilens* A. Gray, dry woods and roadsides; scarce (02717).

Acalypha ostryifolia Riddell, disturbed site; very rare (01503).

Acalypha rhomboidea Raf., upland woods, rich woods, and streambanks; occasional (00859).

Chamaesyce nutans (Lag.) Small, old field and disturbed site; infrequent (01412).

†*Chamaesyce prostrata* (Aiton) Small, disturbed site; rare (01575).

Croton capitatus Michx., disturbed site; rare (01243).

Croton monanthogynus Michx., dry upland disturbed site; rare (01099).

Euphorbia corollata L., old field; frequent (00711).

FABACEAE

†**Albizia julibrissin* Durazz., upland woods; rare (01488).

Amphicarpaea bracteata (L.) Fernald, rich woods and streambanks; frequent (01154).

Apios americana Medik. Calcareous seep; rare (not collected).

†***Apios priceana*** B.L.Rob., rich streambank and rocky hillside; very rare (02679).

Cercis canadensis L., woods; occasional (00674).

†*Chamaecrista fasciculata* (Michx.) Greene, old field and disturbed site; occasional (00862).

†*Chamaecrista nictitans* (L.) Moench, old field; rare (04267).

Clitoria mariana L., old field; infrequent (00868).

†*Desmodium ciliare* (Muhl. ex Willd.) DC., old field; occasional (01097).

Desmodium glabellum (Michx.) DC., upland woods; infrequent (02945 VDB).

†*Desmodium glutinosum* (Muhl. ex Willd.) Wood, rich woods and streambanks; infrequent (00677).

Desmodium nudiflorum (L.) DC., upland woods; frequent (00852).

Desmodium paniculatum (L.) DC., upland woods, rich wooded streambank, old field, and disturbed site; infrequent (01394).

†*Desmodium pauciflorum* (Nutt.) DC., rich woods and streambanks; occasional (00846).

†*Desmodium perplexum* Schub., old field; frequent (01101).

†*Desmodium rotundifolium* DC., dry upland woods; infrequent (01109).

†*Desmodium viridiflorum* (L.) DC., old field; infrequent (01284 VDB).

Galactia volubilis (L.) Britton, old field; frequent (00865).

†**Kummerowia stipulacea* (Maxim.) Makino, disturbed site; rare (01213).

†**Kummerowia striata* (Thunb.) Schindl., old field and disturbed site; infrequent (01103).

†**Lathyrus hirsutus* L., disturbed site; rare (02167).

†**Lespedeza bicolor* Turcz., old field; frequent (00873).

†**Lespedeza cuneata* (Dum.-Cours.) G.Don, old field; frequent (01098).

Lespedeza frutescens (L.) Hornem., old field; occasional (01095).

†*Lespedeza hirta* (L.) Hornem., dry woods and edge of old field; infrequent (01171).

†*Lespedeza procumbens* Michx., old field and dry woods; frequent (01100).

†*Lespedeza repens* (L.) W.Bartram, old field and dry woods; infrequent (00752).

†*Lespedeza stuevei* Nutt., old field; rare (01285 VDB).

†*Lespedeza violacea* (L.) Pers., old field; scarce (01161).

†*Lespedeza virginica* (L.) Britton, old field; occasional (01383).

**Medicago lupulina* L., disturbed site; infrequent (00713).

†**Medicago sativa* L., disturbed site; very rare (03509).

**Melilotus alba* Medik., disturbed site and old field; infrequent (00703).

†*Mimosa microphylla* Dry., old field; rare (02538).

†*Orbexilum pedunculatum* (Mill.) Rydb., old field and dry woods; scarce (00977).

Robinia pseudoacacia L., upland woods and edges of old field; infrequent (01573).

Senna marilandica (L.) Link, disturbed site and streambanks; scarce (01211).

†*Tephrosia virginiana* (L.) Pers., old field and dry woods; infrequent (00630).

**Trifolium campestre* Schreb., old field and disturbed site; scarce (01979).

**Trifolium pratense* L., old field and disturbed site; scarce (01075).

†**Trifolium repens* L., disturbed site; scarce (02168).

†*Vicia caroliniana* Walter, rich ravines; occasional (00125).

**Vicia sativa* L. ssp. *nigra* Ehrh., disturbed site; scarce (02018).

**Vicia villosa* Roth ssp. *varia* (Host) Corb., disturbed site; scarce (02237).

FAGACEAE

†***Castanea dentata*** (Marsh.) Borkh., dry upland woods; rare (00491).

Fagus grandifolia Ehrh., rich ravines; occasional (01016).

Quercus alba L., woods; common (00628).

Quercus coccinea Muenchh., dry upland woods; occasional (00635).

†*Quercus falcata* Michx., upland woods; occasional (01510).

†*Quercus marilandica* Muenchh., dry ridges; infrequent (01163).

Quercus muehlenbergii Engelm., rich rocky wooded slopes and ravines; occasional (00731).

†*Quercus phellos* L., old field; rare (00631).

Quercus prinus L., dry upland slopes and ridges; common (01014).

†*Quercus rubra* L., rich woods and ravines; scarce (00740).

Quercus × *saulii* Schneid. [*alba* × *prinus*], upland woods; very rare (not collected).

Quercus stellata Wangenh., upland woods; frequent (00545).

Quercus velutina Lam., upland woods; frequent (01015).

FUMARIACEAE

Corydalis flavula (Raf.) DC., rich wooded stream terrace; rare (00335).

GENTIANACEAE

Frasera caroliniensis Walter, rich woods and stream terraces; infrequent (03732).

†*Gentiana villosa* L., dry upland woods; very rare (06054).

†*Obolaria virginica* L., upland woods and ravines; rare (03177).

Sabatia angularis (L.) Pursh, old field and disturbed site; rare (02682).

GERANIACEAE

Geranium carolinianum L. var. *carolinianum*, disturbed site; scarce (02217).

†*Geranium maculatum* L., rich woods and banks; occasional (00078).

HAMAMELIDACEAE

†*Hamamelis virginiana* L., woods and ravines; frequent (00513).

†*Liquidambar styraciflua* L., upland woods; infrequent (00841).

HYDRANGEACEAE

†*Hydrangea cinerea* Ser., rich bluffs and streambanks; common (00573).

Philadelphus hirsutus Nutt., rocky woods and bluffs; rare (00517).

HYDROPHYLLACEAE

Nemophila aphylla (L.) Brummitt, rich wooded streambank terrace; scarce (00344).

Phacelia bipinnatifida Michx., rich woods often among rocks and boulders; infrequent (01890).

JUGLANDACEAE

†*Carya alba* (L.) Nutt. ex Elliott, upland woods; common (00627).

Carya cordiformis (Wangenh.) K.Koch, rich woods and ravines; scarce (00900).

Carya glabra (Mill.) Sweet, upland woods; occasional (not collected).

Carya ovalis (Wangenh.) Sarg., upland woods; infrequent (00725).

†*Carya ovata* (Mill.) K.Koch, rich rocky slopes and ravines; infrequent (02674).

Juglans cinerea L., rich ravines; scarce (00898).

Juglans nigra L., rich ravines, rare (01540).

LAMIACEAE

†*Blephilia ciliata* (L.) Benth., rich woods and streambanks; infrequent (00911).

†*Collinsonia canadensis* L., rich woods and ravines; occasional (01353).

†*Cunila origanoides* (L.) Britton, dry upland woods and slopes; occasional (01209).

**Glechoma hederacea* L., disturbed site; scarce (00450).

†*Lycopus rubellus* Moench. In streams, wet banks, and calcareous seeps; frequent (01111).

Monarda bradburiana Beck, upland woods and rocky slopes; occasional (00523).

Monarda fistulosa L., old field and disturbed site; infrequent (00701).

†**Perilla frutescens* (L.) Britton, disturbed site; rare (01556).

**Prunella vulgaris* L., disturbed site and streambanks; occasional (00543).

Pycanthemum loomisii Nutt., old field; common (00872).

†*Pycanthemum tenuifolium* Schrad., old field; frequent (00632).

Salvia lyrata L., old field and woods; occasional (00609).

Salvia urticifolia L., upland woods; rare (04509).

†*Scutellaria elliptica* Muhl. ex Spreng. var. *hirsuta* (Short & Peter) Fernald, woods and streambanks; occasional (00572).

Teucrium canadense L., rich streambank; very rare (03503).

LAURACEAE

†*Lindera benzoin* (L.) Blume, rich woods; frequent (00487).

Sassafras albidum (Nutt.) Nees, upland woods and edges of old field; infrequent (00689).

LOGANIACEAE

Spigelia marilandica (L.) L., streambank; very rare (00890).

MAGNOLIACEAE

Liriodendron tulipifera L., rich woods; occasional (00840).

MALVACEAE

Sida spinosa L., disturbed site; rare (01576).

MENISPERMIACEAE

†*Menispermum canadense* L., rich wooded ravine; rare (02611).

MONOTROPACEAE

†*Monotropa uniflora* L., upland oak-hickory woods; very rare (02942).

MORACEAE

Morus rubra L., rich wooded ravines; scarce (00696).

OLEACEAE

Chionanthus virginicus L., rich streambanks; rare (00741).

Fraxinus americana L., woods and ravines; frequent (00730).

Fraxinus pennsylvanica Marsh., moist upland depression; very rare (00718).

**Ligustrum sinense* Lour., streambanks; scarce (00045).

ONAGRACEAE

†*Circaea lutetiana* L. ssp. *canadensis* (L.) Asch. & Magnus, rich woods and streambanks; occasional (00894).

†*Oenothera biennis* L., old field and disturbed site; scarce (01577).

†*Oenothera laciniata* Hill, disturbed site; very rare (02239).

ORBANCHACEAE

†*Conopholis americana* (L.) Wallr.f., woods beneath oak trees; occasional (00606).

OXALIDACEAE

†*Oxalis dillenii* Jacq., dry field; infrequent (01828).

Oxalis stricta L., dry rocky woods and disturbed site; occasional (00510).

Oxalis violacea L., dry rock outcrops; infrequent (00397).

PAPAVERACEAE

Sanguinaria canadensis L., rich woods; scarce (00449).

PASSIFLORACEAE

Passiflora incarnata L., old field and disturbed site; infrequent (00623).

Passiflora lutea L., rich woods and streambanks; infrequent (00732).

PHYTOLACCACEAE

Phytolacca americana L., disturbed soil; scarce (00858).

PLANTAGINACEAE

†**Plantago lanceolata* L., disturbed site; occasional (00720).

†*Plantago rugelii* Dcne., disturbed site; occasional (00712).

PLATANACEAE

Platanus occidentalis L., streambanks; infrequent (00253).

POLEMONIACEAE

Phlox amoena Sims, rocky woods; rare (00529).

Phlox amplifolia Britton, old field; very rare (00626 VDB).

Phlox divaricata L., rich woods and rocky banks; common (not collected).

Phlox glaberrima L., Calcareous seeps; very rare (01494).

†***Phlox pilosa*** **L. ssp.** ***ozarkana*** (Wherry) Wherry, old field; very rare (02233).

Polemonium reptans L., rich woods and streambanks; common (00117).

POLYGONACEAE

†**Polygonum caespitosum* Blume var. *longisetum* (Bruyn) Steward, disturbed site and gravel bars of streams; occasional (01152).

Polygonum pensylvanicum L., disturbed site; rare (01411).

†**Polygonum persicaria* L., disturbed site; scarce (00844).

†*Polygonum punctatum* Elliott, disturbed site; scarce (00640).

Polygonum scandens L., Edge of old field and woods; rare (01229).

†*Polygonum setaceum* Baldw., wet streambanks; infrequent (01153).

Polygonum virginianum L., rich woods and streambanks; occasional (01110).

†**Rumex acetosella* L., old field; scarce (00622).

†**Rumex crispus* L., disturbed site; rare (00546).

†**Rumex obtusifolius* L., wet streambank; very rare (00897).

PORTULACACEAE

Claytonia virginica L., rich woods; common (00077).

PRIMULACEAE

†*Lysimachia ciliata* L., wet streambanks; infrequent (01060).

Lysimachia cf. *hybrida* Michx., upland woods; frequent (00756).

Lysimachia quadrifolia L., upland woods and old field; rare (02165).

†*Samolus valerandi* L. ssp. *parviflorus* (Raf.) Hultén, wet streambank; very rare (00849).

PYROLACEAE

†*Chimaphila maculata* (L.) Pursh, upland woods; common (00027).

RANUNCULACEAE

Actaea pachypoda Elliott, rich woods; infrequent (01024).

†*Anemone quinquefolia* L., rich woods and streambanks; scarce (00076).

Anemone virginiana L., old field and upland woods; scarce (01070).

Aquilegia canadensis L., rich bluffs and slopes; occasional (00979).

Clematis versicolor Small ex Rydb., rich woods; very rare (01025).

†*Clematis virginiana* L., rich wooded ravines; rare (01357).

†*Hepatica nobilis* Schreb. var. *acuta* (Pursh) Steyermark, rich woods and slopes; common (00446).

†***Hydrastis canadensis*** L., rich wooded ravines; scarce (01354).

†**Ranunculus bulbosus* L., old field; very rare (00415 VDB).

Ranunculus hispidus Michx. var. *hispidus*, rocky woods and banks; occasional (00068).

Ranunculus micranthus Nutt., limestone bluffs; rare (01822).

†*Ranunculus recurvatus* Poir., streambanks; frequent (00519).

**Ranunculus sardous* Crantz, disturbed site and old field; infrequent (01584).

Thalictrum revolutum DC., rich wooded streambanks; infrequent (00878).

Thalictrum thalictroides (L.) Eames & Boivin, rich woods; frequent (00127).

RHAMNACEAE

Ceanothus americanus L., old field and edge of dry woods; infrequent (00566).

Frangula caroliniana (Walter) A. Gray, woods and edges of old field; scarce (01486).

ROSACEAE

†*Agrimonia parviflora* Aiton, wet streambank; rare (01057).

Agrimonia rostellata Wallr., woods and streambanks; frequent (00850).

†*Amelanchier arborea* (Michx.f.) Fernald, upland woods; frequent (00357).

Crataegus calpodendron (Ehrh.) Medik., rocky woods and slopes; infrequent (00518).

Crataegus cf. *flabellata* (Spach) Kirchn., old field; very rare (01030 VDB).

†*Crataegus pruinosa* (Wendl.f.) K.Koch, dry rocky slope forest; rare (02602 VDB).

†**Duchesnea indica* (Andr.) Focke, disturbed sites and gravel bars of streams; rare (05975).

Geum canadense Jacq., woods and bluffs; occasional (00094).

†*Malus angustifolia* (Aiton) Michx. var. *angustifolia*, dry rocky wooded slope; very rare (02957).

†*Porteranthus stipulatus* (Muhl. ex Willd.) Britton, dry woods; infrequent (00726).

Potentilla simplex Michx., dry woods and old field; frequent (00514).

Prunus mexicana S.Watson, dry woods and rocky slopes; rare (00528).

Prunus serotina Ehrh., upland woods and edges of old field; scarce (00058).

Rosa carolina L., edge of woods and old field; scarce (00570).

†**Rosa multiflora* Thunb. ex Murr., moist streambanks; infrequent (00520).

Rosa setigera Michx., limestone outcrops in woods; very rare (01124).

†*Rubus allegheniensis* Porter, upland woods; infrequent (00883).

†**Rubus bifrons* Vest ex Tratt., old field; common (00621).

†*Rubus invisus* (L.H.Bailey) Britton, upland woods; infrequent (02021).

Rubus occidentalis L., woods; infrequent (00042).

†*Rubus pensilvanicus* Poir., upland woods and disturbed site; infrequent (00637).

†*Waldsteinia fragarioides* (Michx.) Tratt., rich woods; rare (00073).

RUBIACEAE

Cephalanthus occidentalis L., streambank; very rare (00845).

Diodia teres Walter, old field; frequent (00882).

†*Galium aparine* L., rich woods; occasional (00509).

Galium circaezans Michx., rich woods; occasional (00483).

Galium pilosum Aiton, old field; occasional (00624).

Galium triflorum Michx., rich woods and moist bluffs; frequent (00641).

†*Houstonia caerulea* L., upland woods; frequent (00386).

Houstonia purpurea L. var. *purpurea*, woods and banks; frequent (00536).

†*Houstonia pusilla* Schoepf, grassy roadbed; very rare (00813).

Mitchella repens L., moist woods; infrequent (00303).

SALICACEAE

†*Populus deltoides* Bartram ex Marsh., gravel bar in stream; very rare (01233).

†*Salix caroliniana* Michx., calcareous seep; very rare (01496).

Salix humilis Marsh. var *humilis*, old field and thickets; infrequent (00060).

†*Salix nigra* Marsh., wet streambank; rare (01156).

SAPOTACEAE

Sideroxylon lycioides L., rocky banks; rare (00910).

SAXIFRAGACEAE

†*Heuchera americana* L. var. *americana*, rich woods; scarce (00533).

Heuchera villosa Michx. var. *macrorhiza* (Small) Rosend., Butters, & Lakela, limestone bluffs and boulders; frequent (00511).

Parnassia grandifolia DC., calcareous seep; rare (01495).

Saxifraga virginiensis Michx., limestone bluffs and boulders; frequent (00081).

†*Tiarella cordifolia* L., rich woods and banks; frequent (00070).

SCROPHULARIACEAE

†*Agalinis gattingeri* (Small) Small, dry rocky woods; rare (01375).

Aureolaria flava (L.) Farw., dry woods; rare (not collected).

†*Aureolaria pectinata* (Nutt.) Pennell, dry woods; rare (00899).

†*Chelone glabra* L., wet streambanks and calcareous seeps; infrequent (01360).

Mimulus alatus Aiton, wet streambanks; infrequent (01067).

†**Paulownia tomentosa* (Thunb.) Sieb. & Zucc. ex Steud., disturbed site; rare (01515).

Pedicularis canadensis L., rich streambanks; infrequent (00080).

†*Scrophularia marilandica* L., streambanks; rare (01467).

**Verbascum blattaria* L., disturbed site; rare (01344).

†**Verbascum thapsus* L., disturbed site; scarce (00876).

**Veronica arvensis* L., disturbed site; infrequent (02019).

†**Veronica serpyllifolia* L., rich mossy streambanks; rare (00562).

Veronicastrum virginicum (L.) Farw., old field and disturbed site; very rare (00887).

SIMAROUBACEAE

**Ailanthus altissima* (Mill.) Swingle, clearing in woods; very rare (00879).

SOLANACEAE

†**Datura stramonium* L., disturbed site; very rare (01409).

Physalis heterophylla Nees, old field and upland thicket; scarce (01574).

†*Physalis longifolia* Nutt. var. *subglabrata* (Mack. & Bush) Cronquist, old field; infrequent (00708).

†*Physalis pubescens* L. var. *integrifolia* (Dunal) Waterf., gravel bar in stream; scarce (04292).

Solanum carolinense L., old field and disturbed site; infrequent (00707).

Solanum ptychanthum Dunal, moist woods; scarce (01027).

STAPHYLEACEAE

Staphylea trifolia L., rich wooded ravines and streambanks; occasional (01359).

STYRACACEAE

Styrax grandifolius Aiton, upland woods and ravines; occasional (00479).

THYMELAEACEAE

Dirca palustris L., rich wooded stream bank; rare (00639).

TILIACEAE

Tilia americana L. var. *heterophylla* (Vent.) Loud., rich wooded streambank; very rare (01506).

ULMACEAE

Celtis laevigata Willd., disturbed site; rare (00716).

Celtis occidentalis L., rich wooded ravines and stream terraces; rare (01019).

Celtis tenuifolia Nutt., dry wooded, rocky slope; very rare (01149 VDB).

Ulmus alata Michx., upland woods; infrequent (00349).

Ulmus americana L., rich stream bank; rare (00082).

Ulmus rubra Muhl., rich woods; occasional (00389).

Ulmus serotina Sarg., limestone bluffs and rocky slopes; rare (01017).

URTICACEAE

Boehmeria cylindrica (L.) Sw., wet streambanks and seeps; occasional (00848).

Laportea canadensis (L.) Wedd., rich woods; infrequent (01022).

Parietaria pensylvanica Muhl. ex Willd., Bluffs and rock outcrops; infrequent (01880).

†*Pilea pumila* (L.) A.Gray, streambanks and seeps; frequent (01225).

VALERIANACEAE

†*Valeriana pauciflora* Michx., rich wooded stream terrace; rare (01878).

Valerianella radiata (L.) Dufr., disturbed site; scarce (01992).

VERBENACEAE

†*Phryma leptostachya* L., rich woods; occasional (00847).

Verbena simplex Lehm., old field, scarce (00688).

†*Verbena urticifolia* L., disturbed soil and gravel bars of streams; infrequent (00693).

VIOLACEAE

Hybanthus concolor (T.F.Forst) Spreng., rich woods; rare (01885).

Viola bicolor Pursh, disturbed site; rare (04507).

†*Viola cucullata* Aiton, wet streambanks and seeps; occasional (01832).

†*Viola hirsutula* Brainerd, dry upland woods; occasional (02541).

Viola sororia Willd., rich woods; infrequent (01826).

Vilola striata Aiton, rich streambanks and terraces; infrequent (01884).

Viola triloba Schwein., rich woods; infrequent (01843).

Viola tripartita Elliott var. *glaberrima* (DC.) R.M.Harper, upland woods and ravines; occasional (01877).

VITACEAE

Parthenocissus quinquefolia (L.) Planch., moist woods and bluffs; occasional (00507).

†*Vitis aestivalis* Michx., dry upland woods; occasional (00490).

†*Vitis cinerea* (Engelm.) Millard var. *baileyana* (Munson) Comeaux, rich woods; infrequent (00485).

†*Vitis rotundifolia* Michx., upland woods; common (01076).

Vitis vulpina L., moist upland thicket; rare (02540).

MAGNOLIOPHYTA, LILIOPSIDA

ARACEAE

Arisaema triphyllum (L.) Schott ssp. *triphyllum*, woods; frequent (00568).

COMMELINACEAE

**Commelina communis* L., streambanks and moist trails; infrequent (00901).

Commelina virginica L., streambanks; infrequent (01063).

Tradescantia subaspera Ker Gawl. var. *subaspera*, rich wooded ravine; rare (02588).

CYPERACEAE

†*Carex amphibola* Steud., rich wooded ravines; occasional (05979).

†*Carex cumberlandensis* Naczi, Kral, & Bryson, rich wooded ravines; frequent (02608).

Carex albicans Willd. ex Spreng var. *albicans*, woods; common (01846).

†*Carex albursina* E.Sheld., rich wooded ravines; occasional (02590).

†*Carex blanda* Dewey, wooded ravines and streambanks; frequent (s.n.).

Carex cephalophora Willd. ex Willd., woods; occasional (00755).

Carex digitalis Willd. var. *macropoda* Fernald, upland woods and dry ravines; occasional (05983).

Carex frankii Kunth, wet depression along road; rare (01689).

Carex granularis Muhl. ex Willd., Calcareous seep; very rare (02604).

†*Carex hirsutella* Mack., old field; frequent (01042).

†*Carex kraliana* Naczi & Bryson, rich wooded ravines, infrequent (05982).

†*Carex laevivaginata* (Kük.) Mack., streambank and gravel bar; rare (05981).

†*Carex laxiculmis* Schwein. var. *laxiculmis*, upland woods; rare (05980).

†*Carex lurida* Wahlenb., streambanks; infrequent (00442).

†*Carex pensylvanica* Lam., upland woods; rare (01834).

†*Carex picta* Steud., upland woods and dry ravines; common (00443).

†*Carex radiata* (Wahlenb.) Small, rich alluvial terraces and adjacent slopes; scarce (06056).

Carex rosea Schkuhr ex Willd., rich wooded ravines; infrequent (03500).

†*Carex torta* Boott ex Tuckerman, streambanks; scarce (01833).

Cyperus echinatus (L.) A.W.Wood, old field; occasional (01041).

Cyperus odoratus L., old field and waste places; scarce (01578).

Eleocharis obtusa (Willd.) Schult., moist streambank; very rare (03727).

†*Scirpus atrovirens* Willd., streambanks; rare (02460).

†*Scirpus polyphyllus* Vahl, streambanks; infrequent (01054).

Scleria oligantha Michx., upland woods; scarce (06053).

DIOSCOREACEAE

†*Dioscorea quaternata* J.F.Gmel., rich woods; frequent (00484).

IRIDACEAE

†*Iris cristata* Aiton, woods and streambanks; frequent (01829).

Sisyrinchium albidum Raf., dry limestone bluff; rare (01817).

Sisyrinchium angustifolium Mill., wooded ravine and streambanks; infrequent (00531).

JUNCACEAE

†*Juncus coriaceus* Mack., calcareous seeps and streambanks; frequent (00683).

Juncus tenuis Willd., old field, roads and paths; occasional (00714).

†*Luzula acuminata* Raf. var. *carolinae* (S.Watson) Fernald, upland woods; occasional (01985).

Luzula echinata (Small) F.J.Herm., upland woods; common (01830).

LILIACEAE

Allium canadense L. var. *canadense*, old field; occasional (00535).

†*Allium canadense* L. var. *mobilense* (Regel) Ownbey, old field; rare (02456).

†*Chamaelirium luteum* (L.) A. Gray, rich wooded ravine; rare (00673).

†*Hymenocallis caroliniana* (L.) Herbert, wooded ravines, stream terraces and streambanks; infrequent (00753).

†***Lilium michiganense*** Farw., wet streambank and wooded alluvial terrace; rare (00636).

Maianthemum racemosum (L.) Link. ssp. *racemosum*, rich woods; frequent (00681).

**Narcissus pseudonarcissus* L., Old field; rare (not collected).

Polygonatum biflorum (Walter) Elliott, wooded ravines and streambanks; frequent (02004).

Prosartes lanuginosa (Michx.) D.Don, rich woods; rare (02591).

Trillium stamineum Harbison, rich woods; infrequent (00390).

†*Uvularia grandiflora* Sm., rich woods; occasional (01026).

†*Uvularia sessilifolia* L., rich woods and streambanks; scarce (00675).

ORCHIDACEAE

Corallorrhiza wisteriana Conrad, rich wooded streambank; very rare (not collected).

†*Cypripedium parviflorum* Salisb. var. *pubescens* (Willd.) Knight, rich wooded ravine; very rare (00699).

†*Goodyera pubescens* (Willd.) R.Br. ex Ait.f., rich stream terrace; very rare (04293).

†*Liparis liliifolia* (L.) Rich. ex Ker Gawl., rich wooded slope and stream terrace; rare (not collected).

†*Platanthera clavellata* (Michx.) Luer, mossy, rocky streamside; very rare (02678).

†*Platanthera peramoena* (A. Gray) A. Gray, wooded alluvial terrace and streambank; rare (02533).

†*Spiranthes tuberosa* Raf., upland oak-hickory forest; rare (01150).

†*Tipularia discolor* (Pursh) Nutt., rich woods; infrequent (00895).

POACEAE

†*Agrostis perennans* (Walter) Tuckerman, upland woods; frequent (01169).

**Agrostis stolonifera* L., old field and disturbed site; infrequent (00704).

†*Andropogon gerardii* Vitman, old field at edge of oak-hickory forest; very rare (02962).

Andropogon virginicus L. var. *virginicus*, old field; common (01541).

†**Anthoxanthum odoratum* L., old field; infrequent (02162).

†**Arthraxon hispidus* (Thunb.) Makino, disturbed site; scarce (not collected).

†*Arundinaria gigantea* (Walter) Muhl., wooded streamside terrace; rare (01547).

**Avena sativa* L., disturbed site; very rare (02243).

Brachyelytrum erectum (Schreb. ex Spreng.) Beauv., rich woods; frequent (00691).

†**Bromus commutatus* Schrad., disturbed site, infrequent (00702).

**Bromus japonicus* Thunb. ex Murr., old field; infrequent (02166).

Bromus pubescens Muhl. ex Willd., rich woods and streambanks; infrequent (00577 VDB).

Chasmanthium latifolium (Michx.) Yates, woods and streambanks; occasional (01358).

†*Cinna arundinacea* L., rich woods and wet streambanks; infrequent (01546).

**Cynodon dactylon* (L.) Pers., disturbed site; rare (01408 VDB).

†**Dactylis glomerata* L., old field; infrequent (00706).

Danthonia spicata (L.) Beauv. ex Roemer. & Schult., oak-hickory forest; frequent (00749).

Dichanthelium acuminatum (Sw.) Gould & C.A.Clark var. *acuminatum*, old field; occasional (00618).

Dichanthelium boscii (Poir.) Gould & C.A.Clark, dry to mesic woods; occasional (00751).

†*Dichanthelium clandestinum* (L.) Gould, margin of woods and old field; infrequent (00698).

Dichanthelium commutatum (Schult.) Gould, dry to mesic woods and streambanks; common (00532).

†*Dichanthelium dichotomum* (L.) Gould. var. *dichotomum*, dry oak-hickory forest; common (00750).

†*Dichanthelium dichotomum* (L.) Gould. var. *ramulosum* (Torr.) R.J.LeBlond, moist streambanks; occasional (01059).

Dichanthelium laxiflorum (Lam.) Gould, dry woods; common (00629).

Dichanthelium malacophyllum (Nash) Gould, old field; rare (01039).

†*Dichanthelium scoparium* (Lam.) Gould, old field; rare (02234).

†*Dichanthelium sphaerocarpon* (Elliott) Gould var. *isophyllum* (Scribn.) Gould & C.A.Clark, old field and wooded streambanks; infrequent (02544).

†*Dichanthelium yadkinense* (Ashe) Mohlenbr., moist to wet streambanks and calcareous seeps; scarce (00685).

†*Digitaria ciliaris* (Retz.) Koeler, disturbed site; rare (01407).

**Digitaria ischaemum* (Schreb.) Schreb. ex Muhl., disturbed site; rare (02944).

**Echinochloa colona* (L.) Link, moist depressions along road; rare (02529).

†**Echinochloa crus-galli* (L.) Beauv., moist depressions along road; rare (01074).

†*Elymus hystrix* L., woods and streambanks; occasional (00679).

†*Elymus macgregorii* R.E.Brooks & J.J.N.Campbell, rich wooded streambank; scarce (not collected).

†*Elymus villosus* Muhl. ex Willd., dry woods and banks; occasional (00854).

Elymus virginicus L. var. *virginicus*, woods and edges of disturbed sites; occasional (00697).

†*Eragrostis spectabilis* (Pursh) Steud., old field; infrequent (01295).

Festuca subverticillata (Pers.) Alexeev, wooded streambanks and terraces; infrequent (02609).

Glyceria striata (Lam.) Hitchc., wet streambanks and calcareous seeps; occasional (00672).

†*Hordeum pusillum* Nutt., disturbed site; rare (02178).

Leersia virginica Willd., Moist streambanks and seeps; occasional (02960).

†*Lolium arundinaceum *(Schreb.) Darbysh., old field, road edges; common (00705).*

†**Lolium perenne* L. ssp. *multiflorum* (Lam.) Husn., old field and disturbed site; occasional (00547).

Melica mutica Walter, Limestone bluffs and rocky woods; occasional (00391).

†**Microstegium vimineum* (Trin.) A.Camus, moist alluvial terraces, calcareous seeps, and gravel bars in streams, frequent (00671).

†*Muhlenbergia schreberi* J.F.Gmel., disturbed site; scarce (01378).

Muhlenbergia sylvatica Torr. ex A. Gray, woods, streambanks, and calcareous seeps; frequent (02720).

†*Panicum anceps* Michx., old field; common (00881).

†*Panicum dichotomiflorum* Michx. var. *dichotomiflorum*, wet road ruts; rare (02939).

†**Paspalum dilatatum* Poir., old field and disturbed site; infrequent (04269).

Paspalum setaceum Michx., old field; infrequent (02964).

†**Phleum pratense* L., disturbed site; rare (03497).

**Poa annua* L., disturbed site; rare (01984 VDB).

†*Poa autumnalis* Muhl. ex Elliott, Moist woods, bluffs, and streambanks; frequent (00524).

†*Poa chapmaniana* Scribn., old field; rare (02220 VDB).

†**Poa compressa* L., disturbed site; rare (01978).

†**Poa pratensis* L., old field; occasional (04519).

Poa sylvestris A. Gray, moist woods, bluffs, and streambanks; occasional (00527).

†*Saccharum alopecuroidum* (L.) Nutt., old field; occasional (01399).

†*Saccharum giganteum* (Walter) Pers., old field, rare (01583).

Schizachyrium scoparium (Michx.) Nash var. *scoparium*, old field and in thin oak-hickory forests; occasional (01542).

†*Smilax tamnoides* L., rich woods; infrequent (00842).

ACKNOWLEDGMENTS

An Undergraduate Research Award from Middle Tennessee State University and an Undergraduate Research Assistantship from the Center of Excellence for Field Biology, Austin Peay State University, provided financial support for this project. We appreciate the helpful insight of E.W. Chester during the beginning phases of the project. Our sincere gratitude is extended to R. Kral for confirming our identification of several difficult specimens, and to R. Naczi for verification of *Carex radiata*. Chris Fleming kindly prepared the map of the study site. Two anonymous reviewers and Robert Kral reviewed the manuscript. Finally, we would like to thank E. Pahler, the landowner, for permission to conduct this study.

ABSTRACT

We evaluate the 36 endemic vascular plants of the Interior Highlands of Arkansas, Illinois, Kansas, Missouri, and Oklahoma. Most of the endemic flora of the region are herbaceous perennials, although nearly a quarter of the endemic plant taxa are annuals. An analysis of the community affiliations of the region's endemic flora reveals that most endemic taxa are associated with glade habitats maintained by edaphic conditions and fire. Riparian habitats and fire-maintained pine-oak woodlands are other habitat associations with significant endemic flora. The Ouachita Mountains region of the Interior Highlands contains a disproportionate representation of the endemic taxa relative to its area, although there is also a smaller cohort of endemics restricted to the Ozark portion of the Interior Highlands.

Key words: Interior Highlands, endemic flora, biogeography, biodiversity, Ozarks, Ouachitas, Arkansas, Illinois, Kansas, Missouri, Oklahoma

RESUMEN

Hemos evaluado las 36 plantas vasculares endémicas de las Interior Highlands de Arkansas, Illinois, Kansas, Missouri, y Oklahoma. La mayor parte de la flora endémica de la región son herbáceas perennes, aunque casi la cuarta parte de las plantas endémicas son taxa anuales. Un análisis de las preferencias de las comunidades de la flora endémica de la región revela que la mayoría de los taxa endémicos están asociados con hábitats pantanosos que se mantienen por las condiciones edáficas y el fuego. Los hábitats riparios y bosques de pino-roble mantenidos por el fuego son los otros hábitats con elementos de flora endémica significativos. La región de las Montañas de Ouachita del Interior Highlands contiene una representación desproporcionada de taxa endémicos de esta área, aunque hay también una pequeña cohorte de endemismos restringidos a la parte de Ozark de las Interior Highlands.

INTRODUCTION

Lists of endemic taxa are valuable tools for defining the uniqueness and conservation significance of biogeographic regions (Takhtajan 1986) and in establishing biodiversity "hotspots" for conservation priorities (Diamond et al. 1997; Ricketts et al. 1999; Myers et al. 2000; Stein et al. 2000; Estill & Cruzan 2001). Few biogeographic regions, however, have detailed endemic vascular plant lists.

SIDA 21(3): 1781–1791. 2005

For example, only recently have endemic plant lists been developed for the Atlantic and Gulf Coastal Plain and the West Gulf Coastal Plain (Sorrie & Weakley 2001; MacRoberts et al. 2002).

The Interior Highlands physiographic region has been relatively well-described physically and biotically (Fenneman 1938; Foti 1974; Nelson 1985; Thom & Wilson 1980; Bryant et al. 1993; Nigh and Schroeder 2002; Skeen et al. 1993; Foti & Bukenhofer 1998; Delcourt & Delcourt 2000). The region has an extensive botanical literature, including floras and atlases (Steyermark 1963; Peck & Peck 1988; Smith 1988, 1994; Taylor & Taylor 1989; Peck et al. 2001; Yatskievych 1999), but it has no comprehensive list of endemic vascular plants, and most botanical information is compartmentalized by state.

As shown in Figure 1, the Interior Highlands are comprised of the Ozarks, Ouachitas, and Arkansas Valley sections, and include significant portions of Arkansas, Missouri, and Oklahoma, along with minor areas of Illinois and Kansas. This region has long been recognized as a geologically, physiographically, ecologically, and culturally distinct region of North America, and constitutes the only highlands in midcontinental North America. The Ouachita Mountains are east-west trending fold-belt ranges of intensely deformed sandstone, shale, and chert (Miser 1929). The northern ranges are long hogback ridges of sandstone separated by broad valleys. The southern ranges are sharp ridges of novaculite separated by narrow, stony valleys (Croneis 1930). The Arkansas Valley is a broad alluvial plain with isolated mountains that generally separates the Ouachita Mountains from the Ozark Plateau. Structurally, the Ozark Plateau is a dome that has been slowly uplifted and eroded, resulting in high levels of topographic, geologic, edaphic, and hydrologic diversity. Bedrock geology includes exposures of Precambrian igneous rocks surrounded by alternating zones of Paleozoic sandstone and carbonate sedimentary rocks (Nigh and Schroeder 2002). Both the Ouachita and Ozark portions of the highlands are characterized by rugged, dissected uplands with abundant exposed rocks and highly variable soil depths.

This paper enumerates the endemic vascular plants of the Interior Highlands, along with information about each species, its plant community affiliations and the ecological processes that maintain these species. These data can be used to focus activities on the habitats, ecological systems, and ecological process regimes in greatest need of conservation action. Glade is used here to mean, open herbaceous-dominated habitats with sparse tree and shrub cover, shallow soils, and abundant exposed rock.

METHODS

For this study, a taxon is considered to be endemic if its range essentially does not extend outside the Interior Highlands. Hybrid taxa are excluded from this list. Nomenclature generally follows Kartesz (1999).

We searched all available sources of information, including extensive consultation with knowledgeable experts, to determine global ranges of species in the vascular flora of Arkansas, Illinois, Kansas, Missouri, and Oklahoma. This included general references such as Kartesz (1999), Kral (1983), Mohlenbrock (2002), Robison and Allen (1995), Smith (1988), Steyermark (1963), Taylor and Taylor (1989), Yatskievych (1999), Flora of North America Editorial Committee (1993–), and more specific papers (e.g. Tucker 1974; Weckman 2002). Also included were various lists of species of concern kept by the Arkansas, Illinois, Kansas, Missouri, and Oklahoma Natural Heritage programs and the Ozark, Ouachita, Mark Twain, and Shawnee National Forests[1].

Once the preliminary list was compiled, we investigated many of the same sources and additional ecological references to determine the plant community affiliation(s) of each species throughout the Interior Highlands. This determination involved developing a general plant community list for the Interior Highlands and assigning each taxon to the most appropriate plant community. We used The Nature Conservancy's classification at the ecological system level (Comner et al. 2003), making ecological system conceptually analogous to plant community as applied here. Some taxa were characteristically affiliated with two or more ecological systems. Ecological systems of the Interior Highlands are listed in Table 2.

RESULTS

Included below (Table 1) is an annotated list of the 36 vascular taxa endemic to the Interior Highlands, arranged alphabetically by family and genus. For each taxon, one or more characteristic plant community types are indicated in brackets after the plant name, using the numbers designated for each community in Table 2. For each species in this list, we also indicate the family, physiognomic profile, distribution pattern within the Interior Highlands – Ozarks (Oz), Ouachitas (Ou), or both – and additional relevant information and comments where applicable. The Arkansas Valley is included in the Ouachita section.

DISCUSSION

We identified a total of 36 endemic vascular taxa within the Interior Highlands; there are no endemic families or genera. There are 24 endemic species, and 12

---

[1] In addition to the taxa treated in this paper, six species of *Crataegus* (Rosaceae), *C. carollensis* Sarg., *C. harveyana*Sarg., *C. lanuginosa* Sarg. *C. latebrosa* Sarg., *C. nuda* Sarg., and *C. thermopegaea* Palmer, are recognized by Kartesz (1999) as being endemic to the region and other potentially endemic hawthorns have been proposed (e.g. *C. ouachitensis* Palmer) but Smith (1994) does not recognize them. Even though endemism is high in *Crataegus*, we have left this complex and incompletely understood genus off the list. There are reports of *Hamamelis vernalis* Sarg. (Hammamelidaceae) from southeastern Texas by Correll and Johnston (1970), Vines (1977), Nixon (1985), Jones et. al., (1997), and Turner et al. (2003), although Flora of North America (1997) states that this species is endemic to the Interior Highlands. Consequently, we have omitted *Hamamelis vernalis* from this treatment. A revision of the genus *Talinum* (Portulacaceae) currently underway may result in the addition of two endemic species to the Interior Highlands flora.

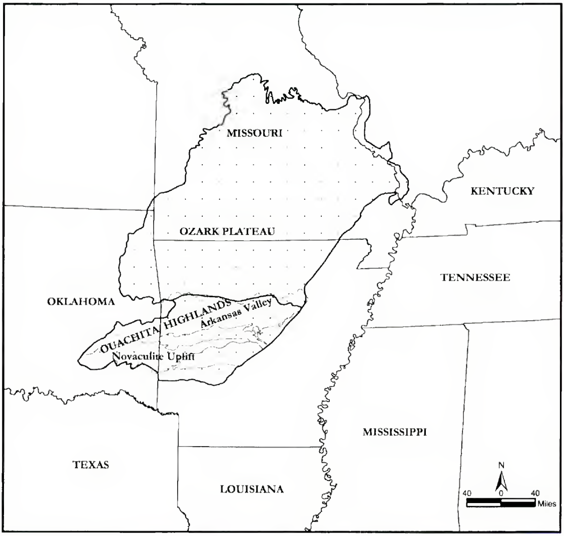

Fig. 1. Map of the Interior Highlands Physiographic Region.

endemic subspecies or varieties of more widely distributed species. Most of the endemic plant taxa in the Interior Highlands are on the Arkansas, Illinois, Kansas, Missouri, and/or Oklahoma Natural Heritage programs "species of concern" lists.

Most (58%) of the endemic vascular plants of the Interior highlands are perennial forbs; this parallels the physiognomy of the overall vascular flora of the region, as well as the ecoregions of midcontinental North America. Only three endemic taxa (8%) are woody, and there is a single endemic fern. Although only nine endemic taxa (25%) are annuals, this is a higher proportion of annuals than in the total native vascular flora of the region, and is likely reflective of the harsh conditions that characterize glade environments, which harbor a disproportionate component of annual species as compared to other habitats in the region.

TABLE 1. Endemic vascular flora of the Interior highlands with community associations in brackets (see Table 2), **Ou** = Ouachita Mountains, **Oz** = Ozark Plateau, **both** = both sections.

APOCYNACEAE

Amsonia hubrichtii Woods. [12] **both;** perennial forb

ASTERACEAE

Echinacea paradoxa var. *paradoxa* (J.B.S. Norton) Britt. [7] **Oz;** perennial forb

Liatris squarrosa (L.) Michx. var. *compacta* Torr. & A. Gray [8] **Ou;** perennial forb; center of distribution in the Novaculite Uplift subsection of the Ouachita Mountains.

Polymnia cossatotensis A.B. Pittman & V. Bates [14] **Ou;** annual forb; known only from the Novaculite Uplift subsection of the Ouachita Mountains.

Solidago ouachitensis C. & J. Taylor [6] **Ou;** perennial forb; center of distribution in the Novaculite Uplift subsection of the Ouachita Mountains.

Vernonia lettermanni Engelm. ex A. Gray [12] **Ou;** perennial forb

BRASSICACEAE

Cardamine angustata O.E. Schulz var. *ouachitana* E.B. Smith [4,5] **Ou;** perennial forb; known only from the Novaculite Uplift subsection of the Ouachita Mountains.

Lesquerella filiformis Rollins [7] **Oz;** winter annual forb; restricted to limestone glades, almost totally within the Springfield Plain subsection of the Ozarks.

Streptanthus maculatus Nutt. ssp. *obtusifolius* (Hook.) Rollins [8] **Ou;** annual forb

Streptanthus squamiformis Goodman [6] **Ou;** annual forb; known only from the Novaculite Uplift subsection of the Ouachita Mountains.

CAPRIFOLIACEAE

Viburnum ozarkense Ashe [5,12,14] **both;** shrub

COMMELINACEAE

Tradescantia longipes E.S. Anderson & Woods. [4,6] **both;** perennial forb; although known from both the Ouachitas and Ozarks, this species is especially characteristic in acidic woodlands on dissected uplands in the Current River drainage, and relatively rare elsewhere in the Interior Highlands.

Tradescantia ozarkana E.S. Anderson & Woods. [4,5,14] **both;** perennial forb

CYPERACEAE

Carex latebracteata Waterfall [5,6,12] **Ou;** perennial sedge

FABACEAE

Amorpha ouachitensis Wilbur [12] **both;** shrub

FAGACEAE

Quercus acerifolia (Palmer) Hess & Stoynoff [1,13] **Ou;** tree; although long thought to be closely related to, or even conspecific with *Q. shumardii*, recent research indicates that this taxon is more closely affiliated with *Q. arkansana* (Williams 2003). The global population is less than 600 individuals.

HYDROPHYLLACEAE

Hydrophyllum brownei Kral & Bates [12] **Ou;** perennial forb; center of distribution in the Novaculite Uplift subsection of the Ouachita Mountains.

LAMIACEAE

Monarda fistulosa ssp. *fistulosa* L. var. *stipitatoglandulosa*, comb. nov. ined. [6,8] **both;** perennial forb; this taxon has apparently not been validly published at the varietal level, although Waterfall (1970) first described it at the species level, which was conceptually endorsed by Smith (1988).

Scutellaria bushii Britt. [7] **Oz;** perennial forb; restricted to dolomite glades, with the majority of the world's population in the drainages of the Current, Eleven Point, and White rivers.

LILIACEAE

Nemastylis nuttallii Pickering [7] **Oz;** perennial forb

POACEAE

Elymus glaucus Buckley ssp. *mackenzii* (Bush) J.J.N. Campbell [7,8] **both;** perennial forb

PTERIDACEAE

Pellaea glabella Mett. ex Kuhn ssp. *missouriensis* (Gastony) Windham [14] **Oz;** fern; this is the di-ploid, sexual variety of a wide-ranging species. Except for the spores, it is morphologically indistinguishable from the apomictic ssp. *glabella* (Wagner et al. 1965).

TABLE 1. continued

RANUNCULACEAE

Delphinium newtonianum D.M. Moore [4,5] **both;** perennial forb

Delphinium treleasei Bush ex K.C. Davis [7] **Oz;** perennial forb

RUBIACEAE

Galium arkansanum A. Gray var. *arkansanum* [6,8] **both;** perennial forb

Galium arkansanum A. Gray var. *pubiflorum* E.B. Smith [6,8] **Ou;** perennial forb; morphologically, this taxon appears closely related to the parent variety and needs further genetic evaluation. Known only from the Novaculite Uplift subsection of the Ouachita Mountains.

Houstonia ouachitana (E.B. Smith) Terrell [6, 8] **Ou;** perennial forb; center of distribution in the Novaculite Uplift subsection of the Ouachita Mountains.

SAXIFRAGACEAE

Heuchera villosa Michx. var. *arkansana* (Rydberg) E.B. Smith [12,14] **both;** perennial forb

Saxifraga palmeri Bush [12] **both;** perennial forb

Saxifraga virginiensis Michx. var. *subintegra* Goodman [1,13] **both;** perennial forb

SCROPHULARIACEAE

Agalinis nuttallii Shinners [17] **Ou;** annual forb

Penstemon cobaea Nutt. var. *purpureus* Pennell [7] **Oz;** perennial forb; although the typical variety is a wide ranging species of the prairie biome, this variety is restricted to glades on carbonate bedrock in the Interior Highlands.

VALERIANACEAE

Valerianella longiflora (Torr. & A. Gray) Walp. [1] **both;** annual forb

Valerianella nuttallii (Torr. & A. Gray) Walp. [1,8] **both;** annual forb

Valerianella ozarkana Dyal [7] **both;** annual forb

Valerianella palmeri Dyal [1,12] **Ou;** annual forb; center of distribution in the Novaculite Uplift subsection of the Ouachita Mountains.

The Ouachita Mountains comprise 25% of the total area of the Interior Highlands, but support 81% of the endemic taxa of the Interior Highlands. Fourteen taxa, representing 39% of the region's endemic plants, are found only in the Ouachita Mountains. Fifteen taxa (42%) are found in both the Ouachita and Ozark regions, while seven taxa (19%) are restricted to the Ozark Plateau. Also significant is that 25% of the endemic Interior Highlands flora is associated with the Novaculite Uplift subsection of the Ouachitas. This geologic substrate with its glades, woodlands, and stream complexes is an ecological hotspot for endemism within the Interior Highlands.

More than half (58%) of the endemic species in the Interior Highlands are associated with glade habitats (acidic, calcareous, novaculite). As defined by Nelson and Ladd (1982), glades are open habitats with strong lithologic control that are dominated by a characteristic herbaceous vegetation, with sparse tree and shrub cover, shallow soils, and often with abundant exposed rock. These exposed xeric or hydro-xeric habitats have extreme environmental parameters including long, usually annual drought periods in the growing season, limited water retention in the shallow soils, and intense solar heating. Many glades are also saturated through much of the dormant season, with frequent freeze-thaw cycles and associated soil upheavals. Drought and fire maintain most glades in a nearly treeless state.

The life histories of the endemic plants associated with glades show diverse

TABLE 2. Characteristic plant community affiliations of 36 endemic Interior Highland vascular plants. Numbers in the percent column refer to the percent of Interior Highlands endemic taxa occurring in this habitat type. All habitat types listed.

Community Complex	**Number**	**Percent**
1. Central Interior Highlands Dry Acidic Glade and Barrens	5	14
2. Ouachita Montane Oak Forest	0	0
3. Ozark-Ouachita Dry Oak Woodland	0	0
4. Ozark-Ouachita Dry-Mesic Oak Forest	4	11
5. Ozark-Ouachita Mesic Hardwood Forest	5	14
6. Ozark-Ouachita Shortleaf Pine-Oak Woodland	8	22
7. Central Interior Highlands Calcareous Glade and Barrens	8	22
8. Ouachita Novaculite Glade and Woodland	8	22
9. Arkansas Valley Prairie and Woodlands	0	0
10. Central Interior Highlands and Appalachian Sinkhole and Depression Pond	0	0
11. Ouachita Forested Seep	0	0
12. Ozark-Ouachita Riparian	9	25
13. Central Interior Acidic Cliffs and Talus	2	6
14. Central Interior Calcareous Cliffs and Talus	5	14
15. Ozark-Ouachita Fen	0	0
16. North-Central Maple-Basswood Forest	0	0
17. South-Central Interior Large Floodplain	1	3
18. Southeastern Great Plains Tallgrass Prairie	0	0

evolutionary traits that allow for survival in these habitats, but which presumably confer no competitive advantages in surrounding wooded habitat. For example, *Echinacea paradoxa* var. *paradoxa* and *Liatris squarrosa* var. *compacta* are shade-intolerant, long-lived perennials with either deep roots or water-holding subterranean tissues and grow in open habitats. The *Valerianella* species are vernal annuals that quickly complete their life cycles in the spring when conditions are relatively cool and wet; they are usually associated with those areas of the glade habitat that remain seasonally saturated due to water seepage. Species distributions may also be controlled by an affinity to particular substrates with specific lithological characteristic and mineral availability. For example, *Scutellaria bushii* is found only on dolomite; these glades are characterized by high levels of soluble cations such as magnesium and calcium.

Twenty-eight percent of the endemic flora occur in riparian habitats. Three (*Amsonia hubrichtii*, *Vernonia lettermannii*, *Valerianella palmeri*) of the ten endemic species found in riparian areas are associated with glade-like habitat structures, i.e. rocky, open habitats along ephemeral or intermittent streams. These habitats are xero-hydric, and maintained by flashy stream flows and soil conditions that make them seasonally xeric and nearly treeless.

We found that 22% of the endemic species are characteristically associated with dry pine-oak and oak woodlands. These plant communities are relatively open, with sparse to moderate tree cover, a diverse and well-developed herbaceous understory with a prominent graminiod component, and a relatively frequent fire regime. The endemic species associated with woodland habitats appear to be intolerant of both extreme exposure and deep shade. *Solidago ouachitensis*, for example, appears to require filtered sunlight but is not found in closed canopy forests or the more exposed glade habitats. Woodland plant communities are maintained in an open condition by fire and intermittent drought but have prevailing environmental conditions relatively less extreme and dynamic than the exposed glades.

Across the Interior Highlands region glades, open woodlands, and intermittent streams form landscape complexes that are closely associated on the landscape. These plant community complexes are maintained in an open or treeless condition by drought, fire, and flood. More than 80% of the endemic flora of the Interior Highlands occur in these landscape complexes.

The list of endemics presented in this paper will change as new information becomes available on plant community associations and species distributions, and as new taxa are discovered and others relegated to synonymy. However, it is now possible to compare the Interior Highlands region with adjacent regions that are physiographically different. For example, the 36 endemic vascular taxa of the Interior Highlands represent perhaps 2% of the native flora, but exhibit no patterns of endemism at or above the genus level. In fact, the Interior Highlands for all of its physiographic uniqueness, including age, long-term isolation from its moiety—the Appalachian Region—and its reputation as a "well-known refugium" (Meyer 1997) shows surprisingly little floristic uniquity from surrounding regions. By comparison, the West Gulf Coastal Plain with virtually no relief and no antiquity, has about 100 endemic taxa (about three percent of its flora) of which three are above the species level (MacRoberts et al. 2002). It is not known whether this same pattern and level of endemism occurs among other organismal groups, but there are suggestions that endemism rates may be higher than among the vascular flora. For example, there are 24 endemic crayfish taxa in the Ozarks (The Nature Conservancy 2003); this represents more than seven percent of North American Crayfish diversity. Preliminary data (Harris & Ladd 2003) indicate that the Ozark region is characterized by an unusually high level of undescribed lichen taxa, including at least two new genera, but current data gaps preclude determining levels of endemism.

ABSTRACT

We studied the presettlement woody vegetation of the Red River floodplain and adjacent upland in Caddo Parish, Louisiana, by analyzing the 1830s Government Land Office surveyors' records. We looked for evidence of monospecific pine savanna/forest in the uplands as historical accounts relate and compared the woody vegetation of the floodplain with that of the upland. We found that the upland was a mixed hardwood-pine forest with some areas almost exclusively hardwood, that there were no areas that were monospecific pine forest, and that the upland and floodplain are floristically different. Oak was rare on the floodplain but occurred near prairies lying within the floodplain.

Key Words: Red River, Louisiana, Caddo Parish, floristics, Government Land Office, land plat

RESUMEN

Hemos estudiado la vegetación leñosa previa a la colonización de la llanura de inundación del Red River y las tierras adyacentes en Caddo Parish, Louisiana, analizando los registros de los supervisores del Government Land Office en los años1830. Hemos buscado pruebas de los bosque/sabana monoespecíficos de pinos en las tierras altas tal como lo relatan las crónicas históricas y se compara la vegetación leñosa de la llanura de inundación con la de las tierras altas. Hemos encontrado que en las tierras altas había un bosque mixto de pino y árboles de madera dura con algunas áreas que casi tienen exclusivamente árboles de madera dura, que allí no había áreas en las que hubiese bosques monoespecíficos de pinos, y que las tierras altas y las llanuras de inundación son florísticamente diferentes. Los robles son raros en la llanura de inundación pero se dan el las praderas próximas a estas llanuras.

INTRODUCTION

The prerequisite to ecological management, conservation, and restoration is knowing what existed in the past (Egan & Howell 2001). There are two main methods of discovering this. The first, and most desirable, is to have some of the original functioning ecosystem left to study. If none of the original remains, or if it is uncertain if any remains, the next recourse is historical records.

Unfortunately, little, if any, of northwestern Louisiana remains in a natural

SIDA 21(3): 1793–1806. 2005

condition, certainly not large landscapes. Thus, we turned to historical materials to understand the reference conditions of the region. These included accounts of travelers, naturalists, and others, and Government Land Office land surveys. Unfortunately, travelers' accounts are brief and focused. Naturalists did better, but again, the accounts are limited and incomplete (e.g., Freeman and Custis Red River expedition [Flores 1984]). Foresters and others interested in exploitable resources also gave descriptions, but these are often so concerned with a single resource that the overall picture is missing (e.g., Mattoon 1915).

Consequently, we focused on 1830s Government Land Office surveyors' records. Our objectives were to determine, in so far as these sources would allow, 1) whether the upland was pine savanna/forest or mixed hardwood-pine forest, and 2) if and in what ways the floodplain and upland differed in woody vegetation.

RED RIVER FLOODPLAIN AND UPLAND: CADDO PARISH

The Red River originates in the Great Plains of eastern New Mexico and the panhandle of Texas and flows east and southeast until it reaches the Mississippi River in central Louisiana (Fig. 1). Red and brownish-red silt and clay particles, eroded from mainly Paleozoic rock, give the river its distinctive color. It is a sluggish river with a low-lying, flat, extensive Pleistocene/Holocene alluvial floodplain valley five to thirty km wide, with oxbows, sloughs, and backwater swamps. As the glaciers receded and the sea levels rose, the gradient of the river lessened, making it braid and meander widely with resultant deposition of alluvium that we see today (Newkirk & Mueller 1980).

Native American hunters entered the Red River area about 12,000 years ago at the end of the last glaciation, long before the present climate and biota were established. Settled agriculturists along the river probably do not exceed 3000 BP. Their effect on the ecology is not known, but it was probably comparatively minor (Neuman 1984; Ames 1999). The Red River was first seen by European explorers in the sixteenth century. Its lower portion was colonized by the French in the eighteenth century, but because of the Great Raft—hundreds of log jams measuring from a hundred meters to a kilometer in length, damming the river and causing overflow resulting in extensive flooding including the creation of numerous raft lakes adjacent and upstream from the rafts—its upper portions were not explored until the nineteenth century when, in 1806, the Freeman and Custis expedition went through and around the Raft to near the present day border of Oklahoma and Arkansas (Flores 1984). Marcy and McClellan (1854) completed exploring the river in the mid-nineteenth century. The Raft was cleared in two stages between 1833 and 1873, with the result that the extensive raft lakes drained, the river lowered and became navigable, allowing rapid exploitation of the floodplain with the establishment of farms, plantations, towns, and cities (see Talfor 1873; Triska 1984; Bagur 2001 for full description of the rafts and raft lakes).

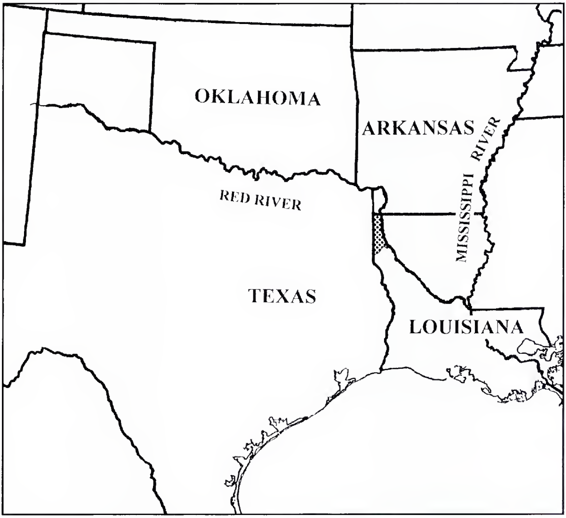

Fig. 1. Course of Red River and location of Caddo Parish, Louisiana (stippled area).

The topography of Caddo Parish is relatively simple. The Red River alluvium or floodplain covers about 28% of the 2,283 sq. km parish (Fig. 2). It forms a continuous north-south border along the eastern edge of the parish. The floodplain can be very narrow as when the river approaches a bluff, but it is generally several km wide. At the edge of the river are natural levees and swales. Farther inland, the topography rises in a slight terrace. Nonetheless, the landscape is relatively flat. Floodplain elevations range from approximately 60 m at the northern edge of the parish to about 43 m at the southern edge. The overall north-south slope is about 0.28 m per km. Sediments are almost entirely of Red River alluvial origin (Edwards et al. 1980).

Flanking the floodplain at its western edge is the upland. This often involves an abrupt elevation transition generally in the range of 20 to 40 m. The upland is geologically older than the alluvium, generally consisting of Tertiary

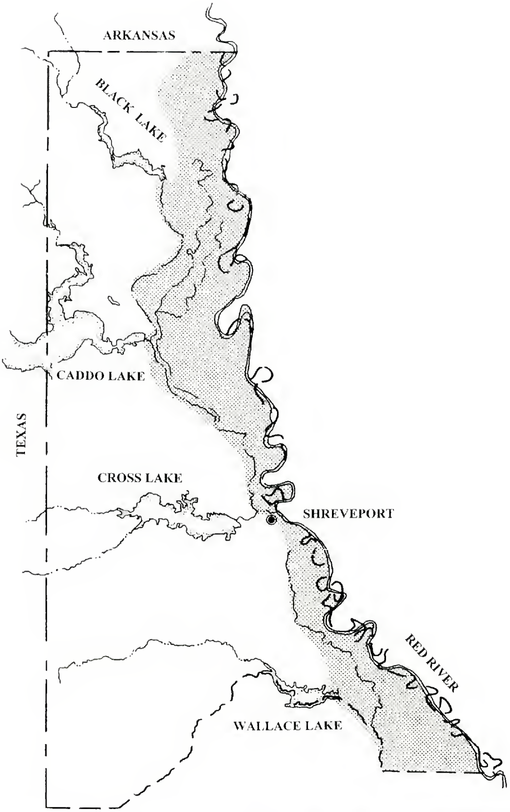

Fig. 2. Caddo Parish (2,283 sq. km) showing Red River, floodplain (stippled), and uplands (not stippled).

deposits. Elevations rise to no more than 137 m, and topography is rolling low hills or relatively flat terraces.

The river, its floodplain, and adjacent upland ecosystems have undergone major modification over the past two centuries. Virtually the entire landscape has been converted to farms and plantations and, more recently, urban sprawl. What once was a continuous savanna/forest with numerous plant communities covering hundreds of thousands of hectares is now virtually gone with only fragments of the natural vegetation remaining and few, if any, in virgin condition. Bald-cypress swamps, black willow riverbank shrublands, and cottonwood forests persist while some floodplain communities such as eastern red-cedar forests, canebrakes, and prairies have vanished entirely (MacRoberts et al. 1997). The upland has also been modified, mainly by urban sprawl, logging, and clearing for farms. Vast areas of forest were clear-cut in the latter part of the nineteenth and early part of the twentieth century.

While floodplains in general have received substantial phytogeographical and ecological attention and there are numerous generalized descriptions and classifications according to hydrologic conditions, soils, and vegetation (e.g., Sharitz & Mitsch 1993; Messina & Conner 1998; Mitsch & Grosselink 2000), the Red River floodplain is poorly known especially floristically (see Newkirk & Mueller 1980). Aside from checklists of parishes and counties along the Red River (e.g., MacRoberts 1979; Thomas & Allen 1993-1998), its last floristic survey was in 1806. The Red River floodplain has never been the subject of an ecological assessment or community study; however, Van Kley and Hine (1998) described the wetland vegetation of Caddo Lake, a raft lake; Ware (1956) briefly described the vegetation on a sand bar near Natchitoches; Teague and Wendt (1994), concentrating on Bossier and Caddo parishes, conducted the first parish-wide comprehensive survey of high quality natural communities in Louisiana, only a few of which turned out to be floodplain communities; and Mundorff (1998) studied bottomland hardwood forests on the Angelina and Neches rivers in east Texas. Dale and Ware (2004) studied wetland tree species in relation to flooding gradient in Arkansas but excluded from their analysis areas dominated by baldcypress, black willow, and cottonwood. Two non-quantified reports round out the list: Palmer (1923) provided an anecdotal report of the Red River forest at Fulton, Arkansas, and the Henderson State University Biology Department (1979) prepared a report for the Army Corps of Engineers that purports to be a "biological inventory of the Red River waterway," but it is of limited value since few details of data collection are provided.

Except in the longleaf pine region of central Louisiana (Bridges & Orzell 1989; Van Kley 1999), the upland in the Red River drainage is no better studied and in general is taken to have been continuous with what characterized the upland of the remainder of the upper West Gulf Coastal Plain: south Arkansas, northeast Texas, and north Louisiana; that is, a mixed pine-hardwood savanna/

forest or a monospecific pine savanna/forest (Teague & Wendt 1994; Carr 2000). Furthermore, there are conflicting historical accounts: were the upland forests dominated by pine, were they sometimes even monospecific pine extending over many hundreds of square km, were they mixed hardwood-pine, or were they a combination of all three (Hilgard 1873, Lockett 1876; Mohr 1898, Mattoon 1915; see reviews in Carr 2000 and Bragg 2002)?

METHODS

1. Bearing tree data. We used the 1830s Government Land Office, Caddo Parish, Tree Book (a summary of the surveyors' notes that gives only the bearing trees to species at each section and quarter section corner, their diameter, and their distance from the corner), surveyors' line notes, and land plats to determine the woody vegetation of Caddo Parish just before Anglo-European settlement. In general, in these surveys four bearing trees were recorded for each section corner and two bearing trees at each quarter section corner. In addition, for each mile, surveyors gave impressionistic "line notes" describing the timber and land quality. Surveyors only used common names, and in many cases were not specific as in the case of hickory, ash, elm, willow, hackberry, locust, and occasionally oak. Nonetheless, using modern information, it is usually possible to determine which species or group of species they meant. Since the limitations of GLO surveys are well known and discussed, little needs to be said here (Delcourt 1976; Whitney & DeCant 2001; Bragg 2002, 2003) except to point out that we analyzed four townships to see if there was bias. We found that there was not (Appendix 1). Using topographic maps, we divided the landscape into upland and floodplain and then entered each bearing tree listed in the Tree Book according to where it occurred on the landscape. The sample involved 5974 trees in the upland and 1805 trees in the floodplain for a total of 7779 trees.

2. Monospecific pine forest. We looked for evidence of monospecific pine savanna/forest in each township by examining the total percentages of various species recorded and, in townships with a high percent of pine recorded, for regional clumping of pine.

3. Roadside surveys. We surveyed both the Red River floodplain and upland by driving highways and backroads between Natchitoches, Louisiana, and the Louisiana-Arkansas border to form an impression of the present day woody vegetation of both. We did not attempt to quantify this aspect of the study. While clearly extensively modified by human activity especially over the last two centuries, it is possible by these surveys to see what species grow in the uplands and floodplain today.

4. Because of the lack of overlap in tree species between uplands and floodplain (see results), we were especially interested in any situation where taxa from one area occurred in the other. We therefore carefully examined areas of the floodplain that had oaks.

RESULTS

1. Bearing tree data. Table 1 lists the Government Land Office bearing tree abundance data for the Red River floodplain and upland for all of Caddo Parish. Surveyors' designations are given as common names; modern interpretations follow in parenthesis. Only taxa with 0.5 percent or higher presence are included.

2. Monospecific pine forest. We found no evidence for monospecific pine savanna/forest. The closest to this condition was in sandy areas in the very northern tier of the parish in T23NR15-16W where pine reached 50 percent of the bearing trees. Nonetheless, even here the surveyors' line notes most commonly read: "oak, hickory, pine & etc," although occasionally "poor rolling pine land," or "poor land oak & pine." There is no mention of the ground cover, and there is no indication in the surveyors' records of pine savanna/forest. Some upland areas had little or no pine, notably T17NR14-15-16W and T19NR15-16W where pine ranged from zero to six percent of the trees and the line notes confirm the absence of pine. Here the notes repeatedly read "oak, hickory." These uplands were oak-hickory woodland/forest.

3. Roadside surveys. Distributed all across the floodplain and often intermixed with one another are ash (*Fraxinus pennsylvanica* Marsh), bald cypress (*Taxodium distichum* (L.) Rich.), boxelder (*Acer negundo* L.), button bush (*Cephalanthus occidentalis* L.), cottonwood (*Populus deltoides* Bart. ex Marsh.), elm (*Ulmus americana* L.), hackberry (*Celtis laevigata* Willd.), honey locust (*Gleditsia triacanthos* L.), mulberry (*Morus rubra* L.), Osage orange (*Maclura pomifera* (Raf.) C.K. Scheid.), pecan (*Carya illinoensis* (Wang.) K. Koch.), persimmon (*Diospyros virginiana* L.), rough-leaved dogwood (*Cornus drummondii* C.A. Mey.), swamp privet (*Forestiera acuminata* (Michx.) Poir.), sycamore (*Platanus occidentalis* L.), and willow (*Salix nigra* Marsh). Chinese tallow (*Sapium sebiferum* (L.) Roxb.) was common and Chinaberry tree (*Melia azedarach* L.) was occasionally encountered. The absence of oak, notably flood-tolerant oaks such as overcup (*Quercus lyrata* Walt.) and willow (*Q. phellos* L.) remains puzzling since we are aware that most southeastern floodplain descriptions have these species (see Sharitz & Mitsch 1993; Messina & Conner 1998; Mitsch & Grosselink 2000).

Our roadside surveys of the upland showed an entirely different woody flora consisting largely of white oak (*Quercus alba* L.), southern red oak (*Q. falcata* Michx.), post oak (*Q. stellata* Wangenh.), blackjack oak (*Q. marilandica* Muenchh.), black oak (*Q. velutina* Lam.), shumard oak (*Q. shumardii* Buckl.), bluejack oak (*Q. incana* Bartr.), water oak (*Q. nigra* L.), loblolly pine (*Pinus taeda* L.), shortleaf pine (*Pinus echinata* P. Mill.), sweet gum (*Liquidambar styraciflua* L.), black gum (*Nyssa sylvatica* Marsh), dogwood (*Cornus florida* L.) black hickory (*Carya texana* Buckl.), mockernut hickory (*C. tomentosa* (Poir.) Nutt.), bitternut hickory (*C. cordiformis* Wangenh.) K. Koch). Oak and pine dominated.

Table 1. Tree abundance data (as percent of total for each landscape) for floodplain and upland based on General Land Office witness trees.

TREES	UPLAND	FLOODPLAIN
Black, Red, and Spanish Oak (*Quercus velutina* Lam. *Q. shumardii* Buckl., *Q. falcata* Michx., *Q. texana*, Buckl.) *Q. pagoda* Raf.	31.5	2.7
Pine (*Pinus echinata* Mill., *P. taeda* L.)	16.3	
Post Oak (*Quercus stellata* Wang.)	11.2	0.6
Hickory (*Carya texana* Buckl., *C. tomentosa* (Poir.) Nutt., *C. cordiformis* (Wangenh.) K. Koch)	10.3	1.2

Other	3.2	2.2
Total	100.0	100.0

4. In the 1830s, on the floodplain, oak and hickory were found to occur mainly in and around the Caddo Prairies in northern Caddo Parish. These long vanished prairies were briefly described by Freeman and Custis in 1806, but Anglo-American settlement soon eraced all evidence of them (Flores 1984; MacRoberts et al. 1997). What these prairies were like will, unfortunately, remain a mystery; the two plants collected from them by Peter Custis in 1806 (*Veronicastrum virginicum* (L.) Farw. and *Eustoma russellianum* (Hook.) G.Don) have never been found in the region again (MacRoberts and MacRoberts 2004).

Surveyors' line notes mention "small cane" being present, and that the prairies were "dry and rich;" the soil was "black and first quality." This condition contrasts markedly with the surrounds, which were described as "overflow land," and "inundated." Additionally, the difference is marked by the fact that by 1838—a year after the Great Raft had been first cleared—there was a "cotton field," "corn field," "Scott's Improvement," "Scotts field," and "Hamilton's Farm" in Caddo Prairie. These were the only fields, farms, or "improvements" in the entire Township, indicating that natural prairies were a very different habitat than characterized surrounding areas. These prairies appear to have been an atypical part of the floodplain—they were on higher elevations, had different soil, and were open as indicated by the number of times the surveyors had to construct a mound for lack of trees to mark corners. This topography and soil difference probably accounted for the oaks and hickories.

DISCUSSION

We found that the woody vegetation of the Caddo Parish floodplain and upland is different. There is virtually no overlap in tree species today nor was there 170 years ago.

Upland forest structure of Caddo Parish appears to have been mixed oak-hickory and mixed oak-pine-hickory savanna/forest. The GLO surveys (both bearing trees and line notes) show that there were only a few areas of the Caddo Parish upland that were dominated by pine and probably none where pine alone dominated. Other areas were hardwood dominated, and this undoubtedly was the more characteristic canopy structure for the entire region, both east and west of the Mississippi River (Skeen et al. 1993; Dale and Ware 1999), notably where the fire return interval was less frequent than further south (Frost 1998).

A comparison of our Caddo Parish surveyors' record results with those of Bragg (2002, 2003) and Williams (1993) for the upland areas of Ashley and Union counties, southern Arkansas, and Williams and Smith (1995) for the Caney Ranger District in north central Louisiana, supports this conclusion. Bragg found oak, pine, and hickory in about the same proportions as we did. Williams (1993) found pine to vary from 51 percent to 4 percent depending on landform, and Williams and Smith found pine only slightly better represented than it is in Caddo Parish but with oak again dominant. Thus, at the time of Anglo-American settlement, pine was probably not as common as it is today (Skeen et al. 1993; Bragg 2003) and was definitely less common overall than oak.

These findings contrast markedly with the GLO survey records for areas with monospecific pine savanna/forest such as within the longleaf pine region of central Louisiana (Bridges & Orzell 1989). On the 182 sq. km Vernon Ranger District of the Kisatchie National Forest, 95 percent of the bearing trees were pine and only along stream courses were there hardwoods and cypress. Pine was the only bearing tree in the upland areas (Grace & Smith 1995; see review by Platt 1999). Historical documents describe monospecific pine savanna/forest for the upper West Gulf Coastal Plain (Hilgard 1873; Lockett 1876; Mohr 1898; Mattoon 1915; see review in Bragg 2002), but the surveyor's notes for such areas have not been analyzed to see how they compare with other pine-dominated savanna/forest.

Our floodplain findings are also somewhat unusual. We had expected oak to be common—notably flood tolerant species. Except in the vicinity of Caddo Prairies, this was not the case. Oak was virtually absent from the floodplain. While there were distinct communities such as cypress swamps, oxbows, and others, the vegetation in general was what has been described as "Batture" or "*Populus deltoides* temporary flooded forest alliance" (Louisiana Natural Heritage 1988; Weakley et al. 1998).

Bois d'arc (*Maclura pomifera*), which is now common on the floodplain, did not appear in the Tree Book and presumably was not present until recently (Weniger 1996; Schambach 2003), although Peter Custis reported a large bois d'arc at Natchitoches in 1806 (Flores 1984), and Chinese tallow tree (*Sapium*) is now ubiquitous in the floodplain, as it is over so much of the south (Bruce et al. 1997).

The floodplain vegetation of the Red River has not been studied. Ours is the first study to use the original Government Land Office records to reconstruct reference conditions. Caddo Parish consists of only a fraction of the Red River floodplain, and until the surveyors notes are fully studied along the entire course of the river, generalizations are not possible. Nonetheless, on the basis of our road surveys, it looks like oak is largely missing from the lower stretches of the floodplain, at least from Natchitoches north to Arkansas. This situation may not prevail north of the Arkansas line. Palmer (1923) described the Red River forest at Fulton, Arkansas and found a combination of plant associations that closely parallels those described in textbooks (e.g., Sharitz & Mitsch 1993; Messina & Conner 1998; Mitsch & Grosselink 2000): cottonwood, sycamore, willow forests next to oak dominated bottomlands, next to cypress swamps, and so on.

APPENDIX 1

Since it has been suggested that there was sometimes bias in a surveyor's selection of bearing trees (Whitney & DeCant 2001; Bragg 2003), we checked for bias. We did this by comparing the frequency with which pine and oak was mentioned in the line notes with the frequency with which they were used as bearing trees in four townships that lacked or virtually lacked pine and two Townships that had the highest percentage of pine. We assumed that if pine or oak was being discriminated against, this would show up in the line notes where there was no reason to not mention a species. Except for pine in T17NR14-15-16W, we did not expect a close agreement of numbers since line notes and section and quarter section tree selection constitute two independent and very different

Table 2. Results of line notes comparison with bearing trees reported for T17NR14-15-16W and T23NR16W.

sampling methods. Nonetheless, we did expect that line notes would not disagree totally with corner results, and they did not.

The results, given in Table 2, show that there is no reason to suppose bias. Line notes for the areas with high percentages of pine as a bearing tree most commonly read: "Timber oak & hickory & etc.," "oak & etc.," and "oak & pine," "pine & oak." Where pine was absent, they read: "oak & hickory."

ACKNOWLEDGMENTS

Gary Loftin, Clerk of Court, and John Basco, Karen Gilbert, and Ron Looney, Clerk of Court Office, Caddo Parish, were instrumental in making this study possible by providing access to land plats and the Tree Book. The research was partly supported by a Louisiana Board of Regents Grant "Floristic Baseline Inventory for Watershed Research and Education," which Virginia Simons Lincove, Associate Vice Chancellor, Louisiana State University in Shreveport, was instrumental in securing. Further support and assistance were provided by Gary Hanson and Patricia Peyton of the Red River Watershed Management Institute, Louisiana State University in Shreveport. Don Bragg, USDA Forest Service, made useful comments on an earlier draft of the paper. Guy Nesom, Botanical Research Institute of Texas, and an anonymous reviewer made many helpful suggestions.

ABSTRACT

An annotated, vouchered checklist is provided of the vascular plant taxa of the 3150 hectare Turkey Creek Unit, Big Thicket National Preserve, Tyler and Hardin counties, southeastern Texas. Six hundred ninety one (691) native taxa and 47 exotic taxa are documented for the unit. The communities of the Turkey Creek Unit are provided.

RESUMEN

Se aporta un listado comentado de los taxa de plantas vasculares junto con los testigos, de las 3150 hectáreas de la unidad Turkey Creek, Big Thicket National Preserve, en los condados de Tyler y Hardin, Sureste de Texas. Se documentan seiscientos noventa y un (691) taxa nativos y 47 taxa exóticos en esta unidad. Se aportan las comunidades de la unidad Turkey Creek.

INTRODUCTION

This is the second part of an intended inventory, based upon available voucher specimens, of the flora of the Big Thicket National Preserve, southeastern Texas. In a previous paper we provided an annotated checklist with community associations of the vascular flora of the Hickory Creek Unit (MacRoberts et al. 2002). In this paper we provide an annotated checklist for the Turkey Creek Unit without community affiliations for species.

SITE AND METHODS

The Big Thicket is located mostly within the longleaf pine region of the West Gulf Coastal Plain in southeastern Texas (Parks & Cory 1936; McLeod 1971;

SIDA 21(3): 1807–1827. 2005

Harcombe & Marks 1979; Marks & Harcombe 1981; Harcombe et al. 1993). The Big Thicket National Preserve consists of 12 units scattered over seven Texas counties. The units range in size from 222 hectares to 10,100 hectares and total about 34,000 hectares (Peacock 1994). We selected the Turkey Creek Unit for the second part of the floristic survey, a 3150 hectare area located in southern Tyler and northern Hardin counties (Fig. 1). The Turkey Creek Unit, which consists of twelve plant communities, was chosen for inclusion in the Big Thicket National Preserve because it is centrally located, is a corridor unit along Turkey Creek, and is diverse (Ajilvsgi 1979; Watson 1979; Harcombe & Marks 1981; MacRoberts & MacRoberts 1998). The unit is about 18 km from north to south and is about 4 km at its widest east-west point. The unit ranges from about 15 to 45 meters in elevation. Details regarding edaphic and climatic factors can be found in Deshotels (1978), Watson (1979), and Marks and Harcombe (1981). A community map of the unit is in Harcombe and Marks (1979).

Like all units of the Big Thicket National Preserve, the Turkey Creek Unit has not been the subject of a floristic inventory although extensive but desultory collecting has occurred there (Watson 1982; MacRoberts & MacRoberts 1998).

The MacRoberts' collected 620 specimens from the Turkey Creek Unit during 11 field days beginning 13 September 2001 and ending 3 April 2003. These are temporarily deposited at Rice University. In addition, in 1997 and 1998, the MacRoberts collected and deposited 65 specimens from the Turkey Creek Unit at TEX for a study of wetland pine savannas (MacRoberts & MacRoberts 1998). Larry Brown collected 243 specimens during 2 field days on 24 July 2002 and 25 October 2003 and about 60 specimens between October 1981 and September1996. Dan Johnson collected about 168 specimens on 7 days between 25 October 2002 and 20 July 2003. Geraldine Watson collected about 236 Turkey Creek specimens over several years in the late 1970s and early 1980s.

Since our purpose is to produce a list of taxa known to occur on the Turkey Creek Unit, a vouchered specimen was considered to be the only evidence acceptable for inclusion in the list. In all, about 1340 herbarium specimens form the data for this report. All specimens have been annotated by Larry Brown except for William Carr's four collections at TEX (which have all been recollected) and the MacRoberts' 65 specimens deposited at TEX for a wetland savanna study. These taxa are listed in MacRoberts and MacRoberts (1998) and most have been recollected during our current survey. The following taxa in the 1998 paper have not been recollected, thus the vouchers for them reside only at TEX: *Lycopodiella appressa*, *Hypoxis hirsuta*, *Eleocharis tuberculosa*, *Rhynchospora gracilenta*, *Rhynchospora rariflora*, *Scleria georgiana*, *Scleria reticularis*, *Aletris aurea*, *Schoenolirion croceum*, *Calopogon tuberosus*, *Panicum verrucosum*, *Paspalum praecox*, *Smilax laurifolia*, *Xyris ambigua*, *Xyris baldwiniana*, *Xyris caroliniana*, *Coreopsis linifolia*, *Marshallia graminifolia* var. *cynanthera*,

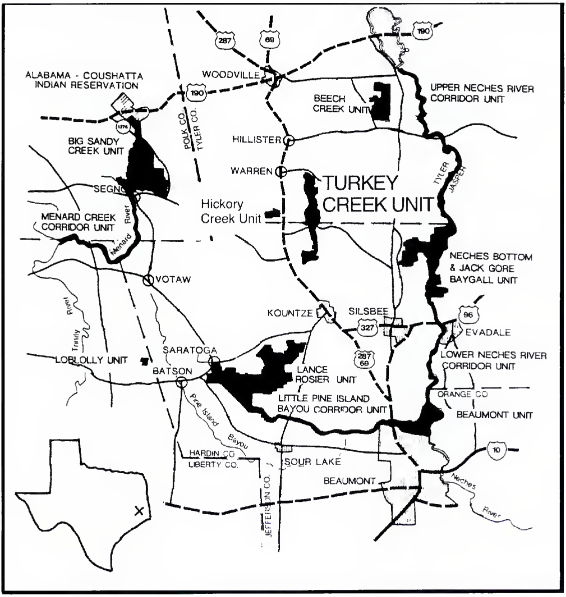

Fig. 1. Location of Turkey Creek Unit within the Big Thicket National Preserve, Texas.

Drosera brevifolia, Drosera capillaris, Polygala cruciata, Photinia pyrifolia (as *Aronia arbutifolia*), and *Viola primulifolia.*

On August 29, 2004, Joe Liggio took the senior author to a new addition of the Turkey Creek Unit. It ranges on the east side of Highway 69/287 between Highway 420 north to Village Creek. In a savanna community north of Highway 420, we collected the following, *Rhynchospora pusilla, Fuirena bushii, Xyris stricta* var. *obscura, Bigelowia nuttallii, Silphium gracile,* and *Tephrosia onobrychoides.* Only *R. pusilla* and *B. nuttallii* were new.

In most cases the nomenclature follows Jones et al. (1997) and Kartesz (1999). Some recent literature sources were followed, especially some nomenclatural adjustments published in the *Flora of North America* volumes. In cases of multiple collections, no more than four are listed for each taxon. For each taxon we list the county of collection if known. Some of Geraldine Watson's collections do not designate county.

The following is a list of communities (mostly using the nomenclature of Marks and Harcombe {1981}) in the Turkey Creek Unit. For each community, except for ponds, we list up to three of the dominant woody species as presented by Marks and Harcombe (1981).

Sandhill Pine Forest: *Quercus incana*, *Q. margaretta*, and *Cornus florida*.
Upland pine forest: *Pinus palustris*, *P. taeda*, and *Callicarpa americana*.
Wetland pine savanna: *Pinus palustris*, *Nyssa biflora*, and *Cyrilla racemiflora*.
Upper slope pine oak forest: *Pinus echinata*, *Quercus falcata*, and *Ilex vomitoria*.
Mid slope oak pine forest: *Pinus taeda*, *Quercus falcata*, and *Cornus florida*.
Lower slope hardwood pine forest: *Magnolia grandifolia*, *Quercus nigra*, and *Ilex opaca*.
Floodplain hardwood pine forest: *Pinus taeda*, *Fagus grandifolia*, and *Carpinus caroliniana*.
Cypress tupelo forest: *Taxodium distichum*, *Nyssa aquatica*, and *Planera aquatica*.
Floodplain hardwood forest: *Quercus nigra*, *Liquidambar styraciflua*, and *Carpinus caroliniana*.
Baygall/stream course: *Cyrilla racemiflora*, *Ilex coriacea*, and *Magnolia virginica*.
Ponds: *Juncus repens*, *Quercus laurifolia*, and *Crataegus opaca*

RESULTS

Annotated list of the Turkey Creek Unit vascular taxa. The following abbreviations are used in the annotated checklist.

CL = C. Lui. His 15 collections are at Rice University.
DJ = Dan Johnson. His 163 specimens are temporarily at Rice University.
GW = Geraldine Watson. Her National Park Service specimens are at Rice University.
LB = Larry Brown. All of his Turkey Creek specimens are at SBSC.
MM = Barbara and Michael MacRoberts. Their collections are temporarily at Rice University except for the 23 taxa whose vouchers are at TEX.
KC = Katie Caldwell. Her collections are at Rice University.
PH = Paul Harcombe. His 15 specimens are at Rice University.
SE = Sandy Elsik. Her 13 collections are at Rice University.
WC = William Carr. His 4 collections are at TEX/LL.
(H) = Collected from Hardin County.
(T) = Collected from Tyler County.
(NC) = A Geraldine Watson collection with no county indicated.
***** = exotic (not native to North America).
+ = see note at end of list.

Ruellia humilis Nutt., (H T) *MM 5675,5451; GW 2566,2761*

Yeatesia viridiflora (Nees) Small, (H) *MM 5635; LB 27090*

ACERACEAE

Acer barbatum Michx., (T) *DJ 2079; LB 11093*

Acer rubrum L., (H T) *LB 27476; MM 4963, 5231*

AGAVACEAE

Manfreda virginica (L.) Salisb. ex Rose, (T) *MM 5770*

Yucca louisianensis Trel., (T) *MM 5286*

ALISMATACEAE

Sagittaria latifolia Willd., (T) *DJ 1894*

Sagittaria papillosa Buchenau, (H) *MM 5667, 2608b; DJ 1993*

AMARANTHACEAE

Froelichia floridana (Nutt.) Moq., (H) *MM 5144; GW 2373,2748*

ANACARDIACEAE

Rhus glabra L., (H T) *MM 5194,5117, 4973; LB 27155*

Rhus copallinum L., (H) *DJ 1664*

Toxicodendron radicans (L.) Kuntze, (T) *DJ 2101, 2088*

ANNONACEAE

Asimina parviflora (Michx.) Dunal, (H T) *MM 5000; SE 2009; LB 27508*

APIACEAE

Centella erecta (L.f.) Fernald, (H T) MM 5664,5077

Chaerophyllum tainturieri Hook. var. *tainturieri*, (H) *MM 5309, 6039*

**Cyclospermum leptophyllum* (Pers.) Sprague ex Britton & P. Wilson, (T) *DJ 1886; MM 6064*

Eryngium integrifolium Walter, (H T) *MM 3507; LB 6589*

Eryngium prostratum Nutt. ex DC., (H T) *DJ 1812, 1843*

Eryngium yuccifolium Michx., (T) *MM 5754, 5059*

Hydrocotyle verticillata Thunb., (NC) *GW 2767, 2676*

Oxypolis filiformis (Walter.) Britton, (T) *MM 5202*

Oxypolis rigidior (L.) Raf., (T) *MM 5203, 5888*

Ptilimnium capillaceum (Michx.) Raf., (H T) *GW 2608, 3421*

Ptilimnium costatum (Elliott) Raf., (T) *MM 5774, 5602; GW 2759; LB 6659*

Sanicula canadensis L., (H T) *MM 5473; GW 2609c; DJ 1780; LB 27138*

Thaspium trifoliatum (L.) A. Gray var. *aureum* Britton, (H) *GW 2471, 2610b*

APOCYNACEAE

Amsonia tabernaemontana Walter, (NC) GW 3241

Trachelospermum difforme (Walter) A. Gray, (H) DJ 1682

AQUIFOLIACEAE

Ilex ambigua (Michx.) Torr., (H T) *GW 2631,2752; DJ 1681*

Ilex coriacea (Pursh) Chapm., (T) *MM 5245, 3892; GW 2452, 3444*

Ilex decidua Walter, (NC) *GW 2693a, 2673*

Ilex longipes Chapm. ex Trel., (H T) *MM 5922, 6063; LB 27481, 27552*

Ilex opaca Aiton, (H T) *MM 5004, 5285*

Ilex vomitoria Aiton, (H T) *MM 4978, 5284*

ARACEAE

Arisaema triphyllum (L.) Schott, (H T) *MM 5317, 5260; GW 1033*

ARALIACEAE

Aralia spinosa L., (T) *MM 5423*

ARECACEAE

Sabal minor (Jacq.) Pers., (H T) *MM 5930, 5316; LB 27459a*

ARISTOLOCHIACEAE

Aristolochia reticulata Jacq., (T) *MM 5052*

Aristolochia serpentaria L., (H) *GW 2645, 2651; DJ 1790*

ASCLEPIADACEAE

Asclepias longifolia Michx., (T) *MM 5080*

Asclepias obovata Elliott, (T) MM *5758, 5050, 5190; LB 27588*

Asclepias perennis Walter, (H) *MM 5636*

Asclepias rubra L., (H) *GW 544*

Asclepias tuberosa Woodson, (T) *MM 5468*

Asclepias variegata L., (H) GW 76, 2627; *MM 5379, 5410*

Asclepias verticillata L., (T) *GW 1167, 2749*

Matelea cynanchoides (Engelm.) Woodson, (H) *LB 27126; GW 2649*

Matelea gonocarpos (Walter) Shinners, (H) *LB 27462*

ASPLENIACEAE

Asplenium platyneuron (L.) Britton, Sterns & Poggenb., (H) *DJ 1789*

ASTERACEAE

Ageratina altissima (L.) R.M. King & H. Rob., (H) *MM 5911, 5919; LB 27506, 27460*

Ambrosia artemisiifolia L., (H T) *LB 27499; MM 5155; CL 901113*

Ambrosia psilostachya DC., (H) *MM 5933*

Ambrosia trifida L., (T) *DJ 2092*

Arnoglossum ovatum (Walter) H. Rob., (T) *MM 5070, 3508; GW 2685*

Baccharis halimifolia L., (T) *GW 2860*

Berlandiera pumila (Michx.) Nutt. var. *pumila*, (H T) *MM 5463, 5395*

Berlandiera pumila (Michx.) Nutt. var. *scabrella* Nesom & B.L. Turner, (H) *MM 5463; LB 27146*

Bidens aristosa (Michx.) Britton, (H T) *MM 5660, 5409; GW 2826, 2629*

Bidens bipinnata L., (H) *DJ 2000*

Bidens frondosa L., (H T) *GW 2895; DJ 1945, 2041*

Bigelowia nuttallii L.C. Anderson, (H) *Brown 30128*

Boltonia diffusa Elliott, (H T) *MM 5673, 5185, 3509; GW 2440*

Chaptalia tomentosa Vent., (T) *MM 5288, 3625*

Chrysopsis mariana (L.) Elliott, (H T) *MM 5898, 5761; LB 5578, 8155*

Chrysopsis pilosa Nutt., (H T) *CL 901190, 901195; GW 2389*

Cirsium horridulum Michx., (T) *MM 6069*

Conoclinium coelestinum (L.) DC., (H T) *MM 5768, 5809 5917; LB 27075*

Conyza canadensis (L.) Cronquist var. *pusilla* (Nutt.) Cronquist, (H T) *MM 5819; DJ 1852*

+*Coreopsis intermedia* Sherff, (T) *DJ 2088a*

Coreopsis linifolia Nutt., (T) *MM 3627*

Coreopsis tinctoria Nutt., (H) *DJ 2012*

Croptilon divaricatum (Nutt.) Raf., (H T) *LB 27484; MM 5146, GW 2379; CL 901184*

Echinacea pallida (Nutt.) Nutt. var. *sanguinea* (Nutt.) Gandhi & R.D. Thomas, (H T) *LB 27575; MM 5378, 5462*

Elephantopus carolinianus Raeusch., (H T) *MM 5796; LB 27513*

Elephantopus nudatus A. Gray, (T) *GW 2868, 2865*

Elephantopus tomentosus L., (H T) *MM 5745, 5116; LB 27120*

Erechtites hieracifolia (L.) Raf. ex DC., (H T) *DJ 1788*

Erigeron philadelphicus L., (H T) *MM 5445, 6035*

Erigeron strigosus Muhl. ex Willd., (H T) *MM 5445, 6046; GW 2541; DJ 2104*

Eupatorium capillifolium (Small) Lam., (T) *LB 27586*

Eupatorium compositifolium Walter, (T) *DJ 2083, 1888; LB 14892*

Eupatorium lancifolium (Torr. & A. Gray) Small, (T) *MM 5748, 5114; LB 27526; DJ 2052*

Eupatorium leucolepis (DC.) Torr. & A. Gray, (T) *MM 5747, 5059*

Eupatorium mohrii Greene, (H T) *GW 2179; DJ 2067*

Eupatorium perfoliatum L., (H) *DJ 1981*

Eupatorium rotundifolium L., (T) *MM 5102*

Eupatorium semiserratum DC, (H T) *LB 27581; GW 2180; DJ 1946, 1994*

Eupatorium serotinum Michx., (H) *MM 5148*

Eurybia hemispherica (Alexander) Nesom, (T) *MM 5891, 5188, GW 2847; LB 6660*

Euthamia leptocephala (Torr. & A. Gray) Greene ex Porter & Britton, (T) *GW 2864b*

Gaillardia aestivalis (Walter) H. Rock var. *aestivalis*, (H) *MM 4964*

Gaillardia pulchella Foug. var. *pulchella*, (H) *MM 5678*

Gamochaeta coarctata (Willd.) Kergerulen, (H) *GW 2479; MM 6059*

Gamochaeta purpurea (L.) Cabrera, (H) *GW 2473; 2615*

Helenium amarum (Raf.) H. Rock var. *amarum*, (H T) *MM 5762, 5140*

Helenium drummondii H. Rock, (H) *MM 5301*

Helenium flexuosum Raf., (T) *GW 2626; MM 5439; LB 18654*

Helianthus angustifolium L., (T) *LB 27590*

Helianthus debilis Nutt. var. *silvestris* (Heiser) Cronquist, (H) *LB 27131a*

Heterotheca subaxillaris (Lam.) Britton & Rusby, (H) *MM 5156*

Hieracium gronovii L., (H T) *LB 27464a, 27130, 27547; MM 5145*

Hymenopappus artemisiifolius DC. var. *artemisiifolius*, (T) *MM 5450, 5281*

Iva angustifolia DC., (H) *DJ 2102*

Iva annua L., (T) *GW 2850*

Krigia cespitosa (Raf.) K.L. Chambers, (H) *GW 2534, 2617b*

Krigia wrightii (A. Gray) K.L Chambers ex K.J. Kim, (T) *MM 5277*
Lactuca canadensis L., (H) *DJ 2109*
Lactuca floridana (L.) Gaertn., (H) *DJ 1793*
Liatris acidota Engelm. & A. Gray, (H T) *MM 5676, 5082; LB 27153*
Liatris elegans (Walter) Michx. var. *elegans*, (H T) *MM 5896, 5915, 5184*
Liatris pycnostachya Michx., (T) *MM 5091*
Liatris squarrosa (L.) Michx. var. *squarrosa* (T) *MM 5771*
*Marshallia graminifolia (*Walter) Small var. *cynanthera* (Elliott) Beadle & F.A. Boynt., (T) *MM 4006*
Mikania scandens (L.) Willd, (H) *DJ 1689*
Oligoneuron nitidum (Torr. & A. Gray) Small, (H T) *MM 5755, 5062, GW 2846; DJ 1693*
Palafoxia reverchonii (Bush) Cory, (H) *MM 4130; GW 2380*
Pityopsis graminifolia (Michx.) Nutt., (T) *MM 5283, 3715*
Pluchea camphorata (L.) DC., (H T) *MM 5804; GW 2764; DJ 1939*

Quercus phellos L., (H) *LB 27485*

+*Quercus velutina* Lam., (T) *PH 313*

Quercus virginiana Mill., (H) *LB 27468*

GENTIANACEAE

Bartonia verna (Michx.) Raf. ex Barton, (T) *MM 5670*

Sabatia gentianoides Elliott, (H T) *MM 5670, 4007*

GERANIACEAE

Geranium carolinianum L., (H T) *MM 6066, 6058, 6054*

GROSSULARIACEAE

Itea virginica L., (H T) *LB 27473a, 27092; GW 2632*

HALORAGACEAE

Myriophyllum pinnatum (Walter) Britton, Sterns &Poggenb., (T) *GW 2308*

Proserpinaca palustris L., (T) *MM 5776*

Proserpinaca pectinata Lam., (H T) *GW 2670b; LB 18658*

HAMMAMELIDACEAE

Hamamelis virginiana L., (H T) *MM 5010, 5436, 5267*

Liquidambar styraciflua L., (H T) *LB 27496; MM 4997, 5383, 5297*

HIPPOCASTANACEAE

Aesculus pavia L., (H) *MM 5234*

HYDROPHYLLACEAE

Hydrolea ovata Nutt. ex Choisy, (H T) *MM 5779; GW 2683*

HYPERICACEAE

Hypericum drummondii (Grev. & Hook.) Torr. & A. Gray, (H T) *DJ 1997; PH 901136*

Hypericum crux-andreae (L.) Crantz, (T) *DJ 1702*

Hypericum galioides Lam., (T) *MM 5663, 3502; LB 6681*

Hypericum gentianoides (L.) Britton, Sterns & Poggenb., (T) *MM 5751; LB 5580*

Hypericum gymnanthum Engelm. & A. Gray, (T) *KC 38*

Hypericum hypericoides (L.) Crantz, (H T) *MM 5055, 4983*

Hypericum mutilum L., (H) *LB 27122*

Triadenum tubulosum (Walter) Gleason, (H) *MM 5921, 5638; LB 27451, 27103*

Triadenum walteri (J.G.Gmel.) Gleason, (H T) *MM 5814; LB 27462, 27451; GW 2893*

IRIDACEAE

Alophia drummondii (R. A. Graham) R. C. Foster, (T) *MM 5061*

Sisyrinchium angustifolium Mill., (T) *MM 5412*

Sisyrinchium campestre E.P Bicknell, (T) *MM 5220; GW 2545*

Sisyrinchium rosulatum E. P. Bicknell, (H T) *MM 5458; GW 2477*

Sisyrinchium sagittiferum E. P. Bicknell, (H T) *MM 6067, 6044*

JUGLANDACEAE

Carya aquatica (Michx. f.) Nutt., (H) *MM 5640, 5639*

Carya cordiformis (Wangenh.) K. Koch, (H) *MM 5926; LB 27456*

Carya glabra (Mill.) Sweet, (H) *DJ 1984, 1985*

Carya texana Buckley, (H) *MM 5654, 5655, 5164; LB 27132*

Carya tomentosa (Lam. ex Poir.) Nutt., (H T) *MM 5815, 5433; DJ 1987; LB 27142*

JUNCACEAE

Juncus acuminatus Michx., (T) *DJ 1747*

Juncus dichotomus Elliott, (T) *DJ 2099, 1862*

Juncus marginatus Rostk., (T) *DJ 1860, 1767*

Juncus repens Michx., (T) *MM 5778; DJ 1836*

Juncus scirpoides Lam., (T) *DJ 2032, 2089, 1768, 1887*

Juncus tenuis Willd., (H) *LB 27115*

Juncus validus Coville, (T) *MM 5067; DJ 2091, 1763*

LAMIACEAE

Hedeoma drummondii Benth., (H) *GW 2617a*

Hyptis alata (Raf.) Shinners, (T) *MM 5071, 3625; DJ 1759, 1899*

Lycopus rubellus Moench, (T) *MM 5805; GW 2867*

Lycopus virginicus L., (H T) *GW 2894; DJ 2082, 2087*

Schoenolirion croceum (Michx.) Wood, (T) *MM 3792*

Triantha racemosa (Walter) Small, (T) *MM 3513; PH 011*

+*Trillium recurvatum* Beck, (H) *MM 5318*

LINACEAE

Linum medium (Planch.) Britton var. *texanum* (Planch.) Fernald, (H T) *MM 5072, 5347; DJ 2051*

Linum striatum Walter, (NC) *GW 2427*

LOGANIACEAE

Gelsemium sempervirens (L.) J. St.-Hil., (H T) *MM 5057, 5236*

Mitreola petiolata (J.F. Gmel.) Torr. & A. Gray, (T) *MM 5787; DJ 1758*
Mitreola sessilifolia (J.F. Gmel.) G. Don, (T) *MM 5773,3510*

LYCOPODIACEAE
Lycopodiella appressa (Chapm.) Cranfill, (T) *MM 3506*

LYGODIACEAE
**Lygodium japonicum* (Thumb. ex Murr.) Sw., (H T) *MM 5119, 5225; LB 27094*

LYTHRACEAE
Ammannia coccinea Rottb., (T) *GW 2855*
**Cuphea carthagenensis* (Jacq.) J.F. Macbr., (T) *MM 5812, 5650; WC 10841; GW 2432*
Rotala ramosior (L.) Koehne, (H) *DJ 1938*

MAGNOLIACEAE
Magnolia grandiflora L., (H T) *LB 27489; MM 4999, 5266*
Magnolia virginiana L., (T) *MM 5085*

MALVACEAE
Hibiscus moscheutos L., (NC) *GW 2560*
Malvaviscus arboreus Dill. ex Cav. var. *drummondii* (Torr. & A. Gray) Schery, (H) *MM 5633; GW 2836; LB 27136*
Sida rhombifolia L., (H) *MM 5645*
Sida spinosa L., (T) *DJ 2056*

MELASTOMATACEAE
Rhexia lutea Walter, (T) *MM 3944; DJ 1714*
Rhexia mariana L., (T) *MM 5756, 3942; GW 2753, 2873*
Rhexia petiolata Walter, (T) *GW 2433*

MENISPERMACEAE
Cocculus carolinus (L.) DC., (T) *GW 2646*

MOLLUGINACEAE
Mollugo verticillata L., (H) *MM 5003; DJ 1675*

MONOTROPACEAE
Monotropa uniflora L., (T) *MM 5892; SE 2033*

MORACEAE
Morus rubra L., (H T) *MM 5769, 5427; GW 2464b, 2621*

MYRICACEAE
Morella caroliniensis (Mill.) Small, (H T) *MM 5092, 5424; DJ 1748*
Morella cerifera (L.) Small, (T) *MM 5093, 5246; GW 2833*

OLEACEAE
Chionanthus virginicus L., (T) *MM 6061*
Forestiera acuminata (Michx.) Poir., (T) *GW 2293*
Fraxinus americana L., (H T) *MM 5808; GW 1446a, 2454; LB 27096*
Fraxinus caroliniana Mill., (H) *DJ 1970*
Fraxinus pennsylvanica Marshall, (H T) *MM 5791, 5792; LB 27461a*
**Ligustrum sinense* Lour., (H) *MM 5385; LB 27105*

ONAGRACEAE
Gaura lindheimeri Engelm. & A. Gray, (H) *MM 5671*
Gaura longiflora Spach, (H T) *MM 5889, 5141; DJ 2103*
Ludwigia alternifolia L., (T) *DJ 1772*
Ludwigia decurrens Walter, (T) *GW 2755a, 2861*
Ludwigia glandulosa Walter, (H T) *GW 2672, 2762; DJ 1986*
Ludwigia hirtella Raf, (T) *DJ 1770*
Ludwigia linearis Walter, (H T) *MM 5781, 5668, 5069; GW 2871*
+*Ludwigia microcarpa* Michx., (T) *DJ 1885*
Ludwigia octovalvis (Jacq.) Raven, (H) *DJ 2008*
Ludwigia palustris (L.) Elliott, (H) *DJ 1943*
Ludwigia pilosa Walter, (H T) *GW 2758; MM 3599; DJ 1979*
Oenothera biennis L., (H T) *DJ 2054, 2110*
Oenothera laciniata Hill, (T) *MM 6065*
Oenothera mexicana Spach, (H) *MM 5380*

OPHIOGLOSSACEAE
Botrychium biternatum (Sav.) Underwood, (H T) *MM 5909, 5299; LB 27467*
Botrychium virginianum (L.) Sw., (H) *GW 2667*

ORCHIDACEAE
Calopogon tuberosus (L.) Britton, Sterns & Poggenb., (T) *MM 3945*
Spiranthes cernua (L.) L.C. Rich., (T) *MM 5897, 5903; LB 27531*
Spiranthes tuberosa Raf., (T) *PH 312*
Spiranthes vernalis Engelm. & A. Gray, (H) *MM 5376*
Tipularia discolor (Pursh) Nutt., (T) *MM 5296*

OROBANCHACEAE
Epifagus virginiana (L.) Barton, (T) *MM 5257*

OSMUNDACEAE
Osmunda cinnamonea L., (T) *MM 3794; DJ 1846*
Osmunda regalis L. var. *spectabilis* (Willd.) A. Gray, (T) *MM 3793*

OXALIDACEAE
+*Oxalis corniculata* L. var. *wrightii* (A. Gray) B.L. Turner, (T) *GW 2524; MM 5206, 5447, 5276*

***Oxalis debilis* Kunth var. *corymbosa* (DC.) Lourteig, (T) *DJ 1771*
Oxalis lyonii Pursh, (T) *M 5252*

Xyris torta Sm., (T) *MM 5096, 3946*

Notes

***Bulbostylis barbata*.**—Jones and Wipff (1992) reported this exotic sedge new to Texas from Newton County. Turner et al. (2003) mapped it only in Newton County. Our Tyler County collection is a new county record. At SBSC, there is one additional collection from the Liberty County portion of the Menard Creek Unit.

***Coreopsis intermedia*.**—This west gulf coastal plain endemic has appeared on some Texas endangered and threatened species list. Smith (1976) mapped it in six northeastern counties. Turner et al. (2003) mapped it in 15 counties mostly in northeast Texas centering largely in Leon, Freestone, Anderson, and Houston counties. Tyler County is a new county record. At SBSC, there are collections from Harris and Jasper counties that were also not mapped in Turner et al. (2003).

***Dioscorea villosa*.**—We follow Raz (2002) in merging *D. quaternata* with *D. villosa* even though Al-Shehbaz and Schubert (1989) maintained them as distinct species and provided some characters to separate them.

***Dysphania ambrosioides*.**—We follow Clemants and Mosyakin (2003) in segregating the glandular *Chenopodium* taxa into the genus *Dysphania*.

***Lilium formosanum*.**—Brown and Elsik (2002) reported this exotic lily, as *Lilium longiflorum* Thunb., new to Texas from Newton and Tyler counties. However, in a re-examination of these two collections and the one from the Turkey Creek Unit, we found that the perianth segments were basally papillose on the adaxial surface. This trait is not present in *L. longiflorum* but is present in both *L. formosanum* A. Wallace and *L. phillippinense* Baker fide Skinner (2002). The shorter perianth segments and wider leaves best fit the description of *L. formosanum*, but our collections lack the reported wine-purple tinge on the abaxial perianth surface. Skinner (2002) indicated that most reports of *L. formosanum* in the United states are referable to *L. phillippinense*, which according to him, is becoming somewhat frequent in Florida especially in the Tallahassee area. For now the correct name to apply to the Texas collections of this escaped lily is problematic.

***Lindernia crustacea*.**—Brown and Marcus (1998) reported this Asian native new to Texas from the Trinity River National Wildlife Refuge in Liberty County and Turner et al.(2003) mapped it only in this county. At SBSC there are additional collections from Hardin and Harris counties. Our Tyler County collection adds another county to its Texas distribution.

***Ludwigia microcarpa*.**—Bridges and Orzell (1989) reported this small flowered seedbox new to Texas from Hardin County. Brown and Marcus (1998) reported collections from Hardin and Chambers counties. Our Tyler County collection is a new county record and at SBSC there is also a recent collection from Polk County. It is now known from four Texas counties.

***Ophiopogon jaburan*.**—Kartesz (1999) mapped this Asian native only in Arkansas, and Smith (1988) indicated that it was escaping in areas around Pine Bluff, Arkansas. This species is commonly planted for ground cover and is commonly referred to as monkey grass. The Hardin County collection came from the Kirby Nature Trail near Turkey Creek far from any house or farm land.

***Oxalis corniculata* var. *wrightii*.**—Turner (1994) used the varietal rank for some east Texas populations of yellow-flowered *Oxalis*. The names *O. dillenii* and *O. stricta* have been applied to this complex in Texas. We concur with Turner's taxonomic designation in light of the present state of knowledge regarding the complex.

***Quercus velutina*.**—Although Turner et al. (2003) mapped this species in a number of east Texas counties. It is a rare species in the more southern counties of east Texas. Shade leaf collections of *Q. velutina* and *Q. falcata* are difficult to separate and may account somewhat for the numerous mapped counties. The Tyler County collection, deposited at Rice University, and one from the Lance Rosier Unit in Hardin County are the most southern county records known to us. The label name on the Hardin County collection was *Q. marilandica* and it was subsequently annotated to *Q. velutina* (shade form) by the oak expert D.M. Hunt.

***Thelypteris hispidula* var. *versicolor*.**—Correll and Johnston (1970) called this fern *T.* x *versicolor*. They considered it a hybrid between *T. dentata* and *T. kunthii* and stated that it was usually found in Texas with one or both of its suspected parents. It is currently treated as a variety of the tropical *T. hispidula* (Alan R. Smith 1993). Turner et al. (2003) mapped it only in San Jacinto, Jasper, and Orange counties. Our Tyler County collection is a new county record.

***Trillium recurvatum*.**—Nixon et al. (1970) and Turner et al. (2003) reported this *Trillium* only from Rusk and Nacogdoches counties. Singhurst et al. (2002) reported an additional collection from Shelby County. Our Hardin County collection is a significant range extension and a new station for this rare species in Texas.

DISCUSSION

There are 123 families and 388 genera for the 738 taxa on the species list. Five families; Asteraceae (96 taxa), Poaceae (98 taxa), Cyperaceae (69 taxa), Fabaceae (47 taxa), and Euphorbiaceae (20 taxa) account for 44% of all taxa collected. The largest genera are *Rhynchospora* (23 taxa), *Carex* (17 taxa), *Dichanthelium* (16 taxa), *Cyperus* (13 taxa), and *Quercus* (12 taxa).

While it is the case that our list is incomplete, as are all floras, and that a few taxa may no longer exist in the unit, most taxa that have grown in the Turkey Creek Unit during the past quarter century have been collected (probably 90+ percent). We estimate that the Turkey Creek Unit has about 710 to 735 native species/taxa.

ACKNOWLEDGMENTS

This study was supported in part by a National Park Service Cooperative Agreement No. CA 14001004 to Paul Harcombe. Brooke Wheeler added some of the early collections into the data base and also aided the new database manager in his use of this program. We also thank Guy Nesom and Barney Lipscomb of BRIT and Eric Keith of Raven Environmental in Huntsville, Texas for their many suggestions that improved the paper. Publications funds were provided by Rice University.

ABSTRACT

Although Greene County, located in the southwest corner of Pennsylvania, has been botanized since the early 1800s, a checklist of its vascular flora has not previously been compiled. A search of herbaria augmented by targeted fieldwork has resulted in a list of 890 taxa of native and naturalized plants comprising 438 genera and 118 families. The five largest families, by number of species, were Asteraceae, Poaceae, Cyperaceae, Rosaceae, and Fabaceae. The six largest genera were *Carex, Solidago, Galium, Rubus, Polygonum,* and *Viola.*

RESUMEN

El Condado de Greene, se localiza en la esquina suroeste del estado de Pennsylvania. Este condado es considerado una de las áreas más diversas y de impacto en el estado, sin embargo hasta ahora no ha sido completada una lista de verificación. Esta lista de verificación contiene familias, géneros, y taxa específicos están ordenados alfabéticamente dentro de los grupos de plantas vasculares tales como Pteridófitas, Gimnospermas y Angiospermas. Esta lista incluye los nombres de especies nativas y naturalizadas conocidas que ocurren en el Condado de Greene. Un total de al menos 118 familias, 438 géneros, y 890 especies fueron encontradas. Las cinco familias más grandes, por el número de especies, fueron Asteraceae, Poaceae, Cyperaceae, Rosaceae, y Fabaceae. Los seis géneros más grandes, por el número de especies, fueron *Carex, Solidago, Galium, Rubus, Polygonum* y *Viola.*

INTRODUCTION

Even though Pennsylvania lacks checklists for most of its counties, the vascular flora known thus far is quite diverse; Rhoads and Klein (1993) reported 3318 taxa of vascular plants for the state, including 2076 native and 1242 introduced. Of the 67 counties in Pennsylvania approximately 24 have floras completed, however a number are unavailable to the public because they are unpublished theses and surveys. The exact number of genera and species in the flora of Greene County was not previously known as a checklist had never been compiled. However, Greene County is currently being seriously impacted by coal

SIDA 21(3): 1829–1859. 2005

mining, making documentation of the flora all the more urgent. This checklist will be needed when reclamation and revegetation decisions are made of the areas that have been mined for coal. Checklist contain baseline information that can be used to monitor changes in our environment and to help us make wise conservational decisions.

Site Description

Greene County, Pennsylvania is located in the southwestern corner of the state (Fig. 1). It is bordered by the counties of Washington to the north, Fayette to the east, Monongalia and Wetzel counties, West Virginia to the south and Marshall County, West Virginia to the west. The county was named for Nathaniel Greene on February 9, 1796; it contains approximately 371,000 acres. Greene County receives total annual precipitation of approximately 38 inches, of which 55 percent usually falls in April through September. Average seasonal snowfall is 31 inches. The last frost of the season is usually around May 18th and the first frost of the season approximately September 25th. The length of the growing season, from the last killing frost in spring to the first killing frost in autumn, is about 149 days (USDA 1983).

The soils of the county consist of three main series: Dormont-Culleoka association, Dormont-Culleoka-Newark association, and Glenflord-Dormont-Library association.

The Dormont-Culleoka association consists of hills with benches and ridges that make up about 75 percent of Greene County. Dormont soils are found predominantly on hillsides and benches and commonly have slips on them. These soils are deep and moderately well drained. They consist of shale, siltstone, limestone and colluvium. The Culleoka soils are mostly on ridges and hilltops but some areas are on hillsides. They consist of limestone, sandstone, siltstone, and shale.

The Dormont-Culleoka-Newark association consists of hills and flood plains. Dormont and Culleoka soils are as described above. The Newark soils are on flood plains. These soils are deep and somewhat poorly drained. These areas were formed from an alluvium derived from limestone, sandstone, siltstone, and shale.

The Glenford-Dormont-Library association consists of terraces, hills, ridges and benches. Glenford soils are on terraces. These soils are deep and moderately well drained. These areas were formed in slackwater alluvium derived from calcareous shale and sandstone. Dormont soils are as described above. Library soils are mostly uplands. These soils are deep and somewhat poorly drained. These areas were formed in slackwater alluvium derived from siltstone, calcareous shale, and limestone (USDA 1983).

Greene County is part of the Kanawha section of the Appalachian Plateau Province. The Kanawha section consists in most places of rounded hills and

Fig. 1. Top. Counties of Pennsylvania. Adapted from Map 2, The Plants of Pennsylvania (Rhoads & Block 2000). **Bottom.** Townships of Greene County. Origin unknown.

ridges, products of the submature dissection of a once featured plain whose character is suggested by the few flat summit areas. The maximum elevation is about 1,600 feet. The entire Greene County drainage area is a tributary of the Mississippi River system, the Ohio River being the immediate master stream (USDA 1983).

History

Indians and fur traders were in Greene County long before the white settlers. In 1760 Pennsylvania and Maryland agreed to the Mason and Dixon Line as a boundary between the two colonies. Obstacles such as Indian attacks retarded the actual demarcation. The line was extended to its western limits in the autumn of 1784 and drawn northward in 1785, finally fixing the southern and western boundaries of Washington County, which included Greene County. Washington County was apart of Virginia until Pennsylvania and Virginia finally agreed upon this boundary line. The first wave of frontier settlement came after the French and Indian War ended in 1763. From the outbreak of the Dunmore's war in 1774 to the end of the American Revolution in 1783 the Indians and early colonists were in conflict. Most of the settlement by colonists took place after the American Revolution. By 1790 the American Indians in Greene County were virtually extinct.

By 1796 the best lands were taken and there was sufficient population to warrant the formation of Greene County, separate from Washington County. As mentioned above, Greene County was named in February 9, 1796, in honor of General Nathanael Greene, one of George Washington's great generals during the American Revolution. The gradual opening of roads, improvement of the Monongahela River for navigation and construction of railroads were important in the development of the county. The first railroad to enter Greene County was the Waynesburg and Washington Railroad in 1877.

Agriculture was the mainstay of Greene County's economy from its earliest settlement. Most of the residents farmed or raised stock. The 1890 census indicate that almost 90 percent of the people lived on farms, most were engaged in agricultural pursuits, and most of the wealth was agricultural in nature. There were no large-scale commercial mines in Greene County in 1886, however, coal had been mined in the county for many years in dirt mines. In the early 1890s improved transportation brought outside investors and the beginning of large-scale coal mining. The gas and oil boom of 1894-1905 changed Greene County. Major oil and gas companies leased thousands of acres and drilled scores of wells attracting new people and outside capital. The 1900 census ranked the progress of manufacturing for the county near the bottom of all Pennsylvania counties. Up until the 1940s agriculture, coal mining and oil and gas production were the main industries in the county. During the 1950s agriculture became less important and coal mining has become dominant in the economy. In 1945 there were 2,860 farms in the county but by 1992 only 633 farms remained. The decline of agriculture may be partly due to the inevitable subsidence of the surface of land that accompanies to coal mining. Subsidence can cause a loss of ground water in wells and springs creating problems for the farmers and other landusers, as well as changing the vegetation. Subsidence and water loss for the lands and people of Greene County has been the subject of much controversy in recent years. Documentation such as what is contained in this report is a necessary precursor to land restoration needed in order to restore the land back to its original state (Smith 1996).

Major Collectors

Collecting in Greene County for the Carnegie Museum Herbarium began in the early 1800s and has continued to the present. Most of the collectors have been members of the Botanical Society of Western Pennsylvania and the staff of the Section of Botany at Carnegie Museum.

Botanists who have made significant contributions to the knowledge of the Greene County flora are: F.H. Beer, F. Bell, W.E. Buker, R. Coxe, M.J. Haywood, L.K. Henry, B.L. Isaac, J.A. Isaac, O.E. Jennings, C.M. Morton, S.A. Thompson, and J.H. Nishida.

METHODS

The checklist was compiled by searching the herbaria of the Carnegie Museum of Natural History (CM) and the Morris Arboretum of the University of Pennsylvania (MOAR) for Greene county specimens. In addition, fieldwork was conducted targeting under-represented areas of the county. Most of the collections were made during the last two years however several specimens due date back as early as 1895 and 1896. The majority of the specimens except for 28 samples, from which collection information was obtained from the Morris Arboretum, are deposited at the Carnegie Museum of Natural History (CM) Herbarium. Other herbaria that were examined for specimens include the Academy of Natural Sciences of Philadelphia and Kent State University. The flora of Rhoads and Block (2000) was the primary source for plant identification. For generic and species names, we have generally followed the Synthesis of North American Flora (Kartesz 1999). Authorities are abbreviated for the majority of taxa according to Brummitt and Powell (1992).

RESULTS AND DISCUSSION

This list includes the names of all native and naturalized species known to occur in Greene County. It includes a total of 118 families, 438 genera, and 890 species. The five families, with the largest number of species, are Asteraceae, Poaceae, Cyperaceae, Rosaceae, and Fabaceae. *Carex*, *Solidago*, *Galium*, *Rubus*, *Polygonum* and *Viola*, are the largest genera. There are approximately 179 non-native species that have been introduced mainly from Europe and Eurasia. This checklist recognizes 3 species of Lycophytes, 39 species of Pteridophytes, 7 species of Gymnosperms and 841 species of Angiosperms. Twenty-six species have global or state ranking.

Of the 26 plants that have global or state ranking only *Scutellaria saxatilis* has a global ranking of G3 or vulnerable status. The remaining 25 plants are either a G4 or G5 status, indicating an apparently secure or secure condition. The genus *Scutellaria*, a member of the mint family, is very distinctive and easily identified by the protuberance on the upper lip of the corolla. This species is a stoloniferous plant with leaves broadly lanceolate to triangular and has cordate leaves at the base. The leaves are coarsely crenate, 4-5 cm long, with a long petiole. The flowers are in panicles. Most of the collections are from semi-shaded areas in dry woods or, occasionally, in moist areas along streams. This species is not common but is inconspicuous and may be overlooked. Its recovery potential is unknown but will be poor unless people search for its existence.

There are five taxa listed by the Pennsylvania Department of Agriculture (2004) as noxious weeds. It is therefore illegal to propagate, sell or transport the following taxa in the commonwealth: *Cirsium arvense* (Canadian thistle), *Rosa multiflora* (multiflora rosa), *Cirsium vulgare* (bull or spear thistle), *Datura stramonium* (jimsonweed), and *Lythrum salicaria* (purple loosestrife). Other mentionable offenders to our native ecosystem listed by the Department of Conservation and Natural Resources (2000) are: *Alliaria petiolata* (garlic mustard), *Lonicera japonica* (Japanese honeysuckle), *Lonicera morrowi* (morrow's honeysuckle), *Celastrus orbiculatus* (oriental bittersweet), and *Elaeagnus umbellata* (autumn olive).

While this list is probably not all-inclusive, it is the most comprehensive list available.

Plant Communities

Based on our field observations and the classifications of Fike (1999), the study area contains the following nine major community types; terrestrial forests, palustrine forests, terrestrial woodlands, palustrine woodlands, terrestrial shrublands, palustrine shrublands, terrestrial herbaceous openings, herbaceous wetlands, and community complexes. In the discussion below additional divisions are made within these nine categories. In categories dominated by woody plants the division is based on the phenology of the dominant species. In herbaceous wetlands the division is between persistent and non-persistent vegetation. Community complex section represents a special situation rather than a parallel classification system. Overall species diversity is high, and many species occur in more than one community type.

Terrestrial forest.—The two subcatagories of this plant community are conifer broadleaf terrestrial forests and broadleaf terrestrial forests.

The conifer broadleaf terrestrial forest is defined by communities of pitch pine–mixed oak forest, dry white pine (hemlock)–oak forest, hemlock (white pine)–northern hardwood forest, hemlock (white pine)–red oak–mixed hardwood forest, hemlock–tuliptree–birch forest, and hemlock–mesic hardwoods forest.

The pitch pine–mixed oak forest community generally occurs on acidic, sandy soils, often on ridgetops and dry southern exposures. Typical shrubs include *Kalmia latifolia* and *Gaylussacia baccata*. The herbaceous layer is sparse with *Pteridium aquilinum*, *Aralia nudicaulis*, *Gaultheria procumbens*, *Cypripedium acaule* and various graminoids.

The dry white pine (hemlock)–oak forest community occurs on fairly dry sites, often with portions of the forest floor covered by rocks, boulders and/or exposed bedrock. The canopy is open and tree growth can be suppressed. The dominant species are *Pinus strobus* or *Tsuga canadensis* and a mixture of dry-site hardwoods, predominantly oaks. *Kalmia latifolia* is an important shrub with typically a sparse herbaceous layer present.

The hemlock (white pine)-northern hardwood forest community can be comprised by any of the three named components. The forests occur mostly on mesic sites, often north-facing, sometimes rocky and steep. *Rhododendron maximum* is usually abundant. The herbaceous layer is generally sparse with a rich bryophyte layer.

The hemlock (white pine)-red oak-mixed hardwood forest contains *Tsuga canadensis* and/or *Pinus strobus* with usually *Quercus rubra* and other hardwoods present. Shrubs include *Viburnum acerifolium*, *Rhododendron periclymenoides* and *Amelanchier* spp. Herbaceous species include *Maiantheumum racemosa*, *Polygonatum biflorum*, *Gaultheria procumbens* and *Podophyllum peltatum*.

The hemlock-tuliptree-birch forest contains tuliptrees and a mix of more southern species. It is generally a lower slope or cove type. *Tsuga canadensis* usually contributes 25% or more of the canopy with *Liriodendron tulipifera* and *Betula* sp. as the characteristic hardwood species. Shrubs include *Hamamelis virginiana*, *Rhododendron maximum* and others. The herbaceous layer is highly variable.

The hemlock—mesic hardwood forests are species-rich lower slope forests with a strong *Tsuga canadensis* component. Shrubs such as *Rhododendron maximum*, *Hamamelis virginiana* and *Lindera benzion* are common. The herbaceous diversity under the hardwood is diverse while under the dense hemlock the vegetation reflects a more northern flora.

The broadleaf terrestrial forest is defined by communities of dry oak—heath forest, dry oak—mixed hardwood forest, red oak- mixed hardwood forest, tuliptree—beech—maple forest, sugar maple—basswood forest, mixed mesophytic forest, red maple (terrestrial) forest, aspen/gray birch forest and black locust forest.

The dry oak—heath forest community is fairly broadly defined and usually occurs on xeric to moderately dry, acidic sites, often on shallow sandy soils. The most characteristic tree species is *Quercus montana* occurring with a mixture of other oak species. The shrub layer is dominated by ericaceous species. Because of the resistant oak leaf litter, the herbaceous layer is generally sparse.

The dry oak—mixed hardwood forest occurs on somewhat calcareous moderately dry soils. It is frequently found on south and southwest-facing slopes. Characteristic shrubs include *Cornus florida*, *Caprinus caroliniana* and *Amelanchier arborea*. The herbaceous species include *Maiantheumum racemosa*, *Polygonatum biflorum*, *Asplenium platyneuron*, *Desmodium* spp., *Hieracium venosum*, *Aralia nudicaulis*, *Carex pensylvanica*, *Carex communis* and *Lysimachia quadrifolia*.

The red oak- mixed hardwood forest is a broadly defined community occurring on mesic sites. *Quercus rubra* is dominant/codominant with various taxa of

Quercus spp., *Betula* spp., *Fagus grandifolia* among others. The shrubs include taxa of *Viburnum*, *Amelanchier*, *Kalmia latifolia*, *Capinus caroliniana* among others. The herbaceous layer is highly variable.

The tuliptree-beech-maple forest occur on fairly deep, slightly acidic soils, at a mid to lower-slope position. *Acer ruburm*, *Liriodendron tulipifera* and *Fagus grandifolia* are the most consistent species for this very mixed forest. Typical shrubs include viburnum, *Capinus caroliniana*, *Cornus florida*, and *Ostrya virginiana*. The herberbaceous layer may be rich.

The sugar maple-basswood forest type occurs on a wide range of sites. Dominant tree species are *Acer saccharum* and *Tilia americana*. Shrubs include *Lindera benzion*, *Hamamelis virginiana* and *Asimina triloba*. There is usually a rich vernal flora.

The mixed mesophytic forest is an extremely rich community type that occurs on deep soils at the base of slopes. Dominant tree species are *Liriodendron tulipifera*, *Acer saccharum*, *Fagus grandifolia*, *Tilia americana* and *Magnolia acuminata*. The herbaceous layer is very rich and includes *Trillium* sp., *Dicentra* sp., *Tiarella cordifolia*, *Hepatica nobilis*, *Sanguinaria canadensis*, *Botrychium virginianum* and *Mitella diphylla*.

The red maple (terrestrial) forest is an early to mid successional type that is becoming common in Pennsylvania. *Acer rubrum* is dominant, but more information needed for the species composition of the community type.

The aspen/gray birch forest is frequently mixed, but can contain nearly pure stands of *Betula* sp. or *Populus* sp. The forest type is commonly found on former agricultural lands or where forestry practices maintain an early successional stage.

The last type of terrestrial forest is the black locust forest. This community type occurs on highly disturbed sites. *Robinia pseudoacacia* is the dominant species with *Betula lenta* being the codominant species. There is usually a dense graminoid understory with many exotic species common.

Palustrine Forest.—The one subcatagory of this plant community has broadleaf palustrine forest, defined by communities of bottomland oak-hardwood palustrine forest, red maple-black-gum palustrine forest, sycamore-(river birch)-box-elder floodplain forest, silver maple floodplain forest and red maple-elm-willow floodplain swamp.

The bottomland oak-hardwood palustrine forest are characterized by the dominance of *Quercus palustris* and/or *Q. bicolor*. Shrubs include *Lindera benzoin*, *Vaccinium corymbosum*, *Dirca palustris* and *Viburnum* sp. The understory includes *Impatiens* sp., *Thelypteris palustris*, *Polygonum* sp. and *Agrimonia parviflora*.

The red maple-black-gum palustrine forest is dominated by *Acer rubrum* and/or *Nyssa sylvatica*. The shrub layer is variable and may include *Vaccinium* *corymbosum*, *Ilex verticillata*, *Alnus* spp. and *Cornus* spp. The herbaceous layer includes such taxa as *Viola* spp., *Osmunda cinnamomea*, *Carex* spp. and *Onoclea sensibilis*.

The sycamore-(river birch)-box-elder floodplain forest occurs along the floodplains of the larger or mid-size river systems. Dominant tree species are *Platanus occidentalis* and *Acer negundo* with shrubs consisting of *Salix* spp., *Cornus* spp. *Vitis riparia*, *Lindera benzoin* and *Toxicodendron radicans* along with several invasive exotics. The herbs include *Impatiens* spp., *Pilea pumila*, and *Urtica dioica*.

In the silver maple floodplain forest community the forest occur along large rivers with a well-developed floodplain. Various *Acer* spp. and *Ulmus* spp. are dominant with shrubs including *Cornus* spp., *Lindera benzoin* and *Toxicodendron radicans* along with several invasive exotics. The herbaceous layer includes *Impatiens* spp., *Pilea pumila*, and *Alliaria petiolata*.

The last community of palustrine forests, the red maple-elm-willow floodplain swamp lands, is primarily associated with lands surrounding the major river systems that are subject to periodic flooding. Besides the above mentioned taxa of red maple, elm and willow, *Carya cordiformis*, *Cornus amomum*, *Lindera benzoin*, *Vitis riparia*, *Onoclea sensibilis* and *Polygonum* spp. are also found.

Terrestrial Woodlands.—The three subcatagories of this plant community are coniferous terrestrial woodlands, conifer-broadleaf terrestrial woodlands and broadleaf terrestrial woodlands. The coniferous terrestrial woodlands consist of communities of pitch pine-heath woodland and pitch pine-scrub oak woodland.

The pitch pine-heath woodland is a community that occurs on rocky ridgetops typically with sandy soils. Soils are usually acidic and dry and the associated tree species are drought-stressed and small in stature. Hardwoods if present only contribute less than 25% of the tree layer. Various shrubs, mostly ericads, form a low shrub layer. Herbaceous species include *Pteridium aquilinum*, *Carex* spp., *Lespedeza* spp. and lichens.

The pitch pine-scrub oak woodlands are very similar to the pitch pine-heath community except for the understory species which consist of *Pteridium aquilinum*, *Carex* spp., various grasses and *Aralia nudicaulis*.

The conifer-broadleaf terrestrial woodlands community is defined by pitch pine—mixed hardwoods woodlands. Soil, drought tolerance, shrub layer, and percent hardwoods are similar to the pitch pine-heath woodland type. Some of the associated taxa are slightly different.

The broadleaf terrestrial woodlands are defined by communities of dry oak-heath woodland, birch (black-gum) rocky slope woodland and yellow oak-redbud woodland.

The dry oak-heath woodland occurs on dry, acidic soils. Dominant tree species are *Quercus* spp., *Nyssa sylvatica*, *Sassafras albidum*, *Betula* spp. and *Acer* *rubrum* with pines species contributing less than 25%. The shrub layer is variable composed of either low shrubs like *Vaccinium* spp. or there may be an additional layer of taller shrubs like *Kalmia latifolia*. Herbaceous layer contains taxa like *Pteridium aquilinum*, *Carex* spp., *Oryzopsis* spp., and *Aralia nudicaulis*.

The birch (black-gum) rock slope woodland occurs most commonly on rocky slopes although it may occur on benches, ridgetops or boulderfields. Birch is usually present with either birch or black-gum dominant. Shrubs such as *Kalmia latifolia*, *Viburnum acerifolium* and *Hamamelis virginiana* are usually present. The herbaceous layer is commonly sparse with an often rich bryophyte and lichen assemblage.

Palustrine woodlands.—The one subcatagory of this plant community, broadleaf palustrine woodlands, is defined by red maple-sedge palustrine woodlands and red maple-mixed shrub palustrine woodlands.

The red maple-sedge palustrine woodlands is a type which occur in disturbed areas frequented by beavers. *Acer rubrum* is often the only tree species, however others may be scattered. The shrub layer is variable and may be dense in upland areas to nearly absent in wetter areas. The herbaceous layer is dominated by sedges.

The red maple-mixed shrub palustrine woodlands occurs on mineral soil with a thin layer of muck. *Acer rubrum* dominates the tree layer with *Cornus amomum*, *Ilex verticillata*, *Lindera benzoin*, *Alnus serrulata*, and *Salix sericea* as representative shrubs. The herbaceous layer is dominated by ferns.

Terrestrial shrublands.—The two subcatagories of this plant community are conifer-broadleaf terrestrial shrublands and broadleaf terrestrial shrublands.

The conifer-broadleaf terrestrial shrublands are defined by red-cedar-redbud shrubland. The red-cedar-redbud shrubland occurs on calcareous soils in areas where the conditions are dry enough to prevent forest development. *Juniperus virginiana* and *Cercis canadensis* are both characteristic taxa of these sites. The herbaceous layer contains various grass species along with *Lithospermum latifolium* and *Aquilegia canadensis*.

The broadleaf terrestrial shrublands are defined by low heath shrubland and scrub oak shrubland. The low heath shrubland are found on either sandy soil or on thin soil over bedrock. Typically found in exposed areas such as ridgetops where frost or drought conditions limit the establishment of trees and tall shrubs. Dominant species are *Vaccinium* spp., and/or *Gaylussacia baccata*. There is an herbaceous and creeping shrub layer with a moss and lichen cover that may be considerable.

The scrub oak shrublands have soil conditions similar to the low heath shrublands, however the former are usually situated in areas where frequent or recent disturbance has removed the tree layer. Scrub oak is the dominant species, occurring along with low growing shrubs such as *Vaccinium* spp., *Gault-*

heria procumbens, and *Gaylussacia baccata*. The herbaceous layer contains mostly various grasses.

Palustrine shrublands.—The one subcatagory of this plant community broadleaf palustrine shrublands, is defined by buttonbush wetland, alder-ninebark wetland, alder-sphagnum wetland, highbush blueberry-meadow-sweet wetland and black willow scrub/shrub wetland.

The buttonbush wetlands are characterized by prolonged flooding. Other shrubs besides *Cephalanthus occidentalis* would include *Cornus* spp., *Salix* spp., and *Sambucus canadensis*.

The alder-ninebark wetlands are shrub swamps dominated by *Alnus* spp. and *Physocarpus opulifolius*. They occur at the upland edge of marshes, at the wetter edge of red maple wetlands, in small upland depressions, or at the base of slopes. The soil generally contains minerals with a thin organic layer, although it may occur on shallow peat. The species composition is variable, and dominance may be shared by various shrubs species. The herbaceous layer contains *Thelypteris palustris*, *Typha latifolia*, and *Galium* spp.

The alder-sphagnum wetlands are dominated by *Alnus serrulata* and/or *A. incana* with a sphagnum layer. The substrate may be peat or a mineral layer with organic matter. Shrubs associated with this community are *Vaccinium corymbosum*, *Ilex verticillata*, and *Cornus racemosa* along with a variety of ferns and sedges.

The highbush blueberry-meadow-sweet wetland is dominated by *Vaccinium corymbosum*, *Spiraea latifolia* or *S. alba* with associates of *Amelanchier* spp, and *Sambucus canadensis*. The herbaceous layer is generally dominated by graminoids and ferns with the sphagnum either forms a continuous layer or forms a hummock.

The black willow scrub/shrub wetlands are types most typical of stream and riverbanks. *Salix nigra* dominates with *Alnus* spp., *Cornus* ssp. and *Salix* spp. also present. The herbaceous layer is variable and includes *Polygonum* spp., *Bidens* spp. along with *Phalaris arundinacea*.

Terrestrial herbaceous openings.—This type is defined by little bluestem-Pennsylvania sedge openings and calcareous opening/cliff lands.

The little bluestem-Pennsylvania sedge opening are grasslands that are on dry, acidic sites which discourage woody species growth. Mosses and lichens are abundant on some sites.

The calcareous opening/cliff lands are on calcareous cliffs, outcrops and rocky slopes. Species composition varies with the amount of moisture, shade and exposure. Woody species may occur at the margins or scattered and would include *Juniperus virginiana*, *Rhus aromatica*, *Toxicodendron radicans*, and *Cercis canadensis* to name a few. The herbaceous layer would include such species as *Aquilegia canadensis*, *Dodecatheon meadia*, and *Aster* spp.

Herbaceous wetlands.—The two subcategories are persistent emergent wetlands and non-persistent emergent wetlands. The persistent emergent wetlands are defined by the following fourteen types: bluejoint—reed canary grass marsh, cat-tail marsh, tussock sedge marsh, mixed forb marsh, herbaceous vernal pond, wet meadow, bulrush marsh, prairie sedge—spotted joe-pye-weed marsh, golden saxifrage—sedge rich seep, skunk cabbage—golden saxifrage forest seep, golden saxifrage—Pennsylvania bitter-cress spring run, water-willow (*Justicia ameicana*) smart weed riverbed community, riverside ice scour community, and big bluestem—Indian grass river grassland.

These wetlands maybe flooded for most of the year as are the marsh communities, or they are subject to seasonal flooding and/or ice scour. The substrate is usually peat, muck, mineral soil, sand deposits or rock; however, clay or clay-loam soils are found in the prairie sedge-spotted joe-pye-weed marsh. The water can be acidic, alkaline, calcareous or spring-like in nature. Although most of the communities are dominated by a herbaceous layer, shrubs and small trees may be present. Some communities are dominated by a single genus and/or species such as the bulrush marsh (*Schoenoplectus* spp.), the cat-tail marsh (*Typha* spp.), and the tusock sedge march (*Carex stricta*). Some areas are dominated by a general type of plant, such as the mixed forb marsh, where broad-leaved plants occur, or the wet meadow, where graminoids are typical. In the herbaceous vernal pond community the species composition varies between sites, as well as annually and seasonally. These habitats, especially the herbaceous vernal pond communities, are critical breeding habitat for amphibians and supply important habitat resources for many species of birds, mammals, reptiles, amphibians and invertebrates. The most common taxa include *Carex* spp., *Scirpus* spp. and *Typha* spp. Invasive species, such as *Lythrum salicaria* are found in some of the communities.The non-persistent emergent wetlands are defined by spatterdock—water lily wetland. These areas contain a combination of emergent and floating-leafed vegetation dominates this community where the substrate is seldom dry. The substrate is mineral soil, muck, or peat. Dominate species are *Nymphaea odorata* and *Nuphar lutea*, along with other aquatic vegetation.

Community complexes.—The one subcatagory is the river bed—bank—floodplain complex. Community types that characterize this complex are sycamore-(river birch)-box elder floodplain forest, silver maple floodplain forest, red maple-elm-willow floodplain swamp, river birch-sycamore floodplain scrub, black willow scrub/shrub wetland, riverside ice scour community, big bluestem-indian grass river grassland, and water-willow-smartweed riverbed community. All of these communities have been described except for the river birch-sycamore flood plain scrub that does not occur in Greene County.

ANNOTATED CHECKLIST OF THE SPECIES OF GREENE COUNTY, PENNSYLVANIA

Taxa are listed according to the following format: taxon name, author(s), (year) collector and number; **global:state ranking** [*Synonyms*] and * = exotic with non-native source. We follow the state (**S**) and global (**G**) ranking systems developed by The Nature Conservancy (1996 version). The global numbers are designated from **1** (critically imperiled) to **5** (secure). Other notations include **SH** = historical occurrence, and SR=reported without persuasive documentation. Synonyms have been included for recognized genera that are not yet in common usage in the state or regional manuals. In cases where there was more than one specimen present in the collection, the use of current known collectors for the western Pennsylvania region was used.

Families, genera, specific and infraspecific taxa are arranged alphabetically within vascular plant groups Lycophytes, Pteridophytes, Gymnosperms, and Angiosperms.

LYCOPHYTES

LYCOPODIACEAE

Huperzia lucidula (Michx.) Trevis., (1971) Buker, W.E.; Leighter, L.D.

Lycopodium digitatum Dill. ex. A. Braun, (1995) Isaac, B.L.; Isaac, J.A. 7543

Lycopodium tristachyum Purch, (1951) Henry, L.K.; Beer, F.H.

BALSAMINACEAE

Impatiens capensis Meerb., (2003) Isaac, J.A. 16375

Impatiens pallida Nutt., (2003) Isaac, J.A. 16374

BERBERIDACEAE

Berberis thunbergii DC., (2003) Isaac, J.A.; Isaac, B.L. 15849

Caulophyllum thalictroides (L.) Michx., (1996) Isaac, B.L.; Isaac, J.A. 8894

Jeffersonia diphylla (L.) Pers., (2003) Isaac, J.A. 15862

Podophyllum peltatum L., (2003) Isaac, J.A. 16415

BETULACEAE

Alnus serrulata (Aiton) Willd., Donley 153

Betula alleghaniensis Britt., (1974) Buker, W.E.

Betula nigra L., (2003) Coxe, R.

Carpinus caroliniana Walt., (2003) Isaac, J.A.; Isaac, B.L. 15825

Corylus americana Walt., (2003) Isaac, J.A.; Coxe, R. 16290

Ostrya virginiana (P. Mill.) K. Koch, (1954) Henry, L.K.; Buker, W.E.

BIGNONIACEAE

Campsis radicans (L.) Seem. ex Bureau, (1993) Haywood, M.J. 61

Catalpa bignonioides Walt., (2004) Isaac, J.A. 17641

BORAGINACEAE

**Cynoglossum officinale* L., (1904) Jennings, O.E.; Eurasia

Cynoglossum virginianum L., (1996) Isaac, B.L.; Isaac, J.A. 8867

**Echium vulgare* L., (2003) Isaac, J.A.; Coxe, R. 16280; Europe

Hackelia virginiana (L.) I.M. Johnston, (1994) Isaac, J.A. 6011

Lithospermum latifolium Michx., (2003) Isaac, J.A.; Coxe, R.; Ernst, S. 15890; **G4:S3**

Mertensia virginica (L.) Pers. ex Link, (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15809

**Myosotis arvensis* (L.) Hill, (1996) Isaac, B.L.; Isaac, J.A. 8913; Eurasia

Myosotis macrosperma Engelm., (1996) Isaac, B.L.; Isaac, J.A. 8854

**Symphytum officinale* L., (1994) Haywood, M.J. 516; Eurasia

BRASSICACEAE

**Alliaria petiolata* (Bieb.) Cavara & Grande, (2003) Isaac, J.A. 16011; Europe

**Arabidopsis thaliana* (L.) Heynh., (1971) Buker, W.E.; Leighter, L.D.; Europe

Arabis canadensis L., (2003) Isaac, J.A. 16154

Arabis laevigata (Muhl. ex Willd.) Poir., (2003) Isaac, J.A.; Isaac, B.L. 15843

Arabis lyrata L., (1950) Henry, L.K.; Beer, F.H.

**Barbarea vulgaris* Aiton f., (1996) Isaac, B.L.; Isaac, J.A. 8882; Eurasia

**Brassica juncea* (L.) Czern., (1952) Henry, L.K.; Beer, F.H.; Eurasia

**Brassica nigra* (L.) W.D.J. Koch, (2003) Isaac, J.A. 16618; Eurasia

**Brassica rapa* L., (1924) Wood, S.; Europe

**Capsella bursa-pastoris* (L.) Medik., (2003) Isaac, J.A. 16188; Eurasia

Cardamine angustata O.E. Schulz, (1992) Haywood, M.J. 6

Cardamine bulbosa (Schreb. ex Muhl.) B.S.P., (1970) Buker, W.E.; Henry, L.K.

Cardamine concatenata (Michx.) Sw., (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15803

Cardamine diphylla (Michx.) Wood, (2003) Isaac, J.A.; Isaac, B.L. 15847

Cardamine douglassii Britt., (2003) Isaac, J.A.; Isaac, B.L. 15831

**Cardamine hirsuta* L., (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15804; Europe

Cardamine parviflora L. var. *arenicola* (Britt.) O.E.Schulz, (1951) Henry, L.K.; Buker, W.E.

Cardamine pensylvanica Muhl. ex Willd., (2003) Isaac, J.A. 15871

Cardamine rotundifolia Michx., (2002) Haywood, M.J. 584

**Draba verna* L., (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15798; Europe

**Hesperis matronalis* L., (1996) Isaac, B.L.; Isaac, J.A. 8908, Europe

Iodanthus pinnatifidus (Michx.) Steud., (1922) Stewart; **G5:S1**

**Lepidium campestre* (L.) Aiton f., (1995) Isaac, B.L.; Isaac, J.A. 7123; Eurasia

Lepidium virginicum L., (2003) Isaac, J.A. 16123

**Microthlaspi perfoliatum* (L.) F.K. Mey., (1996) Isaac, B.L.; Isaac, J.A. 8843; Exotic

Rorippa palustris (L.) Bess. ssp. *fernaldiana* (Butters & Abbe) Jonsell, (2003) Isaac, J.A. 16318

**Rorippa sylvestris* (L.) Bess., (1952) Henry, L.K.; Beer, F.H.; Europe

**Sisymbrium officinale* (L.) Scop., (1995) Isaac, B.L.; Isaac, J.A. 7103; Europe

**Thlaspi alliaceum* L., (2003) Isaac, J.A. 16122; Europe

CAMPANULACEAE

Campanulastrum americana (L.) Small, (2003) Isaac, J. 17146

Lobelia inflata L., (1993) Haywood, M.J. 177

Lobelia siphilitica L., (1993) Haywood, M.J. 141

Lobelia spicata Lam. var. *leptostachys* (A. DC.) Mackenzie & Bush, (1951) Henry, L.K.; Beer, F.H.

Lobelia spicata Lam. var. *spicata*, (1993)Haywood, M.J. 360

Triodanis perfoliata (L.) Nieuwl., (1995) Isaac, B.L.; Isaac, J.A. 7093

CAPRIFOLIACEAE

Diervilla lonicera P. Mill., (1922) Dickey, S.S.

Lonicera canadensis Bartr. ex Marsh., (1993) Haywood, M.J. 103

Lonicera dioica L., (1952) Henry, L.K.; Buker, W.E.

**Lonicera japonica* Thunb., (2003) Isaac, J.A. 16136; Asia

**Lonicera morrowi* Gray, (2003) Isaac, J.A. 16024; Japan

Lonicera sempervirens L., (1896) Hoge, M.K.

Sambucus nigra L. ssp. *canadensis* (L.) R. Bolli, (2003) Isaac, J.A. 16177

Symphoricarpos orbiculatus Moench, (1984) Thompson, S.A.; Nishida, J.H.; Bier, C.W. 1976

Triosteum aurantiacum Bickn. var. *glaucescens* Wieg., (2003) Isaac, J.A. 15978

Triosteum aurantiacum Bickn. var. *illinoense* (Wieg.) Palmer & Steyermark, (2002) Isaac, J.A.; Takacs, M. 14488

Viburnum acerifolium L., (1996) Isaac, B.L.; Isaac, J.A. 8860

Viburnum dentatum L., (2003) Coxe, R.

Viburnum nudum L. var. *cassinoides* (L.) Torr. & A. Gray, (1993) Haywood, M.J. 112

Viburnum prunifolium L., (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15796

CARYOPHYLLACEAE

**Agrostemma githago* L., (1896) Hoge, M.K.; Europe

**Arenaria serpyllifolia* L., Bell 555; Europe

Cerastium arvense L., (2002) Isaac, J.A.; Takacs, M. 14400

**Cerastium fontanum* Baumg. ssp. *vulgare* (Hartman) Greuter & Burdet, (2003) Coxe, R.; Bradburn, M.; Eurasia

Cerastium nutans Raf., (1949) Henry, L.K.

**Dianthus armeria* L., (1995) Isaac, B.L.; Isaac, J.A. 7541; Europe

**Myosoton aquaticum* (L.) Moench, (1995) Isaac, B.L.; Isaac, J.A. 7175; Europe

Paronychia canadensis (L.) Wood, (2002) Isaac, J.A.; Takacs, M. 14415

Paronychia fastigiata (Raf.) Fern., (1997) Grund, S.P. 1975

**Saponaria officinalis* L., (2003) Isaac, J.A. 16613; Europe

**Silene latifolia* Poir., (2003) Isaac, J.A. 16626; Europe

Silene stellata (L.) Aiton f., (2003) Isaac, J. 17136

Silene virginica L., (1996) Isaac, B.L.; Isaac, J.A. 8865

**Stellaria graminea* L., (2003) Isaac, J.A. 16398; Europe

Stellaria longifolia Muhl. ex Willd., (1992) Haywood, M.J. 59

**Stellaria media* (L.) Vill., (2003) Isaac, J.A.; Isaac, B.L. 15818; Europe

Stellaria pubera Michx., (1955) Henry, L.K.; Buker, W.E.

CELASTRACEAE

**Celastrus orbiculatus* Thunb., (2003) Coxe, R.; Japan

Euonymus atropurpurea Jacq., (2003) Isaac, J.A.; Coxe, R. 16296

CHENOPODIACEAE

Chenopodium album L. var. *missouriense* (Aellen) I.J. Bassett & C.W. Crompton, (1954) Henry, L.K.; Buker, W.E.

**Chenopodium ambrosioides* L., (1984) Thompson, S.A.; Nishida, J.H. 2042; Tropic America

**Chenopodium botrys* L., (1955) Buker, W.E.; Europe

CISTACEAE

Lechea racemulosa Michx., (1995) Isaac, B.L.; Isaac, J.A. 7149

CLUSIACEAE

Hypericum gentianoides (L.) B.S.P., (1951) Henry, L.K.; Buker, W.E.

Hypericum hypericoides (L.) Crantz, (1951) Henry, L.K.; Beer, F.H.

Hypericum mutilum L., (1959) Henry, L.K.; Beer, F.H.

**Hypericum perforatum* L., (2003) Isaac, J.A. 16185; Europe

Hypericum prolificum L., (2003) Isaac, J.A. 16147

Hypericum punctatum Lam., (1993) Haywood, M.J. 120

COMMELINACEAE

Commelina communis L., (1993) Haywood, M.J. 133

CONVOLVULACEAE

Calystegia sepium (L.) R. Br., (1951) Henry, L.K.; Beer, F.H.

Calystegia silvatica (Kit.) Griseb., (2003) Isaac, J.A. 16611

Calystegia spithamaea (L.) Pursh, (1994) Haywood, M.J. 470

**Convulvulus arvensis* L., (1896) Hoge, M.K.; Europe

Ipomoea pandurata (L.) G. Mey., (1958) Buker, W.E.

CORNACEAE

Cornus alternifolia L. f., (1995) Isaac, B.L.; Isaac, J.A. 7091

Cornus amomum P. Mill., (1995) Isaac, B.L.; Isaac, J.A. 7514

Cornus florida L., (2003) Isaac, B.L.; Isaac, J.A. 15819

Cornus racemosa Lam., (2003) Isaac, J.; Haywood, M.J.; Coxe, R.; Brandburn, M. 17229

Nyssa sylvatica Marsh., (1951) Henry, L.K.; Beer, F.H.

CRASSULACEAE

Penthorum sedoides L., (2003) Isaac, J.A. 16588

Sedum ternatum Michx., (1996) Isaac, B.L.; Isaac, J.A. 8873

CUCURBITACEAE

Echinocystis lobata (Michx.) Torr. & Gray, (1950) Henry, L.K.; Beer, F.H.

Sicyos angulatus L., (2003) Isaac, J.; Coxe, R., Bradburn, M. 17216

CUSCUTACEAE

Cuscuta gronovii Willd. ex J.A. Schultes, (1984) Thompson, S.A.; Nishida, J.H. 2046

CYPERACEAE

Carex albicans Willd. ex Spreng. var. *albicans*., (1950) Henry, L.K.; Beer, F.H.

Carex albursina Sheldon, (1996) Isaac, B.L.; Isaac, J.A. 8869

Carex amphibola Steud., (1967) Duman, M.G.

Carex appalachica J. Webber & P.W. Ball, (2003) Isaac, J.A.; Isaac, B.L.; Isaac, H.R. 16107

Carex blanda Dewey, (2003) Isaac, J.A. 16305

Carex bromoides Schkuhr ex Willd., Bell 180

Carex bushii Mackenzie, Bell 192

Carex cephaloidea (Dewey) Dewey, (2003) Isaac, J.A. 16379

Carex cephalophora Muhl. ex Willd., (1993) Isaac, J.A. 4512

Carex communis Bailey, (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15800

Carex conjuncta Boott, (2003) Isaac, J.A. 16303

Carex cristatella Britt., (1993) Isaac, J.A. 4379

Carex debilis Michx. var. *rudgei* Bailey, Bell 181

Carex digitalis Willd., Bell 190

Carex frankii Kunth, (1995) Isaac, B.L.; Isaac, J.A. 7512

Carex gracilescens Steud., (1951) Henry, L.K.; Beer, F.H.

Carex granularis Muhl. ex Willd., (2003) Isaac, J.A. 16331

Carex hirsutella Mackenzie, (1995) Isaac, B.L.; Isaac, J.A. 7519

Carex hirtifolia Mackenzie, Bell 243

Carex hitchcockiana Dewey, Bell 166

Carex intumescens Rudge, Bell 179

Carex laevivaginata (Kükenth.) Mackenzie, (1951) Henry, L.K.; Beer, F.H.

Carex laxiculmis Schwein. var. *copulata* (Bailey) Fern., (1951) Henry, L.K.; Beer, F.H.

Carex laxiflora Lam., (1951) Henry, L.K.; Buker, W.E.

Carex lucorum Willd. ex Link, (1997) Grund 1852

Carex lupulina Muhl. ex Willd., Bell 273

Carex lurida Wahlenb., (2003) Isaac, J.A. 16368

Carex normalis Mackenzie, (1995) Isaac, B.L.; Isaac, J.A. 7092

Carex oligocarpa Schkuhr ex Willd., Duman, M.G.

Carex pensylvanica Lam., (1995) Grund, S.P.; Novak, J. 1029

Carex plantaginea Lam., (2003) Isaac, J.A 15875

Carex platyphylla Carey, (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15810

Carex prasina Wahlenb., (1951) Henry, L.K.; Beer, F.H.

Carex rosea Schkuhr ex Willd., (1995) Isaac, B.L.; Isaac, J.A. 7096

Carex scoparia Schkuhr ex Willd., (2003) Isaac, J.A. 16372

Carex sparganioides Muhl. ex Willd., (1997) Grund, S.P. 1831

Carex squarrosa L., Bell 274

**Carex stipata* Muhl. ex Willd. var. *stipata*, (2003) Isaac, J.A. 15982; Europe

Carex swanii (Fern.) Mackenzie, (2003) Isaac, J.A. 16585

Carex torta Boott ex Tuckerman, (1952) Henry, L.K.; Buker, W.E.

Carex tribuloides Wahlenb., (1952) Henry, L.K.; Beer, F.H.

Carex vulpinoidea Michx., (1995) Isaac, B.L.; Isaac, J.A. 7500

Carex willdenowii Schkuhr ex Willd., Bell 250

Carex woodii Dewey, (1998) Grund, S.P. 1897

Cyperus bipartitus Torr., (1921) Jennings, O.E.; Jennings, G.K.; et al.

Cyperus esculentus L., Donley 95

Cyperus flavescens L., (1984) Thompson, S.A.; Nishida, J.H. 2013

Cyperus strigosus L., (2003) Isaac, J.A. 16567

Eleocharis obtusa (Willd.) J.A. Schultes, (2003) Isaac, J.A. 16195

Scirpus cyperinus (L.) Kunth, (1955) Buker, W.E.

Scirpus georgianus Harper, (2003) Coxe, R.

Scirpus hattorianus Makino, (2003) Isaac, J.A. 16570

Scirpus polyphyllus Vahl, Lohr 160

DIOSCOREACEAE

Dioscorea villosa L., (1996) Isaac, B.L.; Isaac, J.A. 8863

DIPSACACEAE

**Dipsacus fullonum* L., (2003) Isaac, J.A. 16629; Exotic

ELAEAGNACEAE

**Elaeagnus umbellata* Thunb., (2003) Isaac, J.A.; Isaac, B.L. 15820; Asia

ERICACEAE

Epigaea repens L., (1951) Buker, W.E.

Gaultheria procumbens L., (1950) Henry, L.K.; Buker, W.E.

Gaylussacia baccata (Wangenh.) K. Koch, (2004) Isaac, J.A. 17375

Kalmia latifolia L., (1951) Henry, L.K.; Beer, F.H.

Oxydendrum arboreum (L.) DC., (2004) Isaac, J.A. 17638; **G5:S3S4**

Rhododendron maximum L., Bell 580

Rhododendron periclymenoides (Michx.) Shinners, (2004) Isaac, J.A. 17377

Vaccinium corymbosum L., (1907) Jennings, O.E.

Vaccinium pallidum Aiton, (2002) Isaac, J.A.; Takacs, M. 14402

Vaccinium stamineum L., (2002) Isaac, J.A.; Takacs, M. 14404

EUPHORBIACEAE

Acalypha rhomboidea Raf., (1992) Haywood, M.H. 404

Acalypha virginica L., (1993) Haywood, M.J. 211

Chamaesyce maculata (L.) Small, (1955) Buker, W.E.

Chamaesyce nutans (Lag.) Small, (1993) Haywood, M.J. 170

Euphorbia commutata Engelm., (1997) Grund, S.P.; Gray, A.; Folman, J.; Gardner, M. 1820

Euphorbia corollata L., (2003) Isaac, J.A. 16390

FABACEAE

Amphicarpaea bracteata (L.) Fern., (1984) Thompson, S.A.; Nishida, J.H.; Bier, C.W. 1945

Apios americana Medik., (1993) Haywood, M.J. 159

Cercis canadensis L., (2003) Isaac, J.A.; Isaac, B.L. 15821

Chamaecrista nictitans (L.) Moench, (1953) Buker, W.E.

**Coronilla varia* L., (1995) Isaac, B.L.; Isaac, J.A. 7505; Europe

Desmodium canadense (L.) DC., (1993) Haywood, M.J. 194

Desmodium glutinosum (Muhl. Ex Willd.) Wood, (2003) Isaac, J.A. 16349

Desmodium marilandicum (L.) DC., (1966) Buker, W.E.

Desmodium nudiflorum (L.) DC., (1951) Henry, L.K.; Beer, F.H.

Desmodium paniculatum (L.) DC., (2003) Isaac, J.A. 17156

Desmodium perplexum Schub., (1993) Haywood, M.J. 157

Desmodium rotundifolium DC., (1954) Henry, L.K.; Buker, W.E.

Gleditsia triacanthos L., (2004) Isaac, A.A. 17508

Gymnocladus dioicus (L.) K. Koch, Donley 160

**Lathyrus sylvestris* L., (1995) Isaac, B.L.; Isaac, J.A. 7485; Exotic

Lespedeza hirta (L.) Hornem., (1974) Buker, W.E.

Lespedeza procumbens Michx., (1921) Jennings, O.E.; Jennings, G.K.; et al.

Lespedeza repens (L.) W. Bart., (1954) Henry, L.K.; Buker, W.E.

Lespedeza violacea (L.) Pers., (1969) Buker, W.E.

Lespedeza virginica (L.) Britt, Lohr 174

**Lotus corniculatus* L., (2003) Isaac, J.A. 16176; Europe

**Medicago lupulina* L., (1995) Isaac, B.L.; Isaac, J.A. 7495; Eurasia

**Medicago sativa* L., (1958) Buker, W.E.; Eurasia

**Melilotus officinalis* (L.) Lam., (2003) Isaac, J.A. 16113; Eurasia

Robinia pseudoacacia L., (2003) Isaac, J.A. 16039

Senna hebecarpa (Fern.) Irwin & Barneby, (2003) Isaac, J. 17153

Senna marilandica (L.) Link, (1951) Henry, L.K.; Beer, F.H.; **G5:S1**

**Trifolium aureum* Pollich, (2003) Isaac, J.A. 16324; Eurasia

**Trifolium campestre* Schreb., (2003) Isaac, J.A. 15988; Europe

**Trifolium hybridum* L., (1985) Thompson, S.A.; Nishida, J.H. 2351; Eurasia

**Trifolium pratense* L., (1995) Isaac, B.L.; Isaac, J.A. 7496; Europe

**Trifolium repens* L., (2003) Isaac, J.A. 16117; Europe

Vicia caroliniana Walt., (1994) Haywood, M.J. 446

**Vicia cracca* L., (1896) Hoge, M.K.; Eurasia

**Vicia villosa* Roth, (2003) Isaac, J.A. 16401; Europe

FAGACEAE

Castanea dentata (Marsh.) Borkh., (2003) Isaac, J.A. 16586

Fagus grandifolia Ehrh., (2004) Isaac, J.A. 17633
Quercus alba L., (1985) Thompson, S.A. 2435
Quercus bicolor Willd., (1921) Dickey, S.S.
Quercus coccinea Muenchh., (1954) Henry, L.K.; Buker, W.E.
Quercus imbricaria Michx., (2003) Isaac, J.A. 16159
Quercus muehlenbergii Engelm., (1984) Thompson, S.A.; Nishida, J.H.; Bier, C.W. 2002
Quercus prinus L., (1991) Isaac, J.A. 3647
Quercus rubra L., (1985) Thompson, S.A. 2432
Quercus stellata Wangenh., (1948) Bryner, C.L. 501
Quercus velutina Lam., (1985) Thompson, S.A. 2434
Quercus x leana Nutt. (pro sp.), (1948) Bryner, C.L. 502

FUMARIACEAE

Corydalis aurea Willd., (1996) Haywood, M.J. 634
Corydalis flavula (Raf.) DC., (2003) Isaac, B.L.; Isaac, J.A. 15827
Dicentra canadensis (Goldie) Walp., (2003) Isaac, B.L.; Isaac, J.A. 15844
Dicentra cucullaria (L.) Bernh., (2003) Isaac, B.L.; Isaac, J.A. 15858

GENTIANACEAE

Gentiana andrewsii Griseb. var.andrewsii, (2003) Coxe, R.; Block, R.; Bradburn, M.
Gentiana clausa Raf., (1954) Henry, L.K.; Buker, W.E.
Obolaria virginica L., (1952) Henry, L.K.; Buker, W.E.
Sabatia angularis (L.) Pursh, (1998) Grund, S.P. 2061

GERANIACEAE

**Geranium columbinum* L., (1993) Isaac, J.A. 4505; Europe
Geranium maculatum L., (2003) Isaac, J.A.; Isaac, B.L. 15838
**Geranium sibiricum* L., (1984) Thompson, S.A.; Nishida, J.H., Bier, C. 1954; Eurasia
**Geranium thunbergii* Sieb. & Zucc. ex Lindl. & Paxton, (1984) Thompson, S.A.; Nishida, J.H. 2007; Exotic

GROSSULARIACEAE

Ribes cynosbati L., (2003) Isaac, J.A. 16334
**Ribes rubrum* L., Rhoads, A.; Eurasia

HALORAGRACEAE

Myriophyllum heterophyllum Michx., (2003) Coxe, R.; **G5:S1**

HAMAMELIDACEAE

Hamamelis virginiana L., (2004) Isaac, J.A. 17635

HIPPOCASTANACEAE

Aesculus flava Aiton, (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15811
Aesculus glabra Willd., (2003) Isaac, J.A. 15883

HYDRANGEACEAE

Hydrangea arborescens L., (2003) Isaac, J.A. 16366
**Philadelphus coronarius* L., (1896) Hoge, M.K.; Eurasia

HYDROPHYLLACEAE

Hydrophyllum appendiculatum Michx., (1995) Isaac, B.L.; Isaac, J.A. 7183
Hydrophyllum canadense L., (1995) Isaac, B.L.; Isaac, J.A. 7164
Hydrophyllum macrophyllum Nutt., (2003) Isaac, J.A. 15882; **G5:S1**
Hydrophyllum virginianum L., (1996) Isaac, B.L.; Isaac, J.A. 8846
Phacelia purshii Buckl., (2003) Isaac, J.A. 16040

IRIDACEAE

Iris cristata Aiton, (2004) Isaac, J.A. 17380; **G5:S1**
Iris pseudacorus L., (2003) Isaac, J.A. 16193
Sisyrinchium angustifolium P. Mill., (1993) Isaac, J.A. 4377

JUGLANDACEAE

Carya alba (L.) Nutt. ex Ell., (1921) Jennings, O.E.
Carya cordiformis (Wangenh.) K. Koch, (1993) Haywood, M.J. 197
Carya glabra (P. Mill.) Sweet, (1905) Jennings, O.E.
Carya ovalis (Wangenh.) Sarg., (1954) Henry, L.K.; Buker, W.E.
Carya ovata (P. Mill.) K. Koch, (1921) Jennings, O.E.
Juglans cinerea L., (2003) Isaac, J.A. 16392
Juglans nigra L., (1951) Henry, L.K.; Beer, F.H.

JUNCACEAE

Juncus acuminatus Michx., (2003) Coxe, R.; Bradburn, M.
Juncus effusus L. var. *pylaei* (Laharpe) Fern. & Wieg., (1954) Henry, L.K.; Buker, W.E.
Juncus effusus L. var. *solutus* Fern. & Wieg., (2003) Isaac, J.A. 16190
Juncus marginatus Rostk., (1951) Henry, L.K.; Beer, F.H.
Juncus tenuis Willd., (2003) Isaac, J.A. 16307
Juncus torreyi Coville, (2002) Paluh, A.T. 1
Luzula acuminata Raf., (1996) Isaac, B.L.; Isaac, J.A. 8888
Luzula echinata (Small) F.J. Herm., Bell 422

Luzula multiflora (Ehrh.) Lej., (1996) Isaac, B.L.; Isaac, J.A. 8887

LAMIACEAE

Agastache nepetoides (L.) Kuntze, (1975) Buker, W.E.

Blephilia hirsuta (Pursh) Benth., (1995) Isaac, B.L.; Isaac, J.A. 7520

**Clinopodium vulgare* L., (2003) Isaac, J.A. 16370; Europe

Collinsonia canadensis L., (1984) Thompson, S.A.; Nishida, J.H.; Bier, C.W. 1992

Cunila origanoides (L.) Britt., (1951) Henry, L.K.; Beer, F.H.

**Glechoma hederacea* L., (1996) Isaac, J.A.; Isaac, B.L. 8840; Eurasia

Hedeoma pulegioides (L.) Pers., (1994) Thompson, S.A.; Rawlins, J.E. 11731

Isanthus brachiatus (L.) B.S.P., 1921) Jennings, O.E.

**Lamium amplexicaule* L., (1996) Haywood, M.J. 631; Eurasia

**Lamium maculatum* L., (1947) Henry, L.K.; Eurasia

**Lamium purpureum* L., (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15802; Eurasia

**Leonurus cardiaca* L., (1995) Isaac, B.L.; Isaac, J.A. 7481; Asia

Lycopus americanus Muhl. ex W. Bart., (1984) Thompson, S.A.; Nishida, J.H. 2026

Lycopus uniflorus Michx. var. uniflorus, (1993) Haywood, M.J. 154

Lycopus virginicus L., (2003) Isaac, J.A. 16572

Meehania cordata (Nutt.) Britt., Bell 619; **G5**:**S1**

Mentha arvensis L., (1950) Henry, L.K.; Buker, W.E.

**Mentha x piperita* L. (pro sp.), (1951) Henry, L.K.; Beer, F.H.; Eurasia

**Mentha spicata* L., (1951) Henry, L.K.; Beer, F.H.; Europe

Monarda clinopodia L., (2003) Isaac, J.A. 16388

Monarda fistulosa L., (1995) Isaac, B.L.; Isaac, J.A. 7538

Monarda media Willd., (1907) Jennings, O.E.

**Nepeta cataria* L., (1954) Henry, L.K.; Buker, W.E.; Europe

Prunella vulgaris L. ssp. *lanceolata* (W. Bart.)

Hulten, (1995) Isaac, B.L.; Isaac, J.A. 7529

Pycnanthemum incanum (L.) Michx., (1951) Henry, L.K.; Buker, W.E.

Pycnanthemum tenuifolium Schrad., (1951) Henry, L.K.; Buker, W.E.

Salvia lyrata L., (2003) Isaac, J.A. 16048

Scutellaria incana Biehler, (2003) Isaac, J.A. 16579

Scutellaria lateriflora L., (1984) Thompson, S.A.; Nishida, J.H. 2077

Scutellaria nervosa Pursh, (2003) Isaac, J.A. 16332

Scutellaria saxatilis Riddell, (2003) Isaac, J.; Haywood, M.J.; Coxe, R.; Brandburn, M. 17230; **G3**:**S1**

Stachys nuttallii Schuttlw. ex. Benth., (2003) Isaac, J.; Coxe, R.; Bradburn, M. 17214

Stachys tenuifolia Willd., (2003) Isaac, J.; Coxe, R.; Bradburn, M. 17223

Teucrium canadense L., (1993) Haywood, M.J. 127

Trichostema dichotomum L., (1921) Dickey, S.S.

LAURACEAE

Lindera benzoin (L.) Blume, (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15799

Sassafras albidum (Nutt.) Nees, (1995) Isaac, B.L.; Isaac, J.A. 7095

LEMNACEAE

Lemna minor L., (2003) Isaac, J.A. 16402

LILIACEAE

Allium canadense L., (2003) Isaac, J.A. 16132

Allium cernuum Roth, (2003) Isaac, J.A. 16583

Allium tricoccum Aiton, (1996) Haywood, M.J. 411

**Allium vineale* L., (2003) Isaac, J.A. 16139; Europe

Clintonia umbellulata (Michx.) Morong, Bell 377

**Convallaria majalis* L., (1896) Hoge, M.K.; Europe

Erythronium albidum Nutt., (1993) Haywood, M.J. 77; **G5**:**S3**

Erythronium americanum Ker-Gawl., (2003) Isaac, J.A.; Isaac, B.L. 15832

**Hemerocallis fulva* (L.) L., (2003) Isaac, J. 16317; Asia

**Hyacinthus orientalis* L., (1941) Henry, L.K.; Exotic

Hypoxis hirsuta (L.) Coville, Sebben

Lilium superbum L., (2003) Coxe, R.; Bradburn, M.

Maianthemum racemosa (L.) Link, (2003) J.A. Isaac 16023

Medeola virginiana L., (1993) Isaac, J.A. 4367

**Narcissus poeticus* L., (1896) Hoge, M.K.; Europe

**Ornithogalum umbellatum* L., (1995) Isaac, B.L.; Isaac, J.A. 7182; Europe

Polygonatum biflorum (Walt.) Ell. var. *commutatum* (J.A. & J.H. Schultes) Morong

{(1975) Buker, W.E.

Polygonatum pubescens (Willd.) Pursh, (1996) Isaac, B.L.; Isaac, J.A. 8899

Prosartes lanuginosa (Michx.) D.Don, (1970) Buker, W.E.; [*Disporum lanuginosa* (Michx.) Nichols.]

Trillium erectum L., (2003) Isaac, B.L.; Isaac, J.A. 15854

Trillium grandiflorum (Michx.) Salisb., (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15807

Trillium nivale Riddell, (1997) Grund, S.P.; Gray, A.; Folman, J.; Gardner, M. 1818; **G4:S3**

Trillium sessile L., (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15808

Uvularia grandiflora Sm., (2003) Isaac, J.A.; Isaac, B.L. 15841

Uvularia perfoliata L., (1993) Haywood, M.J. 79

LIMNANTHACEAE

Floerkea proserpinacoides Willd., (2003) Isaac, J.A.; Isaac, B.L. 15830

LINACEAE

Linum virginianum L., (1951) Henry, L.K.; Beer, F.H.

LYTHRACEAE

Cuphea viscosissima Jacq., (1991) Isaac, J.A. 3674

**Lythrum salicaria* L., (1993) Haywood, M.J. 151; Europe

MAGNOLIACEAE

Liriodendron tulipifera L., (1996) Isaac, B.L.; Isaac, J.A. 8868

Magnolia acuminata (L.) L., (1904) Jennings, O.E.

MALVACEAE

**Abutilon theophrastii* Medik., (1951) Henry, L.K.; Beer, F.H.; Asia

**Hibiscus trionum* L., (1984) Thompson, S.A.; Nishida, J.H. 2044; Europe

**Malva moschata* L., Lohr; Europe

**Malva neglecta* Wallr., Lohr 260; Eurasia/ N. Africa

**Sida spinosa* L., (1951)Henry, L.K.; Beer, F.H.; Tropics

MELASTOMACEAE

Rhexia virginica L., (2003) Isaac, J.A. 17150

MENISPERMACEAE

Menispermum canadense L., (2003) Isaac, J.A. 16339

MOLLUGINACEAE

**Mollugo verticillata* L., (1951) Henry, L.K.; Beer, F.H.; Tropic America

MONOTROPACEAE

Monotropa hypopithys L., (2004) Isaac, J.A. 17653

Monotropa uniflora L., (2003) Isaac, J.A. 16414

MORACEAE

Maclura pomifera (Raf.) Schneid., (2003) Isaac, J.A. 16316

**Morus alba* L., (1951) Henry, L.K.; Beer, F.H.; Asia

Morus rubra L., (1996) Isaac, B.L.; Isaac, J.A. 8864

OLEACEAE

Chionantheus virginicus L., (1896) Hoge, M.K.

Fraxinus americana L., (2003) Isaac, J.A. 16403

Fraxinus nigra Marsh., Bell

**Syringa vulgaris* L., (1896) Hoge, M.K.; Europe

ONAGRACEAE

Circaea lutetiana L. ssp. *canadensis* (L.) Aschers. & Magnus, (1996) Haywood, M.J. 620

Epilobium coloratum Biehler, (1984) Thompson, S.A.; Nishida, J.H. 2043

Gaura biennis L., (1993) Haywood, M.J. 179

Ludwigia alternifolia L., (2003) Isaac, J.A. 17149

Ludwigia palustris (L.) Ell., (2003) Coxe, R.; Bradburn, M.

Oenothera biennis L., (2003) Isaac, J.A. 16605

Oenothera fruticosa L., (1896) Hoge, M.K.

Oenothera parviflora L., Donley, B.F.

Oenothera perennis L., (1994) Haywood, M.J. 468

ORCHIDACEAE

Aplectrum hyemale (Muhl. ex Willd.) Torr., (1997) Shriver, J.S.; Shriver, A.; Smith C. 868; **G5:S3**

Cypripedium acaule Aiton, (1922) Dickey, S.S.

Goodyera pubescens (Willd.) R. Br. ex Aiton f., (1997) Shriver, J.S.; Shriver, A.; Smith, C. 867

Isotria medeoloides (Pursh) Raf., (1922) Bright, J.

Isotria verticillata Raf., (1922) Dickey, S.S.

Liparis liliifolia (L.) L.C. Rich. ex Ker-Gawl., (1995) Isaac, B.L.; Isaac, J.A. 7159

Platanthera lacera (Michx.) G. Don, (2003) Isaac, J.A.; Coxe, R. 16292

Platanthera orbiculata (Pursh) Lindl., (1953) Krouse, D.H.

Spiranthes cernua (L.) L.C. Rich., Lohr, W.N.

Spiranthes lacera (Raf.) Raf. var. *gracilis* (Bigelow) Luer, (2004) Isaac, J.A.; Smith, C. 18488

Spiranthes ochroleuca (Rydb.) Rydb., (1969) Buker, W.E.

Spiranthes ovalis Lindl., (2003) Isaac, J.; Coxe, R.; Bradburn, M. 17225

OROBANCHACEAE

Conopholis americana (L.) Wallr. f., (2003) Isaac, J.A. 16165

Epifagus virginiana (L.) W. Bart., (1969) Buker, W.E.

Orobanche uniflora L., (1996) Isaac, B.L.; Isaac, J.A. 8871

OXALIDACEAE

Oxalis dillenii Jacq., (2003) Isaac, J.A. 16376
Oxalis grandis Small, (2003) Isaac, J.A. 16326
Oxalis stricta L., (1993) Haywood, M.J. 100
Oxalis violacea L., (1996) Haywood, M.J. 629

PAPAVERACEAE

**Chelidonium majus* L., (1994) Haywood, M.J. 426; Europe
Sanguinaria canadensis L., (2003) Isaac, J.A.; Isaac, B.L. 15855

PASSIFLORACEAE

Passiflora lutea L., (2003) Isaac, J.; Coxe, R.; Bradburn, M. 17221; **G5:S1**

PHYTOLACCACEAE

Phytolacca americana L., (1993) Haywood, M.J. 308

PLANTAGINACEAE

Plantago aristata Michx., (1954) Henry, L.K.; Buker, W.E.
**Plantago lanceolata* L., (1996) Isaac, B.L.; Isaac, J.A. 8900; Europe
**Plantago major* L., (1984) Thompson, S.A.; Nishida, J.H. 2050; Europe
Plantago rugelii Dcne., (2003) Isaac, J.A. 16399
Plantago virginica L., (1975) Buker, W.E.

PLATANACEAE

Platanus occidentalis L., (1995) Isaac, B.L.; Isaac, J.A. 7491

POACEAE

**Agrostis gigantea* Roth, (2003) Isaac, J.A.; Coxe, R. 16285; Europe
Agrostis perennans (Walt.) Tuckerman, (1994) Thompson, S.A.; Rawlins, J.E. 11969
Agrostis scabra Willd., Pohl 5922
Andropogon virginicus L., (1951) Henry, L.K.; Beer, F.H.
**Anthoxanthum odoratum* L., (2003) Isaac, J.A. 15989; Eurasia
Aristida dichotoma Michx. var. *dichotoma*, Bell 334
**Arrhenatherum elatius* (L.) Beauv. ex J. & C. Presl, (1995) Isaac, B.L.; Isaac, J.A. 7516; Europe
**Avena fatua* L., (1971) Buker, W.E.; Europe
Bromus ciliatus L., (2003) Coxe, R.
**Bromus commutatus* Schrad., (2003) Isaac, J.A. 16175; Europe
**Bromus inermis* Leyss., (1995) Isaac, B.L.; Isaac, J.A. 7489; Europe
**Bromus japonicus* Thunb. ex Murr., (1995) Isaac, B.L.; Isaac, J.A. 7488; Eurasia
Bromus latiglumis (Shear) A.S. Hitchc., Fogg 18323
Bromus pubescens Muhl. ex Willd., (2003) Isaac, J.A. 16416
**Bromus racemosus* L., (1985) Thompson, S.A.; Nishida, J.H. 2419; Europe
**Bromus sterilis* L., (1996) Isaac, B.L.; Isaac, J.A. 8844; Europe
Chasmanthium latifolium (Michx.) Yates, (2003) Coxe, R.; Bradburn, M.; **G5:S1**
Cinna arundinacea L., (1984) Thompson, S.A.; Nishida, J.H.; Bier, C.W. 1987
**Dactylis glomerata* L., (2003) Isaac, J.A.; Isaac, B.L.; Isaac, H.R. 16096; Europe
Danthonia compressa Austin ex Peck, (2003) Isaac, J.A. 16151
Danthonia spicata (L.) Beauv. ex Roemer & J.A. Schultes, (2003) Isaac, J.A. 16352
Diarrhena americana Beauv., (2002) Isaac, B.L.; Isaac, J.A. 15787; **G4?:S1**
Dichanthelium acuminatum (Sw.) Gould & C.A. Clark, (2004) Isaac, J.A. 17733
Dichanthelium boscii (Poir.) Gould & C.A. Clark, (1995) Isaac, B.L.; Isaac, J.A. 7162
Dichanthelium clandestinum (L.) Gould, (1995) Isaac, B.L.; Isaac, J.A. 7535
Dichanthelium commutatum (J.A. Schultes) Gould, (2003) Isaac, J.A. 16409
Dichanthelium dichotomum (L.) Gould, (1904) Jennings, O.E.
Dichanthelium latifolium (L.) Gould & C.A. Clark, (2003) Isaac, J.A. 16346
Dichanthelium linearifolium (Scribn. ex. Nash) Gould, (2004) Isaac, J.A. 17629
Dichanthelium sabulorum (Lam.) Gould & C.A. Clark var. *thinium* (A.S. Hitchc. & Chase) Gould & C.A. Clark, (2002) Isaac, J.A.; Takacs, M. 14416
**Digitaria ischaemum* (Schreb.) Schreb. ex Muhl, (1984) Thompson, S.A.; Nishida, J.H. 2075; Eurasia
**Echinochloa crus-galli* (L.) Beauv., (1993) Haywood, M.J. 165; Eurasia
**Eleusine indica* (L.) Gaertn., (2003) Isaac, J.A. 16616; Old World Tropics

Elymus canadensis L., (1951) Henry, L.K.; Buker, W.E.
Elymus hystrix L., (2003) Isaac, J.A. 16299
**Elymus repens* (L.) Gould, (2003) Isaac, J.A. 16119; Exotic
Elymus riparius Wieg., (2003) Isaac, J.A. 16172
Elymus villosus Muhl. ex Willd., (2003) Isaac, J.A 16135
Elymus virginicus L., (1951) Henry, L.K.; Buker, W.E.
Eragrostis spectabilis (Pursh) Steud., (1941) Davis, H.A.; et al.
Festuca subverticillata (Pers.) Alexeev, (2003) Isaac, J.A.; Isaac, B.L.; Isaac, H.R. 16103
Glyceria septentrionalis A.S. Hitchc., Bell 271
Glyceria striata (Lam.) A.S.Hitchc., (2003) Isaac, J.A. 16192
**Holcus lanatus* L., (2003) Isaac, J.A. 16172; Europe
Leersia oryzoides (L.) Sw., (1951) Henry, L.K.; Beer, F.H.
Leersia virginica Willd., (1984) Thompson, S.A.; Nishida, J.H.; Bier, C.W. 1999
**Lolium perenne* L., (1995) Isaac, B.L.; Isaac, J.A. 7498; Europe
**Lolium pratense* (Huds.) S.J. Darbyshire, (2003) Isaac, J.A.; Isaac, B.L.; Isaac, H.R. 16097; Europe
Muhlenbergia frondosa (Poir.) Fern, Bell 3645
Muhlenbergia schreberi J.F. Gmel., (1984) Thompson, S.A.; Nishida, J.H. 2076

Polygonum sagittatum L., (1984) Thompson, S.A.; Nishida, J.H.; Bier, C.W. 1975
Polygonum.scandens L. var. *scandens*, (2004) Isaac, J.A. 18515
Polygonum virginianum L., (1998) Grund, S.P. 2048

**Rumex acetosella* L., (1996) Isaac, B.L.; Isaac, J.A. 8874; Europe

**Rumex crispus* L., (2003) Isaac, J.A. 16110; Europe

**Rumex obtusifolius* L., (2003) Isaac, J.A. 16302; Europe

PORTULACACEAE

Claytonia caroliniana Michx., (2003) Isaac, J.A.; Isaac, B.L. 15853

Claytonia virginica L., (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15797

Portulaca oleracea L., (2003) Isaac, J.A. 16624

PRIMULACEAE

Lysimachia ciliata L., (1995) Isaac, B.L.; Isaac, J.A. 7525

Lysimachia lanceolata Walt., (1993) Haywood, M.J. 69

**Lysimachia nummularia* L., (1995) Isaac, B.L.; Isaac, J.A. 7508; Europe

Lysimachia quadrifolia L., (1995) Isaac, B.L.; Isaac, J.A. 7531

PYROLACEAE

Chimaphila maculata (L.) Pursh, (2004) Isaac, J.A. 17654

Pyrola americana Sweet, (1968) Buker, W.E.

RANUNCULACEAE

Aconitum uncinatum L., (1932) Bright, J. 7641; **G4:S2**

Actaea pachypoda Ell., (1969) Buker, W.E.

Actaea racemosa L. var. *racemosa*, (2003) Isaac, J.A. 16575

Anemone quinquefolia L., Lohr

Anemone virginiana L., (2003) Isaac, J.A. 16121

Aquilegia canadensis L., (2003) Isaac, J.A. 15900

Caltha palustris L. var. *palustris*, Bell 423

Clematis occidentalis (Hornem.) DC., (1896) Hoge, M.K.

Clematis virginiana L., (2003) Isaac, J. 17138

Delphinium tricorne Michx., (1996) Isaac, B.L.; Isaac, J.A. 8850

**Helleborus viridis* L., (1940) Baker; Exotic

Hepatica nobilis Schreber var. *acuta* (Pursh) Steyermark, (2003) Isaac, B.L.; Isaac, J.A.; Morton C.M. 15814

Hepatica nobilis Schreber var. *obtusa* (Pursh) Steyermark, (1952) Henry, L.K.; Buker, W.E.

Hydrastis canadensis L., (2003) Isaac, J.A. 16335

Ranunculus abortivus L., (2003) Isaac, J.A.; Isaac, B.L.; Isaac, H.R. 16098

**Ranunculus acris* L., (1995) Haywood, M.J. 561; Europe

Ranunculus allegheniensis Britt., (1996) Isaac, B.L.; Isaac, J.A. 8909

**Ranunculus ficaria* L., (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15812; Eurasia

Ranunculus hispidus Michx. var. *hispida*, (2003) Isaac, J.A.; Isaac, B.L. 15835

Ranunculus hispidus Michx. var. *nitidus* (Chapman) T. Duncan, (1994) Haywood, M.J. 25

Ranunculus micranthus Nutt., (2003) Isaac, J.A.; Isaac, B.L. 15828

Ranunculus recurvatus Poir., (1996) Isaac, J.A.; Isaac, B.L. 8902

**Ranunculus repens* L., (1995) Isaac, J.A.; Isaac, B.L. 7178; Europe

Thalictrum dioicum L., (2003) Isaac, J.A.; Isaac, B.L. 15842

Thalictrum pubescens Pursh, (2003) Isaac, J.A. 16356

Thalictrum thalictroides (L.) Eames & Boivin, (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15815

RHAMNACEAE

Ceanothus americanus L., (2003) Isaac, J.A. 16378

ROSACEAE

Agrimonia gryposepala Wallr., (1993) Haywood, M.J. 95

Agrimonia parviflora Aiton, (1951) Henry, L.K.; Beer, F.H.

Agrimonia pubescens Wallr., (1998) Grund, S.P. 2058

Agrimonia rostellata Wallr., (2003) Coxe, R.; Isaac, J.; Haywood, M.J.

Amelanchier arborea (Michx. f.) Fern., (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15806

Amelanchier stolonifera Wieg., (1949) Henry, L.K.

Aruncus dioicus (Walt.) Fern., (2003) Isaac, J.A. 16178

Crataegus crus-gallii L., (2003) Coxe, R.; Isaac, J.A.; Ernst, S.

Crataegus punctata Jacq., (2003) Isaac, J.A. 16020

Fragaria virginiana Duchesne, (1994) Haywood, M.J. 39

Geum aleppicum Jacq., (1993) Haywood, M.J. 68

Geum canadense Jacq. var. *canadense*, (1995) Isaac, J.A.; Isaac, B.L. 7517

Geum vernum (Raf.) Torr. & Gray, (1996) Isaac, J.A.; Isaac, B.L. 8856

Geum virginianum L., (1950) Henry, L.K.; Buker, W.E.

Malus coronari (L.) P. Mill., (2003) Isaac, J.A. 16417

**Malus pumila* P. Mill, (2003) Isaac, J.A.; Isaac, B.L. 15822; Eurasia

Physocarpus opulifolius (L.) Maxim., (1994) Haywood, M.J. 477

Potentilla canadensis L., (1999) Haywood, M.J. 05

Potentilla norvegica L. ssp. *monspeliensis* (L.) Aschers. & Graebn., (1995) Isaac, B.L.; Isaac, J.A. 7501

**Potentilla recta* L., (1995) Isaac, B.L.; Isaac, J.A. 7533, Europe

Potentilla simplex Michx., (1996) Isaac, B.L., Isaac, J.A. 8896

Prunus americana Marsh., (1951) Henry, L.K.; Beer, F.H.

**Prunus avium* (L.) L., (2003) Coxe, R.; Bradburn, M.; Eurasia

Prunus serotina Ehrh., (2003) Isaac, J.A. 16027

Prunus virginiana L., (1975) Buker, W.E.

**Rhodotypos scandens* (Thunb.) Makino, (2003) Isaac, J.A. 15977; Japan

Rosa carolina L. var. *carolina*, (2003) Isaac, J.A.; Coxe, R. 16281

**Rosa eglanteria* L., (1992) Haywood, M.J. 377; Europe

**Rosa multiflora* Thunb. ex Murr., (1995) Isaac, B.L.; Isaac, J.A. 7539; Asia

Rosa palustris Marsh., (1951) Henry, L.K.; Beer, F.H.

Rubus allegheniensis Porter, (1997) Grund, S.P. 1856

Rubus alumnus Bailey, (1950) Davis, H.A.; Davis, T. 9145

Rubus bellobatus Bailey, (1950) Davis, H.A.; Davis, T. 9154

Rubus flagellaris Willd., (2003) Isaac, J.A. 16046

Rubus laudatus Berger, (1951) Davis, H.A.; Davis, T. 9495

Rubus multifer Bailey, (1951) Davis, H.A.; Davis, T. 9479

Rubus occidentalis L., (2003) Isaac, J.A. 16030

Rubus odoratus L., (1958) Buker, W.E.

Rubus pensilvanicus Poir., (1951) Davis, H.A.; Davis, T. 9496

Rubus pergratus Blanch., (1951) Davis, H.A., Davis, T. 9480

Rubus roribaccus (Bailey) Rydb., (1949) Davis, H.A.; Davis, T. 8882

Spiraea alba Du Roi var. *latifolia* (Aiton) Dippel, (1993) Haywood, M.J. 102

**Spiraea japonica* L. f., (1998) Grund, S.P. 2056; Japan

Waldsteinia fragarioides (Michx.) Tratt., (1895) Guttenberg, G.

RUBIACEAE

Diodia teres Walt., (1951) Henry, L.K.; Beer, F.H.

Galium aparine L., (1996) Isaac, B.L.; Isaac, J.A. 8872

Galium asprellum Michx., (1984) Thompson, S.A.; Nishida, J.H. 2031

Galium circaezans Michx. var. *circaezans*, (2003) Isaac, J.A.; Isaac, B.L.; Isaac, H.R. 16102

Galium circaezans Michx. var. *hypomalacum* Fern., (1950) Henry, L.K.; Buker, W.E.

Galium concinnum Torr. & Gray, (1966) Buker, W.E.

Galium lanceolatum Torr., (1921) Jennings, O.E.

**Galium mollugo* L., (2003) Isaac, J.A.; Coxe, R. 16284; Eurasia

Galium pilosum Aiton, (1951) Henry, L.K.; Beer, F.H.

Galium tinctorium (L.) Scop., Donley 151

Galium triflorum Michx., (2003) Isaac, J.A. 16012

**Galium verum* L., (1921) Dickey, S.S.; Eurasia

Houstonia caerulea L., (1996) Isaac, B.L.; Isaac, J.A. 8897

Houstonia canadensis Willd. ex Roemer & J.A. Schultes, (1921) Dickey, S.S.

Mitchella repens L., (1970) Buker, W.E.; Henry, L.K.

SALICACEAE

Populus grandidentata Michx., (1974) Buker, W.E.

Salix caroliniana Michx., (1951) Henry, L.K.; Beer, F.H.; **G5 S1**

Salix discolor Muhl., (1985) Thompson, S.A.; Nishida, J.H. 2253

Salix eriocephala Michx., (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15794

Salix exigua Nutt., (1995) Isaac, B.L.; Isaac, J.A. 7122

Salix nigra Marsh., (1952) Henry, L.K.; Buker, W.E.

Salix sericea Marsh., (1955) Henry, L.K.; Buker, W.E.

SAXIFRAGACEAE

Chrysosplenium americanum Schwein. ex Hook., (2003) Isaac, J.A. 15903

Heuchera americana L., (1995) Isaac, B.L.; Isaac, J.A. 7118

Mitella diphylla L., (2003) Isaac, J.A.; Isaac, B.L. 15859

Saxifraga virginiensis Michx., (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15816

Tiarella cordifolia L., (1996) Isaac, B.L.; Isaac, J.A. 8895

SCROPHULARIACEAE

Agalinis tenuifolia (Vahl) Raf., (1969) Buker, W.E.

**Antirrhinum majus* L., (1896) Hoge, M.K.; Europe

Aureolaria flava (L.) Farw. var. *flava*, (1975) Buker, W.E.

Aureolaria laevigata (Raf.) Raf., (1993) Haywood, M.J. 97

Aureolaria virginica (L.) Pennell, (1969) Buker, W.E.

**Chaenorhinum minus* (L.) Lange, (2003) Isaac, J.A. 16138; Europe

Collinsia verna Nutt., (2003) Isaac, J.A.; Isaac, B.L. 15850

Gratiola neglecta Torr., (2003) Isaac, J.A. 16397

**Linaria vulgaris* P. Mill., (1974) Buker, W.E.; Eurasia

Lindernia dubia (L.) Pennell var. *dubia*, (1974) Buker, W.E.

Mimulus alatus Aiton, (2003) Isaac, J.A. 16587

Mimulus ringens L., (1951) Henry, L.K.; Beer, F.H.

Pedicularis canadensis L., (1995) Isaac, B.L.; Isaac, J.A. 7166

Penstemon digitalis Nutt. ex Sims, (2003) Isaac, J.A.; Coxe, R. 16288

Penstemon laevigatus Aiton, (2002) Isaac, J.A.; Takacs, M. 14399; **G5**:**S3**

Scrophularia marilandica L., (1984) Thompson, S.A.; Nishida, J.H.; Bier, C.W. 1973

**Verbascum blattaria* L., (1995) Isaac, B.L.; Isaac, J.A. 7504; Eurasia

**Verbascum thapsus* L., (1995) Isaac, B.L.; Isaac, J.A. 7540; Eurasia

Veronica americana Schwein. ex Benth., (2002) Isaac, J.A.; Takacs, M. 14403

Veronica anagallis-aquatica L., (1996) Haywood, M.J. 627

**Veronica arvensis* L., (2003) Isaac, J.A. 15867; Eurasia

**Veronica hederifolia* L., (2003) Isaac, J.A. 15880; Eurasia

**Veronica officinalis* L., (1996) Isaac, B.L.; Isaac, J.A. 8881; Europe

**Veronica persic* Poir., (1920) Dickey, S.S.; Eurasia

**Veronica serpyllifolia* L., (1995) Isaac, B.L.; Isaac, J.A. 7177; Europe

SMILACACEAE

Smilax glauca Walt., (1951) Henry, L.K.; Beer, F.H.

Smilax herbacea L., (1993) Haywood, M.J. 327

Smilax rotundifolia L., (1995) Isaac, B.L.; Isaac, J.A. 7105

Smilax tamnoides L., (1970) Buker, W.E.

SOLANACEAE

**Datura stramonium* L., (1994) Isaac, J.A. 6015

**Nicandra physalodes* (L.) Gaertn., (1921) Jennings, O.E.; Jennings, G.K.; et al.; Peru

Physalis longifolia Nutt., (1951) Henry, L.K.; Beer, F.H.

Physalis pubescens L. var. *pubescens*, (1921) Jennings, O.E.

Solanum carolinense L., (1993) Haywood, M.J. 60

**Solanum nigrum* L., (2004) Isaac, J.A. 18556; Europe

STAPHYLEACEAE

Staphylea trifolia L., (2003) Isaac, J.A.; Isaac, B.L. 15834

THYMELAEACEAE

Dirca palustris L., (2002) Isaac, J.A.; Haibach, M. 14412

TILIACEAE

Tilia americana L. var. *americana*, (2003) Isaac, J.A. 16166

Tilia americana L. var. *heterophylla* (Vent.) Loud., (1951) Henry, L.K.; Beer, F.H.

TYPHACEAE

**Typha angustifolia* L., (2003) Isaac, J.A.; Coxe, R. 16283; Exotic

Typha latifolia L., Donley 97

ULMACEAE

Celtis occidentalis L., (1921) Jennings, O.E.

Ulmus americana L., (1985) Thompson, S.A.; Nishida, J.H. 2293

Ulmus rubra Muhl., (2003) Isaac, J.A. 16026

URTICACEAE

Boehmeria cylindrica (L.) Sw., (2003) Isaac, J.A. 16362

Laportea canadensis (L.) Weddell, (2003) Isaac, J.A. 16319

Parietaria pensylvanica Muhl. ex Willd., (2003) Isaac, J.A. 16157

Pilea pumila (L.) Gray, (1993) Haywood, M.J. 142

Urtica dioica L. ssp. *gracilis* (Aiton) Seland., (2003) Isaac, J.A. 16320

VALERIANACEAE

Valeriana pauciflora Michx., (1992) Isaac, J.A. 3910

Valerianella chenopodiifolia (Pursh) DC., (1996) Isaac, B.L.; Isaac, J.A. 8855

Valerianella radiata (L.) Dufr., (1999) Haywood, M.J. 606

VERBENACEAE

Phryma leptostachya L., (2003) Isaac, J.A. 16408

Verbena hastata L., (1985) Thompson, S.A.; Rawlins, J.E. 12882

Verbena urticifolia L. var. *urticifolia* Perry & Fern., (1993) Haywood, M.J. 169

VIOLACEAE

Hybanthus concolor (T.F. Forst.) Spreng., (2003) Isaac, B.L.; Isaac, J.A. 15839

Viola bicolor Pursh, (1950) Henry, L.K.; Buker, W.E.

Viola blanda Willd., (1951) Henry, L.K.; Beer, F.H.

Viola canadensis L. var. *canadensis*, (1994) Haywood 422

Viola cucullata Aiton, (1996) Haywood, M.J. 432

Viola hirsutula Brainerd, (2003) Isaac, J.A.; Isaac, B.L. 15824

Viola labradorica Schrank, (1976) Buker, W.E.

Viola pubescens Aiton var. *scabriuscula* Schwein. Ex Torr. & Gray, (2003) Isaac, J.A.; Isaac, B.L. 15846

Viola sagittata Aiton var. *sagittata*, (1993) Haywood 540

Viola sororia Willd., (2003) Isaac, J.A.; Isaac, B.L.; Morton, C.M. 15813

Viola striata Aiton, (1996) Isaac, B.L.; Isaac, J.A. 8901

Viola x eclipes H.E. Ballard, (1976) Buker, W.E.

Viola x palmata L. (pro. sp.), (1994) Haywood, M.J. 41

VITACEAE

Parthenocissus quinquefolia (L.) Planch., (1951) Henry, L.K.; Beer, F.H.

Vitis aestivalis Michx., (1995) Isaac, B.L.; Isaac, J.A. 7104

Vitis cinerea (Engelm.) Millard var. *baileyana* (Munson) Comeaux, (1995) Isaac, J.A. 6017; **G4G5?:SH**

Vitis labrusca L., (1994) Isaac, J.A. 6024

Vitis riparia Michx., (1994) Isaac, J.A. 6026

Vitis vulpina L., (2003) Isaac, J.; Coxe, R.; Bradburn, M. 17222

ACKNOWLEDGMENTS

Our thanks go to the Wild Resource Conservation Fund of the Pennsylvania Department of Conservation and Natural Resources for partial funding of the field work. We would also like to thank Dr. Ann Rhoads, an anonymous reviewer and the editor for their helpful comments. We are also thankful to Melanie Van Olffen and Matthew Oborski for data entry.

ABSTRACT

American Beech Woods Nature Preserve is located on Illinoian till in the Wabash Border Division of eastern Illinois. The plant life of this 8 ha site was examined during the 1999–2001 growing seasons. We documented a total of 207 vascular plant species in 148 genera of 71 families (10 pteridophytes, 1 gymnosperm, 49 monocots, and 147 dicots). We also sampled the vegetation using a stratified-random line-strip method. Tree density averaged 249 trees/ha with a basal area of 22.91 m^2/ha. *Fagus grandifolia* Ehrh. (American beech) was the dominant tree species with 63 trees/ha, a basal area of 7.34 m^2/ha, and an importance value 26.1 (possible 100). *Acer saccharum* Marsh. (sugar maple) ranked second in importance value (IV = 15.7) with most individuals in the 10–19.9 cm diameter class. *Quercus velutina* Lam. (black oak) and *Carya glabra* (Mill.) Sweet (pignut hickory) were the only other overstory trees with an importance value greater than 10. In comparison with an earlier study in 1973, the site has experienced a decrease in both tree density (399 trees/ha vs. 249 trees/ha) and basal area (33.35 m^2/ha vs. 22.91 m^2/ha).

RESUMEN

La Reserva Natural de Haya Americana esta ubicada en terreno Illinois en la frontera del Río Wabash en Illinois oriental. La flora del bosque que mide 8 hectáreas fue examinada durante la temporada de crecimiento en los años 1999–2001. Hemos identificado 207 especies de plantas vasculares que incluyen 148 géneros de 71 familias distintas: 10 pteridófitas, una gimnosperma, 49 monocotitedóneas, y 147 dicotiledóneas. Muestreamos la vegetación usando el método de línea-franja aleatoria. La densidad promedia era 249 árboles por hectárea con una área basal de 22.91 m2/ha. *Fagus grandifolia* Ehrh. (haya) era la especie de árbol dominante. Había 63 árboles por hectárea con una área basal de 7.32 m^2/ha y un valor de importancia de 26.1 (posibilidad de 100). *Acer saccharum* (arce de azúcar) tenía una importancia secundaria con un valor de importancia de 15.7. La mayoría de los individuos pertenecían a la clase de tamaño entre 10-19.9 cm. *Quercus velutina* Lam. (roble negro) y *Carya glabra* Mill. (nuez de cerdo) eran los únicos árboles que tenían un valor de importancia de más de 10. En comparación con el estudio de 1973 el bosque ha sufrido una perdida de densidad (399 árboles por ha v. 249 árboles por ha) y área basal (33.35 m^2/ ha v. 22.91 m^2/ha.)

INTRODUCTION

At the beginning of extensive European settlement (ca. 1800), about 61% of Illinois was prairie and savanna. The remainder, mostly the more rugged terrain, was woodland and forest (Küchler 1964; Anderson 1970; Iverson et al. 1991; Ebinger 1997). In such areas of rugged terrain, tree species composition varied

SIDA 21(3): 1861–1878. 2005

locally with oaks (*Quercus* spp.) and hickories (*Carya* spp.) being the common forest species on drier mostly upland sites. Mesophytic species such as elm (*Ulmus* spp.), ash (*Fraxinus* spp.), and sugar maple (*Acer saccharum* Marsh.) were associated with the dissected ravines and narrow river floodplains (Braun 1950; Anderson 1983; Cowell & Jackson 2002). At the eastern edge of Illinois, particularly in the Wabash Border Natural Division, many of these forests contained American beech (*Fagus grandifolia* Ehrh.), tulip tree (*Liriodendron tulipifera* L.), and other tree species typically found in forests to the east of Illinois (Schwegman 1973). American beech has a wide range comparable to that of other major Eastern Deciduous Forest trees.

Beech-maple forests usually included some species of oaks and hickories and reached the western limit of their range in east-central and southern Illinois. In Illinois, the few remaining examples of this community type are associated with steep, deeply dissected ravine systems, narrow valleys, and narrow to broad ridges. The beech-maple component has a rich herbaceous layer on the mesic slopes and an oak-hickory component on the ridges and more level uplands. These remnants have been variously disturbed by logging, grazing, and exotic species invasion.

Three examples of this forest community located in the Wabash River Valley have been dedicated as Illinois Nature Preserves (McFall & Karnes 1995). Occurrences of American beech in this region have enhanced significance as these populations represent the western edge of the range of a wide ranging eastern North American species. The American Beech Woods Nature Preserve contains one of these protected beech-maple forests. The objectives of our study were to document the vascular flora; to determine the composition and structure of the woody and herbaceous vegetation; and to analyze changes in the forest composition that occurred since the forest was last studied in 1973.

DESCRIPTION OF THE STUDY AREA

The American Beech Woods Nature Preserve, dedicated as a nature preserve in 1985, is located in Lincoln Trail State Park (Fig. 1), about 5 km south of Marshall, Clark County, Illinois (SE/4, NW/4, S2, T10N, R12W; 39°20'30"N, 87°42'45"W). Located in the Southern Upland Section of the Wabash Border Natural Division about 15 km from the Indiana state line, the preserve is situated on Illinoian glacial till about 20 km south of the terminal moraine of Wisconsin glaciation (Schwegman 1973). The preserve, about 8 ha in size, has rugged topography, ranging in elevation from 167 m at the edge of Lincoln Trail Lake to 190 m at the highest point. Topographic features include steep-sided ravines, valley walls of various slope aspects, and narrow ridges. The western boundary of the preserve follows the shoreline of Lincoln Trail Lake. Presently most of the preserve is high quality, old second growth, mesic and dry-mesic upland forest (White & Madany 1978). Based on the original Government Land Office survey records

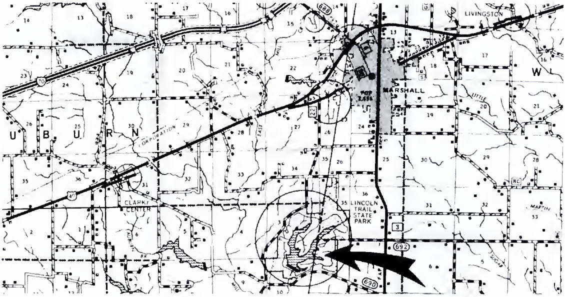

Fig. 1. The location of Clark County in eastern Illinois, and the location of American Beech Woods Nature Preserve in Lincoln Trail State Park, S of Marshall, Illinois (courtesy of the Illinois Nature Preserves Commission).

at the Illinois State Archives in Springfield (Hutchison 1988), the woods still retains many of the species present prior to settlement by Europeans.

The overstory of the preserve was sampled in 1973 as part of an extensive study that examined the structure and composition of beech-maple forests in Illinois, Indiana, Michigan, and Wisconsin (Dunn 1978). Two prescribed burns (Nov 1993 and Dec 1998) have been conducted in the preserve, while seedlings and saplings of sugar maples have been removed recently from the flat uplands and ridgetops.

The soils of the ridgetops are Stoy silt loam, a somewhat poorly drained soil that formed in loess underlain by Illinoian glacial till (Awalt 1979). Soils of the wooded slopes and drainages are Hickory loam, a well-drained soil that developed in Illinoian glacial till. These soils overlay bedrock composed of Pennsylvanian shale and sandstone (Dunn 1978).

The climate is continental, characterized by hot, humid summers and cold winters. Weather station records for Marshall, Illinois, about 6 km north of the preserve, indicate that the area receives an average annual precipitation of 104 cm which falls mostly as rain during the period of April through September (Weather.com 2002). January is the coldest month with an average high temperature of 1° C and an average low temperature -8° C. The record high for the month was 27° C on January 9, 1932 and the record low was -31° C on January 18, 1930. July is the hottest month with an average high temperature of 31° C and an average low of 17° C. The record high for the month was 43° C on July 14, 1936 and the record low was 7° C on July 1, 1937 (weather.com 2002).

MATERIALS AND METHODS

The area was visited numerous times during the 1999, 2000, and 2001 growing seasons. During each trip, all new flowering or fruiting species encountered were collected, the specimens identified, and deposited in the Stover-Ebinger Herbarium (EIU) of Eastern Illinois University, Charleston. Native status and nomenclature follows Mohlenbrock (2002). All vascular plant taxa observed are enumerated in the Annotated Species List (Appendix I).

Vegetation sampling to determine quantitative abundance of woody and herbaceous species was conducted on August 29 and 30, 2000. We employed the stratified-random line-strip method of Lindsay (1955) as modified by Donselman (1973), Levenson (1973), and Dunn (1978). Using this method, overstory trees, saplings, shrubs, and ground layer strata were sampled simultaneously in rectangular plots positioned along transect lines.

Sample plots for the overstory trees (≥10.0 cm dbh) were delimited using a 100 m tape divided into 25 m sections. Overstory trees were sampled in 10 m × 25 m (0.025 ha) with four located along each transect. All trees whose centers were located within the plots were included in the sample. Aspect of the plot, species, and diameter at breast height (dbh) were recorded for each individual located within the boundaries of each plot. Large saplings (5.0 cm dbh – 9.9 cm dbh), intermediate saplings (≥2.5 cm dbh; ≤ 4.9 cm dbh), small saplings (≥ 50.0 cm tall; ≤ 2.4 cm dbh), shrubs, and the groundlayer (woody seedlings <50.0 cm tall and all herbaceous taxa) were sampled in rectangular plots located at the zero, 25 m, 50 m, and 75 m mark of the tape. Aspect, species, and the number of individuals were recorded for all vascular plants in each category that fell within one meter from the tape along a section 2.5 m long (0.00025 ha plot).

When all plots along the 100 m transect line were sampled, a section of 1/2" steel conduit marked "Edgin 2000" was driven at each end of the tape to facilitate the relocation of the transect line for future studies. A new 100 m transect line, located a minimum of 25 m distant from the first line and perpendicular to the ravine was then established and the sampling procedures repeated. This process was replicated along ten 100 m transect lines providing a total of 40 plots in each category.

Density (trees/ha), basal area (m^2/ha), frequency (%), relative density, relative dominance, relative frequency, importance value (relative density + relative dominance + relative frequency/3) and average basal area were determined for each species in the overstory tree stratum. Density (stems/ha), frequency (%), relative density, relative frequency, and importance value (relative density + relative frequency/2) were determined for each species in the small, intermediate, and large sapling, shrub, and ground layer strata.

The Floristic Quality Index (FQI) of the site was determined using the Coefficient of Conservatism (CC) assigned to each species by Taft et al. (1997). The

CC for each species in the Illinois flora was determined by assigning an integer from 0 to 10 for each species based on its tolerance to disturbance and its fidelity to habitat integrity. The FQI is a weighted index of species richness (N = number of species present), and is the arithmetic product of the average Coefficient of Conservatism (C-Value = the average of all species CC's) multiplied by the square root of the species richness ($\surd$N): FQI = C-Value ($\surd$N). Therefore the FQI indicates the level of habitat degradation and provides an assessment of the quality of each tract based on the taxa present. It is particularly useful when combined with quadrat-based sampling methods and provides a way of making quantitative comparisons among sites. The Sørenson Coefficient of Community (Sørenson 1948) was used to determine the similarity of the ground layer vegetation on the different slope aspects in the study area. The index is calculated as $2c/(a + b + 2c)$, where *a* is the number of species unique to sample *a*, *b* is the number of species unique to sample *b*, and *c* is the number of species shared by both samples (Small & McCarthy 2001).

RESULTS AND DISCUSSION

Overstory and woody understory composition and structure.—During the sampling of the overstory, a total of 17 tree species was encountered, including two understory species having little chance of reaching the canopy; seven additional tree species were found elsewhere on the preserve, i.e., outside the sampling transects, accounting for a total of 24 species. Overall tree density was 249.0 trees/ha and total basal area was 22.91 m^2/ha. American beech ranked first in basal area, relative density, relative dominance, and importance value (Table 1). It was the most frequently encountered species, occurred in 70% of the plots, and was evenly distributed throughout most diameter classes. Sugar maple ranked second in importance value and relative density and third in basal area. It occurred in 57.5 % of the plots and was most abundant in the smaller diameter classes with 63% of the individuals encountered being in the 10–19.9 cm diameter class. *Quercus velutina* Lam. (black oak) (IV = 11.7) and *Carya glabra* (Mill.) Sweet (pignut hickory) (IV = 10.0) were the only other taxa encountered with importance values greater than 10. Black oak was most abundant in the medium and large diameter classes while pignut hickory was most abundant in the smaller diameter classes.

Of the remaining overstory trees, tulip tree was the only species to be represented in most diameter classes, being present in low numbers in all but the largest diameter class (Table 1). *Carya ovata* (Mill.) K. Koch (shagbark hickory) was present only in the smaller diameter classes with no individuals over 39.9 cm dbh being encountered. *Carya tomentosa* (Poir. ex Lam.) Nutt. (mockernut hickory) was present in low numbers in the small and medium diameter classes while *Quercus alba* L. (white oak) was present only in the medium diameter

TABLE 1. Density (#/ha) by diameter classes (cm), total density (#/ha), basal area (m^2/ha), frequency (%), relative density, relative dominance, relative frequency, importance value, and average dbh are given for tree taxa encountered during sampling of American Beech Woods Nature Preserve, Clark County, Illinois. Also included is the importance value and average dbh per tree taxa from the 1973 study (Dunn 1978).

classes. Of the remaining trees, most were present as widely scattered individuals with two, *Sassafras albidum* (Nutt.) Nees (sassafras) and *Cornus florida* L. (flowering dogwood) being understory trees.

The overall tree density declined from 399.0 trees/ha in 1973 to 249.0 trees/ha in this study (Dunn 1978) (Table 1). Total basal area also decreased from 33.35 m^2/ha in 1973 to 22.91 m^2/ha in 2000. However, the importance values for American beech, sugar maple, and most other species were very similar to those reported in the previous study. The importance value of shagbark hickory was considerably higher in the present study while those of white oak and red oak were considerably lower.

Seven species having a combined importance of 8.7 in the 1973 study were not encountered during the sampling in this study. Of those species, *Carya cordiformis* (Wang.) Koch (bitternut hickory) and *Fraxinus americana* L. (white ash) had IV's totaling 1.5 in the 1973 study. *Amelanchier arborea* (Michx. f.) Fernald (shadbush), *Carpinus caroliniana* Walt. (musclewood), and *Ostrya virginiana* (Mill.) K. Koch (ironwood) are understory trees that had a combined importance value of 4.8 in the 1973 study. Since no permanent transects were established in the previous study, these changes may be more reflective of sampling error rather than changes in the composition of the forest stand. *Tilia americana* L. (basswood) (IV = 2.4 in 1973) was encountered neither during the sampling, nor the site visits and appears to have been extirpated from the preserve.

In the understory, sugar maple and American beech ranked first and second, respectively in all three sapling categories. Of the remaining understory trees, only flowering dogwood and ironwood were present in all of the sapling categories (Table 2). Hickories were not common in the understory and no oaks were encountered.

A total of 26 dead-standing saplings were encountered in 11 plots. These stems were all in the medium and small sapling categories and occurred in plots located on ridgetops or slopes with an east, west, or southwest aspect. Of 26 stems encountered, 19 appeared to have been top-killed by fire (14 sugar maple, two ironwood, two American beech, and one hickory). Seven dead-standing dogwood saplings were encountered, but it was not clear as to whether these individuals were dead as a result of fire or anthracnose.

Hydrangea arborescens L. (wild hydrangea) and *Lonicera maackii* (Rupr.) Maxim. (bush honeysuckle) were the only shrub taxa encountered. Wild hydrangea was present in one plot located in a creek bottom while one bush honeysuckle shrub was encountered in a plot with a north-facing aspect.

Groundlayer composition and structure.—A total of 70 taxa was encountered in the groundlayer (Table 3). The *Carex* spp. (sedges) as a group ranked first in importance value (IV = 8.8) and occurred in 50% of the plots. *Pilea pumila* (L.) A. Gray (clearweed) ranked second in importance value, being most abundant in plots that occurred in creek bottoms and on the northeast-facing slopes. *Sanicula*

TABLE 2. Density (stems/ha) arranged by aspect, total density (#/ha), frequency (% of plots in which each taxon was observed), relative density, relative frequency, and importance value for large saplings (≥5.0 cm dbh–9.9 cm dbh), intermediate saplings (≥ 2.5 cm dbh–< 5.0 cm dbh), and small saplings (>50 cm tall–2.5 cm dbh) encountered during sampling of American Beech Woods Nature Preserve, Clark County, Illinois.

Table 5. Sørenson Index for groundlayer taxa encountered during sampling of American Beech Woods Nature Preserve, Clark County, Illinois.

	Creek Bottom (30 taxa)	Southwest (20 taxa)	Ridge top (27 taxa)	North (23 taxa)	West (20 taxa)	East (18 taxa)	South (25 taxa)	Northeast (18 taxa)
Southwest	44.0							
Ridge top	56.1	63.8						
North	49.1	32.6	52.0					
West	36.0	40.0	55.3	41.9				
East	45.8	42.1	48.9	39.0	26.3			
South	43.6	48.9	53.8	50.0	44.4	46.5		
Northeast	50.0	31.6	57.8	39.0	47.4	22.2	41.9	
Southeast (3 species)	6.1	8.7	6.7	15.4	8.7	0	7.1	9.5

spp. (snakeroot), *Asarum canadense* L. (wild ginger) and *Viola sororia* Willd. (woolly blue violet) were the only other herbaceous taxa with IV's greater than five. Snakeroot was most abundant in plots that had a west and northeast aspect while wild ginger was most common on the north-facing slopes. Woolly blue violet was present in low to moderate numbers in most plots. Tulip tree, sugar maple, and sassafras were the most commonly encountered tree seedlings. Oak seedlings were rare with only one seedling being encountered on a north-facing slope.

Slope aspects.—Among the overstory trees, American beech ranked first in importance value in plots located on most slope aspects (Table 4). It ranked second in plots with a south or southeast aspect and fifth in plots that occurred on ridge tops. Sugar maple ranked second in importance value in plots having a southwest, north, west, or northeast aspect. Black oak ranked first in plots that occurred on the ridge tops, but no higher than third on the remaining aspects. White oak ranked second and third in plots with an easterly aspect and on the ridge tops, respectively, but was only a minor component or was absent from plots occurring on the remaining aspects. Red oak ranked fourth in plots with a southwest or north aspect and was not encountered in the remaining plots. Among the hickories, shagbark hickory ranked first in plots with a south or southeast aspect while pignut hickory ranked second in plots that occurred on the ridge tops.

The plots located on the ridgetops and the southwest-facing slopes had greatest similarity (63.8% Sørenson Coefficient of Community, Sørenson 1948) (Table 5). Plots located on the southeast-facing slopes were considerably dissimilar to plots located on other slope aspects having Sørenson Coefficient of Community percentages that ranged from 0 to 15.4. These low values may be attributed to the low number of plots with southeast aspects (1) and the low species richness of the plot (3). Most other plots had similarity indices that ranged from 36.1% and 57.8%.

During the study, we observed 207 vascular plant taxa in the study area: 11 ferns, fern allies, and gymnosperms, 49 monocots, and 147 dicots. Of that number, 23 (11.1%) had a Coefficient of Conservatism (CC) of seven or greater and 10 (4.8%) were non-native taxa. The average CC, when calculated for all taxa, was 3.88 and the FQI was 55.8. When calculated for native taxa only, the average CC and FQI were 4.04 and 57.0, respectively. Sites that have an FQI greater than 35 are considered regionally noteworthy, while sites with an FQI greater than 45 are defined as statewide-significant natural areas (Taft et al. 1997).

The composition of American Beech Woods is similar to other beech-maple forests in Illinois and Indiana, having American beech and sugar maple as co-dominants on the mesic slopes with oaks and hickories predominating on the drier slopes or more level uplands (Ebinger 1997; Cowell & Jackson 2002). The decline in overall tree density and total basal area in this preserve is typical of many similar forest stands in the region (Petty & Lindsey 1961; Lindsey &

Schmelz 1964; Barton & Schmelz 1987). Oak density declines as mature individuals die while shade-intolerant and successional species such as tulip tree, ash, and sassafras, persist as minor components because of gap-phase disturbances (Cowell & Jackson 2002).

APPENDIX 1

Vascular flora of American Beech Woods Nature Preserve, Lincoln Trail State Park, Clark County, Illinois arranged alphabetically by taxonomic group. Nomenclature follows Mohlenbrock (2002). Collection numbers with the T prefix are those of Tucker; while the E prefix indicates specimens collected by Ebinger. All specimens were deposited in the Stover-Ebinger Herbarium at Eastern Illinois University, Charleston, Illinois, with some duplicates at ILLS. Taxa preceded by an asterisk (*) are non-native.

ACKNOWLEDGMENTS

We wish to thank the Illinois Department of Natural Resources (IDNR) and the Illinois Nature Preserves Commission for granting permission to conduct the study and collect specimens. Appreciation is also extended to Matt Bowyer, Robert Gillespie, and Amy Young (IDNR) for their assistance with data collection and manuscript preparation. Scott Meiners provided helpful comments on data analysis and manuscript revision. Identification of *Carex* specimens was confirmed by Tony Reznicek (MICH). The abstract was translated into Spanish by Daniel Johnson (U.S. State Dept.).

ABSTRACT

Soil and ecological features of the orchid genus *Hexalectris* were examined to obtain a more accurate description of the factors influencing its distribution and to direct future conservation efforts. Data on canopy and ground cover, tree species diversity, and soil series were obtained for *Hexalectris* in Dallas County, and overlaid with historic data on *Hexalectris* in Texas. We determined that *Hexalectris* does associate with oak and juniper, but the amount of cover at *Hexalectris* sites did not exceed 60%. Ground cover, tree species diversity, and percent oak/juniper did not differ between sites with and without *Hexalectris*. The soil series associated with *Hexalectris* in this region were Eddy-Brackett entisols of 8–20% slope. Soil type was an accurate predictor of areas in which *Hexalectris* could be found. *Hexalectris* appear to be strongly dependent on soil series, a factor which can aid in predicting areas in which *Hexalectris* is likely to be found but has not yet been located, as well as in conservation of this less well-studied genus.

RESUMEN

Se examinaron las características ecológicas y del suelo de la especie de orquídea *Hexalectris* para obtener una descripción más precisa de los factores que influyen su distribución y para futuros esfuerzos de conservación. Se obtuvieron datos de la canopia y el recubrimiento, diversidad de especies arbóreas, y series de suelo de *Hexalectris* en el condado de Dallas, y sobrepuestos con datos históricos sobre *Hexalectris* en Texas. Determinamos que *Hexalectris* sí se asocia con roble y enebro, pero la cantidad de los sitios de *Hexalectris* no excedieron el 60% y además el área cubierta, la diversidad de especies arbóreas, y el porcentaje roble/enebro no cambió entre sitios observados con o sin *Hexalectris*. Las series del suelo asociadas a *Hexalectris* en esta región eran suelo Eddy-Brackett con 8 al 20 por ciento de inclinación. El tipo de suelo fue un indicador preciso para poder predecir el área en que se encontraría *Hexalectris*. *Hexalectris* parece depender fuertemente en la clase de suelos, un factor que puede ayudar a predecir áreas en las que pueda encontrarse *Hexalectris* pero todavía no pueden ser descritas, al igual que la conservación de este género mucho menos estudiado.

INTRODUCTION

Most orchids begin life by forming a mycorrhizal relationship, as seed germination is dependent on a mycorrhizal association to supply the seedling with carbon during its early stages; a relationship known as myco-heterotrophy (Dressler 1981; Leake 1994; Smith & Read 1997). Ultimately, approximately 80% of orchids switch from the myco-heterotrophic lifestyle to one in which carbon exchange occurs in the opposite direction, from orchid to fungus (Atwood 1986). Only 20% of orchid species maintain this symbiosis throughout their lifetime, which can evolve to a high degree of mycorrhizal specialization (Rasmussen 1995; Taylor et al. 2002). Within the recognized orchid subfamilies, the appearance of myco-heterotrophic species is nearly ubiquitous, and these kinds of orchids can be found within all tribes of the Orchidaceae (Dressler & Dodson 1960; Chase et al. 2003). Although recent work has sought to understand the nature of the mycorrhizal associations for orchids and how they relate to orchid taxonomy (Zelmer et al. 1996), less is known about how myco-heterotrophy is related to geographic distribution. It is thought that a high degree of specificity between orchid and fungus may have broader conservation implications, as protection of endangered myco-heterotrophic forms requires both the maintenance of the orchid itself as well as its associated fungus (Taylor et al. 2003). Because these orchids have a relatively low ability to withstand transplantation from the wild (Liggio 1999), determining the specific features found in the habitat of myco-heterotrophic orchids can provide a key to understanding their geographic distribution, and ultimately aid their conservation worldwide.

Corallorrhiza Gagnebin and *Hexalectris* Rafinesque are the only two genera of myco-heterotrophic orchid that occur in Texas. Members of both genera are commonly called "coral root" orchids, due to the presence of anthocyanin in the rhizome, stalk, and flowers (Liggio 1999), although the genera differ in their broader appearance, habitat, and distribution. *Corallorrhiza* includes ten species, of which nine are native to North and Central America (Freudenstein 1997). The genus *Corallorrhiza* is found within all the lower 48 states and Alaska. *Hexalectris* is found in a much narrower range, with a center of diversity in northern Mexico (Luer 1975). As a result, only five of the *Hexalectris* species occur in the United States, and of these species four are limited to parts of Texas (*H. warnockii* Ames & Correll, *H. revoluta* Correll, *H. nitida* L.O. Williams, and *H. grandiflora* (A. Richard & Galeotti) L.O. Williams), Arizona (*H. warnockii*), and New Mexico (*H. nitida*) (Fig. 1). Only *Hexalectris spicata* (Walter) Barnhart ranges widely, occurring along the eastern seaboard as far north as Maryland and West Virginia. The range of two *Hexalectris* species (*H. grandiflora* and *H. revoluta*) is restricted to only two counties in west Texas (Jeff Davis County for *H. grandiflora*, Jeff Davis and Culberson counties for *H. revoluta*; Liggio 1999; Hatch et al. 1990).

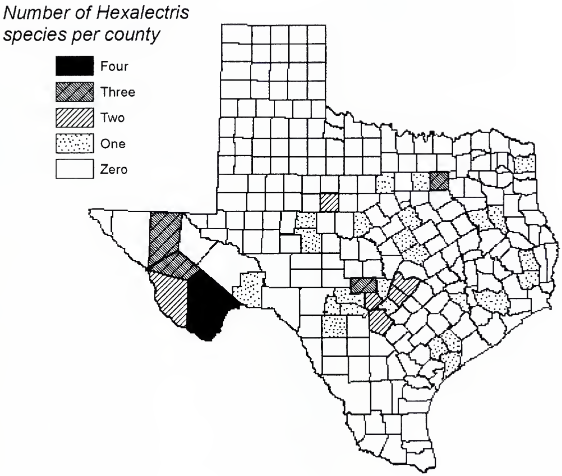

Fig. 1. Distribution map of *Hexalectris* in Texas (based on counties, divided by species, using information from Hatch et al. 1990) Most counties with only one species have either *H. spicata* or *H. nitida*. Most counties with two species have *H. spicata* and *H. nitida*.

In Texas, most of the counties with *Hexalectris* populations are within only three of the state's 11 ecological regions: the Trans-Pecos, the Edwards Plateau, and the Blackland Prairies (Fig. 1; Hatch et al. 1990; Turner et al. 2003). Only *H. spicata* extends beyond these three regions, occurring in all but the High Plains and Rolling Plains of the Texas panhandle. Dallas County (in the Blackland Prairies ecological region) is only one of four counties (Gillespie in the Edwards Plateau, Jeff Davis and Brewster in the Trans-Pecos are the other three) that have three or more species of *Hexalectris*. Dallas County shows a high recorded diversity for Hexalectris, but this is in part related to recently reported range extensions for *H. warnockii* and *H. nitida* (Engel 1987; Mahler 1988), and the new combination *H. spicata* var. *arizonica*, which was described in part based on specimens from the Dallas Nature Center (now Cedar Ridge Preserve) in southwest

Dallas County. However, as most information on *Hexalectris* has appeared only within the last fifty years (Liggio 1999), and relatively few herbarium collections have been made for this genus, *Hexalectris* may perhaps be present over a very large geographic area, and thus be more common than previously thought (Goldman et al. 2002).

In this study we wished to expand the information known about *Hexalectris* abundance and distribution by conducting a detailed census of Cedar Ridge Preserve (CRP) in southwest Dallas County. This is an ideal site for a broad study of *Hexalectris* due to its large area (approximately 256 hectares) and its protected status as both a Dallas County Open Space Preserve and a park within the Dallas Parks and Recreation Department. CRP is also the location of extensive historic study by several orchid hobbyists (V. Engel, D. Williams), long-term plant research and inventory by the Dallas Nature Center (G. Stanford, J. Varnum) and the University of Dallas (M. Brown, A. Collins), as well as the range expansions for H *warnockii* and *H. nitida*, and the discovery of *H. spicata* var. *arizonica* (Catling and Engel 1993). The goals of this study were to 1) compile historic data for *Hexalectris* at Cedar Ridge Preserve, 2) assess the number of *Hexalectris* at the preserve in 2004, 3) determine the ecological characteristics of *Hexalectris* sites, to help provide a more complete description of its habitat, and 4) provide a map of orchid locations at the preserve, to determine whether there are any predictors that may be used to help identify other potential *Hexalectris* sites in Texas.

MATERIALS AND METHODS

All data were collected at Cedar Ridge Preserve, in southwest Dallas County, Texas. CRP is located in one of the few remaining undeveloped areas of the Austin Chalk Escarpment, a geological region of lower Cretaceous limestone that extends northeast from Dallas to the Oklahoma border, and southwest past Waco and Austin into the Edwards Plateau (Dallas Department of Urban Planning 1977)). In Dallas County the escarpment forms a series of steep slopes, with erosion of the bedrock creating a variety of diverse habitats (Kennemer 1987). CRP has been a subject of longtime plant study and monitoring by virtue of its historic role as an environmental center (Greenhills Environmental Center, Dallas Nature Center) and research site (University of Dallas, M. Brown). As a result, we were able to use historic data as well as newly-collected data to create a more complete picture of *Hexalectris* occurrence at the preserve.

Historical data on specific *Hexalectris* locations were obtained by conducting a walk-through of the site (outside of the *Hexalectris* blooming season in November 2003) with Dale Williams, who had significant background knowledge of past orchid records at CRP (Williams 1986). At each site identified by Williams, GPS coordinates were recorded using a Garmin eTrex Legend. Information on dates of specific range extensions for particular species were identified from published accounts by V. Engel, who had conducted surveys similar to Williams (Engel 1987) and had co-described *H. spicata* var. *arizonica* 11 years earlier (Catling & Engel 1993).

Recent data were obtained through both casual sightings as well as detailed censusing. Casual sightings of *Hexalectris* were recorded during ongoing botanical inventory of the preserve (Brown et al., in prep). During that botanical inventory of approximately 75 hectares of the preserve in 2003 and 2004 we recorded GPS coordinates for any *Hexalectris* observed on study transects. Each *Hexalectris* found during surveys was identified by species, and photographed whenever possible.

On July 23 and 24, 2004 we conducted more extensive surveys to specifically count and map all *Hexalectris* found blooming at the preserve. Survey dates corresponded to dates when *Hexalectris* were found on the preserve in 2003 (S. McCabe, pers. obs.). Survey areas were of two different types: 1) areas where historic data on *Hexalectris* were available or 2) areas that were ecologically similar to places where *Hexalectris* were found in the past. GPS coordinates for these sites were logged and mapped. Censusing was conducted with the help of volunteers from the Master Naturalist Program and other volunteers with significant background knowledge of plants. For most census locations we obtained data from small transects on both the right and left sides of the trail whenever possible, and each transect counted as a sampling point. Transects were 20 m long and approximately 3 m wide. In each transect we counted 1) number of *Hexalectris* colonies, 2) total number of *Hexalectris* stems, and 3) number of *Hexalectris* of each species. Data on plant height were recorded for some *Hexalectris* if they appeared to fall outside the typical height values for the species. In each transect, general ecological data on tree species, canopy, and ground cover were obtained for all sites regardless of whether *Hexalectris* were counted or not. Canopy cover was measured as a percentage value, and ground cover values were estimated as percentage of deciduous leaves, juniper scales/leaves, and bare ground.

Statistical analyses were conducted using Microsoft Excel 2000. During analysis, the actual value of the canopy was used, as well as canopy class (< 20%, 21–40%, 41–60%, 61–80%, >80%). Ground cover was divided into five different groups as a ratio of juniper leaves to deciduous leaves (0/100, 25/75, 50/50, 75/25, and 100/0). Diversity of tree species was calculated for each transect using the Shannon Index, to account for both the diversity and evenness of tree species within the transect. Diversity was compared between sites where orchids were present and sites where orchids were absent. We also compared the percent of trees belonging to the genus *Juniperus* at each sampling point and orchid presence/absence, as well as the percent of trees belonging to genus *Quercus* and orchid presence/absence.

GPS data for all *Hexalectris* sites (both current and historic) were converted to ArcView shape files using DNR Garmin Version 4.0.28 (Minnesota Department of Natural Resources 2001), and imported into ArcView 8.3. Arc interchange files for soil data were obtained from the Soil Survey Geographic (SSURGO) Database, available from the Soil Survey Laboratory, National Soil Survey Center (Soil Survey Staff 2004). Details on soil series found in Dallas County were obtained from the Soil Survey of Dallas County (Coffee et al. 1980).

RESULTS

Historic and current *Hexalectris* distribution at Cedar Ridge Preserve

The oldest records of *Hexalectris* at Cedar Ridge Preserve are those described in the paper by Engel (1987). In that paper he describes several orchids originally thought to be *Corallorrhiza* in 1981, although their identification was not confirmed until 1986, when they reappeared and were identified as *H. nitida*. A second species, *H. warnockii*, was identified in that same year by Williams (1986). These records remained the last published account of *Hexalectris* at Cedar Ridge Preserve, until the description of *H. spicata* var. *arizonica* in 1991, partly based on specimens collected at the preserve (Catling & Engel 1993).

We were able to identify eight sites at Cedar Ridge Preserve where *Hexalectris* were historically found (Fig. 2, based on D. Williams, pers. comm.), all of which fell on two trails in the southeastern part of the preserve, within an area dominated by mixed hardwoods and the two coniferous species *Juniperus virginiana* (Eastern red cedar) and *Juniperus ashei* (ashe juniper). This matched the common description of *Hexalectris* habitat, variously described as conifer woods on calcareous soils (Diggs et al. 1999), oak litter and decaying juniper scales/leaves (Engel 1987), leaf mold in the shade of cedars or oaks (Luer 1975), and often upon a slight slope (Coleman et al. 2002). In 2003, the preserve's *Hexalectris* were rediscovered during botanical inventories (S. McCabe, pers. obs.), and ultimately we counted a total of 39 *H. warnockii* that year (K. Gempel, J. Varnum, M. Brown, pers. obs.). However, in 2003 *H. spicata* and *H. nitida* were not found/counted anywhere on the preserve.

In 2004 we conducted transect sampling of 89 different locations which were either 1) areas for which historic data on *Hexalectris* were available (N=12) or 2) areas that were ecologically similar to places where *Hexalectris* were found in the past (N=77) (Fig. 2). In 39 (43.8%) of the 89 sites *Hexalectris* was present. In seven out of eight of the sites identified by Williams *Hexalectris* was present, indicating a reasonable degree of accuracy in the historical data obtained outside the *Hexalectris* blooming season. We counted a total of 308 stems in 141 colonies, or an average of 2.2 stems/colony. The breakdown according to species was as follows: 176 stems of *H. nitida* at 25 different locations (57% of all stems, 64% of all locations), 113 stems of *H. warnockii* at 12 different locations (37% of all stems, 31% of all locations), and 15 stems of *H. spicata* at two locations (5% of all stems, 5% of all locations). In addition, we found four stems of

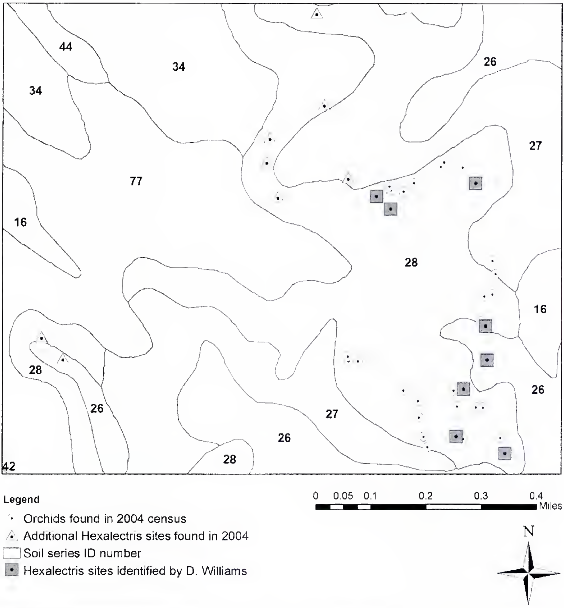

Fig. 2. Distribution map of *Hexalectris* found at Cedar Ridge Preserve. Soil ID numbers are as follows: 16 (Brackett loam, 3–5% slopes), 26 (Eddy clay loam, 1–3% slopes), 27 (Eddy clay loam, 3–8% slopes), 28 (Eddy-Brackett complex, 8–20% slopes), 34 (Ferris-Heiden complex, 5–12% slopes), 44 (Houston Black clay, 1–3% slopes), 77 (Vertel clay, 5–12% slopes). The category "Additional *Hexalectris* sites found in 2004" refers to areas where *Hexalectris* were found outside of the formal survey on July 23/24 2004.

Hexalectris in one colony that were atypical, in that they appeared to completely lack any anthocyanin pigment, and thus were pale yellow to light green. Williams had also noted these atypical individuals during his exploration of the preserve. A sample of this type was later tentatively identified as *H. nitida* by researchers at the Botanical Research Institute of Texas (B. Lipscomb, pers. comm.), although further examination of the sample is pending. Due to the large numbers of *Hexalectris* counted in 2004 and limited time, we were unable to identify plants of the variety *H. spicata arizonica*, but more detailed censusing with trained orchid observers is recommended for inclusion of this type in future censuses. Of the transects studied, only three out of the 39 (8%) had more than one species (2 sites with *H. warnockii* and *H. nitida*, 1 site with *H. nitida* and *H. spicata*).

In the course of sampling we identified several individuals that were taller than the plant heights recorded in the literature. *H. warnockii* is described as ranging up to 30 cm tall (Luer 1975; Diggs et al. 1999), although more recent published accounts have them within a range of 15-40 cm tall (Coleman et al. 2002). In our study we routinely found *H. warnockii* within 30 to 40 cm, with the tallest of this species being 64 cm. For *H. nitida*, published plant heights range from 10–32 cm (Coleman et al. 2002), 15 – 30 cm (Diggs et al. 1999), and up to 30 cm (Luer 1975). Our *H. nitida* were frequently found to be greater than 30 cm tall, with the tallest at 44 cm.

Ecological characteristics of *Hexalectris* sites

Data on canopy cover, ground cover, and tree diversity were obtained from 89 different locations in 2004 *Hexalectris* censusing. To determine whether the presence/absence of orchids is affected by level of canopy cover, canopy was divided into five categories (≤20%, 21–40%, 41–60%, 61–80%, and >80%), which were compared. We found that there was a significant association between canopy cover and orchid presence/absence (χ^2 of association = 13.36, $P < 0.01$, df=4, Fig. 3). Fifty-four percentof the sites with orchids had canopy of between 40 and 60%, and 71% of the sites without orchids had over 60% cover. We found no significant association between the type of ground cover present and orchid presence/absence (χ^2 of association = 5.38, df=3), although all areas on which orchids were found had a ground cover of ≤ 50% juniper leaves.

Diversity of tree species was not significantly different between sites with and without *Hexalectris* (Independent two-tailed $t_{0.05,85}$ = 1.054, n.s.). Sites without *Hexalectris* had a Shannon diversity index of 1.09, compared to 1.17 for sites with *Hexalectris*. Overall, 59% of the trees counted in transects were *Juniperus* spp. (either *J. virginiana* or *J. ashei*), followed by oaks (28% of all trees counted). Sites with and without *Hexalectris* did not significantly differ from one another in the percent of *Juniperus* spp. present (χ^2 of association = 5.43, df=3, n.s.), or in the percent of *Quercus* spp. present (χ^2 of association = 11.42, df=5, n.s.) Only 14% of trees were something other than oak or juniper, and included (in order from highest to lowest number of individuals counted): *Cornus drummondi* (rough-leaf dogwood), *Ilex decidua* (possumhaw), *Fraxinus texensis* (Texas ash), *Viburnum rufidulum* (rusty blackhaw viburnum), and *Rhus* (sumac) spp.

Soil characteristics of *Hexalectris* sites

When soil survey maps were overlaid with maps of *Hexalectris* sites, we were able to show some association between soil type and *Hexalectris* presence (Fig.

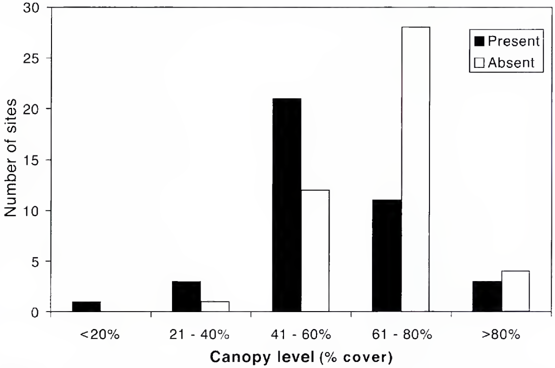

Fig. 3. Relationship between cover class and orchid presence/absence at *Hexalectris* sites

2). Nearly all (93.7% total) of the orchids found were on the Dallas County soil series Eddy-Brackett complex (8–20% slopes). This soil series is classified as a loamy-skeletal, carbonatic, thermic, shallow typic ustorthent (within the entisols), and is often found on strong to moderately sloping hillsides, with a soil depth to approximately 11 inches and a surface layer of grayish brown clay loam 4 inches thick (Coffee et al. 1980). Soils within this complex have rapid runoff, with severe erosion hazard.

Unfortunately, although the data appear to point to an association between soil series and *Hexalectris* presence, interpretation of these data is hampered by the fact that only 16 of the 89 sites examined were something other than the Eddy-Brackett complex (8–20% slopes). To further examine the relationship between soil type and *Hexalectris*, following our initial two-day survey we specifically searched two other areas of the preserve with this soil series, and also mapped datapoints for *Hexalectris* detected during ongoing botanical surveys for other projects at the preserve. Overall, nine additional *H. nitida* were found outside of the 89 areas that we originally surveyed (bringing the total *Hexalectris* count for 2004 to 317). Of these sites, seven (77.7%) were within the Eddy-Brackett complex (8–20% slopes), and the remainder were found on similar soils with less slope. *Hexalectris* found outside of Eddy-Brackett complex (8–20% slopes) were on Eddy clay loam (1–8% slopes) (Coffee et al. 1980).

DISCUSSION

In this study we have been able to provide what is perhaps the largest known count of multiple species of *Hexalectris* orchids at a single research site in the United States. With the initial census from this study, we will be able to follow up our data with future censusing at the preserve and perhaps expansion of the study area into other sites with ecological and soil characteristics similar to those found in this year's census. It is possible that the large number of *Hexalectris* seen this year may be a result of the late spring rains that occurred in Dallas County. In June 2004 Dallas experienced record-breaking rainfall, reaching over 10 inches of rain for the month, or over 250% above the normal June precipitation (Office of the Texas State Climatologist 2004). It is thought that generous rainfall in late spring is necessary for flowering of *Hexalectris* (Engel 1987), although currently there are no published data showing the relationship between rainfall and *Hexalectris* abundance. However, with ongoing censusing of these orchids, we should be able to better elucidate the climatological factors that influence flowering.

Based on the general ecological data collected in this study, we cannot necessarily provide any new information on the plant community with which *Hexalectris* is associated. Oak and juniper are clearly the primary genera that make up both the canopy and ground cover, providing both shelter and a source of decaying organic matter for the fungal symbiont. Yet oak and juniper alone do not necessarily make for good *Hexalectris* habitat. Having a relatively open canopy may also be important, as our study has shown these orchids to be almost completely absent in oak-juniper sites with 60% canopy or greater. As this is not believed to be due to a need for sunlight for photosynthesis (these species do not have chlorophyll and are nonphotosynthetic), cover may influence other factors such as soil or air temperature. Temperature records of microclimate at key sites where *Hexalectris* have been found may be a useful future direction for studies of these species.

The most important result derived from this study is that we were able to predict the occurrence of *Hexalectris* orchids based on soil maps After our initial census efforts, we were able to identify areas on the soil map where a particular soil complex, and consequently the orchids, should occur, and confirm their occurrence through targeted searches. Predictions based on soil type were also corroborated by information from other areas in other parts of Dallas County. *Hexalectris* have frequently been found in Dogwood Canyon, an area approximately 2 kilometers to the southwest of our study area (D. Hurt, pers. comm.). Soil maps reveal that most of the canyon is composed of Eddy-Brackett complex (8–20% slope), with the exception of the lowest levels of the canyon along the creekbed. In addition, long-term observations of areas less than half a kilometer west of the preserve and north of Dogwood Canyon that fall within Cedar Hill State Park show the only recorded orchids to be *Spiranthes* L. C. Rich.

and *Corallorrhiza*, rather than *Hexalectris* (Paul Baldon, CHSP, pers. comm.). Cedar Hill State Park lies mostly on chromustert soils of the Heiden or Vertel complex, which are vertisols, rather than an entisol such as Eddy-Brackett. Finally, we were advised of two small colonies of *Hexalectris* in east Dallas, adjacent to Lower White Rock Creek known as the Scyene overlook (J. Flood, pers. com.) These colonies were located in city parks within an area geologically similar to Austin Chalk Escarpment, and were confirmed to be on Eddy-Brackett complex (8–20% slope). This confirmation helps to solidify the connection between soils and *Hexalectris* incidence in Dallas County.

Based on the information from this study, we have planned to extend this research to other areas with similar soil types. In Dallas County, approximately 1.3% of the land area (3127 hectares) falls within the Eddy-Brackett (8–20%) soil series, and nearly all of these soils are found at 36 locations in the county. With a broader search area, we have the potential to expand the known range of *Hexalectris* within Dallas County, and to protect these areas from expanding development within the county. If the soil-orchid relationship is confirmed in Dallas County, it can potentially be applied to all of Texas. The map of *Hexalectris* distribution in Texas indicates that Dallas County has a high *Hexalectris* diversity compared to most other counties, yet this may be an artifact of a lack of censusing in other areas, or perhaps a limited knowledge of the precise soil and ecological characteristics that this genus requires. With the information from this study, we are confident that the missing pieces of the *Hexalectris* distribution map can be filled, and our knowledge about this genus can be expanded.

ACKNOWLEDGMENTS

Many thanks to Dale Williams for providing his background knowledge of the orchids at Cedar Ridge Preserve, and for his historical information about the orchid search at Cedar Ridge Preserve. The initial observations of orchids in 2003 that set in motion this study would not have been possible without the efforts of Sussann McCabe. Karen Gempel assisted in our informal census of *Hexalectris* in 2003. Stephanie Varnum assisted greatly in survey efforts, data compilation and manuscript editing. Survey efforts in 2004 were aided by members of North Texas Chapter, Master Naturalist programs (Marguerite Kaufman, Annie Smirmaul, Holly Toland, Dana Wilson), other plant enthusiasts (Joann Cross, Shirley Lusk, and Kathy Saucier) and the University of Dallas (Heather McWilliams, John Rueda). Ken Garrison provided photography expertise and photos of these species. Richard Marsden, Winwaed Software Technology, constructed the range map for *Hexalectris* used in this paper. We acknowledge the support of the Botanical Research Institute of Texas, particularly Gary Jennings, Barney L. Lipscomb, and George M. Diggs, Jr. (and Austin College), Jim Flood (North Texas Chapter, Master Naturalist programs), Paul Baldon (Texas Parks

and Wildlife, Cedar Hill State Park) and David Hurt (Dogwood Canyon) provided historic data on *Hexalectris* in other Dallas locations.

ABSTRACT

Trillium texanum Buckley, a member of the *Trillium pusillum* Michx. complex, is rare over its range, occurring in scattered populations in baygalls, streamsides, and wooded seeps. We collected information on the habitat, phenology, population, and soils of *Trillium texanum* on the Angelina National Forest in southeast Texas.

KEY WORDS: *Trillium pusillum*, *Trillium texanum*, baygall, Angelina National Forest, Texas

RESUMEN

Trillium texanum Buckley, miembro del complejo *Trillium pusillum* Michx., es raro en todo su areal, apareciendo en poblaciones dispersas en arroyos e infiltraciones boscosas. Hemos colectado información sobre su hábitat, fenología, población, y suelos de *Trillium texanum* en el Angelina National Forest en el Sureste de Texas.

INTRODUCTION

Except for taxonomy, morphological variation, and distribution, little is published about the *Trillium pusillum* Michx. complex, of which *Trillium texanum* Buckley (or *Trillium pusillum* Michx. var. *texanum* (Buckley) J. Reveal & Broome), is a member (Kral 1983; Freeman 1994; Cabe 1995; Cabe & Werth 1995; Case & Case 1997; Farmer & Schilling 2002; Singhurst et al. 2002; Timmerman-Erskine et al. 2002a, 2002b). Only a decade ago, Freeman (1994:49) pointed out that "ecological parameters have not been measured in any population of *T. pusillum*." More recently, Singhurst (1996), in his summary of *T. texanum*, stated that not only is there virtually nothing known about *T. texanum* ecologically, there are currently no research programs that include it. Since we now know a great deal about the distribution, morphology, and taxonomy of the *T. pusillum* complex, what would be of interest would be ecological/autecological descriptions of *T. pusillum* over its range. What is known is that all members of this complex are shade plants of moist hardwood bottoms, creek sides, or swamps. They occur on a variety of soils from sandy to cherty-flinty, fertile to infertile, alkaline to basic. They occur in the Appalachians and Interior Highlands and on the Coastal Plain (Kral 1983).

Trillium texanum is rare, occurring in small, disjunct populations (Singhurst et al. 2002). It has been found at several locations in Caddo Parish in northwest Louisiana (MacRoberts 1977; Teague & Wendt 1994) and nine east Texas counties (Nixon et al. 1977; MacRoberts & MacRoberts 1998; Singhurst et al. 2002; Turner et al. 2003). It is rated state critically imperiled in Louisiana and imperiled in Texas and globally rare/imperiled (Louisiana Natural Heritage Program 1999; Poole et al. 2004). Its habitat preference has been variously reported as baygalls and wooded seeps (Ajilsvgi 1979; Teague & Wendt 1994; Singhurst et al. 2002).

From 1995 to 1997, we collected information on population, associated flora, and soils for *T. texanum* on the Angelina National Forest in Angelina and Jasper counties in southeast Texas. General descriptions of the area and edaphic conditions are given in Orzell (1990) and Bridges and Orzell (1989).

METHODS

1. In 1995 and 1996, while conducting overall surveys for rare plants on the National Forests and Grasslands in Texas (MacRoberts & MacRoberts 1998), we surveyed for *T. texanum* by walking baygalls, streamsides, and branchbanks in various mesic to xeric sandy longleaf pine uplands in southern Sabine National Forest, Sabine County, and in southern Angelina National Forest in Angelina and Jasper counties. This was slow work because the plants are rare, scattered, and inconspicuous. On the Angelina National Forest, *T. texanum* puts up only a few early spring (March–May) flowers, and although it puts up many inconspicuous single leaves, these are soon overtopped and hidden by later developing herbaceous species, particularly ferns such as *Osmunda* and *Woodwardia*. Since our time was limited and there are many kilometers of potentially suitable habitat along streams in the area, this survey is not exhaustive.

2. In May 1995, we established seven permanent one meter sq. plots in three *T. texanum* populations. Because of the limited number of known populations the sites were chosen as typical of what we had encountered and were accessible to repeated visits. Number of plants and their developmental stage (e.g., single leaf, three leaves but no flower, three leaves with flower, Fig. 1) were recorded for each plot.

3. To define the plant community in which *T. texanum* occurs, we established two permanent plots centered on two of our one meter sq. plots (called plot 2 and plot 4 hereafter). These were chosen because they were typical and accessible. Each measured 18 m × 13.5 m and was divided into three 6 m × 13.5 m sections running parallel to the topographic/moisture/light gradient (Fig. 2). The upper section (highest elevation) was farthest from the stream course; the lower section was closest to the stream course. In the center of the middle section was the one meter sq. plot with *T. texanum*. We surveyed the flora in each plot every two to three weeks between February and November 1996.

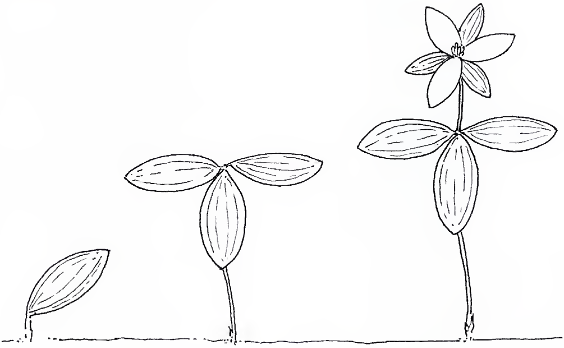

Fig. 1. Above-ground growth forms of *Trillium texanum* (left to right: single leaf, three leaves, three leaves with flower).

4. We collected soil samples to a depth of 15 cm in each of the center plots near the *Trillium* and had them processed at A & L Laboratories, Memphis, Tennessee.

RESULTS

1. We found eight populations of *T. texanum* in Angelina and Jasper counties in the Angelina National Forest. These populations were scattered over an area about 6 km east-west along the Angelina-Jasper county line and were near the headwaters of Trout Creek, Buck Branch, Clear Creek, and Shearwood Creek. These are south-flowing, intermittent streams. The eight populations ranged from a single group of plants consisting of only a few single leaves and scapes occurring within an area less than one meter square to fairly large populations with thousands of leaves and dozens of flowering scapes scattered over a hectare. We did not find *T. texanum* in the Sabine National Forest, although there appeared to be suitable baygall habitat.

The dominant habitat of the whole area where *T. texanum* occurs on the Angelina National Forest is arenic longleaf pine uplands grading into grossarenic uplands (see Bridges & Orzell 1989; Orzell 1990; Harcombe et al. 1993; Turner et al. 1999, for habitat classifications). This area is locally know as Longleaf Ridge. Common upland vegetation of this area consists of *Andropogon ternarius* Michx., *Croton argyranthemus* Michx., *Cnidoscolus texanus* (Muell.-Arg.) Small, *Berlandiera pumila* (Michx.) Nutt., *Dichanthelium aciculare* (Desv.

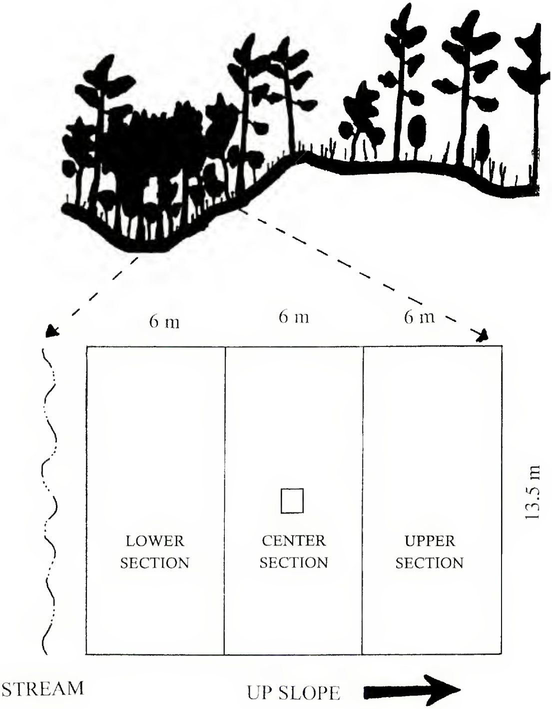

Fig. 2. Study plot layout for plant communities of *Trillium texanum*. Two permanent plots were established, each centered on a one meter sq. plot. Each of the three 6 m × 13.5 m sections of the two plots runs parallel to the topographic/moisture/light gradient. The upper section (highest elevation) is farthest from the stream course; the lower section is closest to the stream course. The center section contains the one meter sq. plot with *T. texanum*.

ex Poir) Gould & C.A. Clark, *Froelichia floridana* (Nutt.) Moq., *Ilex vomitoria* Ait., *Pinus palustris* P. Mill., *Pinus echinata* P. Mill., *Pityopsis graminifolia* (Michx.) Nutt., *Pteridium aquilinum* (L.) Kuhn, *Quercus incana* Bartr., *Q. stellata* Wang., *Q. marilandica* Muenchh., *Schizachyrium scoparium* (Michx.) Nash., *Tephrosia virginiana* (L.) Pers., *Toxicodendron radicans* (L.) Kuntze, *Tradescantia reverchonii* Bush, *Tragia urens* L., and *Vernonia texana* (A. Gray) Small.

2. Table 1 gives the data on the developmental stage of plants in the seven one meter square plots. The vast majority of above-ground growth was single leaves, not scapes with leaves or flowers. In the seven plots, there were only 15 flowering stems in three years, and a total of only 31 scapes. This pattern was typical for all *T. texanum* we observed on the Angelina National Forest. In April and May, the ground cover for the seven plots was always below 30%.

These figures for flowering stems are exceptionally low when compared with recent surveys by Singhurst (1996), who reported populations of *T. texanum* in Cass and Nacogdoches counties of 1000 to 2000 flowering scapes.

3. Table 2 lists the taxa in the different sections of Plots 2 and 4. Counting *Sphagnum*, plots 2 and 4 had 59 species, 50 genera, and 33 families. Plot 4 had 52 species; plot 2 had 37 species. The index of similarity (Sorenson's) between plots 2 and 4 was 67 and between the middle sections of 2 and 4 (where *T. texanum* was) was 65 indicating that both plots were the same community. Seventy percent of these species were found in six baygalls in central Louisiana (MacRoberts et al. 2004) suggesting that these *T. texanum* sites may be part of the general baygall community type that is widespread over much of the West Gulf Coastal Plain (Brooks et al. 1993; Nesom et al. 1997). However, the species has not been found in central Louisiana although there are many baygalls and we have searched for it.

Table 3 examines some of these data further. The upper sections of the plots were the richest, both in number of species and in number of herbaceous species. The lowest section was the least diverse, and the middle section, where *T. texanum* occurred, was intermediate. The lower section was dominated by woody vegetation; whereas the upper section was dominated by herbaceous species. The upper edges of baygalls in the Angelina National Forest are often essentially narrow bogs, with such characteristic bog genera as *Sphagnum*, *Pogonia*, *Eriocaulon*, and *Xyris*. Just upslope of the plots (and of most baygalls in this region) was arenic/grossarenic longleaf pine upland.

The difference in vegetation among the three sections of the plots is undoubtedly due to differences in soil moisture and sunlight. The upper sections received the most sunlight (thinnest canopy and located on the baygall edge next to arenic/grossarenic, relatively open longleaf pine uplands) and had the least saturated soil. The middle section was intermediate, and the lower section received the least sunlight (dense canopy; no open edge) and was often mucky wet.

4. *Trillium texanum* occurred in the Tehran-Letney-Melhomes soil series. These are sandy soils that are deep, gently sloping, poorly drained but rapidly permeable (Dolezel et al. 1988; Neitsch et al. 1982) (Table 4). In the baygalls, these soils are wet most, if not all, of the year. Like bog and baygall soils throughout the West Gulf Coastal Plain, they are acidic and nutrient poor (Nesom et al. 1997; MacRoberts & MacRoberts 2001; MacRoberts et al. 2004).

DISCUSSION

While our observations are local and limited, some ecological information has been gained. In the area of this study, *Trillium texanum* is associated with stream courses, and the typical flora of baygalls that occur below arenic/grossarenic longleaf pine uplands. These sandy uplands hold and slowly discharge water and are often associated with hillside bogs, baygalls, and seepage areas. *Trillium texanum* prefers wet but not inundated soils that are acidic and nutrient poor. It occurs under a deciduous canopy, putting up leaves and scapes in March and April before the canopy blocks light and before other herbaceous plants overtop it. In our study, most of the above-ground vegetation was single leaves with a few scapes. Why these populations should be weighed so heavily in juvenile, non-reproductive individuals, is not known. Habitat preferences and population characteristics in other parts of its range definitely need study before this species complex will be both taxonomically and ecologically understood.

ACKNOWLEDGMENTS

The work was undertaken as part of a Cost-Share Agreement with the National Forests and Grasslands in Texas. Larry Brown, Rob Evans, Stanley Jones, John Logan, Tom Wendt, Joseph Wipff, Jason Singhurst, and Edwin Smith aided in various ways. Jason Singhurst, Guy Nesom, and two anonymous reviewers made many useful comments on the paper.

Monographs in Systematic Botany

JAMES S. MILLER, MARY SUE TAYLOR, and ERIN REMPALA. 2005. **Ivan M. Johnston's Studies in the Boraginaceae.** (ISBN 1-930723-44-X; ISSN 0161-1542, pbk.). *Monographs in Systematic Botany from the Missouri Botanical Garden*, Vol. 101. Missouri Botanical Garden Press, P.O. Box 299. St. Louis, MO 63166-0299, U.S.A. (**Orders:** Missouri Botanical Garden Press, Dept. 46, PO Box 299, St. Louis, MO 63166-0299, U.S.A.; 877-271-1930; http://www.mbgpress.org/). $29.95, 132 pp., 7" × 10".

Ivan Johnston was the chief student of the borage family until his death in 1960. He published 200+ new taxa in Boraginaceae along with numerous new combinations, 13 of the 16 new genera described by him were borages. Among his 107 publications was a series of 31 journal articles entitled "Studies in the Boraginaceae." He also studied various other families, though with less intensity, and conducted floristic studies in South America, Central America, and Mexico—including long periods in the field.

Johnston began his botanical career as a high school student in southern California and continued there for an A.B. (1920 and M.A. (1922), then spent the next 38 years centered at Harvard, as a student (through 1925) and Research Associate and faculty member (1931–1960). From 1925 to 1931, he traveled, collected, and worked as an assistant in the Gray Herbarium.

The volume by Miller, Taylor, and Rempala presents various indexes and lists intended as a "tool for further monographic studies on the Boraginaceae." There is an interesting and nicely written botanico-biographical sketch and these:

* A catalog of the correspondence of IMJ
* An index to the botanical names treated in IMJ's "Studies in the Boraginaceae"
* Publications of IMJ
* Types of IMJ by binomial
* Types of IMJ by collector

ABSTRACT

Dichanthium annulatum has become locally established in southern Arizona and is a new generic record for the state. This tenacious perennial grass is a potentially invasive species of concern and we offer specimen-vouchered documentation for its *entrada* into Arizona. There are three, simultaneous, and independent routes for its spread.

RESUMEN

Dichanthium annulatum se ha establecido localmente en el Sur de Arizona y es una cita de un nuevo género para el estado. Esta gramínea perenne y tenaz, es una especie potencialmente invasora y ofrecemos documentación con especimenes testigo de su entrada en Arizona. Hay tres rutas simultáneas e independientes para su dispersión.

Three species of *Dichanthium*, a genus native to the Old World, have been introduced into North America as forage grasses and are established from Texas to Florida and in northern Mexico (Barkworth 2003), including Sonora: *D. annulatum* (Forsskal) Stapf, *D. aristatum* (Poir.) C.E. Hubb. (Reeder & Reeder 1998), and *D. sericeum* (R. Br.) A. Camus (Beetle & Johnston 1991). Ringed dichanthium, *D. annulatum*, is a highly variable species with a long history as a valued forage and fodder grass widely introduced in tropical and subtropical regions (Barkworth 2003; Bor 1960; Duke 1983; Reeder & Reeder 1998). It was "introduced for forage" and has become well established in thornscrub and tropical deciduous forest in southern Sonora (Reeder & Reeder 1998:504; they report it from 10 localities).

Ringed dichanthium was introduced into the Savanna Biome section inside the very large greenhouse/habitat of the Biosphere 2 near Oracle, AZ, shortly before the system was sealed in 1991 for a 2-year manned mission and then a 5-month and another 6-month mission. After the first two years people went in and out frequently. This wiry perennial is a tropical grass that is "widespread in India and Burma, and tropical and North Africa" (Bor 1960:133). It was selected for the Savanna Biome largely because it was not expected to survive the hard freezes in desert grassland at nearly 1220 meters elevation. It was grown from seeds obtained from CSIRO in Australia. Sometime after 1994, it escaped from the habitat and became established out-of-doors (Dorsi & Burgess 2003). After 1994 the Biosphere 2 campus was managed by Columbia University until they abandoned the project in summer 2004. Large numbers of people went in and out of the greenhouse prior to closure in 1991 and after it was reopened.

In 1995, Biosphere 2 was opened to tourists who passed through the Savanna area on a narrow, well-trodden trail. Tony Burgess, then a faculty member at the Biosphere 2 campus, first noted ringed dichanthium outside of the closed system in 2001. By 2003, a population of this grass had become locally established and was spreading rapidly (Dorsi & Burgess 2003). We speculate that the readily disarticulating spikelets or spikelet clusters with their long awns might have been carried outside inadvertently on shoes or clothing. During the first few years of partial opening people exiting the greenhouse had their shoe soles disinfected with Lysol for control of a nematode in the rainforest areas of the greenhouse but no control was done for pant legs, shoe tops nor socks.

The southern Sonora populations of ringed dichanthium, the only previously known ones from west of the continental divide in southwestern North America, occur in an essentially frost-free region about 620 km south of the Biosphere 2 locality. In southern Sonora and elsewhere this C-4 grass is reproductive with hot-season rains of summer and fall, and when it was introduced into the Biosphere 2 greenhouse it was presumed to be winter-spring dormant. The population sampled in June 2004 at Biosphere 2 had recently-disarticulated as well as fully-ripened spikelets, demonstrating that this species can be reproductive in late spring even at higher elevation. We also found that the plants in this population are tenaciously rooted in very hard, rocky soil and are very difficult to dig up.

In March 2005, Tom Van Devender and Ana Lilia Reina collected ringed dichanthium south of San Nicolás, Sonora, in tropical deciduous forest about 150 km north of the previous collections in the Alamos area (Reeder & Reeder 1998). It apparently was a recent arrival in 2005. They also found the grass in 2002 near Querobabi, about 380 km north of the previously known Sonora records in the non-desert southern part of the state. The northern Sonora population occurs in the Sonoran Desert in an area of presumed minimal winter-freezing. In 2004, Tom and Ana Lilia collected an unusual grass near the Pima County Fairgrounds at the southeastern edge of greater Tucson (about 65 km south of Biosphere 2) that John Reeder identified as *Dichanthium annulatum*. In April 2005, it was discovered in Nogales just north of the Sonora border. Both the fairground and Nogales experience moderate freezes.

Ringed dichanthium has been shown to be potentially invasive in a rather wide range of environments (e.g. Duke 1983). We predict ringed dichanthium will spread widely from the three presently known Arizona sites and at the time of this writing it is probably too late to control it effectively in Arizona except by immediate and concerted effort. The northern Sonora population is also likely to spread, even to southern Arizona only 150 km to the north. Thus this newly arrived non-native perennial grass has three potential and simultaneous routes of expansion in southern Arizona and could become a seriously invasive species.

Voucher specimens: *Dichanthium annulatum*. **U.S.A. ARIZONA. Pima Co.:** W side of Tucson Kart Speedway, just W of Houghton Road (south of I-10), S part of greater Tucson; creosotebush desertscrub; 32°02'02"N, 110°47'12"W; 938 m elevation; locally abundant perennial in dense patch in roadside ditch, 21 Sep 2004, *T.R. ABSTRACT

Twenty-four species or varieties of vascular plants, all native to or naturalized in the southeastern U.S.A., are reported as new or noteworthy for Kentucky. Fourteen of these are native and ten are non-native. Fifteen of the taxa are reported as state records, and the accounts for the other nine taxa provide clarifications or updates on their status in the state. Taxa reported as state records are: *Acanthopanax sieboldianus, Callicarpa dichotoma, Castanea sativa, Cladium mariscoides, Hydrocotyle ranunculoides, Ilex cornuta, Ipomoea quamoclit, Ipomoea turbinata, Lonicera* × *minutiflora, Lonicera xylosteum, Magnolia grandiflora, Quercus texana, Ribes americanum, Salix cinerea* subsp. *oleifolia*, and *Symphyotrichum divaricatum*.

RESUMEN

Se citan veinticuatro especies o variedades de plantas vasculares, todas nativas o naturalizadas en el Sureste de U.S.A., como nuevas o notables para Kentucky. Catorce de ellas son nativas y diez son introducidas. Quince de los taxa son citados como nuevos para el estado, y de otros nueve se hacen aclaraciones o puestas al día de su estatus en el estado. Los taxa citados como nuevos para el estado son: *Acanthopanax sieboldianus, Callicarpa dichotoma, Castanea sativa, Cladium mariscoides, Hydrocotyle ranunculoides, Ilex cornuta, Ipomoea quamoclit, Ipomoea turbinata, Lonicera* × *minutiflora, Lonicera xylosteum, Magnolia grandiflora, Quercus texana, Ribes americanum, Salix cinerea* subsp. *oleifolia*, y *Symphyotrichum divaricatum*.

INTRODUCTION

Recent field and herbarium work has resulted in the discovery of 24 species of native and naturalized flowering plants new or noteworthy for Kentucky. These findings update occurrences and distributions as reported by Beal and Thieret (1986), Browne and Athey (1992), Medley (1993), and Jones (2005). Kentucky rarity status—Special Concern, Threatened, Endangered, or Historical—is based on lists published by Kentucky State Nature Preserves Commission (KSNPC 2000, 2001). Nomenclature, as well as abbreviations for physiographic regions (**AP**—Appalachian Plateaus, **IP**—Interior Low Plateaus, **ME**—Mississippi Embayment), are based on Jones (2005), and herbarium abbreviations follow Holmgren et al. (1990). State distributions in the United States are based on USDA, NRCS (2004). Many of these records have resulted from an on-going statewide survey of woody plants by R.C. Clark, and also from analyses by R.C. Clark and R.L. Jones of recent additions to EKY of major sets of collections from E.T. Browne, H.R. Athey, and M.E. Wharton. Additional records have resulted from recent field work by staff of the KSNPC and other authors listed above.

TAXA NEW OR NOTEWORTHY FOR KENTUCKY

Acanthopanax sieboldianus Makino [*Eleutherococcus pentaphyllus* (Siebold & Zucc.) Nakai] (Araliaceae). Previous reports of fiveleaf aralia were based on specimens persistent after cultivation (Medley 1993). This species has been documented as an escape in Utah, Ohio, West Virginia, Pennsylvania, and in a few states in New England. It was included in Jones (2005) only as a brief note under the family account. The following records from the n. IP of Kentucky are from plants escaped from cultivation.

Voucher specimens. **Grant Co.:** roadside thicket near Zion Station, 7 Jun 1994, *Thieret & Buddell 57455* (KNK). **Jefferson Co.:** woodland edge, Jefferson Hill Rd, ca. 2 mi SW of jct Key's Ferry Road, 1 Jun 1994, *Medley 20021-94* (KNK).

Acer floridanum (Chapm.) Pax (Aceraceae). There has been disagreement on the existence of the Florida maple (or southern sugar maple) in Kentucky. It was accepted by Browne and Athey (1992), rejected by Gueitg and Jones (1991) and Medley (1993), but included as *A. barbatum* Michx. by Jones (2005). Ward (2004) concluded that the Michaux name, *A. barbatum*, was originally linked to specimens of *A. saccharum*, and therefore cannot be used for the Florida maple. The taxon is known from all contiguous states except Indiana, Ohio, and West Virginia. Most of the following records are from the ME of Kentucky.

Voucher specimens: **Butler Co.:** woods along KY 105, 3.8 mi W of Grayson Co. line, 8 Jul 1963, *Browne & Browne 7556* (KY) **Calloway Co.:** Hancock Biological Station, Murray State University, mesic upland oak-hickory forest, 14 Jun 1998, *Thompson 98-162* (BEREA). **Carlisle Co.:** loess bluffs on road off KY 62 to Beech Grove Church Rd, 13 May 1971, *Browne & Browne 71E13.1* (EKY, MDKY). **Fulton Co.:** lower slopes of loess bluffs, 8 Oct 1986, *Campbell s.n* (KY). **Graves Co.:** KY 1763, 1.5 mi W of jct U.S. 45, deciduous woods, 27 Jun 1973, *Browne et al. 73D11* (EKY). **Hickman Co.:** oak-hickory woods, base of loess bluffs, 21 Jul 1995, *Weckman & Rozeman 1758* (EKY). **Marshall Co.:** woods along KY 80, 1.8 mi E Graves Co. line, 12 May 1963, *Browne & Browne 7046* (KY). **Owen Co.:** upland woods near Kentucky River off KY 355, 2 Jun 1996, *Weckman et al. 2815* (EKY).

Callicarpa dichotoma (Lour.) K. Koch (Verbenaceae). The purple beautybush, a native of China and Japan, was previously known as an escape only in North and South Carolina, Tennessee, and Virginia. This report from the n. IP is the first for Kentucky.

Voucher specimen: **Madison Co.:** adventive at woodland edge in Hilltop Acres Subdivision, ca. 6 mi W of Richmond, 4 Oct 2004, *Clark 25570* (EKY).

Castanea sativa Mill. (Fagaceae). Spanish chestnut, native in western Asia, has previously been documented for Alabama, Pennsylvania, and several New England states. It has not been reported in previous literature as naturalized in Kentucky. The following specimens from the AP and IP were determined by R.C. Clark.

Voucher specimens: **Fleming Co.:** swamp forest near Plummer's Landing, 15 Sep 1974, *Meijer s.n.* (KY). **McCreary Co.:** near Whitley City, Summer, 1989, *Campbell s.n.* (KY).

Cladium mariscoides (Muhl.) Torr. (Cyperaceae). Smooth sawgrass is known from all surrounding states except West Virginia and Missouri. It has been reported from Kentucky (see Beal & Thieret 1986) but no previous vouchers are known, and it was not included in Jones (2005). This recent collection from the ne. IP now confirms the presence of this sedge in Kentucky.

Voucher specimen: **Bath Co.:** shallow drainage ditch of wooded wetlands, Hog Hollow drainage of Licking River just SW of Cave Run Dam, elevation 820 ft, 23 Nov 2004, *Feeman s.n.* (MDKY).

Cornus sericea L. [*C. stolonifera* Michx.] (Cornaceae). Red-osier dogwood is known from all contiguous states (except Missouri) to the east, north, and west of Kentucky. The species was accepted for Kentucky by Browne and Athey (1992), but rejected by Medley (1993), and considered a species of questionable documentation by Jones (2005). The following specimens determined by R.C. Clark document the presence of red-osier dogwood in the AP and IP of Kentucky.

Voucher specimens: **Henry Co.:** no locality, 23 Aug 1910, *Garman s.n.* (KY). **Wolfe Co.:** oak-pine woods, along trail to Sky Bridge; single clone of 4 stems, 4 Oct 2004, *Clark 25569* (EKY).

Drosera intermedia Hayne (Droseraceae). Narrow-leaved sundew has been documented from most of the eastern United States, but is known in Kentucky only from specimens collected in the 1800s (see Beal & Thieret 1986 and Medley 1993), and considered Historical in the most recent listings by the KSNPC (2000, 2001). It was recently rediscovered in the s. IP of the state by the KSNPC, in wet, heavily disturbed woodland openings.

Voucher: a digital image deposited at EKY: **Russell Co.:** several hundred plants observed in ruts of wet fields in bush-hogged (previously bulldozed) openings of flatwoods, plants still persistent the following summer, ca. 3 miles N of Russell Springs, on farm along Berry Road, 23 Jul 2003, *Hines & Drozda s. n.* (EKY).

Hydrocotyle ranunculoides L.f. (Apiaceae). Buttercup pennywort has been documented from all contiguous states except Indiana and Missouri. It was not listed by Beal & Thieret (1986), Browne and Athey (1992), or Medley (1993), but was included in Jones (2005), based on the following voucher collected in the far western portion of the ME.

Voucher specimen: **Graves Co.:** Terrapin Creek Nature Preserve, edge of large marsh, forming floating mats, 3 Jul 2003, *White s.n.* (EKY).

Ilex cornuta Lindl. & Paxton (Aquifoliaceae). Chinese holly has previously been reported as an escape only in Alabama and North Carolina, and has not been listed in earlier publications on the Kentucky flora. This collection is from the n. IP.

Voucher specimen. **Madison Co.:** several plants escaping on campus of Eastern Kentucky University, behind Keith Hall, 4 Oct 2004, *Clark 25571* (EKY).

Ipomoea quamoclit L. (Convolvulaceae). Cypressvine is native to tropical America, and is known to escape in all states surrounding Kentucky except Indiana, Ohio, and West Virginia. Medley (1993) rejected this taxon from the Kentucky flora, and it was treated as a "to be expected" species in Jones (2005). This collection is from the n. IP.

Voucher specimen: **Madison Co.:** twining on *Helianthus annuus* in a landfill off South Dogwood Drive and KY 21, Berea, where the species has persisted for two years, 30 Aug 2003, *Thompson & FitzGerald 04-1264* (BEREA).

Ipomoea turbinata Lag. (Convolvulaceae). Purple moonflower, a native of India, has been reported as an escape from most southern states (North Carolina to Texas to Arkansas, except for Alabama and Tennessee). This collection from the far western portion of the ME is a considerable range extension, and is the northernmost record. It was not observed at the site in a follow-up visit in summer, 2003 (M.J. McWhirter, pers. comm.).

Voucher specimen: **Hickman Co.:** Wolf Island, in open field, a cottonwood plantation in bottomland of Mississippi River, Jul 2002, *McWhirter s.n.* (EKY). Determination by R.L. Jones, verified by D.F. Austin, Arizona-Sonora Desert Museum.

Lonicera ×minutiflora Zabel [*Lonicera ×muendeniensis* Rehder] (Caprifoliaceae) This taxon has a complex hybrid origin, and has previously been documented only in Illinois, Indiana, Michigan, and Wisconsin. This collection determined by R.C. Clark is from the n. IP of Kentucky.

Voucher specimen: **Woodford Co.:** along railroad tracks, near U.S. 60 bypass at 2nd railroad crossing W of Lexington-Versailles Pike, 11 May 1962, *Browne & Browne 5176* (EKY).

Lonicera xylosteum L. (Caprifoliaceae). European fly honeysuckle is known from all contiguous states except West Virginia and Tennessee. It was not listed for Kentucky by Browne and Athey (1992), rejected by Medley (1993), but was included in Jones (2005) on the basis of inaccurate specimen determinations.

Voucher specimen: **Laurel Co.:** uplands of Rock Creek Gorge, ruderal community near white pine stand, 4 Jul 1989, *Thompson & Skeese 89-1425* (EKY).

Magnolia grandiflora L. (Magnoliaceae). Southern magnolia occurs across the Coastal Plain from North Carolina to east Texas, north to Arkansas, Tennessee, and Virginia. It is not native to Kentucky, and both Browne & Athey (1992) and Medley (1993) rejected it as occurring outside of cultivation in the state. Specimens listed below document the first spontaneous establishment of *Magnolia grandiflora* in Kentucky. It was included in Jones (2005) as a rare adventive on the basis of these vouchers. The collections are from the ME and the n. IP. A similar distribution pattern has been documented in Tennessee (Chester et al. 1997). Both sites in Kentucky were similar, remnant woodlands with poorly drained, acidic soils, adjacent to urban areas.

Voucher specimens: **McCracken Co.:** single individual in disturbed oak woods and intermittent drainage below baseball field, Paducah Community College, 5 Nov 1994, *Weckman & Weckman 1190* (EKY). **Madison Co.:** low remnant pin oak-red maple woodlot, between KY 595 and Rash Rd, just N of Berea, 23 Jan 1999, *Weckman et al. 4527* (EKY).

Nyssa biflora Walter (Nyssaceae). Swamp tupelo occurs in all contiguous states except Indiana, Ohio, and West Virginia. It was accepted by Browne and Athey (1992), rejected by Medley (1993), and treated as a questionable taxon by Jones (2005). It has now been verified by R.C. Clark for several counties in the ME and IP of Kentucky.

Voucher specimens: **Calloway Co.:** flatwoods on Tobacco Road near Murray, 11 Jul 1996, *Campbell s.n.* (KY). **Cumberland Co.:** low ground near Cloyd's Landing, 2 Oct 1999, *Clark 25351* (EKY). **Fleming Co.:** low ground along Big Run Creek, 0.3 mi N of jct KY 1013, 19 Jul 1999, *Clark & Bauer 25226* (EKY). **Livingston Co.:** 1.2 mi E of Ledbetter, 2.2 mi NE of Tennessee River bridge, 24 Mar 1972, *Wilson s.n.* (MUR). **Marshall Co.:** Sledd Creek embayment, S of KY 641, ca. 2 mi W of Kentucky Dam, shoreline, 30 May 1989, *Grubbs 1437* (MUR) and **Rockcastle Co.:** bank of Copper Creek, 15 Jun 1938, *Wharton 2691* (KY).

Populus balsamifera L. (Salicaceae). Balsam poplar is native to mesic woods of northeastern North America, and has been documented in all contiguous states to Kentucky except Tennessee and Missouri. There long has been confusion about whether this species occurs naturally in Kentucky. Medley (1993) was of the opinion that previous reports of the plants in Kentucky should be referred to *P.* × *jackii* Sargent, a hybrid between *P. balsamifera* L. and *P. deltoides* W. Bartram ex Marshall. Some specimens have been referred to *Populus* × *gileadensis* Rouleau (Balm-of-Gilead poplar), but this taxon is known to be a pistillate clone (Hardin et al. 2001), and several of the cited specimens have staminate catkins. These collections, all verified by R.C. Clark, document the species in both the AP and IP of Kentucky.

Voucher specimens: **Carter Co.:** KY 182, 5.9 mi W of jct U.S. 60, flood plain, 30 Jul 1965, *Browne & Browne 10978* (EKY). **Casey Co.:** Turkey Creek Road, 6 May 1962, *Murphy & Browne 413* (KY). **Lee Co.:** Beartrack, 8 Sep 1974, *Black 10* (KY). **Letcher Co.:** old strip mine area, 0.6 mi from Virginia border, near Eolia, 4 Oct 1978, *Hannan & Phillippe KEP-01-017-00637* (EKY). **Menifee Co.:** bench above Wolfpen Creek, ca. 1 mi N of KY 715, 6 Sep 1989, *Clark & Taylor 22338* (EKY). **Powell Co.:** Anders Branch, 1 May 1993, *Campbell s.n.* (KY).

Potamogeton amplifolius Tuck. (Potamogetonaceae). Largeleaf pondweed is known from most eastern states. Medley (1993) noted that the species was collected in Kentucky in the mid-1800s by C.W. Short, but that it was likely later extirpated. It was included in Jones (2005), based on the following voucher collected by the KSNPC from the s. IP.

Voucher specimen: **Pulaski Co.:** submersed in stream over a 2 × 3 meter area, in Buck Creek near Reynold Hollow, 10 Aug 1999, *White & Fields s.n.* (KNK). Verified by J.W. Thieret.

Prenanthes racemosa Michx. (Asteraceae). Purple rattlesnakeroot is known from most northeastern and northcentral states. The only record of this species in Kentucky was a historical collection from Pendleton County, and the species was considered to be extirpated in the state by Medley (1993). It was listed as "to be expected" in Jones (2005), and the following recent collection by the KSNPC from the n. AP reaffirms its presence in Kentucky.

Voucher specimen: **Lewis Co.:** siltstone/calcareous shale glade, in Crooked Creek Barrens State Nature Preserve, 27 Sep 2004, *Hines & Evans s. n.* (EKY).

Quercus nigra L. (Fagaceae). There have been persistent reports of water oak in Kentucky. Browne and Athey (1992) accepted the species, based on reports from the 19th century. Medley (1993) questioned many of the records, suggesting that some were based on misidentifications or were from trees in cultivation. The species has now been firmly documented from the s. IP by the KSNPC, and other records confirm the ability of the species to naturalize in the ME of Kentucky. The native range of the species in south-central U.S. now includes Kentucky and all contiguous states except Indiana, Ohio, and West Virginia.

Voucher specimens: **Wayne Co.:** large tree on edge of bottomland in Meadow Creek Swamp, S of KY 90, 14 Jul 2000, *Hardin et al. s.n.* (EKY).

Quercus texana Buckley (Fagaceae). Nuttall's oak was not accepted as a member of Kentucky's flora by Browne and Athey (1992) or by Medley (1993). It was included in Jones (2005), based on the following voucher from the ME. It is also known from adjacent Tennessee, Missouri, and Illinois.

Voucher specimen. **Calloway Co.:** common along trail, end of gravel road off KY 444, seeps into Blood River, N of New Concord, 22 Jul 1995, *Weckman & Rozeman 1778* (EKY).

Ribes americanum Mill. (Grossulariaceae). Wild black currant grows from Montana to New England to Missouri, Illinois, Indiana, Ohio, West Virginia, and Virginia. It was not accepted by Browne and Athey (1992) or by Medley (1993). It was included in Jones (2005), based on the following collections from the AP and n. IP.

Voucher specimens. **Lee Co.:** mixed woods, S-facing ravine of Walker Creek, 27 Apr 1996, *Kirk & Clark 41* (EKY). **Madison Co.:** bottomland forest, Bluegrass Army Depot, 14 Jul 1993, *Libby & Mears OB-526* (EKY).

Rosa virginiana Mill. (Rosaceae). Virginia rose has been documented from all states contiguous to Kentucky except Indiana, Ohio, and West Virginia. It was accepted by Browne and Athey (1992), rejected by Medley (1993), and treated as a taxon of unknown status by Jones (2005). The following collections from the AP and IP have now been verified for Kentucky by R.C. Clark.

Voucher specimens: **Harrison Co.:** upland pasture and woodlots, W of Dividing Ridge Road and N of KY 32, 7 Jun 1999, *Clark & Bauer 24680* (EKY). **Menifee Co.:** KY 77, roadside, 0.25 mi from iron bridge, 9 Jul 1969, *Higgins 1618* (KY). **Mercer Co.:** woodland edges between Shakertown and High Bridge, 23 Jul 1955, *Wharton 9217* (KY). **Rowan Co.:** KY 174, 0. 6 mi W of Haldeman P.O., fallow land, 28 Jun 1965, *Browne & Browne 10492* (EKY).

Salix cinerea L. subsp. **oleifolia** (Sm.) Macreight (Salicaceae). Large gray willow, a native of the Mediterranean region, is known to escape in the eastern United States, and has previously been documented from North Carolina, Pennsylvania, New York, Massachusetts, and Maine. Earlier reports of this species in Kentucky were based on specimens from cultivated plants (Argus 1986), and it was not included in Jones (2005). This collection from the ME is therefore the first documentation of the species in Kentucky.

Voucher specimen: **Hickman Co.:** N on Old Milburn Road, E on new logging road to Obion Creek, slough, 23 Aug 1988, *Grubbs 1226* (MUR). Determined by R.C. Clark.

Symphyotrichum divaricatum (Nutt.) G.L. Nesom [*Aster subulatus* Michx. var. *ligulatus* Shinners] (Asteraceae). Southern annual saltmarsh aster was previously known from most southern and midwestern states, including adjacent Tennessee and Missouri, but has not been reported in previous literature on the Kentucky flora. It was known from adjacent counties (Lake and Obion) in the Reelfoot Lake region of Tennessee (Chester et al. 1997). This species was discovered in Kentucky during an Eastern Kentucky University class trip to western Tennessee and Kentucky. The plants were first observed by two students, Amy V. McIntosh and James Storm, who noted the plants growing along a roadside just north of the upper reaches of Reelfoot Lake. This discovery from the ME came too late for inclusion in Jones (2005), where it was treated as "to be expected."

Voucher specimen: **Fulton Co.:** open wet fields, along KY 1282, at jct gravel road, 2.7 mi W of jct KY 311, 2 Oct 2004, *Bio 525/725 class collection # 45* (EKY).

ABSTRACT

The rediscovery of *Ponthieva brittoniae* is reported. The two populations found in Everglades National Park, Miami-Dade County, Florida, represent the only plants currently known from the United States.

RESUMEN

Se cita el redescubrimiento de *Ponthieva brittoniae*. Las dos poblaciones encontradas en el Parque Nacional de los Everglades, en el condado de Miami-Dade, estado de Florida, representan actualmente las únicas plantas conocidas de los Estados Unidos.

Reports of *Ponthieva brittoniae* Ames in the United States have been few since its initial discovery. This species was first collected in southern Florida by botanists J.K. Small and J.J. Carter. Plants were collected in 1909 near Perrine, Florida, and in the Long Pine Key area of what is now Everglades National Park. Fifty-two years later, F.C. Craighead Sr. made a collection in the eastern portion of Long Pine Key near Osteen Hammock. The next report of *P. brittoniae* was made by R.L. Hammer, who found a population of plants growing along a firebreak road in central Long Pine Key in 1979 (McCartney 1997; Gann et al. 2002). Plants persisted along the road until 1986, when the re-grading of the firebreak is thought to have destroyed them. The last recorded sighting of *P. brittoniae* in the United States occurred in 1987 when a single plant was observed in a solution hole by Chuck McCartney northeast of the Hammer station (McCartney 1997). Since then, multiple searches of the historical locations in Everglades National Park have been carried out by Hammer, McCartney, staff of The Institute for Regional Conservation (IRC) and others. The failure of these efforts to locate plants resulted in the listing of this species as "Historical" in South Florida by IRC (Gann et al. 2002). Currently, *P. brittoniae* is listed as endangered by the state of Florida and critically imperiled by Florida Natural Areas Inventory (Chafin et al. 2000).

---

Mention of trade names or commercial products does not constitute their endorsement by the U.S. Government."

SIDA 21(3): 1917–1920. 2005

Although *Ponthieva brittoniae* has been reported for two other Florida counties, Brown (2002) identified these populations as the closely related *P. racemosa* (Walter) Mohr. These two species closely resemble one another but can be distinguished on the basis of sepal and labellum shape (Sauleda & Adams 1980). In addition, *P. racemosa* has petals with green striping while *P. brittoniae* does not. The leaves of *P. racemosa* are present at anthesis while the leaves of *P. brittoniae* are usually absent at anthesis (Luer 1972).

Outside of Florida, *Ponthieva brittoniae* is known from the Bahamas (Ackerman 2002), the Turks and Caicos Islands (J.L. Sadle, unpublished), Cuba (Correll & Correll 1982; Nir 2000) and Hispaniola (J.D. Ackerman, pers. comm.). The current status of this species in the Bahamas is unknown, but it has been reported from New Providence and Andros Island. Pine rockland is still present and protected in some areas on both islands. However, the decline of other pine rockland species on New Providence has been attributed to land clearing (Bahamas Environment Technology and Science Commission 1999). In the Turks and Caicos, plants are known from a single, small, protected population on North Caicos Island. The status of *P. brittoniae* in Cuba and Hispaniola is uncertain. This species is considered to be rare and threatened throughout its range (J.D. Ackerman, pers. comm.).

While conducting rare plant surveys as part of the Critical Ecosystems Study Initiative (CESI) in the Long Pine Key region of Everglades National Park, two populations of *Ponthieva brittoniae* were encountered. The first, initially seen in December 2003, was located in the vicinity of where the last plant was seen in 1987. The site was revisited several times between December and February and 102 plants were observed. These plants undoubtedly represent the population last seen by McCartney. The second population, discovered in January 2004, was located approximately 2 km southwest of the original site. In this population, 139 plants were observed. Of the 241 plants, 72 were flowering.

Populations were found in open pine rockland characterized by exposed limestone substrate with extensive solution holes and minimal leaf litter. The majority of the plants were growing on the vertical walls of solution holes within 0.5m of the pineland's exposed limestone surface. A few plants were found in soil filled cracks on limestone surfaces of the limestone and a single plant was observed growing between a downed log and limestone. Prescribed fires had been carried out in both locations between 2003 and 2004.

In an effort to characterize the habitat of this species, three 5m radius plots were centered on solution holes in which *Ponthieva brittoniae* was growing. Plots were located in both populations. A total of 73 species of flowering plants were recorded in the plots. Associated species found within the solution holes of all plots were *Anemia adiantifolia* (L.) Sw., *Bletia purpurea* (Lam.) DC., *Eupatorium leptophyllum* DC., *Metopium toxiferum* (L.) Krug & Urb., *Mikania* *scandens* (L.) Willd., *Mitreola sessilifolia* (J.F. Gmel.) G. Don, *Phyllanthus pentaphyllus* C. Wright ex Griseb. var. *floridanus* G.L. Webster, *Polygala grandiflora* Walt., *Pteris bahamensis* (J.G. Agardh) Fée, *Samolus ebracteatus* Kunth and *Sideroxylon salicifolium* (L.) Lam. Species growing on the upland portions of all three plots were *Anemia adiantifolia*, *Echites umbellata* Jacq., *Guapira discolor* (Spreng.) E.L. Little Jr., *Ilex cassine* L., *Jacquemontia curtisii* Peter ex Small, *Mikania scandens*, *Myrica cerifera* L., *Passiflora suberosa* L., *Phyllanthus pentaphyllus* var. *floridanus*, *Physalis walteri* Nutt., *Pteris bahamensis*, *Rapanea punctata* (Lam.) Lundell, *Sabal palmetto* (Walt.) Lodd. ex J.A. & J.H. Schultes, *Samolus ebracteatus*, *Schizachyrium gracile* (Spreng.) Nash and *Tetrazygia bicolor* (P. Mill.) Cogn.

Voucher Specimen: **FLORIDA. Miami-Dade Co.:** Everglades National Park, Long Pine Key, S of Winkley Hammock; in recently burned, previously fire suppressed pine rockland, in solution hole 30 cm from top on vertical face; collected with Everglades National Park permit #EVER-2003-SCI-0084 and Florida Department of Agriculture and Consumer Services Regulated Plant Index Harvesting Permit #561,10 Feb 2004, *Sadle 396* (EVER).

ACKNOWLEDGMENTS

The authors thank Chuck McCartney, J.D. Ackerman and Roger L. Hammer for providing information, comments and inspiration. Bryan Naqqi Manco, the Turks and Caicos National Trust and the United Kingdom Overseas Territories Conservation Forum provided financial and logistical support for work conducted in the Turks and Caicos Islands. Barbara S. Carlsward, David L. Martin and an anonymous reviewer provided useful comments on this manuscript. Fairchild Tropical Botanic Garden (FTG) and New York Botanical Garden (NY) provided information on herbarium specimens and label data. Funding for the project that led to this rediscovery was provided by the Critical Ecosystems Study Initiative of the U.S. Department of the Interior through Cooperative Agreement #H5284-03-0044, Rare Plant Monitoring and Restoration on Long Pine Key, Everglades National Park, G.D. Gann and T.V. Armentano, principal investigators.

ABSTRACT

Quercus montana (Fagaceae) is a new species for Missouri, extending the western edge of the range for the species in North America.

RESUMEN

Quercus montana (Fagaceae) es una nueva especie para Missouri, que extiende el extremo occidental de su área en Norte América.

Quercus montana Willd., rock chestnut oak, is common in the NE US, and known to occur in AL, CT, DE, GA, IL, IN, KY, ME, MD, MA, MI, MS, NH, NJ, NY, NC, OH, PA, RI, SC, TN, VT, VA, WV (Nixon & Muller 1997). The species also has been called *Q. prinus* L. in some of the North American botanical literature, but because of persistent problems with the typification and application of that epithet, we are following Nixon and Muller (1997) in using the name *Q. montana*. There has been a recent proposal to reject the name *Q. prinus* (Whittemore & Nixon 2005). We report it from four sites in Wayne Co in southern Missouri, on land owned and managed by the US Army Corps of Engineers (USACE) surrounding Lake Wappapello. The lake was created in 1941 by the USACE to control flooding of farmland on the St. François River (USACE 2002). The Wappapello Project consists of 44,000 acres of land and water; the lake varies in size from 5,200 to 23,200 acres in surface area, depending upon the season. The original vegetation of the area consisted of woodlands that were part of the eastern temperate deciduous forest (Yatskievych 1999). This is the first report of *Q. montana* in Missouri, and a range extension of ca. 50 km for the species on its western boundary. Because of the proximity of the *Q. montana* populations in southern Illinois (Nixon & Muller 1997; see distribution map in FNA, Vol. 3, pg. 476) and the number of populations discovered in Wayne Co, MO, the current report suggests that forested areas in counties lying between the Missouri and Illinois populations should be surveyed for the species.

The populations reported below were from three glades and an oak-hickory forest. In all cases, the specimens were collected from saplings (1–1.5 m) growing in well-drained rocky soil. All specimens were verified by Alan Whittemore (US National Arboretum, Washington, DC). Although saplings appeared to be abundant in the areas, the parent trees were not identified. At glade 1, associ-

SIDA 21(3): 1921–1922. 2005

ated species included *Acer saccharum* Michx., *Carya ovata* (Miller) K. Koch, *Platanus occidentalis* L., *Quercus alba* L., *Q. imbricaria* Michx., *Q. marilandica* Moench., *Q. rubra* L., *Q. ×tridentata* Engelm. and *Ulmus americana* L; at glade 2, *A. negundo* L., *Cercis canadensis* L., *Q. alba*, *Q. imbricaria*, *Q. muehlenbergii* Engelm., *Q. rubra*, and *Q.×tridentata*; and *A. saccharum*, *Q. marilandica*, *Q. muehlenbergii*, *Q. rubra* and *U. alata* Michx. at glade 3. Associated species at the oak-hickory site included *A. saccharum*, *Celtis occidentalis* L., *C. canadensis*, *Q. imbricaria*, *Q. marilandica*, *Q. stellata* Wang var *stellata*, *Q. ×tridentata*, *Q. rubra* and *U. alata*.

Voucher specimen: **MISSOURI. Wayne Co.:** go S on US67 to Hwy 34, go <1 mi W and turn N on Rebel Cave Rd (Co Rd 310); go ca. 0.25 mi, take right fork on Co Rd 311 and continue N ca. 1.25 mi to first USACE parking lot; go through gate for ca. 0.5 mi; limestone glade on left of road (glade 1); N37.12.35 W090.29.49; 7 Aug 2004, *M. Smith 04-151* (MO).

ACKNOWLEDGMENTS

This study was funded by a USACE, St Louis District, contract (DACW43-02-P-1010) awarded to M. Smith. We thank James Gracey and the staff at USACE Wappapello Lake Project Office for logistical support; Alan Whittemore, US National Arboretum, for verification of the oaks; George Yatskievych, Flora of Missouri Project, for help in specimen identification; Paul McKenzie, USFWS, for editing suggestions, and Paige Mettler, Lindenwood University, and Genneth Wells, SIUE, for help in the field. George Yatskievych and Robin C. Kennedy reviewed an earlier draft of the manuscript.

ABSTRACT

Sporobolus heterolepis (Poaceae) is reported as a new addition to the flora of Tennessee. This species is a very rare component of limestone cedar glades and barrens in the central portion of the state. The Tennessee Natural Heritage Program is currently tracking it as a species of special concern.

RESUMEN

Se cita *Sporobolus heterolepis* (Poaceae) como una nueva adición a la flora de Tennessee. Esta especie es un componente muy raro de los claros en los bosques de cedros sobre calizas y lugares áridos en la porción central del estado. El Tennessee Natural Heritage Program está haciendole actualmente un seguimiento como especie de especial preocupación.

Sporobolus R. Br. is a genus of ca. 100-160 species found nearly throughout the tropical and warm-temperate regions of the world (Yatskievych 1999). Chester et al. (1993) listed nine species and infraspecific taxa for Tennessee, including eight natives. In the autumn of 2003, while conducting fieldwork in the limestone cedar glades of middle Tennessee, we discovered a small population of *Sporobolus heterolepis* (A. Gray) A. Gray (prairie dropseed), a species previously unknown from the state.

Voucher specimen: **U.S.A. TENNESSEE. Rutherford Co.:** Interior Low Plateau Physiographic Province, Central Basin Section, Inner Central Basin Subsection, ca. 7.5 km E of Murfreesboro, Flat Rock Cedar Glades and Barrens State Natural Area, growing near edges and among shrub islands of gravelly limestone cedar barrens and glades, 28 Sep 2003, *D. Estes 05437, 05438* with *J. Beck* (TENN).

Sporobolus heterolepis is a perennial, tussock-forming species of prairies, dry woods, glades, savannas, and other open habitats (Yatskievych 1999). The species ranges from southern Canada (Ontario, Quebec, Saskatchewan) south to Georgia and New Mexico (United States Department of Agriculture 2000). Although widely distributed across central and eastern North America, it is most frequent in a large area of the Midwest from the Dakotas to the western Great Lakes region south to the Ozarks. Prairie dropseed is considered locally rare throughout much of its range. For example, it is presumed extirpated in Massachusetts and considered critically imperiled in Quebec, as well as in Connecticut, Georgia, Kentucky, Maryland, North Carolina, Pennsylvania, Virginia, and Wyoming (Nature Serve Explorer 2004). In Illinois, New York, and Ohio, *S. heterolepis* is an imperiled species, and it is considered vulnerable in Michigan, Ontario, and Saskatchewan (Nature Serve Explorer 2004).

All of the individuals we discovered were located on Flat Rock Cedar Glades and Barrens State Natural Area. The Natural Area, cooperatively managed by The Nature Conservancy and the Tennessee Department of Environment and Conservation's Natural Heritage Program, is one of the largest cedar glade preserves in the southeastern United States with over 400 ha (The Nature Conservancy 2004). Five tussocks were found at the edge of high quality limestone cedar barrens and among shrub islands within the glades (Fig. 1).

Interestingly, the Natural Area is home to several rare limestone cedar glade endemics and western disjuncts. Notable glade endemics or near-endemics known to occur on the nearby glades and barrens include *Aster priceae* Britt., *Astragalus bibulatus* Barneby & Bridges, *A. tennesseensis* A. Gray ex Chapman, *Dalea gattingeri* (Heller) Barneby, *Delphinium carolinianum* Walt. ssp. *calciphilum* Warnock, *Onosmodium molle* Michx. ssp. *molle*, *Pediomelum subacaule* (Torr. & A. Gray) Rydb, and *Solidago gattingeri* Chapman. Rare western disjuncts known from the vicinity, some in association with the *Sporobolus*, include *Ammoselinum popei* Torr. & A. Gray, *Dalea purpurea* Vent., and *Oenothera macrocarpa* Nutt. Native grasses such as *Andropogon gerardii* Vitman, *Bouteloua curtipendula* (Michx.) Torr., *Schizachyrium scoparium* (Michx.) Nash, *Sorghastrum nutans* (L.) Nash, and *Sporobolus vaginiflorus* (Torr. ex A. Gray) Wood var. *vaginiflorus* were also common associates.

The Rutherford County population is significantly disjunct from all other known populations. The nearest is located ca. 140 km to the southeast in cedar glades of Chickamauga and Chattanooga National Military Park, Catoosa County, northwestern Georgia (J. Allison, Georgia Natural Heritage Program, pers. comm.). The next closest populations are located ca. 220 km to the northwest and ca. 230 km to the north-northeast in Crittenden and Bullitt counties, Kentucky, respectively (J.J.N. Campbell, The Nature Conservancy, pers. comm.).

Approximately one week after our discovery of *S. heterolepis* in Tennessee, Al Good and Todd Crabtree, members of the Tennessee Native Plant Society who were unaware of our find, independently discovered two additional sites on nearby barrens in the Natural Area (pers. comm.). The Tennessee Division of Natural Heritage has been informed of the presence of *S. heterolepis* in the state and is now tracking it as a species of special concern. It is quite remarkable that given all the attention that the glades of Middle Tennessee have received over the last fifty plus years, especially those in the vicinity of the Natural Area, that this species has only now been discovered in the state.

Fig. 1. **Upper photo:** clump of *Sporobolus heterolepis* (arrow) among shrub island in cedar glade at Flat Rock Cedar Glades and Barrens State Natural Area, Rutherford County, Tennessee, 28 September 2003. **Lower photo:** close-up of *S. heterolepis* at edge of cedar barren, same date.

ACKNOWLEDGMENTS

We wish to thank Forrest Evans, Stewardship Ecologist with the Tennessee Natural Heritage Program, and Sally Rollins Palmer, ILP Program Manager with the Tennessee Chapter of The Nature Conservancy for reviewing this manuscript. Gene Wofford and an anonymous reviewer also reviewed the paper. The Breedlove-Dennis Fund and the University of Tennessee Department of Botany provided funding for travel. Hal DeSelm, retired botany professor at the University of Tennessee confirmed our identification. Lastly, we extend a sincere thanks to Gene Wofford, curator at the University of Tennessee Herbarium, for continued support and appreciation of our collecting efforts.

ABSTRACT

A second population of the rare *Agalinis navasotensis* Dubrule & Canne-Hilliker (Navasota False Foxglove) has been confirmed from a Catahoula Barren in Tyler County, Texas. Previously, the only known locality was an Oakville formation sandstone outcrop in Grimes County, Texas, some 100 miles to the west.

RESUMEN

Se ha confirmado una segunda población de la rara *Agalinis navasotensis* Dubrule & Canne-Hilliker (Navasota False Foxglove) de Catahoula Barren en el condado de Tyler, Texas. Previamente, la única localidad conocida era un afloramiento de arenisca en Oakville en el condado de Grimes, Texas, unas 100 millas al Oeste.

Agalinis navasotensis Dubrule & Canne-Hilliker (Navasota False Foxglove) was described from a single population in a remnant prairie centered on a sandstone outcrop in Grimes County (Canne-Hilliker & Dubrule 1993.) Since the initial discovery, botanists have searched for the plant on other Oakville formation outcrops in Grimes County and on floristically-similar outcrops in Washington County. Aside from a few individuals within a mile of the original site (well within bee-flight and so considered part of the same population) and on soils derived from the Oakville, no specimens were found.

SIDA 21(3): 1927–1929. 2005

In the fall of 2003, John Hays, who with Judith Canne-Hilliker is working on the genus for the Flora of North America, confirmed the identification of about fifty individuals of *A. navasotensis* along a dirt road in Tyler County. [Voucher specimen: **TEXAS: Tyler Co.:** pine plantation and surrounding pine savannah, *J. Hays 3411* 24 Sep 2003 (MMNS)]. Interestingly, he discovered that Donovan Stuart Correll had collected *A. navasotensis* (as *A. pulchella*) at this same site in 1967 [TEXAS: Tyler Co.: xeric Oligocene outcrop, longleaf pine-grassland, flowers pink, *D.S. Correll 35187-A*, 19 Oct 1967 (TEX-LL)]

During the 2004 season, several of the authors had the opportunity to visit the site independently of one another. Each trip found plants that correspond in all respects with plants of the type population of *A. navasotensis*. (The calyx lobes were originally described as minute (Canne-Hilliker & Dubrule 1993), but some individuals in this population had calyx lobes to as long as 1.25 mm.) There were approximately thirty plants divided among several spots on both sides of the road. Persistent rainy weather and impassable roads made searching for more plants on side roads all but impossible.

Voucher specimens: U.S.A. **TEXAS. Tyler Co.:** roadside, sandy clay. *Monique Dubrule Reed and Dana Price 2872*, 8 Oct 2004 (TAMU). **Tyler Co.:** Catahoula Barrens on a high ridge top outcrop, *Singhurst 12501*, 5 Oct 2003 (BAYLU).

The site includes a small outcrop of the Catahoula Barren type, which is somewhat similar in composition to the Oakville formation, but many of the plants were not near exposed rock as in Grimes County. Soils at the site tend to be hard and dry during droughty weather and thick, sticky, and slick under wet conditions. The *A. navasotensis* plants were growing in close proximity to *A. oligophylla* Penn. but were easily distinguishable from that species by the more paniculate inflorescence, smoother foliage, straight rather than curved buds, larger and unrecurved upper corolla lobes, oblong rather than globose fruits, anthers of a deeper yellow, and greener stigmas. *Bigelowia nuttallii* L.C. Anders., *Liatris mucronata* DC., and *Schizachyrium scoparium* (Michx.) Nash were very common at the site, and *A. fasciculata* (Elliott) Raf. was also present.

Agalinis navasotensis is a very rare plant with G1S1, TOES V status (Poole et al. 2004; Jones et al. 1997.) No more than a few hundred individuals may be found in any given year. Thus the discovery of a second population is good news, especially since the type locality is becoming somewhat overgrown and the number of *A. navasotensis* plants has been falling from year to year. However, this new site is so far (over 100 miles) from the type locality and has such different vegetation that we are now faced with new questions. Just how rare is *A. navasotensis*? Is it an outcrop plant or a prairie/savannah plant, does it require both an outcrop-like substrate and an open, grassy, undisturbed habitat, or is it tolerant of a wide range of conditions? Does it require an alkaline soil? Where should we be looking for more populations—in deep East Texas on or near outcrops of non-Oakville formations, nearer the type locality on non-Oakville formations, or on similar formations between the type locality and the new location? Which set of plant associates—dry prairie vs. moist pine savannah—is most typical and has the greatest predictive value? What moisture conditions—well-drained or poorly-drained—are most favorable? How similar are plants of the two localities genetically?

Obviously, having additional localities would be invaluable for understanding the biology of *A. navasotensis*. Anyone who finds plants they believe belong to this species should contact the first author. The key in Canne-Hilliker and Dubrule (1993) will serve to separate *A. navasotensis* from other long-pediceled, slender-leaved members of the genus. Plants should be looked for from mid-September to early October and before early afternoon (the corollas drop after being open only a few hours, making the plants nearly impossible to spot). Images of the species may be found at www.csdl.tamu.edu/FLORA/cgi/gallery_query?q=agalinis+navasotensis.

ACKNOWLEDGMENTS

Thanks go to Larry E. Brown for reviewing the manuscript and to everyone who has looked for *Agalinis navasotensis* over the years.

ABSTRACT

Gibasis pellucida (Commelinaceae) is reported as a new naturalized weed in Texas. A description of the species and key to Texas genera of Commelinaceae are provided.

RESUMEN

Gibasis pellucida (Commelinaceae) se cita como una nueva mala hierba naturalizada en Texas. Se aporta una descripción de la especie y una clave de los géneros de Commelinaceae de Texas.

Gibasis Raf. (Commelinaceae), comprising 11 species, has a neotropical distribution centered in Mexico (Hunt 1986, 1993, 1994; Faden 2000). *Gibasis pellucida* (M. Martens & Galeotti) D.R. Hunt is native to México, mainly on the Atlantic side, and possibly El Salvador, occurring in moist shady places, such as forests and woodlands to 2200 m (Hunt 1986, 1994). In the United States it is mainly grown as an ornamental, but it also occurs as an introduced weed in citrus groves, disturbed sites, and waste places in Florida (Wunderlin 1998; Faden 2000). It has not been previously reported outside of cultivation from Texas (Correll & Johnston 1970; Hatch et al. 1990; Jones et al. 1997).

Recent collections from Galveston and Harris Counties suggest that *Gibasis pellucida* has naturalized in at least three locations in Texas. Plants appear to escape from cultivation, establish and spread readily in disturbed riparian areas under broken- to closed-canopy forests. The species might continue to spread into less disturbed areas, potentially becoming a pernicious weed in Texas and eventually throughout the southeast coastal plain.

The species propagates vegetatively by means of decumbent stems rooting at the nodes followed by fragmentation or death of the older parts. A few seeds have been found on *Rosen 3026* (BRIT) which demonstrates the species' potential to reproduce sexually, although it is usually self-incompatible (Hunt 1986). Potentially, the seeds could have been formed through apomixis, but apomixis has not been reported in Commelinaceae, so sexual reproduction seems more likely.

The following is a key to the Texas genera of Commelinaceae and a description of *G. pellucida*. With the addition of *Gibasis*, all native and naturalized genera of Commelinaceae in the U.S. are now recorded from Texas (Faden 2000).

KEY TO TEXAS GENERA OF COMMELINACEAE

1. Flowers sessile or subsessile; petals inconspicuous; ovary and capsule bilocular ____ **Callisia repens**
1. Flowers distinctly pedicellate; petals conspicuous; ovary and capsule trilocular.
  2. Inflorescences composed of pairs of contracted, sessile, umbel-like cymes; stamens 6, all fertile
    3. Cyme pairs enclosed in or subtended by pairs of large, conspicuous, spathaceous or foliaceous bracts; plants usually not mat-forming ____ **Tradescantia**
    3. Cyme pairs subtended by small inconspicuous bracts; plants mat-forming ____ **Callisia micrantha**
  2. Inflorescences composed of individual, often elongate, pedunculate, usually not umbellate cymes; stamens 6 or fewer, usually some staminodial (rarely all fertile).
    4. Inflorescences enclosed in or closely subtended by leafy bracts (spathes); flowers strongly bilaterally symmetric
      5. Stamens 6, all fertile, some filaments bearded; foliage glaucous ____ **Tinantia anomala**
      5. Stamens 6(–5), polymorphic, 3 fertile and 3(–2) staminodial, all filaments glabrous; foliage not glaucous ____ **Commelina**
    4. Inflorescences not enclosed in or closely subtended by leafy bracts; flowers radially or weakly bilaterally symmetric.
      6. Flowers weakly bilaterally symmetric; petals pinkish purple to violet; stamens 6, 2 fertile and 4 staminodial; annuals ____ **Murdannia nudiflora**
      6. Flowers radially symmetric; petals white, stamens 6, all fertile; perennials ____ **Gibasis pellucida**

Gibasis pellucida (M. Martens & Galeotti) D.R. Hunt (**Fig. 1**). TAHITIAN BRIDAL-VEIL; BRIDAL-VEIL. *Tradescantia pellucida* M. Martens & Galeotti, Bull. Acad. Roy. Sci. Bruxelles 9:376. 1842. *Gibasis pellucida* (M. Martens & Galeotti) D.R. Hunt, Kew Bull. 38:132. 1983. TYPE: MÉXICO: *Galeotti* 49965 (HOLOTYPE: BR).

Tradescantia schiedeana Kunth, Enum. Pl. 4:90. 1843. *Tradescantia geniculata* var. *schiedeana* (Kunth) C.B. Clarke, Monogr. Phan. 3:301. 1881. *Gibasis schiedeana* (Kunth) D.R. Hunt, Curtis's Bot. Mag. 179: pl. 636. 1972. TYPE: MÉXICO. *Schiede* 975 (HOLOTYPE: B).

Herbs, perennial, decumbent, rooting at the nodes, nearly glabrous or sparsely pubescent. Roots fibrous. Leaves 2-ranked, decreasing in size distally on the flowering shoots, blade sessile, narrowly lanceolate to ovate-elliptic, 3–7 × 0.7–2.5 cm, base oblique, apex usually acuminate, margins scabrous, surfaces usually glabrous; sheaths with a vertical line of pubescence, ciliate at the apex. Inflorescences terminal and also axillary from the distalmost, reduced leaves, composed of pairs of umbel-like, peduncluate cymes; spathaceous bract absent; bracteoles persistent. Flowers bisexual, radially symmetric; pedicels 5–15 mm long; sepals free, subequal, 2–2.5 mm long; petals free, equal, not clawed, broadly ovate, ca. 5 mm long, white; stamens 6, equal, all fertile, filaments bearded at the base and above the middle; ovary 3-locular, ovules 2 per locule, 1-seriate. Capsules 3-valved, 3-locular. Seeds 2 per locule, ovate to elliptic in outline, ca. 1 mm long, testa gray, rugose, hilum linear; embryotega dorsal.

Voucher specimens. **TEXAS. Galveston Co.:** on private property about 100 m N of the intersection of FM 528 and Clear Creek, an apparent escape from an abandoned and overgrown home-site, frequent

STEMODIA COAHUILENSIS (SCROPHULARIACEAE), A NEW RECORD FOR THE UNITED STATES

B.L. Turner

Plant Resources Center
The University of Texas
Austin, Texas 78712, U.S.A.

Henrickson (1989) first described *Stemodia coahuilensis* (as *Leucospora coahuilensis*) and mapped its distribution. The species was subsequently transferred to the genus *Stemodia* (s.l.) by Turner (in Turner & Cowan 1993). Previously reported collections have all been confined to north central Mexico (easternmost Chihuahua, Coahuila, northernmost Durango, and Zacatecas).

Recent collections of the species have been obtained from the Big Bend region of trans-Pecos, Texas, as attested to by the following:

UNITED STATES: TEXAS. Jeff Davis Co.: 5.1 mi S of Hwy 90 along Farm Road 2017, bottom of gullies, silty limestone soils, 8 Oct 2004, *Turner 24-492B* (SRSC, TEX). **Presidio Co.:** Big Bend State Natural Area, "vicinity of Sauceda Ranch," 7 Oct 1995, *Worthington 25254* (SRSC).

Henrickson (1989) has presented an excellent line drawing of the species. His description of its habit, however, stands in variance with my observations. He describes the taxon as "Woody rooted [and] woody-based," when in fact all of the plants which I examined in the field were rather slender-rooted annuals; this appears to be also true of Henrickson's material, including the type (LL!) itself. In his defense, however (pers. comm.), he maintains that the slender annual roots are in fact woody.

Flora of China Illustrations, Volume 5, Ulmaceae through Basellaceae includes the following families: Ulmaceae, Rhoipeteleaceae, Moraceae, Cannabaceae, Urticaceae, Podostemaceae, Proteaceae, Olacaceae, Opiliaceae, Santalaceae, Loranthaceae, Viscaceae, Aristologhicaceae, Rafflesiaceae, Balanophoraceae, Polygonaceae, Chenopodiaceae, Amaranthaceae, Nyctaginaceae, Phytolaccaceae, Molluginaceae, Aizoaceae, Portulacaceae, and Basellaceae.

EMILIA FOSBERGII (ASTERACEAE: SENECIONAE) IN TEXAS REVISITED

W.P. Spencer
Department of Agricultural Sciences
Sam Houston State University
Huntsville, Texas 77341, U.S.A.

J.K. Williams
Department of Biological Sciences
Sam Houston State University
Huntsville, Texas 77341, U.S.A.

In a remarkable example of botanical coincidence, the first author has made the second collection of the same species of non-native weed first reported for Texas by the second author (Williams 1994). The first collection was made 10 years to the day previously.

Emilia fosbergii Nicolson is a pantropical weed of "low elevation, dry, urban and disturbed habitats (Wagner et al. 1999)." Smith (1991) reported that the species is "probably indigenous in central or eastern Africa but widely established in the New World ... centering in the U.S. (Florida), West Indies, and subsequently from Mexico to northern South America." The species, was first reported in Texas growing in a disturbed site in Travis County. The second known collection of this plant is from Walker Co., collected about 9 miles north of Huntsville and 165 miles east of Travis County. Despite having been reported in Texas 10 years ago, *Emilia* has not been reported from other counties in Texas (Turner et al. 2003).

Williams (1994) speculated that the weed was brought into Texas as a hitchhiker on nursery plants supplied from Florida. Due to the proximity of a house in the second collection, it was again assumed the plant made its way to Texas through nursery stock.

Following the hunch, the second author visited all of the nurseries in Huntsville to look for evidence of *Emilia*. Indeed, the first nursery visited had an abundance of *Emilia fosbergii* growing as a weed in several pots of *Cycas revoluta* Thunb. and *Morea* sp., both supplied from Florida. Cycads were found growing approximately 60 feet from the collection made along Hwy 19 in Walker County. It is still not known if *Emilia* will become an established weed in Texas, but the disjunct distribution of the species and the increase in urban development suggests that it has ample opportunity to spread.

Voucher specimens. **TEXAS. Travis Co.:** City of Austin, A-1 Grass Nursery, two blocks S of Barton Skyway along S Lamar St., growing in gravel parking lot and planting area, 20 Nov 1993, *Williams s.n.* (TEX). **WALKER Co.:** 8.3 mi N of Hwy 30 along Hwy 19, on the N side of Hwy 19, growing in ditch along highway easement in front of residential area (30° 48' 33.01944" N, 95° 26' 39.76872" W), 20 Nov 2003, *Spencer 1* (SHST); Huntsville, Home Depot nursery, growing as a weed within pots of *Cycas revoluta* and *Morea* sp., 6 Dec 2003, *Williams s.n.* (SHST).

SIDA 21(3): 1937–1938. 2005

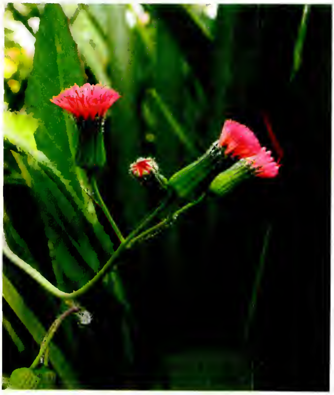

Fig. 1. Heads of *Emilia fosbergii*. Photo by J. K. Williams.

Emilia is a member of the tribe Senecionae as evidenced by the presence of disk flowers, alternate leaves without punctate glands, and non-overlapping phyllaries that are arranged in a single series (Fig. 1). *Emilia fosbergii* is the only species of Texas Senecionae with red corollas.

ABSTRACT

A first report of a rare operculate discomycete, the devil's cigar, *Chorioactis geaster*, from near McKinney, Collin County, Texas.

RESUMEN

Ha sido confirmada ahora una población del devil's cigar, de *Chorioactis geaster*, un discomicete operculado raro, y se han tomado testigos en Collin County, Texas.

Chorioactis geaster (Sarcosomataceae) was first reported from Austin, Texas in 1893 by Charles Peck as *Urnula geaster* based on specimens collected November 24, 1891 and received from L.M. Underwood (Report of the State Botanist, page 39 (or 119 for the inserted report), in the 46 Annual Report of the New York State Museum, 1893). Later, (Report of the State Botanist, NY State Museum Report #62, 1908, page 31) Peck presents further discussion based on additional specimens from Texas. Kupfer (1902:142) placed it in the genus *Chorioactis*, also see Eckblad (1968). Although Imazeki (1938) reported it from Kyushu, Japan, Petterson et al. (2004) suggests the fungi from Japan and Texas represent two separate lineages that diverged at least 19 MYA. In Texas the fungus has been found in Austin (Travis Co.) by Peck and Seaver (1939) Rudy (2001), Dallas Co., near Joe Pool Lake by Rudy and Keller (1996), Ruby (2001), Guadalupe Co. by Mims (2004 on website), Denton Co. by Buller (1934), reported as uncertain by Rudy (2001), Tarrant Co., by Rudy and Keller (1996), Rudy (2001), and Hunt Co., by Rudy and Keller (1996), Rudy (2001). Rudy (2001) also lists Burnet or possibly Llano, and Palo Pinto counties.

In November, 2004 one of us (JS) collected a specimen in a pasture located near Altoga, Texas, in Collin Co., Texas. The specimen was found growing in moist soil 700 yards west of farm road 470, 0.8 miles west of its junction with FR 1827, west of Altoga, Collin Co., Texas. The pasture was a large open field on the east side of Sistergrove Creek within the flood plain in an open area with clumps of *Rumex crispus* L. The pasture had been maintained as pasture for over 30 years. There was no evidence of tree stumps, or shrubs in the area.

SIDA 21(3): 1939–1940. 2005

Voucher specimen. **U.S.A TEXAS. Collin Co.:** in tall growth pasture in moist soil of a flood plain ca. 200 yards E of Sistergrove Creek, 700 yards from farm road 470, 0.8 mi W of jct. with FR 1827, W of Altoga, 20 Nov 2004 (BRIT).

ACKNOWLEDGMENTS

We are grateful to Barney Lipscomb and David Lewis for their help in identification of the specimen. Ellen Bloch kindly located a voucher specimen of *Choriactis geaster* (Peck) Eckblad, Texas, Tarrant Co, City of Arlington, River Legacy Parks by *K.C. Rudy s. n.*, H.W. Keller 8 October, 1994 in the Cryptogamic Herbarium, New York Botanical Garden. John Haines kindly located the type specimen in the New York State Museum. Donald H. Pfister (FH) and David Lewis contributed many useful comments.

Athens, Georgia 30602-7271, U.S.A.

ABSTRACT

Wilbur Howard Duncan (1910–2005) is remembered as the Curator of the University of Georgia Herbarium (1938–1978), skilled field botanist, gifted teacher, field guide author, plant photographer, and friend.

RESUMEN

Wilbur Howard Duncan (1910–2005) será recordado como el curador del Herbario de la Universidad de Georgia (1938–1978), como un botánico de campo con talento, profesor dedicado, autor de guías de campo, fotógrafo naturalista y un gran amigo.

We are saddened to report the passing of Wilbur Howard Duncan (Figs. 1, 2), University of Georgia Professor Emeritus of Botany and retired Curator of the GA Herbarium. He died at his home attended by his family on 25 March 2005 in Athens, Georgia. He was over 94 years old (Anonymous 2005; Zomlefer & Giannasi 2005a, b, c, d).

Wilbur was born on 15 October 1910, in Buffalo, New York, attended Bloomington High School in Indiana, and received an A. B. (1932) and M.A. (Botany, 1933) from Indiana University. After earning a Ph.D. from Duke University under the forest ecologist Clarence F. Korstian in 1938, he began his distinguished forty-year teaching and research career at the University of Georgia, Department of Botany (now Department of Plant Biology). He was also curator of the GA Herbarium. His faculty position at the university was interrupted by four years of service as First Lieutenant and ultimately, Major, in the U. S. Public Health Service (1943–1946) as an entomologist in charge of mosquito control for Charleston, South Carolina (and other locales in the Southeast) during World War II (Powell 2005; Smith 2005).

Wilbur Duncan had an illustrious career spanning seven decades during which he generously shared his enthusiasm and expertise in botany with students, professionals, and amateurs alike. He was direct in imparting information in the classroom setting, but in the field he took on the role of gentle guide: he would ask questions to help students discover the answer, i.e., to "see" the plant for themselves and thereby better commit the information to memory.

SIDA 21(3): 1941–1950. 2005

Fig. 1. Wilbur Howard Duncan, circa 1990, attired with his trademark bowtie.

Students often had difficulties keeping up with Professor Duncan's long-legged strides in the field, but he always waited for them to catch up to examine an interesting plant. After his patient and inquisitive expository, he was off again with a crowd of students trailing far behind him!

He inspired several generations of students via over 20 popular hands-on field courses (UGA 1939, 1942, 1950a, b, 1962, 1971a, b, 1977a b), including: Elementary Botany, Plant Ecology, Field Botany, Taxonomy of Seed Plants (also listed as Plant Taxonomy), Agrostology (also listed as Taxonomy of Grasses; Identification of Grasses; Taxonomy of Grasses, Sedges, and Rushes), Aquatic Plants, Identification of Flowering Plants, Identification of Trees and Shrubs (also under Trees and Shrubs; Taxonomy of Woody Plants), and Local Flora for Teachers. For many years he also taught a course in poisonous plant identification required by the Veterinary School (M. Duncan, pers. comm). Wilbur also supervised six Master's students and ten Ph.D. students, whose studies focused primarily on floristics of the southeast (e.g., Duncan & Pullen 1962; Pullen 1963; Jones 1964; Yates 1969; Yates & Duncan 1970; Gibbs Russell & Duncan 1972; Givens 1971; Faircloth 1971, 1975; Gunn 1974).

Wilbur was a mega-collector in the spirit of Cyrus G. Pringle and Alan H. Curtiss, collecting over 30,000 plant specimens in his lifetime (in multiple sets) that he deposited at GA and distributed to other herbaria throughout the southeastern United States (see Fig. 2). Through his efforts, the GA Herbarium grew from 16,000 to 135,000 specimens during his tenure there. Among these specimens is his first: a collection of *Trillium sessile* (Fig. 3). Wilbur's field work included photographing the plants, as well as making specimens of them. His photographs emphasized features needed for accurate identification—requiring, for example, illumination of the inside of a *Liriodendron tulipifera* L. flower (Duncan & Duncan 1988, p. 151) or the anthers of *Rhexia alifanus* Walter (Duncan & Duncan 1987, p. 106) via a series of homemade handheld reflectors (L. Duncan, pers. comm.). He even flicked droplets of water on floating *Nymphaea odorata* Willd. leaves (Duncan & Duncan 1999, p. 193) to provide proper size contrast.

According to his most recent resume on file in our department, Wilbur published 65 articles in scientific journals, mainly on the floristics of the Southeast (e.g., Duncan 1954a, 1964, 1966a, 1967, 1969, 1977, 1979a; Duncan et al. 1955, 1957), particularly of Georgia (e.g., Duncan 1948, 1950a, 1954b, 1955, 1957, 1960, 1962a, 1966b, 1971, 1979b, 1984; Duncan & Blake 1965; Duncan & Kartesz 1981). Besides floristics, his interests in these species ranged from nomenclature (e.g., Duncan 1950b), descriptions of new taxa (Duncan 1940, 1944, 1950c, 1977; Duncan et al. 1971), morphology (e.g., Duncan 1933, 1950d, 1959a; Duncan & Brown 1954), to natural history (e.g., Duncan 1959b, 1962b; Duncan & DeJong 1964). His discovery of a new rare oak species, *Quercus oglethorpensis* W.H. Duncan (Oglethorpe oak; Duncan 1940, 1950e; Bishop & Duncan 1941), in Oglethorpe County, Georgia, was the first new oak found east of the Mississippi in 90 years (summary in Coder 2003).

The University of Georgia Press published three plant identification books authored by Wilbur during his tenure as faculty member: *Guide to Georgia Trees* (Duncan 1941), *Woody Vines of the Southeastern United States* (Duncan 1975), and *Wildflowers of the Southeastern United States* (Duncan & Foote 1975). Wilbur's greatest claim to fame, however, are his popular field guides produced after his "retirement:" *The Smithsonian Guide to Seaside Plants of the Gulf and Atlantic Coasts* (Duncan & Duncan 1987), *Trees of the Southeastern United States* (Duncan & Duncan 1988), and *Wildflowers of the Eastern United States* (Duncan & Duncan 1999). All three are still in print; the latter, covering over 1,000 species, is currently a best-seller for the University of Georgia Press. At the time of his death, he was completing the manuscript for *Shrubs of the Southeastern*

FIG. 2. Wilbur Howard Duncan, circa 1983, on a trip collecting for his field guides.

Fig. 3. Wilbur Duncan's first specimen (*Duncan 1*; *Trillium sessile* L., Cedar Cliffs, Indiana; 18 April 1932; GA). Wilbur collected over 30,000 sets of vascular plant exsiccatae in his lifetime.

United States, a significant guide including 700 of his color photographs (Sheurer 1999).

Wilbur belonged to 18 professional societies and associations. He was a charter member of the Association of Southeast Biologists and a Fellow of the American Association for the Advancement of Science. He held several offices with the Botanical Society of America and was President of the Georgia Academy of Science for two terms. He was also active in the American Society of Plant Taxonomists, serving four years as a member of the council; the American Institute of Biological Sciences; the International Association of Plant Taxonomists; and the Georgia Botanical Society. He was awarded the 1990 *Elizabeth Ann Bartholomew Service Award* by the Southern Appalachian Botanical Club (Martin 1990). In 1998, the Department of Plant Biology, University of Georgia, initiated the *Wilbur*

Duncan Award for Outstanding Graduate Student in his honor to recognize outstanding graduate student contributions to research, teaching, and service to the department. The single yearly recipient, who demonstrates excellence in these three areas, is awarded $1,000 and an inscribed plaque.

In his retirement Wilbur continued to be a botanical resource for the GA Herbarium and to the many students sharing space with him, especially those involved in floristic studies for their degrees. When students had difficulties identifying a plant, they would finally consult Wilbur–who would absentmindedly rattle off a plant name that inevitably was correct, much to the amazement of the students. Indeed, many were the students sent back to their desks muttering as to why they hadn't thought of the answer themselves!

The faculty and staff of our department were impressed to observe Wilbur here at work five days a week (and often also on the weekends), sitting upright at his microscope in "his corner" or editing portions of his latest book manuscript(s). When most older faculty were looking forward to retirement as a time of rest and passage to other areas of interest, Wilbur had already begun his second botanical career resulting in his well-written popular field guides, beautifully illustrated with his own photographs. His books brought botany to more people at an understandable level than any academic text. These guides are coauthored by his wife of 64 years, Marion Duncan, also a professional botanist. The Duncans logged over 80,000 miles together compiling these field books (McCarthy 1999).

Always busy in the herbarium and nattily dressed in coat and bowtie, Wilbur was an enviable model of a true botanist devoted to his craft. He was efficient, focused, and direct with an acute attention to detail, coupled with a notoriously understated sense of humor. He practiced the art of seeing beauty in everything and readily shared this vision with others. As age and health issues encroached on his schedule, he willed himself to continue until his shrub book was completed, a testament to his strength of character. And the latter, he admitted, was due to the unequivocal support of his loving wife, Marion, who was his best friend, field partner and confidant. Wilbur refused to autograph copies of their field guides unless Marion also provided her signature as coauthor and partner. He was unstinting in his praise and respect for Marion as the steady fulcrum of his life and also never failed to proudly discuss his children and grandchildren. It is often said of certain people that we shall not see their like again, and while perhaps a cliché in today's world, the statement holds a high timbre for the life of Wilbur H. Duncan.

Wilbur Duncan is survived by his wife Marion Duncan; three children (Douglas, Lucia, and Mack Duncan); and four grandchildren (Amber, Laramie, Laura, and Ross Duncan). To honor him, the family has requested donations to the *Wilbur and Marion Duncan Publishing Fund*, a charitable trust established with the University of Georgia Foundation to ensure the publication of the

Duncans' last manuscript, *Shrubs of the Southeastern United States*. Those wishing to participate may send tax-deductible contributions to: The University of Georgia Foundation, *Wilbur and Marion Duncan Publishing Fund*, 394 S. Milledge Avenue, Suite 100, Athens, GA 30602-5582.

ACKNOWLEDGMENTS

We are especially grateful to Marion and Lucia Duncan for graciously taking time in their grief to reminisce about Wilbur; Lucia also generously supplied scanned photographs of her father. Many thanks also to Carla Ingram (Department of Plant Biology) for locating Wilbur's departmental files and for searching our departmental archives for dissertations and Master's theses of his former students. We thank Lynn Cahoon (Remote Reference, Main Library, UGA) and the staff of the Georgia Room, Hargrett Library (UGA) for assistance in tracking down uncatalogued course schedules for 1938–1978 in UGA library archives; Kelly A. Bettinger for editorial criticisms; and Eric Fuchs, for translating the abstract into Spanish. The Department of Plant Biology, University of Georgia, funded production of high-resolution digital scans and photographic prints of Wilbur's first specimen.

BOOK REVIEWS

BRIAN CAPON. 2005. **Botany for Gardeners. Revised Edition.** (ISBN 0-88192-655-8, pbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $19.95, 240 pp., 147 color photos, 3 color drawings, 1 b/w photo, 53 line drawings, 4 tables, 6" × 9".

Botany for Gardeners by Brian Capon is a handy and well-written book for those who wish to learn more about botany and plant ecology. Many naturalists and gardeners already appreciate plants, but often have unanswered questions about the plants they enjoy. For instance—why do roots grow down and shoots grow up? How do water and nutrients move through a plant? What are all the parts of a plant and flower? How do plant grafts work? What are mycorrhizae? What is the purpose of all the different nutrients in fertilizer? These and so many other botanical questions are answered and explained in this book. *Botany for Gardeners* is lavishly peppered with color photographs and black and white drawings that coordinate with ideas and topics being discussed in the text. These images, some of which are from a microscope, enhance the readers understanding of plant structure and make-up.

There are five main sections in the book: growth, organization of plant structures, adaptations, plant functions and reproduction. Each main section is broken down into reasonably sized sub-chapters.

The section discussing plant growth starts with the basics of a plant cell through seed germination and continues into the roots, shoots, leaf growth, and leaf maturity. The section on organization gives the reader an inside look at stems and roots, emphasizing their cellular organization and cell types. The adaptation section introduces the reader to all the ways that plants adapt to various environmental challenges; among these are climate variations, protection from animal browsing, wound healing, chemical protection, and finally enhancing a plants ability to compete in and among other plants for space, light, water, and nutrients. This section also includes an interesting discussion about plant food sources, water storage, and beneficial relationships with fungi.

The section on plant functions covers growth responses to light, gravity, touch, branching, adventitious root formation, and the hormones and environmental conditions involved in those functions. Mineral nutrient requirements, water and mineral uptake and transport within the plant are discussed, as well as the process of photosynthesis.

The final section covering plant reproduction includes discussion of flower parts, pollination, pollination strategies, fruit types, seed formation, and seed dispersal. The final chapter of the reproduction section includes a plant genetics primer that introduces readers to the life cycles of mosses, ferns, and flowering plants, Punnet squares, and gene expression. Some of the valuable tidbits included throughout the chapters are a table listing the origins of garden and many agricultural crop plants, distinct definitions and photographs of spines, thorns and prickles, a list of poisonous household plants, a primer on plant genetics, and an appendix discussing plant naming classification.

Botany for Gardeners not only cover the basics, but also can take a reader much deeper into the details of photosynthesis and plant genetics. Some of the topics may be beyond what any particular reader would like to know. The author does a good job of presenting topics such as photosynthesis, respiration and genetics, which, by nature can be frustrating to understand. The photographs and figures will really help the reader understand what is being discussed; especially items such as cellular organization or structural development where a microscope would be needed to view and understand the topic properly. Whether you are looking for that book that will introduce you to the basics of plant biology, are looking to answer gardening questions, or need a book to help you create a botanical background to learn to use an identification text, *Botany for Gardeners* is the book for you!—*Lee Luckeydoo, Herbarium, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

Robert Ornduff, Phyllis M. Faber, and Todd Keller-Wolf. 2003. **Introduction to California Plant Life: Revised Edition.** (ISBN 0-520-23704-8, pbk.). California Natural History Guides No. 69. University of California Press, Berkeley, CA 94704, U.S.A (**Orders:** California Princeton Fulfillment Services, 1445 Lower Ferry Road, Ewing, NJ 08618, U.S.A., 609-883-1759, 609-883-7413 fax; www.ucpress.edu). $16.95, 341pp., charts, color photos, glossary, 4 1/2" × 7 1/4".

Introduction to California Plant Life has been revised from the 1974 edition and is one of the best resources for learning about the ecology of California flora The text is best suited for people who already have an understanding of biology and ecology because it sometimes uses botanical terms to define other botanical terms.

Introduction to California Plant Life covers all bases in regards to the many varied ecosystems that exist in California, a state known for a wide range of plant life. The opening chapters describe the topology, climate, and soils of California; they do an excellent job of explanation and provide examples of how both the non-living characteristics and the biological components of an area can influence which plant species grow where. An example of these relationships is that of the salt grass (*Distichilis spicata*), a grass species that can tolerate extreme saline conditions that would kill most plants. Also discussed are the effects of other physical/biological parameters in the environment including exposure, microbial, fungal, allelopathy, pollinators and moisture. Finally, the topic of variation within species because of adaptations to local climate and soil conditions, i.e. ecotypes, is developed with reasonable detail.

Three chapters of the book discuss the broad plant communities in California cismontaine (west of the Sierra Nevada crest), montane (high mountain areas), and transmontane (East of Sierra Nevada crest including deserts). Each broad plant community category includes a number of smaller vegetation categories. For example, the montane regions include areas of alpine fell field, montane meadow, and montane coniferous forest The method and focus of the discussion of each broad category allows the reader to follow the included color photos and maps to get a physical understanding of what plants they should find where.

The authors provide a thorough explanation of their classification system for this book. Information on each plant community and indicator species is placed in charts for easy comparison. The authors also provide a chart comparing the common California plant classification systems in the literature. The chapters describing each broad classification community include specific climatic and environmental conditions: among these being strong winds, elevation, rainfall, length of growing season, salinity, fire and poor soil nutrients This type of discussion is very helpful in relating species adaptations to local conditions. A good example is the discussion of the growth habits of species in areas frequented by fire, a common occurrence in parts of California.

An especially intriguing chapter is that of the history of botanical exploration in California The detailed study includes not only the explorers and collectors, but also the notable species they found in the Golden State One example is that of red rose sand verbena (*Abronia umbellata*). Found in California, it was the first plant in western North America to be named using the Linnaean taxonomic rules. This chapter also highlights the fact that many of the important people in plant taxonomy were all involved in California botanical research at one point in time; among the notables are Pursh, Parry, Bigelow, Torrey, Gray and Engleman.

In addition to the history of the California researchers, the authors also include valuable historical information on the evolution of California vegetation itself The changes in California flora are presented by discussion of geoflora and climate change, the focus being on the redistribution of flora throughout geological time. This approach was helpful for this reader to better understand the influence of a regions physical characteristics as well as climatic influence that occur with time. This chapter ends with an overview of the fossil history of coastal redwoods.

Included in the final chapter are modern topics including climate change, human practices, distribution of plants, agriculture and grazing practices, invasive weeds, habitat loss, habitat restoration and biodiversity.

The new edition of *Introduction to California Plant Life* is a wonderful resource for anybody looking to learn more about the ecology of California flora. Keep in mind that some familiarity with botany and ecology concepts will greatly increase the usefulness and ease of reading. Throughout the book, the information and discussions are accented with color photos of plant species and regional characteristics. The authors' inclusion of historical information, anecdotes, and interesting factoids enhances the readers understanding of plant life throughout the state of California. The next time you embark on a California adventure, be sure to bring along this book.—*Lee Luckeydoo, Herbarium, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

Ronald L. Jones. 2005. **Plant Life in Kentucky: An Illustrated Guide to the Vascular Flora.** (ISBN 0-8131-2331-3, hbk.). The University Press of Kentucky, 663 South Limestone Street, Lexington, KY 40508-4008, U.S.A. (**Orders:** 800-839-6855, fax 859-257-8481, www.universitypress.com). $75.00, 834 pp., 1984 b/w line drawn illustrations, 16 tables, 20 figures, 7" × 10".

Plant Life in Kentucky: An Illustrated Guide to the Vascular Flora is a monumental work—it will serve as a comprehensive reference guide to the plant life in Kentucky and an identification manual of the vascular plants for generations of botanists in the Commonwealth. Jones' manual provides the first complete comprehensive treatment of all the known native and naturalized vascular plants of Kentucky, and presents the first set of identification keys for any state flora in the south-central United States. It is the first state flora to incorporate a significant number of the recently proposed major changes in the classification and nomenclature of vascular plants, e.g., Asteraceae and Liliaceae (Jones 2005; SE Biology 52:118), while basically following Gleason and Cronquist's (1991) *Manual of Vascular Plants of Northeastern United States and Adjacent Canada*. Individuals will also find it valuable for the flora of Tennessee as most vascular plants in east-central, central, and western Tennessee are included in the keys.

Jones' *Plant Life in Kentucky: An Illustrated Guide to the Vascular Flora* is essentially two books combined: Part I, Introduction, and Part II, Taxonomic Treatment.

Part I, Introduction, the outstanding reference guide to Kentucky flora, is comprised of 12 sections: Section 1, Overview of This Book—covers plants treated, arrangement of taxa, abbreviated family descriptions, use of keys and abbreviations, sources of information, nomenclature, flowering period, habitats, distributions by physiographic province, relative abundance, non-native species, wetland categories, and a summary of the flora; Section 2, The Physical Setting of Kentucky—contains Kentucky descriptive material, climate, and natural regions by physiographic provinces, forest regions, and ecoregions (Appalachian Plateaus, Interior Low Plateaus, and Mississippi Embayment); Section 3, Vegetation of Kentucky—discusses the forest regions and various plant communities of Kentucky including endangered, threatened, and rare plants; Section 4, Floristic Affinities—intraneous and extraneous floristic affinities are discussed for taxa among the Kentucky floristic regions or ecoregions; Section 5, Endemics—lists plants endemic to Kentucky or to Kentucky and nearby states; Section 6, Conservation Status—covers levels of plant protection in the United States on the international, national, and state-listed species; Section 7, Status of Old-growth Forest—discusses the historical reports and current old-growth forest in Kentucky; Section 8, History of Plant Conservation in Kentucky—deals with biodiversity issues and the preservation of Kentucky biodiversity by state, federal, and private agencies; Section 9, History of Plant Life in Kentucky—begins with a Geological Overview through the Paleozoic, Mesozoic, and Cenozoic eras, their respective geological periods, and the origins of the flora and then concludes with the impact on the vegetation and flora by the Native Americans and influence of Presettlement Conditions; Section 10, Postsettlement Changes in the Plant Life of Kentucky—begins with the effects of habitat alterations from logging, coal mining, wetland losses, acid precipitation and ozone damage, global warming, fungal, animal, and naturalized pests, and concludes with the effects of overzealous harvesting of plants for medicinal or ornamental uses; Section 11, History of Floristic Botany in Kentucky—commemorates the significant men and women contributors to the Kentucky flora from the Antebellum Period, Civil War and Postbellum Period, and Modern Field Botany to the Present; and Section 12, Current Status of Floristic Botany in Kentucky—presents an overview of today's needs to document the botanical biodiversity by geographical regions and counties. Part I consists of 105 pages and ends with an extensive Literature Cited of 439 references.

Part II, the Taxonomic Treatment, consists of diagnostic keys to families, genera, and species present or to be discovered in Kentucky. A total of 179 families, 856 genera, and 2600 specific and infraspecific taxa are treated. Illustrations consist of 1984 black-and-white line drawings, most from Britton and Brown's (1913) three volume work, *An Illustrated Flora of Northern United States and Canada*.

Plant families are determined from the General Keys to Vascular Plants of Kentucky, which lead to four groups: Chapter 1, Pteridophytes of Kentucky; Chapter 2, Gymnosperms of Kentucky; Chapter 3, Dicotyledonae of Kentucky, and Chapter 4, Monocotyledonae of Kentucky. All four chapters have the families, genera, and species listed alphabetically—a highly convenient way to present taxa to workers. These four groups includes family descriptions (habit, leaf arrangement, composition, stipules, flower sex and symmetry, inflorescence type, floral formula, and fruit type), family notes (information on wildlife use and/or human use, important weeds, poisonous plants, and medicinal herbs), and relevant references. The species accounts lists the scientific name, an accepted common name, relevant synonymy, flowering periods, habitat, physiographic distribution, relative abundance, and state/federal designations, and national wetland classification rating. Also, workers can readily locate a family by using the Family Index inside the back cover, then finding the alphabetically-listed genera and species.

The family, genera, and species keys work remarkably well and it is enlightening to find keys that work for plant identification which are complete enough to make accurate identifications, yet not overly complicated to use. A complete, well-defined glossary is available for the vegetative and reproductive morphological terms used in the keys.

The Literature Cited contains 288 references cited in Part II, Taxonomic Treatment. Five appendices follow the Literature Cited: Appendix One, Glossary, consists of nearly 1500 terms as modified from Diggs, Lipscomb, and O'Kennon's (1999) *Shinners & Mahler's Illustrated Flora of North Central Texas*; Appendix Two, Index of Part I; Appendix Three, Index of Scientific Names in Part II; Appendix Four, Index of Common Names in Part II; and Appendix Five, Index of Poplar Books (with Color Photographs) on the Flora of the South-central United States and the Southern Appalachians. Part II consists of 728 pages with the total book composed of 834 pages.

Plant Life in Kentucky: An Illustrated Guide to the Vascular Flora is essential for all persons interested in natural history and vascular plants of Kentucky and the south-central United States in general—it is indispensable for botanists in the Commonwealth. Jones' manual is the most comprehensive and encyclopedic state flora east of the Mississippi River. This remarkable book should be is an important addition to the library of every botanist in the eastern United States—*Ralph L. Thompson, Herbarium, Department of Biology, Berea College, Berea, KY 40404-2121, U.S.A., ralph_thompson@berea.edu*

This illustrated monograph is the most comprehensive generic treatment of legumes for any geographical area of Mexico. The book covers the genera of legumes known to be present in northern Mexico from Tamaulipas to Baja California Sur. The introductory material covers topography, climate, and vegetation types of northern Mexico. Included are 121 genera treated in three families: Fabaceae, Mimosaceae, and Caesalpiniaceae. The Fabaceae is the most abundant family with 87 genera followed by Mimosaceae (19) and Caesalpiniaceae (15). Keys to the families, tribes (only in Fabaceae), genera, and detailed line drawings of distinguishing characteristics are included for most of the genera to facilitate identification. Each genus is provided with a description, followed by distributional information, species number, chromosome number, and economic, ecological, and potential food importance.

The Atlas of Texas covers about 6000 taxa. This is the result of 54 years of herbarium and fieldwork by B.L. Turner, beginning in 1948 at Sul Ross State University, Alpine, Texas. In short, the senior author has examined personally, touched, or "pored over" an estimated several hundred thousand sheets in the preparation of the forthcoming Atlas volumes. Contents include an introduction, atlas of Texas plants arranged alphabetically by family, by genus, by species, and an index.

ABSTRACT

Calyptranthes glandulosa and **Calyptranthes ishoaquinicca**, two new species from Ecuador, are described and illustrated.

RESUMEN

Se describen y se ilustran dos especies nuevas de Myrtaceae del Ecuador, **Calyptranthes glandulosa** y **Calyptranthes ishoaquinicca**.

INTRODUCTION

Calyptranthes is a genus of more than 100 species ranging from Mexico to northern Argentina (Landrum & Kawasaki 1997). It is characterized by the usually paired panicles, the closed calyx opening as a calyptra, and, in many species, dichotomous branching. About 30 species are found in Ecuador, many of them new to science (Holst 1999). Two of these, *Calyptranthes glandulosa* and *Calyptranthes ishoaquinicca*, are described and illustrated in this paper.

Calyptranthes glandulosa M.L. Kawasaki & B. Holst, sp. nov. (**Fig. 1**). TYPE: ECUADOR. ORELLANA ("NAPO" on label): Reserva Biológica Jatun Sacha, Río Napo, 8 km al E de Misahualli, 01°04'S, 77°36'W, 450 m, 21–25 May 1987 (fl), *C. Cerón 1431* (HOLOTYPE: QCNE; ISOTYPES: F, MO, NY, SEL).

Arbuscula. Folia elliptico-oblonga, siccata supra olivacea, subtus brunnea, utrinque grosse pellucido-punctata; nervo medio supra sulcato. Panicula pauciflora; alabastra ochraceo-pilosa. Bacca globosa, glabra.

Small shrubs or trees 2–6 m tall, the trichomes where present yellowish, bifurcate. **Leaf blades** elliptic to oblong or less commonly obovate, 16.6–28(–34) × 5.1–10.5(–20) cm, coriaceous, with conspicuous, dark, convex glands on both surfaces, discolorous when dry, the upper surface olive-green, glabrous, the lower surface brownish-green to light-brown, nearly glabrous, with a few scattered trichomes; apex abruptly acuminate, the acumen 1–2 cm long; base obtuse to cuneate; midvein sulcate above, convex below; lateral veins 20–25 pairs, convex on both surfaces; marginal veins 2, the innermost 3–5 mm from blade margin; petiole 1.1–2 cm long, canaliculate, glabrous, drying blackish. **Inflorescences** paired reduced panicles with ca. 5–20 flowers per panicle, 1.5–5.5 cm long, the

axes pubescent; flower buds ovoid, somewhat constricted in the middle, ca. 4 mm long, distinctly gland-dotted, sessile; bracteoles deciduous, not seen; calyx calyptrate, glabrescent, deciduous; petals absent; stamens ca. 90, the filaments ca. 6 mm long, the anthers ca. 0.5 mm long; style ca. 6 mm long; hypanthium prolonged 1–2 mm beyond the ovary, tomentose without; ovary 2-locular, with 2 ovules per locule. **Fruits** globose, ca. 1.5–2 cm diam., crowned by a circular hypanthium scar, gland-dotted, glabrous; seeds 1–2, ca. 9 × 7 mm, the seed coat membranous; embryo myrcioid, the cotyledons leafy and folded, the radicle well developed, equaling cotyledons in length.

Distribution.—Known only from Amazonian Ecuador, in lowland humid forests, at 200–450 m elevation.

Among the large-leaved species of *Calyptranthes* in Ecuador, *Calyptranthes glandulosa* is readily recognized by the leaf-blades with conspicuous, dark glands on both surfaces. The flowers appear distorted in bud as though diseased. No specimens are known at anthesis, though pollination is evidently occuring as several specimens bear fruit. It is possible that this species has cleistogamous flowers or perhaps a pathogen is present that is interrupting the normal flowering and fruiting sequence.

Calyptranthes ishoaquinicca M.L. Kawasaki & B. Holst, sp. nov. (**Fig. 2**). TYPE: ECUADOR. SUCUMBÍOS: Fundación Sobrevivencia Cofán, Sinangoe Station, Río Sieguyo, near confluence with Río Alto Aguarico, across from Puerto Libre, NW of Lumbaqui, foothills of the Andes, 40m tall lowland hill-forest on gentle ridgeslopes with clay soils, 00°10'45"N,

Fig. 2. *Calyptranthes ishoaquinicca* M.L. Kawasaki & B. Holst (*Aguinda et al. 1345*: isotype, F).

77°29'50"W, 600–800m, 16 Aug 2001 (buds, fr), *R. Aguinda, N. Pitman & R. Foster 1345* (HOLOTYPE: QCNE; ISOTYPES: F, SEL).

Frutex. Folia lanceolata, supra olivacea, subtus flavo- vel pallide-viridia; nervo medio supra sulcato; apice longiuscule acuminata. Inflorescentia 3-flora; alabastra ochraceo-pilosa, apiculata. Bacca globosa, glabra.

Shrubs 1–2 m tall, the trichomes where present yellowish-brown, bifurcate; young stems narrowly 4-winged to 4-angled, quadrangular in cross section. **Leaf blades** lanceolate, 8–14.3 × 1.8–3.6 cm, chartaceous, discolorous when dry, the upper surface olive-green, glabrous, the lower surface yellowish- to brownish-green, nearly glabrous, with a few scattered trichomes especially on the midvein; apex narrowly acuminate to caudate-acuminate with a slender acumen to 3.5 cm long; base obtuse to cuneate; midvein sulcate above, convex below; lateral veins ca. 14–17 pairs, impressed to strongly impressed above, raised below; marginal veins 2, the innermost 1–3 mm from blade margin; glandular dots indistinct on the upper surface, numerous and convex on the lower surface; petiole 1–2 mm long, canaliculate, puberulous, drying blackish. **Inflorescences** paired, (1–)3(–4)-flowered spikes, 2–6 cm long, the axes glabrous, nodding; bracts lanceolate, ca. 5 × 1 mm, puberulous, deciduous; flower buds obovoid, 2–3 mm long, pubescent, apiculate, sessile; bracteoles deciduous, not seen; calyx calyptrate, glabrescent, deciduous in mature fruit; petals absent; stamens ca. 50, the filaments ca. 6 mm long, the anthers ca. 0.5 mm long; style ca. 10 mm long; hypanthium prolonged ca. 1 mm beyond the ovary, tomentose to strigose without; ovary 2-locular, with 2 ovules per locule. **Fruits** globose, 7–9 mm diam., crowned by circular hypanthium scar, orange-red to dark-purple, glabrous; seeds 1–2, ca. 6 × 5 mm, the seed coat membranous; embryo myrcioid, the cotyledons leafy and folded, the radicle well developed, equaling cotyledons in length.

Distribution.—Known only from Ecuador (Sucumbíos and Pastaza), in lowland to montane forests, at 430–800 m elevation.

Calyptranthes ishoaquinicca, well known as "ishoa quinicco" in the Cofán villages (Pitman et al. 2002), has traditionally been used in a Cofán coming-of-age ceremony for young men (12–15 years old), as a purgative to impart strength for their adult lives; they drink a concoction prepared from this plant for ca.10 days, accompanied by much vomiting. It is distinguished from all other species of the genus in Ecuador by having short, 3-flowered inflorescences and chartaceous, narrowly acuminate leaves, with impressed lateral veins.

Additional collections examined: **ECUADOR. Pastaza:** Villano, Pandanuque, encima de colina al S del pozo petrolero Villano 2 de ARCO, 01°28'S, 77°27'W, 550 m, 30 Ago 1987 (fr), *A. Alvarez, H. ABSTRACT

A treatment of the neotropical genus *Siolmatra* is presented. Two species are recognized with descriptions, illustrations, distribution data, and a key to the species provided.

RESUMEN

Se presenta un tratamiento del género neotropical *Siolmatra*. Se reconocen dos especies con descripciones, ilustraciones, datos de distribución, y se aporta una clave de identificación de especies.

The genus *Siolmatra* (Cucurbitaceae) was erected by Baillon (1885) to accommodate *Siolmatra brasiliensis* (Cogn.) Baill. which had resided in the heterogenous genus *Alsomitra* (Blume) M. Roem., now restricted to the Old World. The name *Siolmatra* is an anagram of *Alsomitra*. Subsequently, Baillon (1886) abandoned *Siolmatra*, but Cogniaux (1893) resurrected it and described a second species (*S. paraguayensis*). Cogniaux (1916) later added one new species (*S. amazonica*) and two transferred from *Alsomitra* (*S. pedatifolia* (Cogn.) Cogn. and *S. peruviana* (Huber) Cogn.). Harms (1926) described a sixth species (*S. pentaphylla*), later a seventh (Harms 1933) (*S. simplicifolia*), and Standley (1937) an eighth (*S. mexiae*).

Jeffrey (1962) noted the incongruent mixture of taxa in *Siolmatra* which had been distinguished from *Fevillea* on the basis of leaf type; viz., simple in *Fevillea* versus 3- to 5-foliolate in *Siolmatra*. He redefined the two genera and transferred all taxa to *Fevillea* except *S. brasiliensis*, *S. pentaphylla*, and *S. paraguayensis*. These were maintained by Jeffrey (1978) in his enumeration of the New World Cucurbitaceae. Two species of *Siolmatra* are recognized here. The main distinctions between *Fevillea* and *Siolmatra* are presented in the following key.

1. Leaves with petiolar or laminar glands; calyx with 5 free lobes, these with glandular squamellae (except *F. passiflora*); petals with a medial adaxial flap-like appendage or ridge; staminate flowers with bilocular anthers; fruit globose, usually indehiscent; seeds not winged ______ **Fevillea**
1. Leaves lacking glands; calyx with two pairs of calyx lobes connate, the fifth one free (calyx appearing 3-lobed), glandular calycine squamellae lacking; petals lacking a medial adaxial flap-like appendage or ridge; staminate flowers with unilocular anthers; fruit opening apically by 3 triangular valves; seeds with marginal wings ______ **Siolmatra**

SYSTEMATIC TREATMENT

Siolmatra Baill., Bull. Mens. Soc. Linn. Paris 1:458. 1885. TYPE: *Siolmatra brasiliensis* (Cogn.) Baill. BASIONYM: *Alsomitra brasiliensis* Cogn.

Dioecious tendriled vine or liana; stems slender, sulcate. Leaves pedately 3- to 5-foliolate, petiolate, the leaflets ovate to elliptic, petiolulate or rarely subsessile. Tendrils slender, slightly sulcate, bifurcate distally, coiling both above and below the bifurcation. Staminate inflorescences many-flowered, in axillary panicles on the upper part of the stem, the leaves often reduced upwards; flower buds globose, pedicellate; bracts minute; hypanthium pedicelloid, slender; calyx 5-merous, with 2 pairs of calyx lobes connate, the fifth free (the calyx appearing 3-lobed); petals 5, white, greenish white, or greenish yellow, obdeltoid or obcordate, short-clawed, the inner surface papillate; stamens 5, the filaments slender, the anthers 1-loculate, the locules horizontal or vertical, the filament extension with a dorsal, glandular, hornlike projection. Pistillate inflorescences many-flowered, in axillary racemes or panicles, the leaves often reduced on the flowering branches; flower buds conical; bracts minute; hypanthium conical; calyx 5-merous, with 2 pairs of calyx lobes, these connate, the fifth free (the calyx appearing 3-lobed); petals 5, white, greenish white, or greenish yellow, obovate, the apex emarginate, papillose on the ventral surface; ovary 3-loculate, the styles separate, conical, the stigmas 2-lobed, the lobes strongly divergent. Fruit conical, 3-loculate, obscurely ribbed, shallowly and obscurely pitted, coriaceous, opening apically by 3 triangular valves, the perianth scars evident at the distal end below the area of dehiscence; seeds compressed, oblong or elliptic, with broad marginal wings, woody with chartaceous tips or wholly chartaceous.

1. Leaves 3-foliolate (rarely 4- to 5-foliolate), if the lower leaflets further divided then usually having a common petiolule; petiolule not articulate from the petiole; petals of the staminate flowers obcordate; fruit 6–8 cm long ____ **S. brasiliensis**
1. Leaves 5-foliolate; petiolule articulate from the petiole; petals of the staminate flowers obdeltoid; fruit 3.5–4.5(–7) cm long ____ **S. pentaphylla**

Siolmatra brasiliensis (Cogn.) Baill., Bull. Mens. Soc. Linn. Paris 1:458. 1885. (**Fig. 1**). *Alsomitra brasiliensis* Cogn., in Martius, Fl. Bras. 6(4):115. 1878. TYPE: BRAZIL. s.d., *Saint-Hilaire s.n.* (HOLOTYPE: P, n.v., photo ex P: F, US).

Alsomitra brasiliensis var. *pubescens* Griseb., Symb. Fl. Argent. 136. 1879. *Siolmatra brasiliensis* var. *pubescens* (Griseb.) Cogn., in Engler, Pflanzenr. 4(Heft 66):29. 1916. TYPE: ARGENTINA. JUJUY: San Lorenzo, 4 Nov 1873, *Lorentz & Hieronymus 228* (LECTOTYPE: BR, lectotype here designated; ISOLECTOTYPES: B (destroyed), NY, photo ex B: F, MO, NY, US.).

Siolmatra paraguayensis Cogn., Bull. Herb. Boissier 1:611. 1893. TYPE: PARAGUAY. ALTO PARANA: near Guarapi, 1880, *Balansa 3184* (HOLOTYPE: G?, n.v.; ISOTYPES: B (destroyed), BM, BR, F-fragment, K; photo ex B: F, MO, NY, US).

Vine or liana; stem glabrous, to 5 cm in diameter, the bark scaly, light brown. Leaves 3-foliolate, the lower leaflets occasionally further divided into 2 segments, but usually with a common petiolule, the leaves rarely 4- to 5-foliolate,

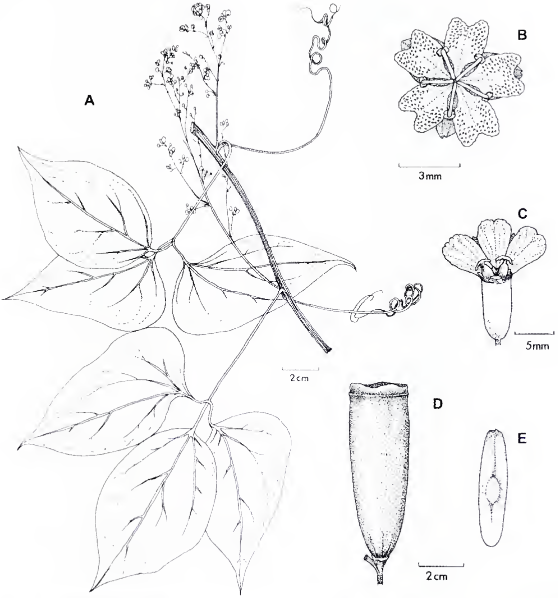

Fig. 1. ***Siolmatra brasiliensis*****. A.** Habit, staminate inflorescence (*Woolston 1149*, K). **B.** Staminate flower (*Venturi 5582*, US). **C.** Pistillate flower (*Hassler 6793*, BM). **D.** Fruit (*Venturi 5394*, F). **E.** Seed (*Venturi 5394*, F).

the blade chartaceous to subcoriaceous, the margin entire or irregularly undulate to lobed (lateral leaflets), ovate to elliptic, the base of the lateral leaflets broadly cuneate to cordate, oblique, unequal, the base of the central leaflets broadly cuneate to subcordate, occasionally oblique and unequal, the apex acuminate, 6–10(–20) cm long, 4–8(–10) cm wide, the upper surface moderately rugose-veined, minutely pustulate, but smooth or nearly so to the touch, tomentellous to glabrate on the veins, occasionally with a few scattered trichomes on the blade, the lower surface with scattered short glandular-capitate trichomes and straight or curved non-glandular trichomes; petiolule 0.5–2 cm long, the median one slightly longer than the laterals, tomentellous; petiole 4–8 (–12) cm long, canaliculate, tomentellous to glabrate; tendrils glabrous or occasionally sparsely strigose near the base. Staminate inflorescences many-flowered, in axillary panicles on the upper part of the stem, 8–30(–40) cm long, the branches with glandular-capitate and straight to curved non-glandular trichomes; pedicel to 1 mm long; bracts up to 0.5 mm long, lanceolate, strigose-tomentellous; flower buds globose, 2–3 mm in diameter; hypanthium pedicelloid, slender, 1–2 mm long; calyx glabrous, the lobes ovate-lanceolate, ca. 2 mm long; petals white, greenish white, or greenish yellow, obcordate, ca. 3 mm long, 2–2.5 mm wide, broadly clawed in the lower 1/4, the apex retuse, the inner surface papillate distally; stamens ca. 2 mm long, glabrous, the filaments slender, the theca oblong, horizontal, ca. 0.4 mm long, the filament extension with a dorsal glandular projection. Pistillate inflorescences many-flowered, in axillary racemes or panicles, 8–15 cm long, the leaves often reduced on the flowering branches and the entire structure to 40 cm long, the indumentum as in the staminate; pedicel and bracts as in the staminate; flower buds conical, 8–15 cm long; hypanthium conical 5–8 mm long, glabrous; calyx lobes triangular, 3–4 mm long, glabrous; petals white, greenish white, or greenish yellow, obovate, 4–6 mm long, the margins erose, the apex emarginate, minutely papillose on ventral surface; styles conical, ca. 2 mm long, the stigma branches diverging at right angles, papillate. Fruit narrowly conical, yellow or yellow-brown, 6–8 cm long, 2–3 cm wide, obscurely ribbed, the surface shallowly and obscurely pitted, the perianth scar at the distal end evident; seeds compressed, with broad marginal wings, narrowly elliptic-oblong, 4.2–5.5 cm long, 0.8–1.5 cm wide (including the wings), the central portion elliptic, 5–7 mm long, 5–6 mm wide, both ends acuminate, the surface papillate, the wings submembranaceous, smooth, with the median rib extending from the central portion to the funicular end.

Distribution and ecology.—The species occurs from eastern Peru south to northwestern Argentina, east to Paraguay and eastern Brazil. It is widespread but generally uncommon, although locally abundant in western chaco forests in Depto. Tarija, Bolivia (Michael Nee, pers. comm.). It occurs in wet forests at low elevations.

Siolmatra brasiliensis is usually readily distinguished from *S. pentaphylla* by its 3-foliolate leaves. However, three collections from Loreto, Peru (*Vásquez et al. 2827; Vásquez et al. 2829; Vásquez & Jaramillo 5532*) have 3-, 4-, or 5-foliolate leaves. However, in *S. pentaphylla* the petiolules are articulate from the petiole, while in they are not in *S. brasiliensis.*

Siolmatra paraguayensis was distinguished by Cogniaux (1916) from *S. brasiliensis* on the basis of its more membranaceous leaves and the ovate rather than triangular sepals of the staminate flowers. *Siolmatra brasiliensis* var. *pubescens* was distinguished by the pubescent lower leaf surface and peduncles.

However, these distinctions are trivial and inconsistent, so the segregates are here reduced to synonymy.

Additional specimens examined. **PERU. Siolmatra pentaphylla Harms, Notizbl. Bot. Gart. Berlin-Dahlem 9:989. 1926. (**Fig 2**). Type. PERU. Loreto: upper Río Marañón, mouth of Río Santiago at Pongo Manserichi, ca. 77°30'W, 160 m, 18 Nov 1924, *Tessmann 4575* (lectotype: G, here designated to replaced destroyed B holotype; photo ex B: F, MO, NY, US; isolectotypes: NY, Bassler Herb. [Peru], n.v.; photograph of isotype in Bassler Herb.: US).

Vine or liana; stem glabrous or rarely sparsely pilose when young, soon glabrescent. Leaves 5-foliolate, the petiolules articulate from the petiole, the blade chartaceous to subcoriaceous, the margin entire, narrowly ovate to elliptic, the base cuneate to rounded, often unequal, the apex acuminate, (5–)7–11 cm long, 3–5.5 cm wide, the upper surface moderately rugose-veined, minutely pustulate, but smooth to the touch, occasionally with a few short trichomes on the midvein, otherwise glabrous, the lower surface glabrate or occasionally pubescent and sparsely short glandular-capitate; petiolules 0.5–1.5 cm long, rarely subsessile, the median one slightly longer than the lateral, pilose and sparsely short glandular-capitate or glabrous; petiole 5–10 cm long, caniculate, glabrate; tendrils glabrous. Staminate inflorescences many-flowered, in axillary panicles on the upper part of the stem, 20–50 cm long, the leaves often reduced upward and the entire floriferous part of the stem to 2 m long, the branches sparsely pilose and short stipitate-glandular or glabrous; pedicel up to 1 mm long; bracts up to 2.5 mm long, linear, with scattered stipitate-glandular and non-glandular trichomes; flower buds globose, 2–3 mm in diameter; hypanthium pedicelloid, slender, 1–3 mm long; calyx glabrous, the lobes ovate-lanceolate, 2–3 mm long; petals white, greenish white, or greenish yellow, 2–3 mm long, ca. 1.5 mm wide, narrowly obdeltoid, clawed on the lower 1/4, the apex retuse, the inner surface papillate distally and at the base; stamens ca. 1.5 mm long, free or variously connate, the filament ca. 1 mm long, the anther vertical, the filament extension with a dorsal triangular, glandular projection. Pistillate inflorescences many-flowered, axillary racemes or panicles, 10–15 cm long, the leaves often reduced on the flowering branches and the entire structure to 40 cm long, the indumentum as in the staminate; pedicels and bracts as in the staminate; flower buds conical, 7–10 mm long; hypanthium conical, 5–7 mm long, glabrous; calyx lobes triangular, ca. 3 mm long, glabrous; petals white, greenish white, or greenish yellow, obovate, 4–6 mm long, the margins erose, the apex emarginate, papillose on the ventral surface; styles conical, ca. 2 mm long, the stigma branches diverging at right angles, papillate, the staminodes 5, ca. 0.5 mm long. Fruit short-conical, yellowish brown (rarely reddish brown), 3.5–4.5(–7) cm long, 2–3 cm wide, obscurely ribbed, the surface shallowly and obscurely pitted, the perianth scars at the distal end evident; seeds compressed, with broad marginal wings, oblong, 3–3.5 cm long, 1–1.3 cm wide (including wings), the central portion

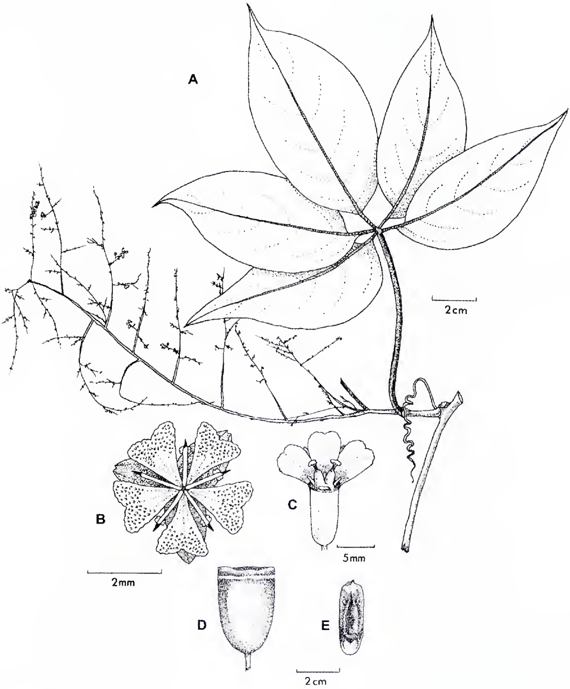

Fig. 2. ***Siolmatra pentaphylla.*** **A.** Habit, staminate inflorescence (*Prance et al. 8039,* NY). **B.** Staminate flower (*Gentry & Revilla 20798,* USF). **C.** Pistillate flower (*Williams 2453,* F). **D.** Fruit (*Mori et al. 9134,* NY). **E.** Seed (*Mori et al. 9134,* NY).

13–17 mm long, 5–6 mm wide, both ends acuminate, the surface smooth, the wings smooth, woody, the distal 3–6 mm submembranaceous and yellow-colored.

Distribution and ecology.—The species occurs in the Amazonian basin from southeastern Colombia and northern Peru, south to northern Bolivia, and east to Pará in Brazil and Guyana. Although apparently widespread in the Amazonian basin, the species is not commonly collected. It occurs in wet forests along riverbanks and flooded lake shores at 100–300 m.

The staminal condition is surprisingly highly variable, more so than that of the other species. The stamens may be entirely free, the filaments connate at base into two groups (2 + 3), two pairs of filaments connate for part or nearly their entire length (2 + 2 + 1), or apparently all short-connate at base.

Although the leaves are typically glabrate on the lower surface, two collections have leaves distinctly pubescent (*Pires 3857*; *Prance et al. 8039*). The fruits are usually 3.5–4.5 cm long and light in color. However, *Pires 3857* has fruits 7 cm long and dark in color. These two collections may represent a distinct taxon, but with so little material available, we are reluctant to describe it.

BOOK REVIEW

ROBERT H. MOHLENBROCK. 2005. **Aquatic and Standing Water Plants of the Central Midwest: Cyperaceae-Sedges.** (ISBN 0-8093-2628-0, hbk.). Southern Illinois University Press. P.O. Box 3697, Carbondale, IL 62902-3697. (**Orders:** 618-459-6633, 618-453-1221 fax, www.siu.edu/˜siupress). $65.00, 272 pp, 183 line drawings, 6" × 9".

Aquatic and Standing Water Plants of the Central Midwest: Cyperaceae-Sedges by Mohenbrock is a flora, which consists of the Cyperaceae portion of the larger Aquatic and Standing Water Plants of the Central Midwest series. The book's central Midwest range includes: Ohio, Indiana, Kentucky, Illinois, Iowa, Missouri, Nebraska, and Kansas.

The flora includes information on 183 Cyperaceae species, including members of the genera *Carex, Schoenoplectus, Eriophorum, Fimbristylis, Fuirena, Trichophorum, Dulichium, Cyperus, Eleocharis, Psilocarya, Scirpus, Hemicarpha, Lipocarpha*, and *Rhynchospora*. There is an overall key to determine genus, as well as within genus keys to determine species. Each species is presented in the book by black and white drawings, which includes images of the whole plant and the spikelet, achene, perigynium, scales and/or sheath, and a detailed description.

The description for each species contains a great deal of information, including the current accepted specific epithet, synonyms, as well as the authority and references for publications for each specific epithet. Each species' description includes plant habit information, descriptions and measurements of culms, root types, bracts, scales, spikelets, notable colors and, where applicable, details on perigynium. The description includes habitat information, with a listing of which states the species are typically found in, and any applicable category assignments (i.e. FACW) within the U.S. Fish and Wildlife Wetlands Inventory. The author has included a handy quick field traits section within the plant description to help determine that species from similar looking others.

The *Aquatic and Standing Water Plants of the Central Midwest: Cyperaceae-Sedges* Flora would be a nice addition to the library of any person who works with aquatic plants. Although focused on the Midwest, a number of the species included in this flora are found in various regions of North America. The black and white drawings are crisp, easy to read images that show major identification traits for the species. The key is straightforward, but the flora does contain a glossary for any unfamiliar terms, and is fairly user friendly. The description for each species is thorough, which can help you decide that you have determined the correct species or not, and includes those very helpful "in the field" identification hints. If you need to identify sedges, be sure to look into this helpful book. —*Lee Luckeydoo, Herbarium, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

REVISION OF *FEVILLEA* (CUCURBITACEAE: ZANONIEAE)

George L. Robinson

USDA APHIS, Plant Protection and Quarantine

Tampa, Florida 33620-5200, U.S.A.

ABSTRACT

A revision of the neotropical genus *Fevillea* with keys, descriptions, and distribution is provided. Two subgenera are recognized: subgenus *Fevillea* with six species and subgenus *Anisosperma* with one species. **Fevillea bahiensis** G. Robinson & Wunderlin from Brazil is described as new and subgenus **Anisosperma** (Silva Manso) G. Robinson & Wunderlin is proposed.

RESUMEN

Se aporta una revisión del género neotropical *Fevillea* con claves, descripciones, y distribución. Se reconocen dos subgéneros: subgénero *Fevillea* con seis especies y subgénero *Anisosperma* con una especie. Se describe como nueva **Fevillea bahiensis** G. Robinson & Wunderlin de Brasil y se propone el subgénero **Anisosperma** (Silva Manso) G. Robinson & Wunderlin.

Fevillea (Cucurbitaceae: Zanonieae), a neotropical genus of seven species, is characterized by leaves with glands, calyx with glandular squamellae (except *F. passiflora*), petals with a medial adaxial flap-like appendage or ridge, staminate flowers with five bilocular anthers, and a globose, usually indehiscent, large-seeded fruit.

TAXONOMIC HISTORY

Fevillea was established by Linnaeus (1753) in honor of Louis Éconches Feuillée, (1660–1732), a French clergyman, explorer, astronomer, and botanist. Linnaeus recognized two species, *F. trilobata* and *F. cordifolia*.

Adanson (1763) published the pre-Linnaean name *Nhandiroba*, of Marcgrave (Piso & Marcgrave 1648), but placed Linnaeus's name *Fevillea* in synonymy, thereby making *Nhandiroba* illegitimate. No species were listed. The name *Nhandiroba* remained unused until resurrected by Kuntze (1891–1898).

The first comprehensive treatment of *Fevillea* since Linnaeus (1753) was that of Seringe (1828) who recognized four species. In addition to *F. cordifolia* and *F. trilobata*, Seringe recognized *F. punctata* (L.) Poir. [=*Trichosanthes* sp.] and *F. javilla* Kunth [=*F. cordifolia*].

Silva Manso (1836) established the monotypic *Hypanthera* with *H. guapeva* [=*Fevillea trilobata*] and *Anisosperma* with *A. passiflora* (Vell.) Silva Manso [=*Fevillea passiflora* Vell.]. Both monotypic genera were accepted by most subsequent workers until recently.

Roemer (1846) recognized *Hypanthera* and *Fevillea*. He placed ten species in *Fevillea*, incorporating some taxa now placed in *Trichosanthes* L., *Pteropepon* Cogn., and *Sicydium* Schltdl. *Fevillea passiflora* was also recognized, but without reference to Silva Manso's placement of the species in *Anisosperma*. Roemer erected two sections: section *Fevillea* with nine species and section *Javilla* with only *F. javilla* Kunth [=*F. cordifolia* L.].

Cogniaux (1878) recognized three species of *Fevillea* for Brazil: *F. trilobata*, *F. albiflora* Cogn., and *F. deltoidea* Cogn. (the latter now in *Pteropepon*). In addition, he recognized the monotypic genus *Anisosperma* and expanded the generic limits of the previously Old World genus *Alsomitra* (Blume) M. Roem. to include two new neotropical species: *A. brasiliensis* [=*Siolmatra brasiliensis* (Cogn.) Baill.] and *A. pedatifolia* [=*Fevillea pedatifolia* (Cogn.) C. Jeffrey]. In a more comprehensive treatment, Cogniaux (1881) expanded *Fevillea* to six species, maintaining *Anisosperma* and *Alsomitra*.

The genus *Siolmatra*, a segregate of *Alsomitra* created by Baillon (1885) to acommodate *Alsomitra brasiliensis* Cogn. [=*Siolmatra brasiliensis* (Cogn.) Baill.], was accepted by Cogniaux (1893) who described a second species (*S. paraguayensis*). Three additional species were later added by Cogniaux (1916), one new (*S. amazonica*) and two transferred from *Alsomitra* (*S. pedatifolia* (Cogn.) Cogn. and *S. peruviana* (Huber) Cogn.). Harms (1926) added a sixth species (*S. pentaphylla*), later (Harms 1933) a seventh (*S. simplicifolia*), and Standley (1937) an eighth (*S. mexiae*). Jeffrey (1962b), noting the incongruent mixture of taxa in *Siolmatra*, recircumscribed the genus and transferred four species to *Fevillea*. In reviewing the New World taxa of the Cucurbitaceae, Jeffrey (1978) listed nine species in *Fevillea*, including *F. passiflora*, considering *Anisosperma* congeneric with *Fevillea*.

FLORAL AND FRUIT MORPHOLOGY

The staminate inflorescence consists of numerous, small, pentamerous flowers that are paniculate in subgenus *Fevillea* or fasciculate to subumbelliform in subgenus *Anisosperma*.

In subgenus *Fevillea*, the midrib of the adaxial surface of the sepals is fused with the lower margins of the petals. At or above this point of fusion extends a small glandular protuberance of uncertain ontogenic origin which is here referred to as a "glandular calycine squamella." The exudate from the squamellae is clear and remains visible on most herbarium specimens. Each petal has a median, adaxial, uncinate appendage or slightly raised glandular midrib which is adnate with the base of the stamen filament. In subgenus *Anisosperma*, the sepals and petals are united at their base and lack squamellae. Instead, the petals have a median, adaxial, glandular ridge.

An articulation occurs between the filiform hypanthium and the pedicel. The indumentum on the staminate flowers is quite variable in most species and is similar (when present) on both the hypanthium and pedicel. However, *F. trilobata* has a stipitate-glandular pubescence on the hypanthium above the articulation in rather sharp contrast to the non-glandular trichomes on the pedicel below.

The presence of five free, bilocular anthers in *Fevillea* is unique for the family and is considered plesiomorphic. The general trend within the Cucurbitaceae is the reduction of stamen number from five to three or to two and the reduction in locule number from two to one.

The pistillate flowers are rarely collected and are thus imperfectly known or unknown for some species. We have seen them in only four of the seven species. Those of *F. pergamentacea* and *F. passiflora* are known to us only through the literature while those of *F. moorei* are unknown.

The petals of the pistillate flowers have a slightly raised median appendage extending from the base to the center, reminiscent of those of the staminate flowers. Two small glands occur at the base of the petal on either side of this median appendage. A large, subrotund, flattened, glandular protuberance extends from the base of the calyx lobe between each petal. These protuberances may represent staminodes. Cogniaux (1878, 1881, 1916) reported these structures, counting 20 small "glands" at the base of the petals. This probably included the sum total of glands, ridges, and protuberances.

The fruits of subgenus *Fevillea* are large, subglobose, mottled green or brown, and gourd-like. The size ranges from 8 to 16 cm in length and from 7 to 13 cm in diameter. An individual plant may produce as many as 50 to 100 fruits at a time (Gentry & Wettach 1986). The fleshy rind of the fruit is zonate above the middle with the hypanthium lip scar (ovary partly inferior). The fruits are typically indehiscent, but reportedly sometimes dehiscent along the hypanthium lip scar in *F. pedatifolia* (A. Gentry, pers. comm.). In contrast, the fruits of subgenus *Anisosperma* are ovoid or oblong, subtrigonous, short-apiculate at the apex, and not zonate above the middle (ovary fully inferior). The seeds (up to 15 per fruit) vary from 3 to 6 cm in diameter and weigh 3 to 9 g when dry. They are among the largest in the Cucurbitaceae and are comparable in size only to those of the paleotropical genera *Telfairia* (Cucurbitoideae: Joliffieae) and *Hodgsonia* (Cucurbitoideae: Trichosantheae). The seed coat consists of three layers. The innermost layer surrounding the cotyledon is spongy and aeriferous. This layer is enclosed in a thin, hard, woody layer. The outermost layer is thin, smooth, and of a corky texture which tends to obscure the margin of the woody layer below but usually does not persist.

DISTRIBUTION AND HABITAT

Fevillea cordifolia has the widest distribution, ranging from southern Mexico, east into the Caribbean to Puerto Rico, south through Central America and into South America to northern Argentina. Dieterle (1976) notes that it is cultivated in some or all Central American countries and is found in most Central American markets, especially in Guatemala. Three species (*F. trilobata*, *F. bahiensis*, and *F. passiflora*) are endemic to eastern Brazil and *F. pedatifolia* and *F. pergamentacea* occur in Ecuador, Peru, and Bolivia, with *F. pedatifolia* extending into adjacent Amazonian Brazil. *Fevillea moorei* is known only from the type material cultivated in England and is probably from Guyana or Amazonian Brazil.

Fevillea typically occurs along river banks, along the edge of tropical primary or secondary forests, and along the edge of seasonally inundated riverine forests, occasionally climbing to heights of 35 m in forest canopy openings. It also is found in forest clearings and along roadsides. It occurs at elevations from near sea level to about 500 m, less commonly up to 1,700 meters.

Fruits and seeds of *Fevillea* are quite buoyant and thus apparently are well suited to dispersal in fresh water. Gentry and Wettach (1986) report that at least one species (*F. cordifolia* or *F. pedatifolia*) of Amazonian Peru occurs in seasonally inundated forests, a habitat in which water dispersal is prevalent. Seed drift materials of *Fevillea cordifolia* have been found within the Caribbean basin well outside the species natural range. Gunn and Dennis (1976), Morton (1981), and the senior author have identified seeds of *F. cordifolia* collected from beaches of southern Florida. Guppy (1917) reported materials found along beaches of the Turks Islands, Tobago, and Grenada. Guppy (1917) and Gunn and Dennis (1976) found that seeds of *F. cordifolia* germinated in fresh water while afloat after the disintegration of the fruit wall, but were generally rendered non-viable in salt water. Although *F. cordifolia* is sometimes listed as an estuarine plant, the seeds are probably not capable of over-sea transport for any distance. However, dispersal by seed drift via salt water can not be disregarded. Guppy (1917) estimated that 5% of the *Fevillea cordifolia* drift seeds reaching the Turks Islands were viable while Gunn and Dennis (1976) found 20% of the undamaged drift seeds on Florida beaches were viable. The high salinity of the beach is probably lethal, thus preventing colonization.

ECONOMIC IMPORTANCE

The high seed oil content of *Fevillea trilobata* was recognized centuries ago by indigenous Brazilians whose use of it was first documented by Marcgrave (Piso & Marcgrave 1648). *Fevillea cordifolia* is similarly well known in the ethnobotanical literature (cf. Gentry & Wettach 1986). It has been used as a purgative, reputed antidote for many kinds of poisoning, and as a treatment for numerous diseases. In Jamaica it is called "antidote caccoon" or "antidote vine" (Adams 1972; Gunn & Dennis 1976; Morton 1981). Lindley and Moore (1870) first reported the use of *Fevillea* seeds by Peruvians as candles. Gentry and Wettach (1986) report that "abiria" (*Fevillea pedatifolia*) is used as candles by the Campa Indians of the Pichis Valley of Peru.

Fevillea seeds may have potential as an edible or fuel oil source. Calculated on a weight per fruit basis, the seed oil content of *Fevillea* is higher than that of any other dicotyledon (Gentry & Wettach 1986). Preliminary analysis of oils extracted from the seeds of two Peruvian species (*F. cordifolia* and *F. pedatifolia*) by Gentry and Wettach show the oil to be simple triglycerides, slightly heavier than those of refined cottonseed oil. All species were rich in the saturated low-weight fatty acids, palmitic (21–60%) and stearic (10–42%), and the unsaturated oleic (17–17%) and linoleic (6–7%). When compared with previous results from the Brazilian *F. trilobata* (Tulloch & Bergter 1979), Gentry and Wettach suggest that the Peruvian species with 60–70% low-weight, saturated fatty acids would be a good sources of fuel oil while the Brazilian species with 57% unsaturated fatty acids would be a good source of polyunsaturated edible oils. However, the relatively high concentration of high molecular weight fatty acids in *F. trilobata*, probably correlated with its purgative properties, may reduce its value as an edible oil. The high percent of stearic acid in *F. cordifolia* might also suggest its use in the candle industry where this chemical is used to harden waxes and in the rubber industry where used as an extender. Preliminary laboratory analysis of *F. cordifolia* at the University of South Florida gave highly variable results thought to be related to the different ages of the seeds tested, further complicating the use of *Fevillea* seeds as a potential commercial oil source (unpublished data). Although *Fevillea* as an oil source is documented in the literature, to date it remains a genus of little or no economic importance.

INFRAGENERIC RELATIONSHIPS

Jeffrey (1962a) recognized two genera within the subtribe Fevilleinae, *Fevillea* and *Anisosperma*. In our treatment, *Anisosperma* is reduced to a subgenus of *Fevillea*. Subgenus *Anisosperma* differs from subgenus *Fevillea* by the shape of the corolla lobes, the character of the median adaxial glandular ridge of the staminate petals, the congested staminate inflorescence, the lack of glandular calycine squamellae on the staminate flowers, and the fruit shape. However, with the presence of the foliar glands, the median adaxial glandular ridge on the petals, and overall similarity in fruit and seed morphology, the single species of subgenus *Anisosperma* is easily accommodated in *Fevillea*.

Within subgenus *Fevillea*, three species groups can be distinguished on the basis of foliar gland characters. The first group consists of *F. pergamentacea* and *F. pedatifolia* which have conspicuous petiolar glands and inconspicuous laminar glands. The others are characterized by having laminar glands only. Of these, *F. cordifolia* and *F. trilobata* have glands terminating the veins on the lamina and lack basal laminar glands while *F. moorei* and *F. bahiensis* both have basal laminar glands only.

SYSTEMATIC TREATMENT

Fevillea L., Sp. Pl. 1013. 1753. *Nhandiroba* Adan., Fam. Pl. 2:139. 1763, nom. illegit.

TYPE: *Fevillea trilobata* L. Lectotype designated by M.L. Green (in Sprague et al., Nom. Prop. Brit. Bot. 190. 1929). This lectotypification replaces the lectotype of *Fevillea cordifolia* L. of Britton and P. Wilson (Sci. Surv. Porto Rico 6:270. 1925) under Art. 10.5b of the St. Louis Code.

Anisosperma Silva Manso, Enum. Subst. Braz. 38. 1836. TYPE: *Anisosperma passiflora* (Vell.) Silva Manso [=*Fevillea passiflora* Vell.].

Hypanthera Silva Manso, Enum. Subst. Braz. 37. 1836. TYPE: *Hypanthera guapeva* Silva Manso [=*Fevillea trilobata* L.].

Dioecious vines or lianas; stems sulcate; tendrils axillary, sulcate, distally 2-fid, coiling both above and below the bifurcation. Leaves alternate, petiolate, the blade unlobed, or palmately 3- to 7-lobed, or 3- to 5-foliolate, with glands on the leaf margins terminating the primary lateral veins and/or 2 glands at the blade base or on the petiole, the petiole canaliculate, sometimes bearing 2 glands at or above the middle. Staminate inflorescences paniculate or subumbelliform, many-flowered, bracteate; flowers short-pedicellate; hypanthium pedicelloid; calyx lobes 5, fused to the petals above, not completely enclosing the petals in bud, with a glandular calycine squamella on each calyx lobe at or near the point of fusion with the petals (except in *F. passiflora*); petals 5, fused to the sepals below, the lobes each with a median, adaxial, uncinate, flap-like appendage or a slightly raised ridge or (in *F. passiflora*) with a thick, glandular ridge; stamens 5, equal, free, inserted near the center of the flower, the anthers bilocular, extrorse, dehiscing longitudinally, the connective with an adaxial glandular protuberance or projection; pollen prolate, 18–22 µ in length, tricolporate, coarsely striate. Pistillate flowers solitary or in pairs; hypanthium deeply cupular; sepals and petals as in the staminate flowers or sometimes the petals differing in shape; ovary partly inferior, 3-locular, the styles 3, free, outwardly curved, the stigmas reniform, capitate, the ovules pendulous, usually 4 in each locule. Fruit globose, gourd-like with a thick, fleshy rind, zonate above the middle with the hypanthium lip scar or non-zonate, indehiscent or rarely circumscissile dehiscent along the hypanthium lip scar; seeds large, orbicular, somewhat compressed, the seed coat consisting of a thick, spongy, aeriferous inner layer surrounded by a thin woody layer, and an outer, usually non-persistent layer, the lateral surface smooth or striate-verrucose, the outer edges smooth or tuberculate, the inner kernel disk-like, oily.

Two subgenera are distinguished as follows:

1. Corolla lobes of the staminate flowers suborbicular, the base cuneate, with a median adaxial uncinate appendage or sharply defined ridge; glandular calycine squamellae present between the petals and the calyx lobes; staminate flowers in spreading panicles; fruit subglobose, zonate above the middle, the apex rounded ____ subg. **Fevillea**

1. Corolla lobes of staminate flowers oblong-hastate, the base with a median adaxial glandular ridge broadening downward; glandular calycine squamellae absent; staminate flowers in congested panicles or subumbelliform; fruit ovoid to oblong, not zonate, the apex short-apiculate ____ subg. **Anisosperma**

Fevillea subgenus **Fevillea**

Fevillea section *Javilla* M. Roem., Fam. Nat. Syn. Monogr. 2:116. 1946. TYPE: *Fevillea javilla* Kunth [=*Fevillea cordifolia* L.].

Staminate inflorescences paniculate; glandular calycine squamellae present; corolla lobes suborbicular with a median adaxial uncinate appendage or slightly raised ridge. Fruit subglobose, zonate above the middle, the apex rounded.

1. Leaves pedately 3- to 5-foliolate ____ **F. pedatifolia**
1. Leaves lobed or unlobed, but not pedately foliolate.
  2. Leaf blade without glands at the base or on the petiole, with marginal glands terminating the veins.
    3. Leaf blade with angled or rarely with rounded lobes, the marginal glands inconspicuous; staminate flowers with the hypanthium densely stipitate-glandular pubescent, the pedicel with non-glandular trichomes ____ **F. trilobata**
    3. Leaf blade unlobed or occasionally with rounded lobes, the marginal glands conspicuous; staminate flowers with the hypanthium and pedicel variously pubescent but not as above ____ **F. cordifolia**
  2. Leaf blade with glands at the base or on the petiole, with or without marginal glands terminating the leaf veins.
    4. Leaves with glands only at the blade base, without marginal glands terminating the leaf veins of the blade.
      5. Staminate flowers 3–5 mm wide; leaves drying reddish-brown, the blade with a conspicuous uncinate-ciliate margin ____ **F. bahiensis**
      5. Staminate flowers 15–20 mm wide; leaves drying green, the blade with a smooth margin ____ **F. moorei**
    4. Leaves with glands either at the blade base or on the petiole, also with marginal glands terminating the veins of the blade.
      6. Leaves with glands at the blade base ____ **F. pergamentacea**
      6. Leaves with glands on the petiole ____ **F. pedatifolia**

Fevillea bahiensis G. Robinson & Wunderlin, sp. nov. (**Fig. 1**). TYPE: BRAZIL. BAHIA: 8 km to the N of Ubaitaba on BR 101, 16 Jun 1972, *dos Santos 2307* (HOLOTYPE: CEPEC; ISOTYPE: K).

Species haec a *Fevillea moorei* Hook. f. differt floribus staminatis minoribus, foliis in siccitate badiis usque atrobrunneis marginibus uncinato-ciliatibus.

Vine or liana; stem glabrous to lightly appressed golden brown-pubescent; tendrils glabrous to lightly pubescent. Leaves unlobed, the blade ovate, (2.5–)6.5–10.5(12) cm long, (3.5–)5.5–9 cm wide, membranaceous, drying dark brown to reddish brown, 5-nerved, the apex acuminate, the base cordate to truncate, the margin entire, with two irregularly shaped glands at the base near the petiole, the upper and lower surfaces glabrous or with scattered, appressed, golden brown trichomes, these usually denser along the leaf veins, the margin uncinate-ciliate, the petiole (1.5–)3.5–5 cm long, glabrous to lightly pubescent. Staminate flowers in a paniculate inflorescence on reduced subterminal, lateral branches, the branches subtended by a reduced leaf; pedicel 1.5–2 mm long, glabrous or sparsely pubescent; bracts linear, ca. 1 mm long; hypanthium 1.5–2 mm long, lightly golden brown-pubescent; calyx shallowly cupular, the lobes

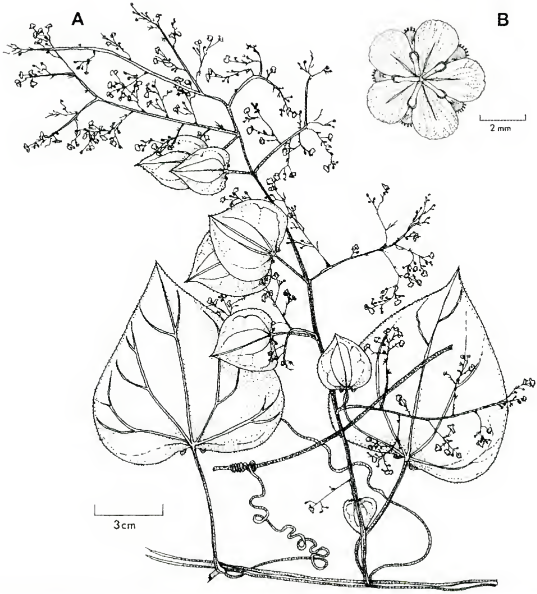

Fig. 1. *Fevillea bahiensis*. **A.** Habit, staminate inflorescence (*dos Santos 2307*). **B.** Staminate flower (*dos Santos 2307*).

up to 1.5 mm long, 1 mm wide, glabrous to sparsely pubescent abaxially, the margin entire, the apex rounded, with scattered stipitate glands, with a glandular calycine squamella at or near the point of fusion with the petals; petals suborbicular, 2.5–3 mm long, ca. 1.5 mm wide, cream-colored, the margin entire, the median adaxial ridge slightly raised; stamens 1–1.5 cm long, the anthers ca. 0.25 mm long, slightly longer than wide, the filaments ca. 0.5 mm long. Pistillate flowers solitary; calyx deeply cupular, the lobes ca. 1.5 mm long, ca. 1 mm wide, dark brown, fleshy; petals strap-shaped, ca. 2 mm long, ca. 1.5 mm wide, cream-colored. Immature fruit subglobose, 2–4 cm long and wide, the surface smooth; mature fruit not seen.

Distribution and ecology.—Endemic to Brazil in southern Bahia.

Additional specimens examined. **BRAZIL. Bahia:** Nova Esperança, São Lourenço, 32 km W of Wenceslau Guimarães, 26 Jul 2001, *Mattos-Silva et al. 4479* (NY); Ramal da Torre da Embratel, entrance 15 km from the Ubaitabe/Itacaré Road (BR 654), 5.8 km from the entrance, 6 Jun 1978, *Mori & dos Santos 10135* (CEPEC, K, NY); km 3, Uruçuca-Taboquinha highway, 19 Jun 1972, *dos Santos 2316* (CEPEC); access road to Torre da Embratel, entrance to the right of road to Ubaitabe/Itacaré (BR 654), 24 Sep 1977, *dos Santos 3130* (CEPEC, K); Almadina Mata da Serra Pancadinho, 10 Mar 1971, *Pinheiro 1076* (CEPEC, K).

Fevillea bahiensis is most similar and probably most closely related to *Fevillea moorei* of Guyana Amazonian Brazil. Both species have glands only at the base of the leaf blade. *Fevillea bahiensis* differs by having smaller staminate flowers (petals 2.5–3 mm long vs. ca. 1 cm long in *F. moorei*) and the leaves drying a dark reddish brown and with conspicuous uncinate-ciliate margins.

Fevillea uncipetala Kuhlm., Arch. Jard. Bot. Rio de Janeiro 4:365. 1925. TYPE: BRAZIL. PARÁ: Rio Branco de Obidos, Castanhal Grande, 4 Nov 1919, *Ducke s.n.* (RB 15924) (HOLOTYPE: RB, n.v.; ISOTYPE: B, destroyed; photograph ex B: F, MO, NY, US).

Vine or liana; stem glabrous or lightly to densely pubescent or tomentose; tendrils glabrous to lightly glandular-pubescent. Leaves with the blade unlobed or occasionally 3- to 5-lobed, suborbicular to cordate, (4–)7.5–13(–18) cm long, (2.5–)5–12(–19) cm wide, membranaceous or coriaceous, 5-nerved, the apex acute, the base cordate to truncate or rarely rounded, the main lateral veins terminating in small irregularly shaped glands, the upper and lower surfaces glabrous to densely pubescent, the petiole (2–)3–7 cm long, glabrous or pubescent. Staminate flowers in a paniculate inflorescence on reduced subterminal, lateral branches, the branches subtended by a glandular bract 0.5–4 mm long;

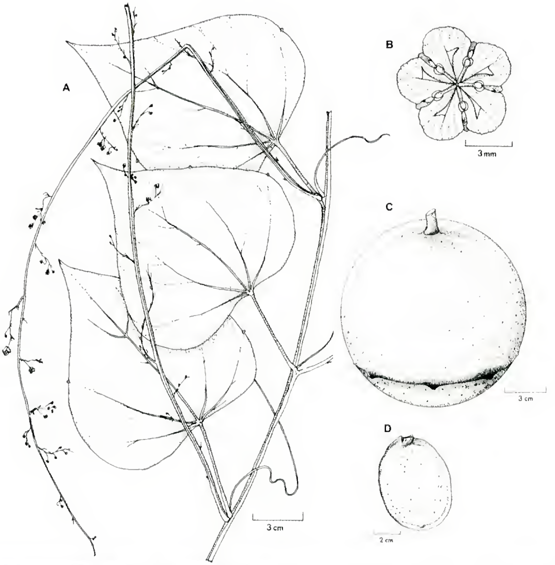

Fig. 2. *Fevillea cordifolia*. **A.** Habit, staminate inflorescence (*Lent 3288*). **B.** Staminate flower (*Klug 3090*). **C.** Fruit (*Huashikat 1078*). **D.** Seed (*Huashikat 1078*).

pedicel 2–4 mm long, glabrous to densely pubescent; bracts linear, glandular, ca. 0.5 mm long; hypanthium 3–4 mm long, glabrous to densely pubescent; calyx shallowly cupular, the lobes 1–2.5 mm long, 1–1.5 mm wide, obtuse or rounded, densely to sparsely glandular-pubescent, the margin entire, the apex rounded, with a small glandular calycine squamella protruding from each sepal at or near the point of fusion with the petal; petals suborbicular, 3.5–5 mm long, 2.5–4 mm wide, white, whitish green, cream-colored, light brown, pink or pinkish orange, dark red, or reddish purple, the margin undulate, the median, adaxial ridge with an uncinate appendage; stamens ca. 1 mm long, the anthers ca. 0.5 mm wide, slightly longer than wide, the filaments ca. 0.5 mm long. Pistillate flowers solitary or in pairs; calyx deeply cupular, the lobes suborbicular, ca. 3 mm long and wide, pustulate, fleshy; petals oblong, ca. 5 mm long, ca. 3.5 mm wide, cream-colored, the median adaxial appendage slightly raised, with 2 small suborbicular glands on each side of the ridge at the base. Fruit subglobose, gourd-like, 10–12 cm in diameter, 10–16 cm long, the surface pustulate, mottled green, zonate above the middle with the hypanthium lip scar and marked at the apex by a raised triradiate line; seeds orbicular, compressed, 1–2.5 cm thick, 4–6(–7.5) cm wide, the lateral surface of the woody layer striate-verrucose or pustulate, with the outer edges smooth or occasionally tuberculate, the tubercles 2–3 mm long.

Distribution and ecology.—Southern Mexico east to Puerto Rico, south through Central America, and into South America to Bolivia. A canopy plant of wet forests from sea level to 1,700 meters.

Fevillea cordifolia is a polymorphic species exhibiting considerable variation throughout its range. The species can be readily distinguished from other members of the genus by its conspicuous marginal laminar glands. It is most similar to *F. trilobata* of eastern Brazil and is distinguished from that species by the typically rounded leaf lobes (when lobes are present), rather than the angular lobes characteristic of *F. trilobata*. *Fevillea trilobata* also has a distinctive stipitate-glandular pubescence on the hypanthium of the staminate flowers, which is sharply differentiated from the uncinate pubescence of pedicel. This pattern of pubescence is lacking in *F. cordifolia*.

Fevillea moorei Hook. f., Bot. Mag. t. 6356. 1878. *Nhandiroba moorei* (Hook. f.) Kuntze, Revis. Gen. Pl. 1:257. 1891. TYPE: GUYANA or BRAZIL: Cultivated at Liverpool Botanic Garden, 1871, *Tyreman s.n.* (HOLOTYPE: K; ISOTYPE: BR-fragment).

Vine or liana; stem glabrous; tendrils glabrous. Leaves with the blade unlobed, broadly ovate, 6–12 cm long, 3.5–7 cm wide, membranaceous, drying light green, 3-nerved, the apex acuminate, the base rounded, with 2 small, irregularly shaped glands near the petiole, the upper and lower surfaces glabrous, the petiole 1–2.5 cm long, glabrous. Staminate flowers in a racemose inflorescence ca. 6 cm long, (10–12 cm fide Hooker f.); pedicel 1–4 mm long, glabrous; hypanthium 5–6 mm long, glabrous; bracts linear, ca. 0.5 mm long; calyx shallowly cupular, the lobes oblong, ca. 6 mm long, 4 mm wide, the apex obtuse, the margin entire, with a glandular calycine squamella protruding at or near the point of fusion with the petals; petals suborbicular, somewhat broader at the apex, ca. 1 cm long, 1 cm wide, pale brick-red, the margin undulate; stamens ca. 4 mm long, the anthers ca. 1 mm long, slightly longer than wide, the filament ca. 3 mm long. Pistillate flowers and fruit not seen.

Distribution and ecology.—Known only from the type material received by J.D. Hooker from David Moore, curator of the Glasnevin Botanic Garden, Dublin, Ireland, who received it from Mr. Tyreman of the Liverpool Botanic Garden.

The material was labeled as "Strychnos curari" and said to have come from Gambia. As suggested by Hooker in the protologue, it is probable that the plant is from South America, possibly Guyana or the Amazon River basin of Brazil where *Strychnos toxifera*, the source of the drug curare is native and was known to occur at that time. Hooker named the plant in honor of his friend, Dr. Moore.

Fevillea moorei is most similar to *F. bahiensis* of southern Bahia, Brazil. It is easily distinguished by its larger staminate flowers, its leaf margins lacking uncinate trichomes, and its 3-nerved leaves which dry to a light green color.

Vine or liana; stem glabrous to densely glandular-pubescent; tendrils sparsely pubescent or glabrous. Leaves with the blade unlobed, or 3- to 5-lobed, or 3- to 5-foliolate, membranaceous to coriaceous, the unlobed or the lobed leaves ovate to ovate-oblong, (6–)8–15(–18) cm long, 9–14(–17.5) cm wide, 5- to 7-nerved, the divisions of the lobed leaves or the leaflets of the foliolate leaves (6–)8–15(–18) cm long, 4–8 cm wide, 1- to 2-nerved, with a petiolule up to 2 cm long, the apex of the blade or leaf divisions acuminate, the base of the blade or leaf divisions oblique or rounded, the margin entire or coarsely crenate-toothed, the primary lateral veins terminating in a small irregularly shaped marginal gland, the upper and lower surfaces glabrous or lightly pubescent, especially along the leaf veins, the petiole 3.5–5(–7) cm long, glabrous to sparsely pubescent, with 2 opposite, prominent, irregularly shaped median to subapical glands. Staminate flowers in a paniculate inflorescence on reduced lateral branches, each branch subtended by a thin scale-like glandular-pubescent bract 0.5–2 mm long; pedicel 0.5–1 mm long, sparsely glandular-pubescent to glabrate; hypanthium 0.5–1.5 mm long, sparsely glandular-pubescent to glabrate; calyx shallowly cupular, the lobes light green or greenish brown, suborbicular, 0.5–1 mm long and wide, the apex rounded or obtuse, glandular-pubescent or glabrous, the margin slightly erose and glandular-ciliate, with a glandular calycine squamella

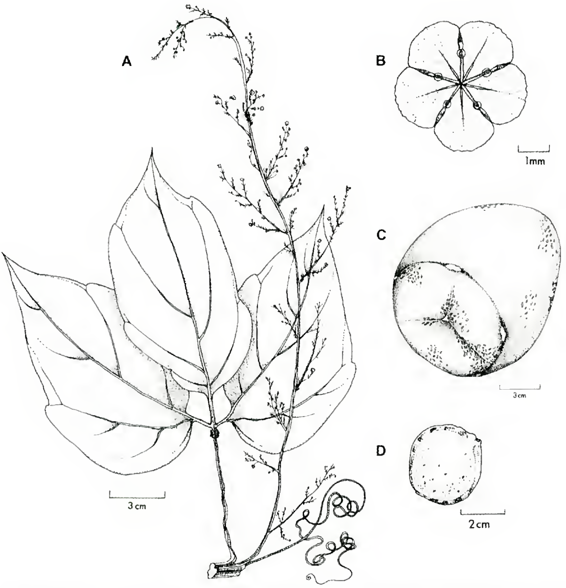

Fig. 3. ***Fevillea pedatifolia*. A.** Habit, staminate inflorescence (*Klug 4187*). **B.** Staminate flower (*Klug 2678*). **C.** Fruit (*Barbour 5533*). **D.** Seed (*Barbaur 5533*).

protruding at or near the point of fusion with the petals; petals suborbicular, 1–2 mm long, 1–1.5 mm wide, white or greenish white, greenish yellow, or yellowish, the margin slightly erose, the median adaxial ridge slightly raised; stamens 0.25– 0.5 mm long, the anthers ca. 0.25 mm long, slightly longer than wide, the filament ca. 0.5 mm long. Pistillate flowers in pairs; pedicel 1.2–2 mm long; calyx deeply cupular, the lobes ca. 3 mm long, ca. 2 mm wide, dark greenish brown, the surface pustulate; petals white. Fruit subglobose, ca. 14 cm long, 13 cm wide, gourd-like, indehiscent or rarely circumscissile dehiscent along the hypanthium lip scar (A. Gentry, pers, comm.), the surface smooth or pustulate, usually a mottled green color; seeds orbicular, compressed, 4–5 cm long and wide, 1.5–2.5 cm thick, silver-white upon drying, the woody layer smooth to slightly pustulate, the winged margin ca. 0.5 cm wide.

Distribution and ecology.—Amazonian Ecuador and Peru, south to Bolivia, and east to Acre and Amazonas, Brazil. A plant of moist to wet forests, occurring at 130–800 meters in elevation.

Selected specimens examined. **ECUADOR. Napo:** Estación Biológica Jatun Sacha, 8 km E of Misahuallí, 01°04'S, 77°36'W, 400 m 23–31 Jan 1989, *Cerón 6076* (MO); km 2, new road from Cotundo to Coca, 1130 m, 5 Aug 1984, *Dodson et al. 15072* (NY). **PERU. La Paz:** basin of Río Bopi, Asunta (near Evenay), 690–750 m, 27–31 Jul 1939, *Krukoff 10666* (F, G, K, MO, NY).

Plants with 3- to 7-foliolate leaves are easily distinguished from other species of *Fevillea*. They previously had been considered a species of *Siolmatra* because of this feature, but the presence of the foliar glands, the bilocular anthers, and the large globose fruit with large unwinged seeds clearly separates it. *Siolmatra*, in contrast, lacks foliar glands, has unilocular anthers, and has a cylindric fruit with winged seeds.

Fevillea peruviana and *F. amazonica* were separated from *F. pedatifolia* on the basis of leaflet number (3 rather than 5). *Fevillea amazonica* was further separated on the basis of the petiolar gland position (median rather than subapical). These characters are not constant and thus *F. peruviana* and *F. amazonica* are here reduced to synonymy as suggested by Jeffrey (1962b).

Plants with unlobed leaves have been called *F. simplicifolia*. Since specimens with leaves intermediate between simple and 3-foliolate are occasionally found (although rare) and there are otherwise no other floral or vegetative differences, *F. simplicifolia* is here reduced to synonomy. Plants with unlobed leaves are sometimes confused with *F. pergamentacea*. However that species is readily distinguished by the presence of a pair of glands at the base of the blade, while the glands in *F. pedatifolia* are on the petiole.

Fevillea pergamentacea (Kuntze) Cogn., in Engler, Pflanzenr. 4(Heft 66):8. 1916. **(Fig. 4)**. *Nhandiroba pergamentacea* Kuntze, Revis. Gen. Pl. 3(2):104. 1898 TYPE: BOLIVIA. Nhandiroba harmsii Kuntze, Revis. Gen. Pl. 3(2):103. 1898. *Fevillea harmsii* (Kuntze) K. Schum., Just's Bot. Jahresber. 26:383. 1898. TYPE. BOLIVIA. SANTA CRUZ: Velasco, 200 m, Jul 1892, *Kuntze s.n.* (LECTOTYPE: here designated, NY; ISOLECTOTYPES: US, B, destroyed; photo ex B, F, MO, NY, US).

Vine or liana; stem glabrous to lightly pubescent; tendrils glabrous. Leaves with the blade unlobed or occasionally 2- to 3- lobed, ovate, 10–11(–15) cm long, (4–) 6–8(–15) cm wide, subcoriaceous, drying very light brown or green, the apex or the lobe tips acuminate or acute to slightly rounded, the base cordate to truncate, the upper surface glabrous, the lower surface lightly pubescent along the veins, the margin entire, occasionally with scattered trichomes, the lateral veins occasionally terminating with a small gland, with 2 small, opposite, irregularly auriculate glands at the base of the blade, the petiole 2.5–4 cm long, glabrous to sparsely pubescent. Staminate flowers in a paniculate inflorescence on reduced lateral branches; pedicel 1–2 mm long, densely to sparsely pubescent; hypanthium 0.5–1 mm long, glabrous; calyx crateriform, the lobes lanceolate, 0.5–1 mm long, ca. 0.5 mm wide, obtuse, slightly erose-margined, sparsely to densely pubescent, with a prominent glandular calycine squamella protruding from each sepal at or near the point of fusion with the petals; petals narrowly obovate, 2–2.5 mm long, 1.5–2 mm wide, cream to yellowish brown, the margin entire, the median appendage slightly raised; stamens ca. 0.5 mm long, the anthers ca. 0.25 mm wide, slightly longer than wide. Pistillate flowers not seen. Fruit globose, 6–7 cm long and wide, green, the surface minutely pustulate; seeds orbicular, compressed, 1.5 cm thick, 3.5–4.5 cm long and wide, the lateral surface of the woody layer smooth to minutely pustulate, the marginal nerve ca. 0.5 cm wide, completely enclosing the seed.

Distribution and ecology.—Amazonian Colombia, Ecuador, eastern Peru, and central Bolivia. A plant of wet forests, occurring between 180 and 500 meters.

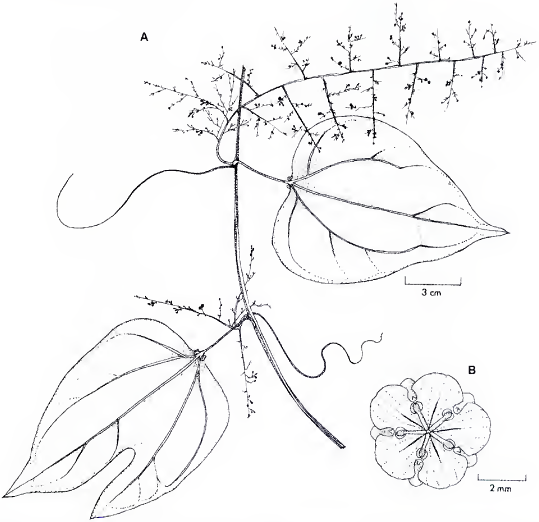

Fig. 4. *Fevillea pergamentacea*. **A.** Habit, staminate inflorescence (*Klug 2198*). **B.** Staminate flower (*Klug 2198*).

Fevillea pergamentacea is most similar to simple-leaved forms of *F. pedatifolia*, but differs in the position and form of its foliar glands and in the shape of the staminate flowers. *Fevillea pergamentacea* is characterized by flat, elongate-elliptic glands at the base of the leaf blade rather than petiolar glands well below the base of the leaf blade as in *F. pedatifolia*. *Fevillea pergamentacea* also has a distinctive crateriform staminate flower as opposed to the shallow cup-shaped flowers of *F. pedatifolia*. The distinction between *F. pergamentacea* and *F. harmsii* on the basis of the leaf shape cannot be maintained and *F. harmsii* is here reduced to synonymy as suggested by Jeffrey (1962b).

Vine or liana; stem densely pubescent, tomentose to lightly pubescent, or subglabrous; tendrils pubescent or glabrous. Leaves with the blade 3-lobed, or occasionally 5-lobed, 6–10 cm long, (2–)5–10(–15) cm wide, membranaceous, the apex acute or acuminate, the main lateral veins occasionally terminating in a small apical gland, the upper and lower surfaces densely to lightly pubescent. Staminate flowers in a paniculate inflorescence on reduced lateral branches; pedicel with uncinate trichomes, 1–3(5) mm long; hypanthium (2–)3–5 mm long, densely to sparsely stipitate-glandular pubescent; bracts glandular, linear, 0.5–1 mm long, densely to sparsely pubescent, the ones subtending the panicle branches, larger, less glandular, more leaf-like, often with a distinct stipe; calyx shallowly cupular, the lobes slender, ca. 2.5 mm long, ca. 1 mm wide, obtuse, densely to sparsely glandular-pubescent with a glandular calycine squamella protruding from each sepal at or near the point of fusion with the petals; petals suborbicular, 3–6 mm long, 1–4 mm wide, pale yellow, cream-colored or pink, each with a median adaxial uncinate appendage; stamens ca. 1 mm long, the anthers ca. 0.5 mm long, slightly longer than wide. Pistillate flowers (fide Cogniaux 1878, 1881, 1916) 1–3; pedicel ca. 6 mm long, densely to sparsely pubescent; hypanthium ca. 2 mm long, densely to sparsely pubescent; calyx campanulate, the lobes with a glandular calycine squamella at the point of fusion between the sepals and the petals; petals strap-shaped, broadened at the base, cream-colored; styles 3; ovary 5–7 mm long. Fruit (fide Cogniaux 1878, 1881, 1916) subglobose, reddish brown, 7–9 cm wide, pubescent or lightly glandular-pubescent, the locules 4-seeded; seeds orbicular, compressed, ca. 4 cm long and wide, ca. 1 cm thick, the lateral surface of the woody layer striate-verrucose, the outer edge tuberculate.

Distribution and ecology.—Brazil from Ceará southwest to Minas Gerais and São Paulo.

Selected specimens examined **BRAZIL. Bahia:** Ilheus, 1836, *Blanchet 2380* (G, F, K, MO, NY, US); km 22 on Ilheus/Itabuna road (BR 415), near Palmoreto, 50 m, 1 Sep 1997, *Jardim et al. 1101* (NY). **Ceara:** Serra do Araripe, Sep 1828, *Gardner 1629* (BM, K). **Espirito Santo:** Reserva Florestal de Sooretama, 9

Fevillea trilobata is most similar to *F. cordifolia* from which it can be distinguished by its usually angular (vs. rounded) leaf lobes and staminate flowers with stipitate-glandular trichomes on the hypanthium which are sharply differentiated from the uncinate ones on the pedicel.

Fevillea subgenus **Anisosperma** (Silva Manso) G. Robinson & Wunderlin, comb. et stat. nov. BASIONYM: *Anisosperma* Silva Manso, Enum. Subst. Braz. 38. 1836. TYPE: *Anisosperma passiflora* (Vell.) Silva Manso [=*Fevillea passiflora* Vell.].

Staminate inflorescences of congested panicles or subumbelliform; glandular calycine squamellae absent; corolla lobes oblong-hastate with a thick glandular adaxial ridge. Fruit ovate or oblong, subtrigonous, not zonate, the apex apiculate.

Fevillea passiflora Vell., Fl. Flumin., Icon. 10:t. 104. 1831 ("1827"). (**Fig. 6**). *Anisosperma passiflora* (Vell.) Silva Manso, Enum. Subst. Braz. 38. 1836. TYPE: BRAZIL. RIO DE JANEIRO: (LECTOTYPE: here designated, Vellozo, Fl. Flumin., Icon. 10:t. 104. 1831 ("1827")).

Vine or liana; stem glabrous or sparsely glandular-pubescent; tendrils glabrous. Leaves with the blade unlobed, ovate to broadly lanceolate, 5–13 cm long, 4.5–7.5 cm wide, membranaceous, with a distinct marginal nerve, the apex acute to acuminate, the base rounded, with 2 small irregular, auriculate glands near the petiole, the upper and lower surfaces minutely pustulate, sometimes sparsely glandular-pubescent, the petiole 1–3 cm long. Staminate flowers in a congested panicle or subumbelliform inflorescence; pedicel (2–)4–5 mm long, sparsely glandular-pubescent; hypanthium 4–5(–13) mm long, sparsely glandular-pubescent; calyx shallowly cupular, glandular-pubescent, the lobes ca. 2.5 mm long, lanceolate, acute; petals oblong-hastate, 5–7 mm long, green or cream-colored, the median adaxial ridge glandular, slightly raised, broadest at the base, gradually tapering to about the center; stamens 1.5–2 mm long, the anthers ca. 1 mm long, slightly longer than wide. Pistillate flowers 2–4 on a short, thick peduncle; styles with the lower part somewhat thickened, the upper part dilated and broadly obcordate, curved inward longitudinally; ovary 6–9 mm long and 4–5 mm wide, glabrous. Fruit ovoid to oblong, 8–15 cm long, 5–11 cm wide, subtrigonous, smooth or irregularly verrucose, fleshy with thickened outer

ABSTRACT

Herbarium study of *Bromus grandis*, *B. orcuttianus*, and *B. orcuttianus* var. *hallii* from western North America has indicated that these taxa are morphologically and geographically distinct, and best treated as species. A new combination **Bromus hallii** (Hitchc.) Saarela & P.M. Peterson is made. *Bromus hallii* differs from *B. orcuttianus* by having densely pubescent blades (verses glabrous in *B. orcuttianus*), lower sheaths with dense short stiff hairs 1 mm long or less (vs. long soft hairs 2–4 mm long), and 1–2(–3) culm nodes (vs. 2–4). *Bromus hallii* differs from *B. grandis* by having blades that are 7.5–16.5 cm long [vs. (13–)18–38 cm long in *B. grandis*], 1–2(–3) culm nodes (vs. 3–7), and lower glumes that are 1(–3)-nerved [vs. 3(1)-nerved]. We provide the first report of differences in the type of pubescence on the lower sheaths between *B. orcuttianus* and *B. hallii*. We confirm the diploid chromosome number of $2n = 14$ for *B. grandis*. We include descriptions, synonymies, and representative specimens examined for *B. grandis*, *B. hallii*, and *B. orcuttianus*, a key to all sections of *Bromus* in California, and a key to *Bromus* sect. *Bromopsis* in California.

RESUMEN

El estudio de *Bromus grandis*, *B. orcuttianus* y *B. orcuttianus* var. *hallii* de Norteamérica occidental ha indicado que estos taxa son morfológica y geográficamente diferentes, y están tratados mejor como especies distintas. Se hace una nueva combinación **Bromus hallii** (Hitchc.) Saarela y P.M. Peterson. *Bromus hallii* se diferencia de *B. orcuttianus* por tener láminas densamente pubescentes (contra glabras en *B. orcuttianus*), vainas inferiores con los pelos rígidos cortos de 1 mm largo o menos (contra los pelos suaves largos de 2–4 mm), y 1 ó 2(–3) nudos en el culmen (contra 2–4). *Bromus hallii* se diferencia de *Bromus grandis* por tener las láminas de 7.5–16.5 cm de largo (contra 18–38 cm en *B. grandis*), 1 ó 2 nudos en el culmen (contra 3–6), y glumas inferiores 1(–3)-nervadas [contra 3(1)-nervadas]. Proporcionamos el primer informe de diferencias en el tipo de pubescencia en las vainas inferiores entre *B. orcuttianus* y *B. hallii*. Confirmamos el número diploide de cromosomas de $2n = 14$ para *B. grandis*. Incluimos descripciones, sinonimias, y especímenes representativos examinados de

SIDA 21(4): 1997–2013. 2005

B. grandis, *B. hallii* y *B. orcuttianus*, una clave de todas las secciones de *Bromus* en California, y una clave de *Bromus* sect. *Bromopsis* en California

Bromus L. is a large genus of approximately 160 species that are distributed worldwide in temperate regions. The genus is distinguished from other grass genera by the combination of leaf sheaths that are connate for most of their length, awns that are inserted subapically, and hairy appendages on the apices of the ovary (Clayton & Renvoize 1986). In the New World, 79 native and introduced species are currently recognized (Pavlick et al. 2003), although new species are being described (e.g., Saarela et al. in review) and the taxonomic boundaries of several difficult species complexes have been reevaluated (e.g., Peterson et al. 2002; Oja et al. 2003; Massa et al. 2004). Molecular phylogenetic investigations have clarified several aspects of the evolutionary history of *Bromus*, and have identified major lineages in the genus, some of which correspond to commonly recognized intrageneric taxa (Pillay & Hilu 1990, 1995; Ainouche & Bayer 1997; Saarela et al. in press). A new classification of the genus has not yet been proposed, pending further study of morphological and molecular variation.

Bromus sect. *Bromopsis* Dumort., the largest of the traditionally recognized sections in the genus, is a non-monophyletic taxon comprised of several lineages that occur in North America, Mexico, South America, and Eurasia (Saarela et al. in press). The section is characterized morphologically by 1(3)- and 3(5)-nerved first and second glumes, lemmas that are dorsally flattened, and a perennial habit (Smith 1970), although some of these characteristics may be symplesiomorphies. In North America north of Mexico, there are 16 native species in section *Bromopsis* that have diversified in a variety of habitats (Pavlick 1995; Pavlick & Anderton, in press). Some species are wide-ranging (e.g., *B. ciliatus* L.), whereas others are highly restricted in distribution [e.g., *B. texensis* (Shear) Hitchc.]. Several taxa (*B. laevipes* Shear, *B. orcuttianus* Shear, *B. orcuttianus* var. *hallii* Hitchc., *B. pseudolaevipes* Wagnon, and *B. suksdorfii* Vasey) are restricted to mountainous regions in the southwestern part of the continent, largely in California (Pavlick 1995). Others [e.g., *B. porteri* (J.M. Coult.) Nash, *B. richardsonii* Link, *B. vulgaris* (Hook.) Shear] have broader distributions in western North America. While studying *Bromus* specimens from California to support preparation of the taxonomic treatment of *Bromus* for the Second Edition of the Jepson Manual (Saarela & Peterson, in prep.), it became clear that *B. orcuttianus* var. *hallii*, despite its varietal rank, is a readily identifiable taxon that can be consistently and reliably distinguished from both *B. orcuttianus* var. *orcuttianus* and *B. grandis*. These preliminary observations stimulated a more detailed investigation of its morphological variation and taxonomic status.

Vasey (1885) named and described *B. orcuttianus* based on collections by C.R. Orcutt from the mountains near San Diego, and collections by W.N. Suksdorf from Mt. Adams in Washington. In his revision of the North American species of *Bromus*, Shear (1900) recognized *B. orcuttianus*, and described larger plants from La Maite, San Diego, with pubescent sheaths, leaves, culms, and spikelets as a new variety, *B. orcuttianus* var. *grandis* Shear. Hitchcock (in Jepson 1912) described plants from the mountains of southern California with densely pubescent blades and cataphylls, and pubescent glumes and lemmas as a new variety, *B. orcuttianus* var. *hallii* Hitchc. Hitchcock (in Jepson 1912) also elevated *B. orcuttianus* var. *grandis* to a species, *B. grandis* (Shear) Hitchc., indicating that it is similar to *B. orcuttianus* var. *hallii*, but differs in its drooping panicle and distinctly 3-nerved lower glumes. Subsequent authors have recognized *B. grandis*, *B. orcuttianus*, and *B. orcuttianus* var. *hallii* in their treatments (e.g., Hitchcock & Chase 1951; Wagnon 1952; Munz & Keck 1959; Hitchcock et al. 1969; Munz 1974; Wilken & Painter 1993; Pavlick 1995; Pavlick & Anderton, in press) although Clayton and Williamson (2002 onwards) synonymized *B. orcuttianus* var. *hallii* with *B. orcuttianus*. In his revision of *Bromus* sect. *Bromopsis* in North America, Wagnon (1952) hypothesized that *B. orcuttianus* var. *hallii* is equally related to *B. grandis* and *B. orcuttianus*, and indicated that it requires further study. Among species of *Bromus* sect. *Bromopsis* in North America, *B. orcuttianus* var. *hallii* is the only taxon recognized currently at the varietal level, even though the characteristics separating it from *B. orcuttianus* var. *orcuttianus* and *B. grandis* are similar in degree to those separating other morphologically similar species of *Bromus*. Here we discuss the morphological, cytological, geographical, and ecological characteristics of these three taxa, and propose a new combination, *B. hallii* (Hitchc.) Saarela & P.M. Peterson. We include synonymies, species descriptions, distributions, and specimens examined for *B. grandis*, *B. hallii*, and *B. orcuttianus*, and keys to the sections of *Bromus* in California, and *Bromus* section *Bromopsis* in California.

MATERIAL AND METHODS

This study is based on examination of over 425 herbarium specimens from CAS, DAO, K, OSU, UBC, UC/JEPS, US, W, and WTU, including most type specimens. Specimens were measured to generate morphological descriptions. Data on geographic distribution, elevation, and habitat were obtained from herbarium specimen labels. Cytological observations of *B. grandis* were carried out by the third author on living material germinated from seeds collected in 1994 (*Cayouette & Darbyshire C7947*). Detailed procedures for the chromosome count are provided in Peterson et al. (2002). The taxonomic key was generated through study of the literature and representative herbarium specimens at US.

RESULTS AND DISCUSSION

Bromus orcuttianus, *B. orcuttianus* var. *hallii*, and *B. grandis* are morphologically similar taxa that have been recognized as distinct for almost a century. Examination of morphological variability among individuals from across the range of these three taxa indicates that they are each easily distinguished by a combination of quantitative and qualitative characteristics, and each has a distinctive geographic distribution. The degree of difference among the three taxa is approximately the same, although one taxon is recognized currently at the varietal level while two are recognized as species. It would be equally logical (although not valid nomenclaturally) to classify individuals currently included in *B. orcuttianus* var. *hallii* as an intraspecific taxon of *B. grandis*, if emphasis were placed on vegetative rather than reproductive characteristics when making taxonomic decisions. To minimize such ambiguity, either one wide-ranging polymorphic species could be recognized, or each morphologically and geographically distinct taxon could be treated as a species. We prefer the latter approach, and propose a new combination, *B. hallii* (Hitchc.) Saarela & P.M. Peterson to accommodate this. This morphological-geographical approach to circumscribing species follows existing treatments of *Bromus* sect. *Bromopsis* in North America, in which taxa with consistent morphological characteristics throughout their ranges are treated as species (e.g., Pavlick 1995; Pavlick & Anderton, in press; Saarela & Peterson, in prep).

Bromus hallii and *B. orcuttianus* are distinguished morphologically by several qualitative characteristics, including the presence or absence of pubescence on the blades, the type of pubescence, and the number of culm nodes (Table 1). *Bromus hallii* is characterized by blades that are densely pubescent abaxially and adaxially, lower sheaths that are densely pubescent with short, stiff hairs up to 1 mm long, and culms with 1–2(–3) nodes. In contrast, *B. orcuttianus* has blades that are glabrous abaxially and adaxially (sometimes with pilose margins towards the base), lower sheaths that are sparsely to densely pilose (occasionally glabrous) with long, soft hairs up to 4 mm long that are easily visible with the naked eye, and culms with 2–4 nodes. Previous authors (e.g., Hitchcock 1951; Pavlick 1995) noted that these two taxa differ in the distribution of the pubescence on the leaves, but they were apparently not aware of the differences noted here in the type of pubescence on the lower sheaths. Additional morphological characteristics distinguish *B. hallii* and *B. orcuttianus*, but there is some overlap in these character states. *Bromus hallii* consistently has pubescent glumes, lemmas, and blades that range in length from 7.5–16.5 cm long, whereas *B. orcuttianus* has glumes that are usually glabrous but sometimes scabrous or pubescent, lemmas that range from glabrous to pubescent, and leaf blades that range in length from 7–24 cm long. The morphology of the inflorescence is the same in both taxa, with stiff branches that are erect and appressed to spreading not more than 90° from the rachises. Good illustrations of the general habit and inflorescence morphology of *B. orcuttianus* and *B. hallii* are found in Pavlick (1995), but these do not adequately emphasize the diagnostic differences of the type of pubescence found on the lower leaf sheaths or the differences in culm node number.

TABLE 1. Diagnostic characters separating *Bromus grandis*, *B. hallii*, and *B. orcuttianus*.

Characters	***B. grandis***	***B. halli***	***B. orcuttianus***
Leaf blades	pubescent	pubescent	glabrous, occasionally pilose near base
Lower leaf sheaths	densely pubescent, hairs up to 1(–3) mm long	densely pubescent, hairs up to 1 mm long	sparsely to moderately pilose, hairs 2–4 mm long, occasionally glabrous
Culm nodes	3–7	1–2(–3)	2–4
Leaf blade length	(13)18–38 cm	7.5–16.5 cm	7–24 cm
Glume surface	pubescent	pubescent	glabrous, scabrous, or pubescent
Lemma surface	pubescent	pubescent	glabrous or pubescent
Lower glumes, number of veins	3(1)	1(3)	1(3)
Awn length	3–6 mm	3.5–7 mm	(4–)5.5–8 mm
Inflorescence branches	flexuous, usually spreading > 90° from culm axis	stiff, erect, ascending and appressed, to spreading not > 90° from culm axis	stiff, erect, ascending and appressed, to spreading not > 90° from culm axis

Stebbins and Love (1941) reported a diploid chromosome count of $2n = 14$ for *B. orcuttianus*, and this was confirmed by counts by Wagnon (1952). Stebbins and Love (1941) synonymized *B. orcuttianus* var. *hallii* with *B. orcuttianus*, thus it is unclear if they obtained counts for material that we are treating here as *B. halli*. Wagnon (1952) was unable to obtain living material of *B. hallii*, and attempts to germinate seeds of *B. hallii* for chromosome counts in this study were unsuccessful. The chromosome number of *B. hallii* remains unknown.

Bromus hallii and *B. orcuttianus* differ in their geographic distributions and mean (μ) elevations. *Bromus hallii* is a narrowly distributed species that occurs in southern California in the mountains of Kern, Fresno, Los Angeles, Monterey, Santa Barbara, San Bernardino, and Tulare counties, at high elevations ($\mu = 6658$ ft; $n = 29$). *Bromus orcuttianus* has a much wider range, occurring in the mountains throughout California, Oregon, southern Washington, eastern Nevada, and southeastern Arizona (Piper 1906; Wagnon 1952; Kearney et al. 1960; Pavlick 1995), generally at lower elevations ($\mu = 5306$ ft; $n = 40$).

Bromus hallii and *B. grandis* are distinguished morphologically by a combination of vegetative and reproductive characteristics (Table 1). The distribution and type of pubescence on the blades, sheaths, and spikelets is similar in *B. hallii* and *B. grandis*, although two specimens of *B. grandis* seen (*Wolf 6888* and

Silveus 2829) have longer hairs up to 3 mm long on the blades and sheaths. The taxa differ in their blade lengths, number of culm nodes, number of nerves on the lower glume, and inflorescence morphology. *Bromus hallii* has blades that are 7.5–16.5 cm long [vs. (13–)18–38 cm long in *B. grandis*], 1–2(–3) culm nodes (vs. 3–7), and lower glumes that are 1(3)-nerved [vs. 3(1)-nerved]. *Bromus hallii* has panicles with stiff branches that are erect or spreading not more than 90° from the culm axis, whereas *B. grandis* has panicles with flexuous branches that are spreading often more than 90° from the culm axis. In immature specimens of *B. grandis* (those collected in late May and early June), the panicles appear similar in morphology to those found in *B. orcuttianus* and *B. hallii*, thus this characteristic should only be used on fully mature specimens. A good illustration of the inflorescence morphology of *B. grandis* is found in Hitchcock (1951). Wagnon (1952) indicated in his taxonomic keys that *B. halli* differs from *B. grandis* in having cucullate (boat-shaped) blade tips, but thorough examination of this character indicates that several individuals of *B. grandis* share this character state, making this an unreliable character. Stebbins and Love (1941) reported a diploid chromosome number of $2n = 14$ for *B. grandis*. Wagnon (1952) did not have fresh material of *B. grandis* for chromosome counts. Our cytological observations of *B. grandis* confirm the diploid number $2n = 14$. Like *B. hallii*, *B. grandis* is a narrowly distributed species endemic to southern California, known from the mountains in the southern counties and in the coastal ranges from Santa Cruz to San Diego counties. *Bromus grandis* generally occurs at much lower elevations ($\mu = 3267$ ft; $n = 25$) than *B. hallii* ($\mu = 6658$ ft; $n = 29$).

Recognition of *B. hallii* as a distinct species increases the number of species in *Bromus* section *Bromopsis* in California to 11, 10 of which are native, and one that is introduced (*B. inermis* Leyss.). Keys distinguishing the sections of *Bromus* and the species of sect. *Bromopsis* in California are presented below. A revised key distinguishing all 34 native and introduced species of *Bromus* in California will be published in the Second Edition of the Jepson Manual (Saarela and Peterson, in prep).

TAXONOMIC TREATMENT

Bromus grandis (Shear) Hitchc., Fl. Calif. 1:175. 1912. *Bromus orcuttianus* var. *grandis* Shear, Bull. Div. Agrostol., U.S.D.A. 23:43. 1900. *Bromopsis grandis* (Shear) Holub, Folia Geobot Phytotax. 8(2):167. 1973. TYPE: U.S.A. CALIFORNIA. San Diego Co.: La Maite, 25 Jun 1883, *C.R. Orcutt 472* (HOLOTYPE: US-81613!)

Bromus porteri var. *assimilis* Burtt Davy, Univ. Calif. Publ. Bot 1:55. 1902. TYPE: U.S.A. CALIFORNIA: south side, San Jacinto Mts, 1901, *H.M. Hall 2228* (HOLOTYPE: UC-37692!; ISOTYPE: US-865453 fragm. ex UC!).

Loosely caespitose perennial. Culms 70–180 cm tall, erect, glabrous to pubescent; nodes 3–7, dark brown, retrorsely pilose below, often covered by sheaths. Leaf sheaths 3.5–12 cm long, closed for most of their length; sheaths densely pubescent, hairs up to 1 mm long; margins smooth, occasionally hyaline at apex; collars densely pilose, with hairs up to 2 mm long, auricles sometimes present; cataphylls and basal sheaths pubescent, sometimes shredding; ligules 1–3 mm long, membranous, densely pubescent to pilose adaxially, glabrous abaxially, apex obtuse, erose; blades (13–)18–38 cm long, 3–12 mm wide, flat, membranous, apically cucullate, sparsely to densely pubescent adaxially and abaxially, hairs up to 1(–3) mm long; margins glabrous, sparsely papillate or scabrous. Panicles 15–26 cm long, 6–17.5 cm wide, open; lower branches 5–26 cm long with 1–6 spikelets, flexuous, nodding and usually spreading more than 90° from the rachises, pubescent; lower inflorescence nodes with 1–4 branches. Spikelets 2.5–3.5(–4.5) cm long, 4–9-flowered, terete to conspicuously distichous at maturity with rachis visible; glumes subequal, shorter than lemmas, pubescent, margins sometimes hyaline; lower glumes 5–8.5 mm long, 3(1)-nerved, apex acute; upper glumes 7–10(–12) mm long, 3(5)-nerved, apex acute; lemmas 11–14 mm long, margins pubescent, backs glabrous to densely pubescent, marginal hairs sometimes longer; backs flattened dorsally; apex entire or minutely bifid, the teeth not greater than 0.2 mm long; awned just below apex, awns 3–6 mm long, straight; paleas 8–11 mm long, shorter than lemma, backs glabrous or slightly pubescent, margins usually pubescent; apex acute; anthers 3–5 mm long, yellowish-orange. Caryopses about 9 mm long, linear, dark brown. Chromosome number $2n = 14$.

Distribution.—Endemic to southern California; San Gabriel Mts., Santa Lucia Mts., San Bernardino Mts., San Antonio Mts., San Jacinto Mts., San Rafael Mts., and Topatopa Mts.

Habitat.—Dry areas in open pine woods, hillsides, and rocky slopes; elevation 1200–8000 ft.

Bromus hallii (Hitchc.) Saarela & P.M. Peterson, comb. nov. *Bromus orcuttianus* var. *hallii* Hitchc., Fl. Calif. 1:175. 1912. TYPE: U.S.A. CALIFORNIA: west side, San Jacinto Mts, 27 Jun 1901, *H.M. Hall 2301* (HOLOTYPE: US-412894!).

Loosely caespitose perennial. Culms 90–150 cm tall, erect, puberulent or occasionally glabrous; nodes 1–2(–3), dark brown, retrorsely pilose to densely pubescent below. Leaf sheaths 6–12.5 cm long, 1/4–3/4 as long as internodes, closed for most of their length, densely pubescent, hairs 0.3–1 mm long; margins smooth, occasionally hyaline at apex; collars densely pilose, with hairs up to 2 mm long, auricles absent; cataphylls and basal sheaths densely pilose, sometimes shredding; ligules 0.5–2.5 mm long, membranous, sparsely to densely pubescent adaxially, glabrous abaxially, apex obtuse, erose; blades 7.5–16.5 cm long, 3–12 mm wide, flat, membranous, apically cucullate, densely pubescent abaxially and adaxially, hairs 0.2–0.5 mm long, occasionally longer hairs up to 1.2 mm on margins near base; margins scabrous or smooth. Panicles 5–16 cm long, 2–11 cm wide, open to densely branched; branches erect, ascending and appressed to spreading not more than 90° from the rachises, pubescent; lower inflorescence nodes with 1–2 branches, lower branches 3.5–11 cm long with 1–2(–3) spikelets, upper spikelets occasionally sessile and spike-like. Spikelets 2.5–3.5(–4.5) cm long, 3–7-flowered, terete to conspicuously distichous at maturity with rachis visible, lowest rhachilla 2.5–4 mm long; glumes subequal, shorter than lemmas; sparsely to densely pubescent, margins sometimes hyaline; lower glumes 5–8(–9) mm long, 1(3)-nerved, apex acute; upper glumes (7–)8–9 mm long, 3-nerved, apex acute, acuminate, or mucronate, the mucro less than 1 mm long; lemmas 10–14 mm long, 5- to 7-nerved, sparsely to densely pubescent across back, marginal hairs sometimes longer, up to 0.5 mm long, backs flattened dorsally to slightly keeled; apex entire or minutely bifid, the teeth not greater than 0.2 mm; awned just below the apex, awns 3.5–7 mm long, straight; paleas 9–13 mm long, shorter than the lemmas, backs glabrous or slightly pubescent, margins usually pubescent; apex acute; anthers 3–6 mm long, yellowish-orange. Caryopses 9–11 mm long, linear, amber to dark brown. Chromosome number unknown.

Distribution.—Endemic to southern California; known only from Fresno, Kern, Los Angeles, Monterey, Santa Barbara, San Bernardino, and Tulare counties.

Habitat.—Dry, open or shady areas on hillsides, rocky slopes, and pine woods in the mountains; elevation 5200–8800 ft.

Bromus brachyphyllus Merr., Rhodora 4:146. 1902. TYPE: U.S.A. OREGON: Crook Co.: Black Butte, open dry pine forests, 19 Jul 1901, *Cusick 2677* (HOLOTYPE: unknown; ISOTYPE: US!).

Loosely caespitose perennial. Culms 90–150 cm tall, erect, glabrous to pubescent; nodes 2–4, dark brown, retrorsely pilose to densely pubescent below. Leaf sheaths 3.5–11 cm long, usually 1/3–2/3 as long as internodes, closed for most of their length; lower sheaths sparingly to densely pilose, hairs 2–4 mm long, occasionally glabrous; upper sheaths pubescent, hairs up to 1 mm long; margins smooth, occasionally hyaline at apex; collars pilose with hairs up to 4 mm long or glabrous, auricles absent; cataphylls and basal sheaths glabrous, sometimes shredding; ligules 1–3 mm long, membranous, glabrous, occasionally pilose adaxially, apex obtuse, erose; blades 7–24 cm long, 3–12 mm wide, flat, membranous, apically cucullate, glabrous, edges sometimes pilose with hairs up to 2 mm or pubescent on lower 15–25%; margins scabrous or smooth. Panicles 7–13.5 cm long, 2–10 cm wide, open to densely branched; branches erect, ascending and appressed to spreading not more than 90° from the rachises, pubescent; lower inflorescence nodes with 1–2(–3), lower branches 3–7.5 cm long with 1–5 spikelets, upper spikelets occasionally sessile and spike-like. Spikelets 2–3.7 cm long, 3–9-flowered, terete to conspicuously distichous at maturity with rachis visible; glumes subequal, shorter than lemmas, glabrous, occasionally scabrous on veins or pubescent, margins sometimes hyaline; lower glumes 5–9 mm long, 1(3)-nerved, apex acute; upper glumes 7–11 mm long, 3-nerved, apex acute or mucronate, the mucro up to 1 mm long; lemmas 9–15 mm long, glabrous, scabrous, or sparsely to densely pubescent, marginal hairs sometimes longer, the hairs up to 0.5 mm long; backs flattened dorsally to slightly keeled; apex entire or minutely bifid, the teeth not greater than 0.2 mm, awned just below the apex, awns (4–)5.5–8 mm long, straight; paleas 8–11 mm long, shorter than lemmas, backs glabrous or slightly pubescent, margins usually pubescent; apex acute; anthers 3–5 mm long, yellowish-orange. Caryopses 6–9 mm long, linear, brown to purple-black. Chromosome number $2n = 14$.

Distribution.— Known from California, Nevada, Oregon, Washington, Arizona, and Utah.

Habitat.—Dry areas in open pine woods, on hillsides and rocky slopes, and in meadows in the mountains; elevation 1850–11500 ft.

Specimens examined. **U.S.A. ARIZONA: Cochise Co.:** Huachuca Mts, Sept 1883, *Lemmon s.n.* (US). **CALIFORNIA: Alpine Co.:** N side of Pigeon Flat, 22 Jul 1940, *Hoover 4423* (K). **Amador Co.:** Pioneer, 3500 ft, 13 Jul 1896, *Hansen 1835* (K, US); Jackson, 7 Sep 1937, *Johannsen 1247* (UC/JEPS). **Butte Co.:** Butte Meadows, 4600 ft, 26 Jul 1917, *Heller 12819* (CAS, OSU, US); Butte Creek, 5000 ft, 21 Jul 1930, *Copeland 1348* (CAS); Jackson Ranch Ridge, along Road 21N25Y ca 0.6 mi E of the W end of the ridge, 3750 ft, 27 Jul 1995, *Janeway 4877* (CAS); W side of Hwy. 32 ca. 1/4 mi N of Forest Ranch, 2357 ft, 18 Jul 1978, *Taylor 1674* (CAS); along Big Bar Mountain Road, about 3 mi SW of Coyote Gap, SE of Pulga, 8 Jul 1987, *Ahart 5796* (CAS). **Calaveras Co.:** near Dorrington, 26 Jun 1978, *Howell, Menzies, & Shockey 53063* (CAS); Dorrington, 1976, *Menzies s.n* (CAS). **Colusa Co.:** Trout Creek, SE Snow Mt, 30 Jul 1981, *Heckard & Hickman 5763* (UC/JEPS). **El Dorado Co.:** along US hwy 50, 3 mi E of Camino, 3400 ft, 15 Jul 1945, *Robbins 2062* (US): Chute Champ Road, 3000 ft, 15 Jun 1937, *White 1078* (US); Fallen Leaf Lake, 27 Jul 1928, *Abrams 12630* (CAS); Fallen Leaf Lake, 9 Jul 1928, *Abrams 12627* (CAS); Glen Alpine region, Camp Agassiz, 21 Jul–15 Aug 1906, *Eastwood 998* (CAS); Echo Summit, 1 Sep 1946, *Howell 22986* (CAS); 0.5 mi W of Omo Ranch Post Office, 22 Jun 1956, *Crampton 3596* (CAS). **Fresno Co.:** Pine Ridge, 5300 ft, 15–25 Jun 1900, *Hall & Chandler 316* (UC/JEPS, US); Huntington Lake, 22 Jul 1927, *Swallen 810* (US); Bearskin Meadow, 2 Jul 1899, *Eastwood s.n.* (US); Granite Basin, 10 July 1927, *Swallen 743* (US); above Deer Creek, N shore of Huntington Lake, 7100 ft, 8 Aug 1951, *Quibell 486* (CAS); Dinkey Creek, Jul 1901, *Dudley s.n.* (CAS); Huntington Lake and vicinity, near ranger station, 7000 ft, 3 Aug 1951, *Pollard s.n.* (CAS); John Muir Trail N of Bear Creek, 9400 ft, 5 Aug 1954, *Raven 7789* (CAS); Mono Creek, 8200 ft, 9 Aug 1953, *Raven 6142* (CAS); Tehipite Valley, Middle Fork of the Kings River, 4650 ft, 26 Jul 1958, *Howell 33958* (CAS); drainage of Deer Creek, above Lakeshore Post

Office, Huntington Lake, 23 Aug 1958, *Bacigalupi & Quibell 6717* (UC/JEPS); E slope of Converse Mt, drainage of Indian Creek, along Kings Canyon Road, 23 Jul 1958, *Bacigalupi & Alava 6498* (UC/JEPS); Huckleberry Creek, Huntington Lake, 28 Jul 1928, *Jepson 13330* (UC/JEPS). **Glenn Co.:** Plaskett Meadows, 6000 ft, 4 Aug 1943, *Howell 19020* (CAS, US); road 168, a few miles E of Shaver Lake, 2100 m, 6 Sep 1994, *Cayouette & Darbyshire C7958* (DAO); Mendocino National Forest, 5500 ft, 21 Jul 1956, *Burcham 368* (K); near Fish Pond Plaskett Meadows, 5 Aug 1943, *Baker 10583* (CAS). **Humboldt Co.:** Orleans Mt., 2 Sep 1946, *Pollard s.n.* (CAS); Trinity Summit, on ridge 2 mi E of Grove's Prairie, 15 Aug 1948, *Tracy 18125* (UC/JEPS); Grouse Mt, 27 Jun 1934, *Clarks & Tracy 11079* (UC/JEPS). **Lake Co.:** N of Hoberg's, 14 Jul 1944, *Hoffman 1967* (UC/JEPS, US); foothills S of Mt. Sanhedrin, midway between Potter Valley and Hullville, 25 Jul 1902, *Heller 5987* (US); S base of Mt. Sanhedrin, 25 Jul 1902, *Heller & Brown 5987* (US), Bartlett Mtn, 23 Jun 1948, *Wagnon 1509* (K); 15 mi N of Lakeview, 6 Jul 1927, *Peck 15517* (CAS); summit of Bartlett Mt, 11 Jul 1939, *Stebbins 2971* (UC/JEPS); NW of Timber Lake, Snow Mt, 16 Jun 1979, *Heckard & Hickman 5086a* (UC/JEPS) **Lassen Co.:** 5 mi S of Susanville, 27 Jul 1927, *Swallen 872* (US); Black's Mt, 10 Jul 1934, *Howell 12554* (CAS); Elysian Valley, W of Janesville, 28 Jun 1973, *Howell, True & Williams 49472* (CAS); Gold Run Creek road S of Susanville, Diamond Range, 1 Aug 1973, *Howell & True 50180* (CAS), Gold Run Creek SW of Susanville, 19 Jul 1976, *Howell 51973* (CAS); on road from Janesville to Thompson Peak, Diamond Range, 31 Jul 1973, *Howell & True 50029* (CAS). **Madera Co.:** 9 mi above Bass Lake on Beasore Meadow Road, 18 Jul 1933, *Springer 505* (OSU); Bass Lake Fish Hatchery, 1 Sep 1951, *Holt s.n.* (CAS). **Mariposa Co.:** 11 Aug 1895, *Congdon s.n.* (US); Signal Peak, Chowchilla Mt., 25–31 Jul 1938, *Quick 2003* (CAS); road 41, Sierra Ntl Forest, 5 miles of Yosemite Ntl Park, 1914 m, 8 Sep 1994, *Cayouette & Darbyshire C7964* (DAO); Yosemite to Wawona, 28 Jun 1911, *Jepson 4295* (UC/JEPS). **Mendocino Co.:** along roadside enroute to summit of Mt. Sanhedrin from Towhead Flat, 7 Jul 1981, *Knight & Knight 4295* (CAS). **Modoc Co.:** Forestdale, 4500 ft, 25 Aug 1894, *Baker & Nutting s.n.* (US); 13 July, *Baker & Nutting s.n.* (US). **Nevada Co.:** Truckee, 14–16 Jul 1913, *Hitchcock 10516* (K, US, W); Banner Mt, 4 mi E of Nevada City, 15 Sep 1961, *True 261* (CAS); Hwy 20, ca. 2.5 mi E of Washington Jct., 5000 ft, 10 Jul 1968, *True 4341* (CAS); Omega Rd, between Omega Diggings and Diamond Creek 14 mi NE of Skillman Flat on Hwy 20, 15 Jul 1965, *True & Howell 2359* (CAS); Mayflower Mine, 5 Jun 1966, *Mott s.n.* (CAS); Banner Mt, ca. 4 mi E of Nevada City, 15 Jul 1965, *True & Howell 2319A* (CAS); on road to Pierce Meadows, short distance from the S Fork of the Yuba River, Tahoe National Forest, 30 Jun 1931, *Smith 2575* (UC/JEPS). **Placer Co.:** Tahoe, 5 Aug 1908, 6225–7000 ft, *Hitchcock 3091* (US); railroad crossing at Blue Canyon, 17 Jul 1956, *Crampton 3723* (CAS); about 2 mi SW of French Meadows on the road to Big Meadow, 2 Aug 1981, *Best s.n.* (CAS); 1 mi from Blue Canyon on road to Emigrant Gap, 4 Aug 1956, *Raven 9999* (CAS); Truckee, 8 Aug 1936, *Yates 5981* (UC/JEPS); Eldorado Canyon, above Bullion Mine, Tahoe National Forest, 4 Jun 1926, *Smith 1883* (CAS, UC/JEPS); Antone Meadow, 7 Sep 1967, *Hoover 10858* (UC/JEPS). **Plumas Co.:** between Blairsden and Gold Lake, 5500 ft, 5 Jul 1938, *Wood 7* (US); Truckee River, July 1888, *Sonne 21* (US, CAS); Butterfly Botanical Area, confluence of Spanish Creek and Butterfly Creek, 2900 ft, 11 Jun 1968, *Howell, Knight, Knight, & True 2352* (CAS); Fern Glen, 26 Jul 1966, *Knight, Knight & Howell 1576* (CAS); Drakesbad, 5500–6000 ft, 17 Jul 1960, *Howell 35494* (CAS); Drakesbad, 5500–6000 ft, 20 Aug 1960, *Howell 36274* (CAS); Gold Lake Road above Blairsden, 5500 ft, 25 Jun 1934, *Ewan 8227* (CAS); Johnsville, 5200 ft, 28 Jun 1951, *Howell 27656* (CAS), Lassen Volcanic National Park, trail to Little Willow Lake, 21 Jul 1960, *Howell 35860* (CAS); near Prattville, Lake Almanor, 14–26 Aug 1944, *Kearney 7* (CAS); near the summit of Soapstone ridge 12 mi W of Bucks, 5500 ft, 7 Jul 1915, *Heller 12053* (CAS, OSU); Quincy, 31 Jul 1942, *Quick 42-46* (CAS); Willow Lake Meadow near the east inlet, 5450 ft, 17 Jul 1957, *Gillett 805* (CAS, UC/JEPS), 3 mi W of Keddir, Butterfly Valley, 3600 ft, 10 Jul 1967, *Rose 67152* (W); near Prattville, 20 Jul 1926, *Howell 2088* (CAS), Round Valley, 9 Jul 1973, *Howell 49722* (CAS); 2 mi NW of Spring Garden, 22 Jul 1975, *Howell 51363* (CAS); Butterfly Valley, 3 mi. W of Keddie, 27 Jul 1966, *Rose 66060* (CAS); about 0.5 mi N of Humboldt Summit, 23 Jul 2001, *Ahart & Oswald 8998* (UC/JEPS). **San Diego Co.:** Cleveland National Forest, E of San Diego, near Cuyamaca Lake, 1700 m, 29, 30 Jul 1915, *Hitchcock 13168* (K, UC/JEPS, US, W); Cuyamaca Mts, 30 Jun 1903, *Abrams 3945* (OSU). **Shasta Co.:** Goose

Valley, 29 Jun–11 Jul 1912, *Eastwood 930*, 985 (CAS, US); 4 Jul 1914, *Smith 735* (CAS); 0.25 mi above Manzanita Creek on Chaos Crags trail, 11 Jul 1957, *Gillett 705* (UC/JEPS, CAS); Goose Valley, 29 Jun, 11 Jul 1912, Eastwood 930 (CAS); Redding, 5 Jun 1934, *Kraebel 25* (UC/JEPS); Logan Mt, 13 mi N of Lassen Peak, Lassen National Forest, 12 Jul 1934, *Whitney 2163* (UC/JEPS); Little Hatchet Creek, 4 Jul 1940, *Jepson 20131* (UC/JEPS). **Sierra Co.:** near summit of Yuba Pass, 6350 ft, 17 Aug 1944, *Beetle 3041* (US); Tahoe Forest, 10 Sep 1925, *Smith 1727* (CAS); Tahoe Forest, 10 Jun 1926, *Smith 1906* (CAS); Tahoe forest, 19 Jul 1926, *Smith 1994* (CAS); Tahoe Forest, 4 Jul 1926, *Smith 1883* (CAS); Independence Lake watershed, W of Independence Lake, 7200 ft, 26 Jul 1977, *True 8380* (CAS); 2 mi E of Bassett station, North Fork of Yuba River, 4 Aug 1934, *Jepson 16850* (UC/JEPS). **Siskiyou Co.:** base of Mt. Eddy, 18 Jul 1915, *Heller 12124* (CAS, OSU, US); S Fork of Shasta River, Mount Eddy, Shasta Forest, 1850–2000 m, 11, 12 Aug 1915, *Eggleston 11635* (US); Sisson, 30 Jul 1894, *Howe 122* (US); near Shasta Springs, 13 Jun 1905, *Heller 8026* (CAS, US); between upper reaches of China and Blind Horse Creeks, S side of South Fork of Salmon River, 24 Jul 1955, *Wiggins 13497* (CAS, UC/JEPS); toward Black Fox, 15 Aug 1899, *Dudley s.n.* (CAS); Trinity Mts, about 6 mi SE of Cecilville, W side of Rush Creek, 21 Jul 1954, *Thomas & Thomas 4432* (CAS); on Everitt Memorial Hwy, 4.7 mi N of McCloud River railroad crossing, 13 Jul 1963, *Frenkel 229* (CAS); English Lake, Salmon Mts, 16 Aug 1969, *Oettinger 1392* (UC/JEPS); below Pine Lake Basin, Salmon Mts, 6 Aug 1969, *Oettinger & Thorne 1246* (UC/JEPS); Humbug Creek, 20 Jul 1908, *Butler 469* (UC/JEPS). **Tehama Co.:** Deer Creek Canon, 17 Jul 1911, *Eggleston 7284* (US); 5.1 mi from Whitlock Camp, 12 Jul 1953, *Baker & Wagnon 12861* (UC/JEPS); E side of Willow Creek, about 1.25 mi N of Jonesville, 24 Jul 1994, *Ahart 7513* (UC/JEPS). **Trinity Co.:** Grasshopper Public Camp, 2.5 mi NW of Stuart Gap, North Yolla Bolly Mts, 17 Jul 1951, *Munz 16575* (CAS); North Fork of Trinity River, Hobo Gulch Camp vicinity, 18 mi NW of Weaverville, along backbone Creek Trail near Keystone, 15 Jun 1972, *Carter 435* (CAS). **Tulare Co.:** S Fork of Kaweah River, 20 Jul 1904, *Culbertson 4512* (US); above Mineral King, 30 Jul 1927, *Swallen 883* (US); Sequoia National Park, 18 Jul 1927, *Swallen 882* (US); Grant Park, 4000–8000 ft, 11 Aug 1895, *Dudley 1205* (CAS), Hollow Log Camp, Jul 1900, *Dudley s.n.* (CAS); middle Kaweah River, 2 Aug 1900, *Dudley 3031* (CAS); Mineral King road, 6000 ft, 15 Jul 1951, *Howell 27780* (CAS); Sequoia National Park, 12 Aug 1896, *Dudley 1625*, Sequoia Forest. Freeman Creek, 2 Aug 1916, 7500 ft, *Cunningham 3* (CAS); Sequoia National Forest, 11500 ft, 23 Jul 1912, *Hopping 22* (CAS); Kaweah River, 20 Jul 1904, *without collector* (US); Sequoia National Park, road to Crystal Cave, near start of Black Oak trail, 21 Jul 1948, *Bailey & Bailey 2446* (UC/JEPS); Lloyd Meadow, near trail to Quaking Aspen on the Springville Road, 24 Jul 1964, *Smith 1316* (UC/JEPS). **Tuolumne Co.:** Yosemite National Park, Echo Creek Canyon, 17–25 Aug 1908, *Hitchcock 3352*, *3355* (US), Yosemite National Park, Tenaya Trail, 6500 ft, 21–22 Jul 1915, *Hitchcock 13136* (US); Yosemite to Wawona, 28 Jun 1911, *Jepson 4295* (US); Yosemite Valley, 4060 ft, 5 Jul 1909, *Jepson 3125* (US), Yosemite National Park, 1 Jul 1938, *Silveus 2873* (CAS); Yosemite National Park, Glacier Point, 11 Aug 1915, *Abrams 5428* (CAS); Yosemite Valley, Sierra Nevada Mts, 5000–8000 ft, 4–12 Jul 1901, *Parish 4360* (CAS); Yosemite, Jul 1902, *Bacon s.n.* (CAS); along Hwy 108, between Twain Harte and Confidence, 10 Jul 1972, 4000 ft, *Wiggins 21785* (CAS); along South Fork road, 2.6 mi E of Twain Harte, 4000 ft, 11 Jul 1971, *Wiggins 21679* (CAS); Dodge Ridge SE of Pinecrest, 21 Jul 1953, *Quick 53-42* (CAS); Herring Creek, 4 mi from Strawberry, 17 Jul 1936, *Wiggins 8543* (CAS); Mather, in the Sierra Nevada in the lower borders of the Transition Zone, 1400 m, 6 Jun 1931, *Keck 1252* (CAS); near Cow Creek Research Station, 5750 ft, 11 Jul 1941, *Quick 41-69* (CAS); Twain Horte, 3700 ft, 6 Jun 1954, *Howell 29944* (CAS); Long Barn, 16 Jul 1941, *Hoover 5470* (K). **Yuba Co.:** about 2 mi NE of Dobbins on Oregon Hill road, 22 Jun 1981, *Howell, Fuller & Barbe 54081* (CAS); about 200 yards S of the 4-H Camp, on W side of Oregon Hill Road, about 0.5 mi N of Marysville Road, about 2 mi NE of Dobbins, 2 Jul 2003, *Ahart 10340* (UC/JEPS). **NEVADA: Washoe Co.:** Incline, 1 Aug 1928, *Smith s.n.* (CAS). **OREGON:** Gayhart Buttes, 1850 m, 8 Aug 1896, *Leiberg 2887* (OSU); East Eagle Creek, 5500 ft, 10 Aug 1909, *Cusick 3369*, *3370* (OSU). **Crook Co.:** base of Black Butte, 19 Jul 1901, *Cusick 2677* (UC/JEPS, US). **Douglas Co.:** along Golden Stairs Trail, E fork of Abbott Creek, ca. 20 mi W of Crater Lake, near Abbott Butte, 19 Jul 1972, *Mitchell 241* (OSU). **Grant Co.:** Strawberry Lake, Strawberry Mts, 17 Jul 1910, *Cusick 3525* (OSU, US).

Jackson Co.: Klamath Forest, 4800 ft, 19 Jul 1934, *Wheeler 2931* (CAS, UC/JEPS, US); Ashland Butte, Siskiyou Mountains, 20 Jul 1887, *Howell 253, 369* (OSU, UC/JEPS, US, W, WTU); summit of Cascades, 10 Jul 1931, *Peck 16747* (OSU); Carberry Creek, 3 mi from mouth of Applegate River, 25 Jun 1931, *Peck 16386* (OSU). **Jefferson Co.:** Suttle Lake, 18 Jul 1925, *Peck 14421* (CAS, K, OSU); Abbot Butte Spring Road, 15 September 1959, *Swedberg 100* (OSU); NW of Sisters, 23 July 1960, *Johnson 543* (OSU); NW of Sisters, 27 Aug 1960, *Johnson 611* (CAS, OSU); near Hwy. 20, W of Black Butte, 20 Jul 1962, *West s.n.* (OSU); Siskiyou, 21 Jul 1908, *Hitchcock 2879, 2909, 2916* (US). **Klamath Co.:** Klamath Valley at Keno, 27 Jun 1902, *Cusick 2838* (CAS, OSU, UC/JEPS, US, W), Pelican Bay, W side of Upper Klamath, 16 Jul 1920, *Peck 9516* (CAS, WTU); Fort Klamath, 29 Jul 1908, *Hitchcock 3012* (US). **Lake Co.:** 15 mi N of Lakeview, 6 Jul 1927, *Peck 15517* (OSU). **Wallowa Co.:** Imnoha River, Wallowa Mountains, 10 Aug 1909, *Cusick 3310* (OSU, WTU). **Washington Co.:** Dixie Mountain, 15 Jul 1910, Cusick 3518 (US). **UTAH:** 1876, *McLean s.n.* (US). **WASHINGTON: Yackima Co.:** Klickitat River, near Mt. Paddo, 12 Jun 1885, *Suksdorf s.n.* (CAS, K, US); Mt. Paddo, 21 Aug 1905, *Suksdorf 5265* (US); Mt Paddo, 27 Aug 1884, *Suksdorf 120* (US). **Klickitat Co.:** Falcon Valley, 13 Jul 1924, *Suksdorf 11754* (CAS, K, OSU, UBC, UC/JEPS, US, WTU); 6 Jun 1891, *Suksdorf 826* (UC/JEPS).

KEY TO THE SECTIONS OF *BROMUS* IN CALIFORNIA

1\. Spikelets laterally compressed; lemmas compressed and keeled ______ sect. **Ceratochloa** (P. Beauv.) Griseb.
1\. Spikelets not laterally compressed; lemmas not keeled.
  2. Lemma apex bidentate, teeth 3–7 mm, awn-like to acuminate.
    3. Awn of the lemma geniculate and/or twisted ______ sect. **Neobromus** (Shear) Hitchc.
    3. Awn of the lemma straight, not twisted ______ sect. **Genea** Dumort.
  2. Lemma apex entire or bidentate, teeth 0–3 mm, not awn-like or acuminate.
    4. Plants perennial, with or without rhizomes, the bases fibrous; lower glume 1- or 3-nerved; upper glume 3- or 5-nerved ______ sect. **Bromopsis**
    4. Plants annual; lower glume 3- or 5-nerved; upper glume 5- or 7-nerved ______ sect. **Bromus** L.

KEY TO *BROMUS* SECTION *BROMOPSIS* IN CALIFORNIA

1\. Plants with rhizomes; awns absent or up to 3 mm long ______ **B. inermis**
1\. Plants without rhizomes; awns present, 1.5–11 mm long.
  2. Most lower glumes on a plant 3-veined.
    3. Upper glumes 5-veined.
      4. Ligule 0.4–1 mm long; glumes scabrous or pubescent; upper glume 6–9 mm long; blades and sheaths pubescent or glabrous ______ **B. pseudolaevipes**
      4. Ligule (1.5–)2–4 mm long; glumes glabrous; upper glumes 7–11mm long; blades and sheaths glabrous ______ **B. laevipes**
    3. Upper glumes 3-veined.
      5. Lemma awns 1.5–3(–4) mm long; blades 2–5 mm wide; anthers 1.5–3.5 (–4) long ______ **B. porteri**
      5. Lemma awns 3–9 mm long; blades 3–12 mm wide; anthers 3.5–5 mm long.
        6. Blades glabrous; lower sheaths pilose, hairs 2–4 mm long; nodes 2–4; inflorescence branches mostly ascending to spreading ≤ 90° from the rachises ______ **B. orcuttianus**
        6. Blades pubescent; lower sheaths pubescent, hairs up to 1(–3) mm long; nodes 3–7; inflorescence branches mostly spreading >90° from the rachises ______ **B. grandis**
  2. Most lower glumes on a plant 1-veined.
    7. Glumes pubescent.

8. Panicles narrow at anthesis, ≤ 2 cm wide; branches erect or tightly ascending; blades and sheaths glabrous **B. suksdorfii**

8. Panicles broad at anthesis, > 2 cm wide; branches erect, ascending, or nodding, usually spreading or divaricate; blades and sheaths pubescent or glabrous.

9. Ligules (2–)3–6(–7) mm long; lemma awns (4–)6–11 mm long; branches of inflorescence glabrous or scabrous **B. vulgaris**

9. Ligules 0.5–3 mm long; lemma awns 3–7(–9) mm long; branches of inflorescence pubescent.

10. Lower sheaths pilose with hairs 2–4 mm long, or glabrous; blades glabrous **B. orcuttianus**

10. Lower sheaths densely pubescent with hairs up to 1 mm long; blades densely pubescent.

11. Longest blades 7.5–16.5 cm long; 1–2(–3) nodes per culm **B. hallii**

11. Longest blades (13–)18–38 cm long; 3–6(–7) nodes per culm **B. grandis**

7. Glumes glabrous.

12. Panicles narrow at anthesis, ≤ 2 cm wide; branches erect or tightly ascending **B. suksdorfii**

12. Panicles broader at anthesis, > 2 cm wide; branches erect, ascending, or nodding, usually spreading or divaricate.

13. Ligules (2–)3–6(–7) mm long; awns (4–)6–11 mm long **B. vulgaris**

13. Ligules 0.5–3 mm long; awns 4–7(–9) mm long.

14. Lemmas not densely pubescent along margins; lemma awns (4–) 5–7(–9) mm long; inflorescence branches mostly ascending to spreading ≤ 90° from the rachises **B. orcuttianus**

14. Lemmas densely pubescent along margins; lemma awns (2–) 3–5(–6) mm long; inflorescence branches spreading to drooping >90° from the rachises.

15. Lemmas glabrous on lower back between pubescent margins; anthers (0.9–)1–1.4(–1.6) mm; second glumes (6.2–) 7.1–8.5(–9.5) mm long; basal sheaths glabrous or with long hairs; top culm blades with hairs on upper surface; top culm nodes usually hairy; caryopses (5.4–)6.2–7.2(–7.5) mm; top culm sheath usually pubescent **B. ciliatus**

15. Lemmas with scattered hairs on lower back between pubescent margins; anthers (1.2–)1.6–2.7(–3.4) mm long; second glumes (7.8–)8.9–11.3(–13.2) mm long; basal sheaths with dense, short, or medium hairs; top culm blades glabrous on the upper surface; top culm nodes usually glabrous; caryopses (6.9–)7.7–9.7(–10.5) mm long; top culm sheath glabrous **B. richardsonii**

ACKNOWLEDGMENTS

We thank Dieter Wilken, an anonymous reviewer, and Barney Lipscomb for constructive comments on the manuscript; the curators of the cited herbaria for the loan of specimens or assistance during visits; Cindy Sayre (UBC) for assistance in the herbarium; and Nicole Fillion (Ottawa) for assistance with the chromosome count. J.M.S. was supported by a Canada Graduate Scholarship from the Natural Sciences and Engineering Research Council of Canada, the University of British Columbia, and a travel grant from the Lawrence R. Heckard Fund of the Jepson Herbarium to visit the U.S. National Herbarium.

BOOK REVIEW

VIRGINIA D. NAZAREA. 2005. **Heirloom Seeds and Their Keepers: Marginality and Memory in the Conservation of Biological Diversity.** (ISBN 0-8165-2435-1, hbk.). The University of Arizona Press, 355 S. Euclid, Ste. 103, Tucson, AZ 85719, U.S.A. (**Orders:** 520-621-1441, fax 520-621-8899, www.uapress.arizona.edu). $35.00 pbk., $29.95 hbk., 190 pp., 31 b/w, author notes, glossary, index, 6" × 9."

The term "seed savers" refers to those persons who grow traditional, heirloom, or handed-down varieties of fruits, grains or vegetables in personal, family or community gardens. In her book, *Heirloom Seeds and Their Keepers*, author Virginia Nazarea presents an analytical approach concerning of the role of seed savers in the preservation and conservation of plant genetic diversity and cultural practices. Such analyses of this mechanism of biodiversity conservation are very timely given increasing concern over the loss of both crop diversity and tradition agricultural practices. Nazarea uses both metaphors and personal histories collected during research to relate the importance of the seed savers, which in continuing to grow heirloom varieties are preserving cultural heritage, family/locality memories, as well as different plant varieties for potential future use. Alternative species of food crops, such as heirloom varieties, help protect farmers and gardeners from complete loss of specific crops as a result of damage or disease, and are important resources for the future of farming.

The author includes short personal stories of persons met through a variety of different research interviews. These stories put a real face on those persons who participate in seed saving. Often, these seed savers are not intentionally saving seeds as a method of retaining biodiversity, but may be subsistence farmers, collect interesting varieties from the wild, retaining seeds as part of their family history, planting seeds that have been handed down over generations, or preserving plants given to them by friends and neighbors. Often these "seed savers" cultivate plants in a way familiar to their family or region; practices that are dying out as a result of increasing development of commercial farming or highly managed agricultural sites. Other seed savers, may have immigrated to new locations, bringing with them plant species from an ancestral country with unique cultivation practices.

You may think this review glosses the surface of this book, and you are correct. I found the topic of *Heirloom Seeds and Their Keepers* to be very interesting, however it was a very challenging book for me to read. Perhaps the language used in this book is common for books written on topics in anthropology and/or sociology, perhaps others are more familiar with the descriptive phrases used to present research in this book, or maybe the author loves her thesaurus, but the need to decipher many phrases left me feeling as though I may not have gleaned all the information the author was providing. A suggestion I offer other readers is to be sure to take your time in reading this book, and keep a dictionary handy for careful consideration of terms and phrases such as "..decolonization of human consciousness and imagination..," "hermeneutic," "...enigmatic proclivities...," "..texture and serendipity of encounters." If life stories of seed savers preserving cultural memory, &/or an analysis of seed savers in protecting biodiversity interests you, read Nazarea's *Heirloom Seeds and Their Keepers* for yourself.—*Lee Luckeydoo, Herbarium, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

TAXONOMIC REVIEW OF *ASTRANTHIUM INTEGRIFOLIUM* (ASTERACEAE: ASTEREAE)

Guy L. Nesom

Botanical Research Institute of Texas
509 Pecan Street
Fort Worth, Texas 76102-4060, U.S.A.

ABSTRACT

Astranthium integrifolium (Michx.) Nutt. has been treated as comprising two taxa (var./subsp. *integrifolium* and var. *triflorum*/subsp. *ciliatum*) or simply as a single species without formal infraspecific designation. The two taxa are completely allopatric and separated by features of vegetative, floral, and cypselar morphology. Consistent with taxonomic ranking of other *Astranthium* species pairs, these two taxa are treated here at specific rank: *Astranthium integrifolium* sensu stricto and **Astranthium ciliatum** (Raf.) Nesom, comb. nov. A neotype is selected for *Bellis ciliata* var. *triflora* Raf. (= *A. ciliatum*).

RESUMEN

Astranthium integrifolium (Michx.) Nutt. se ha tratado comprendiendo dos taxa (var./subsp. *integrifolium* y var. *triflorum*/subsp. *ciliatum*) o simplemente como una sola especie sin designación formal infraespecífica. Los dos taxa son completamente alopátricos y se separan por la morfología vegetativa, floral, y de la cipsela. De acuerdo con el rango taxonómico de otros pares de especies de *Astranthium*, estos dos taxa se tratan aquí con rango específico: *Astranthium integrifolium* sensu stricto y **Astranthium ciliatum** (Raf.) Nesom, comb. nov. Se selecciona un neotipo para *Bellis ciliata* var. *triflora* Raf. (= *A. ciliatum*).

The genus *Astranthium* Nutt. includes 12 species (De Jong 1965), all but three of them restricted to Mexico. *Astranthium integrifolium* (Michx.) Nutt. occurs in northeastern Mexico, but its range is mostly in the central U.S.A. Larsen (1933) and De Jong (1965) treated eastern and western population systems of *A. integrifolium* (Fig. 1) as var. *integrifolium* and var. *ciliatum* (Raf.) Larsen, respectively, or as subsp. *integrifolium* and subsp. *triflorum* (Raf.) De Jong. Shinners (1950) added a third taxon at varietal rank, *A. integrifolium* var. *robustum* Shinners, which subsequently was raised to specific rank by De Jong (1965). Since De Jong's treatment, Texas botanists have maintained *A. robustum* (Shinners) De Jong as a Texas endemic (Fig. 1), but the taxonomy of the more broadly distributed *A. integrifolium* sensu lato has not been critically reevaluated. De Jong's geographic and morphological delimitation of the '*integrifolium* complex' has been accepted in national checklists (e.g., Kartesz 1999), but Cronquist (1980) treated both geographic segments as *A. integrifolium* without formal recognition of infraspecific taxa. Other floristic accounts have dealt

SIDA 21(4): 2015–2021. 2005

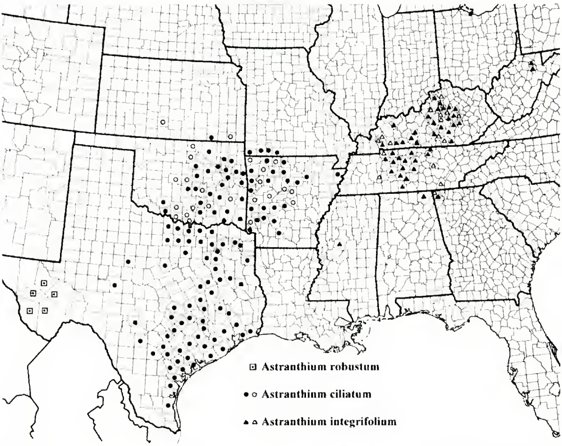

Fig. 1. Geographic distribution of *Astranthium integrifolium*, *A. ciliatum*, and *A. robustum*. Squares and solid circles and triangles are from specimens at KY, MO, SMU-BRIT, TEX-LL, and VDB. Open symbols are from published sources (De Jong 1965; Chester et al. 1997; Great Plains Flora Association 1977; Smith 1988; USDA, NRCS 2001). Populations of *A. ciliatum* also occur in Mexico (Nuevo León and Tamaulipas).

with only one or the other of the two taxa. Accounts for Oklahoma and Arkansas (e.g., Taylor & Taylor 1994; Smith 1994) also have referred to *A. integrifolium* without finer taxonomic distinction, while those for Texas and the Great Plains have recognized infraspecific variants (e.g., Correll & Johnston 1970; Barkley 1986; Diggs et al. 1999).

A reevaluation of *Astranthium integrifolium* sensu lato indicates that the two previously recognized geographic segments are allopatric and distinguished by vegetative, floral, and cypselar features. Consistent with taxonomic ranks of other *Astranthium* species (see comments below), the two taxa are treated here at specific rank.

TAXONOMY

1. Astranthium ciliatum (Raf.) Nesom, comb. nov. *Bellis ciliata* Raf., New Fl. N. Amer. 2:24. 1837. *Astranthium integrifolium* (Michx.) Nutt. var. *ciliatum* (Raf.) Larsen, Ann. Missouri Bot. Gard. 20:35. 1933. *Astranthium integrifolium* (Michx.) Nutt. subsp. *ciliatum* (Raf.) De Jong, Michigan State Univ. Mus. Publ. Biol. Ser. 2:504. 1965. Lectotype (De Jong 1965): USA.

TEXAS. AUSTIN CO.: San Felipe de Austin, 1835, *T. Drummond II. 221* (NY website photo!, as "*Bellis integrifolia* Michx."; ISOLECTOTYPES: K, NY, P, PH).

Bellis ciliata Raf. var. *triflora* Raf., New Fl. N. Amer. 2:25. 1837. *Astranthium integrifolium* (Michx.) Nutt. var. *triflorum* (Raf.) Shinners, Sida 2:348. 1966. NEOTYPE (selected here): USA. TEXAS. Fannin Co., 4 mi N of Bonham, sandy ditch bank, 10 Jun 1945, *L.H. Shinners 7842* (SMU!).

Rafinesque noted that "it [presumably '*Bellis ciliata*'] has also a var. *triflora*, with leaves all acutish and only 3 [ray] flowers. The folioles of the perianthe are lanceolate acuminate in all the sp. not linear as Hooker says, the seeds are obovate pubescent." Because Rafinesque noted that his new species, *Bellis ciliata*, occurs "in Texas and probably extending to Louisiana and Arkansas," it seems reasonable to infer that *Bellis ciliata* var. *triflora* also was based on a Texas collection, perhaps from Drummond, whose collections provided the basis for the description of *B. ciliata*. De Jong (1965) also made this inference in noting that the type locality of var. *triflora* was "Texas." Rafinesque, however, provided no indication of the type, and no type material of var. *triflora* has been found or cited in previous literature.

Small capitula with relatively few and small ray florets are commonly produced late in the season in *Astranthium integrifolium* and *A. ciliatum*, but I have seen no plants with fewer than six florets. Plants of the neotype were described as producing 6–8 ray florets. It seems likely that the capitulum observed and described by Rafinesque had lost several ray florets during collecting, mounting, or handling.

Astranthium integrifolium (Michx.) Nutt. var. *rosulatum* Larsen, Ann. Missouri Bot. Gard. 20:36. 1933. TYPE: UNITED STATES. TEXAS. Matagorda Co.: Matagorda, sandy prairies, 5 Mar 1914, *E.J. Palmer 4855* (HOLOTYPE: MO!). Shinners (1950) accurately noted that the presence of rosulate clusters of leaves reflects early growth stages of a single plant.

2. Astranthium integrifolium (Michx.) Nutt., Trans. Amer. Philos. Soc., ser. 2, 7:312. 1841. *Bellis integrifolia* Michx., Fl. Bor. Amer. 2:131. 1803. TYPE: UNITED STATES. [TENNESSEE] "Cumberland," *A. Michaux s.n.* (HOLOTYPE: P, fide De Jong 1965). De Jong (pp. 434–435) inferred from historical accounts that Michaux probably made the collection in June 1795 in the vicinity of Nashville. Michaux himself (1803) noted that the species occurred "ad ripas rivulorum et in collibus umbrosis Tennassée." "Cumberland" is the only geographic reference on the holotype.

Distinctions between *Astranthium integrifolium* and *A. ciliatum* are in the following contrasts.

Plants fibrous-rooted; basal and lower cauline leaves 3–6 cm long × 7–22 mm wide; involucres 3.5–6 mm high; ray corollas (6–)8–17 mm long; cypselae (1.4–)1.6–2 (–2.2) mm long × 0.9–1.1 mm wide, surface minutely papillate-pebbly with linear striations barely discernible, glabrous or sometimes sparsely glochidiate-pubescent near the apex, or (in northern Kentucky and West Virginia) glochidiate-pubescent over the whole surface ______ **Astranthium integrifolium**

Plants slender-taprooted, rarely fibrous-rooted; basal and lower cauline leaves 1.5–4 (–5) cm long × 3–11(–14) mm wide; involucres (2–)2.5–4.5 mm high; ray corollas (4–)6–10(–12) mm long; cypselae 1–1.6 mm long × 0.6–0.8 mm wide, surface with minute longitudinal striae but otherwise nearly smooth, not papillate-pebbly, sparsely to densely glochidiate-pubescent from base to apex ______ **Astranthium ciliatum**

The morphological distinction of *Astranthium integrifolium* and *A. ciliatum* corresponds with their geography, as mapped in Figure 1. The two are essentially completely separate in distribution: *A. ciliatum* occurs west of the Mississippi

River, *A. integrifolium* to the east. The disjunct outlier in Holmes Co., Mississippi (*Woodson and Anderson 1555*, MO!), is typical *A. integrifolium*; the outlier in Mississippi Co., Arkansas (*Pyle 669*, TEX!), is typical *A. ciliatum*.

Astranthium integrifolium was first reported for West Virginia by Duppstadt (1992), without citation of vouchers. Details are given below. The limited, disjunct distribution and the occurrence primarily along roadsides suggest that this extended population system might be of recent origin, perhaps by accidental dispersal from Kentucky, but the habitats appear to be otherwise natural.

Collections examined. **WEST VIRGINIA. Barbour Co.:** along Pleasant Creek Public Hunting Area road, extending 1.5 mi, both sides of road into Taylor Co., 26 May 1991, *Bush s.n.* (WVA); Pleasant Creek Hunting & Fishing Area, roadside, 6 Jun 1991, *Clarkson s.n.* (WVA); along Co. Road 10, between Hwy 119 and Tygart Lake, N side of Pleasant Creek in Pleasant Creek Public Hunting Area; area of *Prunus, Liriodendron, Acer, Cornus,* and *Crataegus*, with much invasive *Rosa multiflora* and *Lonicera maackii*; *Astranthium* locally abundant in grassy habitats on roadsides, roadbanks, and adjacent fields, 3 Jun 2002, *Nesom FW154* (BRIT, GH, KY, NCU, OS, TENN, TEX, UARK, US, WVA). **Taylor Co.:** along Pleasant Creek Public Hunting Area road, extending 1.5 mi, both sides of road into Barbour Co., 2 Jun 1991, *Baer s.n.* (WVA).

DISCUSSION

De Jong (1965, p. 510) observed that "The two subspecies [of *Astranthium integrifolium*] are separated from one another by quantitative characters and may be recognized throughout their respective ranges. The occasional failure of a single character is compensated for by other characters. The key differences between the two subspecies hold true when they are grown in the greenhouse under uniform conditions." Nevertheless, De Jong noted that in Arkansas, subsp. *ciliatum* "overlaps" and "hybridizes" with subsp. *integrifolium* (p. 474 and p. 505). "The number of specimens which are thought to be putative hybrids is relatively numerous, but not enough specimens are available from different localities to assess the pattern of variation accurately" (p. 511). "The recognition of subspecies rather than varieties is prompted by the considerable ranges of subsp. *integrifolium* and subsp. *ciliatum* and the relatively narrow zone of intergradation" (p. 510).

Intergrades between *Astranthium integrifolium* and *A. ciliatum* were cited by De Jong (1965) from Arkansas (e.g., *Demaree 16912*-SMU!, *Harvey 45*-MO!, SMU!, *Engelmann 129*-MO!), Oklahoma (not seen), and Missouri (e.g., *Bush 7534*-MO!, *Steyermark 22642*-MO!). He did not specify the nature of the intergradation, but from sheets annotated by him, it can be inferred that this was primarily an interpretation of root morphology and general vigor (stem height and leaf size). The 'intergrades' cited from these states (all within the range of *A. ciliatum*, as recognized here) tend to be fibrous-rooted rather than taprooted, but rare plants from Texas (e.g., Gonzales Co., *Turner 3711*-SMU; Harrison Co., *Orr 182*-SMU) also are weakly fibrous-rooted; all of these are interpreted here as population variants rather than intergrades, because they belong with *A. ciliatum* in involucral height, ray corolla length, and especially in cypselar size, surface morphology, and vestiture. The same is true for two Arkansas collections cited by De Jong as *A. integrifolium* subsp. *integrifolium* (Hot Springs Co., *Soulard s.n.*-MO!; Washington Co., *Harvey s.n.*-MO!) and for Missouri collections annotated as "aff. subsp. *integrifolium*" (e.g., *Palmer 39297*-MO!, *Palmer 39483*-MO!, *Steyermark 10393*-MO!). Some Arkansas collections cited by De Jong as intermediate between the subspecies were annotated by him simply as "*A. integrifolium* subsp. *ciliatum*" (e.g., *Bush 929*-MO!, *Palmer 5992*-MO!).

Robust plants of *Astranthium ciliatum* are similar in habit to *A. integrifolium*, and depauperate plants of *A. integrifolium* are similar in habit to *A. ciliatum*. The Arkansas collections interpreted by De Jong as "subsp. *integrifolium*" or as reflecting hybridization were made around Hot Springs (Hot Springs Co.) and Fayetteville (Washington Co.). These plants are generally taller than average for the species (up to 32 cm tall) and have leaves that range larger, and some have fibrous roots, but in involucral size, ray length, and cypselar morphology, they belong with *A. ciliatum*. Cypselae of plants from Arkansas and Missouri also range longer (1.1–1.6 mm) than in Texas and Oklahoma (1–1.2 mm). Whether the larger sizes of these plants might reflect convergence or an ancestral similarity with *A. integrifolium* sensu stricto is not clear. Even though various features overlap in variation, features of cypselar morphology (vestiture and epidermal surface) provide consistent distinction between the two taxa, especially with recognition of the disjunction in their geographic ranges, and I have not seen any plant that could be regarded as intermediate.

In summary, the present study finds that there is no unequivocal evidence for hybridization between plants of *Astranthium integrifolium* and *A. ciliatum*. In fact, their allopatric distribution allows no opportunity for genetic interchange, and differences in cypselar morphology suggest that isolation is complete.

CONSISTENCY IN TAXONOMIC RANK

Morphological distinctions between *Astranthium integrifolium* and *A. ciliatum* are relatively small, but their pattern of relationship and treatment at specific rank are analogous and consistent with the taxonomy of species pairs (as recognized by De Jong 1965) of *Astranthium* found in Mexico. The two are essentially identical in chromosome number ($2n = 8$) and chromosome morphology (De Jong 1965). Their northern distributions and morphological similarity suggest that they have an evolutionary sister relationship. De Jong (p. 523) noted that *A. robustum* ($2n = 6$) "is related to *A. integrifolium*" ... but "the species also shows resemblance to *A. condimentum* and *A. orthopodum* and has the same chromosome number and karyotype as these two species."

The relationship of *Astranthium orthopodum* (B.L. Rob.) E. Larsen and *A.*

condimentum De Jong parallels that of *A. integrifolium* and *A. ciliatum*. They are similar to each other in chromosome number ($2n = 6$) and chromosome morphology and probably are evolutionary sister taxa. Each has a substantial geographic range, but they are allopatric in distribution. They are morphologically separated primarily on the basis of root characters: plants of *A. condimentum* are annuals from a slender taproot; plants of *A. orthopodum* are biennials or short-lived perennials from a fibrous-rooted caudex, sometimes with short rhizomes or basal offsets. Additionally, there are small and overlapping differences in stem orientation and leaf shape and size.

Astranthium splendens De Jong ($2n = 18$) and *A. beamanii* De Jong ($2n = 24$) both apparently have a base chromosome number of $x = 3$ and also probably are evolutionary sister taxa. They are sympatric but grow at different elevations and are otherwise distinguished on the basis of cypselar vestiture (and apparently nothing else): cypselae of *A. splendens* are glochidiate-hairy over the whole surface while those of *A. beamanii* are glabrous or sparsely glochidiate-hairy only near the apex.

ACKNOWLEDGMENTS

Loans of specimens from KY, MO, WKU, and WVA, help of TEX-LL staff during a recent visit, help from Donna Ford-Werntz (WVA) and Bill Grafton in the investigation of the West Virginia plants, and review comments of George Yatskievych are gratefully acknowledged.

BOOK REVIEW

LYNNE RICHARDS and RONALD J. TYRL. 2005. **Dyes from American Native Plants: A Practical Guide.** (ISBN 0-88192-668-X, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $29.95, 340 pp., 155 color photos, 6" × 9".

This book covers 158 natural dye plants that are native to the continental US. Introductory chapters cover the history of natural dyes, natural dyeing processes, and supplies needed to use natural dyes at home.

The authors tested 158 native dye plants using five different mordants and two different dyeing processes. The results are carefully catalogued in seven detailed chapters arranged by color: purple, red, green, yellow, orange, brown, and black. Each chapter includes a table of dye plants, dye process, mordant, and the color produced, along with chips of each color.

A field guide at the end of the book includes color photographs of live plants, common and scientific names, and a short description of each plant included in the book. This guidebook to natural dyes is an excellent reference book for economic botanists, textile artists, and crafters interested in natural dyes.—*Marissa Oppel, Herbarium Assistant, Botanical Research Institute of Texas, Fort Worth, TX, 76012-4060, U.S.A.*

St. Louis, Missouri 63166-0299, U.S.A.

ABSTRACT

The combinations **Calea mediterranea** (Vell.) Pruski (syn.: *Calea platylepis*) and **Calea triantha** (Vell.) Pruski, (syn.: *Calea hispida*) (Heliantheae) are proposed for two species lectotypified herein by Velloso illustrations. A lectotype of *Meyeria hispida* DC. is designated. A key to the species centering about *Calea myrtifolia* is given. **Clibadium arriagadae** Pruski (Heliantheae) from Ecuador is named as a new segregate of *Clibadium pentaneuron*. *Clibadium arriagadae* is the same taxon as represented by the invalid *Clibadium zakii*. *Clibadium arriagadae* differs from *C. pentaneuron* by leaf blades palmately 3- or 5-veined from or near base (vs. subpalmately or plinerved from above blade base) and hirsute (vs. strigose) abaxially. A lectotype (BM-CLIFF folio page 405, *Conyza* 3) is designated for *Conyza bifrons* L. (= *Inula bifrons* L., Inuleae), and this name, once misapplied to an American species of *Pluchea*, is excluded from the flora of the New World. The combination **Conyza popayanensis** (Hieron.) Pruski (Astereae), replacing the illegitimate *Conyza uliginosa* (Benth.) Cuatr., non. Pers., is proposed. The combination **Llerasia macrocephala** (Rusby) Pruski (Astereae) is validated for a Bolivian species originally described in tribe Mutisieae, and *Llerasia lucidula* is treated as a synonym of *L. macrocephala*. Philip Miller's *Conyza baccharis* is lectotypified and is an earlier name for *Pluchea rosea*. The combination **Pluchea baccharis** (Mill.) Pruski (Plucheeae) is made for this coastal plain species, which occurs from eastern North America southward into Nicaragua.

RESUMEN

Se proponen las combinaciones **Calea mediterranea** (Vell.) Pruski (syn.: *Calea platylepis*) y **Calea triantha** (Vell.) Pruski, (sin.: *Calea hispida*) (Heliantheae) para dos especies que se lectotipifican aquí mediante ilustraciones de Velloso. Se designa un lectotipo para *Meyeria hispida* DC. Se ofrece una clave para las especies próximas a *Calea myrtifolia*. **Clibadium arriagadae** Pruski (Heliantheae) de Ecuador se nombra como un nuevo segregado de *Clibadium pentaneuron*. *Clibadium arriagadae* es el mismo taxon representado por el nombre inválido *Clibadium zakii*. *Clibadium arriagadae* difiere de *C. pentaneuron* por los limbos de las hojas palmatinervias con 3 ó 5 nervios desde de la base o cerca (vs. subpalmatinervias o triplinervias desde más arriba de la base) e hirsutas (vs. estrigosas) abaxialmente. Se designa un lectotipo (BM-CLIFF folio página 405, *Conyza* 3) para *Conyza bifrons* L. (= *Inula bifrons* L., Inuleae), y este nombre, por haberse aplicado a una especie americana de *Pluchea*, se excluye de la flora del Nuevo Mundo. Se propone la combinación **Conyza popayanensis** (Hieron.) Pruski (Astereae), para reemplazar a la ilegítima *Conyza uliginosa* (Benth.) Cuatr., non. Pers. Se valida la combinación **Llerasia macrocephala** (Rusby) Pruski (Astereae) para una especie de Bolivia descrita originalmente en la tribu Mutisieae, y *Llerasia lucidula* se trata como un sinónimo de *L. macrocephala*. *Conyza baccharis* de Philip Miller se lectotipifica y es un nombre anterior para *Pluchea rosea*. Se hace la combinación **Pluchea baccharis** (Mill.) Pruski (Plucheeae) para esta especie de la llanura costera, que aparece desde el Este de Norte América hasta Nicaragua en el Sur.

SIDA 21(4): 2023–2037. 2005

The purpose of this note is to validate names in *Calea* L., *Clibadium* F. Allam. ex L., *Conyza* Less., *Llerasia* Triana, and *Pluchea* Cass. needed in various floristic works of Neotropical Compositae being done at the Missouri Botanical Garden, and to lectotypify *Conyza bifrons* L., which is excluded from the flora of the Americas.

CALEA

Jose Velloso prepared *Flora fluminensis*, a landmark flora for the environs of Rio de Janeiro, Brazil in 1790, but died in 1811 prior to its publication. The text was printed in 1825 (Velloso 1825) and distributed in 1829. The text, however, remains incomplete, treating species corresponding to icones published only in volumes 1–8 (8 pro parte). No text is available for species illustrated volume 8 (pro parte), nor for those in volumes 9–11. The Compositae comprise all of volume 8 and part of volume 10, but text is available for about only the first half of the 164 icones (Velloso 1827) published in volume 8. The 11 volumes of figures are dated 1827 (Velloso 1827), but were distributed only in 1831. Thus, 1831 is taken as the date of validation of species represented only by these diagnostic icones, but without corresponding text. It is the plates of two such Velloso names (**Figs. 1 & 2**) that are clearly identifiable with two South American species of *Calea* (Heliantheae; syn. Neurolaeneae), new combinations for which are made below. No type specimens of these two names are known to exist, and consequently the illustrations are designated as the lectotypes.

Calea mediterranea (Vell.) Pruski, comb. nov. (**Fig. 1**). *Buphthalmum mediterraneum* Vell., Fl. Flumin. (Icones) 8. t. 135. 1827 [1831]. LECTOTYPE (designated here): t 135, Vell., Fl Flumin. (Icones) 8. 1827 [1831].

Calea platylepis Schultz-Bip. ex Baker in Martius, Fl. bras. 6(3):267. 1884. Lectotypification from among the dozen or so syntypes is deferred

Distribution and ecology.—*Calea mediterranea* (Vell.) Pruski is a xylopodial subshrub flowering from October to April. It occurs in the Brazilian planalto southwards into Paraguay and northern Argentina.

Calea mediterranea is a member of *Calea* sect. *Haplocalea* (Less.) Pruski (Pruski 1998 sub *Calea platylepis*), and is closely related to *C. cymosa* Less., the type of the section. This section is characterized by generally whorled leaves and umbelliform capitulescences. *Calea mediterranea* differs from *C. cymosa* Less. by narrower, pubescent, pinnately veined (vs. broader, nearly glabrous, 3- or 5-plinerved) leaves and by lanceolate, pubescent (vs. ovate, glabrous) outer phyllaries. Additionally, the lower most whorl of leaves in *C. mediterranea* is often reduced, as illustrated by Velloso (1827), a feature not typical of *C. cymosa*. The radiate capitula of *C. mediterranea* and *C. cymosa* distinguish each of them from the otherwise closely related *C. hassleriana* Chod. and *C. reticulata* Gardner (syn. *Ichthyothere ternifolia* Baker), which have discoid capitula.

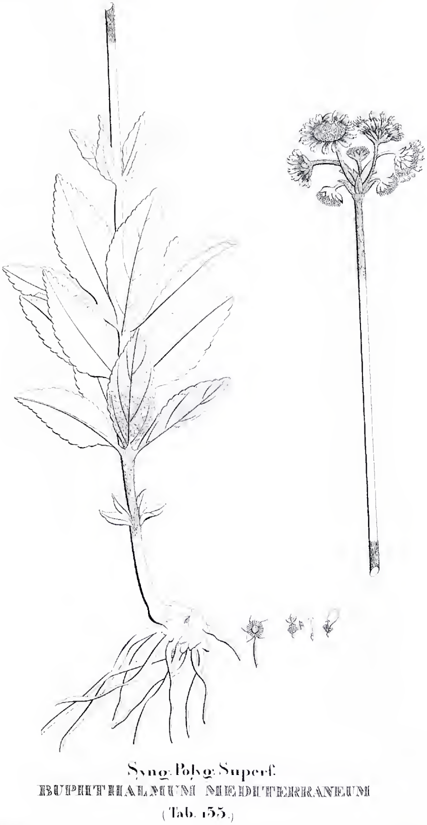

Fig. 1. Lectotype of *Buphthalmum mediterraneum* Vell. [= *Calea mediterranea* (Vell.) Pruski], from Velloso, Fl. Flumin. (Icones) 8: t. 135. 1827 [1831].

Fig. 2. Lectotype of *Aster trianthus* Vell. [≡ *Calea triantha* (Vell.) Pruski], from Velloso, Fl. Flumin. (Icones) 8: t. 120. 1827 [1831].

Calea triantha (Vell.) Pruski, comb. nov. (**Fig. 2**). *Aster trianthus* Vell., Fl. Flumin. (Icones) 8: t. 120. 1827 [1831]. LECTOTYPE (designated here): t. 120, Vell., Fl. Flumin. (Icones) 8. 1827 [1831].

Meyeria hispida DC., Prod. 5:671. 1836. *Calea hispida* (DC.) Baker in Martius, Fl. Bras. 6(3):261. 1884. LECTOTYPE (chosen here from among syntypes): BRAZIL: SÃO PAULO, campis editis, Nov. 1833, *Lund 866* (LECTOTYPE: G-DC [IDC microfiche 800. 975.III.3]; ISOLECTOTYPES: C-4, S). The G-DC lectotype also has a small twig of *H. Imp. Bras. 405* mounted to the lower right of the Lund collection. [Lectoparatype: *Herb. Imperial Brasil* (probably *Vauthier*) *405*: G-DC (fragment of a sheet from P), F (fragment of a sheet from P), P-2.]

Distribution and ecology.—*Calea triantha* (Vell.) Pruski is a subshrub to shrub endemic to Brazil, where it is centered in the state of Paraná. It is known to flower from December to April.

Calea triantha is one of 13 species of the *C. myrtifolia* DC. species group (sensu Pruski 1984; Pruski & Urbatsch 1988) of *Calea* section *Meyeria* (DC.) Benth. & Hook.f. Pruski and Urbatsch (1988) provided a key to the then-known members of this group. Their key is revised herein, incorporating the above new synonymy and *C. semirii* Pruski & Hind, which was described subsequently (Pruski & Hind 1998).

KEY TO THE SPECIES CENTERING ABOUT *CALEA MYRTIFOLIA* (*CALEA* SECT. *MEYERIA*)

1. Leaves glabrous, entire, margins thickened (São Paulo and Paraná, Brazil) ___ **Calea marginata** S.F. Blake
1. Leaves glabrous to hispid, entire to serrate, margins not thickened.
    2. Leaves lanceolate, ca. 6–12 cm long, venation parallel, ca. 3–7-veined (Goias, Brazil) ___ **Calea nervosa** Barroso
    2. Leaves lanceolate to cordate, less than 6.5 cm long, venation pinnate to trinervate.
        3. Capitula one per branch.
            4. Leaves lanceolate-elliptic, foveolate below (São Paulo and Paraná, Brazil) ___ **Calea parvifolia** (DC.) Baker
            4. Leaves elliptic-ovate, smooth below.
                5. Peduncle ca. 8–15 cm long (Paraná and Santa Catarina, Brazil) ___ **Calea ilienii** Malme
                5. Peduncle ca. 1.5–6 cm long (Paraná, Brazil) ___ **Calea monocephala** Dusén
        3. Capitulescence cymose.
            6. Leaves whorled.
                7. Leaves generally four per node, essentially sessile, smooth, pinnate; peduncles 3–15 cm long; ray corolla limb 5–13-nerved; outer phyllaries and leaves green below; pappus scales subequal in length (Distrito Federal and Goias, Brazil) ___ **Calea quadrifolia** Pruski & Urbatsch
                7. Leaves generally three per node, shortly petiolate, rugulose, trinervate; peduncles 0.5–6 cm long; ray corolla limb 5-nerved; outer phyllaries and leaves rust-colored below, less commonly green; pappus scales slightly to greatly unequal in length (Minas Gerais, Brazil).
                    8. Leaves adaxially glabrous or nearly so; involucres campanulate to hemispherical; outermost phyllaries at least apically herbaceous, about as long as the next series; ray corollas yellow, tube 2.7–3.5 mm long, limb 12–14.5 mm long, commonly abaxially glandular; disk

corolla tube shorter than the throat; cypselae 2.5–3.2 mm long, with 1–3 pappus scales often much longer than the others ____ **Calea heteropappa** Pruski & Urbatsch

8. Leaves adaxially hispidulous to sparsely pilose; involucres turbinate to cylindrical; outermost phyllaries mostly scarious, usually much shorter than the next series; ray corollas pale yellow, tube 3.6–4.5 mm long, limb 7–8.5 mm long, abaxially eglandular; disk corolla tube about as-long-as the throat; cypselae 3.8–4.8 mm long, pappus scales generally slightly unequal ____ **Calea semirii** Pruski & Hind

6. Leaves opposite.
   9. Leaves ovate, hispidulous to hispid, serrate, basally cordate, usually shorter than 2.5 cm (Minas Gerais south to Santa Catarina, Brazil; syn. nov. *Calea hispida*) ____ **Calea triantha** (Vell.) Pruski
   9. Leaves elliptic to elliptic-ovate, glabrous to pubescent, entire to serrate, basally cuneate, longer than 2.5 cm.
      10. Leaves to 3.5 cm wide, shiny, serrate, glabrous; foliaceous outer phyllaries serrulate (Paraguay) ____ **Calea chodatii** Hassler
      10. Leaves less than 2.5 cm wide, somewhat shiny or not, entire to serrulate, glandular or puberulent; foliaceous outer phyllaries entire.
          11. Leaves narrowly elliptic; capitula ca. 65-flowered; ray corolla limb 8–10-nerved; disk corolla lobes longer than 1.5 mm; cypselae glabrous (Rio Grande do Sul, Brazil and Uruguay) ____ **Calea kristiniae** Pruski
          11. Leaves elliptic to broadly elliptic; capitula ca. 35-flowered; ray corolla limb 5(–7)-nerved; disk corolla lobes shorter than 1.5 mm; cypselae pubescent on angles.
              12. Leaves entire, ca. 1.5 cm wide (Minas Gerais south to Rio Grande do Sul, Brazil) ____ **Calea myrtifolia** (DC.) Baker
              12. Leaves serrulate, to ca. 2.5 cm wide (coastal São Paulo south to Rio Grande do Sul, Brazil) ____ **Calea phyllolepis** Baker

CLIBADIUM

Arriagada (1995) provided an overview of *Clibadium* (Compositae: Heliantheae), including full synonymy and a key to species. In this overview, Arriagada reduced to synonymy all four northern South American names of *Clibadium* proposed by Robinson (1992). A monograph of *Clibadium* has now been published (Arriagada 2003), and again all names in *Clibadium* proposed by Robinson (1992) are listed as synonyms. I agree with Arriagada (1995, 2003) that *C. pentaneuron* S.F. Blake includes the synonymous *C. funkiae* H. Rob.; *C. laxum* S.F. Blake includes *C. alatum* H. Rob.; and *C. glabrescens* S.F. Blake includes *C. napoense* H. Rob. Thus, three validly described species in Robinson (1992) are encompassed within more widespread taxa, these originally described by Blake in the 1920s and 1930s. A fourth name (*C. zakii*) in Robinson (1992) was based on *Zak & Jaramillo 2881* (MO, US) but without "the single herbarium" housing the holotype being "specified." This name is consequently invalid (Art. 37.6 of the Code, Greuter et al. 2000) and does not exist nomenclaturally. This plant belonging to *Clibadium* section *Clibadium* is validated here with a new type collection and a new epithet honoring my friend Dr. Jorge Arriagada, the monographer of the genus.

Clibadium arriagadae Pruski, sp. nov. (**Fig. 3**). TYPE: ECUADOR. COTOPAXI: road between Quevedo & Lacacunga, 76 km E of Quevedo, 0°57'S, 79°01'W, 2300 m, 5 Apr 1983, *Croat 55804* (HOLOTYPE: MO; ISOTYPE: QCNE).

A *C. pentaneuron* affinis, sed laminae palmativenosae (non subpalmativenosae vel pinnativenosae), rotundata vel truncata (non cuneata), et subtus hirsuta (non strigosa) diversa.

Shrubs to ca. 2 m tall; stems sometimes vining, subterete to subhexagonal, hirsutulous. **Leaves** simple, opposite, petiolate; petioles 0.8–3.5 cm long, hirsute; blades broadly ovate, 4–15.5 cm long, 2–11 cm wide, stiffly chartaceous, palmately 3- or 5-veined from or near base, secondary and tertiary reticulation prominent, base rounded to truncate, margins serrulate, apex acute to acuminate, the adaxial surface scabrid, hirsutulous, the abaxial surface hirsute, eglandular. **Capitulescence** terminal, many-headed, loosely corymbiform paniculate, branches 2–14 cm long, hirsute, ultimate branching trichotomous. **Capitula** 10–12-flowered, disciform, shortly pedunculate, 4–5 mm tall; involucre hemispherical; phyllaries ca. 3-seriate, subequal to weakly graduated, stiffly chartaceous, weakly 3–5-veined adaxially, apically hirsutulous, otherwise glabrous, to ca. 4.5 mm long, 2–2.5 mm wide, outer ones pyriform, apically acute to acuminate, mid-series and inner ones ovate, apically obtuse to rounded; receptacle convex-conical, to ca. 1 mm broad, weakly paleate; paleae lanceolate, to ca. 3 mm long, weakly conduplicate; peduncles 1–2 mm long, terete, glabrous to hirsutulous, one-bracteolate, bracteole lanceolate, 1–2 mm long, hirsute. **Marginal florets** uniseriate, pistillate, 5 or 6, mostly included within involucre; corolla ca. 2 mm long, tubular, cream-colored, apically pilosulose with non-glandular trichomes, minutely ca. 3-lobed, style branches ca. 1 mm long, weakly exserted. **Disk florets** functionally staminate, 5 or 6, mostly included within involucre; corolla broadly funnelform, ca. 2.5 mm long, cream-colored, 5-lobed, lobes deltoid, erect, 0.5–0.9 mm long, pilosulose with non-glandular trichomes; anthers generally included, to ca. 1.7 mm long, dark greenish to black, appendage elongated but not greatly sculptured, basally short-sagittate, filaments ca. 0.3 mm long; style undivided, apex often exserted from corolla; ovary rudimentary. **Cypselae** oblong, flattened, 2–2.5 mm long, apically papillose, otherwise glabrous or nearly so, epappose.

PARATYPE: ECUADOR. BOLÍVAR: Carretera Chillanes-Bucay, en la hacienda "Tiquibuso" del Sr. Gonzalo Gómez, 1°55' S, 79°05' W, 2100 m, 10 Sep 1987, *Zak & Jaramillo 2881* (F, MO, US).

Distribution and ecology.—This species is known only from the Pacific drainage slopes of the Andes in Bolívar and Cotopaxi, Ecuador. It has been collected in flower in April and September from 2100–2300 meters elevation.

Clibadium arriagadae differs from *C. pentaneuron* by leaf blades mostly palmately 3- or 5-veined from or near base (vs. subpalmately or plinerved from

FIG. 3. *Clibadium arriagadae* Pruski. Above: Branches of capitulescence showing patent (not strigose) indumentum. Below: Abaxial surface of leaf showing trinerved venation from very base of blade. (Photographs of the holotype, *Croat 55804*, MO).

well above blade base), these rounded (vs. cuneate) basally and hirsute (vs. strigose) abaxially. The types of the *C. funkiae* H. Rob., *C. pileorubrum* Cuatrec., *C. sarmentosum* Cuatrec., and *C. scandens* Cuatrec. each have leaves strigose abaxially and these four names are accepted as synonyms of *C. pentaneuron*, as proposed by Arriagada (1995, 2003). The stems of *C. arriagadae* are hirsutulous throughout, thus differing from those of *C. pentaneuron* (Ecuador and Colombia), which are sometimes strigose.

Arriagada (1995, 2003) reduced *C. funkiae* (Antioquia, Colombia) to synonymy of *C. pentaneuron*. At one point, I thought that the prominent resin ducts in the phyllaries some material from Antioquia and in *Forero et al. 2279* (MO; Chocó, Colombia near border with the northern limits of Valle, Colombia) could be used to distinguish this material from the generally more southern *C. pentaneuron*. However, the collection from Chocó is near the center of distribution of *C. pentaneuron*, and other material of *C. pentaneuron* from Antioquia lacks the prominent phyllary resin ducts. Thus, there seems to be no meaningful morphological features that one could use to split the Colombia material of *C. pentaneuron* into more than a single taxon. Indeed, this was the observation of Arriagada (1995, 2003), the monographer who reduced *C. funkiae* to synonymy. Moreover, no case for geographic separation of *C. funkiae* as distinct from *C. pentaneuron* can be made. Thus, I recognize *C. pentaneuron* in a slightly narrower concept than does Arriagada (1995, 2003), and segregate only *Clibadium arriagadae* from it.

The morphological distinctions among relatives of *C. pentaneuron* are provided below in the key to species, which modifies couplet #27 of Arriagada (1995, 2003).

KEY TO THE SPECIES CENTERING ABOUT *CLIBADIUM PENTANEURON*

27. Abaxial leaf surface hirsute; leaf blade generally palmately veined from or near base (Ecuador) ____ **Clibadium arriagadae** Pruski
27. Abaxial leaf surface generally strigose; leaf blade pinnately veined or if plinerved then from well above base.
    27.1 Most phyllaries apically acute to acuminate; capitula 24–28-flowered; marginal florets 9–13; disk florets ca. 15 (Ecuador) ____ **Clibadium manabiense** H. Rob.
    27.1 Most phyllaries apically obtuse to acute; capitula 10–14-flowered; marginal florets 5 or 6; disk florets 5–8 (Colombia and Ecuador) ____ **Clibadium pentaneuron** S.F. Blake

CONYZA

Conyza bifrons L. (= *Inula bifrons* L., Inuleae) is lectotypified upon material from the Old World, and this name is thus excluded from the flora of the New World. The new combination *C. popayanensis* (Hieron.) Pruski (Astereae) from the Andes is proposed to replace the illegitimate *C. uliginosa* (Benth.) Cuatr., non Pers. Although *C. primulifolia* (Lam.) Cuatrec. (which includes as a synonym

C. chilensis Spreng., the type of *Conyza*) was transferred to *Erigeron* L. by Greuter (2003), I recognize *Conyza* at the generic rank.

Inula bifrons L., Sp. Pl. (ed. 2) 1236. 1763. LECTOTYPE (designated by Anderberg, Taxon 47:363. 1998): EUROPE: "Habitat in Italia, Galloprovincia, Pyrenaeis," *sin. coll.* (LINN 993.11 [IDC microfiche 177. 577.II.5]).

Conyza bifrons L. var. *bifrons*, Sp. Pl. 861. 1753. *Pluchea bifrons* (L.) DC., Prodr. 5:451. 1836. LECTOTYPE (designated here): EUROPE: "Habitat in Pyrenaeis. Canada," *sin. coll.* (BM-CLIFF folio page 405, *Conyza* 3 [barcode BM000647043], photograph MO).

Conyza bifrons var. *flosculosa* L., Sp. Pl 862. 1753. LECTOTYPE (designated by Reveal, Taxon 47:358 1998): EUROPE: "Habitat in Pyrenaeis, Canada," *sin. coll.* (BM-SLOANE vol. 96, page 26).

Conyza bifrons var. *radiata* L., Sp Pl. 861. 1753. LECTOTYPE (designated by Anderberg, Taxon 47:358 1998). t. 127 as "*Conyza pyraenaica foliis primulae veris*" in Hermann, Parad. Bat., 127. 1698.

Distribution and ecology.—*Inula bifrons* is a summer flowering herb to 1 m tall. It occurs from the Pyrenees of southern France eastwards into Romania and Bulgaria (Tutin et al. 1976).

Linnaeus (1753) named *Conyza bifrons* L. and two varieties of it, giving the locality of "Habitat in Pyrenaeis, Canada" for all three names. Later, Linnaeus (1763: 1207) treated *C. bifrons* as being solely American and represented by Plukenet plate 87 figure 4 (1705), thought to have been drawn from Canadian material, whereas simultaneously Linnaeus proposed the heterotypic *Inula bifrons* L. (1763: 1236), with similar auriculate-clasping leaves, for the European elements. *Pluchea bifrons* (L.) DC. (Plucheeae) was misapplied to material from the Americas by Candolle (1836), as noted by Godfrey (1952), who used the name *P. foetida* (L.) DC. for American plants formerly called *P. bifrons*. Gray (1884: 225) noted that the Plukenet plate was drawn from material collected in Europe, not Canada; thus no original material of either *C. bifrons* L. or *I. bifrons* L. is from the Americas.

Conyza bifrons L., however, has not previously been lectotypified (C. Jarvis, pers. comm.). Linnaeus (1763) restricted the concept *C. bifrons* (1753) to plants he thought to be American, thus potential for misapplication of this name to plants from the Americas remains. Because Linnaeus (1753, 1763) cited a polynomial from Linnaeus (1737), *C. bifrons* L. is lectotypified here by a specimen in the Clifford herbarium, this specimen referable taxonomically to *I. bifrons* L. (Inuleae). *Conyza bifrons* L. is thus excluded formally from the flora of the New World, in agreement with Godfrey (1952) and Tutin et al. (1976).

The name *C. uliginosa* (Benth.) Cuatrec., used for a northern Andean herb (e.g., Aristeguieta 1964; Cuatrecasas 1967; Jorgensen & León-Yánez 1999), is an illegitimate later homonym of *C. uliginosa* Pers., Synops. 2:427. 1807. A new combination based on the senior synonym given by Cuatrecasas (1969) is thus proposed.

Conyza popayanensis (Hieron.) Pruski, comb. nov. *Erigeron popayanensis* Hieron., Bot. Jahrb. Syst. 28:586. 1901. TYPE: COLOMBIA. CAUCA: Páramo de Guanacas, Andium centralium popayanensium, 3000–3500 m, Aug, no year given, *Lehmann 7962* (HOLOTYPE: B, destroyed, photograph sub Field neg. #14855: MO; LECTOTYPE (designated by Cuatrecasas, Webbia 24:217. 1969): K; ISOTYPES: FI, P, US [photograph: MO]).

Erigeron uliginosus Benth., Pl. Hartw. 204. 1845, as "*uliginosum*." *Conyza uliginosa* (Benth.) Cuatrec., Webbia 24:216. 1969, non Pers. 1807. TYPE: ECUADOR: PICHINCHA: In uliginosis ad Hacienda de Chisinche sub Volcán Illiniza (as "monte Ilinissa" in protologue), 1842, *Hartweg 1131* (HOLOTYPE: K; ISOTYPES: G [photograph sub F neg. 28634: MO], NY [photograph: MO], P, W). "Hacienda de Chisinche" is a few kms NE of Illiniza, thus presumably in Prov. Pichincha.

Erigeron sulcatus var. *columbianus* Hieron., Bot. Jahrb. Syst. 28:586. 1901, as "*columbiana*." *Conyza uliginosa* var. *columbiana* (Hieron.) Cuatrec., Phytologia 9:5. 1963. COLOMBIA: CUNDINAMARCA: In silvis montanis densis locis humidis supra Sibaté, 2800 m, 3 Feb 1883, *Lehmann 2535* (HOLOTYPE: B, destroyed; ISOTYPE: US).

Erigeron bonariensis var. *meridensis* Cuatrec., Trab. Mus. Nac. Ci. Nat., Ser. Bot. 33:132. 1936. LECTOTYPE (chosen from among syntypes by Cuatrecasas, Webbia 24:216. 1969): VENEZUELA: MÉRIDA: Serra Nevada de Mérida, s.d., *Moritz 1373* (LECTOTYPE: P). "*Moritz 1373*" was not cited specifically in the protologue, but rather only indirectly by name attribution of "Sch. Bip. in schedam." It seem best to accept the lectotypification of Cuatrecasas (1969).

Distribution and ecology.—*Conyza popayanensis* (Hieron.) Pruski occurs from 2500–4400 meters elevation in the Andes of Venezuela, Colombia, Ecuador, and Peru.

Conyza popayanensis is a branched perennial herb with sessile leaves and a generally dense corymbiform capitulescence with peduncles generally much shorter than 5 mm. The capitula have pubescent subequal long-triangular phyllaries with a broad central colored portion and broad stramineous margins, and the marginal florets have entire or nearly so corolla limbs generally about 0.5 mm long. Cuatrecasas (1969) noted that one of the two plants on the destroyed Berlin holotype had an open capitulescence. Nevertheless, this plant on the destroyed holotype has weakly pubescent leaves typical of this species.

Colombian *Conyza uliginosa* var. *hirsuta* (Hieron.) Cuatrec. [syn.: *Erigeron uliginosus* var. *hirsutus* Hieron., Bot. Jahrb. Syst. 28:587 1901, as "hirsuta"] was recognized by Cuatrecasas (1969). This taxon resembles *C. popayanensis*, but has more densely pubescent herbage, an open capitulescence, peduncles to 20 mm long, narrower phyllaries, and marginal florets with sometimes deeply bifid corolla limbs often to about 1 mm long. Because I have not seen type material of this name, I decline to synonymize it or to recognize it at the species rank. If further study shows that *C. uliginosa* var. *hirsuta* deserves specific recognition, it should be noted that Chinese *C. hirsuta* L. blocks the transfer to *Conyza* of this varietal name.

LLERASIA

The below combination is provided for a Bolivian species of Compositae tribe Astereae, originally described as a species of tribe Mutisieae.

Llerasia macrocephala (Rusby) Pruski, comb. nov. *Moquinia macrocephala* Rusby, Descr. S. Amer. Pl. 162. 1920. *Gochnatia macrocephala* (Rusby) Cabrera, Notas Mus. La Plata, Bot. 15:41.

1950. TYPE: BOLIVIA. LA PAZ: North Yungas, Unduavi, 3300 m [as "3000 m" in protologue], Nov 1910, *Buchtien 3080* (HOLOTYPE: NY; ISOTYPE: US [holotype of *Haplopappus lucidulus* S.F. Blake]).

Haplopappus lucidulus S.F. Blake, Amer. J. Bot. 14:114. 1927 (as "*Aplopappus*"). *Llerasia lucidula* (S.F. Blake) Cuatrec., Biotropica 2:43. 1970. TYPE: BOLIVIA. LA PAZ: North Yungas, Unduavi, 3300 m, Nov 1910, *Buchtien 3080* (HOLOTYPE: US; ISOTYPE: NY [holotype of *Moquinia macrocephala* Rusby]).

Distribution and ecology.—*Llerasia macrocephala* (Rusby) Pruski is a vining shrub occurring from 2500–3300 meters elevation in Bolivia.

Because of similar leaf surfaces occasionally closely tomentose abaxially, species of Vernonieae (especially those of *Piptocarpha*) and discoid species of Mutisieae (especially those of *Gochnatia* H.B.K.) are occasionally confused. For example, Badillo (1994), Pruski (1997), and Sancho (1999) treated *Piptocarpha upatensis* V.M. Badillo as a species *Gochnatia*. *Stifftia axillaris* G.M. Barroso & Vinha, described by Barroso and Vinha (1970) as a species of Mutisieae, was recognized by Robinson (1979) as a species of *Piptocarpha* (Vernonieae). Similarly, *Moquinia macrocephala*, described by Rusby (1920) as having leaf surfaces closely tomentose abaxially and as a species of Mutisieae (in the *Gochnatia* generic alliance), is here treated as a member of tribe Astereae.

Rusby (1920) described *Buchtien 3080* (NY) as *Moquinia macrocephala* (Mutisieae). Later, Blake (1927) noted that at US *Buchtien 3080* was filed as an undetermined species of *Gochnatia*, but actually belonged to tribe Astereae, where he described it as *Haplopappus lucidulus*. Blake (1927) treated most of the 11 species of *Llerasia* as *Haplopappus* [sub "*Aplopappus*"] sect. *Diplostephioides* (Benth. & Hook. f.) S.F. Blake, whereas Cuatrecasas (1970) resurrected *Llerasia* (tribe Astereae) from synonymy of *Haplopappus*.

In a pollen review, Wodehouse (1929: figure 8) noted that by spiny pollen *Moquinia macrocephala* stands apart from taxa of the *Moquinia-Gochnatia* plexus. Cabrera (1971) treated most Moquinias under *Gochnatia*, but excluded *Gochnatia macrocephala* (Rusby) Cabrera from *Gochnatia*. I agree with Blake (1927), Wodehouse (1929), and Cabrera (1971) that *Buchtien 3080* belongs to Astereae rather than to Mutisieae. Here I provide the combination *Llerasia macrocephala* (Rusby) Pruski, which replaces the synonymous *L. lucidula* (S.F. Blake) Cuatrec., the latter recognized by Cuatrecasas (1970).

PLUCHEA

Britten (1898) noted that *Conyza baccharis* Miller, partly characterized by auriculate-clasping leaves with broad serrulate blades and reddish florets, is conspecific with *Pluchea bifrons* (L.) DC. sensu Candolle (1836). Godfrey (1952), however, recognized the white-flowered North American populations formerly called *P. bifrons* as *P. foetida* (L.) DC. *Conyza bifrons* L., as lectotypified above on European material, indeed is a heterotypic synonym of European *Inula bifrons* L. Godfrey (1952) also segregated most of the reddish-purple flowered populations formerly called *P. bifrons* as *P. rosea* R.K. Godfrey, which subsequently has been widely recognized (e.g., Cronquist 1980; Nesom 1989; Arriagada 1998). The lectotype of *Conyza baccharis* has very densely pubescent outer phyllaries and florets with reddish corollas. The earlier *C. baccharis* is thus conspecific with *P. rosea*, and the needed new combination for *Flora Mesoamericana* and *Flora North America* is proposed herein, this updating the earlier identification of *C. baccharis* by Britten (1898).

Pluchea baccharis (Mill.) Pruski, comb. nov. *Conyza baccharis* Mill., Gard. Dict. (ed. 8) *Conyza* no. 16. 1768. Lectotype (designated here): MEXICO: Campeche: "Grows naturally at Campeachy," *sin. coll.* (BM [barcode BM000833507], photograph MO). Material grown in the Chelsea garden by Philip Miller is not extant. The Mexican material was presumably gathered by Robert Millar, who also sent *Conyza* no. 15 from "Campeachy" to Philip Miller.

? *Baccharis viscosa* Walter, Fl. Carol. 202. 1788, hom. illegit., non Lam. 1785. Type: U.S.A.: locality unknown, not seen in BM microfiche of Walter's herbarium. Walter's description partly reads "Varietates, floribus albis, et floribus rubris." I do not know of this name being lectotypified, but if it were to be lectotypified on the reddish-flowered material it would seemingly belong here in synonymy.

Pluchea rosea R.K. Godfrey, J. Elisha Mitchell Sci. Soc. 68:266. 1952. Type: U.S.A. Florida. Lake Co.: lake shores, vicinity of Eustis, 16–31 May 1894, *Nash 758* (holotype: GH; isotypes: F, MO, NY, UC, US).

Distribution and ecology.—This is a coastal plain species occurring (see Godfrey 1952; Nesom 1989; Arriagada 1998) in the southeastern United States (North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, and Texas), the Bahamas, Cuba, Mexico, and Mesoamerica (Campeche, Quintana Roo, Belize, Honduras, Nicaragua).

Pluchea baccharis (Mill.) Pruski is very similar and most closely related to *P. foetida* (L.) DC. (Cronquist 1980; Nesom 1989; Arriagada 1998), from which it differs most notably by pinkish or reddish (vs. generally white) corollas. *Pluchea baccharis* also tends to have a less dense capitulescence, shorter and more densely pubescent phyllaries, and narrower capitula than does *P. foetida*. Villaseñor (1989) noted that the report by Sousa and Cabrera (1983) of *P. foetida* as occurring in Quintana Roo was based on a misdetermination. A collection from Veracruz, Mexico is the sole Mexican or Central American collection of *P. foetida* reported by Nesom (1989), and the material from Veracruz seen by me is referred here to *P. baccharis*.

Pluchea baccharis is also similar to *P. longifolia* Nash, *P. mexicana* (R.K. Godfrey) G.L. Nesom (described as a var. of *P. rosea*), and *P. yucatanensis* G.L. Nesom. *Pluchea baccharis* differs from *P. longifolia* by smaller capitula and smaller leaves, from *P. mexicana* by abaxially sessile-glandular (vs. stipitate glandular) leaves, and from *P. yucatanensis* by abaxially hirsute and glandular (vs. solely sessile-glandular) leaves. Godfrey (1952) listed the illegitimate and non-typified *Baccharis viscosa* as a synonym of *P. foetida* (L.) DC.

ACKNOWLEDGMENTS

I appreciate the reviews of Jorge Arriagada (SCL) and Guy Nesom (BRIT), who kindly read this manuscript for SIDA. I am very grateful that Lucia Kawasaki (F) verified that the abaxial leaf surfaces are indeed strigose on the holotypes of both *Clibadium sarmentosum* and *Clibadium scandens*. I would also like to thank Anna Balla (F), Charles Jarvis (BM), and Michael Nee (NY) for help in various aspects of this work. Frederick Keusenkothen (MO) is thanked for taking the photographs of the Velloso illustrations.

BOOK REVIEWS

C.M. MENZEL and G.K. WAITE (eds.). 2005. **Litchi and Longan: Botany, Production, and Uses.** (ISBN 0-85199-696-5, hbk.). CABI Publishing, 875 Massachusetts Avenue, 7th floor, Cambridge, MA 01239, U.S.A. (**Orders:** 617-395-4056, fax 617-354-6875, email cabinao@cabi.org, www.cabi-publishing.org/bookshop). $140.00 hbk., 336 pp., 72 color, 7" × 9 3/4".

Litchi and longan fruit are extremely important economic plants throughout Asia and are popular in Asian cuisine. Pacific Rim countries are the biggest producers of litchi and longan fruit, but the plants are cultivated and used all over the world.

This book is edited by two experts from the Queensland Department of Primary Industries and Fisheries and covers information on the many cultivars of litchi and longan fruit, including *Litchi chinensis* Sonn. and *Dimocarpus longan* Lour (Sapindaceae). Written by experts in the field, this review book covers the research and science of litchi and longan cultivation, horticulture, and production.

The editors include chapters on litchi and longan taxonomy, history, propagation, fruit disorders, pests, irrigation, flowering, harvesting, diseases, and fruit maturation. This is an excellent resource for growers, horticulturists and other researchers who study and litchi and longan. Beautiful color and black-and-white photographs are included.—*Marissa Oppel, Herbarium Assistant, Botanical Research Institute of Texas, Fort Worth, TX, 76012-4060, U.S.A.*

BARBARA BOSWORTH. 2005. **Trees: National Champions.** (ISBN 0-262—2592-2, hbk.). The MIT Press, 55 Hayward Street, Cambridge, MA 02142-1315, U.S.A. (**Orders:** 617-253-5643 800-405-1619, mitpress-orders@mit.edu, http://mitpress.mit.edu). $39.95, 169 pp., b/w photos throughout, 12" × 9 1/2".

A collection of panoramic views of remarkable trees seen through the eyes of an artist. "Currently, there are 889 national champions and cochampions among the 826 eligible species in the United States." The book pictures 70 of these, including natives and non-natives, as black & white photos taken by Barbara Bosworth from 1991 to 2004, using an 8 × 10 camera. Tree champions are judged on an index of circumference, height, and crown spread, and some of the photographs show obvious behemoths. For others, the viewer is aware that the tree is the biggest of its species, but its isolation and stark contrast with surroundings underlie the sense of beauty and awe conveyed by the photograph. So many of these individuals are lone survivors.—*Guy Nesom, Botanical Research Institute of Texas, Fort Worth, TX, 76012-4060, U.S.A.*

UNA NUEVA ESPECIE DE *GUAREA* (MELIACEAE) PARA COSTA RICA

Alexánder Rodríguez

Instituto Nacional de Biodiversidad (INBio),
Apdo. 22-3100, Santo Domingo, Heredia, COSTA RICA
arodrig@inbio.ac.cr

RESUMEN

Se describe e ilustra **Guarea subsessilifolia**, una nueva especie endémica del cerro Turrubares en el pacífico central de Costa Rica, además, se comenta su relación con otras especies del género.

ABSTRACT

Guarea subsessilifolia, a new and endemic species from cerro Turrubares in the central pacific of Costa Rica, is described and illustrated and relationships with related taxa are discussed.

Guarea es uno de los géneros más grandes de la familia Meliaceae en América tropical y fue establecido por Linneo en 1753 bajo el nombre *Guara*, aunque en 1771 el mismo Linneo corrigió su escritura a *Guarea* (Coronado 2003).

Este género ha sido estudiado taxonómicamente en varias ocasiones. Entre los primeros aportes importantes encontramos el presentado por Casimir de Candolle (1878) quien en una monografía completa para la familia Meliaceae reconoció 2 secciones, *EuGuarea* (actualmente *Guarea*) con 67 especies y la sección *Ruagea* (actualmente reconocido como un género distinto) con tres especies (Coronado 2003). Casi 100 años transcurrieron para que la familia fuera nuevamente revizada y fueron Pennington y B.T. Styles (1981) quienes elaboraron una nueva monografía de la familia para el neotrópico. En esta revisión se reconocen 35 especies de *Guarea* para América tropical, se indica la presencia de otras 5 especies en África tropical y solamente 10 especies fueron reconocidas del trabajo de Casimir de Candolle, además, se reportó para Costa Rica la presencia de 7 especies. También, algunas floras locales han sido aportes regionales importantes en la revisión de este género, tal es el caso de Flora de Guatemala (Standley & Steyermark 1946), Flora de Panamá (Smith 1965) y Flora de Nicaragua (Pennington & Styles 2001).

Recientemente, Coronado (2003) en su estudio relacionado con el complejo de *Guarea glabra* Vahl entre México y Panamá, indicó la presencia de 10 especies para Costa Rica, 3 de las cuales actualmente inéditas, *G. arcuata* Coronado, *G. gentryi* Coronado y *G. zarceronensis* Coronado y distintas a la especie aquí descrita

El género *Guarea* se caracteriza por estar constituido de árboles o arbustos, con hojas alternas, compuestas, generalmente pinnadas y con una yema terminal de crecimiento intermitente, por su condición dioica, flores unisexuales por aborto, aunque pareciendo perfectas, cáliz cupuliforme, pétalos libres, en la mayoría de los casos valvados, estambres con filamentos completamente unidos y formando un tubo cilíndrico, con disco nectarífero intraestaminal, ovario 2–13 locular, lóculos con 1–2 óvulos, frutos capsulares, 2–10(–14) valvados y finalmente por mostrar lóculos con 1–2 semillas, las cuales se encuentran rodeadas por una sarcotesta carnosa, roja o anaranjada.

Las recientes exploraciones en la vertiente pacífica de la cordillera de Tilarán, en Monteverde y en el cerro Turrubares localizado en el pacífico central de Costa Rica ha producido el hallazgo de ésta notable especie de *Guarea* cuyos caracteres difieren de los taxa anteriormente reportados para el género (Pennington et al. 1981; Coronado 2003). A continuación se presenta la descripción de esta especie insólita.

Guarea subsessilifolia Al. Rodr., sp. nov. (**Figs. 1, 2**). Tipo: COSTA RICA. San Jose: Turrubares, San Luis, Faldas del cerro Pelón, 09°48'55"N, 84°28'48"W, 1190 m, 19 May 2005 (fls), *Rodríguez 9613* (holotipo: INB; isotipos: BRIT, CAS, CR, DUKE, GH, MEX, MEXU, MO, NY, TEX, UC, US, USJ, W).

Ab omnibus congeneribus folia subsessilia vel brevipetiolata, foliola proxima redacta diversa

Arbusto 2.5–4 m de altura, dioico. Tronco con corteza interna rosada; tallitos glabrescentes a cortamente hirsutos en ramitas terminales, con o sin esparcidas lenticelas. Hojas pinnadas, con una yema terminal de crecimiento intermitente; subsésiles o pecíolos hasta 0.7 cm de largo, subteretes a levemente aplanados en el lado adaxial, ferrugíneo-puberulentos a hirsutulos, glabrescentes con la edad; raquis 1–17 cm de largo, subterete a canaliculado en el lado adaxial, ferrugíneo-puberulento a hirsutulo, glabrescente con la edad; foliolos 1–10 pares, opuestos, súbsésiles o peciolulos hasta 2 mm de largo y 1.25–1.75 mm de ancho, teretes; lámina 1.5–13 cm de largo y 0.8–4 cm de ancho, oblongo-elípticos, elípticos a ovados, foliolos proximales marcadamente reducidos, 3–8.5 más cortos que los distales, base cuneada a obtusa, en ocasiones levemente oblicua, ápice acuminado o agudo, 5–14 pares de venas secundarias, concolora y verde-grisácea a gris-rojiza al secar, haz y envés puberulentos a esparcidamente pubescentes sobre el nervio principal, glabrescentes con la edad, eglandulosos. Inflorescencias terminales o axilares en ramitas terminales, solitarias, tirsos o cimas, erectas; masculinas con 8–35 flores, 2–6 cm de largo y 1.5–3 cm de ancho, pedúnculo 0.1–2 cm de largo, ferrugíneo-puberulento a hirsutulo, glabrescente con la edad, raquis 0.5–4 cm de largo, ferrugíneo-puberulento a hirsutulo, glabrescente con la edad; femeninas con 4–13 flores, 1–3 cm de largo y 1–2 cm de ancho, pedúnculo 0.2–0.5 cm de largo, ferrugíneo-puberulento a hirsutulo, glabrescente con la edad, raquis 0.3–0.7 cm de largo, ferrugíneo-puberulento a hirsutulo, glabrescente con la edad. Flores estaminadas con pedicelos 2–4 mm de largo, articulados, esparcidamente ferrugíneo-puberulentos, 1–2 bracteolados,

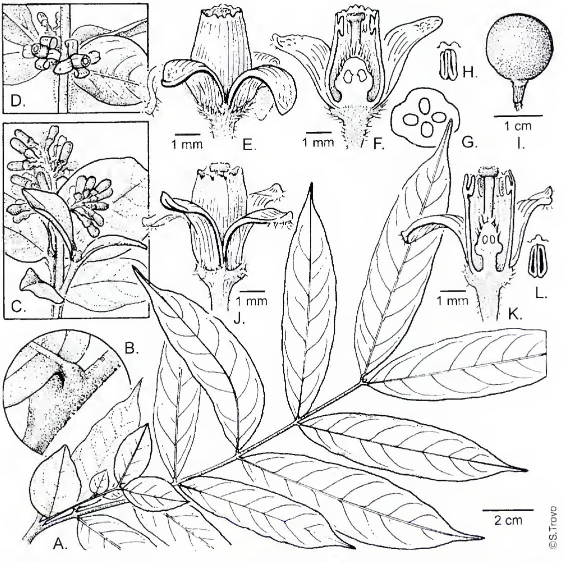

Fig. 1. *Guarea subsessilifolia* Al. Rodr. (*Rodríguez 9613*). **A.** Hábito. **B.** Base de la hoja. **C.** Inflorescencia masculina. **D.** Inflorescencia femenina. **E.** Flor femenina. **F.** Corte longitudinal de flor femenia. **G.** Corte transversal del ovario. **H.** Anterodio. **I.** Fruto. **J.** Flor masculina. **K.** Corte longitudinal de flor masculina. **L.** Antera

bractéolas 0.5–1 mm de largo; cáliz 1–1.5 mm de altura, ciatiforme, verde a pardo hacia la parte distal, esparcida y diminutamente pubescente, lóbulos 4, 0.2–0.35 mm de largo; corola con 4 pétalos, 5–5.5 mm de largo y 1.25–1.5 mm de ancho, blanco-rosados, aunque rosados en botones florales, ápice agudo, lado externo esparcida y diminutamente pubescente, interno papilado hacia el ápice; tubo estaminal 4–5 mm de largo y 1.5–2 mm de ancho, ápice irregularmente dentado, lado externo papilado; anteras 8, 0.75–1 mm de largo y 0.3–0.45 mm de ancho, oblongas a oblongo-obovadas; ginóforo 1–1.25 mm de largo y 0.75–0.9 mm de ancho, glabro, disco nectarífero 0.4–0.5 mm de largo y 1.1–1.3 mm de ancho; ovario 0.7–0.85 mm de largo y 1–1.2 mm de ancho, con esparcidos y largos tricomas; pistilo sobresaliendo levemente sobre el tubo estaminal, estilo 2.25–2.5 mm de largo, glabro, estigma 0.3–0.45 mm de largo y 0.6–0.75 mm de ancho. Flores pistiladas con pedicelos 1.5–4 mm de largo, articulados, esparcidamente ferrugíneo-puberulentos, 1–2 bracteolados, bractéolas 0.5–1 mm de largo; cáliz 0.75–1 mm de altura, ciatiforme, verde a pardo hacia la parte distal, esparcida y diminutamente pubescente, lobos 4, 0.2–0.4 mm de largo; pétalos 4, 5–5.5 mm de largo y 1.7–2 mm de ancho, blanco-rosados, aunque rosados en botones florales, ápice agudo, lado externo esparcida y diminutamente pubescente, interno papilado hacia el ápice; tubo estaminal 4–5 mm de largo y 2–2.5 mm de ancho, ápice irregularmente dentado, lado externo papilado; anterodios 8, 0.75–1 mm de largo y 0.3–0.45 mm de ancho, oblongos a oblongo-obovados; ginóforo 0.5–0.6 mm de largo y 0.75–0.9 mm de ancho, glabro, disco nectarífero 0.3–0.5 mm de largo y 1.3–1.5 mm de ancho, inconspicuo; ovario 4 locular, 0.7–0.85 mm de largo y 1.3–1.5 mm de ancho, seríceo, un óvulo por lóculo; pistilo similar en largo al tubo estaminal, estilo 1.6–1.8 mm de largo, glabro, estigma 0.25–0.3 mm de largo y 0.6–0.7 mm de ancho. Frutos 1–1.5 cm de largo y 1–2 cm de ancho, globosos, lisos, base obtusa, ápice obtuso a subtruncado, rojizos al madurar, glabrescentes a esparcidamente pubescentes, (3–)4 loculado, pericarpo 0.5–1 mm de grosor. Semillas 1 por lóculo, 0.6–0.8 cm de diámetro, subrodeadas por una sarcotesta rojo-anaranjada.

Fenología.—Flores en Mayo y frutos en Abril y Noviembre.

Distribución.—Endémica de Costa Rica, conocida en la vertiente pacífica de la cordillera de Tilarán, en Monteverde y en el pacífico central sobre el cerro Turrubares, en bosques húmedos a elevaciones entre 850–1600 m.

Guarea subsessilifolia se reconoce y distingue de otras especies por su hábito arbustivo y por sus hojas subsésiles o con peciolos muy cortos y por sus foliolos proximales conspicuamente reducidos (en ocasiones caedizos); hojas hasta con 10 pares de foliolos, inflorescencias cortas y escasamente floreadas, flores pistiladas con el ovario seríceo, 4 loculado y con un óvulo por lóculo, finalmente por sus pequeños y globosos frutos, (3–)4 loculares, con una semilla por lóculo, con valvas leñosas y delgadas.

A pesar de que las diferencias florales entre los individuos estaminados y pistilados no es evidentes, se encontraron diferencias significativas entre los individuos de ambos sexos. Los individuos masculinos muestran inflorescencias conspicuamente más largas y con mayor número de flores, el cáliz, el ginóforo y el estilo son ligeramente más largos, además, el ovario y el disco nectarífero son más angosto y menos pubescente que los individuos femeninos.

Esta especie se podría relacionar con *G. glabra* Vahl, *G. guidonia* (L.) Sleumer, *G. jamaicensis* Proctor, *G. pubescens* (Rich.) A. Juss. y *G. macrophylla* Vahl al considerar conceptos taxonómicos usados por Pennington (1981) que incluyen ovario (3–)4 loculado, pubescente, con un óvulo por lóculo, corola pequeña, nunca alcanzando 12 mm de largo, frutos globosos, pequeños, no sobrepasando 2.5 cm de diámetro, lisos, con ausencia de costillas o lenticelas evidentes, pericarpio delgado, menos de 3 mm de grosor e inflorescencias cortas. Sin embargo, estas especies se distinguen fácilmente por mostrar pecíolos evidentes y claramente diferenciados. También, con base en el trabajo de Coronado (2003) y utilizando los mismos conceptos taxonómicos adoptados por Pennington (1981), dentro del complejo de *G. glabra* Vahl la especie podría relacionarse con *G. bullata* Radlk., *G. chiricana* Standl. y *G. petensis* Coronado, sin embargo, estas especies se distinguen igualmente por mostrar pecíolos evidentes y claramente diferenciados.

Esta especie es notablemente rara, se conoce únicamente de 2 localidades, el cerro Turrubares y Monteverde, regiones en las cuales las poblaciones observadas son muy reducidas. Es probable que esta especie se encuentre en alto riesgo de extinción, más considerando que la regiones específicas de recolecta no se encuentran en una estricta categoría de protección y corresponde a sitios con alto uso del suelo en actividades como ganadería y agricultura.

En los bosques de esta región, se observó que *G. subsessilifolia* crece simpátricamente con *G. kegelii* Turcz., además, otras especies comunes en el sitio son *Croton megistocarpus* Gonz. Ram. & Poveda (Euphorbiaceae), *Chrysophyllum brenesii* Cronquist (Sapotaceae), *Daphnopsis folsomii* Barringer & Nevling (Thymelaeaceae), *Hirtella triandra* Sw. (Chrysobalanaceae), *Krugiodendron acuminatum* Gonz. Ram. & Poveda (Rhamnaceae), *Piper subfuscum* C. DC. (Piperaceae), *Hoffmannia psychotriifolia* (Benth.) Griseb. (Rubiaceae), *Lippia cardiostegia* Benth. (Verbenaceae), *Picramnia antidesma* Sw. (Simaroubaceae), *Rondeletia calycosa* Donn. Sm. (Rubiaceae), *Siparuna gesnerioides* (Kunth) A. DC. (Monimiaceae), *Trophis mexicana* (Liebm.) Bureau (Moraceae), entre otras.

Etimología.—El epíteto latino *subsessilifolia* hace alusión a la presencia de hojas casi sésiles.

Paratipos. **COSTA RICA. ABSTRACT

A new species of black zapote from tropical Mexico is described, and photos of the holotype are provided. **Diospyros torresii** M.C. Provance & A.C. Sanders is based on collections from two localities in north and central Oaxaca. This species appears to belong to a group of closely related American *Diospyros* with fruits that are dark-colored and sweet at maturity.

Key Words: black zapote, *Diospyros torresii*, Ebenaceae, Mexican persimmons, systematics, taxonomy, Tehuacán-Cuicatlán Valley, zapote negro

RESUMEN

Se describe una nueva especie del México tropical y se presentan fotos del holotipo. La descripción de **Diospyros torresii** M.C. Provance & A.C. Sanders se basa en colecciones de dos localidades en el norte y centro de Oaxaca. Se cree que esta especie pertenece a un grupo cercanamente relacionado de *Diospyros* de América que tienen frutos de color oscuro y que son dulces cuando maduran.

A monograph of the Mexican *Diospyros* (Ebenaceae) is the current focus of studies by the first author of this paper. During the course of reviewing thousands of collections of American *Diospyros*, it has become clear that there are several undescribed taxa in Mexico. This paper describes one such species based on collections from Oaxaca, Mexico, that do not belong to any currently recognized species. A comprehensive key to the Mexican species of *Diospyros* has not been published since that by P.C. Standley (1924). Such a key and classification will soon be published by the first author in connection with his current work on the genus in Mexico. The new species described here is best considered a member of what we informally recognize as the *Diospyros rosei* Complex.

The flowering sepals of this complex tend to have vermiform glandular hairs at their apices. The sepals of female flowers tend to be strongly accrescent and are 5–8 in number. The species of this group produce medium size fleshy fruits that are dark-colored and sweet at maturity, and may contain from 10 to 16 ovules. In addition to the species described here, this group includes: *Diospyros rosei* Standl., *Diospyros palmeri* Eastw., *Diospyros californica* I.M. Johnst., *Diospyros oaxacana* Standl., *Diospyros sonorae* Standl., *Diospyros texana* Scheele, *Diospyros riojae* Gomez-Pompa, *Diospyros conzattii* Standl., *Diospyros rekoi*

SIDA 21(4): 2045–2050. 2005

Standl., and *Diospyros xolocotzii* Madrigal & Rzed. Some South American species may belong to this group as well. However, sufficient material from that continent was not available for investigation. We have evaluated the holotype of *D. morenoi* A. Pool, a species recently described from Nicaragua (Pool 1997). In our opinion, this material is consistent with *D. rekoi*, a species for which we have seen material from Mexico and El Salvador.

SPECIES DESCRIPTION

Diospyros torresii M.C. Provance & A.C. Sanders, sp. nov. (**Fig. 1**). TYPE. MEXICO. OAXACA: Mpio. Santiago Texcalcingo: 11 km al E de Teotitlán del Camino carr. a Huautla de Jiménez, [approx. 18° 11'N, 97° 02'W], 1710 m, 17 Mar 1985, *R. Torres C. & M.A. Martínez 6636* (HOLOTYPE: MO; ISOTYPE. CHAPA).

Frutices vel arbores 4 m alta; laminae lanceolatae vel ovatae, petioli decurrentes; petala ovalia vel quadrata, ac manifeste introrsa secus marginem dextrum adaxialum; calyces 5–7 partiti; sepala florentia dense minuta clavata glandulosa adaxialiter; fructus ellipsoidei, atropurpurei ubi desiccati.

Shrubs or trees 4 m tall, probably facultatively deciduous; **old stems** often pulverulent, rarely smooth, dark reddish-brown to dark gray; **current years stems** with stiff, erect, reddish hairs densely covering surface, occasionally retrorse, some slightly wavy, densely appressed at the shoot apex; **lenticels** common, filling tissue yellowish to off-white; **bud scales** convex, ovate, densely appressed reddish hairy; **petioles** 2–4 mm long, both sides densely erect white hairy, sometimes clavate glandular hairy, convex below, ± flat and minutely V-grooved above, distal half minutely winged along the margin, sometimes winged the entire length; **mature leaves** entire, alternate, chartaceous, lanceolate to ovate, 3–6 cm long including the petiole, 2–3 cm wide, blade abruptly decurrent on the petiole, mostly grayish in herbarium material, base rounded, obtuse or acute, margin revolute, apex obtusely rounded, sometimes acutely rounded, below sparsely to moderately erect white hairy, hairs sometimes slightly wavy, sometimes clavate glandular hairy, minutely papillate, usually minutely black gland-dotted, above irregularly wavy to ± rugose, glabrate to minutely erect white hairy, sparsely and minutely papillate, sometimes sparsely clavate glandular hairy; **laminar extrafloral nectaries** abaxial, minute, roundish, mostly raised, probably green in living material; **venation** ± brochidodromous; **midrib** prominent below, sub-terete, densely to very densely erect white to reddish hairy, above flush or barely raised, rarely slightly impressed, yellowish, sparsely to densely erect hairy, less hairy distally, often becoming glabrate, often clavate glandular hairy near the petiole; **2° venation** 5–7 major lateral veins on each side of midrib, below raised, above flush with surface or barely raised, very obscure; **3° venation** reticulated below raised or not, visible or not, above impressed, often obscure, sometimes not visible; **new leaves** strigillose below, especially along the midrib, clavate glandular hairy, above minutely hairy, the hairs mostly erect, sometimes appressed, clavate glandular hairy; **female flowers** solitary on young

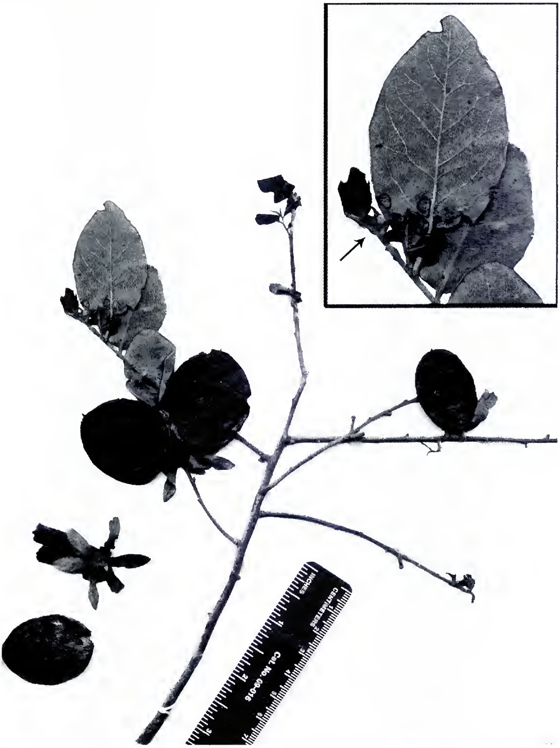

Fig. 1. *Diospyros torresii* M.C. Provance & A.C. Sanders. Holotype, *R. Torres C. & M. A. Martínez 6636* (MO) with detail of leaf (inset) and female flower (indicated by the arrow).

stems; **flowering pedicels** 2 mm long; **pedicel bracts** 2, sub-opposite, 4–7 mm long, 0.75 mm wide, linear, densely minute erect hairy, densely clavate glandular hairy; **fruiting pedicels** 5–10 mm long, ± 1.5 mm wide, somewhat stout, densely but minutely erect hairy, apex hat-shaped; **calyx** 5–7-merous, sinuses rounded, acute; **calyx tube** cupulate, exterior sparsely to moderately minutely appressed hairy; **flowering sepals** 5–6 mm long, ± 2 mm wide, sparsely hairy, the hairs containing a reddish-brown compound, exterior moderately to sparsely appressed hairy, sparsely and minutely clavate glandular hairy, apically dark glandular vermiform hairy, interior densely but minutely clavate glandular hairy, with low to moderate numbers of simple hairs, especially towards base; **fruiting sepals** accrescent in fruit, 16–17 mm long, 5–6 mm wide, thick, ± spreading, lance-ovate to elliptic, apices acutely-rounded, venation obscure, minutely hairy on both sides, sparser towards the apex, minutely black gland-dotted on both sides; **female corolla** 3 mm long; **corolla tube** 1.25 mm long, 2.0–2.5 mm wide, exterior densely appressed hairy, interior glabrous; **lobes** 5, ± 1.75 mm long, oval to quadrate, exterior densely appressed hairy, inside glabrous, involute, more so on the right margin than the left; **ovary** globose, smooth, sparsely minute hairy; **styles** 5, one third of length of ovary, connate, becoming distinct distally; **stigmas** 5, short, labiate; **staminodes** none seen; **male flowers** unknown; **fruit** a berry, ellipsoid, ± 4 cm long, 3 cm wide; **mesocarp** fibrous, orange in herbarium material; **exocarp** ± 2 mm thick, hypodermis moderately thick, sclerified, epidermis minutely blistered, glabrous, atropurpureous in dried material.

Distribution and Ecology.—To our knowledge, *Diospyros torresii* has so far only been collected in the state of Oaxaca, Mexico, however, the type was collected within ca. 2 km of the Puebla state line, and we believe that it probably occurs in that state also. The type collection was made in oak woodlands of the Sierra Mazateca west of Huautla. The condition of the material from the Sierra Mazateca leads us to believe that *D. torresii* is facultatively deciduous. Both sheets of Torres 6636 demonstrate ripe fruit, new female flowers and relatively few mature leaves, but there are a number of young shoots with very young leaves. The paratype was collected from the Tlacolula Valley, but unfortunately is without specific ecological data.

Etymology.—This species is named in honor of Rafael Torres Colín, an authority on *Bauhinia* (Fabaceae) and Oaxacan floristics, and also the collector of the type.

PARATYPE: **MEXICO. Oaxaca:** Mpio. Villa Díaz Ordaz: Barranca of Díaz Ordaz, NW of Mitla, 1700 m, 11 Feb 1966, *M. & A. Kirkby 2739* (NA)

DISCUSSION

Diospyros torresii is currently known from two localities in Oaxaca. The material used to describe this new species was previously identified as *D. palmeri*

Eastwood (*R. Torres C. & R Cedillo T. 6636*) or *D. aequoris* Standley (*M. & A. Kirkby 2739*). Morphologically it most resembles *Diospyros oaxacana* Standley, *Diospyros riojae* Gomez-Pompa and *Diospyros conzattii* Standley. It can easily be distinguished from these species provided fertile material is available. In fact, even though identification of sterile *Diospyros* material is sometimes difficult, in the case of *D. torresii* sterile material should not pose a major problem. The paratype is sterile but we are confident that this material represents the new species. Vegetative features that distinguish *D. torresii* from *D. conzattii* include its smaller, usually thicker leaves and shorter petioles. In addition, the lamina of *D. torresii* is abruptly decurrent on the petiole, and decurrent for a shorter distance than in *D. conzattii*, whereas the leaves of *D. conzattii* are typically tapered basally and often decurrent on the petiole for nearly the entire length. The leaves and petioles of *D. oaxacana* are velutinous to densely pilose, often on both sides, while in *D. torresii* they are glabrous or have only sparse, minute, erect hairs. Furthermore, the leaves of *D. oaxacana* tend to be oval to obovate versus the lanceolate to ovate leaves of *D. torresii*. The leaves of *D. riojae* tend to be larger than those of the new species, but more importantly, the 2°and 3°veins as viewed from the adaxial surface of the leaves are raised and contrast sharply with the lamina. In *D. torresii* the 2° and 3° veins are scarcely visible adaxially.

An interesting detail concerning the type locality is that it is only about 20 km from Coxcatlán, Puebla, and other archaeological sites that have yielded evidence of early agriculture in Mexico (e.g. Smith 1965; Eubanks 2001). Most close relatives of *D. torresii* are known to produce fruits that are edible or even highly desirable. *Diospyros oaxacana* has been recorded as a useful plant in the Tehuacán-Cuicatlán Valley (Casas et al. 2001), and *D. conzattii* has been recorded as a useful plant in Chinantec-speaking communities of the Oaxacan highlands in the District of Cuicatlán (Lipp 1971). Given the large size of the ripe fruits, their probable edibility, and the nearness of this species to some of the oldest agricultural sites in the New World, it may be worthwhile to reevaluate the identification of putative *Diospyros digyna* seeds associated with nearby archaeological sites (e.g. Smith 1965; Callen 1965). Similarly, herbarium vouchers, if they exist, associated with ethnobotanical reports of *Diospyros* usage by nearby indigenous populations (Lipp 1971) should also be reviewed.

Few specimens of this new taxon are known to us, and although this makes it tempting to recommend formal protection for *D. torresii*, we first recommend focused collecting in Oaxaca before such action is taken.

ACKNOWLEDGMENTS

The authors of this paper would like to express their gratitude to Brett Provance for preparation of the Latin diagnosis, Jeffrey Ross-Ibarra for translating the abstract into Spanish, Victor Steinmann for reviewing a very preliminary manuscript and subsequently making many useful suggestions, and also the anonymous reviewers for there recommendations. We would like to thank all of the herbaria that have loaned material for the revision of Mexican *Diospyros*, but especially CHAPA, MO and NA for the loan of specimens that brought this new species to our attention. We would like to thank E.O. Plummer for all of his technical assistance.

ABSTRACT

The new combination **Staurochilus leytensis** (Ames) E.A. Christenson (Orchidaceae) is made.

RESUMEN

Se hace la nueva combinación **Staurochilus leytensis** (Ames) E.A. Christenson (Orchidaceae).

Oakes Ames and his associates at Harvard University accepted extremely broadly defined species during the first half of the 20th century and in the process reduced many taxa to synonymy. *Vandopsis leytensis* Ames was treated as a synonym of *Staurochilus fasciatus* by Ames and Quisumbing (1932). This species is here recognized as distinct and a new combination is published in *Staurochilus*.

Staurochilus fasciatus (Rchb.f.) Ridl., J. Linn. Soc., Bot. 32:350. 1896. *Trichoglottis fasciata* Rchb.f., Flora 55(9):137. 1872; *Stauropsis fasciata* (Rchb.f.) Benth., Index Kewensis 982. 1885. TYPE: "Hinterindien," collector unknown (HOLOTYPE: W).

Distribution.—Thailand, Laos, Kampuchea. Vietnam, Peninsular Malaysia, Sumatra, Borneo (following Seidenfaden 1988).

Staurochilus leytensis (Ames) E.A. Christenson, comb. nov. BASIONYM: *Vandopsis leytensis* Ames, Orchid. 5:222. 1915. TYPE: THE PHILIPPINES: Leyte, Dagami, 60 m, 14 Dec 1912, *C.A. Wenzel 14* (LECTOTYPE: AMES; ISOLECTOTYPE: NY[1], designated by Seidenfaden 1988).

Ames and Quisumbing (1932) illustrated S. leytensis (as *Stauropsis fasciata* (Rchb.f.) Benth.) with photographs, black and white drawings, and colored drawings without noting its distinctive features.

Distribution.—*Staurochilus leytensis* has been collected on Agusan, Leyte, Quezon, Rizal and Sorsogon at elevations of 60–800 m (Valmayor 1984, as *Trichoglottis fasciata* Rchb.f.). While these records need to be reexamined, there is no reason to believe that any of them represent a far disjunct population of true *Staurochilus fasciatus* which is native to Southeast Asia, adjacent Indonesia, and reportedly Borneo.

While *S. fasciatus* and *S. leytensis* are clearly sister species, they are amply

---

[1] An image of the isolectotype is available online at nybg.org

distinct and geographically quite isolated from each other. In *S. fasciatus* the leaves are V-shaped in cross section and ligulate, the lateral sepals are falcate-incurved ("bowlegged"), the petals are flat, the large lateral lip lobes lie in the same plane as the midlobe, and the sepals and petals are densely marked. In contrast, *S. leytensis* has leaves that are flat and proportionately broader, divergent lateral sepals, incurved petals, shallowly suberect-incurved lateral lip lobes, and different floral markings. The species can be distinguished in following key:

Leaves ligulate, V-shaped in cross-section, up to 12 × 2.5 cm; lateral sepals incurved-falcate such that the three sepals form a tall isosceles triangle; petals flat and held rigidly at 180°, large lateral lip lobes lie in one plane together with the midlobe ____ **Staurochilus fasciatus**

Leaves oblong-elliptic, flat with only a depressed midvein, up to 10 × 3 cm; lateral sepals strongly divergent such that the three sepals form an equilateral triangle; petals incurved yielding a shallowly cupped flower, petals of *S. leytensis* appear to be more narrowly clawed than those of *S. fasciatus* but more specimens are needed to quantify this difference, lateral lip lobes shallowly erect-incurved and do not lie in the same plane as the midlobe ____ **Staurochilus leytensis**

While both *S. fasciatus* and *S. leytensis* have pale yellow sepals and petals with transverse brown bars, the markings are different. In *S. fasciatus* the bars are thick and often coalesce toward the segment apices forming nearly solid brown patches. The bars of *S. leytensis* are narrower, cover significantly less of the surface, and do not appear to coalesce into solid patches.

On an historical note, when Ridley (1896) first described *Staurochilus* with *S. fasciatus* as the sole species he stated that "It is commonly stated in horticultural books that this is a native of the Philippines. I have not seen any thence." It appears that he was on the right track after all and that the species does not occur in the Philippines.

ESTUDIOS EN LAS APOCYNACEAE NEOTROPICALES XVII: UNA REVISIÓN DEL GÉNERO *GALACTOPHORA* (APOCYNACEAE: APOCYNOIDEAE)

J. Francisco Morales

Instituto Nacional de Biodiversidad (INBio)
Apto 22-3100
Santo Domingo de Heredia, COSTA RICA

RESUMEN

Las especies del género *Galactophora* Woodson (Apocynaceae: Apocynoideae), son tratadas en una monografía. Seis especies son aceptadas, incluyendo una nueva especie, **G. angustifolia** y se proponen dos nuevos sinónimos. Se brindan claves, descripciones, ilustraciones y especímenes examinados.

ABSTRACT

The species of the genus *Galactophora* Woodson (Apocynaceae: Apocynoideae) are treated in a monograph. Six species are accepted, including a new species, **G. angustifolia**, and two new synonyms are proposed. Keys, descriptions, illustrations and specimens examined are provided.

Galactophora (Apocynaceae, Apocynoideae) es un pequeño género de 6 especies, originalmente descrito por Woodson (1932) y distribuido en el SE de Colombia, Venezuela, Perú, Bolivia y Brasil, que se puede reconocer fácilmente por su hábito usualmente erecto o suberecto (raramente escandente), hojas con la lámina coriácea o subcoriácea, usualmente revolutas marginalmente, sin coléteres en el nervio central adaxialmente, inflorescencias cortamente racemosas o cimas reducidas, terminales o subterminales, usualmente con pocas flores, sépalos sin coléteres en la base de la cara adaxial, anteras aglutinadas a la cabeza estigmática, cabeza estigmática con cinco crestas o proyecciones longitudinales, restringidas a la base, y la ocasional presencia de pelos glandulares en tallos, inflorescencias y sépalos. La presencia de otros géneros en Sur América con caracteres morfológicos similares no es común, pudiéndose confundirse solamente con algunas especies de *Mandevilla* y *Macrosiphonia* con hábito erecto e inflorescencias terminales. Sin embargo, estos géneros se pueden separar con facilidad por la presencia usual de coléteres, ya sea en el nervio central de las hojas adaxialmente, así como en la base de la cara adaxial de los sépalos. Por otro lado, aunque *Prestonia erecta* (Malme) J.F. Morales también tiene hábito erecto e inflorescencias terminales, la presencia de una corona anular alrededor de la boca en esa especie la separa al instante, así como hojas con la lámina foliar membranácea.

Siguiendo con la revisión de géneros de las tribus Echiteae y Mesechiteae (sensu Endress & Bruyns 2000), una monografía del género *Galactophora* es

SIDA 21(4): 2053–2079. 2005

presentada a continuación. Para tal fin, la mayoría de colecciones tipo fueron revisadas, así como las colecciones depositadas en los principales herbarios de Europa, Norte América y del N de S América (Colombia, Ecuador, Perú y Bolivia). El esquema utilizado acá sigue el empleado anteriormente en otras revisiones y monografías de la misma serie (e.g., Morales 2002, 2003).

Características morfológicas notables

Hojas.—Las hojas son opuestas, aunque raramente hojas verticiladas puedan ser encontradas en algunos especímenes, careciendo de coléteres en el nervio central (adaxialmente). Las láminas son invariablemente coriáceas, con los márgenes usualmente revolutos al secar y es común que las venas secundarias apenas estén impresas en ambas superficies, mientras que las venas terciarias raramente están impresas (e.g., *G. schomburgkiana* Woodson).

Pubescencia.—La pubescencia de tallos, hojas e inflorescencias (cuando presente) es típica de *Galactophora* y está compuesto por pelos unicelulares, relativamente rígidos y usualmente de color oscuro al secar, con la parte distal y apical, conspicuamente engrosada y glandular (Fig. 1). Este tipo de pubescencia no está presente en el resto de los miembros de las tribus Mesechiteae ni Echiteae, a pesar de la alta variabilidad de patrones de pubescencia presentes en géneros como *Mandevilla*. Solamente en *M. pachyphylla* Woodson, pelos cortos, bulbosos y a veces levemente uncinados están presentes, pero nunca como los descritos en *Galactophora*. En forma tradicional y continua, la pubescencia ha sido utilizada por varios taxónomos para separar múltiples taxones, entre ellos De Candolle (1844), Müller (1860) y Woodson (1933, 1935, 1936). Sin embargo, la variación intraespecífica en forma general en las Apocynaceae puede ser muy alta y este carácter debe ser usado en la medida de lo posible con precaución y en conjunción con otros caracteres morfológicos. De esta manera, tomando en cuenta la relativamente escasez de cantidad de material disponible en el siglo 18 y en la primera mitad del siglo 19, muchas especies fueron separadas basados en rangos extremos de pubescencia, sin especímenes intermedios que permitieran definir la conexión entre estos extremos. El relativamente alto número de material disponible hoy en día, ha demostrado que varias de esas especies solo representan variaciones extremas de la pubescencia dentro de un mismo taxón y han debido ser sinonimizadas en monografías o revisiones recientes (e.g., Fallen 1983; Hansen 1985; Leeuwenberg 1994 a; Morales 1997, 1998, 1999, 2002, 2003; Williams 1998). De esta manera, la misma situación se ha presentado en *Galactophora*, donde *G. crassifolia* y *G. calycina* han sido separadas básicamente por el indumento presente en la primera y ausente en la segunda (Woodson 1936; Morillo 1995). Tanto los ejemplares tipo como el resto de colecciones examinadas son idénticos en su morfología general y se encuentran una serie de especímenes con grados intermedios de pubescencia, lo que impediría aún más el pensar en reconocer estas dos formas a nivel de variedad.

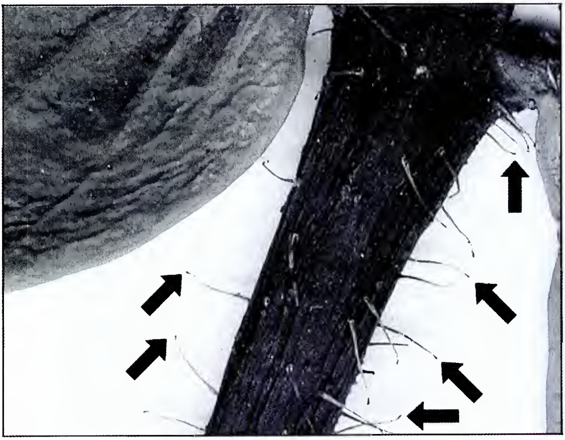

Fig. 1. Detalle de los pelos glandulares de *Galactophora crassifolia* (*Cárdenas & Bangi 4627*, INB).

Esta variabilidad de la pubescencia en este género, reafirma nuevamente la alta variabilidad intraespecífica en las Apocynaceae neotropicales de ese carácter.

Inflorescencias.—Woodson (1936) originalmente describió que las inflorescencias en este género eran subumbeliformes o escorpioidales y corimbosas, pero el análisis y estudio de este carácter ha determinado que en realidad las inflorescencias son cortamente racemosas o reducidas a cimas (ocasionalmente con apariencia subumbeliforme), algunas veces con solo 1 ó 2 flores. En forma usual tienen pocas flores, con un rango de 1 a 5 por inflorescencia, aunque ocasionalmente se encuentran grupos de hasta 11 flores. Las brácteas florales son siempre escariosas y no se reporta la presencia de bracteolas a lo largo del pedicelo.

Cáliz.—El cáliz presenta cinco sépalos, los cuales pueden ser totalmente glabros o presentar en diferentes grados de densidad, el típico indumento de *Galactophora*. La presencia o ausencia del indumento no es determinante para separar especies, pero la longitud de los sépalos en algunos casos puede ser útil para separar algunos taxones. Sin embargo, la más notable e importante diferencia respecto a tratamientos monográficos previos se refiere a la presencia de coléteres en la base de la cara adaxial de los sépalos. Woodson (1936) reportó que los sépalos tenían "several to many indefinitely distributed squamellae," es decir, que albergaban una serie de coléteres fusiformes, pequeños y diminutos, similares a los presentes en otros géneros de las Echiteae, como por ejemplo, *Peltastes*. Sin embargo, después de examinar numerosos sépalos de diferentes especímenes de todas las especies, es claro que *Galactophora* no tiene coléteres, tal y como fueron descritos e ilustrados en la monografía de Woodson (1936). La ausencia de coléteres fue previamente notado por Morillo (1995), quién en su tratamiento de *Galactophora* para la Flora de la Guyana Venezolana, citó que los sépalos, al parecer, carecían de coléteres en la base interna. En forma usual, los coléteres están presentes en casi todos los miembros de las Echiteae y Mesechiteae, con la excepción de *Laubertia* y *Rhabdadenia*.

Corolas.—En forma general, es común que las corolas presenten cinco costillas o crestas longitudinales externas que corren desde la base del tubo hasta el márgen de los lóbulos (Fig. 2). Aunque en material fresco las crestas son apenas evidentes, son mucho más evidentes en material seco. Este tipo de crestas no están presentes en ningún otro miembro de las Mesechiteae o Echiteae y es un carácter bastante distintivo que nos ayuda a reconocer con facilidad las especies de este género. Las partes de la corola mencionadas a través de las descripciones siguen a Morales & Fuentes (2004 b).

Ovario y folículos.—En todas las especies, los dos carpelos se hayan fusionados postgenitalmente en forma basal, separándose ligeramente por encima del nectario. Esto provoca que los folículos, casi en forma invariable, se hallen fusionados en el área basal proximal al cáliz en un área inferior a 2(–2.5) cm de su longitud, para luego separarse de manera definitiva, continuando de forma divergente, continua y rígida. Este tipo de fusión basal, da una falsa apariencia de que los folículos fueran estipitados (Fig. 3). Este carácter no está presente en el resto de las Mesechiteae o Echiteae y es bastante distintivo para el género.

Notas en la clasificación intragenérica

El género *Galactophora* fue descrito en forma relativamente reciente por Woodson (1932), por lo que no fue incluido como tal en clasificaciones infragenéricas previas (e.g., Schumann 1895). En forma posterior, Pichon fue el primero en proponer una extensa clasificación de las Apocynaceae (1948 a, b, c; 1949; 1950 a, b) , clasificando a *Galactophora* en la subfamilia Echitoideae ("Echitoïdees"), tribu Parsonsieae ("Parsonsiées"), junto con la mayoría de los miembros de las Echitoideae sensu Woodson (1935, 1936), excepto *Mandevilla* y sus géneros satélites (e.g., *Allomarkgrafia*, *Mesechites*). Adicionalmente, en su clasificación de las Echotoideae, Pichon (1950 a), ubicó a *Galactophora* dentro de una subtribu propia (*Galactophorinae*), basado en algunos caracteres de la corola y frutos. Posteriormente, Leeuwenberg (1994 b) propuso otro sisterma de clasificación, tratando a *Galactophora* dentro de la tribu *Echiteae* subtribu

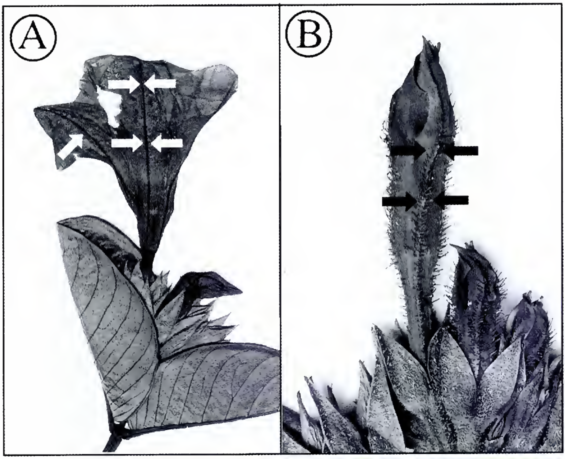

Fig. 2. Detalle de las costillas o crestas longitudinales en corolas de *Galactophora* **A.** *G. crassifolia* (*Prance et al. 25006*, INB). **B.** *G. shomburgkiana* (*Boom & Weitzman 5757*, INB).

Echiteae, donde tanto *Mandevilla*, *Echites* y los géneros relacionados, fueron tratados en la misma subtribu. Sin embargo, en forma general, las tribus propuestas por Leeuwenberg son artificiales (Sennblad et al. 1998) y confusas, debido a la ausencia de una explicación de los criterios utilizados en su delimitación. Ahora bien, Endress & Bruyns (2000) propusieron la más reciente clasificación de las Apocynaceae, incluyendo por primera vez Asclepiadaceae, tal y como fue sugerido por análisis moleculares previos (e.g., Judd et al. 1994; Sennblad & Bremer 1996). En el sistema de Endress & Bruyns (2000), *Galactophora* fue tratado en la tribu *Mesechiteae*, junto con *Mandevilla* y sus géneros relacionados. La inclusión de *Galactophora* dentro de esta tribu, fue basado probablemente por la presencia de las cinco proyecciones o costillas basales de la cabeza estigmática. Sin embargo, sus hojas carecían de coléteres en la superficie adaxial del nervio, carácter común al resto de géneros en esa tribu, con la excepción de *Secondatia*, otro género que fue excluido de esa tribu en forma preliminar por Morales (2003), basado en las caracteres de la cabeza estigmática. Las relaciones intergenéricas de los miembros de las Mesechiteae

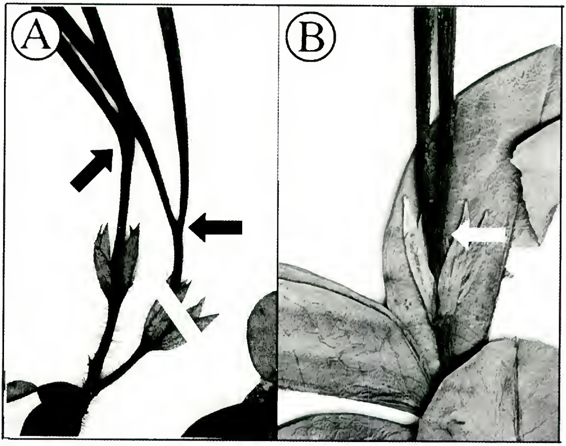

Fig. 3. Detalle de la fusión basal de los folículos en *Galactophora crassifolia*. **A.** *Liesner & Carnevali 22881*, MO. **B.** *Guillén & Roca 2853*, INB.

han sido confusas, debido a los caracteres algunas veces relativamente débiles usados en su separación. En forma reciente, Simões et al. (2004), realizaron un estudio molecular y morfológico para probar la monofilia de la tribu Mesechiteae, donde se confirmó que *Galactophora* debe ser excluido de la tribu Mesechiteae, al igual que Secondatia. Por lo tanto, dado que su ubicación tribal actual es incierta, no se puede comentar en forma apropiada las relaciones intergenéricas de *Galactophora*.

TRATAMIENTO SISTEMÁTICO

Galactophora Woodson, Ann. Missouri Bot. Gard. 19:49. 1932. Tipo: *Galactophora crassifolia* (Müll. Arg.) Woodson

Hierbas arbustivas, raramente escandentes o lianas; las ramitas tiernas algunas veces aplanadas o anguladas, usualmente teretes o subteretes con la edad, con secreción lechosa o acuosa, glabras, glabrescentes a variadamente glandular-pubescentes, los coléteres inter e intrapeciolares, fusiformes e inconspicuos. Hojas opuestas, raramente verticiladas, sésiles, subsésiles a pecioladas, pecíolos eglandulares, sin coléteres a lo largo de la costa adaxialmente, pero con inconspicuos coléteres en los axilas; láminas glabras, glabrescentes a variadamente glandular-pubescentes, coriáceas a subcoriáceas, eglandulares, sin coléteres en el nervio central adaxialmente, usualmente variadamente revolutas, la venación secundaria y terciaria usualmente inconspicua, más raramente levemente impresas en alguna de las caras de la hoja. Inflorescencias racemosas o cimas reducidas, terminales o subterminales, usualmente con pocas flores (1 a 11), glabras, glabrescentes a variadamente glandular-pubescentes, pedunculadas a sésiles o subsésiles, brácteas escariosas, inconspicuas, bracteolas ausentes; sépalos 5, esencialmente iguales, algo imbricados basalmente, escariosos, subfoliáceos, o foliáceos, sin coléteres en la base de la cara interna; corola infundibuliforme, glabra, glabrescente a variadamente glandular-pubescente exteriormente, sin corona anular o corona epiestaminal (apéndices coronales libres) interiormente, usualmente con cinco crestas o costillas longitudinales externamente, distribuidas desde la base del tubo hasta la base de los lóbulos, el limbo dividido en cinco lóbulos, estos variadamente nervados longitudinalmente, con aestivación dextrorsa; estambres cinco, insertos dentro del tubo, incluidos, los filamentos variadamente pubescentes, indumento infraestaminal usualmente presente; anteras conniventes y aglutinadas en dos puntos a la cabeza estigmática, las bases estériles agudas o acuminadas; carpelos dos, unidos apicalmente al estilo, fusionados postgenitalmente en su región basal, usualmente hasta la altura del nectario; cabeza estigmática con cinco proyecciones o costillas longitudinales basales, el resto relativamente cilíndrico, con el ápice algo engrosado; óvulos numerosos, multi-seriados, dispuestos en una placenta axilar y biseriada; nectario anular, entero, subentero o irregularmente lobulado, mucho más corto que el ovario. Folículos 2, apocárpicos, teretes a subteretes, continuos, fusionados en su parte basal y luego separados y divergentes entre sí, glabros, glabrescentes o variadamente pubescentes, dehiscentes a lo largo de la sutura ventral; semillas numerosas, secas, truncadas apicalmente, comosas en el ápice micropilar, usualmente rugosas, más raramente casi lisas.

Género neotropical con 6 especies, distribuido principalmente en el SE de Colombia, Venezuela y Brasil, con una especie extendiéndose hasta Perú y el NE de Bolivia.

CLAVE PARA LAS ESPECIES DE *GALACTOPHORA*

1. Sépalos 15–25 mm de largo ________ **3. G. crassifolia**
1. Sépalos 4–12.5 mm de largo.
    2. Parte inferior del tubo de la corola de 19–31 mm de largo, la boca de (18–)23–32 mm en diámetro; láminas foliares con la venación secundaria y terciaria impresa adaxialmente; distribución geográfica en tepuís entre 750–2000 m ________ **6. G. schomburkiana**
    2. Parte inferior del tubo de la corola de 5.5–14 mm de largo, la boca de 5–16 mm en diámetro; venación secundaria levemente o no impresa adaxialmente, las

venas terciarias no impresas en ambas caras; distribución geográfica en sabanas y áreas diversas entre 100–1200 m.

3. Láminas foliares de 8.5–15.5(–17) × (4–)5–8 cm, ovadas a ovado-elípticas, levemente cordadas basalmente ______ **2. G. colellana**
3. Láminas foliares de 1.7–6.2 × 0.5–2.4 cm, elípticas a angostamente elípticas, cuneadas, obtusas a redondeadas basalmente.
    4. Hojas con la base cordada, sésiles o subsésiles ______ **1. G. angustifolia**
    4. Hojas con la base cuneada, redondeada a obtusa, pecioladas o si cortamente pecioladas, la base nunca cordada.
        5. Inflorescencias con 5 a 11 flores, pedúnculo de 7–42 mm de largo; sépalos de 4–6 mm de largo; parte superior del tubo de la corola de 15–16 mm de longitud ______ **3. G. pulchella**
        5. Inflorescencias con 1 a 2 flores, pedúnculo menos de 2 mm de largo; sépalos de 8–11 mm de largo; parte superior del tubo de la corola de 23–31 mm de longitud ______ **4. G. pumila**

1. Galactophora angustifolia J.F. Morales, sp. nov. (**Fig. 4**). Tipo: COLOMBIA. Caqueta: parque nacional natural Chiribiquete, alrededores del campamento base, borde de quebrada, 19 Nov 1992 (fl), *M. Velayos, J. Cardiel, J. Pedrol & M. Telleria 6319* (holotipo: MA; isotipo: P, fotografía, INB).

A G. *pulchella* Woodson, cui affinis, foliis cordatis, sessilis vel subsessilis et 1–1.4 cm latis differt.

Hábito desconocido; tallos subteretes a teretes, sólidos, glabros o glabrescentes e inconspicuamente glandular-hirsutulos, los pelos glándulares (cuando presentes) negros; coléteres inter e intrapeciolares inconspicuos, ca. 1 mm de largo. Hojas sésiles a subsésiles, el pecíolo menos de 1 de largo; lámina 6.8–9 × 1–1.6 cm, angostamente ovadas a angostamente ovado-elípticas, agudas apicalmente, cordadas basalmente, coriáceas a subcoriáceas, glabras o glabrescentes y con inconspicuos pelos esparcidos abaxialmente, levemente revolutas marginalmente o no revolutas, la venación secundaria levemente impresa abaxialmente, algunas veces inconspicua, las venas terciarias no impresas. Inflorescencia terminal, glabrescente, con más de 6 flores, pedúnculo 5–6 mm de largo, pedicelos 2.5–3 mm de largo, brácteas 1–1.5 × 0.5–1 mm, escariosas; sépalos 5–6 × 1–1.3 mm, angostamente ovados a angostamente ovado-elípticos, acuminados, subfoliáceos, glabrescentes a muy esparcidamente glandular-hirsutulos exteriormente; corola de color desconocido, glabrescente exteriormente, con solo pelos distribuidos en las líneas externas de la corola, el ápice del botón floral cortamente acuminado; parte inferior del tubo 6–7 × 1.5–2 mm, la parte superior 14–15 mm de largo, angostamente cónica, 3–4 mm en diámetro en el orificio; lóbulos 7–8 × 4–5 mm, angostamente obovados; anteras 4–4.2 mm de largo, glabras, las bases estériles cortamente acuminadas, cabeza estigmática 1.5–1.8 mm de largo; ovario 2–2.6 mm de largo, glabro; nectario 0.8–1 mm de largo, entero a subentero. Folículos desconocidos.

Distribución, hábitat y ecología.—Endémica a Colombia al Departamento de Caquetá, donde es conocida únicamente de la localidad tipo, creciendo en

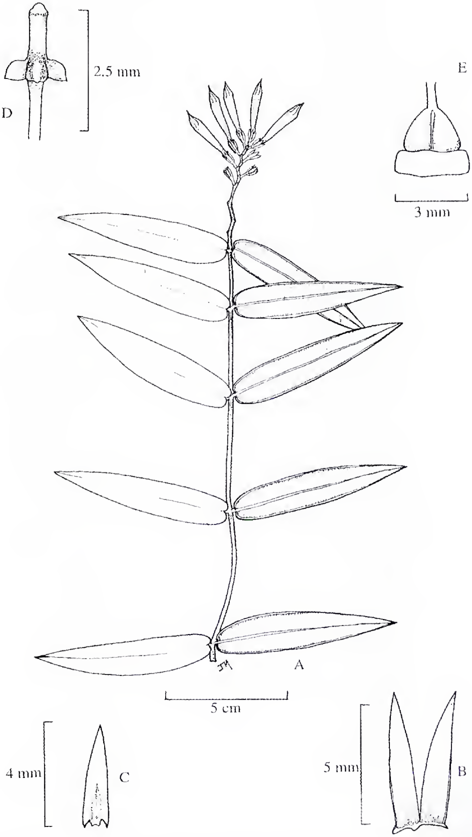

Fig. 4. *Galactophora angustifolia* (*Velayos et al. 6319*, P). **A.** Ramita con inflorescencias. **B.** Sépalos, vista adaxial, mostrando la ausencia de coléteres. **C.** Antera, vista dorsal. **D.** Cabeza estigmática. **E.** Nectario y ovario.

vegetación en bordes de quebradas, en elevaciones de 645 m. Especímenes con flores han sido recolectados en Noviembre.

Galactophora angustifolia es una especie muy distintiva, que se podría confundir con *G. pulchella*, pero se diferencia con facilidad por sus hojas sésiles o subsésiles, con el pecíolo inferior a 1 mm de largo, hojas angostamente ovadas o angostamente ovado-elípticas, con la lámina 1–1.6 cm de ancho y con la base cordada, así como la corola con la parte inferior del tubo de 6–7 mm de largo.

Tanto el hábito como el color de las flores de esta especie son aún desconocidos, debido a que ambos caracteres no son especificados en la etiqueta del holotipo.

2. Galactophora colellana Morillo, Anales Jard. Bot. Madrid. 48:27. 1990. (**Fig. 5**). Tipo: VENEZUELA. AMAZONAS: Río Negro, Cerro de la Neblina, NNE del Pico Phelps, 15 Mar 1984 (fl), *Liesner 16644* (HOLOTIPO: VEN; ISOTIPOS: INB, MO, NY).

Arbusto erecto hasta 1.3 m de altura; tallos aplanados en ramitas jóvenes, subteretes a teretes cuando viejos, sólidos o levemente huecos, esparcidamente glandular-hirsutulos, los pelos glandulares negros; coléteres inter e intrapeciolares inconspicuos, ca. 1 mm de largo. Hojas sésiles a subsésiles, el pecíolo 1–1.5 mm de largo; lámina 8.5–15.5(–17) × (4–)5–8 cm, ovadas a ovado-elípticas, obtusas, agudas, agudo-mucronuladas a obtusas apicalmente, levemente cordadas basalmente, coriáceas a subcoriáceas, muy esparcida y diminutamente papilado-puberulentas en ambas superficies, algo revolutas marginalmente, la venación secundaria levemente impresa, algunas veces inconspicua, las venas terciarias no impresas. Inflorescencia terminal, diminutamente puberulenta, esparcidamente glandular-setosa, con 5 a 8 flores, pedúnculo 14–28 mm de largo, pedicelos 5–8 mm de largo, brácteas 1–1.5 × 0.5 mm, escariosas; sépalos 4–5 × 2–2.5 mm, ovados, acuminados, subfoliáceos, muy esparcidamente glandular-hirsutos exteriormente; corola blanca, muy esparcida e inconspicuamente glandular puberulenta a glabrescente exteriormente, el ápice del botón floral agudo; parte inferior del tubo 13–14 × 1.5–2 mm, la parte superior 15–16 mm de largo, angostamente cónica, 6–7 mm en diámetro en el orificio; lóbulos 9–10 × 4–5 mm, angostamente obovados; anteras 4.5–5 mm de largo, glabras, las bases estériles cortamente acuminadas, cabeza estigmática 1.5–1.8 mm de largo; ovario 2–2.5 mm de largo, glabro; nectario 0.8–1 mm de largo, entero a subentero. Folículos desconocidos.

Distribución, hábitat y ecología.—Esta especie se encuentra distribuida en Colombia, Venezuela y Brasil, donde crece en vegetación arbustiva enana, sabanas arbustivas y afloramientos rocosos en elevaciones de 400–800 m. Especímenes con flores han sido recolectados en Marzo, Julio, Septiembre y Octubre.

Galactophora colellana es una especie que se puede confundir con *G. crassifolia* y *G. schomburgkiana* por el tamaño y forma de sus hojas, pero que se

Arbusto erecto (0.5–)1–2.5 m altura, algunas veces escandente y más raramente una liana; tallos conspicuamente aplanados y angulados en ramitas jóvenes, subteretes con la edad, sólidos, densamente glandular-hirsutos en ramitas jóvenes, esparcidamente glandular-hirsutos a glabrescentes o glabros en tallos viejos, los pelos glandulares negros; coléteres interpeciolares inconspicuos, 1 mm o menos de largo. Hojas sésiles a subsésiles, el pecíolo 1–2 mm de largo; lámina (2.5–)3–11 × 2.1–8 cm, ovadas, ovado-elípticas, obtuso-mucronuladas a emarginado-mucronuladas apicalmente, cordadas a subcordadas basalmente, coriáceas a subcoriáceas, glabras a glabrescentes adaxialmente, diminuta y esparcidamente papiladas a glabras o glabrescentes abaxialmente, algunas veces con puntuaciones negras, variadamente revolutas marginalmente, la venación secundaria levemente impresa, algunas veces inconspicua, las venas terciarias usualmente no impresas. Inflorescencia terminal a subterminal, esparcidamente glandular-puberulenta,con 1 a 5 flores, pedúnculo 8–23 mm de largo, pedicelos 10–16 mm de largo, brácteas 0.5–1 × 0.5–1 mm, escariosas; sépalos 15–25 × 4–6 (–7) mm, ovados, angostamente ovados a ovado-elípticos, agudos o acuminados, foliáceos, esparcidamente hirsútulos a glabrescentes; corola con el tubo crema, blanco a blanco-rosado, los lóbulos rosados, muy esparcidamente glandular-puberulentas a glabrescentes, el ápice del botón floral agudo; parte inferior del tubo 22–32 × 2.5–3 mm, la parte superior 24–32 mm de largo, cónica, 11–16 (–24) mm en diámetro en el orificio; lóbulos 24 × 18 mm, angostamente obovados; anteras 7–8 mm de largo, glabras, las bases estériles cortamente acuminadas, cabeza estigmática 1.9–2.2 mm de largo; ovario 2.9–3.2 mm de largo,

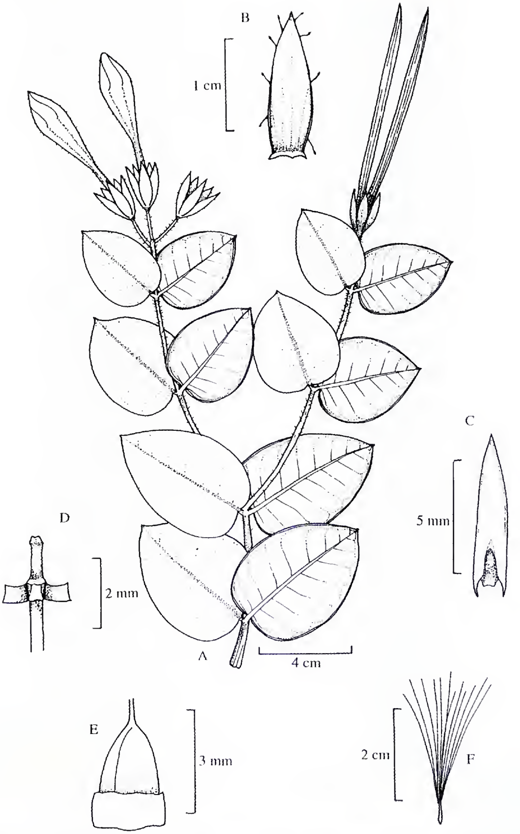

FIG. 6. *Galactophora crassifolia* (*Guillén & Roca 2853*, INB). **A.** Ramita con flores y frutos. **B.** Sépalo, vista adaxial. **C.** Antera, vista dorsal. **D.** Cabeza estigmática. **E.** Nectario y ovario. **F.** Semilla.

glabro; nectario 1–1.2 mm de largo, leve e irregularmente pentalobulado. Folículos 10–17 × 0.3–0.5 cm, continuos, glabros, glabrescentes o variadamente glandular-puberulentos; semillas 3–4 mm de largo, glabras, coma 19–27 mm de largo, crema a blanco-crema.

Distribución, hábitat y ecología.—Se encuentra en Colombia, Venezuela, Brasil, Perú y Bolivia, donde crece en sabanas, bosques enanos en formaciones de arena blanca y en afloramientos rocosos con vegetación arbustiva enana, en elevaciones de 50–600 m. Especímenes con flores han sido recolectados en todos los meses del año. Frutos se reportan de Junio a Febrero.

Nombres comunes.—cupia blanco (Venezuela, Amazonas); bejuco de carbón (Venezuela, Amazonas).

Galactophora crassifolia es la especie más común y ampliamente distribuida, así como la más fácil de reconocer dentro del género por la longitud de sus sépalos, los cuales varían de 15 a 25 mm de largo (vs. 5–12.5 mm en el resto de los taxones). Es común que esta especie sea una hierba erecta o un arbusto pequeño, pero también se conocen especímenes que reportan su hábito en forma de liana (e.g., *Liesner 3415*, MO; *Guillén & Roca 2853*, INB).

Galactophora calycina es reducida a la sinonimia. Básicamente, la única diferencia en los ejemplares tipo de ambas especies es la presencia del indumento de pelos glandulares en *G. crassifolia* y la ausencia de los mismos en *G. calycina*, siendo similares en la longitud de las corolas, sépalos, anteras y demás caracteres. Esto fue comentado en forma previa por Morales y Fuentes (2004 a), quienes sugirieron la sinonimia de *G. calycina*. En el tiempo de la monografía de Woodson (1936), estas especies eran conocidas por solo 17 colecciones (*G. crassifolia* con 7 y *G. calycina* con 10), de las cuales solamente 9 (7 y 2 resperctivamente) fueron revisadas por Woodson. El número evidentemente mayor de material disponible hoy en día, ha permitido conocer mejor la variación morfológica intraespecífica de esta especie y demilitar más claramente sus límites reales. Por otro lado, varias estados intermedios son encontrados, con colecciones con muy escasos pelos, lo que impide aún más la segregación de ambas especies. Es importante recalcar que la pubescencia por sí sola en un carácter bastante variable dentro de las tribus Echiteae y Mesechiteae, donde existen géneros y especies con una alta variabilidad morfológica en ese carácter y que por lo tanto, la separación de taxones por únicamente esa característica es insostenible. Basado en los comentarios y conclusiones anteriores, *G. magnifica* es también reducida a la sinonimia, pues no existen diferencias con la colección tipo de *G. crassifolia*, excepto por la ausencia del indumento en la primera.

Especímenes examinados. **COLOMBIA. 4. **Galactophora pulchella** Woodson, Ann. Missouri Bot. Gard. 19:51–52. 1932. (**Fig. 7**). TIPO: BRASIL. AMAZONAS: Cano Pimicheiro, Jun 1854 (fl), *Spruce 3718* (HOLOTIPO: K; ISOTIPOS: P (foto F neg. 38740), W).

Galactophora petiolata Markgr., Notizbl. Bot. Gart. Berlin-Dahlem 14:129. 1938, syn. nov. TIPO: BRASIL. AMAZONAS: Ríos Curuicuriary y Negro, 26 Feb 1936 (fl), *Ducke 30109* (HOLOTIPO: RB; ISOTIPOS: G, K, MG, P, U, US).

Arbusto erecto, 0.5–2 m de altura; tallos aplanados en ramitas jóvenes, teretes a subteretes cuando viejos, sólidos, usualmente glabros; coléteres interpeciolares inconspicuos, menos de 1 mm de largo. Hojas con el pecíolo de 1–5 mm de largo; lámina 2.7–6.2 × 1.3–2.6(–2.9) cm, elípticas a angostamente-elípticas, raramente ovado-elípticas, obtusas a anchamente agudas apicalmente, coriáceas, cuneadas basalmente, glabras a glabrescentes en ambas superficies, usualmente revolutas marginalmente, la venación secundaria levemente impresa en ambas caras o inconspicua, las venas terciarias usualmente no impresas. Inflorescencia terminal a subterminal, diminutamente puberulenta, con unos pocos y esparcidos pelos glandulares, con 5 a 11 flores, pedúnculo 7–42 mm de largo, pedicelos 7–10 mm de largo, brácteas 1–1.5 × 0.5–0.9 mm, escariosas; sépalos 4–6× 1–1.5 mm, muy angostamente ovados a linear-ovados, acuminados, escariosos, esparcida a moderadamente glandular puberulentos, algunas veces algo glabrescentes cuando viejos; corola rosado pálido o blanco-rosadas, el tubo rosado basalmente, con varios pelos glandulares exteriormente, algunas veces glabrescentes cuando viejas, el ápice del botón floral angostamente agudo; parte inferior del tubo 5.5–7 × 1.5–2 mm, la parte superior 15–16 mm de largo, angostamente cónica, 5–7 mm en diámetro en el orificio, lóbulos 11–17 × 7–10 mm, obovados; anteras 4–5 mm de largo, glabras, las bases estériles angostamente agudas, cabeza estigmática 1.1–1.4 mm de largo; ovario 2.1–2.5 mm de largo, glabro; nectario 0.8–1 mm de largo, levemente pentalobulado. Folículos 7–12 × 0.2–0.3 cm, continuos, glabros; semillas 6.5–7.5 mm de largo, glabras, coma 17–23 mm de largo, crema.

Distribución, hábitat y ecología.—Restringida a Venezuela y el N de Brasil, donde crece en vegetación de sabanas y bosques arbustivos enanos en zonas de arena blanca, en elevaciones de 100–200 m. Especímenes con flores han sido recolectados entre Enero y Junio y en Septiembre. Especímenes con frutos han sido recolectados en Septiembre y Octubre.

Galactophora pulchella se puede confundir con *G. pumila*, pero se separa

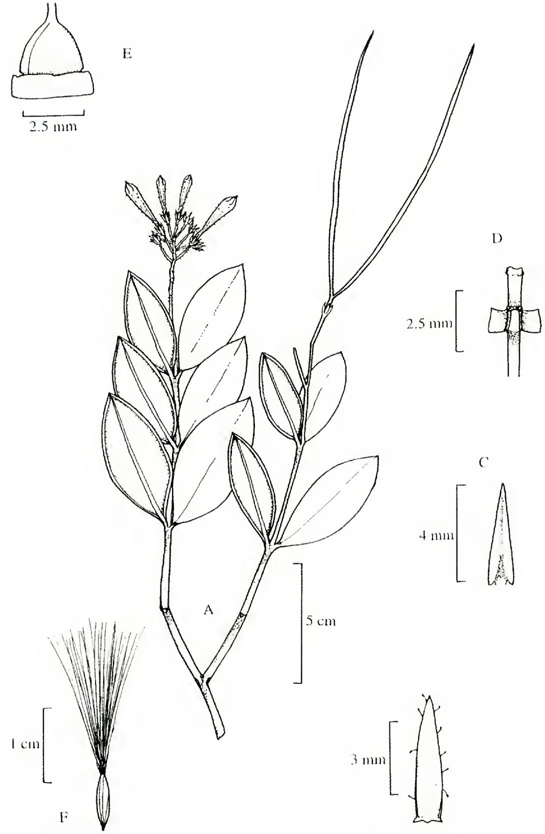

Fig. 7. *Galactophora pulchella* (*Froes 12558*, INB). **A.** Ramita con flores y frutos. **B.** Sépalo, vista adaxial. **C.** Antera, vista dorsal. **D.** Cabeza estigmática. **E.** Nectario y ovario. **F.** Semilla.

por sus inflorescencias con mucho más flores (5–11 vs. 1–2), con los pedúnculos presentes y conspicuos, usualmente de más de 7 mm de largo (vs. ausente o inferior a 2 mm de largo).

Las diferencias entre las colecciones tipo de *Galactophora pulchella* y *G. petiolata* son mínimas y la única diferencia permisible son las hojas más angostas en el tipo de la última especie, siendo concordantes en el resto de los caracteres morfológicos.

Distribución, hábitat y ecología.—Conocida en las partes bajas de la cuenca amazónica en Colombia y Venezuela, donde crece en sabanas y vegetación arbustiva asociada a afloramientos rocosos en elevaciones de 100–400 m. Especímenes con flores han sido recolectados en Abril, Junio, Agosto y Noviembre.

Galactophora pumila es una especie muy distintiva que se reconoce con facilidad por su pequeño tamaño, raramente excediendo los 30 cm de altura, hojas angostas y pequeñas, inflorescencias reducidas a 1 ó 2 flores, y corolas con los lóbulos relativamente pequeños, raramente excediendo los 19 mm de largo.

6. Galactophora schomburgkiana Woodson, Ann. Missouri Bot. Gard. 19:50–51. 1932. (**Fig. 9**). Tipo: GUYANA: Datos perdidos (fl, fr), *Schomburgk s.n.* (HOLOTIPO: K).

Galactophora schomburgkiana var. *megaphylla* Monac., Mem. New York Bot. Gard. 10:127, 129. 1958. Tipo. VENEZUELA. Amazonas: Cerro Duida, río Cunucunuma, 22 Nov 1958 (fr), *Maguire et al. 29706* (HOLOTIPO: NY; ISOTIPOS: F (foto F neg. 51104), US).

Hierba erecta, 0.5–2 m de altura; los tallos teretes a subteretes, algo aplanados en ramitas jóvenes, sólidos, diminuta y moderada a esparcidamente glandular-puberulentos, los pelos glandulares negros, glabrescentes con la edad; coléteres interpeciolares inconspicuos, ca. 1 mm de largo o menos. Hojas con el pecíolo 2–7(–9) mm de largo; lámina (3.5–)4–8.5 _ (1.9–)2.8–5 cm, ovadas, angostamente elípticas a ovado-elípticas, obtusas a redondeado-mucronuladas apicalmente, cordadas a subcordadas basalmente, coriáceas, esparcida y diminutamente glandular- puberulentas en ambas caras, algo revolutas marginalmente, las venas terciarias y secundarias conspicuamente impresas en ambas caras. Inflorescencia terminal, diminutamente glandular-puberulenta, con 3 a 5 flores, pedúnculo 1.4–50 mm de largo, pedicelos 8–15 mm de largo, brácteas 1–3 _ 0.5–1 mm, escariosas; sépalos 5–11(–12.5) _ 2–2.5 mm, angostamente ovados a angostamente ovado-elípticos, acuminados, escariosos a subfoliáceos, muy diminuta y esparcidamente glandular-puberulentos, algunas veces algo glabrescentes cuando viejos; corola púrpura, rosado-púrpura a rojizo-rosado,

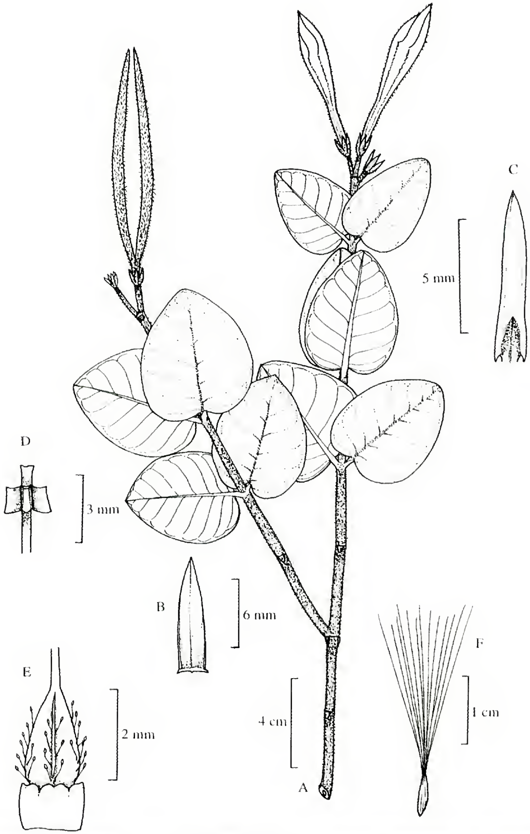

Fig. 9. *Galactophora schomburgkiana* (*Liesner 18551*, MO). **A.** Ramita con flores y frutos. **B.** Sépalo, vista adaxial. **C.** Antera, vista dorsal. **D.** Cabeza estigmática. **E.** Nectario y ovario. **F.** Semilla.

muy esparcidamente glandular puberulentas exteriormente, algunas veces glabrescentes cuando viejas, el ápice del botón floral agudo; parte inferior del tubo 19–31 × 3–3.5 mm, la parte superior 25–42 mm de largo, cónica, (18–)23–32 mm en diámetro en el orificio; lóbulos 23–30 × 22–32 mm, obovados; anteras 7.2–8 mm de largo, glabras, las bases estériles muy cortamente acuminadas, cabeza estigmática 1.9–2.2 mm de largo; ovario 2.8–3.1 mm de largo, con varios pelos glandulares; nectario 1–1.2 mm de largo, irregularmente pentalobulado. Folículos 9–14 × 0.5 cm, continuos, diminuta y densa a moderadamente glandular-puberulentos; semillas 5–6.5 mm de largo, glabras, coma 20–25 mm de largo, canela o amarillo-canela.

Distribución, hábitat y ecología.—bosques enanos y ventosos, áreas de vegetación en lajas graníticas, sabanas y bosques enanos y mezclados con pastizales en elevaciones de 750–2000 m. Floración ocurre de Octubre a Junio. Especímenes con frutos se han recolectado entre Marzo y Junio, Noviembre y Diciembre.

Galactophora schomburgkiana puede confundirse con *G. crassifolia*, pero se puede separar por sus hojas cortamente pecioladas, con pecíolos de 2–4.5 (-6.5) mm de largo (vs. 0–1.5 mm de longitud), hojas con la venación terciaria usualmente impresa en ambas caras (vs. no impresa) y sépalos más cortos, de 5–12.5 mm de largo (vs. 15–25 mm).

La variación intraespecífica extrema e intergradada en el tamaño de las hojas presentes en algunos miembros de las Apocynoideae, no permite reconocer la segregación de variedades basado en ese variable carácter, máxime si no existen en forma adicional, caracteres morfológicos discontinuos para separarlas. Por lo tanto, *G. schomburgkiana* var. *megaphylla* es reducida a la sinonimia.

AGRADECIMIENTOS

Se agradece a los siguientes herbarios por el envío de material en préstamo o por permitir el uso de sus colecciones; ALCB, ASE, BHCB, BM, CAY, CEN, CGE, COAH, COL, CVRD, ESA, ESAL, F, G, G-BOIS, G-DC, GH, HB, HUA, INPA, K, LPB, MEDEL, MG, MO, MOL, NY, P, QCNE, RB, SPF, US, USM, USZ, VEN, VIC, W, Z. Se agradece la autorización del Missouri Botanical Garden (MO) y a James Solomon, por la fotografía de *Galactophora crassifolia* aquí utilizada. Un especial reconocimiento al Herbario del Museo Paraense Emilio Goeldi (MG) en Belém, Pará, Brasil y en especial a Ione Bemerguy, por el envio de fotografías del holotipo y paratipos de *Dipladenia calycina*. También quiero agradecer a Luci-

lle Allorge, por permitirme el acceso a las colecciones de los herbarios del Museo de Historia Natural de Francia (P), así como a Bruno Wallnöfer (W) en Vienna, Austria y a Paul e Hiltje Maas por las facilidades brindadas para la visita de varios herbarios en Holanda. Otras personas que colaboraron con facilidades en el trabajo o logística en diferentes herbarios en Sur América fueron Julio Betancur (COL), Ricardo Callejas y Javier Francisco Roldán (HUA), Stephan Beck (LPB), Alvaro Cogollo (JAUM), Homero Vargas (QCNE), Asunción Cano (USM) y Alfredo Fuentes (USZ). Asimismo, quiero agradecer la ayuda de Rodolfo Vásquez y Rocío Rojas por facilitar mis visitas a Lima, Perú.

BOOK REVIEW

DAVID MORE (illustrations) and JOHN WHITE (text). 2002. **The Illustrated Encyclopedia of Trees.** (ISBN 0-88192-520-9, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $79.95, 800 pp., water color paintings, 6" × 9".

This book is the immediate predecessor of the 2004 *Collins Tree Guide* by Owen Johnson (text) and David More (illustrations) (reviewed in the previous Sida issue [21(3):1322]. The illustrations are extremely accurate and distinctive, but there is remarkable little duplication of illustrations between the two. My comment about the HarperCollins volume also holds for the Timber Press one: "For those interested in cultivated trees in the U.S.A., this is a prime reference." *Anyone* interested in trees will find it interesting and useful (and that's a broad recommendation).

Notes from the coverleaf of *The Illustrated Encyclopedia* are good: "Years ago, artist David More set himself the task of observing and meticulously painting the trees found in Britain, France, Germany, and the Low Countries—common or rare, native or introduced, growing wild or cultivated in arboreta, parks, and gardens. Deciduous trees were painted in the dead of winter as well as in full leaf; he also painted precise details of leaves or needles, bark, blossoms, fruit, nuts and cones. This enormous undertaking required years of study, travel, sketching, painting, and repainting until he was satisfied with each leaf on each page. The results are to be found in this extraordinary book. Well over a thousand species are shown together with as many cultivars. John White's accompanying text describes the native range of each species, the date of its introduction into cultivation, and other key facts. The trees to be found in British and European landscapes are mostly those to be found in North America as well—not surprising, since so many popular trees cultivated in Europe are in fact American natives. Thus, this magnum opus will prove as useful and inspiring in the Western Hemisphere as in the lands of its origin."—*Guy Nesom, Botanical Research Institute of Texas, Fort Worth, TX, 76012-4060, U.S.A.*

LECTOTYPIFICATION AND A NEW COMBINATION IN *MATELEA* (APOCYNACEAE: ASCLEPIADOIDEAE) FOR AN ENDEMIC HISPANIOLAN VINE

Alexander Krings

Herbarium, Department of Botany
North Carolina State University
Raleigh, North Carolina 27695-7612, U.S.A.
Alexander_Krings@ncsu.edu

ABSTRACT

A new combination in *Matelea* is proposed **Matelea domingensis**.

RESUMEN

Se propone una nueva combinctión in *Matelea*: **Matelea domingensis**

Critical study of West Indian specimens of subtribe Gonolobinae (Apocynaceae: Asclepiadoideae) has resulted in the need for a new combination for an endemic Hispaniolan vine:

Matelea domingensis (Alain) Krings, comb. nov. BASIONYM: *Gonolobus domingensis* Alain, Moscosoa 3:46. 1978. TYPE: REPUBLICA DOMINICANA: trepadora de 50–60 cm de largo; flores verde amarillentas; sobre rocas, al pie de un farallón, estribo sur del Isabel de Torres, Puerto Plata, alt. 750 m, 16–17 Aug 1975, *Alain & Perfa Liogier 23780* (LECTOTYPE, here designated: JBSD!)

The critical character defining placement in *Gonolobus* Michx.—laminar dorsal anther appendages (Woodson 1941; Rosatti 1989; Stevens 2001)—is lacking, although mistakenly attributed to the species by Alain Henri Liogier (loc. cit., 1994). When pressed, the apically bilobed, staminal coronal segments (Cs sensu Liede & Kunze 1993; Kunze 1995) of the single prominent open flower of the type specimen were flattened in such a manner to perhaps superficially appear as dorsal anther appendages (Cd sensu Kunze 1995) (Fig. 1, A). However, close scrutiny, as well as study of an additional flower on the type (pressed sideways), reveals that the 'appendages' are in fact erect staminal coronal segments (Fig. 1, B; Fig. 2). Other characters that have been used to refer taxa to *Gonolobus* include winged follicles and the absence of glandular hairs (see Woodson 1941). Follicles are unknown for *Matelea domingensis*, but this character appears to be moot. Few fruit collections were apparently available to Woodson (1941) and more recent analysis has shown the character not to be useful in generic delimitation (Krings, unpubl.). Glandular hairs, although thought characteristic

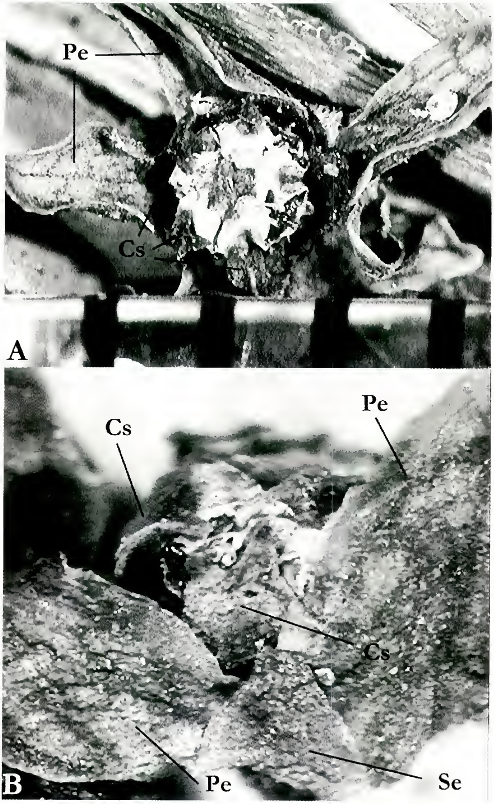

Fig. 1. Flowers of the lectotype of *Matelea domingensis* (Alain) Krings (*Alain & Perfa Liogier 23780*, JBSD): **A**, Openly pressed flower, showing reticulate petals and staminal corona segments arching over the gynostegium; **B**, sideways pressed flower, showing an apically bilobed, erect staminal coronal segment (center). **Cs** = staminal coronal segment; **Pe** = petal; **Se** = sepal. Scale in millimeters.

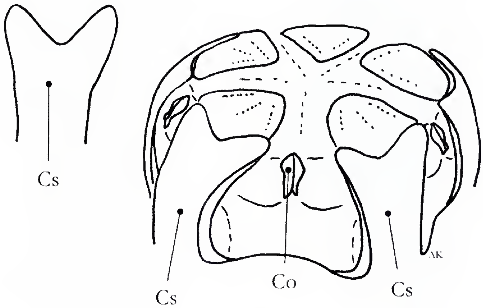

Fig. 2. Corona of *Matelea domingensis* (Alain) Krings (based on *Alain & Perfa Liogier 23780*, JBSD). **Co** = corpusculum; **Cs** = staminal coronal segment.

of *Matelea* Aubl. by Woodson (1941), are also without circumscriptional value in the *Gonolobus-Matelea* question, being present in both the type of *Gonolobus* Michx. (i.e., *G. suberosus* (L.) R. Br.) and numerous species lacking dorsal anther appendages (Rosatti 1989). From study of *Gonolobus* species in the West Indies and the southeastern United States (including the type; see Krings & Xiang 2004), it appears that characters useful for the recognition of *Gonolobus* s.s. include the combined presence of dorsal anther appendages and cordate leaf bases, although at least *G. pubescens* Griseb., *G. stellatus* Griseb., and *G. stapelioides* Desv. ex Ham. have rounded to cuneate leaf bases. A cushion-like gynostegial corona of fused staminal and interstaminal segments that is more or less prostrate, rather than erect, is also nearly ubiquitous among West Indian and southeastern United States *Gonolobus* taxa, including *G. suberosus*, *G. martinicensis* Decne., *G. stellatus*, and *G. stephanotrichus* Griseb. It appears absent in *G. jamaicensis* Rendle, although additional material is needed for further study. A reticulate corolla, as found in *M. domingensis*, does not occur in West Indian or Southeast United States taxa bearing dorsal anther appendages (these referable to *Gonolobus*). Reticulate corollas however, are common in several West Indian taxa that bear winged follicles but lack dorsal anther appendages (see Krings 2005a, b). On-going research aims to resolve the relationships among these taxa using molecular data. Recent progress has shown monophyly for the Gonolobinae (Liede-Schumann et al. 2005), however, with the inclusion of only five *Matelea* and *Gonolobus* taxa, intra-subtribal relationships were not a focus of the study and were not resolved. The emergence of '*Matelea gonocarpa*' (type for *Gonolobus*) within a clade of other *Gonolobus* taxa supports prior treatment of the taxon in *Gonolobus* (see Rosatti 1989; Krings & Xiang 2004). Until a better resolution is achieved and rather than maintaining two internally very polymorphic genera, taxa lacking laminar, dorsal anther appendages, including *M. domingensis*, appear best treated in *Matelea*.

Some discrepancies exist between the protologue and the type specimen for *Matelea domingensis*. Two syntypes were cited in the protologue: "*Alain & Perfa Liogier 13780* (SDM, NY)"; "*A.& P. Liogier & N. Melo 23348* (SDM)." As cited, "SDM" is not an official *Index Herbariorum* acronym, rather an abbreviation for the herbarium of the Jardín Botánico Nacional Dr. Rafael M. Moscoso in Santo Domingo, Dominican Republic or JBSD. However, on the sheet at JBSD, the collection number is typed as 23780. The rest of the label information on the sheet is consistent with the protologue. A handwritten determination on the label reads: "*Gonolobus domingensis* Alain, sp. nov." The collection number "13780" is also cited by Liogier (1994), although the collector recently indicated that it should be 23780 as on the specimen label (Liogier, pers. comm.). Specimens were requested as well from NY, however, *G. domingensis* does not appear to be part of their collections. The additional syntype "*A.& P. Liogier & N. Melo 23348* (SDM)" was not included in a loan from JBSD and it remains unclear whether it is extant. Considering that no other specimens could be found, *Alain & Perfa Liogier 23780* (JBSD) is here designated lectotype for *Gonolobus domingensis* Alain.

ACKNOWLEDGMENTS

I thank the curators and staff of the following herbaria for access to their collections or loans of specimens: BH, BM, BOLO, BREM, BRIT, C, CGE, DUKE, E, F, FI, FLAS, FR, FTG, G, GA, GH, GOET, H, HAC, HAJB, HBG, IJ, JBSD, JE, K, KY, LL, M, MICH, MIN, MISS, MO, NCU, NO, NY, O, OK, OXF, P, PH, RSA, S, TENN, TEX, U, UC, UNA, US, USCH, USF, WILLI, WU, Z. I also thank the curators and staff of the following herbaria for searching their collections for West Indian Gonolobinae material, although finding no representation: BG, BKL, BR, BUF, COLO, CR, FLAS, IA, ISC, LD, MSU, NEU, NSW, UPS, TUR. The thoughtful review of a previous version of the manuscript by Alain Liogier and Mary Endress is gratefully acknowledged.

ABSTRACT

Palaeoanthella huangii gen. & sp. nov., is described from an Early Cretaceous staminate flower in Burmese amber. The genus is characterized by small, staminate flowers composed of a cup-shaped perianth of 8 fused lobes (tepals) arranged in one series with 8 equal subsessile, unappendaged stamens in a single whorl, more or less alternating with the tepals, and having 2 lobed, 4-locular anthers opening by longitudinal slits. Adjacent pollen considered to have originated from the anthers is inaperturate with finely ridged and grooved exines. The fossil shows possible affinities with the eumagnoliid angiosperm family Monimiaceae.

Key words: Burma, fossil, fossilized resin, Monimiaceae, Myanmar

RÉSUMÉ

Paleoanthella huangii gen. et sp. nov., est décrit à partir d'une fleur du Crétacé inférieur de l'ambre de Birmanie. Le genre est caractérisé par ses fleurs petites, staminées, composées d'un périanthe en forme de cupule, formé de huit tépales fusionnés en une série simple et alternant plus ou moins avec huit étamines sans appendice. Les anthères possèdent deux lobes et quatre locules s'ouvrant par des fentes longitudinales marginales. Le pollen trouvé à côté des anthères est considéré comme provenant de ceux-ci ; il est inaperturate, avec des exines finement carénées et rainurées. Ce fossile montre des affinités possibles avec les Angiospermes Eumagnolides de la famille Monimiaceae.

INTRODUCTION

A new genus and species of angiosperm with possible affinities with the family Monimiaceae is described from Early Cretaceous Burmese amber. Since the Early Cretaceous was a period of early angiosperm diversification, all specimens from this time period are extremely important in establishing a minimum age for the appearance of various floral characters. While only a single staminate specimen is available for study, it is well preserved and presents an interesting arrangement of staminal features.

MATERIALS AND METHODS

The piece of amber containing the flower weighs 2.8 gm and is more or less trapezoidal in outline, with a greatest length of 25 mm, greatest width of 19 mm and greatest depth of 7 mm. The flower is situated about 5 mm under the surface of the amber. Due to the presence of insect fossils adjacent to the flower,

SIDA 21(4): 2087–2092. 2005

the amber could not be re-polished further. Examination and photographs were made with a Nikon stereoscopic microscope SMZ-10 R at 80× and a Leica Wild M3Z stereoscopic microscope at 400×. Pollen grains in the amber adjacent to the flower were photographed with a Nikon Optiphot microscope at 600×.

Amber from Burma occurs in lignitic seams in sandstone-limestone deposits in the Hukawng Valley, southwest of Maingkhwan in the state of Kachin (26°20'N, 96°36'E). Nuclear magnetic resonance (NMR) spectra of amber samples taken from the same locality as the fossils indicated an araucarian (possibly *Agathis*) source of the amber (Lambert & Wu, unpublished data, 2002). Palynomorphs from the amber beds where the fossil originated have been assigned to the Upper Albian of the Early Cretaceous (97–110 million years ago) (Cruickshank & Ko 2003); however, since the amber is secondarily deposited, the age could be older.

DESCRIPTION

The flower is approximately 1 mm in diameter. The conspicuous anthers are situated in a whorl at the edge of the receptacle. Since the flower is funnel-shaped, it was difficult to obtain a photo from the top with all its features in focus. Pollen grains attached to the anthers and tepals and in the amber adjacent to the flower indicate that the flower was in anthesis when it entered the resin. The pollen grains illustrated here are considered to have originated from the flower since 1) they are the same size as those on the anthers, 2) they are adjacent to the flower, and 3) a search through the rest of the amber matrix did not reveal any grains similar to those adjacent to the flower.

Palaeoanthella Poinar & Chambers, gen. nov. TYPE SPECIES: **Palaeoanthella huangii** Poinar & Chambers, sp. nov.

Unisexual; staminate flowers small, actinomorphic, perianth cup-shaped, united, bearing 8 lobes (tepals) arranged in one series; tepals connate below, separate above, low, rounded at tip; receptacle bearing 8 equal, subsessile stamens in a single whorl; stamens unappendaged, alternating with tepals; anthers 4- locular, opening lengthwise by marginal slits; pistillate flowers unknown.

Palaeoanthella huangii Poinar & Chambers, sp. nov. (**Figs. 1–2**). TYPE: MYANMAR (BURMA): KACHIN: northern Myanmar, Amber mine in the Hukawng Valley, SW of Maingkhwan, (26°20'N, 96°36'E), Jul 2004, *Chialang Grand Huang, Burmese-97* (HOLOTYPE: male flower deposited in the collection of Chialang Grand Huang, Edison, New Jersey 08820, U.S.A.).

Single staminate flower: dimensions of 945 µm across shorter axis and 1094 µm across longer axis (the difference between the axes is because the tepals on one axis have been eaten by an herbivorous insect); perianth cup-shaped, 34 µm long, externally hispidulous; stamen length, 270–338 µm; stamens subsessile, the four visible filaments ranging from 27–40 µm in length; anthers 270–338 µm in length, basifixed, opening by lateral slits; center of receptacle

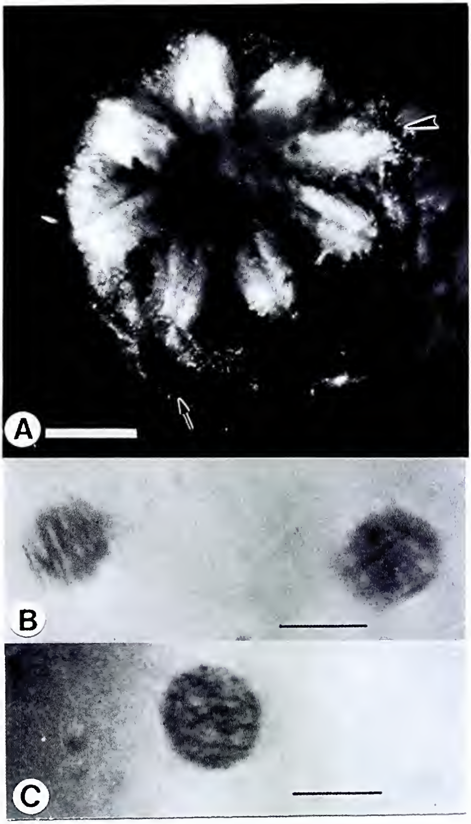

Fig. 1. **A.** *Palaeoanthella huangii* in Burmese amber. Scale bar = 217 μm. Arrow shows a complete tepal; arrowhead shows tepal damaged by a micro-herbivore. **B.** Two pollen grains adjacent to *P. huangii*. Scale bar = 15 μm. **C.** Single pollen grain adjacent to *P. huangii*. Scale bar = 15 μm.

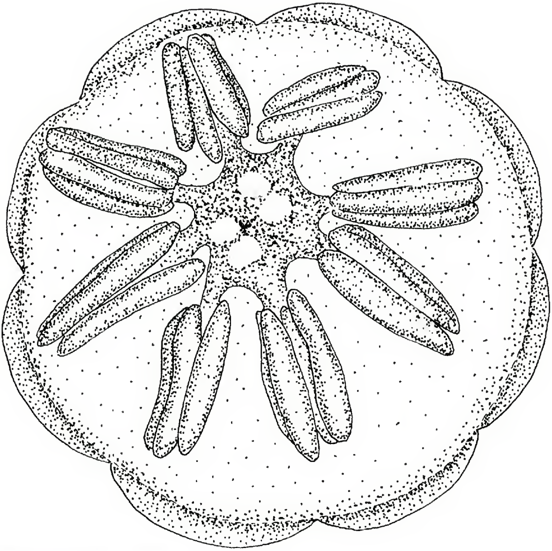

Fig. 2. Partly reconstructed flower of *Palaeoanthella huangii* in Burmese amber. Scale bar = 500 μm.

filled with spongy tissue; pollen grains inaperturate, nearly spherical, 17–20 μm in diameter, exine finely ridged and grooved.

Etymology.—Genus name from the Greek "palaios" for ancient, old, the Greek "anthos" for flower and -ella as a diminutive ending for small. Species named after Chialang Grand Huang, who loaned this valuable specimen for study.

DISCUSSION

It is impossible to assign this flower to a present day family with certainty. However, it does possess some characters [small, unisexual, actinomorphic flowers, cup-shaped monochlamydeous perianth, subsessile stamens, reduction in size of tepals; four-locular anthers opening by 2 lateral longitudinal slits (in staminate flowers with a relatively open floral cup)] found in the family Monimiaceae (Melchior 1964; Hutchison 1966; Endress 1980; Philipson 1986, 1993). Several extant genera of the Monimiaceae have similar features. *Mollinedia* has unisexual flowers with a cup-shaped floral base. While there are numerous stamens in this genus, the filaments are very short and the anthers open lengthwise by slits (Perkins 1901). Another genus is *Kibara* with small unisexual flowers in a hemispherical cup with 8 lobes arranged in 4 series, and 4 stamens. However the anthers open by a single apical slit (Perkins 1901). No extant members of this family have 8 stamens arranged in a single whorl, with the number of stamens equal to the number of tepals and more or less alternating with the tepals.

Pollen of the Monimiaceae varies considerably in size and shape, ranging from spherical to ellipsoidal and from 10 to 50 microns in diameter (Money et al. 1950). Erdtman (1966) describes the grains as usually nonaperturate, 2(–3)-sulcate or oligofor(aminoid)ate, tenui-exinous. The exine can be thick or thin and can appear as granular, finely pitted-reticulate, spinuliferous, ridged or grooved (Money et al. 1950; Sampson 1993). Acolpate pollen with ridged and grooved exines similar to those adjacent to the fossil occurs in the extant genus *Tambourissa* (Money et al. 1950).

It is difficult to identify any defined structures in the center of the flower that might represent stamen appendages, nectaries, or vestigial carpels.

The occurrence of the Monimiaceae in the Lower Cretaceous would be consistent with the primitive status of this family as determined by morphological and molecular findings. Based on their analysis of the plastid *matK* gene sequences of various angiosperms, Hilu et al. (2003) placed the Monimiaceae, together with the rest of the Laurales, in the informal group eumagnoliids, which together with the Chloranthales and monocots, form a sister group to the eudicots. The separation of Monimiaceae sensu stricto from the related families Siparunaceae, Gomortegaceae, and Atherospermataceae is supported by the molecular studies of Renner (1999) based on data from six plastid genome regions. The Monimiaceae occur in warm temperate to tropical areas of the southern hemisphere and enter the Eurasian mainland in Malaysia and Thailand. There are no records of this family in Burma today.

The chewed tepals on *P. huangii* are evidence of herbaceous insect activity, possibly by a beetle or moth larva. The tip of one of the anthers also shows bite marks, indicating indiscriminate feeding on flower parts. The disturbance caused by the herbivore could have dislodged the flower and caused it to fall in the resin.

Several insects groups appear to be involved in the pollination of members of the Monimiaceae. A species of thrips (*Thrips setipennis*) was reported as the sole pollinator of *Wilkiea huegeliana* in an Australian subtropical rainforest, with both male and female flowers serving as brood sites for thrip larvae (Williams et al. 2001). In Ecuador, members of the genus *Siparuna* are pollinated by gall midges of the family Cecidomyiidae. These insects deposit their eggs in the male flowers where the larvae presumably feed on the tissues (Feil 1992). Both gall midges and thrips occur in Burmese amber and representatives of these groups could have pollinated *P. huangii*. A gall midge is preserved near the fossil flower.

Since the amber mines are located on the Burma Plate, which is part of Laurasia (Mitchell 1993), *P. huangii* can be considered of Old World origin.

ACKNOWLEDGMENTS

The authors thank Chialang Grand Huang for loaning this specimen for study, Marcos Kogan for the use of his Leica Wild microscope, Jean-François Voisin for providing the résumé, and Peter K. Endress and Roberta Poinar for helpful comments on earlier versions of this paper.

A NEW COMBINATION IN *STENOTUS* (ASTERACEAE)

Caleb A. Morse

R.L. McGregor Herbarium
University of Kansas Campus West
2045 Constant Avenue
Lawrence, Kansas 66047, U.S.A.

A new combination is necessitated by the forthcoming treatment of the genus *Stenotus* Nutt. (Asteraceae) for the *Flora of North America*.

The combination *Stenotus lanuginosus* (A. Gray) Greene var. *andersonii* (Rydb.) was attributed to H.M. Hall by Kartesz (1994a, 1994b), and has been perpetuated in other publications (International Plant Names Index 2004; USDA, NRCS 2004). However, Hall's combinations were published as subspecies in the genus *Haplopappus* Cass., not varieties in *Stenotus*. Recent treatments, including the one prepared by the present author for a forthcoming volume of the *Flora of North America* project, have regarded North American sections of *Haplopappus* sensu Hall as distinct genera. Therefore, a new combination for this well-marked taxon is necessitated.

Stenotus lanuginosus (A. Gray) Greene var. **andersonii** (Rydb.) C.A. Morse, comb. nov. *Stenotus andersonii* Rydb., Bull. Torrey Bot. Club 27:615. 1900. *Aplopappus andersonii* Blank., Montana Coll. Agric. Sci. Stud., Bot. 1:100. 1905. *Haplopappus lanuginosus* ssp. *andersonii* H.M. Hall, Publ. Carnegie Inst. Wash. 389:172. 1928. *Haplopappus lanuginosus* var. *andersonii* Cronquist, Univ. Wash. Publ. Biol. 17(5):219. 1955. TYPE: U.S.A. MONTANA: Belt Mountains. 1886, *Anderson 3561* (HOLOTYPE: NY, UC [fragment]!)

Tonestus linearis A. Nelson & J.F. Macbr., Bot. Gaz. 56:478. 1913. TYPE: U.S.A. IDAHO: Payette National Forest, 1912, *G.B. Mains J.V-6* (HOLOTYPE: RM!, ISOTYPE: RM!).

ACKNOWLEDGMENT

I thank Kanchi Gandhi for discussion of this issue.

BOOK REVIEW

E.G. BOBROV and N.N. TZVELEV (eds.) STANWYN G. SHETLER (General Scientific ed.). 2004. **Flora of the USSR: Alphabetical Indexes to Volumes I-XXX** (translated from Russian). (ISBN not given). Smithsonian Institution Libraries, Washington, D.C. $99.50 (hbk.), 241 pp., 2 maps, 6 1/4" × 9 1/2".

"The Alphabetical Indexes are cumulative indexes to all 30 volumes of the *Flora of the USSR* and together constitute the thirty-first and final volume of this monumental work. This volume consists mainly of separate indexes to the scientific (Latin) names of (1) the families and (2) the genera and species in the Flora, but it also includes a list or index of the authors of the Latin names, alphabetized by the standard abbreviations used for them in the text, and summaries of other commonly used abbreviations" (from the Scientific Editor's Preface). Synonyms for genera are included but not for species. Two maps are at the very back: "Floristic regions of the USSR" (a foldout) and "Regions used to indicate general distributions of species in the 'Flora of the USSR'."

The whole set (in Russian) was "initiated under the supervision and chief editorship of Academician V.L. Komarov." The original publications were issued 1934–1960; English translations appeared 1968–2002, begun by the Israel Program for Scientific Translations and finished by the Amerind Publishing Co. in New Delhi. The Asteraceae, recognized by some as highly significant, are published as volumes 25 through 30; they are now complemented by a treatment (translated to English) of the family for the "*Flora of Russia*: The European part and bordering regions" (vols. VII in 2002 and VIII in 2003). It is extremely useful to have an English-readable flora for this huge part of the earth. *Flora Europea* and various detailed treatments for Australia are generally comparable, but these are only now being approached in kind by the *Flora of China* and *Flora of North America (north of Mexico)*.—*Guy Nesom, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

PHARUS PRIMUNCINATUS (POACAE: PHAROIDEAE: PHAREAE) FROM DOMINICAN AMBER

ABSTRACT

A grass spikelet with a cylindrical, sigmoidal, uncinate floret in Dominican amber is described as the new species **Pharus primuncinatus** Judz. & Poinar (Poaceae: Pharoideae: Phareae). The fossil can be distinguished from all extant members of the genus by the small (9.9 mm long), curved female floret; relatively short glumes; and the uncinate portion of the floret extending downwards to the middle or slightly below the middle of the lemma. The closest extant relative may be the Mesoamerican *P. mezii*. This is the earliest record of a fossil grass that can be assigned to an extant genus; the earliest record of a member of the basal subfamily Pharoideae; and the only known fossil *Pharus* spikelet.

Key words: fossil grass, *Pharus*, *P. latifolius*, *P. mezii*, *P. primuncinatus*, Poaceae, Pharoideae, Phareae, Dominican amber

RESUMEN

En base a una espiguilla fósil con un flósculo cilíndrico, sigmoide y uncinado se describe una nueva especie, **Pharus primuncinatus** Judz. & Poinar (Poaceae: Pharoideae: Phareae), del ámbar de la República Dominicana. Se diferencia de todas las especies del genéro existentes por su espiguilla pistilada pequeña (9.9 mm de largo); flósculo pistilado curvado; glumas relativamente cortas; y la porción uncinada del lema extendida de la mitad hasta el ápice. La especie existente más relacionada es posiblemente *P. mezii* de América Central. Este es el registro más antiguo de una gramínea fósil que puede asignarse a un género existente; el registro más antiguo del miembro de la subfamilia Pharoideae; y el único fósil de una espiguilla de *Pharus*.

INTRODUCTION

Grass fossils are rare. Those that have been reported mostly occur in sedimentary deposits and their identification at the generic level is problematic. However, amber has remarkable preservative qualities for both plant and animal fossils (Poinar 1992) and a number of angiosperm remains identifiable to extant genera occur in Dominican Republic amber (Poinar & Poinar 1999). Dominican amber originated from resin of the extinct tree, *Hymenaea protera* Poinar (Leguminosae: Caesalpinioideae) that thrived some 20–40 million years ago in Hispaniola (Poinar 1991; Poinar & Poinar 1999). One especially interesting fossil in this amber was a spikelet belonging to the grass genus *Pharus* P. Browne which was associated with mammalian hair (Poinar & Columbus 1992).

SIDA 21(4): 2095–2103. 2005

Pharus was long placed in the Bambusoideae (Judziewicz 1987; Watson & Dallwitz 1992), but recent molecular evidence indicates that it is much more basal than the bamboos and indeed is the second earliest-diverging basal clade in the Poaceae (Clark & Judziewicz 1996; Judziewicz et al. 1999; Grass Phylogeny Working Group 2001).

Daghlian (1981) considered at least 11 reported macrofossils as true fossil grasses but cautioned against assigning fossil pollen grains to the Poaceae since other members of the Poales have similar pollen types. In his review of paleoagrostology, Thomasson (1987) listed 11 published reports of fossil grasses, but determined only three of these to be undoubted representatives of the Poaceae. While the oldest-known unequivocal fossil grass is from the Paleocene/ Eocene boundary in Tennessee (Crepet & Feldman 1991), bambusoid-like monocots extend back into the Early Cretaceous (Poinar 2004), thus the origin of the family may be quite ancient. The present study describes the fossil female *Pharus* spikelet reported earlier (Poinar & Columbus 1992).

MATERIALS AND METHODS

The small triangular piece of amber (7 gm, 37 mm longest length × 25 mm longest width, 15 mm thick) containing the fossil came from La Toca mine, situated between Santiago and Puerto Plata in the Cordillera Septentrional of the northern portion of the Dominican Republic. Dating of Dominican amber is still controversial with the latest proposed age of 20–15 mya based on foraminifera (Iturralde-Vinent & MacPhee 1996) and the earliest as 45–30 mya based on coccoliths (Cêpek in Schlee 1999). A range of ages for Dominican amber may be likely since the amber fossils are associated with turbiditic sandstones of the Upper Eocene to Lower Miocene Mamey Group (Draper et al. 1994). Dominican amber is secondarily deposited in sedimentary rocks, which makes a definite age determination difficult (Poinar & Mastalerz 2000). Observations and photographs were made with a Nikon stereoscopic microscope SMZ-10 R and Nikon Optiphot TM at magnifications up to 600×.

RESULTS

The following characters of the fossil place it in the genus *Pharus*: A single-flowered female spikelet with relatively short, glabrous glumes and an inrolled, cylindrical, tapering, 7-nerved lemma covered with uncinate (hooked) macrohairs.

Order Poales, Family Poaceae, Subfamily Pharoideae (Stapf) L.G. Clark & Judz., Tribe Phareae Stapf

Pharus primuncinatus Judz. & Poinar, sp. nov. **(Figs. 1–5)**. TYPE: DOMINICAN REPUBLIC: La Toca amber mine located between Santiago and Puerto Plata in the Cordillera Septentrional of the northern portion of the Dominican Republic. A female spikelet depos-

ited in the George Poinar amber collection (accession # M-1-4) maintained at Oregon State University, Corvallis, OR 97331.

Fossil female spikelet 9.9 mm long (without pedicel) and 2.3 mm wide subtended by a short pedicel (0.93 mm long), consisting of two glumes and a single floret. First glume 5.2 mm long; second glume 3.3 mm long (the tip bent back and could have been damaged, thus it may have been longer); lemma approximately twice the length of the glumes, somewhat sigmoid, tapered apically into a beak, 7-nerved, with strongly inrolled margins; with a discrete area, beginning approximately 2/5 from the base of the lemma and extending all the way to the tip, densely covered with uncinate macrohairs, the hairs extending from the tip 1/3 of the length of the lemma on the ventral side (3.5 mm from apex), but over half the length of the lemma (5.4 mm from the apex) on the dorsal side; macrohairs 0.22–0.56 mm in length; basal portion of the lemma covered with numerous small papillae (Fig. 4).

Currently, seven extant species of *Pharus* are recognized; they range from Mexico and Florida to Argentina and Uruguay. Using the keys provided by Judziewicz (1987, 1991), the fossil falls into a group of three species with curved to sigmoid female lemmas: *P. latifolius* L., *P. mezii* Prodoehl, and *P. vittatus* Lem. *Pharus vittatus* has female lemmas 19–26 mm long, much longer than those of the fossil, which has a mature lemma 9.9 mm long. The extant species *P. latifolius* and *P. mezii* (Table 1, Fig. 6) have smaller female spikelets than *P. vittatus*, but the floret (9.9 mm long and 2.3 mm wide) and first glume (5.2 mm long) of *P. primuncinatus* are significantly shorter yet wider than those of *P. latifolius* [florets (12–)13–17(–19) mm long, 1–2.3 mm wide, first glume 9–13 mm long] and *P. mezii* [florets 10.5–13.5 mm long, 0.9–1.8 mm wide, first glume 5.3–7.3(–8) mm long]. Also, the female floret of the fossil is bearded with uncinate macrohairs over the majority of its exposed (i.e., not covered by the glumes) surface, while in *P. latifolius* and *P. mezii* the beard is restricted to the apex of the floret (Fig. 6).

Etymology.—The specific epithet *primuncinatus* is from the Latin "first uncinate one," alluding to the first fossil record of hooked macrohairs on a spikelet.

DISCUSSION

Presently, four species of *Pharus* occur in Hispaniola, including *P. lappulaceus* Aubl., *P. latifolius*, *P. parvifolius* Nash, and *P. virescens* Doell. *Pharus mezii*, perhaps the closest relative of the fossil species, is a Mesoamerican and northern South American species of seasonally dry forests. The morphological evidence does not exclude the possibility that *P. primuncinatus* is directly ancestral to both *P. latifolius* and *P. mezii*.

The manner by which the female spikelet arrived in amber has already been cited as the first example of epizoochory in the fossil record (Poinar & Columbus 1992). This condition is obvious from the number of mammalian hairs associated with the spikelet, one of which is still attached to the lemma

TABLE 1. Comparison of *Pharus primuncinatus* to two closely related species.

	Pharus latifolius	***Pharus primuncinatus sp nov.***	***Pharus mezii***
Distribution	Widespread in wet forests in the Neotropics, including Hispaniola	Fossil (Eocene to Miocene) from Hispaniola	Seasonally dry forests, mostly along the Pacific coast from Mexico to Panama; rare in dry forests of Colombia, Venezuela, and Ecuador; not in the West Indies
Female floret length (mm)	(12–)13–17(–19)	9.9	10.5–13.5
Female floret width (mm)	1–2.3	2.3	0.9–1.8
Female floret: Length/width ratio	7.5–12	4.3	7.5–10
Female first glume length (mm)	9–13	5.2	5.3–7.3(–8.0)
Female first glume: Female floret ratio	0.6–0.8(–0.9)	ca. 0.5	0.5–0.6
Distribution of uncinate hairs on the female	Restricted to apical 10–20%; rarely sparse hairs	Found over most of the exposed surface (33–60%)	Restricted to apical 15–25%; rarely sparse hairs elsewhere

by the uncinate macrohairs (Fig. 5). These hairs were identified as the guard hairs of a carnivore (Poinar & Columbus 1992).

There is circumstantial evidence that many species of mammals disperse the adhesive female florets of *Pharus* species, as attested by such local common names of *P. latifolius* and *P. lappulaceus* (Judziewicz 1987: 296–297, 387–388) as "fruta de perro" [fruit of the dog] (Cuba), "riz chien" [dog rice] (French Guiana), "alcusa" [dog in Quichua] (Ecuador), "barba de puma" and "barba de tigre" [beard of the jaguar] (Peru), "yaguá-arroz [jaguar rice] (Paraguay), "barba de paca" [beard of the paca, a large rodent] (Brazil), and "barba de macuco" [beard of the monkey] (several Brazilian collections). The genus may apparently be dispersed by birds as well; common names include "pega pollo" [stick-to-the-chicken] (Dominican Republic), and herbarium specimens with feathers adhering to the inflorescence have been observed.

The present report is the earliest record of a fossil grass that can be assigned to an extant genus, the earliest undoubted record of a member of the basal subfamily Pharoideae and tribe Phareae, and the only described fossil spikelet of a member of the Pharoideae. In 1986, the second author also examined a plastic

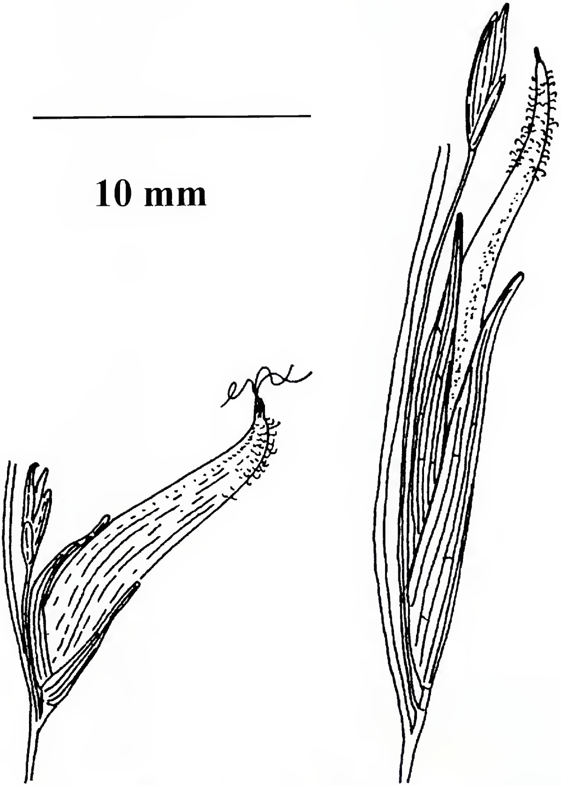

Fig. 6. Spikelet pairs of the extant species *Pharus latifolius* (left) and *P. mezii* (right). The pistillate spikelets are large and curved and the staminate spikelets small and pedicellate. Illustration by Judziewicz.

cast of a leaf blade of an undoubtedly pharoid grass (presumably *Leptaspis* R. Br., sister genus of *Pharus*), from mid-Miocene (12 million years old) volcanic ash northwest of Lake Baringo, Kenya (ca. 1°N, 36°E) kindly provided by Christine Kabuye and Bonnie F. Jacobs; a duplicate cast is on deposit at the University of Wisconsin-Madison herbarium (Judziewicz 1987; Clark & Judziewicz 1996).

ACKNOWLEDGMENTS

The authors thank J. Travis Columbus for originally identifying the fossil grass and lending assistance to this study, and thank him and Lynn G. Clark for their helpful reviews.

ABSTRACT

Comparison of collections of *Libertia colombiana* (Foster 1939) from Colombia, Ecuador, and Peru show that the Bolivian *L. boliviana* (Foster 1946) cannot be upheld as a separate species. We provide an expanded description of *L. colombiana* and establish its range across the Andean paramo as far south as Bolivia, noting the first collections for Ecuador and Peru. We also provide a key to the South American species of *Libertia*, which also occurs in New Guinea, New Zealand, and eastern Australia where there are some six species currently recognized, and possibly three more awaiting description, making a total for the genus of 13 species.

RESUMEN

Mediante comparaciones de ejemplares de *Libertia boliviana* (Foster 1946) y *L. colombiana* (Foster 1939) de Colombia, Ecuador y Perú se propone que *L. boliviana* no puede ser considerada como una especie aparte. Presentamos una descripción ampliada de *L. colombiana* y determinamos su rango de distribución en los páramos andinos hasta el sur de Bolivia, al igual que las primeras colecciones para Ecuador y Perú. Así mismo, incluimos una clave para las especies suramericanas de *Libertia* que también se distribuyen en Nueva Guinea, Nueva Zelanda y el este de Australia, en donde se reconocen cerca de seis especies y posiblemente tres adicionales que están en proceso de descripción para un total de 13 especies para el género.

A member of tribe Sisyrinchieae of Iridaceae subfamily Iridoideae (Goldblatt 1990), *Libertia* is one of two genera of the family with species in Australasia and South America, the other being *Orthrosanthus* (Goldblatt & Henrich 1987; Goldblatt 1990). *Libertia* is recognized mainly by the outer tepals being smaller than the inner, and often much smaller, and more or less green while the inner tepals are usually white, but blue in *L. sessiliflora*. Like other species of Sisyrinchieae, the filaments are partly united and the style divides at the top of the filament column into three slender, diverging branches. A relatively unspecialized member of the tribe, *Libertia* appears to have no other synapomorphies except for a unique basic chromosome number, $x = 19$ (Goldblatt & Takei 1997).

Australasian species include *L. paniculata* (R. Brown) Sprengel and *L. pulchella* (R. Brown) Sprengel, in Australia and New Guinea and four currently recognized in New Zealand, *L. grandiflora* (R. Brown) Sweet, *L. ixioides* (Foster f.) Sprengel, *L. micrantha* A. Cunningham, *L. peregrinans* Cockayne et Allan. Three more were recognized for New Zealand by Blanchon (1998) in an unpublished Ph. D. thesis, *L. cranwelliae*, *L. edgariae* and *L. mooreae*. Of the 14 species of *Libertia* described from South America (Index Kewensis), only five are generally recognized, three in Chile (Skottsberg 1928, 1953; Munoz 1966; Rodríguez & Marticorena 2000), and one each for Bolivia and Colombia (Foster 1939, 1945).

New collections made in the Colombian paramo (Celis 2000) show that *Libertia* is represented there by one relatively uniform species, *L. colombiana* R.C. Foster that was described in 1939. The first collections of *Libertia* from Ecuador and Peru, made in 1998 and 1975 respectively, fall within the range of variation for *L. colombiana*. The presence of *L. colombiana* in Ecuador had not been established when Jorgensen and León-Yánez (1999) published their checklist of the flora of Ecuador and *Libertia* was not included in a checklist of the flora of Peru (Brako & Zarucchi 1993).

A second species, *Libertia boliviana*, was distinguished from *L. colombiana* (and from the closely related Chilean *L. tricocca* Philippi) by its smaller and fewer flowers and in having the filaments free to the base (rather than partly united) (Foster 1946). New collections from Bolivia show that Foster's distinction was incorrect. The filaments are united in the proximal half in the type (*Buchtien 701*, GH), and in two additional collections (Table 1). Morever, there is no significant difference in the size and number of the flowers per inflorescence unit in specimens from Bolivia and those from Colombia and Ecuador. In fact, we can find no character separating *L. colombiana* from Bolivian collections of *Libertia* (Table 1). We thus unite *L. colombiana* and *L. boliviana*. The poor documentation of *L. colombiana* from Bolivia (three collections), Ecuador (one collection), and Peru (one collection) may indicate its rarity in these countries or may be due to its inconspicuous flowers. Until recently, there was also a paucity of records from Colombia, now remedied by specialist collecting there.

The immediate relationships of *Libertia colombiana* are evidently with the Chilean *L. tricocca* which is broadly similar in general appearance, modest stature, and flowers with long pedicels. *Libertia tricocca* is readily distinguished by its narrower leaves, mostly 2–3 mm wide, of firm texture with thickened midribs and margins, its normally a smaller stature, seldom exceeding 20 cm, and short rhizome to 2 cm long. Flowers of *L. tricocca* also have shorter inner tepals, ca. 4.5 mm long, and the filaments united for ca. one fourth their length (versus inner tepals 6.5–7 mm long and filaments united for about half their length in *L. colombiana*).

The remaining species of South American *Libertia* are the robust, large-flowered plant known as *L. chilensis* (Molina) Gunckel (also known by the later name *L. formosa* Graham) and the remarkable *L. sessiliflora* (Poepp.) Skottsb. (syn. *L. caerulescens* Kunth & Bouche). This last species has blue flowers borne

Table 1. Comparison of quantitative characteristics of *Libertia colombiana* and *L. boliviana*.

Character	*L. colombiana*	*L. boliviana*
Height	20–40 cm	30–39 cm
Rhizome length	(2)5–18 cm	7.5–9 cm
Cauline leaves	6.5–28 cm × 3–6 mm	10–26.5 cm × 4–5 mm
Flowering stem length	17–34 cm	10–15 cm
Cauline leaves	2.7–11 cm × 1–3 mm	6 cm × 2 mm
Peduncles (of rhipidia)	2–4.5 cm × 1 mm	2–4.5 cm × 1 mm
Rhipidial spathe length	Outer 9–13 mm	Outer 7–9 mm
	Inner 6–10 mm	Inner 6–7 mm
Pedicel length	(0.3–)1.2–2 cm	0.7–2.5 cm
Flowers per rhipidium	2–3(–4)	2–3
Color flowers	white	white
Outer tepal length	4 mm	3.8–4 mm
Inner tepal length	7 mm	6.5 mm
Filament length	1.8–2 mm, united in lower half	2 mm, united in lower half
Anthers	1.1–1.3 mm, subasifixed	1 mm, subasifixed
Ovary	1–2.5 × 1.5–2.8 mm	2.3 × 2.2 mm
Style	0.8 mm	1 mm
Style branch length	2 mm	2 mm
Capsule	4 × 4–4.5 mm	4 × 5 mm
Seed length	1 mm	1 mm

in sessile rhipidia (the cymose inflorescence units of many Iridaceae) on a straight, unbranched flowering stem.

We include an emended description of *Libertia colombiana* below, a key to the South American species, and outline the complex synonymy of the South American species following Rodríguez and Marticorena (2000).

Libertia colombiana R.C. Foster, Contr. Gray Herb. 127:44. 1938. (**Fig. 1**). Type: COLOMBIA: Risaralda ("Caldas"), río San Rafael, abajo del Cerro Tatamá, 2600–2800 m, 7 Sep 1922, *Pennell 10357* (holotype: GH!; isotype: NY!).

Libertia boliviana R.C. Foster, Contr. Gray Herb. 161:4. 1946, syn. nov. Type: BOLIVIA: La Paz, Región Andina, 3200 m, Nov 1910, *O. Buchtien 701* (holotype: GH!).

Evergreen, often tufted herb 20–40 cm high, with a creeping rhizome up to 18 cm long. *Leaves* 6.5–28 cm × 3–6 mm, in two ranks, sword-shaped, apex attenuate, the margins ciliate, sometimes conspicuously so toward the apex. *Flowering stem* 10–34 cm long, subterete, usually branched, bearing cauline leaves progressively smaller above, 2.7–11 cm long. *Inflorescences* rhipidia, terminal on the main and secondary branches, or sessile in axils of branches 2–4.5 cm long, 2–4-flowered; spathes subequal, the outer 7–13 × 0.4–2 mm, slightly longer than the inner (5–10 × 0.4 mm), lanceolate, apex slightly curvate, with marginal cilia conspicuous toward the apex. *Flowers* on pedicels mostly 12–25 mm

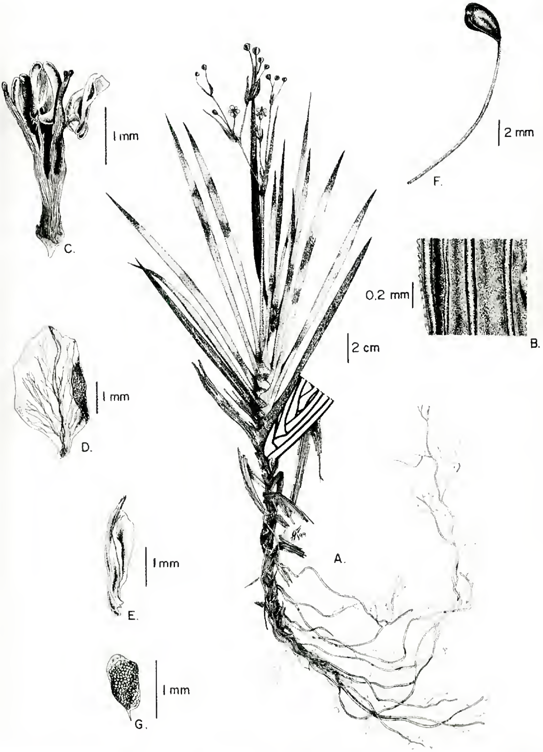

Fig. 1. *Libertia colombiana* R.C. Foster. **A.** Habit. **B.** Detail of leaf. **C.** Stamens and style branches. **D.** Inner tepal. **E.** Side view of outer tepal. **F.** Capsule. **G.** Seed. (*Idrobo 3991*).

long, well exserted from the spathes, subtended by a bract 1-6 mm long, white; *tepals* unequal, the outer whorl smaller than the inner, basally connate for 0.3-0.5 mm, the outer 3.8–4 × 2.2 mm, elliptical-oblong, obtuse, cucullate, venation acrodromus-parallelodromous, with 5 veins conspicuous, the inner 6.5–7 × 3-3.2 mm, spathulate-ovate, obtuse, venation dendroid. *Filaments* 1.8–2 mm long, partially united in the lower half for 0.8–1 mm; *anthers* subasifixed, 1-1.3 mm long. *Ovary* 1-2.5 mm long × 1.5–2.8 mm diameter, spheroidal to ellipsoid; *style* dividing just beyond the top of the filament column into three branches, each 2 mm long, terminally stigmatic. *Capsules* 3–4 × 4–5 mm, subglobose, borne on pedicels 1.5–3 cm long; *seeds* ca. 36 in each capsule, 1 mm long, rounded, surface rugose, reddish brown.

Distribution.—Andean southern America mainly in paramo, 2200–3900 m, fairly common in Colombia in the Vertiente Caucana, Vertiente Magdalenense, and Vertiente Occidental, and evidently local and rare in Ecuador, Peru, and Bolivia.

Additional specimens examined: **BOLIVIA. La Paz:** provincia Nor Yungas, 4.7 km al NE (abajo) de Chuspipata, 16°17' S - 67°47' W, 2800 m, 11 Nov 1987, *Solomon, J 17343* (MO); provincia Sud Yungas, 1.3 km al oeste de Unduavi, 16°18'S - 67°55'W, 3400 m, 12 Nov 1987, *Solomon, J. 17418* (MO). **COLOMBIA. Antioquia:** Abriaquí, Parque Nacional Natural Las Orquídeas, 6°37'2 N - 76°18.2 W, 29 Abr 1990, *Ramírez, J. 3844* (MEDEL); Andes, vereda La Siria, 6°37.2 N - 76°18.2 W, 2200 m, 03 Mar 1995, *Sánchez, D. 4160* (MEDEL). **Cauca:** Páez, Cordillera central, cabeceras del río Palo, quebrada del río López y quebrada del Duende, 2°57.3'N - 76°9.45'W, 3400–3450 m, 03 Dic 1944, *Cuatrecasas 18944* (GH, VALLE); Inza, alrededores de la Laguna de Cusiyaco, 2°33'N - 76°12'W, 3017 m, 07 Oct 1951, *Idrobo 3991* (COL). **Quindío:** Génova, Camino finca Servia-Valle Chiquito, 4°13'N - 75°48'W, 2700–3900 m, 16 Jul 1990, *Vélez, M. 2086* (HUQ); Génova, Vereda alto San Juan, finca La Caucasia, páramo, 4°13'N - 75°48'W, 3200–3500 m, 15 Dic 1995, *Vélez, M. 6534* (HUQ). **Risaralda:** Santuario, Cerro Tatamá, 5°2.6'N - 76°3.4'W, 3200–3400 m, 08 Sep 1922, *Pennell 10474* (GH); Santuario, Vereda Las Colonias, 400 m arriba del campamento, 5°2.6'N - 76°3.4'W, 2910 m, 02 Feb 1983, *Torres 1495* (COL). **Tolima:** Ibagué, Parque Nacional Natural los Nevados, parte alta del río Toche, principalmente en la margen derecha del río, 4°36'N - 75°23'W, 3200 m, 29 Jun 1985, *Barbosa, C. 3556* (FMB); Ibagué, corregimiento de Juntas, faldas del Nevado del Tolima, del Rancho hacia la Cueva, 4°36'N - 75°23'W, 2900-3100 m, 08 Ago 1975, *Jaramillo 5122* (COL). **Valle:** Jamundí, Los Farallones de Cali, cerca a las cuevas de los Osos, 3°9.3'N - 76°50'W, 3600 m, 26 Ago 1991, *Calderón 44A* (COL). **ECUADOR. PERU. **Cuzco:** near Machu Picchu, along old Inca path to Cuzco, Dec 1975, *Rafinski s.n.* (K).

REVISED KEY TO *LIBERTIA* IN SOUTH AMERICA

1\. Flowers pale blue, sessile or with short pedicels less than 3 mm long; ovary ca. 4 mm long; capsules ellipsoid, 7–10 × 5–6 mm **L. sessiliflora**

1\. Flowers white, outer tepals green at least outside, pedicels (7–)10–25 mm long; ovary 1–2.5 mm long; capsules subglobose, 2–4 × 2–5 mm.

  2\. Stem more or less straight, with rhipidia sessile except the terminal; flowers 4–10 per rhipidium; inner tepals 10 × 6.5 mm; filaments 6 mm long, anthers 2.5 mm long; style branches 5 mm long **L. chilensis**

  2\. Stem flexuose, rhipidia pedicellate except in axils of branches; flowers 2–4 per rhipidium; inner tepals 4.5–7 × ca. 3 mm; filaments 1.8–2.5 mm long, anthers 1–1.3 mm long; style branches 2(–3) mm long.

3. Plants less than 20 cm high; creeping rhizome up to 2 cm long; leaves 1–3 mm wide, firm-textured with thickened midribs and margins; inner tepals 4.5 mm long; filaments united for ca. one fourth their length; capsules 2 × 3 mm ________ **L. tricocca**
3. Plants 20–40 cm high; creeping rhizome (2–)5–18 cm long; leaves 3–6 mm wide, without thickened midribs and margins; inner tepals 6.5–7 mm long; filaments united for ca. half their length; capsules 4 × 4–5 mm ________ **L. colombiana**

SYNONYMY OF THE SOUTH AMERICAN SPECIES (EXCLUDING *LIBERTIA COLOMBIANA*)

1. Libertia chilensis (Molina) Gunckel, Rev. Chil. Hist. Nat. 31:87. 1927. *Strumaria chilensis* Molina, Sagg. Stor. Nat. Chili ed. 2:130. 1810. Type: unknown—the identity of the basionym is convincingly demonstrated by Gunckel (1927) to be the plant better known as *L. formosa* R. Grah. based on an analysis of the protologue.

Libertia formosa R. Grah., Edinb. N. Phil. J. 1833:383. Oct 1833. Type: CHILE [as Chili, Cape Horn]: imported by J. Anderson and cultivated first at the Clapton Nursery, London, and then in Edinburgh, Scotland, no preserved specimen known. Illustrations published in Edwards's Botanical Register (Lindley 1833) and in Curtis's Botanical Magazine (Graham 1834) serve to identify the species and may be regarded as type material as they were grown from the same stock originally collected in Chile and cultivated in London and then in Edinburgh. According to Lindley (1833) the plants were collected by J. Anderson on the coast of Chiloe Island. We designate the illustration in Curtis's Botanical Magazine as lectotype.

Libertia crassa R. Grah., Edinb. N. Phil. J. 1833:383. Oct. 1833. Type: CHILE [as Chili, Cape Horn]: imported by J. Anderson and cultivated first at the Clapton Nursery, London, and then in Edinburgh, Scotland, known only from the description.

Libertia elegans Poepp., Fragm. Syn. Pl. Chil. 3. 1833. *Roterbe elegans* (Poepp.) Steud. in Lechler, Pl. Chil. Exsicc. no. 569, comb. inval. non publ. Type: CHILE: near Valdivia, without date, *Lechler s.n.* (ISOTYPE: K).

Libertia grandiflora Phil., Bot. Zeit. 14:648. 1856, nom. illeg. non *L. grandiflora* (R. Br.) Sweet, Hort. Brit. 1:498. 1826. Type: CHILE: Juan Fernandez, collector and date not known (ISOTYPE: SGO).

Notes.—We prefer not to designate lectotypes for *Libertia elegans* and *L. grandiflora* because there may be additional material unknown to us.

Libertia chilensis Klotzsch mss was included by Baker (1877) in the synonymy of *L. elegans* Poepp. and is not a valid name. It therefore does not invalidate the combination *L. chilensis* (Molina) Gunckel. The plant referred to in the literature as *Libertia ixioides* C. Gay (Fl. Chil. 6:31. 1854) is incorrectly attributed to that author. Gay merely called a Chilean plant by this name, citing Forster fil. and Sprengel as authors of the basionym and combination in *Libertia* respectively, i.e., *L. ixioides* (Forster f.) Spreng., which is a New Zealand species. Likewise, the plant called *Libertia ixioides* Klatt [in Mart. Fl. Bras. 2:530, pl. 68, fig. 2. 1871] was not intended as a new species and *L. ixioides* Spreng. was cited in the text as the source of the name. This is the same New Zealand species, and was presumably cultivated in Brazil where there are no native species of *Libertia*.

Libertia macrocarpa Klatt, Linnaea 31:384 (1861–1862) is sometimes cited as a synonym of *L. chilensis* and a possible type has been located at K. This sheet is annotated "Chile, Valparaiso, cultivated at Hort. Gl." and the collector is not recorded. The specimen is a New Zealand species of *Libertia*, perhaps *L. ixioides*, which it matches in the oboviod capsules.

2\. **Libertia sessiliflora** (Poepp.) Skottsb., Nat. Hist. Juan Fernández & Easter Island 2:778. 1928. *Sisyrinchium sessiliflorum* Poepp., Notiz. Geb. Natur.-Heilk. (ed. L. F. Froriep) 23‘):277. 1829; et Fragm. Syn. Pl. 2. 1833. *Tekel sessiliflora* (Poepp.) Kuntze, Revis. Gen. Pl. 2:703. 1891. TYPE: CHILE: without precise locality, Sep, *Poeppig* 283 (HOLOTYPE: B, not seen but extant; MO, photo!).

Sisyrinchium sessiliflorum Hook. & Arn., Bot. Beechey Voy. 1:47. 1830, nom. illeg. non *S. sessiliflorum* Poepp. 1829. TYPE: CHILE: Concepcion, *Beechey s.n.* (probable HOLOTYPE: K!).

Libertia caerulescens Kunth & Bouché, Linnaea 19:382. 1847. TYPE: CHILE: Valparaiso, Lagunillia, cultivated in Berlin, May 1845, without collector (HOLOTYPE: B, not seen but extant; MO, photo!).

Note.—It is not clear whether the name *Sisyrinchium sessiliflorum* J.D. Hook. & Arn., Bot. Beechey Voy. 1:47. 1830 (listed as valid, for example, in Index Kewensis) was intended as a new species or merely the use of Poeppig's epithet, published a year earlier but not cited. While it seems prudent to assume the latter, thus simplifying the nomenclature of this species, the Code of Botanical Nomenclature requires citation of an author or the name must be treated as a new species.

3\. **Libertia triccoca** Phil., Linnaea 29:63. 1857–1858. TYPE: CHILE: Valdivia, without date, *Philippi* 944 (SYNTYPES: B, K!, SGO, not seen; MO, photos!), near Tomé (environs of Concepcion at K), without date, *Germain s.n.* (possible SYNTYPES: K!, SGO, not seen; MO, photo!).

ACKNOWLEDGMENTS

We are grateful to the Instituto de Ciencias Naturales at the Universidad Nacional de Colombia and The Missouri Botanical Garden, specially Colombia Project and their coordinators Olga Marta Montiel and Rosa Ortiz-Gentry for the given facilities to do this investigation. We thank to Henry Arellano by for his illustration, to Rodrigo Bernal for his comments about the synonymies and to the curators and staffs of COL, FMB, GH, HUQ, K, MEDEL, MO and VALLE for allowing us to study their collections.

ABSTRACT

The original descriptions and prologues, type specimens, and available material of *Aristida hitchcockiana* Henrard and *A. appressa* Vasey were compared. Based on morphology, distribution, and habitat, there seems to be no reason to recognize *A. hitchcockiana* as a valid species, and it is synonymized within *A. appressa*.

RESUMEN

Se compararon las descripciones y protólogos originales, ejemplares tipo, y demás material disponible de *Aristida hitchcockina* Henrard y *A. appressa* Vasey. Basándose en la morfología, la distribución geográfica, y el hábitat, parece no haber indicios suficientes para reconocer como especie valida a *A. hitchcockiana*. Por lo tanto, se la sinonimiza a *A. appressa*.

Aristida hitchcockiana was described in 1927 by J.T. Henrard, in his monumental "A Critical Revision of the Genus *Aristida*" (Henrard 1926, 1927, 1928). His new species was described and illustrated as having long narrow panicles, subequal glumes, the second truncate or emarginate, and unequal awns (Fig. 1). In his earlier work on the North American species of *Aristida*, A.S. Hitchcock included the type-to-be of *A. hitchcockiana* within *A. arizonica* (Hitchcock 1924). Accordingly, Henrard called attention to the shorter spikelets and awns, and truncate, emarginate glumes of *A. hitchcockiana* as compared to *A. arizonica*. The new species was known only from the original description and from the type collection at Las Sedas, Oaxaca, México (Hitchcock 1935), and largely ignored or not relevant to subsequent works on Mexican *Aristida* until Beetle's Las Gramineas de México (Beetle 1983), in which he recorded the species from seven states in México. I do not know to which plants he applied the name, only that the illustration is at variance with both Henrard's and Beetle's own descriptions, in that it shows an open panicle with spreading branches and pedicels, acuminate glumes, and long equal awns. In these publications and in Henrard's prodigious "A Monograph of the Genus *Aristida*" (Henrard 1929, 1932, 1933), *A. hitchcockiana* was compared most closely to *A. arizonica*, from which it was distinguished by having longer glumes, lemmas, and awns, but which belied its more obvious similarities.

SIDA 21(4): 2113–2118. 2005

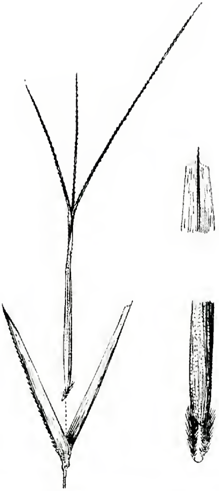

Fig. 1. Spikelet, 2nd glume apex, and callus of *Aristida hitchcockiana* [from Henrard (1932)].

A comparison of *Aristida hitchcockiana* with *A. appressa* Vasey (Fig. 2), based on original descriptions, type material, and specimens, failed to reveal any morphological characters by which to distinguish them (Table 1). For Henrard, the single most diagnostic feature of *A. hitchcockiana* was the truncate and shortly awned apex (the "curious tip") of the second glume, clearly illustrated in the original description and relied upon solely and explicitly in the keys of his Monograph (Henrard 1932, p. 237). This feature is seen clearly in the type, but even there, some of the second glumes are acutish and not very truncate. Examination of nearly 100 specimens of *A. appressa* showed a nearly complete gradation from glumes with truncate and shortly awned apices, through a series with progressively longer awns and more narrow apices, to the other extreme of glumes with long awns, acuminate apices, and noticeable lateral setulae. The truncate apex can be easily overlooked or obscured when the glume is folded or rolled. Perhaps this has lead to the characterization of the glumes of *A. appressa* as being acute or acuminate (Henrard 1932; Beetle 1983),

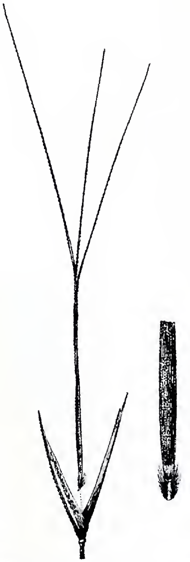

Fig. 2. Spikelet and callus of *Aristida appresssa* [from Henrard (1932)].

when in fact obtuse to truncate glume apices are frequently encountered in that species as well. In addition, I could find no correlation of this condition (a truncate apex) to any other feature. Both species develop long internodes (longer than the sheaths), a line of hairs across the collar (represented by a rim in older material, or glabrate), noticeably long hairs above the ligule on the upper surface of the blade, and lateral awns shorter than the central awn.

Henrard (1929) called particular attention to the "very curious crisp pubescence" of the culms, panicle branchlets, and lower glumes of *Aristida appressa*. This is caused by a scaberulous type of pubescence, usually in lines along the ridges or nerves of the afore-named parts. It is well-expressed in the type of *A. appressa*, but much less so in many other specimens, and can commonly be absent. This same scaberulous pubescence is found in the type of *A.*

TABLE 1. Comparison of *Aristida hitchcockiana* and *A. appressa*.

Feature	***Aristida hitchcockiana*, type**	***Aristida appressa***
Culm height (cm)	75	40–120
Peduncle length (cm)	13	10–40
Internode pubescence	glabrous	glabrous to puberulent
Middle sheath length (cm)	6–10	4–11
Sheath pubescence	glabrous to scaberulous	glabrous to scaberulous
Ligule length (mm)	0.2	0.1–0.2
Auricle region	flaring, ciliolate, with hairs to 2.8 mm	flaring, ciliolate to glabrate, often with hairs to 3 mm
Collar	scaberulous in a line	glabrous to scaberulous in a line
Longest blade length (cm)	17	14–30
Blade width when flat (mm)	1.8–2.0	1.5–2.5
Blade involution	flat, appearing to be rolled due to drying	convolute when young, flat & curling when mature
Blade margin	slightly thickened	slightly thickened
Blade upper pubescence	puberulent/scaberulous with scattered long hairs near ligule	puberulent/scaberulous with scattered long hairs near ligule
Panicle length (cm)	17–24	14–30
Lower branch length (cm)	4–6	5–12
Pulvini	absent	absent
First glume length (mm)	8–10	5–12
First glume apex	acute	truncate to acuminate
Second glume length (mm)	9–11	6–12
Second glume apex	truncate to acute	truncate to acute
Glume pubescence	scaberulous on the nerves	glabrous to scaberulous on the nerves
Lemma length to awns (mm)	11–12	7–13(–16)
Lemma vestiture	glabrous in the lower part, scaberulous in the upper	glabrous in the lower part, scaberulous in upper
Lemma beak	slightly exceeding the glumes	equal to much exceeding the glumes
Callus length (mm)	0.6–0.8	0.6–1
Central awn length (mm)	12–15	15–22
Lateral awn length (mm)	6–9	7–17

hitchcockiana, on culm internodes, branchlets, and the lower glumes. This feature has the same degree of inconsistency as the truncate glume apex: ranging from noticeably present to absent.

Henrard's holotype came from Las Sedas, Oaxaca, México (approximately 100 km northwest of the city of Oaxaca on highway 131, at N17.3523° W96.9444°), collected by Charles L. Smith sometime in 1894. The village was a former railroad station, and sits at about 2100 m in a pine-matorral transition zone, a common elevation and habitat for *Aristida appressa*. *Aristida appressa* is found in all the surrounding states (Chiapas, Veracruz, Puebla, Guerrero), as well as in Oaxaca itself.

The basis for *Aristida hitchcockiana* seems to be simply one end of a single line of variation. Its recognition is partly an artifact of observation: noticed in a few plants where the glumes are not folded or rolled, but overlooked in other plants where the glume apices are obscured. It lacks any distinctive morphology, distribution, or habitat. For these reasons, the name *A. hitchcockiana* Henrard is subsumed without recognition under the older name *A. appressa* Vasey, as detailed below.

Aristida appressa Vasey, Contr. U.S. Natl. Herb. 1(8):282. 1893. TYPE: MÉXICO. JALISCO: Guadalajara, 1886, *E. Palmer s.n.* (HOLOTYPE: US-745676!; ISOTYPES: L fragm., W).

Aristida hitchcockiana Henrard, Meded. Rijks-Herb. Leiden No. 54A:233–234. 1927. TYPE: MÉXICO. OAXACA: Las Sedas, 1894, *C.L. Smith 918* (HOLOTYPE: US-991670!).

ABSTRACT

In the absence of possible holotype material, a lectotype is designated for *Stachys floridana* Shuttlew. ex Benth. in DC. (1848) from material not clearly cited by Bentham but probably in his possession at time of publication.

KEY WORDS: *Stachys*, Lamiaceae, lectotype selection

ABRISS

Aufgrund des Fehlens von Originalmaterial wird für *Stachys floridana* Shuttlew. ex Benth. in DC. (1848) ein Lektotyp aus Belegen ausgewählt, die Bentham zwar nicht zitiert hat, die aber wahrscheinlich zur Zeit des Publikation in seinem Besitz waren.

A review of the genus *Stachys* (Lamiaceae) in the southeastern United States (Nelson 1981) left unresolved some difficult but noncritical nomenclatural details. One of the most vexatious of these remaining inquiries has been the search for a suitable type and type locality for a widespread southeastern species, *Stachys floridana*. Since no single specimen was designated by its author, George Bentham, which can be interpreted as a holotype, our intent here is to document the steps taken in this search and its ultimate resolution by choice of an appropriate replacement, a lectotype.

Bentham (Prodr. 12:478, 1848) published *Stachys floridana* using a name coined by Robert J. Shuttleworth for specimens collected for him by Ferdinand Rugel. (See Geiser 1948, for a brief biography of Rugel.) Bentham published his new *Stachys* by first indicating the source of the name, "(Shuttlew.! pl. Rüg mss.)." He then provided a 41-word diagnostic description based upon materials "Ad Tampa Bay Floridae." As indicated by the further notation "(h. Torr! Rügel!)," Bentham's material apparently consisted of two collections, a specimen from the herbarium of John Torrey and a second from Rugel. Bentham concluded his presentation by providing a 21-word supplemental description that applies to a commonly observed, full-sun variant.

The following relevant collections have been located, presented here in (apparent) order of date of collection:

1. *Unknown collector* 72: Handwritten label bearing "72" and reading "*Stachys floridana* Shuttl.," "Tampa Bay [Hillsborough County] Florida," and "Torrey 18[?]6." Specimen seen: K (photo only). The hand is undetermined.

2. *Rugel s.n.*: Printed labels from the Shuttleworth herbarium, reading "*Stachys floridana* Shuttl. n. sp. Ad margines agrorum, prope Tallahassee [Leon County], Florida, legit Rugel, Mai 1843." Specimens seen: BASBG, BM, K, MIN, MO, NY, USCH, Z [3]. Since Shuttleworth sold and distributed sets of Rugel's 1843 collections (Geiser 1948), additional specimens may exist.

3. *Rugel 176*: Labels headed "From The United States National Herbarium," bearing the printed words "Florida—F. Rugel: 1842–1849. Ex Herb. Mus. Brit.," a handwritten "176," and the plant name. Specimens seen: BM, F, MO [2], NY, US. Apparent duplicates of this collection are at FLAS and NCU, but accompanied by labels printed with the words "Ex Herbario Musei Brittanici," and modern typescript indicating the specimen to be *Rugel 176*, from Lake Monroe [Volusia County], Florida, collected June 1848 (cited imprecisely as from "near Jacksonville" in Nelson 1981).

Since Bentham indicated he had seen two collections of his new species, no holotype can be cited. It would indeed be a straightforward matter to designate the Tampa Bay collection as lectotype if it were not for a series of uncertainties that time and continued investigation have not resolved.

The collector and date of collection of the Tampa Bay specimen remain obscure. Since correspondence and specimen exchanges between Alvan Wentworth Chapman of Apalachicola, Florida, and John Torrey, New York, and between Torrey and George Bentham are well known, our first assumption was that Chapman was either the collector or responsible for transmitting the collection. Certainly Chapman knew the plant; his *Flora of the Southern United States* (1860) recorded the species as occurring in "Middle and South Florida."

But the date borne by the specimen is too early for Chapman's involvement. The unclear digit, as shown by a photograph, is most likely a "2"; a date of 1826 would have required Chapman, born in 1809, to have been 17 at the time of collection. Even if the digit were a "3," as seems marginally possible, Chapman is unlikely to have been the collector or communicator; he did not move to Florida (to Quincy, Gadsden County), as a young physician, until 1835 (Barnhart 1921).

Other early Florida collectors were considered as the possible source. The Seminole Wars, which began in 1818, resumed in 1835 and continued intermittently until the 1840s, made the Florida peninsula an inhospitable place for travel and collection. Yet the military forces sent into the state permitted a few soldier-botanists to reach areas otherwise inaccessible and unknown. Of those whose duties brought them into central Florida, at least three served at Fort Brooke, modern Tampa, or reasonably would have passed through that area to duty stations elsewhere. Gilbert White Hulse, an army surgeon, was based at Fort Brooke beginning in 1836, and sent specimens to Torrey (Ewan 1971). Bradford Ripley Alden, a West Point officer, arrived at Fort King, near present-day Ocala, in 1832 or 1833 and is also known to have sent specimens to Torrey. Melines Conkling Leavenworth, a doctor also stationed at Fort King, collected widely in the northern peninsula during the 1830s. Other botanical explorers in pioneer Florida are also known (Wunderlin et al. 2000). But no records present clear evidence as to the identity of this first collector of *Stachys floridana*.

We have been unable to discover either at K, within the Torrey herbarium (now NY), or in other herbaria, any further early collections of *Stachys floridana* from the Tampa Bay region. It is not apparent why Torrey, who is indicated as the source of the Tampa Bay collection now at K, would have parted with his only specimen. Though the handwriting cannot be confirmed as Bentham's, neither is it clearly that of Torrey. The possibility thus remains that Torrey transmitted a unicate of little perceived value, and that the "Tampa Bay" designation was added by someone other than its collector. But whoever the collector and the place of collection, Bentham's notation of "Torrey"—and the absence of other Torrey specimens available to Bentham—strongly suggests that the collection now marked "72" was among the material in Bentham's possession at time of description.

Rugel's Tallahassee collection of *Stachys floridana* is also imperfectly documented. It is probable his 1843 specimen reached Bentham (at K) as part of a set purchased from Shuttleworth; Rugel's collections of that year apparently were distributed in no other way (Geiser 1948). These sets may have been available for purchase as early as 1844—at a price of 24 Swiss francs per 100 (per "century")—well before publication in 1848. Why Bentham failed to indicate his knowledge of the 1843 specimen is unclear; "ad Tampa Bay" may have seemed sufficient to encompass also Tallahassee. But Bentham did refer to Rugel as a source, and it appears likely that at least one of the specimens collected by Rugel near Tallahassee in May 1843, which consist of a mixture of shade and full-sun variants, was among the original material upon which Bentham based his description.

The Tallahassee specimen available to Bentham at Kew Gardens (K) is on a sheet bearing two collections [Fig. 1]. Two excellent plants of *Stachys floridana* on the right side of the sheet have been mounted alongside an unrelated *Stachys* sp., apparently from Chiapas, Mexico.

The pathway of *Rugel 176* is similarly unclear. The more detailed labels accompanying this collection at FLAS and NCU—as from Lake Monroe, Florida—suggests that BM may have retained (and distributed to other herbaria) only an abbreviated version of the information available from the original labels. The year of collection, 1848, as stated by the FLAS and NCU specimens, is the same as publication of the name. Since the date is in typescript and of recent application, it may merely reflect an archivist's assignment of the publication date to accompany the older printed label. If indeed this were the year of collection, there would have been scant opportunity for timely transmittal of those specimens from Rugel to Shuttleworth and then to Bentham. Moreover, there is no annotation or other marking on the specimen to indicate that Bentham (at K)

Fig. 1. Lectotype of *Stachys floridana* Benth. Two plants, right side: Ferdinand *Rugel s.n.*, Tallahassee, Florida, May 1843. (Plant, left side: unrelated collection of *Stachys* sp., apparently from Chiapas, Mexico.)

had occasion to view the holdings at BM. The bulk of the Shuttleworth herbarium was not acquired by the British Museum until 1877 (Geiser 1948), and if Rugel 176 were part of that transfer it would of course not have reached England until long after Bentham's publication.

Thus none of the early collections are fully satisfactory choices as lectotype for Bentham's *Stachys floridana.* Yet none of the three collections examined can be categorically excluded. Fortunately, the morphological uniformity of this species, as represented by these collections, is such that no taxonomic consequence will follow the selection of one rather than another.

But *Rugel 176*, though the collector's name was cited by Bentham, is clearly a marginal choice as lectotype; it seems unlikely that the specimen at BM, if seen by Bentham, was available to him until after his publication of the name. The second possible lectotype, from Tampa Bay, was probably in Bentham's hands prior to publication, but it is of uncertain provenance and without known duplicates, and is of tenuous quality upon which to base a name.

We have chosen the third possibility, the specimen from Tallahassee, Florida, as our lectotype:

Stachys floridana Shuttlew. ex Benth. in DC., Prodr. 12:478. 1848. TYPE: U.S.A. FLORIDA: [Leon Co.]: Tallahassee, May 1843, *Rugel s.n.* (LECTOTYPE, designated here: K, two plants, right half of sheet [**Fig. 1**]; ISOLECTOTYPES: BASBG, BM, MIN, MO, NY, USCH, Z; (USCH is a mixture, bearing a flowering stem of *Physostegia* in addition to the *Stachys*).

Even though Bentham made no reference to material from Tallahassee, the low probability of his having seen Rugel 176, from Lake Monroe, gives a correspondingly high probability to him having seen Rugel s.n., from Tallahassee; that collection may reasonably be interpreted as the "Rügel" specimen which he cited. The Kew Gardens collection is representative of a common full-sun form of the plant and will, we trust, serve to anchor future understanding of this name.

ACKNOWLEDGMENTS

We are grateful to the curators and staff of the above-mentioned herbaria for the loan of specimens or gift of photographs for this study, especially Ray M. Harley (K), Roy Vickery (BM), and Thomas A. Zanoni (NY); to Hartmut Hilger (BSB) for composition of the German abstract; and to Loran C. Anderson (FSU), Fred R. Barrie (F), Victoria C. Hollowell (MO) for their helpful suggestions in review of our manuscript.

ABSTRACT

North American and Central American taxa of *Symphyotrichum* sect. *Oxytripolium* (*S. subulatum* sensu lato and *S. tenuifolium* sensu lato) have been treated at both specific and varietal rank. As interpreted here, morphological discontinuities and reproductive isolation indicate that specific rank is appropriate for the five annual taxa, including the South American native *S. squamatum*, which is recorded primarily as a waif in the U.S.A. A key is provided to the annual taxa under consideration and summaries of synonymy are given for each. State distribution records are documented for the following: *S. subulatum*—Arkansas, Nebraska; *S. divaricatum*—New Mexico; *S. bahamense*—Georgia; *S. expansum*—Florida, Oklahoma; *S. squamatum*—Alabama, California, Florida, Louisiana, Texas.

RESUMEN

Los taxa de Norte América y América Central de *Symphyotrichum* sect. *Oxytripolium* (*S. subulatum* sensu lato y *S. tenuifolium* sensu lato) se han tratado tanto con rango específico como varietal. Tal como se interpreta aquí, las discontinuidades morfológicas y aislamiento reproductor indican que el rango específico es el apropiado para los cinco taxa anuales, incluyendo la nativa Sur Americana *S. squamatum*, que se cita principalmente como una planta abandonada en U.S.A. Se ofrece una clave para los taxa anuales en consideración y se hacen resúmenes de las sinonimias para cada uno de ellos. Se documenta la distribución en estados de los siguientes: *S. subulatum*—Arkansas, Nebraska; *S. divaricatum*—Nuevo México; *S. bahamense*—Georgia; *S. expansum*—Florida, Oklahoma; *S. squamatum*—Alabama, California, Florida, Texas.

Seven taxa of *Symphyotrichum* sect. *Oxytripolium* (DC.) Nesom (*Symphyotrichum* subg. *Astropolium* (Nutt.) Semple) comprise *Symphyotrichum* (*Aster*) *subulatum* (Michx.) Nesom sensu lato and *Symphyotrichum* (*Aster*) *tenuifolium* (L.) Nesom sensu lato. Six of these taxa are native primarily to North America and Central America (including the Antilles and Bahamas); one is native to South America. One or several of them occur as cosmopolitan weeds, but identifications need to be reexamined for accuracy and consistency. Sundberg (1986, 2004, 2005) has followed a broad species concept, emphasizing putative intergradation among the taxa (see comments below), and treated *S. subulatum* as a single species with five varieties and *S. tenuifolium* with two varieties. All seven of these taxa are treated here (and in Nesom 1994) at specific rank; bases for the taxonomic decisions are differences among the taxa in morphology, geography and ecology, chromosome number, self compatibility, and sterility in

SIDA 21(4): 2125–2140. 2005

natural and experimental hybrids. Information on reproductive biology, chromosome numbers, and hybridization is from Sundberg (1986).

The observations and considerations here are predicated on the initial study and sorting of the North American oxytripolioid taxa by Sundberg (1986, 2004), who found the larger patterns in a taxonomically difficult complex and provided detailed information regarding typification. My disagreements with Sundberg are primarily in asssignments of rank, based largely on interpretation of data, as I mostly agree with his delimitation of taxa. While I have seen plants in the field and studied a large number of specimens, Sundberg collected this group widely and for his dissertation research had on hand several thousand specimens from various herbaria. The lesser intensity of the present analysis and commentary, however, does not invalidate the conclusions. The key provided below is based on Sundberg's dissertation study (1986) but has been modified as I worked through collections. Hopefully, the present overview will supplement that of Sundberg's FNA treatment (2005) in facilitating more accurate identifications of these taxa.

Documentation is provided for various distribution records, which have not been given in Sundberg's dissertation or publications. His distribution maps (1986) were small-scale and did not show U.S.A. counties. Some points of the present discussion were made earlier in brief (Nesom 1994).

Annual taxa—*Symphyotrichum subulatum* sensu lato

A map compiled by Sundberg (1986) shows that in their native (New World) ranges, the five annual taxa are discrete in geographic distribution, each almost completely allopatric with the others. In those with partially contiguous ranges, he indicated in text that intermediates occur in relatively small areas, but intermediates were not shown on the map. The taxa are morphologically distinct although by relatively small differences.

Symphyotrichum squamatum and *S. bahamense* are tetraploids ($2n = 20$), while the other taxa are diploids ($2n = 10$). Sundberg reported naturally occurring intermediates between (1) *S. bahamense* [$2n = 20$] and *S. subulatum* [$2n = 10$], (2) *S. bahamense* [$2n = 20$] and *S. expansum* [$2n = 10$], and (3) *S. divaricatum* [$2n = 10$] and *S. expansum* [$2n = 10$]. His own study, however, provided evidence regarding internal reproductive isolation among these taxa. "Artificial hybrids produced in the greenhouse among these [five] varieties are highly sterile" (Sundberg 1986, p. 63). He obtained plump achenes (presumably those that were germinable) only from crosses between *S. bahamense*-*S. divaricatum*, *S. bahamense*-*S. expansum*, and *S. expansum*-*S. squamatum*, and each of these pairings was between a diploid and tetraploid. A photo in Sundberg (1986) shows 15 mitotic chromosomes of a triploid artificial hybrid between *Symphyotrichum bahamense* and *S. expansum*.

Notwithstanding the significance of naturally occurring intermediates to

Sundberg's view of the variation patterns, he did not report the occurrence of a naturally occurring triploid plant among the 86 natural populations of annual oxytripolioid taxa from which he made chromosome counts. Nor, apparently (judging from his vouchers at TEX), did he make a chromosome count of a plant suspected of being a natural hybrid of a diploid-tetraploid parental cross. Semple (1992) noted that of 6908 chromosome counts reported for North American asters (mostly *Symphyotrichum*) and goldenrods, only 8 (0.12%) were triploid. This suggests that intergradation may not be as prevalent as Sundberg surmised, if it can be inferred from Semple's data that triploids survive at a very low frequency.

Sundberg (2004, p. 906) pointedly summarized his rationale for treatment of these taxa at infraspecific rank: "**The varieties intergrade morphologically where their distributions approach one another**." I have been unable to corroborate this implied ubiquity of intergradation, certainly not to the extent that would suggest treating all taxa as a single species. The annual taxa appear to be essentially discrete in morphology at their points of geographic contact and overlap. Tendencies for overlapping variation in one or a few morphological features, as described by Sundberg (2004), are not necessarily the result of intergradation, which characteristically is understood to imply the existence of a zone of morphological intermediacy with continous gene exchange. Discontinuities in morphology imply the existence of reproductive isolation. Sundberg's sentence immediately following the one above suggests that his view of "intergradation" reflected a broad interpretation of that process: "**This [intergradation] may be the result of past hybridization events and limited gene flow across reproductive barriers**."

Even with recognition that reproductive isolation exists among the annual oxytripolioid taxa, morphological differences often are subtle. Infraspecific variability and parallel variation, especially within *Symphyotrichum divaricatum* and *S. bahamense*, produce individuals that might be misidentified without an understanding of the morpho-geographic patterns. Differences among the diploid taxa, however, are clearer, and the tetraploid *S. bahamense* apparently is reproductively isolated from the three closely related diploid taxa with which it is contiguous-sympatric. The species concept underlying the present analysis emphasizes biological discontinuities.

Annual plants of sect. *Oxytripolium* adventive in Australia and various Pacific islands have mostly been identified simply as *Aster subulatus* (e.g., Walker 1976; Harden 1992; Jones 1999), although Soejima and Peng (1998) reported the occurrence of two taxa (as *A. subulatus* var. *subulatus* and *A. subulatus* var. *sandwicensis*) in Taiwan. Smith (1991) included *A. subulatus* for Fiji, noting that it probably existed only as a ballast waif. Naturalized plants from other parts of the world have been identified as *A. squamatus*, e.g. Europe (Tutin et al. 1976), Russia (Tamamschyan 1959), and Zimbabwe (Mapaura & Timberlake

2004). Where two or more of these taxa may co-occur as adventives in regions outside of their native range, observations and perspective of the present commentary suggest that they will remain morphologically discrete. For example, *S. squamatum*, *S. bahamense*, and *S. expansum* in characteristic morphology have been recorded from Japan (see below).

The name *Aster exilis* Elliott (Sketch Bot. S.Carolina 2:344. 1823) has often been applied to these plants, but as noted by Shinners (1953), a type has never been located and Elliott's description may well have applied to some form of *Symphyotrichum dumosum*. With heads on the upper branches "in racemes on peduncles two to four lines long," ray florets "twice as long as the involucrum," and occurring "in the western districts of Georgia," the plants that Elliott described could hardly be any of the annual taxa considered here.

Symphyotrichum subulatum (Michx.) Nesom, Phytologia 77:293. 1994. *Aster subulatus* Michx., Fl. Bor-Amer. 2:111. 1803. *Symphyotrichum subulatum* var. *subulatum* (sensu Sundberg 2004). TYPE: U.S.A "PENNSYLVANIA."

Aster subulatus var. *euroaster* Fernald & Griscom, Rhodora 37:183. 1935. TYPE: U.S.A VIRGINIA.
Aster subulatus var. *obtusifolius* Fernald, Rhodora 16:61. 1914. TYPE: CANADA. NEW BRUNSWICK.
Aster ensifer Bosserdet, Taxon 19:250. 1970. TYPE: U.S.A. MASSACHUSETTS.

$2n = 10$. Self-compatible. Primarily outer coastal plain of the Gulf and Atlantic coasts of Canada (New Brunswick) and the eastern U.S.A. (Texas, Louisiana, Mississippi, Alabama, Florida-northeastern counties disjunct to the western panhandle region, Georgia, South Carolina, North Carolina, Virginia, Maryland, Delaware, New Jersey, Pennsylvania, New York, Connecticut, Rhode Island, Massachusetts, New Hampshire, Maine); coastal salt and brackish marshes, depressions between sand ridges, spoil banks along canals, shorelines near the coast. Also in inland marshes and saline areas of various states (Arkansas, Nebraska, Illinois, Indiana, Ohio, Michigan, and Ontario). Semple et al. (2002) noted that the species may have been introduced into Ontario only after salt mining began in the region. It was first collected in Michigan in 1914 at a salt mine and "survives now along well salted highways" (Voss 1996). In Illinois, it is "adventive along highways, rapidly spreading in ne. Ill." (Mohlenbrock 2002). Label data and photos of herbarium collections made in eight counties of the Chicago region (V Plants 2005) indicate that the plants there grow mostly in ditches and road shoulders. Collections from south-central Arkansas (citations below) are from an area apparently polluted by salt from oil drilling.

First reports for **Arkansas. Union Co.:** 5 mi S of Calion, sandy oil spill barrens, 8 Oct 1988, *Sundell 8794* (VDB); edge of bare vegetation-less area in salty runoff area from oil wells beside Union Co. Rd. 25, 1 mi N of Urbana near a branch of Richmond Creek, 22 Oct 1987, *Thomas 103,102* (NLU); salty runoff area beside small stream just E of Lawson and S end of Ark. 129, area graded in attempt to clean up runoff from oil wells, 22 Oct 1987, *Thomas 103,117* (NLU); salty area from oil well runoff beside branch of Mill Creek, 2 mi N of Old Union and Ark. 15, 7 Oct 1988, *Thomas 107,952* (NLU, TEX); 1 mi N of Urbana, salty area along a branch of Richmond Creek, beside Union Co. Rd. 25, 7 Oct

1988, *Thomas 108,025* (NLU, VDB); sandy soil in oil field N of Ark. 335 along E bank of Hayes Creek 2 mi E of Norphlet, 15 Sep 1989, *Thomas 112,871* (NLU). First reports for **Nebraska. Lancaster Co.:** just W of Lincoln, Oak Lake, plant very common along saline shore, 7 Oct 1974, *Churchill 4862* (BRIT, NLU); artificial pond by Salt Creek, N of University campus, *Shildneck C-14017* (TEX). *Symphyotrichum divaricatum* also occurs in Lancaster County (e.g., *Shildneck C-14016*, TEX).

Symphyotrichum subulatum usually is distinctive in its heads in a dense, elongate, pyramidal-paniculate arrangement (or corymbiform in small plants with relatively few heads), relatively long involucres, phyllaries without a distinct apical green zone, ray florets 1.5–2.5(–3) mm long and coiling back distally in 1/2–1 coils, disc florets 4–10(–13), accrescent pappus, and typical salt marsh habitat (the only one of the annual taxa adapted to saline substrate). Axillary heads sometimes mature as sessile to subsessile, as is characteristic of *S. bahamense*, but other features of *S. subulatum* establish its identity. It perhaps forms triploid hybrids with *S. bahamense* (fide Sundberg) but apparently is more completely isolated from the other annual taxa (see comments under *S. divaricatum*).

Symphyotrichum divaricatum (Nutt.) Nesom, Phytologia 77:279. 1994. *Tripolium divaricatum* Nutt., Trans. Amer. Philos. Soc. 2, 7:296. 1841. *Aster divaricatus* (Nutt.) Torrey & A. Gray, Fl. N. Amer. 2:163. 1841 (not *Aster divaricatus* L.). TYPE: U.S.A. MISSISSIPPI: "inundated banks of the Mississippi," collected by Thomas Nuttall, probably in December 1811, in the vicinity of Natchez, Mississippi, or around New Orleans, Louisiana (Graustein 1967).

Aster subulatus var. *ligulatus* Shinners, Field & Lab. 21:159. 1953. *Symphyotrichum subulatum* var. *ligulatum* (Shinners) Sundberg, Sida 21:907. 2004. TYPE: U.S.A. TEXAS.

Aster neomexicanus Wooton & Standley, Contr. U.S. Natl. Herb. 16:187. 1913. TYPE: U.S.A. NEW MEXICO (see citation and comments below).

2*n* = 10. Self-incompatible. Common in the south-central U.S.A. (Texas, Oklahoma, Kansas, Nebraska, New Mexico, Arkansas, Louisiana, Mississippi, Alabama, Kentucky (fide Clark et al. 2005), Tennessee, Missouri (in the southeasternmost two counties), apparently spreading eastward (e.g., Virginia; Nesom 2000) and expected to appear elsewhere along the Atlantic coastal plain. Mexico (Tamaulipas southward to the vicinity of Tampico in Veracruz, northern Coahuila, and Chihuahua, in the area of Cd. Chihuahua, Cd. Delicias, and Meoqui). Figure 1. Disturbed habitats, often moist (but usually not wet), sand, loam, and clay, common and often extremely abundant along roadsides and ditches and in lawns; in the drier Great Plains region, it occurs on lake shores, marsh and playa margins, depressions, and flats. Sometimes flowering into February.

Documentation for occurrence in **New Mexico. Chaves Co.:** Roswell, 3800 ft, Aug 1900, *Earle & Earle 327* (US, holotype of *Aster neomexicanus*; NMC isotype). **Eddy Co.:** Carlsbad Springs, *Standley 40329* (US). **Guadalupe Co.:** Los Esteros Creek, *Tschaikowsky 401* (ARIZ). The collections from Eddy and Guadalupe cos. were recorded by Sundberg on exsiccatae lists filed in herbarium TEX.

Symphyotrichum divaricatum is distinct from the other annual taxa in its relatively long and conspicuous ray florets and in its tendency to produce heads in a diffuse arrangement (vs. sessile to subsessile axillary (*S. bahamense*), distally clustered (*S. squamatum*, *S. expansum*), or densely elongate, pyramidal-paniculate (*S. subulatum*). Before production and maturation of axillary heads, the aspect of young plants of *S. divaricatum* may resemble that of *S. bahamense*. Heads in small plants of *S. divaricatum* and in plants from Mississippi and Alabama often are produced in a corymbiform arrangement, more characteristic of *S. expansum*, but the larger heads, long-acuminate phyllaries, and much longer ray corollas indicate their identity.

Sundberg (2004) noted that *Symphyotrichum divaricatum* is "the least variable taxon" [among the annual oxytripolioids], but I observe that it is markedly variable at least in head size (inner phyllaries (4–, 4.5–)5–5.5(–6.5) mm long) and in height (plants (3–)20–100(–200, 300) cm tall). A collection from Hidalgo Co., Texas (*Cory 51331*, SMU), was noted by its collector to be of plants up to 3 meters tall, "the largest aster plant I have ever seen." Plants in lawns will continue to produce small heads even after being mowed to about 3 centimeters in height.

The combined geographic range of *Symphyotrichum divaricatum*, *S. bahamense*, and *S. expansum* is roughly doughnut-shaped, with the Gulf of Mexico as the hole—each of the three taxa occupies a major portion of the circumference. As noted below, *S. divaricatum* and *S. expansum* are slightly, intermittently sympatric at the extremities of their ranges in west Texas and adjacent Mexico (Fig. 1). The geographic ranges of *S. bahamense* and *S. divaricatum* approach each other but apparently do not make contact—the easternmost portion of the range of the latter is in southern to central Alabama, while the former reaches its westernmost point in Bay, Gulf, and Franklin cos., Fla., in the central panhandle region (Fig. 1). *Symphyotrichum bahamense* and *S. expansum* are sympatric in southernmost Florida.

The geographic range of *Symphyotrichum divaricatum* closely approaches that of *S. subulatum* in places along the Gulf Coast. Plants of *S. divaricatum* even grow to terrestrial edges of marsh and deeper water along the coast, but habitats of the two taxa are distinct and they appear to be completely reproductively isolated.

Representative coastal localities for *Symphyotrichum divaricatum* (closely approaching habitats of *S. subulatum*). **Alabama. Mobile Co.:** Battleship Park, brackish moist sands, 22 Oct 1969, *Kral 38290* (VDB); E of Theodore in Deer River area, sandy open dock area (Navy) along Mobile Bay, 25 Oct 1999, *Kral 89064* (NLU, VDB). **Louisiana. Vermilion Par.:** Redfish Point, W side of Vermilion Bay, vicinity USL field station, scattered in marsh (brackish) [growing near *Symphyotrichum subulatum*], 28 Oct 1961, *Reese 5726* (VDB). **Texas. Jefferson Co.:** 3.5 mi SW of Port Arthur, moist places of coastal flats, 18 Nov 1945, *Cory 50949* (SMU); 10 mi W of Sabine Pass on Hwy 87, sand above intertidal zone, 19 Nov 1968, *Mahler 5175* (SMU). Locality for *Symphyotrichum subulatum* sensu stricto sympatric (as noted on label) with *S. divaricatum*. **Mississippi. Jackson Co.:** Pascagoula, vic. Bayou Casotte, S of jct of Louise St. and Washington Ave., heavily disturbed fill area, clay soil with oyster fragments, growing within 100 yds of *Aster subulatus* var. *ligulatus*, 5 Nov 1994, *MacDonald 8179* (VDB).

See further comments following *S. expansum*.

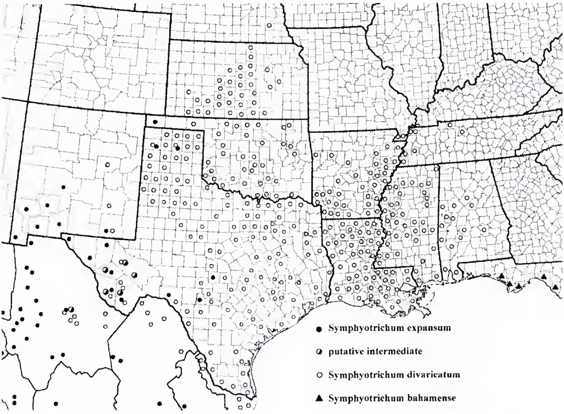

Fig. 1. Geographic distribution of *Symphyotrichum divaricatum*. Also shown are the eastern approach of *S. bahamense* in the Florida panhandle and the western approach and sympatry of *S. expansum*. U.S.A. records for *S. divaricatum* are from BRIT-SMU, MO, NLU, NMC, OKL, TEX-LL, VDB, and various sources of literature; a few (as cited) are from Sundberg (1986). Records for *S. expansum* in Mexico are from TEX-LL and from various other herbaria, accumulated in a yet unpublished taxonomic treatment (Nesom) of Mexican Astereae. Records for *S. bahamense* are from USF and VDB.

Symphyotrichum bahamense (Britton) Nesom, Phytologia 77:276. 1994. *Aster bahamensis* Britton, Bull. Torrey Bot. Club 41:14. 1914. *Aster subulatus* var. *bahamensis* (Britton) Bosserdet, Taxon 19:249. 1970. Type: BAHAMAS: Grand Bahama.

Aster subulatus var. *elongatus* Bosserdet ex Jones & Lowry, Adansonia, ser. 4, 8:406. 1986 (not Bosserdet, Taxon 19:250. 1970, nom. invalid., without designation of a type). *Symphyotrichum subulatum* var. *elongatum* (Bosserdet ex Jones & Lowry) Sundberg, Sida 21:907. 2004. Type: U.S.A. Florida.

$2n = 20$. Self-compatible. From the eastern portion of the Florida panhandle throughout most of peninsular Florida to the Keys (43 counties recorded for Florida in this study); also in a few localities of coastal Georgia and in the Bahama Islands (including the type). Hispaniola: Santo Domingo, 25 Oct 1929, *Ekman 13918* (LL); Alain (1962) included *S. bahamense* in the flora of Cuba. Japan: Chiba Pref., Futtsu City, abandoned rice paddy, 8 Oct 1985, *Enomoto s.n.* (TEX). Ditches and depressions, pond edges, edge and upper part of salt marsh, fresh water marsh, fields, grassy roadsides, lawns, disturbed sites, woods edges.

Documentation for occurrence in **Georgia. Glynn Co.:** ca. 0.4 mi S of E end of bridge of Jekyll Island, upper part of salt marsh, 25 Oct 1975, *Duncan 29660* (VDB); ca. 1.7 mi NW of St. Simons, higher part of salt marsh, 17 Sep 1971, *Duncan 23665* (VDB); exposed, low roadside at Super 8 Motel, 23 Oct 2001, *McNeilus 01-339* (NLU). **McIntosh Co.:** ca. 2.4 mi due N of southern tip of Sapelo Island, marshy area, usually fresh water, just back of narrow strip of oaks along Duplin River, 14 Oct 1956, *Duncan 20635* (BRIT, TEX).

Symphyotrichum bahamense is characterized by its distinctive arrangement of heads (at first at ends of long, bracteate branches, then produced and maturing as axillary and nearly sessile or on very short lateral branches, commonly appearing secund to subsecund) and ray corollas mostly 2–3.5(–4) mm long, with blue to purple laminae coiling back in 2–3 coils. The ray corollas are shorter than in *S. divaricatum* and the disc florets fewer.

According to Sundberg (1986), intermediates between *Symphyotrichum bahamense* and *S. subulatum* "occur sporadically" in Florida on northern extremities of the range of the former (Duval Co. and along the coast of the panhandle region). He noted (2004, p. 907) that "Intergradation [with *S. subulatum*] is demonstrated in the compactness of the capitulescence and the number of disk and ray florets." Such putative intermediates do not appear to be common, however, and F1's would be triploid and sterile (Sundberg 1986). There is no specimen at TEX indicated to be such a hybrid.

Putative intergradation between *Symphyotrichum bahamense* and *S. expansum* in southern Florida was noted by Sundberg (2004, p. 907) to be evidenced by "individuals of [*S. expansum*] ... more robust (to 1.5 m tall) than elsewhere and [with] the ligules ... often pink, instead of white." If any of these putative intermediates are *S. bahamense-expansum* hybrids, the F1's would be triploid and sterile. Plants of *S. bahamense* from southern Florida have a tendency for early heads to develop on relatively shorter peduncles in a corymboid arrangement; these have the general appearance of *S. expansum* but can be identified as *S. bahamense* by their larger involucres and larger, blue to purple ray florets (examples: Hendry Co: *Brass 33406*, USF; Levy Co: *Semple 3966*, USF), and the later (axillary) heads tend to be sessile or short-pedunculate, more like typical *S. bahamense*. The couplet below give details of differences.

Heads at first at ends of long, bracteate branches, then produced and maturing as axillary and nearly sessile or on very short lateral branches, commonly on one side of the main stem and appearing secund to subsecund, in paniculiform arrangements; inner phyllaries 5–6.5 mm long; ray florets in 2–3 series, laminae blue to purple, (2–)2.5–4 mm long and 0.2–0.4 mm wide (dried), coiling back in 2 or more coils; disc florets 11–23 ____ **Symphyotrichum bahamense**

Heads usually corymbiform to thyrsiform in arrangement (borne primarily on distal branches, distally clustered); inner phyllaries 4–5.5 mm long; ray florets in 1(–2) series, laminae white to light pinkish or slightly blue, 2–3 mm long and 0.1–0.3 mm wide (dried), remaining straight or coiling back in 1–2 coils; disc florets (6–)8–15 ____ **Symphyotrichum expansum**

Sundberg (1986) suggested that the tetraploid *Symphyotrichum bahamense* may have had an alloploid origin, with parents the diploids *S. divaricatum* and either

S. expansum or *S. subulatum*. Such an origin would account for at least some aspects of morphological intermediacy in *S. bahamense*.

Symphyotrichum expansum (Poepp. ex Spreng.) Nesom, Phytologia 77:281. 1994. *Erigeron expansus* Poepp. ex Spreng., Syst. Veg. 3:518. 1826. TYPE: CUBA.

Aster inconspicuus Less., Linnaea 5:143. 1830. *Aster exilis* var. *inconspicuus* (Less.) Hieron., Engl. Bot. Jahrb. 29:19. 1900. TYPE: CUBA: homotypic with *Erigeron expansus*.

Erigeron multiflorus Hook. & Arn., Bot. Beechey Voy. 87. 1832. TYPE: U.S.A. HAWAII. Synonymy fide Jones (1984).

Tripolium subulatum (Michx.) DC. var. *parviflorum* Nees, Gen. sp. Aster. 157, 286. 1833. *Symphyotrichum subulatum* var. *parviflorum* (Nees) Sundberg, Sida 21:907. 2004. TYPE: U.S.A. HAWAII: as lectotypified by Sundberg (2004); homotypic with *A. divaricatus* var. *sandwicensis*.

Tripolium subulatum (Michx.) DC. var. *cubense* DC., Prodr. 5:254. 1836. *Aster subulatus* var. *cubensis* (DC.) Shinners, Field & Lab. 21:161. 1953. TYPE: CUBA: homotypic with *Erigeron expansus*.

Aster divaricatus (Nutt.) Torr. & A. Gray var. *sandwicensis* A. Gray, Proc. Amer. Acad. Arts 7:173. 1867. *Aster sandwicensis* (A. Gray) Hieron., Bot. Jahrb. Syst. 29:20. 1901. *Aster subulatus* var. *sandwicensis* (A. Gray) A.G. Jones, Brittonia 36:465. 1984. TYPE: U.S.A. HAWAII: as lectotypified by Jones (1984). Jones (1984) lectotypified *Aster sandwicensis* and interpreted it to represent the taxon identified here as *S. squamatum*. Sundberg followed this interpretation in 1986, but later (2004) decided that the type is correctly identified as *S. expansum*, in the sense of the present study.

Aster pauciflorus Nutt. var. *gracilis* Benth. ex Hemsley, Biol. Centr. Amer. Bot., 122. 1881. TYPE: COSTA RICA. Synonymy fide Sundberg (1986).

Aster madrensis M.E. Jones, Contr. Western Bot. 12:43. 1908. TYPE: MEXICO. CHIHUAHUA.

$2n = 10$. Self-compatible. Moist or wet places, southwestern USA (Texas, New Mexico, Oklahoma, Arizona, California, Nevada, Utah), Florida (southernmost counties and other scattered localities), Mexico (all states, including southern Tamaulipas, Nuevo León, Coahuila, Chihuahua, and Sonora), Central America (Guatemala, Belize, Nicaragua, Costa Rica), Antilles (Jamaica, Hispaniola-D.R.). Hawaii. Japan: Okayama Pref., Kasaoka City, on newly reclaimed land at Kasaoka Bay Polder, 14 Sep 1984, *Enomoto s.n.* (TEX).

First report for **Oklahoma. Cimarron Co.:** along a small creek ca. 7 mi E of Kenton, 25 Sep 1976, *J. Taylor 23717* (BRIT). Cimarron County is the western extremity of the Oklahoma panhandle, relatively close to the Texas panhandle localities in Hartley and Hutchinson cos., cited below.

Disjunct localities in **Texas. Hartley Co.:** sandy soil along Punta de Agua Creek, between Romero and Middle Water, in water of stream, 9 Oct 1964, *Correll 30339* (LL, SMU). **Hutchinson Co.:** Lake Meredith Natl. Rec. Area, Spring Creek picnic and fishing area around small lake and adjacent marsh area, NE side (immediately downstream) of Sanford Dam, in water of ditch beside marsh, 20 September 2002, *Nesom & O'Kennon 853* (BRIT). **Mason Co.:** 5 air mi NNW of Mason, 2.1 mi N of jct. of Hwy 29 and Hwy 398,; then 2.4 mi NW on dirt road, 24 Sep 1999, *Singhurst 8248* (TEX). **Real Co.:** Dry Creek, 0.1 mi S of (downstream from) mouth of Javelina Creek, ca. 800-1000 ft. N of Dry Creek Rd. (Lost Canyon Rd.) from a point 4.0 roadmiles E of its jct. with St. Rt. 55 at Barksdale, elev. ca. 1650 ft., W shoreline of pond, 3 Oct 1998, *Carr 17771* (TEX). **Val Verde Co.:** Pecos River at Highway 90, S of the high bridge of Hwy 90, along the E bank of the Pecos, locally abundant, 9 Nov 1999, *Henrickson 22624* (TEX).

Representative documentation for **Florida. Collier Co.:** Vic. of Naples, S of town, common in marshy ditch, 9 Oct 1962, *Cooley 9028* (USF). **Dade Co.:** Perrine, empty, oolitic lot, 19 Sep 1973, *Kral 51893* (VDB). **Lake Co.:** Eustis-Trout Lake Nature Center, 1 Oct 1991, *Daubenmire s.n.* (USF). **Monroe Co.:** Big Pine Key, Sands subdivision, 8 Sep 1981, *Brumbach 9729* (BRIT, USF-2 sheets); Marathon Key, near intersection of Hwy 1 with 37th Street, roadside fill, 11 Nov 1983, *Sundberg 2327* (TEX) and *2328* (TEX); Key Largo, 0.2 m S of Tavernier Creek along Hwy 1, roadside fill, 11 Nov 1983, *Sundberg 2329* (TEX). **Okaloosa Co.:** Eglin Air Force Base, grassy area around pond just S of Eglin Blvd, along 7th St., 21 Nov 1983, *Wilhelm 11929* (USF).

Symphyotrichum expansum is recognized by its relatively small heads distally clustered in a corymbiform to thyrsiform arrangement and short (but still coiling at maturity), whitish to pinkish or light blue ray florets about as long or slightly shorter (in coiled form) than the pappus. Among the annual taxa, it is the most geographically widespread and elevationally diverse. In the western U.S.A. and Mexico, typical *S. expansum* occurs at 100–1650(–1950) meters; from Central America to Florida, it rarely grows at more than 10 meters.

The range of *Symphyotrichum expansum* apparently slightly overlaps that of *S. divaricatum* in southeastern New Mexico, western Texas, and adjacent Mexico. For the most part, the two are clearly distinct, and attempts by Sundberg (1986) to cross these two diploid taxa produced 0–3% plump achenes, almost all of which were inviable. In a yet unpublished floristic study in the Texas panhandle region (Hutchinson Co.), typical *S. expansum* has been observed in close proximity, without intermediacy, to typical *S. divaricatum*: the latter is an abundant colonizer in the sandy clay at many sites of the fluctuating shoreline of Lake Meredith (e.g., *Nesom & O'Kennon 689*, as cited above), while *S. expansum* was observed in the muck of a wet ditch and marsh margin at only one area immediately below the dam (*Nesom & O'Kennon 853*, BRIT). In Presidio Co., Texas (Big Bend Ranch State Natural Area), the two taxa have been observed and collected in close proximity, without evidence of intergradation: *S. divaricatum* (*Worthington 22636*, TEX, UTEP) and *S. expansum* (*Worthington 22637*, TEX, UTEP). Worthington noted by annotation that he observed two species of 'aster' in BBRSNA. Pringle apparently observed two co-occurring entities in Chihuahua, on the "wet banks of the Sacramento River [vicinity of Cd. Chihuahua], 13 Sep 1886": *Pringle 751* (LL) is *S. divaricatum* while *Pringle 750* (LL) is *S. expansum*.

Even though it appears that some degree of reproductive isolation exists between *Symphyotrichum divaricatum* and *S. expansum*, Sundberg (2004, p. 906) noted that "Populations intermediate in ligule length and width occur in trans-Pecos Texas, parts of New Mexico (including the type of *Aster neomexicanus*, collected in Chaves Co.), Arizona, and Chihuahua, Mexico." My observations corroborate the existence of plants with longer and slightly wider rays, which also are blue to purple, in contrast to the smaller, white to pink rays of *S. expansum*. Most of these occur where the two species are sympatric and apparently are relatively uncommon, compared to the parents. Such putative intermediates are similar to *S. expansum* in their small heads (inner phyllaries mostly 4–4.5 mm long) all strongly distally disposed on wiry peduncles. Because of its relatively large ray corollas, the Chaves Co. collection is identified and mapped here as typical *S. divaricatum*,, although in habit it resembles *S. expansum*.

Collections examined (*Symphyotrichum divaricatum<?>expansum*). **U.S.A. Texas. Brewster Co.:** 3.5 S of Marathon, infrequent in mud at Pena Blanca spring, 21 Oct 1946, *Warnock 46587* (SMU, TEX). **Jeff Davis Co.:** gravel and sand bars of Limpia Creek near Ft. Davis, 8 Oct 1926, *Palmer 23123* (TEX). **Pecos Co.:** roadside along irrigation ditch near Farm Road 1053, 1/2 mi N of Imperial, chromosome number *n*=5, 20 Aug 1967, *Watson 147* (TEX); ca. 5 mi W of Fort Stockton along IH-10, moist ditch along frontage road S of freeway, chromosome number *n*=5, 26 Aug 1983, *Sundberg 2160* (TEX). **Presidio Co.:** infrequent at spring near Rex Ivy's Lodge above La Jitas, 2200 ft, 24 Sep 1961, *Warnock 18163* (TEX). **Reeves Co.:** Hwy 285, S of Pecos, 20 Aug 1941, *Strandtman s.n.* (TEX). **Mexico. Chihuahua:** Delicias, along ditch, 10 Oct 1957, *Knobloch 631* (SMU).

The broad distributions and distinct morphology of *Symphyotrichum divaricatum* and *S. expansum*, their overlap and co-occurrence in a relatively small zone of sympatry, and the relatively few putative intermediates are taken here as rationale for treating both of them at specific rank.

Symphyotrichum squamatum (Spreng.) Nesom, Phytologia 77:292. 1994. *Conyza squamata* Spreng., Syst. Veg. 3:515. 1826. *Aster squamatus* (Spreng.) Hieron., Bot. Jahrb. Aster barcinonensis Sennen, Bull. Acad. Int. Geogr. Bot. 23:242. 1914. Type: SPAIN: Synonymy fide Sundberg (1986).

$2n = 20$. Self-compatible. Native to South America and apparently widely distributed there; rare in California and the southeastern U.S.A. (Alabama, Florida, Louisiana, Texas), apparently mostly as a waif, usually on or near beaches and ballast dumps. Naturalized in Australia(!), Japan(!), Iraq(!), Africa(!), France(!), and probably other regions of the world. Noted by Britton (1914) to occur on Ireland Island and Boaz Island, Bermuda.

Documentation for U.S.A. occurrences. **Alabama. Mobile Co.:** sandy W end of Dauphin Island, 18 Oct 1973, *Tayor and Taylor 15382* (BRIT); Dauphin Island, Itasca Pl. near Iberville Dr., roadside near dunes, 9 Aug 1965, *Deramus D752* (VDB); Battleship Park, by Mobile-Baldwin Co. causeway, abundant on moist brackish sands, 22 Oct 1969, *Kral 38282* (NLU). **California. Kern Co.:** S of Greenfield, intersection of Cottonwood Rd and Buena Vista Rd, along roadside ditch, 16 Apr 1983, *Sundberg 2093*, "this population $n = 10$ pairs" (TEX). **Florida. [Escambia Co.]:** Pensacola, waste ground, 27 Jul 1899, *Curtiss 6497* (GH [fide Shinners 1953], USF); **Franklin Co.:** Apalachicola, ballast weed, Jul 1897, *Chapman s.n.* (MO [fide Shinners 1953], SMU). **Louisiana Orleans Par.:** weedy areas along streets N of New Orleans Convention Center from Howard Street W to elevated hwy in New Orleans, 10 Nov 1991, *Thomas 126,773* (NLU). **Texas. [Galveston Co.]:** "Galveston, sandy beaches, damp sands along the streets, 8 Aug 1902, *J. Reverchon 3319*" (MO, US-2 sheets); the MO collection was cited by Shinners (1953) as *Aster subulatus* var. *australis*; it was identified as *Symphyotrichum squamatum* by Sundberg (1986) and Nesom (1994).

Symphyotrichum squamatum is recognized by its corymbiform to thyrsiform arrangement of heads (borne primarily on bracteate distal branches and distally clustered), inner phyllaries 5–5.5 mm long, with sharply delimited apical green zones, and ray florets numerous (21–28(–38)) with filiform, erect (noncoiling) corollas shorter (1.3–2 mm long) than the mature pappus. It is the only one of the taxa treated here that is not a North American native; its evolutionary relationship to the others may be correspondingly distant. Natural hybridization has not been reported between *S. squamatum* and any other taxon.

KEY TO THE ANNUAL TAXA

1. Heads usually dense in an elongate, pyramidal-paniculate arrangement; inner phyllaries 6–7 mm long, phyllary apices linear-acuminate, distal margins often inrolled/involute, green zone of phyllaries narrowly lanceolate, usually extending the entire length of the phyllary, chartaceous bases short or absent; pappus accrescent, 4–5.5 mm long at maturity and usually longer than coiled ray corollas; habitats wet, saline ____ **Symphyotrichum subulatum**

1. Heads corymbiform to thyrsiform, diffusely paniculate, or secund to subsecund and paniculiform arrangements or at the tips of long, bracteate branches; inner phyllaries 4–6.5 mm long, phyllary apices acute to acuminate, distal margins inrolled/involute or not, green zone of phyllaries lanceolate to elliptic, chartaceous bases usually conspicuous; pappus not accrescent, 3.5–4(–5) mm long at maturity, longer or shorter than ray corollas; habitats moist to wet, rarely saline.
    2. Phyllary tips appressed, acute, flat, inner phyllaries with broadly lanceolate, distinctly demarcated, apical green zone, proximal 1/2–1/3 white-chartaceous; ray floret laminae erect, often involute along the edges (curling inward lengthwise), rarely coiling back distally (if so, then only ca. 1/2 coil), usually shorter than mature pappus; disc florets (3–)7–14 ____ **Symphyotrichum squamatum**
    2. Phyllary tips loose, linear-acuminate, distal margins often inrolled/involute, inner phyllaries with narrowly lanceolate, often weakly demarcated apical green zone, white-chartaceous bases short, ca. 1/3–1/2 the length of the phyllaries; ray floret laminae not involute along edges, usually coiling back distally in 1–4 or more coils, usually as long or longer than mature pappus; disc florets (6–)8–15, 11–23, or (20–)33–45(–50).
        3. Heads usually corymbiform to thyrsiform in arrangement (borne primarily on

distal branches, distally clustered); inner phyllaries 4–5.5(–6) mm long, phyllary apices acute to abruptly short-acuminate or long-acuminate, distal margins inrolled/involute or not; ray florets in 1(–2) series, corollas 2–3 mm long, laminae 0.1–0.3 mm wide (dried), white to light pinkish or slightly blue, coiling back in 1–2 coils or less commonly remaining straight; disc florets (6–) 8–15 ____________________________________ **Symphyotrichum expansum**

3. Head arrangements diffusely paniculiform to pyramidal-paniculiform to corymbiform or secund to subsecund and paniculiform; inner phyllaries 5–6.5 mm long; phyllary apices long-acuminate, distal margins usually inrolled/involute; ray florets in 1–3 series, corollas 2–7 mm long, laminae 0.2–0.8 mm wide (dry), white to blue or puple, coiling back in 2–4 or more coils; disc florets 11–23 or (20–)33–45(–50).
    4. Heads often at ends of long, bracteate branches, axillary heads usually maturing on elongate lateral branches, the whole arrangement often diffusely paniculiform to pyramidal-paniculiform, or heads more distally disposed and the arrangement corymbiform to thyrsiform; ray florets in 1 series, corollas mostly 4–7 mm long, laminae 0.4–0.8 mm wide (dry), blue to white, coiling back 3–4 or more times; disc florets (20–)33–45(–50); south-central U.S.A., extreme northwestern Mexico ____________ **Symphyotrichum divaricatum**
    4. Heads at first at ends of long, bracteate branches, then produced and maturing as axillary and nearly sessile or on very short lateral branches, commonly on one side of the main stem and appearing secund to subsecund, in paniculiform arrangements; ray florets in 2–3 series, corollas mostly 2–3.5(–4) mm long, laminae 0.2–0.4 mm wide (dry), blue to purple, coiling back in 2–3 coils; disc florets 11–23; Florida, coastal Georgia, Bahamas ____________________________________ **Symphyotrichum bahamense**

Perennial taxa—*Symphyotrichum tenuifolium* sensu lato

Symphyotrichum tenuifolium sensu stricto and *S. bracei* (*S. tenuifolium* var. *aphyllum*) are diploid, rhizomatous perennials endemic to coastal and near-coastal habitats. The former occurs mostly in marshes of western Cuba, the Bahamas, and the west coast of southern and central Florida; *S. tenuifolium* occurs in marshes along the Gulf coast from Texas to panhandle Florida and then along the Atlantic coast from northeastern Florida northward as far as Rhode Island, New Hampshire, and Maine. The key by Sundberg (2004) separates the two perennial taxa in a number of features. Each of them has been treated at specific rank by regional botanists (Cronquist 1980; Wunderlin 1982, 1998; Wunderlin & Hansen 2004), but Long (1970), Long and Lakela (1971), and Sundberg (1986, 2004) have regarded *S. bracei* as a variety within a more broadly conceived species. In the initial description of var. *aphyllum*, Long (1970, p. 41) noted that it is "connected by intermediate forms" to var. *tenuifolium* and is "a West Indian-Florida population segregate of the more northern [*S. tenuifolium*]." Sundberg (1986, 2004) observed that the two taxa intergrade where their ranges overlap along the Gulf Coast of northern and central peninsular Florida, from Taylor to Pinellas counties, where "almost all specimens are intermediate," suggesting that parental forms apparently are absent or rare and that gene flow is continuous. In contrast, I find that typical *S. bracei* occurs northward well into the range of typical *S. tenuifolium* (e.g., Hernando Co., *S. bracei*, *Sundberg 2305*, TEX; Citrus Co., *S. bracei*, *Schmid A-6*, USF; Taylor Co., *S. bracei*, *Godfrey 61659*, BRIT). Sundberg (2004) scored *Godfrey 61659* (FSU) as typical of *S. bracei* except for root structure, which is lacking on the BRIT duplicate.

Species-rank concepts of Cronquist, Wunderlin and Hansen, and the present study emphasize the distinctive morphologies of the two taxa, their mostly allopatric ranges, and the apparent hybridization and intermediacy that occurs within only a relatively small area of overlap. Long and Sundberg have emphasized the zone of intermediacy as rationale for treating these two taxa as geographic segments of a single species. Whichever point of view is adopted, treatment of these at specific rank may be more subjective than for the annual taxa, where reproductive isolation apparently is stronger.

ABSTRACT

The pappus traits of 84 taxa of *Canadanthus*, *Ampelaster*, *Psilactis*, and *Symphyotrichum* (subtribe Symphyotrichinae) and 14 other species of asters were examined. Most species of Symphyotrichinae had a pappus consisting of three whorls; 1) a secondary inner whorl of a few bristles 40–85% the length of the inner primary whorl, 2) a primary outer whorl of many bristles with tapering ends about 90–95% the length of the inner primary whorl, and 3) a primary inner whorl of many bristles with very weakly to strongly clavate ends. In addition, a few species of *Symphyotrichum* have a vestigial secondary outer whorl of a single short bristle only about 10–30% the length of the primary inner whorl. In some species of *Symphyotrichum* the secondary inner whorl was difficult to distinguish from the primary outer whorl or possibly was absent. In a small sample of species of *Aster*, *Doellingeria*, *Eurybia*, *Eucephalus*, *Galatella*, *Herrickia*, *Ionactis*, *Oclemena*, and *Oreostemma*, the pappus was either triple or quadruple. The short secondary outer whorl was present in most species examined but was sometimes reduced to very few bristles or absent on some fruits. In some cases, the secondary inner whorl of mid length tapering bristles was present in some individuals in a species but not in others. The quadruple pappus with strongly clavate inner bristles appears to be plesiomorphic for the North American Clade of the tribe Astereae. In single species samples of *Crinitaria*, *Linosyris*, and *Felicia* the pappus differed from that of other species examined.

RESUMEN

Se examinaron las características de los vilanos de 84 taxa de *Canadanthus*, *Ampelaster*, *Psilactis*, y *Symphyotrichum* (subtribu Symphyotrichinae) y otras 14 especies de compuestas. La mayoría de las especies de Symphyotrichinae tienen un vilano de tres verticilos; 1) un verticilo secundario interno de pocas sedas con el 40–85% de la longitud del verticilo interno primario, 2) un verticilo externo primario con muchas sedas de extremos estrechados de aproximadamente el 90–95% de la longitud del verticilo interno primario, y 3) un verticilo interno primario de muchas sedas con extremos desde débilmente a fuertemente clavados. Además, algunas especies de *Symphyotrichum* tienen un verticilo secundario externo vestigial de una sola seda aproximadamente del 10–30% de la longitud del verticilo interno primario. En algunas especies de *Symphyotrichum* el verticilo secundario interno fue difícil de diferenciar del primario externo o posiblemente estaba ausente. En una pequeña muestra de especies de *Aster*, *Doellingeria*, *Eurybia*, *Eucephalus*, *Galatella*, *Herrickia*, *Ionactis*, *Oclemena*, y *Oreostemma*, el vilano era triple o cuádruple. El verticilo secundario externo corto estaba presente en la mayoría de las especies examinadas pero estaba reducido algunas veces a unas pocas sedas o ausente en algunos frutos. En algunos casos, el verticilo interno secundario de sedas de tamaño mediano estaba presente en algunos individuos de una especie pero no en otros. El vilano cuádruple con las sedas interiores fuertemente clavadas parece ser plesiomórfico para el clado Norte Americano de la tribu Astereae. En una sola muestra de especies de *Crinitaria*, *Linosyris*, y *Felicia* el vilano difería de las otras especies examinadas.

INTRODUCTION

The symphyotrichoid aster genera *Canadanthus* Nesom, *Ampelaster* Nesom, and *Symphyotrichum* Nees have long been reported to have a simple pappus with non-clavate bristles, either as species of *Aster* L. (e.g., Gray 1884; Fernald 1950; Cronquist 1955, 1968a, 1980, 1994) or recently as species of *Canadanthus*, *Ampelaster*, and *Symphyotrichum* (Nesom 1994, 2000; Semple et al. 2002). In contrast, some other North American asters historically treated at times in other genera or in *Aster* sensu lato have been reported to have a double (*Eucephalus* Nutt., *Sericocarpus* Nees; Gray 1884; Cronquist 1955) or a triple pappus (*Doellingeria* Nees; Cronquist 1968, 1980; Nesom 1994; Semple et al. 2002). The putatively double pappus consisted of a short whorl of outer bristles and a much longer whorl of inner bristles, while the putatively triple pappus had a short outer whorl and two long inner whorls, the outer slightly shorter and tapering and the inner bristles clavate. Species of *Solidago* L. historically were also considered to have a simple pappus (e.g., Gray 1884; Fernald 1950; Cronquist 1968b, 1980; Nesom 2000; Semple et al. 1999). However, Hood and Semple (2003) demonstrated that nearly all species of goldenrods had a double pappus with two primary whorls of long bristles (the outer shorter and tapering, the inner clavate) and at least some species had an additional secondary outer whorl of a few very short bristles. That is, a genus thought to have a simple pappus in fact had a triple pappus like that reported for *Doellingeria* (synonym: Aster sect. *Triplopappus* Torr. & A. Gray; Torrey and Gray 1841; Semple et al. 2002). Our discovery that goldenrods had a double (or rarely triple) pappus raised the possibility that other genera of Astereae thought to have a simple pappus might also be double or triple. This paper on pappus variation is one in a series being prepared by the first author's lab to report the findings of investigations of cypselae traits, including pappus variation in the North American Clade of the Asteraeae (sensu Noyes & Rieseberg 1999). The pappus whorl terminology proposed by Hood and Semple (2003; secondary outer whorl, primary outer whorl, and primary inner whorl) is used throughout this paper with the addition of new label for a fourth whorl not seen in *Solidago*, the secondary inner whorl of tapered mid length bristles.

MATERIALS AND METHODS

A preliminary survey was undertaken to examine under the dissecting microscope the pappus bristles of one or two specimens of representative species of the sections and subsections of *Symphyotrichum*. Subsequently, a more rigorous survey was conducted involving 80 taxa and one hybrid of *Symphyotrichum* and 4 species of other genera in the subtribe Symphyotrichinae Nesom and 14 species of other North American and Eurasian aster genera listed in Table 1. Observations were made using a dissecting scope (10–70×) or a compound light microscope (20–400×). The degree of the clavateness of bristle tips was determined using the 0–4 rankings described in detail in Hood and Semple (2003). At least five different fruits from each species were observed under the dissecting microscope at a maximum of 70×; most observations were made at 30–40×. For the most part, observations were made on specimens in the WAT Herbarium, but additional material on loan from BRIT, CAN, GH, and NY (Holmgren et al. 1990) was also examined to expand the number of taxa. In addition to several methods used in evaluating pappus features listed by Hood and Semple (2003), assessment of the presence or absence of any short secondary outer whorl linear to scaly bristles and other pappus features were also systematically undertaken. Thus, Table 1 has five columns of observational data plus a column for additional comments, while only four columns were included by Hood and Semple (2003).

Observations on the compound microscope were made from slides prepared as follows. For each species, two ray floret and two disc floret cypselae (with corollas or without corollas still attached) were mounted in Cytoseal™ 60 (low viscosity) mounting medium under a cover slip. Observations at 100–400× on the compound microscope were made similarly to the observations under the dissecting scope at 30–70×. Observations made on the two kinds of scopes were compared and any discrepancies were resolved by re-examining specimens.

Digital photomicrographs were taken using a Nikon CoolPix 990 camera manually held against the ocular lens of either the dissecting or compound microscope. Pictures were taken of specimens under the compound light microscope with either below stage or above stage lighting. Final digital illustrations were made using CorelDraw 12® from digital images edited with Corel PhotoPaint12® (Corel Corp.).

RESULTS AND DISCUSSION

The pappus of the majority of species of the Symphyotrichinae consists of three whorls (Figs. 1–4): 1) a secondary inner whorl of a few intermediate length, fine, tapering bristles usually about 50–70% of the length of the primary inner whorl, 2) a primary outer whorl of tapering, non-clavate bristles that were generally 5–10% shorter than the inner whorl, and 3) a primary inner whorl of very weakly to strongly clavate tipped bristles. The phylogenetically more basal taxa of the Symphyotrichinae *Canadanthus modestus* (Lindl.) Nesom (Figs. 1A–G), *Ampelaster carolinanus* (Walt.) Nesom (Figs. 1H–K), and *Almutaster pauciflorus* (Nutt.) Löve & Löve (Figs. 2A–E) are all diploids ($2n = 18$) with $x = 9$ chromosomal base number (Brouillet et al. 2001a, b; Semple et al. 2002). These have a triple pappus with no secondary outer whorl of short bristles or scales observed.

Table 1. Pappus variation in subtribe Symphyotrichinae: *Symphyotrichum* and related genera. **Clv**, degree of clavateness of inner bristles (0 = not clavate to 4 = strongly clavate); **Clv-Tap**, clavate alternating with tapered bristles (primary inner and outer whorls, y = yes, – not obviously so); **Lgth**, primary outer bristles shorter than primary inner bristles; **Ovrlp,** degree of overlapping of bristles at base (0= not observed; 1=slight overlap; 2= definite overlap); **2nd-Out**, evidence for a secondary outer whorl of very short scaly-bristles.

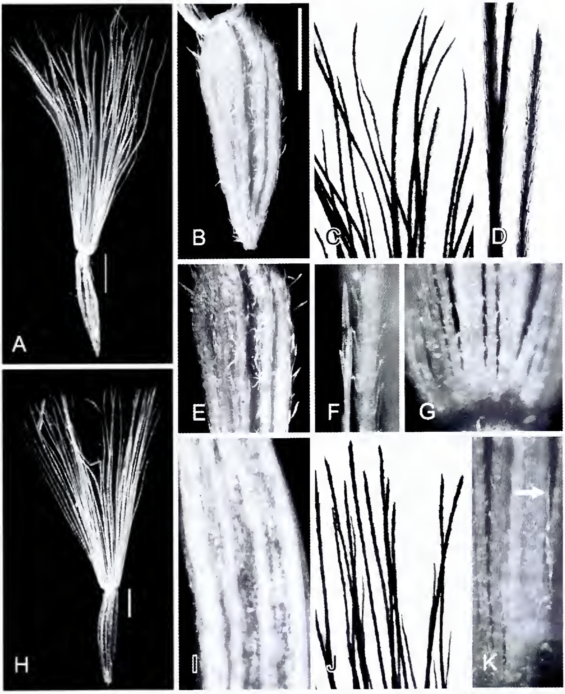

Fig. 1. Cypselae traits in *Canadanthus* and *Ampelaster*, disc fruits; scale bars = 1 mm. **A–G.** *Canadanthus modestus* (*Semple & Brouillet 7008* WAT). **A.** Immature fruit. **B.** Fruit body. **C.** Silhouette of tips of primary outer bristles (short, tapering) and primary inner bristles (longer, clavate). **D.** Clavate tip of primary inner whorl bristle. **E.** Mature fruit body detail. **F.** Tip of primary outer whorl bristle. **G.** Base of primary pappus whorls. **H–K.** *Ampelaster carolinianus* (*Semple 5393* WAT). **H.** Mature fruit. **I.** Detail of cypsela body. **J.** Silhouette of tips of primary outer bristles (short, tapering) and primary inner bristles (longer, clavate). **K.** Base of primary pappus whorls and single secondary pappus whorl bristle (arrow).

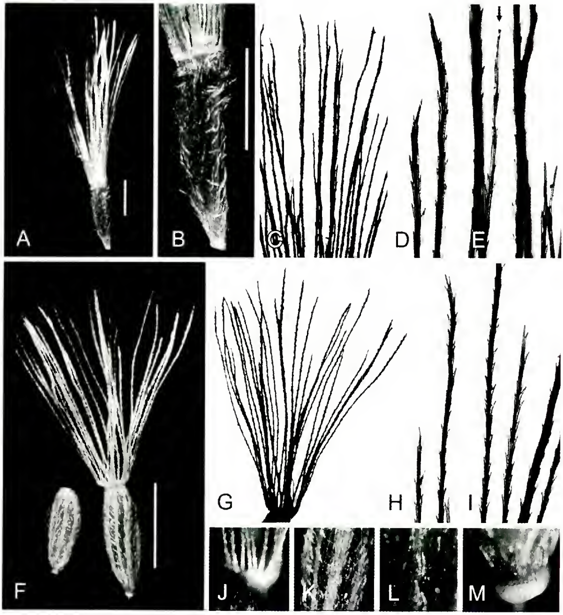

Fig. 2. Pappus traits in *Almutaster* and *Psilactis*; scale bars = 1 mm. **A–E.** Disc fruit, *Almutaster pauciflorus* (*Semple & Semple 5763* WAT). **A.** Mature fruit. **B.** Fruit body. **C.** Silhouette of pappus bristle tips. **D.** Clavate tips of primary inner whorl bristles. **E.** Tip of primary outer whorl bristle (arrow); the two shorter bristles on the right are possible long secondary outer bristles. **F–M.** *Psilactis tenuis (Semple & Heard 8201* WAT). **E.** Heterocarpic ray (epappose) and disc fruit. **G–M.** Disc fruit. **G.** Silhouette of pappus. **H.** Tips of primary whorl bristles. **I.** Tip of long secondary outer whorl bristle. **J.** Base of pappus whorls. **K.** Surface of fruit body. **L.** Detail of ridge of fruit body. **M.** Swollen base of fruit.

The much more derived, heterocarpic *Psilactis tenuis* (Figs. 2F–M) with $2n = 8$ had ray fruits without a pappus and disc fruits with what we interpret as a triple pappus. The mid length secondary inner bristles are obvious (Fig. 1G), but there was little difference in the primary outer and inner whorl bristles except length (Figs. 2G–I).

Within the large genus *Symphyotrichum*, with $x = 8, 7, 6, 5$ and 4 and diploid to duodecaploid taxa, there was some correlation between infrageneric group and degree of clavateness, but there was also considerable variation even between closely related species within the same subsection or even series. For example in *S.* series *Symphyotrichum*, *S. retroflexum* (Lindl.) Nesom (Figs. 4A–F) with $2n = 48$ had the most strongly clavate inner bristles in the genus and a few secondary inner whorl bristles, while *S. novi-belgii* (L.) Nesom with $2n = 48$ had non-clavate inner bristles and the secondary inner bristles were difficult to detect. All members of *S.* subsect. *Occidentales* had inner primary whorl bristles with well developed clavate tips. Most members of *S.* subsect. *Heterophylli* had non-clavate to weakly clavate inner primary bristles, while in the closely related subsect. *Dumosi*, species ranged from having non-clavate to strongly clavate primary inner bristles. Secondary inner bristles were generally few in number and 70–80% the length of the primary inner bristles. In subsect. *Porteriani*, the small fruits had relatively few bristles and very few secondary inner bristles. All these taxa have $x = 8$ and are members of subg. *Symphyotrichum*. This range in variation was also present in *S.* subg. *Virgulus* with $x = 5$, but the secondary inner whorl was more easily recognized as present, more variable in length, and with more and shorter bristles (40–80%).

The most distinct pappus in *Symphyotrichum* occurred in the three members of sect. *Conyzopsis*, which have $x = 7$ (Houle & Brouillet 1985). These have been treated as members of the separate genus *Brachyactis* Ledeb. (Jones 1989) but are likely derived from, or are sister group to, the western North American $x = 8$ *Foliacei* group (subsect. Occidentales; Semple et al. 2002 and earlier cited references). Conyzopsoid asters have a pappus with numerous fine bristles that are not clavate (Figs. 4I–L). The primary outer whorl is variable in length and shorter than the primary inner bristles. We saw no clear evidence of a secondary outer whorl. In short, in addition to having a derived chromosomal base number, being taprooted annuals rather than perennials like all other species in the genus, and being in other ways atypical members of the genus, the conyzopsoid asters also have a derived pappus that is apparently reduced to double, not triple or clavate, and they are the only species within *Symphyotrichum* with accrescent bristles (Nesom 1994).

Within *Symphyotrichum* it is sometimes difficult to distinguish between the whorls of bristles. As in *Solidago* (Hood & Semple 2003), the smaller cypselae with fewer bristles show less evidence for a multiple-whorled pappus. This was more often the case in sect. *Symphyotrichum*.

While most species of *Symphyotrichum* have a triple pappus, a few species also possess a vestigial secondary outer whorl. Only one short bristle was observed on one fruit in each case. These occurred in three different subgenera: subg. *Chapmanii*, *S. chapmanii*; subg. *Symphyotrichum*, *S. lanceolatum* subsp. *hesperium* and *S. retroflexum*; and subg. *Virgulus*, *S. sericeum* and *S. yukonense* (Fig. 3M). The same situation was observed in *Solidago* (Hood & Semple 2003), although for this report greater effort was made to detect the often difficult to

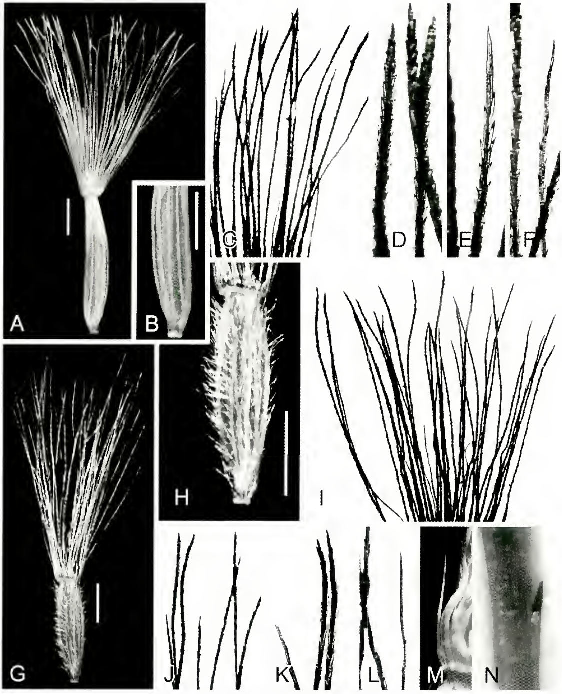

Fig. 3. Fruit traits in *Symphyotrichum*, disc fruits; scale bars = 1 mm. **A–F.** Subg. *Chapmaniani*, *S. chapmanii* (*Canne 2277* WAT). **A.** mature fruit. **B.** Fruit body detail. **C.** Silhouette of upper portion of pappus. **D.** Tips of primary inner whorl bristles. **E.** Tip of primary outer whorl bristle. **F.** Tip of secondary outer whorl bristle. **G–M.** Subg. *Virgulus*, *S. yukonense* (*Semple & Semple 10624* WAT). **G.** Mature fruit. **H.** Fruit body. **I.** Silhouette of upper portion of pappus. **J.** Tips of primary whorl bristles. **K.** Tips of primary inner whorl bristles (lower magnification than D–F). **L.** Tip of secondary outer whorl bristle. **M.** Single secondary outer whorl bristle. **N.** Anthocyanotic barb of primary whorl bristle near base; diffuse pigment also present in shaft.

Fig. 4. see, fine, secondary outer bristles. In all cases in *Symphyotrichum*, such bristles were clearly situated on the outer rim of the pappus. It seems likely that other species also rarely produce a bristle or two of the vestigial secondary outer whorl; finding such bristles was rather serendipitous. Documenting how frequently such rare bristles occur will take considerable time-consuming effort.

In other North American genera examined, species had either a quadruple or triple pappus, with both occurring within *Eucephalus*, *Doellingeria*, and *Ionactis* (Table 1). Historically, the short secondary outer whorl of bristles has been noted in all three genera, which were assumed to have a double pappus. The long inner "whorl" is in fact composed of usually three distinct whorls; a secondary inner whorl with tapering bristles 50–80% the length of the primary inner whorl; a primary outer whorl with tapering bristles 90–95% the length of the primary inner whorl; and a primary inner whorl of bristles with weakly to very strongly clavate bristles. Although species of *Doellingeria* have been treated as members of *Aster* sect. *Triplopappus*, their inner primary bristles are not as strongly clavate as those of some species of *Eucephalus*, which had not been reported to have two distinct whorls of longer inner bristles. These strongly clavate bristles were given a maximum score of 4 in Table 1, but they were more distinctly clavate than any *Solidago* and deserve a score of 5 on the 0–4 scale developed for goldenrods (Hood & Semple 2003).

The cypselae of at least some individuals of some species of *Eurybia* also have a quadruple pappus. Species in the related genus *Herrickia* also rarely had the short secondary outer whorl. The JCS laboratory is currently examining pappus traits in each of these $x = 9$ genera in detail and will report the results in a future paper.

Within the North American Clade some clades have lost one or more whorls of bristles, but not always the same whorl. In the Symphyotrichinae, the three longer whorls of bristles have generally been retained, but the short secondary outer whorl is absent or rarely vestigially present. In the Chrysopsidinae, the $x = 9$ genera have retained all four whorls to varying degrees, while the lower base number taxa have progressively lost the secondary inner and the secondary outer whorls (Semple, accepted). In the Solidagininae, some genera have retained the secondary outer whorl but lost the secondary inner whorl (e.g. *Sericocarpus*) while other genera have retained only the inner two primary whorls and usually lack the secondary outer whorl or possess it in a vestigial state (Hood & Semple 2003). Additional studies of all other subtribes and clades are needed to determine how many whorls of pappus bristles are really present. We note that several species that have been included in *Haplopappus* sensu Hall (1928) have been found to have either a double or triple pappus; this will be reported on in more detail in a future paper.

A few species of Eurasian and African asters were also examined to ascertain whether or not a quadruple pappus occurred in "Basal Group/Southern

Hemisphere Grade taxa" (Noyes & Rieseberg 1999) of Astereae. Four whorls were observed in species of *Aster* (one European, two eastern Asian species) and *Galatella* (Table 1); there were very few short outer bristles and only a few mid length bristles. In the *Crinitaria-Linosyris* group, which is more basal in the tribal phylogeny then *Aster* (Semple et al. 2002), the two species examined (Table 1) had numerous bristles that might be interpreted as four whorls or as a single series grading from very short outer bristles to long inner ones that were very weakly clavate. In both cases the pappus was different from that of North American basal genera. The pappus of the one species of *Felicia* examined lacked short and mid length bristles. The long bristles were slightly varied in length and some possibly were very narrowly clavate. The pappus was more like the most derived ones seen in some North American species, themselves known to be derived. The JCS laboratory has started a large systematic study of pappus variation in the Basal Grade genera of the Astereae and will report on the results in a future paper. At this point, however, it is clear that a quadruple pappus occurs in both the North American Clade and the some genera of Basal Grade of Astereae. A quadruple pappus is a plesiomorphic trait for the North American Clade; loss of whorls to three, two or one are derived states.

SYSTEMATICS IMPLICATIONS

Although *Symphyotrichum* has a triple pappus, for practical purposes, such as preparing keys to genera, it may be most convenient to treat the genus as having an "appearing simple" pappus (i.e., evidently having a single whorl of bristles), except possibly for sect. *Conyzopsis*, which has a distinctive pappus due to its numerous bristles in two similar whorls. In phylogenetic studies, the genus must be recognized as having a triple pappus with a vestigial fourth whorl in at least some species. The low number of secondary inner bristles and their apparent absence in some species reduces the value of this feature for purposes of identification. As well, for most species the low degree of clavateness of the primary inner bristles makes the condition not immediately obvious, as is clearly demonstrated by the fact that no one reported this before. Had we not begun with *Solidago*, we also might not have recognized the triple/quadruple pappus nature of the Symphyotrichinae genera of asters. In some cases, the triple nature of the pappus is only revealed by the small differences in average lengths of the three longer whorls. In Semple et al. (2002), the cypselae of 25 species of *Symphyotrichum* were illustrated in technical line drawing. Only a few of these can be interpreted now as showing differences in the lengths of the primary outer and inner whorl bristles, e.g. *S. praealtum* (Poir.) Nesom var. *praealtum*, and none illustrate the presence of the few-bristled shorter secondary inner whorl. Likewise, only three of the four whorls of pappus bristles of *Doellingeria umbellata* were illustrated; again the secondary inner whorl is missing. This is noted here to emphasize that differences between the secondary inner, the primary outer, and the inner pappus series in the North American Clade of the tribe Astereae are at times minor and difficult to see, but are nonetheless real.

ABSTRACT

Dahlia dissecta var. *sublignosa* was recognized in 1969 based on available herbarium specimens. Here we present molecular evidence to demonstrate that var. *sublignosa* is not the sister taxon to *D. dissecta* var. *dissecta*, nor is it conspecific with either of its two closest allies, *D. linearis* and *D. foeniculifolia*. Therefore, we elevate *Dahlia dissecta* var. *sublignosa* to the rank of species, as **D. sublignosa** (P.D. Sørensen) D.E. Saar & P.D. Sørensen comb. & stat. nov.

RESUMEN

Dahlia dissecta var. *sublignosa* se reconoció en 1969 basándose en los especimenes de herbario disponibles. Presentamos aquí una prueba molecular para demostrar que var. *sublignosa* no es el taxon hermano de *D. dissecta* var. *dissecta*, ni es conspecífico con ninguno de sus dos semejantes más próximos, *D. linearis* y *D. foeniculifolia*. Por ello, elevamos *Dahlia dissecta* var. *sublignosa* al rango de especie, así como **D. sublignosa** (P.D. Sørensen) D.E. Saar & P.D. Sørensen comb. & stat. nov.

INTRODUCTION

Dahlia dissecta S. Watson presently has two recognized intraspecific taxa: *D. dissecta* var. *dissecta* and *D. dissecta* var. *sublignosa* P.D. Sørensen. *Dahlia dissecta* is in sect. *Entemophyllon*, which includes five other species. *Dahlia dissecta* var. *dissecta* is known from rocky slopes and ledges in the Mexican states of Hidalgo and San Luis Potosí, at elevations of 1900–2500 m. While not common, plants are not difficult to find in these areas. Variety *sublignosa* is known only from the type locality and a nearby location in western Tamaulipas, Mexico, at elevations of 2100–2500 m. The ranges for these two varieties are separated by about 137 km at their closest point, and var. *sublignosa* is not sympatric with any other taxa in sect. *Entemophyllon*.

Dahlia dissecta var. *dissecta* was conservatively described based on limited herbarium specimens known at the time (Sørensen 1969). Morphologically, the two taxa are very similar, at least superficially. Both have ultimate leaf segments that closely resemble each other in shape. All of the species in sect. *Entemophyllon* described at the time had substantial perennating stems except *D. dissecta*, which is wholly herbaceous. Variety *sublignosa* is minimally woody at the base of the canes.

SIDA 21(4): 2161–2167. 2005

The varieties differ in that *D. dissecta* var. *sublignosa* tends to be larger, reaching heights of 7–9 dm compared to 3–7.6 dm for var. *dissecta*. Stems of the current year's growth arise directly from a crown of tubers or rootstock on var. *dissecta*, whereas stems of var. *sublignosa* frequently arise from short (5–15 cm) ligneous portions of the previous year's growth. The leaves of var. *sublignosa* can be a little longer (11–19 vs. 10–15 cm), with sometimes smaller ultimate segments (0.5–5.5 vs. 2–9 mm). Outer involucral bracts are 2.5–5.5 mm in width for var. *sublignosa* and 1.8–4 mm for var. *dissecta* (Sørensen 1969). Perhaps the most distinctive feature of difference is the squarish, cusp-tipped leaf segments of var. *sublignosa*, as compared to more rounded leaf segments on var. *dissecta*, which may or may not have a smaller cusp (see Fig. 1a–b).

Observations made with recently collected live material suggested more differences between the varieties than can be seen with herbarium specimens alone. Therefore, a molecular analysis was conducted to clarify the relationship of these two presumed intraspecific taxa.

MATERIALS AND METHODS

Live plant material was obtained from Plant Delights Nursery, Inc., Raleigh, NC, which originated as seed from Yucca Do Nursery, Hempstead, TX, accession number D07-615, collected in the Cerro Peña Nevada Mountains, in the vicinity of the type locality. *D.E. Saar 3521, 3522* (MUR).

Plants of *Dahlia dissecta* var. *sublignosa* flowered in an outdoor plot, which provided material for chromosome counts from pollen mother cells in developing capitula. Heads of appropriate size were fixed in modified Carnoy's solution (4:3:1 v/v of chloroform: absolute or 95% ethanol: glacial acetic acid), transferred to 70% alcohol, and stored at 4°C until the chromosomes were counted. The staining procedure is summarized in Saar (1999).

Leaf material was collected from two greenhouse plants of *Dahlia dissecta* var. *sublignosa* and one plant of *Dahlia foeniculifolia* Sherff at Murray State University. DNA was extracted using a DNeasy® Plant Mini Kit (Qiagen no. 69104). The internal transcribed spacer regions (ITS) of nuclear ribosomal DNA were amplified using forward primer ITS5m (Sang et al. 1995) to prevent accidental amplification of endophytic fungi, if present (Saar et al. 2001), and reverse primer ITS4 (White et al. 1990). Reactions were in 50µL volumes and contained 2 units of *Taq* polymerase (Promega, Madison, WI), 0.2mM of each dNTP, 0.1uM of each primer, and 75ng of template. Amplification was carried out on an MJ Research thermal cycler PTC-200 using the following protocol: one cycle of 2 min 30 sec at 95°C, 30 sec at 50°C, and one min at 72°C.; followed by 30 cycles of 30 sec at 95°C, one min at 50°C, and one min at 72°C; and finished with 6 min at 72°C. Amplified products were run on 1.0% agarose gels using 0.5 × TBE and detected with ethidium-bromide fluorescence on a UV transilluminator. Products were cleaned for sequencing using Microcon® Centrifugal Filter

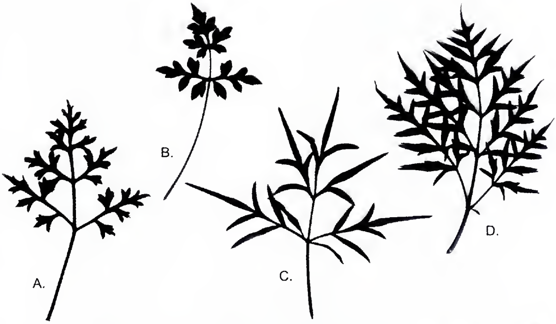

Fig. 1. Comparative leaf shapes from greenhouse-grown plants: **A.** *Dahlia sublignosa* (formerly *D. dissecta* var. *sublignosa*); **B.** *Dahlia dissecta* (var. *dissecta*); **C.** *Dahlia linearis*; **D.** *Dahlia foeniculifolia*. Leaves from these greenhouse plants are representative of wild-grown plants in general shape but are smaller in size and not proportional to each other as suggested here. See text for leaf dimensions of wild-collected plants.

Devices (YM-100) from Millipore (Bedford, MA). Sequencing was on a Beckman-Coulter capillary sequencer. This procedure was performed twice for var. *sublignosa*, beginning with the DNA extraction from fresh leaves. Our sequence for *D. dissecta* var. *dissecta* (Saar et al. 2003) is congruent with the sequence of var. *dissecta* obtained by Gatt et al. (2000), so repeating the procedure for this taxon was deemed unnecessary.

ITS sequences from three species in sect. *Entemophyllon* were downloaded from GenBank (Saar et al. 2003). Material from the remaining species in the section, *Dahlia congestifolia* P.D. Sørensen, was not available, as it is known only from the type specimen. During field work in 1995, we twice searched the W-facing slopes of the somewhat isolated, small limestone mountain of Cerro Chulco near Apan in extreme southern Hidalgo, the type locality of *D. congestifolia*, but failed to relocate this species. Two other unsuccessful searches were made subsequent to the collection of the type but prior to its formal recognition (Sørensen 1987). *Dahlia merckii* Lehm. was used as the outgroup taxon based on Saar et al. (2003) and its sequence was also obtained from GenBank (Table 1).

Sequences were aligned with Clustal W software (alignment available on request). No gaps were needed to align the ingroup taxa; three one-base gaps were required to align the ingroup with the outgroup taxon. They were ignored in the analysis. Single base polymorphisms are limited to one (r) in *Dahlia*

Table 1. GenBank Accession Numbers.

Species	GenBank Accession No.	Source
Dahlia dissecta S. Watson	AY117465	Saar et al. 2003
Dahlia foeniculifolia Sherff	AY117466	Saar et al. 2003
Dahlia linearis Sherff	AY117467	Saar et al. 2003
Dahlia merckii Lehm.	AY117471	Saar et al. 2003
Dahlia rupicola P.D. Sørensen	AY117468	Saar et al. 2003
Dahlia scapigeroides Sherff	AY117469	Saar et al. 2003
Dahlia sublignosa (P.D. Sørensen) Saar & P.D. Sørensen	DQ198259	this study

linearis Sherff and two (y, s) in *D. scapigeroides* Sherff, which were included in the matrix format symbols for analysis. A branch-and-bound search was performed using PAUP* 4.0v8 (Swofford 1998) on a Macintosh G5 computer. Bootstrap analysis (Felsenstein 1985) was performed using 1000 replicates. Pairwise distances [uncorrected ("p") distance matrix] were calculated with PAUP.

RESULTS

The ITS sequences for both plants of *Dahlia dissecta var. sublignosa* are identical, so only one sequence was submitted to GenBank. The new sequence obtained for *D. foeniculifolia* is consistent with that of Saar et al. (2003) but is of better quality (no unknowns or polymorphisms), presumably due to the availability of better leaf material from the same plant (GenBank sequence updated).

The phylogenetic analysis produced two trees of a shortest length of 70 steps (CI 0.971, RI 0.917, RC 0.890, HI 0.029). A total of 671 base pairs were aligned and analyzed: 251 bp in ITS-1, 220 bp in ITS-2, and the remaining bp from flanking regions of coding nrDNA.

Results show that the sister taxon to *Dahlia dissecta* var. *sublignosa* is not var. *dissecta* but either *D. linearis* or *D. foeniculifolia*. The tree shown in Figure 2, based on a strict consensus, results in a polytomy between *D. linearis*, *D. foeniculifolia*, and the two samples of var. *sublignosa*.

A distance matrix of sect. *Entemophyllon* has an average of 1.54% ($\delta = 0.0066$) sequence divergence among the six taxa. *Dahlia dissecta* var. *sublignosa* differs from *D. linearis* by 0.91% and from *D. foeniculifolia* by 1.21%.

The chromosome number is $n=17$.

DISCUSSION

The phylogenetic analysis shows that *Dahlia dissecta* var. *dissecta* and var. *sublignosa* are not conspecific. Leaf and flower morphology and ITS sequences also do not suggest that it is a variety of the next closest taxa, *D. linearis* or *D. foeniculifolia* (Fig. 1). The sequence divergences between var. *sublignosa* and *D.*

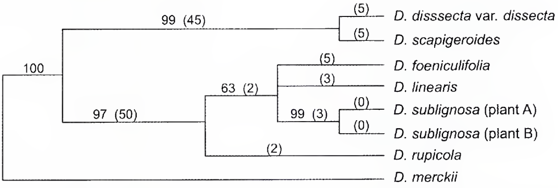

Fig. 2. Phylogenetic anaylsis of *Dahlia* sect. *Entemophyllon* using ITS sequences. Outgroup is *D. merckii* (not in sect. *Entemophyllon*). Numbers above branches represent bootstrap values; numbers in parenthesis indicate number of changes.

linearis and between var. *sublignosa* and *D. foeniculifolia* (0.91 and 1.21%, respectively) are consistent with the other species in the section and other clades in the genus. By comparison, the "variable root clade" (Saar et al. 2003) averages 0.97% (δ = 0.0087) divergence for 10 taxa and the "core *Dahlia* clade" (Saar et al. 2003) averages 0.87% (δ = 0.0096) over 15 taxa. Therefore, it is concluded that *D. dissecta* var. *sublignosa* should be elevated to the rank of species, coordinate with the other taxa of the section:

Dahlia sublignosa (P.D. Sørensen) D.E. Saar & P.D. Sørensen, comb. & stat. nov. (**Fig. 3**). TYPE: MEXICO. TAMAULIPAS: 4.8 km N of Miquihuana in forest dominated by *Pinus* (99°47'N Lat; 23°36'W Long), elev. ca. 2100 m, 14 Jul 1949, *Stanford, Taylor, & Lauber 2436* (HOLOTYPE: NY; ISOTYPES: GH, MICH, TEX, UC, US-2, WTU).

Dahlia sublignosa is readily distinguished from either *D. linearis* or *D. foeniculifolia* by its shorter ultimate leaf segments (0.5–5.5 mm vs. 9–23 for *D. linearis* and 30–55 mm for *D. foeniculifolia*). The chromosome number of n=17 is consistent with five of the other species in the section; the number is not known for the sixth species, *Dahlia congestifolia*.

The elevation of *Dahlia sublignosa* to rank of species brings the number of "wild" species in the genus to 36, but does not include the cultivated forms often called *D. variabilis* Desf. or occasionally *D. pinnata* Cav., but see Hansen and Hjerting (1996) for clarification of the latter binomial.

ACKNOWLEDGMENTS

We thank Courtney A. Thomason for preparing the line drawing of *Dahlia sublignosa*. We are grateful to the folks at Plant Delights Nursery, Raleigh, NC, for generously supplying us with living material of *Dahlia sublignosa*. Guy Nesom and Richard Noyes provided helpful comments for an earlier version of the manuscript.

CORRECTION TO THE TYPE CITATION OF *SARRACENIA ALABAMENSIS* AND VALIDATION OF THE NAME *SARRACENIA ALABAMENSIS* SUBSP. *WHERRYI* (SARRACENIACEAE)

F.W. Case, Jr.

7275 Thornapple Lane
Saginaw, Michigan 48609, U.S.A.

Case and Case (1974) described a new species of *Sarracenia, S. alabamensis* F.W. Case & R.B. Case, from the Fall Line Sand Hills of Chilton, Autauga, and Elmore counties, Alabama. The "type plant" (as cited) was collected June 1971 in Elmore Co., Alabama, from a plant in the railroad ditch approximately halfway between the towns of Elmore and Speigner, but the type specimen was prepared at a later date from a cultivated division of the same plant grown in our personal greenhouse. As cited, the type consisted of a flowering portion (1 May 1972–US 02797766), with the sigmoid spring leaves and flowers, and a summer portion (27 July 1972–US 02797767 and US 02797768) with the large and distinctive summer leaves. For valid publication, however, Article 8.2 of the International Code of Botanical Nomenclature (Greuter et al. 2000) requires that the type be a single gathering made at one time. To correct the error, validation of this name requires designation of a single type, as follows:

Sarracenia alabamensis F.W. Case & R.B. Case, sp. nov. TYPE: ALABAMA. ELMORE CO.: between Elmore and Speigner, gravelly, peaty springhead in thicket of *Rhododendron, Alnus, Magnolia virgini[c]a, Rhus vernix,* and *Arundinaria tecta,* [field collection Jun 1971; greenhouse grown], 1 May 1972, *F. Case & R. Case S500* (HOLOTYPE: US 02797766; ISOTYPE: MICH). Latin description: Rhodora 76:653–655. 1974.

In addition, an infraspecific name is not validly published unless the name of the species to which it is assigned is validly published either simultaneously or previously (ICBN Article 43.1, Greuter et al. 2000). Thus, *Sarracenia alabamensis* subsp. *wherryi* (Case & Case 1976) was not validly published and is reprised here:

Sarracenia alabamensis subsp. **wherryi** F.W. Case & R.B. Case, subsp. nov. TYPE: ALABAMA. WASHINGTON CO.: swampy trough in pine woods about a half-mile E of Chatom, growing with *Sarracenia leucophylla,* [field collection Jul 1972; greenhouse grown], Sep 1974, *F. Case & R. Case S573* (HOLOTYPE: US 02797749). Latin description: Rhodora 78:315. 1976.

ACKNOWLEDGMENTS

I wish to thank Rob Naczi and A.A. Reznicek for bringing this error to my attention and for helping me to correct it. Guy Nesom kindly reviewed the paper and offered additional comments.

A CASE OF DISPUTED ORTHOGRAPHY: IS IT *ECHINOCHLOA COLONA*; OR IS IT *ECHINOCHLOA COLONUM* (GRAMINEAE)?

Daniel B. Ward

Department of Botany
University of Florida
Gainesville, Florida 32607, U.S.A.

ABSTRACT

Within the genus *Echinochloa* (Gramineae) the epithet of the grass familiarly known as Jungle Rice has been spelled either "*colona*" or "*colonum*." Linnaeus, in his original recognition of the species as a member of the neuter genus *Panicum*, chose "*colonum*" as the epithet. This word, from the Latin "*colonus*," is a noun. As such, under the International Code of Botanical Nomenclature it must retain its original spelling whatever the gender of the genus to which it may be assigned. The grass is thus correctly known as *Echinochloa colonum* (L.) Link.

RESUMEN

Dentro del género *Echinochloa* (Gramineae), el epíteto de la especie conocida comúnmente como Arroz Salvaje ha sido escrito tanto "*colona*" como "*colonum*." Linnaeus, en su reconocimiento original de la especie como miembro del género neutro *Panicum*, escogió "*colonum*" como epíteto. Esta palabra, del latín "*colonus*," es un sustantivo. En sí, bajo el Código Internacional de Nomenclatura Botánica, debe conservar su ortografía original, cualquiera que sea el género (masculino, femenino, o neutro) del género al que sea asignado. Así pues, el nombre correcto de la especie es *Echinochloa colonum* (L.) Link.

INTRODUCTION

The Old World grass known as Jungle Rice, a member of the genus *Echinochloa* (Gramineae), is now found in tropical and temperate areas throughout the world. Though in ancient times and into the early 20th century it served as an edible grain, it is now best known as a secondary forage for cattle or as a troublesome weed of wet soils. It was given scientific recognition in the mid-18th century, first as a species of *Panicum*, then as a member of the newly formed genus *Echinochloa*. In these two genera it has borne only a single specific epithet. Yet over the decades different authors, with about equal frequency, have given this epithet two spellings—*colona* and *colonum*. But few have attempted to explain their chosen spelling. And none have provided adequate justification of which spelling is correct.

HISTORY

Jungle Rice—a common name of relatively recent origin—has been known from ancient times. The grains have been found in the intestines of mummies of early Egypt, where their amount and purity make it "most probable that the plant was cultivated as a cereal" (Tackholm & Drar 1941). Its use as a foodstuff in India continued to be documented into the 20th century (Gamble 1928; Bor 1968). The plant was recorded and illustrated by at least three pre-Linnaean authors: Plukenet (1692), Sloane (1696, 1707), and Ehret (1748).

When Linnaeus (1759) published *Panicum colonum* he transcribed the epithet wholly in lower case. His diagnosis of the new species read: *P. spiculis alternis secundis muticis ovatis scabris, rachi teretiuscula*. He referred to the illustrations of both Sloane (1707) and Ehret (1748). His basis may have been a specimen (LINN 80.23; Savage 1945) now in the Linnaean Herbarium obtained from the Irish physician, Patrick Browne, who returned to England in 1756 after a stay in Jamaica (Stafleu 1971); the sheet bears a "Br" in Linnaeus' hand. He may also have seen material in the Jamaica collections of Sir Hans Sloane whom he visited in 1736 (Stearn 1957:110), and was certainly familiar with the plate in Sloane's (1707) book. The plant's relatively distinct morphology, which matches the Sloane and Ehret plates, has made a secure linkage with Linnaeus' diagnosis and name; no later author has questioned the accuracy of their application to the grass known as Jungle Rice.

Panicum is a genus of great size, recently estimated (Mabberley 1996) to contain more than 500 species. It would be even larger if certain groups of species had not been removed as deserving of independent generic rank. *Echinochloa* was among the first of these distinctive groups to be given generic standing, by Beauvois (1812), to contain the familiar Barnyard-grass, *E. crusgalli* (L.) Beauv. Beauvois at the same time formed a second generic segregate, *Oplismenus*. Kunth (1816) then made a transfer of *Panicum colonum*, to form *Oplismenus colonus* (L.) HBK.; and Link (1833) published the now-universally accepted combination (if not spelling), *Echinochloa colona* (L.) Link.

Floristic botanists were slow to accept the new combinations. Influential writers throughout the 19th century—Hooker (1897) and Cooke (1908) in India; Grisebach (1864) in the West Indies; Nash (in Britton & Brown 1898), Chapman (1897), and Mohr (1901) in North America—continued to employ *Panicum colonum*. [Nash (1898), under Britton's editorial edict that all species must have common names, is the apparent originator of the now widely used "Jungle Rice."] Perhaps Merrill (1923) was the last important author to retain Linnaeus' *P. colonum*.

Other than its initial formation, the first significant use of Linnaeus' epithet in the segregate genus *Echinochloa* appears to have been by Nash (in Small's "Flora of the Southeastern United States" 1903), who chose to follow Link (1833) in forming the epithet as "*colona*." Nash seized a second opportunity to promote this spelling by his authorship of the grasses in Britton and Brown (1913), expanding the usage into northeastern North America. The practice received further approbation by Hitchcock (1909) in Cuba; by Stapf (in Prain 1920) and Hutchinson and Dalziel (1936) in Africa; by Gamble (1928) in India; by Hitchcock (in Small's "Manual of the Southeastern Flora" 1933); and by Rozhevits and Shishkin (1934) in Russia.

But opposition began to arise to the burgeoning use of *colona*. Hitchcock (who in his earlier works had employed *colona*) noted (1913): "Dr. E.L. Greene called attention to the fact that the specific name is not an adjective, and suggested that it is probably a genitive plural. The word appears to be contracted from *colonorum*, genitive plural of *colonus*, a husbandman or a *colonist*. Dr. J.A. Nieuwland has kindly searched Latin authorities and verifies this conclusion, though there appears to be no direct authority for the word *colonum*."

Wiegand (1921)—other than Hitchcock, the only author expressing an opinion who had devoted significant time to the taxonomy of *Echinochloa*—observed: "Hitchcock, following Greene, has called attention to the fact that the name *colonum* is not an adjective and hence should not be declined." And Bor (1960), perhaps irritated by the use of *colona* without explanation by other authors addressing the flora of India, brusquely commented: "The correct form of the specific epithet is *colonum*, a contraction of *colonorum*, and not *colona*."

Argument in defense of *colona* was slow to appear. Clayton (in Hepper 1968) may have been the first: "The declension of the epithet depends on whether it is regarded as a noun or an adjective. Lexicographers differ, but the adjectival use was acceptable to those of Linnaeus' own time." This explanation was expanded by Cope (in Nasir & Ali 1982): "The epithet is sometimes treated as the irregular genitive plural of a noun ('of the farmers') and spelt *colonum*. However, there seems no reason to depart from the adjectival form familiar to botanists; though not in the purest classical tradition, its use was sanctioned by lexicographers of Linnaeus' own time." Though citing as his authority an author who had taken the contrary view, Michael (2003) justified *colona*: "Hitchcock (1913) considered that '*colonum*' was a non-declining contraction, but dictionaries of Linnaeus' time treated it as a declining adjective. Because Linnaeus was the first to name the species (as '*Panicum colonum*'), it seems best to follow the practice considered correct in his day; hence '*E. colona*'."

Only these six authors have been found who expressed a justification for their use of either *Echinochloa colona* or *E. colonum*. The many others either held no opinion or gave none in their floristic writings. The three most detailed North American studies—Hitchcock 1920; Wiegand 1921; Gould et al. 1972—all used *colonum*, though only Hitchcock and Wiegand provided justification of the spelling. Two world-scale compilations of plant names (Uphof 1968; Mabberley 1996) pointed in opposite directions. Two comprehensive listings of plant names for temperate North America (Shetler & Skog 1978; Kartesz 1994) similarly differed in their spelling of the epithet. A recent and influential inventory of plants of economic importance worldwide (Wiersema & Leon 1999) chose *colona*.

A cursory survey of floristic authors addressing *Echinochloa* has shown that in the 20th century (and into the 21st) there is rough equivalence to the two positions; 36 have used *E. colona*, while 43 have used *E. colonum*.

Authors who have employed *Echinochloa colona*: Acevedo-Rodriguez (1996), Allen (1992), Balick, Nee and Atha (2000), Britton and Brown (1913), Clayton and Renvoize (1982, 1986), Clewell (1985), Dassanayake et al. (1994), Diggs et al. (1999), Duncan and Kartesz (1981), Gamble (1928), Gibbs Russell et al. (1991), Gould (1975), Green (1985), Hepper (1968), Hitchcock (1909), Howard (1979), Hutchinson and Dalziel (1936), Jones et al. (1997), Maire (1952), Michael (2003), Nasir and Ali (1982), Prain (1920), Robinson and Fernald (1908), Rozhevits and Shishkin (1934), Small (1903, 1933), Stace (1997), Stevens et al. But correct orthography, as in other more obvious niches of plant taxonomy, is not governed by popular vote, but by conformation to codified rules. Though rules are difficult to understand, sometimes treacherous to follow, they are the only path to consistent usage.

DISCUSSION

Orthography is "the art of spelling words according to accepted usage" (Random House 1979). In taxonomic parlance, "accepted usage" is defined by the rules of the International Code of Botanical Nomenclature (Greuter et al. 2000). In the present instance, the determination of whether *colona* or *colonum* is correct is decided by interpretation and application of Article 23, the Names of Species. It is critical to determine whether the word was first used as an adjective, or as a noun. Resolution of these alternatives requires that there be understanding of the origin of the word and its use in the naming of Jungle Rice.

Colonus was a term used in the late Roman Empire for a worker who was bonded to the farmland of a wealthy landowner; though technically not a slave, the worker was not free to seek employment elsewhere. (This practice later became the coerced labor of the middle-age feudal system.) The word *colonus* is a second declension Latin noun; it is masculine. It is often translated as "freeborn serf," or at times as "husbandman," a now-obsolete term surviving only as "animal husbandry," the care and raising of agricultural animals. Occasionally it is read as "farmer" or as "*colonist*," in recognition of the modern inapplicability of the original meaning.

Latin is a highly inflected language (Stearn 1983), that is, the ending of each word indicates the case, number, and gender. *Colonus* is the nominative singular, *colonum* the accusative singular, *coloni* the genitive singular, *colonorum* the genitive plural, etc. Were a Roman to observe, "The *colonus* kicks the horse" (or equus, also a second declension noun), he would say, "*Colonus equum calcitat.*" Were the horse to do the kicking, the expression would be, "*Equus colonum calcitat.*" If the horse kicks more than one person, "*Equus colonos calcitat.*"

In common practice the word *colonus* had no feminine ending, that is, there appears to have been no widely used *colona* in the Latin language (Lewis & Short 1879). That spelling appears to be recorded only twice in the ancient writings (by Ovid). Just as in "horse" (where "mare" indicates the female), the feminine gender most often would have been expressed by a separate word or disregarded entirely. Similarly, there cannot be a neuter *colonum* in the nominative; the structure of the language may appear to permit it, but the concept of a "neuter" worker would be without meaning.

Moreover, there is no adjective *colonus* (or *colona* or *colonum*) in the Latin language. It seems most improbable that "dictionaries of Linnaeus' time treated it as a declining adjective" (Michael 2003). Indeed, were *colonus* treated as an adjective, the word would be unintelligible when translated into English ("free-born serfish"?).

The statements by the six authors who gave reasons for their use either of *colona* or *colonum* need examination. All were brief, some cryptic, and some misleading or erroneous. The three who spoke for continued use of *colonum* (Hitchcock 1913; Wiegand 1921; Bor 1960) clearly understood the word to be a noun (the wording of Hitchcock and of Wiegand: "not an adjective"). They erred, perhaps, in that each seemed to assume his readers would properly interpret this fact to require retention of the original spelling. Two spoke of the word *colonum* being a contraction of *colonorum*; this remark is unneeded in that, while *colonorum* is available (the genitive plural of *colonus*), *colonum* is itself a perfectly good form (the accusative singular), thus requiring no "contraction."

Nieuwland, as quoted by Hitchcock (1913), raised a further detail, that "there appears to be no direct authority for the word *colonum*." There indeed seems to be no documented *colonum* in classical Latin (Lewis & Short 1879). Nieuwland's point may be that he believed proper taxonomic style calls for use only of Latin words known to be recorded in surviving Latin writings. Yet, once recognized as a second declension noun, the word *colonus* implies appropriate spellings in other number and case.

The three authors who spoke for changing the spelling to *colona* (Clayton 1968; Cope 1982; Michael 2003) are more difficult to understand. The claim that lexicographers "of Linnaeus' own time" accepted *colona* (Clayton, paraphrased by Cope and Michael) is made without documentation, and no such lexicographic treatment has been seen (the usage by Ovid perhaps excepted). Most significantly, all three state or indicate that they believe the word *colonus* may be treated as an adjective and thus altered in spelling to agree with the associated genus, perhaps without comprehending that such action must carry them outside the parameters of acceptable Latin.

Linnaeus did not employ the epithet elsewhere than in 1759. The word *colonus*, however spelled, appears to be found in post-Linnaean technical botanical literature only in application to the grass described by Linnaeus (Google, Nov 2003). There are thus no guiding examples of its use with other genera by other authors.

The pathway is indirect by which Linnaeus probably came to use this word for his epithet. The references he cited lack the word: *colonum* does not appear in the phrase-names accompanying the plates of Sloane (1707) nor Ehret (1748), nor in Sloane's (1696) more extensive text. But Sloane (1696)—though this publication was not cited by Linnaeus—referred to a still-earlier publication: Plukenet (1692). There, under a drawing that may be the first illustration of Jungle Rice, and accompanied by a phrase name (*Gramen paniceum minus, spica divulsa*) cited by Sloane, Plukenet noted his plant to be "*Pestis Coloni*," or "plague of the farmer." Plukenet's work was well known to Linnaeus, and it is most probable that this phrase (*Coloni*, here, in the genitive singular) was the inspiration for his selection of "*colonum*."

APPLICATION TO BOTANY

Classical Latin, of course, is not the same as botanical Latin (Stearn 1983). The use of Latin as an international language, a practice of the past 250 years, is relatively rigid, with many words given precise meanings unknown to the Roman writer or scholar. These meanings may originate, not with their classical use, but with the application to a botanical situation, as determined by the Recent author who needs a special term for a special structure.

If the term is employed, not just for descriptive purposes, but for a botanical name, the author's latitude is without limit. It is generally recognized that good style encourages an author to use a term or combination of terms, from Latin or Greek, that closely track classic usage. But, encouragement aside, there is no requirement in the Code (Greuter et al. 2000) that the word (or words) used in forming a name be appropriate, or that it be spelled correctly, or that it have any meaning whatsoever.

A provision of the Code (Art. 23.1; Greuter et al. 2000) would appear to restrict this latitude: "The name of a species is a binary combination consisting of the name of the genus followed by a single specific epithet in the form of an adjective, a noun in the genitive, or a word in apposition..." *Colonum*, though accusative, is used in apposition. But the near-simultaneous permission (Art. 23.2) that an epithet "may even be formed arbitrarily" does allow, by modern rules, deviation from strict nominative structure for a word used in apposition.

Thus Linnaeus, though writing far in advance of the modern rules, still falls within their parameters.

It was common practice for Linnaeus (1753, et seq.) to select as the epithet for his new name a word pre-existing in the medieval botanical literature. Many of these words, perhaps most, were adjectives. But others were nouns—known as substantives—and are carried over unchanged into modern botanical usage. Until the mid 20th century many authors indicated the substantive origin of epithets by retaining a capital letter at the beginning of each epithet so formed. Now, though capitalization of substantives is still permitted, the majority of authors de-capitalize epithets, giving uniformity to the structure of names, but obscuring the history and the original usage of the epithet.

Nouns used for epithets are treated differently from adjectives. Adjectives must agree (in case, number, and gender) with the genus to which they are attached, and this agreement is indicated by the requisite change in spelling. In contrast, the Code (Art. 23.5; Greuter et al. 2000) mandates that a noun retains its own gender and ending irrespective of the gender of the generic name.

An example lies near at hand, of a noun used as an epithet and transferred, without change in spelling, to a genus of another gender. Linnaeus (1753) also described and named the plant now commonly known as Barnyard-grass; he termed it *Panicum Crusgalli*. ("Crusgalli" is literally translated as "chicken's leg," but is usually interpreted to mean "cock's-spur.") When transferred to *Echinochloa* by Beauvois, it became *E. crusgalli* (in modern, preferred usage). Though Linnaeus did not indicate the source of this epithet, his use of a capital initial letter designated it as a substantive. No subsequent author has attempted to treat it as an adjective and adjust the original spelling so as to agree with the gender of the new genus.

Linnaeus' *Panicum colonum* was received differently. In the masculine genus *Oplismenus*, Kunth (1816) recorded it as *O. colonus*. In the feminine genus *Echinochloa*, Link (1833) stated it to be *E. colona*. The arguments so weakly presented for treating *colonum* as an adjective would perhaps have been strengthened had their proponents noted that the originators of these segregate genera had done so also. Had Clayton (1968) referred to botanists rather than lexicographers, he would have been accurate in his observation that "adjectival use was acceptable to those of Linnaeus' own time."

The judgments of Kunth and of Link, however, are still just judgments of later authors, no different from those of the many still later authors who chose *E. colona*. Only the action by the original author, Linnaeus, could potentially carry decisive weight.

It is unknown why Linnaeus (1759) chose "*colonum*" as the spelling of the epithet for his new species. He was, of course, assigning the new entity to the genus *Panicum*, a genus he had formed earlier (1753) and which he had treated as neuter (as indicated both by the ending of the word (*-um*) and by the ending of adjectival epithets he placed thereunder). Since Linnaeus both wrote and spoke Latin (Stafleu 1971:83), he cannot be thought of as making a beginner's error, that is, he would have known full well that the nominative was *colonus* and that the word, carried into botanical usage, would normally retain its nominative spelling unchanged. Too, if he obtained his epithet from the brief usage by Plukenet (1692), he knew the word to be a noun. Yet his use of lower case for the initial letter of *colonum* indicates he thought of the word as formed differently from other substantives.

Two alternatives are offered. Perhaps Linnaeus did understand the word to be a noun and chose the accusative, or *colonum*, for reasons of euphony, for smooth combination with its assigned genus *Panicum*. Or perhaps Linnaeus chose to disregard its meaning as a noun and saw it only as a sequence of letters which could be treated as an adjective and declined to agree with its genus.

CONCLUSION

The second of these possibilities is untenable. One cannot break away from the certainty that Linnaeus would have recognized the word was a noun and must have intentionally chosen the accusative, *colonum*, so that it would follow smoothly his genus *Panicum*. His choice of *colonum* is within the practices of the 18th century and the language of the modern Code. His preference for the harmonious *colonum* rather than the discordant *colonus* in no way negates its status as a noun. His decapitalization of the initial letter is stylistic and immaterial. No argument seems convincing that Linnaeus thought of the word as an adjective. Though Linnaeus, by creating the new name, had the option of selecting for its epithet whatever word he wished, his choice of a word that is a noun removes the power of later authors to treat it as an adjective. As a noun whose spelling is unchanged in whatever genus it may be placed, the name formed by Link in 1833 must be read as *Echinochloa colonum*.

ACKNOWLEDGMENTS

I thank J. Richard Abbott (FLAS), Mary Barkworth (UTC), William J. Dress (BH), Mark A. Garland (PIHG), Walter S. Judd (FLAS), and Dan H. Nicolson (US) for their useful and important comments and suggestions, Christine M. Housel (ABT) for the Hispanicized abstract, and Emily W. Wood and colleagues (GH) for access to critical pre-Linnaean publications.

ICBN CLARIFICATION NEEDED: USE OF RANKS

Guy L. Nesom and Barney Lipscomb

Botanical Research Institute of Texas
509 Pecan Street
Fort Worth, Texas 76102-4060, U.S.A.

ABSTRACT

The current (2000) International Code of Botanical Nomenclature is open to divergent interpretation regarding the use of ranks. Article 4.1 outlines secondary ranks to be used between the principal ranks of family and species and below species. Article 4.2 states that ranks prefixed by "sub-" (termed here as "tertiary" rank, immediately subsidiary in sequence and relative order to principal or secondary ranks) are used to increase the number of ranks to a "greater number" than formed in 4.1. Some taxonomists, in contrast, apparently interpret these Articles such that tertiary ranks may be used without reference to secondary ranks (e.g., subgenus in a genus without sections or series; subspecies in species without varieties or forms). Alternate formulations are offered for Articles 4 and 5 that may more clearly express the intent of the Code: Formulation 1 if the intent is to mandate that tertiary ranks between family and species, and below species, be used only in conjunction with secondary ranks; Formulation 2 if the intent is that tertiary ranks may be used without reference to secondary ranks.

RESUMEN

El actual Código Internacional de Nomenclatura Botanica (2000) está abierto a interpretaciones diversas respecto al uso de los rangos. El Artículo 4.1 esboza los rangos secundarios para usar entre los rangos principales de familia y especie, y especie e inferiores. El Artículo 4.2 establece que los rangos con el prefijo "sub-" (llamados aquí rango "terciario", inmediatamente siguientes en secuencia y orden relativo a los rangos principales o secundarios) se usan para incrementar el número de rangos a un "numero más grande" que los formados en 4.1. Algunos taxónomos, por el contrario, interpretan aparentemente estos Artículos de modo que los rangos terciarios pueden usarse sin referencia a los rangos secundarios (ej. subgénero en un género sin secciones o series; subespecies en especies sin variedades o formas). Se ofrecen formulaciones alternativas para los Artículos 4 y 5 que pueden expresar más claramente la intención del Código: Formulación 1 si la intención es de exigir que los rangos terciarios entre familia y especie, y por debajo de especie, se usen sólo en conjunción con rangos secundarios; Formulación 2 si la intención es que los rangos terciarios puedan usarse sin referencia a los rangos secundarios.

The Articles of the International Code of Botanical Nomenclature (Greuter et al. 2000, the "Saint Louis Code") are "mandatory" rules (Preface, p. vii), and they are generally carefully and rigorously followed by taxonomic botanists. Such nomenclatural prescriptions are intended to provide a stable method of naming and to avoid creation of superfluous names. Valid publication must be in accordance with the Articles.

The 2000 Code is open to divergent interpretation regarding the use of ranks and associated implications for valid nomenclatural practice. As Articles 4.1 and 4.2 are written, ranks in 4.2 (i.e., ranks in addition to those in 3.1 and 4.1) are used in a classification after associated ranks in 3.1 and 4.1 are used, i.e., rank subgenus is used in a genus after there are named sections and/or series in the classification; similarly, rank subspecies is used in a species in which varieties and/or forms already are in use. Current practice, however, is inconsistent regarding which ranks must be used and which ranks are optional. We place the following observations and suggestions on record with the hope that they may lead to clarification of this part of the Code.

Rules pertaining to sequence and relative order of ranks are found primarily in Articles 3, 4, and 5. A closely related pair of these rules—Articles 4.1 and 4.2—is the focal point of apparent ambiguity.

Article 4.1. "*The secondary ranks of taxa in descending sequence are tribe (tribus) between family and genus, section (sectio) and series (series) between genus and species, and variety (varietas) and form (forma) below species.*"

Article 4.2. "*If a greater number of ranks of taxa is desired, the terms for these are made by adding the prefix sub- to the terms denoting the principal or secondary ranks. A plant may thus be assigned to taxa of the following ranks (in descending sequence): regnum,* **sub***regnum, divisio or phylum,* **sub***divisio or* **sub***phylum, classis,* **sub***classis, ordo,* **sub***ordo, familia,* **sub***familia, tribus,* **sub***tribus, genus,* **sub***genus, sectio,* **sub***sectio, series,* **sub***series, species,* **sub***species, varietas,* **sub***varietas, forma,* **sub***forma.*" [bold added]

Article 4.1 outlines secondary ranks to be used below principal ranks. Article 4.2 states that ranks prefixed by "sub" and immediately subsidiary in sequence to principal or secondary ranks are used to increase the number of ranks (presumably for a "greater number" than formed in 4.1).

Recommendation 26A.2 appears to be consistent with the intent of the ICBN in using the "sub" ranks in conjunction with ranks provided in 3.1 and 4.1:

Recommendation 26A.2 "*A subspecies not including the type of the correct name of the species should, where there is no obstacle under the rules, be given a name with the same final epithet and type as a name of one of its subordinate varieties.*"

Article 3 specifies the principal ranks "in descending sequence" as kingdom, division or phylum, class, order, family, genus, and species. Articles 4.1 and 4.2 deal with secondary ranks (4.1) and "tertiary ranks" (4.2—those prefixed by "sub;" although the phrase "tertiary rank" is not used by the ICBN, it is a useful one and apparently consistent with the intent of the Code). Article 5.1 emphatically fixes the relative order of ranks.

Article 5.1. "*The relative order of the ranks specified in Art. 3 and 4 must not be altered (see Art. 33.7 and 33.8).*"

Examples in clarification in 33.7 indicate that

1) principal ranks must be assigned in relative order (e.g., species may not contain genera);

2) secondary ranks must be used within the principal rank to which they are subsidiary (e.g., section must be used within the rank of genus); and
3) a secondary rank can be subsidiary only to a secondary rank earlier in relative order (e.g., forms cannot be divided into varieties).

Based on the 4.2 sequence and relative order of ranks, although not explicitly given in example by the Code, varieties cannot be divided into subspecies. Varieties can be clustered within subspecies rank.

Changes instituted in the 1994 Code
The structure of Articles 4.1 and 4.2 in the 2000 (Saint Louis) Code was first instituted in the 1994 ("Tokyo") Code (Greuter et al. 1994), which divided Article 4.1 of the 1988 Code (Greuter et al. 1988) into two parts (4.1 and 4.2). The newly structured Articles 4.1 and 4.2 remained unchanged in the 2000 Code and were not suggested for modification by the Vienna botanical congress for the forthcoming 2006 Code (Fred Barrie, pers. comm.). The 1988 Code has the following:

Article 3.1. "The principal ranks of taxa in ascending sequence are: species (*species*), genus (*genus*), family (*familia*), order (*ordo*), class (*classis*), division (*divisio*), and kingdom (*regnum*). Thus, except for some fossil plants (see Art. 3.2), each species is assignable to a genus, each genus to a family, etc."

Article 4.1. "If a greater number of ranks of taxa is required, the terms for these are made either by adding the prefix *sub-* to the terms denoting the ranks or by the introduction of supplementary terms. A plant may thus by assigned to taxa of the following ranks (in descending sequence): *regnum, subregnum, divisio, subdivisio, classis, subclassis, ordo, subordo, familia, subfamilia, tribus, subtribus, genus, subgenus, sectio, subsectio, series, subseries, species, subspecies, varietas, subvarietas, forma, subforma*."

No distinction in the 1988 Code was made among ranks below principal ranks. The phrase "secondary ranks" (referred to in the 1988 Code as "supplementary terms") was first introduced in the 1994 Code. The two proposals for change relating to 1988 Article 4.1 (Silva 1993; Greuter & McNeill 1993) were rejected by general vote (McNeill 1993) but were referred to the Editorial Committee, which adopted them in slightly modified form (Greuter, McNeill, & Barrie 1993).

In the original proposal by Silva for modification of Article 4.1 (1993, p. 186), identification of secondary ranks was done with the intention, at least in part, that "proliferation of ranks by use of a prefix should be restricted to ... principal and secondary ranks." In discussion of the proposals at the nomenclature sessions (prior to the Editorial Committee meeting), Rapporteur-général Greuter noted the following, regarding what was to become Article 4.2: "What Silva had attempted, and perhaps partly achieved, was to bring a coherent logic into the hierarchy of ranks—where hierarchy meant, not the taxonomic hierarchy but a classification of ranks by their importance" (Greuter et al. 1993, p. 40).

Difference in Interpretation of the 2000 Code

The wording of Articles 4.1 and 4.2 in the 2000 Code directly implies that tertiary ranks are used between family and genus, between genus and species, and below species (secondary ranks are available in each area) only after use of an immediately preceding secondary rank (in descending sequence). Between kingdom and family (where secondary ranks do not exist), tertiary ranks immediately follow principal ranks. None of the Code notes or examples pertinent to 4.1, 4.2, or 5.1 (and 33.7 or 33.8, as pointed to by 5.1), however, provides explicit clarification regarding this. In alternative interpretation and in practice, and apparently contrary to the 2000 Code, subfamilies are used in a classification without use of tribes, subgenera without sections, and subspecies without varieties.

This difference in interpretation may exist because of a disparity between Articles 4.1 and 4.2: **tertiary ranks precede the secondary ranks in "relative order" and "descending sequence" but because tertiary ranks are used to increase the number of ranks beyond those provided by secondary ranks, secondary ranks precede tertiary ranks in order of use**. If the Code does not intend to mandate this order of use in ranks, then the separation of 4.1 from 4.2, coupled with the wording of 4.2 ("If a greater number of ranks of taxa is desired"), is stated incorrectly or at least is misleading.

Alternate formulations for clarification

In clarification of the problem discussed here, modifications of the 2000 (Saint Louis) Code are suggested. Two alternate formulations provide a contrast between what appear to be different interpretations of the Code. Article 3.1 (unmodified from the 2000 code) is included within both alternatives.

If modifications are necessary for the 2012 ICBN in regard to points considered here, a formal proposal in Taxon will be required. Because of the expanse of time between now and the next Code version, because we are not taking a position of advocacy, and because what the Editorial Committee intended in 1993 is not clear to us, we offer this commentary as a beginning point of discussion.

FORMULATION 1

If the intent of Articles 4 and 5 is to mandate that tertiary ranks be used only in conjunction with secondary ranks between family and genus, between genus and species, and below species, then we suggest that the following better express the intent of the Code.

Article 3.1 (unmodified from 2000 code). The principal ranks of taxa in descending sequence are: kingdom (regnum), division or phylum (divisio, phylum), class (classis), order (ordo), family (familia), genus (genus), and species (species). Thus, each species is assignable to a genus, each genus to a family, etc.

Article 4.1. A plant may be assigned to taxa of the following ranks (in descending sequence): regnum, subregnum, divisio or phylum, subdivisio or subphylum, classis, subclassis, ordo, subordo, familia, subfamilia, tribus, subtribus, genus, subgenus, sectio, subsectio, series, subseries, species, subspecies, varietas, subvarietas, forma, subforma.

Article 4.2. Secondary ranks of taxa are tribe (tribus) between family and genus, section (sectio) and series (series) between genus and species, and variety (varietas) and form (forma) below species. Terms for tertiary ranks of taxa are made by adding the prefix "sub-" to the terms denoting the principal and/or secondary ranks. Tertiary ranks are added if a greater number of ranks of taxa (beyond secondary ranks) is desired.

Article 4.3. Further ranks may also be intercalated or added if a greater number of ranks of taxa (beyond tertiary ranks) is desired, provided that confusion or error is not thereby introduced.

Article 5.1. The relative order of the ranks specified in Arts. 3 and 4 must not be altered (see Art. 33.7 [*the examples following 33.7 would be better placed here*] and 33.8). The sequence of use of ranks between the principal ranks family and species and below species is secondary (in descending sequence), then tertiary. Tertiary ranks follow the principal and/or secondary ranks from which they are derived. Any of the tertiary ranks may be omitted without altering the relative order; the secondary ranks series and forma may be omitted without altering the relative order.

Note a.—Use of the rank of tribe precedes use of subfamily; use of the rank of section precedes use of subgenus or series; use of the rank of variety precedes use of subspecies or form.

Note b.—A genus may be included in a family without reference to a tribe or to a subfamily (omission of one or both of the ranks between genus and family does not affect the relative order of ranks).

If Formulation 1 were adopted, a date might be set beyond which the rules would apply—in order to avoid chaotic invalidity of names at tertiary rank. Or, proposal of a name at tertiary rank prior to an appropriate name at secondary rank might be set to automatically establish the secondary rank.

Formulation 2

If the intent of Articles 4 and 5 is that tertiary ranks may be used without reference to secondary ranks, then we suggest that the following better express the intent of the Code. This formulation returns to the less restrictive nature of the 1988 Code, in which no distinction in use was made between secondary and tertiary ranks (as they are termed here). Here, there is no problem with subspecies as sole infraspecific rank within a classification or with subgenus as sole subdivision of a genus.

Article 3.1 (unmodified from 2000 code). The principal ranks of taxa in descending sequence are: kingdom (regnum), division or phylum (divisio, phylum), class (classis), order (ordo), family (familia), genus (genus), and species (species). Thus, each species is assignable to a genus, each genus to a family, etc.

Article 4.1 (same as in FORMULATION 1). A plant may be assigned to taxa of the following ranks (in descending sequence): regnum, subregnum, divisio or phylum, subdivisio or subphylum, classis, subclassis, ordo, subordo, familia, subfamilia, tribus, subtribus, genus, subgenus, sectio, subsectio, series, subseries, species, subspecies, varietas, subvarietas, forma, subforma.

Article 4.2. Secondary ranks of taxa are tribe (tribus) between family and genus, section (sectio) and series (series) between genus and species, and variety (varietas) and form (forma) below species. Terms for tertiary ranks of taxa are made by adding the prefix "sub-" to the terms denoting the principal and/or secondary ranks.

Article 4.3 (same as in FORMULATION 1). Further ranks may also be intercalated or added if a greater number of ranks of taxa (beyond tertiary ranks) is desired, provided that confusion or error is not thereby introduced.

Article 5.1. The relative order of the ranks specified in Art. 3 and 4 must not be altered (see Art. 33.7 [*the examples following 33.7 would be better placed here*] and 33.8). Any of the secondary or tertiary ranks may be omitted without altering the relative order, but use of tertiary ranks must follow the principal or secondary ranks from which they are derived.

Note a.—A genus may be included in a family without reference to a tribe or to a subfamily (omission of one or both of the ranks between genus and family does not affect the relative order of ranks); then rank of subgenus may be used within a genus without reference to sections; the rank of subspecies may be used within a species without reference to varieties.

Ranks of Taxa in Relation to Biology

The rank of subspecies sometimes is said to apply to a taxon more "species-like" than a variety and for this reason should precede "variety" in relative order of rank. Infraspecific population systems, however, like species themselves, vary continuously in degree of differentiation and reproductive isolation, and if varieties and subspecies both are treated as morpho-geographic taxa, then a biological distinction between the two ranks is arbitrary. We agree with Fred Barrie (pers. comm.) that the ICBN "legislates the names and relative order of ranks, not the taxonomic concepts attached to a given rank nor the [biological] conditions under which it is appropriate to use one over another." The discussion here of the ICBN structure and intent are detached from considerations of the importance or biological significance of ranks.

ACKNOWLEDGMENTS

Preparation of this discussion was precipitated by Ken Chambers, who brought to our attention another Code issue (included in an early version of the manuscript)—that issue is less complex and apparently will be resolved by the ICBN Editorial Committee before publication of the Vienna Code. We appreciate the comments of Tom Lammers, Gerry Moore, Rich Rabeler, Dick Wunderlin, and especially those of Fred Barrie (early manuscript version) and John Strother, which considerably sharpened the clarity of concepts and presentation.

Price not given, 404 pp., color photos, graphs, maps, 7" × 10".

"The publication highlights a diversity of management approaches that have proven particularly innovative and successful in meeting challenges. Thus, it reaches out to foresters, policy-makers, planners and anyone interested in the future of forestry in Asia and the Pacific."

HERBARIUM ACRONYM CORRECTION FOR *IPOMOEA SEAANIA* (CONVOLVULACEAE) HOLOTYPE: SIDA 21(3). 2005

Richard Felger

Drylands Institute
PMB 405, 2509 N. Campbell Ave.
Tucson, Arizona 85719, U.S.A.

Daniel F. Austin

Arizona-Sonora Desert Museum
2021 N. Kinney Road
Tucson, Arizona 85743, U.S.A.

In a recent paper we described *Ipomoea seaania* as a new arborescent morning glory endemic to southern Sonora (Felger and Austin 2005). On page 1296 we list the location of the holotype as "UA," the informal local Tucson "acronym" for the University of Arizona. The correct herbarium designation is ARIZ; that is where the holotype is deposited. The line should read: "*Felger with Robert S. Devine 85-301* (HOLOTYPE: ARIZ."

ABSTRACT

The following 66 chromosome numbers and vouchers for 24 species of *Poa* L. are reported from Canada, México, and the U.S.A.: *P. abbreviata* subsp. *pattersonii*, $2n = 42$, $2n = 42$, $2n = 42$; *P. alpina*, $2n = 28+\mathrm{II}$, $2n = 32+\mathrm{I}$ (2×), $2n = 40+\mathrm{I}$, $2n = 42$, $2n = 56$; *P. arctica* subsp. *aperta*, $2n = 98+\mathrm{I}$; subsp. *arctica*, $2n = 56$; subsp. *arctica* (longipila form), $2n = 56–59$, $2n = 80$, $2n = 88$; *P. atropurpurea*, $2n = 28$; *P. bigelovii*, $2n = 28+\mathrm{I}$; *P. cusickii* subsp. *pallida*, $2n = 56+\mathrm{II}$, *P. fendleriana* subsp. *albescens*, $2n = 28+\mathrm{II}$, $2n = 56$; subsp. *fendleriana*, $2n = 56$ (4×), $2n = 59$, $2n = 58–60$, $2n = 58–64$, subsp. *longiligula*, $2n = 56$, $2n$ ca. 56; *P. glauca* subsp. *glauca*, $2n = 56$, $2n = 56–58$; subsp. *rupicola*, $2n = 48$, $2n = 48–50$, $2n = 54–56$, $2n$ ca. 100; *P. interior*, $2n = 42$; *P. laxa* subsp. *banffiana*, $2n = 84$; *P. leptocoma* $2n = 42$ (2×); *P. lettermanii*, $2n = 14$, *P. napensis*, $2n = 42$; *P. nervosa*, $2n = 28$; *P. occidentalis*, $2n = 14$ (2×), $2n = 28$; *P. paucispicula*, $2n = 42$; *P. piperi*, $2n = 28$; *P. pratensis* subsp. *alpigena*, $2n = 56+\mathrm{III}$; *P. reflexa*, $2n = 28$ (4×); *P. secunda* subsp. *juncifolia*, $2n = 63$; subsp. *secunda*, $2n = 84–88+\mathrm{II}$; *P. sierrae*, $2n$ ca. 58; *P. strictiramea*, $2n = 28–29$, $2n = 29+\mathrm{II}$; *P. supina* c.v. SUPERNOVA, $2n = 14$, *P. tracyi*, $2n = 28$ (5×), $2n = 28+\mathrm{I}$; *P. unilateralis* subsp. *pachypholis*, $2n = 42$; and *P. unilateralis* subsp. *unilateralis*, $2n = 84$.

RESUMEN

Se citan 66 números cromosomáticos y testigos de 24 especies de *Poa* L. de Canadá, México, y E.E.U.U.: *P. abbreviata* subsp. *pattersonii*, $2n = 42$, *P. alpina*, $2n = 28+\mathrm{II}$, $2n = 32+\mathrm{I}$ (2×), $2n = 40+\mathrm{I}$, $2n = 42$, $2n = 56$; *P. arctica* subsp. *aperta*, $2n = 98+\mathrm{I}$; subsp. *arctica*, $2n = 56$, subsp. *arctica* (forma longipila), $2n = 56–59$, $2n = 80$, $2n = 88$; *P. atropurpurea*, $2n = 28$; *P. bigelovii*, $2n = 28+\mathrm{I}$, *P. cusickii* subsp. *pallida*, $2n = 56+\mathrm{II}$; *P. fendleriana* subsp. *albescens*, $2n = 28+\mathrm{II}$, $2n = 56$; subsp. *fendleriana*, $2n = 56$ (4×), $2n = 59$, $2n = 58–60$, $2n = 58–64$; subsp. *longiligula*, $2n = 56$, $2n$ ca. 56; *P. glauca* subsp *glauca*, $2n = 56$, $2n = 56–58$; subsp *rupicola*, $2n = 48$, $2n = 48–50$, $2n = 54–56$, $2n$ ca 100; *P. interior*, $2n = 42$; *P. laxa* subsp. *banffiana*, $2n = 84$; *P. leptocoma* $2n = 42$ (2×); *P. lettermanii*, $2n = 14$; *P. napensis*, $2n = 42$; *P. nervosa*, $2n = 28$; *P. occidentalis*, $2n = 14$ (2×); *P. paucispicula*, $2n = 42$; *P. piperi*, $2n = 28$; *P. pratensis* subsp. *alpigena*, $2n = 56+\mathrm{III}$; *P. reflexa*, $2n = 28$ (4×); *P. secunda* subsp. *juncifolia*, $2n = 63$; subsp. *secunda*, $2n = 84–88+\mathrm{II}$; *P. sierrae*, $2n$ ca. 58; *P. strictiramea*, $2n = 28–29$, $2n = 29+\mathrm{II}$; *P. supina* c.v. SUPERNOVA, $2n = 14$; *P. tracyi*, $2n = 28$ (5×), $2n = 28+\mathrm{I}$; *P. unilateralis* subsp. *pachypholis*, $2n = 42$; y *P. unilateralis* subsp. *unilateralis*, $2n = 84$.

The Flora of North America North of México (Morin et al. 1993) editorial policy requires that chromosome numbers be independently published prior to being reported in the treatments. Therefore, I am reporting a series of chromosome counts here for *Poa* that are unreported or only mentioned with partial voucher

SIDA 21(4): 2195 – 2203. 2005

Table 1. Voucher information for chromosome counts in the genus *Poa* that are new or mentioned with no or only partial voucher information in Soreng (1985, 1990, 1991a, 1991b, 1993, 1998) and Soreng and Hatch (1983). *RJS* = *R.J. Soreng*, *RWS* = *R. W. Spellenberg.*

Taxon	**County & State**	**Specific location, date, collection no. & herbarium**	**Chromosome no. (2*n*), and notes**
Poa abbreviata subsp. *pattersonii* (Vasey) A. Löve, D. Löve & B.M. Kapoor	U.S.A. Colorado:	Clear Cr. Co.: Rocky Mts., Mt. Evens top, SSE of Georgetown ca. 13 km, 3 Aug 1984, *RJS, R. Bayer, M. Dunford & G.L. Stebbins 2555* (US)	**42** (Soreng 1991b, with partial voucher) information
	Colorado:	Summit/Park Co. boundary, Rocky Mts., Tenmile Range, North Star Mt., Hoosier Ridge W of Hoosier Pass, 2 Aug 1984, *RJS, R. Bayer, M. Dunford & G.L. Stebbins 2548* (US)	**42** (Soreng 1991b, with partial voucher information)
	Montana:	Deer Lodge Co.: Anaconda-Pintlar Wilderness, Mt. Tiny, above Storm Lk., 6 Aug 1980, *RJS & RWS 1165-2* (US)	*n* = **21,** from pollen division (Soreng 1991b, with partial voucher information)
Poa alpina L.	CANADA. Alberta:	Banff N.P., ca. 100 km N of Banff on hwy 93, E slopes of Mt. Peyto, S of Peyto Lk., N of Bow Lk., 28 Jul 1980, *RJS & RWS 1018* (US)	**42** (new)
	Alberta:	Plateau Mt., between Mt. Livingston and Mt. Burke, ca. 67 km due N of Colman, 2 Aug 1980, *RJS & RWS 1105* (US)	**56** (new)
	U.S.A. Colorado:	Sagauche Co.: San Luis Mts., N slope of Baldy Chato, off Big Meadow Rd. FR 790, 17 Aug 1980, *RJS & RWS 1406-a* (US)	**28+II** (new)
	Colorado:	Sagauche Co.: San Luis Mts., N slope of Baldy Chato, off Big Meadow Rd. FR 790, 17 Aug 1980, RJS *& RWS 1406-b* (US)	**32+I** (new)
	Wyoming:	Park Co.: Beartooth Pass, E summit, 8 Aug 1980, *RJS & RWS 1213-5* (US)	**40+I** (new)
	Wyoming:	Sublett Co.: Little Sheep Mt., NW of N end of Green Lakes ca. 6 km, 10 Aug 1980, *RJS & RWS 1290* (US)	**32+I** (new)
Poa arctica subsp. *aperta* (Scribn. & Merr.) Soreng	U.S.A. Colorado:	Sagauche Co.: San Luis Mts., N slope of Baldy Chato, off Big Meadow Rd., FR 790, 17 Aug 1980, *RJS & RWS 1412-a* (US)	**99** (Soreng 1985, without voucher)

TABLE 1. (continued)

Taxon	**County & State**	**Specific location, date, collection no. & herbarium**	**Chromosome no. (2*n*), and notes**
Poa arctica R.Br. subsp. *arctica*	CANADA. Alberta:	Kananaskis Prov.P., at Kananaskis Summit (Highwood Pass), near Mt. Arethusa ca. 67 km S of Seebe and Hwy 1, on Hwy 40, on W side, 31 Jul 1980, *RJS & RWS 1094* (US)	**56** (new)
	U.S.A. Colorado:	Pitkin Co. (W of Lake Co. line?), Rocky Mts., Sawatch Range, Independence Pass, 15 Aug 1980, *RJS & RWS 1391* (US)	**88** (new)
	Montana:	Deer Lodge Co.: Anaconda-Pintlar Wilderness, Mt. Tiny, above Storm Lk., 6 Aug 1980, *RJS & RWS 1180* (US)	**80** (new)
	Montana:	Glacier Co.: Glacier N.P., Pigan Pass, 4 Aug 1980, *RJS & RWS 1142* (US)	**56–59** (new)
Poa atropurpurea Scribn.	U.S.A. California:	San Bernardino Co.: Baldwin Lake, 1985, *RJS 2632* (US)	**28** (Soreng 1993, without voucher)
Poa bigelovii Vasey & Scribn.	U.S.A. New Mexico:	Lincoln Co.: White Mts., NE of Sierra Blanca, below Monjeau L.O., 16 Jun 1981, *RJS 1584t* (US)	**28+I** (Soreng 1985, without voucher)
Poa cusickii subsp. *pallida* Soreng	U.S.A. Montana:	Park Co.: NE of Gardner 10 km, E of Jardine, Jun 08 1984, *RJS 2453-a* (US)	**56+II** (Soreng 1991a, with voucher, but location incomplete and number erroneously reported as *RJS 2456*)
Poa fendleriana subsp. *albescens* (Hitchc.) Soreng	MEXICO. Chihuahua:	Sierra Madre Occidental, Creel, near air strip, 15 Apr 1984, *RJS & RWS 2309* (US)	**56** (new)
	Sonora:	5 km NW of Cananea on microondas road N from road to Sonora, 19 Mar 1982, *RJS & RWS 1780-5* (US)	**28+II,** with inversion bridge & fragments (Soreng 1985, without voucher)
Poa fendleriana (Steud.) Vasey subsp. *fendleriana*	U.S.A. New Mexico:	Catron Co.: Sheridan Gulch, 21 May 1983, *RJS & D. Ward 2125* (US)	**56,** with multivalents (new)
	Mexico:	Dona Ana Co.: Organ Mts., W side, below and E of Baylor Pk., 10 Feb 1984, *RJS & R. Neilson 2190-b* (US)	**56** (new)

TABLE 1. (continued)

Taxon	County & State	Specific location, date, collection no. & herbarium	Chromosome no. (2*n*), and notes
	Mexico:	Grant Co.: Black Range, 19 km NW of Mimbres, *D. Ward 81-04* (NMC)	**58–64** (new)
	Mexico:	Lincoln Co.: White Mts., Montgomery Biological Research Station, 8 km N of Ruidoso, 18 Apr 1981, *RJS 1580* (US)	**56** (new)
	Mexico:	Sandoval Co.: Sandia Mts., W base, Juan Tabo Picnic Area, NE of Albuquerque, 6 Jun 1983, *RJS & RWS 2172* (US)	**58–60** (new)
	Mexico:	Socorro Co.: San Mateo Mts., 21 Mar 1984, *RJS 2303* [no voucher]	**56** (new)
	MEXICO. Chihuahua:	Sierra Madre Occidental, 7 km E of Tomachic, 14 Apr 1984, *RJS 2306* (US)	*n* = **28+I,** mitotic, pistillate plant (new)
Poa fendleriana subsp. *longiligula* (Scribn. & T.A. Williams) Soreng	U.S.A. Arizona:	Apache Co.: Chuska Mts., 6.7 km NE of Lukachukai, on BIA-13, 9 Jun 1983, *RJS & RWS 2177* (US)	**56** (new)
	Wyoming:	Park Co.: Mammoth Hot Springs, 08 Jun 1984, *RJS 2454* (US)	*n* ca. **28,** mitotic (new)
Poa glauca Vahl subsp. *glauca*	CANADA. Alberta:	Plateau Mt., between Mt. Livingston and Mt. Burke, 67 km due N of Colman, 1 Aug 1980, *RJS & RWS 1098-3* (US)	56–58, meiosis irregular (new)
	U.S.A. New Mexico:	Taos Co.: Wheeler Peak, ridge 3.3 km N of peak, 0.4 km S of Frazer Mt., 19 Aug 1980, *RJS & RWS 1454-1* (US)	**56,** multivalents and laggers common (new)
Poa glauca subsp. *rupicola* (Nash) W.A. Weber	U.S.A. Colorado:	Pitkin Co.: Rocky Mts., Sawatch Range, Independence Pass, 15 Aug 1980, *RJS & RWS 1372-18* (US)	Ca. **100** (new)
	Wyoming:	Park Co.: Clay Butte Look-Out., ca. 2 km W of Beartooth Lk., 8 Aug 1980, *RJS & RWS 1221-2* (US)	**54–56,** multivalents (new)
	Wyoming:	dito, *RJS & RWS 1221-5* (US)	**48–50,** multivalents (new)
	Wyoming:	Sublett Co.: Top of Little Sheep Mt., NW of N end of Green Lakes ca. 6.25 km, 10 Aug 1980, *RJS & RWS 1299-6* (US)	**48** (new)
Poa interior Rydb.	U.S.A. Colorado:	Sagauche Co.: San Luis Mts., N slope of Baldy Chato, off Big Meadow Rd. FR 790, 17 Aug 1980, *RJS & RWS 1422-a-3* (US)	**42** (new)

TABLE 1. (continued)

Taxon	**County & State**	**Specific location, date, collection no. & herbarium**	**Chromosome no. (2*n*), and notes**
Poa laxa Haenke subsp. *banffiana* Soreng	U.S.A. Montana:	Glacier Co.: Glacier N.P., Pigan Pass, 4 Aug 1980, *RJS & RWS 1137* (US)	**84** (Soreng 1991b, with partial voucher information)
Poa leptocoma Trin.	U.S.A. Montana:	Glacier Co.: Glacier N. P., Pigan Pass, 4 Aug 1980, *RJS & RWS 1148-4* (US)	**42** (Soreng & Hatch 1983)
	Utah:	Summit Co.: Mt. Murdock E of Bald Mt. Pass, Hwy 150, 12 Aug 1980, *RJS & RWS 1347-2* (US)	**42** (new)
Poa lettermanii Vasey	CANADA or U.S.A.:		**14** (A. Löve, pers. com., letter ca. 1982, reported by, Soreng 1991a, voucher unknown)
Poa napensis Beetle	U.S.A. California:	Napa Co.: Calistoga, S end of landing strip W of Lincoln Ave., 27 May 1986, *RJS 2926* (US)	**42** (Soreng 1991a, with partial voucher and location)
Poa nervosa (Hook.) Vasey s.str. (excluding *Poa wheeleri* Vasey)	U.S.A. Oregon:	Marion Co.: Silver Cr. Falls S.P., Winter Falls, 6 Jun 1986, *RJS 2960* (US)	**28** (new)
Poa occidentalis Vasey	U.S.A. New Mexico:	Rio Ariba Co.: SW of Coyote, Puerco C.G., ca. 33 km NW of Los Alamos, 15 Aug 1978, *RJS & S.L. Hatch 48* (US)	**14** (Soreng & Hatch 1983)
	New Mexico:	Otero Co.: Sacramento Mts., ca. 8.3 km ENE of Cloudcroft S of NM-244 on CR-7, Dec early 1978, *RJS 123b* (US)	**28** (Soreng & Hatch 1983)
	New Mexico:	Otero Co.: Cloudcroft, *S.L. Hatch-2222* (TAES)	**14** (Soreng & Hatch 1983, count by S.L. Hatch)
Poa paucispicula Scribn. & .Merr	CANADA. Alberta:	Banff N.P., ca. 100 km N of Banff on hwy 93, E slopes of Mt. Peyto, S of Peyto Lk., N of Bow Lk., 28 Jul 1980, *RJS & RWS 1016* (US)	**42** (Soreng & Hatch 1983, reported as *Poa leptocoma*)
Poa piperi Hitchc.	U.S.A. California:	Del Norte Co.: Off hwy 199 0.6 km on Patrick Cr. Rd above the Middle Fork of the Smith Rv., 2 Jun 1986, *RJS 2950* (US)	**28** (Soreng 1990, 1993, without voucher)
Poa pratensis L. subsp. *alpigena* (Lindm.) Hiitonen	U.S.A. Alaska:	Nome, Jul 1983, *G.L. Stebbins A-3107!* (US)	**56+III,** original det. as *Poa arctica (new)*

Table 1. (continued)

Taxon	**County & State**	**Specific location, date, collection no. & herbarium**	**Chromosome no. (2*n*), and notes**
Poa reflexa Vasey & Scribn.	U.S.A. New Mexico:	Taos Co.: Wheeler Pk. La Cal Basin, ca. 1.7 km NNW of peak, 19 Aug 1980, *RJS & RWS 1478-4* (US)	**28** (Soreng & Hatch 1983)
	Utah:	Summit Co.: Mt. Murdock E of Bald Mt. Pass, Hwy 150, 11 Aug 1980, *RJS & RWS 1336* (US)	**28** (Soreng & Hatch 1983)
	Wyoming:	Park Co.: Clay Butte Look Out., ca. 2 km W of Beartooth Lk.,8 Aug 1980, *RJS & RWS 1227* (US)	**28** (new)
	Wyoming:	Sublett Co.: S side of Little Sheep Mt., NW of Green Lakes ca. 5 km, 10 Aug 1980, *RJS & RWS 1260-3* (US)	**28** (Soreng & Hatch 1983)
Poa secunda subsp. *juncifolia* (Scribn.) Soreng	U.S.A. Nevada:	Lander Co.: Toiyabe Range, E of Austin ca. 13 km on Hwy 50, 1 Jul 1980, *RJS 821* (US)	**63** (Soreng 1991b, with partial voucher information)
Poa secunda J. Presl subsp. *secunda*	U.S.A. Montana:	Glacier Co.: Glacier N.P., Siyeh Pass Trail, 4 Aug 1980, *RJS & RWS 1135* (US)	**84–88+II** (Soreng 1991b, with partial voucher information)
Poa sierrae T. Howell	U.S.A. California:	Eldorado Co.: Deep Canyon, N. Fork of American River, E of Colfax off hwy 80 ca. 2 m, ca. 0.8 km NE of river crossing of Iowa Hill-ColfaxRd., 30 May 1986, *RJS & G.L. Stebbins 2931* (US)	ca. **58** (new)
Poa strictiramea Hitchc.	MEXICO. Chihuahua:	Sierra Madre Occidental, W of San Jose Babicora, C. El Diablo Pass, 2 km W on road to Madera, 13 Apr 1984, *RJS & RWS 2304-a* (US)	*n* = **14+I,** mitosis (Soreng 1991a, with voucher and partial location)
	Chihuahua:	dito, *RJS & RWS 2304-b* (US)	*n* = **14–15+II,** mitosis (new)
Poa supina Schrad. cv. SUPERNOVA	U.S.A. Maryland:	Cultivated from commercial seed, 2000, *RJS & J. Cayouette 5950-b* (US)	*n* = **7,** mitosis (J. Cayouette, unreported)
Poa tracyi Vasey	U.S.A. New Mexico:	Bernalillo Co.: Sandia Crest, rim N of Tram, 16 Jul 1981, *RJS & K. Gadzia 1642* (US)	**28** (Soreng & Hatch 1983)
	New Mexico:	Colfax Co.: WNW of Raton, Raton City Park, 16 Aug 1978, *RJS & S.L. Hatch 64* (US)	**28** (Soreng & Hatch 1983)

TABLE 1. (continued)

Taxon	**County & State**	**Specific location, date, collection no. & herbarium**	**Chromosome no. (2*n*), and notes**
	New Mexico:	Colfax Co.: NW of Raton, Raton City Park, 31 May 1979, *RJS 266* (US)	**28** (Soreng & Hatch 1983)
	New Mexico:	Colfax Co.: N of Raton, John Mayer's Ranch, down canyon from Raton Pass on side of Bartlet Mesa, E side of US-25, 31 May 1979, *RJS 267* (US)	**28** (Soreng & Hatch 1983)
	New Mexico:	Colfax Co.: Raton Ranch, NW of Raton ca. 7.5 km, 3 Jun 1979, *RJS 272* (US)	**28** (Soreng & Hatch 1983)
	New Mexico:	Colfax Co.: Raton Ranch, NW of Raton ca. 12 km, 3 Jun 1979, *RJS 274* (US)	**28** (Soreng & Hatch 1983)
	New Mexico:	Lincoln Co. Sierra Blanca, circ below the Peak, 10 Jul 1982, *RJS & RWS 2007* (US)	**28+I** (new)
Poa unilateralis subsp. *pachypholis* (Piper) Soreng	U.S.A. Washington:	Pacific Co.: Ilwaco, *RWS & D. Southerland 1522A* (NMC)	**42,** R.W. Spellenberg count (Soreng 1998, with partial voucher information)
Poa unilateralis Scribn. subsp. *unilateralis*	U.S.A. Oregon:	Curry Co.: 3.3 km S of Gold Beach on serpentine road cut, Buena Vista Waysides, 300 ft above the ocean, 22 Jun 1949, *J. Clausen 2151* (CAS)	**84,** as *Poa unilateralis*, J. Clausen unpublished (Soreng 1991a, with voucher but no location)

information in Soreng (1985, 1990, 1991a, 1991b, 1993, 1998) and Soreng and Hatch (1983). Table 1 includes full specimen citations and herbaria (acronyms following Holmgren et al. 1990) where the vouchers are deposited for all of my previous and new reports. My own counts were done between 1978 and 1988. Methods for the chromosome preparations were given in Soreng and Hatch (1983).

In addition, vouchers and/or notes of a few counts done by other botanists/authors that have not been reported previously are included. Jacques Cayouette provided his new chromosome count of *P. supina* from the recently introduced (in North America) cultivar SUPERNOVA. The count reported in Soreng (1991a) for *P. lettermanii* was mentioned to me in a letter by A. Löve, ca. 1982. This report is interesting as it raises to three the number of diploid species in the New World (the others are *P. occidentalis* and *P. pseudoabbreviata*). Verification of the count for *P. lettermanii* is needed since I only have the correspondence record. I found an unpublished report for *P. unilateralis* subsp. *unilateralis* of $2n = 84$ on a herbarium specimen at CAS, the count likely done by the collector of the specimen, geneticist Jens Clausen. Myers (1947) reported a count by Stebbins of $2n = 42$, presumably for the typical subspecies (as *P. unilateralis* subsp. *pachypholis* is rather local, more recently published, and restricted to the coast of NW Oregon and adjacent Washington). Richard W. Spellenberg made a count of $2n = 42$ for *P. unilateralis* subsp. *pachypholis*.

Although emphasis has switched away from cytogenetic comparisons of species to DNA analyses in *Poa* (Gillespie & Soreng 2005; Soreng 1990), it is important to have an understanding of the cytogenetic history of taxa in order to interpret results of other analyses, and to be able to locate vouchers and know where they were collected. Of the 66 counts listed in Table 1, 34 are unreported elsewhere. The base chromosome number in the genus *Poa* is $x = 7$, and the counts reported here generally correspond to multiples of seven, but unbalanced sets of chromosomes were frequently encountered. Roman numerals given after numbers (i.e.; $2n = 28+\text{II}$) represent unpaired chromosomes in the metaphase or anaphase of meiosis, or unbalanced numbers in mitosis or later stages of meiosis. Although supernumary or B chromosomes have been reported frequently in *Poa*, no attempt was made to distinguish unbalanced chromotin of this type from fragments resulting from irregular meiosis, etc. Most of the counts reported here conform to numbers reported by other authors for the same taxa. *Poa sierrae* ($2n = 28$) is the only taxon reported here for the first time. In taxa with previously reported counts, other than my own, and disregarding the extra chromotin, the only the previously unrecorded numbers in any taxon reported here are; $2n = 56$ in *P. fendleriana* subsp. *albescens*, and $2n = 48$, 48–50, 54–56, and ca. 100 in *P. glauca* subsp. *rupicola*. This work continues to show the pattern in *Poa* of few diploid taxa, numerous taxa with low, fairly stable tetra- and hexaploid numbers, other taxa with higher eupolyploid series, and taxa with eupolyploid peaks connected by dysploid series of numbers (Hiesey & Nobs 1982; Stebbins 1950).

ACKNOWLEDGMENTS

Most of these chromosome counts were done durning my Masters degree research under Stephen L. Hatch and then Kelly W. Allred, and PhD reseach under Richard W. Spellenberg, at New Mexico State University. My appreciation is extended to these advisors, to Gerrit Davidse and Lynn J. Gillespie for their helpful reviews of the manuscript, and to Jacques Cayouette for allowing me to report his new chromosome count.

GARY GRIGGS, KIKI PATSCH, and LAURET SAVOY. 2005. **Living with the Changing California Coast.** (ISBN 0-520-24447-8, pbk.). University of California Press, Berkeley, CA 94704, U.S.A (**Orders:** California Princeton Fulfillment Services, 1445 Lower Ferry Road, Ewing, NJ 08618, U.S.A., 609-883-1759, 609-883-7413 fax; www.ucpress.edu). $24.95, 540 pp., b/w photographs, 6" × 9".

The first edition of this book titled *Living with the California Coast*, was published in 1985. In the author's words, the first part of the book provides the reader "with some basic background on how the shoreline works, the processes and hazards that occur here, things to consider before buying or building, options in hazardous locations, and how policies and legislation influence our response." In the second part of the book, "the authors and coastal geologists familiar with specific regions describe these individual areas [coastline areas from the Oregon border to Mexico], including what we know about their geology, hazards, and histories."

NORMAN MYERS and JENNIFER KENT (eds.). Foreword by EDWARD O. WILSON. 2005. **The New Atlas of Planet Management.** (ISBN 0-520-23879-6, pbk.). University of California Press, Berkeley, CA 94704, U.S.A (**Orders:** California Princeton Fulfillment Services, 1445 Lower Ferry Road, Ewing, NJ 08618, U.S.A., 609-883-1759, 609-883-7413 fax; www.ucpress.edu). $39.95, 304 pp., color photos, graphs, drawings, 9 1/4" × 12 1/2".

Authors' comments about this book.—"This is no ordinary atlas. It maps and analyses a living planet at a critical point in its history—as one species, own, threatens to disrupt and exhaust its life-support systems. It charts the growing division in the human family. And it proposes that we have the chance to redirect our course, and become caretakers of our future.

The New Atlas of Planet Management is a first approach to this challenging task. It organizes the mass of available environmental data, statistical predictions, and other conflicting opinions and solutions into a simple, coherent structure. It is divided into seven sections: Land, Oceans, Elements, Evolution, Humankind, Civilization, and Management; each of these is considered from three perspectives: Potential resources, Crises, and Management alternatives.

This structure enables us to examine any critical area of concern and to weigh up: first, what it has to offer; second, where, how, and why things are obviously going wrong; and third, how we might set about putting things right, by applying a range of alternative strategies.

More than a structure for a book, this analytical formula offers one possible approach to planet management. We hope it will spur the rising global debate on our future prospects."—*Norman Myers and Jennifer Kent.*

This book is extremely well-illustrated with extensive captions describing the issues, the resources, the crises or even possible solutions

RELATIONSHIPS BETWEEN PLANT FOLKLORE AND ANTITUMOR ACTIVITY: AN HISTORICAL REVIEW[1]

ABSTRACT

The National Cancer Institute's (NCI) record of plants that have shown significant inhibitory effect in experimental tumor systems (active plants), 1960–1974, was compared with species and genera in references on medicinal folklore, including poisonous plants, to determine whether their percentages of active plants were significantly greater than those screened at random (10.4%). The percent active species in medicinal and/or poisonous references in general were found to be 1.4 to 2.6 times greater, while the number and different kinds of medicinal uses appear related to geographical data of species that also indicate medicinal plants were screened more thoroughly because of their widespread occurrence. The best correlation is seen with poisonous plants, including medicinal plants that suggest a moderate to strong therapeutic effect; their percentages of active species were nearly three (29.3%, anthelmintics) to four times (45.7%, arrow and homicidal poisons) greater than plants screened at random. Selection of plants based strictly on use in folk medicine would probably benefit new (start-up) screening programs, whereas in the long-term, it appears more cost effective to systematically screen the broadest diversity of plants readily available since the common medicinal species would be collected irregardless. A systematic collection strategy could give emphasis to genera that have not been exhaustively studied, especially to species with medicinal uses that indicate toxicity or are considered poisonous.

RESUMEN

El registro de plantas del National Cancer Institute (NCI) 1960–1974, que han mostrado un efecto inhibidor significativo en sistemas tumorales experimentales (plantas activas), se compararon con géneros y especies que aparecen en referencias de medicina popular, incluyendo plantas venenosas, para determinar en que medida los porcentajes de plantas activas eran significativamente más altas que las investigadas al azar (10.4%). El porcentaje de especies activas referenciadas como medicinales y/o venenosas en general se encontró que era de 1.4 a 2.6 veces mayor, mientras que el número y diferentes tipos de usos medicinales parecen relacionados con datos geográficos de especies que también indican que las plantas medicinales fueron investigadas más minuciosamente debido a su amplia distribución. La mejor correlación se aprecia con las plantas venenosas, incluyendo las plantas

---

[1] A summary of the data in this paper was presented at the Society for Economic Botany Symposium on Plants And Cancer held in Baltimore, August 1975. An alternate paper was published in Cancer Treatment Reports in August 1976 (Spjut & Perdue, Vol. 50, 8:979–985). Left out were all data and discussion on Quisumbing's (1951) Medicinal Plants of The Philippines, reviews on genera with geographically disjunct uses of medicinal species, and activity according to the tumor systems employed.

medicinales que parecen tener un efecto terapéutico de moderado a fuerte; los porcentajes de especies activas fue de cerca de tres (29.3%, antihelmínticos) a cuatro veces (45.7%, venenos para flechas y homicidios) mayor que las plantas investigadas al azar. La selección de plantas basada estrictamente en el uso en medicina popular probablemente sería beneficiosa para los nuevos programas de investigación, mientras que a largo término, parece tener un costo efectivo mayor la investigación sistemática de una diversidad de plantas fácilmente disponibles ya que las especies medicinales comunes pueden colectarse en cualquier parte. Una estrategia de colecta sistemática pondría énfasis en géneros que no hayan sido estudiados exhaustivamente, y especialmente en especies con usos medicinales que indiquen toxicidad o que se consideren venenosas.

INTRODUCTION

The USDA Agricultural Research Service (ARS) was a major supplier of plant samples for the National Cancer Institute (NCI) Cancer Chemotherapy Screening Program from 1960–1982. The objective of this program was to identify novel chemical structures produced by plants that would be useful in treatment of cancer. Two major discoveries of novel anticancer drugs from this period were taxol (Wani et al. 1971), isolated from stem-bark of *Taxus brevifolia* Nutt. (Taxaceae), initially collected in Washington, August 1962, followed discovery of confirmed antitumor activity in KB Cell Culture (KB), July 1964 (NCI CPAM, 1977), and camptothecin (Wall et al. 1966), isolated from *Camptotheca acuminata* Decne. (Nyssaceae), based on fruit samples collected in September 1961 from a USDA Plant Introduction Station in Chico, California, and reported to have confirmed antitumor activity in L-1210 Leukemia (LE), July 1962 (NCI CPAM 1977). Semi-synthetic derivatives of compounds from both species are currently employed to treat various cancers (Cragg et al. 1996). The commercial development of these anticancer drugs, however, did not occur until the 1990s. In 1986, the NCI re-developed its biodiversity screening program of natural products (Boyd 1992; Cragg et al. 1996; Newman et al. 2003); however, the acquisition of plant samples for the NCI screen was suspended in 2004.

In August 1975, a symposium on "Plants and Cancer" was held in Baltimore, MD at the Annual Meeting of the Society for Economic Botany. The contributors included many scientists actively involved in the NCI search of new anticancer drugs from plant products who had agreed, in advance, to providing a research contribution. My assigned study was "Plant Folklore: A Tool for Predicting Sources of Antitumor Activity? Other contributed papers were "Procurement of Plant Materials for Antitumor Screening" (Perdue 1976), "Preparation of Plant Extracts for Antitumor Screening" (Statz & Coon 1976), "Bioassay of Plant Extracts for Anticancer Activity" (Abbott 1976), "Isolation and Chemical Characterization of Antitumor Agents from Plants" (Wall et al. 1976), "Types of Anticancer Agents Isolated from Plants" (Hartwell 1976), "Distribution of Anticancer Activity in Higher Plants" (Barclay & Perdue 1976), "Novel Plant-Derived Tumor Inhibitors and Their Mechanisms of Action" (Kupchan 1976), "Pharmacology of Antitumor Agents from Higher Plants" (Sieber et al. 1976), and "Plant Products in Cancer Chemotherapy" (Carter 1976). These and others were published collectively in Cancer Treatment Reports, edited by Robert E. Perdue, Jr., and Jonathan L. Hartwell (Vol. 60, No. 8, 1976).

Upon investigating the relationships between antitumor activity and plant folklore, I felt that plants used in folklore were not going to lead to discovery of novel compounds any more than a systematic sampling of the world's plant diversity based on taxonomy, the approach that had been in practice 14 years. Therefore, in order to show this, the most common medicinal uses of plants, and also poisonous plants, would need to be investigated. During the course of the study, the results on the NCI active species found in literature on medicinal and poisonous plants, in comparisons to those screened at random, raised more questions than could be answered, including the one originally proposed. The Spjut and Perdue (1976) paper excluded much data in another manuscript that had been completed and peer reviewed.

After nearly 30 years, the unpublished data still seem relevant to present day studies in ethnobotany and pharmacology, particularly the relationship between antitumor activity and folklore indicating plant toxicity; therefore, this paper will focus on that relationship, including also data from Spjut and Perdue (1976). Another important relationship involves the multiple uses for a large number of widely distributed species; their impact on the apparent correlation between antitumor activity and medicinal folklore will be discussed. Additionally, Spjut (1985) reviewed the random screen methodology in detail with reference to unpublished data on The Philippine medicinal plants; these data will be presented in this publication.

MATERIALS AND METHODS

Literature Surveys.—This paper deals with data compiled from literature and the NCI plant screening program prior to 1977. Folklore and plants in this study were limited to literary sources for evaluating medicinal uses and poisonous effects of higher plants in man and animals. Included are plants believed to have medicinal or poisonous properties, and the scientific literature dealing with active chemical agents in confirmed poisonous and medicinal plants. Botanical data and the references cited, including the nomenclature of plants, are not updated since this paper was prepared and last reviewed in July 1976; however, in regard to pharmacological data on compounds that were isolated, more recent references are provided.

Eight compendia on medicinal and poisonous plants were employed to identify which of their genera and species were active in the NCI program: Hardin & Arena (1974), Hartwell (1967–1971), Kingsbury (1964), Krochmal & Krochmal (1973), Quisumbing (1951), Train et al. (1957), Webb (1948), and Weiner (1972). One of these, Quisumbing (1951), was further utilized to determine whether a specific medicinal use was more closely correlated with antitumor activity. Because antitumor activity appeared to correlate with a wide variety of medicinal uses, additional data from Quisumbing (1951) were compiled and analyzed in regard to multiple uses of plants as related to their geographical distribution. Additionally, we (Spjut & Perdue 1976) prepared our own compilation on plants used as (1) anthelmintics, (2) fish poisons, and (3) arrow, ordeal and homicidal poisons to determine whether there was a correlation between antitumor activity and plant toxicity in contrast to medicinal plants in general.

Active species.—An active species is defined as one represented by one or more extracts having shown a significant inhibitory effect in any tumor system used in the NCI preliminary screen; these were primarily KB Cell Culture (human epidermoid carcinoma of the nasopharynx, KB, 1960–1982), P-388 Leukemia (PS, 1968–82), Lewis Lung Carcinoma (LL, 1962–66), Walker Carcinoma 256 (WA, 1966–69), Sarcoma 180 (SA, 1956–62), Adenocarcinoma 755 (CA, 1956–62) and L-1210 Leukemia (LE, 1956–71) (Abbott 1976; Geran et al. 1972; Hartwell 1976; Suffness & Douros 1979). The NCI provided a print-out of their active species for this study; additionally, another printout indicating tumor systems for the confirmed active species was consulted (NCI CPAM 1977).

Active agents have included a broad spectrum of compounds (Hartwell 1976), some of which were precluded from further screening (e.g., tannins, phytosterols) by changes made in the extraction procedure and tumor assays (Hartwell 1976); thus, the NCI screen evolved to become more selective in identifying active candidates for drug development by eliminating classes of compounds not considered useful for treating cancer (Hartwell & Abbott 1969). During the 1960s, tannins—in aqueous extracts from a wide variety of plants—were frequently active in WA, but also in CA, LL and SA tumors; a total of 164 species, representing 7.7% of all active species (2,127) in this study were tannin actives (Barclay & Perdue1976; Hartwell 1976). Later, tannins were extracted out before testing, while tumors insensitive to tannins were subsequently employed (Hartwell 1976). Consequently, many variables are represented in the definition of an active species, such as differences in extraction procedures, quantity and kind of tumor systems employed, parameters that define activity from testing extracts, and whether specific plant parts screened correspond to those employed in folklore. Nevertheless, it is felt that all plants regarded active by the NCI from 1960–1976 are valid for making comparisons with folk uses of plants.

Comparisons between the NCI active species and those in the literature considered taxonomic synonyms and closely related species when known. For instance, the NCI active species, *Thalictrum polycarpum* (Torr.) S. Wats., based on a sample collected and identified by A.S. Barclay from southern California in 1962, was not found in the literature reviewed to have medicinal or poisonous reports; however, this species could be interpreted as a synonym of *T. fendleri* Engelm. (Munz 1959), one that was reportedly used in medicine by the Indian

Tribes of Nevada (Train et al. 1957). Based on taxonomy, *T. polycarpum* is considered a medicinal plant.

Active genus. Comparisons were also made at the genus level; however, the size of the genus varies—from just one species (e.g., *Camptotheca*) to more than 1,000 species (e.g., *Euphorbia*); Willis (1922) had determined that 47% of all genera are monotypic, 17% have two species, 8% have three species, and the remaining 28% have four or more species. An active genus is one with one or more active species. Because most genera have more than one species (53%), the percentages of active genera will be higher than active species. Also, when more than one species in an active genus is reportedly used medicinally and/or poisonous, the relationship between antitumor activity and folklore will appear closer, or lie between the percentages of active genera and active species.

Random Screen. The rationale of the NCI screen has been to regard any species as a potential source for novel anticancer drugs; thus, screening of plants has been considered random. In practice, however, collecting was not purely random. One reason is that it is not possible to collect every plant species encountered in the field, because the quantity of dry weight needed may not be practical to obtain. Another is that geographic sampling has not been uniform for political and economic reasons.

The number of genera and species screened and active in the NCI program was determined by A.S. Barclay for the symposium on "Plants and Cancer" at the Society for Economic Botany meeting in Baltimore, August 1975. His data accounted for all species and genera screened by the NCI—up to the end of 1974, taking into consideration synonyms and samples that the NCI acquired not only from the USDA, but from all contractors. His tabular summary is reproduced here, Table 1 (Barclay & Perdue 1976).

The percentages for active genera, 26.0, and species, 10.4, are the bases for making comparisons to those in folklore references; however, it must be kept in mind that the numbers for active species and genera are cumulative; i.e., they do not represent the actual frequency at which activity occurs. This is because some species have been screened more than once, or have included more plant parts than others, thus, have had more opportunity to show activity—also keeping in mind that the NCI screen has become more selective over time.

GENERAL SURVEYS

The NCI computer record of active plant species was compared with species and genera cited in indices or texts of eight compendia to determine which have shown antitumor activity (Table 2). With two exceptions, active species were 1.4 to 2.6 times more frequent in references on medicinal and/or poisonous plants than in plants screened at random, while results with active genera were more consistent—at nearly double that of the random screen.

The greater variation at the species level for medicinal plants is partly due

TABLE 1. NCI overall screening data for vascular plants (1960–1974).

	Number Screened	Number Active	% Active
Genera	4,716	1,225	26.0
Species	20,535	2,127	10.4

to many species not screened, in contrast to higher percentages of genera screened. For one reference, Quisumbing (1951), it was determined that 626 of the 855 species were tested; thus, instead of the 16.4% active of those recorded (855), 22.4% of those species actually screened (626) were active—nearly double that of the random screen.

In regard to the wide ranging values seen for poisonous plants, the lower percentage of 9.2% active species in Webb (1948) seems related to many species that are suspected to cause poisoning of livestock. When data from the same reference was restricted to species that were reported to be poisonous *and* also used medicinally, the percent active species was notably higher, 18.9%. These data suggest that plants, both poisonous *and* used medicinally, are more likely to show antitumor activity than those strictly used medicinally. Also, data from other references (Kingsbury 1964; Hardin & Arena 1974) had more plants confirmed to be poisonous, which in Hardin and Arena (1974) were restricted to those taken internally (Spjut & Perdue 1976). The higher percentages of active species (21.5%, 41.1%) and genera (56.4%, 66.4%) in these references on poisonous plants indicate that toxicity is a factor in the apparent correlation between antitumor activity and plants generally used in medicinal folklore.

ACTIVE PLANTS ACCORDING TO NUMBER AND KINDS OF MEDICINAL USES

Quisumbing (1951), in his *Medicinal Plants of the Philippines*, provided species indices for 116 different categories of therapeutic uses and for 111 different kinds of specific diseases, a total of 227 different medicinal applications from which 90 were selected on the basis of 19 or more species being listed to determine whether antitumor activity was more closely correlated with a particular therapeutic effect (Appendix I, 62 medicinal applications) or specific disease (Appendix II, 28 medicinal applications). What we found, however, was a broad correlation with all medicinal applications (Appendix I, II). This broad correlation appears related to a large number of widely distributed species for which many have probably been screened more than once by the NCI, while a correlation between antitumor activity and toxicity is also evident. These relationships will be made apparent in the data and discussion that follow.

Quisumbing (1951), in reporting on 855 species in 580 genera and 143 families of vascular plants in The Philippines, did not limit his review to medicinal uses within The Philippines. He also drew on literary sources outside The Philippines.

TABLE 2. Number and percent of active genera and active species for medicinal and poisonous plants in eight selected references.

Reference	Genera Listed	Genera active	% Genera active	Species Listed	Species active	% Species active
Medicinal Plants						
Krochmal (1973)	207	131	63.3	251	67	26.7
Quisumbing (1951)	580	271	46.7	855	140	16.4
Train et al. (1957)	142	77	54.2	214	32	15.0
Webb (1948)	398	228	57.3	529	87	16.5
Weiner (1972)	285	156	54.7	388	73	18.8
Poisonous Plants						
Hardin & Arena (1974)	113	75	66.4	141	58	41.1
Kingsbury (1964)	282	159	56.4	488	105	21.5
Webb (1948)	433	211	48.7	760	70	9.2
Poisonous Plants used Medicinally						
Webb (1948)	229	153	66.8	196	37	18.9
Plants Used Against Cancer						
Hartwell (1967–1971)	1,201 (1,033 tested)	480	46.5 (tested)	2,725 (1,815 tested)	314	17.3 (tested)

Thus, many plants not known to be used medicinally in The Philippines were included so long as the plant occurred there, a practice not uncommonly employed by many ethnobotanists in other geographic studies of medicinal plants. Nevertheless, the result is that there are many widespread species represented. This is evident in part by finding that 8% of all species in Quisumbing (1951) are endemic to The Philippines, based on geographical data he also provided; thus, 92% of the species in Quisumbing (1951) extend beyond The Philippines.

The distribution of endemic species according to the number of uses is shown in Figure 1. Among 110 species in Quisumbing (1951) listed for only one medicinal application, 25% were found to be endemic to The Philippines, followed by a sharp decline for those reported under multiple applications—15% for plants listed under two medicinal applications, 8% for three medicinal application—to none found under nine or more medicinal applications. It is certainly not surprising to find that narrower geographically distributed species have fewer medicinal reports.

However, the extent to which medicinal species are reported for many different uses is perhaps not fully realized by many ethnobotanists. The 808 species listed, among the 90 medicinal applications selected from Quisumbing (1951), accounted for a whopping, 5,843 species entries (meaning that many of the 808 species are used for more than one application), the distribution of which is shown in Figure 2. As an average, 50% of the species reported under any one

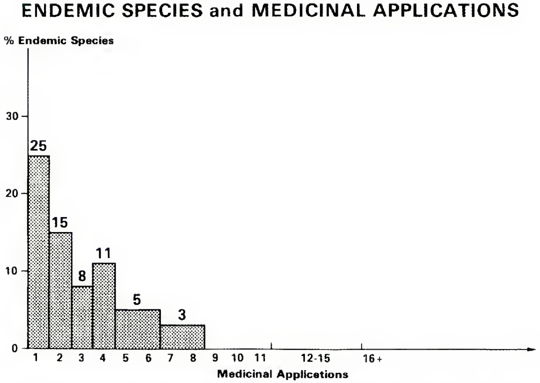

Fig. 1. Percent endemic species to The Philippines according to number of different medicinal applications based on 90 of 227 medicinal applications in Quisumbing (1951). The number of medicinal species for each number of uses is shown in Fig. 2. Of 110 species reportedly used for only one medicinal application, 25% were endemic to The Philippines; for species with two medicinal applications, 15% were endemic, etc., to no endemics for species reported to have nine or more medicinal applications. Geographical data are based on Quisumbing (1951).

medicinal application were also found under 11 or more other medicinal applications.

The extent of the widespread occurrence for many of the medicinal plants reported by Quisumbing (1951) is further evident by percent species screened according to the number of uses recorded, Figure 3, and the fact that relatively few species were actually collected from The Philippines. Some of the medicinal applications in the higher multiple use categories were combined to obtain a more equitable number of species for each category. The results show, as one might expect, a definite correlation between the number of uses and percent species screened, increasing from 45% for species with only one medicinal application, to 99% for those with 16 or more medicinal applications. Plants were procured largely from the United States, Australia, New Zealand, Fiji, Taiwan, India, Turkey, Ethiopia, Kenya, Tanzania, South Africa, Ghana, Mexico, Panama, Colombia, Brazil, and Peru. Small numbers of collections were also obtained from other countries; see also procurement map in Perdue (1976).

For the 90 selected medicinal applications from Quisumbing (1851), 626 species in 531 genera were found to have been screened of which 140 species

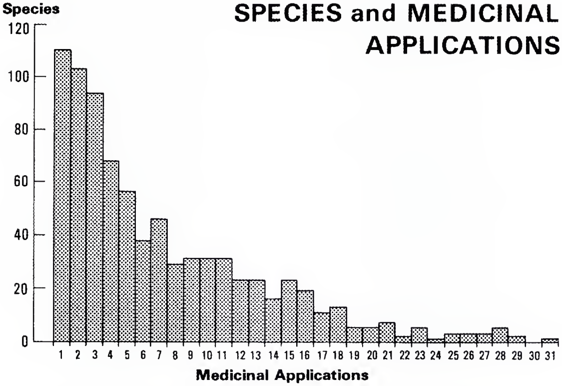

Fig. 2. A numerical distribution of species according to number of medicinal applications for a total of 90 different kinds of medicinal applications that included 808 species in Quisumbing (1951). The number of species for each number of medicinal applications decreases from 110 species used for just one purpose, to one species, *Artemisia vulgaris* L., cited under 31 different medicinal applications.

(22.4%) in 265 genera (49.7%) were active (Appendix III); additionally, 40% of the 140 active species were found to have 12 or more medicinal applications. One medicinal application with notably high percentages of active species and genera was plants used against hemorrhoids, 35.3% (24) of the 68 species and 72.1% of the 61 genera.

Are plants used for treatment of hemorrhoids more closely correlated with antitumor active plants than plants used for other purposes? Statistically, the distribution of active genera and species for the medicinal applications in Quisumbing (1951) might be expected to follow a bell-shaped curve distribution in which there will be higher than average as well as lower than average percentages of active species (and genera). The categories with higher percentages of active species would also be expected to have more widely distributed species based on data presented in Figures 1–3 and the absence of plant collections from The Philippines as already indicated. Indeed, among 68 species listed by Quisumbing (1951) for plants used against hemorrhoids, 75% (51) were reported for 11 or more other medicinal applications, which included 23 of the 24 active species. Therefore, it cannot be concluded that plants used for a particular remedy such as hemorrhoids are more likely to show antitumor activity than plants used for other purposes.

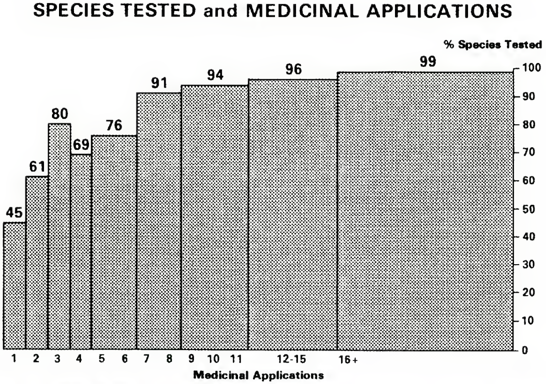

FIG. 3. Percent of species screened by the NCI for antitumor activity according to number of medicinal applications for 808 species listed in 90 of 227 different medicinal applications by Quisumbing (1951). The percent screened for each numerical category of medicinal uses of plants is shown to increase from 45% for species reported to have just one medicinal use to 99% screened for those reported for 16 or more different medicinal applications.

On the other hand, one might argue that the use of plants for many medicinal remedies by one or more cultures should constitute strong evidence for discovering biological activity. At the species level, however, cultural diffusion might exaggerate and multiply reports (Watson 1983), whereas medicinal reports based on disjunct occurrences of closely related species in genera may appear more valid, depending, however, on the size of the genus and number of medicinal species reported. The following six cases exemplify how folklore may appear in one case to have strong validity, while in other instances appears inconclusive.

1) *Brucea* (Simaroubaceae) is a small paleotropical genus of 6 species with *B. antidysenterica* in Africa and *B. javanica* (L.) Merr. in southeast Asia that have reportedly been used for treating skin diseases, dysentery, tapeworm, and cancer (Burkhill 1935; Chopra et al. 1956; Dalziel 1937; Hartwell 1967–1971; Quisumbing 1951; Watt & Breyer-Brandwijk 1962; Webb 1948). Anticancer activity has been identified in both species and one other, *B. guineensis* G. Don, found only in west tropical Africa without any reported use. The anticancer compound, bruceantin (Kupchan et al. 1973), isolated from *B. antidysenterica*, has undergone preclinical studies as a potential drug for cancer chemotherapy. It was found to be toxic in human application; however, derivatives of related compounds are still being investigated for cancer chemotherapy (Cuendet & Pezzuto 2004; Mata-Greenwood et al. 2001).

2) *Colubrina* (Rhamnaceae) includes one widespread species, *C. asiatica* (L.) Brongn., eight species of spotty distribution in the Old World, one in India, three in Indonesia and four in Madagascar, plus about 22 species distributed in tropical and subtropical America (Johnston 1971). *Colubrina asiatica* has been used as an abortifacient and for treating skin diseases (Quisumbing 1951). Species of *Colubrina* in the West Indies and Mexico have been used as an anthelmintic and for treating dysentery and skin diseases (Standley 1922–1926). Anticancer activity has been identified in six New World species, but not in *C. asiatica*. An ansamacrolid, colubrinol (Wani et al. 1973), isolated from *C. texensis* (Torr. & Gray) A. Gray, is related to maytansine, which has undergone clinical studies for cancer chemotherapy as discussed below. *Colubrina californica*, a closely related species to *C. texensis*, has also shown similar activity, but no medicinal reports could be found for these species.

3) *Maytenus* (Celastraceae) is a large pantropical genus of 150 or more species with relatively few species reported for medicinal purposes. One species in South America, *Maytenus ilicifolia* Mart. Ex Reiss., has been employed for treating a variety of ailments such as peptic ulcers, dyspepsia, gastralgia, enteritis, cystitis, insomnia, nervousness, acne, hemorrhoids, dysentery, and cancer (Hartwell 1967–1971; Morton 1968). In Mexico, *M. phyllanthoides* Benth. has been employed as a remedy for scurvy and toothache (Standley 1922–1926), and *M. pseudocasearia* Reiss. has been used to treat dysentery (von Reis Altschul 1973). In East and South Africa, four or five species have been used medicinally as remedies for amoebic dysentery, diarrhea, colic, malaria, epilepsy, “madness,” colds and cancer (Harington 1969; Watt & Breyer-Brandwijk 1962). Anticancer activity has been identified in 21 of 31 *Maytenus* species screened. An ansamacrolid, maytansine (Kupchan et al. 1972), isolated from several African species, underwent clinical trials for cancer chemotherapy. This was discontinued because of toxicity; however, there is renewed interest in derivatives of maytansinoids, which are less toxic (Bander et al. 2003; Larson et al. 1999).

4) *Ficus* (Moraceae) is a very large pantropical genus, ˜800 species (Airy Shaw 1973), and many *Ficus* species are employed medicinally for a variety of purposes throughout the tropics. Seventeen species had shown antitumor activity; yet, none have yielded compounds for clinical studies.

5) *Fritillaria* (Liliaceae) has about 85 species distributed in temperate regions of the northern hemisphere (Airy Shaw 1973). In China, species of *Fritillaria* are used for a wide variety of ailments that include cancer (Hartwell 1967–1971; Steinmetz 1962). In Europe and the Himalayas of India, several species have been used against asthma and tuberculosis (Steinmetz 1962). The NCI has screened species from Southeast Asia, Europe, and the United States; none have shown activity.

6) *Thamnosma* (Rutaceae) is a small genus of ~8 species with a spotty distribution: southern Africa, Arabia, Socotra and the southwestern United States (Airy Shaw 1973). Africans have smoked plants of *T. africana* Engl. to relieve chest conditions (Watt & Breyer-Brandwijk 1962). A decoction of the stems of *T. montana* Torr. & Frem. has been used by Native American tribes of Nevada for colds and as a tonic (Train et al. 1957). Both species have been screened by the NCI; neither was active.

It is apparent from these six cases that an objective analysis is difficult. Subjectively, one might weigh small genera (*Brucea*) more than large genera (*Ficus*), similar medicinal uses as opposed to different uses—among different cultures, spotty distribution as seen for species of *Brucea* and *Thamnosma*, over continuous distribution as in the case of *Ficus*, and to the kinds of medicinal applications, especially cancer (e.g., *Brucea, Fritillaria, Maytenus*) as opposed to treating colds (e.g., *Thamnosma*). In *Ficus* it might appear significant that many species are used medicinally in folklore; however, of 174 species of *Ficus* screened by the NCI, only 9.8% were active, which is slightly less than that of the random screen (10.4%). In the case of *Fritillaria*, however, there is no correlation evident due to lack of activity.

PLANTS USED AGAINST CANCER

Hartwell (1967–1971) compiled a record of more than 3,000 species of plants reported in folklore for treating cancer and other symptomatic conditions such as warts and tumors. The vascular plants included 2,725 species representing 1,201 genera and 185 families. An estimated two-thirds of the species and 86% of the genera were screened for antitumor activity based on sampling of four families (Fabaceae, Liliaceae, Rubiaceae, Rutaceae; Spjut & Perdue 1976); it was not practical to compare all 2,725 species in Hartwell against the record of 20, 225 species screened, as was done for the NCI record of 2,127 active species of which 314 active species were found in Hartwell (1967–1971). Thus, an extrapolated result is provided, indicating 17.3% active species and 46.5% active genera for those screened and used against cancer (Table 2).

The percentages of active species and active genera found in Hartwell's (1967–1971) record of plants used against cancer are comparable to that seen in the general references on medicinal plants (Table 2). It should be realized that the greater the number of species included in a study like that of Hartwell (1967–1971), the greater the number of species that will be represented with relatively narrower ranges in geographical distribution; thus, the impact of the more thoroughly screened, widely distributed species, will be less. The 1.7 fold increase in active species and the 1.8 fold increase in active genera over the random screen in Hartwell's (1967–1971) plants used against cancer is perhaps a more realistic assessment of the relationship between plants used in medicinal folklore and those that have shown antitumor activity in the NCI screen.

RELATIONSHIPS BETWEEN ANTITUMOR ACTIVITY AND MEDICINAL PLANTS, TOXIC PLANTS, AND POISONOUS PLANTS

General Surveys.—The percentages of active species in the general surveys (Table 2) indicated that poisonous plants, including those with medicinal uses, appear more likely to show antitumor activity than medicinal plants in general.

Antitumor activity among the different therapeutic uses (Appendix I) were also evaluated for evidence of a correlation with plant toxicity; for example, a plant used as an emetic will likely induce a stronger physiological reaction, which could also be more harmful if taken in excess, than a plant taken as a stimulant. In a further review of the 62 medicinal applications in Quisumbing (1951, Appendix I), ten were selected as representative of two therapeutic use categories: (1) five that represent a weak-to-moderate effect—stimulant, alterative, diaphoretic, aperient, and laxative—and (2) five that appear to exert a moderate-to strong physiological effect—purgative, cathartic, abortifacient, anthelmintic, and emetic. A comparison of the percentages of the active species in the two categories (Table 3) show that the percentages of active species are all higher in the moderate-to-strong category, suggesting, therefore, that plants with medicinal uses associated with possible toxic side affects are more likely to show antitumor activity than medicinal plants in general.

Plants Used as Anthelmintics.—Plants used as anthelmintics—those taken internally by humans for helminth infestations such as tapeworm, roundworm, guinea worm, elephantiasis and shistosomiasis—are included in Table 3 as an example of a medicinal application where one may expect a moderate to strong reaction in using a plant product that results in the expulsion or destruction of parasitic worms. Thus, from this perspective, the 30% active species of the 150 species listed in Quisumbing (1951) would appear to have a closer correlation with antitumor activity when compared to the 22.4% active species for all medicinal plants in that same reference, besides the less frequent active species among those therapeutic uses that imply a weaker physiological effect (Table 2, 3, Appendix I).

Nevertheless, an independent review of the literature was conducted to determine which species are reported as anthelmintics—because of Perdue's observation on such plants in Ethiopia that were also active in the NCI screen (Spjut & Perdue 1976). Recorded were 668 species in 457 genera and 128 families of which 482 species in 433 genera were screened. The active species, and the bioassay(s) in which they were active, are indicated in Appendix IV; a complete list of plants used as anthelmintics for this study with references to each species is available at www.worldbotanical.com. Of those tested, 29.3% of the species and 52.2% of the genera were active.

The 29.3% active for anthelmintic species is nearly three times that of the

Table 3. Antitumor activity as related to potency of therapeutic effect: selected medicinal applications from Quisumbing (1951).

	Therapeutic Use	Percent Active Species
Weak to Moderate in Effect		
	Stimulant	14.8
	Alterative	23.4
	Diaphoretic	23.1
	Aperient	22.5
	Laxative	20.6
Moderate-To-Strong In Effect		
	Purgative	25.7
	Cathartic	25.9
	Abortifacient	27.9
	Anthelmintic	30.0
	Emetic	32.1

random screen, and is clearly higher than that seen in general references on medicinal plants (Table 1), in particular the 22.4% found for all Medicinal Plants of the Philippines (Quisumbing 1951). These data support the finding that medicinal plants with indication of toxic side effects, such as the case with anthelmintics, are more likely to show biological activity, than medicinal plants in general.

Plants Used as Fish and Arrow Poisons.—As with anthelmintics, we compiled separate lists for plants used as fish and arrow poisons that also included ordeal and homicidal poisons (Spjut & Perdue 1976). These data can be found at www.worldbotanical.com; in this publication, only the active species with reference to the tumor assay are listed, Appendix V, VI.

The results, presented in Table 4, show that the percent active species among those tested was 38.6% for plants used as fish poisons and 45.7% for plants used as arrow, homicidal and/or ordeal poisons.

Plants used as poisons are obviously more toxic than those generally used for medicinal purposes, which are not employed for lethal purposes, but still can be deadly if taken in excess. One might also expect fish poisons to be somewhat less harmful than arrow poisons, because fish poisons are used to capture fish for consumption in which the fish are often only stunned, whereas arrow poisons are intended to kill. Data on antitumor activity that correlates with these differences (Table 4) are seen as another example of a correlation between plant toxicity and antitumor activity.

The correlation that is evident between poisonous plants and antitumor activity led to further evaluation in regard to the type of tumor activity, because activity in poisonous plants was suspected as largely occurring in the KB Cell Culture, a bioassay that is sensitive to cytotoxic agents (Hartwell 1976).

Table 4. Antitumor activity in poisonous plants.

Poisons	Genera tested	%Genera active	Species tested	%Species tested active
Fish	158	65.8	145	38.6
Arrow, Ordeal, & Homicidal	60	75.0	70	45.7

Data in Appendix III, IV, V, and VI, which indicate tumor system of activity with their percentages of active species and genera, confirmed this. These data are summarized in Table 5. The percentages of KB active species were found to be 6.7% for medicinal plants in The Philippines (Quisumbing 1951), 11.4% for anthelmintics, 20.7% for fish poisons, and 30.0% for arrow poisons, in contrast, for example, to activity in the WA assay that was 8.5%, 8.3%, 8.3%, and 7.1%, respectively. Clearly, there is correlation between antitumor activity and plant toxicity based on the KB assay and folklore data.

DISCUSSION AND CONCLUSIONS

Selective approaches to screening plants for antitumor activity have been conducted previously by taxonomy (Belkin & Fitzgerald 1953b), by taxonomy and medicinal use such as anti-malarial plants in the Amaryllidaceae (Fitzgerald et al.1958), and by specific medicinal or poisonous applications such as plants used as cathartics, diuretics and pesticides (Belkin et al.1952a; Belkin & Fitzgerald 1952b, 1953c). These and other similar experimental studies were limited to screening against Sarcoma 37. It is interesting to note that in the case with plants used as cathartics, nearly half of the species tested were active. This might be compared to another study by the same authors using the same bioassay in screening "miscellaneous plants" in which they found only 14% active (Belkin & Fitzgerald 1953a); a comparison that is analogous to the "random screen" in the present study.

One important discovery relating to these investigations came from the medicinal use of a root extract of May-apple, *Podophyllum peltatum* L. (Berberidaceae), known as "podophyllin." Hartwell (1960, 1976) indicated he had investigated podophyllin and samples of May-apple because of their use against cancer by practitioners in the United States and by the Penobscot Indians of Maine. Records for such use were found to date back to 1849; additionally, in Louisiana May-apple was used to treat venereal warts or as an "escharotic," dating back to 1845 (Hartwell 1960). Podophyllotoxin and two peltatins were isolated and found to be highly active in Sarcoma 37 (Hartwell & Shear 1947). Hartwell (1976) commented that the development of podophyllotoxin as a potential drug was complicated by toxicity, but also indicated "there is reason to hope that chemical derivatives may be developed which with will eliminate this disadvantage." "Etoposide" and "teniposide" are semi-synthetic derivatives

TABLE 5. Comparison of general and specific folk uses of plants with percentages of active species according to antitumor assay.

Folklore Use	KB	PS	WA	LL	SA
Medicinal Uses in General (Quisumbing 1951)	6.7	8.2	8.5	1.1	3.5
Anthelmintics	11.4	9.5	8.3	2.1	5.6
Fish Poisons	20.7	9.7	8.3	4.1	8.9
Arrow & Homicidal Poisons	30.0	18.6	7.1	1.4	1.4

currently in use as drugs to treat small-cell lung cancers, testicular cancer, carcinoma, and lymphomas (Moraes et al. 2002). Their development, known also as "VM-26" and "VP-213," came from 4'demethylpodophyllotoxin that was found in a Himalayan species, *Podophyllum hexandrum* Royle (Hartwell 1976).

Advocates of promoting folklore as the tool for discovery of biologically active compounds must recognize that there are a large number of widely distributed species that are frequently reported for use in medicines, and have already been chemically investigated. Examples of these, which have shown antitumor activity, are candlenut (*Aleurites molucanna* [L.] Willd.), custard apples (*Annona reticulata* L., *A. squamosa* L.), star fruit (*Averrhoa carambola* L.), cabbage (*Brassica olearacea*), paradise-flower (*Caesalpinia pulcherrima* [L.] Sw.), Indian laurel (*Calophyllum inophyllum* L.), safflower (*Carthamus tinctoris* L.), Madagascar periwinkle (*Catharanthus roseus* [L.] G. Don), coconut (*Cocos nucifera* L.), coffee (*Coffea arabica* L.), taro (*Colocasia esculenta* [L.] Schott), sunflower (*Helianthus annuus* L.), Indian heliotrope (*Heliotropium indicum* L.), beach morning glory (*Ipomoea pes capre* [L.] R. Br.), mango (*Mangifera indica* L.), China-berry (*Melia azedarach* L.), oleander (*Nerium oleander* L.), avocado (*Persea americana* Mill.), peach (*Prunus persica* L.), pomegranate (*Punica granatum* L.), bracken fern (*Pteridium aquilinum* [L.] Kuhn), mangrove (*Rhizophora mangle* L.), castor bean (*Ricinus communis* L.), nightshade (*Solanum nigrum* L.), teak (*Tectona grandis* L. f.), yellow oleander (*Thevetia peruviana* [Pers.] K. Schum.) (Tables 1 and 2 in Spjut 1985; Buckingham 1993–2005; USDA 1980), and most other species in Quisumbing (1951) that were found to be active in the NCI screen (Appendix III).

Uses for many of these active species date back to the early domestication of plants (Zohary & Spiegel-Roy 1975), a time when there was lack of concern for intellectual property rights or ownership that, for the most part, has evolved only since the last decade (Lesser 1997). Hartwell (1960) noted that cancer remedies can be found as early as 1500 B.C. in the Ebers papyrus of Egypt, that "plant remedies for cancer are described in ancient Chinese and Hindu medical writings," that "the record continues unabated through the Graeco-Roman period and the Christian and Arabian-Middle Ages to modern times," and that "the roster of the hundreds of medical, pharmacological and botanical works recommending herbal treatments for cancer reads like a summary of the great names in the history of medicine." I have further suggested that the various uses for many of the widespread species (e.g., Appendix III) are the result of cultural diffusion; thus, any indigenous ownership claim(s) for a particular use for a particular plant remedy cannot be easily substantiated. Cultural diffusion may also explain many medicinal uses for a species within a relatively narrow geographic area, as evident with plants used by Indian Tribes of Nevada (Train et al. 1957).

Although the occurrence of anticancer activity among plants used as folklore remedies, when compared with that for plants tested at random, suggests that folklore could be a useful tool for predicting sources of anticancer activity, there are also costs that have to be taken into consideration in trying to selectively pursue such plants (Hartwell 1976). A field team can randomly collect as many as 60 (-100) samples in a day from 10–30 species (Perdue & Hartwell 1969), whereas a more selective approach, as I have experienced with recollections of active plants, would yield only 1–2 samples per day. Thus, a random field collection could generate 1–3 new active leads each day, whereas it would require 2–3 days to obtain a similar result in a selective approach. It might be added that this folklore study was based on reports in literature. Obtaining such information directly in the field would cost even more. On the other hand, it is also evident from the data presented in this study that many of the alleged medicinal species would be collected in a random (biodiversity prospecting) screening program—because of their widespread occurrence. Furthermore, a biodiversity (random) type of approach undertaken systematically is not only less expensive, but will also yield novel compounds from plants not reported in folk literature (e.g., camptothecin from *Camptotheca acuminata*, Perdue et al. 1970), and provide a scientific foundation for identifying chemotaxonomic, ecological and other relationships of pharmacological value. Random collections can also include medicinal and/or poisonous plants in the collection strategy, the focus of which might be on genera that are clearly indigenous or endemic to a collection area, and would likely yield novel compounds.

The NCI screen involves more than just identifying leads such as the 2,127 active species reviewed in this study; other steps in drug development include isolating and identifying the active compounds, pharmacological evaluation of the active compounds, and clinical evaluation for treating cancer in three phases (Goldin et al. 1974). Criteria for clinical consideration during the 1970s had included activity in a panel of tumor systems such as the L-1210 Leukemia, KB Cell Culture, P-388 Leukemia, new Lewis Lung tumor, and B16 Melanoma (Goldin et al. 1974; Hartwell 1976). Compounds from only ~1% of the 2,127 active species had reached clinical evaluation—Table 1 in Hartwell (1976). Seventeen of 21 genera in Hartwell (1976, Table 1) were identified as having less of a taxonomic relationship to each other among the compounds of clinical interest (*Acer, Brucea, Camptotheca, Caesalpinia, Cephaelis, Cephalotaxus, Colchicum, Fagara, Heliotropium, Holacantha, Maytenus, Ochrosia, Stereospermum, Taxus, Thalictrum, Tripterygium, Tylophora*). With exception to *Camptotheca* and *Holacantha*, these genera were found to have species reported in the literature as poisonous. *Holacantha*, a genus of two species, has a very limited distribution in southwestern North America, thus, the lack of medicinal reports for this genus is not unexpected, although a closely related genus, *Castela*, includes species used in folk medicine (Standley 1922–1926). Similarly, *Camptotheca*, a monotypic genus of limited distribution in China, lacks reports on medicinal use except for one general reference on a herbarium specimen "drug plant" *F. A. McClure* 6546 at AA (Perdue et al. 1970). Of the remaining genera, all except *Cephalotaxus, Ochrosia, Tripterygium* and *Tylophora* have species reportedly used against cancer or cancer like symptoms (Hartwell 1967–1971).

It might be noted that nearly all active compounds in these plants were discovered from screening in the KB Cell Culture (Hartwell 1976). The correlation between anticancer activity and plant use indicative of toxicity might indicate that future screening of plant extracts could place more emphasis on bioassays that can detect cytotoxicity, such as the KB assay (Perdue 1982; Spjut & Perdue 1976); however, KB activity alone will not lead to development of a new anticancer drug, as evident for plants used as arrow poisons, in which 21% of the active species are strictly KB actives. Many of these plant poisons belong to genera in the Apocynaceae and Asclepiadaceae whose activity is largely due to cardenolides, steroid lactones that have not demonstrated much in vivo activity (Hartwell 1976, Table 15). Poisonous plants in two other families, Cucurbitaceae and Datiscaceae, have yielded only cucurbitacins, triterpenes that are toxic without in vivo activity (Hartwell 1976, Table 10; Cassady & Suffness 1980). Additionally, many other species of poisonous plants are in the Euphorbiaceae in which P-388 Leukemia activity was more frequent, but the compounds were largely phorbol esters (Suffness & Douros 1979). Such compounds are known to be tumor-promoting (Farnsworth et al. 1976), while also inactive in other antitumor assays (Suffness & Douros 1979; Cassady & Suffness 1980); however, one non-tumor promoting phorbol ester was found to have potential for treating AIDS (Gustafson et al. 1992).

Nevertheless, the extent to which plant genera include species reported in folklore to be poisonous, and also used in medicine, especially against cancer, certainly deserve further study. The potential for discovery of novel chemotherapeutic agents would appear greater when geographical evidence indicates similar uses in different cultures as earlier described for *Brucea* and *Maytenus*, while Hartwell (1967–1971) also mentioned that *Heliotropium indicum* and other species of this genus have been reported in folklore for treating cancer in scattered regions of the world. Thus, the relationship between anticancer activity and folklore appears more meaningful and less coincidental when there is this kind of support from taxonomic and geographic data. Future screening might focus on genera that have yet to show activity. A good example is *Fritillaria*, a genus reportedly rich in alkaloids with highly toxic species that are used for medicinal purposes, including cancer (Steinmetz 1962).

One of the most useful drugs in the chemotherapy of acute childhood leukemia (and other cancers), is vincristine from the periwinkle, *Catharanthus roseus* (L.) G. Don., one of the many widely distributed species used in folk medicine. This discovery resulted not from a search for antitumor activity, but was incidental to a search for compounds with hypoglycemic activity. The plant was under investigation in two different laboratories because of its folk use as a remedy for diabetes (Carter 1976). These facts, and the apparent correlation in this paper between various uses of medicinal plants and antitumor activity, suggest that antitumor activity should be looked upon as just one kind of biological activity that probably correlates well with a broad spectrum of other kinds of biological activity.

There is a growing interest in natural products as food additives and as alternative medicines, partly promoted by an awareness and need for biodegradable natural products to replace synthetic chemical compounds that increasingly contaminate our environment (Jacobson 1989). Where new kinds of biological activity are sought, such screening programs can benefit not only by taking into consideration folkloric uses of plants, but also the massive amount of data generated by the NCI random screen, such as the many novel antitumor agents that have been reported. Therefore, one would hope that the NCI continue screening of natural products. The byproducts of this program are invaluable as many compounds, undoubtedly, will find use in other therapies if they cannot be used to treat cancer. A case in point is recollections of antitumor active plants from which small amounts were funneled to Martin Jacobson at another ARS laboratory in Beltsville, MD who apparently found good insecticidal activity in many of the NCI active plants, e.g., *Arnica chamissonis* Less. ssp. *foliosa* (Nutt.) Maquire (USDA ARS Medicinal Plant Resources correspondence; data recorded for requests of recollections by active species and geographical location; www.worldbotanical.com; see also Jacobson 1989).

Finally, there is one aspect of the folk medicine that cannot be compared with the NCI's random method of searching for potential anticancer drugs. In folk medicine, prescriptions may include a combination of two or more plants, and/or other substances. This is especially common in Chinese medicine (American Herbal Pharmacology Delegation 1975). The separate ingredients of a prescription may not show activity, but one may speculate on whether there is a synergistic effect with combined materials as often seen in drug combination therapies.

APPENDIX III.

ANTITUMOR ACTIVE SPECIES IN QUISUMBING (1951) MEDICINAL PLANTS OF THE PHILIPPINES

Species	Tumors						
	KB	PS	WA	LL	SA	CA	Other
Abrus precatorius L.	1	1					
Albizia procera (Roxb.) Benth.			1				
Aleurites molucanna (L.) Willd.		1					
Allamanda cathartica L.	1						
Alstonia scholaris (L.) R. Br.		1					
Amorphophallus paenoiifolius (Dennst.) Nicolson			1				
Anacardium occidentale L.			1				
Anamirta cocculus Wight & Arn.		1					
Anaxagorea luzonensis A. Gray		1					
Annona muricata L.	1						
Annona reticulata L.	1	1					
Annona squamosa L.	1						
Antiaris toxicaria (Rumph. ex Pers.) Lesch.	1	1					
Arcangelisia flava (L.) Merr.		1					
Argemone mexicana L.	1						
Asclepias curassavica L.	1			1			
Averrhoa bilimbi L.		1					
Averrhoa carambola L.			1				

APPENDIX III. (CONTINUED)

Species	Tumors						
	KB	PS	WA	LL	SA	CA	Other
Bacopa monniera (L.) Wettst.	1		1				
Barringtonia asiatica (L.) Kurz					1		
Bauhinia malabarica Roxb.			1				
Boerhavia diffusa L.			1	1			
Brassica olearacea L.			1				
Bryophyllum pinnatum Kurz	1						
Caesalpinia pulcherrima (L.) Sw.			1		1		D1
Calotropis gigantea (L.) Dryander ex Aiton f.	1		1				
Calophyllum inophyllum L.		1			1		
Canna indica L.		1					
Capsicum frutescens L.					1		
Cardiospermum halicababum L.			1				
Carthamus tinctorius L.		1				1	
Cassia alata L.					1		
Cassia occidentalis L.			1				
Cassia siamea Lam.		1					
Casuarina equisetifolia L.	1						
Catharanthus roseus (L.) G. Don		1					
Ceiba pentandra (L.) Gaertner				1	1		
Celastrus paniculata Willd.	1						
Celosia argentea L.			1		1		
Centella asiatica (L.) Urban			1				
Cerbera manghas L.	1						
Cestrum nocturnum L.	1						
Clausena excavate Burm. f.		1					
Clerodenrdon fragans R. Br.			1				
Cocos nucifera L.					1		
Coffea arabica L.			1				
Coix lachryma-jobi		1					
Coleus blumei Benth.		1					
Colocasia esculenta (L.) Schott.			1				
Corchorus olitorius L.	1						
Cordia dichotoma Forst.			1				
Crateva religiosa Forst. f.			1				
Crescentia cujete L. (Roxb.) R. Br. ex Lindley			1				
Cryptostegia grandiflora	1						
Cyperus rotundus L.					1		
Datura metel L.			1				
Derris trifoliate Lour.	1						
Diospyros discolor Willd.		1	1				
Dodonaea viscose (L.) Jacq.					1		
Dregea volubilis (L.f.) Benth. ex Hook. f.			1				
Duranta repens L.		1					

APPENDIX III. (CONTINUED)

Species	**Tumors**						
	KB	**PS**	**WA**	**LL**	**SA**	**CA**	**Other**
Elephantopus scaber L.			1		1		
Elephantopus mollis Kunth	1	1					
Entada phaseoloides (L.) Merr.			1				
Erythrina variegata L.		1	1				
Erythroxylum coca Lam.		1					
Flagellaria indica L.			1				
Gloriosa superba L.			1				
Grangea maderaspatana Poir.			1				
Graptophyllum pictum Griff.			1				
Hedychium coronarium Koenig.		1					
Helianthus annuus L.		1					
Hernandia ovigera L.	1						
Homonoia riparia Lour.			1				
Hyptis suaveolens (L.) Poit.	1	1					
Ipomoea pes-capre L.		1	1				
Ixora coccinea L.		1					
Jatropha curcas L.		1					
Jatropha gossypifolia L.		1			1		
Jussiaea erecta L.	1						
Justicia procumbens L.		1					
Kalanchoe laciniata (L.) DC.	1						
Lagerstroemia indica L.					1		
Lansium domesticum Correa			1				
Lantana camara L.			1				
Leucaena glauca L.		1					
Lonicera japonicum Thunb.					1		
Lunasia amara Blanco	1						
Mallotus philippensis (Lam.) Muell.-Arg.					1		
Mangifera indica L.					1		
Manilkara zapota (L.) D. Royle	1						
Melia azederach L.	1		1	1			
Melia dubia Cav.	1						
Merremia umbellata (L.) Hall. f.		1					
Mimusops elengi L.			1				
Mirabilis jalapa L.			1	1	1		
Morus nigra L.			1				
Muntingia calabina L.	1						
Nerium indicum Mill.	1		1		1	1	
Nopalea cochinellifera (L.) Salm-Dyck		1					
Oldenlandia corymbosa L.					1		
Paspalum scrobiculatum L.		1					
Passiflora foetida L.		1					
Pedilanthus tithymaloides (L.) Poit.	1						

APPENDIX III. (CONTINUED)

Species	**Tumors**						
	KB	**PS**	**WA**	**LL**	**SA**	**CA**	**Other**
Persea americana Mill.		1					
Phragmites australis (Cav.) Trin. ex Steudel			1				
Physalis peruviana L.	1	1					
Pilea microphylla (L.) Liebm.		1					
Piper umbellatum L.	1						
Pithecellobium saman (Jacq.) Benth.		1					
Punica granatum L.	1						
Quassia amara L.	1	1					
Quisqualis indica L.			1				
Rhinacanthus nasutus Kurz	1						
Ricinus communis L.	1	1	1				
Rubia cordifolia L.			1				
Securinega virosa (Roxb. ex Willd.) Baillon			1				
Semecarpus cuneiformis Blanco	1		1	1			LE
Senecio scandens Buch. Ham.		1					
Setaria palmifolia (Koenig) Stapf		1					
Sida cordifolia L.		1					
Solanum nigrum L.			1	1	1		
Solanum verbascifolium L.					1		
Sonneratia acida L. f.			1				
Sphaeranthus africanus L.	1						
Streblus asper Lour.	1	1	1				
Tabernaemontana pandacaqui Lam.		1					
Tamarindus indicus L.			1				
Tectona grandis L.		1					
Tephrosia purpurea (L.) Pers.			1				
Terminalia catappa L.	1						
Theobroma cacao L.					1	1	
Thevetia peruviana (Pers.) Schumann	1	1					
Toddalia asiatica (L.) Lam.	1						
Toona calantas Merr. & Rolfe	1						
Trema orientalis (L.) Blume			1				
Trianthema portulacastrum L.			1				
Vernonia cinerea (L.) Less.			1				
Voacanga globosa (Blanco) Merr.		1					
Waltheria americana L.		1

BOOK NOTICES

Timber Press

JAMES CULLEN (text) with photographs by DEBBIE WHITE and FRIEDA CHRISTIE. 2005. **Hardy Rhododendron Species: A guide to Identification.** (ISBN 0-88192-723-6, hbk.). Published in association with the Royal Botanic Garden Edinburgh and Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $49.95, 496 pp., color photos, 7" × 9".

Publisher's comments.—"For the enthusiastic amateur or experienced rhododendron grower, this landmark reference provides the keys to the accurate identification of the nearly 300 rhododendron species widely in cultivation. An extensive introduction places the work in context as it examines the history of *Rhododendron* classification and gives a full survey of plant structures throughout the many species. Species are listed in systematic order, so that similar species occur close to each other in the text. These are fully described, including complete citations of previous references and notes on the occurrence of wild-origin specimens in cultivation. Beautiful photographs include close-up shots of flower and leaf, microscope images of leaf surfaces, and easy-to-use diagnostic keys, making this the indisputable volume for plant identification. A milestone in the identification of rhododendrons, this will become an essential reference for botanists, nurserymen, and enthusiasts.

Each taxonomic entry includes a description of one or more of the following: Synonymy, Illustration, Habit, Leaves, Vegetative Buds, Inflorescence Buds, Calyx, Corolla, Nectary, Stamens, Pollen, Ovary, Style, Stigma, Fruit, Seeds, Distribution, Flowering, Hardiness Zone, and additional notes.

Taxonomic keys are provided for subgenera, sections, and subsections.

PIET OUDOLF and NOEL KINGSBURY. 2005. **Timber Press Pocket Guide to Bulbs.** (ISBN 0-88192-740-6, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $34.95, 175 pp., color photos, 9 1/2" × 11 1/2".

Publisher comments.—"This is a must-have book for designers, urban planners, landscape architects, and avid gardeners. The authors offer a planting philosophy as well as concrete advice; for instance, questions of scale and movement such as positioning entrances and paths, creating connective layouts, using plants as barriers and as conduits, and maintaining the designed space as plants grow."

ETHNOBOTANICAL REPORT FROM MANGROVES OF PICHAVARAM, TAMIL NADU STATE, INDIA

ABSTRACT

Ethnobotany deals with the study of the natural and traditional interrelationships between man and plants. Mangroves are one of the primary features of coastal areas and play a significant role in coastal development. Mangrove areas are economically exploited, especially for timber and fishery products. A comprehensive knowledge about other aspects, such as active substances obtained from mangroves, is less freely available. This paper reviews the utilization of the mangroves as source of medicinal products for the Pichavaram coastal people. A floristic survey was undertaken and 11 ethnomedicinal plant species belonging to 8 families were recorded from the Pichavaram mangroves. A list of plant species along with the plant part/s used and their mode of application reported to be efficacious for different ailments is provided

RESUMEN

La Etnobotánica trata del estudio de las interrelaciones naturales y tradicionales entre el hombre y las plantas. Los manglares son una de las características primarias de las áreas costeras y juegan un papel importante en el desarrollo costero. Las áreas de manglar son explotadas económicamente, especialmente para madera y productos pesqueros. Un conocimiento exhaustivo de otros aspectos, tales como principios activos que se obtienen de los manglares, está menos disponible. Este artículo revisa el uso de los manglares como fuente de productos medicinales por los habitantes costeros de Pichavaram. Se realizó un estudio florístico y se encontraron 11 especies vegetales etnomedicinales de 8 familias en los manglares de Pichavaram. Se aporta una lista de especies vegetales junto con la parte o partes usadas y su modo de uso para que sean eficaces en diferentes enfermedades.

INTRODUCTION

Mangroves are assemblages of trees and shrubs that grow in the intertidal region of tropical and subtropical coastlines, in areas where river water mixes with sea water. Mangroves have two components, mangrove forests and their

SIDA 21(4): 2243 – 2248. 2005

associated water bodies. A group of woody trees and shrub that can grow well in saline water and logged condition constitute the forest component (Selvam & Karunakaran 2004). Pichavaram is in the North-East coastal part of Tamil Nadu State and lies between Lat.11° 27' N; Long. 79° 47' E.

The Pichavaram mangrove wetland is located in the northern extremity of the Cauvery delta, near the mouth of the Coleroon River. Its total area is about 1,350 ha, with its many small islands being colonized by thirteen true mangrove species. Remote sensing data indicates that nearly 54% of the mangrove forest of Pichavaram (total forested area 700 ha, excluding water bodies, sand dunes etc.) was in a degraded state in 1986. Analysis of the remote sensing data of 1996 showed that the mangrove forest cover has increased by about 60 ha compared to the area in 1987, which is mainly due to the restoration efforts being undertaken collaboratively by the Tamil Nadu Forest Department and M.S. Swaminathan Research Foundation along with the participation of the local communities. Pichavaram mangrove receives fresh water mostly during the northeast monsoon season from October to November. It is reported that 13 species are present in the mangrove wetlands, Tamilnadu; these include two species of *Rhizophora* in Pichavaram, which are regarded as endangered species, a fact that underlines the importance of the Pichavaram mangrove from a biodiversity stand point.

Currently there is an increasing desire to unravel the centuries old secrets of traditional medicines. In India, ethnobotanical studies with a good scientific base have appeared in last 1–5 decades (Chopra et al. 1956; Jain 1963, 1965; Jain & Borthakur 1980; Bhargara 1981; Yadav & Patil 2001).

MATERIALS AND METHODS

An ethnobotanical survey of the forest people of Pichavaram mangrove was undertaken during the 2001–2002. Through repeated interactions and participatory rural appraisal (PRA), details on the ethnobotany of the plants used by the folk population were gathered with villagers using the methods described by Jain (1983). According to Jain (1987) samples of plants were collected, identified and voucher specimens were deposited in the Department of Botany, Faculty of Science, Annamalai University, Annamalainagar, Tamilnadu. The collected plants were identified using the flora of the Presidency of Madras (Gamble & Fischer 1915–1935) This paper describes the most important medicinally used plants.

RESULTS

The traditional knowledge system in Tamilnadu State is fast eroding. There is an urgent need to record all ethnobotanical information among the diverse ethnic communities before the traditional culture is completely lost. As of result of the present study the ethnobotanical use of 11 plant species belonging to 8 families have been reported from the Pichavaram mangrove area. A range of preparations are used to treat diseases. The most popular medicinal preparations are plant extract, decoction, paste and juice. Information on botanical name, herbarium number, local name, family, diseases cured/uses, parts used and mode of application are given in the Table 1.

DISCUSSION AND CONCLUSION

There is an increasing demand for the production of healthcare medicines and cosmetic items from plant origin based on the ancient knowledge in folk remedies. Plant sources are being identified for further investigation for their pharmacological properties and efforts are also being made to investigate the activities of isolated individual constituents.

Eleven species of mangroves were identified as medicinally important for the treatment of snakebite, skin diseases, dysentery, urinary disorders as well as for birth control and as blood purifiers.

Communities (Irulars and Meenavars) living close to and interacting with the Pichavaram mangrove wetlands have gained a unique cognitive understanding of the medicinal values of the plants within the mangroves. Experience has led to a rich knowledge system that is reflected in the native classifications of mangrove wetlands.

The role of ethnobotanical studies is of crucial importance as some miraculous medicines for incurable diseases are known to the local communities. As knowledge acquired through the ages is usually passed on from generation to generation, it is necessary to popularize the identity and utility of these medicinal plants.

Management systems are losing their value because of various factors. Any assistance to protect these traditional systems will win the confidence of the local people; this in turn will be the first step toward the success of community-based mangrove conservation and management. The collection and documentation of traditional knowledge on ethnomedicines is important for finding new, effective safe drugs for a range of ailments. However, to give more support to the above findings, further investigation is needed for the isolation of the active principles and for the pharmacological evaluation of different medicinal plant species.

The estimation of the number of endangered medicinal plants is rising day by day (Jain 1992). Medicinal plants are threatened due to over exploitation, shifting cultivation, deformation and environmental pollution (Karuppusamy et al. 2002). The conservation of medicinal plants not only saves local lives but also improves the socio economic condition of the people where the plants exist. The following strategies have been suggested for the conservation of medicinal plants.

Table 1. Ethnobotanical report from mangroves of Pichavaram, Tamil Nadu State, India.

Latin Name/Family (Voucher Specimen)	**Local Name**	**Disease Cured/Uses**	**Parts Used**	**Mode of Application**
Acanthus ilicifolius L., Acanthaceae (*AUB 102*)	Kazhimulli	Snakebite	Fruits	Crushed fruits are made into a dressing and applied as a dressing to the snake bite.
		Kidney stones	Whole plant	The whole plant is boiled in water and the patient drinks the final solution, half of a glass each time until the signs and symptoms of the kidney stones disappear.
		Skin diseases, small pox, health promotion, detoxification and ulcer	Whole plant	A whole plant paste is applied to the affected body for skin diseases. The juice is orally given for other diseases.
Avicennia alba Blume, Avicenniaceae (*AUB 108*)	Vellaikandal	Birth control	Resin	Resinous substances are mixed with water and given orally.
Avicennia officinalis L., Avicenniaceae (*AUB 110*)	Narikandal	Bone pain, urinary disorders, bronchial asthma, stomach disorders and detoxification	Leaves	The leaves are boiled in water and the extract is given orally
Bruguiera cylindrica (L.) Blume, Rhizophoraceae (*AUB 532*)	Pannukkuchi	Tumor inhibitors, constipation	Leaves	Leaves contain alkaloids. A leaf paste is applied to the tumor.
			Whole plant	The whole plant is boiled in water and the solution is drunk twice daily after meals
Clerodendron inerme Gaertn., Verbenaceae (*AUB 428*)	Peenarisangu	Pain, jaundice,	Leaves	A leaf paste is used.
		washing dishes	Sap of leaves	Leaf sap is used
		malaria, infected wounds, anti-inflammation and itching skin	Leaf extract	Leaf extract and paste is used.

TABLE 1. (continued)

Latin Name/Family (Voucher Specimen)	**Local Name**	**Disease Cured/Uses**	**Parts Used**	**Mode of Application**
Excoecaria agallocha L., Euphorbiaceae (*AUB 483*)	Thillai	Toothache	Latex	A latex extracted from leaves and bark is applied to the tooth.
		Anti-inflammation	Roots	Fresh root material is used.
Ipomoea pes-caprae (L.) Sweet, Convolvulaceae (*AUB 325*)	Adappankodi or Kuthiraikulambu	Wandering and swelling	Whole plant	A whole plant extract is used.
		Skin diseases	Leaves	A leaf paste is used.
		Fatigue	Seeds	Crushed seeds are used.
Rhizophora mucronata Lam., Rhizophoraceae (*AUB 372*)	Kanthal	Diarrhea, nausea and vomiting	Bark	A bark extract is given orally.
Rhizophora apiculata Blume, Rhizophoraceae (*AUB 333*)	Kandal	Diarrhea, vomiting, ameobiasis and stop bleeding	Bark	A bark extract is given orally.
Salicornia brachiata Roxb., Chenopodiaceae (*AUB 238*)	Kozhikali or Seethavavazham	Itches	Whole plant ash	The plant ash is applied to the skin.
Xylocarpus granatum K.D. Koenig Meliaceae (*AUB 267*)	Somundri	Dysentery	Bark	A bark extract is used.
		Illumination of hair	Oil	Oil extracted from the seeds is applied to the hair.
		Diarrhea and cholera	Bark	A bark decoction is given orally.

a) Control over exploitation

b) Establishment of mangroves

c) Cultivation of rare and endangered medicinal species

d) Awareness creation of the utility and conservation of medicinal plants to local communities

ACKNOWLEDGMENT

The authors wish to express their gratitude to K.P. Chellappan, Dean, Faculty of Science (retired) and R. Panneerselvam, Professor and Head, Dept. of Botany, Annamalai University, for their encouragement and help in various ways. Two anonymous reviewers greatly improved the manuscript.

PINGUICULA VULGARIS (LENTIBULARIACEAE) AND ITS USES IN NORWAY

Torbjørn Alm

Department of Botany
Tromsø Museum
University of Tromsø
N-9037 Tromsø, NORWAY

ABSTRACT

Pinguicula vulgaris is a common species in Norway, and well known in folk tradition, not least for its reputed use to curdle milk. Most vernacular names recorded so far, e.g. the widespread *tettegras* or *tettegress* ("rennet grass" or "thickening grass") reflect this use. The fat leaves have also found some uses in folk medicine, e.g. to treat wounds and ringworms, and in folk veterinary medicine, mainly to treat sore teat. There are also a few records of *P. vulgaris* being used as an apotropaic, in magic, and in children's games.

NORWEGIAN SUMMARY/NORSK SAMMENDRAG

Pinguicula vulgaris er vanlig i Norge, og godt kjent i folketradisjonen, ikke minst for sin virkning som tette i melk. De fleste folkelige navn på arten gjenspeiler denne egenskapen, f.eks. det vidt utbredte *tettegras* eller *tettegress*. Bladene har også funnet en viss anvendelse i folkemedisinen, bl.a. til å behandle sår og ringorm, og i folkelig veterinærmedisin, særlig som en kur for såre spener. I noen få tilfeller har *P. vulgaris* også tjent som verneråd, i magi og i barnelek.

INTRODUCTION

Of the three *Pinguicula* species found in Norway, *P. vulgaris* L. is by far the most widespread. It is found almost throughout the country, and in many different environments, from near sea level to 1570 m a.s.l. in interior southern Norway (Elven 1994:559). *P. alpina* L. is more demanding in terms of habitats, preferring calcareous substrates, and the tiny *P. villosa* L. is restricted to *Sphagnum* hummocks on oligotrophic mires in interior SE Norway and northeastern North Norway (Alm 2000).

All three species share the typical characteristics of the genus *Pinguicula*: a rosette of insect-trapping leaves, secreting a viscous, enzymatic fluid in the presence of small insects or other prey (Casper 1966; Heide 1912; Heslop-Harrison & Heslop-Harrison 1980, 1981; Heslop-Harrison & Knox 1971; Legendre 2000; Warming 1886). *P. vulgaris* belongs to the subgenus *Pinguicula* (Casper 1966; Legendre 2000; cf. Jobson et al. 2003). Christen (1961) studied the species from a pharmacological point of view.

In Scandinavian folk tradition, the leaves of *Pinguicula vulgaris* have been used as *tettegress*, "thickening grass" or "rennet grass," to treat or preserve milk, but how this was done, the characteristics of the product, and the mechanism

SIDA 21(4): 2249 – 2274. 2005

behind are disputed (Brøndegaard 1971). The use for dairy products in particular has attracted the attention of numerous authors, e.g. Bergsåker (1982), Brøndegaard (1951, 1971), Evjen (1986), Forsén (1966), Gisler (1749), Gunnerus (1774), Jæger-Lejrvik (1959), Olsen-Sopp (1912), Ränk (1960, 1971), and Weisæth (1990). Høeg (1974) provides much information on the ethnobotany of *P. vulgaris* in Norway. Larsson (1988) carried out an extensive survey of vernacular names in the Nordic countries (see also comments in Hansson 1990). Wix (1995, 1996) provided some notes on traditional uses in Scandinavia, but the language barrier kept him from checking more than a few references.

SCOPE AND SOURCES

This paper aims at a comprehensive review of ethnobotanical traditions related to *Pinguicula vulgaris* in Norway. It should be noted that *P. alpina* may also have served as *tettegress*, although all sources that identify the species (and not only the genus) mention only *P. vulgaris* (e.g. Bergsåker 1982; Bjørndal 1949; Brøndegaard 1971; Gunnerus 1774; Høeg 1974; Kirkevoll 1940; Sortdal 1981; Tonning 1773), or note that the plant used had blue flowers (e.g. Klonteig 2000 and seven letters in NFS Manum). Several voucher specimens confirm the identification as *P. vulgaris*, e.g. in the18th century herbarium of J.E. Gunnerus (in TRH), the 1837-39 herbarium of the linguist Ivar Aasen (Lid 1941), and some vouchers in TROM.

Throughout Norway, *P. vulgaris* or *tettegras/tettegress* is well known in folk tradition. Numerous authors mention its use in milk. Much useful information is found in the vast collection of Norwegian ethnobotanical data assembled by Ove Arbo Høeg in the period 1925 to 1973. However, his large volume (Høeg 1974) makes little use of previous publications.

In addition to data from about seventy publications providing data on Norwegian traditions, some archival data have been incorporated here, mainly from NEG (Norsk etnologisk gransking/Norwegian ethnological survey), NFS (Norsk folkeminnesamling/Norwegian folklore collection) and NOS (Norsk ordbok, seddelarkivet/Norwegian dictionary, card archive). Furthermore, some data have been excerpted from my own ethnobotanical records, mainly from North Norway; these are referred to as EBATA + year and record number. Informants are not identified here; transcripts and some recordings of the original interviews are stored at the Department of Botany, Tromsø Museum (TROM). Unless otherwise stated, all citations have been translated from Norwegian.

Vernacular names

No record of any Norse name for *Pinguicula vulgaris* seems to exist; the species is not mentioned by Heizmann (1993). The oldest surviving record, *Marie sko* ("Mary's shoe"), was made at Bergen in 1599, and is found in the diary of Sivert Grubbe (Rørdam 1873). It is an unusual name (see Table 1), although a couple of other vernacular names referring to the Virgin Mary are known. They are obviously younger than the Christianization of Norway, and must have been coined after AD 1000.

Most Norwegian vernacular names for *Pinguicula vulgaris* reflect its use for making *tettemelk* or "thickened milk" (Fig. 1). *Tette* may be translated as "rennet" (otherwise known as *kjæse* or *løpe* in Norwegian), but the etymological meaning or root is "(make) thick, thight, compact" (Bjorvand & Lindeman 2000; Torp 1919). A straightforward *tettegras* or *tettegress* ("rennet grass" or "thickening grass"), with some dialectal variations, predominates over large areas (Table 1). Exceptionally, it may also occur in place-names, e.g. *Tettgrasmyra* in Trysil (Kvernbekk 1979:64). *Kjæsegras/gress* ("rennet grass") reflects similar use. Several names on *melk-, mjelk- and mjælk-* ("milk") refer to the use in dairy products. Other vernacular names refer to the fat and/or slimy appearance of the leaves, e.g. *feitgras*, "fat grass" (Tonning 1773:4), *sleipgras*, "slippery grass" (Høeg 1974:473), *slimgras*, "slime-grass" (Tonning 1773:4), *såpeblomme*, "soap flower" (Halvorsen 1988:188), and the North Sámi *vuodjalasta* ("butter leaf").

Melkekors ("milk cross") and other names containing *kors* or *kross* ("cross") obviously refer to the leaf rosette. According to Brøndegaard (1971), it may have reminded people of the cross-shaped lower end of traditional churning sticks, but available records would rather suggest that people thought that the leaf rosette looked like a cross or star.

Pinguicula vulgaris in pastures

Pinguicula vulgaris is hardly a very frequent pasture-grass for cattle or sheep. In some areas, the plant was considered harmful, by adversely affecting milk. People believed that milk would become thick if the cows consumed *P. vulgaris*, as recorded at Tolga, Trysil and Åsnes in Hedmark (Furuset 1980:126; Reichborn-Kjennerud 1922:87; NFS Manum), Øyer in Oppland (NEG 69:15278), Tjøme in Vestfold (NEG 69:14491), Marnadal in Vest-Agder (NEG 69:15544), Jølster in Sogn og Fjordane (NEG 69:14404), and other stations in southern Norway (Høeg 1974:491). In Gausdal (Oppland), Vestad (1984:60) was told that "the milk could become thick if the cows ate much of this grass." At Trysil in Hedmark, people had noted that milk products could become thick and sour during the summer. In such cases, they believed that the cows had grazed *tettgubbe* ("thickening old man"), according to Furuset (1980:126) either *P. vulgaris* or *Drosera* spp. In Troms, N Norway, people claimed that such effects of *Pinguicula vulgaris* occurred mainly in the autumn (Alm 1983:393).

Some believed *P. vulgaris* to be poisonous, as reflected in the vernacular name *sprenggras* ("burst grass") in Central Norway (Høeg 1974:492). It was said to be harmful for horses, sometimes for cattle or sheep. Strøm (1762:112) noted that "a few" people at Sunnmøre in W Norway considered *P. vulgaris* as harmful to sheep, though he does not specify in which way. A similar belief is reported

Fig. 1. In Norwegian folk tradition, *Pinguicula vulgaris* has been much used to make thickened milk. A commercial product based on a *P. vulgaris* culture, "Tjukkmjølk," made by Rørosmeieriet, is now on sale nationwide. It was also the first food product in Norway with a "controlled origin" label. In accordance with folk tradition, it is more viscous than ordinary (rennet-based) thickened milk. Photograph by Jorunn Marie Rødli and Mari Karlstad.

from Telemark by Wille (1786), but people there also claimed that sheep avoided the plant. Farmers in Valdres, interior SE Norway, believed that it caused a liver disease in sheep (Kirkevoll 1940:174). At Singsås in Sør-Trøndelag, Central Norway, *P. vulgaris* was believed to cause colic in cattle (Høeg 1974:492). In other areas, no such negative effects on grazing animals were known. In his topographical description of Gudbrandsdalen in SE Norway, Hiorthøy (1785) noted that "Whether this herb is harmful to the sheep, as stated by Mr. Strøm, is not known here."

Folk medicine

In Norwegian folk tradition, *Pinguicula* has found some, but restricted use for medicinal purposes. It was mostly used externally. A decoction of the leaves in water could be used to remove lice from children, and to promote the growth of fair hair: "When the leaves are boiled in water, and the children's heads are washed with it, lice are purged, and the hair grows, and also gets a yellow colour" (Tonning 1773:5). Mohr (1786:152) noted similar use.

In Hallingdal (Buskerud, SE Norway), an ointment was made by boiling

Table 1. Alphabetical list of Norwegian vernacular names for *Pinguicula vulgaris* (original spelling, if different from present-day Norwegian, is indicated). Municipalities (communes) are given is possible. "Numedal area" and similar records indicate vernacular names that may derive from several municipalities within the given area.

Norwegian	**English translation**	**Area and source**
Adam og Eva	Adam and Eve	Troms: Kvænangen (EBATA 2004:7)
Blåstjern	Blue star	Nord-Trøndelag: Nordli (Høeg 1974:493)
Feitegras	Fat grass	Norway, unspecified (Reichborn-Kjennerud 1922:87)
Feitgras	Fat grass	Norway, unspecified (Tonning 1773:4, as Feit-Gras)
Feitgress	Fat grass	Norway, unspecified (Viborg 1793:15, as Feitgræs; Hornemann 1806:20, as Feitgræs)
Feittstjerna	Fat star	Troms: Sørreisa (Høeg 1974:493)
Flogfangar	Fly-catcher	Nordland: Vefsn (Lundestad 1992:35; Øksendal 1977:99, 1993:110)

Tjettblad	Thickening leaf	Sør-Trøndelag (Weisæth 1990:84)
Tjettgras	Thickening grass	Nord-Trøndelag (Høeg 1974:492), Steinkjer: Beitstad (NEG 69:15202) and Egge (NEG 69:14295)
Tjettgras	Thickening grass	Sør-Trøndelag (Weisæth 1990:84)
Tjettgress	Thickening grass	Nord-Trøndelag (Høeg 1974:492), Grong: Hauan (NEG 69:14280)
Tussebetgras	Gnome-bite grass	Buskerud: Hallingdal (Mehlum 1891:397; Reichborn-Kjennerud 1922:87)
Vassfiol	Water violet	Telemark: Vinje: Mosli (Høeg 1974:493)
Vibefeit	Lapwing fat	Nordland: Beiarn (NEG 69:14261)
Ystegras	Curdle grass	Buskerud: Krødsherad (Mørch 1976:993)

the plant, and used to treat what people considered to be *tussebitt* ("gnome bites"), usually infected wounds (Mehlum 1891:397; Reichborn-Kjennerud 1922:87). Høeg (1974:492) noted that the leaves were used for wounds, e.g. in Modalen (Hordaland, W Norway) and Rana (Nordland, N Norway). A slightly more frequent medicinal use was to cure ringworms, recorded at Lillehammer (Hedmark, SE Norway), Sortland (Nordland), Sørreisa, Berg, and perhaps Tromsø (Troms), the four latter all in N Norway (Høeg 1974:492; Reichborn-Kjennerud 1922:87, 1941:56; NFS Gade-Grøn 49). The mode of use was simple: "The root [rosette] leaves were used for ringworms. They rubbed the leaves around the sick part." (NFS O.A. Høeg). In Fåberg, SE Norway and Rana, N Norway, the leaves were used to treat warts. They have also served as a cure for eczema in Troms (Høeg 1974:492) and in Porsanger, Finnmark (EBATA 2005:84), N Norway.

Folk veterinary medicine

Locally, *Pinguicula vulgaris* has found some use in folk veterinary medicine, again mainly as an external ointment. Some used it to treat wounds (Høeg 1974:492; Kirkevoll 1940:174). According to the latter author, it was mixed with linseed oil in Valdres (Oppland, SE Norway). *P. vulgaris* was also used as a cure for sore teat. Sámi herdsmen used the leaves of *Pinguicula* to treat sore teat in reindeer (Gunnerus 1772; Tonning 1773:5), and Norwegian farmers used it for cows in Lærdal and Vik (Sogn og Fjordane, W Norway), and for cows and goats in central Norway (Høeg 1974:492; Weisæth 1990:84). The record from Lærdal is instructive:

(...) this is *Melkekrossen* ["the milk cross"]. It grows on wet rocks and in damp places. At home, we used to boil it with some kind of fat. It was used to anoint the teat of cows when they were sore or cracked. This was a good, old advice which we used when I was at the summer farm at home in Sværefjorden. Perhaps it is still used." (NFS Manum, letter dated 28 September 1958).

In Etnedal (Oppland) and Hægeland (Aust-Agder), Høeg (1974:492) recorded local use of *P. vulgaris* to calm down cows who had already mated. According to Storaker (1928:63), it was also used to cure some kind of "bone disease" in cattle.

Calendar

A wide range of plants have served as calendar marks in Norway, e.g. to indicate when the harvest could start. *Pinguicula vulgaris* is not an important one, but has found at least local use, a tradition first noted by Hans Strøm in his 1756 diary:

"When *Tette-Græsset* or *Melcke-Kaarset* has sprouted, one uses this as a sign, that the cattle are fed [will find sufficient pasture] and may, without danger, be let out to feed on the grass." (Strøm 1756:fol. 66a, cited from Standal *et al.* 1997:143).

Høeg (1974:492) noted a similar tradition, i.e. that the cows could survive outdoors when the rosettes of *P. vulgaris* appeared, at some stations in Western Norway. In a few cases, flowering is suggested as the marker, but this gives an unlikely, late date.

Apotropaic and magical uses

In parts of western Norway, *P. vulgaris* is known as *mjølkekross* ("milk cross") and similar names. The plant was placed in the milk bucket the first time the cows were milked outdoors in spring (Høeg 1974:491-492); the same tradition applied to *Potentilla erecta* (L.) Räuschel. In both cases, the practice served mainly as an apotropaic, based on a kind of similarity magic: putting the "fat" leaves of *Pinguicula vulgaris* or the yellow flowers of *Potentilla erecta* into the milk bucket should ensure a good yield of fat and yellow butter. A fine account is available from Høyanger in Sogn og Fjordane, W Norway:

"I know this plant well. (...) It was called *mjølkekross*. In spring, during the first evening the cows were milked outdoors, we had to burn *bueld* ["farm or cattle fire"]. That is, we collected wood and juniper (*sprake*) to make a fire. While it was burning, the cows should be milked, and in the milk bucket, there had to be a fine *mjølkekross*. This should ensure a good yield of milk during the summer. I was told so by an old dairy maid when I accompanied her while she was milking the cows." (NFS Manum, undated [1958] letter).

The observation had been made some 45 years earlier, i.e. about 1913, when the female informant had visited the neighbouring farm and repeatedly participated in the "bueld" ritual. Her great-grandmother had done the same thing, but kept it secret—as is often the case with such magic rites (additional letter from the same female informant in NFS Manum).

Exceptionally, *P. vulgaris* has also served other magical purposes. At Ringerike (Ådal) in SE Norway, people believed that if the plant was laid under the pillow for the night, the girls would dream of their coming husband (NFS Manum). Children in Dalsfjord (Volda, W Norway) believed that finding much *P. vulgaris* meant they would recover all their sheep when the pasture season was over in the autumn (Høeg 1974:492).

Children's games

Pinguicula vulgaris is hardly an attractive plant for children, though it may at least arouse their curiosity. The only record of any use in children's games derive from the island of Seiland in Finnmark, N Norway: "As children we used the rosette as soap. It was somewhat slippery and slimy and felt like handling soap." (EBATA 2005:2).

Use in dairy products

According to widespread lore in Norway, the leaves of *P. vulgaris* were used to treat milk, which although turning sour, would still retain a better taste than if left untreated, and also gain a desired "thick" quality. (Bergsåker 1982; Grude 1945:106; Hovdhaugen 1971:34; Sandvik 1991; Schübeler 1888:185; records in NEG, NFS, and NOS). Høeg (1974:490) collected information on such use from 83 municipalities in Norway. However, descriptions of the actual process of preparing such milk differ widely in folk tradition, as do the ascribed qualities or characteristics of the product. Several aspects need to be clarified: how "tettemelk" was made, the product and its characteristics, why it was made, and, finally, geographical distribution and time-line.

Preparation

"Thickened" milk could be made in several different ways. Most frequently, it was made by adding a small amount of *tette* or rennet, often just a spoonful, as a starter culture. This *tette* could, however, derive from various sources. At least in the 19th and 20th century, rennet from the belly of slaughtered calves was the most frequently used source of rennet in Norwegian peasant societies. It contains a proteolytic enzyme and various milk bacteria, and its ability to produce curdled milk is well documented (cf. Wix 1995, 1996).

Contrary to this, the effect of *tette* made from *Pinguicula vulgaris* is disputed. Ramus (1715:270), Gunnerus (1772), Tonning (1773) and other 18th century authors found no reason to doubt that *tettegress* could be used to prepare thickened milk. An early account is found in the 1756 diary of Hans Strøm, in a section detailing the plant lore of Kvamsøya in Sande, Møre og Romsdal, W Norway:

"This herb is also placed in the milk which by this shall gain a fine taste, or perhaps become thicker." (Strøm 1756:fol. 66a, cited from Standal et al. 1997:143).

In his *Flora norvegica*, also a rich source of plant-lore, Gunnerus (1772:20) included only a very short note on the ethnobotany of *P. vulgaris*: "Norv. *Tætte-Græss* (qvia adhibetur lacti hyperboreo parando)." A much more detailed account of the way *tettemelk* was prepared is found in his 1774 treatise on dairy products in Norway:

"Thick sour milk is much used for food in Norway, and when prepared for this purpose, one mostly uses *Tætte*" (...) "to make it thick, by which it acquires a better taste. For *Tætte* is used the well-known, so-called *Tætte-Græs* (*Pingvicula vulgaris*), of which the leaves are put in a dish of fresh milk, which thereafter thickens and becomes so sticky, that it may be drawn out in long threads. Subsequently, this *Tætte* will pass its quality on to other milk, into which a spoonful is mixed, just as has already been noted by Mr. von Linné in his *Flora lapponica n. XI. p. 10. litt. 3. de lacte compacto hyperboreo*; and this thick milk, which in this way passes on to further milk, into which it is mixed, the same character, has from this property acquired the name: *Tætte-Melk*." (Gunnerus 1774:142-143).

Tonning (1773) added some interesting details, including observations on the time of year for such practice, and the supposed economic benefits:

"In some places in Norway, when the summer is at its warmest, and the milk will not easily curdle, but rather usually becomes sour too quickly, the peasant wives places the fat and slimy leaves of this herb in the sieve, through which the fresh milk is passed, which in two or three days gives the so-called Tæt-Melk (*Lac hyperboreum*). This kind of milk, which thereby becomes so thick and viscous, that it may be drawn out in long strings, is very economic in numerous rural households, since it may be mixed either with fresh milk, or with water, and thereby greatly increased [in quantity]." ... "Such *Tæt-Melk* is not known to be used in other places than in Norway and Sweden." (Tonning 1773:4-5).

At Gudbrandsdalen in SE Norway, Hiorthøy (1785) recorded the following procedure:

"This grass is collected and placed in the milk vessels, so that the milk should more rapidly curdle and become thick. A spoonful of such milk is subsequently used for other milk vessels, since it has the same effect as the grass itself" [i.e., served as a starter culture] (Hiorthøy 1785:99).

Klonteig (2000) provides a detailed account of the procedure used at Tinn in Telemark, SE Norway. He also noted that *P. vulgaris* had to be collected in spring, while it was growing.

"They rubbed clean wooden cups, troughs or buckets with this leaf rosette [of *P. vulgaris*]. Then they poured fresh milk into the cup. It is left standing until the milk thickens and gets suitably sour. It should not be left standing for so long that the milk could be drawn out as long threads. The *tette* fungus [sic] prevented the milk from getting mouldy or rotten, so that it stayed fresh for a long time." (Klonteig 2000:43; further comment on the time of year p. 78).

Related procedures, i.e. sieving fresh milk through *Pinguicula* leaves, or pouring milk into a container with such leaves, are frequently mentioned in folkloristic and ethnobotanical literature. Evjen (1986:63) claimed that at least locally in Trøndelag, the plant part used was the crushed roots, not the leaves. A record from Jølster in Sogn og Fjordane, W Norway, confirms that the roots were sometimes included, and provides some additional details on the collection of plant material:

"They put their fingers down at the plant [base], below the root, and then extracted both the root and the plant, washed it and put it at the bottom of the container." (NEG 69:14362)

In most cases, only the leaves were used. Some specify that they had to be thoroughly cleaned, others that washing the plant should be avoided, as recorded in Kvænangen, Troms (N Norway):

"At Valan, two old females told me that one had used *tettegres* (...) to make rennet. When using the plant, it should not be washed. The root was cut off and insects stuck in the slime were removed; the rennet was in the slime." (NEG 69:20974)

It should be noted that almost all ethnobotanical traditions included here apply to the Norwegian majority population, living in what was traditionally a faring society. Sørensen & Olsen (1981:28-29) mention similar use of *P. vulgaris* as a substitute rennet among the Finnish ethnic minority of SE Norway, also with an agriculture-based way of living. Contrary to this, *Pinguicula* plays a minor role in Sámi ethnobotany. Those that were involved in traditional reindeer herding would have little use for it (except to treat sore teat in reindeer); the fat reindeer milk hardly needs rennet to become thick, although *Angelica archangelica* L. was often added, according to some authors (e.g. Kuoljok 1971:58) as a kind of rennet. A single example of Sámi use of *Pinguicula vulgaris* as a rennet substitute may be quoted, from Seiland at the coast of Finnmark, N Norway, where people based their living on fisheries and small-scale agriculture. Referring to the 1950's or later, its use was described as follows:

"We collected these stars [the leaves], washed them, and poured warm, fresh milk over them. It was left standing for a day or so, and then it became thickened milk." "It was like a pudding in the bowl. When you took a spoonful, the hole remained." Only fresh milk was considered suitable: "When they ceased having cows, they tried with milk they had bought. But it did not work, (...) it did not turn into true thickened milk." (EBATA 2001:1)

A frequently used, alternative source of rennet in Norwegian folk tradition was terrestrial snails, e.g. the large, black *Arion ater* L., and, according to the descriptions given, several other species as well. Accordingly, such snails were known as *tettegubbe* ("thickening old man") or similar terms (numerous records in NEG 79); identical names have been recorded for *Pinguicula vulgaris* (Table 1). Høeg (1974:490) commented on this tradition, but expressed some doubt if snails had really been used in milk. Such use is, however, well documented from the western, central and northerns parts of Norway (Alm 1983:393, 1985:41-42; Bjørndal 1949:121; Blix 1971; Evjen 1986; Fjellstad 1966:171; Hovdhaugen 1971:34; Weisæth 1990; NFS Gade-Grøn 150; numerous records in NEG). At least in the north, this tradition survived well into the 20th century. In Troms, I have repeatedly been told the names of persons who had used snails for this purpose (e.g. EBATA 1978:26, 2005:45). My own mother had been served *tettemelk* in her youth, but did not like it, in particular because one—according to local lore—could get an unpleasant surprise when the bottom of the bucket became visible. Leaves of *Pinguicula* were not objected to by anyone, but snails certainly were. In some cases, snails may have been more commonly used than *Pinguicula*, leading to a folk belief that the effect of the latter was due to snails having rested on the leaves, depositing slime (Alm 1983:393). In Møre og Romsdal, W Norway, snails were considered the "very best" source of *tette* (Bjørndal 1949:121). A few records also show that such use was known, at least locally, by the Finnish and Sámi ethnic minorities, e.g. at Porsanger in Finnmark, N Norway (EBATA 1992:11).

The note of Bjørndal (1949) is interesting in specifying that three different kinds of rennet were used at Hareid in Møre og Romsdal (W Norway)—and that an apotropaic precaution was added when preparing the milk:

"(...) to get thickened milk, they either used rennet from previously prepared thickened milk, or *tettegras (Pinguicula vulgaris)*, or, the very best: an ordinary black snail. The rennet should be applied to the bottom of the bucket with the fingers, not with a spoon or other utensils, and always in the shape of a cross. If snails were used, they were first wrapped in linen towels and then placed two by two as a cross. This was done to ward off evil." (Bjørndal 1949:121).

The product and its characteristics

Pinguicula-based thickened milk was usually made from fresh milk, without heating or boiling it. When *tette* had been added to the milk, the mixture was stored in a modestly warm place, often on a special shelf. It should not be too warm, in which case the product would turn sour, nor too cold. The final product, i.e. fine *tettemelk* (thickened milk), should be fresh, not very sour, taste well, and be so viscous that it formed a rope from the spoon when retrieved from the container (Jæger-Leirvik 1959). Though descriptions of *tettemelk* vary, most (e.g. Sørensen & Olsen1981:29; Sortdal 1981; NFS Manum) agree that it was more viscous or ropy than milk made from ordinary rennet.

As to the rennet or *tette* itself, whether derived from calves or from *Pinguicula*, people knew that it could be stored for long periods. Weisæth (1990:78) noted that people at a farm in Trøndelag had kept the same culture for more than 40 years. His experiments also showed that tette made from *P. vulgaris* was robust, and could be stored in frozen condition. More frequently, *tette* was stored in a desiccated form (Lorås 1978:8), e.g. by letting it dry in a glazed cup (Jæger-Leirvik 1959:46), in a towel (Støren 1919), in a wooden container (Weisæth 1990:76), or on a piece of wood, which was put in a bag and placed in the food stores (Ambjørgrud *et al.* 1965). When needed again, it was soaked in fresh milk or in a mixture of warm water and fresh milk (Weisæth 1990:76).

Why was it made?

In the old Norwegian society, milk often formed a large part of the diet. It could be the major constituent of several daily meals, especially in inland areas, less so at the coast (Grøn 1942:82). In addition to the culinary aspects noted above, there were two main reasons for preparing *tettemelk*—related to economy and storage.

In the past, fresh or sweet milk was little used in Norway (Grøn 1942:83; Opedal 1940:55). Cream was usually removed to make butter, most of which was sold to allow some cash income. *Tettemelk* could be prepared from both full and skimmed milk. In both cases, the milk sugars (lactose) were transformed to milk acid (Weisæth 1990:83). Due to its thick character, *tettemelk* had a greater ability to make people feel well fed (Lorås 1978:7). It could also be mixed with water and consumed as a drink to quench thirst.

In the past subsistence economy, cattle were frequently inadequately fed during the winter, especially towards spring as fodder stores ran out. As a result, cows would only produce milk for a restricted period of year, mainly in summer (Jæger-Leirvik 1959:46). Preparing curdled milk was important in terms of allowing milk products to be stored. The various "thickened" milk products (bearing a wide variety of vernacular names in Norwegian) could easily be stored for a long time, depending on storage conditions and the time of year. Storing for weeks, months or half a year or more is frequently mentioned in the NEG records. Jæger-Leirvik (1959:47) made a much more modest claim, that *tettemelk* could be stored for about one week.

Rennet was also used to prepare *kjellermelk*, i.e. "cellar milk," which could be stored for several months in summer (Grøn 1942:84). Freshly sieved, warm milk was mixed and boiled with 1/3 of water, cooled to body temperature, and transferred to a barrel with rennet. This procedure was repeated daily until the barrel was full. The mixture was stirred frequently, until turning sour. Only skimmed milk was used (Støren 1919). Contrary to *tettemelk*, "cellar milk" was boiled before transfer to the buckets where it was stored (Weisæth 1990:78). The product could be stored for about one year (Grøn 1942:84; Olsen-Sopp 1912). In parts of Norway, large containers of milk prepared in this way were stored for winter use, e.g. in wooden buckets holding up to 300 litres at Målselv in Troms, N Norway (Sæter 1926:234).

Geographical distribution and time-line

Utilization of *Pinguicula vulgaris* as a rennet substitute—and vernacular names that suggest such use (Table 1)—are known from most of Norway, including Østlandet/SE Norway (Fjellstad 1966:171; Flatin 1918:56; Hagen 1950:281; Halvorsen 1988:198; Kirkevoll 1940:174; NFS Manum), Vestlandet/W Norway (Aasen 1860:10; Arentz 1802:87; Bjørndal 1949:121; Lundberg 1998:253-254; Skre & Skre 1974:53; Strøm 1762:111-112; NFS Manum), Trøndelag (Evjen 1986:63; Weisæth 1990:84; NFS Manum) and North Norway (Alm 1983:393; Blix 1971:218-219; Jenssen 1982:44; Solvang 1924:28; Strompdal 1938:73; NFS Manum); numerous records in Høeg 1974 and NEG may be added to this list.

Preparation of *tettemelk* with *P. vulgaris* seems to have survived longer in the central and northern parts of Norway than in the south. In the latter area, such use may have been uncommon already in the 19th century. In his large Norwegian dictionary, the linguist Ivar Aasen explained *tettegras* as "A herb, which was previously used to make 'Tette'" (Aasen 1873; cf. Grøn 1942:83). Contrary to this, some of those who contributed to the NEG records, mostly in 1959–1960, had first-hand experience of such use. In fact, *tettemelk* may still be used in parts of Norway. According to Weisæth (1990:78) it was in daily use at some farms in Trøndelag, Central Norway in the late 1980's. Thickened milk based on *P. vulgaris* is now marketed as a commercial product by a dairy at Røros in

Sør-Trøndelag, Central Norway (Ola Arvid Feragen, pers. comm. 2005), available throughout Norway.

Although common, the practice of using *Pinguicula vulgaris* as a substitute rennet was not universally known. From Telemark in SE Norway, Wille (1786:122) noted that it was "used here only very rarely instead of rennet." At Krødsherad in Buskerud, SE Norway, Mørch (1976:993) noted that "*Ystegras (tettegras)* is not known to have been used for making thickened milk."

As an alternative to *Pinguicula vulgaris*, a few sources mention similar use of *Drosera* leaves, e.g. in Rogaland (NOS) and Trøndelag (Weisæth 1990). Høeg (1974) does not mention such use of *Drosera* species, but he recorded some vernacular names, similar to the most frequent ones for *Pinguicula vulgaris*, that would suggest it.

The effect on milk: folk belief or reality?

In the early 20th century, Olsen-Sopp (1912) carried out an experimental study of *tettemelk* and how it could be made. According to him, *Pinguicula*-based cultures failed to produce true thickened milk. The product did have a ropy character, but an evil smell. Nilsson (1950), who carried out a microbiological study in Sweden, came to similar conclusions. Experiments at a dairy laboratory in Rogaland (SW Norway) in the 1970s also failed to produce a satisfying product (Bergsåker 1982). Ambjørgrud *et al.* (1965) considered the effect of *Pinguicula* to be little more than mere superstition. Lorås (1978), in her thesis on dairy products, carried out new experiments with *Pinguicula vulgaris* as a source of rennet, but concluded that it was useless.

On the other hand, it is easily proven that sieving milk through *Pinguicula* leaves gives it a ropy character, instantly yielding at least a small amount of a highly viscous, jelly-like product. According to my own experiments, this works even with pasteurised milk, but yields only a small amount, whereas Weisæth (1990:80) succeeded only with fresh milk. Several informants cited in Høeg (1974) noted that one should use fresh, still warm milk directly from the cow.

Even in ethnobotanical literature, the effect of *P. vulgaris* on milk is disputed. Høeg (1974:490) suggested that it was nothing but an example of the doctrine of signatures, i.e. that people inferred the alleged ability to make milk "thick" from the fat leaves of *Pinguicula*. This was refuted by Weisæth (1990), based both on his own experiments and 20th century tradition in his home district of Trøndelag, Central Norway. According to him, *Pinguicula* could indeed be used to make thickened milk. In his experiment, 10-15 fresh leaves of *Pinguicula* sufficed to turn one litre of sweet milk into "a fine and good, thick *tettemelk*" (Weisæth 1990:76). In Sweden, Larsson (1988) claimed to have succeeded in using a *Pinguicula*-based culture, but no details are given on the procedure; some data are provided by Alm and Larsson (1983).

Until recently, however, documentation in terms of milk characteristics, chemistry and the bacteria involved has been weak. A recent study by Haug (1996) succeeded in producing thickened milk using *Pinguicula vulgaris*. An excellent culture was derived from plant material collected at Tromsø. And old rennet culture from Røros in Central Norway, supposedly originally from *Pinguicula vulgaris*, also yielded a satisfying product. Both these cultures contained strains of *Lactococcus lactis* subsp. *cremoris* and *Leuconostoc mesenteroides* subsp. *dextranicum*. However, plant material (*Pinguicula* leaves) from three other Norwegian sites failed to yield thickened milk. Haug (1996) suggested that the leaves had been collected too late in the season, since some ethnobotanical records cited by Høeg (1974) indicated that plants should preferably be collected early in the season, while they were growing. This is partly contradicted by the success of the Tromsø material, which was collected in late summer (August). At present, knowledge of bacteria present on *Pinguicula* leaves is limited, and it is certainly possible that only some plants house species and strains suitable for rennet. This would explain some of the past confusion as to whether *Pinguicula* works or not—and the wide range of results obtained, from complete failures to excellent cultures.

Comparison with the use of *Pinguicula vulgaris* in other areas

Pinguicula vulgaris is widely distributed in the northern hemisphere, including Europe and the northern parts of North America, but absent in most of Asia (Hultén & Fries 1986). Despite this, it plays a much more prominent role in folk tradition in the Old than the New World. Vernacular names reflecting its fat, slimy leaves are widely distributed in Europe, e.g. in Italy, the Netherlands, and in the German-speaking countries (Brøndegaard 1951:958; Marzell 1977:762-763; Schübeler 1888:185), and in much of NW Europe. Very little information on any use of *Pinguicula* species is available from North America. For *P. vulgaris*, Moerman (1998:403) only notes that the Owekeeno of Canada kept dried roots as a good luck charm. Such use is also known from Europe. In Scotland, the plant had some reputation as an apotropaic, protecting cows and milk from witches and other evil influences (Darwin 1996:128; Grigson 1955:312; Milliken & Bridgewater 2004:163-164; Vickery 1995:56).

Just as in Norway, the leaves of *P. vulgaris* have been used to cure wounds in other parts of Europe, e.g. in Germany and Great Britain; other *Pinguicula* species were used for the same purpose in Spain (Brøndegaard 1961:959; Grigson 1955:312-313).

As noted above, the main use of *P. vulgaris* in folk veterinary medicine in Norway was to treat sore teat. This cure is also known from the Great Britain (Allen & Hatfield 2004; Grigson 1955) and the Alps, where Bauhinus (1650-51) noted that herdsmen used it for the same purpose. The belief that *P. vulgaris* could cause harm to livestock, known from parts of Norway, was widespread in Sweden (Larsson 1988, map 26), and is also known from France (Brøndegaard

1951:958) and Great Britain (Grigson 1955:312). In Scotland, it was considered to make the milk of grazing cows disagreeable and stringy, and was reputed to cause disease, e.g. liver fluke infestation, in sheep (Milliken & Bridgewater 2004:66, 122, 248).

Thickened milk has been much used in Eurasia, especially in alpine areas where summer farms or transhumance prevailed (Ränk 1971). Before the advent of refrigerators and other modern technology, it was an important way of storing milk. Vernacular names and other traditions suggesting the use of *P. vulgaris* as a rennet substitute are widely distributed in Europe, especially in the NW, including Norway, Sweden (Larsson 1988), and Great Britain (Grigson 1955:312). Numerous Swedish sources mention such use, including Linnaeus (1737:10), who provided a detailed description of its use among Swedish settlers in the country's northern part. Vernacular names suggesting use in dairy products are also known from the Faroes (Brøndegaard 1971:80; Svabo 1959:156) and in Iceland (Brøndegaard 1971:80; Hjaltalín 1839; Mohr 1786; Nilsson 1988:155; Olsson 1961:118-119; Schübeler 1888:185), both areas largely settled by people of Norwegian ethnic origin. Some vernacular names recorded in Scotland, e.g. on Orkney and the Shetland islands, may derive from Norse settlers, but other Scots and Gaelic names suggest that the tradition was known to the Scots as well. *P. vulgaris* was used as rennet for cheese in Lanarkshire (Darwin 1996:128; Milliken & Bridgewater 2004:65; Vickery 1995:56). A few names of similar origin are known in the German, French and Finnish languages (Brøndegaard 1971:80, Ränk 1960:60). Marzell (1977:766) mentioned the use of *Pinguicula* as a rennet substitute from Kärnten in Austria.

In summary, numerous authors have carried out experiments with *Pinguicula vulgaris* in milk, with widely different results. Experiments and folk tradition agree that the leaves (or their proteolytic enzymes) do have some effect on milk; i.e. by making it stringy. Most laboratory (e.g. Lorås 1978; Nilsson 1950; Nilsson & Nilsson 1958; Olsen-Sopp 1912) experiments with *Pinguicula* have failed to produce thickened milk, at least of a quality suitable for food and storage, and Ränk (1960) suggested the folk use of—or belief in—*Pinguicula vulgaris* as a substitute for rennet was an example of similarity magic, based on a comparison of the viscous, thickened milk and the slimy leaves of the plant. The recent study of Haug (1996) convincingly demonstrated that *P. vulgaris* may be used to make thickened milk, but also that some *Pinguicula*-based cultures failed to do so. This may explain some of the past confusion as to whether *Pinguicula* works or not.

ACKNOWLEDGMENTS

Anne-Marie Wiersholm provided access to and help with the archives at NFS/Norsk folkeminnesamling. Ola Arvid Feragen at Rørosmeieriet supplied information on their use of a *Pinguicula* culture for thickened milk. The referees provided many useful comments. Laurent Legendre, University of Western Australia, helped with some literature.

NOTES ON LOUISIANA BOTANY AND BOTANISTS, 1718–1975

Joseph A. Ewan

Edited by Steven P. Darwin
Department of Ecology and Evolutionary Biology
Tulane University
New Orleans, Louisiana 70118-5698, U.S.A.

Editor's note.—The present paper was written ca. 1992 while the author, formerly at Tulane University, was Research Associate at the Missouri Botanical Garden, St. Louis. It was intended for a volume of essays honoring botanical artist Margaret Stones, but the collection was never published and the manuscript was abandoned. Before the intended submission, Ewan asked me to make corrections and suggest modifications, which I did. With those few and minor changes made, Ewan's notes on Louisiana's botanical history seemed to me well worthy of publication as a stand-alone contribution. For Joseph A. Ewan (1909–1999) see A.S. Bradburn, *Sida* 19:219–222 (2000); L.J. Dorr, *Taxon* 49:107–111 (2000); C. Wolf, *Plant Sci. Bull.* 46:14 (2000). For Ewan bibliography, see L.J. Dorr and D. Holland, *Arch. Natl. Hist.* 27:307–334 (2000). I thank A.S. Bradburn, L.J. Dorr, E.G. Sundell, and J.W. Thieret for reviewing the manuscript and offering valuable suggestions.

> A concern for history has always been regarded as a mark of a civilized man.He who knows only his own generation remains always a child.
>
> — These two maxima, the first from historian Louis B. Wright, the second from college president George Norlin, read from sides of the same coin: perception comes from perspective and from the wide-angled lens of history.

We review the lives and botany of a select few of Louisiana's naturalists-artists-collectors who have left records, sometimes only sketchily, in books, letters, and dried plant specimens from 1718 to 1975. This essay is only an introduction to the history of botanical exploration in the state. Well-known figures are mentioned, but barely remembered persons will be particularly noticed on the premise that search warrants may be posted. My annotated *Bibliography of Louisiana botany*, listing 384 entries to the year 1950, is the base of this review.[1] A supplement to the bibliography by Eric Sundell brought the coverage to 1975 with an additional 433 titles, chiefly of recent taxonomic revisions.

The first naturalist to visit Louisiana was Antoine Simon Le Page du Pratz, who as a traveling architect and engineer observed the flora and fauna.[2] He arrived 25 August 1718 reporting that New Orleans existed "only in name." Though du Pratz died in 1775, in a real sense I met him through the enthusiasm of Stanley Clisby Arthur and his bookseller, Joseph Harmanson, by the publication of a composite altered English translation of du Pratz's *History of Louisiana* based on the London edition. This New Orleans imprint of 1947, important for its annotations and a topical index, had a press run of only 600 copies. Du Pratz had gathered notes of plant and animal names and uses from his early contacts with his slave girl of the Chitimache tribe, purchased soon after his arrival. Louisiana natural history began when she whacked an alligator on the snout as it approached his campfire. From crocodiles to cockroaches, which he remarked are relished by house cats, his narrative is interesting. Five chapters report on forest trees and other botanical subjects. Although he mentions about fifty trees, no specimens collected by him are known. He noticed mangroves as he entered the delta,[3] stating that they were "very common all over America." If you believe you know our flora, try identifying every tree in du Pratz's forest.

Benjamin Smith Barton, Philadelphia naturalist-physician, loaned his copy of du Pratz's "Louisiana" to Meriwether Lewis in 1803. Lewis returned the book four years later after its trip to Oregon.[4] Du Pratz stayed in Louisiana sixteen years, sometime on the Bayou St. John, at an Indian village above New Orleans, and at Natchez. His *Histoire* was written from memory after his return to France. Opinions differ: biohistorian Elliot Coues, though he edited Lewis and Clark's travels and others, did not produce an annotated edition. Coues concluded du Pratz's "matter is very wild and of no account."[5] I suggest his is a clue book, to be verified.

Perhaps the best known of early French travelers on the Mississippi River was Pierre Charlevoix (1682–1761),[6] Jesuit missionary-historian whose visit in 1720 was first published in 1744, but not Englished until John Shea published its six volumes between 1866 and 1872. Charlevoix cited black vomit, *Ilex vomitoria*, cassina,[7] then known by the Indian name apalachina, which altered into Apalachicola, the present Florida river and town. Understandably it was plants then used by Man, black vomit, sweet gum, and wax myrtle, that entered Charlevoix's text.[8]

Before plants were collected and kept in cabinets, they were more or less carefully observed. From this description what do you suggest was Bossu's plant: "a tree that grows in Louisiana that bears a fruit similar to a banana that the natives call *hasseminier*. Savages cover their cabins with the bark and also use it to make little boxes called *cassot*, in which to put fruits."[9] Bossu also says the bark was used to make a trumpet. What tree was it? *Asimina*? Jean-Bernard Bossu (1720–1792), son of a surgeon, was in wars in Italy, moved to the marines, left for Louisiana in 1750 but then was assigned to Illinois country. He lived with the Akancas or Quapaw Indians near the mouth of the Arkansas River, staying there for seven years. Bossu returned to Louisiana in 1758, then for a third time as a private citizen, 1770–1771.

The early travels of Bossu were first translated into English by a German, Johann Reinhold Forster,[10] who later would ship with Capt. Cook on his Second Voyage. Samuel Derris Dickinson in 1982 provided a fully annotated rendition of Bossu's *New Travels* of 1770–1771.[11] As had Charlevoix, Bossu mentions the plants related to man's use, but with more detail: cassine, *Ilex*; candleberry, *Myrica cerifera*; ginseng, *Panax quinquefolius*; red laurel, *Persea borbonia*; white laurel, *Magnolia virginiana* (?); sassafras, *Sassafras albidum*; sweet gum or copala, *Liquidambar styraciflua*; palmetto, *Sabal minor*; "American tea," *Ceanothus americanus*; and yucca, *Yucca* sp.

Scarcely noticed in the history of our plant introductions is *Gaillardia*, known in the South as blanket-flower. In 1786 a six-page paper was published by the Paris Academy of Sciences, the first scientific paper devoted solely to a Louisiana genus. Fougeroux de Bondaroy described *Gaillardia pulchella* as cultivated from Louisiana seed in France by one d'Essales.[12] Whether a cultivated voucher was preserved I do not know. *Gaillardia* was a sensation when it flowered in Europe. Three botanists, Lamarck, Buc'hoz, and l'Héritier raced its description into print in 1788. With the happy exception of Philip Miller's Chelsea gatherings, garden-grown specimens are dubiously labeled or lost.[13] The intense competition among nurserymen to seize the market was not peculiar to France; it will inevitably complicate the effort to fix types of such discoveries as *Gaillardia*. The effort to improve the wild plant and the resulting cultivars further add to the botanical bouillabaisse. Where was that *Gaillardia* seed collected? I suggest on the Opelousas prairies.

We know William Bartram's oak-leaf hydrangea hereabouts. The description of his Florida experiences with bellowing alligators at the Alachua savannah, dramatically sketched in action, are classic. These drawings and important albums of plant specimens, preserved in the Natural History Museum, London, were reported with annotations in 1968.[14] That Bartram suffered great pain from an injury and eye infection meant that his "plan of peregrinations" through Louisiana had to be curtailed, and he collected no specimens. Nevertheless he had pressed westward to the Pearl River country, stayed four or five weeks at the seat of an Englishman named Rumsey on what Bartram called "Pearl Island," which was wiped away by hurricane years ago. He recuperated under the roof of "friendly" Rumsey whose fruit trees had reached "the utmost degree of perfection." His eyes "having sufficient strength to endure the open daylight" he set off from Pearl Island westward in a "handsome large boat with three negroes to navigate her." Using today's maps we trace Bartram's route through the Rigolet's, along Lake Pontchartrain's north shore, across the mouth of the Tangipahoa River through Pass Manchac to Lake Mauripas, to Amite River and an outpost on the Mississippi River. Turning north on the river he lodged at the plantation of William Dunbar,[15] a Scottish gentle-man naturalist whose other plantation near Natchez is better known. He traveled in a "neat cypress boat with three oars" to Pointe Coupee on the west side of the river, then on as far as Port Hudson, admiring the White Cliffs. He finally reached White Plains, an isolated prairie, by horseback, 27 October 1775. Bartram was impressed by sassafras with straight trunks up to 40 or 50 feet. There he saw "great and beautiful whooping cranes." He then retraced his route in Louisiana, his eyes still painful, and returned to Carolina. If you would follow his journey through the southern states, pick up the "naturalist's edition" of *Travels* by Bartram's Boswell, Francis Harper.[16]

Although Claude Robin was a student of Jussieu, and the author of the first description of the Louisiana flora, it is Rafinesque who translated and revised Robin's work, publishing it as *Florula Ludoviciana*. Claude César Robin[17] visited Martinique and Santo Domingo en route to Louisiana. Details of his travels in Louisiana are vague, but he wrote long detailed plant descriptions, noted folk names and uses which amounted to 238 pages of his *Voyage* (Paris, 1807). *Gaillardia* is described but without comment on its dramatic introduction twenty years earlier. Robin's text deserves critical study. A three-column table comparing Robin's, Rafinesque's, and what we think their sometimes cryptic phrases mean, would be welcome indeed.[18] Though we have yet to discover any herbarium records of Robin's, we value his contribution. Incidentally, our black locust, *Robinia*, commemorates Jean Robin, a 16th century French botanist, not Claude Robin.

An actor in the widescreen drama of Audubon's life, though he is barely mentioned in Audubon's writings, was the young artist Joseph Robert Mason.[19] Mason is unnoticed in botanical history for his plant backgrounds. He was born in Cincinnati in 1807 and was a pupil at thirteen in Audubon's drawing class in Cincinnati in the spring of 1820. The instructor must have been impressed with the lad's talents for he took him with him on the flatboat trip to New Orleans. "As the cumbersome ark drifted downstream," to borrow Marshall Davidson's words, Audubon was busy shooting birds and sketching for his planned *Birds of America*. Meanwhile Mason was collecting samples of the plants he would incorporate with the bird drawings, often later added to Audubon's originals. They arrived at Bayou Sara, West Feliciana Parish, in January 1821. Eight days later they were in New Orleans where Audubon added bird drawings to his portfolio, meanwhile making portraits of townspeople to meet his expenses. But when Audubon received an offer from a wealthy plantation owner's wife, Lucretia Pirrie, to teach her daughter drawing, he accepted and they set off for Oakley Plantation near St. Francisville. It was there that Joseph Mason would make most of his Louisiana drawings. For example, Mason drew loblolly pine, *Pinus taeda*, and Audubon signed the drawing "James Pirrie's plantation, Louisiana, July 10, 1821. Plant J.R. Mason."[20] To my knowledge this was the only instance when Audubon recorded Mason's part in his work. Mason drew *Magnolia grandiflora* in fruit on 5 October 1821, but Audubon did not indicate on the drawing that it was Mason's art. I like Mason's jessamine, *Gelsemium sempervirens*. His red-flowered *Iris fulva* is no match for Margaret Stones', but it is an interesting record for the species about twenty years after it was first collected by Aloysius Enslen who was then gathering for Prince Lichtenstein.[21] Audubon wrote to his wife Lucy in 1822, carefully distinguishing Mason's talent from his own, that Joseph Mason "draws flowers better than any man probably in America." Understandably Mason chafed under Audubon's unwillingness to recognize his artistic talents in what was already Audubon's grand plan. On 23 August 1822, Mason left Audubon's employ at Natchez and returned to Cincinnati. Whether it was Mason who later worked in Philadelphia for William P.C. Barton has not been confirmed.[22]

Joseph Mason deserves a study and a census of his Louisiana drawings that will, however, be nettled with confusion, partly on dates, but perennially on attribution. The 1966 American Heritage edition of Audubon's watercolors with Marshall Davidson's introduction, and assistance from the late Harold W. Rickett of New York Botanical Garden, will be your best source for the investigation.[23]

A familiar spring umbellifer about New Orleans is chervil, as the genus *Chaerophyllum* is known in Europe; ours is *C. tainturieri* described by William Jackson Hooker in 1835 from Louis Tainturier's specimen.[24] I found some hints about the Tainturier family in New Orleans' St. Louis cemetery no. 1, aisle 3, that suggest they came from Santo Domingo; no one has put all the dates and doubts into a believable account. S.W. Geiser suggests that Tainturier was professor of mathematics at the College d'Orleans, located at the corner of Hospital and St. Claude streets in New Orleans. Eight letters survive in the Hooker correspondence, the last, 18 April 1836, informs of the dispatch of some plants collected "at 60 miles above New Orleans and which, in great part, are different from those which were sent twelve years ago." This Tainturier essay-in-the-waiting would assist the systematic botanist, and gratify the historian: botanists do not live alone. The College d'Orleans, founded in 1811, represented French influence as Louisiana's first institution of higher learning. One commentator, however, remarked that the Creole cared little for schooling, and so the college "sank in a sea of troubles" and was closed in 1826.[25]

The natural sciences have always flourished with the hand of what Mark Catesby called "encouragers" or the patrons. Little known are the agents who forwarded the collections, held the mail, the true confreres. Joseph Barabino, who kept a small apothecary shop at 144 Old Levee Street, was the agent for Lesueur and Say.[26] The French historian of natural history E.T. Hamy left us an account of Barabino:

> a zealous naturalist who was especially interested in entomology, but whose equipment was quite incomplete. Lesueur helped his new friend with advice, furnished him with pins, cork sheets, etc., etc. The Barrabino [sic] drugstore was the gathering place of several devotees of natural history. It was near the leading market, and everything that was strange in the vicinity of the city was brought there. Lesueur dreamed of making it the center of a society similar to that of Philadelphia. Barrabino spoke several languages and correspondence with foreign countries could be carried on with ease.[27]

Barabino collected *naturalia* for Bory de Saint-Vincent and for the Lyceum of Natural History in New York from the year 1825.[28] When the paleontologist of Philadelphia's Academy, Samuel George Morton, named the Cretaceous fossil

Inoceramus barabini he remarked "I name this species in memory of the many favors I have received from my friend Joseph Barabino, Esq., of New Orleans."[29] Lesueur's portrait of Barabino in the archives of New Harmony bears a note by Robert J. Usher, librarian of the old Howard Memorial Library at Lee Circle: "he died while quite young from fever contracted in the swamps in which he was searching for ferns." The year was 1834.

At Oxford University's Botany Department I was shown the portrait of Charles Giles Bridle Daubeny (1795–1867),[30] who kept a pair of organ-grinder's monkeys at the gate to the Botanic Garden next door to where he lived, in the Gatehouse. These lively guards set off an alarm at unwanted visitors. Daubeny, the son of a rector at Stratton in Gloucestershire, a graduate of Winchester and Magdalen College, was intended for a medical career, but his classes at Edinburgh aroused his interest in geology, especially in volcanology. After travels on the continent he began, when twenty seven, to teach chemistry at Oxford, and two years later was made Professor of Botany in 1834. He visited Canada and the United States, touring Louisiana 5–28 March 1838. His *Journal of a tour* (1842) in an edition of 100 copies "for private circulation," accounts for why so few know Daubeny's American sojourn. New Orleans, Opelousas, "Lake Chicou" come into his narrative but it was a lingering winter that year, and so his plant notes are fewer than for other states he visited. In Daubeny's *Popular geography of plants* (1855) he comments that magnolias "must be seen in America before we can form any conception of their splendour. A petted Magnolia nailed up against a south wall in an English garden, gives a very poor idea of the magnificent trees to be seen there, sometimes 90 feet in height . . . whilst the profusion of their large white blossoms, just delicately tinted, is beautifully contrasted by the background of shining dark green leaves."[31] In a letter to W.J. Hooker, Daubeny wrote "I am distracted by too many objects," and that Hooker would find scant botanical notices in his book.[32] Daubeny's *Journal* deserves, indeed invites with its honest commentary, a rebirth by some publisher, though some of us may not agree when on leaving New Orleans he said "I never left a large city with less regret."

Thomas Drummond wrote his patron William Jackson Hooker at Glasgow from New Orleans on the 5th of January 1832 "I take this opportunity of a vessel going direct for the Clyde to forward what collections I have made during the past season."[33] Born in Perthshire, Scotland, Drummond fell into the orbit of William Jackson Hooker, then Professor of Botany at Glasgow. Perhaps lowly mosses had encapsulated their friendship. Though Professor Hooker reported on Drummond's field work in America in the pages of the *Journal of Botany* soon after his letters arrived, to read the eleven closely packed letters of Drummond, now preserved at Kew, is to sense the high tide of botanical exploration. Drummond was collecting plants (and other *naturalia*) for subscribers whom Professor Hooker had contacted on his behalf. On the 20th of May 1832

Drummond wrote "I have been extremely busy" and asked Hooker to negotiate only eight or ten specimens for each species. To keep up anticipations, however, Drummond often mentioned plants he had collected, for example, *Acacia, Allium, Crinum,* and *Zizania*. Drummond told Hooker, "you frequently find a single specimen & probably don't find it again so that it is impossible to have all the collections [of a single number] full." [34]

At the close of his 1832 season in Louisiana, Drummond hoped he would be able to proceed north from Covington to Natchez through the pine woods north of Lake Pontchartrain where he found what he called "a few pretty plants," namely two species of *Rhexia* and two of *Sabatia*. The extreme barrenness of this country, however, disappointed him. He mentioned that he had found *Drosera brevifolia* and *Pinguicula lutea*.

Before Louisiana, Drummond had been with Sir John Franklin in the Canadian Arctic, and then in the Canadian Rockies collecting both mosses and flowering plants. Yes, this was the "Drummond" of Drummond's phlox, named by Hooker.[35] His phlox was collected in southeastern Texas, grown from seed, the flowers described by Hooker as "brilliant rose-red or purple varying exceedingly on different individuals in intensity." Drummond, however, did not live to admire his introduction. Hooker regretted that although the phlox "bids fair to be a great ornament to the gardens of our country [it must] serve as a frequent memento of its unfortunate discoverer." Drummond's plan after exploring Florida had been to sample the exciting Cuban flora, but his last days in the spring of 1835 will never be known. The British consul at Havana sent Drummond's death certificate to Professor Hooker. Geiser wrote "had [Drummond] made Texas his permanent home the history of Texas botany would have been written very differently," and that he was a man of "tremendous physical energy, of persistence . . . forgetful of self . . . it seems an unnecessarily cruel fate that kept [Drummond] from bringing to completion his work in Texas." [36]

An international enterprise founded by a physician and a professor-parson of the German town of Essingen related to a botanist of Louisiana. A Natural History Traveling Society, or the *Unio Itineraria* of Württemberg, was founded by Dr. Ernst Steudel and Professor Christian Hochstetter, both of Essingen. The *Unio Itineraria* collected specimens from correspondents: William Darlington of West Chester, Pennsylvania, and the French naturalist Jean Louis Berlandier, who collected in Texas, were among the members. By exchange-sale, specimens were distributed to cabinets especially in Europe. Dr. Joseph C. Frank,[37] born in Rastadt, who had published a local flora of his native town in 1830, was deputed by the Society to travel and collect in the United States. According to Stuckey, Dr. Frank botanized in southwestern Ohio and the *Unio Itineraria* distributed sets of his plants, 100 sheets for 11 florins each. These were an important source of information on 19th Century Ohio flora. The Kentucky botanist

Dr. Charles Short says the Grand Duke of Baden commissioned Frank to collect and investigate the flora of the southern states, but his Louisiana stay was brief.[38] He and his wife were stricken with yellow fever, and Frank died two months later in New Orleans in November 1835. He was fifty three. His wife returned to Germany with his collections, and they were distributed in 1836 by *Unio Itineraria*.

Josiah Hale, born in Virginia and a private pupil of Rafinesque, graduated at Transylvania with a medical degree in 1822.[39] He then moved to Port Gibson, Mississippi, an important shipping center where he practiced medicine and collected the local flora. He took off two years for poor health to botanize in Louisiana until 1825 when, as a physician in residence, he moved to Josiah Johnson's plantation twenty miles from Alexandria and continued to collect plants. Hale's first letter to John Torrey in 1838 began his association with Torrey and Gray.[40] They proposed the genus *Halea* in 1842, but forty years later Gray decided it was indeed a species of *Tetragonotheca*. Occasionally a Hale label would catch Gray's eye, for example, "*Ulmus crassifolia* Nuttall. Grows in swamps, subject to inundation, Red River - flowers late in Sept. and ripens fruit in Oct. It will be seen by the present sp[ecimen] that the expression 'ramis teretibus' does not universally apply." [41] Hale's plants were not numbered, and so after Charles Short and others had divided the original specimens and exchanged a portion, the origin "Louisiana" was often all that accompanied the specimen.

The keen interest in botanical exchanges of this era may be seen, for example, as when Hale wrote to Torrey, "at the request of my friend Dr. Leavenworth, I have put up & shipped on the brig Mary Ann, Capt. Wade, a box of specimens of plants growing in the neighborhood of Alexandria." [42] On another occasion Hale wrote to George Engelmann from Canton, Mississippi, "some weeks ago I put on board the steamer Woodruff, at New Orleans, for St. Louis, a small box of specimens of plants for Dr. Mead of Augusta, Ill., directed to your care, by his instructions." [43] Hale took early retirement, married, and invested in local enterprises. When his fortune of 100,000 dollars plunged to 10,000 dollars, he moved to New Orleans to begin private practice again. During these six years in New Orleans he joined Riddell and others to found the New Orleans Academy of Sciences on 1 April 1853, and was elected the first president. Heart trouble set in in January 1856, and Hale died 21 July. In the Academy's Minute Book is written, Dr. Hale "has, perhaps done more to make known the peculiarities of the flora of Louisiana than all others taken together." [44] Hale's particular interests were grasses and sedges, two groups not enamored of by his friend Riddell.

Elsewhere I have taken the historical heights reached by two American botanists for whom two 14,000-foot peaks in Colorado have been named, Gray's and Torrey's, for they dominated nineteenth century systematics. [45] In the middle decades so many novelties were being discovered in the Great West that they nearly ran out of names of botanists to commemorate. William Marbury Carpenter[46] did not collect in Colorado or California, but the stunning genus *Carpenteria*, of which there is but a single species, named by Torrey, commemorates an endemic saxifragaceous shrub of the southern Sierra Nevada. Carpenter was born in West Feliciana Parish 25 June 1811, about twelve miles from St. Francisville. The Carpenters had lived in Louisiana since 1773, and on his mother's side, the Marburys since 1795. At eighteen Carpenter was admitted at West Point as a cadet, but with a rheumatic heart he returned home just before graduation. Soon after leaving West Point he accepted a professorship of Natural Science at Centenary College, Jackson, Louisiana, then called College of Louisiana, teaching botany, geology, "and some other things." He botanized widely in Louisiana on vacations, occasionally with students. In 1832, for example, he collected around Opelousas.

Carpenter wrote to John Torrey, "You will perhaps find some of my statements respecting the size of plants in the south, as inclining to extravagance. If, however, you have traveled in our delta, you will at once know that it is not exaggeration. For example, in vol. 1. p. 260 *Fl[ora] N[orth] A[merica]* you state as follows of the *Berchemia volubilia* ["supple-jack" of the bayous, *Berchemia scandens*] climbing to the height of 12 or 15 ft. In Louisiana, trees exceeding 100 ft in height are sometimes completely covered by it," and "I believe that vines of it are common here which would measure more than 200 ft, and would have a circumference near the root, of 6 to 9 inches."[47]

It is not recorded when Carpenter collected his M.D. degree, but he practiced about Jackson and from 1842 taught materia medica at the Medical School of Louisiana in New Orleans. Charles Lyell, British geologist, visited New Orleans, and we have his story: "Dr. William Carpenter, although in full practice as a physician, kindly offered to accompany me [to examine the geology around Balize, in the Mississippi delta] and his knowledge of botany and geology, as well as his amiable manners, made him a most useful and agreeable companion."[48] They had carried Charlevoix's maps of the passes, published in 1743, and had found them remarkably accurate.

Before his death at thirty-seven years Dr. Carpenter published on geology in Silliman's *Journal*. Perhaps biographical details are buried in Benjamin Silliman's papers at Yale. Fewer than one hundred Carpenter specimens now survive in the Tulane University herbarium. They were once part of the New Orleans Academy of Sciences collection assembled by the physician-botanists Riddell and Hale.

Who was the leading botanist of Louisiana in the Nineteenth Century, who engaged the important collectors Josiah Hale and William Carpenter to cooperate with him in what might have become the first synopsis of the state flora? John Leonard Riddell. Riddell will remain a riddle. More writers have discussed Riddell than any other figure in our story, yet no full biography of this man with details of his various enterprises has ever appeared, though Karlem Riess came close.[49] Perhaps the very incubus of records—twenty eight manuscript diaries at Tulane—have hampered the effort. "At the time of his death, 1865, [Riddell] was considered by many to be the foremost American scientist."[50]

After botanical instruction from Amos Eaton, whom we must admit was one of the most colorful figures in our history of science,[51] Riddell was actively botanizing in Ohio, and trying to sell his bound book-like herbaria to citizens as well as to teachers in female academies. He advertised in the Marietta newspaper that he was willing to collect plants for sale: dried specimens for conversation pieces! In 1833 he began corresponding with John Torrey and sent him herbarium specimens. His 116-page *Synopsis of the flora of the western states* published in Cincinnati in 1835—no small synopsis—was the basis for his botanical activities in Louisiana after his arrival in New Orleans in 1836 to teach chemistry officially, and natural history actually at the Medical College of Louisiana. In many ways we are reminded of Rafinesque. Besides Riddell's catalogue of plants growing spontaneously in Franklin County, Ohio, his six-page "Geological ramble ... near Cleveland," and his abstract on *Oscillatoria* structure, by 1847 he was also lecturing at the People's Lyceum of New Orleans on "Orrin Lindsay's plan of aerial navigation with a narrative of his explorations in the higher regions of the atmosphere and his wonderful voyage around the moon." Riddell's lecture was printed, and it has been suggested that he anticipated H.G. Wells by some half-century. Remember that Riddell's invention of the first practical binocular microscope was noticed in the eleventh edition of the *Encyclopaedia Britannica.*

Riddell served as Federal postmaster of New Orleans during Jefferson Davis's Confederate years. When the Confederate postal system was started 1 June 1861, prepayment of all postage in cash was demanded. It was then that Riddell circumvented Confederate action by issuing "provisional stamps" and "fractional currency" in denominations of one cent to five dollars—all to facilitate the Federal cause.[52] Riddell was undoubtedly a spy for the Union. Small question but that Riddell's botanical work had to be set aside. And where is the largest collection of Riddell's specimens to be consulted? Not in the United States, but at the Natural History Museum, London. Through A.H.G. Alston's efforts it had acquired from a provincial museum in the Midlands a set of 320 specimens, mostly of Louisiana plants (although the bound volume is titled "Ohio"!). Paris had 290 Riddell sheets, acquired with the Durand herbarium,[53] from which Riddell specimens were distributed.[54] The Fielding Herbarium at Oxford University contains about 70 specimens, possibly acquired by Prof. Daubeny.[55] On 27 March 1838 Daubeny met Riddell on his American tour, and though he recorded his New Orleans visit in his *Journal*, strangely he does not mention Riddell.

In this country Tulane University probably has the largest series, roughly

125 sheets, these surviving from the old New Orleans Academy of Sciences herbarium.[56] Gray Herbarium, Torrey Herbarium, Philadelphia Academy, Darlington Herbarium at West Chester, Missouri Botanical Garden, and Smithsonian Institution, all have Riddell specimens. His conflict with Gray, the leading figure in American botany at the time and the only botanist to win a head in the Hall of Fame in New York City, made history. In 1851 Riddell completed a synoptical account of the plants of Louisiana which he submitted to the Smithsonian Institution for publication. Joseph Henry sent the manuscript to Asa Gray for consideration, a customary practice. Though no correspondence relative to Gray's rejection has ever been located, the evidence is found in the Gray Herbarium. Gray scissored and inserted pages from Riddell's manuscript into the copy of *Synopsis of the flora of the western states* which Riddell had presented to him. There will also be found neatly folded manuscript pages in packets on herbarium sheets of the respective species described in Riddell's manuscripts.[57]

Handicapped by residence in a city which Lyell characterized as gripped by cultural paralysis, plagued by two attacks of yellow fever in 1837 and 1853, weakened by the animosities of his colleagues, bound by high costs of local printing and by protracted delays in mail deliveries with his botanical correspondents, Riddell labored under impressive difficulties. Yet, as James Cassedy expressed it, "he combined luck, native talent, and audacity to achieve considerable scientific success in antebellum United States."[58] Granted, his native talents were less than those of an Engelmann or a Chapman, two practicing physicians who achieved more substantial botanical successes. For all its imperfections Riddell's *Flora* would have stabilized the knowledge of Louisiana botany in the mid-nineteenth century.

"The scientific man is always on the road, never at journey's end," as T.D.A. Cockerell wrote, "we necessarily work with incomplete materials and more or less inadequate tools. We have to build on foundations often poorly established, and no matter how clever or industrious we may be, posterity will have to revise and correct much of what we have done. So true is this, that it is easy to become discouraged, and many do fall away and give up the quest."[59]

Americus Featherman collected plants in Louisiana from 1858 until 1875. He was born in 1822 in Oettingen, a county in Germany, and came to the United States when seventeen years of age. According to John Hendley Barnhart he studied medicine at Paris, practiced medicine in Missouri and studied and practiced law.[60] He published three reports on agricultural botany while teaching in the Louisiana State University between 1869 and 1872. For some reason he returned to Europe in 1875 and lived in Paris. Over one hundred of his plant specimens are reported to be in the Paris herbarium. Asa Gray disposed of twelve proposed new species described from Louisiana by Featherman. One, *Sabatia oligophylla*, Featherman illustrated in water color.[61]

The New Orleans World's Industrial and Cotton Centennial Exposition of 1884 brought together botanists with their exhibits. John Gill Lemmon and his wife Sara Allen Plummer Lemmon exhibited Pacific Coast conifers, pressed ferns, and wild flowers.[62] George Vasey submitted grasses, and Joseph Finley Joor, who had lived in Texas for a decade, exhibited the woods of Texas. Joor, born on the Comite River, Parish of East Baton Rouge, graduated from the New Orleans School of Medicine, served as Quarantine Surgeon at Ship Island Station, and practiced at Thibodaux.[63] Facing poor health he moved to the prairies of Texas, first at Harrisburg, then at Birdston. While at Birdston he wrote to George Engelmann for some plant identifications: "I have now on hand specimens of 100 doubtful plants, including several Cruciferae, a Claytonia, a Callirrhoe."[64] He listed a dozen genera, all evidence of his botanical acuity. Joor was appointed Assistant Commissioner for Texas to prepare exhibits of woods and Texas plants for the Exposition.

It was Paul Tulane's gift of $10,000 to establish a natural history collection, shortly after his million dollar educational endowment in 1884, that brought Joor to the Tulane University of Louisiana. He began his assistant curatorship by arranging the 120 mounted birds, small-case habitat groups of chimpanzee, platypus, Kodiak bear, etc., and salvaging the herbarium including collections of Hale, Riddell, and Carpenter which had suffered from neglect in the New Orleans Academy of Sciences. He was appointed Professor of Botany in 1889 though without teaching duties. Tulane President Johnson urged Joor to go to Avery Island when a new shaft in the salt mines was exposing fossils and artifacts. Joor reported that the McIlhennys "most agreeably and hospitably received me."[65] Fossils collected there were divided between Tulane and Mr. Edward Avery McIlhenny; among them were two mastodon teeth, bones of equus, and of a giant sloth. For five years Professor Joor, no longer practicing medicine, cared for the Tulane Museum, continuing to collect plants mostly on his limited free time, and corresponded with botanists, among them George Vasey, A.W. Chapman, and William Trelease of the Missouri Botanical Garden. The early Joor specimens from the New Orleans Academy of Sciences were not among those purchased by the Garden in 1897.[66] Joor died at the age of forty-four. His daughter, Harriett, who taught art at Newcomb College and who retired to Lafayette, Louisiana, asked if I would accept her father's letters on behalf of Tulane. Gladly I did. Those 103 pieces, including a postcard from Asa Gray, now in Tulane archives, relive Joseph Joor's enthusiasm for plant study.

Perhaps the best known Louisiana botanist of the 1890's was the clergyman Abbé Augustus Barthélemy Langlois, born in Charanay, Loire, France, 24 April 1832. He attended the "Grand Seminary" of Lyons, and after 1855 the Seminary of Cincinnati, Ohio, and was ordained in 1857. He was appointed rector of Plaquemines Parish, which extended 110 miles along the Mississippi River. On his arrival at his new home he found the bloody cassock of his predecessor who had been murdered when called out during the night. Pastor Langlois served thirty years at Pointe à la Hache, amassing a reference library and comprehensive collections—his large herbarium went to Catholic University of America, but was later dispersed to several other institutions.[67] In 1887 Langlois moved to St. Martinville in the Teche country. That year he published what he called his provisional *Catalogue* of the Mississippi Delta flora.[68] In it he enumerated nearly 1200 seed plants, 650 fungi, 96 mosses, and 29 hepatics. Lichens were not listed, but over 200 numbers of them had been collected by the time of his death in 1900.

Langlois' fourteen letters to E.L. Greene from 1894 to 1897 tell of his "very happy voyage to Europe" in 1896 when he examined the herbaria at Geneva. "I only discovered at Boissier's Herb. my Louisiana lichens partly determined by John Mueller of Argau before his death."[69] He had also seen the "famous bryologists" Capt. Ferdinand Renauld and Jules Cardot. Langlois' nephew, rector at Breaux Bridge, Louisiana, wrote after his father's death that Langlois' library of "at least 300 volumes" included the thirty-six volumes of Job Bicknell Ellis's *North American fungi*.[70] According to Saccardo's *Sylloge fungorum* there are only 50 sets of Ellis in the world. Shirley Tucker has published a gazetteer of Langlois' collection sites and a bibliography.[71]

What's in a name? How about Bush? How about a "country storekeeper and botanist" as the New York Times headlined its story.[72] When Benjamin Franklin Bush, born in Columbus, Ohio, 21 December 1858, was seven, his mother moved him to Independence, Missouri.[73] The Missouri Pacific Railroad had just been opened from St. Louis to Kansas City, and so Benjamin and his mother rode the first train. Passenger pigeons were in the woods, Carolina parakeets ("paroquets" could be caught with a coat or hat), and prairie chickens were abundant. The Bushes moved to Courtney, sixteen miles east of Kansas City in the early 1890s. In Courtney he sold shoes, overalls, plugs of tobacco, and groceries. Yet Bush was able to prepare herbarium specimens. Thousands of sheets are in leading herbaria—*Index Herbariorum* lists twenty-seven herbaria: the Gray Herbarium has 3400, and the National Herbarium over 5000. His early contacts with Asa Gray and George Engelmann launched his traveling career, and William Trelease's contacts were critical. In 1899 Bush began a decade of exploration for the Arnold Arboretum with Professor Sargent relying on his field knowledge to ferret out the hawthorns then under pursuit. Ernest Jesse Palmer, who wrote a portrait of Bush, met him in 1900. Both botanists had collected in Louisiana. It is Bush's article in Sargent's *Garden and Forest* in 1897 about his search for corkwood, a shrub or small tree to thirty feet, that still challenges.[74] Corkwood, *Leitneria floridana*, discovered in swamps in southeast Missouri, was described by the Apalachicola botanist A.W. Chapman, friend of Asa Gray and John Torrey. Before Bush's discovery *Leitneria* had been known only from its first collection in Florida, and a dubious Drummond specimen from southeast

Texas. Trelease sent Bush to search Bayou Goula, White Lake, Louisiana, but though he "examined thoroughly" the cypress swamps he failed to find any *Leitneria*. He considered the "largest development" of *Leitneria* to be in the "big Lake, in se. Mo. and ne. Arkansas," where shrubs were "about twelve feet in height with stems nearly four inches in diameter." Who will find the first *Leitneria* in Louisiana?

Reginald Wodehouse Somers Cocks took his M.A. at Trinity College, Cambridge, with first honors in classics.[75] He must have been influenced especially by Kew-trained curator at the Cambridge Botanic Garden, Richard Irwin Lynch, indeed a linchpin. Lynch had raised the garden's collection almost to that of Kew for its "botanicks."[76] Cocks first arrived in Canada in 1890, but soon came to Louisiana. There are specimens at Tulane dated "Feliciana, March 1892," and by 1898 he was active in the Louisiana Society of Naturalists. By May 1906 he was corresponding with E.L. Greene, then at the Smithsonian, inquiring about Langlois' localities, and by December he had sent a "small package of plants" for Greene's attention. "I was very often able to get help from Dr. Mohr and Father Langlois" Cocks wrote, "but since their death there has been no botanical investigator anywhere in these parts."[77]

The year 1908 was a flowering for Professor Cocks, for two reasons: he met Harvard dendrologist Charles Sprague Sargent, and after one year at Louisiana State University he accepted the Ida Richardson Chair of Botany at Tulane. This chair had been created by the wife of the Dean of the Medical School, Tobias Gibson Richardson.[78] Cocks was already familiar with the Tulane herbarium, citing records in his paper in the Society of Naturalists' *Proceedings* as early as 1900.[79] It is the Sargent-Cocks circulation that was so significant to our botany, the systole and diastole that kept specimens in motion and diagnosed. I was instructed in Louisiana botany by the over 300 letters written by Charles Sargent to Professor Cocks, "my companion in annual journeys of exploration through the forests of Louisiana,"[80] from 1908 until 1926 when their lives and letters ceased. These letters are alive with the pursuit of hawthorns, oaks, and hickories, which Sargent conjectured he had missed in the first edition of his *Manual* (1905). For example, Sargent wrote Cocks, "in August 1901 Bush collected at Minden a sterile branch of a distinct-looking" species of *Crataegus* subgenus *Crus-galli*, adding a tease: "Is not Minden a place to explore?"[81]

Sometimes the "Cock's spur" is not always on the hawthorn. Sargent: "Britton says the . . . Nutmeg Hickory is called Bitter Walnut in Louisiana. This must be a fake story for in the first place the kernal [sic] is not bitter, and secondly is so rare in Louisiana that it cannot have secured a popular name."[82] Sargent wrote: "Thank you again for all your kindness to me during my visit to Louisiana. I never had a better week or saw finer or more interesting trees, and we must make another trip together before long."[83] After that 1910 letter they had many trips together. Some of you may know the house at the corner of Carrollton and

Freret streets built in 1849 by Nathaniel Wilkinson in Gothic cruciform design, the house snuggled behind a curtain of trees and shrubs. When Charles Low lived there Professor Sargent was house guest on his visits to New Orleans.

When I came to New Orleans in 1947, Percy Viosca was a local watchword. He had supplied teaching materials for biology classes, was with the State Department of Conservation, Curator of Reptiles, etc., in the State Museum, New Orleans, and was a President of the Louisiana Academy of Sciences. "Louisiana's first major herpetologist probably was Percy Viosca, 1892-1961."[84] He published a benchmark paper in the journal *Ecology* on "Louisiana wetlands and the value of their wildlife and fisheries resources."[85] He had given a radio talk sponsored by the Smithsonian Institution, this published in *Scientific Monthly*.[86] Viosca trumpeted Louisiana in 1933 in "a handy reference for tourists . . . and nature lovers generally," published in New Orleans.[87] This is still a very "handy" guide for tracing names now hushed by progress, and the folding map of landform-vegetation by L.E. Boesch is useful.

But it was Viosca's careful study of Louisiana irises that calls our wider attention. Edgar Anderson, that zealous researcher at the Missouri Botanical Garden, gave Viosca front-page recognition in his book *Introgressive hybridization* published in 1949.[88] Introgressive hybridization was a botanical topic that in a decade translated the genetics of hundreds of American plants into printer's ink. Viosca's study of Louisiana irises had soberly reduced the panoply of described "species" proposed by J.K. Small and E.J. Alexander into what Viosca interpreted as but a few freely interbreeding species. There were ninety-five taxa in Small's *Manual* of 1933. Edgar Anderson had known irises in the field while collecting and researching the genus *Tradescantia* with Robert Woodson. Paul Percy Viosca was a field naturalist who knew the sound of frogs, of birds in fleeting migration, and the non-migratory snakes we met in the bayous. I recall my visit to his bedside when he imprinted a thought: "When I have so much knowledge of the fauna and flora, why should this cancer snuff out my life?" He was seventy-two when he died a few weeks later.[89]

Versatile Clair Alan Brown, associated with Louisiana State University from 1926 for forty-two of his seventy-nine years, was first a forester and a mycologist studying wood-rotting fungi.[90] Later he wrote on Louisiana's fossil pollen record, her paleogeologic history, revegetation after flood waters, what plants grow on Indian mounds and the extent of middens, weeds in rice fields, and mushroom poisoning among cattle. He contributed nine chatty essays to *Louisiana Conversation Review*. His *Louisiana trees and shrubs* introduced our woody plants to hundreds of young biologists and vacationers.[91] He liked ferns and found their soil requirements interesting, co-authoring with Donovan Correll a book on ferns of the state.[92] Their attractively illustrated guide, published in an edition of only 500 copies, considers where and why ferns grow in a region we often think of as fern-poor.

Clair was a smiling botanist, optimistic, and thoroughly social. When he married Clara Douglas, serials librarian at the University in 1963, his interest in petrified wood joined her enthusiasm for lapidary handicraft. Clair knew this state. I remember how he warned me on a field trip along Thompson Creek to watch for quicksands. His handy manual *Wild flowers of Louisiana*, illustrated with his own full-color photographs, will be a record of our flora of 1972 a hundred years from now.[93]

> Th' assay so hard, so sharp the conquering ...
>
> Chaucer, Parlement of Foules, ca. 1382

ACKNOWLEDGMENTS

My thanks to so many librarians, archivists, and biologists who have aided my efforts in tracing our history. If this review is rewarding, thank my wife, Nesta,[94] my companion in zealous research.

12. Auguste Denis Fougeroux de Bondaroy, *Hist. Acad. Roy. Sci. Mém. Math. Phys. (Paris)* 1786 (1788) 5. Ewan, *Bibliog.* 10.
13. Hazel le Rougetel, *Chelsea gardener, Philip Miller 1691–1771* (Portland, Ore., 1990) 182.
14. J. Ewan, *William Bartram, botanical and zoological drawings, 1756–1788* (Philadelphia, 1968) 154–167.
15. William Dunbar, 1749–1810, "Scottish-born scientist and Mississippi planter," took up his plantation near Natchez in 1792. Dunbar befriended Bartram's friend, Alexander Wilson. See Clark Hunter, *Life and letters of Alexander Wilson* (Philadelphia, 1983) 101, 373, and Wilson's letter, 358.
16. Francis Harper, *Travels of William Bartram, naturalist's edition* (New Haven, 1958). From this Harper classic, a paper-bound edition with background essay by Robert McC. Peck (Peregrine Smith, Salt Lake City, 1980) is reliable for maintaining original pagination of the 1791 edition.
17. For Claude César Robin, 1750-post 1807, see F. Monaghan, *French travelers in the United States, 1765–1932* (New York, 1961) 81.
18. C.S. Rafinesque, *Florula Ludoviciana* (New York, 1817) is an abridged and augmented translation of Robin's "Flore Louisianaise" in his *Voyage dans l'intérieur de la Louisiane, de la Floride occidentales … 1802 [to] 1806* (Paris, 1807) 3:325–538. See J. Ewan, editor's introduction, reprint Rafinesque, *Florula Ludoviciana* (New York, 1967) i–xl.
19. Essential reference: Stanley Clisby Arthur, *Audubon, an intimate life of the American*

woodsman (New Orleans, 1937) 273, the basis of Irving T. Richards, "Audubon, Joseph R. Mason, and John Neal," *Amer. Lit.* 6 (1934) 122–140, by correspondence with Arthur. Current study: Lois Elmer Bannon and Taylor Clark, *Handbook of Audubon prints* (Gretna, La., 1991) 57, Mason's backgrounds, 91–108. Francis Herrick, *Audubon the naturalist* (New York, 1917) 2:69 refers to Thomas Sully's report of Mason working in Philadelphia. The "Joseph R. Mason, 1808–1842" in George C. Groce and David H. Wallace, *Dictionary of artists in America, 1564–1860* (New Haven, 1957) 428, singularly makes no reference to Mason's association with Audubon!

20. Marshall B. Davidson, Introduction, *Original water-color paintings of John James Audubon for the Birds of America* (New York, 1966) plate 211, but Mason's drawing of *Hydrangea quercifolia*, plate 83, as usual makes no record of his participation.
21. Aloysius Enslen, Austrian gardener whom Frederick Pursh had known in Europe. He collected for Prince Lichtenstein as far south as New Orleans, where he first found the copper-colored *Iris* "on the banks of the Mississippi River near New Orleans," but the records in Vienna evidently lost. Enslen's discoveries, including the iris, were circulated in the Philadelphia coterie. John Lyon listed the "sp. nova. copper coloured flowers," then undescribed, on his broadside of garden novelties from America (*Trans. Amer. Philos. Soc.* 53 (pt. 2) (1963) 57). The latest account on Enslen is J. Ewan, editor's introduction, reprint, F. Pursh, *Flora Americae Septentrionalis* (Cramer, Vaduz, Germany, 1979) 15–16. See also J. Ewan, "From Calcutta and New Orleans, or, tales from Barton's greenhouse," *Proc. Amer. Philos. Soc.* 127 (1983) 125–134. The type specimen of *Iris fulva* Ker. was destroyed in the bombing of World War II. See also Margaret Stones, *Flora of Louisiana ... with botanical descriptions by Lowell Urbatsch* (Louisiana State Univ. Press, Baton Rouge, 1991).
22. William Paul Crillon Barton, 1786-1856, M.D. and Prof. of Botany, University of Pennsylvania, drew 49 native species, colored the plates himself, for his *Vegetable materia medica of the United States* (Philadelphia, 1817–18) but it would have been Barton's ambitious three-volume *Flora of North America* (Philadelphia, 1821-23) that possibly involved Joseph Mason. Barton's wife, Esther Sergeant, assisted with the drawings of both works. See J. Ewan, "History of Philadelphia horticulture: chronology, dramatis personae," *From seed to flower, Philadelphia 1681–1876* (Penn. Hort. Soc., 1976) 59, 65.
23. See note 20. Davidson introduction, xi–xxix. Color reproductions from the Audubon collection at the New York Historical Society.
24. Louis Francois Tainturier, fl. 1825-1840, market-gardener (?), correspondent of W.J. Hooker, whose eight letters, 1824–1836, are preserved at Kew, lived at 47 Burgundy St., acc. *Gibson's guide and directory, 1838,* and *Michel's New Orleans directory, 1840.* The scattered references to Tainturier in Torrey and Gray, *Flora* 1:15, the collections in the Philadelphia Academy, and in T. Nuttall, *Sylva* 1:194, represent correspondence with Hooker and not the unlikely correspondence of Tainturier with American botanists. Ewan, *Old South*. W.J. Hooker, Nov. 21, 1825, to John Richardson, in part, "I am even keeping in view our projected Flora of British N. America and am extending my correspondence to all parts of that Continent, in order that our portion of it may in due

time, be the better illustrated. I have an excellent correspondent even at New Orleans, who sent me large collections from that neighbourhood & some way up the banks of the Mississippi." Hooker-Richardson letters, Kew.

25. For College of Orleans see Joseph A. Breaux, *Publ. Louisiana Hist. Soc.* 7 (1915) 136–142. Ewan, *Old South*. Ewan, *French naturalists* 173. Could there be a connection between the "herbarium of 8000 plants well dried and well preserved" and Tainturier? Joseph Lakanal announced at the College of Orleans in 1822. See John Charles Dawson, *Lakanal, the regicide* (University, Ala., 1948) 133.
26. S.H. Scudder, *Psyche* 8 (1899) 306–308. Harry B. Weiss and Grace M. Ziegler, *Thomas Say, early American naturalist* (Springfield, Ill., 1931) cites six Barabino references.
27. E.T. Hamy, *Travels of the naturalist Charles A. Lesueur in North America, 1815–1837*, Milton Haber, transl. (Kent, Ohio, 1968) 66.
28. Ewan, *Bibliog.* 38, 52, 56. For more on Lesueur and Bory see M. Ly-Tio-Fane, *Le géographe et le naturaliste à l'Ile-de-France, 1801, 1803* (Port Louis, Mauritius, 2003).
29. S.G. Morton, *Synopsis of the organic remains of the Cretaceous group of the United States* (Philadelphia, 1834) 63. Though Morton did not botanize, Asa Gray memorialized him in the celastraceous genus *Mortonia*, in *Plantae Wrightianae* 1 (1852) 34, "to that most eminent American naturalist, the late Samuel George Morton, author of *Crania americana*." For sidelights on the "American Golgotha," see Frank Spencer, *Trans. Stud. Coll. Physicians Philadelphia* ser. 5, 5 (1983) 321–338, and W.J. Bell, Jr. in C.C. Gilespie, ed., *Dictionary of scientific biography* 9 (1974) 540—541.
30. Daubeny, son of an Anglican cleric, is identified by Arnold Thackray as a chemist and geologist, not as a botanist (in C.C. Gilespie, ed., *Dictionary of scientific biography* 3 (1971) 585–586. At the Oxford meeting of the British Association for the Advancement of Science when the Bishop of Oxford hoped to conclude the sessions by "smashing Darwin," Daubeny supported the *Origin*. See Leonard Huxley, *Life and letters of Joseph Dalton Hooker* (London, 1918) 1:521. The Catalogue of the archives of the Oxford Botany Department, now deposited in the Bodleian Library, lists 135 Daubeny titles. Ewan, *Old South*.
31. *Popular geography of plants; or a botanical excursion round the world* (L. Reeve, London, 1855) 113. The work was edited by Daubeny, with the author given as "E.M.C." A ms record equated this with Emily M. Cox, but the National Union Catalog ascribes the authorship to Maria E. Catlow, author of popular works on insects and shells.
32. C.G.B. Daubeny, Oxford, 4 March 1843, to W.J. Hooker, Hooker correspondence, Kew.
33. Thomas Drummond's Louisiana and Texas herbarium records were the first widely distributed among the world's botanical centers. Some of the best narrative in the field of botanical exploration, Samuel W. Geiser, *Naturalists of the frontier* (Dallas, 1948) ed. 2. 55–78, provided a background.
34. T. Drummond, New Orleans, 20 May 1832, to W.J. Hooker, Hooker correspondence, Kew.
35. *Bot. Mag.*, plate 3441. 1835. Geiser provides a map of Drummond's collecting localities.
36. Ibid. 1948, 78.

37. The collections of Joseph C. Frank, 1782–1835, M.D., in the Missouri Botanical Garden herbarium were acquired with the Bernhardi Herbarium. George Engelmann, St. Louis, 17 Feb. 1842, to Asa Gray, comments on Frank's botanizing in western Pennsylvania (Asa Gray correspondence, Harvard). Ronald L. Stuckey, *Castanea* 39 (1974) 263–272, on Frank's Ohio collections. Agnes Chase, *Contrib. U.S. Natl. Herb.* 28 (1929) 32, reported the type specimen of *Paspalum frankii* Steud., labeled "New Orleans, 1837," is in the Drake Herbarium, Paris.
38. See R.L. Stuckey, *Scientific publications of Charles Wilkins Short* (New York, 1978) i–v. Ewan, *Problems* 200. Ewan, *Bibliog.* 20.

ADDITIONS AND EMENDATIONS TO *THE WILD ORCHIDS OF NORTH AMERICA, NORTH OF MEXICO*

Paul Martin Brown[1]

Research Associate
University of Florida Herbarium (FLAS)
Florida Museum of Natural History
379 Dickinson Hall, PO Box 110575
Gainesville, Florida 32611-0575, U.S.A.

ABSTRACT

The Wild Orchids of North America, North of Mexico (Paul Martin Brown and Stan Folsom, University Press of Florida, 2003 ISBN 0-8130-2572-9) has served as an illustrated and annotated checklist of the orchids of that region. In the few years since research was completed for that work many new taxa have been described, other pertinent facts have been published, and six corrections of fact need to be added to the original manuscript. Those additions and corrections, including literature references and photographs, are presented here to enable the reader to update this volume to the close of 2005.

RESUMEN

The Wild Orchids of North America, North of Mexico (Paul Martin Brown y Stan Folsom, University Press of Florida, 2003 ISBN 0-8130-2572-9) ha servido como catálogo anotado e ilustrado de las orquídeas de esa región. En los pocos años desde que se finalizó la investigación del trabajo se han descrito muchos taxa nuevos, se han publicado otros hechos importantes, y se han hecho seis correcciones que necesitan añadirse al manuscrito original. Estas adiciones y correcciones, que incluyen referencias bibliográficas y fotografías, se presentan aquí para posibilitar al lector poner al día en 2005 este volumen.

Since the compilation and publication of *The Wild Orchids of North America, North of Mexico* in April 2003 (research completed in May 2002), six errors have been noted, several older forms revived, numerous new taxa described, new combinations published, range extensions noted, 'lost' species rediscovered, and significant publications presented. Whether one embraces all of the subspecific taxa is not the point of this publication. These taxa have been described and are present in living material, and therefore they deserve some recognition. Recent reassessments of older generic concepts (i.e., *Gymnadeniopsis*) and ongoing molecular work (i.e., *Piperia/Platanthera*) have resulted in several transfers and new combinations. Whereas this is not intended in any way to be a revised or second edition of *The Wild Orchids of North America, North of Mexico*, those combinations and transfers (although in some cases a more accurate assessment of the individual taxon) are usually listed as synonyms, with literature

references, under the appropriate species. Additions and corrections are arranged in original page order of *The Wild Orchids of North America, North of Mexico*.

Page

2

Amerorchis rotundifolia (Banks *ex* Pursh) Hultén

small round-leaf orchis

emend:

forma *angustifolia* (Rousseau) P.M. Brown—narrow-leafed form

Brown, P.M. and S.N. Folsom. 2006. *Wild Orchids of the Canadian Maritimes and Northern Great Lakes Region*, p. 284.

add:

forma *rosea* P.M. Brown—pink-flowered form

Brown, P.M. 2004 *North American Native Orchid Journal* 10: 34.

forma *wardii* P.M. Brown—bicolored form

Brown, P.M. 2004. *North American Native Orchid Journal* 10: 34.

7

Calopogon barbatus (Walter) Ames

bearded grass-pink

add:

forma *lilacinus* P.M. Brown—lilac-flowered form

forma *albiflorus* P.M. Brown—white-flowered form

Brown, P.M. 2003. *North American Native Orchid Journal* 9: 33.

Brown, P.M. and S.N. Folsom. 2004. *Wild Orchids of the Southeastern United States*, pp. 26–27.

Brown, P.M. and S.N. Folsom. 2005. *Wild Orchids of Florida*: updated and expanded edition, pp. 40–41.

8

Calopogon multiflorus Lindley

many-flowered grass-pink

add:

forma *albiflorus* P.M. Brown—white-flowered form

Brown, P.M. 2004. *North American Native Orchid Journal* 10: 21.

Brown, P.M. and S.N. Folsom. 2005. *Wild Orchids of Florida*: updated and expanded edition, pp. 42–43.

Calopogon oklahomensis D.H. Goldman

Oklahoma grass-pink

add:

forma *albiflorus* P.M. Brown—white-flowered form

Brown, 2003. *North America Native Orchid Journal* 9: 33–34.
Brown, P.M. and S.N. Folsom. 2004. *Wild Orchids of the Southeastern United States*, pp. 30–31.

10
Calypso bulbosa (Linnaeus) Oakes var. *americana* (R. Brown) Luer
eastern fairy-slipper
add:
    forma *biflora* P.M. Brown—two-flowered form
Brown, 2004. *North American Native Orchid Journal* 10: 35.
Brown, P.M. and S.N. Folsom. 2006. *Wild Orchids of the Canadian Maritimes and Northern Great Lakes Region*, pp. 32–33.

13
add:
Cleistes ×*ochlockoneensis* P.M. Brown
Ochlockonee hybrid rosebud orchid
(*C. divaricata* × *C. bifaria*)
Brown, P.M. 2004. *North American Native Orchid Journal* 10: 22.
Brown, P.M. and S.N. Folsom. 2005. *Wild Orchids of Florida*: updated and expanded edition, p. 53.

16
add:
Corallorhiza maculata (Rafinesque) Rafinesque var. *ozettensis* Tisch
Ozette coralroot
Brown, P.M. and S.N. Folsom. 2006. *Wild Orchids of the Pacific Northwest and Canadian Rockies*, pp. 40–41.
Tisch, E. 2001. *Madrono* 48: 40–42.

18
Corallorhiza striata Lindley var. *vreelandii* (Rydberg) L.O. Williams
Vreeland's striped coralroot
correct spelling to: Todsen

19
Corallorhiza trifida Chatelain
early coralroot
add:
    forma *verna* (Nuttall) P.M. Brown—yellow-stemmed/white-lipped form
Brown, P.M. and S.N. Folsom. 2006. *Wild Orchids of the Canadian Maritimes and Northern Great Lakes Region*, p. 284.

Corallorhiza wisteriana Conrad

Wister's coralroot
add:
forma *cooperi* P.M. Brown—cranberry-pink colored form
Brown, P.M. 2004. *North American Native Orchid Journal* 10: 22.
Brown, P.M. and S.N. Folsom. 2005. *Wild Orchids of Florida*: updated and expanded edition, pp. 62–63.

20
Cranichis muscosa Swartz
moss-loving cranichis
emend:
rediscovered in Collier County, Florida in 2004
Clusman, R. 2004. *Native Orchid Conference Journal* 1(2): 26–28.

21
Cypripedium acaule Aiton
pink lady's-slipper, moccasin flower
add:
forma *lancifolium* House—narrow-leaved form
House, H. 1924. *New York State Museum Bulletin* 254: 236.

23
Cypripedium fasciculatum Kellogg *ex* S. Watson
clustered lady's-slipper
add:
forma *purpureum* P.M. Brown—mahogany-flowered form
forma *viride* P.M. Brown—green-flowered form
Brown, P.M. 2004. *North American Native Orchid Journal* 10: 36.
Brown, P.M. and S.N. Folsom. 2006. *Wild Orchids of the Pacific Northwest and Canadian Rockies*, pp. 56–57.

24
Cypripedium guttatum Swartz
spotted lady's-slipper
add:
forma *albiflorum* Lee—white-flowered form
Lee, Y.N. 1996. *Flora of Korea*: 1164.

Cypripedium kentuckiense C.F. Reed
ivory-lipped lady's-slipper
add:
forma *summersii* P.M. Brown—concolorous yellow-flowered form
Brown, P.M. 2002. *North American Native Orchid Journal* 8: 30–31.

Calopogon multiflorus
forma *albiflorus* p. 8

Calypso bulbosa var. *americana*
forma *biflora* p. 10

Corallorhiza maculata var. *ozettensis* p. 16

Corallorhiza wisteriana forma *cooperi* p. 19

27

Cypripedium passerinum Richmond

sparrow's-egg lady's-slipper, Franklin's lady's-slipper

add:

forma *minganense* (Victorin) P.M. Brown—dwarf form

Brown, P.M. and S.N. Folsom. 2006. *Wild Orchids of the Canadian Maritimes and Northern Great Lakes Region*, p. 284.

28

add:

Cypripedium ×*herae* Ewacha & Sheviak

Queen Hera's hybrid lady's-slipper

(*C. parviflorum* var. *pubescens* × *C. reginae*)

Sheviak, C.S. 2004. *Orchids* 73(4): 296–299.

29

Cyrtopodium punctatum (Linnaeus) Lindley

cowhorn orchid

photograph is incorrect (is *C. macrobulbon*), see new photograph

add:

Cyrtopodium macrobulbon (La Llave & Lexara) G.A. Romero-González & G. Carnevali Fernández-Concha

giant cowhorn orchid

southwestern Florida; Mexico

photographed (1999) in Monroe County, Florida; introduced?

Brown, P.M. and S.N. Folsom. 2005. *Wild Orchids of Florida*: updated and expanded edition, p. 73.

30

Dactylorhiza aristata (Fischer *ex* Lindley) Soó var. *aristata*

Fischer's orchid

add:

forma *albomaculata* P.M. Brown—white/pink spotted lip form

Brown, P.M. 2004. *North American Native Orchid Journal* 10: 37.

Dactylorhiza aristata (Fischer *ex* Lindley) Soó var. *kodiakensis* Luer & Luer *f.*

Kodiak orchid

add:

forma *alba* P.M. Brown—white-flowered form

Brown, P.M. 2004. *North American Native Orchid Journal* 10: 37.

32

Deiregyne confusa Garay

Hildago ladies'-tresses

Funkiella confusa (Garay) Szlachetko, Rutkowski, & Mytnik

emend:

discovered at Big Bend National Park in 2004

photo in Luer (and on p. 32) taken in Durango, Mexico and does not appear to exhibit pubescent sepals of *D. confusa* and may be *D. durangensis*; see new photograph

Coleman, R. 2006. *Native Orchid Conference Journal* 3: in press.

Szlachetko, D.L., P. Rutkowski, and J. Mytnik. 2005. *Contributions to the taxonomic revision of the subtribes Spiranthinae, Stenorrhynchidinae and Cyclopogoninae (Orchidaceae) in Mesoamerica and the Antilles.* Polish Botanical Studies 20: 229.

45

Insert the following and remove from the indicated pages in *Platanthera*.

Gymnadeniopsis clavellata (Michaux) Rydberg var. *clavellata*

Platanthera clavellata (Michaux) Luer var. *clavellata* (details see p. 78)

little club-spur orchis

Gymnadeniopsis clavellata (Michaux) Rydberg var. *ophioglossoides* (Fernald) W.J. Schrenk

Platanthera clavellata (Michaux) Rydberg var. *ophioglossoides* (Fernald) P.M. Brown (details see p. 79)

northern club-spur orchis

Gymnadeniopsis integra (Nuttall) Rydberg

Platanthera integra (Nuttall) Lindley (details see p. 84)

yellow fringeless orchis

Gymnadeniopsis nivea (Nuttall) Rydberg

Platanthera nivea (Nuttall) Lindley (details see p. 87)

snowy orchis

Rydberg, P.A. 1901. in Britton, *Manual of the Flora of the Northeastern United States*, p. 293.

Brown, P.M. 2002. *North American Native Orchid Journal* 8: 32–40.

Gymnadeniopsis clavellata (Michaux) Rydberg var. *clavellata*

little club-spur orchis

add:

forma *wrightii* (Olive) P.M. Brown—spurless form

Brown, P.M. and S.N. Folsom. 2006. *Wild Orchids of the Canadian Maritimes and Northern Great Lakes Region*, p. 284.

Olive, L. 1951. *Bulletin of the Torrey Botanical Club* 78(4): 289-291. 1951.

Cyrtopodium macrobulbon p.29

Cyrtopodium puncatum p. 29

Deiregyne confusa p. 32

49

emend:
Hexalectris revoluta Correll var. *revoluta*
recurved crested coralroot
Texas; Mexico
Catling, P.M. 2004. *Native Orchid Conference Journal* 1(2): 14–16.
rare and local in the mountains of southern Texas
[photograph and drawing are *H. revoluta* var. *colemanii*]

add:
Hexalectris revoluta var. *colemanii* P.M. Catling
Coleman's crested coralroot
se Arizona
Coleman, R.A. 1999. *North American Native Orchid Journal* 5(1): 312–15.
Catling, P.M. 2004. *Native Orchid Conference Journal* 1(2): 14–16.
this new variety was recently described from southeastern Arizona

50

Hexalectris spicata (Walter) Barnhardt var. *spicata*
crested coralroot
correct: forma *albolabia* to white-lipped form
add:
    forma *wilderi* P.M. Brown—albino form
    forma *lutea* P.M. Brown—yellow-flowered form
P.M. Brown. 2004. *North American Native Orchid Journal* 10: 23.
Brown, P.M. and S.N. Folsom. 2005. *Wild Orchids of Florida*: updated and expanded edition, pp. 134–135.

51

Hexalectris warnockii Ames & Correll
Texas purple-spike
add:
    forma *lutea* P.M. Catling—yellow-flowered form
Catling, P.M. 2004. *Native Orchid Conference Journal* 1(2): 24.

57

insert correct name:
Listera banksiana Lindley
    Listera caurina Piper
northwestern twayblade
Brown, P.M. 2004. *North American Native Orchid Journal* 10: 2–12.
Brown, P.M. and S.N. Folsom. 2006. *Wild Orchids of the Pacific Northwest and Canadian Rockies*, pp. 260.
Lindley, J. 1840. *Genera and Species of Orchidaceous Plants* p. 455.

the rule of priority dictates that *Listera banksiana* (1840) must be used over *L. caurina* (1898)

58
Listera cordata (Linnaeus) R. Brown var. *cordata*
heart-leaved twayblade
add:
 forma *tetraphylla* Lavoie—four-leaved form
Lavoie, G. 1984 *Provancheria* 7: 92.

63
emend:
Malaxis paludosa (Linnaeus) Swartz
bog adder's-mouth
incorrect photograph (is *Platanthera sparsiflora*!); replace with new photograph

64
Malaxis spicata Swartz
Florida adder's-mouth
add:
 forma *trifoliata* P.M. Brown—three-leaved form
Brown, P.M. 2003. *North American Native Orchid Journal* 9: 34.
Brown, P.M. and S.N. Folsom. 2004. *Wild Orchids of the Southeastern United States*, pp. 126–27.
Brown, P.M. and S.N. Folsom. 2005. *Wild Orchids of Florida*: updated and expanded edition, pp. 154–55.

68
Pelexia adnata (Swartz) Sprengel
glandular ladies'-tresses
emend:
discovered in Collier County, Florida in 2004
Brown, P.M. and S. Folsom. 2005. *Wild Orchids of Florida*: updated and expanded edition, pp. 172–73.

69
Piperia candida Morgan & Ackerman
 (*Platanthera candida* (Morgan & Ackerman) R.M. Bateman: homonym)

Platanthera leptopetala (Rydberg) R.M. Bateman

lace orchid

Bateman, R.M. 2003. *Botanical Journal of the Linnaean Society* 142(1): 21.

73

Piperia michaelii Greene

Platanthera michaelii (Greene) R.M. Bateman

Michael's piperia

Bateman, R.M. 2003. *Botanical Journal of the Linnaean Society* 142(1): 21.

Piperia transversa Suksdorf

Platanthera transversa (Suksdorf) R.M. Bateman

flat-spurred piperia

Bateman, R.M. 2003. *Botanical Journal of the Linnaean Society* 142(1): 21.

74

Piperia unalascensis (Sprengel) Rydberg

Alaskan piperia

add:

forma *olympica* P.M. Brown—dwarf montane form
Brown, P.M. 2004. *North American Native Orchid Journal* 10: 37.

Piperia yadonii Morgan & Ackerman
Platanthera yadonii (Morgan & Ackerman) R.M. Bateman
Yadon's piperia
Bateman, R.M. 2003. *Botanical Journal of the Linnaean Society* 142(1): 21.

75
Platanthera blephariglottis Lindley [delete var. *blephariglottis*]
northern white fringed orchis

76
emend and insert with text on p. 79:
Platanthera conspicua (Nash) P.M. Brown
Platanthera blephariglottis Lindley var. *conspicua* (Nash) Luer
southern white fringed orchis
Brown, P.M. 2002. *North American Native Orchid Journal*: 8: 3–14.

79/94
add:
Platanthera convallariifolia (Fischer) Lindley
lily-leaved rein orchis
rare on Alaskan islands; eastern Asia
Sheviak, C.J. 2002. in *Flora of North America*, vol. 26 pp. 559–60.
Brown, P.M. and S.N. Folsom. 2006. *Wild Orchids of the Pacific Northwest and Canadian Rockies*, pp. 132–33.
[note corrected spelling to *convallariifolia*]

80
Platanthera dilatata (Pursh) Lindley var. *albiflora* (Chamisso) Ledebour
bog candles
range extension: east to southwestern South Dakota

81
Platanthera flava (Linnaeus) Lindley var. *flava*
southern tubercled orchis
range extension: east to southern New Jersey

83
Platanthera hookeri (Torrey) Lindley
Hooker's orchis
add:
forma *oblongifolia* (J.A. Paine) P.M. Brown—narrow-leaved form
Brown, P.M. and S.N. Folsom. 2006. *Wild Orchids of the Canadian Maritimes and Northern Great Lakes Region*, p. 284.

emend:
Platanthera huronensis (Nuttall) Lindley
green bog orchis
incorrect line art; replace with new figure

88
correct spelling to:
blunt-leafed rein orchis
few-flowered blunt-leafed rein orchis

89
Platanthera orbiculata (Pursh) Lindley
pad-leaved orchis
add:
 forma *longifolia* (Clute) P.M. Brown—narrow-leaved form
 forma *pauciflora* (Jennings) P.M. Brown—few-flowered form
Brown, P.M. and S.N. Folsom. 2006. *Wild Orchids of the Canadian Maritimes and Northern Great Lakes Region*, p. 284.

90
Platanthera peramoena (A. Gray) A. Gray
purple fringeless orchis
add:
 forma *doddsiae* P.M. Brown—white-flowered form
Brown, P.M. 2002. *North American Native Orchid Journal* 8: 30–31.

104

Spiranthes brevilabris Lindley

short-lipped ladies'-tresses

emend:

now extant from two areas in central Florida

106

Spiranthes cernua (Linnaeus) L.C. Richard

nodding ladies'-tresses

range extension: south to northern Florida

Brown, P.M. and S.N. Folsom. 2004. *Wild Orchids of the Southeastern United States*, pp. 194–95.

Brown, P.M. and S.N. Folsom. 2005. *Wild Orchids of Florida*: updated and expanded edition, pp. 244–45.

108

Spiranthes floridana (Wherry) Cory *emend.* P.M. Brown

Florida ladies'-tresses

emend:

currently known from three very small extant sites in central Florida

Spiranthes infernalis Sheviak
Ash Meadows ladies'-tresses
emend:
not listed as federally threatened, but is considered a species of concern

116
Spiranthes sylvatica P.M. Brown
woodland ladies'-tresses
range extension: northeastern Texas, southeastern Oklahoma, and southern Arkansas

169
Insert in Key 9: *Cyrtopodium* after couplet 2
emend to read:
1b flowers heavily spotted or mottled...2

2a plants epiphytic, flowers yellow with heavy spotting.....*C. punctatum*
2b plants terrestrial or nearly so; flowers orange yellow with mottled spotting.....*C. macrobulbon*

172
Insert in Key 16: *Hexalectris* after couplet 5
emend to read:
5b petals and sepals otherwise...6

6a central lobe of the lip more or less squared at the tip; petals 15–17 mm long; recurved; western Texas.....*H. revoluta* var. *revoluta*
6b central lobe of the lip pointed; petals 19–22 mm long, strongly recurved; southeastern Arizona.....*H. revoluta* var. *colemanii*

181
Insert in Key 28: *Spiranthes* after couplets 11 and 19
emend to read:
11i plants with small (ca. 5 mm), cream-colored flowers; late August/September flowering...11ii

11iia plants with fully opened, although not wide-spreading, flowers.....*S. casei* var. *casei*
11iib plants with nearly closed flowers; restricted to southern Nova Scotia.....*S. casei* var. *novaescotiae*

19i plants with small, cream-colored flowers; late August/September flowering...19ii

19iia plants with fully opened, although not wide-spreading, flowers.....*S. casei* var. *casei*

19iib plants with nearly closed flowers; restricted to southern Nova Scotia.....*S. casei* var. *novaescotiae*

Spiranthes casei differs from *Spiranthes vernalis* and *S. laciniata* in range and drier habitat and from *S. cernua* and *S. ochroleuca* in (usually) single-ranked inflorescence and smaller, ca. 5 mm, flowers with the perianth not as widespreading.

185
Excluded species
add:
Triphora hassleriana (Cogniaux) Schlecter
Photograph from Miami-Dade County in Florida in Bransilver, 2004. p. 115 was labeled as *T. gentianoides* but subsequently identified as *T. hassleriana*. Plants were of horticultural origin and are not reproducing.

190
add:
Cyrtopodium macrobulbon

ACKNOWLEDGMENTS

I am grateful to Stan Folsom his line drawings and watercolor of *Corallorhiza maculata* var. *ozettensis* based upon the original description by Ed Tisch, Ron Coleman for additional information on *Deiregyne confusa*, Scott Stewart, Ann Malmquist, and Helen Jeude for reviewers' comments and Chuck Sheviak and Philip Kauth for additional comments. Barney Lipscomb, editor of *Sida*, has been especially helpful in facilitating the layout of this information.

Note.—A limited number of reprints designed for insertion into *The Wild Orchids of North America, North of Mexico* are available from the author. Copies of the book are also available from your bookseller, the University Press of Florida (*www.upf.com*), or the author (*naorchid@aol.com*).

BOOK NOTICES

Timber Press

MARK C. TEBBITT. 2005. **Begonias: Cultivation, Identification, and Natural History.** (ISBN 0-88192-733-3, hbk.). Published in association with the Brooklyn Botanic Garden and Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $34.95, 272 pp., 212 color photos and water color paintings, b/w line drawings, 7" × 9".

Aside from the chapters on introduction, general cultivation techniques and five appendices, there is a good deal of useful taxonomic information provided. There is a key to the sections of *Begonia* represented in cultivation as well as keys to species within sections. Each species has a very nice botanical description. Appendix E (New Combinations and Synonymy) includes four new combinations: *Begonia conchifolia* Dietrich f. *rubrimaculata* (J. Golding) M.C. Tebbitt, **comb. nov.**; *Begonia modestiflora* Léveillé var. *hypoleuca* (L.A. Lauener) M.C. Tebbitt, **comb. nov.**; *Begonia modestiflora* Léveillé var. *sootepensis* (Craib) M.C. Tebbitt, **comb. nov.**; *Begonia modestifolora* Léveillé var *thorelii* (Gagnepain) M.C. Tebbitt, **comb. nov.**

This will be a useful book to *Begonia* gardeners and botanists alike.

MARY E. GERRITSEN and RON PARSONS. 2005. **Masdevallias: Gems of the Orchid World.** (ISBN 0-88192-737-6, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $45.95, 299 pp., color photos, b/w line drawings, 7 1/2" × 10".

Masdevallias are fascinating and beautiful plants. This book could easily serve as a coffee table book to "wow" friends. A key to the subgenera and sections of *Masdevallia* is included.

Contents—Introduction, The History of the Genus *Masdevallia*, *Masdevallia* Form and Function, Growing Masdevallias, *Masdevallia* Propagation: Hybridization, What Is in a Name?, Showing Masdevallias, Genera related to *Masdevallia*, Subclassification of *Masdevallia*, Featured *Masdevallia* Species, *Masdevallia* Hybrids, Appendix I (Registered *Masdevallia* Hybrids), Appendix II (Species and Culture), Glossary, Nurseries and Flasking Services, Further Reading, and Index.

ABSTRACT

We document 137 species of pteridophytes new to the flora of Peru since the publication of the previous flora by Tryon and Stolze, in 1994. Some of these are recently described species (but no new species are described herein), while many are range extensions of known species from adjacent countries; a few are species that have been elevated in status from lesser rank, or species that have a new name, not mentioned by Tryon and Stolze. Most of these additions are the result of new collections, unknown at the time of the previous flora, and most are from montane rain forests and cloud forests, on the eastern slope of the Andes, from Dept. Amazonas to Dept. Cuzco. This area is known to be the richest for ferns, in Peru. These additions bring the known total of pteridophyte species for Peru to about 1200, making it one of the richest countries in the world for ferns and lycophytes.

RESUMEN

Se registra 137 especies de pteridofitas nuevas para la flora del Perú desde la publicación previa en 1994 del trabajo de Tryon y Stolze. Algunas son especies recientemente descritas, mientras que la mayoría son registros de extensión de distribución desde paises vecinos y unas pocas han sido elevadas en categoría desde rangos menores o tienen un nombre nuevo no mencionado por Tryon y Stolze. La mayoría de estas adiciones son el resultado de recolectas nuevas, desconocidas entonces para la flora previa. Estas adiciones incrementan a cerca de 1200 el total de especies conocidas para el Perú, haciendo de éste uno de los paises más ricos en el mundo en helechos y licofitas.

INTRODUCTION

It is almost an axiom in floristic work, especially in the tropics, that a flora is outdated by the time it is published. Ten years following the completion of the six-fascicle publication of the "Pteridophyta of Peru," by Tryon and Stolze (1989a, 1989b, 1991, 1992, 1993, 1994), approximately 137 additional species of ferns and

SIDA 21(4): 2321 – 2342. 2005

allies have been added to the flora. Thirty-five of these have been recently described in other publications, while the majority (80 spp.) are range extensions of species known previously only from adjacent countries; still others are species that were synonymized (we believe inappropriately; 19 spp.) or now go under a name not mentioned by Tryon and Stolze (2 spp.), or were treated at lesser (varietal) rank (1 sp.). Most of these species additions are the result of new collections, unknown at the time of completion and publication of the Tryon and Stolze flora. These additions, and two corrections (species erroneously reported from Peru), bring the previous (Tryon & Stolze 1994) total of 1060 up to 1195 species. The number will continue to grow, as new species are described and as taxonomic revisions of especially difficult and poorly studied groups (e.g., *Elaphoglossum*) are completed. As a conservative estimate, there may be as many as 100 species already collected but still undescribed, so that the total number of pteridophytes from Peru is likely to eventually approach, if not exceed, 1300 species.

In Peru, the most species-rich areas for ferns appear to be along the eastern slope of the Andes, in montane rain forests and cloud forests (León & Young 1996; Young 1992; Young & León 1999). Tryon and Stolze (1994) reported more than 390 pteridophyte species for each department in this zone, from Amazonas to Cuzco, and our new records increase these numbers further (Table 1). The four departments for which we report more than twenty new species are either in this zone (Amazonas, San Martín, and Pasco) or in lowland Amazonia (Loreto). Proportionally, the increase in the number of known species is highest in Loreto (12%) and Amazonas (11%). In both departments, intensive collecting has recently taken place in preparation for a local florula (in Amazonas, by Rodolfo Vásquez/Henk van der Werff) or in connection with ecological studies (in Loreto, by Hanna Tuomisto). A further indication of the incomplete, but improving knowledge of Peruvian ferns derives from recent collections by Henk van der Werff. In a 2004 shipment of ca. 255 sheets collected from Peru, all from Pasco, Prov. Oxapampa, about 40 species were first records for Dept. Pasco (of which ca. seven were new for Peru), and another four were putatively undescribed (no doubt more, but monographic study is needed). Numbers like this suggest that, ultimately, all of the departments on the eastern slope of the Andes will be found to contain ca. 500–600 species of pteridophytes. Obviously, southwestern Peruvian departments containing substantial dry areas (Arequipa, for instance) will always have low numbers of ferns, regardless how much collecting is done. For fern diversity, it is usually true that wetter is better, especially in the mountains; habitat diversity, both climatic and edaphic, can substantially add to this diversity.

We are reluctant to extrapolate or generalize from the pteridophyte data to other groups of plants or animals, because different taxonomic groups may vary in general biogeographic patterns, ecological requirements, and the state of

TABLE 1. Number of pteridophyte species in the different departments of Peru. The numbers of **known spp.** are taken from Tryon and Stolze (1994); the numbers of **new spp.** are from the present paper or publications cited in this paper. Many additional departmental records are known for species previously reported from Peru by Tryon and Stolze (1989a, 1989b, 1991, 1992, 1993, 1994), but these are not the subject of this paper (Smith, unpubl. data).

Department	Known spp	New spp	% New spp	Total spp

current knowledge. However, we expect that many groups of organisms will converge on the pattern that the highest numbers of new species records will be found from areas with wet climate, high habitat heterogeneity, and low exploration-density, especially the remote areas of the eastern Andes and western Amazonia.

Our ignorance of the Peruvian fern flora can be seen in statistics for *Elaphoglossum*. Mickel (in Tryon & Stolze 1991) recognized 124 species of *Elaphoglossum* (including *Peltapteris*); of these, 50 were newly described in the flora or in papers immediately preceding the flora. However, *Elaphoglossum* can not necessarily be taken as representative for the ferns, inasmuch as it is one of the largest (and consequently most complex and understudied) genera in the Andes.

Recent estimates for the number of pteridophyte species in tropical and subtropical Latin American countries include 1008 species for Mexico (Mickel

& Smith 2004), 1358 species for Mesoamerica (Davidse et al. 1995), and 1204 species for Venezuela (Smith 2005a). The lack of reliable estimates for Colombia, Ecuador, Bolivia, or Brazil make meaningful comparisons of diversity and species richness with those countries impossible, but we predict that all four will be found to contain in excess of 1200 species of pteridophytes, and the total may well approach 1500 species in Colombia.

The goal of this paper is to put on record, in a single place, as many as possible of the recent species additions to Peru, similar to the efforts for flowering plants done by Ulloa et al. (2004). We generally do not address in this paper differences in taxonomic opinion from the previous Tryon/Stolze treatment, except when those differences result in recognition of additional taxa at species rank. As an example of the kind of information not included in this paper, there is now evidence suggesting that *Notholaena nivea* (Poir.) Desv. (Tryon & Stolze 1989b) be placed in *Argyrochosma* (as *A. nivea* (Poir.) Windham) (Windham 1987). In fact, many of the infraspecific taxa treated by Tryon and Stolze (e.g., the three varieties of *Notholaena nivea*) have been or will be accorded species rank in floristic treatments of other neotropical countries (e.g., for Mexico, Mesoamerica, Venezuelan Guayana, Ecuador, and Bolivia; Mickel & Smith 2004; Davidse et al. 1995; Smith in Steyermark et al. 1995; Jørgensen & León-Yánez 1999; Kessler & Smith, in prep.). Other examples illustrating these differing opinions might include *Asplenium radicans* L. var. *cirrhatum* (Rich. ex Willd.) Rosenst. and *A. radicans* var. *partitum* (Klotzsch) Hieron., both of which many authors (Adams in Davidse et al. 1995; Mickel & Smith 2004) elevate to species rank (as *Asplenium cirrhatum* Rich ex Willd. and *A. flabellulatum* Kunze, respectively). These matters are largely a matter of taxonomic opinion, and the overall number of taxa recognized will not change. However, comparisons of taxon numbers at a given rank between countries need to take into account such subjective disagreements.

In this paper, we publish no new taxa or combinations, these are better left to monographers or those doing more detailed floristic work, and require the examination of types and perhaps further field and herbarium studies, both within and outside Peru. Ongoing floristic projects in adjacent areas, especially Bolivia (by Kessler and Smith) and Ecuador (by Øllgaard and collaborators), as well as the production of local florulas within Peru (Río Cenepa area, Dept. Amazonas, by Vásquez et al., in prep.; Cordillera de Yanachaga in Dept. Pasco) can be expected to shed light on many additional taxonomic problems and result in additional species descriptions.

Many of the species accepted and treated by Tryon and Stolze now are known from one or more additional departments within Peru. We do not mention these in the list below, or in Table 1, but specimens can be found in various herbaria, especially the Missouri Botanical Garden (MO) and the herbarium of the University of California, Berkeley (UC), as well as herbaria in Peru (CUZ, HAO, HUT, USM). Some of these additions can also be found in the TROPICOS database: http://mobot.mobot.org/W3T/Search/vast.html

The following species are additions to the Peruvian flora since the completion of the Peruvian pteridophyte flora by Tryon and Stolze (1994). None of these species were recognized at species rank by Tryon and Stolze, and most of the names were not mentioned at any rank. A few names (e.g., *Adiantum villosissimum* Mett. ex Kuhn) were discussed as problematic species or possible synonyms of highly variable recognized species, or treated as synonyms. Further work on the Peruvian fern flora must await description of undescribed species, preferably in a monographic context or at least considering closely related species. An updated fern flora of the country is needed but probably attainable only in the distant future.

Adiantum argutum Splitg. (Pteridaceae)

PERU. Madre de Dios. Prov. Manu: close to village of Diamante, S side of Río Alto Madre de Dios, 12°21'S, 70°57'W, 400 m, *Tuomisto 13368, et al.* (CUZ, USM, TUR, UC). **Prov. Tambopata:** Santuario Nacional Pampas del Heath, Río Heath, Pto. San Antonio, 12°57'12"S, 68°52'60"W, 210 m, *Aguilar & Castro 1055* (MO not seen, UC); Explorer's Inn, near confluence of Río Tambopata and Río La Torre, 39 km SW of Puerto Maldonado, 12°50'S, 69°20'W, *Smith 1363, et al.* (UC); 10 km NW from the mouth of Río Pariamanu, on the E bank of Río de las Piedras, 12°22'S, 69°14'W, 200 m, *Tuomisto 13683, et al.* (CUZ, TUR, USM).

Adiantum decoratum Maxon (Pteridaceae)

PERU. Madre de Dios. Prov. Manu: close to Cocha Cashu biological station on the S side of Río Manu, 11°54'S, 71°24'W, 400 m, *Tuomisto 13106, et al.* (CUZ, TUR, USM); 5 km E from Cocha Cashu biological station, 11°53'S, 71°21'W, 400 m, *Tuomisto 13150, et al.* (CUZ, TUR, USM); close to village of Altos de Maizal, N side of Río Manu, 11°49'S, 71°28'W, 400 m, *Tuomisto 13207, et al.* (CUZ, TUR, UC, USM); N side of Río Manu, 12°8'S, 71°3'W, 400 m, *Tuomisto 13351, et al.* (CUZ, TUR, USM).

Adiantum diogoanum Glaz. ex Baker (Pteridaceae)

PERU. Cajamarca. Prov. San Ignacio: Nambealle, entre La Vega del Toro y Las Abejas, 4°58'46"S, 79°05'01"W, 800–1000 m, *Campos 4730, et al.* (MO, UC); Namballe, Caserio Las Abejas, camino hacia el Río Canchis (La Guayusa), 5°00'S, 79°04'W, 870–950 m, *Rodríguez R. 1642* (MO, UC, USM).

Adiantum dolosum Kunze (Pteridaceae)

PERU. Madre de Dios. Prov. Manu Pakitza, N side of Río Manu, 11°56'S, 71°17'W, 400 m, *Tuomisto 13308, et al.* (CUZ, TUR, USM); 10 km E from mouth of Río Manu, 3 km N from N bank of Río Madre de Dios, 12°16'S, 70°49'W, 300–400 m, *Tuomisto 13520, et al.* (CUZ, TUR, UC, USM); close to village of Diamante, S side of Río Alto Madre de Dios, 12°21'S, 70°57'W, 400 m, *Tuomisto 13379, et al.* (CUZ, TUR, UC, USM); W bank of Río de los Amigos, 3 km upriver from its mouth, 12°34'S, 70°6'W, 200–300 m, *Tuomisto 13649, et al.* (CUZ, TUR, USM). **Prov. Tambopata:** 5 km E downriver from mouth of Río de los Amigos on N bank of Río Madre de Dios, 12°35'S, 70°02'W, 200–300 m, *Tuomisto 13668, et al.* (CUZ, TUR, UC, USM); 10 km NW from the mouth of Río Pariamanu, 12°23'S, 69°22'W, 200 m, *Tuomisto 13690, et al.* (CUZ, TUR, USM).

Adiantum fuliginosum Fée (Pteridaceae)

PERU. Loreto. Prov. Mariscal Ramon Castilla: 3 km S of the village of Huanta, 3°17'S, 71°51'W, 100–150 m, *Tuomisto 5225, et al.* (TUR, USM, Z); 4–8.5 km NW from the village of Puerto Izango, Río Yaguasyacu, 3°16'S, 72°2'W, 100–150 m, *Tuomisto 11317* (AMAZ, TUR, USM). **Prov. Maynas:** Explorama/ACEER reserve, 5–15 km E of the mouth of Quebrada Sucusari at lower Napo, 3°15'S, 72°50'W, 100–

200 m, *Tuomisto 7772, et al.* (AMAZ, TUR). **Prov. Requena:** 3 km E from Requena, 5°4'S, 73°48'W, 150–200 m, *Tuomisto 12746, et al.* (AMAZ, TUR, USM); 10 km E from Jenaro Herrera, 4°55'S, 73°35'W, 150–200 m, *Tuomisto 13009, et al.* (AMAZ, TUR, USM). **Madre de Dios. Prov. Manu:** from mouth of Río Azul ca. 10 km down to Río Madre de Dios, 12°33'S, 70°31'W, 300 m, *Tuomisto 13567, et al.* (CUZ, TUR, UC, USM); 5 km W from the mouth of Río de los Amigos, N bank of Río Madre de Dios, 12°33'S, 70°10'W, 200–300 m, *Tuomisto 13636, et al.* (CUZ, TUR, USM).

Adiantum glaucescens Klotzsch (Pteridaceae)

PERU. Amazonas. Prov. Bagua: Distrito Imaza, Yamayakat. Nororiental del Marañón RENOM, alrededor de la quebrada de Kusut, 04°55'S, 78°19'W, 330–380 m, *Quipuscoa S. 230* (MO, UC, USM).

Adiantum humile Kunze (Pteridaceae)

PERU. Loreto. Prov. Maynas: near Brilla Nueva, Borro [Bora] Indian village on upper Río Yaguasyacu, *Gentry & Revilla 20455* (MO not seen, UC, USM); Río Pastaza, Kapawari, 2°20'S, 76°20'W, 190 m, *Lewis et al. 12569* (MO not seen, USM). **Prov. Mariscal Ramon Castilla:** 3 km S of the village of Huanta, 3°17'S, 71°51'W, 100–150 m, *Tuomisto 5262, et al.* (AAU, AMAZ, TUR, U, USM); between roads Ex Petroleros and Bello Horizonte, Km 38–40 on Iquitos-Nauta road, 4°04'S, 73°28'W, 100–200 m, *Tuomisto 6678, et al.* (AMAZ, TUR, UC); Upper Río Itaya, ca. 2 km SSE of village Carbajal, 4°17'S, 73°35'W, 100–200 m, *Tuomisto 9685, et al.* (AMAZ, TUR, UC); Dist. Sargento Lores, Constancia Norte, Shapajillal, 4°07'19"S, 72°55'25"W, 116 m, *Vásquez 22995, et al.* (MO not seen, UC). **Madre de Dios. Prov. Manu:** S side of Río Manu, close to Cocha Cashu biological station, 11°55'S, 71°19'W, 400 m, *Tuomisto 13298, et al.* (CUZ, TUR, USM); 15 km E from the mouth of Río Manu, N bank of Río Madre de Dios, 12°17'S, 70°46'W, 300–400 m, *Tuomisto 13528, et al.* (CUZ, TUR, USM). **Pasco. Prov. Oxapampa:** Paujil, near Puerto Bermudez, *León 299* (USM). **Ucayali. Prov. Coronel Portillo:** Bosque Nacional von Humboldt, 230–260 m, *Narita 8* (USM).This species was initially listed for Peru by Tryon (1964) and later included as a synonym of *A. latifolium* (Tryon & Stolze 1989: 66).

Adiantum paraense Hieron. (Pteridaceae)

PERU. Loreto. Prov. Loreto: 1.5 km E of the road to Iquitos at km 10 from Nauta, 4°28'S, 73°34'W, 100–150 m, *Tuomisto 4414, et al.* (AMAZ, TUR, U). **Prov. Maynas:** 7 km E of the oil palm plantation at Río Maniti, 3°38'S, 72°56'W, 100–150 m, *Tuomisto 4781, et al.* (TUR, USM); Upper Río Itaya, ca. 10 km SW of village Carbajal, 4°18'S, 73°40'W, 100–200 m, *Tuomisto 10166, et al.* (AMAZ, TUR, UC).

Adiantum villosissimum Mett. ex Kuhn (Pteridaceae)

PERU. Huánuco. Prov. Huánuco: Exito, Balsa Playa, 1100 m, *Vargas C. 5317* (UC). **Junín:** Chanchamayo, 1500 m, *Schunke s.n.* (UC).

Alsophila minervae M. Lehnert (Cyatheaceae)

PERU. Pasco. Prov. Oxapampa: trail to summit of Cordillera Yanachaga via Río San Daniel, 10°23'S, 78°27'W, 2500 m, *Smith & Boetger 7817* (USM) (Lehnert 2003:171).

Alsophila mostellaria M. Lehnert (Cyatheaceae)

PERU. Amazonas. Prov. Bongará: road Pedro Ruiz-Florida, 5°51.7'S, 77°58.4'W, 2200 m, *Lehnert 243* (HOLOTYPE: USM; ISOTYPES: GOET, UC). **Cajamarca. Prov. Santa Cruz:** Dist. Catache, upper Río Zaña valley, ca. 5 km above Monte Seco, ca. 1800 m, Dillon et al. 4883 (HUT). **Pasco. Prov. Oxapampa:** road La Merced-Oxapampa, ca. 23 km from Oxapampa, 10°44.4'S, 75°21.2' W, 1500 m, *Lehnert 242, 321* (GOET, UC, USM). Additional collections cited by Lehnert (2003:172) from Depts. Cajamarca and Pasco.

Alsophila salvinii Hook., vel aff. (Cyatheaceae)

PERU. San Martín. Prov. Rioja: along road Rioja-Pedro Ruiz, El Mirador, 5°40'29"S, 77°46'25"W, 1850 m, *van der Werff 15666, et al.* (MO, UC).

Arachniodes macrostegia (Hook.) R.M. Tryon & D.S. Conant (Dryopteridaceae)
PERU. Loreto. Prov. Maynas: *Moran 3763* (USM); *Revilla 2749* (UC); *Rimachi 8285* (USM); 2 km S of the village of Mishana at Río Nanay, 3°52'S, 73°24'W, 100–150 m, *Tuomisto 2370, et al.* (TUR, USM); Puerto Almendras along Río Nanay, 3°51'S, 73°22'W, 100–200 m, *Tuomisto 6434*, with Ruokolainen (AMAZ, NY, TUR, USM). **Prov. Requena:** 4 km SE from Requena, 5°5'S, 73°49'W, 150–200 m, *Tuomisto 12767, et al.* (AMAZ, TUR, USM); 4 km E from Jenaro Herrera, 4°54'S, 73°38'W, 150–200 m, *Tuomisto 13028, et al.* (AMAZ, TUR, USM). **Pasco: Prov. Oxapampa:** Villa América, Quebrada Castillo, *Arana 18* (USM).

Asplenium eutecnum A.R. Sm. (Aspleniaceae)
PERU. Amazonas: Prov. Condorcanqui: Dist. El Cenepa, Comunidad de Tutino, Pumpu-entsa, 340 m, *Vásquez 24244, et al.* (HOLOTYPE: HUT; ISOTYPES: MO, NY, UC). Also known from Loreto (Smith 2005b).

Asplenium incurvatum Fée (Aspleniaceae)
PERU. Cajamarca: Prov. San Ignacio: Tabaconas, Santuario Nacional Tabaconas Namballe, 5°17'30"S, 79°16'W, 2190–2200 m; *Campos & Tenorio 5708* (MO, UC, USM). **Prov. San Marcos:** 6 km above San Marcos on road to Cajamarca, 2600–2700 m, *Weigend et al. 97/328* (USM). **San Martín: Prov. Rioja:** Aguas Verdes, 5°40'S, 77°40'W, 800 m, on limestone, *van der Werff 16616, et al.* (MO not seen, UC, USM). This species is segregated from *A. serra* Langsd & Fisch. and appears to be restricted to limestone and sandstone outcrops).

Asplenium monodon Liebm. (Aspleniaceae)
PERU. Cajamarca: Prov. San Ignacio: Santo Tomas Bosque Primario, 4°55'S, 78°50'W, 2070 m, *Vásquez 20521, et al.* (MO not seen, UC).

Asplenium palmeri Maxon (Aspleniaceae)
PERU. San Martín: Prov. Rioja: Aguas Verdes, 5°40'S, 77°40'W, 800 m, on limestone, *van der Werff 16612, et al.* (MO not seen, UC, USM).

Asplenium polyphyllum Bertol. (Aspleniaceae)
PERU. Cuzco: Prov. Urubamba: Dist. Ollantaytambo, Huaytampo, 13°10'47"S, 72°21'10"W, 3650 m, *Calatayud 1025, et al.* (UC). Reported by Adams (in Davidse et al. 1995) from Peru, but without citation of specimen.

Asplenium pseuderectum Hieron. (Aspleniaceae)
PERU. Madre de Dios: Prov. Manu: Cocha Cashu Biological Station, along path 12, 11°52'S, 71°24'W, 400 m, *Tuomisto 13074, et al.* (CUZ, TUR, UC, USM); close to Cocha Cashu biological station, 11°53'S, 71°24'W, 400 m, *Tuomisto 13159* et al. (CUZ, TUR).

Blechnum gracile Kaulf. (Blechnaceae)
PERU. Amazonas: Prov. Bagua: valley of Río Marañón above Cascadas de Mayasi near Campamento STte Montenegro (Kms 276–280 of Marañón road), 450 m, *Wurdack 1822* (UC, US not seen, USM). **Prov. Luya:** Camporredondo, Jaipe, 6°09'07"S, 78°21'05"W, 2050 m, *Campos 3646, et al.* (MO not seen, UC, USM). **Cajamarca: Prov. San Ignacio:** La Coipa, La Lima, 5°26'S, 78°55'W, 1800 m, *Campos 4009*, with García (MO not seen, UC). **Huánuco: Prov. Leoncio Prado:** 60 km E of Tingo María, Divisoria Pass, 1500 m, *Tryon & Tryon 5271* (USM). **Junín: Prov. Chanchamayo:** Chanchamayo, 2000 m, *Esposto 636* (USM). **Pasco: Prov. Oxapampa:** Dist. Villa Rica, bosque de Protección San Matias-San Carlos, 1355 m, *Perea & Mateo 083* (MO not seen, UC). **San Martín: Prov. Huallaga:** Abajo de La Morada, 6°57'S, 77°32'W, 2000–2200 m, *Quipuscoa S. 1016*, with Bardalaes (F not seen, UC). Subsumed under *B. fraxineum* Willd. by Tryon and Stolze (1993:59); some of the specimens they cited under that name are *B. meridense* Klotzsch.

Blechnum lechleri Mett. (Blechnaceae)

PERU. Pasco: Prov. Oxapampa: Parque Nacional Yanachaga-Chemillen, Abra Yanachaga, 10°22'S, 75°27'W, *Vásquez 28423, et al.* (MO not seen, UC). One of the syntypes, "Peruvia, Tatanara," is also from Peru. Mentioned, but not accepted, by Tryon and Stolze (1993:68); a synonym is *B. violaceum* (Fée) Hieron. Widely distributed from the Lesser Antilles to Bolivia, and distinguished from *B. cordatum* (Desv.) Hieron. by the pronounced, dark, peglike aerophores at the pinna bases and the dark, atropurpureous rachises.

Callipteris andina Pacheco & R.C. Moran (Athyriaceae)

PERU. Amazonas (Pacheco & Moran 1999:353). It is doubtful whether *Callipteris* is separable from *Diplazium*, but no combination is available in the latter genus.

Campyloneurum amazonense B. León (as *C. amazonensis*) (Polypodiaceae)

PERU. Amazonas: ca. 12–18 km trail E of La Peca in Serrania de Bagua, 1800–1950 m, *Gentry et al. 22930* (HOLOTYPE: USM; ISOTYPES AMAZ, F, MO, UC) (León 2005).

Campyloneurum cochense (Hieron.) Ching (Polypodiaceae)

PERU. Amazonas: Prov. Chachapoyas: Dist. Leymebamba, Alrededor de la Laguna de Los Cóndores, 6°51.102'S, 77°41.415'W, 2500–2700 m, *Quipuscoa S. 1270, et al.* (F not seen, UC). **San Martín: Prov. Mariscal Cáceres:** Parque Nacional del Rio Abiseo, valle de Chochos, 3300 m, *León & Young 2041* (USM).

Ceradenia kalbreyeri (Baker) L.E. Bishop (Grammitidaceae)

PERU. Pasco: Prov. Oxapampa: Chacos, 10°37'S, 75°17'W, 2500 m, *van der Werff 17678, et al.* (MO not seen, UC).

Ceradenia cf. kookenamae (Jenman) L.E. Bishop (Grammitidaceae)

PERU. Cajamarca: Prov. San Ignacio: San José de Lourdes, Picorana, 4°58'S, 78°53'W, 2470–2560 m, *Campos 5593, et al.* (MO not seen, UC, USM).

Ceradenia spixiana (Mart. ex Mett.) L.E. Bishop (Grammitidaceae)

PERU. San Martín: Prov. Rioja: along road Yorongos-Uquihua, *van der Werff 16584* (MO not seen, UC).

Ceradenia tryonorum B. León & A.R. Sm. (Grammitidaceae)

PERU. San Martín: Prov. Mariscal Cáceres: Parque Nacional Río Abiseo, near El Tingo, 7°58'S, 77°18'W, 2800 m, *Léon & Young 3840* (HOLOTYPE: USM; ISOTYPES: TEX, UC). (León & Smith 2003:81).

Cochlidium linearifolium (Desv.) Maxon ex C. Chr. (Grammitidaceae)

PERU. Amazonas: Prov. Bagua: Comunidad de Yamayakat, Bosque primario, 05°03'24"S, 78°20'17"W, 600 m, *Vásquez 23793, et al.* (MO).

Cyathea amazonica R.C. Moran (Cyatheaceae)

PERU. Loreto: Prov. Maynas: Quebrada Tamshiyacu, Caseria Alianza, 4°05'S, 72°58'W, 130 m, *Gentry et al. 29231* (MO); San Miguel, 2 km below Indiana, 3°30'S, 73°02'W, 130 m, *Gentry 65689, et al.* (MO); ca. 5 km NW from village of Gen Gen at Río Mormón, 3°37'S, 73°17' W, *Tuomisto 3034* (AMAZ, TUR) (three additional collections cited by Moran 1995, all from Prov. Maynas).

Cyathea boliviana R. M. Tryon (Cyatheaceae)

PERU. Cuzco: Prov. Paucartambo: carretera a Pilcopata, 2650 m, *León 2204* (USM).

Cyathea brevistipes R.C. Moran (Cyatheaceae)

PERU. Pasco: Prov. Oxapampa: *Foster et al. 10532* (F not seen, USM) (Moran 1991).

Cyathea caroli-henrici M. Lehnert (Cyatheaceae)

PERU. Cuzco: Prov. Urubamba: 2050 m, *Bonino 1127* (CUZ) (Lehnert 2003:180).

Cyathea concordia B. León & R.C. Moran (Cyatheaceae)

PERU. Amazonas: Cordillera del Condor, 1950–2050 m, 3°52'48"S 78°26'00"W, *Beltrán & Foster 1183* (F, USM), type and only known collection (León & Moran 1996).

Cyathea herzogii Rosenst. (Cyatheaceae)

PERU. Cuzco: Prov. La Convención: Cordillera Vilcabamba, 12°38'S, 73°38'W, 1760 m, *Dudley 10588* (NA not seen, USM). **Junín: Prov. Satipo:** Northern Cordillera Vilcabamba, E slope, upper Río Puyeni watershed, 11°33'35"S, 73°38'W, 2090 m, *Boyle et al. 4749* (USM). Distinct at species rank from *Cyathea caracasana* (Klotzsch) Domin, where it was included by Tryon (1976: 77).

Cyathea palaciosii R.C. Moran (Cyatheaceae)

PERU. Amazonas: Prov. San Martín: 5°41'S, 77°48'W, 1950 m, *van der Werff 16721, et al.* (MO not seen, UC) (Moran 1995).

Cyathea thelypteroides A.R. Sm. (Cyatheaceae)

PERU. Amazonas: Bagua Distr., upper slopes and summit of Cerro Tayu, 05°15'56"S, 78°22'07"W, 1030 m, *van der Werff 16323, et al.* (HOLOTYPE: USM; ISOTYPES: MO, UC) (Smith 2005b).

Cyathea tortuosa R.C. Moran (Cyatheaceae)

PERU. Amazonas: Prov. Bagua: Dist. Imaza, Yamayakat, 5°03'20"S, 78°20'23"W, 400 m, *Vásquez 21790, et al.* (MO not seen, UC). **Madre de Dios:** Prov. Manu: Cerro de Pantiacolla, Río Palotoa 10–15 km NNW of Shintuya, 12°35'S, 71°18'W, 650–700 m, *Foster 10703* (F, UC); **San Martín:** along Yorongos–La Florida road near Rioja, 1000 m, *van der Werff 16542, et al.* (MO not seen, UC, USM). Also Depts. Pasco and Loreto (Moran 1991:100).

Cyathea werffii R.C. Moran (Cyatheaceae)

PERU. Amazonas: Puerto Nazareth, 540 m, *Ellenberg 3489* (UC), a paratype (Moran 1991:94).

Cyathea windischiana A.R. Sm. (Cyatheaceae)

PERU. Amazonas: Bagua Distr., Cerro Tayu, ca. 1 hour from Chiriaco, 05°15'56"S, 78°22'07"W, 800 m, *van der Werff 16207, et al.* (HOLOTYPE: UC; ISOTYPE: MO) (Smith 2005b).

Cyathea xenoxyla M. Lehnert (Cyatheaceae)

PERU. Amazonas. Prov. Condorcanqui: Cordillera del Condor, Puerto de la Vigilancia Alfonso Ugarte (PV 3), cabeceras del Río Comainas, tributaria al oeste del Río Cenepa, 3°55.0'S, 78°25.4'W, 1000–1300 m, *Beltran & Foster 1083* (USM). **Prov. Chachapoyas:** road Chachapoyas–Mendoza, 52 km from Chachapoyas, ca. 10 km behind Molinopampa, 6°14.2'S, 77°35.9'W, 2400 m, *Lehnert 229* (GOET, UC, USM). **Cuzco. Prov. La Convención:** Dist. Echaraté, Llactahuaman, N del Rio Apurimac, NE del Pueblo Libre, S de la Cordillera de Vilcabamba, 12°51'55.5"S, 73°30'40"W, 1650 m, *Baldeon et al. 3077* (USM). **Pasco. Prov. Oxapampa:** trail to summit of Cordillera Yanachaga via Río San Daniel, 10°23'S, 75°27' W, 2500 m, *Smith & Boetger 7846* (USM). **San Martín. Prov. Rioja:** road Moyobamba–Pedro Ruíz, Km 395, *Lehnert 216* (GOET, UC, USM). **Ucayali. Prov. Coronel Portell:** Dobson (?), *Ferreyra s.n.* (USM). (Lehnert 2003:177).

Danaea acuminata Tuomisto & R.C. Moran (Marattiaceae)

PERU. Specimens from Depts. Loreto and Madre de Dios cited by Tuomisto and Moran (2001:28), e.g., **Madre de Dios: Prov. Manu:** 4 km S of village of Boca Colorado, 12°38'S, 70°25'W, 300 m, *Tuomisto 13589, et al.* (CUZ, TUR, U, UC, USM).

Danaea bipinnata Tuomisto (Marattiaceae)

PERU. Specimens from Dept. Loreto cited by Tuomisto and Moran (2001:33), e.g., **Loreto**: Mariscal

Ramon Castilla, 20.5–26 km NW from village of Puerto Izango, Río Yaguasyacu, 3°12'S, 72°10'W, 100–150 m, *Tuomisto 11387, et al.* (AMAZ, TUR, UC, USM).

Danaea leprieurii Kunze (Marattiaceae)
PERU. Specimens from Depts. Loreto and Madre de Dios cited by Tuomisto and Moran (2001:50), e.g., **Loreto:** Maynas, Upper Río Itaya, ca. 5 km SSE of village Carbajal, 4°19'S, 73°35'W, 100–200 m, *Tuomisto 10116, et al.* (AMAZ, TUR, UC, US). **Madre de Dios: Prov. Manu:** 4 km S from village of Boca Colorado, 12°38'S, 70°25'W, 300 m, *Tuomisto 13592, et al.* (CUZ, TUR, UC, USM).

Dennstaedtia arcuata Maxon (Dennstaedtiaceae)
All Peruvian specimens treated as *D. werckleı* (H. Christ) R. M. Tryon by Tryon and Stolze (1989b) are referred to *D. arcuata*, by Navarrete and Øllgaard (2000); this name was not mentioned by Tryon and Stolze.

Dennstaedtia auriculata H. Navarrete & B. Øllg. (Dennstaedtiaceae)
PERU. Cuzco: Prov. Convención: Amaibamba, 1700 m, *Vargas 9805* (UC). This specimen cited as *D. arborescens* (Willd.) Maxon, by Tryon and Stolze (1989b:100), a species restricted to the Antilles by Navarrete and Øllgaard (2000).

Dennstaedtia cornuta (Kaulf.) Mett. (Dennstaedtiaceae)
PERU. Amazonas: 12 km E of La Peca, 1700 m, *Barbour 2498* (MO not seen, UC). **Pasco: Prov. Oxapampa:** Palcazu, 10 km N of Oxapampa, 10°32'S, 75°23'W, 2100 m, *D. Smith 8479* (MO not seen UC); along road Chatarra-Cacazu, 10°32'S, 75°04'W, 890 m, *van der Werff 18292, et al.* (MO not seen, UC). This name not mentioned by Tryon and Stolze (1989b), but probably some of the specimens they cited as *D. dissecta* are *D. cornuta*; the former is considered to be restricted to the Antilles, s Mexico, and nw South America. See Navarrete and Øllgaard (2000).

Dennstaedtia coronata (Sodiro) C. Chr. (Dennstaedtiaceae)
PERU. San Martín: Prov. Huallaga: abajo de La Morada, cerca al Río Guabayacu, 6°57'S, 77°32'W, 1900–2000 m, *Quipuscoa & Bardales 962* (UC). Name not mentioned by Tryon and Stolze (1989b). See Navarrete and Øllgaard (2000).

Dennstaedtia mathewsii (Hook.) C. Chr. (Dennstaedtiaceae)
PERU. Cajamarca: Prov. San Ignacio: La Coipa, Vista Florida (camino a la Laguna), 5° 26'10"S, 78° 56'00"W, 1900–2000 m, *Campos 4048*, with García (MO not seen, UC); Huarango, El. Progresso, 5° 19'15"S, 78° 40'00"W, 1300–1450 m, *Campos 6276, et al.* (MO not seen, UC). **Pasco: Prov. Oxapampa:** Parque Nacional Yanachaga, El Huampal, 10°11'S, 75°34'W, 1200 m, *van der Werff 17908, et al.* (MO not seen, UC). Name treated as synonymous with *D. arborescens* (Willd) Maxon by Tryon and Stolze (1989b). See Navarrete and Øllgaard (2000), who considered *D. arborescens* to be restricted to the Antilles.

Dennstaedtia obtusifolia (Willd.) T. Moore (Dennstaedtiaceae)
Specimens cited as *D. dissecta* (Sw.) T. Moore by Tryon and Stolze (1989b) are mostly to be referred to *D. obtusifolia*. According to Navarrete and Øllgaard (2000), *D. dissecta* is restricted to the Antilles, Mesoamerica, and nw S. America, and is not known from Peru.

Diplazium grandifolium (Sw.) Sw. (Athyriaceae)
PERU. Amazonas: Prov. Bongará: Shillac, N by trail from Pedro Ruiz, 5°49'S, 78°01'W, 2300 m, *D. Smith & Vásquez S. 4908* (MO not seen, UC); Dist. Sipabamba, Shilla, ca. 1900 m, *Young & Eisenberg 355* (MO not seen, UC). Tryon and Stolze (1991:83) cited many specimens of this species from Peru, but all as var. *andicola* Stolze. We believe that this variety is a good species and that the correct name at species rank is *Diplazium ballivianı* Rosenst., type from Bolivia. The true *D. grandifolium*, type from

the West Indies, does indeed occur in Peru, but apparently no specimens were seen by Tryon and Stolze. We note that the two Peruvian specimens of *D. grandifolium* cited are from 1900 and 2300 m, while 16 of 18 specimens seen of *D. balliviani* from the southern Andes are from low elevation, 100–400 m; two others, both from Bolivia, extend to 1100 m.

Diplazium immensum Stolze (Athyriaceae)

PERU. San Martín: *Knapp & Alcorn 7749* (F, MO, neither seen). Cited by Tryon and Stolze (1991:77), under *D. macrophyllum* Desv., and as *D. immensum* by Stolze et al. (1994:41).

Diplazium lilloi (Hicken) R. M. Tryon & A. F. Tryon (Athyriaceae)

PERU. Cuzco: Prov. Urubamba: Dist. Ollantaytambo, Huaytampo, 13°09'02"S, 72°30'28"W, 2300 m, *Calatayud & Farfán 1072* (MO not seen, UC).

Diplazium longisorum (Baker) C. Chr. (Athyriaceae)

PERU. San Martín: Prov. Rioja: carretera Rioja–Pedro Ruíz, 1450 m, *van der Werff 15558* (MO not seen, UC).

Diplazium paucipinnum Stolze (Athyriaceae)

PERU. San Martín: along Rioja–Pedro Ruíz, about bridge Serranoyacu, 1170 m, *van der Werff 16777, et al.* (UC) (Stolze et al. 1994:72).

Diplazium tabalosense Hieron. (Athyriaceae)

PERU. Amazonas: Prov. Bagua: Río Urubamba [Utcubamba], on Cerro Tapur above Hda. Misqui, ca. 40 km S of Bagua Grande, 1200 m, *Hutchison 1483* (UC, USM). **Loreto: [Prov. Alto Amazonas]:** above Pongo de Manseriche, mouth of Río Santiago, 200 m, *Mexia 6129* (UC). **Madre de Dios: Prov. Manu:** Río Manu close to Cocha Cashu Biological Station, 11°53'S, 71°24'W, 400 m, *Tuomisto 13177, et al.* (CUZ, TUR, UC, USM); Parque Nacional del Manú, Cocha Cashu Biological Station, *Foster P-84-57, P-84-86* (UC). Several of the specimens cited by Tryon and Stolze (1991:79) as *D. striatum* (L.) C. Presl are *D. tabalosense*, which differs from *D. striatum* by the glabrous costae, costules, and tissue between veins abaxially, less incised pinnae (blades never 2-pinnate, even at the base), and narrower indusia ca. 0.1–0.2(0.3) mm wide. Known from Venezuela, Ecuador, Peru, and Bolivia.

Diplazium wolfii Hieron. (Athyriaceae)

PERU. Junín: Prov. Satipo: Gran Pajonal, Mapari, ca. 12 km SW of Chequitavo, 74°23'W, 10°45'S, 1300 m, *D. Smith 6789* (MO not seen, UC, USM) (see Stolze et al. 1994:22).

Elaphoglossum ambiguum (Mett. ex H. Christ) Alston (Dryopteridaceae)

PERU. Cajamarca: Prov. San Ignacio: Chirinos, localidad de Pacasmayo, 5°15'00"S, 78°55'00"W, 1750 m, *Campos & Garcia 4504* (MO not seen, UC, USM).

Elaphoglossum exsertipes Mickel (Dryopteridaceae)

PERU. Amazonas: near border with Dept. San Martín, 5°41'S, 77°48'W, 2000 m, *van der Werff 16650, et al.* (MO not seen, UC). **San Martín:** along road Rioja–Pedro Ruíz, El Mirador, 5°40'29"S, 77°46'25"W, 1850 m, *van der Werff 15659* (MO not seen, UC).

Elaphoglossum palmarum M. Kessler & Mickel (Dryopteridaceae)

PERU. San Martín: Prov. Rioja: Pedro Ruíz–Moyobamba road, Km 390, Venceremos, 5°50'S, 77°45', 1800–1900 m, *D. Smith 4503* (MO not seen, UC). Previously cited by Mickel (in Tryon & Stolze 1991:143) as *E. litanum* (Sodiro) C. Chr., which is now known only from Ecuador.

Elaphoglossum tovarense (Mett. ex Kuhn) T. Moore ex C. Chr., vel aff. (Dryopteridaceae)

PERU. Amazonas: Prov. Bagua: Yamayakat, 04°55'S, 78°19'W, 320 m, *Jaramillo 1189, et al.* (MO).

Enterosora trichosora (Hook.) L.E. Bishop (Grammitidaceae)

PERU. Amazonas: near border with Dept. San Martín, 5°41'S, 77°48'W, 2000 m, *van der Werff 16667, et al.* (MO not seen, UC).

Equisetum myriochaetum Schltdl. & Cham. (Equisetaceae)

PERU. Amazonas: Prov. Bagua: 25 km E of La Peca, 5900 ft, *Barbour 2880* (MO). **Cajamarca:** Huarango, Nuevo Mundo, 1600–1700 m, *Campos & Núñez 4623* (MO). Synonymized under *E. giganteum* by Tryon and Stolze (1994:15), but well characterized by Hauke (1963).

Eriosorus hirtus (Kunth) Copel. (Pteridaceae)

PERU. Piura: Prov. Ayabaca: Cerro de Aypate, Comunidad Campesina de Tacalpo, anexo Yanchalá, 4°42', 82"S, 79°34'150'W, 2800–2880 m, *Quipuscoa S. 643, et al.* (F not seen, UC).

Eriosorus novogranatensis A. F. Tryon (Pteridaceae)

PERU. Amazonas: San Martín, 5°41'S, 79°48'W, 1940 m, *van der Werff 16729* (MO not seen, UC, USM), *16747, et al.* (MO not seen, UC).

Huperzia dichotoma (Jacq.) Trevis. (Lycopodiaceae)

PERU. Pasco: Prov. Oxapampa: along road Chatarra–Pto. Bermudez, 10°30'S, 75°03'W, 700 m, *van der Werff 18161, et al.* (MO not seen, UC).

Huperzia firma (Mett.) Holub, vel aff. (Lycopodiaceae)

PERU. Amazonas: Prov. Leymebamba: Dist. Leymebamba, ruta Laguna de Los Cóndores, La Atalyaya, alrededores de La Fila, 6°49.056'S, 77°44.134'W, 3000–3500 m, *Quipuscoa S. 1206, et al.* (F not seen, UC).

Hymenophyllum dendritis Rosenst. (Hymenophyllaceae)

PERU. Huanuco: [Prov. Leoncio Prado]: alrededores de Maria, 800 m, *Aguilar 304* (UC). Perhaps most of the specimens cited by Tryon and Stolze (1989a:59) as *H. apiculatum* Mett. ex Kuhn from Peru are better referred to *H. dendritis*, a low-elevation, smaller species (fronds mostly 3–5 cm long) with ovate, rather than obovate involucres, included, shorter receptacles (generally < 1 mm long vs. often slightly exserted receptacles ca. 2 mm long in *H. apiculatum*), and smaller sporangia (ca. 0.3 mm long vs. 0.5 mm long).

Hymenophyllum platylobum Bosch (Hymenophyllaceae)

PERU. Puno: [Prov. Carabaya]: San Gabán, *Lechler 2489* (HOLOTYPE: P, photo US; ISOTYPE: F). Treated by Morton (1947) and by Tryon and Stolze (1989a:68) as a synonym of *H. valvatum* Hook. & Grev., but we believe the two are specifically distinct.

Jamesonia verticalis Kunze (Pteridaceae)

PERU. San Martin: Dto. Huallaga, Saposoa, entre El Tambo y Jalca de El Rayo, camino a Leymebamba, 2800–3200 m, *Quipuscoa S. 2484, et al.* (F not seen, UC).

Lellingeria aff. suspensa (L.) A.R. Sm. & R.C. Moran (Grammitidaceae)

PERU. Amazonas: near border with Dept. San Martín, 5°41'S, 77°48'W, 2000 m, *van der Werff 16686, et al.* (MO not seen, UC).

Lindsaea bolivarensis V. Marcano (Lindsaeaceae)

PERU. Loreto: Prov. Maynas: ca. 7 km E of oil palm plantation at Río Manití, 3°38'S, 72°56'W, 100–150 m, *Tuomisto 4721, et al.* (TUR, UC, USM); trail from the village of Panguana towards Río Manití, about 8 km from Río Amazonas, 3°53'S, 73°5'W, 100–200 m, *Tuomisto 6124, et al.* (TUR, UC, USM); Explorama/ ACEER reserve, 5–15 km E of the mouth of Quebrada Sucusari at lower Napo, 3°15'S, 72°50'W, 100–200 m, *Tuomisto 7755, et al.* (AMAZ, KSP, TUR); 2 km SE of the village Santa Ana at lower Río Tahuayo, 4°6'S, 73°7'W, 100–200 m, *Tuomisto 8863*, with Oré (AMAZ, TUR, USM) (Marcano 1989:254).

Lindsaea coarctata K.U. Kramer (Lindsaeaceae)

PERU. Loreto: Prov. Maynas: close to the village Nina Rumi at lower Río Nanay, 20 km SW of Iquitos, 3°51'S, 73°23'W, 100–200 m, *Tuomisto 5863* (AMAZ, TUR, USM). **Prov. Mariscal Ramon Castilla:** 3–4 km W from village of Puerto Izango, Río Yaguasyacu, 3°18'S, 72°01'W, 100–150 m, *Tuomisto 11227, et al.* (AMAZ, TUR, UC, USM). **Prov. Requena:** 3 km E from Requena, 5°04'S, 73°48'W, 150–200 m, *Tuomisto 12764, et al.* (AMAZ, TUR, USM); 4 km SE from Requena, 5°05'S, 73°49'W, 150–200 m, *Tuomisto 12778, et al.* (AMAZ, TUR, USM).

Lindsaea hemiptera K.U. Kramer (Lindsaeaceae)

PERU. Loreto: Prov. Maynas: 14 km NW from the carretera to Nauta at km 40, 3°56'S, 73°30'W, 100–150 m, *Tuomisto 3557, et al.* (AAU, AMAZ, TUR, USM, Z); Experimental station 'El Dorado' of INIA, Km 25 along road Iquitos-Nauta, 3°57'S, 73°25'W, 100–200 m, *Tuomisto 13049*, with Ruokolainen (AMAZ, TUR, UC, USM).

Lindsaea javitensis Humb. & Bonpl. ex Willd. (Lindsaeaceae)

PERU. Loreto: Prov. Maynas: Experimental station 'El Dorado' of INIA, Km 25 along road Iquitos-Nauta, 3°57'S, 73°25'W, 100–200 m, *Tuomisto 13051*, with Ruokolainen (AMAZ, TUR, UC, USM).

Lindsaea tetraptera K.U. Kramer (Lindsaeaceae)

PERU. Loreto: Prov. Maynas: Experimental station of UNAP at Puerto Almendras along Río Nanay, 20 km air distance from Iquitos, 3°51'S, 73°22'W, 100–200 m, *Tuomisto 6439*, with Ruokolainen (AMAZ, TUR, USM); close to the experimental station of UNAP at San Gerardo, km 13 of the road Iquitos-Nauta, 3°55'S, 73°22'W, 100–200 m, *Tuomisto 7217*, with Ruokolainen (AMAZ, TUR, USM); Experimental station 'El Dorado' of INIA, Km 25 along road Iquitos-Nauta, 3°57'S, 73°25'W, 100–200 m, *Tuomisto 13048*, with Ruokolainen (AMAZ, TUR, UC, USM).

Lomariopsis prieuriana Fée (Dryopteridaceae)

PERU. Loreto: Prov. Maynas: C. Nueva Paleta, Río Napo, 3°01'S, 73°21'W, Flores 348, 353, 363 (AAU). **San Martín: Prov. Rioja:** road Rioja-Pedro Ruiz, 1450 m, *van der Werff 15554* (UC). Additional collections from Loreto cited by Moran (2000:93).

Megalastrum mollis A.R. Sm. (Dryopteridaceae)

PERU. Amazonas: Bagua Distr., along road from Chiriaco towards Bagua, 5°16'57"S, 78°23'10'W, 750 m, *van der Werff 16300, et al.* (HOLOTYPE: UC; ISOTYPE: MO) (Smith. 2005b).

Melpomene assurgens (Maxon) A.R. Sm. & R.C. Moran (Grammitidaceae)

PERU. Cajamarca: Prov. San Ignacio: Tabaconas, Santuario Nacional Tabaconas-Namballe, 5°15'00"S, 79°19'00"W, 2300–2400 m, *Campos 5691, et al.* (MO not seen, UC, USM). Discussed under *Grammitis moniliformis* (Lag. ex Sw.) Proctor by Tryon and Stolze (1993:99).

Melpomene peruviana (Desv.) A.R. Sm. & R.C. Moran (Grammitidaceae)

PERU. Ancash: Prov. Huaras: N of Laguna Llanganuco, 9°03.1'S, 77°36.2' W, 4400, *Lehnert 273* (UC). **Ayacucho: Prov. Huamanga:** Ayacucho-Andahuaylas, above Ocros, 13°23.5'S, 73°57.3'W, 4200 m, *Lehnert 339* (UC, USM); Ayacucho-Andahuaylas, behind furcation to Vilcas Huamán, 13°22'S, 73°58'W, 4200 m, *Lehnert 333* (UC, USM). Synonymized under *Grammitis flabelliformis* (Poir.) C. V. Morton by Tryon and Stolze (1993:102).

Metaxya lanosa A.R. Sm. & Tuomisto (Metaxyaceae)

Cited by Smith et al. (2001) from Loreto. Several additional collections are now known: **PERU. Loreto: Prov. Maynas:** Distr. Iquitos, El Dorado-INIA, Varillal Alto Húmedo, *McDaniel & Rimachi 27814* (IBE not seen, USM); *Moran 3630* (USM); *Rimachi 7526* (USM).

Microgramma acatallela Alston (Polypodiaceae)

PERU. [Loreto]: Prov. Maynas: Iquitos, Estación Biológica, Allpahuayo-IIAPBosque primario, 03°53'S, 73°25'W, 130 m, *Jaramillo & Marcos 703* (MO not seen, UC). **Pasco**: Dist. Pozuzo, Parque Nacional Yanachaga Chemillén, 10°11'S 75°34'W, 1225 m, *Monteagudo 4846, et al.* (MO not seen, UC); El Huampal, *van der Werff 17930A, et al.* (MO not seen, UC). Most likely, specimens identified as *M. piloselloides*, as defined by Tryon and Stolze (1993:152), are *M. acatallela*; the former is generally considered to be restricted to the Antilles, s Mexico, and Guatemala (e.g., Mickel & Smith 2004:398).

Microgramma fosteri B. León & H. Beltrán (Polypodiaceae)

–**PERU. Ucayali: Prov. Padre Abad:** Cordillera Azul del Biabo, cabaceras del Río Pisqui, 8°28'45.6"S, 75°43'5.21"W, 1220 m, *Beltrán 3643, et al.* (HOLOTYPE: USM) (León & Beltran 2002).

Micropolypodium caucanum (Hieron.) A.R. Sm., vel aff. (Grammitidaceae)

PERU. Pasco: Prov. Oxapampa: road to Chacos, near top of ridge, 10°35'S, 75°06'W, 2400–2700 m, *van der Werff 18539, 18573, et al.* (MO not seen, UC); Chacos, 10°37'S, 75°17'W, 2500 m, *van der Werff 17697, et al.* (MO); Parque Nacional Yanachaga-Chemillen, Abra Yanachaga, 10°22'S, 75°27'W, 2900 m, *Vásquez 28455, et al.* (MO not seen, UC).

Pecluma robusta (Fée) M. Kessler & A.R. Sm. (Polypodiaceae)

PERU. San Martín: Prov. Huallaga: Dist. Saposoa, Arriba de Zarumilla, al NO del pueblo, 6°34'55"S, 77°23'06"W, 1350 m, *Quipuscoa S. 2096, et al.* (F not seen, UC) (Kessler & Smith 2005).

Pleopeltis disjuncta M. Kessler & A.R. Sm. (Polypodiaceae)

PERU. Cuzco: *Cook & Gilbert 1510* (US), as cited by Kessler and Smith (2005). See also Tryon and Stolze (1993:137), under *Polypodium furfuraceum* Schltdl. & Cham.

Pleopeltis stolzei A.R. Sm. (Polypodiaceae)

PERU. Amazonas: see Tryon and Stolze (1993:143), Kessler and Smith (2005). A synonym is *Pleopeltis macrocarpa* (Bory ex Willd.) Kaulf. var. *laciniata* Stolze.

Polybotrya sessilisora R.C. Moran (Dryopteridaceae)

PERU. Loreto: Prov. Loreto: 1.5 km E of road to Iquitos at Km 10 from Nauta, 4°28'S, 73°34'W, 100–150 m, *Tuomisto 4435, et al.* (AAU, AMAZ, TUR, U, USM); Río Tigre, 2 km E of the village Paraíso, 3°57'S, 74°17'W, *Tuomisto 13977, et al.* (AMAZ, USM, TUR); Río Tigre, 7 km NW of the village Paicheplaya, 3°00'S, 75°22'W, *Tuomisto 14560, et al.* (AMAZ, TUR, UC, USM). **Prov. Maynas:** Explorama/ACEER Reserve, 15–23 km E of mouth of Quebrada Sucusari at lower Napo, 3°15'S, 72°45'W, 100–200 m, *Tuomisto 7853, et al.* (AMAZ, KSP, TUR, UC); Upper Río Itaya, about 5 km SSE of the village Carbajal, 4°19'S, 73°35'W, 100–200 m, *Tuomisto 10120, et al.* (AMAZ, TUR, US).

Polypodium appressum Copel. (Polypodiaceae)

PERU. Amazonas: Izuchaca, 6°19'40"S, 77°31'05"W, *van der Werff 16936, et al.* (MO not seen, UC). **Junín: Prov. Tarma:** Agua Dulce, 1900 m, *Woytkowski 35479* (UC). The species was subsumed under the much more common *P. fraxinifolium* Jacq. by Tryon and Stolze (1993:132).

Polypodium attenuatum Humb. & Bonpl. ex Willd. (Polypodiaceae)

PERU. Tumbes Hwy to "El Caucho," 400 m, *Coronado 230* (UC). Misdetermined as *P. aureum* by Tryon, in 1957.

Polypodium (Pleopeltis) fayorum R.C. Moran & B. Øllg. (Polypodiaceae)

PERU. Cajamarca: Prov. Santa Cruz: 1800 m, *Sagastegui & Leiva 14092* (UC) (Moran & Øllgaard 1998:437).

Polypodium funckii Mett. (Polypodiaceae)

PERU. Amazonas: Prov. Chachapoyas: Chachapoyas-Mendoza, Km 52, *Lehnert 232* (UC). **Huánuco:** Carpish, 2800 m, *Coronado 70* (UC).

Polypodium giganteum Desv. (Polypodiaceae)
PERU. Pasco: Prov. Oxapampa: along road Chatarra-Cacazu, 10°32S, 75°04'W, *van der Werff 18272, et al.* (MO not seen, UC).

Polypodium gilliesii C. Chr. (Polypodiaceae)
Stork et al. 9283 (UC), *Stork & Vargas 9338* (UC), *Tryon & Tryon 5418* (BM, UC), from Dept. Lima, *Sagastegui 12956, et al.* (UC), from Dept. La Libertad, as well as other specimens seen from Dept. Lima and Dept. Lambayeque from low elevations are this species, and not *P. lasiopus* Klotzsch, as cited Tryon and Stolze (1993:130). *Polypodium gilliesii* differs from *P. lasiopus*, where it was synonymized by both Hensen (1990) and Tryon and Stolze (1993), by having abaxially glabrous or nearly glabrous blades (lacking long, septate hairs) and generally longer, narrower, somewhat diverging, and darker rhizome scales (most prominently seen in Venezuelan specimens, the type locality); in addition, *P. lasiopus* grows at elevations above 1700 m in Peru, while *P. gillliesii* is recorded from 400–800(–1300) m, primarily on lomas.

Polypodium intricatum M. Kessler & A.R. Sm. (Polypodiaceae)
PERU. Amazonas: Prov. Luya: Dist. Camporredondo, Tullanya, Pascana, La Palma, 6°04'35"S, 78°21'45"W, 2710 m, *Vásquez 22033, et al.* (MO not seen, UC, USM). **Cajamarca:** *Campos & Nuñez 4647* (UC). **San Martín: Prov. Rioja:** Pedro Ruíz–Moyobamba road, Km 390, 77°45'W, 05°50'S, 1800 m, *Smith 4414* (MO not seen, UC, USM). See also Tryon and Stolze (1993:130), most specimens cited under *P. loriceum* L.

Polypodium kunzeanum C. Chr. (Polypodiaceae)
PERU. Amazonas: Prov. Bongará: Shillac, north by trail from Pedro Ruíz, 5°49'S, 78°01'W, 2300 m, *D. Smith 4945*, with Vásquez S. (MO not seen, UC). **Huánuco:** between Chinchao and Puente Durand, 2000 m, *Coronado 85* (UC). Cited by Tryon and Stolze (1993) as a synonym of *P. sessilifolium* Desv., which we believe is not closely related. *Polypodium kunzeanum* has much less regular venation, sometimes with two included and themselves anastomosing veins within an areole, cordate-based, nonadnate pinnae (the basalmost with lobes overlapping the rachis), and non-clathrate rhizome scales. Both collections seen from Peru, neither cited by Tryon and Stolze (although *Smith 4945* was annotated as *P. triseriale* vel aff.), are indicated as growing terrestrially.

Polypodium loriciforme Rosenst. (Polypodiaceae)
PERU. Pasco: Prov. Oxapampa: Dist. Chontabamba, carretera a la Suiza, 10°39'S, 75°27'W, 2130–2210 m, *Monteagudo 4539, et al.* (MO not seen, UC).

Polypodium maritimum Hieron. (Polypodiaceae)
PERU. Cajamarca: Prov. San Ignacio: San José de Lourdes, 4°59'22"S, 78°53'03"W, 2020 m, *Vásquez 26336, et al.* (MO not seen, UC); San José de Lourdes, camino al Cerro Picorana, 5°01'40"S, 78°54'30"W, 2100–2200 m, *Campos 5507, et al.* (MO not seen, UC).

Polypodium polystichum Link (Polypodiaceae)
PERU. Huánuco: Prov. Huánuco: Dist. Churubamba, Hacienda Mercedes, Cotirarda, 1560 m, *Mexia 8216a* (UC); Dist. Churubamba, Hacienda Exito, bank of Río Ysabel, 1100 m, *Mexia 8163* (UC). **Pasco: Prov. Oxapampa:** Gran Pajonal, vicinity of Chequitavo, 10°45'S, 74°23'W, 1250 m, *D. Smith 5161* (MO not seen, UC). Related to *P. fraxinifolium* Jacq. but with spreading, long-acuminate scales.

Polypodium (Pleopeltis) tweedianum Hook. (Polypodiaceae)
PERU. Cajamarca: Prov. Contumazá, entrada al Bosque Cachil, 2500 m, *Sagástegui 15107, et al.* (F not seen, UC). Related to *P. pycnocarpum* C. Chr., but with sharply bicolored rhizome scales with a sclerotic mid-stripe.

Polystichum cochleatum (Klotzsch) Hieron. (Dryopteridaceae)

PERU. See Tryon and Stolze (1991:54), under *P. pycnolepis* (Klotzsch) T. Moore; the name accepted by Tryon and Stolze for this species is, in our opinion, a synonym of their *P. orbiculatum* (Desv.) J. Rémy & Fée

Polystichum rufum M. Kessler & A.R. Sm. (Dryopteridaceae)

PERU. San Martín: Prov. Lamas: Dist. Lamas, below English Evangelical Mission, Lamas, *Belshaw 3428* (UC; GH, US not seen). Specimen previously cited as *P. montevidense* (Spreng.) Rosenst. by Tryon and Stolze (1991:52).

Polystichum stuebelii Hieron. (Dryopteridaceae)

PERU. Cuzco: Prov. Urubamba: Dist. Ollantaytambo, Huaytampo, 13°09'02"S, 72°30' 28"W, 2400 m, *Calatayud 1109, et al.* (MO not seen, UC). **Pasco: Prov. Oxapampa:** Dist. Oxapampa, Parque Nacional Yanachaga Chemillén, cercanías del Refugio el Cedro, 10°32'S, 75°21'W, 2420 m, *Monteagudo 3814, et al.* (MO not seen, UC). Probably included within *P. montevidense* (Spreng.) Hieron. by Tryon and Stolze (1991), but the name *P. stuebelii* not mentioned by them.

Polytaenium brasilianum (Desv.) Benedict (Vittariaceae)

PERU. Cuzco: Prov. Convención: Tupitari, 2000 m, *Vargas C. 3440* (UC). This species was recognized as distinct by Tryon (1964), and the Vargas specimen cited as representative, but *Antrophyum brasilianum* (Desv.) C. Chr. was synonymized by Tryon and Stolze (1989b:87) under *A. cajenense* (Desv.) Spreng. [= *Polytaenium cajenense* (Desv.) Benedict]. The latter differs in having oblanceolate (vs. elliptic) blades and darkened (vs. stramineous) midribs abaxially towards the base of the blades.

Pteris consanguinea Mett. ex Kuhn (Pteridaceae)

PERU. Amazonas: Prov. Bagua: 12 km E of La Peca, 1700 m, *Barbour 2497* (MO not seen, UC). **Cajamarca: Prov. San Ignacio:** San José de Lourdes, 5°01'00"S, 78°57'00"W, 1500–1600 m, *Campos 3890, et al.* (MO not seen, UC); San José de Lourdes, 4°59'22"S, 78°53'03"W, 2020 m, *Vásquez 26293, et al.* (MO not seen, UC). **San Martín: Prov. Huallaga:** Dist. Saposoa, al sur de Añazco Pueblo, 2000 m, *Quipuscoa S. 2328, et al.* (F not seen, UC). Specimens placed here would key to *P. decurrens* C. Presl in Tryon and Stolze (1989b:77), but that species differs in a number of respects (see Prado & Windisch 2000).

Pteris muricatopedata Arbeláez (Pteridaceae)

PERU. Huánuco: Prov. Leoncio Prado: Dtto. Emileo Baldizan, Tingo María-Pucallpa La Divisora road, 1600 m, *Rimbach 4993* (NY not seen). **Pasco: Prov. Oxapampa:** 4–5 km N of Mallampampa, 2400 m, *Smith & Canne 5786* (NY not seen). Additional collection from Pasco cited by Arbeláez (1995:177).

Saccoloma membranaceum Mickel (Dennstaedtiaceae, temporarily)

PERU. Amazonas: Dist. Bagua, Imaza, Quebrada Almendro, 5°18'S, 78°20'W, 400 m, *Vásquez 26106, et al.* (MO not seen, UC); Dist. Bagua, along road Imaza-Chiriaco, 5°03'24"S, 78°20'17"W, 400 m, *van der Werff 16182, et al.* (MO not seen, UC); Dist. Imaza, Tayu Mujaji. Comunidad de Wawas, 5°15'56"S, 78°22'07"W, 900 m, *Vásquez 24644, et al.* (MO not seen, UC). **Pasco: Prov. Oxapampa:** along road Chatarra-Cacazu, 10°32'S, 75°04'W, 890 m, *van der Werff 18249* (MO not seen, UC).

Salpichlaena hookeriana (Kuntze) Alston (Blechnaceae)

PERU. Loreto: Prov. Maynas: ca. 10 km SW of Iquitos at zoological park, *Moran 3672* (UC); 7 km E of the oil palm plantation at Río Manití, 3°38'S, 72°56'W, 100–150 m, *Tuomisto 4771, et al.* (AAU, AMAZ, TUR, U, USM); Explorama/ACEER reserve, 23–31 km E of the mouth of Quebrada Sucusari at lower Napo, 3°14'S, 72°39'W, 100–200 m, *Tuomisto 7880, et al.* (AMAZ, KSP, TUR, US); Upper Río Itaya, about 6 km SSE of the village Carbajal, 4°20'S, 73°35'W, 100–200 m, *Tuomisto 10083, et al.* (AMAZ, NY, TUR). **Prov. Mariscal Ramón Castilla:** 2–5 km SW from village of Puerto Izango, Río Yaguasyacu, 3°18'S, 72°01'W, 100–150 m, *Tuomisto 11252, et al.* (AMAZ, TUR, UC, USM). **Prov. Requena:** 2 km N from the biological station of Jenaro Herrera, 4°52'S, 73°39'W, 150–200 m, *Tuomisto 12785, et al.* (AMAZ, TUR, USM). **Prov. Loreto:** 5 km upriver from mouth of Río Pucacuro, 3°17'S, 74°59'W, *Tuomisto 14123, et al.* (AMAZ, TUR, USM). **Madre de Dios: Prov. Manu:** 4 km S from the village of Boca Colorado, 12°38'S, 70°25'W, 300 m, *Tuomisto 13588, et al.* (CUZ, TUR, USM). Subsumed by Tryon and Stolze (1993:70) under *S. volubile* (Kaulf.) J. Sm., but easily distinguished by the serrate sterile pinnule apices, strongly dimorphic, elaminate fertile pinnules ca. 1–2 mm wide and the buds in the axils of sterile pinnae. Tryon and Stolze also cited two specimens from Loreto (not seen) that are most likely this species.

Schizaea fluminensis Miers ex J. Sturm (Schizaeaceae)

PERU. Loreto: *Maas 6336, et al.* (AMAZ, USM); *Mejía s.n.* (USM). Cited by Vásquez (1997) for Loreto; see also León et al. (in press).

Selaginella arthritica Alston (Selaginellaceae)

PERU. Huánuco: Prov. Leoncio Prado: along road from Tingo Maria to Pucalpa, less than 1 km N of Sortilegio, 9°13'16"S, 75°50'15"W, 1310 m, *Croat 81744*, & Sizemore (MO not seen, UC, USM).

Selaginella fragilis A. Braun (Selaginellaceae)

PERU. Loreto: Prov. Requena: 140 m, *van der Werff 1010, et al.* (MO not seen, UC). Subsumed by Tryon and Stolze (1994:84) under *S. parkeri* (Hook. & Grev.) Spring, but this specimen, at least, seems specifically distinct, with much narrower penultimate divisions and long-flagelliform branch apices.

Selaginella leucoloma Alston ex Crabbe & Jermy (Selaginellaceae)

PERU. Puno: trail from Aricoma Pass to Santo Domingo, 5800 ft, *McCarroll 126*, pro parte (MICH). Cited by Valdespino (1995:366).

Selaginella macilenta Baker (Selaginellaceae)

PERU. Junín: Chanchamayo, 750 m, *Kunkel 347* (S). Cited by Valdespino (1995:322).

Selaginella moritziana Spring (Selaginellaceae)

PERU. Pasco: Prov. Oxapampa: San Alberto, 10°32'S, 75°21'W, 2400 m, *van der Werff 18597, et al.* (MO not seen, UC). *Selaginella pearcei* Baker, type from Peru, was subsumed under *S. novae-hollandiae* (Sw.) Spring by Tryon and Stolze (1994:77), but it is referred to *S. moritziana* var. *pearcei* (Baker) Valdespino, ined., by Valdespino (1995).

Selaginella palmiformis Alston ex Crabbe & Jermy (Selaginellaceae)

PERU. Loreto: Prov. Mariscal Ramón Castilla: ca. 3 km S of Huanta, 3°17'S, 72°51'W, 100–150 m, *Tuomisto 5231, et al.* (AAU, AMAZ, TUR, UC, USM). **Prov. Maynas:** surroundings of tourist lodge of Explorama Tours at Río Sucusari, 3°10'S, 72°52'W, 100–150 m, *Tuomisto 5818, et al.* (AAU, AMAZ, TUR, UC, USM); Maynas, trail from village of Panguana towards Río Manití, ca. 8 km from Río Amazonas, 3°53'S, 73°05'W, 100–200 m, *Tuomisto 6101, et al.* (AMAZ, TUR, UC, US); Explorama/ACEER Reserve, 1.6–3.3 km E of mouth of Quebrada Sucusari at lower Napo, 3°15'S, 72°53'W, 100–200 m, *Tuomisto 7712, et al.* (AMAZ, KSP, TUR, UC, US). **Prov. Mariscal Ramón Castilla:** 3–4 km W from village of Puerto Izango, Río Yaguasyacu, 3°18'S, 72°01'W, 100–150 m, *Tuomisto 11232, et al.* (AMAZ, TUR, UC, USM).

Selaginella tomentosa Spring (Selaginellaceae)

PERU. Amazonas: Río Cenepa, second ridge E of Huampami, 900–1000', *Berlin 633* (MO, UC). This species was synonymized under *S. geniculata* (C. Presl) Spring by Tryon and Stolze (1994), but *S. tomentosa* is easily distinguished by the decidedly short-hairy stems. It has been recognized by nearly all other pteridologists, e.g., by Alston et al. (1981:306).

Sticherus aurantiacus Østergaard & B. Øllg. (Gleicheniaceae)

PERU. San Martín: [Prov. San Martín]: Tarapoto, 750 m, *Williams 5972* (US); between Moyobamba and Huallaga, *Stübel 1103* (B).

Sticherus boliviensis (Maxon & C. V. Morton) J. Gonzales, comb. ined. (Gleicheniaceae)

PERU. Puno: Prov. Sandia: Limbani, 3200–3450 m, *Metcalf 30539* (GH, MO, US).

Sticherus decurrens (Raddi) J. Gonzales, comb. ined. (Gleicheniaceae)

PERU. Amazonas: Prov. Bagua: between Aramango and Montenegro, 275 m, *López 4163* (GH). **Cuzco:** Asunción, 1200 m, *Vargas 7908* (GH); Quispicanchis, between Inambari and Quincemil, 500–650 m, *Vargas C. 16487* (H). **Huánuco: Prov. Leoncio Prado:** Tingo Maria, 710 m, *Tryon & Tryon 5263* (GH, USM). **JUNÍN: Prov. Chanchamayo:** La Merced, *Kunkel 652* (GH). **Loreto: [Prov. Alto Amazonas]:** Pumayacu, between Balsapuerto and Moyobamba, 600–1200 m, *Krug 3242* (MO, NY). **San Martín:** road Tarapoto-Yurimaguas, Km 12–15, 2250 m, *Hickok 646* (GH). See Gonzales (2003).

Sticherus ferrugineus (Raddi) J. Gonzales, comb. ined (Gleicheniaceae)

PERU. Cuzco: Prov. Convención: Río Apurimac, above Hacienda Luisiana, *Wade 1333* (GH). **Loreto:** Río Marañón Valley, between mts. of Río Pastaya and Río Huallaga, San Lorenzo, 150 m, *Killip 29219* (NY, US). See Gonzales (2003).

Sticherus lanosus (H. Christ) J. Gonzales, comb. ined. (Gleicheniaceae)

PERU. Cuzco: 5 km N of Aguas Calientes, 2000 m, *Solomon 3172* (MO); Urubamba, Machu Pichu, 2000 m, *Saunders 1232* (GH). **Huánuco:** Cerros del Sira, 9°25'S, 74°44'W, 1560 m, *Dudley 13193* (GH). **Puno:** Carabaya, Ollachea-San Gabán road, Chacaneque, *Boeke 3139* (MO, NY); Valle de Marcapata, 2000 m, *Herrera 1592* (US). See Gonzales (2003).

Sticherus lanuginosus (Fée) Nakai (Gleicheniaceae)

Previously often called *S. penniger* (Mart.) Copel. [= *Gleichenia pennigera* (Mart.) T. Moore, in Tryon & Stolze 1989a], which is considered a synonym of *S. pruinosus* (Mart.) Ching, by Gonzales (2003).

Sticherus melanoblastus Østergaard & B. Øllg. (Gleicheniaceae)

PERU. Pasco: Prov. Oxapampa: La Suiza Nueva, 10°38'S, 75°27'W, 2240 m, *van der Werff 17622, et al.* (MO not seen, UC). Mentioned as possibly in Peru by Østergaard Anderson and Øllgaard (2001).

Sticherus velatus (Kunze) Copel. (Gleicheniaceae)

PERU. Huánuco: Pampayacu, Jul 1829, *Poeppig s.n.* (HOLOTYPE: W, the fragment of *Poeppig s.n.* at US annotated as isotype of *S. velatus* is in fact *S. lanosus*). **Cuzco:** La Convención, Valle Santa Ana, 1000–1500 m, *Herrera 2637* (US); Cuchero, *Poeppig 1117* (W). See Gonzales (2003). This species synonymized under *Gleichenia tomentosa* (Cav. ex Sw.) Spreng. by Tryon and Stolze (1989a:42).

Tectaria microsora A.R. Sm. (Dryopteridaceae)

PERU. Amazonas: Prov. Bagua: Distr. Imaza, Comunidad Aguaruna de Putuim, 4° 55'S, 78° 19'W, 680 m, *Rodríguez R. 967, et al.* (HOLOTYPE: HUT; ISOTYPES: MO not seen, UC, USM); Distr. Imaza, region del Marañón, comunidad de Yamayakat, Quebrada Kusu-Chapi, Río Marañon, 04° 55'S, 78° 19'W, 550 m, *Vásquez 19644* (MO, UC); same locality, 600 m, *Rodríguez R. 288* (MO, UC, USM); Dist. Bagua, along road from Chiriaco towards Bagua, 05° 16'57"S, 78° 23', 10"W, 800 m, *van der Werff 16260* (MO, UC). **Prov. Condorcanqui:** Distr. El Cenepa, región Nororiental del Marañón, Río Cenepa, comunidad Tutino, 04° 33'S, 78° 10'W, 350 m, *Vásquez 18404, et al.* (MO, UC); see Smith (2005b).

Tectaria pilosa (Fée) R.C. Moran (Dryopteridaceae)

PERU. Amazonas: Prov. Bagua: Dtto. Imaza, Comunidad de Yamayakat, 05°03'24"S, 78°20'17W, 450 m, *Rojas 567, et al.* (MO not seen, UC). **Prov. Condorcanqui:** Dtto. El Cenepa, Comunidad Aguaruna Pagki-Suwa, Río Cenepa, quebrada Tayo, 04°31'35"S, 78°10'34"W, 289 m, *Vásquez 22151, et al.* (MO not seen, UC, USM). **Ayacucho: Prov. La Mar:** between Santa Rosa and Hacienda Luisiana, 640 m, *Wasshausen & Encarnación 630* (US not seen, USM). **Loreto: [Prov. Alto Amazonas]:** above Pongo de

Manseriche, bank of Río Santiago, 200 m, *Mexia 6354* (UC). **Prov. Maynas:** Explor Napo Camp at Río Sucusari, 03°20'S, 72°55'W, 120 m, *van der Werff 12926, et al.* (MO not seen, UC). Treated by Tryon and Stolze (1991:25) as a variant of *T. incisa*, but we think *T. pilosa* is adequately distinct, at species rank. They also cited specimens from Depts. Cajamarca, Huánuco, Madre de Dios, and Pasco that may be this species.

Tectaria pubens R.C. Moran (Dryopteridaceae)

PERU. Loreto: Prov. Maynas: ca. 50 km downriver from Iquitos, Explorama Lodge, ca. 120 m, *Moran 3647* (HOLOTYPE: MO; ISOTYPE: UC); additional collections from the same general locality cited by Moran (1992:138).

Terpsichore chrysleri (Copel.) A.R. Sm. (Grammitidaceae)

PERU. Amazonas: [Prov. Bongara]: Laguna de Pomacochas, 2550 m, *van der Werff 15809, et al.* (MO not seen, UC). **Cajamarca: Prov. San Ignacio:** Tabaconas, El Pajonal, camino al Páramo y al Cerro Coyona, 5°17'30"S, 79°16'02"W, 2250 m, *Campos 5728, et al.* (MO not seen, UC); San José de Lourdes, 5°00'S, 78°54'W, 1800 m, *Vásquez 26157, et al.* (MO not seen, UC). Subsumed under *Grammitis asplenifolia* (L.) Proctor by Tryon and Stolze (1993:104), but easily distinguished; some (probably most) of the specimens cited by them as *G. asplenifolia* are, in fact, *Terpsichore chrysleri*, specifically *van der Werff 8608* (UC) and *Woytkowski 35485* (UC), but *Terpsichore asplenifolia* (L.) A.R. Sm. s. str. also occurs in Peru.

Terpsichore mollissima (Fée) A.R. Sm. (Grammitidaceae)

PERU. Pasco: Prov. Oxapampa: Parque Nacional Yanachaga, El Huampal, 10°11'S, 75°34'W, 1200 m, *van der Werff 17846, et al.* (MO not seen, UC). **San Martín: Prov. Rioja:** Moyobamba-Pedro Ruíz, Km 383, 5°50'S, 77°30'W, ca. 2000 m, *Lehnert 221* (UC, USM).

Terpsichore subtilis (Kunze ex Klotzsch) A.R. Sm. (Grammitidaceae)

PERU. Amazonas: near border with San Martín, 5°41'S 77°48'W, 2000 m, *van der Werff 16675, et al.* (MO).

Terpsichore youngii B. León & A.R. Sm. (Grammitidaceae)

PERU. Cuzco: near San Lorenzo, 2300–2500 m, *León & Young 4487* (HOLOTYPE: USM; ISOTYPE: UC) (León & Smith 2003:84).

Thelypteris cinerea (Sodiro) A.R. Sm. (Thelypteridaceae)

PERU. Amazonas: road Chachapoyas-Mendoza, a little past Molinopampa, 6°14'11"S, 77°35'49"W, 2400 m, *van der Werff 15095, et al.* (MO not seen, UC).

Thelypteris steyermarkii A.R. Sm. (Thelypteridaceae)

PERU. Cuzco: Prov. Paucartambo: Kosñipata Valley, Km 150, San Pedro, Río Unión and Río Kosñipata junction, 1800 m, in sandy beach-river, *Núñez 11958* (MO).

Trichomanes accedens Hook. (Hymenophyllaceae)

PERU. Amazonas: Quebrado El Almendro, 5°14'40"S, 78°21'24"W, 430 m, *van der Werff 14560, et al.* (MO not seen, UC). **Loreto: Prov. Requena:** 140 m, *van der Werff 10112, et al.* (MO not seen, UC). **Prov. Maynas:** Mishana, along Río Nanay, 140 m, *van der Werff 10193* (MO not seen, UC); Experimental station of UNAP at Puerto Almendras along Río Nanay, 20 km air distance from Iquitos, 3°51'S, 73°22'W, 100–200 m, *Tuomisto 6429*, with Ruokolainen (TUR, US, USM). Discussed and considered probably synonymous with *T. cristatum* Kaulf. by Tryon and Stolze (1989a:98).

Trichomanes dactylites Sodiro (Hymenophyllaceae)

PERU. Cajamarca: Prov. San Ignacio: San José de Lourdes, laderas del Cerro Picorana, 4°58'00"S, 78°53'01"W, 2500–2540 m, *Campos 5933, et al.* (MO not seen, UC).

Trichomanes pilosum Raddi (Hymenophyllaceae)
PERU. Amazonas: Prov. Bagua: Dist. Imaza, Quebrada Almendra, 5°14'40"S, 78°21'34"W, 400 m, *van der Werff 16124, et al.* (MO not seen, UC).

Trichomanes spruceanum Hook. (Hymenophyllaceae)
PERU. Loreto: Prov. Maynas: Dist. Iquitos, Puerto Almendras, 130 m, on white sand, *van der Werff 9845, et al.* (MO not seen, UC).

DELETIONS FROM THE FLORA

Elaphoglossum peruvianum (L. D. Gómez) Mickel (Dryopteridaceae)
Treated by Mickel (in Tryon & Stolze 1991:170, under *Peltapteris*), but now regarded as a heterotypic synonym of *Elaphoglossum moorei* (E. Britton) H. Christ, according to Moran and Mickel (unpublished ms.); we also subsume *Peltapteris* in *Elaphoglossum*.

Megalastrum yungense (H. Christ & Rosenst.) A.R. Sm. & R.C. Moran (Dryopteridaceae)
The specimen of *M. yungense* cited in Fl. Peru (Tryon & Stolze 1991:14), *D. Smith 4424* (MO not seen, NY, UC), is actually *M. biseriale* (Baker) A.R. Sm. & R.C. Moran, so *M. yungense* is not yet known from Peru.

ACKNOWLEDGMENTS

We thank Jasivia Gonzales for information regarding species of *Sticherus* in Peru, an unpublished part of her dissertation. We also thank curators of herbaria at HUT and MO for loan of specimens and for sending digital images, and two reviewers for helpful comments and suggestions on this manuscript.

ABSTRACT

A survey of the vascular flora of Giles County, Tennessee was conducted between July 1998 and September 2004. A total of 1208 species and infraspecific taxa, representing 138 families and 553 genera, were documented from 30 qualitatively defined habitats, resulting in 912 county records. Several rare taxa were discovered, including two federally threatened species: *Apios priceana* and *Helianthus eggertii*. Other noteworthy rare species found were *Cimicifuga rubifolia, Perideridia americana, Stellaria fontinalis*, and *Xyris laxifolia* var. *iridifolia*. *Arenaria lanuginosa*, a Tennessee endangered species thought extirpated from the state, was rediscovered after not having been collected since 1948. In addition, three state records, *Achyranthes japonica, Euonymus kiautschovicus*, and *Eupatorium × pinnatifidum*, were found. Other noteworthy collections include *Baccharis halimifolia* and *Amaranthus powellii*, each representing second reports from Tennessee.

RESUMEN

Se realizó un estudio de la flora vascular de Giles County, Tennessee entre Julio de 1998 y Septiembre de 2004. Se documentaron un total de 1208 especies y taxa infraspecíficos, que representan 138 familias y 553 géneros, procedentes de 30 hábitats definidos cualitativamente, que aportaron 912 citas para el condado. Se descubrieron varios taxa raros, incluyendo dos especies amenazadas federalmente: *Apios priceana* y *Helianthus eggertii*. Otras especies notables raras encontradas fueron *Cimicifuga rubifolia, Perideridia americana, Stellaria fontinalis*, y *Xyris laxifolia* var. *iridifolia*. *Arenaria lanuginosa*, una especie amenazada de Tennessee que se creía eliminada del estado, se redescubrió después de no haber sido colectada desde 1948. Además, se encontraron tres citas para el estado *Achyranthes japonica, Euonymus kiautschovicus*, y *Eupatorium _ pinnatifidum*. Otras colecciones notables incluyen *Baccharis halimifolia* y *Amaranthus powellii*, ambas representan segundas citas para Tennessee.

INTRODUCTION

Giles County is in a portion of Tennessee that has received very little botanical attention. In 1998, the county's known flora consisted of 263 species and infraspecific taxa (Chester et al. 1993, 1997). In order to increase the knowledge of the flora of Giles County and of southern Middle Tennessee, a study of the county's flora was completed. The objectives of this study were to (1) compile an annotated list of the vascular flora of the county; (2) locate and document state and federally listed plants of conservation concern; and (3) qualitatively describe the county's plant communities.

SIDA 21(4): 2343 – 2388. 2005

Study Area

Giles County is in southern Middle Tennessee (35°23'N, 87°03'W) near the center of the southern border of the state (Fig. 1). The county is ca. 50 km long (north to south) and 36 km wide (east to west) with a total area of 158,248 ha. It is entirely within the Interior Low Plateau Physiographic Province delimited by Fenneman (1938), and lies within two physiographic sections: the Highland Rim and the Central (Nashville) Basin (Quarterman & Powell 1978). The Highland Rim (HR) of Giles County is comprised of two subsections: the Eastern Highland Rim (EHR) and the Western Highland Rim (WHR). The portion of the Rim that occupies the extreme southeastern corner of the county is part of the EHR. The WHR is mostly confined to the western half of the county although portions extend to northeastern and east-central sections in the form of outlying knobs and ridges. Generally, elevations of the HR range from ca. 335 m in the northern portion of the county to 259 m in southern sections. Much of the Rim is rugged and dissected by numerous stream valleys, but in a few areas broad flat uplands occur. Strata of the Mississippian-aged Fort Payne Formation underlie most of the HR. Cherty limestone and chert are the main surface rocks and Chattanooga black shale is exposed on some slopes while on broader ridgetops a thin layer of loess is present (True et al. 1968).

Central and southeastern portions of Giles County lying along the valleys of the Elk River and Richland Creek are part of the Outer Central Basin (OCB) Subsection of the Central Basin Section. The Outer Basin of Giles County is separated from the main Central Basin region to the NNE by the Elk Ridge, a line of west-east trending, shale-capped hills that are technically part of the HR (DeSelm 1959). The OCB is below the level of the surrounding HR, beginning generally on the middle and lower slopes of the hills and extending downward into the valleys of the numerous streams that dissect the county (True et al. 1968). The elevation of the OCB ranges from 183 m to ca. 290 m. The topography varies from level to rolling in larger stream valleys to hilly near the HR. Strata of Ordovician-aged non-cherty phosphatic limestone underlie the OCB (True et al. 1968). Along the Elk River and in the lower section of the Richland Creek Valley, Quaternary-aged alluvial deposits exist. These deposits occur as nearly level to gently sloping terraces and bottomlands that are underlain by nonphosphatic limestone (True et al. 1968).

Five soil associations occur in the study area (True et al. 1968). The Mountview-Fullerton-Pickwick (MFP) association consists of acidic brown silty soils and reddish cherty clay soils that occur on the highest elevated areas of the HR. The topography varies from level to gently rolling. This association makes up about 8% of the county's soils. The Bodine-Mountview-Fullerton (BMF) association is acidic and is comprised of cherty soils, silty soils, and cherty clay soils on broken hills and in deep narrow hollows of the WHR. Although this association is restricted to the western half of the county it makes up 23%

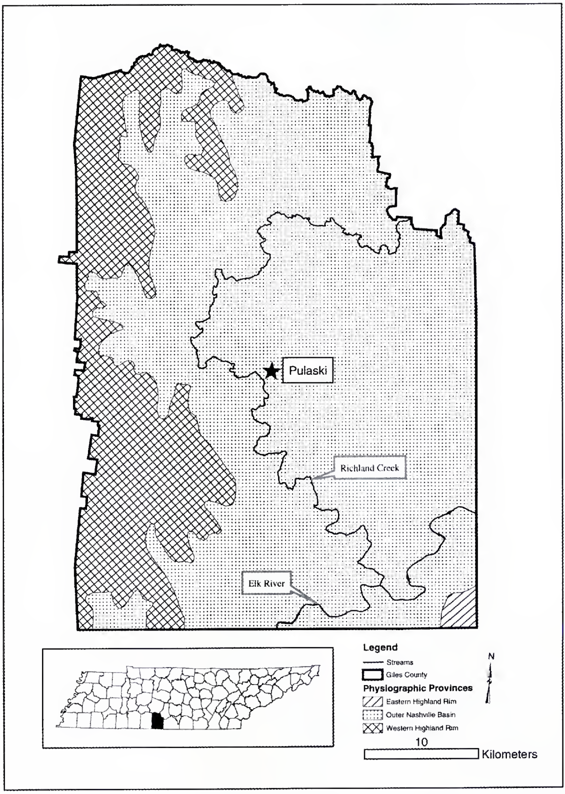

FIG. 1. Map of Giles County, Tennessee showing location of the Western Highland Rim, Eastern Highland Rim, Outer Central (Nashville) Basin, major streams, and the county seat (adapted from Griffith et al. 1998).

of the county's soils. On high winding ridges in east-central and northeastern Giles County, on outliers of the WHR, cherty acidic soils of the Bodine-Fullerton-Dellrose (BFD) association occur, occupying 10% of the county. The Dellrose-Bodine-Mimosa association (DBM) is a cherty and rocky soil found on steep slopes, ridgetops, low-lying knobs, and deep hollows. These soils vary from slightly to strongly acid and make up 27% of the county's soils. In the OCB in valleys of the Elk River, Richland Creek, and their larger tributaries, in bottomlands, on terraces, and on adjacent uplands, soils of the Staser-Armour-Maury (SAM) association occur. These soils are often phosphatic and are neutral to acidic; 32% of the county's soils are of this association (True et al. 1968).

Giles County lies within the Tennessee River drainage system. One of the Tennessee River's major tributaries, the Elk River, crosses the southeastern quarter of the county. The main tributary of the Elk River is Richland Creek. This large creek enters Giles County from the northeast, flows south through the central portion of the county, and empties into the Elk River in the south-central section. Both the Elk River and Richland Creek are medium-sized streams lined mostly by agricultural fields and wooded slopes. Limestone bluffs are frequent along the Elk River and the lower section of Richland Creek. Both streams are characterized by having a shallow channel, a slow to moderate flow, a rocky or gravelly substrate, and numerous gravel bars and shoals. Other important streams in the county include Big, Bradshaw, Buchanan, Indian, Shoal, Sugar, and Weakley creeks. These streams occur in the smaller valleys and are lined mostly by small fields and wooded slopes. They, like the Elk River and Richland Creek, have a rocky or gravelly substrate and frequent gravel bars, shoals, and riffles. While most of the streams in the county are like those described above, Piney Creek on the EHR of extreme southeastern Giles County is a slow-flowing stream that resembles streams of the southeastern Coastal Plain. It has a muddy substrate and is bordered mostly by wet flatwoods.

The study area is located in Köppen's Cfa climatic type and is characterized by a mild rainy climate with hot summers and lacks a distinct dry season (Ackermann 1941). The average growing season is 190 days and extends from April 13 to October 20. The mean annual temperature is 15°C. July is typically the hottest month with an average temperature of 32°C, while January is the coldest with an average temperature of −0.4°C. Annual precipitation totals 139.04 cm with snow accounting for about 12.19 cm. February and March are the wettest months and September and October the driest (True et al. 1968).

Giles County is within the eastern portion of Braun's (1950) Western Mesophytic Forest Region approximately 80-90 km west of the Mixed Mesophytic Forest Region. The Western Mesophytic Forest is transitional to surrounding forest regions and lacks a combination of characterizing dominants. Local climate, topography, and soil conditions influence vegetational characteristics of a particular area (Braun 1950, Chester 1995). Most of the county's forests clearly fit into Braun's Western Mesophytic Forest Region but in the eastern portion of the county, on sheltered north slopes and in ravines, forests with qualities of Braun's (1950) Mixed Mesophytic Forest Region occur.

METHODS

Specimens were collected between July 1998 and September 2004. Thirty plant communities, including all types known to occur within the county, were sampled during the study. Collecting sites were located by driving throughout the county, and by consulting county road, topographic, and county soil survey maps. Specimens were identified using standard field manuals: Small (1933), Fernald (1950), Radford et al. (1968), Cronquist (1980), Isely (1990), Gleason and Cronquist (1991), and Yatskievych (1999). In addition to native taxa, many non-native species were collected or observed during the survey. Non-native taxa listed in the annotated checklist include only those taxa that appeared to be naturalized or persistent. Most voucher specimens have been deposited in the herbarium at the University of Tennessee (TENN). Some specimens have been deposited in the herbaria of Austin Peay State University (APSC), Middle Tennessee State University (MTSU), or the Vanderbilt (VDB) collection at the Botanical Research Institute of Texas. Furthermore, the herbaria at MTSU, TENN, and VDB were consulted for species not collected during this study. All such specimens encountered were checked for accuracy and each was annotated. The status of federal and state listed rare species was taken from the Tennessee Natural Heritage Program (2003). All information concerning the location, habitat, and population status of rare species discovered during the inventory was provided to the Tennessee Natural Heritage Program to aid in their protection. Lastly, the plant communities of the county were qualitatively described according to their physiographic location, soil association, topographic position, and species composition.

RESULTS AND DISCUSSION

Floristic Summary

Of ca. 2000 voucher specimens, 1186 species and infraspecific taxa were collected, resulting in 912 county records. An additional 22 taxa were observed during the study for which vouchers were not collected. Therefore, the total flora of Giles County included 1208 species and infraspecific taxa representing 138 families and 553 genera distributed among 36 pteridophytes, 5 gymnosperms, 28 monocots, and 883 dicots. Asteraceae was the largest family with 151 taxa, followed by Poaceae (109), Cyperaceae (75), Fabaceae (63), Rosaceae (53), Lamiaceae (34), Liliaceae (33), Brassicaceae (31), Ranunculaceae (30), and Scrophulariaceae (30). The woody flora of the county was quite large with 254 taxa. The largest woody genera were *Quercus* (18 taxa, including one hybrid), *Prunus* (10), *Rubus* (9), *Carya* (8), *Crataegus* (7), *Acer* (6), and *Salix* (6). *Cornus*, *Euonymus*, *Hypericum*, *Ulmus*, and *Vaccinium* each had five taxa. *Aesculus* (including one hybrid), *Ilex*, *Lonicera*, *Pinus*, *Rhus*, *Smilax*, and *Vitis* each had four taxa. Woody genera represented by three taxa included *Celtis*, *Clematis*, *Fraxinus*, *Hydrangea*, *Magnolia*, *Rhododendron*, *Rosa*, and *Viburnum*. The largest herbaceous genera were *Carex* (47), *Juncus* (14), *Solidago* (14), *Polygonum* (13), *Eupatorium* (12), *Symphyotrichum* (12), *Viola* (12), *Desmodium* (11), *Dichanthelium* (11), *Asclepias* (10), *Cyperus* (10), *Helianthus* (10), and *Ranunculus* (10). Seventy-nine percent of the flora (955 taxa) consisted of native species while introduced taxa accounted for 237 taxa (20%) (Wofford and Kral 1993). An additional eight species (<1%) were native to portions of Tennessee but did not appear to be native to Giles County. A complete summary of the flora of Giles County is provided in Table 1.

Rare/Protected Plants

In Giles County, 17 taxa are considered rare and are tracked by the Tennessee Division of Natural Heritage (Table 2). Of these, two are federally threatened (LT), two are state endangered (E), five species are listed as state threatened (T), one is listed as special concern-proposed threatened (S-PT), three species are listed as special concern (S), and the remaining four taxa are threatened or of special concern due to commercial exploitation (T-CE, S-CE) (Tennessee Natural Heritage Program 2003).

Prior to this survey, seven rare species had been reported from the county. However, one previously reported rare taxon, *Galium asprellum* Michx. (*R. Kral 64888*, VDB), was based on a misidentified specimen of *Galium mollugo*, a non-native species. Another, *Allium tricoccum*, was reported from the county based on a Kral collection (*R. Kral 54907*, VDB). Upon closer inspection, it was determined that the specimen best corresponds with *A. tricoccum* var. *burdickii* instead of the more eastern *A. tricoccum* var. *tricoccum*. Two additional taxa, *Leavenworthia exigua* var. *exigua* and *Schoenolirion croceum*, were reported from the county based on collections made in the 1950s; unfortunately the populations were not relocated during the study and these taxa are presumed extirpated from the county. A fifth species, *Arenaria lanuginosa*, was collected for the first time in Tennessee from Giles County in 1948 along bluffs of the Elk River (*A.J. Sharp, S. Fairchild, & E. Clebsch 9840*, TENN). As of 1999, the species was listed as endangered and possibly extirpated from the state (Tennessee Natural Heritage Program 1999). In the summer of 2000, *A. lanuginosa* was rediscovered along two bluffs of the Elk River after not having been observed for over 50 years (Estes & Chester 2001). A third Giles County population was found in 2001 (Estes 2004).

As a result of this study, 11 rare taxa were discovered that represent new county records. The most significant were *Apios priceana* and *Helianthus eggertii* (United States Fish and Wildlife Service 1993, 1999), both listed as federally

TABLE 1. Summary of the vascular flora known from Giles County, Tennessee.

Group	Families	Genera	Species and Infraspecific Taxa Native	Non-native	Total
Pteridophytes	14	25	36	0	36
Gymnosperms	2	2	2	3	5
Angiosperms					
Monocots	19	101	231	53	284
Dicots	103	425	686	197	883

[2] Taxon listed as endangered in Tennessee

[3] Taxon listed as threatened in Tennessee

[4] Taxon currently listed as special concerned-proposed threatened in Tennessee

[5] Taxon listed as special concern in Tennessee

[6] Taxon listed as threatened in Tennessee due to commercial exploitation

[7] Taxon listed as special concern in Tennessee due to commercial exploitation

threatened by the United States Fish and Wildlife Service. Estes (2004) provided a more detailed discussion of the significance of these and other notable rare or uncommon plants of Giles County.

Additional Noteworthy Collections

A large established population of the Asiatic species *Achyranthes japonica* var. *hachijoensis* was discovered in extreme southern Giles County on a wooded floodplain of the Elk River at the base of a limestone bluff ca. 3 river miles upstream from Limestone County, Alabama. Medley et al. (1985) first reported this species as new to North America based on material collected from northeastern Kentucky and adjacent West Virginia. This species also has been reported from Ohio (Flora of North America Editorial Committee 2003). The discovery of *A. japonica* var. *hachijoensis* in Giles County represents a state record, a range extension of ca. 500–600 km to the southwest, and the first report of the species from the Tennessee River watershed.

Euonymus kiautschovicus, an introduced shrub native to China, was collected from two localities in Giles County, one along a roadside embankment at the edge of disturbed woods and the other from a weedy bank between a stream and roadside. This species has not previously been reported from Tennessee. At both sites, only one or two plants were found and did not seem to exhibit strong invasive potential.

Eupatorium × *pinnatifidum*, a hybrid species originating from a cross between *E. capillifolium* and *E. perfoliatum*, was collected for the first time in Tennessee from flat uplands on the EHR at the edge of a clearing adjacent to wet flatwoods dominated by *Acer rubrum*, *Pinus taeda*, *Quercus nigra*, and *Q. phellos*. Both *E. capillifolium* and *E. perfoliatum* were growing within 10 m of the *E.* × *pinnatifidum* plants.

At the site where *E.* × *pinnatifidum* occurred, several individuals of *Baccharis halimifolia*, a species formerly restricted to the southeastern Coastal Plain were observed. The shrubs were approximately 1-2 m tall. One month prior to the discovery of *B. halimifolia* in Giles County, one individual was discovered ca. 87 km to the NNE in Rutherford County, Tennessee (Estes 2004). This is the second report for *B. halimifolia* from the state. *Baccharis halimifolia* should be considered an exotic species in Tennessee and is to be expected in disturbed areas across the southern half of the state.

A third species found in Giles County that deserves special mention is *Amaranthus powellii*. This species was discovered in August 2003 on a roadside next to a cornfield in association with *Amaranthus palmeri*, *A. spinosus*, *Eragrostis pectinacea*, and *Senna obtusifolia*. At that time, it had not been previously documented from the state; but shortly thereafter, during the preparation of this manuscript, the Flora of North America Editorial Committee (2003) reported *A. powellii* from Tennessee. This is apparently the second report for the species from the state.

Plant Communities

Thirty qualitatively defined plant communities were sampled in the county.

These were divided into four sections, those that occurred on the HR, those of the OCB, aquatic or riverine communities, and anthropogenically altered or maintained habitats. The 20 communities included for the HR and OCB and the three habitats listed for the Streams and Riverine Communities section were generally natural communities, although most have sustained some type of human-related disturbance. The seven types of Disturbed Sites sampled included areas that generally lacked natural qualities, appeared recently affected by anthropogenic disturbances, or were maintained as unnatural communities by human activities.

Highland Rim

1. Oak-Hickory Forests (OH).—The oak-hickory community was the dominant upland forest type on dry to submesic sites on the HR, occupying broad upland flats, ridge-tops, and upper slopes of south and west-facing hillsides. This community was mostly associated with the Mountview, Bodine, and Dickson series of the MFP, BMF, and BFD soil associations. The canopy contained several species of oak including *Quercus alba*, *Q. coccinea*, *Q. montana*, *Q. stellata*, and *Q. velutina* as well as a few hickory species, including *Carya alba*, *C. glabra*, and *C. ovata* var. *ovata*. Less dominant but common species were *Acer rubrum*, *Nyssa sylvatica*, *Oxydendrum arboreum*, and *Sassafras albidum*. In the subcanopy and understory *Amelanchier arborea*, *Cornus florida*, *Kalmia latifolia*, *Rhododendron canescens*, *Styrax grandifolia*, *Vaccinium arboreum*, and *V. stamineum* were occasional to common constituents. Woody vines common to this community included *Smilax glauca*, *S. rotundifolia*, *Toxicodendron radicans*, *Vitis aestivalis* var. *aestivalis*, and *V. rotundifolia*. Subshrubs and low shrubs were *Chimaphila maculata*, *Hypericum hypericoides* subsp. *multicaule*, and *Vaccinium pallidum*. The herbaceous layer was sparsely vegetated when compared to more mesic forests, but included *Carex picta*, *Coreopsis major*, *Cunila origanoides*, *Danthonia spicata*, *Desmodium rotundifolium*, *Dichanthelium dichotomum* var. *dichotomum*, *Eurybia hemispherica*, *Solidago erecta*, *S. hispida*, *S. ulmifolia*, and *Viola hirsutula*.

2. Rich Forests (RF).—Rich mesophytic forests were primarily found on lower to middle north and east facing slopes, in ravines, and in narrow stream valleys. Such sites were associated mostly with soils of the Bodine and Dellrose series of the BMF soil association. The canopy often contained *Acer nigrum*, *A. saccharum*, *Aesculus flava* (mostly EHR), *Carya cordiformis*, *Fagus grandifolia*, *Fraxinus americana*, *Quercus alba*, *Q. rubra*, *Tilia americana*, *T. heterophylla*, and *Ulmus rubra*. Woody vines of this community included *Menispermum canadense*, *Parthenocissus quinquefolia*, and *Smilax tamnoides*. Common understory shrubs or small trees were *Asimina triloba*, *Carpinus caroliniana*, *Dirca palustris*, *Hydrangea cinerea*, *Lindera benzoin*, and *Staphylea trifolia*. In the herbaceous layer *Actaea pachypoda*, *Adiantum pedatum*, *Anemone acutiloba*, *Botrychium virginianum, Cardamine concatenata, Carex cumberlandensis, C. albursina, C. kraliana, Diplazium pycnocarpon, Erythronium americanum* subsp. *harperi, Hydrophyllum appendiculatum, Jeffersonia diphylla, Oxalis illinoensis, Pachysandra procumbens, Phacelia bipinnatifida, Phlox divaricata, Polemonium reptans, Trillium cuneatum, T. flexipes, T. stamineum, Valeriana pauciflora*, and *Viola pubescens* var. *scabriuscula* were present, in addition to many others.

3. Flatwoods (FW).—This community occurred only in extreme southeastern Giles County on the EHR along Piney Creek in association with soils of the Guthrie and Taft series of the MFP soil association. The site was level and the soil saturated, often for much of the year. *Acer rubrum, Nyssa biflora, N. sylvatica, Quercus nigra*, and *Q. phellos* dominated the canopy while *Q. lyrata* and *Pinus taeda* were occasional associates. Common small trees and shrubs were *Arundinaria gigantea, Cornus foemina, Crataegus marshallii, Hypericum crux-andreae, H. hypericoides* subsp. *hypericoides, Ilex verticillata, Photinia pyrifolia, Rhododendron canescens, Styrax americana, Vaccinium fuscatum, Viburnum dentatum* var. *lucidum*, and *V. nudum* var. *nudum*. Noteworthy herbaceous species of this community included *Arisaema triphyllum* subsp. *pusillum, Carex flaccosperma, C. gigantea, C. intumescens, C. joorii, Chasmanthium laxum, Galium obtusum, Gratiola neglecta, G. virginiana, Isotria verticillata, Osmunda cinnamomea, O. regalis, Platanthera flava* var. *flava*, and *Triadenum virginicum*. Clearings and wet meadows within the flatwoods community supported a number of herbaceous species that were not found elsewhere in the county. Some of these species are more common on the southeastern Coastal Plain. Examples include *Agalinis purpurea, Eryngium prostratum, Gratiola pilosa, Ludwigia linearis, Mikania scandens, Mitreola petiolata, Rhexia mariana* var. *interior, R. mariana* var. *mariana, R. virginica*, and *Spiranthes vernalis*.

4. Bluffs and Rock Outcrops (RO).—Outcroppings of limestone and less frequently shale generally were located on the slopes of hills or often in narrow ravines or along watercourses, mostly in the strongly dissected portion of the HR. Such outcrops were mostly associated with Rockland of the BMF soil association. The rock outcrops were almost exclusively located in or closely surrounded by forested areas. In some places, sizeable bluffs also occurred. Two types of bluff or rock outcrop communities of the HR were identified: those that were relatively moist and those that were dry to xeric. The more mesic bluffs and rock outcrops were located mostly on north or east facing exposures while the drier ones were typically associated with south or west facing aspects. Shrubs or woody vines associated with moist sites included *Decumaria barbara, Hydrangea cinerea*, and *Philadelphus hirsutus*. Herbaceous species common to moist bluffs were *Aquilegia canadensis, Arabis laevigata, Asplenium rhizophyllum, Cystopteris bulbifera, C. tennesseensis, Galium triflorum, Heuchera villosa, Parietaria pensylvanica, Saxifraga virginiensis, Sedum ternatum, Solidago caesia*, and *Thalictrum dioicum*. On drier sites, some of the above species also were present but notable additions included *Andropogon gerardii*, *Asclepias verticillata*, *Cheilanthes lanosa*, *Oxalis violacea*, *Packera obovata*, *Pellaea atropurpurea*, *Pleopeltis polypodioides* subsp. *michauxiana*, *Polymnia canadensis*, *Sedum pulchellum*, *Solidago sphacelata*, and *Woodsia obtusa*.

5. Barrens (RB).—Portions of western Giles County lie within the Barrens of the southwestern Highland Rim described by Shanks (1958). Barrens were mostly encountered on soils of the Mountview and Dickson series of the MFP and BMF soil associations. The county's highest quality barrens were found on the undissected portion of the HR in the southwestern quarter of the county but other good examples occurred on thin ridges and even in some valleys throughout the western edge of the county. They occurred mostly at the margins of oak-hickory forest, often along roadsides, and were apparently principally maintained as open areas by periodic mowing. Without periodic disturbance the barrens likely would be succeeded by oak-hickory forest. Although the barrens themselves lacked trees for the most part, species that occasionally intruded from surrounding oak-hickory forest included *Oxydendrum arboreum*, *Pinus taeda*, *Quercus coccinea*, *Q. marilandica*, *Q. stellata*, and *Sassafras albidum*. Small trees and shrubs of the barrens were *Ceanothus americanus*, *Malus angustifolia*, *Rhus copallinum*, *Rubus flagellaris*, *Salix humilis* var. *humilis*, *Vaccinium arboreum*, and *V. stamineum*. Perennial grasses and members of the Asteraceae and Fabaceae dominated the barrens. The most important grasses were *Andropogon gerardii*, *A. gyrans*, *A. virginicus*, *Dichanthelium* spp., *Panicum anceps*, *Saccharum alopecuroidum*, *Schizachyrium scoparium* var. *divergens*, *S. scoparium* var. *scoparium*, and *Tridens flavus* var. *flavus*. Other herbaceous species were *Ambrosia bidentata*, *Angelica venenosa*, *Asclepias amplexicaulis*, *Aureolaria pectinata*, *Chamaecrista fasciculata*, *C. nictitans*, *Conyza canadensis* var. *pusilla*, *Coreopsis tripteris*, *Desmodium* spp., *Eupatorium* spp., *Euphorbia corollata*, *Eurybia hemispherica*, *Galium pilosum*, *Helianthus* spp. (including *H. eggertii*), *Hypericum drummondii*, *H. gentianoides*, *Lespedeza* spp., *Liatris spicata*, *L. squarrulosa*, *Parthenium integrifolium*, *Pteridium aquilinum* var. *latiusculum*, *Silphium mohrii*, *Solidago* spp., *Spiranthes lacera* var. *gracilis*, *Symphyotrichum* spp., *Veronicastrum virginicum*, and *Viola sagittata*.

6. Marshes (RM).—Marshes were more or less open wetland areas with standing water and were dominated by herbaceous vegetation and shrubs. Those surveyed occurred at the headwaters of small streams and in natural upland depressions. This community was restricted to soils of the Guthrie, Taft, and Lee series of the MFP soil association. Some were created by beaver activity; others were created by human actions such as stream damming and road construction. Trees and large shrubs were mostly restricted to their margins. Important large tree species were *Acer rubrum*, *Liquidambar styraciflua*, *Nyssa sylvatica*, *Quercus phellos*, *Salix nigra*, and rarely *Betula nigra*. Shrubs included *Cephalanthus occidentalis*, *Itea virginica*, *Photinia pyrifolia*, *Rhododendron* *canescens*, *Vaccinium corymbosum*, *V. fuscatum*, and *Viburnum nudum* var. *nudum*. Noteworthy emergent or marginal herbaceous species were *Carex crinita* var. *brevicrinis*, *C. joorii*, *C. lupuliformis*, *Hibiscus moscheutos* subsp. *moscheutos*, *Juncus effusus*, *J. repens*, *Osmunda cinnamomea*, *O. regalis*, *Panicum rigidulum* var. *pubescens*, *Platanthera ciliaris*, *Proserpinaca palustris*, *Rhexia mariana* var. *interior*, *Rhynchospora glomerata*, *Saccharum baldwinii*, *Scirpus cyperinus*, *Sparganium americanum*, *Typha latifolia*, and *Viola* × *primulifolia*. Few floating or submerged aquatics were observed; the most abundant were *Lemna minor*, *Potomogeton diversifolius*, and *Spirodela polyrrhiza*.

7. Wet Meadows (WM).—Wet meadows were frequently encountered in valleys along small streams or in upland swales. They occurred on soils of the Lobelville, Lee, and Lynnville series associated with the MFP, BMF, and BFD soil associations. These sites appeared to be maintained as open areas by periodic grazing or mowing thereby preventing the establishment of large shrubs and trees. The most common shrubs found in the wet meadows included *Alnus serrulata*, *Amorpha fruticosa*, *Cephalanthus occidentalis*, *Cornus amomum*, and *Salix sericea*. Common herbaceous taxa were *Acorus calamus*, *Alisma subcordatum*, *Apios americana*, *Asclepias incarnata* subsp. *incarnata*, *Bidens aristosa*, *B. cernua*, *Boehmeria cylindrica*, *Carex frankii*, *C. vulpinoidea*, *Commelina virginica*, *Dichanthelium dichotomum* var. *ramulosum*, *D. scoparium*, *Eupatorium fistulosum*, *E. perfoliatum*, *Hibiscus moscheutos* subsp. *moscheutos*, *Hymenocallis occidentalis*, *Impatiens capensis*, *Juncus coriaceus*, *Lobelia cardinalis*, *L. siphilitica*, *Ludwigia alternifolia*, *Mentha* × *piperita*, *Mimulus alatus*, *Panicum rigidulum* var. *rigidulum*, *Polygonum hydropiperoides*, *P. sagittatum*, *Rhexia virginica*, and *Solidago gigantea*. At one site on an outlier of the HR in northeastern Giles County, a wet meadow was found that contained three species that are uncommon in Middle Tennessee: *Panicum verrucosum*, *Paspalum fluitans*, and *Trachelospermum difforme*.

8. Acidic Seeps (AS).—This community type was restricted to forested ravine bottoms in extreme northwestern Giles County in the upper sections of small HR streams. The soils of acidic seeps are part of the Lee series, a member of the BMF soil association. The surrounding forest type was predominantly oak-hickory. Some species common to the oak-hickory community were present among the seeps but were mostly restricted to dry hummocks. Such taxa included *Acer rubrum*, *Liquidambar styraciflua*, *Nyssa sylvatica*, *Oxydendrum arboreum*, and *Quercus alba*. Shrubs common to this community were *Alnus serrulata*, *Cephalanthus occidentalis*, *Euonymus americana*, *Itea virginica*, *Photinia pyrifolia*, *Rhododendron alabamense*, *R. canescens*, and *Vaccinium fuscatum*. Important herbaceous taxa were *Bartonia virginica*, *Carex atlantica* subsp. *capillacea*, *C. intumescens*, *Osmunda cinnamomea*, *O. regalis*, *Phlox glaberrima*, *Platanthera clavellata*, and *Thelypteris novaboracensis*. An unidentified species of *Sphagnum*, a non-vascular plant, was one of the dominant ground cover species in this community.

9. Calcareous Seeps (CS).—This type of wetland community occurred along the western edge of Giles County on lower slopes of ravines and hollows along small streams, by waterfalls, or above wet bluffs. The seeps occurred over limestone, had a thin, gravelly, continuously waterlogged substrate, and were level to slightly sloping. This community was restricted to soils of the BMF association, specifically the Rockland type or Lynnville and Lobelville soil series. Most were found among forests but the seeps themselves usually lacked large trees. Shrubs commonly associated with the seeps were *Alnus serrulata* and *Lindera benzoin*. The woody vine *Decumaria barbara* was often associated with the seeps in the southwestern corner of the county. Herbaceous species found were *Cardamine pensylvanica, Carex leptalea, Chelone glabra, Cuscuta compacta, Dichanthelium dichotomum* var. *ramulosum, Dryopteris celsa, Equisetum hyemale* var. *affine, Glyceria striata, Impatiens capensis, Juncus coriaceus, Lobelia cardinalis, Oxypolis rigidior, Samolus valerandi* subsp. *parviflorus*, and *Solidago patula*.

10. Riparian Areas (RIP).—This community included those areas that were located along riparian zones in the HR and was found in conjunction with a variety of series belonging to the BMF soil association. Many species were found in this broad community type although few species were restricted to it. Trees included a few species of *Quercus* and *Acer* as well as *Carpinus caroliniana, Juglans cinerea* (rarely), *J. nigra, Liquidambar styraciflua, Morus rubra*, and *Platanus occidentalis*. Smaller trees and large shrubs were *Alnus serrulata, Arundinaria gigantea, Cornus amomum, Corylus americana, Crataegus calpodendron, Hamamelis virginiana, Lindera benzoin, Salix caroliniana*, and *S. sericea*. Many species of wildflowers inhabited this community, including most of the species listed for the wet meadow community above. Additional noteworthy herbaceous taxa were *Elymus macgregorii, Equisetum hyemale* var. *affine*, and *Mertensia virginica*.

OUTER CENTRAL BASIN

1. Rich Forests (BRF).—In the OCB, rich woodlands occurred most often on middle to upper, north and east facing slopes, along river bluffs, or in sheltered hollows associated with soils of the Bodine, Dellrose, and Culleoka series of the MFP, BMF, and BFD soil associations. Unfortunately, much of this forest community was heavily logged or grazed in the past. The dominant canopy species of the Basin's rich woodlands included *Acer nigrum, A. saccharum, Aesculus flava, Carya cordiformis, Carya ovata* var. *ovata, Fagus grandifolia, Fraxinus americana, Juglans nigra, Liriodendron tulipifera, Quercus muehlenbergii, Q. rubra, Prunus serotina, Tilia americana* var. *americana*, and *T. americana* var. *heterophylla*. A rare component of some of the forests was *Juglans cinerea*.

Smaller woody species that were sometimes present included *Aesculus pavia, Asimina triloba, Carpinus caroliniana, Gleditsea triacanthos, Morus rubra,* and *Ulmus rubra. Euonymus atropurpurea, E. americana, Hydrangea cinerea, Lindera benzoin,* and *Staphylea trifolia* were frequent shrubs. Notable herbaceous taxa were *Actaea pachypoda, Arisaema triphyllum* subsp. *triphyllum, Botrychium virginianum, Carex blanda, C. kraliana, Claytonia virginica, Cynoglossum virginianum, Delphinium tricorne, Impatiens pallida, Jeffersonia diphylla, Osmorhiza claytonii, Panax quinquefolius, Phacelia bipinnatifida, Podophyllum peltatum, Sanguinaria canadensis, Thalictrum thalictroides,* and *Trillium cuneatum.*

2. Dry Forests (BDF).—Dry forests occurred along ridge-tops and on middle to upper, south or west facing and occasionally east facing slopes. This community was most frequently associated with Rockland soils of the DBM and SAM soil associations. These forests, like the remainder of forested land in the county, have been heavily logged and grazed. They contained *Acer saccharum, Aesculus glabra, Carya glabra, C. ovata* var. *ovata, Celtis laevigata, Fraxinus americana, F. quadrangulata, Juniperus virginiana, Quercus alba, Q. muehlenbergii, Q. shumardii, Robinia pseudoacacia, Ulmus alata,* and *U. serotina.* Common small trees and shrubs were *Cornus florida, Crataegus crus-galli, C. intricata, Forestiera ligustrina, Frangula caroliniana, Ostrya virginiana, Prunus americana, Rhus aromatica, Rosa setigera, Symphoricarpos orbiculatus,* and *Viburnum rufidulum.* Frequent woody vines included *Bignonia capreolata, Cocculus carolinus,* and *Smilax bona-nox. Agrimonia pubescens, Anemone virginiana, Asplenium platyneuron, Camassia scilloides, Carex albicans* var. *albicans, C. cephalophora, Chasmanthium sessiliflorum, Elymus villosus, Heliotropium tuberosum, Lobelia inflata, Melica mutica, Nothoscordum bivalve, Scutellaria ovata,* and *Viola palmata* were the common herbaceous species.

3. Limestone Karst Woods (LKW).—This community type was restricted to a small area in the central portion of the county. These forests occurred on small rocky knobs over Ordovician-aged Lebanon or Ridley limestone where soil was sufficiently deep to support forests. Limestone karst woods were associated with Rockland soils of the SAM soil association. The rock outcrops in these communities were often massive (1–4 m tall) and covered several ha. Common tree species of the karst woods included *Celtis laevigata, Diospyros virginiana, Fraxinus americana, F. quadrangulata, Juniperus virginiana, Quercus muehlenbergii, Q. shumardii, Tilia heterophylla, Ulmus alata,* and *U. serotina.* In the subcanopy and shrub layer, *Callicarpa americana, Cercis canadensis, Forestiera ligustrina, Frangula caroliniensis, Rhamnus lanceolata, Rhus aromatica, Sideroxylon lycioides, Staphylea trifolia, Symphoricarpos orbiculatus,* and *Viburnum rufidulum* were found. Frequent herbs were *Cynoglossum virginianum, Delphinium tricorne, Erythronium albidum, Frasera caroliniensis, Nemophila aphylla, Osmorhiza claytonii, Packera obovata, Polygonatum biflorum, Trillium* *cuneatum*, *T. sessile*, and *Vicia minutiflora*. On the rock outcrops in the forest, species such as *Aquilegia canadensis*, *Arabis laevigata*, *Asplenium resiliens*, *A. rhizophyllum*, *A. ruta-muraria*, *Cystopteris bulbifera*, *Heuchera villosa*, *Pellaea atropurpurea*, *Perideridia americana*, *Pleopeltis polypodioides* subsp. *michauxiana*, *Polymnia canadensis*, *Ranunculus micranthus*, *Saxifraga virginiensis*, and *Woodsia obtusa* were present.

4. Cedar Barrens (CB).—This community type was represented by only a few degraded examples that were restricted to the slopes of small knobs over Ordovician limestone in central Giles County. Cedar barrens were found on Rockland soils of the SAM association. They occurred on open slopes surrounded by rocky limestone karst woods within close proximity to cedar glades. *Juniperus virginiana* was abundant near the margins of the barrens and as isolated individuals among them. Most of the woody species were the same as those listed for the glades with a few exceptions such as *Quercus stellata* and *Vaccinium arboreum*. They were dominated by a variety of perennial grasses and herbs. Noteworthy herbaceous taxa were *Allium canadense* var. *canadense*, *Andropogon virginicus*, *Aristida oligantha*, *Asclepias viridiflora*, *Carex cherokeensis*, *Chasmanthium sessiliflorum*, *Croton capitatus*, *Cuphea viscosissima*, *Daucus carota*, *Dichanthelium malacophyllum*, *Eupatorium altissimum*, *E. hyssopifolium*, *Euphorbia corollata*, *Festuca arundinacea*, *Geranium carolinianum*, *Lespedeza procumbens*, *Lobelia spicata*, *Onosmodium molle* subsp. *molle*, *Panicum flexile*, *Potentilla recta*, *P. simplex* (plants in this community may be referable to the variety *argyrisma* Fern.), *Rudbeckia triloba*, *Sabatia angularis*, *Silphium trifoliatum* var. *latifolium*, *Sporobolus clandestinus*, and *Tridens flavus* var. *flavus*.

5. Cedar Glades (CG).—The limestone glades of Giles County were distributed mostly along a 16 km stretch of a 32 km section of a fault line that runs diagonally from NW to SE across the southern half of the county. Along this line, they were mostly along the western edge and to the west of Richland Creek. Like most other glades of Middle Tennessee, these were associated with Ordovician-aged Lebanon and Ridley limestone of the Stones River Group (Miller et al. 1966). They occurred on level to slightly sloping sites with shallow gravelly soil or exposed limestone. Cedar glades were mostly associated with soils of the Rockland type, part of the SAM association. Such sites often were wet in the winter and spring and were dry during summer and autumn. The woody species commonly associated with glade margins included *Celtis laevigata*, *Carya ovata* var. *australis*, *Forestiera ligustrina*, *Frangula caroliniana*, *Juniperus virginiana*, *Quercus muehlenbergii*, *Rhus aromatica*, *Rosa carolina*, *R. setigera*, and *Sideroxylon lycioides*. In the open portion of the glades, common herbaceous species included *Amphiachyris dracunculoides*, *Astranthium integrifolium*, *Carex cherokeensis*, *Cyperus squarrosus*, *Dichanthelium malacophyllum*, *Erigeron strigosus* var. *calcicola*, *Geranium molle*, *Glandularia* *canadensis, Grindelia lanceolata, Heliotropium tenellum, Houstonia purpurea* var. *calycosa, Hypericum sphaerocarpum, Hypoxis hirsuta, Isanthus brachiatus, Leavenworthia torulosa, Malvastrum hispidum, Manfreda virginica, Minuartia patula, Nothoscordum bivalve, Oenothera triloba, Onosmodium molle* subsp. *molle, Oxalis priceae* subsp. *priceae, Opuntia humifusa, Packera anonyma, Panicum flexile, Penstemon tenuiflorus, Phemeranthus calcaricus, Ranunculus fascicularis, Rudbeckia triloba, Ruellia humilus, Salvia lyrata, Scutellaria parvula, Sedum pulchellum, Sisyrinchium albidum, Symphyotrichum priceae, Verbena simplex,* and *Viola egglestonii.*

6. Bluffs and Outcrops (BO).—Other than cedar glades and man-made road-cut bluffs, rock outcrops and bluffs were generally uncommon in the OCB. Some small bluffs were located near caves or springs. Larger bluffs were mostly confined to watercourses, particularly the larger streams such as the Elk River and lower section of Richland Creek. The soils of this community are part of the Rockland type of the DBM and SAM soil associations. Woody species associated with bluffs included *Fraxinus quadrangulata, Hypericum frondosum, Juniperus virginiana, Quercus muehlenbergii,* and *Philadelphus pubescens* var. *pubescens.* Common herbaceous taxa encountered were *Asplenium resiliens, Cheilanthes alabamensis, C. lanosa, Cystopteris bulbifera, Heuchera villosa, Matelea gonocarpos, Pellaea atropurpurea,* and *Sedum pulchellum.*

7. Marshes (BM).—Marshes were rare in the OCB, mostly restricted to the flood plains of large streams. This community was restricted to soils of the Lynnville and Newark series of the SAM soil association. All of those sampled were formed either by man or by beaver activity. Common trees included *Fraxinus pennsylvanica, Platanus occidentalis,* and *Salix nigra* with *Cephalanthus occidentalis* the common shrub. Emergent aquatics were represented by *Leersia oryzoides, Scirpus cyperinus,* and *Typha latifolia.* Floating and submerged aquatics included *Heteranthera reniformis, Lemna minor, Potomogeton diversifolius, P. foliosus, Spirodela polyrrhiza,* and rarely *Azolla caroliniana.*

8. Wet Meadows (BWM).—Wet meadows occurred mostly in the flood plains of larger streams and were associated with the Newark, Lynnville, and Armour series of the DBM and SAM soil associations. This community type was dominated by various herbaceous wetland species. Representative taxa of this community included *Alopecurus carolinianus, Ammannia coccinea, Asclepias incarnata* subsp. *incarnata, Bidens cernua, B. frondosa, Carex frankii, C. vulpinoidea, Cyperus strigosus, Echinochloa muricata, Gratiola neglecta, Iva annua, Juncus acuminatus, J. effusus, Leersia oryzoides, Lobelia siphilitica, Ludwigia glandulosa, L. palustris, Lycopus rubellus, L. virginicus, Panicum dichotomiflorum, Polygonum hydropiperoides, Rorippa sessiliflora, Rotala ramosior, Rumex altissimus,* and *Sagittaria australis.*

9. Limestone Wet Meadows (LWM).—This community type was found in low areas within or near limestone cedar glades or along roadside ditches through gladey areas where the ground was thoroughly saturated for lengthy periods in spring. The soils of this community are part of the Talbott and Roellen series of the SAM soil association. Some are also associated with the Rockland type. The major difference between the Limestone Wet Meadow Community and other wet meadows of the OCB is that the limestone wet meadows are thin-soiled depressions over limestone bedrock. Characteristic species of this plant community included *Carex festucacea, C. granularis, Cuphea viscosissima, Eleocharis bifida, E. obtusa, Hypericum sphaerocarpum, Isoetes butleri, Juncus filipendulus, Leavenworthia torulosa, Mecardonia acuminata, Nothoscordum bivalve, Scirpus atrovirens,* and *S. lineatus.*

10. Riparian Areas (BRIP).—This community type occurred along the flood plains of medium to large streams in association with soil of the Staser, Lynnville, and Armour series of the SAM soil association. Tree species common to this community were *Acer negundo, A. saccharinum, Celtis laevigata, Fraxinus pennsylvanica, Gleditsea triacanthos, Populus deltoides, Quercus shumardii, Salix nigra, Ulmus americana,* and rarely *Betula nigra. Asimina triloba, Cornus drummondii,* and *Staphylea trifolia* were occasional to common understory species. At several sites, *Arundinaria gigantea* was the dominant understory species. *Aristolochia tomentosa,* a high-climbing woody vine, was restricted to this community type. Herbaceous species found in this community included *Ageratina altissima, Alliaria petiolata, Chasmanthium latifolium, Elymus macgregorii, E. virginicus, Laportea canadensis, Microstegium vimineum, Phlox paniculata, Silphium perfoliatum,* and *Verbesina alternifolia.*

STREAMS AND RIVERINE COMMUNITIES

1. Small Streams and Springs (ST).—Small streams and springs were common throughout Giles County. Species commonly found in this community included *Lemna minor, Mentha × piperita, Rorippa nasturtium-aquaticum, Spirodela polyrrhiza,* and *Veronica anagallis-aquatica.*

2. Large Streams and Rivers (RIV).—The two largest streams in Giles County are the Elk River and Richland Creek. These two streams are approximately 25-75 m wide in most places and are characterized by having a slow to moderate current with more or less shallow waters. The substrate is mostly composed of large rocks, gravel, and silt. Aquatic species were generally rare and were confined to the shallow and often swift-flowing riffles or slow-moving backwater areas. Representative taxa found in this community included *Heteranthera dubia, Justicia americana, Podostenum ceratophyllum,* and *Potomogeton nodosus.*

3. Gravel Bars (GB).—Large gravel bars were frequent along the Elk River and Richland Creek. Large woody species generally were not abundant due to perioidic flooding. Woody species that were common in this community included saplings of *Betula nigra, Platanus occidentalis, Populus deltoides, Salix caroliniana,* and *S. nigra.* The common herbaceous taxa were *Cuscuta* sp., *Diodia* *virginiana*, *Dysphania ambrosioides*, *Eclipta prostrata*, *Justicia americana*, *Polygonum* spp., and *Samolus valerandi* subsp. *parviflorus*.

Disturbed Habitats

A number of anthropogenically modified or maintained communities were sampled during the survey. These areas were found in all three physiographic sections and often were surrounded by some of the more natural habitats discussed above. The most common of the disturbed sites sampled included farm ponds and man-made lakes **(FP)**; lawns, old homesites, cemeteries, etc. **(LAW)**; pastures and fields **(PAS)**; crop fields **(CRP)**; roadsides and railroad tracks **(RD)**; abandoned lots and bare ground **(DIS)**; and urban thickets **(UT)**. These sites appeared to receive higher amounts of disturbance than other communities and contained higher numbers of non-native and weedy species compared to more natural communities.

ANNOTATED CHECKLIST

Nomenclature follows the PLANTS database (USDA NRCS 2000) except for the genus *Crataegus*, which follows Wofford and Chester (2002); newly described species (Campbell 2000, Allison & Stevens 2001, Smith 2001); and those plants covered in published volumes of *Flora of North America* (1993, 1997, 2000, 2002a, 2002b, 2003), with the exception of *Carya glabra* and *C. ovalis* and infraspecific taxa within *Lindera*. *Juncus biflorus* and *J. marginatus* are maintained here as distinct species following Radford et al. (1968). The arrangement of the checklist follows that of Wofford and Kral (1993), whereby the taxa are divided into three major groups: PTERIDOPHYTES, GYMNOSPERMS, and ANGIOSPERMS (MONOCOTS, DICOTS). Families and genera are arranged alphabetically within the three major divisions.

An asterisk (*) precedes the scientific name of each taxon not native to Tennesseee (sensu Wofford & Kral 1993). Two asterisks (**) signify taxa that are native to portions of Tennessee but not to Giles County. Entries denoted by the symbol "@" represent recently described taxa (for recently described taxa, a literature citation is provided in brackets following all other information). A cross (†) indicates taxa collected from Giles County prior to this study (mostly based on Chester et al. 1993, 1997); those without a cross represent county records. Taxa preceded by "Δ" were observed but not collected. Rare taxa are listed in **bold** type and are enumerated in Table 2.

Following the scientific name and authority, an abbreviation is listed for the relative abundance of each taxon within the county. An abbreviation for the physiographic area(s) where the taxon was collected or observed and an abbreviation for the habitat are listed next. The abbreviations used in the checklist to represent relative abundance, physiographic province, and habitat types are listed in Table 3.

TABLE 3. Abbreviations used in the checklist of vascular plants known from Giles County, Tennessee.

Symbols Used in the Checklist

***** = Non-native species
@ = Recently described taxon
Δ = Taxon observed but not collected

Relative Abundance

V = Very rare
R = Rare
S = Scarce
I = Infrequent
O = Occasional
F = Frequent
C = Common
X = Extirpated

Physiographic Area

OCB = Central Basin
HR = Highland Rim (both EHR & WHR)
EHR = Eastern Highland Rim
WHR = Western Highland Rim

Plant Communities

AS = Acidic Seep
BDF = Central Basin Dry Forest
BRF = Central Basin Rich Forest
BM = Central Basin Marsh
BO = Central Basin Bluff/Outcrop
BRIP = Central Basin Riparian Area
BWM = Central Basin Wet Meadow
CB = Cedar Barren
CG = Cedar Glade
CRP = Crop Field
CS = Calcareous Seep
DIS = Disturbed Area
FW = Flatwood
FP = Farm Pond/Lake
GB = Riverine Gravel Bar
LAW = Old Homesite/Lawn
LKW = Limestone Karst Wood
LWM = Limestone Wet Meadow
OH = Oak-Hickory Forest
PAS = Pasture/Field
RB = Highland Rim Barren
RD = Roadside/Railroad
RIV = River/Large Stream
RM = Highland Rim Marsh
RO = Highland Rim Bluff/Outcrop
RIP = Highland Rim Riparian Area
RF = Highland Rim Rich Forest
WM = Highland Rim Wet Meadow
ST = Small Stream/Spring
UT = Urban Thicket

The classification used to categorize the relative abundance of each taxon follows that of Murrell and Wofford (1987) and is as follows: very rare, found in a single locale with few individuals; rare, one or two localities, generally small populations; scarce, several localities, or scattered small populations; infrequent, scattered localities throughout; occasional, well distributed but not abundant anywhere; frequent, generally encountered; and common, characteristic and dominant. Taxa not observed over the last 20 years are listed as extirpated.

When taxa were found in all three physiographic areas (Outer Central Basin, Eastern Highland Rim, Western Highland Rim) the word ALL is listed. For taxa collected from both the Eastern and Western Highland Rims the designation HR is given, otherwise each physiographic area is listed separately. Additional habitat information is listed where necessary. For each entry, the physiographic and habitat designations are listed in their order of abundance, starting with the most abundant.

After the information concerning relative abundance, physiographic province, and habitat, the author's collection number is given in parenthesis. For specimens collected by the author housed at TENN only the author's collection number is given (e.g. 01077); however, for specimens housed in herbaria other than TENN, both the author's collection number and herbarium acronym where the specimen is deposited are given (e.g. 01349, VDB). For taxa listed in the checklist that were collected by others, the collector's name, collection number, and the herbarium acronym where the specimen is housed are included (e.g. R. Kral 39577, VDB).

PTERIDOPHYTES

ASPLENIACEAE

†*Asplenium platyneuron* (L.) B. S. P.—F; ALL; BDF, BRF, FW, LKW, OH, RF; (02686).

†*Asplenium resiliens* Kunze—O; OCB, WHR; LKW, BO, RO; (00339).

†*Asplenium rhizophyllum* L.—O; ALL; BO, RO, LKW, RF, BRF; (02825).

†*Asplenium ruta-muraria* L.—R; OCB; LKW, BO; (04452).

AZOLLACEAE

Azolla caroliniana Willd.—R; OCB; BM; (03521).

BLECHNACEAE

Woodwardia areolata (L.) T. Moore—R; HR; FW, AS; (00031).

DENNSTAEDTIACEAE

Pteridium aquilinum (L.) Kuhn var. *latiusculum* (Desv.) Underwood ex Heller—O; HR; RB, OH; (02142).

DRYOPTERIDACEAE

†*Athyrium filix-femina* (L.) Mertens var. *asplenioides* (Michx.) Farw.—O; HR; RF; (00914).

†*Cystopteris bulbifera* (L.) Bernh.—O; ALL; LKW, BO, RO; (06784).

†*Cystopteris protrusa* (Weatherby) Blasdell—I; OCB, WHR; BRF, RF; (02190).

†*Cystopteris tennesseensis* Shaver—S; WHR, OCB; RO, BO; (J. Shaver 10220, TENN).

Δ *Deparia acrostichoides* (Swartz) M. Kato—V; WHR; RF.

Diplazium pycnocarpon (Spreng.) M. Broun—I; WHR, OCB; RF, BRF; (01537).

Dryopteris celsa (W. Palmer) Knowlt., Palmer, & Pollard—V; WHR; CS, WM; (02127).

Dryopteris marginalis (L.) Gray—V; WHR; RF; (00984).

†*Onoclea sensibilis* L.—S; HR; CS, FW; (03763).

†*Polystichum acrostichoides* (Michx.) Schott—C; ALL; RF, BRF, FW; (00970).

†*Woodsia obtusa* (Spreng.) Torr. subsp. *obtusa*—O; OCB, WHR; LKW, BDF, CG, BO, RO; (00666).

EQUISETACEAE

Equisetum hyemale L. var. *affine* (Engelm.) Calder & R. L. Tayor—R; WHR; CS, RIP; (00129).

ISOETACEAE

Isoetes butleri Engelm.—V; OCB; LWM; (03043).

LYCOPODIACEAE

Diphasiastrum digitatum (Dillenius ex A. Braun) Holub—R; WHR; OH, RD; (01607).

OPHIOGLOSSACEAE

Botrychium biternatum (Sav.) Underwood—S; HR; FW, RB; (05030).

Botrychium dissectum Spreng.—R; WHR; RF; (06783).

†*Botrychium virginianum* (L.) Sw.—F; ALL; RF, BRF, LKW; (01936).

†*Ophioglossum engelmannii* Prantl—R; OCB; CG; (01954).

Ophioglossum vulgatum L.—R; EHR, OCB; FW, LKW; (00605).

OSMUNDACEAE

†*Osmunda cinnamomea* L.—I; HR; RM, FW, AS, ST; (01905).

†*Osmunda regalis* L. var. *spectabilis* (Willd.) Gray—I; HR; RM, FW, AS, ST; (00588).

POLYPODIACEAE

†*Pleopeltis polypodioides* (L.) Andrews & Windham subsp. *michauxiana* (Weatherby) Andrews & Windham—O; OCB, WHR; LKW, BDF, BO, RO, on trees and rocks; (01783).

PTERIDACEAE

†*Adiantum pedatum* L.—I; ALL; RF, BRF; (02187).

†*Cheilanthes alabamensis* (Buckl.) Kunze—S; OCB; BO, LKW; (00652).

Cheilanthes lanosa (Michx.) D. C. Eat.—R; OCB, WHR; BO, RO; (02757).

†*Pellaea atropurpurea* (L.) Link—O; OCB, WHR; LKW, BO, RO, CG; (00663).

SELAGINELLACEAE

†*Selaginella apoda* (L.) Spring—V; WHR; RM; (A. J. Sharp, E. Clebsch, & A. Clebsch 9814, TENN).

THELYPTERIDACEAE

†*Phegopteris hexagonaptera* (Michx.) Fée—I; ALL; RF, BRF; (04931).

†*Thelypteris noveboracensis* (L.) Nieuwl.—S; HR; AS, FW; (00916).

GYMNOSPERMS

CUPRESSACEAE

Juniperus virginiana L. var. *virginiana*—F; ALL; CG, CB, LKW, BDF, RDF, RB, RD, PAS, BO, RO; (01616).

PINACEAE

***Pinus echinata* P. Mill.—R; WHR, OCB (probably planted); OH, RB, RD, few if any native stands; (03150).

***Pinus strobus* L.—V; WHR, tree plantation with seedlings; (02140).

Pinus taeda L.—S; ALL; FW, OH, RB, native only in extreme southern part of county; (00367).

***Pinus virginiana* P. Mill.—R; WHR; RD, no native stands observed; (01631).

ANGIOSPERMS: MONOCOTS

ACORACEAE

**Acorus calamus* L.—R; WHR, OCB; WM, BWM; (03772).

AGAVACEAE

Manfreda virginica (L.) Salisb. ex Rose—S; OCB; CG, CB, BO; (00821).

***Yucca filamentosa* L.—R; OCB; RD, LAW, doubtfully native to county; (04954).

ALISMATACEAE

Alisma subcordatum Raf.—S; HR; WM, FW; (00831).

Sagittaria australis (J. G. Smith) Small—R; WHR, OCB; AS, BWM; (05426).

Sagittaria montevidensis Chamisso & Schlechtendal subsp. *calycina* (Engelm.) Bogin—S; WHR; FP, WM; (01333).

ARACEAE

Arisaema dracontium (L.) Schott—R; OCB; LKW; (02115).

Arisaema triphyllum (L.) Schott subsp. *pusillum* (Peck) Huttleston—R; EHR; FW; (00553).

†*Arisaema triphyllum* (L.) Schott subsp. *triphyllum*—F; ALL; RF, BRF, LKW; (01743).

COMMELINACEAE

**Commelina communis* L.—O; ALL; BRIP, BWM, CRP, GB, RD, RIP; (03745).

**Commelina diffusa* Burm. f.—R; OCB; LWM, RD; (02715).

Commelina erecta L. var. *erecta*—R; OCB; CG, BO; (06427).

†*Commelina virginica* L.—S; ALL; WM, BWM; (03864).

†*Tradescantia subaspera* Ker Gawler—S; WHR, OCB; RF, BRF, BRIP, BO; (00980).

Tradescantia virginiana L.—S; WHR; RF, OH; (01920).

CYPERACEAE

Bulbostylis capillaris (L.) C. B. Clarke ex J. D. Hooker—V; WHR; RB, wet ruts; (05289).

†*Carex albicans* Willd. ex Spreng. var. *albicans*—O; ALL; RF, BRF, LKW, OH; (04399).

Carex albolutescens Schwein.—R; WHR; RM, WM; (03276).

Carex albursina E. Sheldon—R; HR; RF; (04401).

†*Carex amphibola* Steud.—I; OCB, WHR; BRF, RF; (05914).

Carex atlantica Bailey subsp. *capillacea* (Bailey) Rezn.—R; WHR; AS; (00424 VDB).

Carex aureolensis Steudel.—V; OCB; BM; (03522).

Carex baileyi Britt.—V; WHR; RM; (00036 VDB).

Carex basiantha Steudel—R; OCB; LKW; (05899).

Carex blanda Dewey—S; OCB; BDF, BRF, PAS, CG; (04446).

Carex cephalophora Willd. ex Willd.—S; WHR; RF; (00614).

Carex cherokeensis Schwein.—S; OCB; CG, CB, LKW; (02039).

Carex complanata Torr. & Hook.—R; WHR; RB; (04905).

Carex crinita Lam. var. *brevicrinis* Fern.—R; WHR, RM; (02353).

Carex cumberlandensis Naczi, Kral, & Bryson.—I; WHR; RF; (05910).

Carex debilis Michx. var. *debilis*—S; HR; AS, FW; (00428 VDB).

Carex digitalis Willd.—R; WHR; AS; (02265).

Carex festucacea Schkuhr ex Willd.—I; OCB, WHR, BWM, LWM, RM; (03243).

Carex flaccosperma Dewey—R; EHR; FW; (02053).

†*Carex frankii* Kunth—O; ALL; BWM, RM, BM, RM; (00668).

†*Carex gigantea* Rudge—V; EHR; FW; (05019).

Carex granularis Muhl. ex Willd.—R; OCB; LWM; (03249).

†*Carex intumescens* Rudge—S; HR; AS, WM, FW; (00967).

Carex jamesii Schweinitz—R; OCB; BRF; (05834).

Carex joorii Bailey—S; HR; FW, WM, RM; (01322 VDB).

Carex kraliana Naczi & Bryson—R; OCB; BDF; (00654).

†*Carex laevivaginata* (Kukenth.) Mackenzie—R; WHR; CS; (02086).

Carex leavenworthii Dewey—S; OCB; BDF; (00649).

Carex leptalea Wahlenb.—R; WHR; CS; (02261).

Carex lupuliformis Sartwell ex Dewey—R; WHR; RM; (00786).

Carex lupulina Willd.—S; HR; WM, FW; (04206).

Carex lurida Wahlenb.—S; HR; AS, FW; (00953).

Carex muehlenbergii Schkuhr ex Willd. var. *enervis* Boott—R; OCB; PAS, CG; (05896).

Carex normalis Mackenzie—R; EHR; WM; (02346).

Carex picta Steud.—I; WHR; OH; (01613).

Carex planispicata Naczi—R; WHR; RF; (05972).

Carex prasina Wahlenb.—R; WHR; AS, RF; (00614).

Carex radiata (Wahlenb.) Small.—R; WHR; RF; (05971).

Carex rosea Schkuhr ex Willd.—I; WHR, OCB; RF, BRF, AS; (03680).

†*Carex scoparia* Schkuhr ex Willd.—X; WHR, OCB; WM, BWM; (K. Rogers 34914, TENN).

†*Carex stipata* Muhl. ex Willd.—R; WHR, OCB; WM, BWM; (K. Rogers 34913, TENN).

Carex stricta Lam.—R; WHR; AS; (02260).

Carex styloflexa Buckl.—R; WHR; AS; (00427 VDB).

Carex swanii (Fern.) Mackenzie—V; WHR; WM; (03278).

Carex texensis (Torr. ex L.H. Bailey) L.H. Bailey—R; EHR; RF, OH; (04400).

Carex tribuloides Wahlenb.—V; WHR; RF; (04913).

Carex virescens Muhl. ex Willd.—V; WHR; RF, OH?; (H. R. DeSelm s.n., TENN).

†*Carex vulpinoidea* Michx.—I; OCB, WHR; BWM, WM, LWM; (03242).

Cyperus acuminatus Torr. & Hook.—V; WHR; DIS; (06790).

†*Cyperus echinatus* (L.) Wood—I; OCB, WHR; PAS, BWM, LWM, WM, RB; (01257).

Cyperus flavescens L.—R; WHR; RD, wet ditch; (02836).

Cyperus lancastriensis Porter ex Gray—S; OCB; PAS; (01199).

Cyperus odoratus L.—S; OCB; PAS; (01205)

†*Cyperus pseudovegetus* Steud.—R; EHR; WM; (05028).

Cyperus refractus Engelm. ex Boeckl.—R; OCB; LWM; (03644).

**Cyperus rotundus* L.—V; OCB; CG; (04100).

Cyperus squarrosus L.—S; OCB; CG, LWM; (04105).

†*Cyperus strigosus* L.—O; ALL; WM, BWM; (04177).

@†*Eleocharis bifida* S. G. Smith—R; OCB; CG, CB, LWM; (03267); [Smith 2001].

Eleocharis engelmannii Steud.—R; EHR; WM; (02352).

Eleocharis microcarpa Torr. var. *filiculmis* Torr.—V; EHR; FW; (05390).

Eleocharis obtusa (Willd.) J. A. Schultes—O; ALL; WM, BWM, LWM; RM, BM; (06288).

Eleocharis cf. *tenuis* (Willd.) Schultes—V; EHR; WM; (06297).

Fimbristylis autumnalis (L.) Roemer & Schultes—R; WHR; WM, FP; (01331).

Isolepis carinata Hook. & Arn. ex Torr.—V; EHR; WM; (02347).

†*Rhynchospora capitellata* (Michx.) Vahl—S; HR; WM, RM; (06306).

Rhynchospora corniculata (Lam.) Gray—R; HR; WM; (02780).

Rhynchospora glomerata (L.) Vahl—S; HR; WM, RM, FW; (03780).

†*Rhynchospora recognita* (Gale) Kral—X; OCB; BO; (A. J. Sharp, S. Fairchild, & E. Clebsch 9892, TENN).

†*Scirpus atrovirens* Willd.—I; ALL; WM, BWM, LWM; (00998).

†*Scirpus cyperinus* (L.) Kunth—S; WHR; RM; (01323).

Scirpus pendulus Muhl.—V; OCB; LWM; (04903).

Scleria pauciflora Muhl. ex Willd. var. *pauciflora*—V; WHR; RB; (05288).

Scleria oligantha Michx.—S; WHR; OH, RO; (05154).

Scleria triglomerata Michx.—S; HR; FW, OH; (05026).

DIOSCOREACEAE

**Dioscorea polystachya* Turczaninow—O; OCB, WHR; BRIP, RIP; (05311).

Dioscorea villosa L.—O; ALL; BRF, RF; (00608).

IRIDACEAE

**Belamcanda chinensis* (L.) DC.—S; OCB, WHR; CG, PAS, LAW; (01474).

Iris cristata Sol. ex Ait.—I; HR; RF; (01849).

**Iris germanica* L.—R; EHR; RD; (04376).

†*Sisyrinchium albidum* Raf.—I; OCB, WHR; CG, CB, LKW, BDF, BDF, BO, RO; (01952).

†*Sisyrinchium angustifolium* Mill.—I; ALL; BWM, WM, PAS, BRIP, RIP; (02200).

JUNCACEAE

†*Juncus acuminatus* Michx.—S; EHR, WHR; FW, WM, BM, BWM; (01012 VDB).

Juncus biflorus Ell.—R; EHR; WM; (06296).

†*Juncus coriaceus* Mackenzie—I; ALL; WM, BWM, CS, AS; (05164).

Juncus debilis Gray—R; EHR; WM; (02339).

†*Juncus diffusissimus* Buckl.—R; WHR, OCB; RM, BWM; (05291).

Juncus effusus L.—I; ALL; RM, WM, BM, BWM; (02844).

Juncus filipendulus Buckl.—R; OCB; LWM, CG; (03246).

Juncus interior Wieg.—R; WHR; RB, DIS; (05304).

Juncus marginatus Rostk.—R; EHR; WM; (02356).

Juncus repens Michx.—R; WHR; RM; (01324).

Juncus scirpoides Lam.—R; EHR; WM; (02777).

Juncus secundus Beauv. ex Poir.—R; WHR, OCB; RB, CG; (05287).

Juncus tenuis Willd.—O; ALL; PAS, BWM, WM, BM; (03862).

Juncus torreyi Coville—V; OCB; BWM; (03690).

Luzula acuminata Raf. var. *carolinae* (S. Wats.) Fern.—R; WHR; RF; (02139).

†*Luzula echinata* (Small) Hermann—I; ALL; RF, BRF; (02136).

LEMNACEAE

Lemna minor L.—O; ALL; FP, ST; (01473).

Spirodela polyrrhiza (L.) Schleid.—S; WHR; FP; (03682).

LILIACEAE

Allium canadense L. var. *canadense*—I; ALL; RB, PAS, CB, CG, RD; (02321).

Allium cernuum Roth—V; OCB; BO; (00835).

*†*Allium sativum* L.—X; OCB; RD; (A. J. Sharp, A. Clebsch, E. Clebsch 40, TENN).

†***Allium tricoccum*** Sol. var. ***burdickii*** Hanes—R; WHR, OCB; RF, BRF; (00406).

**Allium vineale* L.—I; OCB, WHR; RD, PAS, LAW; (02317).

Amianthium muscitoxicum (Walt.) Gray—R; WHR; RF, OH; (02117).

**Asparagus officinalis* L.—S; OCB, WHR; RD, PAS; (04919).

Camassia scilloides (Raf.) Cory—S; OCB; BRF, BDF; (01793).

Chamaelirium luteum (L.) Gray—R; WHR; OH; (03297).

Erythronium albidum Nutt.—S; OCB; BRF, LKW; (01662).

Erythronium americanum Ker-Gawl subsp. *americanum*—R; WHR; RF; (05908).

Erythronium americanum Ker-Gawl subsp. *harperi* (W. Wolf) Parks and Hardin—O; ALL; RF, BRF; (04398).

**Hemerocallis fulva* (L.) L.—I; ALL; RD, WM, ST, LAW; (02357).

**Hyacinthoides nonscripta* (L.) Chouard—V; WHR; RD; (01740).

†*Hymenocallis occidentalis* (J. Le Conte) Kunth—I; WHR; WM, RF; (01334).

†*Hypoxis hirsuta* (L.) Coville—S; OCB, WHR; CG, OH; (01950).

Δ ***Lilium michiganense*** Farw.—V; WHR; RF.

Maianthemum racemosum (L.) Link subsp. *racemosum*—O; ALL; RF, BRF, LKW; (02029).

**Muscari neglectum* Guss. ex Ten.—I; OCB; CG, PAS; (00338).

**Narcissus poeticus* L.—R; WHR; LAW; (00421).

*Δ *Narcissus pseudonarcissus* L.—O; ALL; LAW, RD, PAS.

†*Nothoscordum bivalve* (L.) Britt.—S; OCB; CG, CB, LWM, LKW, BO; (01653).

**Ornithogalum umbellatum* L.—S; OCB; LAW, PAS, CG; (01942).

Polygonatum biflorum (Walt.) Ell.—O; ALL; RF, BRF, LKW; (01916).

Prosartes lanuginosa (Michx.) D. Don—V; WHR; RF; (02034).

†***Schoenolirion croceum*** (Michx.) Wood.—X; OCB; CG, LWM; (E. Quarterman 5218, specimen formerly at VDB, now apparently lost).

†*Trillium cuneatum* Raf.—C; ALL; RF, BRF, LKW; (01934).

Trillium flexipes Raf.—R; WHR; RF; (01733).

Trillium sessile L.—I; OCB; LKW, BDF, BRF; (01916).

†*Trillium stamineum* Harbison—I; ALL; RF, BRF; (01805).

Uvularia grandiflora Sm.—I; WHR; RF; (01666).

Uvularia perfoliata L.—R; WHR; RF; (H. R. DeSelm s.n., TENN).

Uvularia sessilifolia L.—R; EHR; FW (06293).

ORCHIDACEAE

Cypripedium parviflorum Salisb. var. *pubescens* (Willd.) Knight—V; WHR; RF; (02030).

Goodyera pubescens Willd. R. Br. ex Ait. f.—R; WHR; OH, RF; (01485).

Isotria verticillata Raf.—V; EHR; FW; (02800).

Platanthera ciliaris (L.) Lindl.—V; WHR; RM and associated wet woods; (02745).

Platanthera clavellata (Michx.) Luer—R; WHR; AS, RM; (00957).

Platanthera flava (L.) Lindl. var. *flava*—V; EHR; FW; (06283).

Platanthera peramoena (Gray) Gray—V; OCB; BWM; (03868).

Spiranthes cernua (L.) Rich.—R; WHR; PAS, RD; (06880).

Spiranthes lacera (Raf.) Raf. var. *gracilis* (Bigelow) Luer—S; OCB, WHR; CB, RB; (02880).

Spiranthes vernalis Engelm. & Gray—V; EHR; WM; (04943).

Tipularia discolor (Pursh) Nutt.—I; ALL; RF, BRF; (02801).

POACEAE

**Agrostis gigantea* Roth—R; OCB; WM; (06276).

Agrostis hyemalis (Walt.) B. S. P.—R; EHR; WM; (02348).

Agrostis perennens (Walt.) Tuckerman—I; ALL; OH, FW, BDF; (03669).

Alopecurus carolinianus Walt.—R; OCB; BWM; (02206).

Andropogon gerardii Vitman—S; WHR; RB, RO; (03684).

Andropogon gyrans Ashe—R; WHR; RB, RM; (05677).

Andropogon ternarius Michx.—R; WHR; RB; (05676).

Andropogon virginicus L.—C; ALL; PAS, RB, RD; (06884).

Aristida longespica Poir.—R; WHR; DIS; (06799).

Aristida oligantha Michx.—R; OCB, WHR; CB, RB; (02890).

**Arthraxon hispidus* (Thunb.) Makino—R; EHR; WM, FW; (04195).

†*Arundinaria gigantea* (Walt.) Chapm.—O; ALL; BRIP, RIP, BRF, RF, FW; (00250).

Brachyelytrum erectum (Schreb. ex Spreng.) Beauv.—I; WHR; RF; (02848).

**Bromus commutatus* Schrad.—I; OCB, WHR; PAS, RD; (02207).

Bromus pubescens Muhl. ex Willd.—I; WHR; RF; (06413).

**Bromus racemosus* L.—V; OCB, EHR; (01943).

**Bromus sterilis* L.—V; OCB; CG, PAS; (02044).

**Bromus tectorum* L.—I; OCB; RD, PAS, CG; (04457).

Chasmanthium latifolium (Michx.) Yates—I; WHR, OCB; RF, RIP, BRIP, LKW; (01482).

Chasmanthium laxum (L.) Yates—R; EHR; FW, WM; (02776).

Chasmanthium sessiliflorum (Poir.) Yates—I; OCB, WHR; LKW, OH; (00787).

Cinna arundinacea L.—S; WHR; RF; (01532).

**Cynodon dactylon* (L.) Pers.—O; ALL; PAS, LAW, RD, DIS; (05397).

**Dactylis glomerata* L.—O; ALL; PAS, RD; (02096).

Danthonia spicata (L.) Beauv. ex Roemer & J. A. Schultes—I; HR; OH, (02257).

Dichanthelium acuminatum (Sw.) Gould & C. A. Clark var. *acuminatum*—R; OCB; BWM; (02210).

Dichanthelium acuminatum (Sw.) Gould & C. A. Clark var. *lindheimeri* (Nash) Beetle—S; WHR; RB; (03663).

Dichanthelium boscii (Poir.) Gould & C. A. Clark—I; HR; OH, RF; (03759).

†*Dichanthelium commutatum* (J. A. Schultes) Gould—I; ALL; BRF, RF; (H. R. DeSelm 1654, TENN).

Dichanthelium depauperatum (Muhl.) Gould—S; WHR; RB, OH; (02318).

Dichanthelium dichotomum (L.) Gould—O; HR; OH, FW; (05276).

Dichanthelium laxiflorum (Lam.) Gould—O; ALL; BDF, LKW, BRF, RF; (00762 VDB).

Dichanthelium malacophyllum (Nash) Gould—I; OCB; CG, CB, BDF; (00646 VDB).

Dichanthelium microcarpon (Muhl. ex Ell.) Mohlenbrock—I; ALL; WM, RM, BWM, FW; (00788 VDB).

Dichanthelium sphaerocarpon (Ell.) Gould var. *isophyllum* (Scribn.) Gould & C. A. Clark—S; WHR; RB; (03654).

Dichanthelium scoparium (Lam.) Gould—S; HR; WM, RM, FW; (04183).

***Digitaria ciliaris* (Retz.) Koel.—I; OCB, WHR; DIS, CRP, LAW, RD, GB, CG; (02729 VDB).

**Digitaria sanguinalis* (L.) Scop.—I; OCB; PAS, RD; (05264).

**Digitaria violascens* Link—V; WHR; DIS; (06798).

**Echinochloa colona* (L.) Link—I; OCB; BWM, LWM; (04081).

**Echinochloa crusgalli* (L.) Beauv.—S; WHR; GB, DIS; (02730).

†*Echinochloa muricata* (Beauv.) Fern. var. *muricata*—I; ALL; WM, BWM, BM, RM; (04077).

Saccharum alopecuroidum (L.) Nutt.—O; ALL; PAS, RB, RD; (04109).

Saccharum baldwinii Spreng.—V; WHR; RM; (01326).

Saccharum giganteum (Walt.) Pers.—R; EHR; WM, RB; (04197).

Schizachyrium scoparium (Michx.) Nash var. *divergens* (Hack) Gould—R; WHR; RB; (02864).

Schizachyrium scoparium (Michx.) Nash var. *scoparium*—I; HR; RB, OH, RO; (03649).

*†*Secale cereale* L.—S; OCB; CG, RD; (02209).

**Setaria faberi* Herrm.—O; OCB; CRP, DIS, PAS, RD; (05413).

Setaria parviflora (Poir.) Kerguelen—O; ALL; BWM, WM, PAS, RD, RB; (02733 VDB).

*†*Setaria viridis* (L.) Beauv. var. *major* (Gaudin) Pospichal—R; OCB; CRP; (H.R. DeSelm 1652, TENN).

**Setaria viridis* (L.) Beauv. var. *viridis*—I; OCB; CRP, DIS, PAS, RD; (05266).

Sorghastrum nutans (L.) Nash—R; WHR; RB; (02916).

**Sorghum halapense* (L.) Pers.—F; ALL; DIS, PAS, CRP, RD; (00776).

Sphenopholis intermedia (Rydb.) Rydb.—R; EHR; FW; (02101).

Sphenopholis nitida (Biehler) Scribn.—I; ALL; BRF, LKW, RF; (03251).

Sporobolus clandestinus (Biehler) A. S. Hitchc.—S; OCB; CG, CB; (05649).

Sporobolus compositus (Poir.) Merr. var. *compositus*—R; OCB; CG; (05487).

Sporobolus vaginiflorus (Torr. ex Gray) Wood—I; OCB; CG, CB; (04103).

Tridens flavus (L.) A. S. Hitchc. var. *flavus*—O; ALL; RB, PAS, LWM, RD; (04169).

**Vulpia myuros* (L.) K. C. Gmel.—R; WHR; RB; (4920).

Vulpia octoflora (Walt.) Rydb. var. *glauca* (Nutt.) Fern.—R; WHR; RB; (00587).

PONTEDERIACEAE

*Δ *Eichhornia crassipes* (Mart.) Solms—R; OCB, WHR; FP, observed in two separate ponds over the course of two or three years but plants were not seen in either pond in 2004.

Heteranthera dubia (Jacq.) MacM.—R; OCB; RIV, swift shallows; (03517).

Heteranthera reniformis Ruiz & Pavon—V; OCB; BM; (03528).

POTOMOGETONACEAE

Potomogeton diversifolius Raf.—R; WHR; RM; (02752).

Potomogeton foliosus Raf. subsp. *foliosus*—R; OCB; BM; (03523).

Potomogeton nodosus Poir.—V; OCB; RIV, swift shallows; (03520).

SMILACACEAE

†*Smilax bona-nox* L.—F; OCB, WHR; BDF, LKW, CG, BRIP, RIP, BO, RO; (00208).

Smilax glauca Walt.—I; ALL; OH, RB, FW, BDF; (00022).

Smilax hugeri (Small) J. B. Norton ex Pennell—S; WHR, OCB; RF, LKW; (00604).

Smilax lasioneura Hook.—S; WHR, OCB; OH, RF, BDF, PAS; (01472).

Smilax rotundifolia L.—O; ALL; OH, FW, BDF; (00200).

†*Smilax tamnoides* L.—I; WHR, OCB; RF, BRF, RIP, BRIP; (00162).

SPARGANIACEAE

Sparganium americanum Nutt.—R; WHR; RM; (03782).

TYPHACEAE

Typha angustifolia L.—V; WHR; RD, roadside ditch; (00995).

Typha latifolia L.—I; ALL; RM, BM, BWM, FP; (03693).

XYRIDACEAE

Xyris laxifolia Mart. var. ***iridifolia*** (Chapman) Kral.—V; EHR; WM; (06298).

ANGIOSPERMS: DICOTS

ACANTHACEAE

Justicia americana (L.) Vahl—I; OCB; RIV, GB; (03519).

Ruellia caroliniensis (J. F. Gmel.) Steud.—I; WHR; RB, RD; (00992).

Ruellia humilis Nutt.—S; OCB; CG, CB; (00784).

Ruellia strepens L.—S; OCB; LKW, BDF, CG; (04091).

ACERACEAE

Acer barbatum Michx.—S; WHR; RF; (05277).

Acer negundo L.—I; ALL; BRIP, RIP, FW; (00142 MTSU).

Acer nigrum Michx. f.—I; WHR, OCB; RF, BRF; (01922).

Acer rubrum L. var. *trilobum* Torr. & Gray ex K. Koch—O; ALL; OH, FW, RM, RD; (00826).

Acer saccharinum L.—O; OCB; BRIP, BM; (05319).

†*Acer saccharum* Marsh.—C; ALL; RF, BRF; (04499); [including both var. *saccharum* and var. *schneckii* Rehd.].

AMARANTHACEAE

**Achyranthes japonica* (Miq.) Nakai var. *hachijoensis* Honda—R; OCB; BRIP; (06419).

Amaranthus hybridus L.—I; OCB; CRP, DIS, RD; (03746).

**Amaranthus palmeri* S. Wats.—S; OCB; CRP, DIS, RD; (04175).

**Amaranthus powellii* S. Wats.—R; OCB; CRP; (05273).

**Amaranthus spinosus* L.—O; ALL; PAS, DIS; (02714).

ANACARDIACEAE

†*Rhus aromatica* Ait.—I; OCB; LKW, CG, CB, BO, BDF; (01970).

Rhus copallinum L. var. *latifolia* Engl.—O; ALL; RB, OH, BDF, PAS, RD; (03664).

†*Rhus glabra* L.—O; ALL; PAS, RD; (03672).

Rhus hirta (L.) Sudworth—S; OCB, WHR; BRF, PAS, RD; (03983).

Toxicodendron radicans (L.) Kuntze—C; ALL; OH, BDF, RF, BRF, FW, BRIP, RIP; (03675).

ANNONACEAE

Asimina triloba (L.) Dunal—F; ALL; RF, BRF, BRIP, RIP; (00401).

APIACEAE

Angelica venenosa (Greenway) Fern.—I; WHR; RB; (00976).

*†*Carum carvi* L.—V; OCB; RD; (R. Kral 64893, VDB).

†*Chaerophyllum procumbens* (L.) Crantz.—I; OCB; BRF, RF; (05839).

†*Chaerophyllum tainturieri* Hook—O; ALL; PAS, RD, DIS; (02316).

Cicuta maculata L.—R; OCB; BWM; (02835).

**Conium maculatum* L.—I; OCB; DIS, PAS, CRP, BWM, BRIP; (04501).

Cryptotaenia canadensis (L.) DC.—I; ALL; RF, BRF; (00943).

**Daucus carota* L.—F; ALL; PAS, DIS, RD, RB; (03656).

Erigenia bulbosa (Michx.) Nutt.—S; WHR; RF; (01634).

Eryngium prostratum Nutt. ex DC.—V; EHR; WM; (02791).

†*Eryngium yuccifolium* Michx.—V; WHR; RB; (R. Carter & T. Smith 3133, VDB).

Osmorhiza claytonii (Michx.) C. B. Clarke—I; ALL; RF, BRF, LKW; (00436).

Osmorhiza longistylis (Torr.) DC.—S; WHR, OCB; RF, LKW; (04911).

Oxypolis rigidior (L.) Raf.—S; WHR, OCB; AS, CS, ST, WM, BWM; (01184).

*†*Pastinaca sativa* L.—R; OCB; PAS, RD; (04942).

Perideridia americana (Nutt. ex DC.) Reichenb.—V; OCB; LKW; (02112).

†*Ptilimnium capillaceum* (Michx.) Raf.—S; EHR, OCB; WM, BM; (02774).

Sanicula canadensis L. var. *canadensis*—O; ALL; RF, BRF, BDF; (00945).

Sanicula odorata (Raf.) K. M. Pryer & L. R. Phillippe—I; WHR; RF; (00934).

Sanicula smallii Bickn.—R; WHR; OH; (02849).

Sanicula trifoliata Bickn.—S; WHR, OCB; RF, BRF; (02728).

†*Thaspium trifoliatum* (L.) Gray var. *aureum* Britt.—O; WHR; RF, RO; (02684).

**Torilis arvensis* (Huds.) Link—S; OCB; DIS, PAS, CG; (03704).

†*Zizia aurea* (L.) W. D. J. Koch—S; WHR; RIP; (02130).

APOCYNACEAE

Amsonia tabernaemontana Walt. var. *tabernaemontana*—V; WHR; RF; (04912).

Apocynum cannabinum L.—I; ALL; WM, BWM, RD; (00983).

Trachelospermum difforme (Walt.) Gray—V; WHR; WM; (04000).

**Vinca major* L.—R; OCB; RD, BDF; (01788).

**Vinca minor* L.—S; OCB, WHR; LAW, LAW; (01632).

AQUIFOLIACEAE

†*Ilex decidua* Walt.—S; OCB; BDF, RD; (06793).

Ilex longipes Chapman ex Trel.—R; WHR, OCB; OH, LKW; (02871).

Ilex opaca Ait.—S; WHR, OCB; OH, BDF; (00282).

Ilex verticillata (L.) Gray—R; EHR; FW; (00555).

ARALIACEAE

Aralia racemosa L.—V; WHR; RF; (01269).

Aralia spinosa L.—I; ALL; RF, BRF, OH; (00961).

*Δ *Hedera helix* L.—R; OCB; LAW, UT.

Panax quinquefolius L.—S; ALL; RF, BRF, LKW; (00933).

ARISTOLOCHIACEAE

Aristolochia serpentaria L.—I; WHR; RF; (02824).

†*Aristolochia tomentosa* Sims—I; OCB; BRIP; (03184).

Asarum canadense L.—O; ALL; RF, BRF; (01736).

ASCLEPIADACEAE

Asclepias amplexicaulis Sm.—R; WHR; RB; (03661).

Asclepias exaltata L.—V; WHR; RF; (02268).

Asclepias incarnata L. subsp. _incarnata_—I; ALL; WM, BWM, RM, BM; (03859).

Asclepias quadrifolia Jacq.—R; WHR; RF; (02129).

Asclepias syriaca L.—O; OCB; PAS, BRIP, RD; (03671).

Asclepias tuberosa L. subsp. _interior_ Woods.—O; ALL; PAS, RD, RB; (04918).

Asclepias variegata L.—S; WHR; RB, OH; (02249).

Asclepias verticillata L.—V; WHR; RO; (05158).

Asclepias viridiflora Raf.—R; OCB; CG, CB; (03715).

Asclepias viridis Walt.—R; OCB; CG, PAS; (02108).

Cynanchum laeve (Michx.) Pers.—I; OCB, WHR; DIS, BRIP, RD; (03514).

Matelea caroliniensis (Jacq.) Woods.—I; WHR; RF, RO; (02323).

†_Matelea gonocarpos_ (Walt.) Shinners—I; OCB, WHR; LKW, BDF, BO, RO; (00657).

ASTERACEAE

Achillea millefolium L.—O; ALL; PAS, DIS, RB, RD; (02138).

†_Ageratina altissima_ (L.) King & H. E. Robins.—I; OCB, WHR; RF, BRF, BDF, DIS, RD; (04066).

Ambrosia artemisiifolia L.—F; ALL; DIS, RB, CG, PAS, CRP, RD; (04068).

Ambrosia bidentata Michx.—R; WHR; RB; (02739).

Ambrosia trifida L.—O; OCB, WHR; BRIP, RIP, DIS, RD, PAS; (04067).

Amphiachyris dracunculoides (DC.) Nutt.—S; OCB, CG, CB, PAS; (04099).

†_Antennaria plantaginifolia_ (L.) Richards.—O; ALL; OH, BDF, LKW; (01715 APSC).

Antennaria solitaria Rydb.—S; WHR; OH; (01874).

*Anthemis cotula _L.—R; OCB, PAS; (04952)._

*_Arctium minus_ Bernh.—S; OCB; DIS, PAS; (06432).

Arnoglossum atriplicifolium (L.) H. E. Robins.—I; WHR; RF, RIP; (03872).

†_Arnoglossum muehlenbergii_ (Schultz-Bip.) H. E. Robins.—R; WHR; RF; (00950).

*_Artemisia annua_ L.—O; OCB; DIS, RD, PAS, CG; (04093).

†_Astranthium integrifolium_ (Michx.) Nutt. subsp. _integrifolium_—S; OCB; CG, CB, LKW; (01773).

*_Baccharis halimifolia_ L.—V; EHR; FW, DIS; (04202).

Bidens aristosa (Michx.) Britt.—I; WHR; WM, RM; (01517).

Bidens bipinnata L.—I; OCB; CG, LKW, BDF, DIS; (02887).

†_Bidens cernua_ L.—S; OCB; BWM; (04088).

Bidens frondosa L.—S; OCB; BWM, DIS; (05467).

Boltonia asteroides (L.) L'Hér—R; EHR; WM; (04190).

Brickellia eupatorioides (L.) Shinners—V; OCB; CG, CB; (04097).

Smallanthus uvedalius (L.) Mackenzie ex Small—I; HR; RF, RD; (05423).

Solidago arguta Ait. var. *caroliniana* Gray—I; WHR; RB, OH; (03681).

Solidago caesia L.—I; ALL; RF, BRF, BO, RO; (06794).

†*Solidago canadensis* L var. *scabra* Torr. & Gray—F; ALL; RB, PAS, RD; (04111).

Solidago erecta Pursh—I; WHR; OH; (02900).

Solidago flexicaulis L.—R; WHR; RF; (02726).

Solidago gigantea Ait.—I; ALL; WM, BWM; (01129).

Solidago hispida Muhl. ex Willd. var. *hispida*—I; WHR; OH; (02902).

Solidago missouriensis Nutt. var. *fasciculata* Holz.—R; WHR; RB; (01047).

Solidago nemoralis Ait.—O; WHR; RB, PAS; (01521).

Solidago odora Ait. var. *odora*—I; WHR; RB; (02869).

Solidago patula Muhl. ex Willd.—R; WHR; CS; (06379).

Solidago rugosa P. Mill. ssp. *aspera* (Ait.) Cronq.—I; HR; OH, RB, WM, FW; (06781).

Solidago sphacelata Raf.—R; WHR; RO; (02846).

Solidago ulmifolia Muhl. ex Willd.—I; WHR; OH; (05274).

**Sonchus asper* (L.) Hill—I; EHR, PAS; (02340).

Symphyotrichum cordifolium (L.) Nesom—I; WHR; RF; (01481).

Symphyotrichum drummondii (Lindl.) Nesom—S; OCB, WHR; BDF, RO; (05638).

Symphyotrichum dumosum (L.) Nesom—I; WHR; RB; (02868).

Symphyotrichum lanceolatum (Willd.) Nesom—S; WHR, OCB; WM, BWM; (05465).

Symphyotrichum lateriflorum (L.) A. & D. Löve—O; ALL; RF, BRF, PAS, RD; (01349 VDB).

Symphyotrichum ontarione (Wieg.) Nesom—R; OCB; PAS, LWM, BWM; (05645).

Symphyotrichum patens (Ait.) Nesom—I; WHR; RB, OH; (02972).

Symphyotrichum pilosum (Willd.) Nesom—F; ALL; PAS, RD, DIS; (01471).

Symphyotrichum priceae (Britt.) Nesom—R; OCB; CG; (06789).

Symphyotrichum shortii (Lindl.) Nesom—O; ALL; BDF, BO, RO, OH; (01382).

Symphyotrichum undulatum (L.) Nesom—R; WHR; RB, OH; (02974).

Symphyotrichum urophyllum (Lindl.) Nesom—O; WHR, OCB; RF, BRF, RO; (01536 VDB).

**Taraxacum laevigatum* (Willd.) DC.—R; OCB; RD; (01974).

**Taraxacum officinale* G. H. Weber ex Wiggers—F; ALL; PAS, RD, DIS, CRP; (06441).

Verbesina alternifolia (L.) Britt. ex Kearney—O; WHR, OCB; RIP, RF, BRIP, WM, BWM; (01261).

Verbesina virginica L.—O; WHR, OCB; RIP, BRIP, CG, CB, PAS; (01131).

†*Vernonia gigantea* (Walt.) Trel. ex Bran. & Cov.—F; ALL; PAS, RB, WM, BWM; (03860).

**Xanthium strumarium* L.—I; ALL; PAS, DIS; (04095).

BALSAMINACEAE

Impatiens capensis Meerb.—O; ALL; RF, BRF, WM, BWM, CS, AS; (01032).

Impatiens pallida Nutt.—R; WHR, OCB; RF, BRF; (01128).

BERBERIDACEAE

**Berberis bealei* Fortune—V; WHR; PAS; (05915).

*Δ *Berberis thunbergii* DC.—V; OCB; PAS.

†*Caulophyllum thalictroides* (L.) Michx.—R; WHR; RF; (02727).

Jeffersonia diphylla (L.) Pers.—S; WHR, OCB; RF, BRF; (00385).

*Δ *Nandina domestica* Thunb.—V; OCB; highway roadcut.

†*Podophyllum peltatum* L.—C; ALL; BRF, RF, BDF; (01746).

BETULACEAE

Alnus serrulata (Ait.) Willd.—O; HR; RIP, CS, AS, FW; (00316).

Betula nigra L.—S; ALL; RM, FW, BRIP; (01142).

Carpinus caroliniana Walt.—F; ALL; RF, BRF, RIP, BRIP; (02857).

Corylus americana Walt.—I; WHR; OH, RF; (00962).

†*Ostrya virginiana* (Mill.) K. Koch—O; ALL; BDF, LKW, OH, RF, BRF, BO, RO; (05278).

BIGNONIACEAE

†*Bignonia capreolata* L.—O; ALL; RF, BRF, BDF, LKW; (02046).

†*Campsis radicans* (L.) Seem ex Bureau—O; ALL; RF, BRF, BDF, RD; (02709).

**Catalpa bignonioides* Walt.—R; OCB; BRIP; (02189).

**Δ *Catalpa speciosa* (Warder) Warder ex Engelm.—S; OCB; BRIP.

BORAGINACEAE

*†*Buglossoides arvensis* (L.) I. M. Johnston—S; OCB; CG, RD, DIS; (01660).

Cynoglossum virginianum L.—I; ALL; BRF, BDF, LKW, RF; (01953).

*Δ *Heliotropium indicum* L.—R; EHR; FW.

Heliotropium tenellum (Nutt.) Torr.—R; OCB; CG, CB; (02690).

†*Lithospermum canescens* (Michx.) Lehm.—V; OCB; CG; (E. Quarterman 5268, VDB).

Lithospermum tuberosum Rugel ex DC.—I; WHR, OCB; OH, RF, BDF, LKW, RB; (02882).

Mertensia virginica (L.) Pers. ex Link—I; WHR, OCB; RIP, BRIP; (00127).

†*Myosotis macrosperma* Engelm.—O; ALL; RF, BRF, BDF, LKW; (01958).

†*Onosmodium molle* Michx. subsp. *molle*—S; OCB; CG, CB, PAS; (04849).

BRASSICACEAE

**Alliaria petiolata* (Bieb.) Cavara & Grande—S; OCB; BRF; (03182).

*†*Arabidopsis thaliana* (L.) Heynh.—R; EHR; CRP; (04394).

†*Arabis laevigata* (Muhl. ex Willd.) Poir. var. *laevigata*—O; ALL; RF, RO, BRF, BO, LKW; (01737).

*†*Barbarea verna* (P. Mill.) Aschers.—S; WHR; RD, RIP; (02134).

*†*Barbarea vulgaris* Ait. f.—O; ALL; PAS, RD; (00435).

*†*Brassica rapa* L.—O; ALL; CRP, PAS, RD, DIS; (00328).

*†*Capsella bursa-pastoris* (L.) Medik.—I; OCB; CRP, RD, DIS; (01748).

†*Cardamine angustata* O. E. Schulz—I; WHR; RF; (03039).

†*Cardamine bulbosa* (Schreb. ex Muhl.) B. S. P.—I; WHR; CS; (01727).

†*Cardamine concatenata* (Michx.) Sw.—F; ALL; BRF, RF; (01701).

Cardamine diphylla (Michx.) Wood.—R; OCB; BRF; (05832).

**Cardamine hirsuta* L.—C; ALL; CRP, DIS, BRF, BDF, RF, LKW; (01774).

†*Cardamine parviflora* L.—R; OCB, WHR; LKW, RO; (A. J. Sharp, C. J. Felix, & W. Adams 10930, TENN).

Cardamine pensylvanica Muhl. ex Willd.—S; WHR, OCB; CS, BWM; (04453).

†*Descurainia pinnata* (Walt.) Britt. subsp. *brachycarpa* (Richards) Detling—X; OCB; CG; (E. Quarterman, J. Baskin, & S. Oakland 64-52, VDB).

*†*Descurainia sophia* (L.) Webb ex Prantl—V; OCB; RD; (R. Kral 64884, VDB).

Draba brachycarpa Nutt. ex Torr. & Gray—R; EHR, OCB; CRP, CG; (04395).

**Draba verna* L.—I; OCB; CG, RD, DIS; (01661).

*†*Erysimum repandum* L.—R; OCB; CRP, RD; (03077).

Iodanthus pinnatifidus (Michx.) Steud.—S; WHR; RF; (02186).

†***Leavenworthia exigua*** Rollins var. ***exigua***—X; OCB; CG; (E. Quarterman, J. Baskin & S. Oakland 64-61, VDB).

†*Leavenworthia torulosa* Gray—S; OCB; CG, LWM; (01603).

*†*Lepidium campestre* (L.) Ait. f.—R; OCB; CG; (01964).

*†*Lepidium densiflorum* Schrad.—V; OCB; RD; (R. Kral 64894, 2 May 1980, VDB).

†*Lepidium virginicum* L.—I; OCB; CG, CB, PAS, RD, DIS; (03272).

†***Lesquerella densipila*** Rollins—R; OCB; CRP; (01672).

**Rorippa nasturtium-aquaticum* (L.) Hayek.—O; ALL; ST; (01768).

Rorippa sessiliflora (Nutt.) A.S. Hitchc.—R; OCB; BWM; (04396).

Sibara virginica (L.) Rollins—S; OCB, WHR; CRP; (01671).

*†*Sisymbrium officinale* (L.) Scop.—S; OCB; CG, RD; (01969).

**Thlaspi arvense* L.—R; OCB; RD; (01790).

BUXACEAE

Pachysandra procumbens Michx.—I; WHR; RF; (04910).

CACTACEAE

Opuntia humifusa (Raf.) Raf. var. *humifusa*—I; OCB; CG, CB, BO, PAS; (01626).

CALLITRICHACEAE

Callitriche heterophylla Pursh subsp. *heterophylla*—S; WHR; RM; (02203).

CAMPANULACEAE

†*Campanulastrum americanum* (L.) Small—I; WHR, OCB; RF, BRF; (00655).

Lobelia cardinalis L.—I; WHR; WM, RM, RIP, ST; (01134).

Lobelia inflata L.—I; WHR; RD; (02702).

Lobelia puberula Michx. var. *puberula*—I; WHR; RB; (01300).

†*Lobelia siphilitica* L.—O; ALL; BWM, WM; (05418).

Δ *Lobelia spicata* Lam.—V; OCB; CB.

†*Triodanis perfoliata* (L.) Nieuwl. var. *perfoliata*—I; WHR, OCB; DIS, RD; PAS; (02313).

CAPPARACEAE

**Cleome hassleriana* Chod.—V; WHR; GB; (02732).

CAPRIFOLIACEAE

**Lonicera fragrantissima* Lindl. & Paxton—R; WHR, OCB; RD, UT; (03038).

**Lonicera japonica* Thunb.—C, ALL; BRF, BDF, BWM, RF, WM, BRIP, RIP, PAS, RD; (02256).

**Lonicera maackii* (Rupr.) Herder—R; OCB; RD, UT; (05670).

†*Lonicera sempervirens* L.—I; WHR; OH, RO; (02081).

Sambucus nigra L. subsp. *canadensis* (L.) R. Bolli—O; ALL; BWM, BM, WM, RM, FW, BRIP, RIP, CS; (02826).

†*Symphoricarpos orbiculatus* Moench—C; ALL; BDF, LKW, OH, BRF, RF, BO, RD; (05644).

Viburnum dentatum L. var. *lucidum* Ait.—R; EHR; FW; (02790 EKU).

Viburnum nudum L. var. *nudum*—R; HR; FW, RM; (05013).

†*Viburnum rufidulum* Raf.—O; ALL; BDF, LKW, BRF, RF; (01973).

CARYOPHYLLACEAE

†***Arenaria lanuginosa*** (Michx.) Rohrb.—R; OCB, WHR; BO, RO; (02755).

*†*Arenaria serpyllifolia* L.—R; OCB; RD; (02194).

*†*Cerastium brachypetalum* Desportes ex Pers.—S; OCB; CG, RD; (01784).

Cerastium brachypodum (Engelm. ex Gray) B. L. Robins.—R; WHR; OH; (05906).

*†*Cerastium fontanum* Baumg. subsp. *vulgare* (Hartman) Greuter & Burdet—S; OCB; RD; (A. J. Sharp, C. J. Felix, & B. Adams 10957, TENN).

**Cerastium glomeratum* Thuill.—S; WHR; LAW; (02092 VDB).

†*Cerastium nutans* Raf.—S; WHR; RO, RF; (01924 VDB).

**Dianthus armeria* L.—I; OCB; RD, PAS; (02196).

**Holosteum umbellatum* L.—S; OCB; CRP, CG; (01674).

†*Minuartia patula* (Michx.) Mattf.—I; OCB; CG, CB, BO; (00363).

**Myosoton aquaticum* (L.) Moench—R; WHR; CS, ST; (02090 VDB).

**Saponaria officinalis* L.—I; OCB, WHR; RD, PAS; (01077).

**Silene latifolia* Poir. subsp. *alba* (P. Mill.) Greuter & Burdet—R; WHR; RD; (02723).

Silene stellata (L.) Ait. f.—S; WHR; RF; (01045).

†*Silene virginica* L.—O; ALL; RF, OH, RO, BRF, BDF; (00595).

Stellaria fontinalis (Short & Peter) B.L.Robins.—R, OCB; LWM; (03250).

**Stellaria media* (L.) Vill. subsp. *media*—C; ALL; RF, BRF, LKW, LAW, PAS, RD; (01867).

Stellaria pubera Michx.—I; HR; RF; (01810).

CELASTRACEAE

Celastrus scandens L.—V; WHR; RIP; (01529).

**Euonymus alata* (Thunb.) Sieb.—R; EHR; FW, OH; (02049).

†*Euonymus americana* L.—F; ALL; RF, BRF, LKW; (02122).

†*Euonymus atropurpurea* Jacq. var. *atropurpurea*—S; OCB; LKW, BDF, BRF; (02889).

**Euonymus fortunei* (Turcz.) Hand.-Maz.—R; OCB; UT, LKW; (05902).

**Euonymus kiautschovicus* Loesener.—R; OCB; BDF, RD, BRIP, UT; (05674).

CHENOPODIACEAE

**Chenopodium album* L.—O; ALL; DIS, RD, PAS, GB, CRP; (04172).

Chenopodium standleyanum Aellen—V; WHR; RF; (03981).

**Dysphania ambrosioides* (L.) Mosyakin & Clemants—I; OCB; PAS, GB, DIS; (01198).

CISTACEAE

Lechea minor L.—V; WHR; RB (05309).

†*Lechea mucronata* Raf.—S; WHR; RB; (02843).

CLUSIACEAE

Hypericum acutifolium Ell.—R; WHR; RB; (06776).

Hypericum crux-andreae (L.) Crantz—R; EHR; FW, WM: (02797).

Hypericum drummondii (Grev. & Hook.) Torr. & Gray—I; WHR; PAS, RB; (01189).

Hypericum frondosum Michx.—S; OCB; BO, BDF; (00985).

Hypericum gentianoides (L.) B. S. P.—R; WHR; RB; (02854).

Hypericum hypericoides (L.) Crantz subsp. *hypericoides*—S; HR; FW, OH, AS, WM; (02703).

†*Hypericum hypericoides* (L.) Crantz subsp. *multicaule* (Michx. ex Willd.) Robson—I; ALL; OH, BDF; (00023).

†*Hypericum mutilum* L.—I; ALL; WM, RM, BWM, BM; (01147).

**Hypericum perforatum* L.—R; OCB; RD; (04917).

Hypericum prolificum L.—R; OCB; BDF; (00774).

Hypericum punctatum Lam.—I; ALL; RB, PAS, OH, BDF; (01318).

Hypericum sphaerocarpum Michx.—I; OCB; CG, LWM, CB; (02688).

Triadenum virginicum (L.) Raf.—R; EHR; FW; (04189).

Triadenum walteri (J.G.Gmel.) Gleason—VR; WHR; CS; (06380).

CONVOLVULACEAE

Calystegia catesbiana Pursh—R; WHR; RB; (2078 VDB).

Calystegia silvatica (Kit.) Griseb. subsp. *fraterniflorus* (Mackenzie & Bush) Brummitt—F; OCB, WHR; BRIP, RIP, BWM, WM, RD; (03754).

**Dichondra caroliniensis* Michx. —R; OCB; LAW; (06440).

**Ipomoea coccinea* L.—R; OCB; RD; (01340).

**Ipomoea hederacea* Jacq.—S; OCB; CRP, DIS, RD; (05412).

†*Ipomoea lacunosa* L.—R; OCB; CRP; (01336).

†*Ipomoea pandurata* (L.) G. F. W. Mey.—I; WHR; OH, RB; (00991).

**Ipomoea purpurea* (L.) Roth—S; OCB; RD, CRP; (06881).

CORNACEAE

Cornus alternifolia L. f.—V; WHR; RF; (01757).

†*Cornus amomum* P. Mill.—I; ALL; WM, RM; ST, AS, CS, BWM; (01528).

†*Cornus drummondii* C. A. Mey.—I; OCB; BDF, LKW, BRIP, BO, CG, CB; (04108).

†*Cornus florida* L.—F; ALL; RF, BRF, BDF, OH; (01809).

Cornus foemina P. Mill.—R; EHR; FW; (02341).

Nyssa biflora Walt.—R; HR; RM, FW; (02793).

†*Nyssa sylvatica* Marsh.—O; ALL; OH, BDF, BRF, FW, RM; (02925).

CRASSULACEAE

†*Penthorum sedoides* L.—I; ALL; WM, BWM, RM, BM; (02725).

†*Sedum pulchellum* Michx.—I; OCB; CG, BO, LKW; (00455).

**Sedum sarmentosum* Bunge—R; WHR; RO; (02088).

Δ *Sedum ternatum* Michx.—S; WHR; RF, RO.

CUCURBITACEAE

**Citrullus vulgaris* (Thunb.) Matsumura & Nakai—V; WHR; DIS; (05302).

**Cucurbita pepo* L.—R; OCB; PAS, RD; (01194).

†*Melothria pendula* L.—R; EHR; FW; (04185).

Sicyos angulatus L.—I; OCB; BRIP; (04090).

CUSCUTACEAE

Cuscuta compacta Juss. ex Choisy—S; WHR; CS, ST, RIP; (01299).

Cuscuta gronovii Willd. ex J. A. Schultes—R; EHR; WM; (04203).

Cuscuta pentagona Engelm.—I; OCB, WHR; PAS, RD; (05429).

DIPSACACEAE

**Dipsacus fullonum* L.—R; OCB; PAS, RD; (05173).

EBENACEAE

Diospyros virginiana L.—F; ALL; PAS, BDF; (01908 MTSU).

ELAEAGNACEAE

**Elaeagnus umbellata* Thunb.—R; WHR, OCB; OH, RD, PAS; (03148).

ERICACEAE

Gaylussacia baccata (Wangenh.) K. Koch—V; EHR; FW; (02803).

†*Kalmia latifolia* L.—I; HR; OH, RO; (02894).

†*Oxydendrum arboreum* (L.) DC.—O; ALL; OH, BDF; (03658).

Rhododendron alabamense Rehd.—R; WHR; AS, OH; (01852).

Rhododendron canescens (Michx.) Sweet—I; HR; OH, FW, RM, AS, RB; (01872).

Rhododendron periclymenoides (Michx.) Shinners—R; HR; OH, AS; (01802).

†*Vaccinium arboreum* Marsh.—I; ALL; OH, RB, CB; (02888).

Vaccinium corymbosum L.—R; EHR; FW; (00038).

Vaccinium fuscatum Ait.—I; HR; OH, AS, FW, RM; (03026).

†*Vaccinium pallidum* Ait.—I; WHR; OH, RB; (00423).

Vaccinium stamineum L.—I; HR; OH, RB; (01758).

EUPHORBIACEAE

Acalypha gracilens Gray—R; WHR; RB; (02861).

Acalypha ostryifolia Riddell—I; OCB; CRP, PAS, RD; (04089).

†*Acalypha rhomboidea* Raf.—X; OCB; BO; (A. J. Sharp, S. Fairchild, & E. Clebsch 9859, TENN).

Acalypha virginica L.—O; ALL; RD, DIS, CRP, LWM, CG, GB; (05174).

**Chamaesyce maculata* (L.) Small—I; OCB; PAS, RD, DIS; (05392).

Chamaesyce nutans (Lag.) Small—I; ALL; PAS, RB, RD, CG, CB; (04125).

**Chamaesyce prostrata* (Ait.) Small—R; OCB; CRP, RD; (05320).

Croton capitatus Michx.—S; OCB; CG, CB; (05484).

†*Croton monanthogynus* Michx.—I; OCB; CG, CB, BO, RD; (05617).

Euphorbia corollata L.—I; WHR; RB, OH, RD; (01051).

**Euphorbia cyparissias* L.—R; OCB; RD, LAW; (01652).

Euphorbia dentata Michx.—I; OCB; BO, CG, CB; (00648).

Euphorbia mercurialina Michx.—R; OCB; BRF; (03185).

Phyllanthus caroliniensis Walt.—I; ALL; WM, BWM; (04118).

Tragia cordata Michx.—V; WHR; RO; (05159).

FABACEAE

**Albizia julibrissin* Durazz.—I; ALL; DIS, BRF, RF, RD; (00159).

†*Amorpha fruticosa* L.—S; WHR, OCB; WM, CG; (01130 APSC).

Amorpha nitens Boynt.—R; OCB; CG; (00780).

†*Amphicarpaea bracteata* (L.) Fern.—I; ALL; RF, BRF; (01599).

Quercus × *filialis* Little—V; WHR; RM, WM; (02909).

†*Quercus imbricaria* Michx.—S; OCB, WHR; BDF, OH; (04107).

Quercus lyrata Walt.—R; HR; RM, WM, FW; (02907).

Quercus marilandica Munchh.—S; HR; OH, RB; (02926).

Quercus michauxii Nutt.—R; OCB; BRIP; (02922).

Quercus montana Willd.—O; ALL; OH, BDF; (05904).

†*Quercus muehlenbergii* Engelm.—C; ALL; LKW, BDF, BO, BRF, RF, RO; (04094).

Quercus nigra L.—S; EHR; FW; (04113).

†*Quercus pagoda* Raf.—S; OCB; BDF, BRIP; (00007).

†*Quercus phellos* L.—I; HR; FW, RM, WM, OH; (02910).

Quercus rubra L.—O; ALL; RF, BRF, LKW; (01476).

†*Quercus shumardii* Buckl.—C; ALL; BDF, BRF, LKW, BO, RF; (05422).

Quercus stellata Wangenh.—O; ALL; OH, BDF; (04112).

Quercus velutina Lam.—O; ALL; OH, BDF; (00960).

FUMARIACEAE

†*Corydalis flavula* (Raf.) DC.—I; OCB, WHR; BRF, BDF, RF, LKW; (03139).

Dicentra cucullaria (L.) Bernh.—R; WHR; RF; (01698).

GENTIANACEAE

Bartonia paniculata (Michx.) Muhl.—V; EHR; FW; (05388).

Bartonia virginica (L.) B. S. P.—V; WHR; AS; (01310).

Frasera caroliniensis Walt.—I; WHR, OCB; RF, OH, BDF, LKW; (00963).

Obolaria virginica L.—R; WHR; OH; (03140).

Sabatia angularis (L.) Pursh—I; WHR, OCB; RB, CG; (03712).

Sabatia brachiata Ell.—R; WHR; RB; (03651).

GERANIACEAE

Geranium carolinianum L. var. *carolinianum*—I; ALL; PAS, RD, CG; (01951).

**Geranium dissectum* L.—S; OCB; CRP, LAW, PAS; (01946).

Geranium maculatum L.—I; HR; RF; (01762).

**Geranium molle* L.—S; OCB; LKW, CG, CB; (01775).

GROSSULARIACEAE

Itea virginica L.—S; HR; AS, RM, WM, FW; (00549).

HALORAGACEAE

**Myriophyllum aquaticum* (Vell.) Verdc.—R; OCB; FP, BWM; (05280).

Proserpinaca palustris L.—R; HR; RM, FW, ST; (00561).

HAMAMELIDACEAE

Hamamelis virginiana L.—I; HR; RF; (01050).

Liquidambar styraciflua L.—O; ALL; FW, OH, BDF, RM; (00790).

HIPPOCASTANACEAE

Aesculus flava Ait.—I; ALL; BRF, RF; (05838).

†*Aesculus glabra* Willd.—I; OCB; BDF, PAS; (00818).

Aesculus × *hybrida* DC.—V; WHR; RF; (00408 VDB).

Aesculus pavia *L.—O; ALL; BRF, BDF, RF; (01798).*

HYDRANGEACEAE

†*Decumaria barbara* L.—R; WHR; RF, RIP; CS; (03757).

Hydrangea arborescens L.—R; OCB; BRF; (03515).

†*Hydrangea cinerea* Small—F; ALL; RF, BRF, RO, BO; (02452).

Hydrangea quercifolia Bartr.—R; WHR; OH; (02100).

Philadelphus hirsutus Nutt.—S; WHR; RF, RO; (02188).

†*Philadelphus pubescens* Loisel. var. *pubescens*—S; OCB; BO, BDF; (A. J. Sharp, S. Fairchild, & E. Clebsch 9864, TENN).

HYDROPHYLLACEAE

Hydrophyllum appendiculatum Michx.—I; OCB, WHR; BRF, RF; (01932).

Hydrophyllum macrophyllum Nutt.—R; WHR; RF; (02145).

†*Nemophila aphylla* (L.) Brummitt—O; OCB; LKW, BDF, BRF; (01717).

†*Phacelia bipinnatfida* Michx.—O; ALL; RF, BRF; (00402).

Phacelia dubia (L.) Trel. var. *interior* Fern.—V; OCB; CG; (01782).

†*Phacelia purshii* Buckl.—O; OCB; PAS, CG, RD; (03264).

JUGLANDACEAE

†*Carya cordiformis* (Wangenh.) K. Koch—O; ALL; RF, BRF; (05421).

Carya glabra (Mill.) Sweet—O; ALL; OH, RF, BDF, BRF; (00028).

Carya ovalis (Wang.) Sarg.—O; OCB, WHR; RF, BDF, BRF; (00057).

***Carya illinoinensis* (Wangenh.) K. Koch—R; OCB; RD; (02923).

Carya laciniosa (F. Michx.) Loudon—R; OCB; BRF, BDF; (05387).

†*Carya ovata* (P. Mill.) K. Koch var. *australis* (Ashe) Little—I; OCB; BDF, LKW, BO, CG, CB; (00611).

Carya ovata (P. Mill.) K. Koch var. *ovata*—F; ALL; BDF, OH, BRF, RF, LKW; (05406).

Carya tomentosa (Poir.) Nutt.—O; ALL; OH, BDF; (00139).

Juglans cinerea L.—S; ALL; RF, BRF, RIP; (00249).

Juglans nigra L.—F; ALL; BRIP, RIP, BRF, RF; (05285).

LAMIACEAE

†*Agastache nepetoides* (L.) Kuntze—S; WHR; RF, RIP; (R. Kral 36930, TENN).

*Δ *Ajuga reptans* L.—R; OCB; LAW.

Blephilia ciliata (L.) Benth.—I; OCB, WHR; CG, LKW, RF; (03273).

Blephilia hirsuta (Pursh.) Benth.—R; WHR, OCB; RF, BRIP; (03741).

*†*Calamintha nepeta* (L.) Savi—V; OCB; BDF, BO; (01003 VDB).

Collinsonia canadensis L.—I; WHR; RF; (01533).

Cunila origanoides (L.) Britt.—R; WHR; OH; (02973).

**Glechoma hederacea* L.—O; ALL; PAS, LAW, RD, RF, BRF; (01702).

Hedeoma hispida Pursh—R; OCB; PAS; (04895).

Isanthus brachiatus (L.) B. S. P.—I; OCB; CG; (05650).

*†*Lamium amplexicaule* L.—F; ALL; PAS, LAW, RD; (01619).

**Lamium purpureum* L.—F; ALL; PAS, LAW, RD; (00360).

Lycopus americanus Muhl. ex W. Bart.—S; OCB, EHR; LWM, FW; (06788).

Lycopus rubellus Moench—I; WHR, OCB; CS, BWM; (01267).

Lycopus virginicus L.—I; OCB; BWM, BM; (05250).

*†*Marrubium vulgare* L.—X; OCB; thin limestone soil; (A. J. Sharp, C. J. Felix, & B. Adams 10968, TENN).

**Mentha × piperita* L.—O; WHR, OCB; WM, BWM, BM; (01038).

†*Monarda bradburiana* Beck—S; WHR; OH, RB, RF; (02076).

Monarda fistulosa L.—I; WHR; RB; (00964).

*†*Perilla frutescens* (L.) Britt.—F; ALL; PAS, DIS, RD, GB; (04069).

**Prunella vulgaris* L.—O; ALL; PAS, BWM, RD; (00940).

†*Pycnanthemum loomisii* Nutt.—O; WHR; RB, RD, PAS, OH; (02845).

Pycnanthemum muticum (Michx.) Pers.—R; EHR; WM; (06303).

Pycnanthemum tenuifolium Schrad.—I; WHR; RB; (03650).

†*Salvia lyrata* L.—O; ALL; PAS, RD, OH, BDF, LKW, CG, CB; (00609).

Salvia urticifolia L.—R; WHR; OH, RB; (02252).

Scutellaria elliptica Muhl. ex Spreng. var. *hirsuta* (Short & Peter) Fern.—I; WHR; RF; (05151).

Scutellaria incana Biehler var. *incana*—R; WHR; WM; (00581).

Scutellaria integrifolia L.—R; EHR; WM; (02338).

Scutellaria lateriflora L.—I; WHR, OCB; WM, BWM; (01265).

Scutellaria ovata Hill—R; OCB; BDF; (00656).

†*Scutellaria parvula* Michx. var. *parvula*—S; OCB; CG, CB; (01785).

†*Teucrium canadense* L.—I; OCB; BWM, BM, PAS; (03491).

Trichostema dichotomum L.—V; WHR; RB; (02860).

LAURACEAE

†*Lindera benzoin* (L.) Blume var. *benzoin*—O; ALL; RF, BRF, RIP, BRIP; (02977).

Lindera benzoin (L.) Blume var. *pubescens* (Palmer & Steyermark) Rehd. —R; OCB; BM; (03886).

†*Sassafras albidum* (Nutt.) Nees—O; ALL; OH, BDF, PAS, RB; (03657).

LINACEAE

Linum medium (Planch.) Britt. var. *texanum* (Planch.) Fern.—R; WHR; RB; (02741).

Linum striatum Walt.—I; HR; WM; (02795).

†*Linum virginianum* L.—R; WHR; RD, RB; (03686).

LOGANIACEAE

Mitreola petiolata (J.F.Gmel.) Torr. & Gray—R; EHR; FW; (02792).

Spigelia marilandica (L.) L.—O; ALL; RF, BRF, BDF, BO, RO; (00993).

LYTHRACEAE

Ammannia coccinea Rottb.—R; OCB; BWM; (05414).

Cuphea viscosissima Jacq.—S; OCB; LWM, CG, CB, BO; (02875).

Rotala ramosior (L.) Koehne—I; ALL; WM, BWM, RM, FP; (04079).

MAGNOLIACEAE

Liriodendron tulipifera L.—C; ALL; RF, BRF; (00136).

Magnolia acuminata (L.) L.—R; WHR; RF; (01755 VDB).

**Magnolia grandiflora* L.—R; OCB; LAW, RD; (06268).

†*Magnolia macrophylla* Michx.—R; HR; RF; (02121).

MALVACEAE

†*Hibiscus moscheutos* L. subsp. *moscheutos*—I; ALL; WM, RM, FW, BWM, BM; (01133).

**Hibiscus syriacus* L.—S; WHR, OCB; RF, RD, LAW; (06444).

**Hibiscus trionum* L.—V; OCB; CRP; (01339).

Malvastrum hispidum (Pursh.) Hochr.—R; OCB; CG; (05631).

*†*Sida spinosa* L.—O; ALL; PAS, DIS, RD, CG; (05482).

MELASTOMATACEAE

Rhexia mariana L. var. *interior* (Pennell) Kral & Bostick—R; HR; RM, FW; (02796 VDB).

Rhexia mariana L. var. *mariana*—S; EHR; WM; (02769).

Rhexia virginica L.—S; HR; WM, FW; (02704).

MENISPERMIACEAE

Calycocarpum lyonii (Pursh) Gray—S; OCB, WHR; BRIP, RF; (03734).

Cocculus carolinus (L.) DC.—O; OCB, WHR; BDF, BRF, RO, LKW, CG, RD; (01470).

†*Menispermum canadense* L.—I; WHR, OCB; RF, BRF; (03694).

MOLLUGINACEAE

Mollugo verticillata L.—I; OCB; CRP; (01177).

MONOTROPACEAE

Monotropa uniflora L.—V; WHR; RF; (02830).

MORACEAE

**Broussonetia papyrifera* (L.) L'Hér. ex Vent.—S; OCB; UT, BDF, RD, LAW; (05315).

**Maclura pomifera* (Raf.) Schneid.—O; OCB; PAS, BDF, LAW; (04106).

**Morus alba* L.—R; EHR, OCB; UT; (05016).

Morus rubra L.—O; ALL; BRF, BDF, BRIP, RIP, RF; (03875).

OLEACEAE

Chionanthus virginicus L.—S; WHR; OH, FW; (02794).

†*Forestiera ligustrina* (Michx.) Poir.—I; OCB; LKW, CG, CB, BDF, BO; (02873).

**Forsythia viridissima* Lindl.—R; OCB; LAW; (03033).

Fraxinus americana L.—F; ALL; RF, BRF, BDF, (05279).

†*Fraxinus pennsylvanica* Marsh.—O; ALL; BRIP, RIP, BM, RM, BWM, WM, FW; (00154).

†*Fraxinus quadrangulata* Michx.—I; OCB; LKW, CG, BDF, BO, BRF; (00653).

**Jasminum nudiflorum* Lindl.—R; OCB; RD; (01604).

**Ligustrum sinense* Lour.—C; ALL; BRIP, RIP, BRF, RF, BDF, LAW, LKW; (02198).

ONAGRACEAE

†*Circaea lutetiana* L. subsp. *canadensis* (L.) Aschers & Magnus—I; HR; RF; (00949).

†*Epilobium coloratum* Biehler—S; OCB, WHR; BWM, WM; (R. Kral 36940, VDB).

Ludwigia alternifolia L.—I; ALL; WM, RM, BWM, BM, AS; (02705).

Ludwigia decurrens Walt.—S; WHR, OCB; WM, BWM, FP, GB; (01330).

Ludwigia glandulosa Walt.—R; OCB; BWM; (05427).

Ludwigia linearis Walt.—V; EHR; WM; (02778).

Ludwigia palustris (L.) Ell.—O; ALL; RM, BM, WM, BWM, ST, FP; (01146).

**Ludwigia uruguayensis* (Camb.) H. Hara—V; WHR; ST; (06266).

Oenothera biennis L.—O; ALL; PAS, RD; (02919).

†*Oenothera laciniata* Hill—S; OCB; CG, DIS, RD, CRP; (01966).

**Oenothera speciosa* Nutt.—S; EHR, OCB; RD; (00558).

Oenothera triloba Nutt.—S; OCB; CG; (01779).

OROBANCHACEAE

Conopholis americana (L.) Wallr. f.—S; WHR, OCB; RF, BRF, LKW; (01787).

†*Epifagus virginiana* (L.) W. Bart.—S; WHR; RF; (01534).

OXALIDACEAE

Oxalis illinoensis Schwegm.—R; WHR; RF; (01929).

†*Oxalis priceae* Small subsp. *priceae*—S; OCB; CG; (01949).

Oxalis stricta L.—F; ALL; PAS, DIS, RD, LAW, RB, OH, BDF, GB; (02067).

†*Oxalis violacea* L.—I; OCB, WHR; CG, LKW, BO, RO; (01721).

PAPAVERACEAE

*Δ *Papaver dubium* L.—R; OCB; RD.

†*Sanguinaria canadensis* L.—O; ALL; RF, BRF; (01664).

Stylophorum diphyllum (Michx.) Nutt.—R; HR; RF; (01803).

PASSIFLORACEAE

†*Passiflora incarnata* L.—F; PAS, RD; (03747).

Passiflora lutea L.—S; WHR; RF; (01251).

PHYTOLACCACEAE

Phytolacca americana L. var. *americana*—F; ALL; PAS, RD; (00763).

PLANTAGINACEAE

Plantago aristata Michx.—R; WHR; PAS, RB; (01192).

**Plantago lanceolata* L.—F; ALL; PAS, LAW, RD; (00938).

Plantago rugelii Dcne.—F; ALL; PAS, LAW, RD; (00951).

Plantago virginica L.—I; WHR, OCB; RD, CG; (01901).

PLATANACEAE

Platanus occidentalis L.—C; ALL; BRIP, RIP, BM, BWM, RM, WM, FW; (04930).

PODOSTEMACEAE

Podostemum ceratophyllum Michx.—R; OCB; RIV, swift shallows; (03488).

POLEMONIACEAE

†*Phlox amoena* Sims—R; WHR; RB; (00351).

†*Phlox divaricata* L. subsp. *divaricata*—O; HR; RF, RIP; (01723).

†*Phlox glaberrima* L.—R; WHR; AS; (00956).
Phlox paniculata L.—R; WHR, OCB; RIP, RF, BRIP, RD; (03532).
Polemonium reptans L.—O; ALL; RF, BRF, RIP; (01734).

POLYGALACEAE

Polygala ambigua Nutt.—R; WHR; RB; (02742).
Polygala cruciata L.—V; EHR; WM; (06301).
Polygala incarnata L.—R; WHR; RB; (02853).
Polygala sanguinea L.—S; HR; WM, RM; (01148).

POLYGONACEAE

**Polygonum aviculare* L.—S; ALL; RD, GB; (02354).
*†*Polygonum caespitosum* Blume var. *longisetum* (de Bruyn) A. N. Steward—O; ALL; GB, ST, BRIP, RIP, RF, BRF, DIS, (03699).
**Polygonum cuspidatum* Seib. & Zucc.—R; OCB; UT; (06436).
*†*Polygonum hydropiper* L.—X; WHR; RM; (A. J. Sharp, E. Clebsch, & A. Clebsch 9822, TENN).
Polygonum hydropiperoides Michx.—I; ALL; WM, RM, BWM, BM, FW; (02760).
Polygonum lapathifolium L.—S; ALL; WM, BWM; (05162).
†*Polygonum pensylvanicum* L.—O; WHR, OCB; WM, BWM; (05463).
**Polygonum persicaria* L.—I; OCB; BWM, RD, DIS; (05168).
†*Polygonum punctatum* Ell.—I; EHR, OCB; WM, BWM; (03858).
Polygonum sagittatum L.—S; HR; WM; (01381).
†*Polygonum scandens* L.—S; WHR; RO; (06328).
Polygonum setaceum Baldw.—R; WHR; GB, ST; (01253).
†*Polygonum virginianum* L.—O; ALL; RF, BRF, BDF, LKW; (01127).
**Rumex acetosella* L.—I; ALL; PAS, RD; (01854).
Rumex altissimus Wood—I; ALL; BWM, BM, WM, RM; (02062).
**Rumex conglomeratus* Murr.—V; OCB; BWM; (06442).
**Rumex crispus* L. subsp. *crispus*—F; ALL; PAS, DIS, RD; (02204).
**Rumex obtusifolius* L.—R; WHR; RD; (02829).

PORTULACACEAE

†*Claytonia virginica* L.—O; ALL; RF, BRF, BDF; (01699).
†***Phemeranthus calcaricus*** (S. Ware) Kiger—R; OCB; CG; (03703).
**Portulaca oleracea* L.—I; OCB; CG, CRP, RD; (04102).

PRIMULACEAE

Dodecatheon meadia L.—R; WHR; RF; (03134 MTSU).
Lysimachia ciliata L.—R; WHR; RIP; (05294).
**Lysimachia nummularia* L.—S; OCB; BWM, BRIP; (02201).
Lysimachia quadrifolia L.—R; WHR; RF; (03679).
†*Samolus valerandi* L. subsp. *parviflorus* (Raf.) Hultén—S; WHR, OCB; CS, ST, GB; (03761).

PYROLACEAE

Chimaphila maculata (L.) Pursh—F; ALL; OH, BDF; (00231).

RANUNCULACEAE

†*Actaea pachypoda* Elliott—I; ALL; RF, BRF; (01807 APSC).
†*Anemone acutiloba* (DC.) G. Lawson—O; HR; RF; (00317).
Anemone americana (DC.) H. Hara—R; WHR; OH; (01633).
Anemone quinquefolia L. var. *quinquefolia*—R; WHR; RF; (03137).
†*Anemone virginiana* L.—I; WHR, OCB; RB, CG, CB, BDF; (01049).
†*Aquilegia canadensis* L.—I; ALL; BO, RO, LKW, CG; (00342).
Cimicifuga rubifolia Kearney—R; WHR; RF; (02912).
†*Clematis catesbyana* Pursh—R; OCB; CG, CB, BDF; (03252).
**Clematis terniflora* DC.—R; OCB; RD; (01341).
†*Clematis versicolor* Small ex Rydb.—R; OCB; BO, BDF; (06423).
Clematis viorna L.—R; WHR; RF; (04914).
Clematis virginiana L.—O; OCB, WHR; BRIP, RIP, RD; (01260).
**Consolida ajacis* (L.) Schur—V; OCB; LKW; (03645).
†*Delphinium tricorne* Michx.—I; OCB, WHR; BRF, RF, LKW; (01794).
Enemion biternatum Raf.—R; WHR; RF; (01696).
Hydrastis canadensis L.—S; WHR, OCB; RF, BRF; (01266).
†*Myosurus minimus* L.—R; OCB; PAS, CRP, RD; (E. Quarterman 5261, VDB).
†*Ranunculus abortivus* L.—O; ALL; BRIP, RIP, LAW, RD, PAS, FW, BRF, RF; (01669).
**Ranunculus bulbosus* L.—S; OCB; RD; (05837).

†*Ranunculus fascicularis* Muhl. ex Bigelow—S; OCB; CG, CB, LKW; (00343).

Ranunculus hispidus Michx. var. *hispidus*—I; WHR; RF, OH; (01865).

Ranunculus hispidus Michx. var. *nitidus* (Chapman) T. Duncan—S; EHR, OCB; WM, FW, BWM; (01668).

†*Ranunculus micranthus* Nutt.—S; OCB; LKW, BO; (01778).

*†*Ranunculus parviflorus* L.—V; OCB; RD; (R. Kral 64879, 2 May 1980, VDB).

Ranunculus pusillus Poir.—S; ALL; WM, BWM; (02054).

†*Ranunculus recurvatus* Poir.—I; HR; RF; (00602).

**Ranunculus sardous* Crantz—C; ALL; PAS, RD, LWM, CG; (00939 VDB).

†*Thalictrum dioicum* L.—R; WHR; RF, RO; (01868).

Thalictrum revolutum DC.—S; WHR, OCB; WM, BWM; (03865).

†*Thalictrum thalictroides* (L.) Eames & B. Boivin—F; ALL; RF, BRF, LKW; (01667).

RHAMNACEAE

Berchemia scandens (Hill) K. Koch—S; OCB, WHR; BRF, RF; (02128).

Ceanothus americanus L.—S; WHR; RB; (00232).

Frangula caroliniana (Walt.) Gray—O; ALL; BRF, BDF, LKW, RF, PAS, RD; (03646).

Rhamnus lanceolata Pursh.—R; OCB; LKW, CG; (02885).

ROSACEAE

Agrimonia parviflora Ait.—S; WHR, OCB; WM, BWM; (01132).

Agrimonia pubescens Wallr.—S; OCB; BDF; (01178).

†*Agrimonia rostellata* Wallr.—I; WHR; RF; (01262).

Amelanchier arborea (Michx. f.) Fern.—O; HR; OH, RB, FW; (00128).

Amelanchier canadensis (L.) Medik.—R; WHR; RB, OH: (02141).

**Chaenomales speciosa* (Sweet) Nakai—V; OCB; BDF (06273).

Crataegus calpodendron (Ehrh.) Medik.—S; WHR, OCB; RF, BRF; (01915).

Crataegus collina Chapm.—R; OCB, WHR; PAS; (03771).

Crataegus crus-galli L.—S; OCB, WHR; PAS, BDF, OH, RB; (03854).

Crataegus intricata Lange—O; ALL; PAS, RF, BRF, BDF; (02137).

Crataegus marshallii Egglest.—R; EHR; FW; (00552).

Crataegus pruinosa (Wendl. f.) K. Koch—R; OCB, WHR; PAS, BDF; (00226).

Crataegus spathulata Michx.—V; OCB; BDF; (s.n.).

**Duchesnea indica* (Andr.) Focke—F; ALL; PAS, RD, LAW; (05967).

Fragaria virginiana Duchesne—R; OCB; CG; (04458).

†*Geum canadense* Jacq.—I; WHR, OCB; RF, BRF, LKW; (00944).

†*Geum vernum* (Raf.) Torr. & Gray—R; OCB; BRF; (01975).

†*Geum virginianum* L.—X; OCB, WHR; densely wooded slopes; (H. K. Svenson 8811, TENN).

Malus angustifolia (Ait.) Michx.—S; HR; RB, OH, PAS; (01754).

**Malus pumila* P. Mill.—R; OCB; PAS, LAW; (00252).

Photinia melanocarpa (Michx.) Robertson & Phipps—R; HR; FW, RB; (03186).

Photinia pyrifolia (Lam.) Robertson & Phipps—I; HR; AS, RM, WM, FW; (01847).

Physocarpus opulifolius (L.) Maxim.—V; OCB; BO; (00836 APSC).

Porteranthus stipulatus (Muhl. ex Willd.) Britt.—S; WHR; OH, RB; (02251).

**Potentilla recta* L.—I; OCB; RD, PAS, CG, CB; (02099).

†*Potentilla simplex* Michx.—I; WHR; OH, RB; (01857); [Plants of cedar glades and cedar barrens in the county may belong to the variety *argyrisma* Fern. while plants from other habitats seem to belong to the typical variety].

Prunus americana Marsh.—O; ALL; BDF, BRF, RF, PAS, RD, CG; (01795).

†*Prunus angustifolia* Marsh.—O; OCB; PAS, RD, CG; (01320).

**Prunus caroliniana* Ait.—V; OCB; UT, RD; (00352).

**Prunus cerasifera* Ehrh.—R; OCB; PAS; (05409).

Prunus hortulana Bailey—R; OCB; RD; (01745).

*Δ *Prunus mahaleb* L.—R; OCB; BDF, LAW.

†*Prunus mexicana* S. Wats.—S; OCB; BDF, PAS; (00260 VDB).

Prunus munsoniana W. Wight & Hedrick—R; WHR; RD; (00248).

**Prunus persica* (L.) Batsch—I; ALL: RD, PAS, LAW; (06446).

Prunus serotina Ehrh.—F; ALL; BRF, RF, BDF, OH, PAS; (01791).

**Pyracantha fortuneana* (Maxim.) Li—V; OCB; PAS; (05632).

**Pyrus calleryana* Decne.—R; EHR; RD; (05424).

**Pyrus communis* L.—S; OCB; PAS, LAW; (05968).

Rosa carolina L.—S; OCB, WHR; CG, CB, RB; (02109).

**Rosa multiflora* Thunb. ex Murr.—F; ALL; PAS, BDF, BRF, RF, BRIP, RIP, RD; (05293).

Rosa setigera Michx.—O; OCB, WHR; BDF, PAS, RD, BWM; (03890).

Rubus alumnus Bailey—R; WHR; OH; (00032).

Rubus argutus Link—C; ALL; PAS, RD; (05410).

*Δ *Rubus bifrons* Vest ex Tratt—R; OCB; PAS, RD.

**Rubus discolor* Weihe & Nees—R; EHR; RD; (05425).

Rubus flagellaris Willd.—I; HR; RB, OH, PAS; (00398).

Rubus occidentalis L.—I; ALL: BRF, RF, BDF; (06445).

Rubus pensilvanicus Poir.—R; EHR; RF; (05405).

*Δ *Rubus phoenicolasius* Maxim.—V; OCB; BRF.

Rubus trivialis Michx.—R; OCB; RD; (01789).

**Spiraea prunifolia* Seib. & Zucc.—S; WHR, OCB; RD, LAW; (01700).

**Spiraea thunbergii* Seib.—R; OCB; CG, LAW: (01615).

RUBIACEAE

†*Cephalanthus occidentalis* L.—I; ALL; WM, RM, BWM, BM, FW, FP; (00764).

**Cruciata pedemontana* (Bellardi) Ehrend.—R; OCB; RD; (02195).

Diodia teres Walt.—O; ALL; PAS, RB, CB, CG, RD; (01190).

†*Diodia virginiana* L.—I; OCB, WHR; BWM, WM, PAS; (01143).

†*Galium aparine* L.—F; ALL; BRF, RF, LKW, PAS, RD, BRIP, RIP; (01961).

Galium circaezans Michx.—I; ALL; RF, BRF, LKW; (05147).

*†*Galium mollugo* L.—V; OCB; PAS; (R. Kral 64888, VDB).

Galium obtusum Bigelow—R; EHR; FW; (00554).

**Galium parisiense* L.—R; OCB; RD; (06439).

†*Galium pilosum* Ait.—I; WHR; RB, PAS; (00761).

Galium tinctorium L.—I; ALL; WM, BWM; (02833).

Galium triflorum Michx.—O; ALL; RF, BRF, LKW, RO, BO; (02451).

Houstonia caerulea L.—I; HR; OH; (00429).

Houstonia purpurea L. var. *calycosa* Gray—S; OCB; CG, CB; (03274).

Houstonia purpurea L. var. *purpurea*—I; ALL; RF, OH, BRF, BDF; (02126).

Houstonia pusilla Schoepf—S; OCB, WHR; PAS, CRP; (01635).

†*Mitchella repens* L.—S; HR; FW, OH; (05394).

*†*Sherardia arvensis* L.—I; OCB; PAS, LAW; (01939).

RUTACEAE

**Poncirus trifoliata* (L.) Raf.—S; OCB; PAS, BDF; (05835).

Ptelea trifoliata L.—R; OCB; BDF, BRIP; (03742).

SALICACEAE

**Populus alba* L.—S; WHR; RD, LAW; (03873).

*Δ *Populus* × *canescens* (Ait.) Sm.—V; OCB; PAS.

Populus deltoides Bartr. ex Marsh.—I; OCB; BRIP, BWM, BM, DIS; (01971).

*Δ *Populus nigra* L.—V; WHR; PAS.

Salix caroliniana Michx.—I; WHR, OCB; RIP, GB; (03749).

Salix humilis Marsh. var. *humilis*—R; WHR; RB; (01910).

Salix interior Rowlee.—I; OCB; BWM, BM, BRIP, GB, RD; (01948).

Salix nigra Marsh.—F; ALL; BRIP, RIP, BM, RM, BWM, WM, FP; (00160).

**Salix* × *sepulcralis* Simonkai—R; OCB; RD, BRIP; (05969).

Salix sericea Marsh.—R; WHR; WM, ST; (00066).

SAPINDACEAE

**Cardiospermum halicacabum* L.—S; OCB; BWM, PAS; (01201).

SAPOTACEAE

†*Sideroxylon lycioides* L.—I; OCB; BDF, LKW, CG, CB; (05633).

SAURURACEAE

Saururus cernuus L.—R; OCB, EHR; BM, BWM, FW; (03887).

SAXIFRAGACEAE

†*Heuchera americana* L. var. *americana*—S; WHR; RF; (02133).

†*Heuchera villosa* Michx.—O; ALL; RO, BO, LKW; (06281); [Giles County material is referable to var. *macrorhiza* (Small) Rosl, But. & Lak.].

Mitella diphylla L.—R; WHR; CS, RF; (01766).

†*Saxifraga virginiensis* Michx.—O; ALL; RO, BO, LKW, RF, BRF; (01622).

Tiarella cordifolia L. var. *collina* Wherry—O; HR; RF; (03135).

SCROPHULARIACEAE

Agalinis gattingeri (Small) Small—S; WHR; RB, OH; (02914).

Agalinis purpurea (L.) Pennell—R; EHR; WM, FW; (04184).

Aureolaria flava (L.) Farw.—I; WHR; OH; (02897).

Aureolaria pectinata (Nutt.) Pennell—S; WHR; RB, OH; (03683).

†*Aureolaria virginica* (L.) Pennell—R; EHR; FW, OH; (02798).

†*Chelone glabra* L.—I; WHR, OCB; WM, BWM, CS, AS, ST; (01302).

Dasistoma macrophylla (Nutt.) Raf.—S; WHR, OCB; RF, RD, BDF; (00935).

†*Gratiola neglecta* Torr.—S; EHR, OCB; WM, FW, BWM; (02059).

Gratiola pilosa Michx.—R; EHR; WM; (05020).

Gratiola virginiana L.—S; HR; FW, AS; (03190).

Leucospora multifida (Michx.) Nutt.—R; OCB; CRP; (05318).

Lindernia dubia (L.) Pennell var. *anagallidea* (Michx.) Cooperrider—V; WHR; RB, DIS; (06791).

Lindernia dubia (L.) Pennell var. *dubia*—S; EHR, OCB; WM, BWM; (05014).

Mecardonia acuminata (Walt.) Small var. *acuminata*—R; OCB; LWM, CG; (02893).

†*Mimulus alatus* Ait.—I; HR; WM; (05022).

**Paulownia tomentosa* (Thunb.) Sieb. & Zucc. ex Steud.—O; ALL; BRF, RF, RD; (05404).

Pedicularis canadensis L.—S; WHR; RF; (02131).

†*Penstemon calycosus* Small—I; OCB, WHR; PAS, RD, BRIP, BO; (02098).

†*Penstemon tenuiflorus* Pennell—R; OCB; CG, CB; (03269).

Scrophularia marilandica L.—R; OCB, WHR; BRF, RF; (05155).

**Verbascum blattaria* L.—I; OCB, PAS, CG, RD; (03639).

**Verbascum thapsus* L.—F; ALL; PAS, RD; (00965).

*†*Veronica agrestis* L.—R; OCB; CRP, RD; (00321).

Δ *Veronica anagallis-aquatica* L.—R; OCB; ST.

*†*Veronica arvensis* L.—I; ALL; RD, DIS, BDF; (01759).

**Veronica hederifolia* L.—R; WHR; RO; (01720).

**Veronica peregrina* L. subsp. *peregrina*—I; OCB, WHR; CRP, RD, DIS; (02093 APSC).

**Veronica persica* Poir.—R; OCB; RD, LAW; (04351).

**Veronica polita* Fries.—R; WHR; RD; (00122 VDB).

Veronicastrum virginicum (L.) Farw.—R; WHR; RB; (02707).

SIMAROUBACEAE

**Ailanthus altissima* (P. Mill.) Swingle—O; ALL; BRF, BDF, RF, RD; (05312).

SOLANACEAE

**Datura stramonium* L.—I; ALL: PAS, RD, DIS; (04128).

*Δ *Nicandra physalodes* (L.) Gaertn.—R; OCB; CRP.

Physalis angulata L.—I; OCB, WHR; CRP, DIS, RD; (01335).

Physalis heterophylla Nees—S; OCB; CG; (04921).

†*Physalis longifolia* Nutt. var. *subglabrata* (Mackenzie & Bush) Cronq.—I; OCB; RD, PAS; (01206).

Physalis virginiana Mill. var. *virginiana*—R; WHR; OH, RB; (02250).

Solanum carolinense L. var. *carolinense*—O; ALL; PAS, RD, DIS; (02312).

Solanum ptychanthum Dunal—S; WHR; RF, RB; (05290).

STAPHYLEACEAE

†*Staphylea trifolia* L.—F; ALL; RF, BRF, BRIP, RIP, LKW; (01526).

STYRACACEAE

Styrax americanus Lam.—R; EHR; FW; (02071).

Styrax grandifolius Ait.—S; WHR; OH; (02082).

THYMELAEACEAE

†*Dirca palustris* L.—I; WHR, OCB; RF, BRF; (02976).

TILIACEAE

†*Tilia americana* L. var. *americana*—I; ALL: RF, BRF; (03874).

†*Tilia americana* L. var. *heterophylla* (Vent.) Loud.—F; ALL; RF, BRF; (04900).

ULMACEAE

†*Celtis laevigata* Willd.—F; ALL; BDF, LKW, PAS, BRIP, RIP; (03709).

Celtis occidentalis L.—R; WHR; RIP; (02920).

Celtis tenuifolia Nutt.—R; OCB, WHR; LKW, CG, RB; (01388 VDB).

Ulmus alata Michx.—O; ALL; LKW, BDF, PAS, OH; (01618).

†*Ulmus americana* L.—I; ALL; BRIP, RIP, BDF; (00082).

*Δ *Ulmus pumila* L.—R; OCB; PAS, RD, LAW.

Ulmus rubra Muhl.—O; ALL; RF, BRF; (03765).

Ulmus serotina Sarg.—I; OCB, WHR; BRF, BDF, RF, PAS; (02921).

URTICACEAE

Boehmeria cylindrica (L.) Sw.—I; ALL: WM, RM, BWM, BM; (00942).

Laportea canadensis (L.) Weddell—I; ALL; RF, BRF, RIP, BRIP; (00941).

†*Parietaria pensylvanica* Muhl. ex Willd.—S; WHR; RF, RO; (04915).

†*Pilea pumila* (L.) Gray—I; ALL; RF, BRF, ST; (05167).

†*Urtica chamaedryoides* Pursh.—I; ALL; RF, BRF; (01799).

VALERIANACEAE

Valeriana pauciflora Michx.—R; WHR; RF; (01913).

*†*Valerianella locusta* (L.) Lat.—I; OCB; PAS, DIS; (04456).

†*Valerianella radiata* (L.) Dufr.—O; WHR, OCB; PAS, RD, RF; (02125 APSC).

†*Valerianella umbilicata* (Sullivant) Wood—I; OCB; CRP, RD, PAS, LWM; (04455).

VERBENACEAE

†*Callicarpa americana* L.—I; OCB; BDF, LKW; (03648).

Glandularia canadensis (L.) Nutt.—R; OCB; CG; (01704).

Phryma leptostachya L.—I; ALL; RF, BRF, BDF; (00667).

†*Phyla lanceolata* (Michx.) Greene—I; ALL; WM, BWM; (02832).

**Verbena brasiliensis* Vell.—R; OCB; PAS, BRIP; (03489).

Verbena hastata L.—R; WHR; WM, RM; (03753).

Verbena simplex Lehm.—O; OCB, WHR; CG, CB, PAS, BO, RD, RB; (02043).

Verbena urticifolia L.—I; OCB, WHR; PAS, RD; (00778).

VIOLACEAE

Hybanthus concolor (T. F. Forst) Spreng.—I; WHR; RF; (01763).

†*Viola bicolor* Pursh—O; ALL; RD, PAS, CRP; (00362).

Viola cucullata Ait.—I; WHR, OCB; CS, ST, WM, BWM; (00378).

Viola egglestonii Brainerd—R; OCB; CG; (01624).

Viola hirsutula Brainerd—S; WHR; OH; (03142).

†*Viola palmata* L.—I; ALL; BDF, RF, BRF, LKW; (02132).

Viola × *primulifolia* L.—R; WHR; RM; (00464).

†*Viola pubescens* Ait. var. *scabriuscula* Schwein. ex Torr. & Gray—O; ALL; BRF, RF; (00404 APSC).

Viola sagittata Ait.—R; WHR; RB; (03147).

†*Viola sororia* Willd.—O; RF, BRF, PAS, LAW, BRIP, RIP; (01695).

†*Viola striata* Ait.—I; ALL; RF, BRF, RIP, BRIP; (01797).

Viola tripartita Ell.—S; WHR; RF, OH; (02031); [Giles County material is referable to variety *glaberimma* (DC.) Harper].

Viola walteri House—R; OCB, WHR; BRF, RF; (03061).

VISCACEAE

Phoradendron leucarpum (Raf.) Reveal & M.C. Johnston—I; OCB; epiphytic on trees; (05675).

VITACEAE

***Ampelopsis arborea* (L.) Koehne—R; OCB; BWM; (05317).

†*Ampelopsis cordata* Michx.—I; OCB; BRIP; (05316).

Parthenocissus quinquefolia (L.) Planch.—F; ALL; RF, BRF, RIP, BRIP, LKW; (05305).

Vitis aestivalis Michx. var. *aestivalis*—O; ALL; OH, BDF; (02267).

Vitis cinerea (Engelm.) Millard var. *baileyana* (Munson) Comeaux—S; WHR; RF, RIP; (02266).

Vitis rotundifolia Michx.—O; ALL; OH, BDF; (00191).

†*Vitis vulpina* L.—F; OCB, WHR; BRIP, RIP, BWM; (05419).

ACKNOWLEDGMENTS

I would like to thank the following individuals for their assistance during this project. Eugene Wofford, curator of the University of Tennessee Herbarium, and Edward Chester, professor of biology at Austin Peay State University, served as mentors and offered helpful advice throughout the project. Claude Bailey, Roger McCoy, and David Lincicome of the Tennessee Natural Heritage Program deserve thanks for providing information concerning several rare species. Robert

Kral, curator of the Vanderbilt Herbarium at the Botanical Research Institute of Texas kindly verified several problematic specimens and loaned material for study, and Ed Schilling, professor of botany at the University of Tennessee, assisted with the identification of some specimens of *Helianthus*. Chris Fleming prepared the figure. Lastly, Eugene Wofford, Hal DeSelm, Edward Chester, Robert Kral, Joey Shaw, and two anonymous reviewers provided many helpful comments that improved the manuscript.

THE VASCULAR FLORA OF MONTGOMERY COUNTY, ARKANSAS

Travis D. Marsico[1]

University of Arkansas Herbarium (UARK)
Biomass Research Center 141
Fayetteville, Arkansas 72701, U.S.A.

ABSTRACT

A floristic inventory in Montgomery County, Arkansas, documented 1,110 vascular plant taxa. Fifty-nine taxa (5% of county total) in Montgomery County are considered to be of conservation concern and are tracked by the Arkansas Natural Heritage Commission. One hundred and thirty-four taxa (12% of county total) were introduced, 21 (2% of county total) of which are considered invasive. The families with the most taxa represented in the flora are Asteraceae (144), Poaceae (120), Cyperaceae (82), Fabaceae (75), and Rosaceae (38). *Elatine triandra* Schkuhr represents a species never before collected in Arkansas. A single federally endangered species, *Ptilimnium nodosum* (Rose) Mathias, was noted. *Hydrilla verticillata* (L.f.) Royle, a federally listed noxious weed was collected. Montgomery County has one of the highest proportions of sensitive species in Arkansas, but has fewer than 20% of the State's known alien species, probably due to its high diversity of rare habitats and a relatively intact landscape. With 1,110 taxa, Montgomery County is the sixth best-collected county in Arkansas. However, since most Arkansas counties have fewer than 800 documented taxa, there is a clear need for increased floristic work if the species that grow in Arkansas are to be known.

RESUMEN

Se llevó a cabo un inventario florístico en el condado de Montgomery, Arkansas, que proporcionó una lista de 1.110 taxa de plantas vasculares. Cincuenta y nueve taxa (5% del total) del condado de Montgomery son considerados raros y están siendo monitoreados por la Comisión Herencia Natural de Arkansas (Arkansas Natural Heritage Commission). Ciento treinta y cuatro taxa (12% del total del condado) son introducidos y 21 (2% del total del condado) son considerados especies invasoras. Las familias con un mayor número de taxa representados en la flora son Asteraceae (144), Poaceae (120), Cyperaceae (82), Fabaceae (75), y Rosaceae (38). *Elatine triandra* Schkuhr es una especie que fue colectada por primera vez en Arkansas. Fue encontrada una sola especie federal en peligro, *Ptilimnium nodosum* (Rose) Mathias. Se colectó *Hydrilla verticillata* (L. f.) Royle, una especie nociva federal mencionada. El condado de Montgomery tiene una de las más elevadas proporciones de especies sensibles de Arkansas, pero tiene menos del 20% de las especies introducidas en el estado, probablemente debido al gran número de hábitats raros y un paisaje relativamente intacto. Con 1.110 taxa, el condado de Montgomery es el sexto condado muestreado de Arkansas. Sin embargo, puesto que la mayoría de los condados de Arkansas tienen menos de 800 taxa documentados, hay una necesidad de más estudios florísticos con el fin de conocer las especies que crecen en Arkansas.

INTRODUCTION

Floristic studies have long provided botanists with baseline knowledge of plant species distribution and habitat preference, so proportionately more is known from locations that have had extensive inventories (Duncan 1953). Descriptive studies are needed before subsequent ecological endeavors can be conducted. No systematic inventory of the Ouachita Mountains' flora has been conducted to date with the exception of Hot Springs National Park (Palmer 1926; Scully 1937, 1941, 1942). In addition, certain areas of botanical interest in the Ouachitas (e.g., Rich Mountain, Mount Magazine, and Albert Pike) have received much attention by botanists, but very frequently for their charismatic plant species, and a comprehensive flora accompanied by vouchered specimens is lacking. This study is the first one of its scale in the physiographic region of the Ouachita Mountains of Arkansas.

Geography, Geology, and Soils

Montgomery County is located in west central Arkansas in the Central Ouachita Mountains (Fig. 1). The county covers 2,023 km^2 (781 mi^2), and is characterized by east-west trending ranges of the Ouachita Mountains, including the Fourche, Caddo, and Cossatot mountains. The Fourche Mountains are located in the northern part of the county. The central portion of the county consists of a large basin that contains the Ouachita and Caddo rivers. The Caddo Mountains are south of the basin, and southwest of the Caddo Mountains are the Cossatot Mountains. Elevation in Montgomery County ranges from a low of 149 m in the very southeast corner of the county along Sugarloaf Creek to a high of 673 m at Slatington Mountain in the southwest (490 to 2209 ft).

Geologically the area is old and the exposed rock and soils are varied. The oldest rock in the state, which dates from the Cambrian and lower Ordovician periods, is Collier Shale, which is partially exposed in Montgomery County (Braden 1999). The east-west geology of the Ouachita Mountains displays the rock in decreasing age both north and south of the center due to anticline folding during the Pennsylvanian Period.

All the sedimentary rocks in the Ouachita Mountains were deposited before the tectonic events of the late Pennsylvanian. Each rock type was deposited in a horizontal stratum, but was subsequently twisted and folded into its present shape (Palmer 1926). Thrust faulting and folding due to continental collision gave the Ouachita Mountains their compressed anticline/syncline deformation (Snider 1982). The Ouachita fold belt extends from southwest Alabama north through Arkansas, and southwest through Oklahoma, Texas, and into Mexico. The 2,100 km course of the Ouachitas is only exposed for 500 km (Flawn 1959). The rocks are shale, sandstone, quartzite, conglomerate, and novaculite (Palmer 1926). Novaculite, the slightly metamorphosed product of chert (Guccione 1993), is mined for high-quality whetstone in the area, and is interesting both geologically and

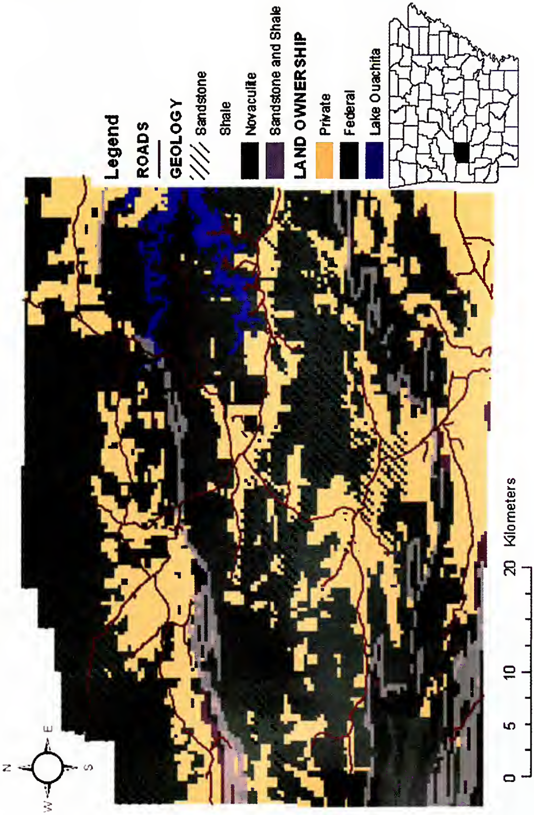

Fig. 1. Geology and land ownership in Montgomery County, Arkansas.

botanically. Additionally, novaculite glades are habitats unique to the Ouachita Mountains. Substantially due to its geology, Montgomery County is rich in regional endemics of both plants and animals. The area has a great diversity of habitats in close proximity to one another (Braun 1950) due to its rough and varied topography.

Soil orders in the region are Entisols and Ultisols. Entisols are young soils with little or no evidence of developed soil horizons. In the Ouachita Mountains they form in the vicinity of stream courses where erosion is extreme and equals or exceeds soil formation. Ultisols are old soils that form in warm, humid climates with a seasonal dry period under forest vegetation. Ultisols are the dominant soils in Montgomery County (Soil Survey Staff 1998, 1999). Soils in the area are commonly thin and in many places, including steep slopes and glades, the parent geologic material has far greater influence than that of the soil.

Climate

The climate of Montgomery County and the central Ouachita Mountains is broadly described as humid sub-tropical (Bailey 1995). The climate of the state of Arkansas is influenced by its latitude between 33 and 37 degrees north, the prevailing westerlies, polar fronts from the continent, and Gulf of Mexico moisture (Baldwin 1984). The following climate data were compiled from the National Oceanic and Atmospheric Administration (NOAA) observations collected in Mount Ida, Arkansas, in central Montgomery County, from 1931 through 2000, but represent 66 years of observation due to missing values from 1948, 1949, 1950, and 1954. The average annual high temperature is 23°C (73°F), the average annual low temperature is 8°C (47°F), and the overall average annual temperature is 15°C (60°F). Temperatures have ranged from an all-time high of 47°C (116°F) on August 10, 1936, to a low of -29°C (-21°F) on February 2, 1951. Even though extremes in precipitation or temperature occur, they are rare. The average hottest day for a given year is 39°C (103°F), but the most common value in the 66 years of data collection was 38°C (100°F). The average coldest temperature for a year is -15°C (5°F), and the most common value was -13°C (8°F). The average period without a freeze (growing-season) is typically between 200 and 240 days in the Ouachita Mountains province (USDA 1981).

The area receives some of the highest rainfall in Arkansas (Reinhold 1969) with an annual average of 141 cm (55 in.). The range of annual rainfall, however, is incredibly varied, with a maximum of 213 cm (84 in.) recorded in 1945 and a minimum of 83 cm (33 in.) recorded in 1936. The Ouachita Mountains are high enough to draw more rainfall from passing storm systems than other natural regions of Arkansas. Precipitation is seasonal with the spring months of March, April, and May commonly being wettest and typical dry times in July through September. Snow is limited in the region, and one out of every five years lacked snow entirely. The average annual snowfall for the area is 12 cm (5 in).

The greatest yearly snowfall recorded was 47 cm (19 in) in 1988. Ice storms are uncommon, but may be severe. In December 2000, an ice storm struck the region and dramatically opened the forest canopy. There were long-term changes in vegetation structure due to the severity of that storm.

Anthropogenic Influence

Montgomery County and the greater Ouachita Mountain region were occupied by early Americans in the Dalton cultural period in the early Holocene for hunting grounds and short-term settlements. There is evidence that even in rugged areas of the Cossatot Mountains by the late Caddo period (15th Century), hunting and gathering was supplemented by small plots of maize, beans, and squash (Early 2000). Although First Nations peoples mined and farmed small plots, their impact to the landscape in the area appears small compared to that after European settlement.

European descendants typically from Mississippi, Alabama, and Georgia settled in the Ouachita Mountains in the 19th Century. They were predominately of English or Scotch-Irish heritage, and lived subsistence lives with only small farms, often surrounded by virgin woodland (Smith 1986). When mechanized logging arrived in the Ouachitas around 1900, the vegetation began to change rapidly as large tracts of shortleaf pine timber were logged. Virtually no virgin timber remained by 1950. The Arkansas National Forest was set aside in 1907 (changed to the Ouachita National Forest in 1926). Sustained yield forestry began to replace "cut out and get out" practices in the 1920s, but as a valuable timber resource the areas within the Ouachita National Forest experienced heavy logging. In the 1970s Weyerhaeuser Company began intensively managing its stands as monocultures of loblolly pine. The Ouachita National Forest began to use even-age management as well (Smith 1986). Such management regimes are now unacceptable on public lands. It is important to note that although none of the land is in its pre-settlement state, and all of it is managed, the majority of Montgomery County retains the landscape's original character, and allows for a great number of native species to persist or thrive. The Ouachita National Forest and Montgomery County will likely keep their semi-natural character long into the future.

Ever since the warming and drying after the most recent ice age, plant communities in the region have experienced human induced fires. Though Euro-American settlers in the South were casual in their feelings toward fire, national policy prevented fire in an effort to prevent damage to property. However, U.S. Forest Service policy in the South had always contained provisions for allowing fire, and interest in using fire as a management tool increased (Pyne 1982). Currently, the Ouachita National Forest prescribes burns to limit potential for catastrophic fire and improve wildlife habitat (http://www.fs.fed.us/r8/ouachita/fire/fire_management%20.shtml).

Although ecosystem degradation by land management practices is always a concern, most of Montgomery County is in federal land holding, and ecosystem destruction from development is of little concern. A potential problem, now, and the second most important cause for the decline of imperiled species is the introduction of non-native, invasive species (Stein et al. 2000). Common exotic invasive species in Montgomery County include *Elaeagnus umbellata*, *Lespedeza cuneata*, *Ligustrum sinense*, *Lonicera japonica*, and *Microstegium vimineum*.

Ecological Systems

The Ecological Systems Database (NatureServe 2003) was used as a framework for classifying ten plant communities in Montgomery County. The communities are defined on a meso-scale, allowing for patterns of ecological variability while remaining recognizable to guide conservation and land managers' needs (Comer et al. 2003). NatureServe lacked anthropogenically managed or created communities that did not fall under the categories of "natural" or "semi-natural." These include easily recognizable areas such as pastures, roadsides, and abandoned pits or quarries. A distinct community dominated by *Pinus taeda* was not included for the Ouachita Mountains. The only natural community that was lacking from the published list was the Shale Glade Ecological System. Shale glades are important botanically in Montgomery County because they are areas where unique plant assemblages form and include species found nowhere else in the county.

(PIN) Ozark-Ouachita Shortleaf Pine-Oak Forest and Woodland.—The Ozark-Ouachita Shortleaf Pine-Oak Forest and Woodland covers the largest land area in Montgomery County. It is classified as a natural or semi-natural, vegetated, and upland matrix. The thread that ties this variable system together is the presence and often dominance of *Pinus echinata*. The hardwood components, dominated by various *Quercus* species, vary with slope, aspect, and moisture conditions (Dale & Ware 1999). There are other hardwood canopy species in the system such as *Carya* spp. and *Prunus serotina*, but they are less abundant than oaks. The canopy ranges from completely closed to more commonly open with as little as 40% canopy cover. The system covers a wide range of topography from level to steep slopes, most aspects, and is not tied to a specific topographic feature (e.g., streams) or geology. Understory species include *Vaccinium* spp., *Solidago* spp., *Monarda* spp., and *Schizachyrium scoparium* as dominants.

(LOB) Ouachita Mountain Planted Loblolly Pine Forest.—This ecological system is not listed by NatureServe (2003) for Montgomery County probably because *Pinus taeda* is thought to be exotic to the Ouachita Mountains. The loblolly pine system is similar to the shortleaf pine system in the Ouachitas except that it is dominated by *Pinus taeda* rather than *Pinus echinata*. The com-

munity is located only in the southeastern portion of the county where the topography is less rugged and slopes are less steep than in other areas. Common herbaceous species include *Asclepias variegata*, *Lactuca canadensis*, *Pseudognaphalium helleri*, *Clitoria mariana*, and *Rhexia mariana*. Except for its location in the Ouachita Mountains, the community matches closely the *Pinus taeda* forest alliance of the West Gulf Coastal Plain Pine-Hardwood Forest (NatureServe 2003). Sites in Montgomery County range from obvious plantations with trees in straight rows to a more natural system managed by fire. Although all sites may represent plantings in this area, the system (at least non-plantation sites) can follow the semi-natural classification of the Ozark-Ouachita Shortleaf Pine-Oak Forest and Woodland with a different dominant canopy species, or the West Gulf Coastal Plain Pine-Hardwood Forest in a more northern location.

(MES) Ozark-Ouachita Mesic Hardwood Forest.—The Ozark-Ouachita Mesic Hardwood Forest is classified as a natural or semi-natural vegetated upland small patch system. This community may be found on low, north-facing slopes and along river terraces in areas that are not distinctly riparian. *Quercus alba* and *Q. rubra* are common oak dominants, but the classic mesic species are *Fagus grandifolia* and *Acer barbatum*. *Tilia americana* is another canopy species, and *Asimina triloba* and *Magnolia tripetala* may be found in the understory. In the Crystal Campground area, the mesic forest includes a population of *Pinus strobus*, planted for timber in 1910, but subsequently naturalized, and it is the only reproducing population known in Arkansas. The herbaceous layer of this community contains a wide range of spring ephemeral species such as *Trillium recurvatum*, *Cypripedium kentuckiensis*, and *Podophyllum peltatum*. Mesic forest habitat provides greater moisture to vegetation thus supporting different species than the shortleaf pine-oak forest and woodland system.

(RIP) Ozark-Ouachita Riparian.—The Ozark-Ouachita Riparian community is variable in vegetation, but has one main topographic feature that ties the system together—streams. The system is classified as natural or semi-natural, vegetated, and upland. The spatial pattern is linear. Canopy species may vary, but typically include *Liquidambar styraciflua* and *Platanus occidentalis* as canopy dominants. *Acer* spp. and various *Quercus* spp. are also canopy species in the riparian ecosystem. *Betula nigra* occurs infrequently. The understory and shrub layers often consist of *Lindera benzoin*, *Alnus serrulata*, *Hamamelis vernalis*, *Carpinus caroliniana*, and *Ostrya virginiana*. The herbaceous layer is diverse and commonly consists of *Festuca subverticillata*, *Osmorhiza longistylis*, *Galium aparine*, *Viola pubescens*, and *Elymus virginicus*. Certain riparian sites also include the Ouachita Mountain endemic, *Hydrophyllum brownei*. The riparian system does not often include *Fagus grandifolia* in its canopy. The riparian zone in Montgomery County is typically found from the immediate riverbank through a system of periodically flash flooded terraces. The size of

the stream dictates the distance away from the stream that the riparian community is encountered. The substrate consists of soils that are rich and well-drained and often with abundant gravel.

(SEE) Ouachita Mountain Forested Seep.—The Ouachita Mountain Forested Seep community is characterized as a natural, small patch, vegetated wetland. All seepage areas have water coming from below the ground surface. Seeps may occur at the headwaters of streams or along riparian areas. They are saturated or very moist throughout the year. The canopy may be dominated by *Liquidambar styraciflua*, *Quercus alba*, *Acer rubrum*, and *Magnolia tripetala*, which is also common in the understory. The coverage of the canopy is variable from fully covered to quite open. However, due to the soft substrate, which allowed for easy uprooting, much of the canopy in many seeps in Montgomery County was dramatically opened by an ice storm in December 2000. Subcanopy species commonly encountered are *Magnolia tripetala*, *Ilex opaca*, *Carpinus caroliniana*, and *Corylus americana*. Aside from the saturated soil, the herbaceous layer provides a distinctive sign of a forested seep. Ferns are abundant and diverse and include *Osmunda cinnamomea*, *Osmunda regalis*, *Athyrium filix-femina*, *Onoclea sensibilis*, and others.

(NOV) Ouachita Novaculite Glade and Woodland.—The Ouachita Novaculite Glade and Woodland system is defined as a small patch of natural occurrence that is vegetated and upland. The diagnostic feature for the community is novaculite geology. The system is found from 450–640 m (1476–2100 ft.) in elevation and is a mosaic of open glades, outcrops, and woodlands. Dominant species include *Quercus stellata*, *Quercus marilandica*, *Quercus rubra*, and *Carya texana*. The endemic *Quercus acerifolia* is found only in this and the Ouachita Montane Oak Forest system. A common and often distinctive member in the subcanopy is *Ptelea trifoliata*. The herbaceous layer is dense with grass species including *Bromus* spp., *Danthonia spicata*, *Dichanthelium* spp., and *Schizachyrium scoparium*. *Ambrosia artemisiifolia*, *Helianthus divaricatus*, and *Helianthus hirsutus* are other common associates. Trees are often stunted and gnarly due to drought, fire, wind, and ice, all of which are thought to play important roles in the maintenance of this system.

The Ouachita Montane Oak Forest is a similar community to the Novaculite Glade system except that it lacks novaculite substrate. The inclusion of this system under the Novaculite heading is appropriate here because the montane oak forest has a limited extent in Montgomery County. It is only found in high-elevation areas in the northwest part of the county. Although the geology differs, vegetation is remarkably similar in both high-elevation communities, and does not warrant a separate community designation in Montgomery County.

(SHA) Ouachita Mountain Shale Glade.—The Ouachita Mountain Shale Glade community is characterized as a small to large patch, natural or semi-

natural vegetated, upland system. The soil is very thin and shale (the dominant substrate) is often exposed at the surface. This ecosystem is found on level or slightly sloped topography in the basin regions of the Ouachita Mountains. There is often no tree canopy associated with this system, but *Juniperus virginiana* and *Carya texana* have become common canopy species. There is little shrub layer, as the system is dominated by a diverse array of herbs and grasses. The shale substrate acts as a fragipan, creating very wet surface conditions in the early spring that dry throughout the summer, when the system appears nearly barren. This hydro-xeric phenomenon characterizes the shale glade. Herbaceous species include *Talinum calycinum* and *Dodecatheon meadia*, as well as many members of the Asteraceae including *Coreopsis grandiflora*, *Silphium laciniatum*, and *Solidago* spp.

(ROA) Ouachita Mountain Upland Herbaceous with Regular Interval Human-Induced Disturbance.—This community includes those habitats that are managed by, at minimum, yearly grazing or mowing: roadsides, roadside ditches, pastures, and cemeteries. These are linear, small patch, or large patch, anthropogenic upland vegetated systems. They are typically without a tree or shrub layer and consist mostly of grasses and other herbaceous species such as *Daucus carota*, *Bidens* spp., *Trifolium campestre*, *Paspalum* spp., *Lolium* spp., and *Tridens flavus*. The species growing in these habitats are adapted to full sun and a range of moisture conditions. Although not considered by NatureServe, this system is important to the categorization of the plant species in the Ouachita Mountains. Pastures and roadsides favor grass species, which tolerate mowing/grazing, serve as entry points and corridors for invasive species, represent novel habitat for natives, and make up a large land area.

(WEE) Ouachita Mountain Upland Herbaceous-Shrubby with Single Major Human-Induced Disturbance.—This community is common along abandoned Forest Service roadways, but also is used for any land not actively managed, such as abandoned lots, pits, or mines. It is a linear or small patch vegetated, upland anthropogenic system. Though much less important in terms of land area covered than Regular Interval Disturbance system, it is distinct from it. The main difference between the ecosystems is type of disturbance. The Regular Interval Disturbance system has regular, at least annual mechanical disturbance, whereas this weedy community begins with a single major disturbance only. After this usually vegetation-voiding initial event, colonization and succession occur undisturbed, unless aided by plantings to reduce erosion. This system is characterized by weedy or early successional herbaceous and shrub species and represents an ever-changing continuum from unvegetated bare ground to late successional stages. These habitats are abundant with non-native species such as *Ligustrum sinense* and *Lespedeza cuneata*. Other abundant early colonizers include *Ambrosia* spp. and *Acalypha virginica*.

(WET) Ouachita Mountain Human Created/Maintained Still Water Wetland and Gravel Bar.—This system is a variable system that includes anthropogenic lakes and ponds (none of which are natural in the Ouachita Mountain landscape), a beaver created upland marsh, and natural gravel bars of rivers and streams. These are wetland systems that can often be described as early successional. Regulated lakes and ponds in the region have a fluctuating shoreline allowing for wetland plant growth and colonization that follows the water level. Stream gravel bars, though natural, mimic this pattern due to rapid water level changes in streams and rivers. Gravel bars also experience vegetation-voiding disturbance during flash floods. These systems are dominated by a mix of wetland herbaceous and shrub species and weedy early successional plants. True aquatic species include *Nymphaea odorata*, *Potamogeton* spp., and *Utricularia gibba*. Examples of emergent or terrestrial species in this system are *Justicia americana*, *Xanthium strumarium*, and *Cleome hassleriana*. Richardson Bottoms, a beaver created upland marsh, though a unique community in the Ouachita Mountains, fits under this category for ecological system description.

METHODS

Voucher collections were made from August 2001 through October 2003. Several primary collecting sites were established by conducting pilot searches early in the study, reviewing topographic maps, and consulting Ouachita National Forest and Arkansas Natural Heritage Commission unpublished document accounts (Orzell 1985; Bates 1993; Robison & Marsh undated). The primary sites are representative of the diversity of habitats found within the political boundary of Montgomery County. At primary sites, collections were made in each phase (spring, summer, fall) of the growing season. Auxiliary sites were visited only once or twice throughout the study period.

Vouchers were collected according to standard collecting methodology, and material was compared to UARK specimens and keyed with pertinent floras (e.g., Radford et al. 1968; Smith 1994a; Diggs et al. 1999; Yatskievych 1999) for the majority of the identifications. A representative voucher specimen for each taxon was deposited at the University of Arkansas Herbarium (UARK). Specimens were assigned a community type from which they were collected in order to provide a high resolution of species distribution within Montgomery County.

After all collections were identified, Smith (1988) by way of the Texas A&M Bioinformatics Working Group website (http://www.csdl.tamu.edu/FLORA/cgi/kartesz_ar_ page_click?county=Montgomery) was consulted for species collected from Montgomery County by previous investigators. Taxa that were found on Smith's list that were not collected in the current field study (2001–2003) were noted. Subsequently, a search was conducted for the listed specimens. Identifications of specimens found at UARK were verified, and those at other herbaria were accepted as correctly identified without review. Collections made by E.L. Hardcastle, C.S. Reid, D.X Williams, and C.T. Witsell in Montgomery County since 1988 were also reviewed.

RESULTS

Plant collections resulted in 1,013 taxa at and below the species level, 474 genera, and 139 families. Further investigation led to the discovery of additional species collected by others for Montgomery County. These additions bring the total known taxa for Montgomery County to 1,110 species and subspecific assignations, 506 genera, and 143 families. The plant families with the greatest number of taxa are as follows: Asteraceae (144), Poaceae (120), Cyperaceae (82), Fabaceae (75), and Rosaceae (38). Forty-three taxa that had previously been reported from Montgomery County could not be supported by voucher specimens, and have subsequently been excluded from the flora. The specimens either never existed (a verbal report only), could not be found, or have been annotated as some other taxon.

Fieldwork resulted in the addition of one species not previously known to occur in Arkansas: *Elatine triandra* Schkuhr. *Elatine triandra* is native to the United States and the collection represents a range expansion from its known distribution. This wetland species was collected on the muddy shores of a recently constructed lake southwest of Mount Ida.

Fifty-nine of the 1,110 taxa in Montgomery County are tracked by the Arkansas Natural Heritage Commission. Species of special concern, therefore, make up 5% of the flora in Montgomery County. One population of the listed, federally endangered species *Ptilimnium nodosum* (Rose) Mathias was located. The voucher is a photograph (*T.D. Marsico 3247*, UARK), since a permit to collect endangered species was not obtained. The location of the population had been studied by Hardcastle and Williams (2000), and as stated in their report, thousands of individuals were observed.

Non-native species have recently gained the attention of land managers. One hundred and thirty-four (12%) taxa of the 1,110 of the Montgomery County flora are represented by species categorized as non-native. Of those, 21 are considered invasive. Montgomery County also contains a native invasive, *Baccharis halimifolia* L. Invasive status follows the working list from the Rare and Invasive Plants of Arkansas Conference (RIPAC) in October 2003 (Arkansas Native Plant Society 2003). One of the taxa collected is a federally listed noxious weed, *Hydrilla verticillata* (L.f.) Royle.

Collections made during the course of the study revealed that the riparian and roadside communities are home to the greatest number of species, whereas the planted loblolly pine forest, forested seeps, and shale glades had the fewest species. Also of note is the three communities with the greatest percentage of introduced taxa are those that are human created and/or dominated (Table 1).

TABLE 1. Summary of plant collections by community type in Montgomery County. Because only Marsico collections were assigned to a community, 1013 taxa are used in "total" calculations. Community codes are lob—Planted loblolly pine forest, mes—Mesic hardwood forest, nov—Novaculite glade and woodland and montane oak forest, pin—Shortleaf pine-oak forest and woodland, rip—Riparian, roa—Roadside, roadside ditch, pasture, and cemetery, see—Forested seep, sha—Shale glade, wee—Weedy areas such as abandoned ONF roadways, abandoned lots, pits, or mines, wet—Wetlands including lakes, ponds, mudflats, gravel bars, and a marsh.

	Number of Native Taxa (N)	**Number of Introduced Taxa (I)**	**Total Taxa (N+I)=T**	**Percent of County Total Marsico Collections (T/1013)*100**	**Percent in Habitat Introduced (I/T)*100**
LOB	91	4	95	9%	4%
MES	283	14	297	29%	5%
NOV	196	15	211	21%	8%
PIN	289	14	303	30%	5%
RIP	418	36	454	45%	9%
ROA	355	68	423	42%	19%
SEE	167	4	171	17%	2%
SHA	145	13	158	16%	9%
WEE	149	53	202	20%	36%
WET	330	46	376	37%	14%

DISCUSSION

The 1,110 taxa documented for Montgomery County places it sixth among the best collected counties of the state. While it is important to remember that botanical diversity relates to land area, topographic diversity, and land use practice, many places in the state of Arkansas are still not well known botanically. The best collected county is Washington with 1,355 taxa, and the worst is Woodruff with 347 (Smith 1994b). The top five best collected counties, except for Pulaski, are in the Ozark Plateaus Natural Division. All counties in Arkansas that have had systematic botanical inventories conducted have over 900 known taxa; therefore, it is probable that all counties in the state have this potential. Still, 65% of Arkansas counties have fewer than 800 documented taxa. This underscores the need for increased floristic work if the flora of Arkansas is to be fully understood.

With 59 species of special concern, Montgomery County has one of the highest proportions of sensitive plant species in Arkansas. When combined with animals, the Ouachita Mountains have a high level of endemism (Robison & Allen 1995). Contributing to the diversity, Montgomery County contains disjunct species from the Ozark Plateaus and the nearby Gulf Coastal Plain. Also, shale and novaculite glades, forested seeps, and mesic and riparian communities are hot-spots for rare species. The high number of rare habitats provides adequate conditions for the plants that are specific for those habitats.

After habitat destruction, alien or introduced species are the second-greatest threat to imperiled species (Stein et al. 2000). Montgomery County has fewer than 20% of the known alien species in Arkansas, but over one-third of the total native species known to occur in the state. While the flora of Arkansas is comprised of about 24% non-native taxa (Arkansas Vascular Flora Committee, pers. comm.), Montgomery County has only half that (12%). One possible reason for this difference is the relatively intact landscape of Montgomery County. Even though anthropogenic influence has been pronounced, human activities have not prevented the landscape from retaining many of its original qualities. For example, where there was once pine-dominated forest, this system remains today. Human population remains low, and agriculture is not a prominent force. In contrast, the state of Missouri has seen its numbers of introduced taxa increase by 35% from the early 1960s through the late 1990s. This is at least partially attributable to unprecedented environmental changes including a highly and continually disturbed landscape, favoring the predominate annual and biennial habit of introduced taxa (Yatskievych 1999). Therefore, it is not surprising that the vast majority of introduced species in Montgomery County are found in the three main human created or dominated landscapes of roadsides, wet areas, and abandoned roadways or lots. Over one-third of the introduced taxa collected in this study were gathered from the community classified as "weedy areas," which by definition would include a high number of weeds.

Overall, roadside and riparian habitats include the highest diversity of species in Montgomery County. This is due primarily to the widespread nature of each of these communities in a linear system. While roadsides and streamsides do not amount to a majority of the Montgomery County landscape, they cut through all other communities, allowing for high numbers of species exclusive to those communities alongside species that spill out from other communities. The planted loblolly pine forest, novaculite and shale glades, and forested seeps have the lowest overall diversity simply due to the very low amount of land area each covers in the county.

ANNOTATED CHECKLIST OF VASCULAR PLANT TAXA

Taxa below all represent vouchers from Montgomery County, Arkansas. They are listed alphabetically by family, then alphabetically by genus, specfic epithet, and subspecific designation where appropriate. For all vouchers collected by T.D. Marsico, following the Latin name is a collection number corresponding to a specimen deposited at UARK, the habitat codes for where the taxa were collected, whether the taxa are native (N) or introduced (I), and any other special designation such as a species of special concern (SC) or invasive (**I***). Taxa listed that were not collected by the author have the Latin name followed by the collector of the voucher, his/her collection number, the herbarium in which the voucher is located, and its status as native or introduced. Habitat codes are as follows: **lob**—Planted loblolly pine forest, **mes**—Mesic hardwood forest, **nov**—Novaculite glade and woodland and montane oak forest, **pin**—Shortleaf pine-oak forest and woodland, **rip**—Riparian, **roa**—Roadside, roadside ditch, pasture, and cemetery, **see**—Forested seep, **sha**—Shale glade, **wee**—Weedy areas such as abandoned ONF roadways, abandoned lots, pits, or mines, **wet**—Wetlands including lakes, ponds, mudflats, gravel bars, and a marsh. All nomenclature follows The PLANTS Database (USDA, NRCS 2004).

ACANTHACEAE

Dicliptera brachiata (Pursh) Spreng., 4626, rip, N
Justicia americana (L.) Vahl, 3138, pin, rip, roa, wet, N
Ruellia humilis Nutt., 2642, nov, roa, sha, N
Ruellia pedunculata Torr. ex Gray ssp. *pedunculata*, 2405, pin, wet, N
Ruellia strepens L., 4250, rip, see, N

ACERACEAE

Acer barbatum Michx., 834, mes, N
Acer leucoderme Small, 2754, nov, N, SC
Acer negundo L., 3261, rip, roa, wee, N
Acer rubrum L. var. *drummondii* (Hook. & Arn. ex Nutt.) Sarg., 4955, pin, rip, wet, N
Acer rubrum L. var. *rubrum*, 5053, lob, mes, pin, rip, roa, see, wet, N
Acer saccharinum L., 3135, rip, wet, N
Acer saccharum Marsh. var. *saccharum*, 5692, nov, rip, N

AGAVACEAE

Manfreda virginica (L.) Salisb. ex Rose, 3742, nov, roa, sha, N
Yucca arkansana Trel., 4994, pin, roa, N

Alismataceae

Alisma subcordatum Raf., 5539, roa, wet, N
Echinodorus cordifolius (L.) Griseb., 3295, wet, N
Sagittaria graminea Michx. var. *graminea*, 5485, rip, wet, N
Sagittaria latifolia Willd., 4027, roa, N
Sagittaria platyphylla (Engelm.) J.G. Sm., 5771, wet, N

Amaranthaceae

Amaranthus retroflexus L., R. D. Thomas, 131846, NLU, I
Amaranthus spinosus L., 4414, wet, N
Iresine rhizomatosa Standl., 3877, rip, wee, N

Anacardiaceae

Rhus aromatica Ait. var. *aromatica*, 3947, nov, pin, roa, sha, N
Rhus copallinum L., 5997, nov, pin, roa, wee, N
Rhus glabra L., 5534, pin, roa, wee, N
Toxicodendron pubescens P. Mill., 5061, pin, N
Toxicodendron radicans (L.) Kuntze, 2651, lob, mes, nov, pin, rip, roa, see, N

Annonaceae

Asimina triloba (L.) Dunal, 5447, mes, nov, rip, N

Apiaceae

Chaerophyllum procumbens (L.) Crantz var. *procumbens*, 4727, mes, nov, rip, roa, wee, wet, N
Chaerophyllum tainturieri Hook. var. *tainturieri*, 4699, mes, roa, N
Cicuta maculata L., 2308, rip, roa, N
Cryptotaenia canadensis (L.) DC., 5456, mes, pin, rip, see, wet, N
Daucus carota L., 5105, roa, wee, wet, I
Erigenia bulbosa (Michx.) Nutt., 540, rip, N
Eryngium prostratum Nutt. ex DC., 5473, lob, rip, roa, wet, N
Eryngium yuccifolium Michx., 3580, rip, roa, N
Hydrocotyle prolifera Kellogg, 4068, rip, wet, N
Hydrocotyle verticillata Thunb. var. *verticillata*, 3890, rip, N
Osmorhiza longistylis (Torr.) DC., 1626, mes, nov, rip, see, N
Oxypolis rigidior (L.) Raf., 3572, mes, pin, rip, N
Ptilimnium capillaceum (Michx.) Raf., 5478, wet, N
Ptilimnium nodosum (Rose) Mathias, 3247, wet, N, SC, Federally Endangered
Ptilimnium nuttallii (DC.) Britt., 2562, pin, sha, wee, wet, N
Sanicula canadensis L., 5503, lob, mes, nov, pin, rip, see, sha, wet, N
Sanicula odorata (Raf.) K.M. Pryer & L.R. Phillippe, 1718, mes, rip, N
Sanicula smallii Bickn., 1603, mes, N, SC
Spermolepis inermis (Nutt. ex DC.) Mathias & Constance, 2601, wee, N

Taenidia integerrima (L.) Drude, 1744, mes, rip, N
Thaspium barbinode (Michx.) Nutt., 3436, mes, rip, N
Thaspium trifoliatum (L.) Gray, 2514, mes, rip, see, N
Torilis arvensis (Huds.) Link, 2590, pin, wee, I
Trepocarpus aethusae Nutt. ex DC., 5452, pin, rip, wee, wet, N
Zizia aurea (L.) W.D.J. Koch, 4984, pin, rip, roa, wet, N

Apocynaceae

Amsonia ciliata Walt. var. *ciliata*, E. Sundell, 11139, UAM, N
Amsonia hubrichtii Woods., 3153, rip, sha, wet, N, SC
Amsonia tabernaemontana Walt., 4861, mes, nov, N
Apocynum cannabinum L., 5533, roa, N
Trachelospermum difforme (Walt.) Gray, 5521, lob, pin, rip, roa, sha, wee, wet, N
Vinca major L., 4762, pin, roa, I*

Aquifoliaceae

Ilex ambigua (Michx.) Torr., 3485, mes, N
Ilex decidua Walt., 3041, rip, roa, N
Ilex longipes Chapman ex Trel., 3484, mes, rip, N, SC
Ilex opaca Ait. var. *opaca*, 5467.5, mes, rip, see, N
Ilex vomitoria Ait., 5733, lob, mes, nov, pin, N

Araceae

Arisaema dracontium (L.) Schott, 5506, rip, wet, N
Arisaema triphyllum (L.) Schott, 1831, mes, rip, see, N

Araliaceae

Aralia spinosa L., 4197, mes, wee, N

Aristolochiaceae

Aristolochia serpentaria L., 3350, mes, pin, N
Aristolochia tomentosa Sims, 5597, rip, N
Asarum canadense L., 1495, rip, N

Asclepiadaceae

Asclepias longifolia Michx., 2392, sha, N
Asclepias quadrifolia Jacq., 1602, mes, pin, see, N
Asclepias tuberosa L. ssp. *interior* Woods., 2248, nov, roa, sha, N
Asclepias variegata L., 5492, lob, mes, pin, roa, see, N
Asclepias verticillata L., 3188, nov, roa, N
Matelea baldwyniana (Sweet) Woods., 2748, nov, rip, roa, sha, N
Matelea decipiens (Alexander) Woods., 334, mes, N
Matelea gonocarpos (Walt.) Shinners, 2360, rip, N

Aspleniaceae

Asplenium platyneuron (L.) B.S.P., 5509, lob, mes, nov, pin, rip, roa, sha, wee, N
Asplenium bradleyi D.C. Eat., R. D. Thomas, 100549, UARK, N
Asplenium trichomanes L., J. L. Roberts, 254, UARK, N

Asteraceae

Achillea millefolium L., 2394, roa, sha, N
Ageratina altissima (L.) King & H.E. Robins. var. *altissima*, 4534, mes, nov, pin, rip, N
Ambrosia artemisiifolia L., 4109, nov, pin, roa, wee, N
Ambrosia bidentata Michx., 4287, roa, wee, N
Ambrosia trifida L., 4161, rip, roa, wee, N
Antennaria parlinii Fern. ssp. *fallax* (Greene) Bayer & Stebbins, 984, pin, N
Antennaria parlinii Fern. ssp. *parlinii*, 717, mes, N
Antennaria plantaginifolia (L.) Richards., 4670, mes, nov, pin, rip, sha, N
Arnoglossum plantagineum Raf., 2395, pin, roa, sha, N
Astranthium integrifolium (Michx.) Nutt., 1544, rip, roa, wee, N
Baccharis halimifolia L., 5130, mes, roa, wet, N*
Bidens aristosa (Michx.) Britt., 4081, nov, pin, rip, roa, wee, wet, N
Bidens bipinnata L., J. E. Moore, 3347, UCAC, N
Bidens discoidea (Torr. & Gray) Britt., 6044, roa, N
Bidens frondosa L., 4604, roa, wet, N

Boraginaceae

Cynoglossum amabile Stapf & Drummond, Mrs. J. Miller, 179, UARK, I
Cynoglossum virginianum L., 1694, mes, see, N
Hackelia virginiana (L.) I.M. Johnston, D.M. Moore, 430153, UARK, N
Heliotropium indicum L., 4070, rip, wet, I
Lithospermum latifolium Michx., 4942, rip, N
Myosotis verna Nutt., 5038, mes, rip, see, wet, N
Onosmodium molle Michx. ssp. *subsetosum* (Mackenzie & Bush) Cochrane, 4401, nov, N

Brassicaceae

Arabis canadensis L., 2361, sha, N
Arabis laevigata (Muhl. ex Willd.) Poir. var. *laevigata*, 1812, rip, N
Arabis missouriensis Greene, 1657, mes, nov, pin, rip, roa, wet, N
Barbarea verna (P. Mill.) Aschers., 1295, pin, rip, roa, I
Brassica rapa L., 769, roa, I
Cardamine angustata O.E. Schultz, 576, rip, see, N, SC
Cardamine bulbosa (Schreb. ex Muhl.) B.S.P., W. Butler, 28, UCAC, N
Cardamine concatenata (Michx.) Sw., 619, mes, pin, rip, see, sha, N
Cardamine hirsuta L., 688, mes, rip, roa, see, sha, wet, I
Cardamine parviflora L. var. *arenicola* (Britt.) O.E. Schultz, M. C. Black, 44, UARK, N
Cardamine pensylvanica Muhl. ex Willd., 4713, wet, N
Draba aprica Beadle, E. Sundell, 11143, UAM, N, SC
Lepidium virginicum L. var. *medium* (Greene) C.L. Hitchc., 2179, roa, wee, N
Lepidium virginicum L. var. *virginicum*, 2570, rip, roa, wee, wet, N
Rorippa nasturtium-aquaticum (L.) Hayek, C. Reid, 1961, UARK, N
Rorippa palustris (L.) Bess. ssp. *fernaldiana* (Butters & Abbe) Jonsell, 4819, roa, wet, N
Selenia aurea Nutt., 696, sha, wet, N
Streptanthus maculatus Nutt ssp. *obtusifolius* (Hook.) Rollins, 5699, nov, N, SC

Buddlejaceae

Polypremum procumbens L., 3297, wet, N

Cabombaceae

Brasenia schreberi J.F. Gmel., 5021, wet, N

Cactaceae

Opuntia humifusa (Raf.) Raf. var. *humifusa*, 2362, nov, roa, sha, N

Callitrichaceae

Callitriche heterophylla Pursh ssp. *heterophylla*, 5031, mes, pin, roa, sha, wet, N

Campanulaceae

Campanulastrum americanum (L.) Small, 3643, mes, nov, rip, N
Lobelia appendiculata A. DC., 5069, lob, pin, roa, N
Lobelia cardinalis L., 4264, rip, roa, see, wet, N
Lobelia inflata L., 3454, mes, rip, wee, N
Lobelia puberula Michx., 6028, lob, mes, pin, roa, wee, wet, N
Lobelia siphilitica L., 4467, roa, N
Lobelia spicata Lam., 2374, lob, pin, rip, sha, N
Triodanis lamprosperma McVaugh, 1903, nov, pin, roa, sha, wee, wet, N

Triodanis leptocarpa (Nutt.) Nieuwl., 1760, sha, N
Triodanis perfoliata (L.) Nieuwl. var. *biflora* (Ruiz & Pavon) Bradley, 2220, roa, wet, N
Triodanis perfoliata (L.) Nieuwl. var. *perfoliata*, 2011, nov, pin, rip, roa, wet, N

Capparaceae

Cleome hassleriana Chod., 3866, wet, I
Polanisia dodecandra (L.) DC., G. E. Tucker, 5297, APCR, N

Caprifoliaceae

Lonicera flava Sims, Mrs. J. Miller, 63, UARK, N
Lonicera japonica Thunb., 1673, mes, rip, see, wee, wet, **I***
Lonicera sempervirens L., 993, lob, mes, nov, rip, roa, sha, N
Sambucus nigra L. ssp. *canadensis* (L.) R. Bolli, 5525, mes, rip, roa, wee, wet, N
Symphoricarpos orbiculatus Moench, 3637, nov, pin, rip, roa, N
Viburnum nudum L., 2446, see, N
Viburnum prunifolium L., 1134, pin, N
Viburnum rafinesquianum J.A. Schultes, 1026, mes, N
Viburnum rufidulum Raf., 2010, mes, nov, pin, roa, N

Caryophyllaceae

Arenaria serpyllifolia L., 4781, wee, I
Cerastium glomeratum Thuill., 759, mes, rip, roa, wee, wet, I
Dianthus armeria L., 5490, nov, roa, sha, wee, I
Minuartia muscorum (Fassett) Rabeler, 2331, rip, roa, sha, N
Paronychia fastigiata (Raf.) Fern. var. *fastigiata*, J. E. Moore, 3088, UCAC, N
Saponaria officinalis L., 3440, wet, I
Silene stellata (L.) Ait.f., 3259, nov, pin, rip, roa, see, N
Silene virginica L., 1282, mes, nov, pin, rip, roa, N
Stellaria media (L.) Vill. ssp. *media*, 881, mes, nov, pin, rip, wee, wet, I
Stellaria media (L.) Vill. ssp. *pallida* (Dumort.) Aschers. & Graebn., 686, roa, wet, I

Celastraceae

Euonymus americana L., 1792, mes, rip, N

Ceratophyllaceae

Ceratophyllum demersum L., 5486, wet, N

Chenopodiaceae

Chenopodium ambrosioides L., 4416, rip, wet, I
Chenopodium standleyanum Aellen, 4404, nov, N

Cistaceae

Lechea mucronata Raf., 3677, lob, N
Lechea tenuifolia Michx., 1296, roa, sha, wee, wet, N

Clusiaceae

Hypericum drummondii (Grev. & Hook.) Torr. & Gray, 3554, pin, roa, sha, wee, wet, N
Hypericum gentianoides (L.) B.S.P., 3617, nov, pin, roa, N
Hypericum gymnanthum Engelm. & Gray, 3242, roa, N
Hypericum hypericoides (L.) Crantz, 3748, nov, pin, rip, roa, wee, wet, N
Hypericum lobocarpum Gattinger, 3285, rip, N
Hypericum mutilum L., 5736, rip, roa, see, wet, N
Hypericum prolificum L., 3185, mes, pin, rip, roa, sha, wet, N
Hypericum pseudomaculatum Bush, 2267, nov, sha, wee, wet, N
Hypericum punctatum Lam., 3284, mes, nov, rip, roa, wee, wet, N
Triadenum walteri (J.G. Gmel.) Gleason, 4305, wet, N

Commelinaceae

Commelina communis L. var. *communis*, 2587, mes, rip, wee, wet, I
Commelina diffusa Burm. f., 4611, wet, N
Commelina erecta L. 3559, rip, wee, wet, N
Commelina virginica L., 5738, rip, see, wet, N
Murdannia keisak (Hassk.) Hand.-Mazz., 4408, wet, **I***
Tradescantia bracteata Small ex Britt., 2415, pin, N
Tradescantia ernestiana E.S., Anderson & Woods., 998, mes, rip, roa, wet, N
Tradescantia hirsuticaulis Small, 4809, nov, pin, roa, wet, N
Tradescantia hirsutiflora Bush, 2586, nov, wee, N
Tradescantia longipes E.S. Anderson & Woods., 694, sha, N, SC
Tradescantia occidentalis (Britt.) Smyth, 2679, lob, mes, wet, N
Tradescantia ohiensis Raf., 5052, mes, nov, rip, roa, wee, wet, N
Tradescantia ozarkana E.S. Anderson & Woods., R. Kirkwood, K-26, UCAC, N, SC

Convolvulaceae

Ipomoea hederacea Jacq., 4630, rip, I

Ipomoea lacunosa L., 3855, rip, wee, wet, N
Ipomoea pandurata (L.) G.F.W. Mey., 3147, mes, rip, roa, wet, N

Cornaceae

Cornus drummondii C.A. Mey., 1575, rip, N
Cornus florida L., 2230, mes, nov, pin, rip, roa, see, N
Cornus foemina P. Mill., 5763, rip, wet, N
Cornus obliqua Raf., 2089, mes, pin, rip, roa, N

Crassulaceae

Penthorum sedoides L., 5767, lob, see, wet, N
Sedum nuttallianum Raf., J. L. Roberts, 277, UARK, N
Sedum pulchellum Michx., 1757, sha, N
Sedum ternatum Michx., 778, mes, rip, N, SC

Cucurbitaceae

Melothria pendula L., 3590, rip, roa, N
Sicyos angulatus L., 4115, roa, wee, N

Cupressaceae

Juniperus virginiana L. var. *virginiana*, 5504, nov, pin, roa, sha, wet, N

Cuscutaceae

Cuscuta compacta Juss. ex Choisy, 4005, rip, roa, see, wet, N
Cuscuta cuspidata Engelm., E. B. Smith, 3370, UARK, N
Cuscuta gronovii Willd. ex J.A. Schultes, 6020, roa, wee, N
Cuscuta indecora Choisy, 4226, wee, N
Cuscuta pentagona Engelm., 6022, rip, sha, roa, wet, N
Cuscuta polygonorum Engelm., 3642, nov, N

Cyperaceae

Bulbosytlis capillaris (L.) Kunth ex C.B. Clarke, 220, sha, N, SC
Carex albicans Willd. ex Spreng. var. *albicans*, 770, rip, N
Carex albolutescens Schwein., 2393, sha, N
Carex amphibola Steud., 1588, mes, rip, see, N
Carex blanda Dewey, 1476, mes, rip, wet, N
Carex bushii Mackenzie, 2372, roa, sha, N
Carex caroliniana Schwein., 5179, wet, N
Carex cephalophora Muhl. ex Willd., 2098, mes, nov, pin, rip, roa, see, N
Carex cherokeensis Schwein., 4714, mes, rip, wet, N
Carex complanata Torr. & Hook., 2160, lob, pin, rip, wet, N
Carex crinita Lam., 4967, mes, rip, see, wet, N
Carex davisii Schwein. & Torr., 1632, mes, N, SC
Carex debilis Michx. var. *debilis*, 1652, mes, N
Carex digitalis Willd., C. T. Bryson, 4344, UARK, N
Carex festucacea Schkuhr ex Willd., 2542, rip, see, wet, N
Carex flaccosperma Dewey, 5469, pin, rip, roa, wet, N
Carex frankii Kunth, 5481, mes, pin, rip, roa, see, wee, wet, N
Carex glaucodea Tuckerman ex Olney, 5087, pin, roa, wet, N
Carex granularis Muhl. ex Willd. var. *granularis*, 5111, roa, N
Carex grayi Carey, 3603, rip, N
Carex hirsutella Mackenzie, 2100, mes, nov, pin, roa, sha, wet, N
Carex intumescens Rudge, 4958, rip, wet, N
Carex jamesii Schwein., P. E. Hyatt, 6937, UARK, N
Carex joorii Bailey, 3898, rip, N
Carex laevivaginata (Kukenth.) Mackenzie, J. H. Rettig, 540, UARK, N, SC
Carex latebracteata Waterfall, 5002, pin, sha, N, SC
Carex laxiculmis Schwein., P. E. Hyatt, 7329, UARK, N, SC
Carex laxiflora Lam., J. H. Rettig, 560, BRIT, N, SC
Carex leavenworthii Dewey, 1548, rip, roa, N
Carex leptalea Wahlenb., 2444, see, N
Carex lupulina Muhl. ex Willd., 4959, rip, wet, N
Carex lurida Wahlenb., 5460, mes, pin, rip, roa, see, wet, N
Carex muehlenbergii Schkuhr ex Willd., 3089, mes, nov, pin, roa, sha, N
Carex nigromarginata Schwein., 762, mes, pin, roa, N
Carex oklahomensis Mackenzie, 2384, rip, roa, sha, N
Carex oligocarpa Schkuhr ex Willd., 1435, rip, N
Carex ouachitana Kral, Manhart & Bryson, 2791, mes, N
Carex oxylepis Torr. & Hook. var. *oxylepis*, 2417, mes, pin, roa, N
Carex oxylepis Torr. & Hook. var. *pubescens* J.K. Underwood, 1076, mes, see, N, SC
Carex retroflexa Muhl. ex Willd., 1513, mes, rip, see, N
Carex rosea Schkuhr ex Willd., 2437, mes, rip, see, N
Carex squarrosa L., 5172, pin, N
Carex stricta Lam., E. B. Smith, 3801, BRIT, N, SC

Carex swanii (Fern.) Mackenzie, 2739, nov, N, SC
Carex texensis (Torr.) Bailey, 1499, rip, N
Carex torta Boott ex Tuckerman, 1097, mes, rip, see, N, SC
Carex tribuloides Wahlenb., 5494, wet, N
Carex vulpinoidea Michx., 5475, lob, mes, nov, pin, rip, roa, see, wet, N
Cyperus aristatus Rottb., E. Sundell, 10606, UARK, N
Cyperus echinatus (L.) Wood, 2066, pin, wee, N
Cyperus erythrorhizos Muhl., 4482, wet, N
Cyperus esculentus L., 436, wee, wet, N
Cyperus flavescens L., D. M. Moore, 32971, UARK, N
Cyperus iria L., 4549, wee, wet, I
Cyperus lupulinus (Spreng.) Marcks, 3725, nov, wee, N
Cyperus polystachyos Rottb. var. *texensis* (Torr.) Fern., 4560, wet, N
Cyperus pseudovegetus Steud., 5747, wet, N
Cyperus retroflexus Buckl., 3729, nov, wee, N
Cyperus squarrosus L., 382, wet, N
Cyperus strigosus L., 3324, roa, see, sha, wet, N
Dulichium arundinaceum (L.) Britt., 3257, wet, N, SC
Eleocharis acicularis (L.) Roemer & J.A. Schultes, 3300, wet, N
Eleocharis engelmannii Steud., 2304, rip, sha, wet, N
Eleocharis lanceolata Fern., 5553, roa, N
Eleocharis obtusa (Willd.) J.A. Schultes, 2724, mes, rip, roa, sha, wee, wet, N
Eleocharis quadrangulata (Michx.) Roemer & J.A. Schultes, 5131, wet, N
Fimbristylis annua (All.) Roemer & J.A. Schultes, 180, sha, N
Fimbristylis autumnalis (L.) Roemer & J.A. Schultes, 4235, wee, wet, N
Fimbristylis vahlii (Lam.) Link, 396, wet, N
Kyllinga pumila Michx., 4419, wee, wet, N
Rhynchospora caduca Ell., 3178, roa, N, SC
Rhynchospora corniculata (Lam.) Gray, 5751, rip, wet, N
Rhynchospora globularis (Chapman) Small, 5611, roa, N
Rhynchospora glomerata (L.) Vahl, 3568, rip, N
Rhynchospora recognita (Gale) Kral, 2687, lob, rip, roa, N
Schoenoplectus pungens (Vahl) Palla var. *pungens*, 3849, wet, N
Scirpus atrovirens Willd., 5578, roa, wet, N
Scirpus cyperinus (L.) Kunth, 5731, lob, wet, N
Scirpus georgianus Harper, 2310, mes, rip, N
Scirpus pendulus Muhl., 5128, roa, N
Scleria oligantha Michx., 2229, lob, nov, pin, roa, sha, N
Scleria triglomerata Michx., 2497, pin, N

Dennstaedtiaceae

Dennstaedtia punctilobula (Michx.) T. Moore, G. Oleson, 87-017, UARK, N, SC
Pteridium aquilinum (L.) Kuhn var. *latiusculum* (Desv.) Underwood ex Heller, 2151, mes, pin, roa, N
Pteridium aquilinum (L.) Kuhn var. *pseudocaudatum* (Clute) Heller, 5510, roa, N

Dioscoreaceae

Dioscorea oppositifolia L., 3587, rip, I
Dioscorea villosa L., 5442, mes, pin, rip, N

Dryopteridaceae

Athyrium filix-femina (L.) Roth ssp. *asplenioides* (Michx.) Hulten, 5491, lob, mes, rip, see, N
Cystopteris protrusa (Weatherby) Blasdell, 3413, rip, N
Cystopteris tennesseensis Shaver, 2770, mes, rip, N
Dryopteris celsa (Wm. Palmer) Knowlt., Palmer & Pollard ex Small, 2536, see, N, SC
Dryopteris marginalis (L.) Gray, 2430, mes, pin, see, N
Onoclea sensibilis L., 1687, see, N
Polystichum acrostichoides (Michx.) Schott, 5479, mes, pin, rip, see, wet, N
Woodsia obtusa (Spreng.) Torr. ssp. *obtusa*, 3663, mes, nov, pin, N
Woodsia obtusa (Spreng.) Torr. ssp. *occidentalis* Windham, 3330, rip, sha, wee, N

Ebenaceae

Diospyros virginiana L., 5500, nov, rip, roa, wet, N

Elaeagnaceae

Elaeagnus umbellata Thunb., 3592, pin, rip, roa, wet, **I***

Elatinaceae

Elatine triandra Schkuhr, 4041, wet, N

Equisetaceae

Equisetum hyemale L. var. *affine* (Engelm.) A.A. Eat., 4457, roa, N

Ericaceae

Gaylussacia baccata (Wangenh.) K. Koch, V. Bates, 10455, UARK, N, SC

Lyonia ligustrina (L.) DC., 5529, mes, rip, see, wet, N
Rhododendron prinophyllum (Small) Millais, 289, rip, see, N
Rhododendron viscosum (L.) Torr., 2309, mes, pin, rip, see, wee, N

Viola striata Ait., 954, rip, see, N
Viola villosa Walt., 779, rip, N

Vitaceae

Ampelopsis arborea (L.) Koehne, 4114, rip, roa, N
Ampelopsis cordata Michx., 3472, mes, roa, N
Parthenocissus quinquefolia (L.) Planch., 5446, mes, nov, pin, rip, roa, see, sha, N
Vitis aestivalis Michx., 3596, mes, pin, nov, rip, N
Vitis cinerea (Engelm.) Millard var. *cinerea*, 5517, pin, rip, roa, wee, wet, N
Vitis palmata Vahl, 4048, wet, N
Vitis rotundifolia Michx. var. *rotundifolia*, 5050, nov, pin, rip, roa, see, wet, N
Vitis rupestris Scheele, V. Bates, 10447, UARK, N
Vitis vulpina L., 5744, mes, pin, rip, wee, wet, N

Xyridaceae

Xyris jupicai L.C. Rich., 3889, rip, N

ACKNOWLEDGMENTS

I gratefully acknowledge the University of Arkansas Herbarium (UARK) for its continuous support of this research effort in the form of funds and resources as well as people who proved to be an invaluable resource and support system. Funding for the project was provided by UARK, the Ouachita National Forest (ONF), and the Arkansas Native Plant Society. The Ouachita Mountains Biological Station provided an excellent place to stay and work while I was in the field. I thank Johnnie Gentry for discussions on the directions the project should take and about the manuscript. Cindy Sagers and David Krementz also provided ideas and assistance. Susan Hooks (ONF) was instrumental in providing information that allowed me to choose primary collection sites. Johnnie Gentry, George Johnson, Sarah Nunn, Jim Peck, Chris Reid, and Eric Sundell helped in identifications. I thank Rob Doster, Johnnie Gentry, Edie Hardcastle, Terry McKay (ONF), Sarah Nunn, Matt Nutt, Chris Reid, John Shadwick, and Theo Witsell (ANHC) for their company and assistance in the field. Johnnie Gentry, Cindy Sagers, David Krementz, Leesia Marshall-Rosenberger, Sarah Nunn, Krista Clements Peppers, and Staria Vanderpool, as well as three anonymous reviewers commented on the manuscript. I especially thank my wife, Katie Marsico, who not only assisted in the field and reviewed the manuscript, but supported me with her love through it all.

JIM JERMYN (text) with photographs by WILHELM and DIETER SCHACHT. 2005. **Alpine Plants of Europe: A Gardener's Guide.** (ISBN 0-88192-734-1, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $39.95, 320 pp., color photos, 8 b/w figures, 7 1/2" × 10 1/2".

The photographs are truly exquisite and the photographers are to be congratulated. I found it hard to close the book once I opened it. Nine chapters from the history of European alpine plants to alpine gardening, fill in the space between the stunning photos.—*Barney Lipscomb, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

JOHN E. BRYAN. 2005. **Timber Press Pocket Guide to Bulbs.** (ISBN 0-88192-752-2, flexibind). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $19.95, 227 pp., 300 color photos, 5 3/4" × 8 1/4".

As noted in the Preface, this book "is intended to give gardeners a greater appreciation of bulbs." The bulbous plants referenced in the *Guide to Bulbs* are arranged alphabetical from *Achimenes longiflora* to *Zantedschia elliotiana*. The *Guide to Bulbs* gives information to more than 700 species, cultivars, and hybrids. Everyday helpful information on such things as cultivation, maintenance, and pests and diseases is also found in the *Guide*.—*Barney Lipscomb, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

MIKANIA BUCHTIENII (ASTERACEAE: EUPATORIEAE) NEW TO ARGENTINA

ABSTRACT

Mikania buchtienii B.L. Rob. (Asteraceae, Eupatorieae) is first reported as occurring in Argentina, where it has been collected in the Yungas region of the northwestern part of the country (Salta and Jujuy provinces). The species, which was known only from Bolivia, is described and illustrated and a key shows the differences between *M. buchtienii* and *M. euryanthela*, a closely related species.

RESUMEN

Mikania buchtienii B.L. Rob. (Asteraceae, Eupatorieae) se cita por primera vez para Argentina, donde ha sido colectada en las Yungas de la región noroccidental del país (provincias de Salta y Jujuy). La especie, que vive en Bolivia, es descripta e ilustrada, y una clave muestra las diferencias entre *M. buchtienii* y *M. euryanthela*, una especie muy afín.

During an extensive taxonomic study of the genus *Mikania* in Argentina (Cerana 1997a, b), two specimens from the northwestern Argentina (Yungas region) came to our attention. After a literature review and comparison with similar species, we concluded that it was necessary to relocate and collect the species in its natural habitat in order to determine its identity. In July 1997, February and November 1998, three trips were made to Las Capillas in Jujuy Province to search for the species, but without success. In October 2000, field studies were conducted in San Pedrito, Salta Province, located about 45 km from Estación Vespucio. One flowering specimen, which also had fruits from the previous year, was collected. Other plants present were in the vegetative stage.

In addition to the field studies, specimens from the following herbaria were examined: BAB, CORD, CTES, JUA, LIL, LP, LPB, SI. Our research has shown that the collection and herbarium specimens represent the first records of *Mikania buchtienii* B.L. Rob. for Argentina. This is also the first known occurrence of the species from outside of Bolivia. A specimen was sent to W.C. Holmes of Baylor University in Waco, Texas, who confirmed our determination.

Mikania buchtienii B.L. Rob., Contr. Gray Herb. n. s. 64:7. 1922. (**Fig. 1**).
Twining lianas; stems terete, striate, glabrate. Leaves simple, coriaceous, opposite, petiolate, inconspicuously stipulate; petioles 10–30 mm long; blades from

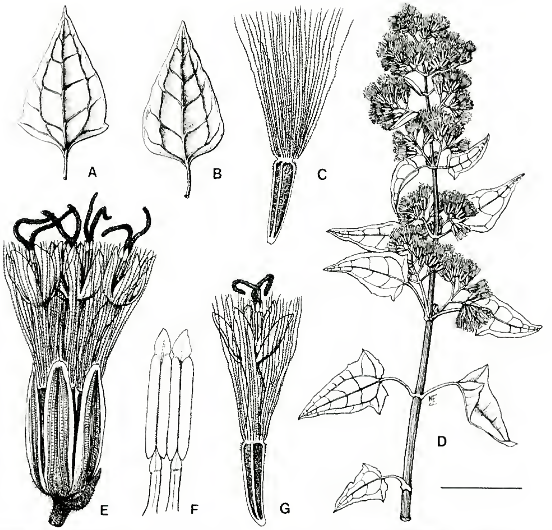

Fig. 1. ***Mikania buchtienii*** **B.L. Rob. A. Leaf with deltate-hastate shape. B. Leaf with deltate-ovate shape. C. Achene. D. Flowering branch. E. Head. F. Stamens. G. Floret. (A, B: *Cerana 1740*, CORD; C-G: *Schulz 5482*, LIL). Scale bar = 30 mm (A, B, D), 3 mm (C, E, G), 1 mm (F).**

deltate-hastate to deltate-ovate or ovate, 30–90 × 20–60 mm, margins entire to slightly serrate, bases subcordate to rounded, apices acute; upper surfaces glabrescent, lower surfaces glabrate or slightly pilose. Capitulescence paniculate to cylindrical, dense, branches terete, terminal or axillary disposed; heads ca. 10 mm long, peduncles pubescent; subinvolucral bracts lanceolate, abaxially pubescent, 2.5–3.5 × 0.7 mm, located at the base of the peduncle or beneath the head; phyllaries 5–6.7 × 1.2–1.8 mm, apex obtuse or rounded, the outer bracts oblong, lanceolate or oblanceolate, abaxially pubescent, the inner ones, lanceolate, glabrate, apex ciliate. Corolla white, 5–6.5 mm long, tube 2.8–3.5 mm long, limb widely campanulate to campanulate 2–3 mm long, divided into lanceolate corolla lobes extending almost to the base (2.3–2.6 mm long); style glabrous. Achenes 3.5–4 mm long, more densely pubescent apically, ribs serrulate;

pappus yellowish white with 45–60 barbellate bristles, 5.5–7 mm long.

Phenology.—Flowering specimens were collected from August to October, but it is assumed that flowering and fruiting occur from August to March.

Habitat and distribution.—The original description and previous additional reports of *M. buchtienii* have been based on specimens collected in upland forests, riverine woodlands and mattoral areas in the Yungas region of Bolivia, at 1100–3500 m (Robinson 1922a, b). The new records extend the known range to the forests and borders of woods in the Yungas region of Salta and Jujuy, Argentina, at 1000–1200 m. This biogeographical province has a wet and humid climate with over 2500 mm of rain annually and temperatures between 14° and 26° C (Cabrera 1971).

Specimens examined. **ARGENTINA. Jujuy:** Capital, Las Capillas, 22 Sep 1981, *Ahumada y Rotman 4321* (JUA, SI). **Salta:** General José de San Martín, San Pedrito (Pozos de la Standard), 25 Aug 1944, *Schulz 5482* (LIL, BAB, CTES); General José de San Martín, San Pedrito, Empresa Panamerican Energy, a ±200 m de la Histórica Escuela, 19 Oct 2000, *Cerana 1740* (CORD, BAYLU).

BOLIVIA. La Paz: Nor Yungas, Yolosa hacia Chuspipata, pasando Sacramento Bajo y el derrumbe grande, antiguo (16° 16' S, 67° 47' W), 19 Sep 1995, *Beck 22468* (LPB); Inquisivi, "Río Churu", following the Río Churu from 200 m W of Aguilani to 1 km above the main fork up river, 3 km SE of the ruins of Choquecamiri, 17 km N of Choquetanga (16° 42' S, 67° 20' W), 12 Sep 1991, *Lewis 40208* (LPB); Inquisivi, "Aguas Calientes de Calachaca", in the area of the thermal springs of the Río Calachaca Jahuira, 9 km NW of Choquetanga (16° 48' S, 67° 19' W), 9 Mar 1991, *Lewis 38244* (LPB).

Mikania buchtienii is closely related to *Mikania euryanthela* (Malme) W.C. Holmes, which is widespread in Paraguay, southern Brazil (State of Parana) and the provinces of Corrientes, Chaco, Formosa and Misiones in Argentina (Barroso 1959; Holmes & McDaniel 1996; Cerana 1997a, b). Both species are similar in leaf blade shape, corolla shape and very long corolla lobes. The main differences between them are summarized in the following key:

KEY TO DISTINGUISH *MIKANIA BUCHTIENII* AND *M. EURYANTHELA*

1. Leaf blades membranaceous, deltate-ovate, bases subcordate to truncate, glabrate; capitulescence paniculate, scattered; subinvolucral bracts slightly pubescent, with a prominent middle nerve; corolla glabrate, limb 2–2.3 mm long divided into corolla lobes 1.5–1.7 mm long; achenes glabrous ________ **Mikania euryanthela**
1. Leaf blades coriaceous, deltate-hastate, deltate-ovate, or ovate, bases subcordate or rounded, upper surfaces glabrescent, lower surfaces glabrate or slightly pilose; capitulescence paniculate to cylindrical, dense; subinvolucral bracts pubescent, with an inconspicuous middle nerve; corolla pubescent, limb 2–3 mm long divided into corolla lobes 2.3–2.6 mm long; achenes pubescent ________ **Mikania buchtienii**

ACKNOWLEDGMENTS

We are grateful to curators of the herbaria BAB, CORD, CTES, JUA, LIL, LP, LPB, SI, and St. Beck, director of the herbaria LPB for their loan of specimens. We appreciate M. Nee (NY) for sending us digital images. We thank W.C. Holmes of Baylor University, Waco, Texas, for assistance in confirming the identity of our plant. Guy Nesom and an anonymous reviewer offered helpful improvements. We thank managers of Panamerican Energy for providing access to the property and transportation while on-site. We thank A.P. de Pereyra (F.C.A., Universidad Nacional de Córdoba, Argentina) for assistance with the English version of the manuscript. Financial support for the research was provided by Agencia Córdoba Ciencia and Fondo para la Investigación Científica y Tecnológica (FONCyT). Thanks are also due to N. de Flury and L. Ribulgo for drawing the excellent illustration.

ABSTRACT

Populations of the expanding exotic *Ranunculus ficaria* L. (Ranunculaceae) are reported escaped in North Carolina. Voucher specimens are cited and an updated key to *Ranunculus* L. in the Carolinas is presented.

RESUMEN

Poblaciones de la exótica en expansión *Ranunculus ficaria* L. (Ranunculaceae), se citan escapadas en Carolina del Norte. Se citan los especímenes y se presenta una clave actualizada de *Ranunculus* L. en las Carolinas.

Populations of the exotic *Ranunculus ficaria* L. (lesser celandine) are known outside of cultivation from the northeastern United States, Oregon, and Washington (Gleason & Cronquist 1991; USDA, NRCS 2005), but the species has been previously collected in the Southeast only in Kentucky, Tennessee, Virginia, and Maryland (Whittemore 1997). *Ranunculus ficaria* is native to much of Europe (Tutin 1976; Taylor & Markham 1978). The species was reported in New York State as early as 1890 (Hollick & Britton 1891). By the mid 1940s, it was known from several northeastern coastal states, as well as Virginia (*Sargent s.n.*, NCSC), but had not yet reached West Virginia (Bell 1945). The taxon was not previously reported for North Carolina by Radford et al. (1968), Pittillo et al. (1969), Pittillo et al. (1972), Kral (1981), Pittillo and Brown (1988), or Whittemore (1997). However, a population of the species was recently encountered in Raleigh (Wake Co., North Carolina). Twenty-nine clumps were observed, of which seventeen were either in flower or fruit at the time of collection. Individuals were observed

SIDA 21(4): 2429 – 2437. 2005

only in areas receiving partial shade for a significant portion of the day. They were absent from portions of the lawn receiving full sunlight.

Voucher collection **U.S.A. North Carolina. Wake Co.:** Raleigh, backyard lawn of residential home on Van Dyke Avenue, in partial shade, absent from portions of lawn receiving full sun, 11 Apr 2005, *Krings 1271* (AUA, F, FLAS, GA, LSU, MISS, NCSC, NCU, TEX, UNA, US, USF, USCH, VDB).

The species has also been observed on a private property in Chatham Co., where it had apparently been planted in the past, but is now escaping short distances into nearby natural areas. Due to summer senescence, vouchers of this population have not been taken this year.

Several attempts have been made to morphologically distinguish diploid from polyploid plants of *R. ficaria* (Marsden-Jones 1935; Marsden-Jones & Turrill 1952; Lawalrée 1955). Unfortunately, most of these have proven unreliable (Heywood & Walker 1961; Jones 1966; Taylor & Markham 1978). Arguing that too great a reliance had been placed on chromosome counts, Sell (1994) recognized five subspecies (Table 1), with the caution that these taxa could be recognized with ease only if cultivated or examined at intervals through their flowering and fruiting periods. If only seen once in the field or from a single specimen, certain identification would remain difficult. The following key was provided by Sell (1994) to facilitate identification:

1\. Leaf blades to 8 × 9 cm; petioles to 28 cm; flowers to 60 mm diam; achenes to 5.0 × 3.5 mm
  2\. Stems rather robust, but straggling; bulbils present in leaf axils after flowering ____ subsp. **ficariiformis**
  2\. Stems robust and erect; without bulbils in leaf axils after flowering ____ subsp. **chrysocephalus**
1\. Leaf blades to 4 × 4 cm; petioles to 15 cm; flowers to 40 mm diam; achenes to 3.5 × 2.2 mm
  3\. Leaves crowded at base with few on short stems ____ subsp. **calthifolius**
  3\. Leaves less crowded at base and more numerous on the elongate stems
    4\. Bulbils not present in leaf axils after flowering; achenes well-developed ____ subsp. **ficaria**
    4\. Bulbils present in leaf axils after flowering; achenes poorly developed ____ subsp. **bulbilifer**

USDA, NRCS (2005) reported only *R. ficaria* var. *bulbifera* Marsden-Jones for the United States. Sell (1994) pointed out that this name is illegitimate, being a later homonym of *R. ficaria* var. *bulbifer* Albert, which Sell treated in synonymy under subsp. *bulbilifer* Lambinon. Based on Whittemore's (1997) description of the species, the flower sizes of individuals of subsp. *bulbilifer* in the United States would be on the upper end compared with European individuals as recognized by Sell (1994) (Table 1).

Following Sell (1994), the individuals of the Wake Co., North Carolina population are tentatively referable to subsp. *ficariiformis* (F.W. Schwartz) Rouy & Fouc, previously not reported for the United States. Though there are some more

Table 1. The five subspecies of *Ranunculus ficaria* L. recognized by Sell (1994). Fls=flowers; ptio=petioles; ptls=petals.

subsp. *bulbilifer* Lambinon	**subsp. *calthifolius* (Reichenb.) Arcangeli**	**subsp. *chrysocephalus* P.D. Sell**	**subsp. *ficariiformis* (F.W. Schultz) Rouy & Fouc.**	**subsp. *ficaria***
Tetraploid Ptio ≤ 15 cm long Axillary bulbils globular	Diploid Ptio ≤ 7 cm long Axillary bulbils absent	Tetraploid Ptio ≤ 21 cm long Axillary bulbils absent	Tetraploid Ptio ≤ 28 cm long Axillary bulbils ovoid or globular	Diploid Ptio ≤ 15 cm long Axillary bulbils absent
Fls ≤ 25 mm diam Ptls 6–11 × 2–5 mm, not contiguous	Fls ≤ 30 mm diam Ptls 10–15 × 2.5–6 mm, not contiguous	Fls ≤ 60 mm diam Ptls 18–25 × 9–15(–18)mm, contiguous or overlapping	Fls ≤ 50 mm diam Ptls 17–26 × 4–12 mm, contiguous or overlapping	Fls 20–40 mm diam Ptls 10–20 × 4–9 mm, often contiguous
Occurs throughout most range of the species, although rare in Mediterranean region	Restricted to east-central and south-eastern Europe	Occurs in the eastern Mediterranean region	Occurs in the central and western Mediterranean Region	Restricted to western Europe

diminutive plants in the population, a number of individuals bear leaves > 4 cm diam and petals ≥ 17 × 6 mm, that are contiguous to overlapping (see Table 1 for a comparison of characters among subspecies). On some plants, ellipsoid axillary bulbils are evident. However, subspecific taxa of *R. ficaria* are not uniformly accepted. Citing extensive intergradation in form, Whittemore (1997) did not recognize any subspecific taxa in his treatment of *Ranunculus* L. for the *Flora of North America*. To help address the continuing disparity in taxonomic treatments, detailed studies are needed to examine the distribution of haplotypes and potential morphological correlations. Such an approach has been useful for other expanding exotic plants (e.g., Saltonstall 2002, 2003a–c; Saltonstall et al. 2004). Further investigation is also needed to determine more precisely the timing and mode of introduction, as well as the rate of spread of the species. Survey of herbarium collections may shed more light on this matter. Pertinent studies regarding the life history, pollination biology, and ecology have been published by Marsden-Jones (1935, 1936) and Taylor and Markham (1978).

To improve collections, Sell (1994) suggested that specimens should be taken late when fruit and bulbils are developed. However, at this stage any flowers remaining open are typically late ones, which are generally smaller than

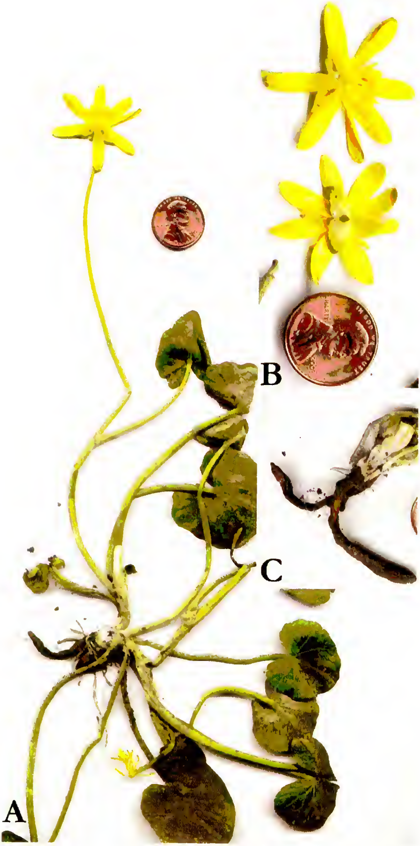

FIG. 1. *Ranunculus ficaria* L. **A.** Habit; **B.** Flowers; **C.** Tuberous roots. Based on *Krings 1271*.

those when the plant first came into flower. To improve our understaning of the distribution and ecology of subspecies, botanists should note flower sizes on an initial visit to populations and then check the bulbils and fruits at a later date (Sell 1994).

Ranunculus ficaria (Fig. 1) can be distinguished from its Carolina congeners by the combination of unlobed, reniform to suborbicular leaves, tuberous roots, typically three sepals, yellow petals ≥ 10 mm long (sometimes partially fading to white with age), and pubescent, beakless achenes. An updated key to Carolina congeners, largely adapted from Whittemore (1997), is provided below. Following arguments presented by Nesom (1993), we diverge from Whittemore (1997) in treating *R. carolinianus* DC. as a species, rather than as a variety of *R. hispidus* Michx. Distribution, habitat, and frequency information follows Weakley (2005) (Mt = Mountains; Pd = Piedmont; Cp = Coastal Plain). Unless otherwise indicated, provincial distributions and comments apply equally to North Carolina (NC) and South Carolina (SC). Asterisks indicate exotic species.

KEY TO *RANUNCULUS* IN THE CAROLINAS

1. All leaves unlobed
    2. Leaf blades reniform to suborbicular or orbicular, bases shallowly to deeply cordate.
        3. Roots tuberous; petals ≥ 10 mm long; achenes pubescent, beaks absent ________ ***R. ficaria*** L. [Pd (NC); disturbed rich forests and bottomlands, mesic suburban forests, lawns, naturalized locally from horticultural plantings; rare]
        3. Roots filiform; petals ≤ 3.5 mm long; achenes glabrous, beaks subulate, curved ________ **R. abortivus** L. [Mt, Pd, Cp; low fields, disturbed areas, bottomlands, lawns, roadsides; uncommon]
    2. Leaf blades ovate to lanceolate, bases truncate, rounded-obtuse to cuneate (sometimes cordate in *R. laxicaulis*, then petals 2–6 mm long).
        4. Petals 1–3, 1.5–2 mm long ________ **R. pusillus** Poir. [Mt (NC), Pd, Cp; marshes, ditches, other wet habitats; common (uncommon in Mt)]
        4. Petals 4–6, 5–8 mm long
            5. Proximal cauline leaf blades 5.9–12.2 cm long; petals 5; achenes to 1.8 mm long ________ **R. ambigens** S. Wats. [Pd (NC), Cp (NC); marshes; rare]
            5. Proximal cauline leaf blades to 5.7 cm long; petals 4–6; achenes 0.8–1 mm long ________ **R. laxicaulis** (Torr. & A. Gray) Darby [Cp; marshes; rare]
1. All or some leaves lobed or compound.
    6. Leafy stems creeping and rooting at the nodes, or floating in water (then rootless).
        7. Leaves 3-foliolate.
            8. Achene margins 0.4–1.2 mm wide ________ **R. carolinianus** DC. [Mt, Pd, Cp; swamp forests, wet woodlands, open marshy wetlands; uncommon]

8. Achene margins 0.1–0.2 mm wide ____ ***R. repens** L. [Mt (NC), Pd (NC), Cp; low meadows, disturbed areas; uncommon]

7. Leaves simple, lobed, parted, or dissected.
   9. Leaves ≤ 1 cm long; floral receptacles glabrous; petals white; achenes ≤ 1.6 mm long ____ **R. hederaceus** L. [Cp; coastal brackish marshes, other circumneutral soils; rare]
   9. Leaves ≥ 1.2 cm long; floral receptacles sparsely hispid; petals yellow; achenes ≥ 1.8 mm long ____ **R. flabellaris** Raf. [Cp (NC); pools in floodplains of small stream swamps, other stagnant or slow moving waters; rare]

6. Leafy stems erect or if decumbent rooting only at the base (rarely rooting at the nodes in *R. sceleratus*), never floating.
   10. Style absent; achene margins thick and corky, emergent aquatic or on wet soil ____ **R. sceleratus** L. [Pd (NC), Cp; marshes, ditches, and stream margins; uncommon]
   10. Style present; achene margins not corky; various habitats, but not aquatic.
       11. Basal leaves variously unlobed to deeply divided; achenes thick-lenticular or asymmetrically thick-lenticular to compressed-globose, 1.2–2 times as wide as thick.
           12. Stems villous ____ **R. micranthus** Nutt. [Pd (NC); rich forests; rare]
           12. Stems glabrous.
               13. Sepals glabrous; achene beaks 0.1–0.2 mm long ____ **R. abortivus** L. [Mt, Pd, Cp; low fields, disturbed areas, bottomlands, lawns, roadsides; uncommon]
               13. Sepals hispid; achene beaks 0.6–1 mm long ____ **R. alleghaniensis** Britton [Mt (NC, SC?); cove forests, rich forested slopes; uncommon]
       11. Basal leaves always deeply lobed or compound; achenes strongly compressed, at least 3–15 times as wide as thick.
           14. Achenes spinose or papillose (sometimes smooth in *R. sardous*).
               15. Petals 1–2 mm long; receptacles glabrous; achenes finely papillate, each with a hooked bristle.
                   16. Flowers pedicellate; sepals 5 ____ ***R. parviflorus** L. [Mt, Pd, Cp; disturbed areas; common (rare in Mt)]
                   16. Flowers sessile; sepals 3 ____ ***R. platensis** Spreng. [Pd (NC); lawns and ditches; rare]
               15. Petals 4–10 mm long; receptacles pilose or hispid; achenes coarsely papillate (but not terminating in hooked bristles), spinose, or tuberculate.
                   17. Sepals spreading; achenes 5–9, borne in a single whorl, long-spinose ____ ***R. arvensis** L. [Mt (NC), Pd; fields, disturbed areas; rare]
                   17. Sepals reflexed; achenes 13–60, borne in ovoid or globose heads, papillose to spinose.
                       18. Basal leaves simple; achene beaks 2–2.5 mm long ____ ***R. muricatus** L. [Pd (SC), Cp (SC); ditches and marshes; rare]
                       18. Basal leaves compound; achene beaks to 0.7 mm long.

19. Petals 7–10 mm long; achenes sparsely papillate or sometimes smooth ____________ ***R. sardous** Crantz [Pd, Cp; low fields, disturbed areas; uncommon]
19. Petals 4–5 mm long; achenes densely tuberculate ____________ ***R. trilobus** Desf. [Cp (SC); fields, roadsides, ditches; rare]

14. Achenes smooth, glabrous or pubescent.
  20. Petals 3–5 mm long; achene beaks markedly recurved ____________ **R. recurvatus** Poir. [Mt, Pd, Cp; bottomland forests, cove forests, swamps, mesic slope forests; common]
  20. Petals ≥ 7 mm long; achene beaks more or less straight, not markedly recurved.
    21. Sepals reflexed along a defined fold 1–3 mm above base.
      22. Stem bases bulbous, corm-like; petals 9–13 mm × 8–11 mm ____________ ***R. bulbosus** L. [Mt, Pd, Cp; fields, roadsides, disturbed areas; common (rare in South Carolina)]
      22. Stem bases not bulbous; petals 7–10 × 4–8 mm ____________ ***R. sardous** Crantz [Pd, Cp; low fields, disturbed areas; uncommon]
    21. Sepals spreading (sometimes reflexed from base with age).
      23. Basal leaf blades 3–5-parted, pentagonal in outline ____________ ***R. acris** L. [Mt (NC), Pd (NC), Cp; pastures, fields, roadsides, disturbed areas; common (uncommon in Pd, rare in Cp)]
      23. Basal leaf blades 3–5-foliolate, ovate to deltate in outline.
        24. Tuberous roots absent ____________ **R. hispidus** Michx. [Mt, Pd; rich moist forests, creek banks, mesic to dry woodlands and forests, bottomlands; common]
        24. Tuberous roots present ____________ **R. fascicularis** Muhl. ex Bigelow [Mt (NC), Pd; wet flats with prairie affinities, rocky barrens and glades over mafic rocks, ultramafic outcrop barrens, limestone barrens; rare]

ACKNOWLEDGMENTS

We are grateful to Charles W. Averre (Prof. Emeritus, Dept. Plant Pathology, NCSU) for bringing the plant to our attention and the thoughtful reviews of a previous version of the manuscript by Michael Denslow, Carl Keener, and an anonymous reviewer.

BOOK NOTICE

CHARLES BOEWE (ed.). **A C.S. Rafinesque Anthology.** 2005. (ISBN 0-7864-2147-9, pbk.). McFarland & Company, Inc., Box 611, Jefferson, NC 28640, U.S.A. (**Orders:** www.mcfarlandpub.com, 800-253-2187). $45.00, 271 pp., 17 b/w figures, 7" × 10".

From the back cover.—"Among American naturalists, C.S. Rafinesque (1783–1840) is second only to Audubon in the popular interest he sustains. This interests is due in part to his colorful life and provocative personality, but he is also remembered for devising Latin scientific names for more plants than any other naturalists who ever lived—and a great number in the animal kingdom, as well. This passion for nomenclature has kept his name memorable (some would say notorious) among naturalists. Yet his taxonomic writings made up only a part of his extensive oeuvre."

There are at least six previous books on Rafinesque also edited by Charles Boewe. Rafinesque's essays covered in this volume are **1)** Antiquities, **2)** Linguistics, **3)** Society, **4)** Education, **5)** Public Lectures, **6)** Popular Science, **7)** Phytogeography, **8)** Natural Science, and **9)** Metaphysics.

A great fan of Rafinesque was the Canadian born botanist, Lloyd H. Shinners (SMU). Ruth Ginsburg, in her 2002 biography, *Lloyd Herbert Shinners: By Himself*, discusses Shinners' admiration for Rafinesque. The following excerpt gives some insight into the life of Rafinesque and his influence on at least one botanist:

"Constantin Samuel Rafinesque was a naturalist, traveler, and writer. Born in Constantinople, he spent much of his youth in Italy and came to the United States in 1815. He was not trained in botany, but he read widely in several languages and became deeply interested in natural history, making important contributions to ichthyology as well as botany. Shinners admired his wide knowledge, his voracious appetite for discovery and publication, and especially his courage in defending unpopular positions. Lack of diplomacy, organization, and understanding of their limitations were other characteristics that they shared."

If you enjoy reading about great naturalists then you will definitely enjoy Boewe's *A C.S. Rafinesque Anthology.—Barney Lipscomb, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

THE OCCURRENCE OF *CERASTIUM PUMILUM* (CARYOPHYLLACEAE) IN OKLAHOMA

ABSTRACT

Cerastium pumilum (Caryophyllaceae) was recently reported for Oklahoma without documentation. This paper documents the occurrence of *Cerastium pumilum* W. Curtis in Oklahoma. The first collection from Oklahoma was made in 1981 from Hughes County but no additional collections were made until 2003. Since that time, *C. pumilum* has been documented in eight additional counties. Thus, *C. pumilum* is currently known from a total of 11 Oklahoma counties.

RESUMEN

Cerastium pumilum (Caryophyllaceae) se citó recientemente de Oklahoma sin documentación. Este artículo documenta la presencia de *Cerastium pumilum* W. Curtis en Oklahoma. La primera colección de Oklahoma se hizo en 1981 en Hughes County pero no se hicieron colecciones adicionales hasta 2003. Desde entonces, *C. pumilum* se ha documentado en otros ocho condados. Así pues, *C. pumilum* se conoce actualmente de un total de 11 condados de Oklahoma..

Cerastium pumilum W. Curtis (Caryophyllaceae) is an annual plant species native to Europe and southwest Asia (Diggs et al. 1999). It has been reported from the adjacent states of Arkansas, Kansas, Missouri, and Texas, but not Colorado (USDA-NRCS 2005). Morton (2005) mapped *C. pumilum* in Oklahoma but did not provide voucher documentation. The Oklahoma distribution record in Morton (2005) is based on a 1981 collection by Steve Stephens.

Voucher collection: **OKLAHOMA. Hughes Co.:** 3.5 mi W of Calvin, roadside shoulder, red sandy soils, few plants, 7 Apr 1981, *Steve Stephens 90325* (KANU).

However, *C. pumilum* is not listed in Taylor and Taylor (1994) and a search of Hoagland et al. (2005) revealed that no collections had been deposited in Oklahoma herbaria prior to 2003, when the authors collected it from three counties. Since then, it was collected from five additional counties in 2004 and three in 2005. All specimens reported below are deposited in the Robert Bebb Herbarium at the University of Oklahoma (OKL), with the exception of Caddell and Rice

(*GMC 1039*) which is deposited at the University of Central Oklahoma (CSU). Since these specimens represent locales covering a broad geographic extent, additional county records are no doubt forthcoming.

Additional voucher specimens: **OKLAHOMA. Beckham Co.:** 1.1 mi E of I-40 from jct. with Hwy 34, T11N, R22W, sec 35, disturbed area, 3 Apr 2003, *Buthod and Hoagland, AB3649.* **Cleveland Co.:** Norman, T9N R2W sec 32, disturbed area, 7 May 2005, *Amy Buthod, AB6762.* **Kay Co.:** Blackwell city park, T27N, R1W, sec 23, disturbed area, 29 May 2003, *Buthod, Hoagland, and Fagin, AB3822.* **Lincoln Co.:** Turner Turnpike (I-44) at exit 171, T15N, R5E, sec 32, disturbed grassland, 6 May 2004, *Buthod and Hoagland, AB6155.* **Major Co.:** ca. 3 mi W of Bouse Junction on Hwy 412, T22N, R16W, sec 6, grazed pasture, 22 Apr 2004, *Buthod and Shannon, AB4563.* **Oklahoma Co.:** Forest Park in Oklahoma City, T12N, R3W, sec 13, disturbed grassland, 27 Apr 2004, *Buthod, Hoagland, and Fagin, AB4609.* **Oklahoma Co.:** Lake Arcadia, T14N, R2W, sec 34, disturbed area, 3 Mar 2005, *Amy Buthod* and *Lacy Brookshire*, AB6251. **Ottawa Co.:** Approximately 7.2 mi NE of Grove, T26N, R23E, sec 33, disturbed area, 22 Apr 2004, *Buthod, Hoagland, and Brookshire, AB4544.* **Pawnee Co.:** 5 mi W of Cleveland on Hwy 64, T21N, R7E, sec 15, disturbed area, 1 Apr 2004, *Buthod and Hoagland, AB4521.* **Stephens Co.:** 1.6 mi SW of Bray at Clear Lake, T2N, R6W, sec 29, disturbed area, 13 Mar 2003, *Hoagland and Buthod, AB3421.* **Woodward Co.:** Alabaster Caverns State Park, T26N, R18W, sec 28, disturbed area along roadside near Canyon Campground, 7 May 2005, *Caddell and Rice, GMC 1039.*

ACKNOWLEDGMENTS

We thank Richard Rabeler for reviewing the paper and for bringing the Stephens specimen to our attention and Craig Freeman for providing the label data from that specimen.

FIRST RECORD OF *NYMPHOIDES INDICA* (MENYANTHACEAE) IN TEXAS

Ken Saunders

Freshwater Resources Program
Inland Fisheries Division
Texas Parks and Wildlife Department
San Marcos, Texas 78666, U.S.A.

ABSTRACT

The first Texas record of *Nymphoides indica* (L.) Kuntze (Menyanthaceae) is reported new for Texas.

RESUMEN

Se cita por primera vez para Texas *Nymphoides indica* (L.) Kuntze (Menyanthaceae).

Nymphoides specimens were collected from Soldier Springs, Uvalde County, Texas in April 2002 and subsequently planted in small water gardens upon return to the laboratory. Specimens from this locale had previously been cursorily identified as *N. aquatica* (Bill Carr, The Nature Conservancy of Texas, pers. comm.). However, upon inspection of flowers from reared specimens, it was determined that the species was instead *N. indica* (independent species verification by David Lemke, Texas State University Biology Department), which represents a new species record in Texas.

Voucher specimen: **U.S.A. Texas. Uvalde Co.:** Soldier Springs, ca 2 km S. of the U.S. Hwy 90 bridge and a short distance upstream of County Road 202 (Tom Nunn crossing), floating in water with *Trichocoronis rivularis* and other species, from the banks out into mid pool, 18 Apr 2002, *Saunders & Lemke s.n.* (SWT).

It has since been observed in at least one other spring system upstream of Soldier Springs, also within the Nueces River basin (Chad Norris, Texas Parks and Wildlife Department, pers. comm.).

Two native *Nymphoides* species are known to occur in the southeastern United States (Wood 1983; Jacono 2002), namely *N. cordata* (Ell.)Fern and *N. aquatica*) (J.F. Gmel.) Kuntze. *Nymphoides indica* (L.) Kuntze (water snowflake) is native to both New and Old World tropical regions, but like many other introduced aquatic macrophytes, has been brought to the United States for ornamental uses. Ornduff (1969) did not find consistent morphological difference between New World plants known as *N. humboldtiana* (H.B.K.) Kuntze, and Old World plants known as *N. indica* (L.) Kuntze. Ornduff thus concluded the two must be conspecific and since the name *N. indica* has priority both Old and New World specimens should be referred to by this name. Occurrence of wild populations of *N. indica*, until now has been documented only in two

SIDA 21(4): 2441 – 2443. 2005

southwestern counties in Florida (Wunderlin & Hansen 2004) where it is spreading rapidly (Jacono 2002).

Nymphoides indica is a floating perennial with tuberous and adventitious, spur-like roots; it can propagate through rhizomes. Within its native range, it occurs in shallow ponds and stream pools at elevations below 1500 m (Ornduff 1969; Sivarajan & Joseph 1993). Flowers are produced in cymose, umbel-like clusters, which occur on the petiole on the same node as the spur-like roots. Flowers have four to eight petals covered with copious marginal hairs producing a furry appearance, hence the common name water snowflake (Wood 1983). The flowers are fairly small and slender (1.7–2.7 cm wide), white with a center area of light yellow (Ornduff 1969; Jacono 2002). Anthers are often black and seeds range from 1.0–1.7 mm in length (Ornduff 1969).

The springs and pool at Soldier Springs lie entirely within the flood plain of the Nueces River but during normal flows are separated from the main course by a point of land. The pool flows into the river at the downstream end of the point along the eastern edge of the channel. Spring flows emanate from gravel and cobble substrates within a short spring run at the head of the pool. The pool has depths in excess of 1.3 m (Bill Carr, *op cit*), is up to 30 m wide, and measures a few hundred meters in length. Brune (1981) classified the springs as moderately large, meaning they have a mean discharge between 0.79 and 7.93 m^3/s.

At the time of the *Nymphoides indica* collection, the spring run and pool were densely vegetated with various aquatic macrophyte species. Among the most prolific was *Trichocoronis rivularis*, a species with restricted global distribution and found only in a few southwestern Texas and northern Mexico spring systems and cienegas (Bill Carr, *op cit*). *Trichocoronis rivularis* together with *N. indica* formed areas of very dense vegetation extending from the banks out into mid pool. Both species were distributed throughout the pool but were most dense from the mouth of the spring run downstream to about the middle of the pool. Other common macrophytes included *Justicia americana*, *Ludwigia* sp., *Myriophyllum* sp., *Nasturtium officinale*, and *Potamogeton illinoensis*.

ACKNOWLEDGMENTS

Thanks to Bill Carr, The Nature Conservancy of Texas, for providing background information, and to David Lemke, Texas State University, Biology Department for verification of specimen identification. Nicholas Tippery and Guy L. Nesom provided helpful review comments.

MUSCARI COMOSUM (LILIACEAE) NEW TO TEXAS

Lee M. Luckeydoo

Botanical Research Institute of Texas
509 Pecan Street
Fort Worth, Texas 76102-4060, U.S.A.
LLuckeydoo@BRIT.org

ABSTRACT

Muscari comosum (L.) Mill. (Liliaceae) is reported as a non-cultivated persisting population in Parker County, Weatherford, Texas. This species, non-cultivated, is a new record for the state of Texas.

RESUMEN

Muscari comosum (L.) Mill. (Liliaceae) se cita como una población persistente no cultivada en Parker County, Weatherford, Texas. Esta especie, no cultivada, es una nueva cita para el estado de Texas.

Muscari comosum (L.) Mill. (tassel grape-hyacinth, feather hyacinth) has not been reported for Texas by Correll and Johnson (1970), Hatch et al. (1990), Jones et al. (1997), Diggs et al. (1999), or Flora of North America (2002). This species has been reported for several other states in the U.S.: South Carolina (Haldeman 2001), Oregon, Missouri, Illinois, Ohio, Pennsylvania, Tennessee, Virginia, North Carolina, Georgia (Kartesz 1999), and Kentucky (Kartesz 1999; Jones 2005).

A Texas collection of *Muscari comosum* is in the Tracy (TAES) Herbarium, Texas A&M University (Brazos Co. *Ness s.n.*, 10 Apr 1899). The label information states that this was a "single specimen found on campus" (Kruse pers. comm. 2005). No further information was available as to this specimen having been cultivated or existing as a persisting population.

The Texas collection reported here was submitted to the Botanical Research Institute of Texas by a homeowner in Weatherford, Texas (Parker County). The species had not been planted in the yard since the owner's family moved into the home in 1948. The plants were first noted in the yard approximately "20 years ago." This is a non-cultivated persisting population that is currently growing in two groups. The homeowner has observed a gradual increase in the number of plants of *M. comosum* over time. The plants thus appear to be spreading slowly.

Muscari comosum (Fig. 1) is a perennial that regenerates from a bulb and is native to the Mediterranean region (Lopez Alonso & Pascual Reguera 1989). This species has a distinctive flowering scape (raceme), which has fertile, dark purple, urn-shaped flowers that are spaced along the top half of the axis and a tassel of infertile purple flowers at the tip of the axis. Synonyms for this plant include *Hyacinthus comosus* L.

FIG. 1. *Muscari comosum*. Illustration by Pierre-Joseph Redouté (1759–1840) (Mallary & Mallary 1986).

Voucher specimen: **TEXAS: Parker Co.:** Weatherford, owner's family have lived in home since 1948, these plants were not seen until 1980/1990- occurring in 2 clumps (15 and 9 scapes); flowers deep purple with tassel at top of stalk, fragrant, *Spear s.n.* 15 Apr 2005. A photograph, dated 1992, of *M. comosum* in homeowner's yard accompanies this specimen.

ACKNOWLEDGMENT

Thanks to Barney Lipscomb of BRIT for providing assistance with identification, Monique Reed for her valuable comments, and Dale Kruse of the Tracy Herbarium for providing collection data.

ANNOUNCEMENT

Digital Atlas of the Virginia Flora Is Online

The *Digital Atlas the Virginia Flora*, a significantly augmented and somewhat revised version of edition III of the *Atlas of the Virginia Flora* (hardcopy 1992), is now available on the Virginia Tech website at http://www.biol.vt.edu/digital×atlas. The Atlas project for the Virginia flora was initiated by Alton M. Harvill, Jr., of Longwood College, Farmville, Virginia, in the mid 1970s. With assistance from a group of other Virginia botanists who were also collecting extensively in the state, Harvill produced three hardcopy editions of the *Atlas* (1977/1981, 1986, and 1992). Following Dr. Harvill's retirement, this group [which he had named and incorporated as the Virginia Botanical Associates (VBA)] continued his work by accumulating new records from their own and others' more recent field work (e.g. records from the Virginia Division of Natural Heritage). The group also targeted numerous taxonomic issues needing resolution.

Ultimately, the VBA set the goal of making available on-line a modified and updated version of *Atlas III* and began developing a checklist. Thomas F. Wieboldt compiled and maintained the developing checklist at the Massey Herbarium at Virginia Tech, and he also modified family circumscriptions to follow (largely) the Angiosperm Phylogeny Group (APG2). The initial database was populated with records from the 1992 hardcopy edition; then VBA members added new records to the database.

The Digital Atlas of the Virginia Flora is very much a work in progress. This is especially true in regard to mapping of infraspecific taxa that are currently "buried" in species maps because the specimens on which these maps were based had been identified only to species level.

Users of the web-site are invited to correspond with the VBA regarding the *Digital Atlas of the Virginia Flora*. Please direct questions, comments, and/or any new data to *Thomas F. Wieboldt, Massey Herbarium, Virginia Tech, Blacksburg, VA 24061; phone (540) 231-5746; e-mail: wieboldt@vt.edu.*

ABSTRACT

Hydrocotyle sibthorpioides (Apiaceae) is reported as new to the Texas flora. Introduced species in the East Texas flora, as well as noxious plants and invasive exotics (including four particularly problematic species (*Cuscuta japonica*, *Orobanche ramosa*, *Solanum viarum*, and *Triadica sebifera*) are discussed.

RESUMEN

Hydrocotyle sibthorpioides (Apiaceae) se cita como nueva para la flora de Texas. Se discuten especies introducidas en la flora del Este de Texas, así como plantas nocivas y exóticas invasoras (incluyendo cuatro especies particularmente problemáticas (*Cuscuta japonica*, *Orobanche ramosa*, *Solanum viarum*, y *Triadica sebifera*).

Hydrocotyle is a cosmopolitan genus of approximately 130 species of creeping perennial herbs, including a number grown as ornamental ground covers (Mabberley 1997) or cultivated in water gardens or other aquatic habitats. *Hydrocotyle sibthorpioides* Lam., lawn marsh-pennywort or lawn water-pennywort, is a native of Asia (Mabberley 1987, 1997) but is widely cultivated. The species, usually described as a lawn weed, is naturalized in a number of localities in the eastern United States (Arkansas, Florida, Delaware, Georgia, Indiana, Louisiana, Kentucky, Maryland, New Jersey, North Carolina, Ohio, Pennsylvania, South Carolina, Tennessee, Virginia, and West Virginia) and in California and Hawaii (Gleason & Cronquist 1963; Strausbaugh & Core 1978; Constance 1993; Kartesz 1999; USDA PLANTS Database 2005). It was not reported from Oklahoma (Taylor & Taylor 1994); however, it is reported from both Arkansas and Louisiana (USDA PLANTS Database 2005). Despite this proximity, the species has not been previously reported from Texas (Correll & Johnston 1970; Stanford 1976; Hatch et al. 1990; Jones et al. 1997; Diggs et al. 1999).

A collection made in 2001 in Dallas is apparently the first documented occurrence of this species for Texas.

Voucher specimen: **TEXAS. Dallas Co.:** spreading in landscape, 3511 Overbrook, Dallas, 5 Jun 2001, *B. Lipscomb 3502* (BRIT).

SIDA 21(4): 2449 – 2456. 2005

Since originally observed at the collection locality, the species has persisted and spread in the lawn. Because this plant is low-growing and inconspicuous, particularly when growing with taller grasses, we suspect that it is more widespread in Texas yards and has simply escaped notice. It has likely been intentionally planted into other localities as a ground cover or accidentally introduced with soil, compost, or cultivated plants.

Hydrocotyle sibthorpioides can be recognized by the following description (modified from Gleason & Cronquist 1963, 1991; Radford et al. 1968; Strausbaugh & Core 1978; and Constance 1993). Delicate, glabrous, perennial, terrestrial herb; stems creeping; leaves petiolate, the petioles 0.5–2+ cm long; leaf blades reniform to suborbicular, shallowly 5–7-lobed, 3–12+ mm wide, minutely crenate; umbels simple, capitate, with 3–10 sessile flowers, peduncled, the peduncles 5–15 mm long; flowers sessile, whitish; fruits round, 1–1.5 mm wide. Mar–Sep. Kartesz (1999) listed *H. rotundifolia* Roxb. as a nomenclatural synonym. An illustration (Fig. 1), reprinted from Hiroe and Constance (1958), and a photograph (Fig. 2) are provided.

The five species of *Hydrocotyle* known to occur in Texas can be distinguished using the following key modified from those in Gleason and Cronquist (1963), Radford et al. (1968), Constance (1993), and Diggs et al. (1999):

1. Leaves peltate (= petiole attached to middle of lower surface of leaf blade).
   2. Flowers in a simple umbel (= all flowers in inflorescence attached at the same point) **H. umbellata** L.
   2. Flowers in a branched umbel or in whorls along an inflorescence axis (definitely not all attached at the same point)
      3. Flowers in a branched umbel, with more than 2 branches **H. bonariensis** Lam.
      3. Flowers in whorls along an unbranched inflorescence axis, forming an interrupted spike or spike-like raceme or the axis with only 2 branches **H. verticillata** Thunb.
1. Leaves not peltate, the petiole attached at base of a notch.
   2. Plants aquatic; stems and petioles fleshy; individual flowers and fruits with short but distinct pedicels **H. ranunculoides** L.f.
   2. Plants terrestrial; stems and petioles thread-like; individual flowers and fruits sessile **H. sibthorpioides** Lam.

Hydrocotyle sibthorpioides is yet another introduced species (considered here as those originating outside the United States) added in recent years to the flora of Texas. Such non-native species are variously referred to as alien, exotic, or foreign. Their effects on the Texas flora have been commented upon a number of times in recent years (e.g., Diggs et al. 1999; O'Kennon et al. 1999; see Diggs et al. 2006, in press, for a detailed discussion), and there is growing concern in the state about their potential impacts. Recently (2003), a bill authorizing the Texas Department of Agriculture to publish a list of noxious plants was passed (Hibbs 2003; Texas Parks & Wildlife 2003), and that list is now available on-line (Texas Administrative Code 2005). However, Texas still has no single authority in

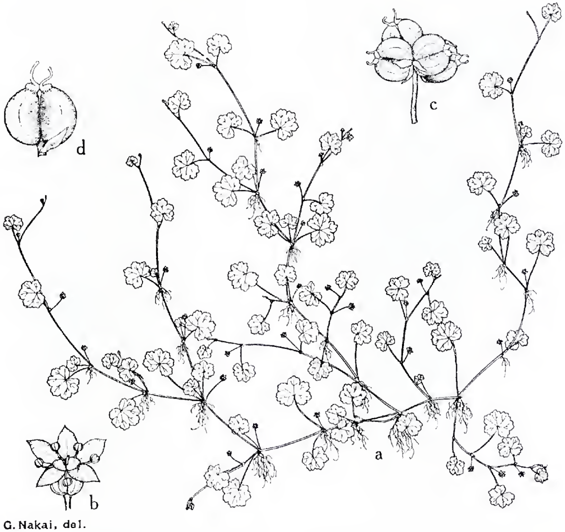

FIG. 1. Habit of *Hydrocotyle sibthorpioides* (reprinted from Hiroe & Constance 1958, fig. 4).

charge of addressing invasive species issues, and detailed policies for effective and coordinated control efforts are still lacking. This deficiency could prove costly to the state in the future, both economically and ecologically. Fortunately, significant attention is now focused on the problem, and a major collaborative conference addressing the issue, the state-wide Texas Invasive Plant Conference (The Pulling Together Initiative), was held in November of this year (TexasInvasives.org 2005).

Data recently obtained for volume one of the *Illustrated Flora of East Texas* (Diggs et al. 2006, in press) indicate that of the 3,402 total species known for East Texas, 619 species or 18% of the East Texas flora are introduced. Unfortunately, very little is known regarding the percentage of Texas' land area covered primarily by such exotics or the percent biomass represented by alien species in a variety of Texas habitats. Certainly vast areas of grazing land and roadsides are vegetated almost exclusively by exotics such as King Ranch

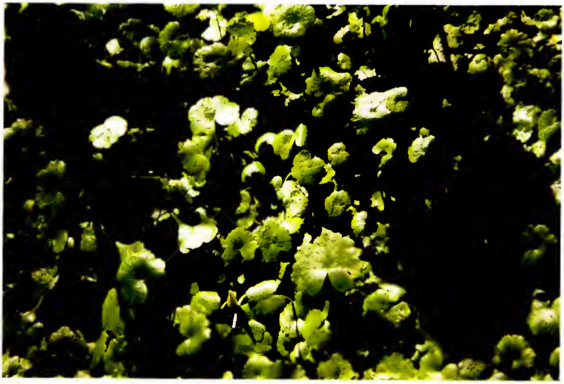

Fig. 2. Photograph of *Hydrocotyle sibthorpioides* (photo by B.L. Lipscomb).

bluestem (*Bothriochloa ischaemum* (L.) Keng var. *songarica* (Rupr. ex Fisch. & C.A. Mey.) Celerier & Harlan), Johnson grass (*Sorghum halepense* (L.) Pers.), Bermuda grass (*Cynodon dactylon* (L.) Pers.), and tall fescue (*Festuca arundinacea* Schreb.). Casual observation and anecdotal evidence would suggest that many other habitats are seriously affected as well. A particularly troubling example is the eastern Asian *Triadica sebifera* (L.) Small [*Sapium sebiferum* (L.) Roxb.], usually known as Chinese tallow tree or as popcorn tree, which has been widely used in landscaping in East Texas, in part because of its brilliant fall color. However, this species is now widely recognized as one of the most serious invasive exotics in East Texas and in the adjacent Gulf Prairies and Marshes (e.g., Barrilleaux & Grace 2000; Keay et al. 2000; Loos 2002). It is particularly problematic in invading and destroying native Coastal Prairie habitats and is showing a rapid increase in sapling populations in some floodplain forests of the Big Thicket National Preserve (Harcombe et al. 1998; Keay et al. 2000). In fact, in areas that had previously been primarily native forest, one can now find large numbers of young individuals of *Triadica sebifera*, sometimes being swarmed over by yet another invader, Japanese climbing fern (*Lygodium japonicum* (Thunb. ex Murray) Sw.).

A table in the *Illustrated Flora of East Texas* (Diggs et al. 2006, in press) lists 41 species recently (since 1997) introduced into East Texas (and new to the state). This listing is almost certainly incomplete, in part because of species discovered since the book went to press. While many of these exotics, such as *Hydrocotyle sibthorpioides*, may be innocuous and present little danger of becoming invasive or otherwise of concern, a number pose serious conservation or economic threats. A weed with the potential to be economically devastating, *Orobanche ramosa* L. (hemp broom-rape or branched broom-rape), is now spreading in the west central part of East Texas and has been reported from at least 22 counties (Texas Cooperative Extension 2003). Recently (2004), it was discovered as far north as Dallas County (J. Quayle, pers. comm.). It is apparently being spread widely by highway mowing equipment. This chlorophyll-less native of southern and central Europe is a well known root parasite of agricultural crops, including bean, cabbage, celery, eggplant, pepper, potato, and sunflower and has the potential to have a significant economic impact in Texas. In heavily infested areas in other parts of the world, hemp broom-rape has been known to cause total crop failure (USDA undated). It is classified as a federal noxious weed (USDA Natural Resources Conservation Service 2002). *Cuscuta japonica* Choisy, Japanese dodder, is another federal noxious weed. Though currently reported in Texas only from Houston (Harris County), there is concern about its possible spread (Camilli 2002; Huber 2002). It is an aggressive parasitic vine which attacks a variety of woody plants and has the potential to have serious ecological and economic consequences if not eradicated. *Solanum viarum* Dunal, tropical soda apple, is yet another federal noxious weed recently reported from Texas (Reed et al. 2004). This perennial, prickly shrub native to Brazil and Argentina is an alternate host to several viral diseases and pathogens that attack other members of the Solanaceae. It is thus a threat to a number of vegetable crops including tomatoes, potatoes, eggplants, and peppers (Byrd et al. 2004). A final well known example is *Salvinia molesta* Mitchell, giant salvinia, a federal noxious weed that in recent years has been found in abundance at Toledo Bend Reservoir on the Texas-Louisiana border (Jacono 1999b) and at numerous other localities in the state. This South American native (Forno & Harley; Forno 1983; U.S. Geologic Survey 2000) is a serious threat to aquatic habitats in Texas (Diggs et al. 2006, in press). Considered "one of the world's worst weeds" (Jacono 1999b), it has been introduced by humans to fresh waters of Africa, Asia, Australia, s Europe, New Zealand, North America, and the South Pacific and has resulted in severe economic and environmental problems (Jacono 1999a, 1999b; Garbari et al. 2000). The plants can grow rapidly, cover the surface of lakes and streams, and form floating mats that shade and crowd out native plants. Additionally, the mats (sometimes to a meter thick) reduce oxygen content, degrade water quality, and can cause physical problems including hindering boats, clogging irrigation and drainage canals, and blocking water intakes (Thomas & Room 1986; Jacono 1999a, 1999b, 1999c; Wood et al. 2001; Moran 2004).

The four species just discussed are among the 29 species currently on the Texas Noxious Plant List (Texas Administrative Code 2005). Unfortunately, among the 619 introduced species documented for East Texas, there are numerous other detrimental exotics that could certainly join them on the list. Further, without major emphasis on prevention, there will almost certainly be additional problematic introduced species added to the Texas flora in the years to come.

ACKNOWLEDGMENTS

We would like to thank Robert George for locating and scanning the illustration and for obtaining a number of references and Guy Nesom and Monique Reed for reviewing the manuscript. We also thank Lorine Gibson for her assistance

ANNOUNCEMENT

2005 Delzie Demaree Travel Award Recipients

The 17th Annual Delzie Demaree Travel Award was presented at the 52nd Annual Systematics Symposium (7–11 Oct 2005) at the Missouri Botanical Garden. Three students were presented the Travel Award: **Mario Blanco**, University of Florida; **Pedro Fiaschi**, Virginia Commonwealth University; and **Lina S. Juswara**, Ohio State University.

The 2005 Travel Awards were underwritten by **1)** Delzie Demaree Travel Award Endowment, **2)** Members of the Delzie Demaree Travel Award Committee, and **3)** John Clayton Chapter of the Virginia Native Plant Society.

Anyone interested in making a contribution to Delzie Demaree Endowment Fund, which supports the travel award, may make contributions by VISA or MasterCard or by a check, payable to Botanical Research Institute of Texas, to Barney Lipscomb, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A. 1-817-332-7432; Email: barney@brit.org. Thank you.

2006 Applications for the Delzie Demaree Travel Award

Applications for the 2006 Delzie Demaree Travel Award should include a letter from the applicant telling how symposium attendance will benefit his/her graduate work and letter of recommendation sent by the major professor. Please send letters of application to: Dr. Donna M.E. Ware, P.O. Box 8795, Herbarium, Biology Department, The College of William and Mary, Williamsburg, VA 23185-8795, U.S.A. 1-757-221-2799; Email: ddmware@wm.edu. The period for receiving applications will end three weeks prior to the date of the symposium if a sufficient number of applications are in hand at that time. Anyone wishing to apply after that date should inquire whether applications are still being accepted before applying. The Systematics Symposium dates for 2006 are 13–14 October.

The Delzie Demaree Travel Award was established in 1988 honoring **Delzie Demaree** who attended 35 out of a possible 36 symposia before he died in 1987. Delzie Demaree was a frontier botanist, explorer, discoverer, and teacher. His teaching career as a botanist began in Arkansas at Hendrix College in 1922. He also taught botany at the University of Arkansas, Navajo Indian School, Yale School of Forestry, Arkansas A&M and Arkansas State University at Jonesboro where in retired as professor emeritus in 1953. On of the things he enjoyed most as a botanist was assisting students with their field botany research.

BOOK REVIEWS

MARY PRATT. 2005. **Practical Science for Gardeners.** (ISBN 88192-718-X, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $24.95, 175 pp., b/w drawings, conversion chart, appendices, glossary, index, 6" × 9".

In *Practical Science for Gardeners*, Mary Pratt gives the reader some of the science behind common and successful gardening practices. This book will be especially interesting for gardening enthusiasts that may not have any botanical background. The book is written in a very conversational style with clever chapter titles such as "Nature arms race and how to negotiate a peace deal," for the chapter discussing weeds, pests and methods of control. This relaxed little science book can be thought of as horticulture "lite," offering the reader a simplified scientific rationale for why some common practices are effective and others are not. Pratt also includes quite a bit of personal charm and relates some her personal gardening strategies.

Chapters include information on basic cellular building blocks, plant anatomy, plant hormonal chemistry, soil science, pest control, biodiversity, basic genetics, genetically modified plants, plant classification and plant species naming. After reading the information within these chapters, readers will understand the answers to many important gardening questions including: which nutrients do what in a plant, the benefits of different fertilizer nutrient ratios, why light and placement are so important to plants, what happens when plants are water stressed, processes that occur in a seed during germination, ways to determine plant nutrient deficiencies, the importance of biodiversity in the garden, what soil pH is, and how to correct improper soil pH, what are some integrated pest management and biocontrol strategies, and what does genetically modified mean.

Chapters are presented in a way to help readers apply the scientific information discussed to practical garden uses. Each chapter includes a number of boxes that provide gardening suggestions related to scientific or research information just presented. These suggestions include some practical information for solving or preventing garden problems. For instance, after reading the information on hormones and their functions in the plant, a gardening suggestions box includes information on how to ripen tomatoes, and the effects of pruning plants. Pratt also suggests books for further reading on topics presented in each chapter. Important words within each chapter are bolded, and many of these bolded words are defined in a glossary found at the end of the text.

This book will be of particular important for British gardeners. Although the information presented in the chapter on biodiversity is applicable to many environments, the examples and suggested species given are specific for the UK. One theory of succession, climax theory, is presented and the development of woodland, grasslands and wetlands gardening habitats are discussed. A variety of gardening strategies for success and suggested species are included in the discussion on each of these gardening habitats. Readers outside of the UK be cautious in using the species suggested, what does well in one area, may be an aggressive invasive in another (Eurasian Milfoil, *Myriophyllum spicatum*, for example).

Practical Science for Gardeners is an easy and enjoyable read, and can be a useful book for gardeners interested in learning the science behind successful gardening practices. Practical Science for Gardeners presents a cursory overview of plant and horticultural science behind gardening that should encourage readers to learn more of the science on topics of interest to them; the author has thoughtfully included suggestions for more advance reading by chapter topic. The information is presented in a way that encourages the reader think about why garden practices may or not be valid.

Pick up a copy of Mary Pratt's *Practical Science for Gardeners*; reading it will be like enjoying a conversation over the fence with well-informed gardening neighbor.—*Lee Luckeydoo, Herbarium, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

BEN-ERIK VAN WYK. 2005. **Food Plants of the World.** (ISBN 0-88192-743-0, hbk.). Timber Press Inc. 133 S.W. Second Ave, Suite 450, Portland, OR 97204-3527, U.S.A. (**Orders:** www.timberpress.com, mail@timberpress.com, 503-227-2878, 1-800-327-5680, 503-227-3070 fax). $39.95, 480 pp., many color photos, 6 1/2" × 9 1/2".

Have you ever looked at unfamiliar produce, beans, grains, or spices in the groceries and asked yourself—What is that, where does it originate from, and more importantly, what parts can you eat and what preparation is needed? Author Ben-Erik van Wyk has provided the answers to such questions in his book, *Food Plants of the World*. van Wyk, has constructed a food plant encyclopedia, listing information on 354 food plants and their close relatives, complete with fantastic color photographs. *Food Plants of the World* would be a great resource for food scientists and epicures alike.

The first section of the book lists primary crops by regions: i.e. central Asia, Africa, etc. This is followed by major food categories, such as cereals, pulses, fruits, vegetables, herb, sugars, beverage plants, spices and flavors. Descriptions of the major food categories include information on general anatomy, basics on processing and cooking, and other interesting facts. Within each food category, are lists of the "main" plants by common names, followed by the scientific names. This list of primary foods in the category is important as a quick reference to determine the scientific name of common foods, although common names are also found in the index. The author has included some intriguing color photographs of foods within a category with common names in the captions, for instance for cereals, the photograph shows lines of different grains. Note that the author admittedly uses the labels of fruit and vegetable in the "grocery," not in the botanical sense.

The bulk of the text is the food plant "encyclopedia" in alphabetical order by specific epithet. Each food entry contains vibrant color images of the plant, as well as the edible portions. Following the food photographs, are descriptions including the plant description, origin and history, parts consumed, cultivation and harvesting, uses, nutritional value, assorted notes, common names in various languages and the family to which the species belongs. The descriptions are very thorough and the common names in multiple languages can be very helpful when shopping in different groceries or markets for foods and spices.

The author has included handy references after the food encyclopedia. The first is a section discussing the structure and function of nutrient compounds. The chemical structures of various sugars, starches, fats, proteins, vitamins and minerals are included in the discussion. The descriptions of the different structures describe a small portion of the chemistry of how the body processes such molecules and compounds, and often, the author has provided a little information on the food sources that many of the various compounds are derived from. The second reference included is a quick guide to commercialized food plants, with common name, edible portions, country of origin, and base nutritional values. The remaining items include a glossary, further reading section, and index.

Food Plants of the World by Ben-Erik van Wyk is highly recommended for those in food sciences or anyone with a general interest in learning more about the foods consumed around the world. The text is thorough and sharp, and the color photographs are fantastic in helping to visualize the plant in the field and the edible portions. This could be a wonderful reference book or gift for cooks, horticultural students or "foodies" in general. Definitely a book worth a look!—*Lee Luckeydoo, Herbarium, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

Jan Wrede. 2005. **Trees, Shrubs, and Vines of the Texas Hill Country.** (ISBN 1-58544-426-X, pbk.). Louise Lindsey Merick Natural Environment series; no. 39. Texas A&M University Press, John H. Lindsey Bldg., Lewis St. 4354 TAMU, College Station, TX 77843-4354, U.S.A. (**Orders:** wlawrence@tamu.edu, http://www.tamu.edu/upress, 800-826-8911). $23.00 hbk., 246 pp., color photos, index, 5 3/4" × 8 1/2".

Each of 126 species is illustrated by at least one color photograph. A short morphological description is provided for each species with a brief commentary on aspects of its biology, growth characteristics, and uses (for landscape and for wildlife forage and habitat). Within gymnosperms, dicots, and monocots the species are arranged alphabetically by family, genus, and species, one species per page. The first one-fifth of the book includes nicely written sections on red cedar management, healthy streams, benefits of native species, landscaping with woody plants, and invasive species. At the end are appendices with information on native plant nurseries and demonstration gardens and other resources for native plants. A multi-page chart gives "color or aroma," "season," "potential height," "site preference," and "wildlife uses" for 117 native species. The book surely will quickly be in the hands of many residents of central Texas and will be much used and valued. It potentially provides a great service toward Hill Country conservation.

For identification of woody plants, Wrede's book is the successor of Daniel Lynch's *Native & Naturalized Woody Plants of Austin & the Hill Country* (1981) and could have supplanted it. Surprisingly, though, the newer book does not include a large set of Hill Country species treated and illustrated in the earlier one: *Ageratina (Eupatorium) havanensis, Ampelopsis arborea, Ampelopsis cordata, Andrachne phyllanthoides, Berchemia scandens, Bernardia myricifolia, Buddleja racemosa, Castela texana, Catalpa speciosa, Ephedra antisyphyllitica, Ficus carica, Fraxinus pennsylvanica, Galphimia (Thryallis) angustifolia, Juglans nigra, Ligustrum sinense, Mimosa biuncifera, Nicotiana glauca, Pavonia lasiopetala, Populus alba, Prunus caroliniana, Prunus mexicana, Quercus macrocarpa, Quercus sinuata, Rosa bracteata, Sesbania drummondii, Symphoricarpos orbiculatus, Thamnosma texana, Ulmus americana.*

Among further Hill Country omissions, more conspicuous and interesting are these. *Amorpha roemeriana, Convolvulus arvensis, Condalia viridis, Croton texensis var. alabamensis, Dalea formosa, Diospyros virginiana, Forestiera reticulata, Juglans major, Ligustrum lucidum, Ligustrum quihoui, Matelea edwardsensis, Mimosa texana, Parthenocissus heptaphylla, Passiflora incarnata, Rubus bifrons, Salix exigua, Salvia ballotiflora.* Also not included are *Opuntia engelmannii* (the most common Hill Country species of prickly pear, the Texas state plant), *O. imbricata, O. davisii, O. macrorhiza*, and *O. phaeacantha*. Hawthorns are treated as "*Crataegus* sp.," acceding to the myth that "The taxonomy of the Hill Country *Crataegus* is uncertain," and continuing "and there may be several species that are very hard to separate, so all can be conveniently treated as one." *Crataegus crus-galli, C. greggiana, C. reverchonii, C. tracyi, C. turnerorum, C. uvaldensis*, and *C. viridis* are Hill Country species and are no more difficult to identify than the *Prunus* species. The smaller photo (p. 148) shows *C. crus-galli*, the larger *C. tracyi*. Finally, in view of the lengthy and useful discussion of cedar management (all presumably assumed to be *Juniperus ashei*), at least a mention of *J. pinchotii* and *J. virginiana* would have been appropriate, although neither is abundant in the Hill Country.—*Guy Nesom and Bob O'Kennon, Botanical Research Institute of Texas, Fort Worth, TX, 76012-4060, U.S.A.*

Dariusz L. Szlachetko, Piotr Rutkowski, and Joanna Mytnik. 2005. **Contributions to the Taxonomic Revision of the Subtribes *Spiranthinae*, *Stenorrhynchidinae* and *Cyclopogoninae* (Orchidaceae) in Mesoamerica and the Antilles.** (ISBN 83-89648-18-0, pbk.; ISSN 0867-0730). Polish Botanical Studies 20. IB Publisher, Polish Academy of Sciences, W. Szafer Institute of Botany, Lubicz 46, PL-31-512 Krakow, POLAND. (**Orders:** ed-office@ib-pan.krakow.pl). Euro 90,00; ca. USD $105.46, 387 pp. 646 figures (including maps, types, line drawings, and color plates), 17 × 24 cm.

This long-awaited publication by Szlachetko and his associates is a major contribution to the taxonomy and distribution of these three Spiranthoid subtribes. Treating 170 species in 35 genera, it is copiously illustrated with not only maps for each species but diagnostic morphological line drawings, photographs of type specimens, and a sprinkling of color plates and is an excellent reference for those interested in this particular group of orchids. Covering Mexico, Central America, and the Antilles many species are also found in the United States in Florida, southwestern Texas, southern New Mexico, and southeastern Arizona. Each genus is heavily referenced and although several newer genera and new combinations are used ten pages of cross-referenced synonyms are given.

The are two negative aspects of the volume. The lack of a general index, although the aforementioned synonyms are helpful in locating current treatments, requires going back and forth from the Table of Contents to the synonyms; the arrangements of genera and species is by subtribes and not alphabetical. Following what unfortunately appears to be a trend in publications on this region, when species are also found in the adjacent United States the information on them is either lacking or erroneous, primarily because it is based up work done more than 25 years ago. For some reason distributional work presented in several recent major North American publications works was not consulted.

Significant corrections that should be made concerning US distribution would include:

Pages 14–17: *Mesadenus polyanthus* (Reichenbach f.) Schlecter listed for USA and is not found here, whereas *M. lucayanus* (Britton) Schlecter is not listed for the USA and is present in Florida.

Pages 146–153: The treatment of *Sacoila squamulosa* at any rank or synonym is curiously missing. Szlachetko has treated in other publications as *S. lanceolata* var. *squamulosa*. It is present throughout much of the range of the work as well as in central Florida.

Pages 209–210: *Schiedeella fauci-sanguinea* (Dod) Burns-Balogh is listed erroneously for USA and figure 351 is *Schiedeella arizonica* P.M. Brown photographed by C. Luer in Arizona and known from the USA in southwestern Arizona and western Texas.

Page 229: *Funkiella confusa* (Garay) Szlachetko, Rutkowski, and Mytnik (syn. *Deiregyne confusa* Garay) omits USA (Texas) from the range whereas *F. durangensis* (Ames & C. Schweinfurth) Szlachetko on page 232 is listed for USA but does not occur there.

Page 299: *Cyclopogon elatus* (Swartz) Schlecter omits USA (Florida) from the range.

Page 302: *Cyclopogon cranichoides* (Grisebach) Schlecter omits USA (Florida) from the range.

Page 313: *Pelexia adnata* (Swartz) Poiteau ex Richard omits USA (Florida) from the range.

Supporting documentation for all of the above may be found in the appropriate generic treatments within the Orchidaceae, *Flora of North America*, volume 26.—*Paul Martin Brown, Ocala, FL 34481 U.S.A., naorchid@aol.com*

MARGARET MEE. 2004. **Margaret Mee's Amazon: Diaries of an Artist Explorer.** (ISBN 1-85149-454-5, hbk.). Antique Collectors' Club in association with The Royal Botanic Gardens, Kew, Sandy Lane, Old Martlesham, Woodbridge, Suffolk, IP12 4SD, UK. (**Orders:** www.antiquecollectorsclub.com, 01394-389950, 01394-389999 fax, email info@antique-acc.com). $59.50, 319 pp., water color paintings, 9 1/2" × 11 1/2".

Some books are a slow read, this was one. Not because it was boring...hardly! Encounters with snakes, armed poachers, malaria, electric eels, and storms, read as high adventure, to say the least. What made the book a slow read was that the book is also an art book, filled with full-page botanical paintings of Margaret Mee, the writer/artist/adventurer who journeyed to the Amazon to paint the rare and unknown flowers indigenous to the region. The reader is faced with the choice, at every turn of the page; do I read the wild story or do I gaze at the magnificent art? It is impossible to do both. The complex, otherworldly plants of the Amazon are executed in such exacting detail, you must pause and stare, thus forgetting about the story you were reading. Yet the adventure the artist recounts of hunting plants via dugout canoe, is so compelling, you dare not slow down to study the life-like paintings.

Margaret Mee's Amazon Diaries of an Artist Explorer is a hefty book bursting with big reproductions of her finished watercolors, intimate small sketches, studies done quickly 'in situ,' and photographs documenting the people met and the places visited. She recorded triumphs large and small, "I swam in the black water of the river, fearful of the currents, and went collecting in a dugout canoe with two young Indian boys. Gilberto climbed high in a tree, and from a rotting branch, which I feared would fall upon him, threw down a strange bromeliad which I had seen from afar the plant was not in flower, but I had no doubt that this was a new species."

Mee did not begin her travels deep into the fertile rainforests until the age of forty-seven. She continued until seventy-six. So focused was she on her mission to document the flora of the vanishing Amazon, that she would often return to a distant outpost, where a rare plant had been spotted months earlier, just for the opportunity to record it in bloom.

Ever focused on her mission to paint rare and unknown species, she brushed off the misery of mosquitoes, hunger, humidity and drenching rains. The artist writes in her diary of finding *Acacallis cyanea*—the blue orchid. "I walked until I was exhausted, wading through streams and then, with soaking canvas shoes, ploughed through black, swampy ground. But I was delighted with the results of my journey, for I had material for many paintings."

Margaret Mee when conditions favored such, set up an easel and painted, she also painted seated in the bottom of a rocking canoe, and when approaching dusk made either method of painting difficult, plants were piled into the bottom of the boat and painted later. She rendered the most complex of plants with a deft hand, explaining away the unfavorable conditions matter-of-factly, "the flowers fell in golden showers as I unraveled the tendrils. I painted the plant seated in the boat as we moved upstream, for vine flowers are delicate and ephemeral."

Her work combines the rare ability to commit to paper, the strictest botanical detail of a plant, while at the same time, imbuing it with artistry. Her will and determination triumphed in a series of paintings of the Moonflower, which blooms briefly and only at night. She set up an all night vigil to witness the opening of the night bloomer. As it unfurled she painting furiously, by torchlight...until daybreak, at which time the ephemeral flower withered and was no more. The resulting body of work represents the only known images of the nocturnal beauty.

Place this book at your nightstand. Read the wild adventure of this tireless explorer or gaze at the magnificent paintings of a brilliant botanical artist ...or do both. You will be lured back to it nightly, like a moth to a Moonflower.

Cynthia Padilla, National instructor of botanical arts and naturalist illustration is sought out for research projects, reviews, commissioned plant portraits, workshops, and as a travel leader on sketching tours. http://www.botanicalart.50megs.com/ Join other botanical arts and natural science enthusiasts at: http://groups.yahoo.com/group/botanicalart

DAVID R. FOSTER and JOHN D. ABER. 2004. **Forests in Time: The Environmental Consequences of 1,000 years of change in New England.** (ISBN 0-300-09235-0, hbk.). Yale University Press, 302 Temple Street, P.O. Box 209040, New Haven CT 06520-9040, U.S.A. (**Orders:** www.yale.edu/yup, 203-432-0960, 203-432-0948 fax). $45.00, 447 pp., b/w figures, tables, index, bibliography, contributors, bibliographic essay, 6" × 9 1/4".

The book, *Forests in Time*, is composed of essays by multiple authors that discusses the history of a New England forest. Harvard University acquired nearly 3,000 acres to establish the Harvard Forest, a study site located in Petersham, Massachusetts, as an area to conduct ecological research. The authors stated that in order to understand current environmental issues, one must understand the history of a particular area. This book was easy to read, and provided graphs and tables to help the reader understand the ecological changes of a forest, although some of these graphs were harder to interpret than others. The authors use of detailed pictures throughout the book helps the reader develop a better perspective of how this forest changed through time. The book is divided into five main sections: background to ecological studies, regional history, modern forest landscape, understanding forest ecosystems, and lessons learned from this study.

The **first section** introduces readers to the ecological studies, conducted in the forest study site, and the reasons for Long Term Ecological Research (LTER). The text helps readers understand that landscape change occurs in response to environmental, anthropogenic, and biological factors. The landscape changes are studied at four spatial scales: site, landscape, sub-region, and region. Each of these spatial scales are affected by hydrology, humans, vegetation, and the biogeochemistry of the ecosystems. Because trees have long generation times, long-term studies must be conducted in order to understand any changes that occur.

The **second section** describes historical changes of the forest. The Harvard Forest landscape has seen a variety of changes in time: from being a tundra, boreal forest, and temperate forest at some point in its life. These changes occurred through natural (wind, pests, and fire), as well as anthropogenic (Native American) disturbances.

The **third section** explains how historical land use can affect species richness (number of species present) and species composition both directly and indirectly. The influence of several historical and modern factors were tested at the Montague Plain and Prospect Hill including prior land uses that can alter the soil organic matter and nutrient storage availability of the soil. The authors used several graphs to support the change in abundance of specific plants at each site and the effects of land-use history. These graphs showed a strong correlation between the carbon to nitrogen ratio and nitrification in forest soils with different land-use histories. Studies on the long term influences between the forest and atmosphere were performed. The forest removes more ozone than the atmosphere, and appeared to have a more considerable influence than urban areas or ecosystems composed of smaller vegetation. All of these changes have worked in creating the present forest ecosystem.

The **fourth section** discusses research conducted to understand forest ecosystems through long-term studies. Scientists conducted several research experiments designed to simulate hurricane affects on forest ecosystems, the process of nitrogen saturation, soil warming, and litter and root influences on soil This research allows for long term study of these various effects. There were several controls used throughout the experiments: nutrient fluctuation, "ecophysiological performance, population dynamics, vegetation structure, and ecosystem productivity."

The **fifth section** and conclusion reviewed lessons learned from research done in the forest. This research is leading to a better understanding of forest systems and ideas to improve land conservation. The land and forest are constantly changing, and people that manage this land need to "find ways to incorporate landscape change into long term planning". This constant change proves that in natural systems, such as the forest, long term studies must be conducted because they help to develop better conservation objectives.

This book was very interesting, and will help readers understand the importance of long term ecological research. This book was written in a way that it is easy for those new to science and ecology to understand. It is recommended to persons interested in New England terrestrial ecology, disturbance effects on forest structure, and long-term research locations.—*Keri McNew, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

DOUGLAS E. SOLTIS, PAMELA S. SOLTIS, PETER K. ENDRESS, and MARK W. CHASE. 2005. **Phylogeny and Evolution of Angiosperms.** (ISBN 0-87893-817-6, pbk.) Sinauer Associates, 23 Plumtree Rd, Sunderland, MA 01375-0407, U.S.A., (**Orders:** 413-549-1118 fax; orders@sinauer.com; www.sinauer.com). $59.95, 370 pp., numerous b&w figures, 8 1/2" × 11".

Rare is the book that has you cursing its basic tenets and thesis, yet draws you to explore it often. This is such a book. In many ways, it is already a classic. So you might as well buy a copy and place it within easy reach next to Cronquist's *Integrated System*.

In essence, *Phylogeny and Evolution of Angiosperms* is the magnum opus of the Angiosperm Phylogeny Group (APG). Although the authors' style is somewhat detached, as if to explain the actions of the APG as a third party, they are actually movers and shakers of the APG. They know its workings and conclusions from the ground up. Although leaders in the field of angiosperm molecular systematics, they are all classically trained, mostly in the 1970s and are well versed in plant morphology. This fact is evident in the text, and that is the reason for my oxymoronic relationship with this book.

Organization of the chapters is such that they fall into three natural sections. Chapters 1 and 2 provide general background and concepts. Chapters 3 to 9 are detailed accounts of molecular support and morphological characteristics of the major segments of the APG classification (sequentially, the basal angiosperms, monocots, basal eudicots, peripheral core eudicots, caryophyllids, rosids, and asterids. Chapters 10–13 examine the application of the APG classification to problems and concepts of evolutionary diversification across the angiosperms.

Why I love this book:

It is a readable and elaborated explanation of the current APG classification. Besides incorporating new publications to update APG II, the authors present new analyses to answer questions raised during the composition of the book itself.

Not only do the authors put the APG cladogram into words, but they also characterize the morphology of the taxa (especially orders) recognized in the APG classification. In particular, they report any synapomorphies that corroborate the molecularly defined clades. This is especially helpful in cases with morphologically divergent taxa that are united on molecular grounds. The authors are to be commended for a writing style that keeps this material from becoming tedious.

- The book is a gold mine of data and references, citing both recent molecular and morphological studies. Combined with Cronquist's *Integrated System*, it provides a commanding window into the comparative literature on angiosperms.
- It summarizes many new insights into genomics, morphogenetics, and the regulation of gene expression. In short, it is a great resource for keeping up-to-date.

Why I hate loving *Phylogeny and Evolution of Angiosperms*:

- I thoroughly disagree with the philosophical basis of the authors' conclusions. This philosophy is: "DNA sequence similarity is the ace that trumps all." The last section of each characterized taxonomic group is devoted to a discussion of "Character Evolution." Likewise, the last four chapters examine general trends across angiosperms. In these discussions, every morphological character that is discussed is evaluated for homology by its distribution on the molecular cladogram—no exceptions. Am I uneducated or simply prudent enough not to jump on this latest bandwagon? Is one to believe that a sample of three genes (two of which are plastid metabolic genes) adequately sample the genome of angiosperms? Even for the subclades based on as many as seven genes, is that an adequate sample? Given how little is known about gene regulation, expression of phenotype, and interaction of the genome with the proteonome (especially that carried through the egg cell), such sweeping conclusions are premature, at best, and potentially disruptive and destabilizing to systematics. Indeed, the DNA is information that contains messages in much the same way that language composed of symbols does. Is not the basing of our classification on the comparisons of nucleotide matches much the same as saying we have translated a message by simply analyzing the occurrence frequency of letters in the message?

So what should a classically trained botanist do with this book? Obtain a copy; use it to keep up-to-date with this bandwagon and perhaps launch your own research projects. Refer to it often as you read molecular or other systematic papers. Use it to memorize the APG classification to be conversant with molecular systematists.

I can imagine that others may hate to love this book for other reasons. What if you are a molecular biologist with limited background in morphology? Obtain a copy, smugly agreeing with the APG classification. Then, force yourself to learn the morphology so skillfully introduced in the book.

Could it be that the authors, too, will come to hate to love their own book? On page 19 they say, "A new paradigm is needed to promote further progress in seed plant relationships in general and angiosperm origins in particular. Given the direction that the molecular and genetic data are taking us, this new paradigm may be much more radical than even the authors suppose.

Why will you hate loving *Phylogeny and Evolution of Angiosperms*?—*Roger W. Sanders, Research Associate, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A., rsanders@brit.org.*

BIENNIAL REPORT AND UPDATE 2004–2005

SIDA, CONTRIBUTIONS TO BOTANY
Source of current research in classical and modern
systematic botany for readers throughout the world
...bringing out the best in botanical science for plant conservation and education

To all authors, we thank you for choosing *Sida, Contributions to Botany* as your forum to disseminate information and knowledge gained by scientific inquiry. Volume 21 is the largest volume of SIDA ever published. SIDA is published twice a year. Volume 21 has 2511 pages, 290 authors, 224 published contributions, and includes 237 new names and new combinations. Published papers are available online in Adobe Acrobat format (PDF files); the PDF files are true representations of the hard copy of SIDA <*http://www.brit.org/sida/SCBCurIssue.htm*>.

A word of thanks to the 298 individuals acknowledged on pages 2469–2470, who generously supported SIDA through their time and expertise in reviewing 227 manuscripts submitted for volume 21. All manuscript submissions are peer-reviewed by distinguished reviewers; your support is deeply appreciated. If by chance you reviewed a manuscript and your name was left out, the error rests solely on the shoulders of this editor and I truly apologize. Please bring any omissions to my attention.

Below are the dates of publication for each of the four issues of volume 21, subscriptions for calendar year 2006, and distribution of SIDA. We also bring to your attention (see page 2468) the *Mary M. Hennen Scientific Publications Endowment,* established to provide support to the future of BRIT's scientific publication program (*Sida, Contributions to Botany* and *Sida, Botanical Miscellany*). The index to volume 21 (2004–2005 follows and the issue concludes with a printed copy of the current guidelines to contributors. The online version is at *http://www.brit.org/sida/SubmitPaper.htm*.

We thank all authors, reviewers, subscribers (individuals, institutions, organizations), and readers for your continued interest and support. It is our plan to continue bringing you the best sources of current research in classical and modern systematics with your continued support. Wishing you the best in 2006 and beyond.—**Barney Lipscomb** (BRIT), Editor; **John W. Thieret** (NKU), Associate Editor; and **Félix Llamas** (LEB), Contributing Spanish Editor.

Dates of publication

21(1), pp. 1–510: 20 August 2004
21(2), pp. 511–1248: 28 December 2004
21(3), pp. 1249–1954: 5 August 2005
21(4), pp. 1955–2511: 21 December 2005

Subscriptions and distribution.—Sida is distributed in over 90 countries. There are 860 subscriptions, 345 domestic and 515 foreign. Brazil has the most subscribers (38) outside of the U.S.A. Sida is available through paid subscription or scholarly exchange. Online information is available at *http://www.brit.org/sida/subscriptions.htm*.

Annual subscription rates for Sida, Contributions to Botany for 2006.

Domestic (USA only)

1) Subscribing institutions (universities, libraries, and other institutes including agents)	**$75.00**
2) Individual personal subscriptions	**$39.00**

Outside the USA

1) Subscribing institutions (universities, libraries, and other institutes including agents)	**$85.00**
2) Individual personal subscriptions	**$39.00**

Mary M. Hennen Scientific Publications Endowment Established.—In honor of his wife, **Mary**, BRIT research associate, professor emeritus of botany at Purdue University, the world's pre-eminent authority on the systematics and biogeography of the rust fungi, **Joe Hennen** has established the *Mary M. Hennen Scientific Publications Endowment* to provide support to the future of BRIT's scientific publication program (*Sida, Contributions to Botany* and *Sida, Botanical Miscellany*). Joe and Mary (life-science librarian at Purdue University) have long recognized that publication of scientific botanical information is an integral part of conserving our natural heritage.

Every gift to the endowment will make a difference for the future of *Sida* and *Sida, Bot. Misc.* There are many different ways to make a gift; use a credit card, give a check, stock, pledge, bequest, trust, memorials, employer/employee matching contributions, installments, etc. The BRIT Press seeks your support to ensure innovation and excellence in preparation, manufacture, and distribution of botanical research and scientific discoveries for the twenty-first century. For more information about the BRIT Press or anyone interested in making a contribution to the *Mary M. Hennen Scientific Publications Endowment*—which supports *Sida* and *Sida, Bot. Misc.*—contact **Barney Lipscomb** at the Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, Texas 76102-4060, U.S.A.; 817-332-7432; barney@brit.org; sida@brit.org.

SIDA GUIDELINES FOR CONTRIBUTORS

Sida home page: *http://www.brit.org/sida/*
Guidelines: http://www.brit.org/Sida/SubmitPaper.htm

Sida, Contributions to Botany (ISSN 0036-1488) is an international journal of systematic botany containing primary research papers sensu lato, including anatomy, biogeography, chemotaxonomy, cladistics, ecology, floristics, genetics & evolution, numerical taxonomy, paleobotany, and palynology. *Sida* is open to all authors anywhere; coverage is not restricted to any geographical area.

All manuscripts submitted to *Sida* are considered by at least two reviewers. Manuscripts may be submitted in English or Spanish. Page costs are $35 per page but may be waived or reduced under certain circumstances. Please contact the editor and make arrangements before publication. Manuscripts are not rejected due to lack of financial support. Submit manuscripts and editorial questions to Barney Lipscomb, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TEXAS 76102-4060, U.S.A. Phones: 1-817-332-4441 voice; 1-817-332-4112 fax. Our electronic mail address is sida@brit.org. Access *Sida* home page at *www/brit.org/sida.*

Submissions: Please submit manuscripts in electronic format as an email attachment. If you wish submissions are also accepted by USPS mail with a single hard copy and on computer disk. Figures/illustrations may be submitted in low-resolution format (**jpgs**) as email attachments for review purposes only. Upon acceptance for publication, the manuscript may be submitted as an email attachment or returned in the mail with a single hard copy and an electronic copy. If you have figures/illustrations in electronic format they should be submitted in **tif** format, scanned at the absolute best quality possible. Digital figures may have to be submitted on a CD-ROM disk if they are too large for email. Typically b/w line drawings should be scanned at 600 dpi or higher and b/w half tones and color photos at 300 dpi. If you need your figures/illustrations digitized, the editorial staff at *Sida* will be happy handle any electronic digitization needs you have; all original material can be returned if requested. Color digitization works best from color transparencies (slides).

Consult the latest issue of *Sida* for format of articles and notes regarding title, author, and address. Ranges of numbers are separated by double hyphens (6--8) OR use an en dash (–). Footnotes, figure legends, appendices, and tables should be on separate pages and inserted at end of manuscript following references. Authors are encouraged to use the APG families, nearly all of which are on / APweb/ which can be accessed through the Missouri Botanical Garden research site (Angiosperm phylogeny).

Abstract

Every paper should include both an English and Spanish, or another major language abstract.

Specimen Citations

Label information should be followed for specimen citations in whatever language. Follow whatever unit if measure is provided on the label (metric or English). Use the collector's last name (or full name) and number or (s.n) and *italicize*. Abbreviate the months of the year by the first three letters of the month without a period. Example: Texas. Jeff Davis Co.: 1 mi W of Fort Davis, 3 Jan 1972, *Smith 118* (BRIT). Example: **BRAZIL. Bahia:** Serra da Agua de Rega, 23 km N of Seabra, road to Agua de Rega, ca. 1000 m, 24 Feb 1971 (fr), *Irwin et al. 30894* (HB, MBM, MO, NY).

Author Citations

Use the author abbreviations as given in the *Author Abbreviations* compiled at the Herbarium, Royal Botanic Gardens, Kew (1992). Use et or the ampersand (&) between two authors; for more than two authors, restrict to the first one followed by et al. Do not *italicize* or underline in the manuscript the terms et, et al., ex, or in.

Plant names in the text should include authorship or clearly state the botanical nomenclature being followed.

Latin Descriptions or Diagnoses; English Descriptions

Please provide a Latin diagnosis for each new taxon. After the Latin diagnosis, an English or Spanish version is recommended highlighting the diagnostic characters. Write plant descriptions as incomplete sentences with phrases separated by semicolons.

Figures

Please present ALL figures (maps included) as a unified, single sequence of figures. A scale should be in or on the illustration or photograph; reduction will automatically reduce the scale and subject proportionately. In halftones, sharp glossy photographs with good contrast are necessary for good reproduction. Please mount illustrative material (halftones, line drawings, etc.) on flexible paper so that may be mounted and on a high-speed drum scanner if need. You may also submit graphic materials in electronic format. Typically b/w line drawings should be scanned at 600 dpi or higher and b/w half tones and color photos at 300 dpi. Please consult the editor for additional information if need. Color figures can be used and an additional cost maybe charged. Color digitization works best from color transparencies (slides). Please submit color prints for reviewing purposes.

References

This includes all of the literature cited in the text and may include other article citations the author may deem desirable. Normal text references should be cited as follows: 'Ricketson and Pipoly (1997) stated...' or 'the latest revision (Ricketson & Pipoly 1997)' when reference is used as authority for a statement. When there are three or more authors use only the name of the first author followed by et al.. 'Barrie et al. (1992a) stated'. References at the end of the article are arranged alphabetically and chronologically making use of a,b, etc. if an author had more than one publication in a given year. Author's names are printed in Cap/small caps, NOT ALL CAPS, please type author names in Cap/small cap or in Cap/lower case except for initial capitals. Only the first letter of the initial word, proper nouns, and proper adjectives of titles should be capitalized. Please note there is no space between initials of authors. For journal abbreviations, use *Botanico-Periodicum-Huntianum*. Reference examples:

Barrie, F.R., C.E. Jarvis, and J.L. Reveal. 1992a. The need to change Article 8.3 of the Code. Taxon 41:508—512.

Ricketson, J. and J. Pipoly. 1997. A synopsis of the genus *Gentlea* (Myrsinaceae) and a key to the genera of Myrsinaceae in Mesoamerica. Sida 17:697—707. [author's names in cap/lower case]

Crawford, D.J. 1983. Phylogenetic and systematic inferences from electrophoretic studies. In: S.D. Tanksley and T.J. Orton, eds. Isozymes in plant genetics and breeding, Part A. Elsevier, Amsterdam. Pp. 257—287. [author's names in cap/small cap]

Sivinski, R.C. and K. Lightfoot (eds.). 1995. Inventory of rare and endangered plants of New Mexico. New Mexico Forestry and Resources Conservation Division. Energy, Minerals and Natural Resources Department. Misc. Pub. No. 4.

SIDA 21(4): 2510. 2005

Abbreviations

When the following abbreviations are used the period is omitted. Distance: mm, dm, cm, m, km, ft, mi; directions (in caps): S, N, E, W, months: first 3 letters only, Jan, Feb, etc. Example: Potter Co.: 2 km W of Dot, 5 Jun 1971, *Smith 118* (SMU).

Documented Plant Chromosome Numbers

Refer to **Sida** 21(3):1663. 2005.

Acknowledgments

Recommendation: Consider acknowledging the herbaria consulted for any data in your paper as this acknowledgment might help herbaria and institutions justify their existence and support either from their own institution or from granting agencies. In a time where herbaria are merging and even dying, let's not take them for granted.

Floristic Papers

Floristic papers are important, but they need to be more than a list of plants, they need added value, they need meat and context added. Such papers should emphasize the uniqueness of the floristic study area, physical characteristics, cultural and historical information, land use history, climate, major vegetational habitats, rare/endangered/special concern taxa, new county records, state records, disjuncts, invasives, etc. Lists in and of themselves are not that useful. Annotate your list as much as possible. The more annotations you can add to the checklist the more value it will have. A list that provides ecological notes on rare and endangered taxa or other noteworthy taxa, State and Federal status on any rare and endangered species, and highlights and notes any endemics, disjuncts, or significant geographic distribution records, etc., is so much more valuable and useful. Conservation issues are also important and any information and discussion on such would add considerable value to the paper.

Also note which and how many species are state-listed by the Heritage Program if they exist. Summarize how many taxa occur in various classes of county numbers, which is informative for conservation of the state's flora.

Range Extensions

Range extension papers will ONLY be considered for publication when the taxon being reported represents a new state record, significant disjunct, documented exotic/invasive, rare and/or endangered or is a rare endemic.

Questions: Email the editor (Barney Lipscomb, barney@brit.org).

This photographic guide to the Wild Flowers of Mombacho is color-coded and arranged by Family within the color sections. It covers flowering plants found on the whole of the Volcano; which includes both tropical cloud forest and dry, deciduous forest, at lower altitudes.

The book covers 200 plants, each of which has two or three photographs and a short description in both English and Spanish giving common name(s); a short description of the plant; height; flowering period; habitat and any known use of the plant. The vast majority of plants are likely to be found in similar habitats throughout tropical America and nearly one third are pan tropical, making this book of interest to a wide audience throughout the tropics.

WILD FLOWERS OF MOMBACHO
NICARAGUA
FLORES SILVESTRES DEL MOMBACHO
BY HELEN PICKERING

BRIT
PRESS

The Atlas of Texas covers about 6000 taxa. This is the result of 54 years of herbarium and fieldwork by B.L. Turner, beginning in 1948 at Sul Ross State University, Alpine, Texas. In short, the senior author has examined personally, touched, or "pored over" an estimated several hundred thousand sheets in the preparation of the forthcoming Atlas volumes. Contents include an introduction, atlas of Texas plants arranged alphabetically by family, by genus, by species, and an index.
