

XI .N4

The India Rubber World Index

VOLUME LIII

October, 1915, to March, 1916

VOLUME LIV

April, 1916, to September, 1916

NEW YORK:

THE INDIA RUBBER PUBLISHING CO.
1916.

A

Accelerator, Vulcanization.....	115
Acceptances: Circulars, Regulations and Informal Rulings of the Federal Reserve Board.....	664
Acken, John (Portrait and Sketch).....	489
Acreage, Rubber, British Malaya.....	381
Statistics, World's.....	382
Adamson Mold Presses, Two New.....	120
Tread Mold.....	21
Aeroplanes, Model, Driven by Rubber Strands.....	237
Rubber in the Construction of.....	463
Tires.....	605
Africa, British South, Rubber Import Statistics.....	88
French, Preparation of Rubber in.....	505
German West, Hevea Export Statistics.....	256
German West, Rubber Planting Notes.....	256
Portuguese West, Hevea Export Statistics.....	256
Portuguese West, Rubber Planting Notes.....	256
African Rubbers, Researches on.....	114
Agricultural Bulletin of the Federated Malay States.....	295
(Book Review).....	
Air Hoist, Utility.....	661
Akron Rubber Trade.....	33, 84, 141, 192, 250, 308, 372, 432, 497, 561, 620, 679
Alden, Frederick J., Death of.....	240
Amazon, Optimism of.....	(Editorial)
Rubber Industry of.....	(Book Review)
Rubber Situation in.....	93
American Export Statistics, 1915.....	273
Rubber Exports in 1915.....	(Editorial)
Ampol, "First Aid" Iodine.....	116
Amsterdam, New Waterproof Clothing Factory in.....	198
Analysis of Power Costs.....	358
Andrews, Benjamin L., Death of.....	357
Aniline Oil, Manufacture of.....	167
Aniline Plant, Assembly of.....	167
Announcements, Rubber Club.....	194
Antimony, Golden Sulphide of, Select Methods of Analysis of.....	598
Anti-Splasher for Sink, Dust.....	418
Apparatus for Laboratory.....	64, 116, 225
Apron Feed for Mills, Hale's.....	601
Laboratory and Patient's Bib, Rubber-Coated.....	298
Aqua-Phone, The.....	236
Arch Support, Anterior-Metatarsal.....	609
Arens, Dr. P. "Handleiding Voor De Bereiding Van Rubber".....	(Book Review)
Antimony, Golden Sulphide of, Select Methods of Analysis of.....	598
Arnold, Charles H., Death of.....	(Portrait)
Mrs. Charles H., Death of.....	24
Asbestos and its Embargo.....	(Editorial)
Asbroft, R. W.....	(Portrait and Sketch)
ASSOCIATIONS—	
Associated Manufacturers of Electrical Supplies, Meeting of.....	138
National Association of Cotton Manufacturers, Semi-Annual Meeting.....	28
Rubber Trade Association of New York Adopts New Rules.....	18
Rubber Trade Association of New York, Annual Meeting.....	137
Austin, George E., Death of.....	612
Auto Brush, "Kleenway".....	355
Auto Clock, Lewis "Nojar" Rubber Retained.....	172

*Illustrated.

Auto Lamp Dimmer, Monarch Adjustable.....	174
Auto Robe, "Front-Seat".....	546
Auto-Tent, Handy.....	546
Auto Wind-Shield Cleaner, "Clear-O-Scope".....	481
Autographic Friction Test of Hose and Belting.....	591
Automatic Control of Time, Temperature, and Exhaust in Tire Vulcanizers.....	530, 531
Automobile Camp Bed and Tent.....	419
Construction, Hard Rubber in.....	405
Engineers, Society of, Proposed Rubber Standards.....	229
Fuel Situation, The.....	(Book Review)
Show for 1916.....	194
Show, New York's Sixteenth Annual.....	222
Steering Wheel.....	173
Tire Fabric, Moisture Content of, and Its Influence upon the Weight and Tensile Strength.....	549
Tire Fabrics, Standardization of.....	(Book Review)
Viaphone, Turner's.....	354
Aylsworth, J. W.....	(Portrait and Sketch)

B

Bag, Thermo Steaming.....	296
Bailey, Milton T., Death of.....	(Portrait)
Balance, Improved Analytical.....	74
Ball, "Ebonite" Bowling.....	126
Golf, Design.....	71
"F. & S. Colonel".....	670
Invention.....	662
Tennis, "Goodrich Championship".....	297
"Maderite".....	125
"New Paramount".....	668
Balloon Fabrics in Europe—II. Manufacture of.....	399
Novelties.....	547
Valves, Toy.....	670
Balloons, Toy, Machine for Inflating.....	338
Toy.....	15
Toy, Rolling Beads on Necks of.....	661
Barium Salts in Vulcanized Rubber Goods, Determination of.....	352
Barker, Melvin Hazen, Death of.....	357
Barley Mill, Pure Rubber and the.....	(Editorial)
Bassett, Charles Warren, Death of.....	423
Bat and Glove Protecting Cricketer's Knuckles.....	71
Batavia, Report of International Rubber Congress and Exhibition.....	(Book Review)
Bath Fixture, Watrous.....	174
Bathing Accessories, Rubberized.....	607
Cap Novelties.....	418
Cap and Protecting Towel, Waterproof.....	419
Cap Plaiting Machine.....	601
Caps, Machines for.....	341
Costume Novelties.....	335
Costumes, Fashions in.....	545
Shoe, "Trinka Fuffit".....	490
Suit Case.....	355
Baxter, James E., Death of.....	(Portrait)
Bed Forming Machine, Kuentsel's.....	601
Wire Forming Machine.....	541
Bed, "Universal" Tubular.....	538
Bell, P. Carter, Death of.....	(Portrait)
Bed, Driving, for Motor Cycles.....	678
Benzol, Commercial Production of.....	470
Or Alcohol in Hydrocarbon Mixtures, Tests for.....	114
Bias Cutting Machine, New.....	220

Bib, Patient's and Laboratory Apron, Rubber-Coated.....	298
Bird and Game Calls, New Rubber.....	72
Birkenstein, L.....	(Portrait)
Birmingham Pneumatic Tire Tread Machine.....	177
Block Planer, Freeman Improved.....	660
Boots (See Footwear).....	
Boston, Preparedness Parade.....	(Portrait of Major H. P. Ballard)
Rubber Trade.....	31, 82, 139, 190, 248, 309, 371, 433, 497, 562, 563, 621, 680, 681
Bottle and Nipple, Nursing "Hygeia Cozy".....	71
Medicine Drop, with Rubber Cap and Bulb.....	296
But, Rubin Duplex.....	297
Bourne, Lyman M.....	(Portrait and Sketch)
Bowling Mat and Foot-Grip.....	669
Brake, Clutch, Magnetic and Safety Stop, for Mills.....	321
Brazil, Export Statistics.....	325
Export Statistics for 18 Years.....	263
Interesting Letters from.....	41
Rubber Export Statistics from Para and Manaus.....	153, 391, 455, 517, 579, 639, 699
Rubber Situation in.....	507
Rubber Tires Imported.....	41
Rubber Tires in.....	93
Situation in.....	630, 631
Brazilian Products, Interesting Exhibit of.....	500
Rubber, Proposal to Reduce Tariff on.....	690
Breakspear, F. C., Death of.....	612
Breathing Apparatus, Vacuum.....	482
British Gold Coast, Export Statistics.....	148
Guiana, Hevea in.....	508
Guiana, Rubber and Balata in.....	689
Guiana, Rubber Plantations in.....	631
Guiana, Tapping Statistics.....	508
Honduras, Cattle Export Statistics.....	608
Malaya, Acreage under Rubber.....	381
Malaya, Rubber Export Statistics for 10 Years.....	381
Solid Tire Rim Standards and American Sizes.....	474
South Africa (See Africa).....	
Standard Solid Tire Rims.....	604
Brush, Auto, "Kleenway".....	355
Crinoline, Vulcanizing, Set in Rubber.....	600
Brushing, Shaving and Massage.....	126
For Painting, Rubber Cemented.....	608
"Heldite" Shaving.....	174
Bryant, Richard S., Death of.....	300
Burette Reading Device.....	346
Burke, James W., Death of.....	422
Burma, Rubber Export Statistics.....	91
Burner, High Temperature.....	597
Butadiene, Polymerization of.....	64
Buyers' Directory for the Wholesale Drug, Chemical and Allied Trades, Stubbs'.....	(Book Review)

C

Cable, New, for Motor-Driven Conveyances.....	71
Strippings Are Welcome, Where.....	(Editorial)
Cables, Market for.....	618
Calendar and Mill Rolls, Cooling by Refrigeration.....	534
Controllers, Rubber.....	542
Kearns Multiple Friction.....	479

*Illustrated.

EDITOR'S BOOK TABLE—(Continued).

Agricultural Bulletin of the Federated Malay States	295
Automobile Fuel Situation, The	416
Chemical Calculations	175
Chemical Technology and Analysis of Oils, Fats and Waxes	175
Die Technologie Des Kautschuks	123
Dictionary of Textiles	295
Exporting, Practical	234
"Financier Rubber Share Handbook, The"	13, 543
Fundamentals of a Cost System for Manufacturers	664
Green Book for Buyers	483
Handbook of Weaves	234
Hendrick's Commercial Directory of the United States	69
"India Rubber and Balata Belting as Conveyor and Power Transmission Belts"	543
"Large Single Versus Dual Solid Tires for Rear Truck Wheels"	543
"Legacy of the Exposition"	610
List of Para Exporters and Importers, 1915	416
Medical Who's Who, 1916, The	483
Oil, Paint and Drug Reporter Green Book for Buyers	123
Plants at Many Lands: South America	416
Personal Reminiscences of James Mapes Dodge	664
Physiological Principles for Determining Value of Various Rubber Tapping Methods	(Prof. Dr. Hans Fittig) 234, 483
Practical Safety Methods and Devices	664
"Preparing Plantation Rubber for the Market"	543
"Railway Expansion in Latin America"	610
Report of The International Rubber Congress and Exhibition, Batavia	68
Rubber Companies' Position	123
Rubber Growers' Association, 1915, Transactions of	295
Rubber in Netherlands East India	123
Rubber Industry of the Amazon	175
Rubber Machinery	(H. C. Pearson) 68
Rubber Producing Companies	610
Seventeenth Year Book and Annual Report of The Rubber Club of America, Inc.	664
Standardization of Automobile Tire Fabrics	416
Stock Exchanges (London and Provincial)	123
Ten-Year Record	123
Stubs' Buyers' Directory for the Wholesale Drug, Chemical and Allied Trades, 1916	295
Tariff Systems of South American Countries	664
"Technologie Der Kautschukwaren"	295
"Tractive Resistance to a Motor Delivery Wagon on Different Roads and at Different Speeds"	610
Trade Directory of Central America and the West Indies	175
Twentieth Century Russia and Anglo-Russian Review	123
Van Nostrand's Chemical Annual for 1913	123
Efficiency, Professional	(Editorial) 461
Electric Cleaner with Soft Rubber Brush	714
Storage Battery in the Motor Car	589
Switch, Automatic, for Automobiles	608
Electrical Supplies, Associated Manufacturers of, Meeting	138
Electrician's Glove, Aetna	545
Electricity, Welding Rims by	473
Employees, Keeping Contented	565
Employers' Patriotic Duty	(Editorial) 588
Endlich, Rudolph, Death of	358
"England's Dictatorship"	(Editorial) 1
English, Goodrich, Good	(Editorial) 106
Envelope Sealer, Standard	36
Europe, Some Rubber Interests in	548
European Pneumatic Tire Sizes	404
Rubber Trade After the War, The	465
Trade Notes	378, 439, 685
Exercising Apparatus, Indoor	173
Exhibit of Brazilian Products, Interesting	500
"Exide" Battery Service Test	340

Export Tax on Ceylon Rubber, New	(Editorial) 53
Exporting, Practical	(Book Review) 234
Expositing, Chemical and Society Meetings, National	655
Chemical Industries, National	613
"Legacy of Exposition"	(Book Review) 610
Extraction Apparatus, Electrically Heated	116
F	
Fabric, Balloon, in Europe—II, Manufacture of	399
Proofed Rubber Goods, Machine for Trade-Marking	348
Strip Machine, Suber's	601
Tester, Scott	665
Tire, Tests Shown by Lantern Projection	429
Factories, Rubber, Fire Hazards in	
(Editorial) 217	
Far East, Comparative Distances	124
Plantation Rubber Export Statistics	153
Rubber Routes from the	124
Federated Malay States, Rubber Export Statistics	153, 210, 263, 321, 387, 454, 513, 529, 638, 695
Rubber Planting in	381
Filter Reservoir, Constant Level	225
Rings, Rubber	624
"Financier Rubber Share Handbook"	
(Book Review) 543	
Financing Imports of Plantation Rubber	536
Finger Cot, "Unika" Rubber	668
Protector, Rubber for Sewing	298
Fire Hazards in Rubber Mills	219
Hazards in Rubber Factories	(Editorial) 217
Fires, Preventing Spreader-Room	693
Spreader, Causes of	286
Firestone Tire & Rubber Co., Changes in Organization	370
Firestone Tire & Rubber Co.'s "Homestead Outing"	734
Firestone Truck Tires Adapted to Railway Tracks	493
Fisk Rubber Co., New Buildings of	247
Fly Swatter, "Sanitary" Flexible Rubber	236
Flynn, Michael M., Death of	(Portrait) 239
Football Pants with Elastic Band	72
FOOTWEAR—	
Air Pressure Rolling Machine for	478
Army Sandal, New	481
Boot and Shoe Sole Rolling Machine	178
Boots and Shoes, Foreign Import Duties on	349
Boots, Rubber, with Muller Top	197
"Buddy" Inside Lace Paces	213
Canadian Consolidated	125
Manufacture, Rubber, Processes of	347
Mourning	418
Outing Shoes, Six New	17
Price Lists, Rubber	228
Pump, Silk Outing	298
Red-Legged Boot for Santa Claus Trade	350
Repairing Outfit	333
Rubber Boot for Severe Service	315
Rubber, Pressure Cure of	174
Shoe with Elastic Side Gore	353
Sporting Boots, Light Weight	420
Tan Military Rubber Boot	480
"Unika Putti" Bathing Shoe	233
Vulcanizing Apparatus	298
Work Shoe with Rubber Heel and Rocker Bar	298
"Ford Air Break"	609
Rear Wind-Shield	608
"Uniq" Running Board	608
Foreign Import Duties on Boots and Shoes	35, 87, 143, 194, 253, 312, 375, 437, 501, 568, 570, 624, 683
France, Consumption of Rubber in	376
Rubber Situation in	145, 197
Rubber Statistics	325, 460, 521
Rubber Trade in	314, 438, 569, 570, 685
Rubber Cochon China, Rubber Tree Statistics	256
Indo-China, Rubber Cultivation	266
Iron-Band and Chin Mask	658

Fruit Jar Ring, Scaloped	480
Fundamentals of a Cost System for Manufacturers	(Book Review) 664
G	
Gages, Caliper, for Rubberized Fabrics	541
Gammer's Tire Machine Drum	231
Gardner Valve Packing Grinder	421
Garter, Sportsman's Engraved	482
Gas Burners for Vulcanizing and Heating	476
Gasoline Hose, "Thermoid"	749
Gear Drive, Throop Reduction	475
Guide-Mat, New	354
Generator, Sulphuretted Hydrogen	225
German Weeds, Rubber from	571
West Africa, Hevea Export Statistics	256
West Africa, Rubber Planting Notes	256
Germany, Rubber Trade in	37, 89, 199, 255, 312, 377, 440, 503, 625
Waste Rubber Import and Export Statistics	616
Girdle, Tree Elastic	609
Grove, Acton Electrician's	545
Tennis Racquet	708
Gloves, Batting and Bat, Protecting Cricket-er's Knuckles	547
Workmen's Protective	547
Goggles, Rubber, Protection against Gases and Acids	126
Gold Coast, British, Export Statistics	148
Golf Ball, The	(Editorial) 275
Design	721
"F. S. Colonel"	760
Industry, Development and Changes in	787
Invention	762
Statistics	(Editorial) 275
Ceat, Pivot Sleeve	480
Grip, "Satin"	546
Tees, Something New in	482
Goodrich Co., The F. F.	308, 362, 432
"Championship" Tennis Ball	297
Gasoline Hose	15
Good English	(Editorial) 106
Safety Respirator	296
Goodyear, Charles	(Portrait) 424
Tire Mileage Chart	445
Gotschall, Louis, Death of	129
Grant Solid Tire Patent Litigation	430
Gray, Matthew Hamilton, Death of	24
Great Britain, Consumption of Rubber in	376
India Rubber Trade in	35, 87, 143, 195, 253, 314, 375, 437, 501, 502, 568, 569, 624, 683, 685
Green Book for Buyers	(Book Review) 483
Greetings, The Season's	(Editorial) 161
Grinder and Mixer, Modern	659
Gardner Valve Packing	421
Guarantee, Rubber, New Form of	466
Guatemala, Rubber Tires in	690
Guiana, British, Balata Export Statistics	316
Rubber and Balata in	619
Hevea in	508
Guiana, Dutch, Balata Export Statistics	213
Rubber Situation in	91
Rubber Trade in	689
Guiana, French, Balata Export Statistics	213
Guianas, Rubber Situation in	315
Gum Bracket with Rubber Holders	126
Gum, New Grease	16
Gunn, J. Newton	(Portrait and Sketch) 132
Gutta Percha, Botany and Source—III	5
Botany and Source—IV	55
Vulcanization of	12
H	
Hair Tonic Comb	72
Trimmer, Every Man His Own	117
Hall, Edwin R., Death of	(Portrait) 356
Halhand, James T., Death of	(Portrait) 551
Handbook of Weaves	(Book Review) 234
"Handliding Voor De Bereiding Van Rubber"	(Book Review) 351
Handles, Hard Rubber	126

Roads, Compd., Applying, to Solid Tire	540
Hard Rubber in Automobile Construction	405
Hardy, William E.	(Sketch) 76
Hat Cover, "Utility"	546
Hawkins, Edmund R., Death of	(Portrait) 180
Head Bands, Elastic	481
Headlight Dimmer, Soft-Lite	353
Heath, Rubber Manufacture and	(Editorial) 106
Heated, Dry, Shipping Goods	424
Heater, Dry, Passing of the	(Editorial) 332
HEELS AND SOLES	
All Rubber Heel Liner	125
Interchangeable Rubber Heel	*72, 609
Jones' "Never-Losen" Rubber Heel	608
Louis Rubber Lift for Heels	608
"Monkey Grip" Rubber Sole	126
New Armor-Tread Sole	72
"On the Level" Rubber Heel	297
Phillips' Rubber Heels and Soles	70
Pneumatic Rubber Heel	419
Rubber Soles and Heels in the British Shoe Industry	409
"Textan" Sole	545
Universality of Rubber Heel	567
Henderson, William McLean, Death of	422
Hendrick's Commercial Directory of the United States	(Book Review) 69
Hevea and Hurricanes in Jamaica	203
Ho, Brazil, Guiana	568
Porcelain from Hevea	568
Hill, Warren M., Death of	11
Hoggson & Pettis Manufacturing Co.	(Sketch) 183
Holland, Export Statistics	625
Rubber Import and Export Statistics	90
Rubber Trade in	625
Hood Rubber Co., Annual Statement	625
"Welfare" Factory Work	189
Hopewell, John, Death of	(Portrait) 357
Hoses, Soaking and Polishing Boots for	172
Horseshoe, "Fruin-Tail" Rubber Bar	424
Hose and Belting, Autographic Friction Test of	591
Hose Coupling	*22
Goodrich Gasolene	15
Metal and Rubber for Gasolene	482
Or Tubing in 500 Foot Lengths, Vulcanizing	*661
Protector, Rubber	608
Radiator, "Tessoid"	608
Rigometer Garden	668
Texelux Steam	173
Hotchkiss, Justus S., Death of	129
Huebon, Otto P., Death of	(Sketch) 551
Hunter Dry Kiln—A Comparison	294
Hurley, Edward N. (Extracts from "Trade Press and Problems of Business")	339
Hutchinson, Charles K. (Portrait and Sketch)	492
Hydraulic Force Cup, McDemott	607
Tire Vulcanizing Mold and Press	122
Hydrometer, Rubber	*669
I	
Ice-Packer with Rubber Bulb	420
Leak-Down Coagulation Process	628
Import Duties, Foreign, on Rubber Tires	342
Imports of Plantation Rubber, Financing	*336
Rubber of the United States	Statistics of 44, 54, 98, 155, 213, 214
Imports, Rubber, Growing Banks of	(Editorial) 54
Rubber, Number in United States	54
Incorporations, New	*26, 78, 135, 188, 243, 303, 366, 428, 491, 557, 616, 676
"India Rubber and Balata Belting as Conveyor and Power Transmission Belts"	
South, Hevea Production	(Book Review) 543
South, Rubber Export Statistics	91
South, Rubber Planting Notes	256
Indo-China, French, Rubber Cultivation	256
Industrial Methods, Modern, in Rubber Industry	10

Poisons in Rubber Manufacture.....	107

"ENGLAND'S DICTATORSHIP."

TWO of the New York dailies, belonging to the type of journalism usually classed as "sensational," devoted much space in their issues of September 21 to what they chose to call the British seizure of the American rubber trade. They quoted at length—as live news—the articles of agreement entered into last January between the British government and the rubber manufacturers of the United States, which were set forth in detail in the February issue of THE INDIA RUBBER WORLD. This belated and extensive exploitation of the conditions which have governed rubber imports from British ports during the last eight months was occasioned by the protest of the German Embassy at Washington to the State Department concerning the control, or at least partial control, which England holds over various raw materials, including rubber, needed by the American manufacturer.

One of these dailies stated that an investigation was being urged to learn "if civil or criminal action should not be brought under the Sherman Act to end Great Britain's complete control of the rubber trade of the United States."

Just what civil or criminal action could be brought, and against whom or what, it would be highly interesting to learn. If the English choose so to guard their rubber as not to let it be used to aid their enemies they certainly appear well within their rights; and if American manufacturers want British rubber so much that they are willing to subscribe to the conditions laid down—the conditions *per se* involving no impropriety—they are surely justified in their course.

The other journal which gave so much space to this subject made this statement in conspicuous headlines: "Rubber Club as agent for Empire dictates terms to manufacturers." Nothing could be farther from the facts. The Rubber Club is not the agent of the British Empire nor has it dictated to any manufacturer or to anyone else.

When, last November, the embargo was placed on rubber shipments from British ports it was obvious to everyone that the American trade was confronted with a situation bound to be embarrassing and liable to prove extremely serious. It was evident that something had to be done and done at once. The most representative organization in the trade is the Rubber Club, and its officers, at great sacrifice of time, and fully appreciative of the burden they assumed, took up the task of finding the best and quickest means of securing for our manufacturers their normal and necessary supplies, and as a result of their efforts the embargo was removed. The instant relief to the rubber trade and the freedom from further vexation which it has since enjoyed is the best proof of the excellence of their work.

How necessary it was to comply with the terms of the British government, not only for the good of the trade but for the general welfare of the public, is shown by the import figures of crude rubber during the present year. Since the first of February, when the embargo was lifted, to the first of August, the crude rubber importations at the port of New York amounted to 11,364 tons from Brazil and 25,000 tons from London, all of this excepting 128 tons being plantation rubber. In other words, over two-thirds of our supply of crude rubber during the last eight months has come from London, none of which would ever have reached an American port except through compliance with the conditions laid down by the British government.

If no such agreement had been made and no rubber received by American manufacturers except the very inadequate supply coming from Brazil, the price of crude rubber would undoubtedly have remained at the high figure reached in the early days of the war, and might even have gone to the two-dollar mark, as has been the case in those European neutral countries which refused to comply with British conditions. In that event the price of rubber goods to the consumer would inevitably have mounted with great rapidity, and those journals which now decry "England's control of the American

rubber trade" would have fulminated against the iniquities of the rubber robbers.

WHAT A MOUNTAIN OF SCRAP THE WAR IS MAKING!

WHAT a plethora of scrap rubber there will be one of these days when the war is over!

For the year ending June, 1914, the total imports of scrap rubber in the United States amounted to nearly 26,000,000 pounds, nearly 20,000,000 of which came from Europe. For the year ending last June, eleven months of which were included in the war period, the total imports of scrap rubber amounted to only 11,000,000 pounds. The Department of Commerce has not yet published its report giving the individual sources of this supply, but the figures have been compiled, and they show that the receipts from Europe for the last fiscal year amounted to only 4,286,195 pounds; hardly more than one-fifth of the amount received the year before and less than one-eighth of the volume received from that source in the year ending June, 1913.

Naturally the Germans are sending us no scrap rubber, though they have unearthed every piece of it in the Empire and doubtless have a larger accumulation than ever before. The neutral countries of Europe are also conserving every piece of rubber obtainable, and even in England and France, where new rubber is in fair abundance, there would, of course, be no disposition to export any considerable quantity of old rubber, which it might be a great convenience to have a little later.

More rubber is now on its way to the scrap heap than ever before in the history of the industry. This is an automobile war. For the first time in the history of military operations the motor car is the chief mobilizer. Troops, supplies, equipment, aeroplanes—all move on motor vehicles. At the beginning of the war, or soon afterwards, Germany, according to the best estimates obtainable, had 70,000 motor vehicles in military service; while the Allies doubtless had three times that number. Even assuming, as is often stated, that military auto-trucks last only a month (in all probability they last much longer) the Allies, or at least England and France, must greatly have increased their number of auto vehicles during the last twelve months. The English factories alone have been producing seven or eight hundred motor vehicles a day and their importations from the United States since the war began exceed 50,000. And there is no other rubber product that reaches the scrap heap so quickly as a tire on an auto in service at the front.

So, all in all, between the universal destruction of rubber goods in Europe and the lack of incentive for the present for collecting these rubber remains for the American reclaimer—as shown by the meager receipts

at our ports—the accumulation of rubber scrap on the Continent must be enormous, and the amount available for reclamation after the cessation of hostilities without precedent.

THE OPTIMISM OF THE AMAZON.

OPTIMISM is half the battle. In fact, to observe mathematical accuracy, it is probably two-thirds. Consequently it is pleasant to read in the letter which appears on a later page in this issue, from a man long identified with the rubber interests at Para that, no matter what the plantation people do, the Amazon will always be able to hold its own. His cheerful prophecy runs as follows:

"The Amazon will always be able to compete with Ceylon in prices. As cheap as they may be able to produce their rubber, the Amazon will be able to produce it still cheaper."

To be sure, the statistics of the Amazon, when compared with those of the East, have rather a pessimistic aspect. In 1905 the output of the Amazon country amounted to 35,000 tons of rubber. The product of the plantations amounted to 145 tons. The estimated yield for the present year is 35,000 tons for the Amazon, or just the same as 11 years ago, while the plantations will probably produce 90,000 tons. In other words, while the Amazon is just where it was a decade or more ago, the product of the plantations has increased during that period over 600 times. Moreover, while no one prophesies an increase in the Amazon production, at least for many years to come, careful estimators believe that within four or five years the plantations will produce 300,000 tons. Furthermore, men experienced with Amazon production place the cost of a pound of Upriver fine put on board at Para at 60 cents, while in the East many of the plantations have already reduced the cost of a pound of rubber to 25 cents, and in some cases to less than 20 cents.

In view of this deadly parallel a note of optimism from the Amazon is certainly most gratifying. Undoubtedly there will always be some rubber coming from the Amazon, regardless of price reductions in the East. But unless some comprehensive plan of colonizing labor is adopted, shipments from Para are likely in time to consist chiefly of such rubber as is easily accessible and which may be gathered in time which would otherwise be unemployed, and the returns from which, whatever the market price, will be viewed as so much clear gain.

The Story of Gutta Percha—III.

BOTANY.

IT may well be imagined how great was the desire of all intelligent persons, when gutta was first brought to Europe, to know the identity of the tree from which it was derived. In 1844 the Rev. Edward White, Chaplain of Singapore, sent a dried branch of the tree to Dr. William Griffith, of the Madras Medical Service and superintendent of the Botanical Garden of Calcutta. There was neither flower nor fruit, but from the leaves Dr. Griffith was able to decide that it belonged to the Natural Order, *Sapotaceae*. He thought that it might belong to the genus *Chrysophyllum*, but would not pronounce on this matter. *Chrysophyllum*, however—though one species has been found in Malaya—is chiefly an American genus. It gets its name from the beautiful golden color of the underside of its leaves, and this peculiarity is shared by the tree which furnishes the gutta percha. The fruit of *Chrysophyllum cainito* is the star-apple of the West Indies.

It was not until 1846 that a flowering branch was sent to Kew Gardens by Mr. Thomas Lobb, botanical collector for the Messrs. Veitch, nurserymen of Exeter. Sir William Hooker made an examination of the plant and found that the corolla had fallen off, and while he was able to confirm Dr. Griffith in placing it among the Sapotads, he was yet unable to determine the genus. He thought it might belong to *Bassia*, an East Indian and African genus, which includes the butter trees of India. In 1847 specimens of branches with flowers and fruit were received by Sir William Hooker from Dr. Oxley, of the Indian Medical Service.

The amateur botanist is usually impatient with synonyms and often with good reason. The renamer, who spends his arid existence in trying to find excuses for renaming discoveries of better men, is an unmistakable nuisance and hardly a fit subject for conversation in which polite restraint is necessary. But it is a fact that even the greatest botanists are not infallible and the name chosen by Sir William Hooker was discarded by his own son at a later date. *Isonandra gutta* was the name under which this famous tree was first made known to the world. *Isonandra* is sonorous and rhythmical, though the meaning "equal stamened" is far from a distinctive trait. The genus had been established by Wight in 1840 and is represented by several species, along with which Sir William placed the newly determined species. This was in spite of the fact that *Isonandra* had its flowers in fours and the newcomer in sixes. This might

have been regarded as merely a specific difference if other species had not been found which agreed in this and other respects with the gutta percha tree, and in 1864 a generic difference was established by Thwaites under the name of *Dichopsis*. The specific name *gutta* was retained; and to this naming Bentham and Hooker agreed. Thus the matter stood until the late Dr. Burck, of the Dutch East Indian Service, called attention to the fact that Padre Blanco had in 1837 given the name *Palaquium* to indubitable specimens of the genus known as *Dichopsis*. By every rule in the establishment of nomenclature this name is entitled to stand and has now gained very general acceptance. This discussion is necessary to a correct understanding of the subject and there is really no excuse for the further use of *Isonandra* or *Dichopsis*. The question of correct nomenclature is of extreme importance to an intelligent understanding of any subject.

So it is *Palaquium gutta*, Burck, which takes its place in the botanical lists of all future time; and it is fitting that this honor should fall to one who has done so much for the knowledge of gutta percha and in preparing the way for its continued production. As to the question of whether *P. oblongifolium* and *P. borneense* should be recognized as species or as varieties of *P. gutta*, it must be said that in this, as in all like matters, the burden of proof lies with the "splitters" of species. The differences are but slight—size of leaf, etc.—and the three varieties, or species if it be insisted upon, furnish the only gutta percha of first class quality. Everybody is able to remember *Palaquium gutta* and there is certainly a call for good reasons when people are asked to remember three species instead of one.

The Order *Sapotaceae* is found in the tropical regions of Asia, the East Indies, America and Africa. The Sapotads are related to the Ebony and Storax families, but not to any order which includes any caoutchouc-producing plants. All of these families are represented in the United States, though by a very few species. Of the *Ebenaceae*, one is the persimmon. The *Styracaceae* includes the tree which produces the gum benzoin or gum benjamin, the source of the benzoic acid and benzoates of commerce.

Careless writers and even some botanical textbooks have called Sapotads "Soapworks," being misled by a curious resemblance of the words *Sapota* and *Sapindus*, the specific name *Saponaria* (the soapberry) of one *Sapindus* and the fact that several species of the latter possess saponaceous principles. But while *Sapindus* is "soap of India," *Sapota* is from the native Mexican name

LOW GRADE GUTTA, SANTAI BASSAL.

referring to the type genus, now called *Achras*. The *Sapotaceae* have no relation whatever to the *Sapindaceae*, which order includes our common maple.

The fact that the woods of a few species contain saponin gives much less warrant for calling the *Sapotaceae* "Soap-worts" than would the same fact about the Pink Family.

Another error which has been made by careless writers is to speak of the gutta percha tree as "guttiferous." This adjective is properly used only with reference to the *Guttiferæ*, the Gamboge Family, which includes no gutta percha or rubber-producing plants. The resemblance in name is quite accidental, being derived from the Latin "gutta," meaning tear, and refers to the drops of resin which exude from trees of this order. The Sapotads—trees and shrubs—include forty genera and about four hundred species. All contain a milky juice, of which gutta percha, while the most important, is not the only one with commercial value.

Achras, which, as *Sapota*, gave its name to the order, furnishes the gum chicle which, as chewing gum, gives employment to unnumbered millions of American jaws. This tree, once *Sapota achras*, but now *Achras sapota*, bears the fruit known as the sapodilla or sapodilla plum, one of the most agreeable of tropic fruits, and it was cultivated in the West Indies for years before its gum had become the chief course at the barmitide banquets of the present-day American. Another very im-

furnishes the valuable gum bearing the tree's specific name, which is also the name used by the natives.

Not all the Sapotads yield a gum which by any possible license can be called gutta percha, and only *Palaquium gutta* and its two varieties or sub-species furnish the first class gum; but there are a number of trees, all belonging to the same order, which furnish gutta percha of a more or less inferior quality. They include *Palaquium*, *Paysona*, *Isodonandra* and possibly some other genera. It is a matter of definition whether balata and the karite gum of West Africa be classed as gutta percha, but it is just such a question as to whether cauliflower is cabbage. The botanist says that it is, but the cook says it is not. The botanist, the chemist and the customs officials may be a unit in declaring these gums gutta percha, but the manufacturer has another opinion. And it is the opinion of the man who deals with the material that fixes the custom which lexicographers must confirm and all others admit. The botanist tells us that the bean-pod is a fruit while the strawberry is not; but when we order fruit with our breakfast we are likely to mean strawberries rather than bean-pods. But whatever the case about these gums, there is no doubt about such gums as the so-called pontianac gum, the "gutta jelutong," which comes from *Dyera costulata*, a gigantic tree of the Dipterocarpaceæ family. They are not gutta percha,

GUTTA TARRAI, ARTOCARPUS KUNSTLERII

PALAUQUUM GUTTA

PALAUQUUM OBLONGIFOLIUM

PAYSONA LEERI

important Sapotad is the genus *Mimusops*, found in the tropics on both hemispheres, and one American species, *Mimusops balata*,

but low-grade rubber. It may be said with all possible emphasis that no tree of the Natural Order *Sapotaceae* produces

rubber; no plant outside of our family produces gutta percha.

The geographical limits are almost equally precise. The best gutta percha, that from *Palagium gutta* and its sub-species, comes only from the lower part of the Malay peninsula, the two great islands of Sumatra and Borneo, together with the smaller islands immediately adjacent to the three chief land masses. The other species which produce what manufacturers recognize as gutta percha, though not of the best quality, are found in a slightly more extended territory, including the entire Indo-Malayan region as far as Wallace's Line. This line, named after its discoverer, Alfred Russel

Wallace, marks a sharp separation between the flora and fauna on either side of the line. On one side the plants and animals are essentially Asiatic, on the other they show the characteristics of the Australian region. This line runs between Bali, an island at the east end of Java, and Sumbok, twenty miles further east; passes between Borneo and Celebes and then extends south of the Philippines, which belong to the Asiatic group and, as it happens, possess several species of gutta-producing trees of the genera *Palagutium* and *Paysona*. Of course, Wallace's Line has been crossed, in the course of ages, by many species of plants and animals and it is possible that there is some truth in the story of the finding of gutta percha in German New Guinea, but the species reported are said to have Malay names, which indicates that their importation was of recent date and does not affect the main facts of the distribution of the gutta percha tree.

Closely related to the Ebony Family, the Sapotads resemble them in the structure of their woods which, however, generally speaking, are red instead of black. As in most extensive orders and genera there is a wide range in density, etc., some being fine cabinet woods, while others are comparatively soft and adapted only for boards and lumbers of inferior class. This is important from an economic point of view because trees, even if long lived, are not immortal and the ultimate value of the lumber product is a necessary factor in a correct estimate of the value of a plantation. Unfortunately, the wood of *Palaquium gutta* is not first class, though of handsome appearance and well adapted for purposes where great strength or hard usage is not expected. *Paysonia leeri*, which gives a good quality of gutta percha, furnishes a hard and valuable light brown wood, which is more than twice as heavy as that of *Palaquium gutta*. The wood of the balata, as well as that of the chiclé tree, is handsome and valuable.

Speaking again of what the botanists have done in naming and renaming gutta producers, the following partial list is most informing:

PALAQUIUM GUTTA.

[illegible]

SOURCES AND SUPPLY

In 1857 a committee of the Ohio legislature reported that there was no need of protecting the passenger pigeon because that bird existed in such countless numbers that the ceaseless activity of the gunners could never effect any serious diminution. Today there is in the world just one solitary passenger pigeon, awaiting in captivity the day when death shall take it to join the millions of its kind, exterminated by man's brutal and insatiable greed.* Twenty years ago the leading rubber manufacturers were interviewed as to the desirability and possible profit to be found in the culture of india rubber. Without a single exception the answers were deprecatory, and they make curious reading at a time when quite half of the india

rubber coming to the world's markets is from the plantations of countries then furnishing a negligible quantity of the rubber supply. Here are some of the comments:

"The stories about rubber planting strike me very much as Jules Verne's writings—good reading, but of no practical use. I believe it would be as easy to import the rubber lands and place them in the United States as to successfully operate a large rubber plantation."

"Why do I not interest myself in the cultivation of rubber? I will answer that question by asking another. Why don't I go into the cultivation of coal? In other words, what is the use of doing what is already well done?"

"The rubber forests are inexhaustible and a scarcity of rubber or an inadequate supply seems out of the question. No

The daily papers recently noted the death of this sovereign

necessity for rubber plantations exists and therefore no capitalist pays any attention to it."

"The rubber forests are boundless, inexhaustible. Hardly the fringe has been touched."

"What is the use of trying to do what the Almighty has done so well for us?"

It is necessary to make some such exhibit as the foregoing in order that we may understand the amazing frame of mind which has permitted the sweeping away of the forests which have supplied the gutta percha of which the world has stood in need. Buy all that comes; make all the money possible out of it; let posterity look out for itself. What has posterity done for us? Seventy years of this attitude have reduced the once abundant supply of gutta percha trees to such an extent that they are now found only in remote districts, where the remaining specimens are being mercilessly combed out. The usual solemn ceremony of locking the stable after the horse is stolen has been faithfully carried out and forest regulations have been made after the forests were stripped. It has been said that there was no danger of extermination

because the natives would not kill out young trees for the reason that these would not produce gutta percha. As well say that

was felled or even a little of the soil, might reasonably be expected to be found mingled with an adhesive gum gathered by clumsy and careless workers. But this does not explain the sticks and stones, the dirt and rubbish of a thousand kinds which pass through the custom house, concealed by gutta percha, like nuts covered with chocolate.

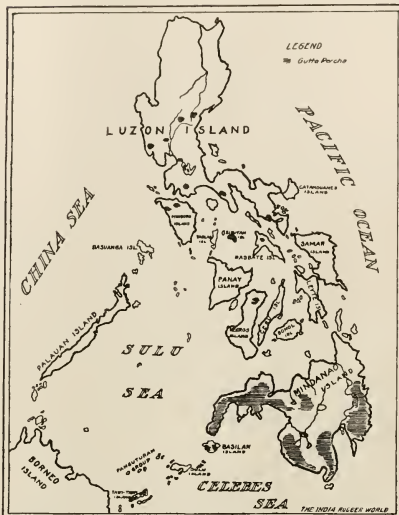

Analyses show that the dirt runs from practically nothing to as high as forty per cent. Dr. Sherman, of the Philippine Forest Service, says that the natives, in preparing the gutta percha for market, "place the dirt, bark,

the two items may well balance each other; and five million pounds annually may be taken as the world's recent production of gutta percha. If the only use for gutta percha were the replacement of existing cable lines and these should last an average of forty years, half the present supply would be required to meet this demand. And when we consider that the present supply comes by natives going further and further into the fastnesses of the wilderness, it is evident that the end of the tale is near the telling and that it is a condition and not a theory that confronts us.

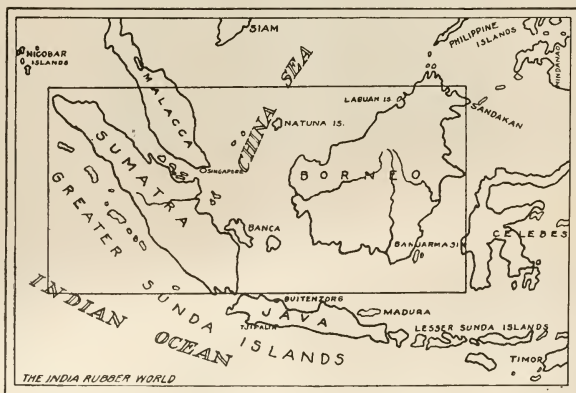

The gutta percha coming from some far tropic isle, where every prospect pleases and only man is vile, has had a long and unfortunate acquaintance with that vile exception and thousands of tons of concrete evidence of his villainy have been shipped across the seas in innocent cakes of gutta percha, which, like charity, is made to cover a multitude of sins. Of course, some bark and chips with other extraneous matter, like bits of the herbage on which the tree

was felled or even a little of the soil, might reasonably be expected to be found mingled with an adhesive gum gathered by clumsy and careless workers. But this does not explain the sticks and stones, the dirt and rubbish of a thousand kinds which pass through the custom house, concealed by gutta percha, like nuts covered with chocolate.

Analyses show that the dirt runs from practically nothing to as high as forty per cent. Dr. Sherman, of the Philippine Forest Service, says that the natives, in preparing the gutta percha for market, "place the dirt, bark,

made at that time for several great cables. In 1912 the im-

ports, stones, used-up hatchets, etc., on the inside as much as possible." (To Be Continued.)

Rubber's Service in Quarantine.

UNDER normal conditions 800,000 persons and \$800,000,000 worth of goods enter this country through the port of New York every year. Indeed, it is authoritatively stated that 70 per cent. of all the immigrants admitted to the United States annually do so by way of the metropolis. No wonder, then, that Dr. Joseph J. O'Connell, the health officer of that haven for foreigners, has declared that "The port of New York is the sanitary frontier of the United States." There are

RUBBER COVERED CASE FOR TESTING
DISINFECTANTS.

28 other seaboard cities where quarantine stations are maintained, and each and all of these serve as bulwarks or defenses against disease coming to our shores from other countries.

While the usual tide of immigration from Europe has been greatly reduced because of the World War, still the number of foreign ships coming to our ports has materially increased, and because of this fact the quarantine of our seaboard cities must not flag in its vigilance. The average person imagines that it is the infected immigrant that is most to be feared. This is not the case, because the sick are comparatively easy to detect and so are those that are likely to develop some communicable malady. Our greatest peril lies in those apparently healthy people who, while immune themselves, are actually bearers of menacing germs. These "carriers," but for the tireless watchfulness of our quarantine officers, might all too easily get by into our populous cities, and once there they might form a center of infection that would soon involve scores and possibly hundreds of our citizens.

The story we have to tell is how these state and national officials work and are ever on the alert to safeguard the public health, and to describe the part in this vital service that rubber plays in many directions. Once more we shall see how this particular material meets the requirements with peculiar fitness, and through its agency the barriers are made more effective against alien enemies of the microscopic sort. The diseases likely to develop into epidemics are plague, typhus, smallpox, and cholera. We know fully well the ravages wrought by typhus in Servia since the beginning of hostilities in Europe a year ago.

Happily, it is definitely known now that the louse is the means by which this destructive disease is transmitted from a sufferer to a ready victim; and the health officer's problem, apart from dealing with the malady when discovered, is to hunt for these loathsome vermin upon incoming passengers and to place immediately under suspicion any person or persons of this sort, especially if they have been near anyone having typhus in any of its stages. These seemingly healthy but suspected foreign

arrivals are called "contacts," and are sent to a detention station for quarantine where they can be segregated and watched. In the case of plague, science generally holds the rat responsible for the spreading of this dire malady, and even though a ship may come in with a clean bill of health, still she must be subjected to thorough fumigation for the destruction of all rodents if the craft has come from a port which has been visited by this disease at any time during many months previous. This is particularly the case if the vessel has lain right alongside the dock at the infected port, so that rats could come aboard.

At present the disease most being feared of foreign origin is cholera. The war between the Balkan nations and the Turkish empire reintroduced cholera into Europe, and because of the large fleet of ships reaching our shores now for supplies from that continent it is all the more necessary that our precautions be redoubled. However, even though the peril is increased by the present great conflict, still Dr. O'Connell gives us this reassurance: "Rapid progress in the comparatively new science of bacteriology has given to sanitarians the immeasurable advantage of a precise knowledge of the causative agencies of cholera, plague, and typhus fever, the three scourges of major importance considered in connection with this war. Methods of isolation and sanitation have been worked out with the result of greatly augmenting the efficiency of public health officers."

Now let us see how rubber figures in this battle in behalf of the public health. We can best do this by describing some of the routine work at one of our ports. Let us assume that the ship to be inspected has come from an infected port, or that the foreign seaboard city is the outlet for a region in which

SPONGING OFF WITH A SOLUTION OF BICHLORIDE OF MERCURY.

one of these communicable diseases is prevalent. For the sake of example let us choose typhus fever. The inspectors board the craft at quarantine. Each is armed with a clinical thermometer held in a hard rubber case. The gangways are guarded so that everyone on board must march before these officers, the number must tally with the ship's list, and no chance is given anyone to "repeat" so that a sick man can be impersonated by a well one while he lies hidden. In making this inspection, the quaran-

tine doctors frequently wear rubber gloves, and in rainy weather they don a rubber uniform from head to foot.

The typhus patients and the "contacts" are promptly removed, while the ship remains at quarantine for fumigation. The sick go to a ward or island set apart for the treatment of infectious diseases, and the "detains" are segregated elsewhere after undergoing an anti-parasitic bath. Their clothing is sterilized by steam. Each "contact" has a brass identification disc, hung upon a rubber cord or necklet, and a similarly numbered tag is fastened to his clothing while undergoing sterilization. All quarantine employees who handle patients and "contacts" are equipped with rubber gloves. Nurses and orderlies engaged in the sanitation of "contacts" and the treatment of patients wear rubber gloves and aprons, and the nurses' hair, tightly dressed, is covered by rubber caps.

In the disinfecting chamber the big iron doors are hermetically sealed by means of thick rubber gaskets, and in all of the detention rooms, which must be fumigated, all ventilators have rubber gaskets and the windows and doors are provided with rubber stripping so that these openings may be made both air-tight and vermin-proof. Indeed, this manner of sealing all spaces is uniform, so that every chamber at quarantine can be fumigated from time to time. We find the most extensive use of rubber in contagious disease wards. At Swinburne Island, New York, a thoroughly typical ward is provided with rubber flooring, pillow slips of rubber, rubber sheeting between the patients and the mattresses, rubber in various forms in the medical cases, while the attendants wear rubber-soled shoes to deaden sound. The modeling of all corners, combined with the wide use of rubber, makes it possible, after the removal of patients, to thoroughly fumigate and then to wash down the walls, ceiling, etc., by means of a hose turned loose freely. If any of the sufferers die, they are wrapped in rubber winding sheets before removal to the crematory for final disposition. Where vessels are disinfected after arrival with diseased patients, power pumps are employed for extensive work, and these use rubber hose having hard rubber nozzles of a duplex type, by means of which either a straight stream or a spray may be discharged.

The attendants in the bathrooms where the "contacts" are given an anti-parasitic bath, all wear rubber boots in addition to the rubber coats and gloves which we have already described. Of course, the usual rubber utensils, commonly found in hospitals, such as hot water bags, ice bags, tubing, rubber corks, etc., are abundantly in evidence. And in the bacteriological laboratory, where the specialists examine samples brought them from the incoming ships, rubber in many forms serves as nothing else will. One of our illustrations shows a sample case for testing the effects of a disinfectant on certain germs. This, when sealed, is covered with a close-fitting rubber cap.

But the quarantine service, both federal and state, is not alone concerned with keeping out diseased or germ-bearing persons. Our national welfare is very much involved in the proper administration of animal quarantine both interstate and between this country and foreign ones. This is not confined alone to

living animals but to many products of the animal industry, such as hides, hair, wool, horn, etc. These can all carry disease-breeding germs, and where there is the slightest chance of infection they are not admitted to the country nor allowed to be moved from state to state until properly disinfected. This disinfecting takes a variety of forms, depending upon the nature of the material, but where the germ-killing spray is used the operatives commonly wear rubber boots and rubber hose is well-nigh indispensable in the proper distribution of the disinfectant. Cattle cars, stockyards, etc., are thus treated when necessary, and one of the commonest disinfectants is slacked lime.

Perhaps to the rubber industry the most interesting quarantine

campaign was that inaugurated last November and only recently brought to a successful conclusion. We refer to the battle here waged against the foot-and-mouth disease. The last previous epidemic was in 1908, but the widespread recrudescence of this old world animal malady late last year was marked with a good deal of virulence. The District of Columbia and 22 states developed cases in varying numbers, but the disease was most serious in 15 of the states and called for the promptest sort of action on the part of the state quarantine officers. It should be of interest to know that the origin of the outbreaks of foot-and-mouth disease in 1902 and 1908 were definitely traced to imported vaccine virus used on calves in the propagation of virus for use in vaccinating against smallpox.

As soon as the disease appeared last November, the state and federal authorities immediately organized their quarantine forces, and an army of fully 1,000 inspectors was detailed to deal with the epidemic radically. This meant that every farm and every stockyard had to be visited and not a single head of cattle overlooked in the search for traces of the malady. The equip-

ping of this force made a good-sized demand upon rubber goods dealers. Each inspector had to be clothed in rubber from tip to toe. His outfit consisted of a rubber hat, a rubber coat, rubber gloves, and rubber boots reaching well above the knees. In addition to this he was provided with a white rubber fumigating cape.

The inspectors were called upon to examine the mouths and the hoofs of all beef cattle, and to see to the prompt disposition of the diseased and to properly disinfect the other animals and their quarters. It was not so much fear of personal consequences from the malady as to facilitate their washing down afterwards that the inspectors were clothed in outer garments of rubber. Each man had a tin basin and a sponge and his rubber clothing was liberally wiped off with a germicide bath of bichloride of mercury. But this superficial treatment was not enough to meet the exacting official requirements.

Lest the underside of the rubber overcoat might have become infected, it was necessary to kill any germs lurking there and at the same time to disinfect the clothing lying closer to the body of the inspector. As our illustration shows, the white rubber fumigating cape fastens snugly about the neck and is ample enough to completely cover the wearer. By spreading out the

THE WHITE RUBBER FUMIGATING CAPE IN SERVICE.

bottom of the cape like a tent, the rising fumes from the disinfectant would be caught and held until they had done their intended work. For this fumigation a mixture of formalin and permananate of potash were used in their crystalline form. When mixed, a vigorous reaction takes place, and a large quantity of formaldehyde gas is liberated. This method is particularly efficient on account of the rapidity with which the gas is given off as well as because of its searching quality and its bacilli-killing properties. Thus, before an inspector left an infected place and packed his belongings to go somewhere else, his rubber clothing was both disinfected and fumigated.

The actual disinfecting of barnyards, stables, stockyards and the like must, of necessity, be carried out on a larger scale than would be possible by hand distribution of the germicide. Accordingly, in Pennsylvania alone, the inspectors, of which there were quite 150, were provided with steam-driven disinfecting pumps. As these could not use bichloride of mercury without inviting injury to the mechanism, cresol—a preparation of creosote—was employed for a disinfectant. The force had a battery of 25 pumps of this sort, capable of spraying a large area very quickly, and each pump had at least 100 feet of the best rubber hose. This gives some idea of the manner and extent in which rubber served to effectually deal with one of the worst epidemics of the foot-and-mouth disease.

Of course, there are other diseases that are more or less with us always, such as the result of the animal tick, tuberculosis, Texas fever, anthrax, hog cholera, etc. All our state and government inspectors are continually on duty, and their supervision extends to post mortem examinations of animals as well as to the examination of meats and meat products in the preparing. Some of this work is of such a character that the men must wear rubber boots and possibly rubber coats in the discharge of their duties. This is particularly so where animals have to be dipped in suitable germicide to kill the disease-breeding tick, etc.

In order to safeguard our domestic herds all imported animals are subject to inspection and quarantine just as are human immigrants. But this precaution is not always so confined. The service operates likewise to keep out certain diseases which are communicable from animals to people, as, for example, Malta fever—a malady which can be transmitted from infected goats by way of their milk. We have a number of animal quarantine stations where the incoming beasts are carefully watched for varying periods, and in the administration of certain divisions of this important work rubber plays its part to protect the operatives and to facilitate thorough fumigation and disinfecting. Despite the precautions which we insist upon before shipment from abroad, and the care taken in transit, diseased animals reach our ports, and for this reason our animal quarantine is most exacting.

The government owns and maintains three quarantine stations for animals imported through the ports of Boston, New York and Baltimore. The one at Athenia, New Jersey, 16 miles from New York, covers about 51 acres of ground and has 23 stables. The stables, most of which are modern brick structures, have a capacity of about 600 cattle. At every stage of their handling during the passage from ship to quarantine station,

disinfected barges and cars are available. Rubber hose and rubber garments are used extensively, and as the station is widely illuminated by electric lighting, rubber, of course, is a necessary insulator. As the scientific side of this work calls for a bacteriological laboratory, here, too, rubber figures in many ways.

In addition to those at Boston, New York and Baltimore, animal quarantine or inspection stations are maintained by the government at Chicago, Kansas City and South St. Joseph, Missouri; Omaha, Nebraska; National Stock Yards, Illinois; Indianapolis, Indiana; Buffalo, New York, and Pittsburgh, Pennsylvania, as well as at the following additional ports of export: Portland, Maine; Philadelphia; Norfolk and Newport News, Virginia; Port Royal, South Carolina; New Orleans, and Gal-

veston. Besides what the federal authorities do in this matter the states, too, do their part, and this makes in all a fairly-sized army of inspectors and their subordinates. In addition, the railroad companies and proprietors of stockyards and stables located at the ports of export are required to keep separate, clean, and disinfected stockyards and pens or stables for the use of export animals.

All of the principal foreign nations maintain quarantine services like our own against communicable diseases reaching their shores through immigrants, tourists, etc., and certain of them exercise the same safeguards in keeping out livestock carrying the germs of infection. In some cases the inflicted animals are segregated only for a prescribed period, while in other ports diseased beasts are promptly exterminated. The Canadian government has patterned its service after ours in the matter of animal quarantine. It must also be remembered that we maintain inspectors abroad at the principal ports from which cattle for breeding purposes are shipped to this country, and there, too, India rubber finds kindred uses.

The pumps used for disinfecting are commonly of two kinds: those operated by hand and those functioned by either steam power or gasoline motors. The hand-powered affairs are much like the pumps used for spraying orchards. The steam-driven apparatus, of course, are bigger and are intended to deal quickly with larger surfaces. With all of them rubber hose and a good deal of it is needed.

But we are no less careful regarding the animals shipped out of the country, for the volume of that business depends entirely upon the healthfulness and the desirability of American livestock. Therefore, our inspection of these animals for export is extremely exacting, cattle are tested with tuberculin for the detection of tuberculosis and equine animals with mallein for the detection of glanders. During the five years ending with 1913, the Bureau of Animal Industry made over 2,500,000 inspections of animals for export. These places of inspection are scattered all over the United States. Today, because of the war in Europe, we are exporting a still greater number of animals to supply the needs of some of those foreign nations.

No ship is allowed to take cattle from our shores unless it is in a fit condition to receive them and likely to carry this livestock to the other side and deliver them there in a healthy and acceptable state. To make these vessels proper carriers it is needful to disinfect them, and again rubber lends its invaluable service to the proper execution of this precautionary work.

INSPECTING A STEER'S MOUTH.

To refer again briefly to the European war, while various anti-toxins have done much to reduce mortality, still the vast armies in the field would long ago have been decimated by one or more scourges but for the modern methods of disinfecting camps, trenches, and hospitals. The medical staffs of the several armies have looked very well, indeed, to this form of defense

A HUGE FUMIGATING TUBE HOLDING AN ENTIRE TRAIN

against devastating fevers, and it is in this particular that the present strife stands out in vivid contrast to past conflicts.

The one malady, however, that has caused an enormous sacrifice of life has been typhus. This has lingered in the Balkan region since the war there several years ago, and within the past twelve months Serbia has suffered frightfully from that fever's ravages. The Russians also contracted the disease during the campaign in the Carpathians and in Galicia, and the Teutonic medical men, especially those of the German armies, have taken

CAR BEING FUMIGATED BY STEAM FROM A LOCOMOTIVE.

effective means to rear a barrier against the spread of that scourge among the Kaiser's forces and in the Fatherland where Russian prisoners are quartered.

For this service they have had recourse to the sterilizing power of steam. The particular object of this method of attack is the typhus-transmitting louse. Unhappily, the filthy creature is a

very common thing among the lower classes of the Czar's subjects, and the hardships of camp and march have engendered careless personal habits, thus favoring the propagation of these disease-carrying insects. As a precaution, the Germans have instituted disinfecting plants at many points for the sterilizing of clothes and the destruction of these vermin. All railroad trains used for bringing in from Russia either Russian or German wounded from the eastern field of action are thoroughly cleansed in this fashion by steam. At Potsdam, for instance, a great steel cylinder, sealed at both ends by circular doors seating on rubber gaskets, makes it possible to run a whole train inside for sterilization. The steam, hot water, or formaldehyde is delivered by rubber hose from an available plant. Again, the same death-dealing vapor is blown into other cars used for transporting troops to and from the eastern theatre of war, and thus disease germs of every kind are effectively disposed of. Our illustrations give a very comprehensive idea of the means and the methods employed in this vitally necessary service.

ITALY AS A MARKET FOR AMERICAN RUBBER GOODS.

Although a state of war has never been officially declared to exist between Italy and Germany, the former's entry on the side of the Allies has broken off all her commercial relations with the German empire.

Italy has been a large purchaser of German rubber goods, but it is a question whether she will be so in the future if it can be avoided. The latest available statistics of the rubber trade between Germany and Italy are for 1913, which was the last normal commercial year. These statistics only show direct imports from Germany, not taking account of the large quantities of German rubber goods that reached Italy indirectly through other countries. They show that Italy imported 54,533,600 pounds of German rubber goods, consisting principally of rubber sheet, rubber solutions, rubber thread, hose, tubing, solid and pneumatic tires, printing cloths, rubberized and elastic fabrics, rubberized garments, mechanical goods such as packings, belts, etc., rubber and gutta-percha covered wires and cables, and hard rubber goods. The most important imports were insulated cables and wires.

The war will undoubtedly result in the extension of the uses of rubber and rubber goods in Italy. Italians will hardly be disposed to purchase from Germans if they can do otherwise with equal satisfaction. Italy should, therefore, offer a good field for American rubber manufactures.

AMERICAN EXPORTS OF MOTOR VEHICLES.

The fiscal year ending June 30, 1915, marked the close of an exceptional period in the annals of the American motor truck industry. Exports of commercial motor vehicles amounted to 13,996 machines, valued at \$39,140,682, as compared with 784 vehicles, valued at \$1,181,611 exported during previous fiscal year and 993 commercial automobiles valued at \$1,737,141 exported during the 12 months ending June 30, 1913.

The year 1914-1915 was less favorable to exports of pleasure cars, which only amounted to 23,880 cars, valued at \$21,118,953, against 28,306 machines, valued at \$25,392,963 during the previous year and 24,292 vehicles, valued at \$24,275,793 exported during the fiscal year 1912-1913.

AEROPLANES ARE IN DEMAND ABROAD.

During June and July of the present year Great Britain imported from the United States aeroplanes valued at \$765,544. Italy imported aeroplanes worth \$10,105, and Mexico imported \$3,535 worth of flying machines during the same period.

REDUCTION IN PENNSYLVANIA TIRE PRICES.

On September 1 the Pennsylvania Rubber Co. reduced the prices of its smaller sized vacuum cup tires. The following are some of the new prices: 31 x 3½, \$16.90; 30 x 3½, \$16.20; 30 x 4, \$19.55; 28 x 3, \$12.65; 28 x 3½, \$15.40.

What the Rubber Chemists Are Doing.

VARIATION IN RATE OF VULCANIZATION OF RUBBER.

THE "Malay Mail" reports a lecture on "The Variability of Rubber," delivered in July at Klang by B. J. Eaton, chemist of the agricultural department of the Federated Malay States.

The lecturer referred to two terms of frequent occurrence—standardization and uniformity—both as yet hazy and indeterminate. There is a marked tendency to look to fine hard Para as the standard because manufacturers have had experience with it extending over many years. That, however, is the only argument in its favor. The term uniformity, as applied to rubber, means rubber of the same type. Different types of rubber may vary in mechanical strength, but variation in vulcanizing quality is far more important to the rubber manufacturer. The matter of form and appearance is of little consequence to the manufacturer, although important to the broker, buying and selling on looks rather than by test.

In vulcanizing rubber with sulphur the manufacturer has recourse to three methods in securing a given result. He may vary the amount of sulphur, or the temperature and time of vulcanization. In the experimental work of the agricultural department, the sulphur and temperature were fixed and the time varied. In the original experiments all the rubbers tested gave their best results in $2\frac{1}{2}$ to $3\frac{1}{2}$ hours. Different mechanical results were obtained by changing the time of cure. Subsequently a piece of Byrne-cured (smoked) slab rubber gave its maximum mechanical results at $1\frac{1}{2}$ hours' vulcanization. Ordinary Byrne-cured loaf vulcanized in the normal time of $2\frac{1}{2}$ to $3\frac{1}{2}$ hours, and the inference was drawn that the Byrne method of smoke curing has no effect on the rapidity of cure.

To demonstrate this point rubber slabs were made and smoked in an ordinary smoke house, and these were vulcanized in $1\frac{1}{4}$ to $1\frac{1}{2}$ hours. Then unsmoked slabs of pan coagulum, made the same thickness as the smoked slabs, were tested and found to vulcanize much more quickly than either the Byrne-cured slab or the ordinary smoked slab. Evidently this was due to the form in which the rubber was prepared, and had nothing to do with the smoking which actually retarded the vulcanization.

Further experiments led to the conclusion that an alteration or a presence in the latex, and in the coagulum, caused this marked variability in the rate of vulcanization.

Rubber consists approximately of 94 per cent. of caoutchouc, 1 per cent. of mineral salts, 2 to 3 per cent. of resins, and 2 to 3 per cent. of protein. The ingredient most liable to change is the protein, and probably some substance derived from this acts as an accelerator. Experimentally it was found that this change occurs in the coagulum if left for six days before being creped. No evidence of this change can be detected in the appearance of the rubber, which in consequence requires to be tested to ascertain its vulcanizing quality.

As concerns rubber estate practice several factors affect vulcanization. These are thickness, *i. e.*, amount of serum removed; smoking, which retards vulcanization; the use of formalin or other preservatives; amount of acetic acid used in coagulation, and the dilution of the latex. The age of the tree also affects the proportion of protein and other constituents of the latex.

The more uniform methods now adopted on many estates tend to greater uniformity of product; but variability is due chiefly to the difference in rubber from different estates.

In these experiments, in preparing the block of pan coagu-

lum, which was left in this form for some days, a really new type of rubber has been discovered. It vulcanizes more rapidly than fine hard Para and ordinary plantation grades, which take medium time. Only eight or nine samples of fine hard Para have been tested so far, but it is remarkable that all vulcanized in about the same time.

It is, therefore, natural for the small manufacturer to rely on fine hard Para. The reason for its lack of variation is attributable to the uniform method of its preparation, and not because of any intrinsic value of the method. As it may require two or three months to prepare a ball of fine hard Para, any variations in its quality are averaged.

The formation of the accelerating substance is believed to be effected by bacteriological action. Rapid curing samples show better mechanical tests than those that cure slowly.

Rapid vulcanization eliminates the danger of overheating, and that is probably the reason for the increase of strength.

The lecturer credits Dr. Schidrowitz with first pointing out this variability in rate of cure in plantation rubber, of which the experiments at the agricultural department first showed the cause. It is possible now to prepare a rubber which will vulcanize correctly at any particular time, within certain limits.

In conclusion, Lawrence Lewton-Brain, director of agriculture, Federated Malay States, remarks that, although an insufficient number of experiments have been completed, the results already obtained indicate that the variability in the rate of cure is probably caused by a difference in the quantity or quality of certain non-caoutchouc constituents of the latex, which remain in the rubber after coagulation. There may be other factors, such as the physical condition of the caoutchouc which affect the quality of the material as regards elongation and tensile strength. This problem is now being investigated.

POTASH FROM HEVEA.

The following analytical data appeared in a review of the potash situation given recently in one of the papers published in the tropics:

Hevea:	Ash. Per cent.	Potash. Per cent.
Bark	10.6	9.2 on ash
Leaves	4.4	25.8 on ash
Leaves, old	4.4	4.7 on ash
Wood	6.0	13.5 on ash
Seed husk	1.6	0.31 on sample
Seed meal	3.4 on sample
Latex	0.35	43.0 on ash
Crépe	0.4	23.4 on ash
Biscuit	0.4	26.4 on ash

SULPHIDE OF CARBON AS A VULCANIZER.

Mathews and Strange have discovered that a solution of natural or synthetic rubber subjected to 40 per cent. carbon disulphide in a closed vessel, turns into "gel" which, when dried, is vulcanized rubber.

COAGULATION OF LATEX BY ELECTRICITY.

Coagulation of rubber latex by electricity has been successfully performed on plantations where acetic acid was scarce. This coagulation is effected in a porous vessel with carbon electrodes, using a low tension current. The latex is slightly diluted with water and the gum separates very rapidly. It is perfectly clear and limpid.

INFLUENCE OF PROTEINS AND RESINS UPON VULCANIZATION.

In a very interesting study Stevens shows the influence of these two substances upon vulcanization. Rubber, completely freed of its proteins and resins, only sets 1.8 per cent. of sulphur, whereas when simply washed it sets 2.86 per cent. of sulphur.

Latex.—The breaking strength is 125 pounds in the first case and in the second case 60 pounds per square millimeter. The stretching constants vary in the same proportion. In adding resins, proteins or casein to rubber the character of vulcanization and the physical characteristics are modified.

VULCANIZATES OF GUTTA PERCHA.

Dittmar has vulcanized (compounds) various proportions of resins, gutta percha and sulphur and thus obtained a series of elastomers. By this treatment of important percentage of resin becomes insoluble in acetone in proportions varying between 2 and 4-1/2 per cent.

RUBBER SUBSTITUTE.

A modified form of sulphurized oil rubber substitute has recently been patented by an Austrian chemist, V. Ottorepitz British patent No. 21,524 (1914). The substitute is made from fatty vegetable oils by the combined action with heat of sulphur and dilute nitric acid. In this way a tough substance is obtained which is soft when hot and elastic when cold. After washing, this material is vulcanized with sulphur in the same manner as ordinary india rubber. The following is an example, in detail, of the manufacture of this product.

To one kilogram of linseed oil 150 grams of sulphur are added and the whole heated to 130 degrees C., to dissolve the sulphur. This liquid is poured into its volume of dilute nitric acid; heated and agitated for several hours in a water bath until the liquid is converted into a yellow body which is soft when hot and elastic and tough when cold. Notable quantities of sulphuric acid are to be found in the nitric acid. This body is thoroughly washed with water, and dried in thin layers at 100 to 110 degrees C.

To one kilogram of this dried material, 200 grams of flowers of sulphur and a sufficient quantity of benzol is added for converting the whole into a gelatinous dough which is then dried and vulcanized by heating. The product thus obtained is said to be tough and elastic and to serve as a successful substitute for rubber.

PATENTED TREATMENT OF RUBBER.

PURIFYING ISOPRENE.—F. E. Matthews and E. H. Strange—British patent No. 6,897 (1914)—purify unsaturated hydrocarbons (isoprene) by treatment with sulphurous acid and alcoholic hydrochloric acid.

ACCELERATORS.—British patent No. 10,833 (1914); addition to No. 4,263 (1914). (See THE INDIA RUBBER WORLD, August, 1915). S. J. Peachy. Paranitrosodiphenylamine or reduction products of the nitroso-compounds mentioned in the parent specification—such as dimethyl-paraphenylenediamine—are used for accelerating the vulcanization of natural or artificial caoutchouc.

LEATHER, WATERPROOF AND NON-SLIPPING.—United States patent No. 1,150,047, Alex. McLennan. Leather is treated in a drum with a solution of rubber and celluloid in acetone, together with a solution of amber resin dissolved in benzol and a solution of juniper gum.

CONDENSATION PRODUCT WITH RUBBER.—United States patent No. 1,150,642, Hans Stockhausen. Heating formaldehyde with phenol until a liquid intermediate product is formed, and mixing this product with ferric chloride until a plastic, moldable mass is obtained, which mass is mixed with caoutchouc and sulphur, and hardened by heat.

RUBBER SUBSTITUTE.—British patent No. 1,171 (1914), Joseph Baier and Arthur G. M. Weale. Dry animal tissue is converted into a viscous jelly by treatment with zinc chloride solution or hydrochloric acid, thickened with dry, starchy matter, and air dried. A solution of rubber in turpentine is then mixed to form with it a thick dough. The paste thus formed is the rubber substitute and is applicable to leather or fabric. The substitute may be cured by heating at 250 degrees C. till tough.

SUBSTITUTE FOR EBONITE.—British patent No. 76 (1914), Ernst

Kranse and Hans Blicher. Aluminium and cellulose yeast residue is mixed with dry powdered alumen to a uniform mass. This is treated with formaldehyde and the water removed by pressure and evaporation. The plate-like material is obtained from this material at 100 degrees C. under high pressure.

RECOVERING RUBBER FROM AUTOMOBILE TIRES.—British patent No. 16,116 (1914), H. Debaugre. The tires are soaked for two or three days in xylol or other solvent, when the fabric can easily be stripped away from the rubber. The rubber attached to the fabric layers can be removed by a revolving wire brush. The rubber is ground while in the brittle, swollen condition produced by the solvent, and the latter recovered from the rubber and fabric by steam or dry distillation, in the latter case under reduced pressure. The solvent may also be removed by washing with acetone or alcohol. (THE INDIA RUBBER WORLD, October 1, 1914.)

COAGULATION OF LATEX.—British patent No. 1455, Carlos de Cerqueira Pinto. A coagulating preparation consisting of a mixture of varying proportions of creosote, hydrochlorate of quinine and carbonate of soda dissolved in alcohol. This solution is diluted preferably with the wash water resulting from washing coagulated latex, and the dilute mixture added to the latex to be coagulated. The coagulation takes place rapidly and the rubber obtained possesses the entire nerve of the latex employed.

RECLAIMING WASTE RUBBER.—British patent No. 12,271 (1914), Frank Vincent O'Neill, Boston. A process for dissolving out the caoutchouc from vulcanized waste rubber. The waste is treated in a closed receptacle, under pressure (about 60 pounds) at a temperature below that detrimental to the rubber product (266 degrees F.) in the presence of boiling resin spirit. The solvent is removed from the dissolved and devulcanized rubber by evaporation. The product is said to have all the characteristics of the original rubber compound before vulcanization.

SYNTHETIC SUBSTITUTE FOR GUTTA PERCHA, BALATA AND CAOUTCHOUC.—British patent No. 17,253 (1914), Arthur Heinemann. A process for producing a homogeneous substance possessing properties similar to gutta percha and balata from butadiene and the like; such as isoprene, dimethyl, butadiene and generally hydrocarbons possessing two conjugate double links. These hydrocarbons are dissolved in acetone and polymerized by passing sulphurous acid gas into the solution. The resultant precipitate of polymerized hydrocarbons is then compressed for four days at 6,000 pounds per square inch to remove the oily liquids present and produce a homogeneous mass. The product is vulcanizable with sulphur.

PLASTIC COMPOSITION.—J. S. Campbell, British patent No. 9,370 (1914). Plastic composition consisting of a mixture of finely divided leather, fatty or resin oils, mineral fillers, sulphur and rubber, gutta, balata or rubber waste adapted to be calendered or dissolved and spread on fabrics, prepared by vulcanizing for use as packing, shoe soles, belting and tire treads.

PONTIANAK (JELUTONG) RUBBER RESIN.—Charleston Ellis and A. A. Wells have done much experimental work on Pontianak resin solutions. Their conclusions are: (1) Of the solvents or thinners commonly used in varnish and paint oil making, benzol is the most energetic on Pontianak resin. (2) Heating the resin for an extended period makes it more soluble and increases the proportion of unsaturated bodies. Temperatures above 650 degs. F. exert a marked influence, both as to solubility and chemical and physical properties. (3) Pontianak rubber resin is very inert to alkalis and, practically speaking, may be regarded as unsaponifiable.

THE interesting work on "Sulphide and Sulphate Sulphur" reported in this department last month should have been credited to H. P. Stevens, M.A., Ph.D., F.I.C. [An interesting discussion on the subject of Pontianak resin will be found in THE INDIA RUBBER WORLD, July, 1909.]

THE NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES.

THE first exposition held in America devoted exclusively to chemical industries took place in Grand Central Palace, New York City, from September 20 to 25.

The progress of chemical industry was interestingly demonstrated by the attractive exhibits of 80 or more manufacturing companies and chemical, engineering and metallurgical societies, in addition to an extensive exhibit by the Bureau of Standards, Department of Commerce of the United States.

The chemical and allied industries represented, included paper, pulp, asphalt, explosives, aniline and vegetable dyes, hard rubber appliances for use in handling acids and other chemicals; molded dielectric materials, refractories, glass, abrasives, copper, lead and rare metals; laboratory apparatus; instruments for measurement of heat, electricity and pressure, and a large and varied display of machinery adapted for chemical manufacturing operations, such as mixing, distilling, draining, drying, evaporating, pumping and weighing.

Certain exhibits had special interest for the rubber chemist and manufacturer. Among these should be mentioned the display of chemical apparatus made by the Bureau of Standards. Lenz & Naumann, and Eimer & Amend. The latter showed the direct reading gravitometer of Young designed particularly for determining the specific gravity of rubber samples. Lenz & Naumann showed a torsion balance, by C. Becker & Co., for reading specific gravity of heavy liquids. The well-known and efficient mixing and solution churns of Werner & Pfleiderer have practically become standard in many branches of industry, and types were shown adapted to light work generally.

The American Hard Rubber Co. displayed a general line of vulcanite utensils for handling acids. This company also manufactures hard rubber pipes, fittings, bottles, buckets, measures and specialties of every description.

An interesting installation in their booth was a large electrically driven pump in operation, the liquid end of which is built entirely of hard rubber to withstand the destructive action of acids, alkalis, dyes or other corrosive liquids. The illustration shows one of these hard rubber pumps connected for steam instead of electrical operation.

Bakelite and condensate products were shown in great variety by the respective companies. These well-known products have remarkable adaptability, due to their chemical and physical qualities. In particular they are found as the insulating feature of many complex electrical devices and instruments.

An extensive line of machinery was exhibited, especially adapted to industrial chemical operations, with interest centering largely in that designed for the manufacture of dyes and accessory materials. In this connection the Buffalo Foundry & Ma-

chinery Co., Bethlehem Foundry & Machine Co. and Duriron Iron Castings Co. featured the anti-corrosive qualities of the cast iron used by them in the manufacture of kettles, stills and connections for handling acids. Samples of the metal were shown in comparison with ordinary cast iron, in sulphuric, nitric and hydrochloric acids. The machinery exhibit of the J. P. Devine Co. was limited because of the demand for their commercial apparatus, practically to laboratory apparatus, such as autoclaves, vacuum pans, pumps and vacuum dryers. Complete aniline manufacturing plants have recently become an important section of their output of general chemical machinery.

The work of the Bureau of Standards of the Department of Commerce was attractively displayed in distinct sections with placarded statements of the scope of each division of the work, which was made clear by actual apparatus and samples of materials examined, and by numerous photographs of testing machines used; and also a collection of the publications of the Bureau.

The scope of the work of the Bureau, as relates to rubber, embraces the following: Chemical, physical and electrical tests upon crude rubber, rubber hose, bands, valves, packing, gaskets, gloves, insulated wire and submarine cables; research and publications; methods of chemical analysis and physical testing; specifications; direct determination of rubber, mixing and vulcanizing of rubber; experimental plant for manufacture of rubber goods; testing mechanical rubber goods; physical properties of rubber, and the effect of temperature on physical properties.

EDITOR'S BOOK TABLE.

THE FINANCIER RUBBER SHARE HANDBOOK. TWELFTH EDITION, 1915. The Financier & Bullionist, Limited, London. [Cloth, 8c., 815 pages. Price 2s. 6d., net.]

THE Rubber Share Handbook is a compilation of information regarding some 500 companies owning rubber producing properties in the East, Africa and South America, and gives in each instance the capital stock of the company, shares issued, office address, list of directors, cost of estate, and statistics of production, costs, etc. It also contains particulars of the industry generally, the following table, taken from the preface, showing the world's rubber production for the past two years with estimate for 1915, and the rate of total increase:

	Plantation.	Brazil.	Rest.	Total.	per cent Increase.
1913	47,618	39,370	21,452	108,440	9.6
1914	71,380	37,000	12,000	120,380	11.0
1915	85,000	35,000	5,000	125,000	4.0

The author gives as his opinion that there is no present cause for anxiety among investors as to the price and supplies of crude rubber, but rather that the possibility may be kept in mind of an actual shortage by the end of the year, the war having created an increased demand. With regard to the future, the belief is expressed that the rubber producing industry is approaching a somewhat critical period. The year 1916 will mark the coming into bearing of large plantings made during 1911, from which a production of from 10,000 to 15,000 tons may reasonably be expected. This, with the 100,000 tons estimated as the 1916 output of the 750,000 acres planted prior to 1911, indicates an increase in plantation production of 25,000 to 30,000 tons.

Discussing the situation created by the war, since the commencement of which Germany and Austria—whose combined receipts of rubber for 1914 amounted to 14,000 tons—have succeeded in importing only a very small quantity of this material, the author believes that these countries will find it necessary at the close of the war to immediately replenish their depleted stocks. He also believes that, though there may be a temporary drop in rubber prices when peace seems imminent, due to dis-

continuance of the manufacture of military supplies, this will be compensated for by resumption of activities in other lines that have been affected by the war. Of course, there is little chance of a commodity continuing to sell at more than twice the cost of production when the supply is rapidly increasing, but there is good reason to believe that plantation rubber will always yield substantial if not phenomenal profit to its producers. Some of the old-established plantations have already reduced their cost of production to the neighborhood of 9d (18.24 cents) per pound, and the chances are that further reductions will be possible, though generally the cost on a yield of 400 pounds to the acre amounts to about 1s (24.33 cents) per pound. The cheapest producers to date are in the Straits Settlements. Ceylon's advantages in the matter of general expenditure are counter-balanced by a poor soil which necessitates the extensive use of fertilizers and naturally adds to the cost of production. The same applies to a great extent to Southern India. Sumatra should ultimately be able to produce crude rubber as cheaply as Malaya, but although the same claim has been made for Java, results do not appear to sustain the contention.

Regarding production per acre the editor states that he has fixed 400 pounds as an average for mature plantations, but that the productivity of rubber estates varies, like costs of production. Climate and soil are the two principal factors in rubber production, and in these respects Malaya is most favored, with Sumatra and North Borneo nearly as fortunate; so that these three countries should stand first in respect to yields. Fertilizers have enabled Ceylon to keep well up with Malaya in rubber yields in spite of her less favorable climate and poor soil. Droughts in Java are against that country's obtaining yields equal to those obtained in the other rubber producing countries, and Java is not likely to average more than 100 pounds of *Hevea* rubber per acre.

Of course, these facts do not necessarily affect the value of estate investments, for shares in an estate producing 600 pounds of crude rubber per acre may be inferior in value to holdings in another property yielding only 300 pounds per acre; everything depending upon the share market capitalization per acre of the respective estates.

Rubber trees in Malaya, Sumatra and North Borneo are generally considered tappable at the end of the fifth year, when the trees are about 18 inches in girth at 3 feet from the ground. In Ceylon, India and Java the tappable stage is reached about one year later. This is true only of plantations where there are no intercrops, for, when *Hevea* is interplanted with tea, coffee, cocoa, etc., the development of the rubber-producing trees is retarded, in some cases, as much as two years.

NEW TRADE PUBLICATIONS.

OUTING, SPORTING AND TENNIS LISTS.

THE new price lists of the United States Rubber Co., issued September 1, and covering its various brands of sporting, outing and tennis shoes, show what great expansion has taken place during the last few years in this particular department of rubber footwear. The company has issued five different lists as follows: "United States Rubber Co.'s Sporting and Outing Shoes," "The Glove Brand of Canvas Rubber-Soled Shoes for Tennis, Yachting and Dancing," "The Hub-Mark and Rival Rubber-Soled Canvas Shoes for Yachting, Tennis and Summer Wear," the "Rival Tennis" and "Vim Tennis."

All these lists are of uniform size, $3\frac{1}{2} \times 6\frac{1}{2}$, but they vary in the volume of contents from the list of Sporting and Outing Shoes, which contains 28 pages, to the Rival and Vim Tennis lists, which consist of a single card. The twenty-eight page list contains thirty-six illustrations and describes over twenty different types of rubber-soled summer footwear. This list is quite an

artistic creation, being printed in black, blue and buff and having at the top and bottom of every page some scene in colors appropriate to the shoe described. These little sketches, which are deftly done, show tennis, yachting, golf, camping, baseball and a variety of other spirited scenes.

The Glove brand list contains sixteen pages and shows as many half-tone illustrations of the outing shoes made in this brand. The Hub-Mark list is confined to eight pages and contains half-a-dozen illustrations showing the yachting, gymnasium and tennis shoes made with this popular trade-mark. The Vim tennis list is evidently intended for people who want comfortable summer shoes at a very comfortably low price. This brand embraces only Oxfords and the prices, which are net in all these different lists, run from 40 cents for men's to 32 cents for children's sizes.

The growth of the popularity of the canvas rubber-soled shoe and the development of different types to supply every demand, constitute one of the most interesting features of recent rubber footwear history.

SOME FIRESTONE BOOKLETS.

"Mileage Talks" is an interesting booklet of 24 pages, in octavo size, published by the Firestone Tire & Rubber Co., of Akron, Ohio, to show on just what tire mileage depends.

The booklet is full of information about tires, their durability and details of their construction. The whole is generously illustrated.

Another enterprising Firestone publication is evidently intended to assist retailers in utilizing Firestone advertisements. It is a 16-page booklet, $10\frac{1}{4} \times 6\frac{3}{4}$ inches in size, the title, "Boom" spectacularly illustrated in black, pink and green on the cover by the blast of a cannon. Within are specific descriptions of the various Firestone "ads"—which include folders and catalogs, road signs of steel and cloth, posters, hangers, and even lantern slides—with "live wire" suggestions to the dealer as to how he may make use of them for his own benefit.

The Firestone Tire & Rubber Co., of Akron, is publishing a new house organ called "The Firestone." It is a four-page illustrated paper, intended for circulation among the employees in the company's many branches throughout the country and it gives a readable and naturally optimistic account of the various Firestone activities, both commercial and social.

On the occasion of the flag raising ceremonies described on page 620 of the August issue of THE INDIA RUBBER WORLD, the Essex Rubber Co., Inc., of Trenton, New Jersey, distributed an attractive souvenir in the form of a metal medallion three inches in diameter, with a raised brass edge and having in the center, in a raised design, enameled in colors, the seal of the United States. The souvenir evidently is intended for a paper weight and is admirably adapted for this purpose.

A booklet issued by the General Bakelite Co., 100 William street, New York, with the somewhat complicated title of "Oxybenzylmethylenglycolanhydride"—the full chemical name for the condensation product known as Bakelite—contains a description of the distinctive properties of this compound and illustrations of the various products made of it.

GOVERNMENT REPORTS AS AN AID TO EXPORTERS.

American manufacturers desiring export trade will find much to interest them in "Commerce Reports," a daily publication issued by the United States government. Besides listing the opportunities for the sale of American goods in foreign markets, it gives a complete daily record of the requirements of the United States government, notices of current changes in the tariff and trade-mark laws of foreign countries, and other valuable information. This is a pamphlet of 20 or more pages, the cost of which is \$2.50 per annum.

New Goods and Specialties.

"DE LUXE" RUBBER GOODS.

THE cuts below illustrate new items just added to one company's line of druggists' sundries. The larger cut shows a "De Luxe" combination water bottle and syringe, and also a fountain syringe, in the "Wearever" quality; on both of which patents have recently been granted. These articles are each

molded in one piece, being made of maroon rubber, with smooth surface. The syringe tubing is of extra large size, in hexagon design, and the four rapid flow pipes accompanying each syringe are threaded for screw attachment to the tube. The conversion of the hot water bottle into a syringe is effected through a combination cap.

The smaller illustration is of the new "Take-a-Part" ear and ulcer syringe, in the same class with which is also a new infant syringe. These are both made with maroon rubber bulbs and with detachable pipes, the former of soft red rubber, and the latter of flexible black rubber. [The Faultless Rubber Co., Ashland, Ohio.]

TOY BALLOONS.

Some new "Eclipse" brand rubber toy balloons are shown in the illustrations below. These balloons are of the squeaker variety and are made of high-grade rubber, in sizes from 16 to 60 inches in circumference when inflated. They are furnished with patent stoppers if desired, for inflation by means

of a bellows. In the "Dying Teddy Bear" class, the company makes also rabbits, chickens, donkeys, cats, etc. The oval balloon is made in various sizes and with a large mouthpiece. The baby squeaker comes in two sizes, either plain or in colors, the line—which includes all kinds of air balloons,

squirts, etc.—being produced in an assortment of beautiful brilliant colorings. [The Rubber Novelty Co., Limited, Knott Mill, Manchester, England.]

A NEW RUBBER BOOT FOR SEVERE SERVICE.

What miners particularly want in rubber boots is the maximum of wear, comfort of course being assumed. A new rubber boot

has recently come on the market intended especially for workers in iron mines and men employed in garages and other places where the floors are of cement and not particularly smooth; in other words, where the wear on the sole of a rubber boot is unusually hard. This new boot is quite similar to the rubber boots with leather soles which have been so popular for many years, with one exception—that in place of the leather sole there is a specially tough cemented sole which the makers say, judging from various tests made, will considerably outwear the leather sole. This new sole is called the "Nauga," which suggests that probably it is made in a Naugatuck factory. If so, that is distinctly in its favor, as Naugatuck has been famous for superior rubber footwear for the last 65 years.

The "Nauga," by the way, is an extension sole, which saves the foot of the boot from any hard knocks. In color it is a chrome yellow. [United States Rubber Co., New York.]

A NEW GOODRICH GASOLINE HOSE.

The great trouble encountered in piping gasoline has been that the fluid dissolves rubber, causing disintegration and thereby allowing small particles of rubber to get into carburetors and cause engine trouble.

With the end in view of rectifying this trouble, a new gasoline hose has been put on the market. The inside rubber tube is protected from the gasoline by a very fine fabric, specially treated, which is held in place by a steel wire. The result is that no matter how much disintegration takes place, no particles of rubber, however small, can get into the gasoline. The wire is a flat steel spiral which covers approximately two-fifths of the surface of the fabric, and prevents kinking of the hose.

The hose comes in two styles, the "Commander" and the

"Goodrich." The latter has a smooth surface and its inner construction differs from that of the former in that the protecting wire is wider than that of the "Commander" brand, which has a corrugated surface. [The B. F. Goodrich Co., Akron, Ohio.]

ELASTIC FABRIC AS A WEIGHT REDUCER.

In certain directions it is quite probable that the use of elastic fabrics is not as general as it was formerly. For instance, whereas a few years ago practically every well balanced man wore suspenders as a necessary part of his equipment, a number of men, particularly those of athletic tendencies, now affect the belt in place of the suspender. But if on this account the consumption of elastic fabrics used in the manufacture of suspenders has decreased somewhat, this falling off is more than compensated for by increased uses in other directions, as, for instance, in the making of various articles for

women's wear with the intention of reducing unnecessary avoirdupois. Of the three

The third cut shows a hip reducer made of elastic webbing woven with the fabric and fitting snugly. It is 12 inches in width, adjusted by laces in front, and has four hose supporters. [Bellas Hess & Co., New York.]

"FIRST AID" IODINE AMPUL.

This germ-proof container for tincture of iodine has at one end a rubber covering which connects the glass tube with a cotton brush. To use, break off the hermetically sealed end to admit the air, then break the glass inside the rubber covering by pressing down upon the rubber, thus allowing the iodine to flow through the cotton brush on the injury in need of cauterization. As tincture of iodine is highly evaporative, the rubber answers the double purpose of preventing evaporation and guiding the flow of iodine to the proper outlet. [H. K. Mulford Co., Philadelphia.]

NEW GREASE GUN.

A new grease gun built to hold a gallon of grease and provided with a system for registering the amount discharged at any one time, is equipped with a special type of rubber hose for carrying the grease to the desired point. This hose was chosen for the purpose because of its ability to stand garage conditions. This grease gun is substantial in design, for hard garage use. [John J. Zwald, Emporium, Pennsylvania.]

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

A FEW RAINCOAT FEATURES.

The new coat illustrated combines all the latest style features of the dressy models with warmth and storm proof qualities, being

made of heavy rubberized covert cloth. It is now on the market in the fashionable shades of gray and tan. It has a full skirt and raglan sleeves with button-trimmed cuffs. The collar may be worn rolled back in Quaker effect or turned up high around the neck. Such a coat with the collar turned up, and with pockets and vents for the hands—when worn in combination with a hat as illustrated, makes the carrying of an umbrella unnecessary. This hat is made in rubberized material in colors to match the coat, and with the brim turned down protects the face in the severest weather. [Bellas Hess & Co., New York.]

AMONG THE LATEST RIDING HABITS.

Latest showings include some new riding habits, of which two are here reproduced. Both are made of Oxford melton, and another point of similarity is the rubber facing in the coat skirts, one of which is turned back to show this rubber protection. Apart from these features and the breeches, they are dissimilar in style, one costume having a single breasted long coat, while the other, which is on

sale at present only in brown, is a double breasted flare model. [Franklin Simon & Co., New York.]

A RAGLAN RAINCOAT.

The number of men who are accustomed to treat the umbrella with silent neglect, not to say with open disdain, and to look only for protection in times of storm to the raincoat, is constantly increasing. Here is a raincoat with a number of new features. It will be noticed by the illustration that it belongs to the raglan style and that it is single breasted without a fly front. The more novel features lie in the length and width of the lapels and also in the extra stitching at the cuffs and around the pocket flaps. This coat is made of tan colored cashmere, double texture, and guaranteed to be waterproof. It is also made with an extra full skirt. [A. G.

Spalding & Bros., 520 Fifth avenue, New York.]

SIX NEW OUTING SHOES.

There is no other department of rubber footwear which has shown during the last few years such development and expansion as the manufacture of outing and tennis shoes.

VARSITY OXFORD.

RAMBLER OXFORD.

ROVER OXFORD.

The outing has become much more of an institution of late years than it was formerly. A considerable portion of the American public now devotes itself quite continuously to the

resembles the "Varsity," but is made only in misses and children's sizes, and in order to please juvenile tastes can be had in golden glow duck with red soles, it so desired.

Among the new outing shoes offered this fall are two

VERANDA PUMP BLACK DUCK WITH WHITE SOLE.

VERANDA PUMP WHITE DUCK WITH BLACK TRIMMING.

VERANDA PUMP WHITE DUCK WITH STRAP.

outing, locating it during the summer months along the New England coast, and transferring it during the winter months to Florida, Southern California and other semi-tropical climes. It is quite natural, therefore, that the paraphernalia for those who give themselves over to outings should increase in extent and variety.

The latest catalogs of "outing shoes" show six new varieties not hitherto offered the public. Briefly described and illustrated they are as follows:

First is the "Varsity," a white duck shoe made with a welt and having a white rubber sole with wedge heel. This shoe is intended for both men and women and is made in both "Oxfords" and "Bals." The "Rambler" is quite similar to the "Varsity" in its general appearance and construction except that it has a full heel instead of a wedge heel. The "Rover"

effects being an obvious concession to the prevailing tastes at the present time for multi-colored footwear.

Another "Veranda" pump for women is made of white duck and white rubber, with black trimming around the edge of the upper, and provided with a strap. A better idea of these various shoes can be obtained from the accompanying illustrations.

A new last has also been introduced this year in outing shoes for children, called the "Nature" last. The accompanying cut showing the forward half of one of these shoes, viewed from above, gives a very good idea of its natural lines and comfortableness. [United States Rubber Co., New York.]

NATURE LAST.

CORD TIRES FOR AEROPLANES.

Resiliency and security against "blow outs" are important factors in aeroplane tire building, while large tire section diameter is necessary to provide maximum cushioning qualities. The superior resiliency of cord tires has long been recognized, and the success achieved by tires of this type in automobile track races demonstrates the fact that they rarely "blow-out."

The illustration shows a new Goodyear aeroplane cord tire. It is the 26 x 4 regular clincher which contains from four to six cord layers, insuring extreme reinforcement. [The Goodyear Tire & Rubber Co., Akron, Ohio.]

THE "SKUDDER CAR."

An interesting new mechanical vehicle for children from 3 to 12 years old is called the "Skudder Car." It can be propelled at a speed of 10 miles per hour on smooth pavements by the rider. It is provided with ball bearings and solid rubber tires. [The Skudder Co., Straus Building, Chicago.]

EVERY MAN HIS OWN HAIR TRIMMER.

Every man who has entered a barber shop for the purpose of securing a plain and simple haircut and has been interrogated by the industrious barber as to whether he did not want in addition a shampoo, dry or wet; electric massage, an eyebrow trim and an alcohol rub will be glad to learn that if he so elects he can from now on trim his own hair in the quiet and solitude of his own home. An inventive genius, obviously a

friend of all mankind, has devised a simple and inexpensive apparatus which enables the owner to do his own hair trimming when and where he will. It consists of a hard rubber comb to which safety blades are attached. These blades can be adjusted in such a way that the hair may be trimmed long or short, as desired, or one part of it trimmed long and the other part trimmed short. In addition to saving the time wasted while waiting for "Next," this little instrument is obviously a saver of expense. [American Safety Hair Cutter Co., Pittsburgh, Pennsylvania.]

The Rubber Trade Association of New York Adopts New Rules.

THE following rules governing crude rubber contracts, recently adopted by The Rubber Trade Association of New York, constitute such an important step in the history of rubber importing as to be well worth reproducing in full.

RULES.

All sales by private treaty purporting to be made subject to the Rules of the Rubber Trade Association of New York, shall be considered as made subject to the following Rules:

STANDARD QUALITIES.

1. Plantation Standards consisting of *Hevea* Thick and Thin Pale Plantation Crepe, *Hevea* First Latex Crepe, *Hevea* Ribbed or Plain Smoked Sheets, Unsmoked Sheets and (or) Biscuits, to be as understood in London and (or) New York; Para Standards—To be as understood in New York.

INFERIOR QUALITY.

2. Where a parcel of rubber is sold under one of the standard descriptions for a specified shipment, arrival, delivery or on the spot and finally found inferior, buyer shall have the option of rejection and the quantity so rejected, whether the whole or any portion, shall not constitute a delivery on the contract. Should the time for delivery have expired the seller shall have three (3) clear working days to replace the quantity rejected provided that such quantity was, in the opinion of the arbitrators, a *bona fide* tender, otherwise Rule 11 to apply.

3. Where a parcel of rubber is sold with a description of quality other than specified in Rule 2, and upon delivery is found inferior, or any portion is found inferior, then the buyer must accept the same with an allowance, provided such allowance, in the opinion of the arbitrators, be not more than two cents (2c.) per pound or otherwise as may be specified in the contract; but should the parcel, or any portion tendered, be rejected the seller to have the option (provided that it was in the opinion of the arbitrators a *bona fide* tender) of substituting guaranteed quality on the spot to fulfill his contract within three (3) clear working days or the expiration of time for delivery as the case may be, otherwise Rule 11 to apply.

DELIVERY WEIGHTS.

4. The words "about" or "more or less," when used to define quantities contracted for, shall mean the nearest amount which sellers can fairly and reasonably deliver, but no excess or deficiency shall be greater than 2½ per cent. The word "ton" shall mean a ton of 2,240 pounds.

5. Final delivery on any contract to be within 100 pounds of the weight contracted for, but in any case the nearest weight of the contract quantity that the average weight of the packages of the final tender admits. But where it is found impossible to deliver within 100 pounds, taking the average weight of the packages tendered, any deficiency, or excess, shall be invoiced or invoiced back, as the case may be, at the market price on the date of delivery. Should buyer and seller fail to agree on the market valuation at such time same is to be fixed, without fee, by the arbitration committee.

6. Buyers shall have the option of rejecting any tender of less than 2,000 pounds, except in completion of a contract; but tenders of less than 2,000 pounds may be combined provided rubber so tendered is in the same neighborhood.

DECLARATION OF VESSELS.

7. After declaration should the vessel, or vessels, carrying any portion of a contract calling for shipment be lost, such contract is to be cancelled to the extent of the goods lost. Should the shipment not be declared by the seller prior to the loss of the vessel carrying the shipment, such loss shall not vitiate the contract or any part thereof.

PROMPT SHIPMENT.

8. The term "prompt shipment" from foreign ports shall, under normal conditions, be considered as follows: Within a period of fifteen (15) days if shipped from Great Britain or Europe, thirty (30) days if shipped from the Far East, thirty (30) days if shipped from the Amazon Valley.

TENDERS.

9. Plantation grades when tendered to the buyers shall be taken within three (3) clear working days; all other grades

within two (2) clear working days. The tender to be received by the first buyer before 3.30 p. m. (11.30 a. m. on Saturdays), and the first and each subsequent buyer must pass same on with due despatch, but in any case within one (1) hour of receipt. Tenders received between 1 p. m. and 2 p. m. must be received by the next buyer before 3 p. m., but in no case later than 5 p. m. on the last working day of the period of delivery (1 p. m. on Saturdays). For the purpose of this rule a day is to be taken as commencing at 10 a. m. and ending 5 p. m. (Saturdays 1 p. m.). Any party failing to re-tender within the times specified as above becomes a first seller.

10. It shall be considered a proper tender when rubber is discharged from steamer and (or) ready for delivery.

DEFAULT.

11. Wherever it may be admitted by the seller, or decided by arbitration, that the seller has failed to fulfill the terms of the contract, the buyer shall close by invoicing back the rubber to the seller at once at a price and weight to be fixed by arbitration, which price shall not be less than 2 per cent. and not more than 10 per cent. over the estimated market value of the shipment contracted for on the day upon which the default occurs, the difference to be due in cash in ten (10) days.

EXAMINATION AND ACCEPTANCE.

12. Buyer shall be afforded full opportunity, by the seller, of examining rubber on the dock or at warehouse, and once delivery is taken it constitutes final acceptance. All risk after weighing for account of buyer. Delivery shall be considered completed after rubber has passed the weighmaster's scales and weights ex-dock or ex-warehouse to be final.

WEIGHING AND TARING.

13. Unless otherwise stated in the contract all tenders of plantation rubber or rubber in bales may be weighed in drafts at the option of the seller. Rubber shall be weighed gross to the 1 pound, if in drafts, and may be weighed to the ½ pound, if weighed by the package. Cases tared shall be weighed to the ½ pound. Paras shall be grossed and tared case by case to the 1 pound. All other grades of rubber which cannot be readily tared are to be billed at tares guaranteed by seller.

PLANTATION TARES.

14. Plantation tares shall be ascertained by taring 10 per cent. of each lot (but in no case less than 3 cases) and adjustment made on the basis of shrinkage or gain as compared with the marked tares. Weighmaster is to furnish weight returns or marked tares. Where no official weights or marked tares are available all cases are to be tared. If either party, buyer or seller, desires to have any quantity in excess of 10 per cent. of the delivery tared, it shall be at the expense of the party demanding same.

MONTHLY DELIVERY CONTRACTS.

15. Where a contract calls for monthly delivery or shipment, each month or specified part of a month's delivery or shipment is to be treated as a separate contract.

OPTION OF DELIVERIES.

16. Where rubber is sold for shipment from a foreign port, the seller may tender in fulfillment of the contract, rubber not coming from that port, provided it is of the same description and quality as the rubber named in the contract and is tendered according to the terms of the contract so far as the time and place of delivery are concerned.

ARBITRATION ON IDENTICAL CONTRACTS.

17. When the subject matter and terms of contracts are identical, or identical except as to date and price, all arbitrations shall be held as between first seller and last buyer as though they were contracting parties, and the award made in pursuance thereof, subject to the right of appeal to the committee of the association, shall be binding on all intermediate parties, providing that the terms of the contract have been fully fulfilled.

NOTIFICATION OF REJECTIONS.

18. If acceptance of any parcel of rubber is refused by a buyer, immediate notification must be given the seller, same to be supplemented in writing within 24 hours, stating specific reasons for such refusal.

SPECIAL AGREEMENTS.

19. Any special agreement expressed in a contract supercedes the rule to the extent said rule is affected thereby.

FORCE MAJEURE.

20. Should shipments or deliveries be prevented during the period stipulated in a contract by reason of war, riots, strikes, government embargoes or other force majeure causes, the time allowed for shipments or deliveries shall be extended until the operation of the causes preventing shipments or deliveries has ceased.

TERMS OF PAYMENT.

21. Terms of Payment: Cash on delivery less 10 days' interest at the rate of 6 per cent. per annum.

22. These rules shall govern all contracts made on or after July 15, 1915.

REMINISCENCES.

By a Veteran Rubber Factory Superintendent.

SOME years ago a rubber shoe manufacturing firm was troubled with blistered shoes. After they had tried every way they could think of to stop it I was asked to come and see if I could find the cause. Soon after my arrival I went into the compounding room, and running my hand down in the whitening box I found the whitening damp from a leaking steam pipe. The pipe was repaired and the blisters stopped.

At a large shoe factory I found the soling calender rolls running even motion, with a man behind each machine pushing the stock in to keep it off the floor. The machines were changed to slip motion and the men taken away. These machines had run wrong for 50 years.

This factory was making as high as 16 per cent. "seconds." In two months the proportion was reduced to one-quarter of 1 per cent. Then I was called in the office and told that customers were finding fault because they were not getting enough seconds. It had been the rule to put so many seconds in every case of first quality.

In fitting out a new factory the upper and soling calenders were placed in opposite position to that intended. The reason was to keep the men from getting caught in the rolls at the top; and I have always thought they turned out better work.

It has been a matter of wonder to me in going from one factory to another to find how tenaciously manufacturers hold to a wrong idea rather than have an outsider tell them of something better. It is false pride with many of them.

In one place they were boiling oil for varnish 30 days and nights, when the boiling was stopped and varnish made without boiling the oil. They figured that this had cost them a lot of money. One factory had the idea that all compounds must be tumbled about in a rolling barrel, without any thought about cleaning or taking out all the compounds. The barrel was finally put on the dump, and then the goods took on a better appearance.

When starting a new mill, a branch of another some miles away, I sent to the old factory for thermometers to test the heaters. Putting in a few shoes, the heat was run along regular lines, but I found the shoes were not vulcanized, so I tried again, and the same thing happened. I was puzzled. Filling a small kettle half full of sulphur I hung it alongside the thermometer. When the sulphur commences to melt the glass ought to stand about 240 degs., but it was 290 degs. Sending word to the manager of the other factory that the thermometers were out 50 degrees, he said they meant to tell me about it—that they were made so on purpose, to mislead the inquisitive. The secrets in rubber mills are not so many as supposed.

In these progressive days, with the many chemists employed, I suppose nothing can go wrong. But good horse sense goes a long way, and sometimes fools the chemist. I have known it to do so many times. After all there is nothing as good as a strong thumb-nail.

As I think of the many experiences during forty or more

years in rubber mills I wonder if those engaged in the business today are having troubles of their own.

In all the years I was engaged in the rubber business the one thought uppermost in the mind of the management was that the opposition was doing better work at less cost; that the other factory was more up-to-date, and that if they could get the secret they would be better able to compete.

It occasionally happened that I went with some of these competitors. One instance is most prominent in my mind. For several years I had heard about the wonderful shoes this concern was making, the brilliant luster of the varnish, the up-to-date styles; in fact the praises were sung on about everything connected with the boots and shoes of this company.

Now, what was the truth? Three months after leaving this factory I was superintendent of the other. When talking with the manager about taking the position, he said that for many years they had ignored the shoes of the first firm as of no account, and that they cut no figure in the market, but now their customers were asking why they did not turn out as good shoes. He also said that on examination he found them superior to their own. In one month after I joined the new plant about every formula was changed to a cheaper and better, with the cost cut in two in many cases, and the number of formulae cut from 80 to 20. The ticket had been going down for some time. It immediately went from \$8.00 to 16.00 pairs a day.

My experience in different factories teaches me that most of them carry altogether too much mixed stock, considering the money invested, the room it takes, deterioration, liability to contamination, etc. Does anyone believe that he gets the same results from materials after lying for weeks in the stockroom that he gets when they are first mixed? I am not a believer in throwing stock from mixing mill into calender, but I have found stock better after two or three days.

In taking charge of a small factory I found several tons of mixed stock, also a good-sized building full of clippings and other cloth scraps. In a few months this was all utilized in the factory, not one pound wasted, and this factory—which had just kept its head above water for three years—made 150 per cent. the first year.

My way was to compound up or down as required to make a stock suitable for a desired purpose, instead of mixing new stock and probably having some to put away. A good deal of the above applies only to those who do a general rubber business.

In one place I found many dollars' worth of varnish in barrels and cans lying about the yard and out-buildings. The varnish had been made at different times, each maker thinking he knew the trick but having failed. Some made it with blown oil after Weber's formula, some with Baltic oil, Calcutta or any old oil that came to hand. This was all *reclaimed* (excuse me for using this word), and every gill of it used in the regular way, and came out all right.

This reminds me of a man who at one time was well known to the trade. When he first came under my notice he was running a factory making tan shoes vulcanized with steam heat. These I understood found their way back to the factory. Afterwards he had a small experimental shop back of his house. One day he came to the factory where I was employed, and as I had visited him at his home I did my best to show him everything of interest in the factory. When he was passing out the office door he remarked that it was wonderful. I asked him just what he meant. Why, he said, it was wonderful how well my employer had got along for one who knew so little.

Which shows how little effect failure has in taking the conceit out of a man.

"Rubber Machinery." Mr. Pearson's newest book, filled with valuable information for rubber manufacturers, is now ready for mailing. Price, \$6.

New Machines and Appliances.

A NEW BIAS CUTTING MACHINE.

GORDON'S invention relates to an improvement in bias-cutting machines and particularly to those machines adapted for cutting very wide sheets of rubber cloth.

Referring to the illustration, in which like letters indicate like parts in both drawings—*I* designates the side frames, *B* the roll of frictioned fabric, *C* the fabric, and *D* the liner roller. The fabric is passed over roller *E*, down and around roller *F*, and over roller *G*, all being positively driven from the belt pulley *H* by spur and chain gearing.

From the roller *G* the fabric passes down and under a weighted roller *I* and then over the fabric guide *J* to the table. The guide *J* consists of bent fingers, one set inclined to the right and the other toward the left. Their forward ends are connected with a slide operated by a hand rod by which the fingers are adjusted.

The surface of the table is formed by a series of ribbed plates *K* which are interrupted at intervals by spaces in which are mounted transverse rollers *L* which normally project above the

is the same and the bridge is lifted evenly. The cutting is done by the downward stroke of the bridge and shear.

In front of the table is a carriage *C*, projecting beyond the rear edge of which is a series of lower gripper fingers arranged in line, with clearance notches. Co-acting with these lower fingers is a corresponding series of upper fingers or grippers *I'* which are connected with a rock shaft mounted in bearings on the ends of the carriage. Secured to the rock shaft is a series of forwardly extending arms beneath which springs are placed to force the grippers together. As the carriage moves toward the cutters, the grippers are open, but when the grippers have passed on the raising plate they are released by a lug striking a stop which closes the grippers, just as the fingers enter the notches in the raising-plate and while the bridge is raised. The grippers come together to grip the edge of the fabric which has been lifted from the lower knife by the raising plate, the edge of the fabric being in line with and caught by the grippers.

Adjustably mounted on one of the tubular bearings is a cam

plane of the table. These rollers are mounted so that they can be dropped below the plane of the table.

At the forward end of the table is a lower knife *M* which extends diagonally across the frame at an angle of 45 degrees. Above this knife is a transverse plate that is raised and lowered by rod *N*, a bell-crank lever, and a cam, driven from the main shaft *O*. Above the plate is a strip of card cloth beneath which the fabric passes and which prevents the fabric from creeping backwards while permitting it to be drawn forward. Co-acting with the lower shear *M* is a movable upper shear *P*, which is fixed to the bridge *Q*. The bridge and shear are raised by vertical rods *R*, *R*, connected to bell crank levers *S*, *S*. The front lever *S* is connected by the rod *T* to a lever that is rocked by an eccentric attached to the main shaft *O*. The opposite lever *S* is connected by a short rod to a similar lever and eccentric on the same shaft so that the movement imparted to the rods *R*, *R*

H' which determines the extent to which the fabric is drawn forward before the cutting takes place, and on the end of the rock-shaft is an arm which engages with this cam to open the gripper fingers. As the carriage moves forward the grippers are opened and the strip of fabric released, the machine being timed so that the cutter descends when the carriage reaches the limit of its forward movement. The severed portion of the fabric drops on aprons *X* driven from a roller and running over adjustable rollers *Y* at the forward end of the machine.

With this machine the fabric is drawn on the table and spread out flat and any tendency to creep to one side is overcome by the warp fingers. If the fabric creeps to one side or the other, by manipulating the fingers which spread the fabric toward opposite sides its course may be properly directed through the machine. [William A. Gordon, assignor to Birmingham Iron Foundry, United States patent No. 1,148,162.]

ADAMSON'S TREAD MOLD.

Tire treads are usually vulcanized either in press-mold or wrapped with strips of cotton cloth. In the former method the gases in the compound are sometimes trapped, causing blisters; while cloth wrapping is expensive.

Adamson's mold provides a support of powdered soapstone or molder's sand, which surrounds the tread surface of the casing and holds it in shape while the gases are free to escape.

Referring to the drawing, 1 is a metal core on which the casing is built up, and which is hollow to permit access of steam through openings 2. The upper and lower mold sections 3 and 4 respectively have channels 5, which form the beads 6, the sections being clamped together by bolts 7. The lower mold section 4 is extended annularly at 8, forming a circular channel that surrounds the tread surface 9.

In practice the built-up tire shoe is placed between the sections 3 and 4, which are then clamped together. This shapes the beads as well as the body of the shoe in the usual manner. The pocket formed by the extensions of the molds is then filled with molder's sand, which is tamped, in the usual manner, and brought flush with the upper edges of the extensions, when the mold is ready for the vulcanizer. The sand surrounding the tread surface of the shoe will maintain the rubber stock—softened by the rise in temperature—against movement, while it also permits the escape of any gases liberated in the rubber. [C. F. Adamson, assignor to United States Rubber Co., United States Patent No. 1,150,922.]

OTHER INVENTIONS.

Raymond B. Price has recently been granted five patents covering processes of vulcanization and methods of making rubber thread and other vulcanized products. Brief descriptions follow:

VULCANIZING WITH A FLUID MEDIUM. Tires, hose, boots, and shoes are vulcanized in a bath of calcium chloride or other heat transmitting mediums of a fluid nature under the vulcanizing temperature. [United States patent No. 1,152,834.]

VULCANIZING WITH A FLUID MEDIUM UNDER PRESSURE.—The article to be vulcanized is surrounded with a heating medium and the latter subjected to pressure. [United States patent No. 1,152,835.]

VULCANIZING FABRIC AND RUBBER.—A layer or layers of fabric are interposed between layers of rubber such as in hose or tires. The fabric layer is first subjected to fluid pressure and then a greater pressure is applied to the exterior rubber layers. This removes the moisture and compacts the layers of fabric and rubber. [United States patent No. 1,152,836.]

WARMING, PRE-HEATING, AND VULCANIZING PROCESS.—Boots and shoes are treated to a preliminary warming at or under atmospheric pressure, then to a pre-heating at a temperature above the curing heat and at a pressure above, at, or below atmosphere, and finally they are vulcanized. [United States patent No. 1,152,837.]

MAKING RUBBER THREAD.—A number of superimposed layers of rubber sheet are coated with a medium, such as glycerine, that is liquid at the vulcanizing temperature and the pile is then vulcanized. The coating of glycerine prevents the layers from adhering so that they can be separated after vulcanizing. [United States patent No. 1,152,838.]

DRYING APPARATUS FOR RUBBER-COATED FABRICS WITH RECOVERY OF THE SOLVENT.—The air space about all surrounding a proofed fabric from which solvent is being evaporated is completely enclosed, and facilities are provided for inspecting the fabric after passing the spreading knife. The vapor of the solvent is recovered in a closed system in which the vapor-laden air is drawn by a fan from the drying chamber through two refrigerators for condensation; the residual air being reheated and passing again into the drying chamber. [E. Bataille, French patent No. 474,003—1914.]

A NEW WATERPROOF FABRIC AND PROCESS OF MANUFACTURE.—The inventor uses loose staple cotton, hair or threads distributed in thin layers, the fibers of one or more layers being angularly disposed to the fibers of the adjacent layers. When a sufficient number of layers have been piled together they are submerged in a solution of rubber. After the excess rubber has been pressed out the material is sheeted.

The claim is made that tires made up of this material are non-skid and puncture proof, and that rubber heels of the material wear longer and will not slip on wet pavements. [Hadden Swain, United States patent No. 1,152,349.]

MANUFACTURE OF SEAMLESS GOODS.—Gloves, nipples, finger cots, tobacco pouches, etc., are made by dipping. A recent invention covers a process which consists in dipping and vulcanizing separately each successive layer of rubber. The layers may be of different rubbers and consistency, and in making gloves, nipples and finger cots the head at the open end is formed before curing by rolling up the layers. [Thomas W. Miller, assignor to The Faultless Rubber Co., United States patent No. 1,152,372.]

THE GARDNER VALVE PACKING GRINDER.

Hard rubber valves must be accurately finished to be serviceable—that is, the two opposite sides of the ring should be ground flat and parallel to within two thousandths of an inch. Also rings of the same size should not vary in thickness more than five thousandths of an inch.

The Gardner machine is used for grinding at the same time two parallel sides of a valve or ring. The two abrasive discs

are mounted on oppositely placed heads driven by independent belts. The right hand head is fixed and the one on the left is moved laterally by a rack and gear operated by a hand or foot lever. A micrometer stop-screw, graduated in thousandths of an inch, regulates the forward travel of the head so that duplicate work can be finished accurately.

In the illustration the grinder is shown in operation, finishing, one at a time, valves of six different sizes. These are clamped in a simple wooden holder and held between the revolving discs by the right hand of the operator. The movable head and grinding disc is brought up against the valve by a lever operated by the left hand of the operator.

With the larger valve rings, a roughing cut is first made with coarse discs to bring the ring down to within 12 thousandths of finished size. Finer discs are then substituted and the finishing cut made bringing the valves down to size. The output is 600 to 625 of the small valves per hour, as only one cut is required, and 350 to 370 of the larger valves per hour, as two cuts are required. [Gardner Machine Co., Beloit, Wisconsin.]

THE SILENT CHAIN DRIVE.

The introduction of electric drives in the most progressive rubber mills has greatly changed the appearance of factory interiors. The unsightly line and countershafts with whirling pulleys and flying belts are gone. While this is primarily due to the motor drive, it is the application of the chain drive that makes this transformation complete.

The silent chain consists of stamped links pivoted together forming a multiple chain that is as flexible as a belt and as positive as a gear. Both the drive and driven gears are accurately cut to fit the chain. Transmission service in rubber mills is very severe. As a matter of fact gearing has heretofore been used almost exclusively, but the repair and maintenance costs due to the gears transmitting shock, have in many cases caused the substitution of chain drives.

For heavy intermittent service, such as driving washers, mixers or grinders, where the load often varies from 25 per cent, to 150 per cent, within a few seconds, the chain drive is very satisfactory. When applied to calendars the driving force is positive but elastic and is equal at each instant to the uneven load usually carried by these machines. The chain drive is particularly well fitted for driving textile machinery, such as hose braiders, looms and special tire fabric machines. The smooth drive and even turning of rotating parts result in fewer broken threads. It is peculiarly fitted for the operation of air compressors, positive pressure blowers, and similar machinery, and for driving ventilating and heating fans. The silent chain permits of compact construction and requires but a minimum of attention.

The service cost per horse-power of a chain drive is probably lower than any gear, rope or belt transmission, tests on small

Chain drive—1,200 horse-power drive, 240 to 80 r. p. m., 100 in. centers; one 31-tooth sprocket, driver 30.21 in. diameter; one 93-tooth sprocket, driven 89.42 in. diameter; 33.5 ft., 27 in. x 31 in. silent chain—price, not including balance wheel, \$3,748.75.

TWO 200-H. P. LINK-BELT SILENT CHAIN DRIVES. OPERATING LINE SHAFTS FOR RUBBER MILLS. SIZE OF CHAIN: 2-INCH PITCH BY 12-INCH WIDE.

The chain drive is now used to transmit power to many rubber machines. A total of over 33,000 horse-power in service in rubber mills shows the popularity of this type of power transmission.

A NEW STITCHER.

The hand stitcher is not only a very simple tool, but is an extremely useful one. In fact it is almost indispensable in the manufacture of certain goods; for instance, in rolling down the fabric strips and making smooth

joints in tire building. The usefulness of this tool has greatly increased recently, and has resulted in the development of an improved ball bearing stitcher, which is made by the Hoggson & Pettis Mfg. Co., New Haven, Connecticut.

A NEW HOSE COUPLING.

This device does away with hose clamps, straps and couplings that require special fastening tools when attaching hose to a threaded terminal. The end of the hose is slipped into the corrugated end of the socket, which is then screwed on

the threaded sleeve. This is provided with a long taper which expands the hose against the corrugated socket, holding it in a positive grip. No special tools are required to make or break the connection, as ordinary wrenches are sufficient for the purpose. [The National Hose Coupling Co., Peoples Gas Building, Chicago.]

1,000-H. P. and 500-H. P. MORSE SILENT CHAIN DRIVES, OPERATING TWO LINE SHAFTS IN A LARGE RUBBER MILL. SIZE OF CHAINS: 3-INCH PITCH X 24 INCHES WIDE AND 3-INCH PITCH X 12 INCHES WIDE, RESPECTIVELY.

powers having shown that this efficiency runs from 98½ to 99 per cent.

The following comparison is a good example of the greater compactness of this modern power transmission.

Rope drive—1,200 horse-power, 240 to 80 r. p. m., 42 ft. centers; diameter of driving sheave, 6 ft. 4½ in.; diameter of driven sheave, 20 ft.; 30 ropes, each 1¼ in. in diameter—price, including balance wheel weighing 120,000 lbs., \$6,900.

In the August number of THE INDIA RUBBER WORLD there was shown a very interesting "permanent set" testing machine used in the laboratory of the New York Insulated Wire Co. The invention was credited to M. M. Kahn, of the laboratory staff, but Mr. Kahn writes us that it was not his invention and we therefore gladly correct the error.

The Obituary Record.

A. G. SPALDING.

While Albert G. Spalding, who died September 9 at his home in Point Loma, Southern California, after a brief illness of ten days, had been a rubber manufacturer for many years, he had been prominent in many other relations and probably was most widely known through his association with athletics in this country, and especially through his connection with the "national game" of baseball. He was a man of marked versatility and

A. G. SPALDING.

was eminently successful, in his younger days in sports, and in his maturer years in mercantile and manufacturing pursuits, while he barely missed conspicuous success in politics.

Mr. Spalding was born in Byron, Illinois, September 2, 1850. He came of excellent American lineage, his first ancestor in this country being Edward Spalding, who settled in Massachusetts in 1630.

Young Spalding left school at the age of 15 to become a grocer's clerk at a salary of \$5 per week. His remarkable skill

in the game of baseball, then beginning to gain wide popularity through the country, soon weaned him away, however, from weighing sugar and delivering sacks of flour. He held the position of pitcher on several local nines, though still giving the major part of his time to more serious mercantile affairs. But in 1871 he was offered the position of pitcher on the Boston "Red Stockings"—the most famous ball team of its day—and he pitched that team to a championship four years in succession; in '76 going to the Chicago National team, which in turn became the champion nine because of his extraordinary work in the box. He remained with the Chicago club only two years, when he retired as an active player, though he remained as manager and secretary.

In the meantime, in '76, with his brother, James W. Spalding, he founded the house of A. G. Spalding & Bro., a firm that grew with great rapidity, establishing branches in all the chief cities of the United States and in Europe and becoming famous all over the world. In connection with the distributing business carried on by this firm a factory was started a number of years ago at Chicopee, Massachusetts, for the manufacture of baseballs, tennis balls and, later, of golf balls.

Mr. Spalding, notwithstanding his large mercantile interests, could not entirely divorce himself from the national game. In 1881 he became president of the Chicago National Club and seven years later, carrying out a plan which he had long entertained in his mind, he took the Chicago team and another, called the "All-Americans," on a tour around the world. As baseball was an unknown game to many of the people in Europe and farther east, this tour of the two famous American nines created

a decided sensation. He retired from active baseball management in 1891.

In 1899 Mr. Spalding brought about the merger of 150 bicycle manufacturing companies into the American Bicycle Co., of which he was the first president. In 1900 he became a resident of Point Loma, California, and a member of the Theosophical colony of that place. In 1910, when the first election was held in California under the primary law which had just been passed, he was persuaded by his friends to enter the contest for United States senator. He carried 75 out of 130 legislative districts, but, notwithstanding that fact, the legislature declared for another candidate.

Mr. Spalding was married twice, his first wife being Miss Sarah J. Keith, of Campello, Massachusetts, who died in 1899. His second wife was Mrs. Elizabeth Churchill Mayer, of Point Loma, who with two sons, Albert G. Spalding, Jr., and Keith Spalding, and an adopted son, Durand Churchill, survives him.

MILTON T. BAILEY.

Milton T. Bailey, for the last 28 years connected with the Apsley Rubber Co. and for a number of years past its secretary, died September 11 at the Massachusetts General Hospital, Boston, after an illness of several weeks.

Mr. Bailey left his home in Hudson August 3 to go to his summer home in West Southport, Maine. He was taken ill immediately on reaching that place. For two weeks his condition

was considered very serious, but during the third week he seemed to improve and on September 9 started for home. The trip from the Maine coast to Boston proved to be exceptionally rough and Mr. Bailey suffered several heart attacks. On reaching Boston he was taken to the hospital, where he died the next morning.

Mr. Bailey was born in Milan, Ohio, May 8, 1843. He went to school in Pennsylvania and though still under age at the time of the Civil War enlisted as a sergeant with the 143rd Pennsylvania Infantry.

He saw the hardest imaginable service, going through the horrors of both Libby and Andersonville prisons. At the conclusion of the war he became a bookkeeper for William Apsley in Pennsylvania and in '87 transferred his services to the Apsley Rubber Co., Hudson, Massachusetts, first being a bookkeeper, later financial manager, and during the last ten or twelve years of his life, the secretary of that corporation.

He was a man of the greatest conscientiousness and was highly regarded by all his associates. In addition to his business duties, which were engrossing, he found time for many local interests. He was a member of the G. A. R., of the Odd

M. T. BAILEY.

Fellows, president of the *San Saloon League* of his town, prominent in the work of *gifting* a public library for Hudson, and the founder of the *First Congregational Church* of that place, holding important offices in it for many years. During the funeral services, which were held in the *Congregational Church*, the flag on the *Apsley factory* and the flag on the *Town Hall* were at half mast.

EVERETT G. EBERHART.

Everett G. Eberhart, vice-president and general manager of the *Mishawaka Wooten Manufacturing Co.*, *Mishawaka, Indiana*, died August 17 in his forty-eighth year, having been born in *Mishawaka* March 19, 1868.

He was the youngest son of *Adolphus Eberhart*, who, with the late *M. B. Beiger*, organized the *Mishawaka company* for the manufacture of the all-knit boot, which they originated. After his graduation from the high school of his native town in 1887, Mr. Eberhart immediately entered his father's factory and worked in various departments so as to acquire a general knowledge of the industry. Later he was transferred to the office, and in 1903 was made vice-president and general manager, positions which he occupied until his death.

During the 28 years of Mr. Eberhart's connection with the *Mishawaka company* it increased from a small organization of 200 employees making a yearly product of \$500,000 in value, to a large corporation employing 2,700 people and producing a yearly output to the value of \$10,000,000. And it is the consensus of opinion among Mr. Eberhart's associates that this pronounced success was in no small measure due to his sound judgment and initiative.

WILLIAM R. POPE.

William Ripley Pope, electrical engineer of the *National Conduit & Cable Co.*, of *Hastings, New York*, died at his home in that village September 16 of apoplexy. Mr. Pope was born September 9, 1856, at *Lake Roland, Maryland*. He came to *New York* in 1889, and had been connected with the *Cable company* for a number of years. He was for twelve years one of the village trustees of *Hastings* and was the founder of the *Hastings Building & Loan Association*. He is survived by his wife and a daughter, Mrs. George E. Townsend.

MATTHEW HAMILTON GRAY.

Matthew Hamilton Gray, formerly engineer-in-chief of the *India Rubber, Gutta Percha & Telegraph Works, Limited*, *Silvertown, London, England*, passed away at *Glenquich, Perthshire, Scotland*, September 2, at the age of 61 years, having been born in *June, 1854*, at *Glasgow, Scotland*.

Mr. Gray was a brother of *Robert Kaye Gray*, the late managing director of the *Silvertown works*, and a member of one of the most famous families in the telegraph, electrical and rubber industries. He was educated to be a mining engineer and to perfect his knowledge he traveled around the world, visiting the *United States, South America and the Far East*. He returned to *England* and, following his father's advice, entered the services of the *Silvertown works* in the capacity of assistant engineer. He played an important part in the laying of cables in *Mexico, Central and South America, and from England to Spain*. He managed the laying of the *Spanish National Cable from Cadiz to the Canaries*, and he connected *Brazil with Africa*.

He retired from the active service of the *Silvertown works* about seven years ago, but up to his death he continued to interest himself in the various operations of that company.

MRS. CHARLES H. ARNOLD.

For more than thirty years, *Charles H. Arnold* has been a prominent figure in the rubber trade. Not only is he well known, but many have visited his fine estate in *Stoneham* and met its capable and womanly mistress. To all such the news of her sudden death will come as a great shock. For the bereaved husband and sons, whose loss is unmeasurable, the deepest sympathy is extended.

NOTES OF THE TIRE TRADE.

TIRES AT THE TWIN CITIES MOTOR RACES.

Though the day was hot there was little tire trouble at the 500-mile speedway race held at *Fort Snelling, Minnesota*, September 4. The outside rear tires suffered most from the strain of the race. This is the case in all track races, and it is due to the fact that the outside of the track is always roughest, and that at the turns a great portion of the weight of the cars is thrown on the rear outside wheel. The six cars that finished the race made eighteen tire changes, showing the average tire life in the race to be about 170 miles. The winning *Stutz cars* used *Silverdown cord tires*. Tire blow-outs caused the destruction of 11 wheels, of which ten were rear wheels. A few treads were thrown.

A curious feature of the race was that the two winning cars ran neck and neck practically throughout the whole race and one, the winner, changed six tires, whereas the other, which made practically the same average speed, only made three changes.

During the fiscal year ending June 30, 1915, the *United States* exported automobile tires to the value of \$4,963,270, as compared with \$3,505,267 during the previous fiscal year, showing an increase of \$1,458,003.

THE PERLMAN RIM PATENT SUSTAINED.

The *United States District Court for the Southern District of New York* has sustained *United States patent No. 1,052,270*, issued February 4, 1913, to *Louis H. Perlman*, of *New York*, and has issued an injunction against the *Standard Welding Co.*, of *Cleveland, Ohio*. The court further ordered that an accounting be made of the profits, which the defendant company derived from the infringement of the *Perlman patent*. The demountable rim, subject of the patent sustained by this decision, was perfected by its inventor as far back as 1903. It is supported on a small amount of surface and is capable of ready application and removal, and yet is firmly locked on the fixed rim when in use.

LARGER TIRES

Most of the 1916 models of American built automobiles selling at prices above \$750 are provided with what were formerly known as oversize tires. This makes ample provision for the overloading motor cars are so often subjected to.

A METAL CORD TIRE.

The popular cord tire is receiving a good deal of attention these days and inventors are striving diligently to produce a better or even as good an article, without actually infringing on

the original patents. Instead of cotton cords, Mr. Miller, of the *Anderson Rubber Works*, uses wires that are twisted and wound with friction tape, forming metallic cables.

The tire is built up in the following manner: A strip of friction fabric is first placed on the core. Over this is placed a strip of rubber stock and then a layer of metallic cables is laid

diagonally across the core. On this layer is placed another strip of rubber stock and then another layer of metallic cables is laid diagonally and at an opposite angle to the first; then another strip of rubber stock and a strip of frictioned fabric that extends from head to head; and finally the breaker strip and tread are applied. This tire is said to be blow-out proof.

News of the American Rubber Trade.

PICHER LEAD CO. INCREASES CAPITAL TO FIVE MILLIONS.

THE original capitalization of the Picher Lead Co. was \$100,000, but the assets of the company have increased until their value is approximately \$4,500,000. Consequently the stockholders of the company at a meeting held on September 1, in order to bring the capitalization more nearly into uniformity with the company's real assets, voted to increase the capital stock to \$5,000,000. The corporation still remains a Missouri company.

Of the increased stock all but \$1,000,000 was subscribed and taken by the old stockholders of the corporation, the remainder being held by the company as treasury stock.

DEVELOPMENT OF THE FISK RUBBER CO.

This company began manufacturing operations 17 years ago, starting with bicycle tires. Its progress has been rapid. Today it gives employment to about 3,000 people, with a weekly payroll of \$48,000. The principal product is the Fisk pneumatic tire. The capacity of the plant is 5,000 tires daily and this output is now being realized, and makes the Fisk Company an important factor in tire production. In addition to its large automobile tire output the company also manufactures many bicycle tires and a full line of tire repair accessories.

UNITED MALAYSIAN RUBBER CO. NOT AFFECTED.

A recent issue of the "Sarawak Gazette" published in Sarawak, Borneo, contained a letter written by the Rajah of Sarawak, stating that the United Malaysian Rubber Co., Limited, in London, had been notified that its Jelutong concessions in the Sarawak territory had been cancelled and that all the rights under that concession had ceased.

But when the officials of the company at the New York office were questioned about the matter, they made the following statement: "It is quite true that these concessions have been cancelled, but in the form in which they were interpreted by the Sarawak Government they have been of no use to us, so the cancellation of them does not affect our operations. Our plant at Goebilt is still in operation and will continue. There is no intention of liquidating the company."

RUBBER WORKERS GET SALARY INCREASE.

The Manhattan Rubber Manufacturing Co., of Passaic, New Jersey, posted notices on September 16 to the effect that all employees with the concern from six months to two years would receive a 3 per cent. increase in salaries; those who had worked from two to five years, 5 per cent., and all over five years a 7 per cent. increase. The company employs about 750 hands.

RUBBER COMPANY DIVIDENDS.

The Firestone Tire & Rubber Co., of Akron, Ohio, has declared an extra dividend of 4 per cent. on its common stock, payable October 15.

The Republic Rubber Co., of Youngstown, Ohio, paid on September 1 a dividend of 1½ per cent. on its preferred stock.

Early in September the Canadian Consolidated Rubber Co., Limited, of Montreal, Canada, declared the regular quarterly dividend of 1¼ per cent. on the preferred stock, payable September 30, to stock of record September 18.

The Rubber Goods Manufacturing Co. of New Jersey paid, September 15, its sixty-sixth regular quarterly dividend of 1¼ per cent. on the preferred stock to stockholders of record September 13.

SEMI-ANNUAL UNITED STATES RUBBER REPORTS.

Complying with a request made by a number of their stockholders, the directors of the United States Rubber Co. have voted to issue semi-annual reports of the company's condition. A request had been made for quarterly reports, but the directors did not think this advisable owing to the very considerable expense involved.

THE SOMERSET RUBBER RECLAIMING WORKS.

The Harmer Rubber Reclaiming Works, of East Millstone, New Jersey, changed their name, October 1, to the Somerset Rubber Reclaiming Works and their headquarters from East Millstone to New Brunswick, New Jersey. There will be no change in the management or the officers, I. Laurie remaining president and A. Marcus secretary and treasurer. The office was moved to New Brunswick, as that city has much better postal facilities than its neighbor, East Millstone.

MR. FORD HAS NOT BOUGHT CONTROL OF THE GOODRICH CO.

Mr. Henry Ford has been very much in the public eye of late and has been extremely active in various directions, but in one respect the rumors of his activities are not well grounded. The report was circulated that he had bought control of The B. F. Goodrich Co. This is most emphatically denied. Mr. Raymond, vice-president of that company, in speaking of this rumor says:

"The B. F. Goodrich Co. has \$60,000,000 of common stock outstanding. To secure control of this class of stock it would be necessary to purchase over \$30,000,000 in the open market. Nowhere near this amount has changed hands recently. Furthermore, I feel that if Mr. Ford desired to secure control of the Goodrich company he is the sort of man who would come to us and deal directly with us. Control of the Goodrich company is now in the same hands as at the time of its formation—by that I mean it is in the hands of the Goodrich family, with Mr. Work and others who were the prior holders of control."

TWO RUBBER MEN ON SECRETARY DANIELS' BOARD.

Among the twenty-two men representing eleven different scientific associations appointed, September 12, by Secretary Daniels as members of the Naval Advisory Board, there are two men well known to the rubber trade. One is Thomas Robins, of Stamford, Connecticut, who is one of the representatives of the Inventor's Guild. Mr. Robins has been associated with the development of the conveyor belt for the last quarter century. In fact, if one should refer to the back files of THE INDIA RUBBER WORLD, he would find in the May issue of 1896, a three-page article on rubber conveyor belts and their use by Mr. Robins, which, told about all there was to say at that time on this subject. He is the author of many useful inventions connected with belt conveying, and he is president of the Robins Conveying Belt Co. of New York.

The other rubber representative selected by Secretary Daniels, is Dr. L. H. Backeland of Yonkers, New York, who was nominated as one of the two representatives of the American Chemical Society. Though Dr. Backeland was born in Belgium, he has resided in this country for many years and has become famous by his invention of substitutes for hard rubber, notably, "Bakelite" and "Condensite." Outside of the rubber trade, he is known as the inventor of the photographic paper called "Velox." He has held many important positions in scientific societies and has read many notable papers before scientific bodies.

SENATOR COLT DELIVERS A NOTABLE ADDRESS.

SENATOR LI'BARON C. COLT, brother of Col. S. P. Colt, president of the United States Rubber Co., delivered an address at the Rhode Island Fair held at Kingston in that State, September 16, which has received much attention from the press of New England. It was an admirable interpretation of the general feeling now pervading the whole country regarding the maintenance of peace coincident with a thorough preparation for war.

The senator, naturally, from his long years on the bench, takes a judicial view of all questions, and he believes that international disputes are quite as susceptible of peaceful settlement as disputes between individuals; and in substantiation of this view he cited the century of peaceful solution of all questions that have arisen between the United States and Canada. He also called attention to the advanced ground that the United States has taken in the matter of submitting international questions to arbitration, but he admitted that the time had not yet arrived when a nation's good will towards its neighbors could constitute a sufficient defence. The following paragraphs give a very fair idea of the senator's general viewpoint:

"The United States and Canada for the past hundred years have settled all controversies, some of them of a grave character, by arbitration. In this instance consent and usage have ripened into a habit, the effect being that both countries have reached such a frame of mind that it is difficult to conceive of a dispute between the two countries which they would not be willing to arbitrate. When all nations have reached this frame of mind, war will cease.

"The United States should take just pride in its efforts for more than a century in behalf of peace, justice and good will among the nations of the earth. It has led the movement for arbitration, for the rights of neutrals, for the inviolability of private property in maritime warfare, for the amelioration of the laws of war, and for the establishment of a truly international court of justice modelled on our Supreme Court.

"But today we are confronted by present conditions which we cannot escape from—the intense spirit of nationality, uncertain rules of international law and an imperfect system of arbitral justice—and while these conditions exist we are only following the dictates of reason and common sense when we insist that this country should be reasonably prepared for war."

MR. STEDMAN BACK AGAIN.

The news that Arthur W. Stedman is back in the rubber trade will be received with much satisfaction by his hosts of friends. As of yore, Mr. Stedman's particular line will be crude rubber. With offices in Boston and New York and excellent connections, his success is assured. As he states it, his business is to be "strictly commission," and the emphasis that he lays upon the "strictly" leads one to believe that he will live up to it. Mr. Stedman's Boston office is at 73 Beverly street.

NEW INCORPORATIONS.

Brooklyn Tire Co., Inc., August 30, 1915; under the laws of New York; authorized capital, \$30,000. Incorporators: William L. Cahn, Edward F. Quinn and Malvina DuFresne, all of 128 Broadway, New York City. Manufacture and deal in vehicle tires.

Davenport Safety Tire Co., The, August 7, 1915; under the laws of Arkansas; authorized capital, \$100,000. Incorporators: J. R. Alexander and W. H. McLaughlin. Location of principal office, Little Rock, Arkansas. To own and develop United States Patent No. 1,077,044.

Double Mileage Tire Co., Inc., September 22, 1915; under the laws of New York; authorized capital, \$10,000. Incorporators: John J. Mahler, 319 Electric avenue, Rochester; Warren Bulkeley, 60 Plymouth avenue; Fred McCausland, 84 Plymouth avenue, both in South Rochester, all in New York. Tires.

Economy Tire Co., Inc., September 9, 1915; under the laws of New York; authorized capital, \$1,000. Incorporators: Frank A. Koonz, 9 Robinson street; Earle C. Hall, 306 Summit ave-

nue; Edward J. Vrooman, 1206 Union street, all in Schenectady, New York. Tires and accessories.

Illinois Rubber Co., September 1, 1915; under the laws of Maine; authorized capital, \$75,000. Incorporators: Albert F. Jones, president; T. L. Croteau, treasurer, and James E. Manton, clerk, all of 281 St. John street, Portland, Maine. To produce, manufacture, buy, sell, export, import and generally deal in and with rubber and gutta percha; merchandise and substances of which rubber is a component part.

International Rubber Co., The, September 2, 1915; under the laws of Colorado; authorized capital, \$100,000. Incorporators: Charles C. Gates, John G. Gates and Ernest H. Cooper. Location of principal office, Denver, Colorado. To manufacture, buy, sell and deal in all kinds of rubber goods.

Montclair Rubber Co., August 24, 1915; under the laws of New Jersey; authorized capital, \$10,000. Incorporators: Walter F. Smith, Alice F. Smith and J. Clifford Stricker, all of Trenton, New Jersey. Location of principal office, 203 East State street, Trenton, New Jersey. To manufacture, sell and purchase all kinds of goods of which rubber is a component part.

National Pneumatic Tire Co., The, July 24, 1915; under the laws of Ohio; authorized capital, \$25,000. Incorporators: Peter Kelly, Wesley J. House and William Sylvia. Location of principal office, Cleveland, Ohio. To manufacture and sell rubber goods, tires and rubber specialties and to control patents covering same.

Nu-Septic Hard Rubber Syringe Co., Inc., September 22, 1915; under the laws of New York; authorized capital, \$1,000. Incorporators: Samuel L. Weiss, 408 Bainbridge street, Marx Finestone, 483 Park place, and Henry Klein, 723 McDonough street, all in Brooklyn, New York. Rubber goods, etc.

Rutherford Removable Rubber Tip & Novelty Co., July 27, 1915; under the laws of Washington; authorized capital, \$50,000. Incorporators: William Rutherford, W. E. Foy and H. B. Waite, all of Seattle, Washington. To buy and sell rubber supplies and automobile attachments of rubber.

Service Sole & Heel Co., August 13, 1915; under the laws of Delaware; authorized capital, \$10,000. Incorporators: John C. Gilpin, 1917 Rittenhouse street, Philadelphia; John Davidson, Rutledge, both in Pennsylvania, and Solomon F. Glenn, 322 Cooper street, Camden, New Jersey. To buy, sell or otherwise deal in rubber, leather, boots, shoes, heels and all kinds of findings.

Standard Four Tire Co., June 30, 1915; under the laws of Iowa; authorized capital, \$240,000. Incorporators: J. R. Beaver, William J. Richards, A. L. Higbee and H. S. Charles, all of Keokuk, Iowa. To manufacture, buy and sell rubber goods, such as automobile tires, accessories, etc.

Sunset Rubber & Supply Co., August 6, 1915; under the laws of California; authorized capital, \$25,000. Incorporators: E. S. Long, W. M. Friedenberg, J. H. Bathrich, Jr., Pauline F. Bathrich, L. T. Chanslor, F. P. Williams and Alice V. Deeble. Location of principal office, 1020 West Thirty-sixth street, Los Angeles, California. To manufacture and deal in rubber goods and articles of all kinds.

United Tire & Rubber Co., July 31, 1915; under the laws of Ohio; authorized capital, \$1,000. Incorporators: Jesse S. Wainright, Jacob Reinhardt and S. J. Colwell. To buy, sell, manufacture, deal and trade in auto and vehicle tires, etc.

Wood Auto Supply Co., Inc., September 9, 1915; under the laws of New York; authorized capital, \$25,000. Incorporators: Charles J. Wood, 320 Rutgers street; George E. Camp, 7 Noyes street, and Emerson M. Willis, Proctor Boulevard, all of Utica, New York. Auto and carriage tires.

Zegler Tire & Fabric Co., August 26, 1915; under the laws of Indiana; authorized capital, \$50,000. Incorporators: Casimir Zegler, Edwin R. Dean and Francis I. Hardy. Location of principal office, South Bend, Indiana. To manufacture fabric of all kinds and also automobile, bicycle and carriage tires.

JESSE E. LA DOW.

WITH the Executive Committee of the Rubber Club of America, Inc., at its last meeting, held September 16, elected Mr. Jesse E. La Dow of the Mansfield Tire & Rubber Co. as a member of the Legislative Committee of the club it did not make the selection at random. Mr. La Dow was chosen for that position because, while a rubber manufacturer, he is also a lawyer

J. E. La Dow.

of extended practice and experience and because, furthermore, he has devoted a great deal of time to the study of the tariff and other legislative matters so far as they affect the rubber industry.

Mr. La Dow is typical of the West in this regard at least—he is full of enthusiasm and energy and believes that if a thing ought to be done it can be done. He was born in Ohio, his ancestors being among the early pioneers to that State, leaving the effete

civilization of New York State a hundred years or so ago for those remote western wilds. He attended the public schools of Ohio, and when he graduated from the Ohio Northern University in 1884 he first took a plunge into business, but after a year decided that the law was the more attractive and took up that study, with the result that three years later he was admitted to the Supreme Court of that State. He practiced law in Mansfield many years but always found the appeal of business very strong; so much so that in 1912, when the old Mansfield Rubber Co. had fallen into bankruptcy, he bought it in and held it in trust until the present Mansfield Tire & Rubber Co. could be organized by himself and associates. He was chosen counsel and secretary of the new company and his efforts, together with those of the general manager, G. W. Henne, have been largely responsible for the company's present success.

In the early part of the present year Mr. La Dow and his associates organized the Columbia Tire & Rubber Co. of Columbiiana, Ohio, for which he also acts as secretary and counsel.

Mr. La Dow has exceptional aptitude for organization and he is very enthusiastic in regard to the possibility of the organized cooperation of all the rubber manufacturers and their workmen in the way of legislative benefits for the industry. He believes—and his own success in that direction gives him ample ground to stand on—that employers and employees should work together for the common good and that in this connection the employer should take the trouble to inform the employee in regard to legislative enactments proposed, pointing out to the workmen whether they are beneficial or detrimental; and he believes the same course should be pursued in relation to candidates for office, state or national—that their record and their promises should be placed before the men in the factory so that they can vote intelligently as regards their own interests.

Mr. La Dow is thoroughly optimistic as to what can be accomplished through legislative activity for the good of the rubber trade if the 400 members and over of the Rubber Club, representing some 20 different states, will act together.

JOSEPH M. GILBERT WITH THE GIBNEY COMPANY.

At a special meeting of the stockholders of the Gibney Tire & Rubber Co. held in Philadelphia, September 7, Joseph M. Gilbert was elected vice president and director of sales.

Mr. Gilbert is one of the best known men connected with the tire trade, having been prominently associated with this branch of the rubber industry most of the time since 1900. Fourteen years ago he was sales manager of the Firestone Tire & Rubber Co. Later he went to the Continental Caoutchouc Co., of which he became general manager; and when in March, 1911, the Continental company was merged with Morgan & Wright, the G. & J. Fire Co. and the Hartford Rubber Works Co. into a new corporation—the United States Tire Co.—Mr. Gilbert, was made general manager of the new company. It was said at the time that he was considerably instrumental in bringing about this consolidation of interests and later in supplanting the four individual brands made by these four companies with the United States Rubber Co.'s brand.

In April, 1913, Mr. Gilbert resigned his position with the United States Tire Co. to become president and general manager of the Lozier Motor Co., of Detroit. His acceptance of the new position with the Gibney company indicates that Mr. Gilbert intends once more to devote his energy, experience and ability, which are of an exceptional order, to the tire industry.

MR. DUBOSC IN THE UNITED STATES.

The author of the excellent article on rubber substitutes which appeared in the September number of *THE INDIA RUBBER WORLD*, A. Dubosc, editor of "Le Caoutchouc & la Gutta Percha," is at present in the United States; indeed he is at the center of the rubber interest here—in Akron, Ohio.

RUBBER CHEMIST DISAPPEARS.

Dr. Herbert Lindener, chief chemist of the Braender Rubber & Tire Co., Wallington, New Jersey, disappeared early in September; and though a diligent search has been made for him by his friends and by the police, no trace has yet been discovered of his whereabouts. As he was in the habit of carrying a considerable sum of money on his person it is believed by the authorities that he has met with foul play.

PERSONAL MENTION.

A. D. Weber, for some years in charge of the footwear production and sales at the head office of the Dominion Rubber System in Montreal, has been appointed general manager of the Canadian Consolidated Felt Company, Limited.

On the first of September Boris Bielcy of New York was appointed American representative and agent of the firm of Leonard Morris, Manchester, England. Mr. Bielcy has opened an office at 59 Pearl street, New York.

F. I. Reynolds, formerly tire sales manager of The B. F. Goodrich Co., has been chosen as manager of the automobile tire department of the United States Tire Co., which is increasing its executive personnel to handle the rapid growth of business.

George H. Carnahan has been elected president of the Continental Rubber Co. of New York in place of Edward B. Aldrich, who recently resigned.

W. E. Hardy, for the past eleven years connected with the Diamond Rubber Co., and The B. F. Goodrich Co., and lately in charge of the sales of their mechanical rubber goods division, has been appointed sales manager of the Boston Belting Co., Boston.

Andrew Wightman, formerly of The Staunton Dielectric Rubber Co., Muskegon, Michigan, which is now the Vulcanized Products Co., has resigned his position as superintendent of the Vail Rubber Co., Chicago, and will make his home at San Diego, California.

H. MUEHLSTEIN & CO.

The accompanying half-tone shows the waste rubber warehouse of H. Muehlstein & Co., located at 391-5 Washington street, New York. It has a floor space of 43,000 square feet, and is in close proximity to important railroads and steamship docks.

The New York staff consists of 27 members, and the house has branches in Chicago, Akron and London. The Chicago agency takes care of all western territory, while the Akron branch covers the central states. Mr. Muehlstein, still a very young man, has developed his present elaborate organization by close attention to business and the exercise of unusual executive capacity.

PURCHASING AGENTS DINE AND TALK.

The Purchasing Agents' Association of New York held its first meeting of the season at the Hotel Breslin on the evening of September 21. After the dinner had been duly appreciated there were some interesting addresses, and, in addition, a three-reel motion picture entertainment showing the various processes used in the manufacture of steel pipe, the pictures covering the whole process from the mining of the ore to the finished product.

A number of men interested in the rubber trade are members of this association, including F. W. Lingley, of the American Hard Rubber Co., New York; A. H. Searle, of the Barrett Manufacturing Co., New York; J. A. Lampe, of the Strong Rubber & Asbestos Manufacturing Co., New York; F. M. Moore, of Alexander & Baldwin, New York; E. M. Eisenkraft, of A. Schrader's Sons, Inc., Brooklyn; J. I. McComb, of the Joseph Dixon Crucible Co., Jersey City, New Jersey; G. W. Skirm, of the United & Globe Rubber Manufacturing Co., Trenton, and G. Winters, of the La Favorite Rubber Manufacturing Co., Paterson, New Jersey.

SEMI-ANNUAL MEETING OF COTTON MANUFACTURERS.

The National Association of Cotton Manufacturers met at the Hotel Griswold, New London, Connecticut, from September 9 to 11. The annual banquet was the special feature of the meeting. After dinner addresses were made by President Albert Green Duncan, Charles G. Bancroft and Hon. John W. Weeks. Several papers of interest to the trade were read during the meeting. A golf contest, baseball and tennis games with suitable trophies, added to the general entertainment.

TRADE NEWS NOTES.

The durability of the United States Tire Co.'s inner tubes was recently demonstrated in a novel manner by a member of the advertising force. The tube was placed around the man's waist, a rope being tied to it and drawn over a pulley. He was then lowered from the sixth floor of the First National Bank Building, New York, his entire weight being held by the rubber tubing until he reached the ground.

J. P. Devine Co., of Buffalo, New York, is actively engaged in the manufacture of machinery for numerous aniline plants, some of which are to be installed by American rubber companies, whose demand for aniline can, at present, be met in no other way.

The Boston Belting Co., Boston, has lately placed the Memphis, Tennessee, agency for its goods with the well known rubber house of Towner & Co., who will carry in stock a line of the Boston Belting Co.'s well known goods, and will be in position to supply the requirements of their trade in the Memphis territory.

The retail trade in United States tires in St. Louis will be handled by the United States Sales Co., recently organized with the following officers: Edgar Gartside Niggeman, president; George J. Breaker, treasurer, and Frederick C. D. Dobson, secretary. The salesroom will be at 3567 Lindell avenue.

The Quality Tire & Rubber Co., of Hartville, Ohio, has increased its capital stock from \$75,000 to \$500,000 and will enlarge its plant. The sales offices of the company are located in Akron.

A complete vulcanizing plant has been installed at Nashville, Tennessee, as the home of a new tire sales company. The concern will be known as the Federal Tire Service Co. Its personnel consists of Alvin Wingfield and F. W. Reynolds, both of Little Rock, Arkansas, and both experienced in the tire business. Besides the line of Federal tires the company will carry a complete stock of inner tubes, as well as all other rubber accessories manufactured by the Federal Rubber Manufacturing Co., of Milwaukee, Wisconsin.

Plans have been prepared for a new power-house, to be erected by the Falls Rubber Co., Cuyahoga Falls, Ohio. Two 150-h.p. high-pressure water-tube boilers, as well as vacuum pumps, will be installed, for power, heating and vulcanizing purposes.

Receivers have been appointed for the Morgan & Marshall Rubber & Tire Co., of East Liverpool, Ohio, on petition of Charles Stein, C. Cronin and P. McNicol, the first of whom has a suit pending against the company on a claim of \$1,600.

L. W. Hewitt, a stockholder in the Southern Tire Co., Louisville, Kentucky, has filed suit in the Circuit Court to have a receiver appointed to collect the outstanding accounts, pay off the debts of the concern, and wind up the business.

The American Fountain Pen Co. has opened a new office at 15 to 19 Maiden Lane, New York, to be occupied jointly by this company and the firm of Lewis & Hill, its export agents. F. S. Latremore, for the past two years manager of the Chicago office, will be in charge.

The Gordon Rubber Co., of Canton, Ohio, has changed its name to Gordon Tire & Rubber Co. Its capital stock of \$300,000 has been increased, and an addition to its plant is contemplated.

It is probable that Somerset County, Maine, will become a large source of supply for asbestos, valuable deposits having been found in Skowhegan by Charles H. Warren, mineralogist of the Massachusetts Institute of Technology. An extensive report has been made by Mr. Warren, in which he states that an investment of \$400,000 would be needed to make the supply available.

TRADE NEWS NOTES.

The resolution recently adopted by the American Iron, Steel & Heavy Hardware Association to the effect that the distribution of automobile accessories is to be undertaken by American heavy hardware jobbers will have important consequences, according to Secretary John C. Purdie. He believes that this action will eliminate the garage and special automobile repair man and rehabilitate the country and city blacksmith shop, and that this will mean lower repair prices.

The report of the special investigating committee appointed by Mayor Mitchell, of New York, following the subway fire of January 6, shows an extraordinary lack of proper insulation. It is alleged that rubber-covered wire which should be in conduits is left exposed and, moreover, was found to be cracked in many places. The committee recommends that electric wiring be installed in a fireproof manner throughout.

The New Jersey Automobile Trade Association is planning to hold an automobile show in Newark, New Jersey, during the last week in February.

The Ford Motor Co., Detroit, has contracted with the Marion Insulated Wire & Cable Co., Marion, Indiana, for about 300,000 feet of insulated wire—some of it as large as 300,000 circular mils—to be used in a large addition to the Ford plant.

Plans have been prepared and contracts are soon to be awarded by the Lambertville Rubber Co., Lambertville, New Jersey, for the erection of a three-story brick plant 60 x 110 feet in dimensions.

A brief has been submitted to the Interstate Commerce Commission by the National Association of Waste Material Dealers protesting against the restraint of railroads from advancing the classification on rags, waste, etc., in less than carload lots from fifth to fourth class. Specific reasons on behalf of this protest are given and members of the waste material trade hope for a favorable decision on October 13, when the case will be argued.

At the twentieth annual convention of the International Association of Municipal Electricians held in Cincinnati, Ohio, August 24 to 27, R. A. Smith, of Norfolk, Virginia, read a paper on "The Advisability of Using Concentric Wiring in this Country." An extended discussion on this subject followed.

George A. Hasson & Co., a new tire concern at Columbus, Ohio, act as agent for the Chester and Traveler lines of tires and tubes.

The Chester Rubber Tire & Tube Co., Chester, West Virginia, a subsidiary of the New York firm, is extending its plant so as to increase its capacity about eight times.

D. L. Davis Co., Fort Madison, Iowa, is planning to erect a large factory building for the manufacture of a tire inflater.

The McClurg Rubber Co. has been organized to take over the business of the S. & M. Rubber Co., of Coshocton, Ohio, its stockholders having exchanged their stock from the old company to the new, all unpaid stock in the old concern having been canceled by the courts. The reorganized company assumes all outstanding obligations. Machinery is now being installed for the manufacture of tires.

The Federal Rubber Manufacturing Co., Cudahy, Wisconsin, has erected a five-story addition to its plant, covering 50,000 square feet of space. The new building will be used chiefly for the manufacture of automobile casings.

The New York Electrical Show, ninth annual exposition, will be held at the Grand Central Palace, New York City, October 6-16.

RUBBER CLUB EXECUTIVE COMMITTEE MEETING.

The meeting of the Executive Committee of the Rubber Club was held at the Union League Club, New York, on September 16, 1915, George B. Hodgman presiding. The resignation of Francis R. Peabody of Akron, Ohio, was accepted, and Jesse E. LaDow, secretary of the Mansfield Tire & Rubber Co., Mansfield, Ohio, was elected a member of the legislative committee, *vice* Eugene H. Clapp, Boston, resigned.

The following new Firm Members were elected: Brighton Mills, Passaic, New Jersey, representative, Thomas M. Gardner and Fred Stern & Co., 44 Whitehall street, New York, Fred Stern, representative. The following Associate Members were also elected: Geo. W. Sherman, of The B. F. Goodrich Co., Akron, Ohio; J. William Fellows, of the Boston Woven Hose & Rubber Co., Cambridge, Massachusetts; Francis S. Dane, Hood Rubber Co., Watertown, Massachusetts; Homer J. Killion, Killion Rubber Co., Dorchester, Massachusetts; Harry A. MacKusick, Philadelphia Rubber Works Co., Philadelphia; Ernest C. Clark, Clark Rubber Co., Franklin, Massachusetts.

The Executive Committee would be glad if out-of-town members as well as those resident in New York would make use of the club's commodious rooms at 17 Battery Place. Telephone service, stenographic assistance, and other general office conveniences will be furnished free to all members.

RUBBER CLUB DINNER TO BE HELD JANUARY 28.

The annual dinner of the Rubber Club of America will be held on the 28th of next January, at seven p. m., in the Astor Gallery and Myrtle Room of the Waldorf-Astoria, New York. The meeting of the Executive Committee and Board of Directors of the club, as well as of the Executive Committee of the Mechanical Rubber Goods Manufacturers' Division and the Rubber Sundries Manufacturers' Division, will be held at four p. m. on the same day, at the same hotel.

AS TO SHIPPING TIRES TO HOLLAND.

The secretary of the Rubber Club sent out, September 21, a communication to rubber manufacturers regarding a rather peculiar situation that has arisen in the export trade to Holland. The Holland-American Steamship Line, according to this communication, has informed forwarding agents that it would receive goods, including rubber—as for instance, automobiles with tires—for direct shipment to Holland in case they were assigned to the Netherlands Oversea Trust, this corporation having entered into an agreement with the British authorities.

But it appears that this agreement covers general contraband goods and does not refer to the export of rubber goods, which must be governed altogether by the agreement made between American manufacturers and the British government. The secretary closes his communication as follows:

"In view of the attitude of some forwarding agents and some steamship lines, we can only again warn manufacturers to exercise extraordinary caution over their export shipments and not let any products for export go out of their factories without positive knowledge that they will be handled in accordance with the bonds and guarantees."

ICELAND AND THE AZORES CLASSED WITH EUROPEAN NEUTRALS.

The following communication referring to Denmark, the Azores, and the Canary Islands, was sent to rubber manufacturers by the secretary of the Rubber Club, September 21:

"The British Government has ruled that Iceland, belonging to Denmark, the Azores Islands, belonging to Portugal, and the Canary Islands, belonging to Spain, are to be classed as neutral European territory when making shipments of manufactured rubber goods. Goods consigned to these islands by signers of the British rubber guarantee should be shipped by way of the United Kingdom and license obtained for re-shipment therefrom."

Very truly yours, H. S. VORHIS, Secretary.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A dealer in rubber goods in Norway is anxious to form commercial relations, on an agency basis, with American manufacturers of pneumatic tires for automobiles and bicycles and solid truck tires; also air-hose. Report No. 18,128.

A commission merchant in Brazil is desirous of communicating with American importers of rubber, etc., samples of which he will supply. Report No. 18,140.

A tire repair shop in Brazil is in the market for vulcanizing machinery, rubber paste and repair materials. Report No. 18,150.

A Brazilian firm offers American dealers an opportunity to bid on 100 tons of scrap rubber. Report No. 18,153.

The representative of an Italian firm desires names and addresses of American exporters of ceresin wax, large quantities of which are needed. Report No. 18,158.

A business man in Brazil has samples on exhibition at the Bureau of Foreign and Domestic Commerce, Washington, of carnauba wax, in the supply of which he would be glad to interest American firms. (Refer to file No. 64,706.) Report No. 18,169.

A firm in Spain wishes to secure samples of rubber for use in the manufacture of rubber stamps. Report No. 18,172.

A firm in Scotland desires to correspond with American manufacturers and exporters of textile and elastic goods similar to samples which may be examined at the Bureau in Washington or its branch offices. (Refer to file No. 64,746.) Report No. 18,205.

A brewing firm in Greece is in the market for rubber discs for beer bottle stoppers, similar to samples which may be seen at the Bureau or its branches. (File No. 64,658.) Report No. 18,213.

A firm in Italy desires to represent American manufacturers of surgical apparatus, rubber goods, hospital supplies, etc. Report No. 18,222.

A dealer in the Netherlands desires to communicate with American manufacturers and exporters of sporting goods. Report No. 18,273.

RUBBER TRADE INQUIRIES.

[117.] A dealer in specialties desires names of manufacturers of bathing shoes with rubber soles and heels.

[118.] A correspondent would like addresses of manufacturers of cement-making churns.

[119.] A rubber company wishes to get in touch with a firm manufacturing machines for braiding straight side bead wires.

[120.] A South American importer of rubber heels, handling 40,000 dozen or more a year, is seeking a source of supply.

[121.] Inquiry has been received for names of manufacturers of rubber in sponge form; also for the name of a manufacturer of machines for cutting the sponge rubber into shape.

[122.] An inquiry has been received for the name of a firm which can supply cotton linters to the trade.

[123.] A correspondent wishes to know where Chatterton's compound may be purchased.

[124.] We have an inquiry from South America for flat rubber rings of European standard as to thickness, quality, etc.—the rings being cut thinner than "21 to the inch."

[125.] A correspondent wishes to know where "Aristi" and "Geranium Red" can be purchased in the United States.

PROPOSED GOVERNMENT PURCHASES.

The Bureau of Supplies and Accounts, Washington, is inviting bids to be opened October 12, on Navy Department supplies as

follows: Five thousand pairs rubber boots—schedule No. 8,818; 32 swinging reels for hose—schedule No. 8,807; rubber covered wire—schedule No. 8,820.

TRADE NEWS NOTES.

One of the attractive exhibits at the 43rd Annual Convention of the International Association of Fire Engineers, held in Cincinnati, Ohio, the first of September, was the display of the Bi-Lateral Fire Hose Co., of Chicago, Illinois. The construction of their hose was explained by the representatives of the company.

Mr. Herbert Sewell, president of the Sewell Cushion Wheel Co., of Detroit, Michigan, predicts an output for this year as large as the total output of the last five years. To create additional space for stock the company is adding two stories to a one-story structure in the rear of their quarters.

The Standard Four Tire Co., of Keokuk, Iowa, expects to begin operations in its new factory building in November. The company has just purchased the entire holdings of the Amazon Rubber Co., of St. Louis, and will remove a part of the machinery to Keokuk.

The Cleveland-Ford Tire Co., Cleveland, Ohio, is erecting a factory in that city which will have a main building 46 x 300 feet, two stories and basement, with a wing 50 x 60 feet and a one-story power house 40 x 100 feet, all of brick and reinforced concrete. The following officers have been elected: President, James L. Smith; vice-president, P. C. Remick; secretary and treasurer, Walter J. Leimbach; general manager, A. E. Pearce.

The Empire Rubber & Tire Co. of Trenton, New Jersey, is erecting an office building in Boston, Massachusetts, which will be 25 x 95 feet, representing an investment of nearly \$75,000.

The Luck Tire & Manufacturing Co. is planning to erect a \$100,000 plant at San Antonio, Texas, for the manufacture of pneumatic puncture-proof automobile tires.

A newly organized firm, Loeb & Heller, will operate a wholesale metal, rubber and scrap iron business at 1250-1252 West Fifteenth street, Chicago. Both members are well known to the trade, having been in business for a number of years.

THE DE LASKI & THROPP CO. WINS SUIT.

The United States Circuit Court of Appeals for the Third Circuit has recently affirmed the decree of the United States District Court for the District of New Jersey, in the case of The de Laski & Thropp Circular Woven Tire Co. vs. William R. Thropp & Son's Co. In this litigation, which involved United States patent No. 1,011,450, owned by The de Laski & Thropp Circular Woven Tire Co., and covering its well known tire wrapping machine, the lower court held that the patent was valid and was infringed by the tire wrapping machine manufactured by the William R. Thropp & Son's Co.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of the shares of rubber manufacturing companies on September 25 last are furnished by John Burnham & Co., 31 Nassau street, New York, and 41 South La Salle street, Chicago:

	Bid.	Asked.
Ajax-Grieb Rubber Co., common.....	309	
Ajax-Grieb Rubber Co., preferred.....	191	110

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

NEW ENGLAND rubber conditions as a whole have improved materially during the past six weeks and the outlook is promising. The tire, rubber shoe manufacturers and proofers are especially busy, but makers of mechanical goods with certain exceptions are only fairly active. Some of the tire factories are working double shifts, and the product being turned out is, as nearly as can be learned, mainly for domestic consumption.

The newly formed Rain Coat Manufacturers' Association held its first official meeting in the committee rooms of the Kimball Building, 18 Tremont street, on the afternoon of Saturday, September 25, for the purpose of electing officers, drafting by-laws and converting the benevolent organization agreed upon on the Wednesday preceding into a corporation. The membership of the Association, which includes all but one large and two small companies of this class of raincoat manufacturers, is confined within a radius of 25 miles of Boston. The recent strike has been virtually settled, as over 95 per cent. of the workers have returned to work. The officers of the association are William Lichtenstein, president; Samuel Goldstein, vice-president; H. P. Gordon, treasurer, and Daniel Harris, secretary and general counsel.

The directors are William Lichtenstein, Samuel Goldstein, H. P. Gordon, Barney Bennett, Lewis Fein, Louis Simmons and D. S. Shapiro. The attorneys for the association are Harris & Harris, 18 Tremont street, Boston. Included in membership are the following twenty raincoat companies: Bay State Raincoat Co., Bennett Bros. Raincoat Co., C. & C. Raincoat Co., Crowne Raincoat Co., Eagle Raincoat Co., Goodrich Raincoat Co., Hub Raincoat Co., International Raincoat Co., Metropolitan Raincoat Co., Monarch Raincoat Co., New England Raincoat Co., Panama Raincoat Co., Red Cross Raincoat Co., Star Raincoat Co., Tremont Raincoat Co., United Raincoat Co., Universal Raincoat Co., Washington Raincoat Co., Rubin Mfg. Co., Weatherproof Garment Co.

Building materials worth \$15,000 and four freight cars were destroyed by fire and a gasoline explosion in the yard of the Fisk Rubber Co., Chicopee Falls, on July 15. The company's buildings were in great danger and the chief of the fire department has received a letter of commendation with a check for \$25 enclosed for the Firemen's Benefit Association, in appreciation of the work of the department in checking further damage.

A rumor has been afloat that the explosion was due to a German plot, possibly the act of a "crank"; but there seems to be no foundation for this, save the present excitable state of the public mind.

"Fisk Day" was celebrated on September 4 by a holiday with pay for all the employees of the company, the total cost in free wages amounting to close upon \$10,000.

The Alden Rubber Co., 58 Thayer street, succeeds the Hoyt Rubber Co. of the same address. The present officers of the company are G. Edwin Alden, president; B. E. Phillips, treasurer, and John Alden, secretary. They are making a general line of molded specialties.

The Boston employees of The B. F. Goodrich Co. recently held their annual outing at Lexington Park, Lexington, 250 being present. After a ball game there were field sports, all well contested, including some novelties, among them the "Inner Tube" race, the "White Boot" endurance run, and the "Hipress" race. The Goodrich delegation of footwear salesmen, headed by Director of New England Sales on Footwear, J. S. Capen, took prominent parts in these events. It is a question who enjoyed the feature races the more, the participants, or the audience. Luncheon

was served in the grove. In the evening, a theatre party was enjoyed, after which special cars were waiting at the Park entrance for the return trip.

The King Rubber Co., Hyde Park district, have just completed a brick factory, 125 x 65 feet, and are about ready to move in. They will shortly put out a most attractive line of tobacco pouches, said to possess a number of new features.

C. P. Lovering Co., East Cambridge, are making a composition sole and heel with a rubber binder, which they claim is as durable as leather and will hold stitches as firmly. This is a resilient product which does not draw and it can be successfully attached to McKay and Turn Shoes, in the soling and healing of which only the best leather has been previously used. This company also makes a line of rubber soles and heels as well as molded insulation.

This is the day of clubs and associations; and they are good things. One of the most interesting is the Friction Plug-Heel Manufacturers' Association, with headquarters in Boston. The representatives meet semi-occasionally, swap trade gossip, have a dinner and, incidentally, get exceedingly well acquainted with each other.

The first unit of the factory building of the Atlantic Rubber Co., of Atlantic, designed by J. A. DeWolff, has recently been completed and is a model of factory construction and arrangement.

The B. & R. Rubber Co., of North Brookfield, has purchased control of the Wills carton erecting and filling machine for jar rings.

The Duxfut, "the sole that floats," and the Para Oak soles, according to shoe manufacturers, are the equal if not the superior of leather soles. The A. & A. Rubber Co., of South Framingham, is to be congratulated for their production.

The Plymouth Rubber Co., Canton, Massachusetts, is making a very energetic and successful push on its "Durable-Kompo" soles, which is particularly timely, as the price of sole leather soars higher and higher.

The Annual Fall Convention of the salesmen of the B. & R. Rubber Co., was held at the factory, North Brookfield, during the second week of September.

Captain Francis H. Appleton recently returned from a very pleasant trip to the Panama Exposition at San Francisco, which he attended as one of four delegates from Aleppo Temple to the Imperial Council of The Mystic Shrine, which convened at Seattle. The delegation, which included J. W. Work, the well-known maker of lasts for rubber footwear, traveled in a private car and were accorded most cordial receptions at Seattle, and other western cities. Captain Appleton, who was accompanied by Mrs. Appleton, stopped over at Buffalo and Lake George, where they spent a delightful month on the return trip.

The captain gave a dinner to Colonel Sidney Hedges on the occasion of that gentleman's 71st birthday on Monday, September 27, at the Algonquin Club, Boston. Colonel Hedges was for more than 25 years the New England manager of the Mutual Benefit Life Association of Newark, New Jersey, retiring last year. He is prominent in masonic and military circles, and was formerly in command of the Ancient and Honorable Artillery Co. of Boston.

Charles A. Coe, Eastern selling agent of the United States Rubber Co., 140 Essex street, recently started West on his annual trip. He will cover Middle Western states and will be away four or five weeks.

Harold P. Fuller, of E. H. Clapp Rubber Co., returned last Saturday from a week's tour of Canada. He states that business conditions there are very favorable.

The Banigan line in New England is now represented by A. E. Barney, formerly with the LaCrosse Rubber Mills Co., of LaCrosse, Wisconsin.

Walter F. Thomas, of the Tyer Rubber Co., of Andover, Massachusetts, was married at the Hotel Somerset, Boston, September 18, to Miss Helen K. Goss, of Melrose.

Arthur W. Stedman, before his plunge into the crude rubber business at his new office, 69 Beverly street, made the week of September 20-25 a "golf week." It is said that he lowered his previous scores by many points and re-enters the rubber trade with a firm belief that were rubber not his manifest destiny he could easily become the champion golfer.

The New England men, even when they are transplanted to New York, get back home for vacations. For example, Charles W. Barnes, the assistant manager of sales of the United States Rubber Co., spent his vacation at Duxbury, Massachusetts.

George H. Mayo, manager of branch stores of the United States Rubber Co., put in the heated term at Wolfboro, New Hampshire.

H. C. Kalish has returned from a trip to the Panama-Pacific Exposition. Mr. Kalish, it will be recalled, is manager of the Wales-Goodyear department of the United States Rubber Co., of New England.

Mark M. Converse, of the Converse Rubber Shoe Co., of Malden, owns a farm in Lyme, New Hampshire, where he spent his summer vacation.

The many friends of William S. Mayo, that veteran of the rubber shoe trade in Boston, will be glad to know that the operation he recently underwent at Corey Hill Hospital, in Brookline, was successful and that he is rapidly convalescing.

North Brookfield, in this State, is possessed of an inventor of rubber devices of a great deal of value. This inventor is Arthur J. Wills. Some of his machines are: Overflow trimmer for mold work, such as heels and mats; automatic blister pricking apparatus for rubber mats; a cutter for baby carriage tires; jar ring cutting blade; duck plug cutter for rubber heels, etc.

George E. B. Putnam, Boston correspondent for THE INDIA RUBBER WORLD, is spending his vacation at Camp Kingfisher, Norway, Maine.

In the exceedingly comfortable parlor of the Point Shirley Club, Point Shirley, Massachusetts, are two fine oil paintings. One is of Capt. Francis H. Appleton, the present president of the club, and the other is of Joseph Work, the ex-president. Both are very well known in the rubber trade.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

NOW that the summer vacation season has passed, the rubber factories of the State are resuming their stride, and overtime is again becoming the rule in several of the plants. Whether or not business is rushing depends largely on whether the particular plant under consideration deals in those supplies which are most necessary to the European nations now at war or to the automobile trade, in which there never seems to be any cessation of activity.

The increased call for rubber footwear, and for tennis shoes in particular, which has been prevalent throughout the United States during the last few months, has made itself felt at the Narragansett Rubber Co.'s plant in Bristol. This corporation has been and is now busy shipping large quantities of tennis shoes, arctics and other rubber footwear, the demand being not only large but well distributed.

The Bourn Rubber Co., Providence, reports a keen demand for rubber shoes of all kinds. While there are large orders for arctics, rubber boots, lumbermen's and Alaskans, tennis shoes have enjoyed a marked popularity, the sale for this class of goods exceeding all previous years.

The annual returns of the Board of Tax Assessors of the city of Providence were filed with the City Treasurer on September 1 and show a total levy of \$5,063,520.76. In the list of corporations, concerns and individuals assessed for \$50,000 or more, together with the valuation placed upon their property by the Board are the following: Joseph Banigan estate *et al.*, \$450,640; Joseph Banigan estate, \$1,000,480; Joseph Banigan Rubber Co., \$160,100; Augustus O. Bourn, \$113,640; Bourn Rubber Co., \$147,000; Walter S. Ballou, \$248,880; Samuel P. Colt, \$210,100; Davol Rubber Co., \$400,000; Mary E. Davol, \$748,000; Glendale Elastic Fabric Co. of Massachusetts, \$175,300; Mrs. Lotta P. Kelley, widow of Arthur L. Kelley, \$91,640; Mechanical Fabric Co., \$342,740; New England Butt Co., \$193,420; Samuel M. Nicholson, \$249,600; Trustee under will of Joseph Davol, \$450,000; Revere Rubber Co., \$1,447,280.

* * *

The International Rubber Co., of West Barrington, is to have a spur track from the line of the Fall River and Bristol division of the New York, New Haven & Hartford Railroad, put in to facilitate the handling of raw material and the manufactured product-carriage cloth. The New Haven railroad officials have consented to the plan and permission has also been granted by the Town Council, and the rails will be continued into the company's yards.

The work of erecting a new vulcanizing room at the plant of the International Rubber Co. is completed and the new structure is now being equipped for use. The company has been granted permission for the erection of a one-story brick dry house, 25 x 76 feet, to be steam heated.

* * *

The Revere Rubber Co. has plans for the construction of a new laboratory, of one story, reinforced concrete, as an addition to its plant on Eagle and Valley streets, Providence. Dr. W. P. Bradley, one of the chemical experts of the corporation, has compiled data for a new method of manufacture, and the new building, when completed, will be used for the mixing of chemicals for the new process. It is said that the new laboratory will be one of the finest of its kind in this country.

* * *

The old sugar refinery building on Thames street, Bristol, has been taken over by the National India Rubber Co., and is being completely remodelled from foundation to roof. When completed it will contain four stories and basement, and will be made to look like an entirely new structure. A shell of brick is being constructed on the outside and new and more shapely windows are being placed. Vice-president LeBaron C. Colt says that the building is to be used by the National company as a storehouse and that separate departments will be arranged on each floor for the various kinds of finished goods manufactured by the concern.

* * *

Several improvements have been made recently upon the buildings of the Narragansett Rubber Co., Bristol.

* * *

The Rutherford Rubber Co., a corporation of East Rutherford, New Jersey, has filed notice with the State Secretary of Rhode Island that William O. Cook, of Providence, is the accredited legal representative in this State.

* * *

The Phillips Insulated Wire Works has commenced the erection of a new three-story brick building on Central avenue and Freeman street, Pawtucket. It will be of mill construction, 100 x 70 feet.

* * *

Colonel Samuel P. Colt, president of the United States Rubber Co., on September 10 made a general inspection of the plant of the National India Rubber Co., at Bristol, of which he is also president, visiting every department.

* * *

W. Mulry has opened at 97 Empire street, Providence, an em-

porium for automobile accessories. He will make a feature of factory seconds of all makes of tires.

George H. Campbell, for 21 years employed as foreman at the plant of the Collyer Insulated Wire Co., Pawtucket, died at his home in Mansfield, Massachusetts, September 1.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

TRENTON is pushing steadily ahead as one of America's most important rubber centers and in line with this program comes the announcement that many thousands of dollars are to be expended at once in adding to the capacity of the factories here.

The Ajax-Grieb Rubber Co. has announced that it will erect an extensive addition to its plant, enabling it to give employment to five hundred additional hands—practically doubling the firm's output. The new addition will be made on land already owned by the company. The main new building will have a frontage of 350 feet and a depth of 60 feet. It will be three stories high. Another mill room 150 by 150 feet will also be constructed.

In announcing the company's intentions in this direction it is also stated that a dividend of 7 per cent. on preferred and 24 per cent. on common stock has been declared.

The Thermoid Rubber Co. is building a \$25,000 addition to its plant. Part of the new structure will be devoted to the making of hose, and the rest of it will relieve other departments of the factory already overcrowded. A contract for additional machinery has already been placed. The new building, which is to be of brick and steel, will be 190 feet long and 71 feet wide, and two stories high. With the completion of the new structure the company will be enabled to place about 75 more operatives at work.

The FitzGibbon Company, large users of rubberized cloth in the making of automobile tops, have placed a contract for the erection of a new factory 90 feet wide and 700 feet long, which will enable the firm to increase its capacity many times.

The Mecca Tire Co. has begun to make tires in its newly acquired factory on Mulberry street. It will market the line under the name of "Peerless." The tires are to be white with a tread bearing a triangular design. The plant, which is being fitted up by the William R. Thropp & Sons' Co., is not in full operation as yet; but one vulcanizer is now employed and another is to be installed soon.

Announcement is made that the Z. Z. Tire Co., which is rushing work on its Yardville plant, will be ready for operation about January 1.

The unusually wet weather since the first part of June has caused a big falling off in orders for garden hose. Salesmen report that dealers have thousands of feet of garden hose piled up in their warehouses. As this is the normal time to take orders for next year's delivery the real effect of the present situation will be felt next year. The raincoat and footwear people have, on the other hand, experienced an increased demand for goods.

Thomas McGuire, who has been an inside man for the United and Globe Rubber Manufacturing Cos., has taken a road position, covering Southern territory, for the same firm.

The old factory of the Brockville Rubber Co. has been opened as a reclaiming plant by a company of which E. R. Soliday

of this city is the head. Mr. Soliday, who is also connected with rubber interests at Lambertville, is very ill at present with kidney trouble.

John A. Lambert, of the Acme Rubber Manufacturing Co., has been nominated for trustee of the Trenton Chamber of Commerce, the election being held October 12. The Chamber of Commerce is endeavoring to have the Pennsylvania and the Philadelphia & Reading railroad companies erect additional freight stations at points more advantageous for some of the rubber mills.

Among the concerns filing articles of incorporation in the office of the Secretary of State this month is the Montclair Rubber Co., with offices in the Wilkinson Building, Trenton. The capital stock is given at \$10,000. The incorporators are Walter F. Smith, Alice F. Smith and J. Clifford Stricker.

In connection with an accident which resulted in the death of a man at the plant of the Essex Rubber Co., Judge Marshall of the Mercer Court of Common Pleas has interpreted the Workmen's Compensation Act in a way which is of particular interest to manufacturers. The workman was employed by a rigger who was erecting some scaffolding at the plant. The rigger loaned the workman to a structural iron contractor who was erecting an addition to the factory. It was while he was actually employed by the structural iron man that he was killed in a fall. The court held the original employer liable, and a verdict for \$3,000 damages was awarded.

It is stated that the Colorado Tire & Leather Co. of Denver, Colorado, which has hitherto had its milling and calendaring done by an Ohio factory, intends after the first of November to do this work in its own plant. With this in view the company, according to reports, has been interviewing several department heads in Trenton mills in regard to taking positions in the Denver factory.

Joseph Thropp, secretary of the William R. Thropp & Sons' Co., makers of rubber machinery, is recovering from an operation for appendicitis.

The John A. Roebling's Sons Co. is erecting a new auditorium at the corner of Sixth avenue and Main street, to accommodate desired entertainments. It will have a dance hall, a stage, a convention platform, and a basketball floor.

The Roebling Construction Co., a subsidiary of the John A. Roebling's Sons Co. has filed a certificate of dissolution with the Secretary of State.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

AKRON is no "fair weather friend" of industry, according to the report of the chief statistician of the state industrial commission, recently made public. In spite of the thousands of unemployed last year, few business concerns and industries shut down absolutely; and two of Akron's rubber plants gave their employees full time during the year; one ran overtime and comparatively few operated less than 300 days. Thirteen rubber factories worked their employees between 54 and 60 hours a week.

Reports of an exceptionally prosperous year for The B. F. Goodrich Co. are back of the marked advance in Goodrich common stock, which touched its highest point since 1912 on the New York Stock Exchange and in the Akron market during the month of September. Nearly 15,000 shares changed hands on the New York Stock Exchange in one day, and there was a large volume of private trading in Akron.

President H. S. Firestone, in his annual report at the meeting of the Firestone Tire & Rubber Co., held at the general offices at Akron, September 1, stated that sales during the fiscal year amounted to \$25,187,884.33, an increase of \$5,937,744.41, or 31 per cent. over the preceding year. He explained that the company is now producing 7,500 pneumatic tires daily and that after the factory additions now under way are completed it will turn out 12,000 tires per day, or an increase of 60 per cent. All the old directors were re-elected.

The Firestone company has contracted for an eight-story building at Kansas City, Missouri, to be completed next spring. It will be built of steel and concrete with a terra cotta exterior, and will cost between \$150,000 and \$200,000. The first floors are to be occupied by the tire company and the top floors leased for loft uses.

* * *

The Firestone Company held its third annual "Homestead Outing" on September 18. Fifty autos decorated with flags, banners and pennants carried foremen, superintendents and officials numbering 200, sixty miles to the old Firestone homestead at

"HOMESTEAD OUTING" OF FIRESTONE TIRE & RUBBER CO.

Columbiana, where they spent the day as guests of President H. S. Firestone. Following a bountiful feast in an immense tent, all renewed their youth with happy zest in ball games, "quoits," etc.; camera and "movie" men snapping the various activities for a permanent record of the day of jollification.

* * *

Five new buildings in Akron are nearing completion for the plant of the Goodyear Tire & Rubber Co. This will mean an addition of about 2,000 more employees.

It is reported that the Goodyear company has sold to the Spanish government two war balloons, which are now being built at the aerial department of the Goodyear plant.

The office help of the Goodyear company are now carried to and from work in a double-decked 34-passenger jitney owned by the company. In appearance the new transportation wagon resembles a truck with a second floor attached.

* * *

The Marion Tire & Rubber Co., which was recently incorporated in Marion, Ohio, has taken over the plant formerly occupied by a shoe company and will install tire-making machinery. It is announced that an Akron rubber man will manage the plant, but his name has not been divulged. It is planned to start active business in about six months. The capitalization of the company is \$300,000, of which one-half is preferred stock, the

other half being common. J. L. Price, S. B. Lippincott, W. H. Holverstott, R. T. Lewis, A. J. Berry, W. T. Jones and W. F. Meyer are the principal stockholders in the new corporation.

* * *

The Mohawk Rubber Co. is planning to erect a two-story addition to the new four-story building now nearing completion. The dimensions of this addition will be 43 x 61 feet and it will cost about \$5,000.

The name of the Gordon Rubber Co. of Canton, Ohio, has been changed to the Gordon Tire & Rubber Co. The firm will specialize in the manufacture of automobile tires.

Papers have been filed changing the name of the O'Neil Tire & Protector Co. to the O'Neil Tire & Rubber Co.

It is reported that the American Tire & Rubber Co. has received a large order for tires for the Allies. The company has advertised for an additional force of tire makers.

The Miller Rubber Co. has started a free tire service in Akron which has attracted widespread attention. Five service cars have been allotted to this work, and no matter what make of tire is used a telephone call will bring a service car to fix the trouble free of charge.

Stockholders of the Excel Rubber Co., makers of rubber accessories, have asked for a receiver. The company's liabilities are said to be \$16,000, with assets of \$6,000.

* * *

Harry C. Miller has been appointed general sales manager of the pneumatic tire department of the B. F. Goodrich Co., succeeding F. I. Reynolds, who resigned last June. He will have the management of both the Goodrich and Diamond pneumatic tire sales and will make his headquarters at the factory in Akron.

Mr. Miller has had a comprehensive experience in other branches of the company, having handled equipment contracts with the big Michigan manufacturers when he was manager of the Detroit branch, and having had charge for several years past of all sales on the Pacific Coast and in the Hawaiian Islands and the Orient.

C. B. Raymond, secretary of the Goodrich company, was among the principal speakers at the opening of the new Akron water works on September 1.

Robert K. Sheppard, formerly manager of sales for the insulated-wire department of the Goodrich company, is now sales manager for the Simplex Wire & Cable Co., Boston.

George Talbot, one of the oldest men in point of service in the sales department of the Firestone Tire & Rubber Co., has been elected mayor of Urbana, one of the leading cities in Illinois, where he will assume his duties on the first of the year.

THE RUBBER TRADE ON THE PACIFIC COAST.

The Los Angeles branch of the Federal Rubber Co. has moved from South Olive street to larger and more commodious quarters in the Morrison Hotel Building, at Pico and Hope streets.

* * *

The Hunter-Smith Sales Co. have adopted the plan of sending out a Sunday service car on the various highways at Tacoma, fully equipped with a wrecking crew, a full line of tires, and all necessary implements to extricate stranded motor cars from ditches and hazardous places. This should be a great boon to tourists.

* * *

Charles H. Minto, well and favorably known in the automobile, motor and bicycle tire trade, and for the past fifteen years connected with the Hartford Rubber Works and their successors, the United States Rubber Co. of California, has recently been appointed manager of the tire department of the San Francisco store.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

FOREIGN TIRE IMPORTS.

A MATTER which is attracting considerable notice in our press, from such staid publications as the "Quarterly Review" down to the half-penny daily, is the increased importation of American motor cars and also tires. It is with the latter that we are mainly concerned in this journal, though, of course, the car business is the more important. There is no need to emphasize the fact that German and Austrian tires are unprocurable and that French and Russian are much restricted in their supply. It should, however, be said that before the war tires were imported because of various business interests and not because they could not be obtained of home manufacture. At the present time, as our rubber tire works are all busy on government requirements, no doubt private customers experience delay in the filling of their orders and this has certainly been to the advantage of sellers of American tires, who have been energetic in pushing their wares and have established a series of important distributing depots up and down Great Britain to supplement the selling organization which sufficed for the pre-war business.

I am not going into the matter of the American exchange here, but as we are continually being exhorted to buy as little from foreign countries as possible, it is obvious that this applies to the purchase of home-made tires. Patriotism, however, frequently fails to rise to the heights demanded of it, and in this respect the tire manufacturers find it necessary to advocate an impost on foreign tires, and to judge by the tone of the utterances of erstwhile large tire dealers, it would not be surprising if something were done in this direction, though the main move will be directed at the more important car, of which the tire is only an accessory. It is understood that this matter will come up for early consideration on the re-assembling of Parliament. With regard to the contract for American tires placed by makers of American cars in England, I am authoritatively informed that the intention was to place the order in Great Britain, but that prompt delivery could not be guaranteed.

Leaving this topic, I may say that one or two recent occurrences in which journalists have come within the mesh of our war laws indicate that contributors to foreign papers must walk or, rather, write warily. I must bear this in mind while also remembering that every column I write helps to reduce the adverse balance of untold millions which is troubling our financial experts at this time. Some day, perhaps, the world will have the history of our anti-submarine warfare and this is not the time or place for premature disclosures. I think, however, it is a safe assumption that the recent fall in the price of rubber is largely due to the official statement from the Admiralty that the submarine menace is well in hand, the natural deduction being drawn that the arrival of supplies from the East is pretty well assured.

As far as government orders are concerned, both for our own services and for those of our allies, there is at the time an absence of the rush and excitement of twelve months ago, which means that the manufacturers have the situation well in hand. Indeed, in some quarters it is asserted that the easing off of this business is due to the placing of orders in America, though I have no satisfactory evidence of this and am much inclined to doubt it. In concluding this paragraph I should like to mention the appreciation with which the editorial in the August issue of *THE INDIA RUBBER WORLD*, headed "Shall We Keep the Faith?" has been received by

British subscribers. As the judgment in the "rubber or gum" Prize Court case has not yet been delivered I must defer any comments until next month.

ERASING RUBBERS.

In my last notes I made reference to a substitute for erasing-rubber and in case an impression should be created that the genuine article is being superseded, perhaps I may be allowed to say that rubber erasers are being made by our rubber works to a much greater extent than before the war, owing to the cessation of German and Austrian imports. For instance, the North British Rubber Co., Limited, have been paying particular attention to school and stationers' rubbers, with the view of putting on the market a line of goods to replace the many varieties which in recent years have come in large quantities from the continent. The North British list comprises fourteen brands or qualities, each with a distinctive name, the number to the pound in weight being an index to the size; the prices varying from 1s. 8d. per pound in boxes to 3s. 1d., this latter price referring to a special quality for erasing pencil marks from tracing paper in drawing offices.

THE WICKHAM HARD CURE PROCESS.

The report of the Dunlop Rubber Co., Limited, with regard to plantation rubber cured by this process (see *THE INDIA RUBBER WORLD*, March, 1915), which is the property of a British limited company, will necessarily prove disappointing to those financially interested. Presumably this report is to be taken as a House of Lords' decision, from which there is no appeal, though of course we all know the prevailing tendency of rubber manufacturers and experts to arrive at contrary conclusions. The virtues of creosote *per se* and the retaining of moisture in the rubber have proved to be based on unreliable ground. The result in effect is to support the opinion long held by a good many of us that the high tensile strength of the Brazilian product is primarily due to the age of the trees rather than to any magical result of the smoking process, efficacious though this may be in some respects. As the age of the trees is one of the things that the great scientific resources of the Eastern planters cannot in the nature of things alter, the Brazilian need not fear that his supremacy will be taken from him.

TRADE PROFITS.

Many of our prominent rubber works being private enterprises or private limited companies which do not publish their balance sheets, the public has no means of arriving at their profits or losses. As all the rubber companies of any standing have, however, on their own showing been extremely busy during the war, it is only natural to assume that the private concerns have done equally as well as those whose balance sheets are published in the papers. In the case of the Leyland & Birmingham Rubber Co., Limited, we note an increase of 50 per cent. for 1914-15 over 1913-14 and over 100 per cent. as compared with 1912-13. The customary dividend of 7½ per cent. is increased for this year to 12½ per cent. This absorbs £33,532, and it is notable that unusually large allowances have been made for depreciation, reserve for discounts, bad and doubtful debts, and that £10,000 is carried to reserve, which now stands at £45,000, as against an issued ordinary share capital of £268,257. With regard to the profits made lately by rubber companies it must be borne in mind that the price of raw rubber has not only been at a moderate figure, but there has been an absence of violent fluctuations—conditions which are favorable to the manufacturer.

ASSOCIATION FOR ADVANCEMENT OF SCIENCE.

The British Association for the Advancement of Science held its 85th anniversary meeting this year at Manchester. Hitherto at these meetings the subject of synthetic rubber has been quite prominent. This year it practically did not enter into any of the discussions. One of the most interesting features of the meeting was the inspection by the members of the Association of the cable works at Trafford Park of W. T. Glover & Co., Ltd. At a luncheon given by the company to the visitors the managing director, E. A. Claremont, who acted as chairman, gave an interesting account of the origin of the company 50 years ago, the founder being a Salford draper who conceived the idea of covering crinoline steel with waxed cotton so that damp would prevent the steel from damaging the dress fabric. From this small beginning the insulation of cables arose, necessitating the removal to a Salford works, which were repeatedly enlarged until about 15 years ago the present works were built on a more modest scale than they exist today. With regard to the war, Mr. Claremont said they had had to make very large quantities of telephone wire for field service; this material only had temporary use, as it could not be picked up again in active warfare for future use.

The visitors were then conducted through the works, where they inspected the various processes of pickling, drawing and tinning the copper wire; the insulation of the wire either with paper, rubber or bitumen; the lead covering where the molten lead is applied at a pressure of 13 tons to the square inch; the armoring and final testing. The paper cables, which are specially for use in damp situations, are insulated with Glover's diatrine, which is paper treated with a special insulating compound. After seeing the making of paper insulated telephone wires a visit was made to the rubber department. Although at an earlier period of the firm's history the rubber compounds were bought manufactured up to the vulcanizing stage, this is not now the case, a complete rubber manufacturing plant being now installed. This proved of special interest to the visitors. The only rubber on view was a quantity of Fine Hard biscuits and it was stated that only small quantities of plantation rubber were used and no inferior brands or reclaimed rubber. Among the foreign orders the firm has in hand is a cable for the Calcutta Electric Supply Co. to carry a pressure of 30,000 volts, and this is being tested up to 75,000 volts. The tendency of recent practice in electricity is the employment of higher and higher pressures and a new responsibility is thrown upon insulated cable makers.

Among other works which received parties of members of the association were the British Westinghouse Co. and the Ford Motor Co. (England), Limited.

IS BRITISH RUBBER LEAKING INTO GERMANY?

For some time it has been believed in Mincing Lane, that Germany was still succeeding in obtaining supplies of rubber from Great Britain, and it has been suggested that the rubber trade should cooperate in refusing to sell to firms of alien origin. It is stated that 60 per cent. of the crude rubber sold in London is sold to German firms whose members have become naturalized British. Some people profess to believe that export figures show that there exists a serious "leakage." The Board of Trade returns for the first six months of 1915 show that British exports of rubber to "other countries" (the United States, France and Russia) were very nearly double what they were in the corresponding period of 1914, amounting in value to £1,088,000 (\$5,294,752), as compared with £549,000 (\$2,671,709) exported during the first six months of last year. Shipments to Germany and Belgium during the first six months of 1914 amounted to £1,650,000 (\$8,029,725), so that even were the

whole of the excess of exports to find its way to Germany, that country would still be receiving but one-third of its quantity of crude rubber. It must also be taken into consideration that neutral countries are obliged to supply themselves with many rubber articles they formerly imported from the countries now engaged in the war, and this has stimulated their domestic rubber industries and rendered increased imports of crude rubber necessary. No doubt some leakage has occurred but it is probable that it has been of little importance. At a meeting of the Council of the Rubber Growers' Association, a special committee was appointed to consider this question.

SYNTHETIC PRODUCTS CO.

The English company formed to manufacture synthetic rubber has published some interesting information in its general annual report.

A factory known as the Rainham Works, was installed for experimenting with the manufacture and the vulcanization of synthetic rubber, but work has been stopped as the government commandeered the factory.

Of the total paid-in capital of the company there only remains £1,289 (\$6,273) in the banks, a great part of the capital having been spent in installing the experimental plant. The cost of scientific research amounted to over £12,000 (\$58,398), and the company has spent £40,000 (\$194,660) without having sold any rubber. In spite of the declarations of the managers it appears that the undertaking was not on the way to success.

The manufacture of acetone at Kings Lynn seems to be giving good industrial results in spite of the difficulties experienced in separating properly the two bacterias that act on the starch. All the acetone manufactured since June, 1914, has been purchased by the British War department.

THE RUSSIAN-FRENCH INDIA-RUBBER, GUTTA-PERCHA & TELEGRAPH WORKS, "PROWODNIK."

The Russian-French India-Rubber, Gutta-Percha and Telegraph Works, "Prowodnik," of Riga, Russia, reports gross profits of £60,000 (\$3,211,890) in 1914, against £415,000 (\$2,019,598) in the previous year. As the company maintains branches in Germany and Austria, it was necessary to deduct a large sum for "doubtful" debts in addition to £165,000 (\$802,973) for ordinary depreciation, as against £100,000 (\$486,650) in 1913; so that there only remained £180,000 (\$875,970) available for distribution, as compared with £252,000 (\$1,226,358) distributed to shareholders in 1913. The dividend proposed was £1 (\$4,866) per share on the capital of £1,800,000 (\$8,759,700), as compared with £1.4s. (\$5.87) per share paid in previous year. The actual payment was postponed until September on account of the depreciation in the Russian rate of exchange.

TIRE FAMINE IN SWITZERLAND.

It is reported that the Swiss government has caused census bureaux to be opened throughout the country for determining the quantities of cycle, motor cycle and automobile tires available for immediate use. Owners and holders of such tires are under obligation to report at these bureaux.

The latest monthly report of the electricity bureau in the communications department at Tokyo gives an increase of 14 in the number, and \$541,475 in the combined capital of electric enterprises since the end of the year 1914; of which power suppliers make up the largest number. During May four companies were promoted in Hokkaido, Niigata, Nagano and Ishikawa Prefectures for the purpose of carrying on lighting operations, with a combined capital of \$62,897 and total power generated of 267 kilowatts.

The Rubber Trade in Germany.

By Our Regular Correspondent.

THIS country has been at war one year, and I therefore believe it appropriate to begin this letter with a brief review of the past twelve months.

Immediately after the outbreak of the war the Imperial government took the necessary measures to minimize the ill effects of war conditions and the German people, with extraordinary flexibility, adapted themselves to the situation. For the past twelve months we have been patiently and hopefully supporting the burdens of the war. Commerce and industry have suffered all sorts of losses through the increased cost of raw materials, the suspension of practically all foreign trade, and the falling off of home trade.

The war began under conditions favorable to our armies and all counted on an early peace. This being the feeling, speculation continued active until the government saw itself obliged to regulate the prices of all necessities of life. England then declared her "starving-out of Germany" policy. Speculation was dead, but the prices of commodities had already reached such a level as to cause great distress among our poorer people. Workmen saw the cost of living constantly increasing, while wages followed the opposite course. Large concerns, as well as the government, were obliged to take measures to keep their employees from starvation. In all the lines where war contracts were not available there was a great number of unemployed. The Allies' blockade was not alone responsible for our sufferings, for it must be borne in mind that before the war our enemies were our best customers.

Considerable export trade was done through Italy until that country declared itself for our enemies, when this all came to a full stop. England perfected her control of the shipping of the Netherlands and of the Scandinavian countries, and what little foreign trade remained was curtailed by the different embargoes our government was obliged to declare. Our commerce and industries have suffered incalculably, but, in spite of all that, I can truthfully say that both our commerce and our industry are in a healthy condition. We have learned how to cooperate efficiently and help each other. If we do not forget the teachings of this year the good to us will be well worth the sacrifices.

The rubber industry was among the first to feel the stress of war. Outside of those which could accept government contracts for tires, surgical goods and the like, few factories were kept going. And even those which were working night and day on war orders did so at little profit.

At the beginning of the war, when the prospect looked bright for the German armies, rubber men, like all the rest of Germany, felt sure that peace would be a matter of weeks and the raw material problem received little or no attention, the only cloud being the lack of skilled labor and the government's seizure of all supplies of benzene and benzol. But as the war continued and prospects of early peace faded away, the shortage of raw materials was keenly felt, prices became prohibitive, and skilled labor became more and more scarce. The shrinkage of credit obliged manufacturers to pay cash for all raw materials, and in turn they had to demand cash from their customers. This has caused much ill feeling in our rubber trade.

Some foreign trade was done until the prejudices of the Roumanians and the Italians, who feel their racial attachment to France, made matters too difficult for German salesmen. The strict enforcement of the British rubber embargoes put the final touch to the destruction of the splendid optimism that witnessed the beginning of the war. The calendar year ended with little or no profits to show, but still with good hopes for the future. Conditions, however, have not improved: on the contrary, it can

be safely said that as long as the war lasts our rubber industry will continue to suffer.

In spite of the restrictions placed on the use of motor vehicles some dealers are still able to offer cars for sale; in certain instances equipped with new tires. Rumor has it that these fully equipped machines have found their way here from America. Automobile interests here are already taking steps to have the government exercise care in disposing of its used automobiles and motor trucks after the war is over. Ways and means are being devised to distribute these machines without causing too great disturbance in motor values. Rubber factories are interested in this movement, which directly concerns them. At the present time our automobile factories are working night and day on government orders.

Artificial rubber rumors are continuing to go the round of the daily press but, as a matter of fact, the production of synthetic rubber in quantities is a problem yet to be solved and years will no doubt pass before there will be any artificial material capable of competing with the real rubber nature supplies. Lately it was announced that an American scientist by the name of Noble had been able to make rubber from tar by using a high-frequency current of about 500,000 volts. The description of his process was not very intelligible, but this did not prevent the announcement from being taken seriously, or apparently so, by the daily newspapers. Of course the tale found no credence among professional men here.

The unexpected length of the war has obliged the government to strictly enforce its decrees affecting raw materials. The list of those affected by national defense measures is lengthening each day. Cotton that before the war could be obtained in Bremen at 0.64 mark (0.15) per pound cannot now be obtained for less than 1.30 marks (\$0.31). When we read that Liverpool quotes cotton at 50 pennings (\$0.12) you can understand our feelings towards England. Hardly an article of merchandise has escaped the general increase of prices. Of course these increases are all due to the scarcity of raw materials. I cannot discuss the government's measures. This is prohibited. All I can say is that they were taken in the interest of the nation. Quantities of crude rubber as small as two pounds come under government supervision and must be held at the government's disposal. The same applies to all chemicals used by the rubber and many other industries. Recently an embargo was placed on calcinated magnesias.

Automobiles, cycles, motorcycles and parts have long been under an export embargo. An embargo was recently placed on exports of wire and cable making machinery.

The enormous quantities of leather necessary for the equipment and maintenance of the army and navy, and the restrictions the government has put on the use of leather, have so increased the prices of this commodity that it no longer can be used for making shoe soles and heels and similar articles. Several important rubber factories, seeing an opportunity to develop the use of rubber soles and heels, have been making experiments and now claim to have found a perfect substitute for sole and heel leather. These substitute soles are said to be a combination of felt and rubber, and the manufacturers who have developed their manufacture hope to reap good profits, at least during the war.

A topic that is receiving considerable attention at the present time is the number of sales of rubberized garments. Dutch merchants have been making throughout Germany. These garments are not believed to be of Dutch but of British manufacture and they are being offered throughout the empire at very low cash

prices. There are factories in Holland that turn out rubberized fabrics, but the belief here is that no Netherlands factory can manufacture and sell at the prices at which the garments are being offered.

The tremendous importance of this year's agricultural crop to the nation is causing the different farming centers to take special precautions to guard against the possibility of its destruction by fire. It is hoped that this movement will be beneficial to the rubber industry. Large orders for hose are expected.

A feature of the present condition of our mechanical rubber goods trade is that most manufacturers and jobbers have no men to send out to solicit trade, while on the other hand consumers are little disposed to purchase on account of poor business conditions and the fact that no one solicits their orders.

The sugar beet crop promises to be a fairly large one, and the sugar industry should offer a good market this year for rubber mechanical goods unless the economy policy continues to govern everything. The brewing business that has always been a very large purchaser of mechanical rubber goods is very injuriously affected by present conditions. Beer has become so expensive that people can no longer purchase it as they used to. However, in view of the government's "mobilization" of metals, as we call it here, the brewers can hardly expect to get any metallic pipes and they will most certainly have to use hose. This ought to be good for the rubber industry, or at least for those who have suitable hose for sale.

Rubberized cuffs and collars are selling well, both to the military and to the civil population. This line is providing good business to rubber manufacturers able to produce it. Rubberized gaiters and rubberized garments are much used by the men in the trenches, and rubber hose is playing an important part in the trench warfare.

It is current in rubber circles here that large German rubber manufacturers and dealers in crude rubber have made contracts in neutral countries where they are collecting large quantities of crude rubber for importation to Germany immediately upon the reestablishment of peace. The object is to guard against a boom in rubber prices, possible freight shortage and other causes of delay. The government is said to have granted special permission to make foreign payments in such cases where the interest of the nation's industries is concerned.

Serious efforts are being made toward bringing about a commercial alliance with Austria-Hungary. Since the beginning of the war our allies have fought side by side with us on most of the battle fronts, and many believe that we should be united at least commercially after the war. The Dual Monarchy consumes far more rubber goods than it can produce and, although Germany has been furnishing a large percentage of the surplus demands of our ally, France, Great Britain, Russia and Italy have been selling millions of marks of rubber goods in Austria-Hungary. We believe that this should no longer be and that the Teutonic allies at war should be closer together in peace and should combine to supply their needs as far as possible.

Latest reports state that certain Belgian rubber factories have partially resumed operations. They had been closed down since the outbreak of the war.

At the general annual meeting of the Central Association of German Rubber manufacturers, which was held in Berlin recently, it was stated, regarding the financial position of the association, that the balance in hand amounted to 13,735.50 marks (\$3,269.05), as compared with 21,339.92 marks (\$5,079), balance on hand January 1, 1914. The association contributed 10,000 marks (\$2,380) for relieving the families of those killed or injured in the war. During the year the association's membership increased from 46 to 68 members. It was voted that a large portion of the available funds be invested in the national war loan. Tire standards were also discussed, and there was a vote of encouragement to the

movement for tire size standardization. A customs tariff treaty with Austria-Hungary was advocated.

Another item of rather peculiar interest I wish to mention before closing. Our troops on the Eastern front have suffered much from vermin, and, curiously enough, the rubber industry has been foremost in relieving their sufferings from this source. Our druggists' sundries manufacturers have been doing an extensive business in hard rubber vaporizers and sprayers of all types and sizes.

Professor Harries, of the Kiel University, well known as the original producer of synthetic rubber and for his writings on the subject, has been promoted to the University of Göttingen.

* * *

Your German contemporary, the "Gummi-Zeitung," recently lost one of its oldest and most faithful collaborators in the death of Mr. August Foerster, who passed away at Blasewitz, near Dresden, at the age of 78. Mr. Foerster has been contributing to the "Gummi-Zeitung" for the past 20 years.

A TIRE DEALER CONVICTED OF FRAUD.

A tire dealer in Germany who operated a tire vulcanizing shop together with a small business in old rubber, in the course of business came into possession of a tire casing which was in perfect condition except for a large hole. As he knew the tire was not old he shipped it to its manufacturer's claim department claiming guaranty money, alleging that the tire belonged to one of his customers who had only used it a short time when it "blew out," causing an accident that nearly resulted in the customer's death. The claim department of the tire manufacturing company, however, had a very efficient card index system which enabled them to discover that the tire in question had already been subject of adjustment, some three months previous. The company sent a representative to visit the dealer and receive his complaint and then filed an accusation with a public prosecuting attorney. The tire dealer was brought to trial and compelled to admit that the tire had come into his possession as "old rubber." He was sentenced to four weeks in jail and \$25 fine.

In the course of the trial it transpired that the tire company was in the habit of indexing and carefully marking in secret characters each tire returned for a refund on guaranty. The marking was done in such a manner that not even the repair man, who went over the tire carefully both inside and out, was able to discover the minuscule markings.

DANISH CABLE INDUSTRY.

Denmark is one of the largest operators of submarine cables in the world. Danish cables connect all parts of the globe. Most of these cables were manufactured in Copenhagen.

According to the Norwegian Consul-General at the Danish capital, the Danish cable industry has more than proved its value in the present world crisis. Insulated wire and cables were among the first articles placed on the embargo list by the warring nations. Before the war Germany was the greatest supplier of cables to Norway and Sweden, where electric power, and consequently cables, are extensively used. The Danish Cable & Wire Manufacturing Co., of Copenhagen, which was already supplying the needs of Denmark, has been able to cover all the demands of the Scandinavian countries since the outbreak of the war.

A wedge-shaped cushion, the sides and bottom of which are smooth, is covered on top with a sheet of rubber sponge that absorbs the perspiration of the invalid and prevents bed sores. [German patent No. 629,124. Toni Doutreloup.]

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

WHOLESALE RUBBER WASHING.

RUBBER planters in the Far East, particularly those who are situated near forests that abound in wild rubber, have for a long time been in the habit of purchasing gum from the native collectors. At first such rubber was shipped in the condition in which it was received. Later, however, the progressive planters installed machinery for washing and drying, and were able to substantially improve the quality of the wild product. A typical instance of this planting accessory is furnished by the Kuching Trading Co., Limited, of Sarawak, Borneo.

It was formed in 1909 by J. H. Brodie, a Scotchman who had spent 6 or 8 years in Sarawak with the Borneo Co., Limited, and was thoroughly familiar with local conditions, and R. S. Hardy, an American who had spent several years in Mexico in the guayule business, together with a number of local Chinese traders.

An old "Go-Down," or storehouse, was secured and renovated, and in it were placed a small 8-inch washer and an upright engine which ran the washer by belt. The original object of the mill was to refine Borneo rubber by washing and sheeting, and then to dry it ready for shipment instead of shipping in the crude form. For a while the 8-inch washer did its work, but often with additional coolie power, for at times the stiff chunks of rubber stuck in the rolls, and the belt would slip, until a couple of coolies gave it an additional heave, forcing the rubber through the rolls.

Finally it was decided to put in real washers, and two 24-inch washers were built for the company in Singapore and a 75 horsepower engine was obtained. These washers were at that time the heaviest and largest ever used in the Far East. The company had some difficulty in installing this larger machinery, for the tubular boiler which was brought over from Singapore was quite a problem. It was landed on the dock in Kuching and fortunately the chief engineer on the steamship "Rajah of Sarawak," who purchased the boiler for the company, had foresight enough to bring over a truck to get it

steam winch onto the truck on the wharf, and then coolies with a long rope pulled the truck through the wharf storehouse to the street. Here every stray Chinaman and Malay was gathered in and pressed into service until there were 50 of them pulling the

INTERIOR VIEW OF THE PLANT OF THE KUCHING TRADING CO.

boiler up to the mill, with great shouting and yelling. After much hard labor the new equipment was set going. A vacuum dryer was also installed, the first ever used in Borneo.

The company progressed finely for a time, but the advent of plantation rubber in quantity and its low price, and the falling off in use of low-priced wild rubber caused the company to drop this work and devote its attention to washing plantation rubber.

In Borneo the natives have planted many acres of *Hevea* trees in small areas—anywhere from one to one hundred acres—and scattered all over the country; and as their trees came into bearing they were able to tap and collect their latex and coagulate it; but their method of sheeting was

by rolling the coagulated latex with a bottle or a rolling pin. The company, therefore, has been a great help to them, as it now takes the coagulated latex, either buying it outright or charging so much per pound, and sheets and washes the rubber properly. Some of this rubber which the Kuching company has prepared has brought the highest price in the Singapore auctions.

THE PLANT OF THE KUCHING TRADING CO.

TRANSPORTING RUBBER TO THE DOCKS.

from the wharf up to the mill—a distance of about a mile. In Sarawak there are no horses or motor trucks; in fact, coolie labor only. The boiler was transferred from the steamer by the

AS TO FEEDING HENS ON LATEX.

In an earlier number of THE INDIA RUBBER WORLD there was an article forecasting uses for rubber, the concluding paragraph of which ran as follows: "The list grows long and this is but a beginning; there are scores of industries yet to be viewed, and, above all, the backbone of all industry—the farmer—has been neglected. Perhaps—and this is but a vague suggestion—if he raised his milk-fed hens on rubber latex, egg shells would cease to be fragile."

The "Goodrich," the sprightly publication issued monthly by The B. F. Goodrich Co., quoted quite extensively from this article in a late number and followed the concluding paragraph with this addendum: "In this connection we are reminded of certain hotel-served poultry which gave the impression that it, too, had been raised on latex, with the result that instead of producing a bounceable egg the rubber substance had become incorporated in the edible tissues."

Some Rubber Planting Notes.

COST OF PRODUCTION OF PLANTATION RUBBER.

THE Far Eastern press has of late devoted considerable attention to the question of giving greater publicity to estate costs. Opinions on the subject, of course, differ, the majority of the parties interested being opposed to the publication of costs, while a strong minority favor the publication of this information. The majority consider the cost of production of rubber as a business secret that should not be divulged, but the minority contend that rubber planting is an exceptional line of business and that it stands on a plane by itself. A correspondent of the Kuala Lumpur daily "Malay Mail" gives the following view of the question:

Rubber planting is an industry practically limited to the Dutch East Indies, Malaya and Ceylon. There are rubber plantations in East Africa and in a few other parts of the globe, but their combined output is so small that their existence does not affect the question. Large sums of money have been secured from thousands of shareholders and invested in rubber plantations. The Far Eastern plantation industry has led to a change in government policies. It concerns not only investors but the world in general, occupying a unique position not to be compared with general industries.

Though admitting this, there are many people who still maintain that it would not be a good thing to publish "all-in" costs. "Why," they ask, "should the whole world know our costs in producing rubber?" The "Malay Mail's" correspondent believes that the adoption by all of the practice of publishing costs would lead to greater economic stability—that the competitive element has to exist to produce the best results and that the competitive test can be safely applied to rubber estate work. The industry is, comparatively speaking, a young industry, with much to learn. The boom days are over, and prices are lowering to a more natural level. The successful estate manager is reducing his costs to a minimum by improved methods in tapping and by improvement in the yields obtained. If every estate published its costs, this economy should act as an incentive to those still producing on a fairly high scale.

Another point is that the vast number of shareholders who have invested in rubber naturally want to know, not only what the output has been and what profit has been made, but what was the cost of production. But there should be uniformity of accounts. It is difficult accurately to apportion estate charges. The average estate is planted in sections, and the rubber is in varying stages of development. If the whole estate is to bear the "all-in" costs, it is obvious that the sections of it that are not in bearing are going to consume a large amount of money without giving any output return. The accounts should be made separately for each section, so that it could be ascertained what the actual cost of working each section is. But where the whole estate is in bearing, and all estate and managerial items are chargeable against the rubber harvested, there is no reason why the cost per pound of rubber could not be published with beneficial results.

PARA RUBBER IN THE BRITISH GOLD COAST COLONY.

The government of the British Gold Coast recently published a report on the agricultural department of the colony which contains some interesting items regarding experiments conducted in the department's experimental stations at Tarquah and Coomassie with Para and *Funtumia*.

At Tarquah two lots of *Hevea* trees, of 15 trees each, have been tapped continuously on the half-spiral and half-herring-

bone systems since March, 1910. The total average yield per tree from the two systems is 17 pounds, 4 ounces and 14 pounds. 10½ ounces, respectively, showing a yield of over 2½ pounds per tree in favor of the herring-bone system. The herring-bone system employed consisted of three half-herring-bone cuts at about 20 inches apart on one-third of the circumference of the tree. It was found that the bark on this one-third of the tree was used up after 16 months continuous tapping, so that the original bark would last four years, at the end of which time the new bark would be sufficiently strong to be retapped. Experiments proved that better results are obtained from renewed bark than from the original bark.

The estimated cost of production for rubber produced on the department's experimental stations was from 9 to 11d. per pound, so that the rubber produced was sold at a profit in spite of the low rates prevailing in the crude rubber market.

Experiments conducted with *Funtumia* trees, which are tapped in the full herring-bone fashion, showed that the *Funtumia* is not a good rubber plantation tree, for the yields were small for first tappings and even smaller for second tappings, the only redeeming feature being the lower cost of collecting and preparing the rubber, which was 2½d. per pound for the first tapping and 4½d. for the second tapping. *Funtumia* grows more slowly than *Hevea*, it develops a poor root system and is easily uprooted by storms. Pests gave the Gold Coast experimental stations but little trouble except when the trees were young.

RUBBER EXPORTS FROM MOZAMBIQUE.

During the year 1913—the latest period for which statistics are available—the exports of rubber from Portuguese Mozambique amounted to 17,906 pounds.

RUBBER PLANTING IN BRITISH GUIANA.

Mr. C. K. Bancroft, assistant director, Department of Science and Agriculture, British Guiana, recently contributed an interesting article on Para rubber planting in British Guiana to the "Daily Argosy," of Georgetown, British Guiana.

The writer states that the cost per acre of bringing Para trees into bearing amounts to about £40 [\$194.66]. From experiments in tapping 379 trees five and a half years old, and 300 trees six and a half years old at the Issororo experiment station, he deduces that the cost of collecting rubber from trees growing under suitable conditions would average slightly less than seven cents per pound dry rubber. He believes that these experiments, though they were conducted on a small scale, demonstrate that plantation rubber can be produced at a profit in British Guiana with Para plantation rubber selling on the market at 48 cents per pound, and that the average profit per acre would be in the neighborhood of \$144 per annum.

DROUGHT IN NORTHERN BRAZIL.

The states of Ceara, Parahyba and Rio Grande do Norte, in Northern Brazil, are suffering from a very severe drought. The stricken districts furnish annually a large contingent of rubber gatherers who are now in a condition of famine and totally unable to equip themselves or to pay for their transportation to the rubber districts. As the Brazilian government subsidizes the lines of steamships running up the rivers to the forests in the interior it is suggested, in influential circles in Northern Brazil, that the government should furnish free transportation to those desiring to go into the rubber country.

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

Interesting Letters from Brazil.

THE RUBBER SITUATION ON THE AMAZON.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

THE present low price of rubber, as we have predicted, has not affected the industry on the Amazon very much. The Amazon will always be able to compete with Ceylon in prices, as we have already said. The Amazon will not be removed as a producer of rubber. As cheap as they may be able to produce their rubber, the Amazon will be able to produce it still cheaper. The middlemen, however, who are many, between producer and consumer will earn less profit. The proof of this is that during 1914 and 1915 there were very few failures recorded on the Amazon, and these in small amounts.

Practically the whole business is now conducted on a cash basis. The war has cut off their former supplies from England, Germany and the other belligerent countries with which they had a 3-to-6 months' credit. Since the Amazon is compelled to import the necessities of life, it is obliged to purchase goods from the United States. The commission houses and the manufacturers, although very anxious to get Amazonian trade (the National City Bank not yet having established an institution which could be of great help to them in ascertaining the credits), are exporting goods to them for cash only. The Amazonian importers buying for cash have no other course than to supply the *ariadores* for cash, who in their turn send goods to the rubber centers in the interior only upon the receipt of the rubber for the goods bought. In many instances a clerk of the *ariadore* goes along with the boat carrying the goods, to exchange them for rubber and other products.

The war of course has been very bad for all business and also for the Amazon, but at the same time it has taught the Amazon a good lesson. On account of the great risk it has removed the entire credit system by means of which they could overcharge 50 to 80 per cent. on the goods.

Everybody was squandering money in going to Europe and buying all kinds of useless paraphernalia. Some bought boats at \$100,000, which, after being used once or twice a year, would remain idle the rest of the time. Now they are working on a real business basis. The rubber producer is taking from the *ariadore* only those goods which he must take and which he cannot raise on his estate. Formerly he was supplied with beans, rice, corn, canned stuff, etc., in order to make profit. These he could easily raise on his estate by farming, raising cattle, chickens, etc. Now he is actually doing these very things.

For these reasons it is our opinion that the Amazon, barring all other obstacles including the 22 per cent. duty to the government, can still compete with the East. There is no doubt that Para rubber is much better than Ceylon rubber for the manufacturer. Ceylon claims, however, that she supplies a rubber that is 25 per cent. richer than Para rubber because of the loss in washing. This will easily be overcome. It is already realized, and all steps are being taken to cure the rubber in such a way as to obviate this loss and yield the same purity of rubber as Ceylon claims to produce.

The speculation in rubber on the Amazon is altogether shameful. In many instances the price here in New York is much lower than that paid by some export houses in Para. According to the present outlook sales at that port will be largely for future delivery. Though they do not have the rubber nor even have it in view, some Para exporters sell for future delivery at a much lower price than is actually quoted in the New York market. Of course, should the quotation rise, they are liable to be badly caught. They do not take this into consideration, but continue to lower the price with every sale.

As we stated above, the commerce is becoming more and more stable, since earning less they spend less. The government which calculates its budget from the former price or the prevailing price has a greater deficit each year and is seeking a way to regulate this, from which originate the valorization schemes. In attempting to improve this situation the state gets in touch with the Federal government, which, being already interested in other products, mixes them all up together, and brings forth a valorization plan which, while suitable to some, cannot be suitable to all. At any rate the entire thing will bring confusion and the men who will suffer will be the same rubber exporters.

The low price of rubber renders the income of the country less. For this reason they are trying to increase it by paying more attention to other products, especially hardwoods with which the forests of the Amazon are full, and which are very valuable and cannot be gotten in any other country. All other timber is also to be found there, and will surely be in demand after the war ceases.

MIGUEL P. SHELLEY.

PLANTING HEVEA ON THE AMAZON.

The following paragraphs are taken from a letter, which recently appeared in a paper published in Manaus, written by the owner of an estate near the mouth of the Purus River, some miles above Manaus, who is planting rubber extensively and apparently with a good deal of enthusiasm.

"On reading the message of the Governor of the State, in that interesting part where he treats of the means of encouraging the planting of *Hevea* in our State, I could not resist the duty of associating myself with this excellent train of thought, seeing that in my opinion the planting of *Hevea* is one of the surest means of assuring the future prosperity of the Amazon. I have, in fact, already planted many thousand rubber trees and am still continuing to do so.

"In addition to the recommendations of the Governor's message it would be specially useful, Mr. Editor, if the authorities of the interior were instructed to insist upon *Hevea* being planted when State lands are encroached on and cleared for planting cassava. These clearances are abandoned after making the floor, and fresh forest is cleared for the ensuing year, leaving the former clearing to become overgrown again with jungle, while it would be so simple to plant *Hevea*, seeing that one man can plant a thousand trees in a day.

"It is thus that our forests are getting cut down without any permanent advantage to ourselves, and to the detriment of our children.

"If a man puts in a day's work planting a thousand rubber trees among his cassava, it is by no means a day lost, as cleaning out the weeds and undergrowth benefits the cassava as well, and when the cassava is pulled up at the end of the year, the land remains fairly clean for another six months, which gives the *Hevea* a start of eighteen months and a growth of ten feet in height, so that it runs no risk of getting caught up and choked by the jungle afterwards.

"By adopting this plan I myself have rubber trees five years and eight months old, with a circumference of 110 centimeters at the base, that could already be tapped by modern methods."

NEW CRUDE RUBBER FIRMS AT PARA AND MANAOS.

The firms of Zarges, Berringer & Co. and Zarges, Ohliger & Co., which have dealt extensively in crude rubber in Para and Manaus, and from which the capital and interests of E. A. Zarges and Heilbut, Symons & Co., of London and Liverpool, were withdrawn on December 31 last, have been succeeded by Berringer & Co. and Ohliger & Co., who will continue the business. F. C. A. Berringer and Hugo Ohliger are joint partners in the new firms, the former of which will have its headquarters at Para, the latter being located at Manaus. A circular issued on August 4 names F. W. F. E. Paschen as their authorized representative in those cities, with full power of attorney.

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED AUGUST 17, 1915.

- N**O. 1,150,047. Waterproof treatment of leather. A. McLennan, Ross Herford, England.
- 1,150,065. Dipping device comprising rubber covered resilient layer. H. T. Rosen, Walkerton, Ind.
- 1,150,120. Stocking supporter. M. L. Irwin, Philadelphia, Pa.
- 1,150,225. Wheel and tire. M. C. Overman, New York, N. Y.
- 1,150,460. Life preserver. J. Schreiber, Lincoln, Ill.
- 1,150,508. Respiratory mask or helmet. A. B. Dräger, Lübeck, Germany.
- 1,150,517. Game. M. L. Hawks, New York, N. Y.
- 1,150,540. Drying apparatus. J. O. Ross, assignor to B. F. Sturtevant Co., both of Boston, Mass.
- 1,150,593. Corset. J. Goldner, New York, N. Y.
- 1,150,642. Process of manufacturing condensation products from formaldehyde and phenol. H. Stockhausen, Creifeld, and Reinhold Grühl, Charlottenburg—both in Germany.
- 1,150,776. Fishing bait box. P. Lamb, Englewood, Colo.

Trade Marks.

- 77,605. Bowers Rubber Works, San Francisco, Cal. The word *Victor*. For rubber hose, belting and composite rubber piston packing.
- 78,639. Charles Niedner's Sons Co., Malden, Mass. A color line longitudinally disposed upon the goods and incorporated in the fabric and formed of a central stripe of three red warps alternating with two yellow ones, and on either side a broken stripe of two green warps contiguous to the yellow stripes. For linen hose.
- 78,640. Charles Niedner's Sons Co., Malden, Mass. A color line running longitudinally and of incorporated in the fabric. For linen hose.
- 81,626. Boston Rubber Shoe Co., Malden and Boston, Mass. The word *Nugget*. For rubber boots and shoes.
- 83,663. Montgomery Ward & Co., Inc., New York, N. Y. Diamond shape design with the initials *M* and *W*. For rubber balls and general sporting goods line.
- 86,182. B. E. Nevins, Merceusburg, Pa. Representation of a pneumatic tire with *Sofat* performing repairs. A semi-liquid or cement seal for rubber tires.
- 86,501. Wyckoff & Lloyd Co., Springfield, Mass. The word *Lotus*. For rubber and fibrous packings and rubber hose.
- 86,895. York Manufacturing Co., York, Pa. The words *York Co.* For rubber packing.
- 87,405. The Worthington Ball Co., Elyria, Ohio. The word *Trey*. For golf balls.
- 87,463. The Goodyear Tire & Rubber Co., Akron, Ohio. Representation of a ball with the word *Ox-Lite* through the center. For leather fiber and rubber soles and heels.
- 87,736. Hood Rubber Co., Watertown, Mass. Representation of a horse shoe. For rubber boots and shoes and tennis shoes having rubber soles vulcanized to the shoe.

ISSUED AUGUST 24, 1915.

- 1,150,922. Apparatus for vulcanizing tire shoes. C. F. Adamson, East Palestine, Ohio, assignor to the United States Rubber Co., New York, N. Y.
- 1,150,930. Watch protector. L. Cohn, New York, N. Y.
- 1,150,986. Tire for vehicles. H. Besser, Alpena, Mich.
- 1,151,086. Rim construction for dual tires. J. C. Cole, assignor to Fisk Rubber Co.—both of Chicago Falls, Mass.
- 1,151,093. Toy balloon. A. H. Du Bois, New York, N. Y.
- 1,151,133. Tire. C. B. Steele, New York, N. Y.
- 1,151,144. Artificial foot comprising a pneumatic sack. J. E. Wofe and T. Browning—both of Cassaway, W. Va.
- 1,151,227. Packing. C. E. Stokes, Trenton, N. J.
- 1,151,239. Insulated wire stripping device. S. G. Wood, Brooklyn, N. Y.
- 1,151,396. Inflated ball. F. T. Roberts, Trenton, N. J.
- 1,151,511. Shoe heel. E. W. Burt, Boston, Mass.

Design.

- 47,763. Hot water bottle. B. F. Stauffer, Akron, Ohio, assignor to The B. F. Goodrich Co., New York, N. Y.

Trade Mark.

- 87,192. Needham Tire Co., Needham, Mass. Illustration of a spear with the word *Needham*. For rubber and rubber and canvas tires.

ISSUED AUGUST 31, 1915.

- 1,151,604. Pneumatic tire. W. S. Mummery, Minot, N. D.
- 1,151,797. Horseshoe. W. J. Kent, New York, N. Y.
- 1,151,859. Sectional air bag. J. P. Brophy, Birmingham, Ala.
- 1,151,924. Steam vulcanizer. E. N. Brown, Cleveland, assignor of one-half to J. Gordon, Cleveland—both in Ohio.
- 1,151,980. Feed plug for a fountain pen. De Witt C. Van Valer, Richmond Hill, assignor to Modern Pen Co., New York—both in New York.
- 1,152,067. Top comprising elastic cord. E. Allison, San Francisco, Cal.
- 1,152,115. Dancing shoe with rubber sole pad. D. McCormick, Columbus, Ohio.
- 1,152,185. Spading plate for waterproof footwear. K. F. W. Koch, Chicago, Ill.

- 1,152,246. Battery cell with vulcanized rubber lining. W. L. Walker, Groton, Conn.
- 1,152,247. Battery jar. W. L. Walker, New London, Conn.
- 1,152,267. Vulcanizing apparatus. C. M. Beardsley—Harriet Marion Beardsley, administratrix—Cleveland, Ohio.
- 1,152,276. Pressure gage with a rubber air chamber. J. A. Bowden, Los Angeles, Cal., assignor to A. Schrader's Son, Inc., Brooklyn, N. Y.
- 1,152,284. Arch support for shoes. P. Broadbooks and L. E. Smith—both of Batavia, N. Y.
- 1,152,317. Dental vulcanizing flask. E. A. Hewes, Eskbank, Dalkeith, Scotland.
- 1,152,324. Rubber tire. A. S. Krotz, Janesville, Wis.
- 1,152,349. Waterproof fabric and process of manufacture. H. Swain, San Francisco, Cal.
- 1,152,372. Manufacture of seamless rubber articles. T. W. Miller, assignor to The Faultless Rubber Co.—both of Ashland, Ohio.

Design.

- 47,771. Vehicle tire. M. Bergougnan, Paris, assignor to Société Générale Des Etablissements Bergougnan, Clermont Ferrand, Puy-de-Dôme—both in France.

Trade Mark.

- 83,461. Hooley Hill Rubber & Chemical Co., Hooley Hill, near Manchester, England. The word *Accelerene*. For a chemical substance for use with india rubber during the process of vulcanization.

ISSUED SEPTEMBER 7, 1915.

- 1,152,470. Vehicle tire. F. U. Adams, Hastings-on-Hudson, N. Y.
- 1,152,508. Puncture proof wheel. W. J. Higgs, Lehi, Utah.
- 1,152,543. Demountable felly-had for vehicle wheels. J. E. Perrault, Belmont, assignor to Hood Rubber Co., Watertown—both in Massachusetts.
- 1,152,584. Machine for operating on shoe soles. E. E. Winkley, Lynn, Mass.
- 1,152,595. Invalid's corset. J. M. Bodensick, assignor of one-third to G. O. Bodensick—both of New York, N. Y., and one-third to F. Brooker, Brooklyn, N. Y.
- 1,152,601. Fountain pen filler. H. N. Carpenter, Woodford, Vt.
- 1,152,602. Fountain pen filler. H. N. Carpenter, Woodford, Vt.
- 1,152,609. Pneumatic spring. B. W. Davis, Phillips, Wis.
- 1,152,636. Sprinkler. H. E. Houston, Wichita Falls, Tex.
- 1,152,652. Hose nozzle. J. McBoyle, Oakland, Cal.
- 1,152,657. Tire structure. J. Pionkowski, Cleveland, Ohio, assignor of three-eighths to S. Pasielski, one-eighth to J. Yablonski, and one-eighth to M. Grayce.
- 1,152,672. Hose supporter. T. P. Tuite, New York, N. Y.
- 1,152,753. Garment supporter. B. F. Orewiler, Chicago, Ill.
- 1,152,756. Elastic tire for vehicle wheels. L. T. Petersen, assignor to The Republic Rubber Co.—both of Youngstown, Ohio.
- 1,152,779. Tire. H. Behn and J. Vene, assignors of one-fifth to H. Behn, one-fifth to J. Vene, one-fifth to W. Marks, one-fifth to G. J. Streisel, Sr., and one-fifth to C. C. Mair—all of Elizabeth, N. J.
- 1,152,791. Switch throwing mechanism. R. V. Collins, assigned to Royal Engineering Corporation—both of New York, N. Y.
- 1,152,830. Elastic vehicle tire. T. Midgley, Worthington, Ohio, assignor to Morgan & Wright, Detroit, Mich.
- 1,152,834. Process of manufacturing articles from plastic materials. R. B. Price, Mishawaka, Ind.
- 1,152,835. Process of treating plastic materials. R. B. Price, Mishawaka, Ind.
- 1,152,836. Process of treating combined plastic and fabric articles. R. B. Price, Mishawaka, Ind.
- 1,152,837. Process of treating plastic materials. R. B. Price, New York, N. Y.
- 1,152,838. Method of making vulcanized rubber products. R. B. Price, New York, N. Y.
- 1,152,887. Inner sole. E. C. Donnell, Brockton, Mass.
- 1,152,902. Vehicle tire comprising an inner tube. M. Perez, Chicago, Ill.
- 1,152,906. Auto tire. J. A. Read, Arlington, N. J.
- 1,152,929. Garment supporter. L. E. Bernebaum, Chicago, Ill.
- 1,152,935. Process of producing compounds of rubber and steel wool. J. P. Crane, Chicago, Ill.
- 1,152,938. Eraser holder for typewriting machine. B. F. Fortin, Hartford, Conn., assignor to Underwood Typewriter Co., New York, N. Y.
- 1,152,966. Wheel comprising a pneumatic tire. D. H. Padden, Chicago, Ill.
- 1,152,978. Tubing machine. V. Royle, Paterson, N. J.
- 1,152,981. Force cup comprising an elastic cup body. W. F. Schacht, Huntington, Ind.
- 1,152,993. Vulcanizer. P. D. Thropp, assignor to The De Laski and Thropp Circular Woven Tire Co.—both of Trenton, N. J.
- 1,153,002. Joint for hose connections. A. M. Wright, Bloomington, Ill.
- 1,153,026. Tire pressure gage. R. A. Campbell, Minneapolis, Minn.
- 1,153,030. Diver's dress consisting of a shirt or jacket and separate trousers. F. L. Claren, assignor to the Firm Drägerwerk, Heintz and Bernh. Dräger—both of Lübeck, Germany.
- 1,153,040. Process and apparatus for purifying caoutchouc. H. Debaugé, Paris, France.

- 1,153,042. Tire protector. G. L. Dillard and W. Johns—both of Mogollon, New Mexico.
 1,153,059. Vulcanizer. J. M. Ginter, Wooster, Ohio.
 1,153,068. Demountable rim fastener. W. L. Hale, North Attleboro, Mass.
 1,153,091. Hose rack. W. McClintock, New York, N. Y.
 1,153,095. Car window cleaner. E. J. Martin, assignor of one-fifth to R. W. Thompson—both of Washington, D. C.
 1,153,105. Pencil eraser having an elastic lining. W. V. O'Connor, Grand Forks, N. D.
 1,153,119. Resilient wheel. A. Kirby, Unionville, Mo.
 1,153,139. Shoe filler comprising gum resin, etc. H. Snell, Hanover, assignor of one-third to G. J. J. Clark, and one-third to D. J. Head, West Hanover—both in Massachusetts.
 1,153,147. Garter. E. B. Winters, assignor to Johnson Spring Garter Co.—both of Coffeyville, Kan.

Trade Marks.

- 79,893. John Wanamaker, New York, N. Y. The word *Toplow*. For foot balls, hand balls, basket balls, golf balls, tennis balls, etc.
 84,820. Sears, Roebuck & Co., Chicago, Ill. Representation of a pyramid with the word *Ro*. For rubber garden hose.
 85,819. DeLion Tire & Rubber Co., Trenton, N. J. The word *DeLion*. For rubber tires.
 86,991. The Gem City Specialty Co., Dayton, Ohio. A miniature picture of a boy and girl on a seesaw with the words *Teeter's Sugar Mint Gum*. For chewing gum.
 86,992. The Gem City Specialty Co., Dayton, Ohio. The word *Butternut*. For chewing gum.
 87,096. Flower Waste & Packing Co., New York, N. Y. Illustration of a circle with the words *Flower, Leaf, Flower, Resilient and Potent*. For journal packing made of cotton and woolen threads combined with coir or cocoanut fiber.
 87,252. Kahn Brothers Co., Chicago, Ill. The words *Week End*. For raincoats, slippers, boots, rubber and canvas, etc.
 87,896. Sol. Meyer, Cleveland, Ohio. The word *Hermet-Pakt*. For surgeons' rubber gloves.
 87,996. H. Sonneborn & Co., Inc., Baltimore, Md. The word *Sonco*. For raincoats, etc.

ISSUED SEPTEMBER 14, 1915.

- 1,153,194. Tire armor. P. A. Christensen, Benson, Minn.
 1,153,286. Tool for stripping insulation covering from electric wires. H. D. Cahill, assignor to F. W. Whitcher Co.—both of Boston, Mass.
 1,153,305. Tire case. W. S. Heath, San Mateo, Cal.
 1,153,324. Tire vulcanizer apparatus. H. J. Lepsch, Ridgway, Pa.
 1,153,348. Void tire. G. T. Seeger, Revere, Mass.
 1,153,368. Heel plate for rubber heels. T. C. Beasley, Richmond, Va.
 1,153,396. Resilient pneumatic tire. F. Loder, La Fayette, Ind.
 1,153,406. Fire hose coupling. H. W. Sisson, Lake George, N. Y.
 1,153,409. Massaging device. J. R. Wheeler, Baltimore, Md., assignor of one-half to J. C. Allen, Northampton, Mass.
 1,153,481. Vehicle wheel with demountable rim. R. S. Bryant, assignor to The Standard Welding Co.—both of Cleveland, Ohio.
 1,153,482. Vehicle wheel with demountable rim. R. S. Bryant, assignor to The Standard Welding Co.—both of Cleveland, Ohio.
 1,153,490. Device for applying chains to wheels. E. A. Harris, Seranton, Pa., assignor to Alceom Mfg. Co., Newark, N. J.
 1,153,534. Automobile horn. M. A. Aufero, Brooklyn, N. Y.
 1,153,576. Circular loom. V. Royle, Paterson, N. J.
 1,153,593. Telephone receiver. N. Baldwin, Mill Creek, Utah.
 1,153,655. Telephone cable. K. W. Wagner, Berlin-Lankwitz, Germany.
 1,153,687. Bathing cap. B. Hellinga, Amsterdam, Netherlands.
 1,153,704. Wrapping. F. M. Pierce, Chicago, Ill.
 1,153,799. Eraser tip for lead pencils. S. Kraus, assignor to Eagle Pencil Co.—both of New York, N. Y.
 1,153,848. Wind shield cleaner. B. C. Loring, assignor to J. A. Moross and R. C. Loring, trustees—both of Detroit, Mich.

Designs.

- 47,827. Water bag. C. H. Plog, Mamaronock, assignor to New York Mackintosh Clothing Co., New York—both in New York.
 47,830. Tire. H. W. Raymann, Portland, Ore.

Trade Marks.

- 71,401. Kelly-Springfield Tire Co., Jersey City, N. J. The words *Kelly-Springfield Kant Slip Tread*. For pneumatic tires.
 87,359. Carlsen-Williams Co., Chicago, Ill. Representation of a seal with a pneumatic tire and the words *Silver Medal*. For pneumatic tires, pneumatic tire casings and inner tubes.
 87,706. George R. Jones Co., Manchester, N. H. The words *Bobby boots*. For rubber soles, etc.
 87,809. Mecca Mfg. and Specialty Co., New York, N. Y. The word *Mecca* and 400. For automobile tires, inner tubes, etc.

UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1914.

*Denotes Patents for American Inventions.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, AUGUST 18, 1915.]
 9,773 (1914). Rubber mudguard. F. Maloux, 11 Boulevard de Versailles, Suresnes (Seine), France.
 9,833 (1914). Reservoir pens. R. A. Ker, 13 Bayston Road, Stoke Newington, London.
 9,967 (1914). Pneumatic tire. S. Librowicz, 7 Castor-Kyasse, Vienna.

- 10,350 (1914). Utilizing waste rubber. H. Gare, Cumberland House, Park Lane, Wembley, Middlesex.
 10,392 (1914). Apparatus for vulcanizing foot and shoe soles. F. A. Antoni, 8 Achenenstrasse, Cologne, Germany.
 10,135 (1914). Wheel tire. F. Clayton, 59 Charles street, and C. T. W. House, 260 Wellington Road South—both in Stockport.
 10,214 (1914). Machine for inserting studs in tire treads. Dunlop Rubber Co., Limited, 14 Regent street, Westminster, and F. J. Kegan, of Dunlop Rubber Co., Limited, Alma street, Coventry.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, AUGUST 25, 1915.]

- 10,440 (1914). Cable. R. R. Stoll, 2 Kirklands avenue, Baidon, Yorkshire.
 10,449 (1914). Rubber pad for lace machine. E. Jardine, Deering street, and F. Rostance, 1 Greenfield street—both in Old Lenton, Nottingham.
 *10,673 (1914). Wheel tire. J. W. Blodgett, 333 East Garfield Boulevard, Chicago, U. S. A.
 10,683 (1914). Electric switch with rubber buffer. R. Bosch, 4 Militärstrasse, Stuttgart, Germany.
 10,833 (1914). Vulcanizing india rubber, etc. S. J. Peachey, 8 Halesden Road, Heaton Chapel, Stockport.
 *10,855 (1914). Divers' dress. E. Niehoff, Roanoke, Virginia, U. S. A.
 *10,856 (1914). Foot arch support. E. J. Emery, 3 Market Square, Portsmouth, New Hampshire, U. S. A.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, SEPTEMBER 8, 1915.]

- *11,618 (1914). Wheel tire. A. E. Shaw, 1502 Hampton street, Columbia, South Carolina, U. S. A.
 11,731 (1914). Firemen's mask. W. J. Mellers-Jackson, 28 Southampton Buildings, London.
 11,732 (1914). Tire cover. Dunlop Rubber Co., Limited, 14 Regent street, Westminster, and C. Macbeath, Salford street, Aston, Birmingham.
 11,741 (1914). Mud guard comprising a flexible and resilient cushion. B. Howard, 2 Maudsley Cottages, Hanwell, Middlesex.
 11,748 (1914). Exercising apparatus. C. H. Roche, School Gymnasium, Tonbridge, Kent.
 11,772 (1914). Spring wheel with continuous outer rigid ring and rubber cushion. A. H. Roberts, "Denham," Avenue Road, Leamington, Warwickshire.
 11,784 (1914). Dental vulcanizer. E. A. Hewes, Duncraig, Waverley Road, Edbank, Dalkeith, Midlothian.
 11,788 (1914). Ship fender. L. Jacobson, 14 Borcham street, Bethnal Green Road, London.
 11,849 (1914). Waterproof cover for basket. H. T. Kemp, 2 Tuam Road, Newcastle, Kent.
 11,889 (1914). Electrical injunctors and like boxes. St. Helens Cable & Rubber Co., and J. C. White—both of Arpley, Warrington, Lancashire.
 11,929 (1914). Electrical conductors: forging and stamping metals. R. Holland, 29 Wilson street, Stretford, near Manchester, and E. A. Claremont, Brook Cottage, High Leigh, Cheshire.
 11,934 (1914). Producing electric oscillations. H. Manders, 56 Pelham Road, Gravesend, Kent.
 12,018 (1914). Subaqueous audible signaling. Signal Ges. Werk Ravensberg, Habsburger Ring, Kiel, Germany.
 12,060 (1914). Submarine vessel having a collapsible tube made of flexible material. H. Kelley, 30 Grayshott Road, Southsea, Hampshire.
 12,063 (1914). Vehicle wheel. T. J. Roswell, Trent House, Waltham Abbey, Essex.
 12,123 (1914). Wheel tire. J. Stevenson, 2 Ongar Road, Earl's Court, London.
 *12,130 (1914). Vehicle wheel. C. O. Vantrese, Nashville, Tenn., U. S. A.
 12,139 (1914). Extrusion machine. C. J. Beaver, "Rangermont," Crescent Road, Hale, and E. A. Claremont, Brook Cottage, High Leigh—both in Cheshire.
 12,168 (1914). Infant's soother. F. Schutze, Black Bull Works, Caledonian Street, London.
 12,168 (1914). Waterproof paint consisting of powdered resin, French chalk and other ingredients mixed to a thick paste with a mixture of rubber solution. W. H. Kemp, "Maureen," Crutchfield avenue, Walton-on-Thames, Surrey.

NEW ZEALAND.

- [ABSTRACTED IN THE PATENT OFFICE JOURNAL, AUGUST 5, 1915.]
 35,734 (1914). Rectal syringe. M. E. Le-Vine, Norwich Chambers, 56 Hunter street, Sydney, N. S. W.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Date of Application).

- 475,784 (July 29, 1914). Process and arrangement for making metallic wires covered with a sheath or casing of gutta percha for making hat frames and for other purposes. A. Jell'Ott.
 475,800 (May 29). Metallic covering for vehicle tires. P. Duret.
 475,808 (July 29). Vehicle tire with metallic covers. P. F. H. Fersans.
 475,841 (July 30). Elastic wheel. Chew, Sergeant and Groff.
 475,850 (March 19). Tread for wheels of vehicles intended for use in soft ground. Société Schneider et Cie.
 475,897 (July 31). Spare or detachable wheel. P. L. Juv.
 475,910 (March 29). Elastic wheel with air pistons. L. C. Pharaon.

- 475,975 (August 10). Substance to render air tubes serviceable in spite of their porosity and punctures. F. D. Belfrage.
- 476,013 (August 14). Elastic tire for wheels. W. C. Wreen and J. J. Harrigan.
- 476,036 (March 31). Improved elastic tire for vehicle wheels. A. Bonnar.
- 476,116 (August 28). Improvements made on apparatus for feeding fabric winding machines, especially those used by manufacturers of pneumatic tire fabrics. The Miller Rubber Co.

THE GERMAN EMPIRE.

PATENTS ISSUED (With Date of Validity).

- 287,094 (January 13, 1915). Needle holder for medical injection apparatus. Gustav Rudolf Schumacher, Detroit, U. S. A., represented by E. W. Hopkins, patent lawyer, Berlin SW 11.
- 287,093 (October 10, 1914). Liquid vaporizer. (Supplement to patent No. 284,980.) Karl Heinicke, Reichswaldallee, 7, Dusseldorf.
- 287,110 (October 4). Process for attaching rubber heels to shoes. Julius Bahnsen, Kaiserlautern, Palatinate.
- 287,150 (June 13, 1913). Sewing machine for surgical purposes. Essbach, Klingenthal.
- 287,203 (June 5, 1914). Nozzle for hose and tubes, especially adapted to garden hose. Bernhard Schulz, Berlinerstrasse, 151 Berlin-Lichterfeld.
- 287,299 (July 19). Machine for manufacturing sheets from fibrous materials and cement; for instance, asbestos or cardboard or the like and cement. Bircher and Flüg, Zurich, Switzerland. Represented by Messrs. G. Dedreux, A. Weickmann and H. Kaufmann, patent lawyers, Munich.
- 287,382 (December 17, 1913). Nursing bottle with reinforced neck for the nipple. Carl Cade, Hollandsstrasse 10, Herford-in-Westphalia.
- 287,478 (July 17, 1914). Hose or tube jet having a plurality of small holes; also machine for manufacturing it. Supplement to Patent No. 265,318. Dr. Carl Veltman, Kunsnacht, near Zurich, Switzerland.
- 287,526 (September 24). Press for stamping leather and similar materials in which the stock is automatically fed to the press. United Shoe Machinery Co., Paterson, N. J., and Boston, Mass., U. S. A.; represented by Messrs. K. Hallbauer and A. Bohr, patent lawyers, Berlin SW 66.
- 287,547 (October 2). Interchangeable rubber heel. Otto Goltseh, Glatz-in-Silesia.

RUBBER TIRES IN BRAZIL.

The use of automobiles in Brazil is continually on the increase. Yet every tire has to be imported. The tire imports from the United States for the year 1914 amounted to but three per cent. of the total, the tire trade of Brazil for 1914—as shown by the value of its imports—being distributed as follows:

BRAZILIAN IMPORTS OF TIRES FOR 1914.

	Value.
France	\$188,247
United Kingdom	100,965
Belgium	79,243
Germany	74,131
United States	15,714
Italy	11,416
All other countries	6,975
Total	\$477,086

As foreign automobile tire manufacturers are largely occupied in furnishing tires to the countries at war, American manufacturers have at present an exceptional opportunity for introducing their tires in Brazil.

CHILEAN IMPORTS OF RUBBERIZED FABRICS.

It cannot be said that Chile offers a very extensive market for rubber goods, but at the same time American exports to that country ought to be much larger than they are. While eight months of the year are practically dry in Chile, during the four winter months there is quite a fall of rain, the average yearly rainfall at Valparaiso being 35 inches. The statistics for 1913, which are the latest available, show that out of an importation of over 32,000 pounds of rubberized cotton fabrics, only 44 pounds were exported from the United States. The statistics in detail are as follows:

During 1913 Chile imported 32,557 pounds of rubberized cotton fabrics valued at \$18,857, of which Great Britain furnished 20,000 pounds valued at \$11,579; Germany 8,937 pounds, worth \$5,180; France 3,510 pounds, worth \$2,034, and the United States only 44 pounds, worth \$26. The total imports of woolen rubberized fabrics amounted to 2,168 pounds, valued at \$4,304, of which 1,526 pounds, worth \$3,031, came from Great Britain. Germany and France furnished smaller quantities, and the United States only 49 pounds, valued at \$96.

OUTPUT OF DUTCH RUBBER COMPANIES.

The United States Consul-General at Amsterdam, Holland, writes that reports to date of Dutch rubber producing companies show that for the first seven months of 1915 the product of these companies was much greater than for the corresponding period of 1914, and about equal to the total product of 1913.

The same consular officer reports that on August 31 the Royal Netherlands Steamship Co. began to operate steamers between Amsterdam and Callao, Peru, and Valparaiso, Chile, via the Panama Canal. Sailings will be monthly, and six or seven of the company's 50 steamers will be devoted to this service.

Review of the Crude Rubber Market.

NEW YORK.

SEPTEMBER 30, 1915.

EARLY in the month spot quotations were steady but futures were unsettled and prices nominal. The market was quiet and buying confined to special lots at figures that reflected the far from normal condition of the market. There was a noticeable lack of real demand and as supplies were plentiful the natural result was easier prices. On September 7, First latex spot was quoted at 58½ cents, and Upriver fine at 56 cents, although sales at 54 cents were reported.

There was no change noted during the first two weeks of the month. Inquiries were plentiful, but the volume of actual buying was not up to the hopeful expectations for big September business.

About September 16 the market developed a firmer tone and continued strong until the 20th, when higher prices were recorded for plantations, First latex and Smoked sheet spot selling at 59 cents, while Upriver fine had fallen off and was quoted at 55½ cents.

The market stiffened up during the last week of the month and considerable interest developed in futures, particularly for October and December. A fair business in Pará sorts was done and Upriver fine, November and December delivery was sold at 54 cents. The market continued firm and the month closes with First latex spot, selling at 60 cents and Smoked sheet at 59½ cents, while Upriver fine is offered at 55 cents.

The Booth Line steamer "Francis" is now due with 180 tons of rubber. The steamship "Atahualpa" of this same line, with 100 tons from Iquitos, will receive rubber at Manaós and Pará, arriving in New York October 10.

LONDON.

Early in September there was marked activity in buying orders for all spot and future grades, which developed a steady market and firm prices. Sales of First latex, spot, were made at 2s. 4¼d. Smoked sheet, spot, was selling at 2s. 4¼d. Hard Pará was steady at 2s. 4¼d.

There was little change as the month progressed and excepting the usual fluctuations of a quiet market there was little to record. By the middle of the month prices had eased off. First latex and Smoked sheet, spot, were quoted at 2s. 4d. and Hard Pará was easy at 2s. 4¼d. Considerable interest developed in plantations during the fourth week of the month and resulted in a firmer and more active market. First latex, spot, was selling at 2s. 4¼d. and Smoked sheet, spot, was quoted at 2s. 4¼d.

A small increase of 249 tons is shown in London stocks at the end of August, 1915. Imports were 3,901 tons and deliveries were 3,652. Total imports for the eight months were 43,490 tons, and deliveries were 44,084 tons.

PARÁ AND MANAÓS.

Recent reports from Manaós indicate that arrivals in July and August of this year were large, and for September and October they are expected to be above the average. If a large crop should be realized and exchange remain at a low figure, it would mean a prosperous year for the Amazon valley. With exchange at 12d. (24 cents) as compared with 16d. (32 cents) the rate before the war, the Amazon exporter can do business at remunerative prices.

Receipts at Pará were 2,245 tons in August against 1,290 tons in July and 1,620 tons a year ago. The total for eight months was 24,575 tons against 25,610 tons. The decrease was entirely in cauchó. The Amazon crop year ended June 30, and 35,305 tons were produced against 39,115 tons in 1913-14, a decrease of 3,810 tons. The difference is due to the falling off in the output of cauchó.

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows:

"The same easy conditions have prevailed in the money market during September as for several months previously, and the demand for paper has been good, both from banks in this city and elsewhere, the best rubber names being taken at 4@4½ per cent., and those not so well known 5@5½ per cent."

SINGAPORE.

Guthrie & Co., Ltd., report [August 11, 1915].

The record quantity of 296 tons catalogued for the auction held today met with a fairly steady demand, about 160 tons changing hands.

Fine pale crepe was again wanted, the top price of the sale viz: \$133, being paid for one very fine lot. Fine ribbed smoked sheet sold up to \$130, a decline of \$2. Plain smoked sheet was unchanged for the week, all parcels offered being readily taken.

The lower grades, with the exception of dark crepe, marked declines of from \$1 to \$6.

The demand for scrap was better than for some time past, virgin and pressed marking substantial increases.

The following was the course of values:

	In Singapore Picul,*	Sterling equivalent per pound in London.	Equivalent per pound in cents.
Sheet, fine ribbed smoked	\$128@130	2/ 5 1/2 @ 2/ 6 1/2	66.56 @ 61.32
Sheet, fair to good ribbed smoked	126@127	2/ 5 1/2 @ 2/ 5 1/2	59.80 @ 60.05
Sheet, plain, smoked	119@127	2/ 4 @ 2/ 5 1/2	56.76 @ 60.05
Sheet, unsmoked	112@120	2/ 2 1/2 @ 2/ 4 1/2	53.72 @ 57.27
Crepe, fine pale	130@133	2/ 6 1/2 @ 2/ 7	61.32 @ 62.84
Crepe, good pale	123@129	2/ 4 1/2 @ 2/ 6 1/2	58.53 @ 61.06
Crepe, fine brown	119@126	2/ 4 @ 2/ 5 1/2	56.76 @ 59.80
Crepe, good brown	113@119	2/ 2 1/2 @ 2/ 4	54.22 @ 56.76
Crepe, dark	109@117	2/ 1 1/2 @ 2/ 3 1/2	52.50 @ 55.75
Crepe, bark	98@113	1/ 11 1/2 @ 2/ 2 1/2	47.64 @ 54.22
Scrap, virgin	83@104	1/ 8 1/2 @ 1/ 10 1/2	41.30 @ 50.42
Scrap, pressed	90@ 91	1/ 9 @ 1/ 10	44.34 @ 44.85
Scrap, loose	80@ 94	1/ 7 1/2 @ 1/ 10 1/2	40.29 @ 46.12

* Picul = 133 1/2 pounds.

Quoted in S. S. dollars = 2 1/4 [56 cents].

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official cablegram received from the Colonial Secretary, Singapore, announces that the export of plantation rubber from the Straits Settlements during the month of August amounted to 2,295 tons, as compared with 2,324 tons in July and 1,325 tons in the corresponding month last year.

The following is a comparative table showing the export for three years:

	1913.	1914.	1915.
January	784	1,181	2,576
February	743	1,703	2,741
March	898	1,285	2,477
April	762	1,548	1,978
May	814	1,309	3,588
June	812	1,480	2,349
July	1,120	1,584	2,324
August	1,315	1,325	2,295

Total

These figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements, such as Borneo, Java, Sumatra and the non-Federated Malay States, as well as rubber actually exported from the Colony, but do not include rubber exports from the Federated Malay States.

THE RUBBER SCRAP MARKET.

THE first two weeks of September witnessed a rather colorless rubber scrap market that reflected the dullness of the crude rubber position. Business was quiet in all grades of scrap and the only interest in evidence was centered in boots and shoes. There was an acknowledged scarcity of stocks and the mills came into the market for small lots in order to try out the claim of short supplies. Sales of boots and shoes were reported at 7¼ cents, and several large orders were reported at 7½ cents. The balance of the list exhibited little change worthy of record, and traders appeared to be waiting for the expected September buying movement.

During the last week of the month, the market developed a much stronger tone and boots and shoes advanced under good demand. Several lots were disposed of at 8½ cents and heavy buying was reported in one instance at 8 cents. Inquiries for trimmed arctics developed sales on a basis of 6½ to 6¾ cents. However, actual buying appeared to be limited to certain mills. No. 1 white auto tires sold for 6½ cents under a good demand, while No. 2 were quoted at 6¼. Auto tires mixed were easy at 5½, and stripped and unguaranteed tires were quoted at 3½ cents. There was little interest shown in the other grades and prices remained practically the same as a month ago.

MARKET FOR COTTON AND OTHER FABRICS.

RAW cotton has advanced steadily during the month and prices have reached record figures. The upward movement is supported by active trading that has not been equalled since the outbreak of the war. The South seems to be in a favorable situation for handling the crop and the outlook for the southern planter is bright. It is predicted that cotton will sell for 15 cents by the first of the year.

SEA ISLAND COTTON.

The demand was sufficient, early in the month, to keep the Savannah market unchanged. Mills were bidding from one-half to a cent under quotations. During the third week Sea Island advanced under a general and active demand, and by September 25 sales of Floridas and Georgias were being made in Savannah and interior points at the following figures: Fancy, 23 cents; Extra choice, 22½ cents.

EGYPTIAN COTTON.

The latest news from Egypt is of an encouraging nature as decided improvement in crop conditions is noted in many districts. The new level of higher prices has been maintained with firmness, despite the unfavorable trade reports and heavy stocks on hand. Late in the month the Alexandria markets followed

America's example by advancing. On September 23 the following prices were quoted: C. I. F. Boston, December shipment from Alexandria: Afifi, \$19.00 to \$22.25; Upper, \$16.13 to \$18.88; Nubari, \$19.88 to \$22.50; Sakelardies, \$20.63 to \$24.25.

FABRICS.

The cotton fabric market is advancing and prices are quoted with the understanding that new prices are being made every day.

The duck market is strong and heavy, buying orders are the cause of the rumor that mechanical ducks will be higher.

Tire fabrics are extremely active and a good volume of business is being done with the rubber mills.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

SEPTEMBER has been an extremely quiet month for the rubber chemical trade. Routine business has been normal and prices practically unchanged throughout the month. The rubber mills are apparently not inconvenienced to any great extent by the absence of German supplies.

The market for barytes has been quite steady and the scarcity of German grades has not affected the market, but has helped the consuming demand for domestic goods. The prices for pure white and off-color barytes have undergone no change since last month.

The market for chalk remains uncertain and forward shipments are extremely difficult to predict. Despite the difficulties in securing raw materials, the producers of whitening have not advanced prices.

Spot supplies of both domestic and foreign lithopone are difficult to obtain and domestic manufacturers appear to be sold up on contracts. The prices on both foreign and domestic grades are nominal. Zinc oxide continues to be in steady demand due to the regular call for deliveries on contract. New contracts are reported to have been made at higher prices, but the present list shows no change over last month. Zinc sulphide has advanced to 7½ cents.

Crimson antimony is to be had in limited quantities at prices varying from 80 to 85 cents per pound, while limited supplies of golden are quoted at from 60 to 70 cents—both quotations being nominal. Black hypo is only to be obtained in small lots and several dealers have reported that there was none to be had at the present time.

The pig lead market developed a strong tone during the closing week of the month and predictions of higher prices were heard. White lead, red lead and sublimed blue lead, however, have not changed in price since last month, in spite of the upward tendency of the raw material.

Dry colors have been in good demand and prices are holding firm at the unusual levels established by war conditions. Domestic production is not yet far enough advanced to affect the market. Soluble aniline oil colors have advanced to \$2.50 per pound, showing an increase of 50 cents over last month.

The solvents have changed but little. The output of benzol is constantly increasing and notwithstanding the growing demand at home and abroad, the price is occasionally shaded from 85 cents to 80 cents a gallon.

SPAIN AS A MARKET FOR AMERICAN RUBBER TIRES.

Spain can hardly boast the good roads that some other European countries have, nor is the general level of wealth in that country particularly high, but at the same time a good many automobiles are used there and the number is constantly increasing. And while hitherto the tires for these machines have been imported from neighboring countries, the present difficulty in the way of continuing these importations makes Spain rather an inviting field for the American manufacturer. The auto. tires hitherto principally used in Spain have been the Michelin and Le Gaulois, made in France, and the Prowodnik made in Russia. In addition, the Klein tire, manufactured in Spain, and the only tire of home manufacture, has been in considerable use. Some American tires, principally Goodrich, have also been sold. The preference for foreign tires is shown by the fact that the French, Russian and American tires have all commanded a price from 10 to 15 per cent. above that paid for the home-made brand.

There is no prejudice whatever in Spain against American tires, but it would be impossible for a manufacturer to get any foothold in that country unless he established an agency or branch office in Barcelona—which is the national center for the automobile trade—and then in addition had sub-agencies in several of the larger cities which could draw their supplies from the Barcelona store.

It would be necessary to have a selling force able to speak Spanish, or, at the least, French, a language with which the more pretentious business men are familiar. Then of course it would be necessary to do more or less pioneer work in order to make any headway against the brands already established in that country. The European tire makers resort to considerable general advertising, using the newspapers, bill-boards, theater curtains and the other means of reaching the public generally which are familiar to all large advertisers.

The tire size most generally used is 815 x 105 millimeters, corresponding closely to 32 x 4 inches. The Spanish tire, the Klein, retails in this size at \$26.40 for a plain casing, and \$7.40 for an inner tube. Other sizes sell at proportionate prices.

The Spanish customs duty on all pneumatic tires, including automobile tires, is 270 pesetas (52 cents) per kilogram of net weight (2.2046 pounds). On solid tires, including tires for horse-drawn vehicles, these duties are 1.20 pesetas (23 cents) per kilogram of net weight.

Carriage tires of rubber are also extensively used in Spain, especially for such types of vehicles as broughams, Victorias, landaus and dog-carts.

AEROPLANES ARE IN DEMAND ABROAD.

During June and July of the present year Great Britain imported from the United States aeroplanes valued at \$765,544. Italy imported aeroplanes worth \$10,105, and Mexico imported \$3,535 worth of flying machines during the same period.

THE NEW EXPORT TAX ON CEYLON RUBBER.

THEORETICALLY, the English mind is strongly addicted to the doctrine of free trade—the import and export of material and merchandise without barrier or burden. But theories bend to conditions, and as the times are very much out of joint the Colonial authorities of Ceylon decided early in October to place an export tax of ten shillings per 100 pounds, or 2½ cents a pound, on all rubber leaving their ports. This action came as a distinct surprise to the rubber importing trade of the United States and its immediate effect was an advance in price of plantation rubber, followed by a lesser increase in the price of Brazilian sorts.

One cause assigned for this new levy was labor difficulties on the plantations arising from the recent riots in some of the Eastern cities; but probably the underlying reason was the financial pinch felt in British administrative circles, both at home and in the

colonies, in unison with all the other belligerents. This urgent need of revenue is likely to be a chronic condition among the warring nations, at least for some time to come, and as a consequence imposts that are placed on commerce now may be looked upon as there to stay for a considerable length of time.

But the most interesting question is, who will have to pay this extra 2½ cents per pound? The customer? If so, the importers, manufacturers or consumers, or all three combined, of the United States will have to bear at least one-half the burden. The rubber exports from Ceylon for the first eight months of the present year, omitting re-exports of rubber produced elsewhere, amounted to over 25,000,000 pounds. Nearly 40 per cent. of this was shipped direct to New York. Undoubtedly another 15 per cent., which went to London, later found its way to American ports. It will be safe to estimate the total exports for the year at 40,000,000 pounds, over 50 per cent. of it coming, first or last, to the United States. So that if the customer pays the tax, our contribution for the year would amount to over half a million.

But in the present condition of the market, with the abundant supply of rubber, the customer is not likely to bear very much of this burden. In fact, he appears already to have shifted it back upon the producer. For though the price of plantation rubber advanced 1½ cents a pound on the announcement of the tax, in less than three weeks' time this entire advance had disappeared and Ceylon rubber was being offered at the same figures as before the imposition of the tax.

There is no assurance, however, that the consumer may not feel the effect of this tax later. The exigencies of the war will call for more and more revenues, and it is quite within the possibilities that this initial tax of 2½ cents per pound may be materially added to, as necessity arises, and that other Eastern ports may also get the habit. It is quite conceivable under present conditions, and with no prospect of immediate peace, that Eastern rubber might ultimately be called upon to pay export duties equal to those of South America, for instance, where Manaos levies 18 per cent. and Para over 22 per cent. In that event, the producer could hardly be expected to bear the burden alone. His offerings would certainly decrease, prices would advance, and the consumer would either have to shoulder some share of the burden or else be content with decidedly smaller supplies. Of these two alternatives he would undoubtedly accept the former.

WILL THERE BE A "DUMPING" OF RUBBER GOODS?

MANY reports have come from Washington of late to the effect that our statesmen, now scattered abroad over the country but soon to re-convene at the national capitol, are considering the possible effects upon the American market of the cessation of hostilities across the waters. A considerable number take the attitude that Europe will be in such dire straits, and it will be so necessary for her to rehabilitate herself industrially that she will be willing to forego all profits and all luxuries, and even the comforts of life, in order to reopen her factories and find purchasers for their products. As a consequence, they fear a great dumping of cheap European goods on the American market.

Others take an opposite view and maintain that when the war is over Europeans will be so exhausted in men, morale and material that they will be totally unable to compete with the healthy economic conditions which obtain in this country, and that American manufacturers will have nothing to fear from European products.

Probably both of these extremes are wrong. Undoubtedly the truth lies in some middle ground. There is no question that Europe will be in a very sad state industrially and that she will bend every energy towards re-entrance into her former markets; but that these efforts will be sufficient to flood the United States with extremely low-priced products seems hardly probable. It is likely, however, that in a short time after the conclusion of hostilities, American imports of European goods will equal, if they do not surpass their volume prior to the outbreak of the war.

How will this situation affect the rubber trade? In footwear and mechanical goods probably very little. In the tire trade and in hard rubber, druggists' sundries, clothing, sporting goods and toys the effect is likely to be more noticeable. For instance, after the enactment of the Underwood tariff, which reduced the duties on tires from 35 to 10 per cent., there was a noticeable increase in the imports of this article. During the first seven months of 1913 manufactured rubber imports into the United States equaled in value \$720,544. During the first seven months of the following year, after the new tariff had gone into force, these imports increased nearly 50 per cent., and, undoubtedly, had it not been for the war, imports of tires and the other kinds of rubber goods mentioned above would have continued to show a substantial growth in volume.

Accordingly, in view of the situation immediately antedating the European outbreak, it seems altogether reasonable to anticipate that when peace is restored there will be an increase in imports of rubber goods, which, while not necessarily alarming, will at least be worthy of attention on the part of American manufacturers.

THE GROWING RANKS OF RUBBER IMPORTERS.

IT was not so many years ago that a man with the normal number of digits could count the American importers of crude rubber on the fingers of one hand—with possibly some slight assistance from the other hand. Of brokers, pure and simple, there were still fewer. But all that has been changed. A fairly careful listing of the companies, firms and individuals now engaged in the pursuit of importing crude rubber into the United States shows their number to be 115, while of brokers there are 23; making a substantial total of 138. This growth in the number of the importers' ranks is certainly a noteworthy feature of the general development of the industry.

To be sure, the manufacture of rubber goods in the United States is vastly greater now than it was a few years ago and the importation of crude material naturally is much larger. By way of comparison, 20 years ago the entire value of the annual production of rubber goods in this country did not exceed \$75,000,000, and the annual consumption of crude rubber was not over 18,000 tons. The year 1915 will unquestionably witness a production of rubber goods exceeding \$400,000,000 in value, or over five times its value of two decades ago; while crude rubber imports will be close to 60,000 tons if they do not exceed that figure. But even so, with all this great general growth, the increase in the number of importers and brokers has been proportionately much more rapid and presents an interesting phenomenon.

AN OVERSEAS TRUST TO INSURE NEUTRALITY.

THE American Overseas Corporation, which bids fair to be in operation within a very few days, seems on the surface to be an excellent idea—so excellent, in fact, that it is surprising that it has not been suggested before; as it is a simple arrangement for avoiding the delay and irritation of the constant surveillance of American cargoes by the belligerent powers.

Briefly, the plan is to form an organization of large exporting and financial interests to guarantee that American exports shipped to neutral countries are in reality designed for neutral consumption. While the United States Government will not be officially responsible for the conduct of the enterprise it has, through Secretary Redfield, given its approval of the project and agreed to render it substantial assistance.

It is stated that the British Government is ready to give recognition and approval to this new movement. This is quite logical, as it would relieve the British authorities of a great deal of irksome police duty. Instead of being obliged to keep constant oversight over a large number of exporters, great and small, it will be able to deal with one responsible organization whose standing will place its good faith beyond question. While to American commerce it means a welcome relief from irritating interference, with not infrequently costly delays.

The Story of Gutta Percha—IV.

SOURCES CONTINUED.

IN the whole world there is no other article about which there is so much of lying, thieving and fraud as crude gutta percha. Cheating each other, cheating the ultimate consumer, is the chief vocation, the production of real gutta percha being quite incidental. As it arrives it is worthless for manufacture, and it is only after a prolonged series of cleansings that the free gifts of the simple forest people have been eliminated and the gum rendered fit for use.

The gatherer does not consider that he is cheating when he puts stones into the product he sells to the dealer, who cheats him in price and weight. It is only a trade custom. The Chinaman also has his trade customs and an amazing knowledge of the chemistry, physics and economics of adulteration and cheating. As the supply grows less, the mixture of water, dirt and inferior gums grows larger. There is a

great variety of sorts of gutta percha in the eastern markets, all known by Chinese or native names and differing from each other chiefly in the manner of their adulterations. Dr. Sherman took a specimen of the pure gum to a Chinese dealer and asked him what kind it was. The latter said that it was a new kind to him and that he guessed no Chinaman had made it—which was a good

guess. These traders pay the native gatherers of the more remote districts about three cents a pound for their product, giving in payment "traders' goods" of quite as honest quality as the gutta percha which comes from their adulteration studios. The problem of their regulation or suppression is one which imperatively confronts all the governments having lands with gutta percha forests.

EXPLORING FOR GUTTA.

The first supplies of gutta percha naturally came from the Malay Peninsula, but with the increasing demand, Sumatra, just across the strait, soon began sending its gum. Further and further away the traders reached. In a few years all the great trees in readily accessible districts had been hacked down and supplies were coming from far afield. As the young trees grew to maturity, they fell under the axe and, for all practical purposes, the gutta percha tree ceased to exist in the localities where it was earlier known. From further and further away the supplies came, for, as the gatherers were forced to go further into the interior, the natives

of the outer periphery were roused to begin the destruction of the trees of their own forests. So the stream steadily flowed into and from the shipping ports and fatuity declared that this was sure proof that the forests were inexhaustible and the supply would always keep pace with the demand. Borneo was soon drawn upon—the last of the great reservoirs was tapped. But in the early eighties the insistence of men who declared that destruction without renewal could not forever go on aroused the French, British and Dutch governments to try to learn something about this mysterious reservoir of gutta percha, from which for forty years the world's supply had been ceaselessly drawn.

France was first in the field in the person of M. Seligmann-Lui, who, in 1881, was sent by his government to explore the gutta percha country for trees and then look for more of the same kind in the neighboring French possession of Cambodia

and French Cochinchina. This expedition proved that gutta percha trees cannot be had by wishing for them, and French Indochina had to continue without native gutta percha forests. But M. Seligmann-Lui gained much valuable information about the habitat and characteristics of the gutta percha-producing trees.

The expedition of Mr. Leonard Wray, Jr., who thor-

oughly explored the Malay Peninsula, not only placed important botanical material in the possession of the establishment at Kew and in the Indies, but contained illuminating information as to the wasteful manner in which the collection was made and the amount of gum left to decay in the fallen tree.

The last of the historic expeditions was perhaps the most important of all—that of Dr. W. Burck, of the Dutch Colonial Service, who, at the time he started, late in 1883, did not know of the expeditions of M. Seligmann-Lui and Mr. Wray. He was a thorough botanist and his painstaking studies were embodied in a monograph on the *Sapotaceae* of the East Indies. He pointed out that the genus known as *Dichopsis*, having been separated from *Isonandra*, was identical with the genus described, as *Palauquium* by Father Blanco in his "Flora of the Philippines." His researches and conclusions have come to be regarded as the final word as to the botanical characteristics and distribution of the gutta percha trees.

In 1912, Herr Rudolph Schlechter, of the German colonial em-

STARTING A GUTTA PERCHA PLANTATION, BURIT TIMAH, SINGAPORE.

mittee, exploring the north coast of Kaiser Wilhelm Land—the German section of New Guinea—spent several days in travel through dense swamps, toward the Bismarck mountains. Near the Goldfields station they found gutta percha of good quality. They felled some large trees which Herr Schlechter identified as a species of *Palaquium*, the product being equal to, if not identical with, the product known to the Malays as "getah taban merak," and belonging to the best type of gutta percha. The material found had the same reddish tinge as that seen in Perak.

At the time of the American occupation of the Philippines, and for several years later, all works on gutta percha made the specific statement that no gutta percha-producing trees had been found in those islands. Yet, for twenty years, at least, exportations had been going on. The trade had almost stopped, however, because the gum had

been so debased by the Chinese adulterators that the usually none-too-particular post dealers had revolted, and would have no more of it. Immediately after the Americans assumed control, the gathering and export were resumed. In 1900 the government learned that the wild natives of Mindanao were engaged in cutting down the gutta percha trees at a rate which meant their speedy extermination. To get at the real facts they dispatched Dr. Penroyer Sherman, Jr., who made a thorough exploration of the islands, reporting on the botanical and economic aspects of the matter. He found gutta percha-producing trees in large areas of Mindanao and a few in other localities, including some small tracts in Luzon. There were nine species of *Palaquium*, but none of *Palaquium gutta* or its sub-species. It was, indeed,

in the "Flora of the Philippines" that *Palaquium* was first named. The valuable *Payena Lerii* was also found, and furnishes a considerable part of the exports.

AT LAST, MODERN METHODS.

Although these expeditions did not result in the discovery of new and untapped "inexhaustible" forests of gutta percha trees, they gave much-needed light on the methods necessary for the finding of future supplies of the indispensable gum. It was realized that there was a distinct anomaly in gaining a necessity for the greatest triumph of modern civilization by methods which it

were base flattery to describe as paleolithic. Nature had spent fifty years in building up a beautiful tree, which has the mysterious power of making the much-prized gutta percha. A naked savage cuts it down and leaves it to rot, draining out a pound of gutta percha, and leaving forty times as much to go to waste. He mixes a little dirt and water with the gum, sells it for a few cents to a dealer, who adds his own sophistications, and passes it along on its way to civilization. And for this destructive work the people who are most interested in preventing it pay ever higher and higher premiums!

There are evidently three

ways in which to meet the problem of conserving the supply. One is the protection of the remaining forest trees; another is better means of collecting, and a third, the cultivation of the plant. All three methods have been undertaken by the Dutch authorities of the East Indies, and probably in time to avert a real disaster in the failure of the supply. The first is the one which most naturally occurs to the student of the problem, but

GUTTA PERCHA NURSERY.

GUTTA PERCHA PLANTATION HEADQUARTERS, JAVA.

it is hedged about with great difficulties. The native of the back districts knows only the law of the jungle, which is not the same as that of the colonial office. Those who know how bitterly the pot-hunting classes of civilized lands resent the

enactment and enforcement of necessary game laws, may have some faint idea of what the native of the forest, a hundred miles from the nearest white station, thinks of a law which says that he shall not cut down the tree which no white man ever has seen or ever will see. The tree is there, the Chinese dealer is convenient, and he needs the money. Forest laws are highly desirable, but only the most impossible optimist will see in them any effective correction of existing conditions. Laws forbidding export will do something, but where there are thousands of miles of coast line, with innumerable coves sheltering the craft of a race of born sailors, it will be seen that this plan also presents difficulties.

In the matter of collection it is obvious that the industry of deliberate adulteration with either dirt or inferior gums is not one to be encouraged. The one sure way to suppress an undesirable commodity is to destroy its market; and it is a question whether the time has not arrived when importing countries should not take steps to abate the adulteration nuisance. If all gutta percha arriving at the ports of the consuming countries were subject to analysis and refused admittance, when too outrageously sophisticated, the dealers in dirt would begin to learn their trade over again. It cannot be left to individual buyers to reject the debased commodity. Competition will always defeat any plan of that kind. If undertaken by the governments, every effort should be made

to prevent any country from trying to gain an advantage in trade by offering an open market to the outlawed adulterations refused by other ports.

The economist must weep when he sees a great tree cut down

for a handful of gutta percha, and weep again when he sees three per cent. taken away and ninety-seven per cent. left to decay. The first consideration is whether the gum may not be secured by tapping, leaving an uninjured tree to produce further supplies. The answer is that it can be so obtained, but not by the irresponsible wild gatherer. The native does not know how to tap the trees, and does not

want to know. It is far easier and much less dangerous to fell the tree, and the yield is greater than that gained by tapping. If he undertook tapping with the tools he carries, he would kill the tree and get practically nothing for his pains.

Reform in this direction, while highly desirable, does not seem to promise much in regard to the remaining forest supplies. As in most if not all latex-producing plants, the characteristic product of the gutta percha trees is found in the leaves, as well as in the bark. As a matter of fact there is, weight for weight, about twice as much gutta percha in the leaves as in the bark, but obtaining it is not so simple a

matter. If a dried leaf of *Palaquium* be broken and the pieces carefully pulled apart, little white threads of gutta percha can be seen, and if a green leaf be broken, tiny beads of latex will appear like those on a dandelion or lettuce leaf. Early experiments, though carried on with a great deal of perseverance, failed to extract the gutta percha in satisfactory form, and a heap of gutta percha leaves was as a matter of practical

CULTIVATED GUTTA PERCHA TREES (4½ YEARS OLD) AT PANJINDANGAN.

CULTIVATED GUTTA PERCHA TREES AT TJIPETIR (*PALAQUIUM ORBICIFOLIUM*; AGE 22½ YEARS.

value very much like a clay bank containing thousands of dollars' worth of aluminum, which it would cost tens of thousands to extract. Physical and chemical processes both were tried with varying success, the chief chemical processes being the dissolving out with various petroleum products or with toluene, or with other re-ous distillates. By this means gutta percha of a high degree of commercial purity and low resin-content was obtained, but there were strong disputes as to its availability for cable purposes. It was maintained by some chemists that, notwithstanding the low resin-content, these resins were more detrimental than the larger proportion found in the ordinary commercial gutta percha. In the leaf gutta percha the resin is chiefly alkan, and it was claimed that a more nearly equal mixture of alban and fluavit, even in larger proportion to the amount of gutta, improved the dielectric and tensile properties. The earlier leaf gutta percha was also distinctly colored with chlorophyll, and "green gutta" was put down in the market as of distinctly inferior grade.

The mechanical production involves the comparatively simple process—on paper—of grinding and boiling the leaves. As a matter of fact, it was only after prolonged study and effort that the mechanical details were perfected and commercial success attained. This, however, has been done, and a large part of the future supply of gutta percha will certainly be of leaf origin. It is not likely, however, that leaf production will ever figure largely in the case of wild forest trees. To carry the necessary machinery to the forests, or to carry the leaves to the settlements, would not be an easily economical process.

It is, then, to the cultivated *Palaquium* groves that we must look, and that involves a good look ahead, for the "taban merak" is a slow-growing tree, and if "the man who plants pears, plants for his heirs," the same is even more true of gutta percha. But we, who are the heirs of all the ages, have reason to be glad that others before us have looked out for us, and, while most of us are selfish and short-sighted, there are in every generation a few who are wise beyond their time. One of these was J. E. Teyssmann, who, in 1856, procured the planting of some trees of "taban merak" at the residency gardens at Buitenzorg, of which he was curator from 1830 to 1869. From the few trees then planted will come a far greater part of the world's future supply than from all the countless millions then standing in the "inexhaustible forests," which short-sighted persons were engaged in exploiting. These furnished the stock of the gardens planted at Tjipetir, in Java. From these gardens will come the stock of most of the future gutta percha plantations of the East Indies—that is to say, of the world.

The plantations are on the south coast of Java, and are situated at an elevation of 1,700 feet. The first planting was made under the supervision of Dr. Burck. There are now about 2,500 acres under planting. At the beginning the trees are planted four feet apart each way. After three years they have grown so that thinning must be resorted to, and the leaves and

young twigs are utilized for the production of gutta percha. From this time on, the proportion of gutta percha obtained grows greater, and from a mature plantation it is believed that there can be had about one hundred pounds to the acre. Of this, about three-fourths would be from the leaves, while one-fourth would be obtained by tapping by the herring-bone method. If the leaf-gutta lacks in any degree the qualities of that obtained by tapping, it is at least superior to most of that which comes to the market, while for purity and evenness of standard, that obtained by tapping on plantations is, of course, unequalled.

At prices paid in recent years for the best qualities a yield of at least \$150 an acre for a long series of years is one which could easily be anticipated.

Wireless telegraphy is invaluable in providing communication with ships at sea, and it is highly useful in supplementing cable communication. But, so far as the demand for gutta percha is concerned, it is likely to make for its increase rather than otherwise. For the wireless, being much less capable of monopolization than cable communication, tends to set a limit to the price which can be charged for messages. On the other hand, for long distances, the cable can be operated more cheaply. The wireless keeps down the rate. The cable company bids for business at lower rates. Lower rates mean more messages; greater facilities; more cables, more gutta percha.

Gutta percha species of various sorts have been planted here and there through the Malay peninsula. Experiments conducted by the forest department in 1913-14 consisted in cutting off some sixty gutta trees at a height of about 15 feet and plucking from 50 to 100 per cent. of their leaves. These trees had put out new shoots and grown

new leaves five months after their mutilation and their appearance was quite healthy, proving that the growing gutta tree can be relieved each year of all its leaves without fatal injury.

In tapping experiments one thousand and thirty trees having a minimum girth of 18 inches produced a total of 469 pounds of clean gutta, or an average of 6.35 ounces per tree. In no case were the trees excessively damaged, most of them being only slightly tapped. Some trees measuring from 30 to 42 inches in girth produced as high as 11 ounces each, while 17 trees exceeding 42 inches in girth produced 1½ pounds.

The French Government also has planted with *Palaquium gutta*, *Payena Lerii*, and other gutta trees in Algeria, Madagascar, Martinique, Guadeloupe and French Guiana. The growth of these trees is exceedingly slow, and it is generally felt that private planters should not be expected to tie up their capital for so long a time, but that governments should do the planting.

The area that can be profitably planted with *Palaquium gutta* remains to be seen. Besides countries to which the tree is native there are—Java, where success has already been attained; probably the Celebes, the Philippines, the Moluccas and New Guinea; also Ceylon and the southern part of British India. Not improbably, also, certain localities in the corresponding latitudes of Africa and South America.

(To be continued.)

A CHINESE MORO TRADING BOAT AT MINDANAO FOR GUTTA PERCHA.

Rubber in the Service of Life Saving.

MOST of us have heard so much about the ordinary cork-filled life-preserver that we have generally come to look upon this material as the best thing for the service. This is a mistake. There is no denying the virtues of this buoyant bark, but it has its drawbacks. A cork-packed life-belt is bulky, and because of this fact a number of them require a good deal of space. Therefore, in most instances, we find these protective articles stored away in more or less inaccessible places. To get them out of the way they are put just where panic-stricken passengers will find it hardest to get them when the moment of peril arrives. Because of these circumstances, inventive cunning has been busy for years in seeking other forms of life-preservers, turning to different materials to solve the problem of compactness and buoyancy, together with greater accessibility in time of need.

It is an interesting fact that the first and also the last work in which Charles Goodyear interested himself had to do with life-preservers. In the winter of 1834, after an unfortunate career in the hardware business, Goodyear, who was then a young man a trifle over 30 years of age, visited New York on a business errand and happened to pass the New York store of the Roxbury Rubber Co. He had read quite a little about the wonderful success of the new rubber industry which had recently sprung into existence, and he went into the store to examine some of the rubber products manufactured by that company. His attention was attracted to a life-preserver. He examined it carefully and, with his quickness of perception he discovered that it was susceptible of considerable improvement. He went home and thought the matter over, and his ingenious mind soon suggested how the apparatus could be improved. He returned to the store hoping to sell his idea to the company.

The agent in charge of the New York business of the company was struck at once with Goodyear's ingenuity and hoped, as he had been able to make one valuable suggestion, that he might make another of infinitely greater value, so he took him into his confidence at once, and told him that they did not care to buy his improvement on the life-preserver, for the simple fact that the whole rubber business was on the verge of collapse, as the company had made up a great quantity of goods during the cool months of the preceding year and had distributed them quite widely, only to discover when the warm weather of summer came on that all these rubber goods—shoes, coats, life-preservers and all the rest—had a fatal tendency to melt. If Goodyear could discover some remedy for this difficulty, the storekeeper told him that his fortune would be made.

Thirty years later, after Goodyear's wonderful achievements, and after the great honors that the English and French governments had bestowed upon him, he was in London when he encountered the statement in some publication that twenty human beings were drowned every hour of the day. It made a deep impression on him, and he immediately fell into one of those moods of abstraction to which he was given when he was trying to solve some new rubber problem. He brooded on the matter so much that he was unable to sleep, and his wife, fearing the results of the continued strain, asked him to get his mind on some other subject and try to sleep.

"Sleep," he replied; "how can I sleep while twenty human beings are drowning every hour, and I am the man who can save them?"

It was Goodyear's hope to invent something that would effectually stop this great loss of human life by drowning. He sought to discover some way of converting into a life-preserver some customary article of apparel, like the hat, or coat; and he even sought to devise some sort of necktie that could be inflated and thus keep a person afloat. He thought that every detachable article on shipboard—every table, every chair and stool—ought to be so constructed as to serve as a life-preserver. Though he died before carrying this work to a thoroughly successful completion, many of his ideas were later embodied in sundry life-preserving devices.

About forty-five years ago, a few years after

Goodyear's death, an inventor constructed an all-india-rubber suit, which should not only serve to keep the wearer afloat but should provide sustenance for some time. For this purpose it had a receptacle sufficient to store a little supply of drinking water and another receptacle to hold food enough for several days.

Furthermore, the suit was so contrived that the wearer could fix himself upright in the water or recline on one side or the other, or on his back. With each suit was a paddle. The price was moderate. The practicability of the suit and its good wearing qualities under long and hard usage were demonstrated by the late Paul Boyton before the naval boards of all nations and under rigorously conducted tests made to interest the principal foreign and domestic steamship companies.

In an endurance test in Russia, Boyton, in his india-rubber suit with the receptacles for food and drinking water, remained forty-eight hours in the water, when the atmosphere as recorded by a Fahrenheit thermometer was 20 to 30 degrees below zero. The tests were carried out under the direction of Admiral Popoff and staff, and were highly successful. In the following winter,

CAPTAIN BOYTON ENJOYING AN OCEAN SAIL AND A CIGAR.

four men garbed in the Boyton pattern of life-saving suits made the round trip between Calais and Dover in cold and stormy weather with comfort.

We can verify many kindred performances by reference to the periodicals of the later "seventies." One of the amusement features for big excursion boats at that time was to go seaward, put Boyton overboard, and, after he had paddled about for a while to watch him prepare a hot meal for himself on the rolling waters.

The United States, the French and the British navies recommended the purchase of a few Boyton suits, but this encouragement was not enough to save the enterprise from disaster, and the investors lost the half million which they put in the project. It has been said that the main factor against the sale of the invention was the conservatism of ship owners, who considered the old life-preserver of cork and canvas quite good enough. This is hardly correct. It was not conservatism but economy that constituted the prime obstacle to adoption. A cork life-belt cost comparatively but a trifle, and where the crews were numerous and the passenger lists big, this phase of the matter made the supplying of Boyton suits impracticable. Indeed, the exigencies of "business" rather than the need of improved safeguards for travelers upon the water have generally prevailed, unless legislative enactments have forced changes.

It is a matter of common knowledge that life-boats have been carried for years without being put in the water, and cork life-belts have become virtually useless through dry rot in the course of years of non-use. Ship owners, therefore, have widely grown to look upon these protective facilities much in the light of waste-

ful expenditures—capital that they could have used to their own profit in other directions. Every conference dealing with safety upon the sea has met with no end of opposition whenever it undertook to declare certain things to be needful for the better security of travelers and crews. It is apparent, then, that the inventor must labor in the direction of economy and for the attainment of efficiency plus compactness. This explains the reason for so many of the life-belts and life-vests and -jackets that have come into being of late years.

LIFE-PRESERVING DEVICE OF FIFTEEN

YEARS AGO.

Consisting of Coil of Rubber Tubing with Mouthpiece.

Rubber has seemed the ideal material for most of these latter-day inventions, its elasticity permitting an article of small compass to be filled with air to provide the desired measure of buoyancy, while combining both water- and air-tightness. Some of our illustrations clearly indicate the general trend of these devices. In one case, we have a man inflating the annular folds of a rubber belt, and a modification of this idea is found in a double-walled waistcoat—the compartments being readily inflated by the wearer. Naturally, the man seeking protection in this fashion would wear the article of dress described whenever he ventured upon the water, and certainly there would be reassurance in knowing that it would not be necessary to rush for a cork life-

belt in the moment of danger and possibly not be able to reach it in time.

For a good many years the United States Life Saving Service, now merged in the United States Coast Guard, tested all sorts of life-saving apparatus of reasonable promise, and many of these have been and are extremely ingenious. One of them reported upon in 1890 showed plainly the pioneer influence of Boyton. This suit was of two parts—head cover and a one-piece garment for the entire body—not unlike a modified diving dress. The hood covered the head completely and had wire-gauze panels in the face for the admission of light and air and to enable the wearer to look out. The body portion was gathered in around the neck by a drawing-string, and the hood secured outside of this band. The suit was composed of rubber cloth, and for additional buoyancy there were rubber floats arranged on a belt to be fastened about the waist. About the same time an inflatable rubber belt, capable of being filled by means of an air bulb, was offered to the service for trial. The buoyant tubes were made of rubber.

The Bunsen life-saving and swimming apparatus was submitted for test in 1900. The life-preserver consisted of three rubber sacks encased in saten covers. The sacks were designed to be strapped about the body and to be inflated through small rubber tubes, which closed automatically by spring clamps. The swimming attachment consisted of umbrella-shaped propellers,

Copyright by Gorodess from Underwood & Underwood, N. Y.

AS THE EDLUND SUIT LOOKS ON THE WATER.

attached to the wrists and ankles by elastic bands. The idea was that the propellers would open and shut with the movements of a swimmer's limbs and thus propel him through the water. The official board, while recognizing the possible usefulness of such an equipment, considered the apparatus rather cumbersome and not susceptible of quick adjustment.

ONE OF THE EARLY
LIFE-PRESERVING
VESTS.

DONNING THE EDLUND LIFE-
PRESERVING SUIT.

The same year the Life-Saving Service had submitted to it the McNicholas life-preserver. This device consisted of a rubber sleeveless coat containing air chambers capable of being inflated by the wearer by means of air tubes. Leather flaps were attached to the hands and feet to aid the wearer when swimming. There was a mirror which could be elevated to a position perpendicular to the body to show the wearer while swimming upon his back any obstructions that he may approach. Two bags were attached about the waist, partly inflated to give them buoyancy, and designed to carry provisions and water. It was an ingenious device but not adapted to the requirements of the service.

Only a few years ago the Life-Saving Service examined the Rader life-preserver. According to the official report this affair consists of a vest or sleeveless coat, made of rubber-lined cloth, and provided with a number of air pockets capable of being inflated by means of a tube or mouthpiece that could be sealed by a screw valve. As will be seen, there is a persistent similarity of effort and general form present in most of these inventions. Today, the "Gieve" life-saving waistcoat, an English invention, gives us a modification of a combined garment for every-day wear and an inflatable rubber ring or belt. It is a good illustration of compactness, efficiency and readiness. The wearer has only to blow air into it through a small flexible tube and he is insured ample buoyancy for keeping his head and shoulders above the water.

One of the particular advantages of the rubber life-belt is that its proportions can be made such that it will not interfere with the motions of swimming while yet providing the needful sustaining buoyancy. With the cork life-belt, on the other hand, the thing is so bulky that it seriously hampers efforts towards self-propulsion, and the ultimate safety of the wearer may frequently depend upon his reaching some definite goal or point. So well is this matter of compactness recognized as a desideratum that in thousands of pleasure craft and in nearly all modern submarines—where space is decidedly precious—the life-preservers are made of rubber and are inflatable. In under-water boats this is particularly important, because the passages of escape are narrow, and men wearing cork life-preservers would find it extremely difficult if not impossible to get out of a sinking submarine through the average hatchway.

Possibly one of the most ingenious affairs of recent design is the life-saving handbag invented by John L. Edlund, a Norwegian. Ordinarily, this grip has the outward appearance of a handbag of goodly proportions, and can actually be used as such. But when turned inside out the thing becomes a one-piece garment made up largely

of rubber-lined cloth into which the owner can crawl and seal himself water-tight before jumping overboard. There is a dead-light fitted with a glass plate which permits him to look out, and a couple of valves in the top of the arrangement provide a way for the admission of fresh air. As one of our illustrations shows, a man weighing 160 pounds does not overtax the reserve of buoyancy; and by putting his hands in the hollow flippers it is possible for the occupant of this garment to propel himself through the water. Food and water sufficient for a number of days can be carried inside of this novel dress. The prime objection that can be offered to the equipment is that the bag on shipboard would be filled with things and probably stored in the owner's stateroom when urgently needed. In other words, it would be inaccessible if the vessel were sinking rapidly.

A somewhat kindred although not exactly similar life-saving suit has recently been invented by a German engineer, and for water tightness a rubber fabric is relied upon. In this case, the feet are not free to assist in self-propulsion, and in order to maintain the dress upright when occupied and in the water, a perforated metal bucket forms the lower end of the suit. The weight of this, when filled with water, keeps that part of the dress lowermost. The whole suit is packed in this can when not in service. A still closer return to Paul Boyton's outfit is that recently invented by Carl G. Walle, of Brooklyn, N. Y. He has a three-piece suit of rubber fabric consisting of a water-tight hood, a jacket, and trousers with rubber boots attached.

In order to bring the history of life-preservers down to the latest moment, mention should be made of a device demonstrated in New York harbor on the 16th of last month by Mr. Youngren, of Wyoming. This consists of a

FLOATING ON THE SEA IN THE YOUNGREN SUIT.

waterproof union suit of rubberized fabric which entirely envelops the body, fitting tightly, with an elastic band around the neck. Buoyancy is afforded by a belt which goes around the

waist and over the shoulders, made of kapoc, a new substance resembling cotton. In order to keep the figure in an upright position, 5-pound lead weights are placed at the feet. The outside pressure of the water naturally sends the air within the suit up around the neck and shoulders, making an additional agency for keeping the body upright.

The inventor believes that by the use of this suit the shipwrecked mariner may not only float for several days, but float in comparative comfort, having a supply of food and water. The latter is provided for by a rubber bottle attached at the waist outside of the suit and furnished with a rubber tube long enough to reach the mouth. The food is kept inside the suit and by simply slipping the elastic neckband up to the forehead the wearer can eat in dry comfort. The weight of the entire suit is 15 pounds, and it can be folded into comparatively small compass. The first of the two accompanying illustrations shows the wearer of the suit prepared for his plunge into the water, and the second shows him comfortably floating about on the surface.

To save persons from drowning has a twofold phase. The first, that of keeping them from sinking, has been the aim of the various apparatus we have already described in which rubber figures so importantly; but it is no less desirable that some ready means be provided for the recovery of those that have gone to the bottom and yet can be resuscitated if brought to the surface for treatment soon enough. The Germans have undoubtedly blazed the way in this latter effort, and the well-known Draegerwerk, at Luebeck, has evolved an exceedingly efficient and novel equipment for just such vital emergencies, and a great many of these are now in use abroad.

Hitherto in drowning accidents where the body has been carried out by currents or undertow, the only sort of rescue work has been by means of diving apparatus which, of course,

ment can be put on in a few seconds, gives the rescuer unlimited freedom of movement, and makes him independent of external air supplies for at least a half hour. The diver carries with him his own air supply in steel bottles filled with compressed oxygen, which regenerates the air confined within the helmet. In a general way in construction and operation this apparatus is similar to that used in rescue work in smoke and noxious fumes, which was described in detail in the issue of this publication for March, 1915.

After donning the Draeger outfit, the rescuer jumps into the water over the spot where the body is believed to be, and is immediately carried to the bottom by means of weights. He can move about till he finds the body. He then encircles it with a rubber belt which he inflates from a small steel bottle of compressed air. The body immediately rises to the surface and the rescuer, detaching his weights, rises with it. This apparatus is a part of the equipment of the crews on the German submarines, as was mentioned in the article on "Rubber's Vital Part in the Submarine," in the issue of THE INDIA RUBBER WORLD for last June.

The British have evolved an escape dress for a like service in submarines, and the well-known English firm of Siebe, Gorman & Co. is directly responsible for this development in which water-tightness is obtained by the generous use of rubber. Our illustrations suffice to give an excellent idea of this outfit and its working. Like the German Draeger dress, the English equipment is provided with a combined purifier and oxygen

THE SIEBE-GORMAN LIFE-SAVING
OUTFIT FOR SUBMARINE
SERVICE.

THE SIEBE-GORMAN APPARATUS AT THE SURFACE.
The wearer has inflated his buoyant belt and has opened the helmet face plate.

generator. A man so confined need not lack for fresh air for a considerable period. When the surface is reached, the wearer is able to inflate a flexible chamber which surrounds the jacket, forming a life-belt, and then he can open the glazed port in the front of the helmet and breathe freely from the atmosphere. Siebe, Gorman & Co. have supplied many hundreds of these rescue outfits for the British and other foreign services.

It would take a long list to cover the manifold forms rubber has taken in the effort to provide means to keep people afloat and to prevent their drowning. Many thousands of these are in use today. Besides these, other buoyant rubber devices are in continual use in the teaching of people to swim or in making it possible for them to venture into the water quite free from any risk.

If human ingenuity can accomplish it, Goodyear's dream of some device universally effective in saving human beings from drowning will yet come true.

THE DRAEGER APPARATUS FOR
RESCUING THE DROWNED.

necessitated a supply of air, from above the surface of the water, and consequently required a pumping crew. In most cases there was no such apparatus available, and even where it was it proved cumbersome and slow to operate, while naturally it greatly restricted the movements of the diver. The new Draeger equip-

What the Rubber Chemists Are Doing.

SOLUTIONED fabrics used in building automobile tire casings may be injured by action of sulphurous or sulphuric acid formed during the vulcanization process. Protection against this possibility may be secured by impregnating the fabric, previous to solutioning, with such salts as the double sulphates of zinc and ammonium, magnesium and ammonium, or acetate or carbonate of ammonium. The amount of these salts should vary from five to thirty per cent. of the rubber employed in the tire, and it desired may be added to the rubber solution as a compounding ingredient.

V. Cayla, in a recent issue of "Le Caoutchouc & la Gutta-Percha," writes on the use of sodium bisulphite in the preparation of plantation rubber.

The object of using bisulphite of soda is to preserve the light color of plantation rubber by retarding oxidation. The matter, therefore, does not concern smoked sheets, biscuits or fine hard Para, which are always dark in color.

Without the use of bisulphite, plantation varieties, after being prepared, frequently show grayish in color, more or less dark, sometimes with dark stripes on a lighter ground. This coloration is not due to the incorporation of impurities in the crude gum but to chemical modification. It is a much discussed point whether this modification has any effect on the rubber from the manufacturer's standpoint. It is a fact that lack of uniformity in appearance substantially depreciates the value of the rubber with purchasers, practically irrespective of other more important qualities.

The cause of this loss and inconvenience to plantation rubber producers was first overcome in the Federated Malay States by the addition of bisulphite of sodium to the rubber latex. Practically all the pale crepe is now so prepared. Plantation practice varies with circumstances. An authority, Mr. Barrowcliff, makes the following statement regarding the proportions of bisulphite employed: The minimum proportion of bisulphite that produces any effect on the color of the rubber is one part of bisulphite to 6,500 parts of latex. This amount gives fine crepe and sheet rubber. It corresponds with the addition of one half ounce per gallon of latex, of five per cent. bisulphite solution in water. Thin sheets with a strong tendency to oxidize and intended for smoking, and undiluted latex especially rich in rubber require an ounce of five per cent. solution to 3,250 of latex. Barrowcliff recommends, for the preparation of pale crepe, the use of one part of bisulphite solution in 1,000 of latex, although one part to 400 of latex may be used for the thinnest crepe. The presence of bisulphite in rubber impedes its drying; consequently in the preparation of thick stock small proportions only are employed.

B. J. Eaton prescribes two ounces of bisulphite to ten gallons of latex containing 15 pounds of rubber.

Vulcanization tests made in the Federated Malay States have shown bisulphite-treated rubber to be equal, not to say superior to that untreated. Manufacturers have, however, declared that rubber so treated loses quality and has a tendency to become brittle. These conclusions of the manufacturers are quite contrary to those published by Barrowcliff in 1912, who stated that bisulphite needed to be used only in small quantities and that it was entirely eliminated from the rubber.

Clayton Beadle, H. P. Stevens and Sydney Morgan, in their study of the effect of bisulphite in preparing rubber from latex, compared the properties of bisulphite-treated and untreated samples of rubber under identical conditions. They found very little difference between these samples, but proved that those treated with bisulphite were slightly superior to the others and concluded that bisulphite is excellent in its effect in obtaining uniformly pale rubber.

The inconvenience of using bisulphite is that the treated rubber dries rather slowly, requiring from two to three days extra. It is also more difficult to smoke. For this reason the proportion of bisulphite must be adjusted to the amount required to stop oxidation, and at the same time not substantially retard the drying of the rubber. Otherwise the formation of mildew will be facilitated, which means spotted rubber and other undesirable conditions. Therefore, each planter must experiment for himself to determine the quantity of bisulphite to add to his particular quality of latex.

Barrowcliff mentions that excessive use of bisulphite may cause formation of sulphuric acid, causing detrimental effects. This is not supported by the results of Beadle, Stevens and Morgan, who state that traces of sulphite are often found in rubber not prepared with bisulphite. They have also preserved rubber prepared with sulphuric acid for five years without noting any alteration, thus proving that the presence of sulphuric acid is not injurious to rubber. Bisulphite-treated rubber is unquestionably good and satisfies the demand for the lightest-colored rubber for specific uses. Color is not an indication either of quality or lack of quality.

NEW PROCESSES IN RUBBER MANUFACTURE.

METHOD OF PROOFING FABRICS.—United States patent No. 1,154,875, James Meade. First a light coating which is partially dried, and then a heavy coating on which second layer of fabric is pressed. The machine is described in this issue.

MAKING RUBBER BANDS.—United States patent No. 1,155,325, Thomas W. Miller, assignor to The Faultless Rubber Co. Rubber is molded in the form of a tube and vulcanized and then cut into bands.

MAKING SPONGY RUBBER.—United States patent No. 1,156,184, P. Schidrowitz and H. A. Goldsborough. (See THE INDIA RUBBER WORLD, July, 1915.) Coagulating rubber latex under conditions producing a porous or spongy coagulum and fixing the pores by vulcanization.

INSULATING COMPOSITION.—United States patent No. 1,156,452, L. H. Backeland, assignor to General Bakelite Co.

RUBBER PRESERVATIVE COMPOSITION.—United States patent No. 1,156,561, Samuel T. Smith.

VULCANIZING AND ATTACHING RUBBER.—United States patent 1,157,572, Frederick Moench. This process consists in applying a preliminary coating of rubber dissolved in a mixture of chloroform and gasoline, allowing the coating to dry, scratching the dried coating thoroughly into the face of the material and applying over it an unvulcanized rubber sheet coating; finally heating the rubber-coated article for an hour at 320 degrees F. for vulcanization.

MANUFACTURE OF A SEAMLESS RUBBER GLOVE WITH LINING OF EXPOSED ELASTIC FABRIC AND INTERMEDIATE LAYER OF ADHESIVE MATERIAL.—United States patent 1,157,646. Thos. W. Miller, assignor to The Faultless Rubber Co.

SUBSTITUTE FOR LAMPLACK.—United States patent No. 1,156,742, Bardon, Nichols & Brugiere. Ground burned rice hulls.

TUBULAR CORDS.—British patent No. 12,629 (1914); J. D. Tew, Akron, Ohio. A number of strands impregnated with rubber are twisted together in tubular form. (See August issue.)

IMPREGNATING TEXTILE FABRICS WITH RUBBER SOLUTION.—British patent No. 17,097 (1914); G. W. Beldam and A. U. B. Ryall. The fabric on a roller is immersed in rubber solution and is wound off on another roller, also immersed in the solution, passing on its way, across the surface of one or more perforated, revolving rollers or between two plane-surfaced, perforated boxes, to the interior of which rubber solution is sup-

plied under pressure. This treatment causes the fabric to vibrate, producing a movement of the threads with the effect of assisting the penetration of the rubber solution into the goods.

COLLOIDAL SULPHUR.—French patent No. 446,692; Lumière. Crystallized hyposulphite of soda, 125 parts, dissolved in 1,000 parts of water, is mixed with a solution of dextrine, 200 parts, in 1,000 parts of water. To 300 volumes of the mixed solution, 60 volumes of 22-degree hydrochloric acid is added. The colloidal sulphur precipitated from the hyposulphite is separated by filtration, dried and used promptly, for it depolymerizes rapidly.

PATENTED TREATMENT OF RUBBER.

CONCENTRATED RUBBER LATEX.—British patent No. 24,680 (1914); Samuel Milne. A Scotch inventor proposes to concentrate rubber latex for delivery to manufacturers. The purpose of this treatment is to obviate the tedious manipulations and expensive plant required to secure dry rubber from the latex by the usual methods. The evaporation is conducted either at atmospheric pressure or in vacuum, and is not carried to the point of coagulation. The concentrated latex, while hot, is placed in suitable air-tight vessels for shipment.

The latex, prior to, during or after evaporation may be treated with any suitable preservative to prevent decay. It may also be treated under pressure to destroy by suitable temperature any germs which may induce decay, the resulting rubber not being impaired by temperatures considerably over the boiling point, at which all harmful germs would be destroyed. Thus treated and packed, rubber latex may be kept for comparatively long periods without deterioration and, when required, is in a form suitable for immediate use for a great variety of manufacturing purposes, with or without the addition of water. It can be mixed with almost any material and applied in many ways.

The concentrated latex may be further treated or dried to produce rubber in the usual form.

POLYMERIZATION OF BUTADIENE.—British patent No. 17,253 (1914); A. Heinemann. Isoprene, or a mixture of isoprene and butadiene, is dissolved in an equal volume of acetone, and sulphur dioxide is passed into the cooled solution for about four and one-half hours, or until a white precipitate ceases to form. The saturated solution is allowed to stand for four days. The precipitate is then separated and washed with acetone. When dry it has but little strength, but when molded for four days under a pressure of 6,000 pounds per square inch, to expel the oily substances, the product possesses great strength, and has properties similar to gutta percha and balata. It can be vulcanized by heat without further addition of sulphur, yielding a soft product or one similar to hard rubber.

CAOUTCHOUC FROM ISOPRENE.—United States patent No. 1,146,253; A. Heinemann. A process for the production of caoutchouc from isoprene, by first passing a substance composed of oxygen through the isoprene while maintaining the latter at a low temperature and then heating the product for a time sufficient to effect polymerization.

LABORATORY APPARATUS.

IMPROVED ANALYTICAL BALANCE.

AT the recent National Exposition of Chemical Industries in New York, an improved direct reading analytical balance was shown which is attaining deserved popularity among analysts, who are prompt to appreciate its advantage over the ordinary balance, which necessitates a rider for fine weighing. The improvement is the use of a small chain so arranged that any proportion of its weight may be progressively added to or removed from the beam of the balance and the amount of this weight read directly. The use of this chain in lieu of fine weights and rider,

promises to revolutionize the design of delicate balances and their method of manipulation. Direct readings in milligrams and tenths are not only rendered possible by the device, but the time required to make a weighing is considerably reduced. The innovation is

due to the efforts of Christian Becker of New York, the well-known manufacturer of analytic balances.

To operate the new attachment a thumb screw at the side of the balance is rotated. This controls the position of a sliding block on a vertical graduated scale. The chain is suspended with one end attached to the beam and the other to the sliding block. Movement of this block adds more or less of the chain weight to the beam till balance is obtained. Altering the chain weight can take place while the beam is in motion and the weighing progress without interruption or opening the window of the balance. Milligrams are read from the long scale and tenths of milligrams by the vernier on the sliding block. The range of the chain weight is considerable. In one of the popular-size balances the chain will weigh from one-tenth milligram to 50 milligrams. By variation in the chain weight the graduated scale can be calibrated for finer or coarser weighing. The demand for the new balance is far in excess of the facilities of the manufacturers to supply it and demonstrates the prompt appreciation of the advantages offered by the radical departure in design. [Fimer & Amend, New York.]

RUBBER FILTER RINGS.

Two new forms of rubber filter rings for use with filtering crucibles are shown in the accompanying illustrations. One of these is entirely of soft rubber and the other of hard rubber

with soft rubber flanges (shown in the cross section). They are of special value where the unobstructed use of the entire sides and bottoms of porous filters is desired, as only about one-eighth of an inch of the upper rim is grasped in the ring. The device can be instantly applied or removed for cleaning and will fit any 60 degree funnel. It can be used with any filtering crucible on the market. [E. H. Sargent & Co., Chicago.]

New Machines and Appliances.

A MOTOR-OPERATED SCREWDOWN FOR CALENDERS.

CALENDER rolls require extremely accurate adjustment and are quite heavy. The result is the use of a hand-wheel screwdown mechanism which is geared very low and operated for a considerable period of time if the rolls are to be moved any distance. Whenever a calender is changed from frictioning to sheeting, it is necessary to drop

the bottom roll to have it completely clear the sheet of rubber which is delivered from the lower side of the middle roll.

Because the hand-wheel operating the screwdown mechanism must be revolved so many times and is an extremely tiresome job, calender operators drop the bottom roll barely enough to clear the sheet. As a result, a very considerable personal injury hazard is created, for there is a fair probability of a careless operator getting his fingers caught between the bottom and middle rolls. As a matter of fact, many accidents have occurred which were directly due to the hand-wheel.

The accompanying sketch on this page shows diagrammatically the manner of installing a motor screwdown mechanism. In this, the hand-wheel ordinarily employed is removed and a sprocket wheel for silent chain drive substituted. The motor screwdown mechanism is placed at one side and operatively connected with the sprocket on the screwdown shaft by a suitable length of silent chain. The usual clutch for selecting top or bottom rolls is retained. Two control pedals, one for opening, the other for closing the rolls, take the place of the hand-wheel. The improvement is a notable one and will at once be appreciated by all practical rubber men. The old hand-wheel with its slow, laborious movement and the ever present element of danger in its use, can now be consigned to the scrap pile. [The Cutler-Hammer Clutch Co., Milwaukee, Wisconsin.]

SOUTHWARK SOLID TIRE PRESS.

This is a belt-driven 200-ton hydraulic press for forcing solid tires on rims.

One point of superiority is that the lower table is movable and very much lower than usual, which makes the handling of the tires much easier; while in practice, two men can turn out much more work than with the older type of press. Another advantage is that the ram is brought down through the idle stroke with tank pressure, therefore no power is required for doing actual work.

The machine is controlled from a patented operating valve so designed that at any time the press is at rest—either on the up or down stroke—the water is automatically by-passed. This feature eliminates the safety valves against which the pump frequently had to operate on other types of machines. [Southwark Foundry & Machine Co., Philadelphia, Pa.]

THE SCOTT FABRIC TESTER.

This tester is known as the horizontal type and is designed for heavy work. It has two heavy cast-iron frames holding four solid steel bars $1\frac{1}{2}$ inches in diameter.

Resistance to the pull on the sample is obtained by dead weight and there are no springs to influence the test. The recording head is a one-piece casting rigidly fastened to the frame. The main shaft rotates in two frictionless ball bearings protected by dust caps. On this shaft is affixed a large metal drum having a finished surface 4 inches in diameter to receive a chain connecting with the head clamp. Attached rigidly to each side of this drum are two finished steel bars heavily riveted at their lower ends to form one solid unit. These double bars carry the resistance weights, which are iron and made in sections for convenience in handling. The capacity of the machine is determined by the number of weights placed upon the levers. Two

rows of graduations can be placed upon the dial, the outer row reading from G to any capacity desired up to 2,000 pounds. The inner row may be made to read from 0 to any capacity desired so that by removing certain weights a more delicate machine is obtained for lighter materials. Thus a machine for tire fabrics may be constructed with a total capacity of 800 pounds, and by removing part of the weights a machine of 400 pounds capacity may be had for tapes, braids, etc.

Attached to the frame of the machine are two steel quadrants, the upper sides of which are provided with machine-cut teeth. On the outer sides of the weight levers are six steel pawls of varying length which engage the rack teeth and hold the weight levers and dial pointer at the exact position of the break. A third quadrant without teeth is suspended from the frame and passes between the weight levers connecting with a long hand lever on the head end of the machine. To reset the weight lever and dial hand, it is only necessary for the operator to pull this lever.

The driving mechanism is enclosed in a heavy iron box supported on the frame. The main driving shaft extends through this box in a horizontal position and is provided at the back with a pair of 10-inch tight and loose pulleys and shipping mechanism to receive a 1½-inch flat belt. A hand-wheel, which may be removed when not in use, is fitted to the front end of this shaft for experimental and research work.

When it is desirable to drive by motor, a small gear attachment is used to replace the tight and loose pulleys, increasing the speed in a ratio of 3 to 1, thus enabling the drive to be made by a single belt direct from a one-quarter H. P. motor placed on the floor under the machine. [Henry L. Scott & Co., Providence, Rhode Island.]

THE NUTTALL FLEXIBLE COUPLING.

Flexible couplings have almost entirely replaced rigid connections between driving and driven shafts in rubber mill practice, because they eliminate the necessity of exact shaft alignment and cushion the shocks of starting and stopping heavy mills and grinders. The Nuttall coupling owes its flexibility to rubber.

The "Type A" coupling shown in the illustration is made up of two cast-iron spiders with interlocking arms which are separated by cylinders of rubber, held in place by two steel rings

that are locked in the arms of the spiders.

Power is transmitted through the rubber cylinders, compressing them and obtaining flexibility through their resiliency.

Its simple construction makes this type more desirable than ordinary couplings and the ease of renewing the rubber cylinders makes the maintenance cost very low. [R. D. Nuttall Co., Pittsburgh, Pennsylvania.]

THE NILSON TILTING WIRE REEL.

The saving of time and physical exertion in loading coils of heavy wire on reels was the inventor's object in designing the tilting reel.

The operator trips the lever with his foot and the upper part is gradually lowered until the wire-carrying section is within a few inches of the floor. The guards are removed from the prongs, the coil of wire up-ended and slid upon the carrier. The guards are then replaced and the set screws tightened. When the lever is released the loaded reel is easily returned to its upright position by the operator. It can also be adjusted horizontally to feed flat wire. [The A. H. Nilson Machine Co., Bridgeport, Connecticut.]

PROTECTION OF ALTERNATING CURRENT MOTORS.

In alternating current motor installations it is common practice to provide means for automatically disconnecting the motor from the circuit in the event of sustained overload. It is also usual, except in the case of some small motors which can be thrown directly on the line under load to cut the motor out of circuit when the line voltage drops to a certain predetermined percentage of normal.

To provide for both overload and low-voltage protection of alternating current motors up to 2,500 volts and 300 amperes, the General Electric Co., of Schenectady, New York, has developed a new relay for use in conjunction with the usual type of G.E. low-voltage release and which is shown in the accompanying illustration.

MACHINERY PATENTS.

PETER D. THROPP'S PRESS VULCANIZER.

THE vulcanizer to which this invention is applied, as shown in the illustration, is of the well-known vertical type used for curing the casings of pneumatic tires. The following description of the operation of the vulcanizer will explain the novel features of this invention.

Assuming the chamber 8 and platen 23 to be in their lowered position, the molds are stacked on the platen, and the stack is compressed against the head plate 17 by the ram 6. The auxiliary ram 11 is then put in operation, closing the chamber 8 against the head 3, where it is locked by the bolts 13. The steam, introduced through the inlet 13, impinges against the circular depression 21 in the plate 17, and is forced to travel therefrom through the grooves 16 and 19 to the outer portion of the head 3, and hence to the outer portion of the chamber 8. Upon reaching the outer portion, the steam passes down around the stack of tires 7, engaging the outer portions. When it reaches the bottom of the chamber 8 it is permitted to pass up through the holes 24 and 25 in the support 23, and thus come in contact with the inner portion of the stack of tires. Upon reaching the top of the vulcanizer it will again pass outwardly by way of the depression 22 and grooves 20, coming in contact a second time with the outer surfaces of the molds.

It will be seen that as long as the steam is admitted to the vulcanizer it will continue this cycle, thereby following a free and uniform circulation, and giving a uniform cure to the tires. The grooves 16, which are not in communication with the inlet

ts, serve as additional channels of circulation during the curing period. When the cure is complete, the steam is let off through the blow-out 26, the support 23 and cylinder 8 depressed, and the tires removed. [Peter D. Thropp, assignor to The De Laski & Thropp Circular Woven Tire Co., United States patent No. 1,152,993.]

NIPPLE BEAD FORMING MACHINE.

Beads on nipples, medicine dropper bulbs, finger cots and similar articles are at present formed by hand, or in a mold. Mahoney's invention provides means whereby this work may be done mechanically in a rapid, economical and accurate manner.

In the accompanying plan view, the bodies of the nipples *A*, which are unvulcanized, are molded on the forms *B*. As the heads *D* on the operating rods (not shown) are brought into engagement with the cam plate *E*, the forms are applied to the chucks *C*. Then as the chucks pass out of engagement with the cam plate, the forms are clamped in place and both the form and chuck are rotated so that the forming roller *F* is brought into engagement with the form. The action of the roller is to turn the rough edge of the nipple outwardly, thus causing it to roll upon itself and form the desired bead [J. L. Mahoney, United States patent No. 1,154,191.]

ROYLE'S MULTIPLE TUBING MACHINE HEAD.

This new tubing machine head is designed for the manufacture of a honeycomb pneumatic tube section for tires, as well as for multi-perforated tubes in general. In the side elevation of the machine *A* is the stock worm, *B* is the cylinder and *C* its jacket. The die *D* is held by the holder *E* and the tubular nut *F*. Into the web *G* of core bridge *H* is secured a gang of cores *I* with their tree ends extending to the outer end of the die *D*. Another gang of cores *J* is secured into the web of the other bridge *K*, their ends also projecting outwards to the die. The inner ends of the core members pass through holes in the bridge webs and are secured by nuts screwed on their threaded inner ends.

The core members of the two gangs alternate in such a manner as to bring the outer ends of the two gangs in the desired relation to one another to produce the honeycomb structure desired. A V-shaped opening, shown in the front elevation, is made along the inner side of the tire by locating a tapered projection *L* at the mouth of the die. This opening is serviceable in applying the casing and tube section therein to the rim. [Vernon Royle, United States patent No. 1,152,978.]

MEADE'S MULTIPLE SPREADING AND DOUBLING APPARATUS.

In the illustration *A* and *B* are two rolls of fabric. From *A* the fabric *N* passes upward to spreader *C*, and from the gage knife *D* receives a light coat of waterproofing. It is dried by steam coils *E* as it passes up and around idler rollers to another spreader *F*, where it receives a heavier coating. The fabric *O*, from roll *B*, passes through a doubling device *G*. Here the two

fabrics are pressed together lightly and at *H* a second doubling device brings the two layers of fabric together without endangering the exposed surfaces. The goods are then passed over the heating drum *I*, after which they pass under the hood *J* into an upward current of air. At *K* is another doubler where heavy

pressure is exerted on the goods, which then pass through the measuring device *L* and are wound on the core *M*. [James Meade, United States patent No. 1,154,874.]

OTHER MACHINERY PATENTS.

UNITED STATES OF AMERICA.

ISSUED SEPTEMBER 21, 1915.

1,154,419. Machine for applying cement to the margin of flexible material. William F. Lautenschlager, Cincinnati, Ohio.

ISSUED SEPTEMBER 28, 1915.

1,154,663. Schleroscope for testing hardness of materials. William F. Shore, assignor to The Shore Instrument and Manufacturing Co., New York.

1,154,737. Repair vulcanizer. William F. Stearns, Exeter, N. H.

1,154,843. Collapsible core. J. H. Coffey and J. H. Coffey, Jr., Toronto, Canada, assignors of one-half to Gutta Percha and Rubber Limited, Toronto, Canada.

1,154,964. Braider mechanism. Frank Bently, Watertown, Mass., assignor to Simplex Wire and Cable Co., Cambridge, Mass.

Reissue.

13,988. Soft metal mold. William Eggers, New York, N. Y.

ISSUED OCTOBER 5, 1915.

1,155,345. Smoothing and ironing insulated wire wrappings. Adolf Finckelstein, Charlottenberg, Germany, assignor to Siemens-Schuckertwerke G. M. B. H., a corporation of Germany.

1,155,909. Repair vulcanizer. Frank L. Gibson, Pender, Neb.

ISSUED OCTOBER 12, 1915.

1,156,096. Apparatus for treating plastic material. Raymond B. Price, New York, N. Y., assignor to Rubber Regenerating Company, a corporation of Indiana.

1,156,180. Pneumatic tire mold. William A. Robbins, Glen Ridge, N. J.

1,156,570. Collapsible core. Park E. Welton, Akron, Ohio, assignor to Katherine B. Welton, Akron, Ohio.

1,156,793. Repair vulcanizer. Abel Magri and Arthur V. Griffith, Port Washington, N. Y.

UNITED KINGDOM.

ISSUED SEPTEMBER 13, 1915.

12,207 (1914). Machine for covering wire, cord and elastic by winding. E. W. Cooper, 41 Condon Road, Coventry.

12,255 (1914). Knitting, weaving and finishing fabrics for heavy belts. Soc. Anon. pour l'Exploitation des Procédés Westinghouse-Leblanc, 7 Rue de Berlin, Paris.

476,259 (October 5). Improved compression molds. H. A. Wickham.

The Editor's Book Table.

REPORT OF THE INTERNATIONAL RUBBER CONGRESS AND Exhibition, Batavia, October 19-23, 1914. Published in English by Filiaal Albrecht & Co., Batavia, Java. (Cloth, 8vo., 297 pages. Illustrated.)

WHILE, naturally, this report concerns itself largely with rubber planting and will in consequence be interesting chiefly to planters, still it contains some chapters on other phases of the rubber industry which will be found of value to those whose connection with rubber lies quite outside the planting interests.

The 1914 Batavia Rubber Congress and Exhibition was the second of its kind to be held in Java, the former having been held in the same city in December, 1907. The first congress was held at a time when the rubber planting industry was practically in its infancy, when many important people still doubted its success, and when rubber planters worked more or less in the dark, searching to discover the best methods for cultivating rubber trees and preparing their product for market. The 1914 Batavia Rubber Congress and Exhibition was a demonstration of the tremendous strides that have been made by the rubber planting industry during the last few years.

It was originally planned to open the exhibition on September 8, but the war made it necessary to postpone the opening ceremonies until October 19, when the official inauguration occurred in the presence of His Excellency, the Governor-General of Netherlands India.

Owing to the war many foreign members, among them the editor of THE INDIA RUBBER WORLD, were unable to reach Batavia to deliver the addresses they had prepared for the occasion.

On the first day of the congress, following the inaugural ceremonies, debates were held regarding the selection of *Hevea* for plantation purposes; the diseases and pests of plantation *Hevea* and the significance of branching in young trees. Mr. G. F. A. Steenkamp explained the exhibits of the General Planters' Association of the East Coast of Sumatra.

Catch crops, mixed cultures, planting distance and thinning-out were discussed on the second day. These discussions were followed by demonstrations of scientific methods for testing rubber by J. G. Fol, chemical engineer attached to the Netherlands Government Rubber Experimental Station in Java. The third day of the congress was given over to the consideration of artificial manure, tapping and tapping methods, and the preparation of rubber. The fourth day witnessed the closing of the congress with the usual accompaniment of speeches and distribution of prizes. But before the closing addresses, Mr. Fol was again heard in a paper on scientific testing as opposed to empirical methods of determining the value of rubber.

All these discussions, conferences, lectures and addresses, together with the composition and decisions of the jury, are given in full in this report; also the papers which, owing to the war, could not be delivered at the congress by their respective authors.

THE INDIA RUBBER WORLD of JANUARY, 1915, gave a complete list of prizes at the Batavia Rubber Exhibition as well as Henry C. Pearson's paper on "What Rubber Manufacturers Want in Crude Rubber." Other papers, not delivered at the congress but published in full in the report are: "Science and Tropical Agriculture," by Dr. F. A. F. Went, of Utrecht, Holland; "Progress Made in the Investigation of Hereditary Transmission and Its Importance in the Cultivation of Tropical Plantation Plants," by Dr. Erwin Baur, of Berlin (reported in German); "The Present Status in the Production of Artificial Rubber," by Dr. Willy Hinrichsen, of Berlin (reported in German); "Short Resume of an Experiment in Period Tapping," by H. Wulf Walters, of Ceylon; and "Farming with Dynamite," by Harold Hamel Smith, editor of "Tropical Life."

RUBBER MACHINERY. BY HENRY C. PEARSON. PUBLISHED by THE INDIA RUBBER WORLD, New York. [Cloth 8 vo., 419 pages, 428 illustrations. Price \$6.00.]

The remarkable development of the rubber manufacturing industry has proved a great incentive to inventive ingenuity and mechanical skill. There has been a constant succession of new machines to meet the new problems of this rapidly growing branch of manufacture. Some of these have been tried and discarded as inefficient, while others have found a permanent place in rubber factories, albeit, in most instances changed and added to from time to time. To the invention of new machines and the development of old appliances, there has been no end. Yet, during the fifty years in which this process has been going on, no attempt has ever been made to tell adequately the story of this great mechanical development until Henry C. Pearson, editor of THE INDIA RUBBER WORLD, took up the task some two years ago. The results of these months of labor are given in this volume just from the press.

The book covers, in a general way, the whole subject of machinery used in the preparation of crude, compounded and reclaimed rubber. The first four chapters have to do with machines used in the basic operations of crude rubber washing, drying and compounding. And adequate mention is made of the important part cotton fabrics play in rubber manufacture and the mechanisms used in preparing cloth for coating.

The chapter on calenders shows the great advancement from Chaffee's crude machine to the perfected modern giant with motor-drive. The kinetics of washers, mills and calenders are fully covered in the chapter on clutches and drives, including the humanitarian safety stops.

Vulcanizers are given adequate space and generous illustration. General types are shown that have to do with curing by heat, steam, water, air, and electric, sulphur and ultraviolet rays; and also the cold cure apparatus for immersing the uncured rubber in a bath of chloride of sulphur or treating it to chloride of sulphur fumes. There are vulcanizing presses, screw and hydraulic, of the single and multiple ram type, with one, two and even seven platens. The enormous power and great capacity of the modern press vulcanizers described and illustrated reflect the insistent demand of the tire industry.

Tubing was formerly made wholly by hand. The author tells how the long, laborious process has been superseded by powerful machines that force the plastic rubber through intricate dies emerging in the form of tubes, solid tires, cushion tires and a great variety of mechanical rubber goods.

There are two exhaustive chapters on spreading, doubling and surface-finishing machines used in coating the surface of a sheet of fabric with rubber. The development from the original Hancock spreader to the present-day machine of accurate operation is shown by English and French, as well as American types. The vulcanizing of proofed fabrics by the electric, vapor and cold-curing processes—the methods and machines employed in impregnation and proofing and the final solvent recovery are fully described. Then follows the chapter on cement and solution making that shows the American, English and German advancement in this important part of the industry.

The first of the two chapters on extraction covers the apparatus used in separating rubber and gutta from shrubs, vines, roots and leaves. It includes guayule extraction and the German and French methods of extracting gutta percha from leaves, and is followed by desinuating apparatus.

How the vast quantities of rubber scrap are reclaimed and restored in useful form to the rubber manufacturer is concisely described in the two chapters on Reclaiming.

The great variety of instruments for recording and controlling temperature and pressure during vulcanization of rubber goods is given in detail. The book closes with a complete story in text, half-tone and outline illustration of the apparatus and machines used in the rubber laboratory; while the last, and to many the most important feature of this valuable book is the comprehensive and carefully prepared subject index.

HENDRICKS' COMMERCIAL DIRECTORY OF THE UNITED STATES for buyers and sellers. S. E. Hendricks Co., Inc., New York, 1915. [Quarto, 1,503 pages. Price 10 dollars.]

This commercial register was founded in 1891 and the present volume is its 24th annual edition. Attention has often been called in this department to the wonderful completeness of this monumental work and the accuracy with which the compilation is made. The present volume contains 1,503 pages. This is about 90 pages less than the edition of a year ago, but this does not indicate that there is less matter. On the contrary, the edition of a year ago has been revised with extreme care and everything eliminated from it that was not of a strictly current and useful character. So that while this present volume contains fewer pages than its immediate predecessor it has in reality quite a good deal of new information that has not hitherto appeared in this register.

Another pleasing feature of this latest edition is the fact that it is printed from entirely new type, which gives every page a clean and attractive appearance. This edition is also bound in leather instead of in cloth, as has hitherto been the case.

Probably most of the readers of this publication are familiar with this standard work, but to any who may not be it need only be stated that it is a complete register of practically every American industry, giving under a comprehensive system of classification and sub-classification the producers, manufacturers, dealers, and large consumers connected with all the important American industries, including railroading, engineering, contracting, architectural construction, mining, quarrying, and every line of manufacture. To show the completeness of the work, it might be added that the index alone, printed four columns to a page, occupies 147 pages.

NEW TRADE PUBLICATIONS.

AN ILLUSTRATED CATALOG OF CHEMICAL LABORATORY SUPPLIES.

AN illustrated, descriptive catalog of chemical and assay laboratory supplies (483 pages) bound in loose leaf covers, has been received from Eimer & Amend, 205 Third avenue, New York. The book is a series of special circulars or pamphlets fastened in adjustable covers. This form has been adopted pending the publication of a new edition of the regular bound catalog, which apparently must wait for settled conditions in the matter of foreign importations. In certain lines American-made substitutes are being supplied.

A MEMORANDUM BOOK FROM WOOD-MILNE, LIMITED.

Wood-Milne, Limited, of Preston, England, whose specialties are rubber heels, solid pneumatic tires and golf balls, have favored their friends and customers with an attractive little memorandum book, 3½ x 6 inches, or in other words just convenient pocket size. It contains the calendar for the present year and for 1916, a page where the owner can jot down certain personal matters like his telephone number, watch number, size of gloves, and other similar memoranda that is liable to escape one's memory, and, in addition, has several pages of general information, some of it useful chiefly to people in England, but the rest equally useful everywhere else. The remainder of the book consists of blank pages for memoranda, with a number of leaves specially ruled for an expense account. The pages are finished with a gilt edge and inserted in suede leather

covers provided on the inside with pockets for bills, stamps and tickets—together a useful little volume.

STANDARDS FOR RUBBER-COVERED WIRES AND CABLES.

This is a 126-page, illustrated manual published by the Underwriters' Laboratories, Inc., Chicago, for the benefit and service of users of rubber insulated wires and cables for electric lighting and power circuits. This manual, which appears to have been prepared with great care, describes in detail the system of label service of the Underwriters' Laboratories, the specifications and tests prescribed by the National Electric Code for rubber insulated wires and cables, the Laboratories' methods for testing rubber compounds used for such electrical insulations and their system of following-up and testing market samples of articles bearing their labels.

To facilitate the insertion of additional matter this manual has been bound in loose leaf form, a very obvious convenience.

"THE APPLICATIONS OF CHEMICALS IN THE PREPARATION OF RUBBER."

This pamphlet of 24 pages is from the pen of Dr. A. J. Uitéc, and is published in the Dutch language by H. van Ingen, Surabaya, Java. It treats of the different chemicals used in the preparation of rubber—coagulants, anti-coagulants and bleaching and disinfecting agents. A brief appendix describes some of the diseases and pests affecting plantation *Hevea*.

DISEASES AND PESTS OF THE HEVEA BRASILIENSIS IN JAVA.

This is a report by Dr. A. A. L. Rutgers and Dr. K. W. Dammernann of the work of the Department of Plant Diseases in the Netherlands Indies, published by the Department of Agriculture at Batavia, in the form of a paper-covered booklet, quarto size, 45 pages. It is published in Dutch and in addition to the text has a number of good-sized illustrations showing the effect upon the *Hevea* tree of the various diseases and pests described.

Like many trees growing far away from their aboriginal land, the *Hevea Brasiliensis*, in the plantations of Java, is subject to a number of more or less serious diseases affecting its roots, trunk, branches and leaves. Animal pests such as wild pigs, rabbits and crickets also cause considerable damage to plantation *Hevea*. The authors have made exhaustive studies of these diseases and pests, of their causes and remedies and the results of these studies are reported in this book, which is well illustrated by photographic cuts and should be of important service to rubber planters in the East.

GOODRICH NEWS SERVICE.

The news service department of The B. F. Goodrich Co. is publishing photographs, in the form of posters 13 inches square, of current events of general interest showing, incidentally, the wide use of Goodrich tires. These posters are furnished to Goodrich dealers, together with gummed strips for pasting them in their show windows. The size and topical interest of these pictures are sure to attract the attention of passersby and fix the Goodrich trade marks in the minds of those among them who are tire users.

A LEATHER CASE FOR A BUNCH OF KEYS.

The Somerset Rubber Reclaiming Works, of New Brunswick, New Jersey, has recently distributed a useful little souvenir in the shape of a leather cover for the bunch of keys which every well-ordered man carries. A feature of value lies in a metal check, stamped with a number, which is registered at the Somerset works. Should the keys be lost, they would naturally be returned to the company, which in turn would be able to locate the owner.

"Rubber Machinery," Mr. Pearson's newest book, filled with valuable information for rubber manufacturers, is now ready for mailing. Price, \$6.

New Goods and Specialties.

A RUBBER COMB WITH STAGGERED TEETH.

THOSE with scanty locks little realize what discomforts accompany the combing of heavy and curly hair with the ordinary comb. For the possessor of luxuriant locks, the "Climax" comb is an unmix'd blessing. The teeth of this comb are set in staggered formation, projecting alternately on either side, and at the base of each tooth there is an opening in the form of a large loop—thus securing a minimum of friction and allowing the comb to pass easily through the hair. The loop construction also makes the teeth more flexible and adds greatly to the strength of the comb as a whole. The manufacturers of the "Climax"

state that it is practically impossible to break this comb by use. [American Hard Rubber Co., New York.]

WEATHERPROOF CLOTHING.

To reproduce illustrations of all the new fall and winter styles in weatherproof clothing would require considerable space;

therefore only a limited number, by leaders in this line, are shown. Productions of several prominent manufacturers have been given a place in these columns during the past few months, but the collection would be neither representative nor complete if it did not include the styles shown in this number. These comprise a lady's coat of English tweed, in black and white or mixture.

and a man's coat of double texture material, both waterproofed by the "Kenreign" process. [C. Kenyon Co., New York.]

They also comprise the "Swithin" sport coat for men, from the stock of a specialist in this class of apparel. This coat is made of rubberized silk. The open plait in the back affords ease of movement in golf and other sports. [Abercrombie & Fitch Co., New York.]

CHURCH TELEPHONES FOR DEAF WORSHIPPERS.

With the aid of a simple apparatus recently devised the church-goer whose hearing is defective may now listen in comfort to the entire service, no matter where he or she may be seated.

A telephone transmitter consisting of three special microphone transmitter units in an ebony-finished case is mounted on the pulpit. The receivers in the pews are of the usual watch-case variety, with a lorgnette handle provided with a special sliding extension to vary

the length from four to seven inches—thus making them so convenient for use that they may be held to the ear for any length of time without fatigue.

A jack connected to the line leading to the transmitter is placed in the pews, and each receiver has a cord and plug. To make the instrument available, the plug is simply inserted in the jack. This telephone apparatus could be used equally well in the theatre or lecture hall. The receiver cap, handle, receiver case and mounting block molded inside of the case are made of hard rubber. [Western Electric Co., New York.]

DENTAL AND SURGICAL INHALERS IN NEW FORMS.

The greater success of present-day surgery is due not only to increased knowledge and skill on the part of the surgeon, but also quite largely to improved implements and appliances. Specialization in apparatus of this sort with an aim toward perfection has lately resulted in the introduction of two new inhalers used to produce analgesia or anesthesia, both of which are here illustrated.

The nasal inhaler is particularly suited to dental work. Besides the rubber tubing common to the general type, the nose-piece of this inhaler is made of soft rubber, and rubber pads are attached to a steel head band which adjustably supports the tubing and prevents it from dragging over the head. There are four of these soft rubber pads, two fitting across the forehead, as shown in the picture, and the remaining two forming a hollow in which the back of the head fits.

The soft rubber nose-piece can be adjusted to fit, air-tight, over any nose, and an adjuster strip makes it possible to bring any amount of pressure required against the face or to press back any desired amount of the upper lip, for work on front teeth. The inhaler, while durable, is simple in construction and can easily be taken apart for sterilization.

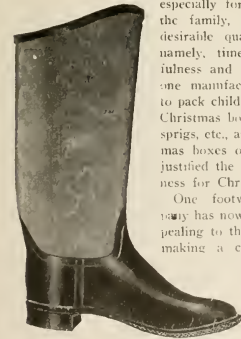

The surgical inhaler is intended for use where prolonged anesthesia is required, where it is desirable that the inhalation of atmospheric air may be controlled by the anesthetist. This inhaler has an air cushion of rubber which completely embraces the nose and mouth and which is made to fit air-tight by inflation. This cushion is attached to a transparent celluloid hood through which the patient's lips may be seen and any necessity for admission of atmospheric air promptly noted. The hood with its rubber cushion is so connected with the valve body that the position of the patient's head may be changed without lifting the mask from the face. [The S. S. White Dental Manufacturing Co., Philadelphia.]

A RED-LEGGED BOOT FOR SANTA CLAUS TRADE.

Some active mind in the rubber trade discovered some years ago that rubber boots made particularly good Christmas presents, especially for the younger members of the family, combining four eminently desirable qualities in Christmas gifts, namely, timeliness, usefulness, healthfulness and acceptability. Accordingly, one manufacturer after another began to pack children's rubber boots in fancy Christmas boxes ornamented with holly sprigs, etc., and the sale of these Christmas boxes of rubber boots thoroughly justified the belief of their appropriateness for Christmas-time.

One footwear manufacturing company has now gone a step further in appealing to the Santa Claus trade. It is making a child's boot with a black foot and a red leg of the watered silk pattern. This boot is called the "St. Nick," and, like others especially intended for holiday trade, will be packed in individual holly boxes. [United States Rubber Co., New York.]

A NEW CABLE FOR MOTOR-DRIVEN CONVEYANCES.

A leading cable manufacturer has just brought out a new line of armored cables for motor cars, motor boats and other motor propelled conveyances. The insulation of these cables consists of high grade rubber, varnished cambric and waxed and varnished

braids. The armor is in the form of a D-shaped brass wire ribbon or a galvanized steel wire wound closely around the cable. Other types have plain rubber insulation without braided coverings. [The Standard Underground Cable Co., Pittsburgh.]

NEW HYGEIA INVENTIONS.

Rubber nipples for babies' nursing bottles constitute quite an item in the annual sales of manufacturers of druggists' sundries, the demand being constant and regular. Hitherto the nipple has been the only part of the bottle to be made of rubber, but here is a new nursing bottle, the "Hygeia Cozy," the food receptacle of which is a collapsible rubber bag. This rubber food receptacle is surrounded and supported by an aluminum jacket open at the bottom for purposes of ventilation—which also gives support to the breast nipple, an other new nursing device brought out by the same manufacturers.

There is a hidden shield in the dome of the breast nipple, about its base, which makes it non-collapsible while freely yielding in all directions. It also has a short neck, which prevents the child from accomplishing what seems to be a baby's chief aim, strangulation while feeding. This nipple and the rubber nursing bag—which can be turned inside out for cleaning—in combination, form an innovation in nursing bottles and leave no excuse for lack of perfect sanitation in the matter of the baby's food supplies. [Hygeia Nursing Bottle Co., Buffalo, New York.]

PROTECTING THE CRICKETER'S KNUCKLES.

To be sure, the game of cricket does not enjoy the same vogue in the United States as baseball does, for instance, but still there are a great many cricket players in this country and naturally they want the same sort of equipment that the cricket players of England find indispensable. As a part of this equipment, the batting glove might be mentioned. This is made of white duck with elastic bands attached to the back of the glove and going around the wrist to insure a good fit, and having in addition rubber tubes running along the fingers and over the knuckles at the back of the glove to protect the hand from the occasional impact of the ball; for the cricket ball it must be remembered is a fairly hard commodity and to have it shot against the unprotected knuckles produces a sensation by no means agreeable. This batting glove obviates any such contingency.

Another highly desirable feature in the cricketer's equipment is a bat with an inserted layer of rubber through the entire length of the handle. The handle is split in the middle, a layer of rubber put in, then the whole wound with cord. This insert of rubber serves the excellent purpose of taking the sting out of the blow when the bat strikes the ball too near the handle or too near the end—something that is always liable to occur. [A. G. Spalding & Bros., 520 Fifth avenue, New York.]

GOLF BALL DESIGN.

The accompanying illustration shows the new design adopted by Eleazer Kempshall, famous golf ball manufacturer, for use on golf or playing balls.

HAIR TONIC COMB.

Those who hope by the application of tonics and restoratives to increase the natural beauty of their hair or to repair the ravages of time or other unavoidable natural conditions; also the aspirants to enhancement of personal charm through a change in the color of their hair, will find a convenient agent in the rubber comb here illustrated.

This is an all-rubber device, the teeth being hollow, so that when inserted into the liquid cup, a pressure of the rubber bulb causes the comb to drink up the liquid, to be later distributed by gentle pressure of the bulb as the comb is drawn over the scalp. [Montgomery, Ward & Co., New York.]

RUBBER BIRD AND GAME CALLS.

The rubber bird and game call is not a new article of manufacture, but it is certainly one of the most practical articles of its kind, for it is not affected by dampness; and the near approach of the season of its greatest usefulness makes mention of it timely.

The illustration shows a duck call made entirely of hard rubber. It has a sliding device by which the tone can be instantly changed, to imitate different kinds of ducks and to meet varying conditions of weather. It is known as the "O. K." call, retails at one dollar and will give unlimited service. [New York Sporting Goods Co., 15-17 Warren street, New York.]

RUBBER SHOCK ABSORBERS FOR THE EARS.

An ear defender is a positive necessity for protection against damage to the ear drums and deafness resulting from excessive air vibrations induced by heavy gun fire, shell explosions, etc. The illustration shows the form of this device furnished by the British government to its army and navy. The body of the defender is made of hard rubber, in a variety of sizes. Near the large end is a series of alternating discs of fine wire gauze, and a diaphragm of gold beaters' membrane. The latter stands free of contact, and is limited to the minutest motion by the gauze on either side of it. This instrument effectually protects the wearer's hearing by excluding violent concussions of air, and at the same time permits him to hear ordinary conversations. An ebonite tool for cleaning the open end of the defender accompanies each pair of instruments securely packed in a pocket case, in which they are held in place by rubber studs. [The Mallock-Armstrong Ear Defender Co., 86 York street, London, England.]

This is a new rubber sole, lighter than leather, of good wearing quality, and is not a perspiration inducer. These soles, three-eighths of an inch thick, are now being worn by policemen, motor-men and others whose occupation requires a heavy-soled shoe that is flexible and comfortable. [The B. & R. Rubber Co., North Brookfield, Massachusetts.]

THE ARMOR-TRED SOLE.

Dentists are using a jar for sterilizing their instruments. The top is fitted with a rubber ring like the ordinary preserve jar ring. [The S. S. White Co., Philadelphia.]

THE INTERCHANGEABLE RUBBER HEEL.

A western shoe manufacturing concern has brought out and is applying to all its shoes a new rubber heel that will help the wearer to walk straight and also to eliminate—or at least moderate—the cobbler's bill, for when he finds himself running down at the outside of the heel he can simply change that heel over

to the other shoe, bringing the worn part to the inside of the foot. The change is easily made and requires only a screwdriver for its mechanical execution.

This heel is made of tire rubber, with a metal insert that receives a similar metal plate nailed to the heel base of the shoe. A screw through these plates, in the center of the heel, holds the heel firmly in place. The heel is made in sizes to fit the various sized shoes, the plate in the heel corresponding in size to the plate in the shoe for which it is made. The line of shoes on which this new rubber heel is being used includes men's heavy work shoes, high boots for hunting, etc., and boys' shoes. [The Trolle Shoe Co., Racine, Wisconsin.]

FOOTBALL PANTS WITH ELASTIC BAND.

Of all athletic sports football is the most strenuous, and a costume facilitating freedom of movement, as well as, affording adequate protection against accident, is a prime necessity for the would-be player. Nose-guards, ear-guards, face-masks, etc., have been described in previous issues of this publication. In the football pants here illustrated a new feature, namely, a broad elastic band—as will be seen in the accompanying illustration—performs the double service of holding the thigh guards in the proper place and allowing greater freedom of movement than was possible with the old-style pants. The garment is made of fine, tan-colored khaki cloth, with a separate lining, to which the felt or padded drill hip pads and felt-lined thigh guards are attached, being easily removed to permit the lining to be washed. [Rawlings Manufacturing Co., St. Louis, Missouri.]

RUBBER COVERED SCREW DRIVER.

The application of soft rubber to the handles of small hand tools should meet with approval, for rubber handles have many advantages. A screw driver with the handle and stem covered with rubber is shown in the illustration and is an excellent example of molded rubber work.

Such a tool is indispensable to the electrician who works around electrical machinery, particularly the low voltage type. It is insulated and therefore proof against the carelessness which in the use of an ordinary screw driver frequently results in short circuits and considerable damage.

The rubber affords an excellent grip and also immunity from blisters. The exposed steel blade measures 3½ inches and the length over all is 11½ inches. [H. D. Smith & Co., Plantsville, Connecticut.]

The Scimatco laboratory tubing is "different from any other rubber tubing on the market." So says the Scientific Materials Co., Pittsburgh.

The Tire Trade.

THE MCGRAW COMPANY OPENS PACIFIC COAST BRANCHES.

At the annual meeting of the stockholders of The McGraw Tire & Rubber Co. held at the company's executive offices, East Palestine, Ohio, October 4, the following officers were re-elected for the ensuing year: E. C. McGraw, president; R. W. McGraw, vice-president; John Morgan, vice-president and treasurer; L. M. Keyes, secretary, all of East Palestine.

It was decided to establish direct factory branches on the Pacific Coast, at San Francisco, Los Angeles, and Portland, Oregon, under the district management of S. L. Warner, and the sales management of C. K. Whittaker, with headquarters at San Francisco. C. H. Connelly, heretofore Buffalo manager, will take charge of the Kansas City branch, while his former assistant, G. J. Marshall, will succeed to the management of the Buffalo store. R. G. Nelson, who has been connected with the McGraw sales department for the past six months, has been appointed superintendent of branches.

The company is adding new buildings of steel and brick to its plant at East Palestine which will give 800,000 square feet of additional floor space. It is also expending \$300,000 for new machinery.

UNITED STATES BICYCLE TIRES.

The United States Tire Co.'s 1916 line of bicycle tires includes 16 different styles of casings, most of which closely resemble in appearance the automobile tires manufactured by the company, such as "Nobby Tread," "Chain Tread," etc.

NEW TIRE FACTORY IN COLORADO.

The Dry Climate Tire Manufacturing Co., which was recently formed in Colorado with a capital of \$200,000, has started manufacturing operations at Arvada, Colorado, about 7 miles from Denver. This new tire manufacturing company expects in a few weeks to be able to produce 100 casings and 350 inner tubes a day. The factory as it now stands cost \$28,000 and \$35,000 of machinery has been installed in it.

BALTIMORE REGULATES USE OF SOLID RUBBER TIRES.

An ordinance of the city of Baltimore, Maryland, requires users of motor trucks equipped with solid tires to take out licenses for the use of these tires. This measure is intended to prevent users of trucks from running their machines with tires so worn and damaged that they injure the pavements.

A NEW NON-SKID TIRE CASING.

The accompanying cut shows a new non-skid tire casing, the feature of which is an exceptionally thick, heavy tread designed to combine the valuable qualities of suction-type treads with those of raised or studded types. Hence the designation "Universal Tread" which the manufacturer, the Michelin Tire Co., Milltown, New Jersey, has given this casing. The extra heavy, broad tread of special design, it is claimed, causes this tire "to stick to the ground" when the car is being started and when the brakes are applied, thus obviating slipping and the resultant friction which wastes substantial quantities of valuable rubber. Superior resiliency, perfect non-skid qualities and greater durability are the principal advantages claimed for this new casing.

"Rubber Machinery," Mr. Pearson's newest book, filled with valuable information for rubber manufacturers, is now ready for mailing. Price, \$6.

CAN BRAZIL BE PERSUADED TO LOWER THE TARIFF ON TIRES!

Early in October the secretary of the Rubber Club sent out a letter to the tire manufacturers calling their attention to the fact that while rubber boots and shoes entered Brazil under a 20 per cent. differential tariff, rubber tires enjoyed no such privilege, and suggesting that they make an appeal through the State Department of Washington to the Brazilian Government to have tires included under the differential tariff clause, in making up the revenue budget for the coming year.

GENERAL NOTES REGARDING TIRE MANUFACTURING COMPANIES.

The Luck Tire & Manufacturing Co., of San Antonio, Texas, is erecting a \$100,000 factory to manufacture the Luck pneumatic puncture-proof tires for automobiles. This tire was invented by John J. Luck, of San Antonio, and its qualities have been tested during the past eighteen months. It is stated that a set of tires has traveled 14,000 miles over some of the roughest roads of Texas.

The Republic Rubber Co., of Youngstown, Ohio, reports very satisfactory service from its solid truck tires. These are manufactured of a stock which resists the tendency to break and crumble by the heat developed under severe conditions of road use.

The Republic Company is marketing a new automobile tire of specially designed cord construction.

The salesmen and office force of the Philadelphia branch of the Goodyear Tire & Rubber Co. held a banquet at the Adelphi Hotel, Philadelphia, on the evening of October 15.

The plant of the Perfection Tire & Rubber Co. in Factory—the new factory addition to Fort Madison, Iowa—is rapidly nearing completion. The output of the factory has been contracted for by an eastern jobbing firm. The officers are: J. H. Christian, president; C. R. Cole, vice-president; D. A. Stickleman, treasurer; and L. A. Rockwell, secretary.

A new rubber plant called the Sebring Tire & Rubber Co. is under way at Sebring, Ohio, a building 60x190 feet with power house separate being in process of construction. The company's officers are as follows: H. D. Weaver, president; C. B. Smith, vice-president; William Stevenson, secretary; Ed. Stanley, treasurer; John Hotchkiss, manager.

The Punctureless Auto Tire Co., recently formed at Akron, has elected the following officers for its first business year: W. R. Price, president; D. A. Messner, vice-president and general manager; S. Arthur Messner, secretary and D. I. Evans, treasurer.

The United States Wheel & Tire Co., which for some time has been operating at Pierre, South Dakota, has been reincorporated in Illinois with a capital of \$300,000, to manufacture automobile wheels, tires and complete motor trucks.

It is reported that the American Tire & Rubber Co., Akron, has a contract to furnish 1,000 tires weekly to the Russian government. The contract was negotiated through the Imperial Russian consul in Toronto, Canada, and it is said that it is for the duration of the war.

The new three-story brick building of the Marathon Tire & Rubber Co. at Cuyahoga Falls, Ohio, is nearing completion.

It is said that the purchase of tires just made by the Keystone Tire & Rubber Co., of 1650 Broadway, New York, is the largest cash tire deal ever made. The company has bought a million dollars' worth of casings from one of the leading manufacturers.

The Southern Tire & Rubber Co., of Augusta, Georgia, is increasing its staff from 50 to 90 employees and doubling its output, which now amounts to about 75 tires per day.

PERSONAL MENTION.

Edward F. Moloney has recently taken charge of sales in the New York territory for the Gihney Tire & Rubber Co., of Philadelphia, as manager of the New York branch. Mr. Moloney was formerly with the Firestone Tire & Rubber Co. as manager of the solid tire department of that company's New York branch.

G. A. Dodge, mechanical engineer of the Mansfield Tire & Rubber Co., Mansfield, Ohio, has recently been elected a member of the Society of Automobile Engineers.

M. H. Parsons, formerly with the Goodyear Tire & Rubber Co., has accepted the position of district sales manager for the McGraw Tire & Rubber Co., of East Palestine, Ohio.

Elmo H. Trump, formerly superintendent of The Quality Tire & Rubber Co., of Hartsville, Ohio, is now superintendent of the new Sebring Tire & Rubber Co., of Sebring, Ohio, which expects to be making tires by February 1, 1916.

James Czuzens recently resigned his position as vice-president and general manager of the Ford Motor Co. and Frank L. Klingensmith has been appointed to succeed him. Edsel B. Ford, son of Henry Ford, succeeds Mr. Klingensmith as secretary of the company.

Mr. G. H. Stonestreet, who for the past three years has been connected with British Goodyear interests, has been appointed manager of the South African branch of the Goodyear Tire & Rubber Co., with headquarters at Capetown. Mr. Stonestreet was formerly connected with The B. F. Goodrich and Continental companies and sailed recently for his new post.

The Knight Tire & Rubber Co., of Canton, Ohio, has appointed H. D. Palmer sales representative in New York State territory, in place of E. J. Coniff, who resigned.

A NEW "TROUBLE-PROOF" TIRE.

A new automobile tire, made by the Leather Tire Goods Co., Niagara Falls, New York, is built with a strip of chrome tanned leather placed inside the casing next to the inner tube and protecting the latter from nails, pieces of glass and similar hard objects that may come through the tread of the tire where most punctures occur. It is also claimed that when the casing is badly worn the leather will prevent it from blowing out.

PERFECTION ASBESTOS FABRIC TIRES.

A new tire, guaranteed to be proof against puncture, blow-out, heat, water and grease, is to be presently placed on the market by a company in Fort Madison, Iowa. The peculiarity of the "Perfection" tire—as it is branded—is that a fabric made of woven asbestos takes the place of the usual Sea Island cotton fabric. Its breaker strip is woven from asbestos-covered wire.

TIRE TREAD WEAR.

An item of tread wear not commonly recognized is sliding friction. P. W. Litchfield, of the Goodyear Tire & Rubber Co., defines this as the friction between the tire and the ground due to surface motion of the tread. As the tire surface is doubly curved, flattening it against the ground involves a certain amount of surface distortion. When this distortion is transferred from one part of the tread to another, a continuous sliding friction is produced.

NO WONDER THE TIRES ARE STRONG.

A STORY told by pictures is much more impressive than a story told by words. For instance, the Goodrich company, describing the cable cords which form the body of the Silvertown cord tires, speaks as follows:

"With 144 strands of cotton thread made from long fibered Sea Island Cotton, each one impregnated with rubber which has literally been driven into it, and then cabled together

and again impregnated with rubber, each cord which goes into a Silvertown is capable of standing approximately 250 pounds of straight tensile pull."

That is a good description, brief and intelligible; but one really gets a better idea of the strength of this cord by looking at the accompanying illustration, which shows a stocky gentleman, said to weigh 190 pounds—and he certainly looks it—sustaining his whole weight by a single Silvertown cord.

A SINGLE SILVERTOWN STRAND HOLDS A 190-POUND MAN.

It might be added that in constructing the tires these cords are laid across the tread at an angle of 45 degrees. One layer is placed above the other at an angle of 90 degrees. Two of these layers constitute the carcass of the tire, on top of which are laid a cushion drum, breaker strip, and the tread rubber.

CORD TIRES AT THE ASTOR CUP RACE.

The Astor Cup Race held October 9 at the Sheepshead Bay Motor Speedway, near New York City, was a notable triumph for American built automobiles and American tires. The distance, 350 miles, was covered by the winner in 3 hours 24 minutes 42 seconds—an average speed of 102 miles per hour—and the second car finished within 90 seconds of the winner. Only six cars finished, and out of these six the first five were American machines equipped with Goodrich Silvertown Cord tires. In fact the sixth car at the finish—a French Delage—was also running on "Silvertowns," and averaged better than 84 miles per hour.

In reading these figures few realize the tremendous strain such terrific sustained speeds impose upon rubber tires. But in spite of the terrible grind only ten tires were changed during the entire race. Of these, nine were on right, or outside wheels; the only left tire changed being replaced as a measure of prudence because it appeared dangerously worn. The winning car covered the distance of the race without a single tire being changed.

News of the American Rubber Trade.

ENGLAND DENIES INTERFERENCE WITH AMERICAN TRADE.

SO many charges have been made in influential quarters that Great Britain was seriously interfering with the legitimate trade of the United States with neutral European nations for the benefit of her own exporters that the British government thought the situation warranted a reply, and this was made early in October by Sir Edward Grey in the form of a note handed to Ambassador Page. Sir Edward cites facts and figures to prove that there can have been no interference with American trade to neutral countries in Europe for the simple reason that this trade has, as a whole, largely increased since the beginning of the war. Referring to the rubber situation, he speaks as follows:

Re-exports of rubber from the United Kingdom to Scandinavia and the Netherlands declined from 17,727 cents of 100 pounds in January-May, 1914, to 16,693 cents in January-May, 1915; on the other hand exports of rubber from the United States to the same destinations increased from 1,579 cents to 5,040 cents. Larger re-exports of rubber to the United States from this country have indeed taken place, but all other re-exports of rubber have declined during this period, as the following figures show:

	Jan.-May, 1914.	Jan.-May, 1915.	Increase over 1914.
To all destinations.....	553,864	667,509	*113,645
Of which to United States.....	348,435	418,619	†170,184

*Or 20.5 per cent. †Or 68.6 per cent.

MORE RUBBER TO THE UNITED STATES.

It will therefore be seen that this country has actually been supplying more rubber to the United States at the expense of other neutrals, while American exporters have taken advantage of this to ship increased quantities of rubber to Scandinavia and the Netherlands.

RUBBER BROKERS MAKE A CLAIM ON THE GOVERNMENT.

When the United States Government decided that it must raise more revenue last year, it passed an act requiring the placing of a ten-cent stamp on every contract. The same act, dated October 22, 1914, called for a special tax of twenty dollars for each commercial broker. This added considerably to the expense of doing business. The law required a ten-cent stamp on every contract passed, whether it was for a hundred-ton sale or just a single case of pontianak, on which the broker's commission might amount to only five cents.

But the brokers, of course, are all patriotic men, and they bought the stamps in ten-dollar lots, and stuck them on the contracts as soon as they were closed and forwarded to the importers or sellers. Then the sellers, in turn, sent memoranda of receipt of these contracts to the buyers and slapped on each such acknowledgment, or contract, a similar ten-cents' worth of gummed paper.

This seemed to be double taxation, but it continued until somebody waked up to this fact. Then there came a ruling that the broker was not the responsible party to the transaction, but that all the responsibility for filling such contract rested with the seller, and that the seller, and he only, need place the adhesive tax certification on his contract. The importers immediately notified the brokers, and now the brokers are endeavoring to secure from the government the amounts they have expended under the misunderstanding that they were liable. Many of them had a larger or smaller number of ten-cent stamps on hand. These they turned in to the Revenue offices of their districts, and with them claims for all the stamps they have stuck on their contracts.

These claims are still in abeyance. The brokers have heard nothing from the government, but such matters move slowly, if they move at all, and the brokers hope to get a refund, some day, which will go on the credit side of their profit and loss account.

WHO HAS LOST 800 POUNDS OF RUBBER?

A circular was sent out on October 22 from the office of the secretary of the Rubber Club to crude rubber importers, dealers and brokers, calling their attention to the fact that 800 pounds of crude rubber had recently been bought by the captain of a railroad barge lying at New Brighton, Staten Island, from the captain of a scow, which at the time of purchase was tied to one of the North River piers. As obviously this is a very unusual channel for the distribution of crude rubber supplies, the transaction on the face of it savors of irregularities, and it is highly probable that somebody is short 800 pounds of rubber. Any one who discovers that he is in such a situation can apply to The Rubber Club of America, 17 Battery Place, New York, for further information.

THE NEW YORK ELECTRICAL EXPOSITION OF 1915.

The Electrical Exposition and Motor Show of 1915 was held at the Grand Central Palace, New York, October 6-16. The large attendance attracted by the promise of new and interesting features was amply repaid by the many excellent exhibits.

The great electrical achievement of the year, the bringing of two cities three thousand miles apart within speaking distance of each other, was given a popular demonstration. Each day an average of 1,500 "listened in" on the transcontinental telephone line, and heard a brief account of the day's happenings at the Panama-Pacific Exposition, some music, and the roar of the Pacific Ocean, breaking against the rocks at the entrance to San Francisco harbor.

There were altogether 163 separate exhibits and among those attracting the most attention were the exhibits of the Army, Navy and Treasury Departments of the United States Government, the Treasury Department showing one of its electrical money laundries, washing and ironing paper money presented for that purpose by visitors to the show.

The General Electric Co. departed somewhat from the usual display of miscellaneous material in an attempt to make an exhibit of more educational value—the principal feature being the daylight motion pictures, illustrating the methods employed in the manufacture of various electrical devices.

The Westinghouse Electric & Manufacturing Co. exhibited a complete collection of electrical devices for the home, shop or office. The particular feature was the new Westinghouse electric range, which has an automatic device which allows the housekeeper to put in a meal at any time, set it for the hour at which the dinner is desired, and then leave the rest to the range. At the appointed hour the dinner will be found cooked to the minute.

RUBBER COMPANY DIVIDENDS.

At the annual meeting of the Swinchart Tire & Rubber Co., of Akron, Ohio, held on September 29, the regular quarterly dividend of 1½ per cent. was declared.

On October 7 the board of directors of the United States Rubber Co. declared a quarterly dividend of 2 per cent. on the first preferred stock and a quarterly dividend of 1½ per cent. on the second preferred stock of the company, to stockholders of record October 15, payable October 30.

Directors of the Kelly Springfield Tire Co. have declared a quarterly dividend of 3 per cent. on the common stock, payable November 1 to holders of record October 15. The previous disbursement made was 1½ per cent.

At the annual meeting of the Electric Hose & Rubber Co., Wilmington, Delaware, October 19, a semi-annual dividend of 5 per cent. on the common stock of the company was declared.

J. W. AYLSWORTH.

TO have been intimately associated with Thomas A. Edison for 26 years is in itself a signal distinction; and to have taken out over 60 patents, all marking distinct progress in the development of new and widely useful substances, is certainly an accomplishment of no mean order. Both of these honors belong to J. W. Aylsworth, technical chemical expert, whose laboratory is in East Orange, New Jersey, and who is familiar to the rubber trade as the inventor of synthetic gums and waxes known under the trade names of "Condensite" and "Halowax."

Mr. Aylsworth is a native of Indiana, and graduated from Purdue University in that State. Twenty-six years ago he became connected with Thomas A. Edison in his work in the famous laboratory in West Orange. In his work as a consulting chemist for the great inventor, he has developed and patented many improvements in incandescent lamp filaments, the Edison storage battery, phonograph recording compositions, record molding processes, and in many other products of modern inventive genius. He is recognized among chemists as a man of unusual attainments in that science.

Early in 1906 Mr. Aylsworth became acquainted with the remarkable properties of phenolic condensation products, and immediately recognized their applicability for use in making improved phonograph records. In the spring of 1908 his experiments had advanced to such a state that The Edison Co. decided to undertake the development of disc record manufacture with his phenolic condensation product composition, the "Diamond Disc Record" being the result.

Somewhat later the Condensite Co. of America was formed to develop the manufacture and use of these substances for other industries for which he foresaw their eminent utility. This company has made rapid progress in developing products of marked value to the electrical industry and in the plastic molding art, operating under more than 40 of Mr. Aylsworth's patents relating to "Condensite," and nearly half as many relating to "Halowax."

Mr. Aylsworth still maintains his relations with Mr. Edison, whose chief consulting chemist he now is, and is also actively engaged as the technical director of the Condensite Co. of America.

WILLIAM E. HARDY.

AMONG those who gave heed to that venerable piece of advice heard very frequently a generation ago, "Go West Young Man," was William E. Hardy, recently appointed sales manager of the Boston Belting Co. Later, however, he heard the more modern slogan, "Back East," and concluded that that probably fitted his personal case best—so back East he came.

Mr. Hardy was born in a rubber atmosphere, so to speak, for he first saw the light in Akron, June 5, 1879. His education was

J. W. AYLSWORTH.

secured in the public schools there, and later he graduated from Bachtel College, an institution which has done its share to make Akron famous.

Although William Hardy's thesis at graduation had for its subject "Rubber Substitutes," his studies specialized more on mining and metallurgy, and on graduating he joined his father, working at mining in the wild southwest, Arizona, Colorado, Nevada and Old Mexico. During the years spent in this industry he had many interesting experiences, but Mr. Hardy is a modest man, rather averse to talk about himself. It is certain, however, that he could tell some good stories of adventure were he so inclined.

Then, turning his face eastward, young Hardy worked for a year for the Brown Hoisting Machine Co. in Cleveland, after which he joined the Diamond Rubber Co. factory forces in Akron. His job was running a belt press in the press room. But not long was he working on that press. He was made a factory inspector, then became assistant sales manager of mechanical goods. This was the record of the first seven years with the Diamond Rubber Co. For many months the management urged him to go to New York and take the supervision of sales in that city, and at last he was prevailed upon to do so. He held that position for a couple of years, leaving this to return to Akron to become sales manager of mechanical goods of The B. F. Goodrich Co., which had absorbed the Diamond company.

Mr. Hardy served these two companies eleven years. When the Boston Belting Co. was looking for the best man in the country to take up the work of Mr. Elson, whose prolonged illness prevented him from carrying the load, the officers decided upon Mr. Hardy as the man, and negotiations were at once opened to secure him, with the result that he is now installed as sales manager, with his office at the Roxbury factory of that company.

Mr. Hardy is a young man of ability and energy, a man of experience, with a record of success. He is married, has two interesting children and will live in Brookline as soon as the railroads deliver his *lures et penates*, long overdue, from Akron. At present he boasts of no club memberships, but acknowledges that he is entitled to wear the square and compass. That he is a man of many friends any one will affirm, after being with him ten minutes, and that he will make a host of new ones in his present position is unquestionable, as is also the prediction that he will prove a conspicuous success in this new and responsible position.

MR. WADE MADE FACTORY MANAGER.

Mr. J. Arthur Wade has been appointed factory manager of the mechanical rubber goods and the general rubber goods departments of the Montreal mill of the Canadian Consolidated Rubber Co., Limited. As this factory makes all of the company's hose, belting, packing, druggists' sundries, molded goods and plumbers' supplies, it is obvious that the new manager will have his hands full. Mr. Wade started in the rubber industry in 1895 with the Revere Rubber Co. Eleven years later he joined the Canadian Consolidated Rubber Co., Limited, of Montreal, and has been with them ever since, excepting two years—1912 and '13—during which he was general superintendent of one of the New England mills.

DR. DAHNE SAILS FOR BRAZIL.

Dr. Eugenio Dahne, whose fine exhibit of Brazilian products at the San Diego Exposition was mentioned in some detail in the September number of this publication, passed through New York October 15 on his way back to Brazil for a short visit. The San Diego Exposition has fully lived up to the expectations of its promoters and Dr. Dahne's Brazilian department has been one of its most attractive features. The Exposition will close until the end of the year, when it will be re-opened on a more extended scale for another six months. Dr. Dahne expects to return to this country in December.

PERSONAL MENTION.

One of the most interesting lists of names published in the New York papers in some time was that which appeared early in October showing the assessments on personal property made by the Tax board. The first two names on that list, as everyone might imagine, were John D. Rockefeller and Andrew Carnegie. The fifth name was James B. Ford, vice-president of the United States Rubber Co.

An International Trade Conference will be held under the auspices of the Foreign Trade Department of the National Association of Manufacturers, December 6 to 8, at the Hotel Astor, New York City. On the general committee of arrangements are M. A. Oudin, manager of the foreign department of the General Electric Co.; Edwin C. Shaw, vice-president of The B. F. Goodrich Co.; and George E. Long, vice-president of the Joseph Dixon Crucible Co., Jersey City.

At the annual meeting of Wright & Ditson, dealers in athletic goods, Boston, recently held, W. H. Cook was elected to the position of secretary in place of Temple F. Craigie, deceased.

T. Frank Manville, of H. W. Johns-Manville Co., has been elected president of the Wright Aeroplane Co., recently organized with \$1,000,000 capital to take over and develop the aeroplane patents purchased from Orville Wright.

Chester J. Pike, for many years connected with the sales department of the United States Rubber Co., and more recently interested in advertising—especially in the preparation and placing of advertising relating to rubber footwear—was elected director of the Advertising Agents' Association at their annual meeting held recently in Boston.

Mr. J. B. Linder, who joined the Ajax-Grieb Rubber Co. two years ago, having charge of their New York office, has now been appointed the company's general sales manager.

John H. Kelly, vice-president, and Frank V. Springer, manager of the export department of the Republic Rubber Co., returned recently from a month's visit to Europe in the interest of the company's foreign trade, which has been especially active in truck tires. This was Mr. Springer's third trip to Europe during the present year.

Morton L. Paterson, who has been continuously connected with the footwear business since 1887—largely in the rubber shoe specialty—has recently assumed management of the Converse Rubber Shoe Co.'s business at Chicago.

Charles R. Sargent, formerly manager of the Cleveland branch of Innis, Speiden & Co., importers and commission merchants in chemicals and colors, Chicago, has been put in charge of the company's Chicago branch. He will still retain general supervision of the Cleveland office.

Joseph T. Mahon, of the Henderson Rubber Co., Baltimore, recently visited New York City and northern New Jersey in the interests of his company. He reports an active inquiry for "Rub-Hide," an ingredient manufactured by the Henderson company for the purpose of strengthening and preserving rubber.

William E. Barker, manager of sales of the United States Rubber Co., who sailed for Europe late in September on important business in England and France, embarked for home on October 22 and is expected to arrive in New York about the first of November.

E. H. Sprague, for many years president of the Omaha Rubber Co., Omaha, Nebraska, has resigned from that position and William McAdam, formerly manager of the Interstate Rubber Co., has been elected to succeed him. J. L. Eastman, for many years a salesman for the Interstate Rubber Co., has been elected manager to succeed Mr. McAdam.

E. W. Rutherford, lately superintendent of the Wales-Goodyear rubber shoe factory at Naugatuck, Connecticut, has been appointed assistant to General Footwear Factory Manager Myron H. Clark, of the United States Rubber Co., and Charles R.

Haynes has succeeded Mr. Rutherford as superintendent of the Wales-Goodyear mill.

The annual meeting of the Western Association of Shoe Wholesalers, held in Chicago late in September, was attended by George H. Mayo, merchandise manager of branch stores of the United States Rubber Co., and also by Charles A. Coe, the Eastern selling agent of the same company.

MR. WADLEIGH SAILS FOR SINGAPORE AGAIN.

The issue of THE INDIA RUBBER WORLD for January, 1914, contained a brief account of the activities of W. L. Wadleigh, of Boston, in the importation of crude rubber and its distribution to the manufacturers of that city and vicinity. After being engaged for a number of years in the distribution of various grades of rubber from Mexico, he determined to make a visit to Singapore with a view to forming associations there for the distribution of plantation rubber in this country; and in carrying out this project he sailed for Singapore in January of last year, remaining in the East for a number of months, and establishing the Wadleigh Co., Limited, of Singapore.

After a year or more in the United States he has sailed again for Singapore, embarking on October 24 on the steamship "Finland," via London and Marseilles, where he will transfer to a P. & O. steamer for the East. He plans to return to this country next May. Before sailing he announced that The Goodyear Tire & Rubber Co. had arranged with the Wadleigh Co., Limited, of Singapore, to purchase crude rubber for The Goodyear Company in the Far East. The Wadleigh Company will also act as special selling agent for the Goodyear products throughout the Straits Settlements and the Malay Peninsula.

EDISON AND THE ELECTRIC INCANDESCENT LAMP.

EDISON DAY, October 21, commemorated the thirty-sixth anniversary of the invention of the electric incandescent lamp and was celebrated in honor of its inventor, Thomas A. Edison. On December 21, 1879, just two months to a day after Mr. Edison first successfully made a carbon filament glow in a glass bulb from which the air had been exhausted, the news of the great invention was given to the world.

This was before Edison had successfully determined and chosen carbonized bamboo, the only substance used for about ten years, in making filaments for commercial lamps, which was followed by the "squirted" filament employing carbonized cellulose in one form or another. Next the metalized carbon filament was used, then the pressed tungsten filament, and finally the special form of drawn tungsten wire used in modern Edison Mazda lamps.

How much the rubber industry owes to Thomas A. Edison becomes instantly evident when we consider how extensively rubber is used in the electrical industry. It enters into almost innumerable forms of insulation for electric wiring, switchboards and general apparatus. As a matter of fact, without rubber it would be impossible to construct the many types of existing electrical apparatus, the many forms of transmission and control of electrical energy that are now in practical operation.

EDISON—36 YEARS AGO.

THE HODGMAN NEW YORK OFFICE TO MOVE UPTOWN.

The Hodgman Rubber Co., in selecting a location for its new New York City sales office, has followed the march of business northward. The place decided on is the front part of the third floor of the Munsey building, 8 West Fortieth street, which is one of the newest and most modern of the large office buildings recently erected in that section. This location is very central, being convenient both to the New York Central and Pennsylvania Railroad stations and the hotel district, and is easy of access to out-of-town buyers. The Hodgman company intends to maintain this new office—after removal of the main office to

Tuckahoe, New York—as a sales office only, but through direct wire connection with the factory and an auto truck service, deliveries to the New York local trade will be promptly made, and direct freight and express shipments to other parts of the country

will reach their destination without any appreciable loss of time. The removal to these new quarters will be made soon after the first of the new year.

NEW INCORPORATIONS, WITH AUTHORIZED CAPITAL, ETC., 1915.

Armstrong Rubber Co., Inc., The, October 6 (New York), \$200,000. George F. Armstrong, 40 East Newell avenue, Rutherford, New Jersey; Socrates X. Newman, 172 Clay avenue, Rochester, New York; Sadie Mallagh, 60 St. Nicholas avenue, New York City. To manufacture tires and rubber goods of all kinds.

Auto Tire & Equipment Co., The, October 1 (South Carolina), \$5,000. W. K. McDowell, J. H. Young, W. Burgeson, Charleston, South Carolina. To deal in automobile accessories, etc.

Beacon Falls Rubber Shoe Co., September 25 (Massachusetts), \$1,850,000. Louis Bacon, George B. Harris, 111 Devonshire street; Daniel E. Gray, 241 Congress street, Boston, Massachusetts. To manufacture and deal in rubber goods.

Dirigo Rubber & Manufacturing Co., October 1 (Maine), \$50,000. Ernest C. Wallace, president; E. A. Willard, treasurer, and William H. Murray, clerk. Office, 415 Congress street, Portland, Maine. All kinds of manufacture.

Durable Rubber Co., Inc., October 4 (New York), \$4,000. David Auster, 895 East 172d street, Bronx; Moses Redler, 1570 Madison avenue, New York City, and Charles Baron, 9 Warren street, Newark, New Jersey. To manufacture rubber goods.

General Rubber Manufacturing Co., September 29 (Ohio), \$200,000. M. O'Neil, Patience J. O'Neil, P. F. O'Neil and

Lucy A. Mahar. To manufacture and deal in rubber products.

Gregory Rubber Co., The, October 18 (Ohio), \$25,000. Clyde F. Beery, T. M. Gregory, T. M. Gregory, Jr., Leona Gregory, and Winifred Gregory. To manufacture rubber novelties.

Independent Rubber Works, Inc., September 29 (New York), \$1,200. Samuel Gordon, 452 Kosciusko street; Morris Solomon, 2002 Douglas street; Jesse Germansky, 198 New Jersey avenue, Brooklyn, New York. Auto tires.

Marion Tire & Rubber Co., The, October 19 (Ohio), \$250,000. D. M. Mason, M. B. Mason, Robert G. Berlekemp, W. E. Sexton and O. M. Mason. Office, Cleveland, Ohio. To manufacture auto tires and rubber supplies.

New Castle Rubber Co., of Illinois, October 6 (Illinois), \$10,000. Directors: L. W. Hottel, H. M. DeSilva and J. S. Wilson. Office, 2724 Michigan avenue, Chicago, Illinois. To deal in rubber goods.

Pearce-Arrow Tire & Rubber Manufacturing Co., October 1 (Delaware), \$500,000. F. R. Hansell, Philadelphia, Pennsylvania; George H. B. Martin and S. C. Seymour, Camden, New Jersey. Office, Guarantee & Trust Co., Ford Building, Wilmington, Delaware. To manufacture and deal in automobiles and tires.

Peters Company, Inc., October 5 (New York), \$20,000. Henry Trenchard, Jr., Harry E. Trenchard, 252 Ocean Parkway, and Louis J. Peters, 664 10th street, Brooklyn, New York. To manufacture gummed products and materials.

Petters, Inc., O. H., October 6 (New York), \$3,000. John W. Suling, 107 West 111th street; Walter E. Wenzel, 122 Fulton street; Levina Leitch, 226 West 123d street, New York City. Rubber stamps.

Porter Rubber Co., September 13 (Ohio), \$125,000. Joseph C. Porter, A. H. Boyd, W. F. Church, C. F. Smith and L. P. Metzgar. To manufacture and deal in rubber products.

Scott Pneumatic Action Co., Inc., The, October 6 (New York), \$10,000. Ray W. Scott, Harmon, New York; William F. Braun, 16 Sherman place, Jersey City, New Jersey, and George Becker, 934 Jackson avenue, New York City. To manufacture player piano actions, etc.

Sebring Tire & Rubber Co., The, September 15 (Ohio), \$200,000. John Hotchkiss, William F. Smith, C. B. Smith, H. D. Weaver and W. B. Stevenson. To manufacture and deal in mechanical rubber goods, etc.

Self Vulcanizing Rubber Co., September 8 (New Jersey), \$25,000. Albert Keedwell, Dodd street, East Orange; Adrian Tichenor, Raymond street; Josiah Decker, Montclair, New Jersey. To manufacture and deal in self-vulcanizing rubber.

Twin City Cord Tire Co., The, September 16 (Minnesota), \$50,000. Charles A. Ennis, Maurice A. Hessian and C. L. Archer. To manufacture automobile tires.

THE BEACON FALLS COMPANY INCORPORATES IN MASSACHUSETTS.

The Beacon Falls Rubber Shoe Co. took out incorporation papers in Massachusetts, September 25, with an authorized capital stock of \$1,650,000; \$650,000 being 7 per cent. preferred stock, and \$1,000,000 being common stock. The incorporators are Louis Bacon, George B. Harris and Daniel E. Gray. The officers of the company are identical with the officers of the old Beacon Falls Rubber Shoe Co., of Connecticut, viz.: Tracy S. Lewis, president and treasurer; A. H. Dayton, vice-president; R. L. Fisher, assistant treasurer, and Lewis C. Warner, secretary.

A Boston brokerage house has been offering the company's preferred stock at 105 and accrued dividend, at which figure the yield is a little over 6½ per cent.

THE WESTINGHOUSE AIR BRAKE MEETING.

The annual meeting of stockholders of the Westinghouse Air Brake Co. was held at Wilmerding, Pennsylvania, October 21. Condensed statements covering the fiscal year ending July 31, 1915, and a general report by the president, H. H. Westinghouse, were submitted. A dividend of \$2.00 per share was declared, payable October 30 to stockholders of record October 9.

INSULATED WIRE SHIPPED DIRECT TO NORWAY.

Evidently some manufacturers of insulated wire have taken the attitude that this product did not come under the interpretation of the term "rubber manufacturers" as used in the guarantee given by American rubber manufacturers to the British Government, under which they agree not to ship rubber goods to neutral countries except by way of London. A shipment of 7 cases and 18 bundles of insulated wire was made by a New York shipping company on the "Bergensfjord," sailing October 16, direct to Norwegian ports. On October 23 the secretary of the Rubber Club sent a circular letter to the insulated wire and cable manufacturers of the country, calling their attention to this shipment, of which he had been notified by the British consul-general of New York. The letter concludes with the following paragraph:

"Under the present conditions it is most necessary that all manufacturers of rubber-covered wire goods inform their customers regarding the terms of the British Rubber Guarantee relating to export shipments, and in order to protect their own interests it would seem advisable to have a thorough understanding with firms who have made such export shipments in respect to any further purchases which they may make. The British Government at present is exercising special diligence regarding rubber-covered wire."

A NEW DIRECTORY OF THE RUBBER TRADE.

At the rate at which the rubber trade of the United States has grown during the last few years it is inevitable that any directory purporting to give an accurate census of this industry should be soon outgrown. That is what happened to the directory of the rubber trade which was published by THE INDIA RUBBER WORLD in 1906. Inside of five years it was quite inadequate properly to represent the trade. Accordingly, in 1912 this office published a new directory, this time including not only the rubber trade of the United States and Canada, but of the whole world.

This, in turn, no longer adequately covers the rubber field of today. Consequently we are engaged in the preparation of a new rubber trade directory which will appear some time in January next. As it is impossible under present conditions to get any accurate idea of the rubber trade of Europe and as, necessarily, the European situation after the war will differ materially from conditions prior to the war, it was inevitable that Europe should be omitted from this compilation. The new 1916 directory, therefore, will be confined to the rubber trade of the United States and Canada. It will contain a list of the rubber manufacturers of these two countries, arranged under three different classifications. The first arrangement will be alphabetical, irrespective of location. In this list the officers of all the different corporations mentioned will be given. The second arrangement will be geographical, first under an alphabetical arrangement of states and then of the towns in each state. The third arrangement will be an alphabetical one, according to the type of goods manufactured.

In addition, there will be lists of crude rubber importers and brokers, rubber reclaimers, rubber stores and supply men for the rubber trade, including those who sell fabrics, compounding ingredients and rubber machinery.

The department devoted to trade marks and trade names, which has been a valuable feature of the two former directories, will be revised, enlarged and corrected to the present time, and will be even more complete in this book than in either of its predecessors. It will be the best directory of the trade yet published.

THE MECHANICAL RUBBER GOODS DIVISION DINNER.

The Mechanical Rubber Goods Division of The Rubber Club of America, Inc., will have a dinner, November 3, at 6:30 p. m. at the Union League Club, New York.

THE ANNUAL MEETING OF THE NEW YORK RUBBER TRADE ASSOCIATION.

The annual meeting of the Rubber Trade Association of New York will be held in the Association's rooms at 82 Beaver street, New York, November 4, at 3 p. m.

WESTINGHOUSE ELECTRIC INCREASES WAGES.

The Westinghouse Electric & Manufacturing Co., of East Pittsburgh, Pennsylvania, has granted its shop employees an average 8-hour and 40-minute day instead of the average 9-hour day, or a 52-hour week instead of a 54-hour week, and they will have the same weekly wage for 52 hours now obtained for 54 hours. A bonus of 6 per cent. on the earned wages is also to be paid in progressive quarterly installments, which will give the employees a yearly increase of about 10 per cent. in wages. The new work hours and bonus payments began October 1.

A savings fund has been established to encourage thrift among the employees, the company acting as trustee and guaranteeing the deposits and 4½ per cent. interest.

MR. AYLSWORTH THE INVENTOR OF CONDENSITE.

To the Editor of THE INDIA RUBBER WORLD:

In your issue of October 1, Dr. L. H. Baekeland is mentioned as the inventor of Condensite. This is an error. The inventor is J. W. Aylsworth, who for more than a quarter of a century has been closely associated with Thomas A. Edison, as his chief consulting chemist.

Condensite was developed in the course of a search for a better material to be used in the manufacture of phonograph records, and the Edison Diamond Disc record is the result. Condensite is the only phenolic condensation product that has ever been successfully used in the making of a record, which is probably the most difficult plastic moulded article to manufacture without imperfections.

Condensite is unlike any other phenolic condensation product, because of the unique method by which it is made, and which, of course, is thoroughly described in the Aylsworth patents. By this process the product, during the reaction between the chemicals of which it is composed, is heated to such a degree as to dissociate all the water, a process which if employed in the manufacture of any of the forms of phenolic condensation products described in the art prior to the Aylsworth patents, would render them useless.

This absence of water even in minute quantities, gives to the final product a capacity for taking extremely minute impressions in moulding, as well as imparting to them unusual electrical and other qualities of value.

The next step in the manufacture of Condensite very much resembles that of rubber manufacture. It is compounded with a chemical that reacts upon it when heated, and hardens the product, just as sulphur or other vulcanizing mediums harden rubber when similarly treated, and the process of molding is very much the same as in rubber manufacture.

Your mention of Condensite also refers to it as a substitute for rubber. This is true only in a very small degree; it has in some instances been used in the place of rubber, but its development, so far, has chiefly been in competition with other substances, and with respect to rubber, we should say that Condensite rather supplements than substitutes it. Each possesses valuable properties not found in the other.

CONDENSITE COMPANY OF AMERICA.

Kirk Brown, President.

October 21, 1915.

ANNUAL REPORT OF THE INTERCONTINENTAL RUBBER CO.

IN the annual report of the Intercontinental Rubber Co., issued October 4, and covering the year ending July 31, 1915, the secretary states that although conditions in Mexico have not improved during the past year, still it was possible to operate the company's factory at part capacity. The difficulties, however, were great and were much increased by the totally inadequate railway service. Though the prices for rubber prevailing during the year were low, the company's operations show a profit.

The balance sheet, which is reproduced in full below, shows net profits for the last fiscal year of over \$240,000, as compared with a little less than \$51,000 for the preceding year; and the surplus last July was nearly \$200,000 larger than at the same time the year before.

BALANCE SHEET—JULY 31, 1915.

ASSETS.	
Investments in stock of merged and subsidiary companies:	
By cash	\$2,315,321.59
By stock issues	28,198,575.30
Patents (exclusive of subsidiary companies)	\$30,513,896.89
Accounts and notes receivable, etc.	15,141.77
Advances to subsidiary companies	\$455,194.22
Sundry accounts	153,292.02
Investment securities (market value)	608,486.24
Cash	1,114,493.75
	239,789.07
	\$32,491,807.72
LIABILITIES.	
Capital stock: common	\$29,031,000.00
Accounts payable, taxes accrued, etc.	
Due to subsidiary companies	\$266,258.03
Sundry accounts	2,806.58
Reserve accounts	269,064.61
Surplus (as below)	764,665.72
	2,427,077.39
	\$32,491,807.72
SURPLUS ACCOUNT.	
Surplus August 1, 1914	\$2,195,840.95
Gross profit on operations	\$180,140.24
Net income from securities, interest, etc. (after adjustment of investment securities to current market value)	94,280.90
Less administration and general expenses	\$274,421.14
	34,184.70
	240,236.44
Charges against surplus:	
Reserve against loans to subsidiary companies	\$9,000.00
	9,000.00
Surplus July 31, 1915	\$2,427,077.39

H. G. ARMSTRONG JOINS THE MUEHLSTEIN FORCES.

H. Muehlstein & Co., dealers in scrap rubber, whose headquarters are in New York, but who also have offices in Akron and Chicago, have decided, in order to cover the whole field and take in New England, to open a branch office in Boston, and they have selected H. G. Armstrong to take charge of this office and act as their eastern representative. Mr. Armstrong is widely known in the rubber trade, as he has been connected with it for something over 15 years. For ten years he was with the United States Rubber Co. in various important positions, acting at different times as their agent in Baltimore and Chicago, and later being connected with the main selling department in New York; and in these various capacities he made a very extensive circle of acquaintances, both east and west.

The books on business efficiency always devote a few chapters to "The Value of a Pleasing Personality," as if that were something the unfortunate who did not possess it could acquire by reading books. A pleasing personality is a gift of the gods, and is not to be had in any other way. Now, Mr. Armstrong has it, and for that reason the Muehlstein company is fortunate in securing him to represent it in the New England field, particularly as he knows Boston very well, and is very well known in Boston.

TRADE NEWS NOTES.

The Electric Hose & Rubber Co., of Wilmington, Delaware, is extending its plant by the addition of a large one-story warehouse of brick and concrete, 248 feet long and 31 feet wide.

The General Electric Co., Schenectady, New York, has begun the construction of a one-story furnace building, 60 x 178 feet, which will cost \$16,000.

The Allen Machine Co., Erie, Pennsylvania, have reported a recent sale to the Dunlop Tire Co., Limited, Manchester, England, of six 8-inch electrically driven tubing machines. Two were double machines and four were single.

Standard Woven Fabric Co., of Framingham, Massachusetts, which manufactures multiestos products and rubber specialties, has purchased the plant of the Walpole Tire & Rubber Co. at Walpole and will take possession about December 1.

The Second Pan American Scientific Congress will meet in Washington, D. C., from December 27, 1915, to January 8, 1916. John Barrett, director general of the Pan American Union, is secretary general of the congress. There will be special representatives and speakers connected with various educational and scientific bodies throughout the 21 American republics.

The capital stock of the Southwark Foundry & Machine Co., Philadelphia, has been increased from \$500,000 to \$1,300,000.

In an exciting game on the Passaic, New Jersey club field, Saturday, October 9, the New York Belting & Packing Co. won the factory baseball championship, defeating the United Piece Dye Works nine by the score of 4-0.

Oscar Cutler, formerly of Cutler, Spack & Co., scrap rubber dealers, Chelsea, Massachusetts, has dissolved partnership and established new offices at 98 Second street, Chelsea, as Oscar Cutler & Co.

Jacob L. Caplan, formerly of Caplan & Sall, Philadelphia, has dissolved partnership and is now conducting a general waste material business at the same address under the firm name of Jacob L. Caplan Co.

The gross sales of the Converse Rubber Shoe Co. for the nine months ending September 30, amounted to \$974,821, compared with \$906,942 for the same period of 1914. Net profits were \$131,750 this year, compared with \$83,542 last year, a gain of 58 per cent.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of the shares of rubber manufacturing companies on October 25 last are furnished by John Burnham & Co., 31 Nassau street, New York, and 41 South La Salle street, Chicago:

	Bid.	Asked.
Ajax-Grieb Rubber Co., common	300	
Ajax-Grieb Rubber Co., preferred	101	
Firestone Tire & Rubber Co., common	800	810
Firestone Tire & Rubber Co., preferred	112	28
The B. F. Goodrich Co., common	76	78
The B. F. Goodrich Co., preferred	110	112
Goodyear Tire & Rubber Co., common	333	337
Goodyear Tire & Rubber Co., preferred	1095 1/2	110 1/2
Kelly-Springfield Tire Co., common	275	280
Kelly-Springfield Tire Co., 1st preferred	92	92 1/2
Kelly-Springfield Tire Co., 2nd preferred	225	235
Miller Rubber Co., common	250	
Miller Rubber Co., preferred	109	110
Portage Rubber Co., common	59 1/2	62
Portage Rubber Co., preferred	94	95
Rubber Goods Manufacturing Co., preferred	275	
Swinehart Tire & Rubber Co.	91	93
United States Rubber Co., common	54	56
United States Rubber Co., preferred	105	107

"Rubber Machinery," Mr. Pearson's newest book, filled with valuable information for rubber manufacturers, is now ready for mailing. Price, \$6.

THE OBITUARY RECORD.

GEORGE F. DAVENPORT.

GEORGE F. DAVENPORT, a salesman in the employ of the Boston Belting Co. for nearly 26 years, died suddenly from heart failure at his home in Ashmont, October 19. Mr. Davenport was born November 22, 1852. He was well-known in the paper industry, as he had sold the products of his company to paper mills located in New England for more than 25 years, and he had many loyal friends. Funeral services were held at his residence, 32 Roslin street, Dorchester, Massachusetts, Thursday, October 21. The interment took place in Belgrade, Maine.

JOHN LOYD.

John Lloyd, head of the machinery manufacturing house of John Lloyd & Co., died at his home in Brooklyn, October 5. He was born in Newton, Massachusetts, in 1835. He entered the United States Navy at the time of the Civil War as an assistant engineer and was assigned to various important duties connected with the Federal men-of-war. He resigned from the navy in 1867, went to New York, and established a general machinery business which was carried on for a number of years under the name of McLaughlin, Grover & Lloyd, but after the death of his partners became John Lloyd & Co. He was one of the first, if not the very first, of the machine manufacturers in the United States to build elastic band cutters for rubber mills. He also constructed various other special machines for use in rubber manufacture.

WARREN M. HILL.

Warren M. Hill, treasurer of the National Tack Co., and at one time identified with rubber manufacture, died suddenly of heart disease at his home in Boston, October 26, in his 53d year. While for many years past Mr. Hill had been associated with the Tack company and with banking interests in Boston, and had not been identified with rubber interests, 25 years ago he was president of the Standard Rubber Co., of Brockton, Massachusetts. In 1892 this company changed its name to the Standard Rubber Corporation, and in 1905 the plant was bought by a leather manufacturer and went out of existence as a rubber factory.

RUBBER TRADE INQUIRIES.

- [126.] A subscriber wishes to know the name and address of a maker of porcelain forms for dipped goods.
- [127.] An inquiry has been received for the name of a manufacturer of dipping machines.
- [128.] A company desires to purchase a second-hand rubber mixing mill with rolls from 24 to 36 inches in length.
- [129.] An inquirer wishes to know if there is a machine made for imprinting a trade mark on each yard of rubberized sheeting, along the selvage.
- [130.] A Panama shipper desires to secure an automatic appliance for severing blocks of balata.
- [131.] A London firm would like to correspond with manufacturers of toys and games.
- [132.] A Western correspondent desires names of manufacturers of dental gum.
- [133.] The name of a manufacturer of imported wooden fabrics for rubberizing is requested.
- [134.] An inquiry has been received for manufacturers of Egyptian cotton cloth fabric for use in filter presses.
- [135.] A merchant in England is desirous of obtaining white canvas boots and shoes with rubber soles, from half a dollar up.
- [136.] A foreign correspondent would like to correspond with a manufacturer of benzol.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A commission agent in the United Kingdom desires to represent manufacturers of dress shields and other miscellaneous articles. Report No. 18,631.

An American consular officer in Brazil reports that a market in the market for chloride of sulphur, sulphide of carbon, benzene lithopone and pentasulphide of antimony. Report No. 18,638.

A firm in Sweden wishes to purchase about 200 pounds of black tubing, 30 pounds of red tubing, air cushions, hot water bottles and other surgical supplies. Report No. 18,674.

A man in Italy wishes to represent a firm manufacturing hard rubber articles, such as syringes, thermometers, atomizers and rubber bulbs. Report No. 18,691.

A company in India wishes to be placed in communication with American manufacturers and exporters of rubber surgical and medical goods. Report No. 18,704.

A firm in Argentina desires to receive catalogs, samples, etc., of American-made cloth for raincoats, bathing suits and caps, and rubber tubes. Report No. 18,715.

A firm in India desires catalogs, price lists, etc., of rubber tires for horse carriages. Report No. 18,722.

A general agent in the Netherlands wishes to secure the sole agency for American manufacturers of elastic goods. Report No. 18,759.

A business firm in Argentina desires to secure the agency for American manufacturers of automobile tires and accessories. Report No. 18,768.

A Swiss firm would like to establish business relations with American manufacturers of rubber bands for use in making tin cans air-tight. Report No. 18,781.

A man in Greece desires quotations on insulated switchboard cable for telephone apparatus and single insulated wire. Report No. 18,807.

A man in Denmark wishes to purchase American-made oilcloth, rubber shoes and waterproof clothing. Report No. 18,836.

A trading corporation in the Netherlands, selling goods in the Dutch East Indies, desires to communicate with American manufacturers of rubber and other goods. Report No. 18,845.

A Russian manufacturer desires to establish business relations with American manufacturers or exporters of material and equipment required for the manufacture of rubber stamps and engraving work. Report No. 18,855.

IN THE MARKET FOR FIRE HOSE.

The fire commissioners of San Jose, California, will purchase 3,000 feet of 2½-inch hose and 2,000 feet of 1½-inch hose, to be delivered December 1.

The Good Will Fire Co., of New Castle, Delaware, is asking for samples and prices on 300 feet of hose.

The Union Fire District of South Kingstown, Rhode Island, has voted to purchase a motor combination chemical and hose wagon, equipped with 3,500 feet of chemical hose and 1,000 feet of regulation hose.

PROPOSED GOVERNMENT PURCHASES.

The Bureau of Supplies and Accounts, Washington, is inviting bids, to be opened November 9, on Navy Department supplies as follows: 7,200 feet rubber fire hose, 45 feet suction hose—schedule No. 8887; 4,000 feet rubber air hose—schedule No. 8911; 2,000 feet rubber wash deck hose—schedule No. 8918; 335 pounds hard rubber, in sheets—schedule No. 8925. To be opened November 23; 1,500 rubber packings—schedule No. 8943. To be opened November 30: sheet rubber, cloth and insertion wire packing—schedule No. 8941.

Replete with information for rubber manufacturers—McPearson's "Crude Rubber and Compounding Ingredients."

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

IN several branches of the rubber business there is increased activity, which in part makes up for the quiet times of last season and the early fall. The clothing trade is booming, and the manufacturers of the standard and finer lines are so rushed with orders that extra hours or larger forces are necessary. The makers of coated fabrics are running their factories double time. The footwear trade was busy during September, but tapered off during October, and at present writing manufacturers and wholesalers are waiting for the rush which must inevitably come when the first heavy storm of late fall arrives.

Garden hose business is flat. There have been but small sales at retail, as the entire summer was a wet one. Retailers did not send in any repeat orders, and have carried over sufficient stocks to warrant a refusal to order any goods for spring delivery. In fire hose, specifications have been drawn so fine and competition is so fierce that this trade is unsatisfactory. The rubber belting business is in a hopeful mood, for leather belting has so increased in cost as to almost prohibit its use. Manufacturers of leather belting are now obliged to pay 75 cents a pound, more than double its normal cost. Were it not for the various rope drives and other power-transferring mediums, rubber belting should have a boom, and perhaps it may, later.

There are somewhat conflicting reports of the tire business. Naturally business falls off at this season, for many who motor in summer store their cars along about this time, and buy no more tires till spring. But if the retail business is falling off, wholesale trade in some factories is encouraging, for some good future delivery contracts are reported closed, which will keep certain mills busy for a large part of the time between now and early spring. A growing branch of rubber manufacture is that of rubber soles for shoes, and those factories engaged in this line. Druggists' sundries are in moderate call.

* * *

The demands on its factory space have necessitated the addition of another building to the plant of the Apsley Rubber Co., at Hudson. This will be a brick structure, four stories high, 40 feet wide and 120 feet long. It will be used, on completion, for storage purposes, thus allowing additional machinery to be installed in the main factory and thereby enlarging its regular output. The company completed its new heater building in September, and will make some other important changes, in order to keep pace with the increased demand for its clothing and footwear.

An interview with Mr. Apsley lays at rest some rather persistent rumors that he intended to sell out, this being most positively denied. He says that the company is doing the largest business in its history, each week showing a larger force and an increased pay-roll. Mr. Apsley is just as active and ambitious as when he started his little factory in Hudson over thirty years ago, and to talk with him one is inclined to believe he will continue a prominent factor in the rubber trade for another thirty years.

* * *

The factory erected for the Patterson Rubber Co. at Lowell, which was put up at auction some months ago, and bought in by Francis H. Appleton of this city to secure his claim against the Patterson company, has been sold to Ralph B. Phillips, manager of the American Steam Gauge Co., who has formed the R. B. Phillips Manufacturing Co., and is manufacturing shells there on a contract for the British Government.

* * *

Press statements to the effect that the Plymouth Rubber Co. sold 500,000 yards of rubberized blankets to one of the allied governments and was considering doubling the capacity of their plant to fill a new order for 3,000,000 yards, have been emphatically denied by Mr. Stone, treasurer of the company. The plant

is running day and night, but entirely on domestic business. To quote Mr. Stone: "The company believes in supplying its own customers first, regardless of attractive prices quoted on temporary business."

* * *

Creditors of the Walpole Tire & Rubber Co., of Walpole, have been allowed a seventh dividend amounting to 35 per cent. by decision of Judge Dodge in the United States district court. This brings the total dividend disbursements to 85 per cent.

* * *

The Goodyear Tire & Rubber Co. has had on exhibition in its window at the Boston branch some very attractive displays the last month. First was displayed a miniature representation of a South American jungle, showing the rubber trees being tapped, and the latex coagulated and smoked, little dolls well simulating Indians being shown. There were also specimens of the different varieties of crude rubber, each properly labeled. There was also a portrait of Charles Goodyear. The exhibit was visited by a number of delegations of school children and their teachers, who felt the educational importance of such an exhibit.

Last week's display was based upon the premise, "If Charles Goodyear could return," and shows how important has grown the industry based upon Goodyear's discovery. The window was filled with articles made in the Goodyear factory in Akron, appropriately labeled, among them many varieties of tires for automobiles, motorcycles, bicycles, trucks and carriages; also a large line of hose, belting, packing and mechanical goods. The jungle scene was still retained, and made a fitting background for this display.

* * *

At the Suffrage parade in this city, October 16, toy balloons were much in evidence—the Suffragists and "anties" both using these attractive toys to display the colors of their party.

* * *

Hon. L. D. Apsley, of the Apsley Rubber Co., Hudson, gave an interesting talk at the monthly meeting and dinner of the New England Shoe Wholesalers' Association on October 13.

* * *

A. L. Belcher, who for several years has represented the Revere Rubber Co. in Europe, with offices in London, was in this city several days last month, devoting most of his time to consultation with the officers of the company, inspecting the factory and planning for future business. He has sole charge of the mechanical goods sales across the water, which under his able management have grown steadily during the last ten or a dozen years.

* * *

George F. Davenport, whose death on October 19 is mentioned on the obituary page of this issue, was a member of the family of that name prominent in Roxbury. Previous to his connection with the Boston Belting Co. he was a salesman for Samuel Kidder, the mill supply house of Boston. He went to the Boston Belting Co. twenty-six years ago, and at once specialized in paper-mill supplies, building up an extensive trade. He was a man of genial qualities, loyal to his house, popular with his customers, combining a keen trade insight and strict integrity with unbounded good-fellowship.

* * *

Chester J. Pike, Jr., of the United States Rubber Co., of New England, is the subject of considerable chaffing by his fellow-workers. He made somewhat elaborate preparations for his hunting trip in the wilds of Maine, and his total was one partridge and one hedgehog.

* * *

James E. Odell, the popular Boston rubber broker, takes his vacation in sections, a few days at a time. His custom is to tour some attractive route in his automobile, his longest trip being one of six days through the White Mountain region of New Hampshire.

Robert C. Harlow, of Plymouth, president of the Monaquet Rubber Co., of South Braintree, went to Richmond with the Ancient and Honorable Artillery on the occasion of its recent visit to that city.

* * *

Harry Arnold, assistant superintendent of the Converse Rubber Co., Malden, started a few days ago on his annual hunting trip to the Rangeley Lake region, with a full camping outfit, and all the ammunition necessary to deplete the forests of game.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

THE Essex Rubber Co. inaugurated this week one of the broadest and most liberal policies in the interest of its employees that have ever been adopted by a manufacturing plant, in this section of the country, at least. It is a plan under which the company will pay every employee to go to night school and improve himself or herself by acquiring a better education.

Some companies have gone to considerable expense to encourage their employees to acquire education in special lines which would fit them to be better workmen in the particular vocation they chanced to be following. The Essex company plan, however, does not limit the list of studies. Many of the young women employees are, for instance, learning dressmaking. Many of the young men are selecting branches totally distinct from the rubber business. Certainly no selfish motive can be imputed to the company, since it is willing to help educate a youth to become a technical man in an altogether different line of business.

Each employee taking advantage of the company's liberality will find in his pay envelope each month a sum of money to be known as "the educational premium." This sum of money will equal the hourly wage earned by the employee for half the time spent by him at any evening class or classes. For the proper carrying out of the plan the company has arranged with the Board of Education, the School of Industrial Arts, the Y. M. C. A. evening schools and the Y. W. C. A. evening classes. Some of the classes are especially for those who cannot talk English. A number of foreigners employed at the plant are taking advantage of this unusual opportunity to learn more about the ways of the land of their adoption. This feature alone, particularly at this time, when so much stress is being placed upon this question, has brought forth hearty commendation from officials of all ranks. Leading teachers and others interested in educational work are closely watching the progress of the plan and without exception they are highly enthusiastic over it.

* * *

Several Trenton factories have experienced labor trouble in the unskilled branches of late. Two rubber concerns are among the number. They are the Globe Rubber Co. and the Essex Rubber Co. At these plants the places of the disgruntled men have been taken by other workmen, and in the trimming department at the Essex plant, where some of the girls left their work, their places were satisfactorily though temporarily filled by the wives of the company officials and factory foremen.

* * *

Peter Chevalier, of France, has returned home after spending several weeks in the plant of the John E. Thropp's Sons Co., where he studied the mechanism of the tire-making machines produced by the company. Mr. Chevalier will act as the French agent of the Thropp company, and several tire-making machines have already been sent to France. They will replace the machines of German make heretofore used in the French shops, the American machine doing quicker and better work and requiring fewer hands to operate it.

Jacob L. Newman, of Newark, has been appointed receiver

for Leon Jaffress, a motor tire dealer of Plainfield, with offices also at Harrison, New York City, Detroit and Cleveland.

At the Trenton Fair held recently the exhibit of orchids made by Charles E. Roebing, president of the John A. Roebing's Sons Co., was one of the finest ever seen at an exposition. Mr. Roebing is one of the leading amateur orchid collectors in this country.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE various rubber factories throughout the State are reported to be working to their full capacity, and it is expected that they will continue to operate under similar conditions for an indefinite period. Never in the history of the rubber industry of Rhode Island has there been such a general activity, or such encouraging prospects. Rubber goods necessary to the surgeons of the armies in Europe are in increasing demand and immense quantities are being continually shipped. The factories that are working on automobile tires are rushed to fill their orders, while the boot and shoe factories are turning out unusually large quantities of footwear.

* * *

The plant of the Revere Rubber Co., on Valley street, this city, is at present being operated three evenings a week, and the indications are that night, as well as steady day work, will be the order for some time to come. The company is erecting a one-story brick and concrete building as an addition to its facilities, which will be used for storage purposes. It has recently completed a new one-story reinforced concrete laboratory building, which will take rank with anything of its kind in this section of the country, both in its appointments and equipment. It is 41 x 104 feet, with brick tunnels and tile partitions, built to carry two more stories, whenever necessity demands. The building includes three office rooms, a cold storage room, physical testing room, mill room, vulcanizer and press room, and a chemical laboratory.

* * *

In planning for the new storehouse for the National India Rubber Co. at Bristol, the location selected is said to be the best that could be obtained for facilities in handling the manufactured goods of the corporation. A spur-track runs from the New York, New Haven & Hartford Railroad yards to the new storehouse so that freight cars can be taken into or beside the storehouse, which adjoins the railroad yards.

Extensive repairs have just been completed at the pumping station of the National India Rubber Co. and at the DeWolf Inn, which is used by the National company for the housing of nearly 200 of its female employees.

The National company pays the largest tax of any corporation or manufacturing company in the town of Bristol, where its plant is located. The amount this year is \$8,025 on an assessed valuation of \$585,750.

The wire department of the National company is increasing its product, and running overtime to keep pace with the orders.

A full force of help is now engaged steadily at the National mills, where over 2,800 people are employed, with promise of full time for an indefinite period.

* * *

The Tubular Woven Fabric Co., of Pawtucket, is rushed with orders for fall and winter shipment, and several of its departments are working three nights a week until 9 o'clock to turn out the requisite amount of work. The company is making a new water and oil-proof hose, which is designed for use on automobiles, and it is reported to have closed contracts with several of the largest automobile manufacturers in the country for early shipments of considerable magnitude.

* * *

The Narragansett Rubber Co., located on Wood street, Bristol, has recently made numerous alterations at the plant to secure additional room and to facilitate operations, and a considerable

addition is being constructed for storage and other purposes. There is a possibility that in the spring several new buildings will be erected, with material additions to the present structures. Since the reorganization of the concern there has been a steadily increasing business.

* * *

Stockholders, creditors and others interested in the settlement of the affairs of the suspended Atlantic National Bank of this city were greatly pleased with the announcement early in the month that Judge Dodge, in the United States District Court, had allowed a seventh dividend amounting to 35 per cent. to all the creditors of the Walpole Tire and Rubber Co. This brings the total disbursements to date to 85 per cent. of the claims. The Atlantic National Bank was one of the largest creditors of the Walpole company and its suspension was a material factor in forcing the Walpole company into financial difficulties.

* * *

The McNaul Tire Co. has removed from 344 Weybosset street to the new Franklin building, 50 Franklin street.

The calendering department of the International Rubber Co.'s plant at West Barrington is being operated night and day, while other departments are being run on an overtime schedule.

* * *

Considerable attention has recently been attracted by the arrival of four cases of imported statuary for the estate of Colonel Samuel P. Colt, president of the United States Rubber Co., at Bristol, which were received through the local custom house. They were modeled by the master hand of Rodin and were purchased in Paris several months ago by Colonel Colt, and the four pieces are said to have cost about \$50,000. One of them, it is said, has long been sought by the Metropolitan Museum of Art in New York.

The pieces of statuary, as named by the sculptor, are "Le Lion Douloureux," "Eve," "Psyche" and "L'Epervier et la Colombe." The purchase of the statue of "Eve" was consummated some time ago, but Colonel Colt also desired to obtain possession of the

Beatty will be assistant to Manager L. C. Rockhill of the auto tire department and will have a much broader field. The change was announced on the return of Mr. Beatty from the recent big conference of branch managers and representatives at the home office at Akron. Mr. Beatty will be succeeded here by Edward J. Smith, who comes to Providence from the Hartford, Connecticut, branch, where he has been for the last three and a half years.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

BANKERS in close touch with the manufacturing interests in Akron predict general prosperity and an unusually successful year for the rubber factories—the customary "slack season" early in the fall and winter now proving a mythical term. Large additions to the Goodrich, Firestone, Kelly-Springfield, Miller and Goodyear plants are being built, and it is confidently expected that all of these factories will run at full capacity throughout the winter, with additional workers totaling 2,000.

Rubber stocks are active; the possibility of a 4 or 5 per cent. dividend on Goodrich in January and of 1916 dividends on Firestone common stock of 20 per cent. being favorable influences in the trading. It might be added that the Goodrich officials give no intimation as to what action they may take.

Akron rubber factories are supporting a bill which has been introduced in Congress to allow manufacturers to establish retail prices below which dealers could not sell. Rubber plants claim that price-cutting is unfair competition and only used as a bait to attract the public to the purchase of other articles at higher prices, and they have petitioned dealers in their products to urge congressmen from their districts to vote for the bill.

* * *

The annual sales convention of the Firestone Tire & Rubber Co., ending September 30, was the most successful convention ever held by the company, the attendance being

FIRESTONE SALES CONVENTION,

three other marbles, but was unable to do so because of the sculptor's attachment for them.

Rodin desired to keep the statues himself, as he intended to add them to his own private collection in Paris. It was only after the Germans made their drive upon the French capital that he became fearful for the fate of his creations, and finally acquiesced in Colonel Colt's wish to purchase them.

* * *

Samuel M. Beatty, for the past two years manager of the local branch of the Goodyear Tire & Rubber Co., has been promoted to factory representative in the sales promotion department, with headquarters at the factory at Akron. In his new position Mr.

larger and the interest greater, with results correspondingly valuable. There was a total attendance of 500 men, every state in the Union and six foreign countries being represented.

For three days branch managers and salesmen from the many branches of this organization broadened their knowledge of business conditions in general and the tire business in particular by attendance at conferences where the theoretical side of the business was fully and ably discussed by company executives, branch managers and salesmen; the subjects including carriage, motorcycle, bicycle, motor and pneumatic tires; accessories, rims, exports, adjustments, credits, advertising and factory and branch efficiency. Each

man also studied the detailed construction and manufacture of Firestone tires in the factory itself.

An inspiring sight was the home plant in Akron, with five large additions in process of construction. Seven acres of additional floor space will be provided by these enlargements, allowing for an output of 12,000 pneumatic tires per day.

Dinners and outings at the lakes around Akron, and theater parties and banquets at the local hotels, brought the men together socially.

Plans have been approved for a new Firestone employees' club building, four stories high, with a basement, which will cost \$85,000.

* * *

The B. F. Goodrich Co. has inaugurated a plan of insurance for its employees, beginning November 1, which includes an old age pension, compensation for the sick and those injured in service, and a life insurance policy ranging from \$500 to \$1,000, according to the time the employee has been working for the company.

The plan of providing these safeguards evolved from a system of physical examinations begun in 1914. The statistics gathered showed physical deficiency in the majority of workers. The sensible and beneficent conclusion upon these results was stated by E. C. Shaw, second vice-president of the Goodrich company, as follows:

"The corporation believes it to be a part of its business to protect, as far as possible, the well-being of all who have contributed to its success and it holds it to be essential to that success that every employee be able to enter upon his or her daily task in fit condition, with mind untroubled by unnecessary worry."

The Goodrich company is to have two more five-story factory buildings, one 100 x 300 feet in dimensions and the other 100 x 260 feet; both costing approximately \$400,000.

* * *

The Kelly-Springfield Tire Co. has purchased the plant of the Cataract Rubber Co. at Wooster, Ohio, with the

C. O. Baughman, secretary; R. A. May, treasurer. The regular quarterly dividend of 1½ per cent. was declared, and a probable increase of the rate early in 1916 to 7 per cent. was discussed.

The capital stock is \$800,000. The buildings, real estate and machinery are placed at \$369,000. There is a surplus of \$195,000. A large three story addition to the factory of the company has just been completed and the erection of another addition 60 x 100 feet has been begun.

* * *

The Western Tire & Rubber Co., of Kansas City, Missouri, has purchased 12 acres in Akron, on which is being erected a building of sufficient size to accommodate its constantly increasing accessory business and to provide space for the manufacture of casings and tubes. The building will be finished November 15, and it is expected that the factory will be in full operation by December 1.

The company will be reincorporated under the laws of Ohio, with a different name, with a paid-up capital of \$200,000.

* * *

The welfare department of the Goodyear Tire & Rubber Co. has applications for 100 new homes in the community on Goodyear Heights, and hopes within a year to have 2,000 people living in that district. A new quarter-mile running track has recently been completed for the public playgrounds of the community.

The Goodyear "safety first" committee has begun a campaign to prevent accidents in the plant caused by the carelessness and over-confidence of new employees, who attempt to hurry their work to keep pace with the more experienced. "Don't try to compete with your 'buddy,'" is the slogan of the campaign. "Take your time until you have learned the job."

* * *

An addition to the plant of the Atlantic Foundry Co. in East Akron is being completed, which will double its capacity and output.

FIELD AT THE FIRESTONE FACTORY.

object of immediately increasing its output to handle the rapid development of business.

* * *

The Miller Rubber Co. will soon build a new garage and salvage house, and a press room, both buildings to be one story high, with basement. The estimated cost—\$6,000 and \$4,000, respectively—is low, as the company will be its own contractor.

* * *

At the annual meeting of the Swinehart Tire & Rubber Co. on September 29 the following officers were re-elected: Thomas F. Walsh, president; E. L. Mather, vice-president;

The old M. & M. Rubber Manufacturing Company has been reorganized and incorporated under the name of The Giant Tire & Rubber Co., with a capital of \$50,000. Claude E. Hart, president of the M. & M. company, and J. F. Schaefer, secretary and treasurer, will retain their offices in the new organization, which will begin operations about the middle of November in a remodeled building on North Howard street.

The Lincoln Rubber Co. has purchased the abandoned plant of the Summit Rubber Co., of Barberton, which will be operated as a branch of the Lincoln company's Akron factory.

On October 25 about 1,500 machinists employed by Akron rubber companies and allied industries, were notified that their wages would be increased 15 per cent. The increase is made voluntarily by employers.

The howling league of The B. F. Goodrich Co. is in full swing for the season, with H. W. Hicks as president; Victor A. Parker, vice-president; J. G. Evans, treasurer, and L. B. Kennedy, secretary.

F. A. Seiberling, president of the Goodyear Tire & Rubber Co., has given the new Akron field artillery battery an armory site in East Akron, including a large tract for the armory, parade and maneuver grounds.

Mr. Seiberling was Akron's representative at the recent directors' meeting of the national chamber of commerce at Cleveland.

SOME RUBBER NOTES FROM CHICAGO.

By Our Regular Correspondent.

GENERAL conditions in the rubber trade of Chicago appear to have improved during the past few weeks, according to the leading men in the business here. Mechanical rubber men without exception declare themselves well satisfied with the volume of orders now being received. The heavy grain harvest in the west resulted in numerous rush orders for belting, and many elevator proprietors, who a few weeks ago were resisting the efforts of salesmen to sell them needed belting, have been writing urgent letters for goods. However, the local houses know the country elevator trade well, and were prepared to make prompt shipments on orders after the regular season, so that little distress was caused. The rubber clothing people are having a better fall than last year, owing to the fact that the wet weather started earlier this year. Indeed, they are closing a remarkable summer, during which many houses did a volume of business larger than they ever thought possible. Rubber specialty houses report a good trade, and while the holiday rush is not yet apparent, sales to drug stores and the retail trade in general are quite satisfactory.

Rubber men who are members of the Illinois Manufacturers' Association are much interested in the fight which is being made by that organization on certain features of the factory inspection laws, on the ground that they are worthless, as far as giving protection to the employees is concerned. A dinner was held last week at the Hotel La Salle at which a number of prominent manufacturers in different lines were present. A plan for correcting the objectionable features was outlined. It is claimed that some manufacturers have been forced to spend as much as \$100,000 for improvements which have not done the workmen a particle of good. The manufacturers have a suspicion that certain corporations are prospering at their expense, owing to what is alleged to be inspired factory legislation.

Great enthusiasm witnessed the departure early in the month of the western representatives of the Firestone Tire & Rubber Co. for Akron for the purpose of attending the annual convention of the company in that city. A special train was required. Only a few years ago thirty men were all that could be mustered on a similar occasion. This year at least three hundred were on hand.

The Peck Wheel Co., 4058 Princeton avenue, has been missing rubber automobile tires for some time, and it has become apparent that the firm is one of those marked by the organized band of tire thieves who have been preying on local supply houses and freight yards for a number of months. Recently several members of the band were stopped by officers as they were leav-

ing the Peck company premises with a wagon load of tires. The men leaped from the wagon and escaped amid a volley of shots.

The Central Rubber & Tire Co. is the name of a new firm which has just taken out incorporation papers at the office of the state auditor. The company is incorporated for \$150,000. The incorporators are: Clinton S. Bailey, W. J. Carter and Israel S. Berkman. The firm will make headquarters in this city.

PACIFIC COAST NOTES.

C. A. Ellison and A. H. Skinner, Jr., have formed a partnership and opened a store in Tacoma for the sale of Knight tires. Both men are well known in Tacoma business circles. Mr. Ellison was with the United States Rubber Co. for eleven years, both in the sales division and in looking after tire stocks, covering the Northwest as traveling salesman out of Tacoma and Portland. Mr. Skinner was recently connected with the Pacific Auto Supply Co., Inc., of Seattle, in which he still retains a financial interest.

The Stowe Rubber Co., of Los Angeles, filed a certificate of incorporation under the laws of California on September 24, with a capital stock of \$20,000. The company will deal in automobile supplies and accessories; all kinds of rubber and fabric goods, etc. The directors are: William J. Stowe, Ada F. Stowe, and Perry W. Stowe—all of Los Angeles.

The Savage Tire Co. has recently opened a branch store in Los Angeles which, in common with all the other branches of the company, is supplied with well-equipped service cars which care for the tire troubles of all motorists, whether users of Savage tires or not, within the city limits of the cities where branches are located. Savage factory distributors, located in all the principal traffic centers, give a like service.

A remarkable record for the United States Tire Co.'s tires was brought to the attention of Manager Wilkinson, of the Los Angeles branch, in the travels of Harold L. Arnold's car, which has been used in scientific work. The first trip was across Death Valley and over the mesa of Western Nevada to Rhyolite in search of ore. No tire trouble was experienced on this trip of more than 2,000 miles across the sands, gravel washes and great ridges which cut out tires quicker than any other sort of road. The car traveled 9,000 miles on one set of United States tires.

RUBBER EXHIBITS AT THE SAN FRANCISCO EXPOSITION.

Though the distance between the rubber manufacturing centers of the east and San Francisco is too considerable to expect a large display at the San Francisco Fair of the products of eastern manufacturers, at the same time rubber is by no means absent from the list of attractions at this exposition. These rubber displays are for the most part made by western companies located near San Francisco.

One of the most interesting displays in the Manufacturers' Building is that of the Bowers Rubber Works of San Francisco. This firm gives a complete demonstration of the manufacture of garden hose. Pará and Ceylon rubber is shown in the bulk, and near at hand are workmen operating a loom for the purpose of weaving fabric for the rubber-lined hose turned out by that company. It is of interest to know that a record was made during the summer by the firm, when 32,000 feet of this hose was turned out without a single defect.

The Gold Medal Waterproofing Co., manufacturers of waterproof clothing of Oakland, California, has a fine display in the same building, which gives something of an idea of what is being done in the rubber clothing field by the western manufacturers.

"Rubber Machinery," Mr. Pearson's newest book, filled with valuable information for rubber manufacturers, is now ready for mailing. Price, \$6.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE outstanding topic for discussion in trade circles at the moment is the Budget, especially the items of war profits tax. Another tentative feature of the Budget which excited a great deal of discussion was the proposal to put a tax on imported motor cars, motorcycles and tires of 33½ per cent. To be sure, this idea has now been definitely abandoned, but it was not only suggested but for a brief time actually put in force, the basic idea evidently being that it was not only desirable to add to the revenue of the government, but to reduce our expenditure for foreign, and especially American products in order to bring the trade balance back more nearly to its normal position.

Just what effect this import duty would have had on tires if continued is a matter of speculation. Its immediate effect was the raising of prices by some of the tire manufacturers with plants in this country and the circulation of reports that some of the American manufacturers who have found an English market intended to establish factories in England. Just how much revenue would actually have been derived from such a tax is problematical, but there is plenty of evidence showing that our home manufacturers have not been able to supply the British demand for tires, in view of which fact undoubtedly a considerable importation would have continued.

With respect to the war tax on increased property, government contractors note with satisfaction that this applies to traders generally and not only to those who are entitled to write "contractors to the government departments" on their note paper. The tax has certainly been received with satisfaction by the army of professional men who, during the last twelve months, have seen their incomes, like the Snark, fading softly and silently away. It is perhaps not unnatural, however, that there should be a certain amount of grumbling among manufacturers of war material, which includes tires, at giving up 50 per cent. of their profits, which had been set aside for the payment of extensions to buildings now in progress. Such extensions, they argue, would not have been required for ordinary business and will be only partially utilized when affairs have returned to the normal. At many of our rubber works enlargement and rebuilding on a considerable scale is now in operation, and their position is certainly not on an equal plane with other concerns which have made large profits without any capital expenditure.

NEW RUBBER WORKS IN HOLLAND.

The rubber manufacturing firm of Wilhelmi & Co., of the Hevea works, Hoogezaand, has bought some factories at Doorwerth, near Arnhem, in order to take up the manufacture of motor and cycle tires. It is also stated that premises have been acquired at Naarden, which is 15 miles to the east of Amsterdam, for the same purpose. In an advertisement in the English press for machinery it is significant that reference is made to second-hand machinery. Doubtless if the firm wishes to get to work quickly it is useless to insist on a new plant. Owing to circumstances which it would be superfluous to enumerate, the delivery of new machinery cannot be guaranteed for any near date, and this has led to the anomalous situation of old machinery costing more than new. To give an instance, if you want to buy a certain type of spreading machine you will be quoted £130 [\$632.64] for a brand new one, delivery when you get it. On the other hand, you can get a second-hand machine delivered at once, but the price asked will be £170 [\$827.30].

With regard to the Dutch rubber industry, those readers who have retentive memories will recall an interesting article on some Rotterdam works written by Mr. Pearson on the occasion of a visit to Holland six or seven years ago. Holland in past

years has been a good market for British, German and American rubber goods, and the new works must naturally tend to decrease the country's imports. Arnhem, which is situated on the right bank of the Rhine, is the capital town of Gelderland—on account of its scenery called the "Dutch Paradise"—and is only a few miles from the German frontier.

RUBBER OR GUM.

Referring to the proceedings in the London Prize Court with regard to the rubber consignments on the steamship "Friedland" and steamship "Kim," I feel constrained to say a few words in this column. I have only seen press reports of the trial, and these are necessarily condensed; but from these reports it might be taken that H. L. Terry, who was quoted by Mr. Baird, really thought that rubber and gum were interchangeable terms. In Terry's book it is stated that the term "gum" was commonly used for rubber in America, but he goes on to state that this practice is decidedly objectionable. This point seems to call for mention, as quite possibly it was not put before the attorney-general, who spoke somewhat slightly of the author named. The real situation is a somewhat anomalous one, as there is plenty of evidence as to the use of the term "gum" for rubber in conversation, but apparently none whatever as to its use in invoices or other commercial documents.

In Great Britain its use appears to be limited to boots, especially army rubber boots, which are very generally termed by officers "gum boots." Whether such boots have been invoiced to officers as gum or rubber boots is a matter on which I am making enquiries. But the present case is concerned particularly with the raw material, which is only associated in Britain with the well-known clauses of patents which refer to rubber, gutta percha and allied gums. With regard to the Continent, it is noteworthy that while the German-speaking peoples and the Scandinavians use the single term "*gummi*," the Latin nations qualify it by adding elastic—in French, *gomme élastique*; in Italian, *gomme elastica*, and in Spain, *goma elastica*, being the terms in common use.

PERSONAL.

The president of the Board of Trade has appointed Mr. Vernon James Watney, J.P., to be an additional member of the committee which deals with questions relating to the export of rubber and tin from the United Kingdom and British Possessions. This brings the number of the committee to four.

George Spencer Moulton & Co., Limited, whose works are also at Bradford-on-Avon, has suffered a severe loss in the death in active service of Lieutenant Eric Moulton, son of John Moulton, chairman of the company, who is a brother of Lord Justice Moulton, who, as a Fellow of the Royal Society, has taken a very prominent part on the government High Explosives Committee. The deceased officer was a grandson of Alexander Moulton, the founder of the firm.

EXPORT OF RECLAIMED RUBBER.

The North Atlantic Lines Conference has somewhat arbitrarily refused to take any further shipments of reclaimed rubber to America from London, Liverpool and other West Coast ports. It appears that this is due to fear that such shipments may reach the enemy. At the same time such shipments are not altogether stopped, because they are proceeding from Hull, to which town the railway freight has, of course, to be paid. Those interested have made strong representation to the shipping companies operating in the West, but so far with no result. Crude rubber is, of course, being regularly shipped from London to America.

COTTON CLOTH EXPORTS.

By order of the Board of Trade, new restrictions which will chiefly affect Lancashire will shortly come into effect, a committee of the Manchester Chamber of Commerce being now engaged in arranging the details. With regard to cloths unsuitable for air craft purposes, a Chamber of Commerce certificate will suffice in case of export, while for cloth suitable for air craft purposes, application for export must be made to the War Trade department in London. The tests to discriminate between the two sorts are count weight and ratio of strength to weight.

RUBBER MILL EMPLOYEES AT THE FRONT.

The rolls of honor of employees serving with the forces exhibited at most of our rubber works continue to grow in volume with the prolongation of hostilities. That at Charles Macintosh & Co.'s works now contains over 600 names. Regular collections have been made in their works for the various war funds, in every case the sum collected being supplemented by an equal sum subscribed by the company.

THE SIRDAR TIRE & RUBBER CO.

I may add to the notice I recently gave about the resuscitation of this Bradford-on-Avon company that the capital is held by the Avon Rubber Co., Limited, which runs it as a separate branch of its own business, in this respect following the procedure of an eminent firm in the north of England. The works are fully equipped with up-to-date machinery and have been kept in operation since the time the old company got into financial difficulties.

MORE FIRES.

An outbreak of fire, fortunately not of a serious nature, occurred on September 23 at the waterproofing works of J. Mandlerberg & Co., Limited, Manchester.

Another fire of a more disastrous character broke out on October 1 at the works of J. E. Baxter & Co., Limited, which closely adjoin the Leyland & Birmingham Co.'s works at Leyland. The latter company's brigade worked hard both to subdue the outbreak and to prevent its extension to their own premises, a matter in which they were successful. The damage done on the scene of the fire was considerable, the cause being attributed to vapors from a spreading-machine catching fire.

VARIED ACTIVITIES OF THE FRENCH MICHELIN TIRE CO.

Since the war broke out in Europe the Michelin Tire Co., of Clermont-Ferrand, France, which is one of the largest tire manufacturing concerns in Europe, has been producing 6,000 pneumatic automobile tires per day. A great proportion of these tires are of the steel-studded leather-tread type which is very popular in Continental Europe, where almost every car is equipped with at least one rear tire of this type. The Michelin company does not manufacture solid rubber tires, but has an important valve manufacturing department which is now producing 8,000 fuses and 500 high explosive shells per day, and a wheel manufacturing department now engaged in manufacturing artillery wheels for the army.

ETABLISSEMENTS HUTCHINSON.

At the annual shareholders' meeting of the Etablissements Hutchinson, which was held recently in Paris, France, it was stated that the company's profits for the fiscal year 1914-1915 amounted to 2,446,152.65 francs (\$472,107) as compared with 2,353,188.72 francs (\$454,165) in the preceding year, showing an increase of \$17,942. The president of the company, Mr. Georges Lelièvre, stated that in spite of the many difficulties the present year promised to be very satisfactory.

It will be remembered that the Etablissements Hutchinson is an important rubber manufacturing concern which was established in France in 1853 by Hiram Hutchinson, an American.

MR. MANDERS APPOINTED PRESS MANAGER.

THE Rubber Growers' Association, of London, has appointed

A. Staines Manders as its press manager, and a better selection could not have been made in all England. Getting the press to devote its valuable space to commercial topics is an art. It is altogether a legitimate art, for the press is always glad to print what will appeal to its readers, even though it may advance

the interests of some particular industry, and Mr. Manders has the gift as few men possess it of bringing to the attention of the press the most interesting features connected with the rubber industry.

It will probably be remembered that when he arrived in New York some months previous to the rubber show, held in that city in 1912, to finish the preparations necessary for that event, he was interviewed regarding his mission

by the reporters of the New York papers. He gave them much valuable information regarding the rubber exposition that was to be, but one particular statement which he made, namely, that scientific analysis had shown that the dust of the city streets—through attrition of tires, heels and horse shoe pads—was 12 per cent. rubber, struck the reporters as something distinctly new, and as a result of that interview a great deal of space in the American press, including both city and rural papers, was given to the discussion of this new idea. It was discussed from its economic and sanitary standpoints, and in this way a great deal of public attention was directed towards the coming rubber show, which was of course what Mr. Manders wanted to accomplish.

Mr. Manders has organized and managed four international rubber expositions—three in London and one in New York—the success of which depended upon the amount of publicity the daily press of the two cities was willing to give these enterprises; and the amount of space which they received was ample proof that Mr. Manders knew just how to prepare his press matter so that it would pass the editorial test.

The Rubber Growers' Association, of London, represents the important planting interest of the East, which has already reached vast proportions and will soon be one of the great industries of the world. With Mr. Manders as the press manager of this Association the Eastern planters need never fear that their light will be hid under a bushel.

IMPORTS OF RUBBER GOODS INTO BRITISH SOUTH AFRICA.

Statistics of imports of rubber goods into British South Africa are given under two headings only—conveying hose and rubber and gutta percha.

During 1914 the imports of conveying hose amounted to \$95,120, as compared with \$108,974 for the previous year, showing a decrease of \$13,854. Imports of rubber and gutta percha, specifically, amounted to \$116,479 and \$118,140 in 1914 and in 1913 respectively, showing a decrease of \$1,661 in 1914.

A. STAINES MANDERS.

The Rubber Trade in Germany.

By Our Regular Correspondent.

SINCE my last communication there has been no amelioration in the general state of affairs here. At present there is a little more movement in commercial and industrial circles than there was at my last writing, but this is only the natural sequence of the dead summer season. Business continues to suffer from the confused conditions we are experiencing. Before this war we had no idea of the effect it would have on our commercial and industrial life. Practically all those doing any considerable business are working either directly or indirectly for the army. Manufacturers who never before had anything to do with government supplies are overrun with war orders. Industries that could exist only with difficulty in peace times are now doing a flourishing business, while others that were prosperous under normal conditions have been ruined by the war.

One of the greatest sources of trouble is the lack of orders. Everybody is either saving or has nothing to spend, a state of affairs most injurious to general trade. The rubber industry is, of course, not an exception to the general rule. While large dealers having direct or indirect commercial connections with the government have more orders than they can fill, the small dealers cannot secure enough business for their needs.

The rubber industry, like all of our industries that depend upon foreign countries and the colonies for their supplies of raw materials, is suffering greatly from the present situation, but conditions would long ago have been worse than they are had not our manufacturers taken advantage of the low prices prevailing in the rubber markets just previous to the war, when they stocked large quantities of crude rubber. The government also deserves credit for the judicious manner in which it organized the preserving and distribution of raw materials. Now we realize the mistake we made in purchasing our crude rubber in foreign markets. Had Hamburg been our chief supplier of crude rubber, a larger stock of it would have been on hand there when the war broke out. Most of our manufacturers, however, purchased their crude rubber in foreign markets and the rubber trade of Hamburg, though great, was not a German trade; Hamburg was a receiving point for redistribution to other countries, especially Russia and Scandinavia.

Unskilled employees, including those who do not know how to make out an order and those who do not know how to fill one, are causing much trouble to both dealers and manufacturers. This will be readily understood when I state that in many cases not only all the old employees are at the front, but also the managers and employers themselves.

The number of articles no longer to be had in other than substitute qualities, like the list of those no longer to be had at all, is constantly increasing. The greatest trouble is that many substitute qualities do not give satisfactory service. Answering complaints and making adjustments have become the principal occupations of our dealers and manufacturers of rubber goods. The most difficult position is certainly that of the dealer who, to keep his trade, is obliged to make all sorts of promises and, not being backed up by the manufacturer's warranty, is obliged to make good at his own expense, or lose his customers.

The demand for rubber coats never has been so large in Germany as in the last year. Good crude rubber is essential in making rubberized garments. Substitute rubber-proofing gives poor service. Our manufacturers are not allowed to use crude rubber for making garments and can only deliver "war

qualities"; but the prices asked for these garments have been extremely high and have led customers to believe they were getting the very best Germany can produce. As this is certainly not the case, much discredit has fallen on rubber coats and other garments of native manufacture. We fear that the industry will suffer from this false impression, and those interested have already organized to explain matters to the public and make it clear that German rubber coats should not be judged from the quality of those purchased this year under war conditions. An "Association of German Rubber Garment Manufacturers" has been formed, with headquarters in Berlin, for the protection of the German rubber garment industry.

Many rubber manufacturers here are relieving their difficult situation by producing small articles for the comfort of the troops in the field. Of this class of articles are ground-cloths, proofed caps, proofed face and neck protectors, gas-masks and the like. These are sold by mail-order, mostly, but also by dealers, either direct to the soldiers at the front or to their relatives at home, who forward the goods to them. Military doctors have been prescribing foot-arches for men suffering from flat feet. The continuous strain of long marches with heavy equipment has caused much suffering from this source and the manufacture of foot-arches has become a feature of the business of many of our rubber manufacturers.

One peculiar effect of the war has been the increase in the demand for flexible truncheons or clubs of the type used by the London police force. These truncheons are made of a combination of rubber and fabric. They are not used by our troops for defending the Fatherland, but are purchased by the people at home for their personal protection against the tramps and vagabonds that infest the country in these troubled times.

Returning to the subject of substitutes or "war qualities," as we call them here, tire casings made from reclaimed rubber are giving fairly good service on bicycles, but inner tubes made from reclaimed rubber are of no value at all, and several organizations interested in tires have petitioned the Imperial War Minister asking that small quantities of crude rubber be allowed to manufacturers from time to time for making inner tubes.

The mechanical packing trade, which has suffered less than others, is now badly affected by the high cost of asbestos, which, owing to the shortage of rubber, has been used in great quantities for mechanical purposes. Lately the price of asbestos and asbestos articles has increased 25 per cent.

The spinning and weaving industries, which heretofore have been very active, have been much curtailed because of the fact that the government has been obliged to restrain and regulate the use of textiles. According to the latest government decree spinning and weaving factories must not work more than 10 hours per day and not more than five days per week.

The surgical rubber industry is now obliged to follow the same course as other industries and offer substitute qualities. The army and navy sanitary services alone are still receiving first-class surgical rubber goods. In Belgium our military governor has prohibited the manufacture of surgical goods and also of leather goods, except in cases where special permission is granted by the delegate of our war department attached to the Belgian service.

The price of rubber insulated wires, all of which are being made in substitute qualities only, recently increased 20 per cent.

Benzol and naphtha solvents can now only be used by firms working directly or indirectly on government orders. A recent decree fixed the qualities and prices of these solvents as follows:

	Marks.	U. S. Currency.
Pure toluol per 100 kilis. (220 pounds)	45	\$10.71
Benzol, naphtha solvent and xylol.....	63	14.95
Combination of 70% benzol and 30% alcohol....	67	15.95
Combination of 25% benzol and 75% alcohol....	74	17.61

Other combinations or mixtures than those above given are not allowed. The shortage of crude rubber and the general use of reclaimed qualities make the rubber reclaiming business exceptionally good; all the reclaimers here are very busy.

We hear that the advance of our troops in Russian territory has obliged the "Prowodnik" factory to remove to Charkow, and that there is even a question of transferring this huge rubber plant to a point beyond the Ural mountains.

Our rubber manufacturers have been large contributors to all the government's war loans. Only recently the Continental company of Hanover contributed 5,000,000 marks to the third war loan, while its employees subscribed 1,000,000 marks, making the total contribution of the Continental works 6,000,000 marks [\$1,428,000] for the third loan alone.

The reopening of our foreign trade after the war is a subject that is receiving much serious attention here. In my last letter I mentioned rumors of German interests collecting large quantities of raw materials in neutral foreign countries to be rushed to Germany as soon as peace is resumed. Meetings have been held and will continue to be held by representative organizations to discuss the future of our foreign commerce.

The scarcity of rubber and manufactured rubber goods led our government recently to instruct school teachers to tell their pupils to search the roadways over which they pass and pick up all pieces of glass and sharp metal likely to injure the tires of cycles and motor vehicles. From all sides we hear that the effect of these orders has been magical and that tire trouble brought about by glass, nails, sharp iron junk, etc., is now quite insignificant.

A GERMAN VIEW OF THE EFFECT OF THE WAR ON THE WORLD'S MARKETS FOR RUBBER GOODS.

A RECENT issue of the "Gummi-Zeitung," published in Berlin, contains a comprehensive article giving the German view of the effect of the war on the world's markets for rubber goods and the possible future of the international trade in this line. Here is the gist of the article:

Before the war broke out the world markets had been well stocked in rubber goods of all kinds, with the possible exception of mechanical goods and toys. The demand for mechanical goods is one of the most constant and regular in the rubber trade. Germany was perhaps the most important supplier of the world's requirements in this line, but England, France and the United States also produced and exported large quantities of rubber mechanical goods. There being so many sources of supply, importers and dealers felt sure that, should any one of their providers become incapacitated, they could rely on the others to supply their demands.

In this they made a grievous mistake. Germany was cut off by the war, but England and France could not take her place, for their manufacturers were too busy manufacturing for domestic and war needs. There remained the United States, who accepted an agreement with England that has tied up her export trade in rubber goods. Even were there no such contract to restrict their operations, American manufacturers could do but little foreign trade, for their domestic market absorbs practically all their production of rubber mechanical goods. The result is that most European countries have all they can do to supply their own needs, while

China and other foreign markets are obliged to suffer and wait.

Rubber footwear was part of the wearing apparel of practically every Chinaman. Northern China obtained most of its rubber goods from Russia, which can hardly be expected to be able to continue business under present conditions. The Allies are absorbing all the rubber footwear they can produce and a good portion of the American production. The rest of the American production is consumed by the domestic market. The same state of affairs exists throughout the rubber trade of the world. Germany hears from all sources that there is a shortage in rubber goods.

However, it cannot be said that the demand for rubber goods is very large. Outside of mechanical goods the demands have, generally speaking, been rather limited. The unsettled state of affairs leads merchants to purchase only from hand to mouth and to allow their stocks to become depleted. This practice will prevail until the war is ended. "What will happen then?" There will be a great boom in the rubber trade.

In spite of all the writings of the British press, South Americans and other neutrals will be glad to purchase German goods. Little inclination has been shown towards purchasing British goods. The trade Germany is losing while the war lasts goes to America. When South America shall have exhausted the supply of rubber goods Germany furnished her during the six months preceding the war she will look to the United States for further supplies. The British press states that Germany's losses are American profits. This is so. But America's gains are also British losses. Neither America nor England can compete successfully with German rubber goods, for their costs of production are too great. That is why they have been obliged to specialize in their exports of rubber goods. Germany sells all kinds of rubber goods, while they have to specialize in a few lines in which they can offer better conditions and prices. German merchants can offer the entire line as a whole at better prices and they will soon regain their supremacy when peace is re-established. America's gains will be but temporary except in a few special lines. The real loser in this war will be England.

CONDITIONS IN RUBBER TRADE IN HOLLAND.

The American Consul-General at Rotterdam, Holland, reports that only \$250,000 worth of rubber shares was subscribed to in the Netherlands in 1914, as compared with \$1,470,000 offered and subscribed to in that country during the previous year. Notwithstanding the fact that few shipments of rubber were received during the latter five months of 1914, the imports of crude rubber for that year exceeded those for 1913 by something like 650,000 pounds, the total for 1914 being 2,935,066 pounds, against 2,286,900 pounds for the preceding year.

The port of Rotterdam's exports of crude rubber to the United States amounted to \$302,520 in 1914 as compared with \$159,789 exported to this country in 1913, showing an increase of \$142,731. While the exports of rubber waste amounted to \$76,743 in 1913, Rotterdam only shipped \$19,188 of rubber waste to the United States during 1914.

RUBBER FAMINE IN SWEDEN.

Mention has already been made in these columns of the tire famine prevailing in Sweden through the government's failure to comply with Great Britain's request that it place an embargo on all exports of rubber and rubber goods. Late reports from reliable sources stated that matters had become so serious that only 160 motor cars were able to continue service in Stockholm owing to the shortage of tires. Lately, however, the government has acceded to the British demands and the serious situation created by the lack of rubber will no doubt soon be removed.

RUBBER PLANTING NOTES.

EFFECT OF THE WAR ON THE RUBBER TRADE OF THE NETHERLANDS INDIES.

CRUDE rubber, generally speaking, has not been injuriously affected by the war. On the contrary, the war appears to have benefited the rubber trade in many instances; this in spite of the fact that one of the world's largest consumers of crude rubber is cut off from all sources of supply. In any event, the war has caused some important changes in the world's rubber markets. Antwerp has ceased, at least temporarily, to be a crude rubber market and the Amsterdam market has been greatly affected. London has become even a greater center for crude rubber sales than it was before the war, and a new rubber market has been created at Batavia.

Americans and Japanese are now purchasing rubber in Batavia and having it shipped direct to destination. During the first five months of 1915 the exports of crude rubber from Batavia to America direct amounted to 2,596,906 pounds, as compared with 67,316 pounds during the corresponding period of 1914 and 13,708 pounds during the first five months of 1913. Batavia's direct exports to Japan during the first three months of 1915 aggregated 191,571 pounds, as compared with no exports of crude rubber at all in 1913.

On the other hand, only 532,145 pounds of crude rubber went from the Dutch East Indies to Holland during the first quarter of 1915 as compared with 1,572,973 pounds shipped during the corresponding period of 1914.

The difficulties experienced at the opening of the Batavia market through lack of shipping facilities have been overcome by the creation of regular steamship services between that port and the United States and Japan. Prices in the Batavia crude rubber market are based on London prices.

EXPORTS OF RUBBER FROM BURMA DURING 1914-1915.

The production of rubber in Burma is steadily increasing. During the fiscal year 1914-1915 the exports of crude rubber from this British colony amounted to 987,392 pounds, as compared with 765,073 pounds exported during the previous fiscal year. Of the exports for 1914-1915, 892,304 pounds were shipped to Great Britain and 82,992 pounds to the Straits Settlements, the remainder going to various other destinations.

RUBBER IN SOUTH INDIA.

The exports of crude rubber from the Presidency of South India, British India, during the fiscal year 1914-1915 increased 50 per cent. in quantity and 19 per cent. in value as compared with the previous fiscal year. Like many other countries, South India is having its labor troubles. These are of a peculiar kind. The tremendous growth of the rubber planting industry in Ceylon and Malaya creates an enormous demand for labor in these countries, which have been obliged to import coolies from abroad and especially from South India, with the result that labor is short on the plantations of the Presidency. Though the war has caused emigration to slacken somewhat, it still continues on an alarming scale, and several boards have been formed in South India to devise ways and means for checking the tide which is menacing the future of the local plantations. For the fiscal year 1914-1915, in spite of war conditions, 49,028 men, women and children left South India for the Straits Settlements, 79,757 went to Burma and 144,146 to Ceylon. During the previous fiscal year these emigrations amounted to 117,783 to Malaya, 130,725 to Burma and 190,059 to Ceylon.

CEYLON RUBBER PLANTATION ACREAGE.

According to the Ceylon Blue Book for 1914 the total area under rubber in the island amounted, in 1914, to 168,178 acres. During that year 34,353,099 pounds of crude rubber were exported.

CEARA RUBBER IN BRITISH NORTHERN NIGERIA.

The hermann, an intensely dry land-wind of the coast of Africa, has always been a formidable barrier in the way of the cultivation of perennial plants in the northern provinces of British Nigeria, and, according to the 1913 and 1914 annual reports of the Agricultural Department of these provinces, published recently, experiments are being conducted by that department to determine how well *Ceara* rubber trees can be developed to resist this dreaded wind.

Ceara seed was sown at distances of 12 x 12 feet and germination was quite regular and uniform so that most of the saplings reached a height of 6 feet during the first six months. At this point the hermann caused the leaves to fall from the young *Ceara* plants, thus arresting their development. The experiments will continue.

MR. WRIGHT MAKES SOME ESTIMATES.

Writing recently of the past and future of the rubber planting industry, Herbert Wright, editor of "The India Rubber Journal," states that the world's consumption of crude rubber has been increasing, for the past five years, at the rate of at least 12 per cent. per annum. Though 1914 could not be considered a normal year, some of the world's most important consumers of crude rubber being shut off from supplies during half of the year, the consumption of crude rubber increased normally.

As to the future, Mr. Wright estimates the total Mid-Eastern production for 1915 at 80,000 tons. Regarding consumption he believes that America alone will consume 80,000 tons of crude rubber, and if the war should terminate during the year, Germany and Austria would need at least 40,000 tons to re-stock their factories and supply the urgent needs of their population. In his opinion the rubber planting industry will be in a much stronger position after the war than it ever was before.

PYROLIGNEOUS ACID FOR COAGULATING RUBBER.

Dry distillation of cocoanut shells yields crude acid of 10 to 12 per cent. strength. When diluted to 1 in 10 of water it can be used for producing smoked rubber at a greatly reduced cost.

THE RUBBER SITUATION IN DUTCH GUIANA.

By Our Regular Correspondent.

SUCCESSFUL HEVEA CULTIVATION IN DUTCH GUIANA.

THE Compagnie Des Mines D'or de la Guyane Hollandaise is to be congratulated on the successful cultivation of 39,418 rubber trees, 9,000 of which will be tapped for the first time during this year.

M. Gufroy, the president of the company—which is located in Paris—visited the colony as far back as 1906, and at the time contracted the rubber fever. He purchased thousands of seeds of the *Hevea Brasiliensis* variety, and took them along with him to the concessions, which are situated on the extreme limits of the colony bordering on the Brazilian frontier. The seeds were first planted out in nursery beds and afterwards transplanted on the hill sides of the mine. They grew wonderfully, and in almost every case are today fully developed, and, as before stated, tapping operations are to begin during this year.

This French concern deserves great praise for the foresight displayed by the president in adding to the revenues of the mine, which, by the way, is the largest gold producer in Dutch Guiana. In 1914 no less than 328½ kilograms pure gold was produced by the crudest methods of hand labor, and it is expected that by the end of 1915 their revenues will be greatly increased by the addition of a big rubber production.

It is the intention of the company to plant out every available foot of land on the property with *Hevea Brasiliensis*, and so create a monopoly in the business in future.

The close proximity to the forest of Brazil, the home of the *Hevea*, may in a measure account for the rapid and successful growth of the trees on the company's concessions. It must not be forgotten that the land on which these 39,418 rubber trees are flourishing so luxuriantly is purely mountainous and rather rocky. This fact goes to prove the theory of some planters in the colony to be all wrong that *Hevea* only thrives well on the flat marshy soils on the coast, where the plantations are located. The distance from the coast to the mines is about 200 miles, along the winding Maroni river, and then into the Lawa, which takes its rise in the Tumuc Humac mountains, which divide the colony of Dutch Guiana from Brazil.

REVIVAL OF THE BALATA INDUSTRY.

Although bleeding operations began late in the season, the returns have been considered satisfactory under the circumstances, and the amount of balata so far reported at the Custom House is 745,960 kilograms [1,641,112 pounds]. There are several thousand kilos, however, not yet ready for shipment from the concessions to Paramaribo, owing to the dry state of the upper rivers which renders transportation slow and expensive. A journey that is accomplished under normal conditions in three or four days sometimes in dry weather requires as much as twenty days.

Balata gathering, with the thousand and one difficulties connected therewith, is not an ideal job and those engaged in the business are deserving of every encouragement and support.

The company in New York that was instrumental in adjusting the new ordinance, through the authorities at Washington, of which mention was made in the September number of THE INDIA RUBBER WORLD, is doing well and expects to reap a good harvest of balata, although operations began late in the season. This concern is operating with a very large number of laborers and has a substantial office administration in Paramaribo. It is an example of what can be accomplished when capital and intelligence are combined.

Since my last communication, importations from the United States have increased by 100 per cent., and, especially noticeable are such commodities as beef, pork, flour, fish, canned goods, with a large quantity of kerosene oil and gasoline. This increase in the imports only goes to prove that matters are being gradually adjusted in the balata business, and that in the course of time this once flourishing industry will revive and become, as in times past, the colony's main source of revenue.

The prospecting season begins in a few days, and several expeditions are leaving town for the interior, where line-cutting will continue until the end of the year. It is said by some well-informed people that vast tracts of country have been recently discovered with as many as ten trees of tappable size to the acre.

LEAF DISEASES ON THE RUBBER PLANTATIONS IN SURINAM AND BRITISH GUIANA.

In consequence of the reported outbreak of leaf disease in connection with the rubber trees on some of the plantations in the colony, I communicated with a plantation proprietor in British Guiana—where all, or nearly all, of the trees are said to be afflicted—to ascertain what steps had been taken in that colony to check the spread of the disorder, and was informed that G. E. Bodkin, the government economic biologist, had left Georgetown for the government experimental station at Christianburg, where he will undertake certain measures to ascertain the most effective way of controlling the disease by spraying.

The disease is said to have affected the rubber trees at the Consolidated Co.'s plantations in the northwest and on the Essequibo, at Coverden on the Demerara river, Greenheart Camp, and at the Christianburg experimental station. It has not yet been ascertained whether Berbice county has been affected also.

Professor Harrison has stated that the disease was first noticed by him about 1900, at Nottegedacht, in the Canal Polder, and then at Greenheart Camp, and subsequently at Christianburg, where the government experimental station is located. His de-

partment investigated, and since that time the disease has been reported at various rubber estates. Some of them have been very extensively attacked, and some slightly, where the pest was looked after in time. Now the department is taking steps to see what is the most effective way of dealing with the disease. He anticipates that on the return of the government biologist from Christianburg he will be able to give some definite facts.

Professor Harrison pointed out that the most unfortunate part of the disease was that after it attacked the plants it checked their growth. Then after the leaves had fallen there was always the possibility of the disease extending to the other plants. It is wise to keep the disease under control at an early period; but complaints are now coming in from planters who possibly have not done so. Professor Harrison was also of the opinion that the disease had possibly spread from the native to the cultivated rubber trees.

Mr. Petch, the government mycologist at Ceylon, writing recently about the leaf diseases of the *Hevea brasiliensis*, said: "The fungus which causes the diseases was first described by Hennings in 1904, under the name of *Dothidea Ulci*. The specimens had been collected by Ule in the upper Amazon Valley, Jurua (Acre Territory), on the banks of the Rio Jurua, Mirum (Acre Territory), and on the banks of the Amazon in the neighborhood of Iquitos (Peru). Hennings did not give an account of the injuries caused by the fungus. Dr. Huber, however, on the occasion of his visit to Ceylon, stated that it sometimes caused serious damage and defoliated the trees. In 1911," continues Mr. Petch, "Dr. J. Kuyper described what was considered a different leaf disease of *Hevea* from Surinam. The disease occurs in three forms. In the first stage the young leaves, only three to five days old, exhibit transparent olive green or dark green patches, which are sometimes so numerous that the whole leaf blackens and collapses. In the nurseries, sometimes, every plant is attacked. *Hevea* leaves grow rapidly, and apparently the fungus cannot attack the older tissues. More recently, Bancroft has recorded another leaf disease, from British Guiana. The symptoms were a spotting of the leaves, followed by an increase in the size of the spots, with the production of dried areas which eventually fall away from the green parts, leaving holes in the leaf surface." Mr. Petch concludes that it would appear probable, therefore, that the British Guiana leaf disease is the same as that of Brazil and Surinam.

The Department of Agriculture at Paramaribo is now making extensive examinations on many of the rubber plantations with a view of adopting the best scientific measures for combating the disease. On a recent visit to plantation Voorburg the courteous manager, Mr. Arntz, was kind enough to take me through his drying factory, where I was treated to a sight of nearly 1,000 kilograms of fine Para rubber in sheets. This plantation is run by an experienced man and can lay claim to being the best rubber producing estate in Dutch Guiana.

Mr. Arntz informed me that previous to his trip to the Far East last year he was quite pessimistic about the rubber industry ever making good in the colony, but since he was in a position to see for himself and to study Far East conditions he has now become quite an optimist and entertains great hopes for the future rubber industry in Dutch Guiana.

ARGENTINE EXPORT PROHIBITION.

A recent presidential decree of the Argentine Republic prohibits, among numerous other things, the exportation of rubber goods.

VENEZUELAN CUSTOMS TARIFF LAW.

The Republic of Venezuela has promulgated a new customs tariff law, in which goods are specified under categories rather than under each class of the tariff. Waterproof clothes of wool and rubber are dutiable at 10 per cent. ad valorem; while waterproof clothes of cotton and rubber are taxed 25 per cent. specific; rubber belting at 25 per cent. specific, and suspenders, braces and garters at 50 per cent. specific.

THE RUBBER SITUATION IN THE AMAZONS.

By Our Regular Correspondent.

THERE has been a genuine awakening here since my last letter. Our people are beginning to see the real cause of their troubles, and there is a serious movement under way to find a remedy. We are actually starting to devise rational ways and means for reorganizing the economical life of the country.

Rubber was for many years the sole foundation of the economical edifice in this part of Brazil. We called it "black gold," and it was almost as stable a standard as gold as long as we held the monopoly of its production. But we have lost this monopoly. We are no longer first among the world's producers of crude rubber. Other countries now produce and sell more rubber than we do. Our standard is depreciated; the foundation of our economical structure is gone and with it the structure itself. We shall have to rebuild.

When the present crisis was first felt, in 1913, we believed it to be the same sort of experience we had passed through so often before. But we were mistaken. The present crisis is not like the others; it is deeper rooted. It is a crisis of transition, a phenomenon of economical evolution. There is no use counting, as heretofore, on some intervention of Providence; we must act ourselves and waste no more time in vain hopes. To count on the destruction of Eastern plantations by disease or plague, as some have been disposed to do, is pure folly. No more relief for us can be hoped from this source than from the war. When the latter broke out and prices of crude rubber increased, many of our people felt sure that old averages would again be attained. You know how faulty this calculation has turned out to be.

We must reorganize and rebuild. Rubber is going to count in the future prosperity of this part of the Union, but it will not be all, as it was in the past. The greatest obstacle in our way certainly is tradition—old habits. Our soil, of course, is perfect for the rapid and healthy development of rubber plantations. We certainly can produce as good, if not better, rubber than other countries, and we are nearer than they are to the consuming markets. Our whole problem is the reduction of the cost of production. The lack of labor, which has always been an obstacle in the way of reducing the cost of our crude rubber, is being remedied by extensive immigration, mostly from the southern Brazilian states. The great factor in the cost of crude rubber production now, as heretofore, is the expense of living, which must be materially reduced.

Here is where habit stands in our way. Our people are so used to relying on foreign countries for their supply of the necessities of life that it is not easy to educate them to understand that this system is the principal cause of their troubles. But the people are beginning to pay more attention to the production of the necessities of life. Farming and stock-raising will decrease the amount of our imports, and consequently they will lessen the amount of money spent abroad. Coöperative associations for production and consumption are being organized. Rural credit will be developed and organized to facilitate the purchase of the necessary implements for farming and for raising stock.

Modern agricultural systems will be substituted for the primitive methods now generally in vogue in this country. The work of reorganization has started and it will be carried on actively, though with care not to interfere more than necessary with present business methods.

Our forest wealth will continue to be exploited and at the same time improved. Our people will be taught to recognize the possibilities their land offers them. New means of communication and new markets will be created, while those already in existence will be modernized and improved. Private shipping concerns will be encouraged, and we believe the best way to do this is to see that they are supplied with freight to carry the whole year round. When the economical transformation of the Amazons shall be an accomplished fact, with the abundant

local production of the necessities of life, and with increased trading facilities, incidentally we certainly shall be able to compete with the Orient, whose sole advantage lies in low cost of production. The future of this country is not so black as many are inclined to believe it to be. Our new economical edifice will be built with rubber as part of its foundation, and not as the whole foundation, as it was in the case of the old structure now wrecked.

There is a rumor here that the government intends to send a national transport steamer, the "Sargento Albuquerque," to Holland with a cargo of coffee, crude rubber and other products.

Statistics for the fiscal year 1914-1915 show that our exports of crude rubber amounted to only 35,305 tons as compared with 39,115 tons exported during previous fiscal year—a decrease of more than 9 per cent.

AUTOMOBILE TIRES IN BRAZIL.

Crude rubber is the second in importance of Brazil's exports, but there are no automobile tire factories in Brazil, where, up to the present time, French, English, German, Italian and Belgian tires have dominated the market. This fact is principally due to the experience of European exporters and the long credits they allow to reliable dealers in Brazil. European tires are furnished in all styles and sizes to meet the requirements of American as well as of European-made cars. American tire manufacturers only supply about 3 per cent. of all the tires used.

The customs duty on automobile tires was 5 per cent. ad valorem until March 31, 1915, when the new law for protecting Brazilian rubber was put in force and an import duty of 50 per cent. ad valorem placed on all automobile tires not made of fine Para. As is known, the customs officials were unable to enforce this law owing to the difficulty of determining the origin of the rubber. New rulings have modified the law so that now importers, on paying the old duty of 5 per cent. ad valorem, sign a promise to pay the difference of 45 per cent. in the event the legislature should fail to repeal the "fine Para" law.

The Michelin Tire Co., of France, whose tires have quite a vogue in Brazil, publishes normal price lists for all of its types and sizes of tires, together with the extra charge imposed by reason of the increase in Brazilian customs rates, and binds itself to refund these surcharges to the purchaser in the event the law is repealed. For instance, the Michelin price lists show: 34 x 4-inch tire-casing, "Semelle" type (leather steel-studded non-skid tread), normal price \$40.75; supplementary charge \$14—to be refunded should Congress repeal the "fine Para" tariff law.

WILL AMAZONAS PERMIT "CUTTING" OUTSIDE THE STATE?

Manaos owes her commercial supremacy to the old law which prevents "cutting" rubber outside the boundaries of the state. There has been a rumor of a recent discussion in the State Congress of Amazonas concerning a change in this time-honored decree. Should the law be changed permitting rubber to be "cut" outside of Amazonas it will be a severe blow to the rubber commerce of Manaos. "Cutting," it might be added, is a collective term that denotes cutting, grading, sorting, packing and shipping.

EXPORT TAX ON RUBBER ADVANCED BY THE STATE OF AMAZONAS.

A law has been passed by the Congress of the State of Amazonas, Brazil, raising the export duty on rubber from 15 per cent. to 18 per cent. This action was taken without the slightest warning and caused consternation in the trade. Many exporters had already bought several hundred tons of rubber on the 15 per cent. basis and were faced with a loss of 3 per cent. The Chamber of Commerce of Manaos has protested to the Governor, who finally permitted shipments to go forward at the 15 per cent. rate by the first American and European steamers sailing after the new tax was declared.

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED SEPTEMBER 21, 1915.

- N**O. 1,153,948. Vehicle wheel. H. V. Pannecocke and H. Schaefer—both of Detroit, Mich.
 1,154,055. Force cup. G. C. Reeves, Chicago, Ill.
 1,154,069. Audiotape. C. S. Havre, France.
 1,154,119. Resilient tire. D. M. Kamper, assignor of forty-seven and one-half one hundredths to J. Rosenwasser—both of New York, N. Y.
 1,154,154. Spanner or Wrench for use with a detachable vehicle wheel. W. Wright, Stoke Park, Coventry, assignor to The Dunlop Rubber Co., Limited, Aston Cross, near Birmingham—both in England.
 1,154,216. Vehicle wheel rim. W. F. Stengel, assignor of one-half to J. Benker—both of Akron, Ohio.
 1,154,218. Demountable rim. J. J. Stosick, South Milwaukee, Wis.
 1,154,259. Hose coupling. C. H. Light, Des Moines, Iowa.
 1,154,280. Undergarment in which elastic fabric is used. A. Wylie, Rockville Center, N. Y.
 1,154,288. Collapsible rim. W. B. Christopher, assignor of one-half to C. C. Baxter—both of Birmingham, Ala.
 1,154,318. Tire filler. H. J. S. Keim, Cataasauqua, Pa.
 1,154,372. Battery cell. A. Burritt, Ozark Park, N. Y.
 1,154,442. Tool for repairing tires. F. Severson, Muncy, Pa.
 1,154,476. Filling device with rubber sleeve. H. S. Benjamin, Rochester, N. Y.
 1,154,484. Resilient tire for road vehicle. W. H. Carmont, Kingston, England.
 1,154,491. Orthopedic cushion. L. DeOliva Del, New York, N. Y.
 1,154,497. Wheel with flexible tire. J. F. Evans, Martinsburg, W. Va.
 1,154,504. Vehicle wheel tire. A. W. Gano, Carrollton, Ill.
 1,154,525. Anti-skidding and traction apparatus for vehicle wheel. J. McMullen, Bate, Mont.
 1,154,529. Game table with elastic cushions. L. Meluzzi, Buenos Aires, Argentina.
 1,154,556. Hose supporter. B. S. Alsop, New York, N. Y.

ISSUED SEPTEMBER 28, 1915.

- 1,154,629. Demountable rim. C. C. Harbridge, assignor to Detroit Demountable Rim Co.—both of Detroit, Mich.
 1,154,817. Multiple chamber pneumatic tire. J. W. Turner, Kirtsville, Mo.
 1,154,848. Pneumatic tire. H. S. Dew, De Walt, and W. H. Minton, Missouri City—both in Texas.
 1,155,018. Piston packing. G. S. Towne, Oakland, Cal.
 1,155,025. Rubber tread flexible armor for pneumatic tire. C. L. Wolfe, Brooklyn, N. Y.
 1,155,046. Storage battery. W. A. Crowds, assignor of one-half to Atkinson, Menter & Co.—both of Chicago, Ill.
 1,155,047. Storage battery. W. A. Crowds, assignor of one-half to Atkinson, Menter & Co.—both of Chicago, Ill.
 1,155,053. Tire of shoe holder for automobiles. F. W. Ehrlich, Newark, assignor to E. A. Whitehouse Mfg. Co.—both in New Jersey.
 1,155,209. Heel grip. M. H. Burke, Denver, Colo.
 1,155,246. Resilient wheel. A. Jettia, Orr, Minn.
 1,155,255. Tire. J. E. McCoughtry, Gary, Ind.
 1,155,315. Wheel for self propelled vehicles. J. McGeorge, assignor to The Cleveland Engineering Co.—both of Cleveland, Ohio.

ISSUED OCTOBER 5, 1915.

- 1,155,367. Liner for pneumatic tires. F. E. Neal, Anderson, Ind.
 1,155,394. Pneumatic tire mounting. E. K. Baker, assignor to Universal Rim Co.—both of Chicago, Ill.
 1,155,395. Vehicle wheel. E. K. Baker, assignor to Universal Rim Co.—both of Chicago, Ill.
 1,155,396. Mounting for tire. E. K. Baker, assignor to Universal Rim Co.—both of Chicago, Ill.
 1,155,397. Vehicle wheel. E. K. Baker, assignor to Universal Rim Co.—both of Chicago, Ill.
 1,155,398. Demountable rim for automobile wheels. E. K. Baker, assignor to Universal Rim Co.—both of Chicago, Ill.
 1,155,413. Non-skidding device. M. C. Gannett, Brooklyn, N. Y.
 1,155,417. Pneumatic tire mounting. C. G. Hawley, and E. K. Baker, assignors to Universal Rim Co.—both of Chicago, Ill.
 1,155,575. Core formed of a resilient rubber substitute. W. Hoskins, La Grange, Ill.
 1,155,577. Patch for pneumatic tire. L. H. Israel, Fairfield, Iowa.
 1,155,584. Medicine dropper. F. C. La Grange, Cedar Rapids, Iowa.
 1,155,611. Fountain pen. H. W. Pierce, Waverly, Mass.
 1,155,644. Rubber shoe. J. T. Crowley, assignor to The Beacon Falls Rubber Shoe Co.—both of Beacon Falls, Conn.
 1,155,646. Hose clamp. F. P. D'Arcy, Kalamazoo, Mich.
 1,155,659. Catametal belt of elastic webbing. E. Johnson, Cincinnati, Ohio.

- 1,155,693. Fountain pen. R. L. Warnock, Ohio.
 1,155,775. Inner tube for pneumatic tire. J. J. Voorhees, Jersey City, N. J., assignor to Brown Perfection Tube Co., New York, N. Y.
 1,155,848. Rectal syringe. C. A. Tyrell, New York, N. Y.
 1,155,864. Corset with elastic inserts. A. Abt, assignor to The Warner Brothers Co.—both of Bridgeport, Conn.
 1,155,865. Elastic wheel. E. Amond, Paris, France.
 1,155,874. Friction and metal plug for rubber heels and other tread surfaces. F. Berenstein, Chelsea, assignor of one-half to W. Berenstein, Boston—both in Mass.
 1,155,919. Tire deflating tool. W. C. Gannell, Cadiz, Ohio.
 1,155,982. Attachable outer sole for boots and shoes. R. M. Withycombe, Sydney, New South Wales, Australia.

ISSUED OCTOBER 12, 1915.

- 1,156,054. Hot water bottle. W. M. Brown, Cambridge, Mass.
 1,156,099. Vehicle wheel. L. Risk, Waterloo, Iowa.
 1,156,153. Vehicle wheel having a solid rubber tire. R. Kronenberg, Ohligs, Germany.
 1,156,155. Vehicle tire. N. R. Landis, Portland, Ore.
 1,156,172. Bed pan constructed of rubber. I. Poindexter, Prineville, Ore.
 1,156,202. Breast shield. A. C. Barrett, Montgomery, Ala.
 1,156,238. Bathing cap. I. W. Litchfield, Newton, Mass.
 1,156,242. Cushion wheel. C. T. Miller, Menard, Ill.
 1,156,268. Combined tire valve and pressure gauge. O. F. R. Bromberg, San Diego, Cal.
 1,156,278. Vacuum horsehoe. J. M. Dove, assignor to C. P. Dryden—both of Chicago, Ill.
 1,156,293. Recoil pad for guns having a soft rubber cushion. W. R. Jorgensen, Chicago, Ill.
 1,156,328. Pressure regulating device for tire valves. C. H. Thayer, assignor of one-fourth to G. P. Ransom, one-fourth to G. A. Gucker, and one-fourth to M. L. Sullivan—all of Elmira, N. Y.
 1,156,393. Elastic garter. A. P. Coolbroth, Cambridge, Mass.
 1,156,487. Hat or cap band with section of elastic. S. Kunstadter, Chicago, Ill.
 1,156,523. Invalid cushion having an inflatable cushion body. J. A. Clemens, assignor to Davol Rubber Co.—both of Providence, R. I.
 1,156,706. Hose rack. C. Nuhring, Cincinnati, Ohio.
 1,156,719. Float valve mechanism with an inflated rubber bag. R. L. Stokes, assignor to W. H. Darrow—both of Cincinnati, Ohio.
 1,156,740. Blanket holder including a strip of elastic material. C. M. Berden, Maywood, N. J.
 1,156,748. Spring and presser bar for fountain pens. E. F. Britten, Jr., Jersey City, New Jersey, assignor to L. E. Waterman Co., New York, N. Y.
 1,156,749. Life saving belt or buoy. J. Brown, Liverpool, England.
 1,156,808. Dust reducer. Brasserie, M. Perlat, assignor to Ye Lady's Outfitter—both of New York, N. Y.
 1,156,835. Elastic garment supporter. D. G. Butts, assignor to The Ivory Garter Co.—both of New Orleans, La.
 1,156,862. Pneumatic tire gate. R. C. Sibley, Boston, Mass.

Reissue.

- 13,993. Tennis shoe. N. E. Tausley, Watertown; and C. H. Roper, Belmont, assignors to Hood Rubber Co., Watertown—all in Massachusetts.

UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1914.

*Denotes Patents for American Inventions.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, SEPTEMBER 15, 1915.]
 12,230 (1914). Reservoir pen. F. Rayeau, 52 Faubourg Poissonnière, Paris.
 12,262 (1914). Device for marking boxes, etc., comprising a cylinder containing rubber. H. A. Wiseman, 109 Holsworth Square, Gray's Inn Road, London.
 *12,271 (1914). India rubber. F. V. O'Neill, 117 Draper street, Dorchester District, Boston, Massachusetts, U. S. A.
 12,278 (1914). Wheel tire. S. E. Page, 27 Chancery Lane, London.
 12,306 (1914). Spring wheel with pneumatic cushion. R. T. Park, 137 York street, South Melbourne, Victoria, Australia.
 12,363 (1914). Tire attachment to rim. T. Dunn, 8 Sherwood street, Piccadilly Circus, London.
 12,366 (1914). Fabric used in the manufacture of hose. W. J. Mellersh-Jackson, 28 Southampton Buildings, London.
 12,419 (1914). Diving dress. Neufeldt & Kuhnke, Werk Ravensberg, am Habsburger Ring, Kiel, Germany.
 12,430 (1914). Diving suit. Neufeldt & Kuhnke, Werk Ravensberg, am Habsburger Ring, Kiel, Germany.

- 12,421 (1914). Diving suit. W. P. Thompson, 6 Lord street, Liverpool.
12,422 (1914). Diving suit. W. P. Thompson, 6 Lord street, Liverpool.
12,440 (1914). Flexible tubing and hose made from a rubber substitute composition. K. A. Nestler and K. A. Gartner—both of Wiesa, Saxony, and L. Traube, 153A Am Lützow, Charlottenburg—both in Germany.

- 12,500 (1914). Apparatus for detecting and closing punctures. F. W. Farr, 30 Bridge street, Northampton.

- 12,581 (1914). Ornamental belt and lining attached to garments by a rubber solution instead of stitching. A. M. Purce, White House, Randalstown, Antrim, Ireland.

- 12,588 (1914). Brace or suspender having a number of elastic parts. H. Carhartt, 32A Hope street, Liverpool.

- *12,632 (1914). Cover for wheel tire. J. D. Tew, 87 Rose avenue, Akron, Ohio, U. S. A.

- 12,663 (1914). Tire attachment to rim. C. J. Walker, The Tannery, St. James' Road, Northampton.

- 12,665 (1914). Rubber tire with a converging tread. M. Mettler, 34 Kochstrasse, Leipzig, Germany.

- 12,743 (1914). Siphon bottle with hard rubber stem. O. L. Eugster, British Syphon Mfg. Co., Barnsbury street, London.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, SEPTEMBER 22, 1915.]

- 12,837 (1914). Reservoir pen. Kilo-Werk Fabrik für Gebrauchsgegenstände Ges. Hennef-on-Sieg, Germany.

- 12,884 (1914). Ball. P. A. Martin, 31 Westfield Road, Edgbaston, and J. Stanley, 70 Ivor Road, Sparkhill—both in Birmingham.

- 12,902 (1914). Window casing made of rubber. E. K., W. P., and S. J. Bedington—all of 45 Northwood street, Birmingham.

- 12,919 (1914). Golf ball. A. E. Terry, Novelty Works, Redditch.

- 12,939 (1914). Wheel tire. G. Soper, High River, Brandt, Alberta, Canada.

- 13,000 (1914). Wearing apparel having rubber faced seams. I. Frankenburg & Sons, 1. Frankenburg and J. Caseman—all of Greengate Rubber Works, Salford, Lancashire.

- 13,003 (1914). Stuffing box packing comprising cotton fibre which is treated with rubber solution and vulcanized. Puritas Disinfectants Co., Evington Valley Road, and H. C. Rought, 39 Evington Valley Road, Leicester.

- 13,009 (1914). Gramophones in which rubber tubing rings are used. H. D. and A. Taylor—both of Buckingham Works, Bishop-hill, York.

- 13,072 (1914). Photographic and like films containing rubber. J. E. Braudenberger, Thaoen-les-Vosges, France.

- 13,110 (1914). Jacket and cover for wheel tire. T. R. Walton, 14 Spence Road, Walthamstow, London.

- *13,128 (1914). Rubber and leather compositions. E. B. Cook, 138 Holten street, Danvers, Massachusetts, U. S. A.

- 13,142 (1914). Hypodermic syringe with rubber stopper. J. G. Castro, 3 Calle Tundidores, Granada, Spain.

- 13,157 (1914). Fountain tooth brush. A. Binning, Hatfield, and T. L. Reeves, Mill Green, Hatfield, Hertfordshire.

- 13,162 (1914). Tire valve. C. E. Baker, 34 Blue street, Carmarthen.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, SEPTEMBER 29, 1915.]

- 13,376 (1914). Elastic hair binder. L. Lenton, Rockland Works, Eagle street, Coventry.

- *13,419 (1914). Spring wheel with continuous outer rigid ring. E. F. Krell, 11 Jones street, Detroit, Michigan, U. S. A.

- 13,484 (1914). Rock drill with rubber pad. J. M. and J. L. Holman and J. L. Camborne, Cornwall.

- 13,485 (1914). Taper holder with flexible air bulb. S. Carvin, 34 Boundary street, Liverpool.

- 13,496 (1914). Pea shelling machine with two rubber covered rollers. E. L. Hunter, 131 Gilles street, and F. J. Sheridan, Harcourt Buildings, Victoria Place—both of Adelaide, South Australia.

- 13,573 (1914). Soles and heels with springs embedded in rubber. A. G. and R. G. Doyle, 46 Newlands Park, Sydenham, London.

- 13,589 (1914). Electrolysis; cells with ebonite frames. Soc. Anon. L'Oxybryde Francaise, 54 Rue Philippe de Girard, Paris.

- 13,609 (1914). Siphon bottle with rubber washer. G. Göttl, 24 Humboldtstrasse, Aussig-on-the-Elbe, Austria.

- 13,640 (1914). Tire attachment to rims. Wolsley Tool & Motor Car Co., A. Remington, and J. G. Sweeney—all of Alderley Park, Birmingham.

- 13,761 (1914). Stocking protector of rubber. R. Molenkamp, 8 Rue Choron, Paris.

- 13,775 (1914). Hydroplane with air bag. J. Buchanan, 6 Kavelston Park, Edinburgh.

- 13,780 (1914). Spring wheel with pneumatic cushion. G. Singer, 15 Praterstrasse, Vienna, and R. Luzzato, 342 Commerciale, Trieste—both in Austria.

NEW ZEALAND.

[ABSTRACTED IN THE PATENT OFFICE JOURNAL, AUGUST 19, 1915.]

- 36,057 (1914). Attachable rubber outer sole for boot and shoe. R. M. Withycombe, "Wyoming," Macquarie street, Sydney, N. S. W.

[ABSTRACTED IN THE PATENT OFFICE JOURNAL, SEPTEMBER 2, 1915.]

- 36,445 (1915). Elastic girth. A. C. Gull, Serpentine, Grazier and C. Watson, 82 Barrack street, Perth—both in West Australia.

- 36,481 (1915). Preservation of pneumatic tire. E. Wood, 231 Elizabeth street, Melbourne, Victoria.

THE GERMAN EMPIRE.

PATENTS ISSUED (With Dates of Validity).

- 287,618 (February 25, 1913). A steam or hot air bath that can be used in bed. Iseo Gyenes Károly, of Hungary. Represented by Messrs. J. Tannenbaum and Heinrich Heilmann, Patent lawyers, Berlin SW. 68.

- 287,679 (November 12). Bed bath tub. Elizabeth Anna Mary Gallagher, New York City, U. S. A. Represented by E. Lamberts, Patent lawyer, Berlin SW. 61.

- 287,753 (October 27, 1914). Process for manufacturing field gray water-proof tent cloth. Linny and Kunzli, Sickingen-on-the-Rhine.

- 287,787 (September 4, 1912). Process for manufacturing a rubber-like substance. Badische Anilin- und Soda-Fabrik, Ludwigshafen-on-the-Rhine.

- 287,919 (July 10, 1914). Anti-skid protector for motor vehicle tires. Bernhard Greif, Berger Ufer 2a, Düsseldorf.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

- 476,052 (August 19, 1914). Lever for adjusting tire casing patches. F. Russell.

- 476,208 (April 9). Improved wheels for agricultural and road tractors, and similar machines. M. Lerdin.

- 476,292 (October 14). Heel with rubber metal piece. E. Le Roy.

- 476,351 (October 20). Improved rims for elastic wheels. G. Miller.

- 476,359 (October 22). Improvement to flexible parts, especially those for fastening auxiliary tires and anti-skid treads over tires of vehicle wheels. The Aston Chain & Hook Co.

- 476,418 (October 31). Relineer for pneumatic tires. A. F. Tiedge.

TRADE MARKS.

- 87,066. J. W. Buckley Rubber Co., New York, N. Y. The word *Buckley*. For rubber shoes, rubber belting, rubber packing, etc.

- 87,254. The Mechanical Rubber Co., Jersey City, N. J. The planet Saturn with its ring and the word *Saturn*. For machinery packing composed of rubber or rubber compound.

DESIGNS.

- 47,861. Rubber boot. F. E. Payne, assignor to The Goodyear Rubber Co.—both of Middletown, Conn.

- 47,872. Pneumatic tire tread. P. B. Bosworth, assignor to The Victor Rubber Co.—both of Springfield, Ohio.

- 47,873. Vehicle tire. W. F. Bowers, San Francisco, Cal.

- 47,874. Container for hot water bottles and fountain syringes. L. L. Britton, Denver, Colo.

- 47,875. Vehicle tire. J. Christy, Cleveland, assignor to The Portage Rubber Co., Cleveland, Ohio.

- 47,876. Vehicle tire. J. Christy, Cleveland, assignor to The Portage Rubber Co., Barberton—both in Ohio.

- 47,877. Deflating implement. C. E. Delaplaine, Jacksonville, Ill.

- 47,890. Vehicle wheel tire. E. C. May, Edmonton, Alberta, Canada.

- 47,892. Tread for tire. J. Hauvette-Michelin, New Brunswick, assignor to Michelin Tire Co., Milltown—both in New Jersey.

- 47,933. Rubber shoe. F. E. Payne, assignor to The Goodyear Rubber Co.—both of Middletown, Conn.

- 47,944. Tire. H. C. Arnold, Malden, Mass.

- 47,947. Tire casing. J. H. Christian, Detroit, Mich.

- 47,963. Rubber tire tread. N. J. and F. Mooney—both of San Francisco, Cal.

- 47,969. Tire tread. D. Spence, Norwalk, Conn.

- 47,972. Tire tread. R. F. Teall, assignor to The Toledo Ford-Tire Co.—both of Toledo, Ohio.

RUBBER INDUSTRY IN NICARAGUA.

For a long time rubber gathering was the chief resource of eastern Nicaragua, but this industry was very injuriously affected by the development of Far Eastern plantations and the consequent fall in rubber prices. The lower cost of plantation rubber finally ruined the Nicaraguan industry, though it was not until 1913 and 1914 that this trade was seriously affected. Up to that time it is estimated that as many as 4,000 workers were engaged in gathering rubber on the eastern coast of Nicaragua. The average result of a day's labor was from four to five pounds per man, for which the laborer received 40 cents gold per pound. In 1914 practically all of this labor was left unemployed and the merchants lost their principal means of establishing foreign credit balances. In 1910, the exports of crude rubber from Nicaragua amounted in value to \$280,876; in 1911, to \$214,960; in 1912, to \$207,748; in 1913, to \$96,471; while in 1914, these exports only amounted to \$48,776. In 1910 prices were as high as \$1.30 per pound. Today they vary from 18 to 25 cents per pound.

Review of the Crude Rubber Market.

NEW YORK.

OCTOBER 30, 1915.

A FAIRLY good business was done in spot and December-January futures during October. Prices did not change materially. First latex spot sold for 61 cents, and Upriver fine for 54½ cents on the first of the month. On October 30 First latex was 61½ cents and Upriver fine 58¾ cents.

The announcement of the new Ceylon export tax only resulted in minor and temporary fluctuations. The impression is that the other rubber producing colonies in the Far East will not impose a new tax on rubber exports.

The unstable condition of exchange had a tendency to lower values, but this was overcome by the firmness of the market. Future buying has been mostly confined to January-March deliveries and therefore orders for the greater part of next year's supplies are yet to be placed. This condition is caused by the small difference in present prices for forward sales. On October 29, First latex, January-March delivery, was 59¾ cents, and January-June delivery, 59½ cents.

The future of Singapore as an important rubber market now seems assured. The large rubber manufacturers and dealers are establishing offices or agencies in that city. It is significant that in August 2,110 tons of rubber arrived in New York, shipped direct from Singapore and Colombo, while shipments from London and Liverpool were 1,996 tons for the same period.

The steamship "Indrawaddy," sailing from Singapore direct to New York with 1,000 tons of rubber, put in at Colombo with fire in her hold. She is expected to arrive in New York, November 20, three weeks late. The Booth steamship "Denis" from Pará and Manaoás with 180 tons is now due. The Lloyd Brasileiro steamship "Rio de Janeiro" from Pará, was due October 30, with 235 tons.

Shipments of rubber invoiced through the American Consul at London for the United States during the nine months ending September 30, 1915, were valued at \$43,080,562, compared with \$25,303,056 for the same period in 1914.

LONDON.

The market for the first week in October was active, due to American buying, and prices advanced. Spot and October crépe brought 2s. 6d. Smoked sheet 2s. 5½d., and hard fine Pará was quoted at 2s. 5d. November-December crépe was marked 2s. 5¼d., and January-June, 1916, 2s. 4¾d.

The market continued quiet with prices steady, supported by moderate buying. On October 21, spot crépe and smoked sheet ribbed were both quoted at 2s. 4¾d.; November-December, 2s. 4½d.; January-June, 2s. 4¼d.

Forward contracts for delivery in 1916 are going at 2s. 2d. (52.7 cents) and 2s. 4d. (56.7 cents) and it is reported that a large number of sales covering the greater part of next year have been made on the basis of these figures. Such contracts have been made with the planters, shipments to be made direct to New York.

MANAOS.

The general demand at this point is good and the market is steady. Stocks are not accumulating as might be expected at this time of year. Apparently there has been heavy selling of futures. Upper Cauchó ball is in good demand at firm prices. July and August, generally quiet months, showed unusual arrivals. The receipts are expected to continue in good volume until the close of the present year. Under these circumstances prices are not expected to advance unless stimulated by European demand.

BATAVIA, JAVA.

Private auctions were held at Batavia on August 17, Septem-

ber 17 and October 18. No. 1 crépe brought 61 cents per pound. Private auctions will be held on November 19 and December 17.

SINGAPORE.

At the auction held on September 1, 1915, 234 tons were offered and 176 tons changed hands. Pale crépe and ribbed sheet sold for \$131 [\$73.36 United States currency] and \$129 [\$72.24 United States currency] respectively per picul (133½ pounds).

At the auction held on September 8, 225 tons were offered and 155 tons sold. There was a demand for Pale crépe which readily brought \$133 [\$74.48 United States currency] per picul.

NEW YORK QUOTATIONS.

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows:

"The demand for commercial paper has continued good through October, as for several months past, and the best rubber names have been taken freely at 4@4½ per cent, and those not so well known 5@5½ per cent, the latter mostly by out-of-town banks."

NEW YORK PRICES FOR SEPTEMBER (NEW RUBBER).

(Same period 1913, 17,188,348 pounds; same period, 1912, 8,594,000.)

The export figures of rubber given in the above table for 1914 include the imports re-exported. (These amount to 2,782,475 pounds.) To arrive at the total quantity of Ceylon rubber exported for that period deduct these imports from the total exports. The figures for 1915 are for Ceylon rubber only.

SINGAPORE.

Guthrie & Co., Ltd., report (September 15, 1915):

The rubber auction held to-day opened quietly and bidding throughout was somewhat irregular.

Fine pale crepe again sold readily and for one lot \$132 was paid. Fine ribbed smoked sheet was \$1 down at \$128 and few lots reached this price, the average being about \$127. Unsmoked sheet was in very good demand, all parcels being eagerly snapped up at from \$112/1/8.

The lower grades marked an average decline of \$4, demand for these being slow.

Of 201 tons offered, 127 tons changed hands.

The following was the course of values:

	In Singapore Picul.*	Sterling equivalent per pound in cents.	Equivalent per pound in cents.
Sheet, fine ribbed smoked.....	\$125 @ 128	2/ 5 1/4 @ 2/ 5 1/2	59.29 @ 60.56
Sheet, fair to good ribbed smoked.....	123 @ 124	2/ 4 3/4 @ 2/ 5	58.53 @ 58.79
Sheet, plain, smoked.....	115 @ 121	2/ 3 3/8 @ 2/ 4 3/4	54.98 @ 57.52
Sheet, unsmoked.....	112 @ 119	2/ 2 1/2 @ 2/ 4	53.72 @ 56.76
Crepe, fine pale.....	126 @ 132	2/ 5 1/2 @ 2/ 6 1/4	59.80 @ 62.33
Crepe, good pale.....	125 @ 128	2/ 5 @ 2/ 6	59.29 @ 60.56
Crepe, fine brown.....	121 @ 124	2/ 4 1/4 @ 2/ 5	57.52 @ 58.79

THE RUBBER SCRAP MARKET.

OCTOBER 30, 1915.

THE New York market developed considerable activity early in October, due to the spirited trading in boots and shoes. It was apparently a trader's market, which the mills refused to support with substantial orders. Prices asked for boots and shoes were 8 1/2 cents delivered. All other grades were inactive and prices unchanged.

The interest in boots and shoes continued during the month despite the lack of large buying orders from the mills. The price level was evidently too high, and consumers preferred to wait for better prices. However, actual transactions were made at 8 1/2 cents.

The rest of the list has not developed unusual interest. There are excessive stocks of auto, tires, and prices are therefore easier. Solid and bicycle tires, which have been slow for several months, are firmer. There appears to be a surplus of white tires, resulting in lower prices. Tubes are firmer, and a good buying demand is anticipated by holders of tube stocks. No change has been noted in the other grades of scrap, although hose is receiving fair attention and prices are holding their own.

NEW YORK QUOTATIONS FOR CARLOAD LOTS.

October 30, 1915.

Britain has been commandeered by the war office and none can be sold or exported. Litharge has been in demand at firm prices, while market quotations on white and red lead have not changed; though sales have been reported at higher figures based on better quality.

The rosin and turpentine markets have been very active and advances have probably reached the limit. Aniline oil is selling at 95 cents to \$1.50 per pound, and pine and rosin oil have advanced.

THE CRUDE RUBBER GUESSING CONTEST.

FROM a normal and fairly satisfactory price level of 62 cents, First Latex Crêpe has suddenly risen to 83 cents, and that without apparent cause. Those who buy, and eke those who sell, particularly the latter, are trying to tell the reason why. These guesses, for as yet they are nothing else, are of more than academic interest. They follow along in order about like this:

The Suez Canal is closed, or about to be closed, deflecting or holding up rubber cargoes for some weeks.

Several of the great tin and rubber carriers have been torpedoed and sunk in the Mediterranean.

The British Government has suddenly commandeered five to ten thousand tons of rubber.

British firms having German affiliations have placed large orders for rubber, thus incidentally suggesting an early peace.

A longer delay in the clearing of the Panama Canal than was expected.

Serious conditions in Ceylon and the Malay States because of native uprisings.

The presence of big rubber buyers in the Far East who are placing large orders for future delivery.

The fact that the big manufacturers have been out of the market for months and that they have at last begun to buy largely.

All of the above are guesses, and as such are equally valuable.

The fact remains, however, of the unexplained advance in plantation sorts, and the sympathetic rise in the prices of Brazilian rubber and rubber scrap.

Verily, with higher rubber, more costly cotton and compounding ingredients at prohibitive prices, some slight advance in prices of manufactured goods is in order.

DEARTH OF COMPOUNDING INGREDIENTS.

CAN the American rubber trade face the new year confidently so far as chemicals and compounding ingredients are concerned? Will our sources of supply suffice in 1916, and will the prices be reasonably steady? These are questions that have been asked frequently of late; and we have made a survey of the field and sought the opinions of men qualified to speak authoritatively. In our columns elsewhere the results are given at some length; and the prospect for some of the important materials is decidedly unpromising.

However, there is this to be remembered: none of the ingredients that are becoming so scarce and costly are absolute necessities. Other colors, different compounds, a great variety of substitutions will enable the rubber manufacturers to turn out goods just as acceptable as of yore. And in due time all of the high-priced ingredients will be made in our factories.

RUBBER AND COMPOUNDING RESERVES.

SOME time ago the price of crude rubber reached the high mark of three dollars a pound. There were those, chiefly rubber producers, who believed that it would remain there for a period of years at least. Just at that time, however, there came into the market enormous quantities of rubber scrap, notably motor tires, which under improved reclaiming processes became crude rubber and proved one of the great factors in driving the price down to a reasonably low figure. Thus the rubber

manufacturers were not without a reserve to call upon in times of stress.

A similar condition exists today in respect to various compounding ingredients. Many are scarce, or held at prohibitive prices. There is, however, a vast amount held in reserve in the world's scrap rubber. White scrap may be turned into white rubber again. Autimony stocks may be reclaimed, and so on. All that is needed is a little more careful sorting. The reserve is there for use until prices come down again.

RUBBER MANUFACTURE AND HEALTH.

THE bare suggestion to the old timer that rubber manufacture was anything but healthful would be received with scorn. Nay, facts, incontrovertible so far as rule of thumb reasoning went, could be adduced to support the theory of healthfulness. For example, in the first of the big rubber shoe factories, compounds were known as "paints". They were made up of whiting, lampblack, lime, barytes, white lead, litharge and sulphur. All of these were mixed together in a large bin, by a man with a hoe, and then run through burr mills to ensure further mixing and a greater degree of fineness. The men who did the hoeing and the burr mill mixing, ate, breathed, and absorbed the powders, but that they were anything but healthy would be strenuously denied. Indeed, if we listen to factory tradition, rubber work is very healthful. When other and nearby industries are afflicted with smallpox, scarlet fever, German measles and the like, how very often it happens that the rubber mills are immune. The workman explains it by the presence of sulphur in the air, and also hazards the idea that "bugs" will not live with naphtha and similar fumes. There is also a superstition among old rubber men that while lightning may smite almost any building, even a church, it never strikes a rubber factory.

There has ever been a sort of half knowledge in the trade that litharge might induce lead poisoning. But the cases where it was known were few and far between. Workers also were made slightly sick by naphtha fumes, but they recovered quickly and were properly ashamed of themselves afterward.

Chloride of sulphur was ever recognized as poisonous, and even in the smallest dipping shops the workers were protected from its fumes as much as possible. In fact, few until quite recently used the cold cure.

As for the commoner ingredients, the chalks, talcs,

oils, gums and waxes, as well as the evil-smelling rubber, the workmen were steeped in and powdered with them all, and lived to ripe old age in spite of them.

That is why, when rumors of investigations were heard, they were so scornfully received.

Nevertheless, on the part of the efficiency men and the big manufacturers, and the rubber chemists there was nothing but welcome for the government investigator who hunted down possible poisons in compounds and the poisoned among workmen. Now that the report has been handed in and scanned it shows the trade to be in good shape. Where harmful ingredients are used the men are pretty generally guarded. When they are not, the suggestions in the report point a way toward absolute safety.

GOODRICH GOOD ENGLISH.

AS "The Sun," New York, is noted among newspapers for its correct and sonorous English, so is The B. F. Goodrich Co. noted among rubber manufacturers. This reputation dates from the time, some years ago, when instead of writing "we are sending in same mail," as was usual, they put it, "we are forwarding by correlative post." Their latest bid for super-excellence in English is a tire tread made of "Hyper-Rubber." Lexicographers are more or less familiar with "Hyper" as an anti-skid on such smooth tread words for example as critical, and sensitive. It means in effect a little bit more than the most, better than the best. If the Goodrich Hyper-Rubber is really what its name implies, the compound must be a Hyper-Hummer.

MR. JOHN P. LYONS, FOR FOUR YEARS PAST ASSOCIATE editor of THE INDIA RUBBER WORLD, resigned his position early in November and will spend the winter in Southern California. His many friends trust that the change of climate will be of great benefit, both to his invalid wife and to Mr. Lyons himself.

THE RUBBER COVERED WIRE ENGINEERS' ASSOCIATION was perhaps the oldest rubber club in the United States. At all events it was started one year before the New England Rubber Club. It now comes into prominence by merging its identity with that of the Associated Manufacturers of Electrical Supplies. This adds strength to both organizations, and is where the older association belongs, together with all of the cable, conduit, storage battery and insulation manufacturers.

Industrial Poisons in Rubber Manufacture.

It has long been known that some of the solvents and compounding ingredients used in rubber manufacture are injurious to health. It is also a fact that, to the best of their ability, many rubber manufacturers have guarded against dele-

basic carbonate of lead red lead, antimony pentasulphide and trisulphide, aniline oil, naphtha, benzene, coal tar benzol, carbon disulphide, and carbon tetrachloride.

Of the lead compounds, the most dangerous is said to be white lead, although litharge is nearly as bad. Sublimed white lead is not as poisonous as either of the two mentioned, but is poisonous if handled carelessly or inhaled as dust. Lead poisoning is brought about by breathing lead-contaminated air, by eating food or chewing tobacco that has been handled by lead-smeared hands.

LEAD POISONING AMONG RUBBER WORKERS.

Quoting from Dr. Hamilton's report:

Lead poisoning is essentially a chronic disease marked by acute attacks. The development of the symptoms is slow and insidious, and by the time they become acute the man has absorbed a good deal of the poison, and recovery from the acute symptoms does not mean that he is free from chronic plumbism. The first symptoms usually noted are loss of appetite, a disagreeable taste in the mouth, indigestion, loss of strength, constipation, more or less insomnia and headache. An acute attack is usually ushered in by obstinate constipation and is characterized by agonizing colic. In other cases it is the nervous system chiefly that is affected. Insomnia, headache, weakness of the muscles most often used, chiefly of the extensors of the wrist, attacks of mental confusion, even loss of consciousness and convulsions, are the symptoms in this type of cases, and they may or may not be accompanied by typical lead colic. Aside from these acute attacks, a slow chronic change takes place in the lead-poisoned workman, leading to profound anemia, hardening of the blood vessels, and alterations in such organs as the kidneys, liver, and heart, and to more or less permanent paralysis of forearms or ankles. There are many other changes which may be brought

A PROTECTED MIXING MILL.

terious dust and fumes wherever poisonous ingredients were used. Up to the present time, however, that work has been individual, as there has been no general knowledge upon which to base preventive measures. The Bureau of Labor Statistics of the United States, in its investigation of Industrial Accidents and Hygiene, has taken up the subject and reported upon it very thoroughly. This report is in the form of an illustrated bulletin of 64 pages, written by Alice Hamilton, A.M., M.D., and is the result of two years personal investigation of the leading rubber factories of the United States.*

Thirty-five factories in the following cities: Boston, Massachusetts, including three suburbs; Hudson, Massachusetts; Providence, Rhode Island; New Haven and Naugatuck, Connecticut; Tuckahoe, New York; Trenton and Lambertville, New Jersey; Akron, Ashland, Cleveland, and Youngstown, Ohio; Detroit, Michigan; Mishawaka, Indiana; and Chicago, Illinois, were visited and investigated. The lines covered were: Footwear, Mechanical Rubber Goods, Tires, Druggists' Sundries and Toys, Hard Rubber, Proofing and Rubber Reclaiming. The departments investigated in general were the compounding room; the mixing mills for dry compounding, solution mixing, spreading and dipping, while under vulcanizing, the dry heat, steam heat, press work, and especially the acid and vapor cures being taken up in order.

The poisonous substances listed are litharge, sublimed lead, *Bulletin of the United States Bureau of Labor Statistics No. 179. By Alice M. Hamilton, A.M., M.D. Industrial Poisons Used in the Rubber Industry.

MACHINE FOR ROUGHENING ENDS OF INNER TUBES.

about by lead poisoning, but the above is a description of the more typical forms.

Records were secured of 66 cases of lead poisoning in rubber works during 1914, distributed among the various branches of the trade as follows: tires 27, footwear 9, clothing 6, druggists'

supplies 3, mechanical rubber 1, factories making all kinds of goods 20. These men were working in the compounding and mill rooms. The greater number had been employed more than a year, but one compounder had worked only 3 months, another 9 months, and a third 11 months before they were taken ill. The men had worked for longer periods showed evidence of chronic plumbism.

ANTIMONY SULPHURETS.

No physician was found who had absolutely recognized a case of antimony poisoning in a rubber worker. Dr. A. J. Carlson, of the Hull Physiological Laboratory of the University of Chicago, was furnished by Dr. Geer of The B. F. Goodrich Co., with samples of crimson sulphuret of antimony and golden sulphuret of antimony. He found them soluble in human gastric juice. Symptoms of antimonic poisoning are as follows:

Abdominal pain, nausea, loss of appetite, dysenteric attacks, sores in the mouth, salivation, wasting, weak heart, attacks of dizziness, and albuminuria or glycosuria. In the rubber industry the golden sulphide is handled in large quantities and usually with the utmost recklessness. One can see men powdered with it from head to foot. The fact that no physician who was interviewed had ever seen what he recognized as a case of antimony poisoning in a rubber worker is not very significant, because the symptoms of antimony poisoning could easily be masked by or mistaken for the symptoms of lead poisoning, since both chemicals are used in the compounding rooms and on the mixing mills.

ANILINE OIL.

Dr. Hamilton found one physician attached to a large plant who had observed over 100 cases of aniline poisoning. In this plant hoods have been installed to carry off the fumes. The men have been instructed to watch for the warning symptoms and then to go out into the open air at once, and he now has only slight cases.

Industrial poisoning from aniline oil is well known, for many cases have occurred in the great German factories in which aniline derivatives are made. The oil is a volatile poison affecting the nervous system and acting destructively upon the red blood corpuscles. The first symptom of aniline poisoning is pallor, which soon changes to a striking bluish color, especially in the lips. There is usually severe headache and general weakness and, if the exposure to the fumes continues, loss of consciousness which may be prolonged alarmingly. The breath and the urine smell of aniline and the blood shows changes due to the withdrawal of oxygen and the destruction of the red blood cells.

Aniline oil vaporizes at room temperature and is absorbed chiefly through the respiratory tract, but may be absorbed also through the skin. In the rubber industry the men are exposed to the fumes of aniline in the compounding room, where it is kept and measured out, and in the mill room, where it is poured over the rubber in the mixing mills or in the "warm-up" mills. The cylinders of these mills are heated to soften the rubber, and the heat aids in volatilizing the aniline. Even the rubber on the calenders may give off fumes of aniline.

Acute aniline poisoning, both mild and severe, is not at all uncommon in Akron, and not only workmen, but physicians, speak of the victims as "blue men," or "blue boys," because the most distinctive symptom is the intense cyanosis. It is said that severe cases used to occur quite often a few years ago when aniline was first introduced into the Akron plants, and the doctors did not at once recognize which was the chemical responsible for the trouble. Since that time serious efforts have been made in some plants to protect the users from fumes. The first record of aniline poisoning in the rubber industry in this country seems to be that contained in the recent report of Dr. E. R. Hayhurst, of the Ohio State Board of Health. Dr. Hayhurst found three cases of aniline poisoning in the compounding and milling departments of rubber factories in Ohio.

Most of the information gathered concerning cases of aniline poisoning in Akron dated back several years, to the time when the danger was not appreciated and safeguards not yet introduced.

COAL TAR BENZOL.

No cases of poisoning by this solvent were noted in American factories. Several were reported in European factories.

Benzol is not used nearly so much in the United States as in Germany. It is twice as expensive as petroleum in this country, while in Germany and Austria it is somewhat cheaper than petroleum. A very complete study, both historical and experimental, on the effects of the vapors of coal-tar benzol and petroleum naphtha and benzine as used in industrial processes was made by K. B. Lehmann and his assistants in the University of Wurzburg. Benzol is a product of the distillation of coal tar or coke, passing over at about 90 degrees to 95 degrees C. (194 degrees to 203 degrees F.). The commercial variety is about 85 per cent. pure. Lehmann's experiments on animals showed that the fumes of benzol cause irritation of the mucous membranes of throat and larynx, and of the eyes; muscular twitchings, and, later, convulsions, unconsciousness, fall of body temperature, and death from respiratory paralysis. The same symptoms have been noticed in cases of violent acute poisoning in human beings who have entered vats containing benzol or spilled large quantities of it and inhaled the fumes, but the poisoning that occurs in rubber factories is

neither so rapid nor so intense and the symptoms are not so typical.

ACUTE PETROLEUM POISONING.

One case was reported of a man who worked in a dipping room.

The symptoms of poisoning by benzine vapors are usually given as headache, nausea, stupid feeling, heaviness or sleepiness, roaring in the ears, inclination to cough, feeling of irritation and constriction in the throat, trembling of the hands and arms, sensation of crawling over the skin, excitement or irritability. Girls are said to grow very talkative and foolish and laugh a great deal; men are said to be easily provoked to anger and are unreasonable. These symptoms may be felt most intensely during the first hours of the day, but in other cases they come on when the person leaves work and goes out into the open air. The workpeople call an acute attack of such poisoning a "naphtha jag."

Rarely is the severe acute form of benzine poisoning seen in this country except in places such as oil wells and refineries, where the exposure to fumes is great. Occasionally, however,

DEDORIZING ROOM.

a severe case may occur among the men employed in the naphtha churning rooms of a rubber factory, for when many different kinds of cement are used the churns have to be cleaned out, and the fumes of naphtha may be heavy enough to overcome the workmen who do this. Another place where severe naphtha poisoning may occur is in the dipping room. The men here work over large tanks filled with thin rubber cement and the temperature of the room is kept at 90 to 98 degrees F., to hasten the evaporation of the naphtha. A case of this sort from a dipping room was reported to us by a physician in an Ohio town. The patient, a strong man, was found by the physician lying in bed comatose, with cold skin, pale, and almost pulseless. He had been dipping wooden forms of gloves into the tank of cement and had felt so dizzy and ill that he was obliged to leave work and go home, but on the way he began to stagger and would have fallen had not two men half carried him home. He was put to bed and not till then did he lose consciousness. His illness lasted several days, but he recovered completely, never, however, venturing to go back to the same sort of work.

CHRONIC NAPHTHA POISONING.

The author, after referring to British records, turns to a report of the Massachusetts General Hospital, 1913-1914. A number of rubber workers applied for treatment for various disorders. The supposition was that they were caused by benzene poisoning, but the records are not regarded as being beyond doubt. Several cases of rubber workers who made or used rubber cement are cited, however, by Dr. Hamilton, which would seem to prove the poisonous effect of the fumes on certain workmen. She says:

As for symptoms, the workpeople claim that they taste naphtha all the time and that this destroys their appetite for food. An attack of "naphtha jag" is succeeded by a stage of depression and dullness, with clouded memory, and on the following day headache, loathing for food, and a feeling of exhaustion.

CARBON DISULPHIDE.

The extremely dangerous character of this compound is discussed at some length, the facts being gathered in European rubber factories. Few physicians in the United States seem to have recognized this poison or its properties. Dr. Hamilton gives several cases of poisoning from this solvent, the following being typical:

The two most dangerous poisons which are encountered in the rubber industry are used in the so-called acid cure or cold cure and in the vapor cure, processes by which sulphur in the form of the monochloride is introduced into the rubber. It is not the monochloride itself that is dangerous, for, according to Lehmann, who tested it experimentally, sulphur monochloride causes nothing more than an irritation of the conjunctiva and of the mucous membranes of nose and throat. The danger is in the

addition of carbon disulphide or carbon tetrachloride or benzol, and these are poisonous in the order mentioned.

Most of the physicians in our rubber-manufacture towns do not seem to have even heard of the use of carbon disulphide in the rubber industry, nor are they familiar with its toxic properties, consequently it is very hard to determine whether or not our way of using it results in serious trouble.

It is certainly possible that the insane asylums have received cases of unrecognized carbon disulphide psychosis, since insane rubber workers are committed from these towns without any inquiry being made as to the exact occupation of the patient and the possible industrial source of his disease. Most of the cases of poisoning discovered in the course of this inquiry were described by foremen of factories, only a few by physicians.

The foreman of the cold-curing department of a dipped-goods factory was very eloquent on the subject of carbon disulphide poisoning. He said his men used to go crazy from the fumes until he made them work for short spells

only, alternating with other work. During the preceding year he had had 12 men under him and all had felt the effects in some way, complaining of headache and dizziness, or indigestion, or loss of mental power, or loss of memory, or muscular weakness, especially in the legs. He himself suffered a good deal from dizziness and severe occipital headache, and had lost strength. He said he always felt the effects of the fumes most at the beginning of the week or after a vacation. Sleeplessness was one of his chief complaints, while one of his workmen said that the fumes made him drowsy all the time—he could drop off to sleep whenever he sat down.

CARBON TETRACHLORIDE.

This, as a rule, has been thought to be not particularly harmful. Investigation in European factories, however, proved it to be distinctly poisonous. The report on the American factories is as follows:

In the effort to avoid the fire risk from carbon disulphide fumes several American rubber factories are now using the non-inflammable carbon tetrachloride, which is, however, not as powerful a rubber solvent as carbon disulphide and is more expensive. Superintendents and chemists in the factories where the former is used are apparently ignorant of its harmfulness, and this is hardly to be wondered at since the ordinary textbooks of toxicology do not even mention it, and the few that do have very little to say about it. Von Jaksch speaks of severe nervous disturbances having occurred among workmen who used a mixture containing carbon tetrachloride on the inside of boilers to prevent incrustations. Gadamer simply states that this substance is used in industry and may cause poisoning with symptoms like those of chloroform.

Carbon tetrachloride was found actually in use in only three factories. In one of them a man who had dipped rubber goods in a solution for seven months complained of nausea and loss of appetite, which he attributed to his occupation. In another,

ACID CURING OR COLD CURING OF BALLOONS.

a tire factory where the liquid is painted on the ends of inner tubes, a workman stated that since he had been doing this sort of work he had lost weight and that he felt a constant irritation of the eyes, nose, and throat. In the third factory two splicers believed that their health had suffered from the effects of the carbon tetrachloride vapors. One, especially, said that he had lost many pounds in weight, that he had nausea and loss of appetite, vomited frequently, and felt weak all over. The men who do the work without wearing gloves are liable to a dermatitis of the hands and arms.

Dr. Hamilton finds that in many of the factories using the poisonous ingredients under consideration great care has been taken to keep the workers from coming in contact with these substances. In many others, however, she finds that little or no attention has been paid to the matter. She suggests arrangements in the compounding room so that dust from the lead and antimony compounds be obviated. This may be done by automatic weighing appliances, closed receptacles and avoidance, as much as possible, of personal contact in handling.

For poisonous ingredients, mixing mills should be fitted with powerful exhaust hoods and arrangements whereby the worker neither directly handles nor breathes the dust.

In using ingredients or solvents which give off injurious fumes, exhaust hoods, perfect ventilation, closed cans and cups are advised.

In other words, if the workman is protected against breathing the fumes, inhaling or handling poisonous dust, the danger of poisoning is reduced to a minimum.

The whole report is not only timely, but is exceedingly clear and comprehensive. Dr. Hamilton has wonderfully grasped the general details of rubber manufacture, which is shown by the complete avoidance of the usual minor but irritating technical blunders that writers not themselves rubber experts are so prone to indulge in.

RUBBER AS RELATED TO THE WAR.

A VERY interesting lecture, illustrated by lantern slides, was given on November 9 by A. D. Thornton, of the Canadian Consolidated Rubber Co., Limited, before the Canadian Railway Club, at Montreal, Canada. Mr. Thornton said in part:

"Now, as to rubber and its uses in the great European war. Well, there is hardly any detail of equipment in which it does not figure. First and foremost is the use of automobile and truck tires; the consumption here is enormous. Huge quantities are manufactured by the Allies, then again factories in Canada and the United States are running overtime on these lines; hip boots for the men in the trenches are being manufactured for the coming winter; one million waterproof capes were recently ordered by the British Government. Ground sheets are used for almost any purpose; the men lie upon them when firing, sleeping, etc., also when tents are cleared out in the morning all the blankets, clothing, etc., are placed on one of these sheets, spread on the ground. If the British force is 3,000,000 men, and every man had a sheet, the weight would be 3,750 tons. In the hospitals we find rubber sheeting, air cushions, hot water bottles, ice bags, drainage tubes and many other surgical instruments.

"But now let me come to the point where rubber must be used; where it is absolutely essential.

"There is no explosive made from rubber, but I am quite safe in saying that without the assistance of rubber no explosives could be manufactured.

"In the manufacture of dynamite, which is an infusorial earth saturated with nitro-glycerin, rubber is very essential. Nitro-glycerin is both a poison and a tonic, and in the hot weather the operators perspire freely, and unless they use rubber gloves, the tonic exudation enters the system and it is quickly poisoned. In addition to gloves, they must wear rubber boots.

"The manufacture of 'Smokeless' calls for the use of rubber in almost the same way. The base is cotton waste, which, when saturated with nitric acid, undergoes a chemical change. It be-

comes an explosive, and is called gun cotton. The cotton is cleaned in an alkali bath, to remove all traces of grease, and then all moisture is removed, and the cotton placed in air-tight cylinders to prevent it re-absorbing atmosphere. Rubber gaskets have to be used on these cylinders.

"There are, I am advised by competent authority, about one hundred and forty thousand men manufacturing explosives for use in the war, every one of whom is forced to wear rubber boots, coats, gloves, etc.

"The use of balloons in the war is well known to us all. Here again rubber is used extensively.

"The Zeppelin is filled with gas bags, which are made of rubber. The outer coat of the balloon is also covered with rubber. The Parseval and the Lebaudy are really immense gas bags, with balloonet chambers on the inside.

"But it is in the use of automobiles, ambulance cars, guns, trucks, etc., that the use of rubber comes into notice as to quantity. I have been at great pains to obtain figures as to the consumption of all the armies on the continent now at war, and it would seem that between three and four thousand tons of rubber goods are destroyed daily, and it is unquestionably growing larger. This winter hip boots will be used in the trenches. One firm in England received an order for 2,000,000 pairs, weighing about 7,000 tons. When

you consider the armies of other nations, you are astounded at the tonnage which must be in demand."

NATIONAL EXPOSITION MANAGEMENT ENTERTAINS CHEMISTS.

A notable gathering of well-known industrial chemists met at the Chemists' Club, 52 East Forty-first street, New York, Wednesday evening, November 10, 1915. The occasion was a dinner tendered by the management of the exposition, to discuss plans for the 1916 National Exposition of Chemical Industries.

Among those present were: Raymond F. Bacon, Charles H. Herty, Henry B. Faber, A. D. Little, E. F. Roeber, George D. Rosengarten, T. B. Wagner, L. H. Baekeland, M. C. Whitaker, B. C. Hesse, Adriaan Nagelvoort and Charles F. Roth; also R. G. Hollaman and F. W. Payne, of the International Exposition Co., all of whom will serve on the advisory committee for the 1916 National Exposition of Chemical Industries to be held at the Grand Central Palace, New York, week of September 25, 1916. At this meeting Dr. Charles H. Herty was elected to serve as chairman of this committee for the coming year.

An advisory committee was selected, and preliminary plans laid for enlarging the size and scope of the coming exposition.

RED CROSS CANNOT SEND RUBBER GOODS TO GERMANS.

Presumably on the ground that they might be used for military purposes, Great Britain refuses to allow shipment to Germany and Austria of hospital supplies, gloves and blankets, there being a possibility of such goods being reclaimed and used in the manufacture of tires, of which the powers in question are in such urgent need. If, in spite of the assurance of Ambassador Gerard at Berlin, and the American Red Cross Society, that the goods would be used only for hospital purposes, the British authorities still refuse the right of shipment, the American Red Cross would naturally have to suspend such shipments to all countries.

Effect of the War on Chemicals and Compounding Ingredients.

TO those interested, it might seem that the war had made a special target of the rubber industries. In many directions prices have mounted, some of them pretty well skyward, and there are those in the chemical market that freely predict still higher prices. This is certainly not reassuring. Happily, there are sources of information that promise betterment in some important departments, but for the present the producer should be wary of chasing rainbows. On the whole, rubber manufacturers should not be optimistic as to quantities and prices.

A casual review of the situation today indicates that there are special ingredients that the compounder may have to abandon, and no time should be lost in seeking for reasonably satisfactory substitutes. In some cases this prospect is discouraging, particularly where the trade is using for certain goods in-

gredients that have peculiar properties and rank way ahead of any second best. The research chemist will have his hands full, but perhaps the spur of necessity may bring abundant reward in the end. This is one of the phases of the situation, and is mainly, though not entirely, the consequence of a stoppage of foreign supplies.

Unquestionably the biggest factor in raising prices and reducing or cutting off needful materials is the military demand from abroad. Munitions and fighting tools generally make the heaviest drain, but there are allied phases of warfare that call for their portion, and one of these is in the medical requirements of this awful struggle. The rise in the cost of zinc oxides was immediately the outcome of the greatly increased use of brass. Millions upon millions of cartridges have been turned out for small arms and machine guns, and still larger

NORMAL PRICES VS. WAR PRICES. NOVEMBER, 1915.

Chemicals and Compounding Ingredients.	Heavy Line Shows Normal Price. Light Line Shows Increase in Price.	Normal Prices.	War Prices.

red seal065 lb.	.30 lb.
white seal075 lb.	.31 lb.

brass cases have been needed for the various calibers of rapid-fire field pieces. Fixed ammunition, the shell and powder charge being put up in cartridge form, is essential to the quick-firing gun, both afloat and ashore, and only brass answers for these capsules.

Zinc oxide, also, now appears to be susceptible of military application. A very large dealer in New York received a short while ago a long-distance telephone call from Canada. The Canadian would-be purchaser desired zinc oxide, and expressly said he did not want it for use in the manufacture of rubber goods. When pressed for an explanation, he admitted that it was needed for a lacquer for the inside of shells. Again, zinc oxide was sought for mixing with a special coating for barbed wire destined for the European battle front.

Where certain raw materials are concerned that we have formerly, either in part or exclusively, obtained from foreign sources, the supply will continue to be uncertain or denied us entirely. This is not explained wholly by the maintenance of blockades, for the fact is, British and German shipping have been the principal carriers of many of these alien products, and neutral sources of supply are closed to us now or hampered in their deliveries simply because merchant craft are not available for this service.

Taking up in detail the principal chemical and compounding ingredients used in the manufacture of rubber, there is generally a unanimity of opinion as to the market of 1916, but in some instances the experts disagree, and we are stating the facts as they have been given us. We can only hope that where these authorities are not in accord, the turn of the market will be favorable rather than otherwise to the rubber manufacturer. However, as we have said before, optimism should be held in check.

VIEWS OF THE SUPPLY MEN.

ACETONE AND ACETIC ACID, both wood distillates, will continue to advance. In the case of acetone, which is used largely as a solvent of gun cotton in making smokeless powders, it was impossible to get any spot two months ago, and it will probably remain scarce. The same situation prevails in the matter of acetic acid, and the outlook for lower prices for the consumer is most unfavorable.

AMMONIUM CARBONATE. There is apparently no reason why this should be scarce. Ammonium is used variously in the manufacture of explosives, but many of our steel plants and some of our gas works are saving this by-product; so the war demand is being met accordingly without affecting the general market.

ANTIMONY, CRIMSON AND GOLDEN SULPHURETS. The situation is complicated in regard to these pigments. Shipments of metallic antimony from Europe have either been prohibited or stopped by blockade, and those from China and Japan have practically ceased because of the part that Japan is now taking in supplying Russia with munitions. It is said that certain consignments from China and Japan actually reached the Pacific coast and were then bought from the American consignees and dispatched at once to Vladivostok, reaching Russian ammunition makers via Siberia.

Imported stocks of both crimson and golden antimony are practically exhausted. Several domestic makers are producing acceptable qualities in an experimental way, but not in sufficient quantities to take care of the demand. Owing to difficulty in obtaining the raw material, prices of both crimson and golden antimony are high and will remain so until conditions governing the export of the crude material from China are radically improved.

BARIUM SULPHATE, precipitated, the base of which is bin-oxide of barium, is becoming scarcer each day. The European sources are practically cut off and almost prohibitory prices prevail.

BARITES is likely to advance still further. Since the war be-

gan we have had to turn to Tennessee as well as Missouri for our requirements. Several domestic plants are now producing it and there is promise of ample supply. However, if the barium industry is to continue, it will need ample protection after the war. In connection with the matter of barium and barytes, blanc fixe should be mentioned now, being made from barium monoxide. Blanc fixe is at present worth \$100 a ton, and will probably go higher.

BENZOL. While we have heard much of late about domestic producers, intended to encourage us, still as a matter of fact no manufacturer of benzol is yet ready to quote fixed prices or to promise lower costs in the near future. Indeed, one manufacturer has quoted \$1.10 a gallon. The steel companies of the United States are now, by the husbanding of their by-products and the introduction of suitable apparatus, turning out 15,000,000 gallons a year, and this in contrast to the 3,000,000 gallons of benzol of the days before the war. But, unhappily, the part this plays in the making of modern explosives has resulted, nevertheless, in an inadequate supply. Prices are going up, and the ordinary user is seriously inconvenienced and likely to be more so. Only limited amounts can be now had on a year's contract, and that at 70 cents a gallon, while spot is quoted at 80 cents.

BETA NAPHTHOL is scarce because naphthalene, from which it is made, is hard to get. One of the biggest domestic producers has none for immediate delivery, but holds out hope for 1916. There are only two manufacturers here and the price may reach \$3 a pound.

BLACK HYPO. This product is not to be had at all.

CARBON BISULPHIDE. The American producers will probably be able to meet the demands, and the price should remain substantially unchanged.

CARBON TETRACHLORIDE. While we have two or three domestic producers in this field, still they can not supply the demand now that imports from England especially have ceased. The price will probably go up.

CAUSTIC SODA (76 per cent.), is high-priced now and an advance is predicted. Prices may range anywhere from 6 to 10 cents a pound. It is said that the present price is not justified by the available supply, but that it probably reflects that "sympathetic" rise which so often follows the advance of other chemicals. The Germans are using caustic soda extensively in the air-regenerating equipment which they supply for the men in the trenches handling the gas-making apparatus, and in the breathing equipments furnished to aviators and the escape helmets for the crews of submarines. Contracts are being made at 4½ and 4¾ cents in car lots for 1916 delivery.

CHROME GREEN AND YELLOW will both be higher, owing to the scarcity of the basic materials from which they are made. Here we see the effect of the demands of the metallurgist and particularly of the steel mills engaged in the fabrication of war materials. Green oxide of chromium may go to 40 cents a pound.

GRAPHITE. The domestic crystalline graphite, commonly known to the trade as "flake," is more likely to increase than to diminish in price. Owing to the war, our usually big importations of graphite from Ceylon have been very much reduced, and because of hampered shipping we are not getting our accustomed supply from Corea. The output of the mines in Mexico, upon which we have drawn generously, has been curtailed by the disturbed conditions in that country.

IRON OXIDES. While the domestic resources are ample, the native products are not as good as those from abroad. The German supply is completely cut off and the English one is limited and higher in price because of increased cost of production.

LEAD OXIDES are all based on the state of the metal market, which is still advancing on account of the war. Here is where the destructive bullet hits reflexively the rubber manufacturers.

LITHARGE has advanced a quarter of a cent a pound lately, and there is a further upward tendency. The average level in 1916 will, unquestionably, be a high one.

LITHOPONE (30 per cent.) is becoming scarcer due to the advance of the zinc market. Very little is now imported, and none, of course, from Germany. Lithopone will probably advance from one to two cents a pound. The market is now firm at 7 cents on contracts for 1916, and plus charges, will bring it up to 7½ cents a pound. For local distribution to small buyers the market price will range between 7½ and 8 cents a pound.

MAGNESIA CARBONATE. There are four or five American producers who formerly had to almost beg for orders, but now they cannot take care of the business offered them, as the foreign demand is so great. It is being used in the making of explosives, and is employed as an inert "carrier" for nitroglycerin and the like in the manufacture of dynamite and its destructive kindred.

CALCINED MAGNESIA, the cheaper German grade, is advancing, and prices will be much higher.

MAGNESITE has heretofore come mostly from Greece, but this source of supply is now shut off. Pacific coast magnesite is not available in sufficient quantities to meet the demand, and the cost of transportation is high. This material is used in the making of refractory linings for steel furnaces and in the fabrication of crucibles, etc. The state of the steel market, in meeting the requirements of war, explains the magnesite situation. Prices will range between \$50 and \$60 a ton.

OIL, ANILINE. Owing to the new manufacturers here, prices now may be made on contracts for next year ranging from 75 to 80 cents a pound. Producers naturally want to cover the cost of their lately established plants, and are purposely keeping up the prices to that end.

OIL, PINE. The prices for this oil have been high because the turpentine plants in the South were shut down at the outbreak of the war. There is practically none of this in the market now and prices are advancing, ranging from 65 to 80 cents a gallon.

ORANGE MINERAL. At this writing, the price is 12 cents a pound, and there is every reason to believe it will advance.

PITCH, Burgundy, supply rapidly diminishing.

PRUSSIAN BLUE is going higher on account of the increased cost of domestic manufacture. A large dealer has declared that it is unwise to predict the ultimate price.

ROSIN prices are high, but it is quite likely that there will be a decline immediately following the arrival of the December crop. However, it is probable that an advance will again be made. The comparatively low prices here are due to the difficulty of shipping abroad, and the domestic users benefit accordingly. Rosin is employed extensively in the manufacture of a variety of munitions.

RUBBER SUBSTITUTES have gradually increased in price owing to the advance in the cost of oils, particularly rapeseed. The rise in rubber substitutes has been quite 25 per cent. since the outbreak of the war, and the future is decidedly problematical.

SHELLAC is gradually advancing, and is uncertain, like all other allied crop products.

SULPHUR CHLORIDE has been the object of an extraordinary foreign demand, and such, too, has been the case with bisulphide of carbon. Heretofore business has been refused by domestic manufacturers in the interest of American consumers. If, however, this available foreign business is covered, then the domestic consumer will undoubtedly face an advance in price. How long the American producer can withstand foreign offers at persuasive prices is a question.

SULPHURIC ACID is one of the hardest things to get in the chemical market today, and it figures importantly in a wide variety of industries. Prices are way up, and as much as \$200 a ton has already been demanded for spot. This situation intimately concerns rubber reclamation.

TOLUOL, pure. The market now ranges between \$4.50 and \$5 a gallon, and none can be had on contract until 1917. Some spot is available in varying quantities, due to excess of production over that estimated by the manufacturers. As long as the war continues the scarcity will probably prevail.

VERMILION, brilliant, will grow scarcer the longer the war continues, as German base colors are necessary to its production. The supply is now almost exhausted. American vermilion is equally affected by the conflict in Europe through the advance of the mercury market, mercury being extensively employed in making the widely used detonator—fulminate of mercury.

WAXES present an interesting situation. More yellow beeswax is used than white beeswax. The price now ranges from 25 to 40 cents a pound. For this natural yellow beeswax the wide world is being drawn upon—Asia, Africa, Australia, and practically all of the islands of the seas, and our importations are exceptionally large. The stocks have been well absorbed, so that prices have been maintained. We have taken care of European consumption in doing this. Ozokerite and montan, which are produced in Austria and Germany, are no longer coming to us and the supply is substantially exhausted. On a normal market selling at from 18 to 20 cents a pound we now have to pay as high as 65 cents for ozokerite. Montan selling ordinarily at from 5¼ to 6¼ cents a pound has sold recently at 25 cents. Ceresin is ozokerite wax refined and lowered in price by the admixture of paraffin. The price of ceresin will naturally depend upon the supply of ozokerite, and we can get no more of this until the war ends. Most manufacturers of paraffin are sold up three to six months ahead.

WHITING will probably remain about the same but with an upward tendency due to the higher cost of cliff stone—the advance there being the result of increased labor costs, coal, and the lack of barrels. The future price can not be safely predicted.

YELLOW OCHRE is to be had here from domestic deposits, but the product is of low strength. The best comes from France and the price is going up on account of the lack of labor and other economic consequences of the war. It is not unlikely that there may be an advance of a cent a pound.

ZINC OXIDES. As is well known, there has been a highly speculative market in these, and certain gradings, such as "XX Horsehead," have sold as high as 15 cents a pound. Of French process, green seal, there is practically no supply here. In fact, inquiries are now coming from abroad for all grades. Zinc sulphide, 30 per cent., is so scarce that one big dealer has said he does not know where any can be obtained. Certainly the outlook for the makers of white goods is a most unpromising one for 1916.

There are, however, a number of chemicals and ingredients that have not been affected by the war and are normal in price and quantity. For instance, talc, soapstone, aluminum flake, mica, asbestos and sulphur flowers are produced in this country and are cheap and plentiful. Asphaltum, lampblack, infusorial earth, tripolite earth, rotten stone are about normal in price and the supplies are apparently abundant for all purposes.

The complete and well-arranged catalog of the Scientific Materials Co., Pittsburgh, Pennsylvania, devoted to chemical laboratory equipment, has been received. It is fully illustrated and well indexed, and will be appreciated among chemists.

The Arthur H. Thomas Co., Philadelphia, Pennsylvania, publishes a large cloth-bound catalog of 579 pages supplemented with a 70-page list of reagents. The book is devoted to apparatus selected for laboratories of chemistry and biology in their application to education, industry, medicine and public health. As a reference book it will be appreciated in any laboratory.

What the Rubber Chemists Are Doing.

VULCANIZATION EXPERIMENTS ON PARA RUBBER.

IN the October issue of THE INDIA RUBBER WORLD there was given an abstract of a lecture by B. J. Eaton on "Variation in Rate of Vulcanization of Rubber." Since that date the authors' report of the original investigation has been published in the "Journal of the Society of Chemical Industry" (Vol. 34, pp. 989-999). The authors, B. J. Eaton and J. Grantham, chemists of the agricultural department of the Federated Malay States, have there recounted their investigations, with many tables and curves showing the relations between time of cure and vulcanization for various samples of rubber. Supplementary to the abstract of the lecture, mentioned above, the following summary of their results will be of interest.

1. Considerable variation exists in plantation Para rubbers from the same as well as from different estates.

2. This variation relates chiefly to its rate of vulcanization, and not to its general mechanical properties, especially in the case of properly prepared "first latex" samples.

3. Given the rate of cure under specific conditions, vulcanized rubber having similar mechanical properties can be made from all good samples of "first latex" rubbers.

4. Differences in mechanical properties are greater between high and low-grade plantation rubbers than among first quality rubbers. Some rubbers never attain the maximum mechanical properties reached by others, whatever the period of cure adopted. These differences in the case of "first latex" rubbers are not so important to the manufacturer as the differences in rate of cure, and are not of the same order.

5. The rate of cure is due to some non-caustic substance in the latex, possibly protein or other organic constituent, or to some product derived from these substances, which acts as a catalyst and accelerates the rate of cure.

6. This substance may be already present in the latex, or it may be subsequently formed there by decomposition and taken up by the rubber in variable quantity, according to the mode of preparation, or, alternatively, it may be formed in the coagulum in variable quantity, depending on the amount of serum remaining or the presence of preservatives which hinder or prevent its formation. These theories await investigation.

7. Smoking, removal of excessive serum in the washing process, and preservatives are among the artificial factors which either hinder the formation of this substance or, if it exists in the prepared rubber, partially destroy it.

8. The catalytic substance is probably not affected greatly by heat. Whether heat destroys it, or prevents its formation in the latex or partly coagulated rubber, awaits investigation.

9. The rate of cure of a rubber under specific conditions is not indicated in any way by the mechanical or any other apparent properties of the raw material.

10. Two alternatives are suggested to secure uniformity between rubbers from the same or different estates: (1) The issue of certificates giving correct rate of cure and mechanical properties at this cure; (2) the attainment of more uniformity by uniting the rubber from latex collected during a series of days into one ball or block, which may be described as the method of averages.

Over three years ago (July, 1912), Messrs. Beadle and Stevens clearly showed, for the first time, that the removal of the nitrogenous matter from Para rubber resulted in slow-curing rubber, as indicated by low percentage of sulphur in "combination" with the rubber and poor physical qualities; while the excess of protein matter has the reverse effect. They particularly drew attention to the influence of the protein on the speed of vulcanization. They also pointed out the importance of their discovery

as regards the vulcanization of synthetic rubber. In subsequent papers Beadle and Stevens have shown that not only the nitrogenous matter, but also the resinous matter, affects the quality and speed of vulcanization of the rubber. [See reference in THE INDIA RUBBER WORLD, May, 1914.]

CONDENSATION PRODUCTS.

A very interesting paper on the condensation products of phenol and formaldehyde, with special reference to bakelite, by Goro Matsumoto, appears in the "Journal of Chemical Industry," Japan, Vol. 18, page 434 (1915). Mr. Matsumoto classifies these various products in three groups, namely, crystallizable, soluble and fusible, insoluble and infusible. His results on bakelite are thus summarized:

(1) The whole process may be divided into three stages: the initial condensation, the concentration of the products, and the hardening. Reactions in all stages are accelerated by certain reagents.

(2) The following may be used as condensing agents: sulphuric acid, hydrochloric acid, ammonium hydrate, sodium sulphate, sodium carbonate and sodium hydrate.

(3) As a hardening agent only basic substances, as sodium hydrate or ammonium hydrate can be used, of which the latter is better.

(4) The combination of sodium hydrate as the condensing agent and ammonium hydrate as the hardener gives the best results both in yield and quality.

(5) With the use of cresol instead of phenol a similar substance is obtained.

TEST FOR BENZOL OR ALCOHOL IN HYDROCARBON MIXTURES.

The well-known German chemist, Dr. Fritz Frank, in a recent article mentions a method for the colorimetric estimation of benzol or alcohol in mixture with hydrocarbons of the paraffin series. The test is credited to Karl Dietrich, who obtained from dragon's blood resin a coloring material which gives a crimson color in the presence of benzol or alcohol. The test is made by means of "Diacorubin paper," which is impregnated with varying proportions of diacorubin resin in order to afford quantitative color reactions in a standard test volume of liquid.

RUBBER RESINS.

In a voluminous article, published serially in "Gummi Zeitung," Dr. F. Jacobsen reviews the work of many authorities concerning the presence of resin in rubber latex and in various commercial grades of rubber. There seems to be much doubt as to the function of these resins in the plant economy, and not much agreement as to their effect in rubber other than that they seem to act as catalysts during vulcanization, and consequently are not advantageously removed except in the extreme case of Pontianac, where the resin content is the chief ingredient.

RESEARCHES ON AFRICAN RUBBERS.

F. Heim and others in the "Bulletin of Agricultural Intelligence," Vol. 6, 581 pages (1915), report investigation of the "Gohine" liane (*Landolphia heudelotii*), a source of rubber in French West Africa. The writers have analyzed two samples of this rubber from the Upper Senegal-Niger region and give data concerning strength, extension, nerve, elasticity and permanent stretch of these samples and also other samples from the same variety grown in different stations and prepared by various methods of coagulation. Compared with fine hard Para the rubber had equal strength and greater resiliency and stretch. Three samples of rubber from French Equatorial Africa, known as "Ovotina Noir" or "Andang," "Kondo" or "Pembe," and

"N'Caui," were analyzed by the authors, without knowledge of their botanical origin. But the data shows that "Owouina" rubber is interesting because of its great chemical purity, comparable to that of Para. "Kondo" rubber also appears to possess a fair technological value.

CHEMICAL TREATMENT OF RUBBER.

UNITED STATES OF AMERICA.

MOLDABLE PHENOLIC CONDENSATION PRODUCT. 1,146,299 and 1,146,300. J. W. Aylsworth.

VULCANIZATION ACCELERATOR.—1,157,177, S. J. Peachey. The invention relates to the use of Paranitrosec-dimethylaniline or its homologues to accelerate vulcanization of rubber, as mentioned in *THE INDIA RUBBER WORLD*, August, 1915.

RUBBER SUBSTITUTE.—1,159,257 and 1,159,258. Georges Nuth. These patents relate to the preparation of elastic rubber-like substances derived by the action of amines on ordinary sulphuretted fatty oil "substitutes" or "factices" and the subsequent vulcanization of the polymerized substances to various degrees of elasticity or hardness. These new bodies have high electrical insulating property. When dissolved in appropriate solvents they serve as adherent, flexible, transparent and brilliant varnishes. A long list of ammonia derivatives of the fatty and aromatic series is named as suitable for the formation of the new elastic bodies.

PROCESS OF VULCANIZING RUBBER.—1,159,327. Paul I. Murrill. This process relates to an improvement in the cold cure process of vulcanization by which the purity of sulphur monochloride is preserved against the deteriorating influence of atmospheric moisture. The improved process does not entirely prevent the decomposition of the sulphur monochloride but offsets it by other reactions whereby inert substances result. This is accomplished by adding to the sulphur monochloride, diluted with the usual inert liquid to adapt it for use, a quantity of metallic sodium. After standing about twenty hours the liquid may be used as a vulcanizing agent and the sodium will combine with the impurities.

UNITED KINGDOM.

VULCANIZING RUBBER.—12,661 (1914). Abridgment of October, 1915. F. Bayer & Co. The subject matter of this patent was referred to in a note on vulcanization accelerators in *THE INDIA RUBBER WORLD*, June, 1915. It relates to the vulcanization of natural or artificial rubber-like substances in the presence of such ammonia derivatives of a basic reaction, other than those that liberate free ammonia under the conditions of vulcanization, or such nitrogenous organic bases, other than piperidin or its homologues or derivatives of these bases, that possess a dissociation constant in aqueous solution greater than 1×10^4 . Examples of such bases are sodium amide, benzylamine, naphthyl-lenediamine, quaternary ammonium bases, the addition product of ammonia and acetaldehyde and paraphenylenediamine.

PHENOL-ALDEHYDE CONDENSATION PRODUCTS.—28,187 (1913). Abridgment of October, 1915. A. Heinemann. In the production of resinous condensation products from phenol or cresols and formaldehyde or its polymers, the reacting substances are first heated without a condensing agent, yielding a liquid oxy-benzyl-alcohol, and this product is further heated in an open vessel with sulphur dioxide solution. The product can be rendered insoluble by further heating or treatment with a basic catalyst.

ERONITE SUBSTITUTE.—76 (1914). Abridgment of October, 1915. A rubber substitute is made by mixing minced animal tissue, such as sinews, after heating with an astringent solution such as zinc chloride or hydrochloric acid, with starchy matter, such as powdered tapioca. The dough thus formed, after drying,

is preferably mixed with a small proportion of rubber latex or a solution of rubber or resin, for example 6 to 12 per cent. of rubber dissolved in turpentine. The product is heated until tough and applied as a dressing to leather, canvas or other fibrous base.

RUBBER AND LEATHER COMPOSITIONS.—13,128 (1914). E. B. Cook. Leather reduced to a fibrous state is mixed with vulcanizable rubber compound on rubber mixing rolls and the product vulcanized by heat, for use as shoe soles, pneumatic tires, door mats and other tread surfaces. In an example $\frac{2}{3}$ parts leather fiber are added to $\frac{1}{3}$ parts crude rubber, 2 parts reclaimed rubber, $\frac{1}{8}$ parts fossil flour, $\frac{1}{2}$ parts litharge, $\frac{1}{4}$ part sulphur and lampblack or other pigment.

SYNTHETIC RUBBER. 297 (1915).—Dr. Hermann Stern, Karlstrasse 42, Munich, Germany. This invention relates to the production of hydrocarbons of the diolefin group, more particularly isoprene, caoutchouc and caoutchouc-like substances. The essential characteristic of the process consists in, or includes, the treatment of an aliphatic ketone or ketones with fuming sulphuric acid. The process in its simplest form consists in heating acetone or its homologues with fuming sulphuric acid. For example, if 500 grams of acetone are heated with about 350 grams of fuming sulphuric acid containing 18 to 20 per cent. of sulphuric anhydride, there results, after distilling off the volatile liquid products, and neutralizing the solid residue with an alkali, approximately 350 grams of solid caoutchouc-like substances. Similar substances are obtained if there is substituted for acetone, or used in conjunction with it, homologues, such as diethyl ketone, methylethyl ketone or propyl-brutyl-ketone.

THE FRENCH REPUBLIC.

RUBBER SUBSTITUTE AND PROCESS FOR MANUFACTURING. 476,396 (October 21, 1914).—V. Ottorepetz. (Same as British patent No. 21,524, 1914). See *THE INDIA RUBBER WORLD*, October, 1915.

RUBBER SUBSTITUTE. 476,509 (April 24, 1914).—J. de la Fresnaye and L. Aimond.

RUBBER SUBSTITUTE, PLASTIC, SEMI-PLASTIC OR HARD MATERIAL obtained by using human or animal hair, scraps of tortoise shell, leather, or horn, and process for manufacturing it. 476,578 (April 28, 1914).—G. L. Lussaud and R. Montois.

CONDENSATION PRODUCT. French patent 468,879. A. Labbé—Resorcinol, hydroquinone, pyrogallol, pyrocatechol and their derivatives are dissolved in formaldehyde in presence of very small amounts of dilute mineral acids which appear to act as catalysts. The mass solidifies after several hours to an elastic product, the hardness of which increases with the dilution of the formaldehyde, and which can be rendered transparent by addition of acetone or glycerol to the formaldehyde. The product is permanent, fireproof and easily worked.

THE GERMAN EMPIRE.

PROCESS FOR HARDENING PLASTIC MASSES OF GLUE, GLYCERIN AND powdered fillers. 288,321 (June 23, 1914).—J. Traube, Am. Lützow, 130, Charlottenburg.

RUBBER SUBSTITUTE. PROCESS FOR PRODUCING SOLID PLASTIC masses. 288,347 (May 20, 1914).—Supplement to patent 274,176. Karl Hagendorf, Baufeld-bei-Fredersdorf Ostbahn and Dr. Adolf Breslau, Hektorstrasse, 13, Berlin-11alensee.

RUBBER SUBSTITUTE. PROCESS FOR MANUFACTURING A substance specially suited for being worked into tires. 288,476 (July 22, 1913).—Murizio Baricelli, Nordstrand, near Christiania, Norway. Represented by R. Schmchlik and C. Sattow, Berlin, S.W. 61.

RUBBER SUBSTITUTE. PROCESS AND APPARATUS FOR MAKING plastic masses out of fibers and cements subjected to the action of sulphur, sulphur chloride and nitric acid on oil, tar and the like. 288,532 (Nov. 29, 1914).—Nicolaus Reif, Christuskirche 24, Hanover.

NEW MANUFACTURING PROCESSES.

UNITED STATES OF AMERICA.

INSULATED WIRE AND TERMINAL.—1,157,916, Arthur M. Wentworth, Pittsfield, Massachusetts, to General Electric Co., Schenectady, New York.

METHOD OF MAKING RUBBER FLOAT-BALL VALVES.—1,158,009 and 1,158,395. David Stephen, assignor to the H. O. Canfield Co. The upper half of the float-ball is stiffened by an internal disc of hard rubber, upon which the outer ply of soft rubber is cemented, carrying the metal insert for attachment.

PRINTING BLANKET.—1,158,033. Frank E. Ellis. A rubber surface blanket with textile plies and an insertion of a ply of sheet cork composition to secure softness and pliability.

BEAD FOR PNEUMATIC TIRES.—1,158,194, M. W. Fink and A. M. Kobiolke. A molded tire bead of rubber reinforced with internal longitudinal triangular strip of leather and with a leather cover for the body.

PNEUMATIC TIRE.—1,158,227. H. O. Johnson. The special feature is an endless chain of looped, metallic links, specially formed from steel tape. This chain is placed as a protecting band between the tire casing and the inner tube to prevent puncture of the latter.

ART OF MANUFACTURING FOOTWEAR.—1,158,389. W. E. Piper, assignor to Boston Rubber Shoe Co. An apparatus for cold pressing or molding, between flexible diaphragms, uncured rubber footwear on lasts, thus compacting the adhesive plies by expelling the contained air preliminary to vulcanization.

PRESSURE APPLYING APPARATUS FOR FOOTWEAR.—1,158,390. Chester J. Randall, assignor to Boston Rubber Shoe Co. The goods on lasts are supported in an adjustable bell-shaped tank containing air under pressure.

HOSE.—1,158,595. John J. Voorhees, Jr. A hose formed of a strip of spirally wound flat metal, with a superimposed ply of fabric and a cord spirally wound upon the outer surface to form inwardly projecting ribs between the spirals of the metal strip and a tube of rubber applied in close contact with the outer surface of the fabric. The ribs prevent movement of the spirals and contact between the metal and rubber, besides protecting it.

VACUUM TREATMENT OF COMPOSITIONS OF RUBBER.—1,158,843. Raymond B. Price, assignor to Rubber Regenerating Co. The process begins by incorporating a vulcanizing agent with vulcanizable plastics previous to their vulcanization. Then subjecting the mass during or subsequent to this addition, simultaneously to a kneading action and to the action of a vacuum, and finally subjecting the surface of the mass to a sealing pressure when enclosed in a yielding covering.

HOSE.—1,158,995. Richard J. Evans. A hose with tube and cover of rubber and bias-cut plies of asbestos fabric applied spirally.

EXTRACTION OF RUBBER.—1,159,137. Dominique Vecchini. The object is to successively reduce to an extreme degree of fineness shrubs and bark of rubber-bearing plants, in a specially designed machine, thus frictionally heating the rubber to an agglomerating temperature, without injury to its fibrous nature.

COATED FABRIC.—1,159,155. William G. Ayres, assignor to William Ayres & Son. A body or core of coarse burlap with a thick fibrous mass on one side and a thin fibrous mass on the other, these fibrous masses being connected to each other through the meshes of the burlap. A preliminary coating of rubber is applied to one face of the material to lay the fibers perfectly smooth, and a finish coating is then applied to the previously coated surface.

RESILIENT WHEEL.—1,159,218. Arthur Frederick Hawksley. Molded forms, with or without outer rubber covering, are built up with rubber impregnated cord and shaped to surround and protect resilient air tubes located around the inside circumference of a wheel.

UNITED KINGDOM.

A NEW FABRIC IMPREGNATING PROCESS.—The fabric is submerged in the rubber solution and passed between rollers, which cause it to vibrate. This opens the threads so that uniform impregnation is obtained. [G. W. Beldam and A. U. B. Ryall, British patent No. 17,097—1914.]

LABORATORY APPARATUS.

IMPROVED MICROMETER READING DEVICE.

LABORATORY workers will appreciate the ease and accuracy with which the graduations of thermometers and burettes can be read by the Lenzmann micrometer reading device. This unique little instrument was publicly shown for the first time at the recent National Exposition of Chemical Industries in New

York City. It was devised to meet a genuine need, and was first approved for use in the laboratories of the United States Bureau of Standards. The original form has been improved by the addition of a small electric lamp located so as to illuminate the scale and to render it more easily read. The "Lenzmann" differs from other reading devices intended for the same purpose. It consists of a combination of lenses, but, in addition, is provided with an adjustable lens with a very fine hair line through its center and

connected to a graduated micrometer screw in such a way that it may be moved across a certain space in either direction. This makes it possible to subdivide the space between any two graduation marks of a thermometer or burette into from two to twenty parts. The illustration shows a side view of the instrument clamped to a thermometer. The subdivision of the scale being observed is read from graduations on the face of a cylinder forming part of the milled thumb nut. [Lenz & Naumann, New York.]

ELECTRICALLY HEATED EXTRACTION APPARATUS.

A compact apparatus, suitable for general laboratory extractions in analytic work is shown in the illustration. It is of revolving type, mounted on an electrically heated base. It will accommodate any style of glass extractors, and any need for adjusting the corks on the tubes, in order to remove any part of the glassware, is obviated. The condensing tube slides easily through the cooling tank, thus enabling any flask or extractor, or both, to be removed from the cork and not the cork from the glass parts, as in other forms of support. There are no valves or washers used and it is impossible for the cooling tank to leak where the tube passes through. The water enters at the bottom, through the center column and down to the bottom of the condenser, the warmer water rising and overflowing through the central column to an outlet in the base opposite the inlet. This arrangement dispenses with the many rubber-jointed individual condensers, and their clamps, heretofore used. [E. H. Sargent & Co., Chicago, Illinois.]

"Rubber Machinery," Mr. Pearson's newest book, filled with valuable information for rubber manufacturers, is now ready for mailing. Price, \$6.

Modern Industrial Methods in the Rubber Industry.

W. Armur Johnston, Jr.

NOT long ago a friend addressed the writer as follows: "Why doesn't the rubber industry in general put a more reliable product on the market? Usually I am obliged to stretch several rubber bands before I can get one that won't break, two out of every five auto shoes I buy have to be returned for credit, because they become unusable before the completion of their guaranteed mileage," and so on with water bags, syringe bulbs, shoes, and other rubber articles he had occasion to use. It was not any one make that he complained of, for he had tried many of the best, and although some proved to be more reliable than others, successive purchases of the best sooner or later proved their unreliability. A certain firm manufacturing apparatus for hospital use recently installed an expensive equipment, including several hundred feet of standard rubber tubing which they bought for the purpose directly from a well-known rubber factory. Within a very short time the tubing had become unusable. The rubber factory replaced the entire lot, but the results were just the same, and in both cases the cause of the trouble was laid to improper curing. Such experiences are only too common and have led to general condemnation of the rubber industry for its unreliable product and its backwardness compared with other industries.

The manufacturers meet these criticisms by claiming that the art of rubber manufacture is still comparatively young; that the nature of the product itself offers peculiar difficulties not found elsewhere because of the variability in the raw state and the changes which are likely to occur in the finished article after it is made; that they are spending large sums of money investigating and trying to eliminate these troubles; and, finally, that the many stores in which the product is sold and over which they exercise no control carry rubber stocks unreasonably long before selling.

To many of those who are acquainted with the manufacture of rubber articles, these claims are readily understood and appreciated; but they do not satisfy the present needs of the consumer, and it is a belief held by the writer, as well as by others, that the average rubber shop overlooks two very important weaknesses, namely:—

1. An absence of a high standard of mechanical practice and precision;
2. The use of empirical instead of scientific methods in the control of processes, and the handling of materials.

Comparisons of representative shop practice may make the first of these points clearer. Contrast, if you will, the usual methods employed in a machine shop with those found in a rubber factory even of the better type. In the former a workman is assigned a task on a machine—a milling machine, for instance—which makes one or more cuts under graduated control from any desired angle. The material upon which he operates and of which his cutting tool is made—tool or machine steel, hard or soft brass, or whatever it may be—is of practically uniform quality, not only from different sources of supply, but also in different purchases over considerable intervals of time. A clear understanding of what is expected of the workman is shown on a detail working drawing made in advance from a complete design, so that the result harmonizes with other work on the same or other pieces and is a part of a schedule of operations whose previous consideration, as a whole, assures the elimination of misfits and a standard quality which can be repeated as often as desired. Any experienced machinist who can operate the machine and read the drawing, can produce the same result. No change in the design is allowed without a reconsideration of the

whole by the designer. The judgment of the lower-priced machinist can have no effect upon the quality of the product so long as he adheres to the instructions on the drawing and the design and drawing are correct.

In the rubber shop, however, a workman does his work on a machine—a mixing mill, for instance—where the adjustments of heat application and roll spacing are not under graduated control. He puts on the mill the rubber and ingredients, which are usually weighed out for each batch in advance, adjusts the roll-spacing or gage, applies steam or cold water to the rolls, and handles the mixture in accordance with his sight, touch, and previous experience. He is given few, if any, written instructions to follow. Nor does the material which he works on act uniformly, even in different batches of the same kind of mixture. This may be because of quality variations in the crude rubber or other raw materials, or it may be caused by differences in previous treatment due to faulty workmanship or the different personal equation of a substitute workman. At any rate the mill-man takes the materials as furnished him and endeavors to work them into a condition which his experience tells him is about right. Other operations throughout the whole process, except possibly curing and vulcanizing, are carried on similarly; so that there is at best only an incomplete harmonizing of all operations as they affect the whole finished article. In some plants chemical and physical examinations are made to check the results of important operations; but although they indicate and save many defects, such tests are often difficult and of questionable reliability. In short, the maintenance of the manufacture of a rubber product of uniform quality, according to present practice, is very largely dependent upon the judgment and personal equation of the more or less experienced workman, rather than upon a high standard of mechanical practice and precision. The result is a product of variable quality, as might be expected.

It might be well to state here that the writer realizes that among rubber, as well as among other factories, there may be exceptions where a higher state of development obtains; but, unlike the others, the number of exceptions among rubber shops is comparatively small, as evidenced by the condition of the product on the market.

Thus far an endeavor has been made to indicate the absence of a high standard of mechanical practice and precision in the average rubber shop by comparing the present existing conditions with those of a modern representative of high development—the machine shop. Hereafter an attempt will be made to describe briefly a few of the better methods of handling materials and of controlling processes.

In any effort to standardize the rubber shop the first necessity is to eliminate as far as possible the effects of unavoidable variations in the crude rubber as it is now frequently marketed in small quantities by many different growers or estates. One of the best methods is to include always in each batch or millful a small quantity of the product of each of several of the same reliable growers in the same quantity ratio to each other. The more growers included the less will be the percentage content of each, and the less possible variation from standard quality by occasional failure to obtain the product of one or two of the usual growers. This may involve increased purchasing and weighing costs, but the resulting smoother manufacturing conditions, fewer defects, and more uniform quality of product will more than justify the extra expense. With the wild South American rubbers the same treatment can be applied to different brands or marks when the usual available quantity

of any one of them is insufficient. And just as plantation or estate rubber must be delivered in original containers, so shippers, brokers, and weighers must not put different brands and marks of wild rubber in the same shipping case. The attainment of these requirements is difficult now, but only because they are not generally insisted upon.

Other important ingredients of rubber mixtures should be similarly treated. Ordering by specification should be carried out as far as possible, and on all materials tests for approval should be made before acceptance for use. Then each accepted purchase should be assigned a lot number and where the tests on several different containers of the same purchase indicate important differences in quality, which the manufacturers cannot avoid, each quality should be treated as a separate lot with a letter suffix added to the original purchase lot number. It has been found most convenient to have an independent series of lot numbers, beginning with 1, for each kind and grade of material. Thus an accepted purchase of, say, sulphur would become lot 1, and differences in quality, if found in that purchase, would indicate lots 1A, 1B, 1C, etc. The next accepted purchase would become lot 2, etc. Cost and stock accounts may be kept on each lot or group of lots, as may be found most practical.

Not only purchasing and stock-keeping, but also manufacturing by individual lots, should be strictly adhered to. For products of repeated manufacture this involves the following:

ARTICLE CLASSIFICATION.

All rubber work may be divided into the preparation and manufacture of the following general classes of articles, each of which should be assigned successive lot numbers.

RAW MATERIALS:

- Dried Highland plantation *Hevea* rubber, lots 1, 2, 3, etc.
- Dried wild *Hevea* rubber, lots 1, 2, 3, etc.
- Zinc Oxide, grade 1, lots 1, 2, 3, etc.
- Zinc Oxide, grade 2, lots 1, 2, 3, etc.
- Etc.

MIXTURE:

- Mixture 4 (*i. e.*, formula No.) lots 1, 2, 3, etc.
- Mixture 22, lots 1, 2, 3, etc.
- Etc.
- (A lot may contain any number of batches or millfuls.)

CALENDERED SHEET:

- Calendered Mixture 4—18 (*i. e.*, gage No.) lots 1, 2, 3, etc.
- Calendered Mixture 4—15, lots 1, 2, 3, etc.
- Calendered Mixture 30—18, lots 1, 2, 3, etc.
- Etc.

FINISHED PRODUCTS:

- Lots 1, 2, 3, etc., for each kind, size and shape.

PACKED PRODUCTS:

- Lots 1, 2, 3, etc. for each different style and size of package of the same and different finished products.

The same raw material may be used in two or more mixtures. The same mixture may be calendered into two or more gages or thicknesses of sheet, and so on right through the complete classified list of articles, so that each article must be a separate manufacturing unit. The reasons for this will be more apparent later on.

LIST OF STANDARD OPERATIONS.

Each article should have its own complete list of operations or divisions of work, which are made in accordance with location, machinery, cost and other considerations, and there should be no deviation from this list in the manufacture of successive lots. Thus, in the preparation of a raw material we may have

- a. Ordering
- b. Testing
- c. Preparing (*i. e.*, sifting, etc.).

The article is then considered complete, and put into stock for such use in one or more mixtures, as may be required. Its cost, ready for use, may be easily obtained.

Or, in making a mixture we usually go through the operations

- a. Weighing rubber and ingredients
- b. Mixing
- c. Refining
- d. Testing.

The article is then considered complete and ready for use in one or more calendered mixture articles. Or, finally, in making a finished product we may

- a. Make up
- b. Cure
- c. Finish (*i. e.*, trim).
- d. Test.

An operation can be added to any list to cover the same kind of work that has to be done on almost every lot, or regularly upon only a few pieces or pounds of the same lot.

In contrast with the above, the list of operations in the usual rubber shop, when there are any at all, runs through the entire schedule of work for the complete process, from the sifting of only as much of the raw material as is immediately needed, to the final packing of the finished product. But it is generally conceded to be good economy to bulk as far as practicable all the same kind of work on the same article, which, in other words, means to sift at one time all the same lot of raw material, to mix at one time all the requirements of the same kind of mixture for a convenient period, etc. For this reason and also because of shop ordering, cost, stock, and other considerations, this detailed classification of articles and the lists of standard operations are very important; in fact, no complete plan of shop standardization can do without them.

UNIFORMITY CONSIDERATIONS.

It is customary in mixing a lot of mixture containing a number of batches to use up one lot of rubber or ingredients as far as it will go, and then to finish the remaining batches with one or more other lots. This may even happen with several different raw materials in the same mixture. Such a procedure ignores the possibilities that slightly varying qualities of the successive lots of raw materials may cause more or less important differences in the finished mixture. In other words, every batch of the mixture may not be of uniform quality. Of course, the standardization and testing of raw materials will diminish the chances of trouble, but the manufacture of few, if any, of the raw materials, especially colored pigments and rubber, has not as yet reached such a state of quality uniformity in successive purchases that this way of putting them together will produce the most uniform results possible.

There is a better method, and it requires only a small amount of additional advance laying out on paper. When two or more different lots of the same raw material have to be put into the same lot of mixture, they should be so apportioned that each batch throughout the entire lot of mixture will contain exactly the same proportion of each lot of raw material. Similarly, every pound of calendered sheet should be made identical with every other pound in the same lot by the previous blending of any different mixtures or different lots of the same mixture which are to be sheeted out. And in curing, any two or more lots of mixture or calendered sheet of which the pieces are to be made, should be so blended that every cured piece in the same lot should contain exactly the same proportions of the same kinds and lots of calendered sheet or mixture, and hence of raw materials.

This system of lot manufacture, involving thorough article and operation classification, is not so complicated as it might appear. Its successful installation does, however, require patience, practice, and experience, and until those who handle it acquire proficiency they are likely to want to revert to the old method, because it seems easier and because the new way appears to require extra effort for small and perhaps unapparent differences. But eventually, if they honestly maintain its integrity,

they will find that the most systematic method is really the easiest in the long run, and that not only its faithful maintenance permits the tracing of a complaint to an individual purchase of raw material, but—what is even more important and perhaps otherwise unattainable—its systematic procedure creates a more favorable shop condition in which there is greater economy, fewer irregularities and delays, and greater assurance of a more uniform final product.

Another important item in shop management that adds to the scientific or systematic handling of materials has to do with a method of determining the time of issuing and the quantities of shop and raw material orders. It has been called "periodic ordering," but it might more truly be named stock budgeting, "or it requires the predetermination of possible manufacturing requirements over a convenient interval of time, and the bulking of the necessary shop and raw material orders therefrom. A three months' period has been found most satisfactory in one plant, but other shops may find a longer or shorter period of greater advantage. The essentials of its successful operation are to divide the year commensurately into periods, to use good judgment in the estimation of advance requirements from past records and future indications, and to carry the schedule through unaltered after the orders have once been issued. If a change is believed necessary after it is too late to make an alteration, a supplementary order can be put through as a special, or the deficiency—or excess—can be remedied in the planning of the requirements for the next period. Advance period estimates should be made to allow sufficient time for the washing and drying of crude rubber, the resting of mixtures, etc. The development of several periods has to be experienced before this method is completely installed, and in some shops it may require even longer to make adequate adjustments of stock, space, and equipment; but the method is very flexible in its application to wide variations in shop conditions, and its advantages, aside from those of financial budgeting, are steadier labor and shop conditions with the elimination of rushed and inactive intervals, because an advance knowledge of work to be done within a period makes possible a more economical assignment, the elimination of excessive stock, space, and equipment requirement with the resulting minimum investment of capital, and the steady and frequent production of a semi-perishable product with an advance knowledge of the expected dates of completion.

Lack of space in a general article like this prevents the explanation of other large betterments for the control and handling of raw materials, such as strict stock-room control and the routing of operations, and complete cost and overhead expense accounting systems with comprehensive monthly and yearly summaries. Suffice it to say here, however, that all these systems and methods have been worked out from a conception of Taylor's Scientific Management, partially applied to the rubber industry, and their superiority over present methods, or lack of methods, in the average rubber shop is in every way more economical and desirable.

When the handling of materials has been thus standardized and the materials themselves made as uniform as possible, then, and not until then, the control of processes can be improved. Rubber mills, calenders, and tubing machines can be successfully equipped with comparative temperature measuring instruments and roll-spacing gages so that the variables of heat and handling can be controlled and standardized for each kind of mixture with reasonable accuracy. Press curing in molds with both steam and temperature indicators has usually attained a higher standard of accuracy than other operations, but there is still much more room for improvement in the use of better presses and molds, and more adequate tools for ejecting and cleaning.

Open steam vulcanizing is usually controlled by clocks, steam gages, and pyrometers or thermometers. The steam experts say that pressure varies directly with temperature, and that with gages and temperature indicators of equal accuracy and sen-

sitiveness either instrument will indicate the true heat conditions within the vulcanizer. And yet the rubber worker knows that under the most uniform conditions and with the same temperature indication on either the gage or thermometer, he is obliged, for a good cure, to alter the time of cure to suit the use of "live" or "dead" steam; the former condition produced by a slightly opened exhaust valve to permit the continual escape of a small amount of steam and water, and the latter by an exhaust which passes through a steam trap. The rubber worker also knows that the curing directions in an autoclave where heat is externally applied to a sealed pot containing water are very different from those required for the same material in the same mold in the usual tank vulcanizer which is heated by the injection of steam through a valve with the ejection of water of condensation through a steam trap or slightly opened exhaust valve. The writer has yet to hear of a satisfactory scientific explanation of these phenomena and until it is forthcoming, the open steam vulcanization of soft rubber goods will continue to produce the present uncertain results, in spite of the strict observance of uniform conditions with which rubber manufacturers now endeavor to surround this important operation.

With materials and machines standardized, specific instructions can be worked out and put into concise form, so that the workman can follow them just as a machinist follows his blueprint or drawing.

It has been the writer's experience to develop and apply most of these suggestions for the betterment of rubber shop and product conditions, and the results obtained have more than compensated for the effort involved. One representative experience may serve to illustrate: In a calendaring operation a gang of eight workers were turning out an average of 400 units a day. They were experienced, and it was believed that only automatic machinery could lower the costs of the operation. Nevertheless, three years later, after the installation of most of the improvements above outlined and without automatic machinery, they were averaging 600 units per day, with one less worker—an increased production of 50 per cent. with 12 per cent. less labor. The more uniform quality of the material delivered to the calender, and the more favorable shop conditions, had resulted in fewer interruptions and in the production of a larger quantity of usable finished product.

It is the writer's firm belief that if these higher standards of mechanical practice and precision, with more scientific methods of controlling processes and handling materials, as above outlined, are adopted, it will be entirely possible to put many rubber articles on the market with a guaranteed advance date—molded in the article or indelibly stamped on fool-proof packages—which will tell positively just when the rubber manufacturer's responsibility ends, as in the case of the kodak film industry. It will then be the concentrated incentive of the manufacturer not only to endeavor to advance the date as far ahead as possible, but also to see to it that the product is so well made that under normal usage it will not have to be returned for credit before the expiration of the guaranteed date.

When such a condition shall have been reached, the rubber industry will be beyond the cause for the complaints of the present unhappy consumers of rubber products, and its position will be alongside of, and not behind, the higher developments of other industries. Such a consummation need not await the millennium, for its accomplishment by the industry, as a whole, but only the awakening of the individual rubber manufacturers to the opportunity that is before them.

RUBBER ENZYMES.

It is generally admitted that enzymes are the cause of the tack in rubber. Dr. Uttie states that they can be destroyed by heating the latex or even the gum for 15 minutes at 176 degrees Fahrenheit.

New Machines and Appliances.

TWO NEW ADAMSON MOLD PRESSES.

THIS hydraulically operated mold press, with swing bolts which may be quickly removed, shows a vast improvement over the ordinary hose vulcanizing press.

The machine, which is shown herewith, receives molds up to 24 inches in width and 20 or more feet in length.

In operation the top mold and platen, which are clamped together, are raised sufficiently to allow the operator ready access

to the lower mold. The lengths of hose, on their respective mandrels, are now placed into the cavities of the lower mold, the upper mold and platen are then lowered, and then the bolts are swung into position. Water under pressure is simultaneously turned into the 6 cylinders, forcing the rams upward and the two mold sections together, thereby exerting the necessary pressure on the hose. The steam is then turned on until the cure is complete.

The second illustration shows a new bicycle tire mold press operated hydraulically, with a swinging lower mold to facilitate the insertion or removal of the tire.

It may have a number of platens arranged one above the other, to any desired height. The lower platen can be swung out clear of the machine by the handle, as shown, and the tire mold

inserted. The platen and mold are then swung back into alignment with the upper platen, when the ram action is started. The upper platens have an opening to afford inflation of the tires when the press is closed. First, the lower platen will be forced up against the upper platen which, in turn, will force the lower platen of the next tier against its upper platen. The continued application of the ram will force tight joints, when the steam is admitted for curing the tires. [Adamson Machine Co., Akron, Ohio.]

WILLS' AUTOMATIC JAR RING CUTTING LATHE.

The special feature of this machine is an intermittent rotating star gear which controls the travel of the disc cutting knife and is automatically locked in position during each cut, thus in-

sureing uniformity in thickness of the rings produced. The illustration shows the assembled machine with a partly cut rubber sleeve on the mandrel. [United States patent No. 1,036,763. Arthur J. Wills, North Brookfield, Massachusetts.]

SOUTHWARK TIRE BEAD PRESS.

The illustration herewith shows a special type of quick-acting press for forming and shaping beads. The advantages of this

machine are explained in the following description furnished by the manufacturers:

"The moving table is controlled by air cylinders, thus permitting the table to be moved in and out of the work very quickly, necessitating the minimum amount of labor. The table is sufficiently long to permit the bead being taken out and a

new one inserted for pressing, while the press is doing actual work. The press is made entirely of steel castings instead of built-up beams and cylinders. A very low moving table makes it unnecessary to lift the tires, thus making handling easier. The ram is brought down to the work through idle stroke with tank water so that no power is required except for actual work. The press is controlled by a patented operating valve so designed that when the press is at rest the water is automatically by-passed." [Southwark Foundry & Machine Co., Philadelphia, Pennsylvania.]

THE C. C. PRESSURE REGULATOR.

Whenever it is necessary to use steam or air at a pressure lower than that of the initial pressure an automatic pressure regulating device is recommended. Such regulators are useful in rubber mills, particularly in connection with vulcanizers and dryers.

The C. C. Pressure Regulator, Type A, shown herewith, is a simple main valve operated by a piston under the control of an auxiliary valve. The adjustment of the auxiliary valve and the control of the service pressure are effected by a hand wheel which compresses a regulating spring.

The operation is as follows: To start the regulator turn the hand wheel 1 (Fig. 1) to the right,

compressing the regulating spring 2. Diaphragm-hub 5 is forced inward, deflecting the diaphragm 6 which, abutting the stem of auxiliary valve 7, moves it away from its seat, allowing steam from the inlet to pass through drilled passage 8, through the auxiliary valve port, and on into annular groove 9. Connecting with this groove is drilled passage 10 (Fig. 2), through which steam passes to the top of piston 11. The piston 11 being of greater area than the main valve 12, the latter is forced from its seat, permitting steam to enter the service system.

The pressure in the service side of the valve is introduced into the chamber 13 (the inner side of diaphragm 6—Fig. 1) through drilled passage 14, shown in both Figs. 1 and 2.

When the steam pressure against the inner side of the diaphragm 6 is greater than the pressure of the regulating

spring 2 on the outer side, the latter is forced back. The auxiliary valve 7 is permitted to close, cutting off the supply of steam above the piston 11, and the main valve 12 closes. As the service pressure falls, the regulating spring 2 again deflects the diaphragm 6, which opens the auxiliary valve 7, followed by the opening of the main valve 12.

FIG. 2.

The diaphragm 6 is really in a state of balance between two

forces, the regulating spring 2 on the outer side, and the service pressure in chamber 13 on the inner side. The degree of compression of the regulating spring 2 determines the service pressure which is automatically maintained up to the capacity of the regulator. The service pressure is not affected by fluctuations of the initial pressure so long as there is sufficient excess of the latter to furnish the necessary operating power.

The dirt and scale usually carried by the steam is caught by the metal screen 20. [Crane Co., Bridgeport, Connecticut.]

REED POWER PATTERN GRADER AND CUTTER.

Footwear patterns cut by hand are always imperfect and have to be carefully trued up, also by hand, before the binding edge can be put on. The power machine, illustrated herewith, operates with a pantographic movement, cutting and grading the patterns in one rapid operation, completely ready for the application of the binding edge.

The machine can be set for any size by an automatic mechanical device necessarily accurate and always uniform. Gage scales secure perfect and uniform grades which require no further al-

teration or filing. By the use of these scales, patterns may be reproduced by merely keeping record of the gage number on the pattern—thus allowing repeat orders to be easily filled.

The variety of work which may be accomplished includes keeping laps even on all sizes; grading difficult and stay patterns; locating eyelet holes and grading top facings. By using traces of different sizes, patterns may be cut out either of full size or with allowance for binding. The cutting mechanism consists of a punch and die, making 2,100 strokes per minute. The power may be furnished through belts or electric motors. Factories equipped with this machine should turn out a new set of finished and graded patterns in half the time now required. [Charles E. Reed & Co., Chicago, Illinois.]

MACHINERY PATENTS.

PRICE'S VACUUM CHAMBER TUBING MACHINE.

IN order to obtain rubber in a compact form free from air, moisture and gases, Price has invented this apparatus for the treatment of plastic materials.

The accompanying longitudinal section shows only one of the several ways in which the rubber may be fed to the cylinder A. The feed hopper D may be horizontal and diversified tandem, or feed rolls arranged in the hopper, or a feed plunger in the hopper used to force the material to the cylinder.

The material is fed into the hopper *D* and is forced by the stock worm *E* towards chamber *A*. When the material reaches the opening into the larger chamber *A*, it expands and is subjected to the direct action of a vacuum through one or more pipes *F*.

This removes all entrapped air, moisture and gases. An effectual seal is provided by the movement of the material in the hopper and in the large chamber *A*, thus allowing an efficient vacuum to be exerted. The material is then carried along by stock worm *B*, rotated by belt wheel *C*, to the discharge outlet *G*. [Raymond B. Price, assignor to Rubber Regenerating Co., United States patent No. 1,156,096.]

MACHINE FOR LEATHER NON-SKID STUDS.

Steel studs of leather non-skid treads are evenly spaced around the tread in three staggered rows by the machine illustrated herewith. Referring to the drawing—the hoop shaped template *A* has three rows of holes corresponding to the studs of the tread, and is supported by three rollers *B*. It is turned intermittently by a pawl that engages teeth cut on the inner periphery of the template. The lever *C* that moves the pawl rocks on shaft *D* through a cam on the driving shaft. The template *A* is adjusted transversely for a new row of studs by the eccentric sleeves of the rollers *B* operated by handles *E*.

The leather tread is slipped on the template, which is then placed in the machine. The punch *F*, guided by the template, punches a hole, and a stud is brought forward and inserted from below by the plunger *H*. A washer, fed from above the template, is dropped over the stem of the stud, which is then riveted by the hammer *G*. [Dunlop Rubber Co., Limited, and F. J. Keegan, British patent No. 10,214, 1914.]

HYDRAULIC TIRE VULCANIZING MOLD AND PRESS.

In this process the tire cover is molded and vulcanized simultaneously by placing the cover, in the form of a cylindrical ring, in contact with a suitably grooved heated ring, and pressing it by radially moving segments.

In the illustration *A* is the ring, which is heated by making it a part of a steam-heated chamber, and *C* is one of the movable segments. When two or more tires are to be molded and pressed, either ring *A* may be grooved, or additional rings, as *B*, may be employed.

The radial segments are forced outwards by the toggle-joints *D*, joined to the piston *E*, working in the upper part of hydraulic cylinder *F*. The radial segments slide between the fixed parts *G* and *H*, and are attached to the cylinder *F*, which moves over a fixed piston *I*. The two pistons are separated by a diaphragm about two-thirds of the way up in the cylinder.

In operation, water under pressure is admitted above the fixed piston *I* to raise the cylinder *F* and press head, and when further upward motion is stopped by plate *H*, water under pressure is admitted under the piston *E* to straighten out the toggle-joints and compress the tire cover. [Dunlop Rubber Co. and C. Macbeth, British patent No. 11,732, 1914.]

The Editor's Book Table.

DIE TECHNOLOGIE DES KAUSCHUKS. BY DR. RUDOLF DIETMAR A. Hartleben, Vienna, Austria, and Leipzig, Germany. 1915. [Large, 8vo, 597 pages, 520 illustrations.]

THIS handbook, in German, on "The Technology of Rubber," is a valuable systematic collection of data dealing with rubber and rubber goods manufacture. The material has been gathered from many published and original sources. The author is proprietor of a government authorized testing laboratory in Gratz, Austria, devoted to the technology of the rubber industry. He has thus had exceptional facilities for the study of the subject. The book embodies the results of factory and laboratory investigations of rubber manufacturing problems. The section on factory plan and equipment, as well as that on processes, represent the best current German practice.

The author states in his preface that the value of his book lies in the fact that the conclusions given were developed by combined studies of theory and practice modified by intimate personal discussion of the topics with practical rubber manufacturers, qualified as specialists to deal with technical problems.

The book has much value for the American manufacturer, particularly in the way of suggestion and comparison of methods.

Below is an outline of the subjects treated, condensed from the contents:

Tapping, gathering, coagulating and preparation of crude rubber, both wild and plantation.

Factory plans and equipment, including power, heating, drying and vulcanizing apparatus.

Reclaiming waste rubber and the manufacture and use of rubber substitutes.

Fabrics used in rubber manufacturing.

Rubber manufacturing machinery for various purposes, general and special.

Space is devoted to details of the manufacture of a large variety of hard and soft rubber goods, such as mechanical, footwear, druggists' sundries, thread, toys, proofed goods, tires, gutta percha articles, balata, belting and synthetic rubber.

OIL, PAINT AND DRUG REPORTER GREEN BOOK FOR BUYERS. September, 1915, edition. Issued semi-annually by Oil, Paint & Drug Reporter, New York. [Board covers, 164 pages.]

This useful guide is well along in its third year, and will, no doubt, be welcomed heartily by both old friends and new. It contains a comprehensive index, including the principal chemicals and compounding ingredients of interest to the rubber manufacturer, and gives the names and addresses of producers and dealers.

STOCK EXCHANGES (LONDON AND PROVINCIAL) TEN-YEAR Record of Prices and Dividends from 1905 to 1914. Frederic C. Mathieson & Sons, London, England. 1915. [Cloth, quarto, 496 pages.]

This is a work of substantially 500 pages, and appears now in its ninth issue; in fact, it contains cumulative data covering prices and dividends from 1905 to 1914.

To the rubber trade, the book is of interest because of the information which it gives in relation to British rubber companies, both manufacturing and planting.

The book has been described as the best and fullest work of reference of its kind in the world. It not only embraces all prominent securities in the various fields covered, but includes a great many of lesser importance. From the preface of this latest edition we quote the following: "The highest and lowest prices in this work being mainly of actual transactions officially recorded on all the different Stock Exchanges of the United Kingdom, the record for 1914 of this portion is necessarily only carried to the end of July, when the Stock Exchanges were closed and war was shortly afterwards declared; the dividends

paid, however, are to the end of the year, while notes have been made of the cessation of the number of interest payments. The re-opening of the London Stock Exchange on January 4, 1915, with generally lower prices than those current in the 'Stock Exchanges' Ten-Year Record,' calls attention to the advantages investors now have in being able to obtain higher yields for their capital.

"The rearrangement and writing-off of nominal capital, and the reorganization of companies, continued to be somewhat intricate in many cases, and 'splitting' shares with a higher nominal value into more shares of a lower denomination is still in favor. The attention given to these subjects over such a period as ten years must enhance the value of the tables, which have again increased in number."

RUBBER COMPANIES' POSITION. W. H. RICKINSON & SON, London, E. C., England. 1915. [Board covers, 96 pages. Annual subscription, 21s. postpaid.]

This relates to rubber planting companies in the Far East and summarizes the condition and prospects of 91 of them. To quote the editors: "Our object in issuing this handbook is to assist subscribers in forming as near as possible an idea of the present and immediate future position of a company, and the advisability or otherwise of extending or curtailing the field of their investments. The particulars given as regards capital, planted acreage, monthly output, etc., are extracted from the latest reports, balance sheets and circulars issued by the various companies."

VAN NOSTRAND'S CHEMICAL ANNUAL FOR 1915. EDITED BY John C. Olsen, A.M., Ph.D. D. Van Nostrand & Co., New York. [Leather covers, 669 pages.]

This is a valuable compilation of chemical information presented largely in tabular form for convenient reference. There are 116 tables, grouped in several sections, such as general tables of atomic weight, physical constants of the elements, factors for calculation of indirect gravimetric analysis, etc.; calculation of volumetric analysis and gas analysis; physical constants of chemical compounds; specific gravity tables and alcohol tables; equivalents of weights and measures; thermochemistry and stoichiometry.

RUBBER IN NETHERLANDS EAST INDIA. NETHERLANDS-EAST Indian-San Francisco Committee of the Department of Agriculture, Industry and Commerce. J. C. T. Van Dorp & Co., The Hague, Holland. [Paper covers, 12 pages. Illustrated.]

This is a very brief and interesting review of rubber cultivation in Java and Sumatra. It gives a good idea of the development work in connection with plantations, together with an account of the rubber trees that have given the best results under cultivation there. The growing of the Palaquium for the extraction of gutta percha, which has been treated at length in various papers, is here summarized.

TWENTIETH CENTURY RUSSIA AND ANGLO-RUSSIAN REVIEW. John Bile, Sons & Danielson, Limited, London, W., England. [Paper covers, 83 pages. Price, 1s. net.]

This is a new quarterly, the aim of which is to give the English-speaking public an intimate idea of Russia in her modern phases.

The land of the Czar has been a closed book, and few realized its nature and needs. A magazine, therefore, that will help the English-speaking world to a better understanding of this vast realm, and its commercial opportunities should certainly be of present interest and value. Of the many papers of interest in the initial number one may be mentioned as typifying the whole, and that is "The Future of Russia as a Trade Center." The new journal, through its excellent beginning, gives promise of taking first rank among the world's reviews.

NEW TRADE PUBLICATIONS.

DRUGGISTS' SUNDRIES CATALOG IN ENGLISH, SPANISH AND PORTUGUESE.

A COMPREHENSIVE catalog of druggists' sundries and surgical rubber goods, bearing their registered trade-mark, "Alpha," is published by Parker, Stearns & Co., Brooklyn, New York. A complete assortment of the goods manufactured by this company, including syringes, water-bottles, atomizers, nursing bottles and nipples, operating room goods, etc., are presented in their proper colors. The catalog and index consists of 152 pages, bound in heavy paper covers, embossed with a design showing *seringueiros* engaged in tapping rubber trees, and is printed in English, Spanish and Portuguese.

THE PICHER LEAD CO.

"Protective Coatings for Structural Metals" is the title of a timely booklet issued by the Picher Lead Co., of Chicago, Joplin, and New York.

No one will contradict the statement made in this brochure that "The necessity of conserving the enormous quantities of iron and steel used nowadays in structural work of all sorts has brought architects and engineers to a very serious consideration of the causes of corrosion or oxidation of structural metals and the means of protecting them."

The booklet also enumerates the points of excellence desired in a metal-protecting paint, which are briefly color, opacity, firmness, toughness, durability, cheapness, and high basicity.

Sublimed lead pigments, by test, have all of these points when compared with other commercially available pigments, and of these is specially urged sublimed blue lead.

CATALOG OF "PHILKOB" PACKING AND RUBBER GOODS.

A catalog of packing and other mechanical rubber goods illustrates in 56 pages the goods sold by the publisher, P. W. Koebig, 116 Broad street, New York, under his trade-mark "Philkob." It plainly states, in connection with each packing, the materials from which it is manufactured and the uses for which it is adapted, as well as sizes, weights, prices, etc. The foreign buyer will find the weights and dimensions of standard packages, in metric as well as ordinary figures, an important aid.

THE NORTH BRITISH RUBBER CO., LIMITED.

The North British Rubber Co.'s catalogs are always interesting, and their latest, "North British Sand Shoes and Tennis Shoes" and "North British Linen-Finish Waterproof Collars, Cuffs and Fronts," are no exception. Speaking of shoes, their 1916 styles will remain much as for the past season. The company lay stress upon the fact that the shape and finish are all that could be desired. Particular attention is directed to their khaki-colored shoe. Another specialty is the special grooved soling to get over the trouble of breakage. The grooves do not run directly across the sole, but, instead, are at somewhat of an angle, which quite obviates the difficulty previously experienced.

In the matter of linen-finish waterproof collars, cuffs, and fronts, pleasing varieties of shapes and styles are illustrated. All are made either with plain or metal buttonholes, the latter measurably lengthening the serviceable life of the different articles.

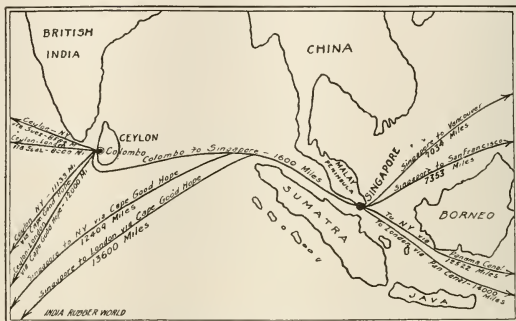

The company announces that the serious advances in the prices of raw materials have necessitated higher prices for these manufactured articles, and made it wiser to confine output only to the finer products. Therefore, certain previous grades will not be

continued, and only that quality which the company calls "The Best" will be produced.

RUBBER ROUTES FROM THE FAR EAST.

WITH the Panama Canal blocked by landslides and the possibility that the Suez Canal may any day be closed to facilitate the passage of troops, American manufacturers are becoming apprehensive in regard to the supply of plantation rubber.

There are really no grounds for such apprehension, as the

MAP OF RUBBER ROUTES FROM THE FAR EAST.

accompanying map and the following figures will show. Singapore, a prominent rubber shipping port, is nearer to New York via the Cape of Good Hope than it is to London by some 1,200 miles. The difference in the distance from Singapore to New York by way of Panama and the Cape is very small and is in favor of the latter route; from Singapore to New York via Panama is 12,522 miles, via the Cape of Good Hope, 12,409 miles, or 113 miles less; to London, via the Cape of Good Hope, is 13,600 miles, a difference of nearly 1,000 miles in favor of New York; while London is 14,000 miles from Singapore by way of Panama, 1,478 miles further than New York by the same route.

There is still another route, already tested with satisfactory results, by which communication with Singapore could be established. From Singapore to Vancouver, British Columbia, is but 7,034 miles, to San Francisco 7,352, and both of these ports have direct rail connection with New York and the Eastern States.

That rubber shippers are beginning to recognize the importance of these figures is shown in the latest receipts of plantation rubber. Six months ago, in May of the current year, to be exact, we received at the port of New York 4,344 tons of plantation rubber, of which 1,260 tons came directly from Singapore and Colombo and 3,084 tons from Liverpool and London. For the month of September, of the current year, our receipts of plantation rubber at New York amounted to 5,019 tons, of which 3,349 tons was shipped directly from Singapore and Colombo, the balance, 1,670 tons, coming by way of London or Liverpool.

From the above figures it does not look as though the closing of both the canal routes would seriously interfere with our receipts of plantation rubber. In fact, the American importer appears to have adapted himself in advance to the possibilities of the situation.

J. Spencer Turner Co., 86 Worth street, New York, is doubling the capacity of its duck mills, which are expected to turn out the increased product by January 1, 1916.

New Goods and Specialties.

THE HIGHEST PRICED RUBBER TUBING IN THE WORLD.

THREE-QUARTER inch rubber tubing at a little over \$6 a foot indicates something of greater value than the ordinary squirted compound of zinc oxide and rubber. A trifle over that price is charged for the patented electric warming tube shown

in the accompanying illustration. The tube is used with a special inhaling apparatus. It is built in plies, the rubber wall being only an eighth of an inch in thickness. Between two of the rubber plies is an inner coil of copper wire through which an electric current is passed. This heats the gas before it reaches the patient, thus bringing it to exactly the temperature of the human body. Between the outer plies of rubber is another coil of piano wire which makes it impossible for the tube to kink. [The S. S. White Dental Manufacturing Co., Philadelphia, Pennsylvania.]

NEW FEATURES IN THE "PERFECTED" DATER.

A rubber date band radically different from anything of the kind hitherto used in dating stamps has been introduced in the "Perfected" Lock Band dater illustrated herewith. These bands are of the type-block variety, with the blocks a trifle lower than usual, and each character is molded with a small air cavity, making it in effect a miniature pneumatic cushion. The bands are non-stretching and are made without woven fabric of any kind, their reinforcement consisting of fish-line silk and the joining of the ends being effected by means of a metal clasp which engages the center of the silk.

Several other features of the dater represent improvements in design and construction, included among these being the method of moving the date band. This band is turned by a toothed drum operated by a finger button on the side of the handle. Each dater is also fitted with a regular full thickness air cushion. [The R. H. Smith Manufacturing Co., Springfield, Massachusetts.]

THE "MADERITE" TENNIS BALL.

In order that a tennis player may make his strokes tell certainly, each ball must respond to those strokes in a like manner. To obtain this uniformity the greatest care must be used throughout the entire process of making the ball—in molding the core, gauging the weight, etc. An unusual degree of this valuable quality is claimed by the manufacturers for "Maderite" tennis balls. The highest grade new rubber, tested by chemists in their laboratory, forms the core. Felt of the correct weight and of a specially resistant quality, newly discovered, is used for the cover and firmly gripped to the surface of the core at every point. When complete, each ball is tested in every way before leaving the factory, and fully guaranteed. The manufacturers are receiving excellent reports from this new ball, which is evidently destined to be popular. [The Seamless Rubber Co., New Haven, Connecticut.]

CANADIAN CONSOLIDATED FOOTWEAR.

In the family bathroom, the youngsters are apt to be over-vigorous in their ablutions and splash the surroundings generally, as well as themselves in particular. The "Happy Thought"

bathroom slipper is probably the idea of some long-suffering paterfamilias. It is made of waterproof duck, in men's sizes only, and is thoroughly practical and inexpensive.

A sport shoe especially popular for running is called the "Sure-foot Balmoral." It has black rubber foxing, a rubber sole and rubber cleats. The top is made of dark tan leather, and the shoe is reinforced with ankle pads and has a leather insole and counter. A feature of the "Marathon Balmoral" which makes it an exceptionally satisfactory shoe for athletics is the solid rubber

spiked sole. It has all the advantages of the steel spiked shoe, with none of its detrimental effects. The rubber spikes do not tear up the turf on the putting greens of the golf course, nor scratch the floors of the clubhouse when one enters after the game. This shoe is made in the Bell vamp pattern, with blue, black or tan duck tops, as desired. It also has leather insoles. [Canadian Consolidated Rubber Co., Limited, Montreal, Canada.]

A WATERPROOF FOLDING SEAT.

The dampness of the English climate makes sitting on the ground at any season of the year a foolhardy proceeding. In this waterproof, woolen-lined seat, which can be folded up and put in one's pocket, however, the traveler, the sportsman, and also the ordinary citizen in the British Isles will find a most convenient, comfortable and healthful device.

Incidentally, other countries, notably our own, have damp days. [The Altrincham Rubber Co., Altrincham, England.]

ALL RUBBER HEEL LINER.

The "Nu-Grip" heel liner here shown no doubt makes good the promise of its name. The non-slipping quality of rubber when in contact with dry surfaces is well known, and this

device is made entirely of rubber, the surface intended to lie next the stocking being checked to further insure the grip. It is shaped to fit the back of a low-cut shoe, and is attached by applying rubber cement to its smooth surface and to the counter of the shoe. After allowing five minutes for drying, it is simply placed in position and pressed firmly against the counter. The "Nu-Grip" is supplied in several sizes, for both men's and women's shoes, in either tan, black or white. [The Scholl Manufacturing Co., Chicago, Illinois.]

RUBBER GOGGLES FOR PROTECTION AGAINST GASES AND ACIDS.

With the exception of the lenses, which are held in a special groove of the eye cup, and can be readily removed, these goggles are made entirely of rubber. They are of one-piece construction, can be easily cleaned, are dust and rain proof, and light and sanitary. They afford complete protection to the eyes, and yet are sufficiently ventilated to be worn with comfort. Chemists, or other persons working amid gases, acids, fine dust, etc., will find them particularly valuable. An elastic head band, adjustable to any size, holds the goggle firmly and comfortably against the face. [T. A. Willson & Co., Inc., Reading, Pennsylvania.]

**THE "MONKEY GRIP" RUBBER SOLE.**

A feature which renders the rubber sole here illustrated of especial value in athletic sports, and upon slippery pavements, is the oval-shaped raised design covering the ball of the foot, and

provided with flat-ended studs which lend the clinging quality suggested by the name, "Monkey Grip." This sole is a particularly satisfactory substitute for the spiked shoe often worn on the golf links, which ruinously tears up the turf on the putting greens. It is made of very tough-fibered rubber, and the manufacturers claim it gives exceptional service. When worn in combination with the "Monkey Grip" heel, which has U-shaped ribs and flat-ended studs forming a non-slipping bottom, the wearer is well equipped for the most unfriendly elements or strenuous sports. [C. J. Bailey & Co., Boston, Massachusetts.]

A RUBBER AND METAL PACKING.

It has always been a difficult matter to obtain a metallic packing which can be installed without making changes in rods or boxes. This problem has been solved by "Noheet"

metallic packing, a patented article made by the Lubricating Metal Co., 2 Rector street, New York. "Noheet" metallic packing is made of alternating rings of "Noheet" bearing metal and rubber, and is so constructed that in use the metal, not the rubber, is forced into contact with the rod. The metallic rings are made to fit the various sizes of rods, thus doing away with extra work of installation.

It is especially adapted to ammonia pumps, steam piston rods and valve stems, oil pumps, chilling machines, air compressors and packing service of every description.

A new porcelain mogul-base socket, equipped with $\frac{3}{8}$ -inch or $\frac{1}{2}$ -inch aluminum caps, as desired, has a rubber gasket which makes the joints between the upper and lower portions absolutely tight and therefore weatherproof. [Harvey Hubbell, Inc., Bridgeport, Connecticut.]

A new shoe designed for the outdoor worker, and labeled the "Workshu", has rubber soles, and canvas uppers of the same fabric as that used in automobile tires. A very comfortable shoe is thus furnished at a moderate price. [Amherst Boot & Shoe Co., Limited, Halifax, Nova Scotia, Canada.]

HARD RUBBER HANDLES.

Umbrella and parasol handles in simple and ornate designs are being manufactured by the Hanover Vulcanite Co., the well-known German makers of hard rubber specialties, soft rubber toys and novelties. The illustration shows one of the more ornamental handles, which has a pannelled recess on either side, one containing a neat bevel plate glass mirror and the opposite a small comb. Other patterns include mirror only. A large variety of the usual straight or bent forms are shown, all more or less ornamented. [Geo. Borgfeldt & Co., New York.]

**THE "EBONITE" BOWLING BALL.**

Bowling balls made of hard rubber throughout are, of course, not an entirely new thing, but this particular ball is a recent product, specially constructed, the company claim, to give life-long service, without cracking or splitting, and to roll accurately. It is made in four sizes: Small size, $4\frac{1}{2}$, $4\frac{3}{4}$ and 5 inches in diameter, the large size, 27 inches, weighing 14, 15 and 16 pounds. The trade mark encircling the holes of the ball is in the form of a red dumb bell. [Stowe & Woodward Co., Newton Upper Falls, Massachusetts.]

COMBINATION SHAVING AND MASSAGE BRUSH.

The rubber massage brush attached to this shaving brush provides a handy contrivance for softening the beard when shaving. It is intended to be used after applying the lather. Also, if used after shaving, it stimulates the circulation and tones up the skin. The bristles of the shaving brush are also set in rubber, measure $2\frac{1}{4}$ inches in length, and are made of fine white or mixed badger hair. [Montgomery Ward & Co., New York.]

**GUN BRACKET WITH RUBBER HOLDERS.**

A new gun bracket, called the "Universal", for use in hunting duck from a boat, is provided with U-shaped rubber holders which protect the fine finish of the gun as it rests between them. The bracket is attached to the boat in a position which allows the gun when not in service to swing freely, with muzzle pointing upward and in the direction the boat is going. It is thus ready for immediate use, and there is no danger of shooting a hole in the bottom of the boat. [New Process Specialty Co., Milwaukee, Wisconsin.]

INFANTS' ALL RUBBER TRUSS.

This is a bandage used for cases of umbilical or navel hernia in infants and youths. If put on a baby soon after birth it avoids all danger of navel rupture. The sponge rubber pad is velvety in texture, and will not slip. It is provided with a button in the center and a small strip of rubber at one end. The narrow rubber belt has several holes, allowing for adjustment as to size, the proper hole being stretched over the center button and the end of the belt being passed through the rubber strip in the manner of a buckle. To clean this truss it is only necessary to dip it in hot water and press it in a towel or cloth [Akron Truss Co., Akron, Ohio.]

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

Rubber Toys for the Holidays.

RUBBER toys for the holidays present new variety this season, attributable in no small degree to the enterprise of American rubber manufacturers.

As usual, the hand-made German toy animals are works of art. This year there are some notable additions in this line, offered by George Borgfeldt & Co., the well-known New York importers. The very latest German toys follow military models, as a natural consequence of the dominating conditions in Europe. These, however, are not obtainable in the American market today, although there is no shortage of German and Austrian toys.

The Mechanical Rubber Co., Cleveland, Ohio, is making a special feature of white rubber toys. Special claim is made for these goods that they are absolutely free of all soluble, injurious pigments or other deleterious matter; consequently are perfectly suitable for the use of the youngest children, whose chief pleasure is in mouthing their toys.

Particularly attractive is the line of toy balloons, inflated balls and "Rubber Bubbles" of the Faultless Rubber Co., Ashland, Ohio. The balls are made both in solid colors and in parti-colored bandings. The surfaces are printed with a variety of human and mechanical figures and various decorations of wild and domestic animals and comic faces. "Rubber Bubbles" are a substitute for soap-bubbles. They are thin rubber balloons in attractive colors, provided with inflating pipes and self-closing valves for retaining the air. Still another novelty in inflatable toys is the pocket punching bags. These are good-sized, stout wall, decorated balloons made with self-closing valve and provided with elastic cord and handle.

The illustrations show the attractive and appropriate Christmas designs and verses with which the holiday balloons are ornamented. They are particularly suitable as tree decorations and guaranteed to delight the heart of any young American.

BALLS AND BALLOONS OF THE FAULTLESS RUBBER CO.

Made in Red, White, Blue and Other Colors, and Are Fine Examples of Artistic Dipped Work.

MECHANICAL RUBBER CO.'S WHITE TOYS.

Non-Poisonous and Very Artistic.

TOYS HANDLED BY GEORGE BORGFELDT & CO.

Made Chiefly in Brilliant Reds, Except the Kewpie, Which Is White, with Movable Arms.

The Obituary Record.

GEORGE E. MELIUS.

GEORGE ESLEY MELIUS, vice-president and treasurer of the H. O. Canfield Co., Bridgeport, Connecticut, died at his home in that city on October 28, after several months illness, at the age of 57 years.

Born in New York City and educated at its public schools and at the College of the City of New York, which conferred on him the degree of Bachelor of Arts, he took up the study of medicine, which he followed for two years before deciding that he did not wish to be a doctor. In 1885 he accepted a position as book-keeper for the H. O. Canfield Co. and remained in the service of that corporation for the rest of his life, except while United States deputy collector of customs in 1900. His advancement with the company was steady and progressive until he finally became its vice-president and treasurer.

A member of the Algonquin Club, the Seaside Club, the Commercial Travellers' Association, the Bridgeport Business Men's Association (of which he was for a time president) and a thirty-third degree Mason, he took an active interest in the affairs of these organizations and enjoyed the esteem of his fellow members and of his business associates. He is survived by his widow and one daughter.

Mr. Melius had hundreds of warm friends, both in and out of the rubber trade. He was a man of fine presence, cultured, witty and sympathetic. The business community in Bridgeport in particular and the rubber trade in general suffer a great loss in his untimely demise.

ISAAC L. RICE.

Isaac L. Rice, who prior to his retirement from business about two years ago was actively engaged in various manufacturing interests, including the rubber industry, died suddenly of heart disease in New York on November 2, 1915, at the age of 65 years. He was born at Warneheim, Bavaria, and came as a boy to this country with his parents. After attending the Central High School in Philadelphia, Pennsylvania, he entered the Columbia Law School in New York, and graduated *cum laude* in 1850.

His entry into the business world was made in 1886 as counsel for the Southern Railroad. He was afterwards foreign representative of the Philadelphia & Reading Railroad and was subsequently identified as president with many important manufacturing interests. He was chairman of the Board of Directors of the Consolidated Rubber Tire Co., afterwards changed to the Kelly-Springfield Tire Co., and for a number of years president of the Buckeye Rubber Co., a subsidiary of the Consolidated Rubber Tire Co., and was instrumental in the erection of its plant.

An enthusiastic chess player, and inventor of the "Rice gambit," he was a member of the Manhattan Chess, Rice Chess and Brooklyn Chess Clubs in this country, as well as of the St. George's Chess Club and City Liberal Chess Club of London, England, in addition to his membership in the Lawyers', Lotos, Automobile and Harmonic Clubs, and rounded out his active career by publishing "What is Music?" and contributing many articles to the leading magazines.

Mr. Rice is survived by his wife, whom he married in 1884, and his family, consisting of two sons and four daughters.

Mrs. Rice, on behalf of herself and children, has donated \$1,000,000 to found and endow a model hospital for convalescents, in New York, to be known, in memory of her late husband, as the Isaac L. Rice Hospital for Convalescents. The idea was entertained by Mr. Rice before his decease, and plans for the buildings had already been prepared.

PHILIP W. PRATT.

Philip W. Pratt, founder of the Elastic Tip Co., died in New York on the 20th of November.

Seventy-nine years ago Mr. Pratt was born in Abington, Massachusetts, receiving his education at its public schools and at Phillips-Exeter Academy. He entered the lumber business in Abington, but gave it up as uncongenial, and being of an ingenious turn of mind had invented a rubber tip for crutches, chair legs, etc., which he determined to place on the market. He invented several other tips of different designs for similar purposes, and drove about the country with a horse and wagon selling his goods. An arrow tipped with a vacuum cup that caused it to adhere to the target at which it was aimed, the invention of a man named White, of Philadelphia, having attracted his attention, he purchased the right to its use and invented a pistol to discharge it.

About 1870 he went to Boston and renting a small office, carried on the business of manufacturing his specialties there. The business was removed about 1880 to Atlantic avenue where, as the Elastic Tip Co., it is still conducted.

He continued in the meantime his inventive endeavors, the last of which were mostly improvements on the rubber and fabric inventions of Rolon E. Foster. He went with the Foster Rubber Co. in 1903 and was identified with them up to the time of his death.

Besides his elastic tip inventions, rubber heel plugs and machines for impregnating the cloth of which they are made occupied his attention and were the subject of several patents issued to him. One such patent was on an elaborate machine which took fabric from the bolt, impregnated it with rubber and passed it backward and forward under an exhaust fan until dry, so that it could be rolled up at the other end of the machine. One of these machines was in successful use at the Walpole Rubber Co.'s factory. The fabric thus treated was used in making the plugs in the friction plug heels on the market.

From the anti-slipping heel to the non-skid tire was but a rational step. Mr. Pratt took out several patents on tires using these plugs, while in others the fabric was built in a sort of staggered, pyramidal form to prevent slipping. While none of these tires were placed on the market negotiations were in progress for their manufacture at the time of his death.

Mr. Pratt married Sarah Louise Hunt, of Abington, and of their several children but three reached maturity. One was the late D. S. Pratt, president of the Foster Rubber Co., who died in March, 1913. The only living son is Benjamin H. Pratt, sales agent for the Fisk Rubber Co., at San Francisco, who was on his way back to the Pacific Coast after a visit of inspection at the

company's factory when he was halted at Worcester by the news of his father's death. A Tugboat married George A. Stetson, president of the Elastic Pipe Co., Boston.

PHILIP JAMES KING.

At the age of 75 years, Philip James King, famous as a designer of balloons, who is said to have created the first balloon that crossed the English Channel and was the originator of the "fish balloon," the forerunner of the modern airship, died last month in a suburb of London.

DIETRICH MUSHORN.

After being for nearly half a century connected with the Eagle Pencil Co., New York, Dietrich Mushorn died at his home in the Cypress Hills section of Brooklyn on November 10. Deceased was born in Oldenburg, Germany, 71 years ago, and is survived by his widow, three sons and three daughters.

JUSTUS S. HOTCHKISS.

One of the oldest and best-known retired merchants resident in New Haven, Connecticut, Justus Street Hotchkiss, died at his home in that city on November 12, aged 84 years. Prominent for many years in banking circles, he was also largely interested, as a stockholder, in rubber manufacturing companies, one of his cousins being Henry L. Hotchkiss, president of the L. Candee Rubber Co., New Haven. The will of the deceased disposed of an estate of about \$2,000,000, a liberal share of which he distributed among relatives and faithful servants and to local institutions. As residuary legatee, Yale University will receive nearly \$1,000,000, which will be divided in equal amounts between the academic, law and logical departments, without restriction.

LOUIS GOTTSCHALK.

Louis Gottschalk, F.R.S., an expert chemist who made a special study of the synthetic production of rubber, died last month at his residence, Newark, New Jersey, aged sixty-seven years.

Deceased, who was educated at the University of Munich, Bavaria, devoted much time to the study of the production of synthetic rubber, using some highly explosive ingredients in his process. Two years ago an explosion occurred in his laboratory at Sewaren, New Jersey, by which his wife, who was greatly interested in his work, was fatally injured; and not long afterwards a second explosion resulted in the death of his son-in-law. He had finally succeeded in replacing the explosive chemicals with others of a less dangerous character and received the patents on his process shortly before his death.

RUBBER-SOLED SHOES POPULAR AT KARACHI.

The American consul at Karachi, India, in a recent letter, comments on the rubber-soled canvas sport shoe extensively worn in that district for every purpose, as follows:

The white canvas shoes sold here are of English make. They are cheaper than American-made white shoes, but not so good. * * * The rubber soles, so far as I have seen, are red. Dealers say that white rubber soles are not in demand here, as they cost more. I have personally tested the low canvas shoes with red rubber soles sold locally, and compared them with several pairs of American low canvas shoes with white rubber soles that I brought from the United States. The American shoes cost me about 50 cents more a pair at retail in New York than the British-made shoes in Karachi, and lasted more than twice as long under identical conditions of wear. The American shoes were of better shape, and held their shape better.

The Karachi consulate would like to have American shoe catalogues and price lists to place on file.

AMERICAN RUBBER SHOES IN BULGARIA.

Bulgaria's trade with the United States has always been very fickle and subject to great variations. An example of this is shown by statistics of Bulgarian imports of rubber shoes from this country. In 1913 these imports amounted to 14,552 pairs of rubber shoes, valued at \$8,757, whereas in

1914, according to the best available statistics, not a single pair of American rubber shoes was imported into that Balkan state.

FEDERAL TRADE COMMISSION INQUIRIES.

A Federal trade commission has been appointed by Congress, to obtain information by correspondence and personal interview in regard to foreign trade conditions.

Public hearings have been given at various points throughout the country for the purpose of eliciting the desired information, and about 30,000 letters sent out, some 20,000 to American manufacturers and the remainder to others familiar with foreign trade conditions or interested in export commerce. The trade of the world has been so affected by the war in Europe that special opportunities have been opened for American enterprise to enter foreign markets and obtain a largely increased share of their trade.

The letters were accompanied by a return postal card intended to give the commission a broad "yes" or "no" referendum on the advisability of export combinations and to put its members in touch with those willing to furnish facts covering topics on which the commission desires information. It is expressly stipulated that any facts communicated as confidential will be so treated by the commission.

Prompt and frank response is being made by business men to the inquiries, and at last account nearly 10,000 replies had been received, many of the answers being particularly explicit in regard to the advantages and disadvantages of cooperation in foreign trade.

The commission is desirous of completing its investigation with all possible despatch so that the results of its labors may be an aid to Congress' in determining what action may be required in the public interest, for the promotion of American trade. An early response to its questions will be appreciated.

NEW REGULATIONS GOVERNING EXPORT PROCEDURE.

The announcement that new United States regulations relative to export procedure will become effective January 1, 1916, has created such intense interest among manufacturers and shippers that the Bureau of Foreign and Domestic Commerce, Department of Commerce, Washington, D. C., has found it necessary to re-print the new order, with explanatory text. That pamphlet is just off the press and is being supplied free of charge to those interested, upon application to the above-mentioned office. All shipments for export to foreign countries, or to Alaska, Hawaii, and Porto Rico, will be affected by the new regulations.

STATEMENT OF THE INDIA RUBBER WORLD.

Statement of the ownership, management, circulation, etc., required by the Act of August 24, 1912, of THE INDIA RUBBER WORLD, published monthly at New York, N. Y., for October 1, 1915.

Editor, Henry C. Pearson, Tompkins Corners, Putnam county, New York.

Managing Editor, None.
Associate Editor, John P. Lyons, Hotel Apthorp, Broadway and Ninety-fourth street, New York.

Business Manager, William M. Morse, 99 North Broadway, Tarrytown, N. Y.

Publishers, The India Rubber Publishing Co., 25 West Forty-fifth street, New York.

Owner, Henry C. Pearson, Tompkins Corners, Putnam county, New York.

Known bondholders, mortgages, and other security holders, holding 1 per cent. or more of total amount of bonds, mortgages, or other securities: None.

(Signed) WILLIAM M. MORSE, Business Manager.
Sworn to and subscribed before me this sixth day of October, 1915.

(Signed) FREDK. SPRINGER, Notary Public,
Westchester County.
[SEAL]
Certificate filed in New York County, New York County Clerk's No. 204, Register's No. 6370. (My commission expires March 30, 1916.)

THE HOME OF THE PENNSYLVANIA COMPANY.

ABOUT twenty-six miles from Pittsburgh, at Jeannette, in a picturesque valley adjacent to the main line of the Pennsylvania Railroad, are the factory and main offices of the Pennsylvania Rubber Company, a thoroughly modern establishment.

The company started as manufacturers of rubber goods of various descriptions in 1902. The growth of the business made reorganization necessary in 1910, when many new additions were made to the rapidly expanding plant. Last year, the building that forms the central feature of our picture, a six story, fireproof structure 200 x 140 feet, with steel frame, brick walls and concrete floors and columns, was completed, making an addition of 125,000 feet of floor space to the already large plant, which now has in the various buildings, a floor space of 400,000 square feet. Five of the stories are employed for manufacturing purposes, the general offices of the company occupying the sixth or top floor. With the aid of the latest improved machinery the company turns out daily 2,000 "vacuum cup" automobile tires, 5,000 automobile inner tubes, 3,000 bicycle tires and 3,500 hand-made tennis balls. A new power plant, adjacent to the main building, with boilers of 3,000 horse-power and turbo-generators, furnishes power, light and heat for the various departments.

A feature of the establishment is the solicitude displayed for the comfort and health of employees, which is regarded as a factor in successful work. Light and fresh air are abundant on every floor. For every employee a steel locker is provided and in addition to the excellent lavatory accommodations there are 14 shower baths for the use of employees. The drinking water supplied by never-failing sanitary fountains, is first filtered, sterilized and refrigerated. A dining room, a hospital with skilled attendance, and a laboratory contribute to the completeness of this model home of the "vacuum cup" tires.

BULLET-PROOF TIRES AGAIN.

Five years ago it was attempted to adapt the Casimir Zeglen invention of a bullet-proof fabric to the manufacture of pneumatic tires, but the Philadelphia company which acquired the rights was not successful in the undertaking and failed financially. The problem has been taken up again by a \$50,000 corporation, formed recently by Mr. Zeglen in South Bend, Indiana, and known as the Zeglen Tire & Fabric Co. Dr. E. R. Dean, of South Bend, is president of the new company, and F. J. Hardy, secretary.

OPIUM SMUGGLED IN RUBBER TIRES.

The daily newspapers recently reported a new use for rubber pneumatic tires which was discovered in Manila, Philippine Islands. A large touring car was landed on the wharf from a trans-Pacific liner and driven away under its own power. It was afterwards learned that \$27,500 worth of opium had been injected into the four tires fitted to the wheels of the car and into three spare tires carried "for emergencies."

CHANGES AT THE FISK RUBBER CO.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has issued an addition to its first preferred stock of \$1,500,000, making the total outstanding stock, \$14,775,000.

New additions to the plant, now in process of construction, are an administration building; a concrete warehouse, 300 x 120 feet; a manufacturing building, 600 x 120 feet; each building to be six stories high—which will give the company a total floor space of more than 27 acres.

The Fisk Company has appointed R. D. McPhal manager, covering the states of Oregon, Washington, Idaho and British Columbia, with headquarters at Portland, Oregon.

NEW RUBBER COMPANY AT PLAINFIELD.

The Rubber Insulated Metals Corporation, recently incorporated in New Jersey, has purchased the Electro-Chemical Rubber & Manufacturing Co. and now controls its patented electrochemical process for the permanent attachment of rubber to iron and steel.

The company has secured the plant at Plainfield, New Jersey, formerly operated by the Century Rubber Co., and is engaged in manufacturing the Century brand of automobile tires and inner tubes. The capacity of the equipment is 200 or more tires and tubes daily. The factory is in charge of J. A. MacEwan, superintendent, and

Dr. Leo Daft, chemist and consulting engineer. It is the plan of the company to add to its tire business a line of mechanical goods, especially such as require the attachment of rubber to metal, as in solid tires, squeeze rolls, valves and other specialties.

A RUBBER FIBER TIRE TREAD.

The main portion of the tire tread here illustrated consists of one continuous piece of specially compounded fiber, $\frac{1}{2}$ inch thick on the tread portion, and tapering down to where the tread enters the beads to approximately $\frac{1}{16}$ inch. The manufacturers claim that this tread affords unequalled wearing and resilient properties, the side walls giving with the movement of the tire as leather side walls cannot do, and the fiber being tougher than leather, and very flexible and waterproof. The one-piece construction does away with the laps along the side that all leather treads must have, and which let in water. It can be cemented at the bead of the casing, and fitted perfectly to any sort of tire—after inflation to the correct pressure, depending upon the size of the tire—the edges gripping between the rim and the casing, and being held on by the same pressure and in the same manner as the tire itself. [V. K. Sturges Co., Oakland, California.]

PLANT OF THE PENNSYLVANIA RUBBER CO., JEANNETTE, PENNSYLVANIA.

News of the American Rubber Trade.

BOSTON WOVEN HOSE & RUBBER CO.

THE Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, has filed with the Secretary of State of Massachusetts a statement of its financial condition, as required by the statutes, for the business year ending August 31, 1915, the details of which are reproduced below:

ASSETS.			
Patents	\$1.00		
Office furniture	1.00		
Land (assessed value)	\$160,900.00		
Buildings	1,536,624.25		
	\$1,696,924.25		
Less reserve for depreciation	480,258.17	\$1,216,666.08	
Machinery and tools	\$1,566,767.32		
Less reserve for depreciation	801,784.63	763,982.67	\$1,980,650.75
Cash	\$333,033.08		
Accounts receivable	\$62,090.22		
Merchandise inventory	869,404.14	1,764,531.44	
		\$3,745,182.19	
LIABILITIES.			
Loans			
Accounts payable (not yet due)	\$49,366.20		
Accrued wages	11,024.52		
Unpaid dividend		\$60,770.72	
Capital stock	\$2,000,000.00		
Surplus and guarantee	1,684,411.47	3,684,411.47	
		\$3,745,182.19	

At a directors' meeting the regular quarterly dividend of 3 per cent. on common stock was declared and the regular semi-annual dividend of 3 per cent. on preferred stock, both dividends payable December 15 to stockholders of record December 6.

The company will increase the common stock from \$1,250,000 to \$2,000,000, distributing the new stock to present holders in the form of a 60 per cent. stock dividend.

A DECISION IN FAVOR OF THE MARKS' PATENT.

A recent decision by District Judge Hazel of the United States Circuit Court of Appeals, of New York, declares that the A. H. Marks' patent on recovered rubber (the alkali patent) is valid.

RUBBER COMPANY DIVIDENDS.

At a meeting of the board of directors of The B. F. Goodrich Co. held October 27, a quarterly dividend of 1¼ per cent. was declared on Goodrich preferred, payable January 1, 1916, to stockholders of record December 21.

A quarterly dividend of 1¼ per cent. has been declared on Plymouth Rubber Co.'s preferred stock, payable December 1 to stockholders of record November 16.

RUBBER COMPANY SHARE QUOTATIONS

The following market quotations of the shares of rubber manufacturing companies on November 7 last are furnished by John Burnham & Co., 31 Nassau street, New York, and 41 South La Salle street, Chicago:

	Bid.	Asked.
Ajax-Grieb Rubber Co., common	375	450
Ajax-Grieb Rubber Co., preferred	101	110
Firestone Tire & Rubber Co., common	700	725
Firestone Tire & Rubber Co., preferred	112	115
Fisk Rubber Co., common	125½	125
Fisk Rubber Co., 1st preferred	106½	108½

Swinsheart Tire & Rubber Co.	53½	55
United States Rubber Co., common	107	108½
United States Rubber Co., preferred		

*And accrued divs.

EARNINGS OF THE UNITED STATES RUBBER CO. LESS THAN IN 1914.

Owing to the increased cost of raw materials—which in the case of tires alone averages 10 per cent. higher than a year ago—the earnings of the United States Rubber Co. are not expected to be as large this year as in 1914, according to a statement recently made by Colonel Samuel P. Colt, president of the corporation. The company is now turning out, at its various plants, upwards of 8,000 automobile tires daily, and it is expected that the output will reach between 13,000 and 14,000 tires before very long.

The company's footwear business is holding its own.

Colonel Colt stated that a small quantity of rubber is coming in from the plantations owned and cultivated by the company in Sumatra. While the quantity coming in will increase from year to year, the plantations are not expected to furnish any considerable share of the rubber required by the company until 1921. If, as the colonel anticipates, this rubber, equal in quality to the grade now selling on the market at 60 cents, can be brought here at a cost of 25 cents per pound, the Sumatra plantations will be an asset of no small importance to the company.

NEW PRICES FOR AMERICAN PROCESS ZINC OXIDE.

The New Jersey Zinc Co., New York, recently announced to the trade that American process "Horsehead" zinc oxide will be sold under a semi-annual contract and the clauses relating to protection and cancellation will be omitted. Deliveries will be limited to a maximum of 20 per cent. monthly, and will be spread as nearly as possible over the period of contract in regular monthly quantities. Where more than one grade is used, a definite quantity of each is to be specified.

Sales of the "Florence" brand, French process zinc will be confined to the first quarter of the year 1916. Contracts will be written separately and such tonnage will not be included in making up the 50-ton base of other grades. Where more than one grade is used a definite quantity of each is to be specified.

The following prices are for contracts covering the periods above mentioned, deliveries to begin January 1. They are based on shipments in barrels, f. o. b. shipping point, with freight allowance on carload lots. When shipped in paper bags of 50 pounds net weight, in carload lots, the price will be one-eighth of a cent a pound less than that given for "Special" and "XX Red." Quotations are subject to change without notice.

AMERICAN PROCESS "HORSEHEAD" BRAND.

	30-Ton Base.	Carloads.	Less Carloads.
Special	per pound \$0.09½	\$0.09½	\$0.09½
XX Red08½	.08½	.08½

FRENCH PROCESS "FLORENCE" BRAND.

White Seal17	.17½
Green Seal16½	.16½
Red Seal16	.16½

A SURREPTITIOUS SHIPMENT OF RUBBER ON THE ZEALANDIA.

The protest entered by the captain of the American steamer *Zealandia* against the exercise by the British cruiser *Isis* of the right of visit and search, on the ground that his vessel was at anchor within the three-mile limit from the coast of Mexico, has resulted in some interesting disclosures. It appears that the British consul-general in New York learned that 500 tons of rubber had been purchased for consignment to Malmö, Sweden, to the order of the German government. That it had been shipped from New York to New Orleans, thence to Progress, Mexico, where it was to be loaded on the *Zealandia*. In the meantime, the British government, informed of these facts, had sent orders to the captain of the *Isis* to search the *Zealandia*, and the rubber was found in the cargo of rosin, hides, etc., she had loaded for Malmö, Sweden.

PRESIDENT J. NEWTON GUNN.

COLONEL SAMUEL P. COLT has always possessed the rare faculty of selecting lieutenants specially fitted to assist him in the administration of the great corporation of which he is the head. Now, to the able trio, Messrs. Sawyer, Williams and Price, all "right hand men," he has added as a fourth the well-known production engineer, J. Newton Gunn.

Mr. Gunn was born in Springfield, Ohio, in 1867. His boyhood and youth were spent in that charming middle western city, and the beginnings of his education were in its excellent public schools. After graduation there, he took special courses in the sciences, mathematics and languages, under private tutors. His first essay at business was with the Library Bureau of Boston, where he developed the use of commercial card indexes and invented the tab system.

As lecturer on industrial organization at Harvard College he was the first to define the field of industrial and production engineering. Indeed, he was the creator not only of the name "production engineer," but of the profession itself.

In 1901 Mr. Gunn organized the firm of Gunn & Richards, production engineers and certified public accountants, which afterwards became a corporation, and as its president was brought in contact with many of the great industrial organizations of the United States and Canada. In 1895 he was so impressed with certain organization features abroad that he spent 12 months on the continent studying industrial conditions. On his return to the United States, his services were at once in demand. He surrounded himself with able assistants, capable of handling the ordinary problems of accounting and efficiency, but in later years arranged his own work so that he could devote his entire time to one corporation. To do this he sometimes stood in the background and planned, and at other times took over the management in person and staid with it until the business was placed upon a sound, systematic, producing basis. Such a case as this was his administration of the affairs of the great Studebaker Corporation. After the amalgamation of the Studebaker Brothers Manufacturing Co. and the Everitt-Metzger-Flanders Co., he became general manager for two years, and systematized the great business on an efficiency basis.

The fact that Mr. Gunn had so brilliantly proved the value, or rather the necessity, for the production engineer in modern industry, brought him first to the attention of the officials of the United States Rubber Co. Negotiations, begun early last summer, finally resulted in the election of Mr. Gunn to the presidency of the United States Tire Co., and also to the office of assistant to the president of the United States Rubber Co.

For both of these positions Mr. Gunn is singularly fitted. A tireless worker, he never shows signs of hurry, worry or irritation. His desk is always clear, and most of his work is "done the day before."

In spite of his busy life, Mr. Gunn has time for club and social affiliations. For years he was one of the directors of the Lotos Club, New York; he is a fellow of the American Association of Public Accountants, a member of innumerable clubs, such as the Engineers, Midway (New York), etc. His home in the winter is in New York, and in the summer at his country seat, Braemore, Litchfield, Connecticut.

Charles R. Keiser, formerly connected with The B. F. Goodrich, McGraw Tire & Rubber, and Gordon Rubber companies, has accepted the position of factory superintendent of the Double Fabric Tire & Rubber Co., at Auburn, Indiana.

PERSONAL MENTION.

Van H. Cartmell, president of the Kelly-Springfield Tire Co., returned on November 8 from an extended tour of the Pacific Coast, in the course of which he visited the Exposition and also every prominent agent of his company from San Diego to Vancouver.

J. T. Rose, formerly vice-president of the Atlanta Steel Co., Atlanta, Georgia, has recently been elected president of the Midgley Tire & Rubber Co., Lancaster, Ohio.

W. V. Logan has joined the McGraw Tire & Rubber Co., East Palestine, Ohio, as assistant sales manager. Mr. Logan has been identified for many years with the tire business, and recently returned from a trip to Russia on behalf of one of the large tire companies.

H. D. Palmer has been appointed New York State representative of the Knight Tire & Rubber Co., Canton, Ohio, succeeding E. J. Coniff, who has resigned.

M. S. Azulay, formerly a salesman for the Derby Rubber Co., Derby, Connecticut, and more recently manager of the Nearpara Rubber Co., Trenton, New Jersey, has been engaged by the Akron Tire Co., Inc., New York, to represent them in the Southern States.

E. S. Williams, president of the United States Tire Co., has resigned and will devote his exclusive attention to the mechanical rubber business of the United States Rubber Co. J. Newton Gunn, assistant to Colonel Samuel P. Colt, president of the United States Rubber Co., has been made head of the tire company.

Frank Waldo, of the firm of E. M. & F. Waldo, is on an extended business trip through the Middle West and Pacific Coast. Mr. Waldo is chairman of the membership committee of the National Paint, Oil & Varnish Association, and while at the Coast he worked for that committee, as well as attending to business matters for his firm, and also visited the San Francisco and San Diego exhibitions. He is now returning by way of Tacoma, Portland, Seattle, Minneapolis and Chicago, and expects to arrive in New York about Christmas-time.

Raymond G. Wells, who formerly specialized as an expert on electrical installation for the rubber trade for the Westinghouse Electric Co., has resigned his position and accepted one with the Alexander Hamilton Institute of New York. Mr. Wells' present effort is in the line of securing students for the reading course on business, which is now being used by ambitious young rubber men.

The retirement is announced of W. C. Hendrie, as manager of the W. C. Hendrie Rubber Co., Torrance, California. R. Ahrens is his successor. The retirement of W. F. Hackett, the company's superintendent, who is succeeded by E. W. Snyder, is also announced.

G. B. Withers, a pioneer planter of *Hevea* in British Guiana, who is located at "The Hills" Estate, Bartica, some forty miles up the Essequibo River, was a recent visitor to New York.

Charles A. Besam, formerly of the Knight Tire & Rubber Co., Canton, Ohio, has recently acquired control of the Quality Rubber Co., Hartsville, Ohio.

NEW TIRE LINER.

From Cleveland, Ohio, comes another addition to the innumerable inventions for prolonging the life of pneumatic tires. The new tire life-saver consists of a heavy rubber inner tire or liner encasing three resilient spring steel ribbons that protect the tread and side walls of the casing. The extra thickness of this liner tire is overcome by using smaller inner tubes and inflating at less than normal pressure. [National Pneumatic Safety Inner Tube Co., Cleveland, Ohio.]

J. NEWTON GUNN.

JOSEPH W. WORK.

It is a safe wager that a very large percentage of the rubber footwear men of the world would recognize the accompanying portrait as that of "Joe" Work. His familiarity with the industry, or at least one branch of it, footwear, has brought him in touch with practically every manufacturer in that line, and has thus broadened out his acquaintance to many in other branches of the rubber trade.

Joseph W. Work was born in Newburyport, Massachusetts, May 20, 1852. The family is of the old Presbyterian, North of Ireland type, the head of the family landing on the Isle of Shoals, off the New Hampshire coast, in the early colonial days, and later settling in Newburyport. His grandfather was town clerk there before it became a city, and was also sexton and clerk of the historical Old South Church. It was then

JOSEPH W. WORK.

his duty to call or "cry" the marriage banns on three successive Sundays before a marriage could be solemnized.

Mr. Work received his education in the schools of his native city, and then secured a minor position in the old Mechanics' Bank there. Later he went to the Maverick Bank in Boston, where for several years he held the position of cashier, which he retained until the institution closed in 1892. For six months thereafter he was associated with the receiver of the bank. Then, as he expresses it, he drifted into the last business.

Through the advice of E. A. Saunders, at that time prominent in the management of the United States Rubber Co., he formed the Middlesex Last Co., and purchased a last manufacturing plant. As manager of that concern he built up a most successful business, producing lasts for rubber and leather shoe manufacturers.

For years Mr. Work lived up to his name, and built up a fine business, which he controlled until this year, when, the opportunity presenting itself, he sold out to Taylor & Lander. But, even with the change of ownership, he still has charge of those customers who manufacture rubber footwear, though relinquishing the leather shoe end.

Mr. Work has acquired every degree in Masonry, and has filled nearly every chair in the various bodies. He is treasurer of six Masonic bodies, and also holds the same office in the Mystic Shrine. He was treasurer of the entertainment committee at the triennial meeting and election of officers of Northern Jurisdiction of the Supreme Council in Boston last September.

Mr. Work is past president of the Point Shirley Club, and as a member of the house committee has several times placed the clubhouse at the disposal of the New England Rubber Club and its successor, the Rubber Club of America, Inc., on the occasions of their summer outings. The banquets held there by the rubber fraternity have never been excelled by those at outings held elsewhere. At all of them Mr. Work has been in evidence as a courteous, genial host.

SON OF DR. WATTS IN NEW YORK.

Charles T. Watts, son of Dr. Francis Watts, C.M.G., D. Sc., F.R.S., F.A.S., head of the Imperial Department of Agriculture for the West Indies, is now in New York. Mr. Watts has been connected with the various experiment stations in the West Indian Islands, notably at Dominica and Jamaica, and did much in experimental rubber planting.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A firm in Portugal desires samples and price lists of golden sulphide of antimony, pigments, etc. Report No. 18,866.

A business man in Norway wishes to communicate with American manufacturers or exporters of vulcanized (stranded) cable. Report No. 18,899.

An English firm desires quotations on cheap fountain pens. Report No. 18,934.

A New Zealand firm wishes to act as agent for the sale of chewing gum. Report No. 18,938.

A commission agent in Spain desires samples, catalogs, price lists, etc., of American rubber overshoes. Report No. 18,946.

An American consular officer in an insular possession states that there is a market in his district for automobile tires. Report No. 18,990.

A firm in South America, which has a ton or more of block balata to dispose of weekly, seeks buyers. Report No. 19,007.

A firm in India desires to be put in touch with American manufacturers of rubber stamp making materials. Report No. 19,014.

A Norwegian firm wishes to communicate with American dealers in suspenders, elastic for hats, and other articles. Report No. 19,015.

A Swiss firm wishes to represent an American manufacturer of garters. Report No. 19,033.

A business man in Holland would like to establish connections with manufacturers of elastic cord, rubber pharmaceutical goods, and wearing apparel. Report No. 19,077.

A representative of large plantations in the Dutch East Indies is in the market for machinery for preparing crude rubber for the market. Report No. 19,177.

A man in Spain desires catalogs, samples, prices and terms for combs made of ebonite. Report No. 19,249.

A Spanish company desires to communicate with manufacturers of automobile tires. Report No. 19,252.

A firm in Switzerland would like to establish commercial relations with American manufacturers of rubber balls used as toys. Report No. 19,253.

A firm in Italy desires to correspond with manufacturers of erasers and other stationery articles. Report No. 19,279.

A business man in Spain wishes to be placed in communication with manufacturers of corset materials and equipment, elastic webbing, rubber for garters, etc. Report No. 19,296.

RUBBER TRADE INQUIRIES.

[137.] An inquirer wants to buy toy balloons and toy balloon whistles.

[138.] A subscriber wishes to be put in touch with a maker of aprons used on compound mixing mills.

[139.] A dealer in rubber goods desires names of manufacturers of metal shut-offs for fountain syringes.

[140.] An inquiry has been received for the name of a manufacturer of tumbling barrels.

[141.] A correspondent desires the name and address of a manufacturer of vulcanized fiber in sheets and rods.

[142.] A buyer wishes to be put in touch with makers of India rubber rain overcoatings, in piece goods, not finished coats.

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

TRADE NEWS NOTES.

The Paint Grinders' Convention, held in Cleveland, Ohio, during the week ending November 13, was attended by a number of manufacturers and distributors of compounding ingredients used in rubber manufacture. Among them was R. W. Evans, of the Picher Lead Co., with factories at Joplin, Missouri, and offices in the Tacoma Building, Chicago, Illinois.

A 60x200 feet addition, of tile and concrete, is being built for the J. P. Devine Co., Buffalo, New York, manufacturers of vacuum drying apparatus.

A unique enterprise is being conducted by the Samson Co., Philadelphia, Pennsylvania. Rubber bands are made in special sizes and weights adapted for the particular uses stipulated by the customer. This business, less than a year old, has shown considerable progress and indicates the possibilities of even the humble rubber band.

The Electric Hose & Rubber Co., Wilmington, Delaware, which has been in a continuous state of expansion for the past ten years, is erecting a building 30x225 feet, to be used as a storehouse for raw material.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has secured the services of Dr. W. H. Coon, of Haverhill Massachusetts, as medical inspector or in charge of the welfare work in their factories.

The Turner, Vaughn & Taylor Co., Cuyahoga Falls, Ohio, is putting up an addition to its plant to accommodate two 10-ton cranes.

The Buffalo Foundry & Machine Co., Buffalo, New York, has opened a New York office at 1432 Whitehall Building, Battery Place, this city. The company manufactures the "Buřlovak" apparatus, which includes vacuum dryer, of all types for drying all sorts of materials; dry vacuum pumps; condensers; vacuum drying and impregnating apparatus, etc. They also make complete plants and apparatus for the manufacture of aniline, phenol, beta-naphthol, picric acid, caustic soda, and acids. They do a general jobbing, foundry and machine business, and can quote on castings up to 200 tons weight each, including all necessary foundry and machine work.

The I. T. S. Rubber Co., Elyria, Ohio, is putting out a rubber heel, said to be designed by a practical shoemaker. It is claimed that this heel solves the problem of tight joints without cementing. It may be nailed on any leather heel regardless of shape, and the back pressure on the edge insures a tight joint.

The Clement Restein Co., Philadelphia, Pennsylvania, changed its name on September 28 to the Belmont Packing & Rubber Co., the personnel of the company remaining as before.

On October 12, patent No. 1,156,523 was granted to the Davol Rubber Co., Providence, Rhode Island, for the "Rest Easy," non-slip Bed Cushion, described on page 268 of the February, 1915, issue of THE INDIA RUBBER WORLD.

The St. Mungo Manufacturing Co. of America, makers of golf balls, now occupies new quarters at 121-123 Sylvan avenue, Newark, New Jersey.

The Quaker City Rubber Co., Philadelphia, Pennsylvania, has recently arranged to have the John O. Flauitt Carriage Co., of Memphis, Tennessee, act as its representative in selling tires and rubber accessories in Memphis.

BUILDING AIRSHIPS AT NAUGATUCK.

The first of the proposed fleet of dirigibles for the United States is now under way and the important order for the balloon fabric has been awarded to the United States Rubber Co. The work of constructing the fabric, which requires much skill and care in manufacturing, the success of the airship depending largely on the strength and capacity of the envelope, is now in progress at the India Rubber Glove Manufacturing Co.'s plant at Naugatuck, Connecticut.

The airship is being built by the Connecticut Aircraft Co., New Haven, Connecticut, under the supervision of Captain T. S. Baldwin, who supervised the building of the first German dirigible, and also the only dirigible ever owned by the United States Army.

The enormous envelope will have a tremendous lifting capacity and a new and improved shape, which by test has been proved to offer a minimum wind resistance. The airship, when completed, will be shipped to Florida, where it will be tested.

MONATIQUOT RUBBER WORKS CO. CONSOLIDATE OFFICES.

The Boston offices of the Monatiquot Rubber Works Co. have been consolidated with the general offices of the company at South Braintree, Massachusetts. This move eliminates the duplication

of records which were necessary before and makes for better efficiency throughout. All of the company officials are now located at the factory office building, which has been altered and improved to take care of the additional offices.

TWIN-CITY COMPANY ENLARGES.

The Twin-City Cord Tire Co., Inc., whose incorporation was mentioned in the November issue of THE INDIA RUBBER WORLD, has main offices in the Plymouth Building, Minneapolis, Minnesota, and branch sales offices in St. Paul and Duluth, Minnesota. We are advised that the company has decided to reorganize as a national company, with a probable capitalization of \$2,000,000. A site is being considered for a new plant in St. Paul, which covers about 30 acres and has, at the present time, suitable buildings on it with 100,000 square feet of ground floor space.

NO REASON TO FEAR A "DUMPING" OF FOREIGN GOLF BALLS.

A. G. Spalding & Bros., of New York, call attention to the expiration next April of the Haskell patent on golf balls, and confidently announce that they will be fully prepared to meet all competition, whether from manufacturers in this country or in England. Further, as they put it: "The Dimple marking is patented and we shall most assuredly protect our rights in it."

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

MONATIQUOT RUBBER WORKS CO.'S PLANT AT SOUTH BRAINTREE, MASSACHUSETTS.

MR. BOURNE AND BY-PRODUCTS UTILIZATION.

Word comes from Chicago that Lyman M. Bourne is now associated with the By-Products Realization Co. as vice-president. Mr. Bourne has been active in the rubber industry ever since his graduation from the Massachusetts Institute of Technology in 1904.

LYMAN M. BOURNE.

His first position was as research assistant in the laboratory of the late Dr. Carl Otto Weber, where he remained until Dr. Weber's death. He then entered the employ of the Revere Rubber Co. in their Chelsea plant, as chief chemist, and remained in this work until called to Brooklyn, New York, as superintendent of the Eastern Reclaimed Rubber Co. In 1909, he went with the Goodyear Tire & Rubber Co., where he held the position of chief chemist and department manager. In 1914 he became general manager of the Double Fabric Tire Co. at Auburn, Indiana, but resigned that position to accept the vice-

presidency of the By-Products Realization Co., Chicago, Illinois.

Mr. Bourne's rubber experience is wide and his acquaintance with the trade is very large. His energy and efforts in his new connection will be applied, as he states it, in the prevention and utilization of by-products and waste material.

BRAZILIAN TARIFF ON TIRES.

Information received by the State Department, Washington, D. C., from the Hon. Edwin V. Morgan, American Ambassador at Rio de Janeiro, is to the effect that American interests are asking the Brazilian Government to fix the duty on automobile tires at 2 milreis per kilo [147 cent a pound] with a preferential reduction of 20 per cent. on tires manufactured in the United States. Ambassador Morgan is supporting this proposition, which, of course, would be of advantage to tire manufacturers in the United States. He also states that the provision of the law last year, known as the "Fine Parâ" law, will probably be reconsidered by the present session of the Brazilian Congress.

NEW INCORPORATIONS, WITH AUTHORIZED CAPITAL, ETC., 1915.

American Tire Company of West New York, New Jersey, October 29 (New Jersey), \$100,000. William Kahn, August Kahn, Otto Schumann, 577 Fifteenth street; John Berger, Alphonse Thourot, 522 Bergenline avenue, West New York, New Jersey. Office, 601-607 Fifteenth street, West New York, New Jersey. To manufacture rubber tires for automobiles, etc.

Blair Shoe Company, Inc., November 6 (New York), \$3,000. Max Darvas, 62 Smith street; Louis Blair, Jacob Blair, 214 Clinton street, Brooklyn, New York. Shoes and rubbers.

Emanuel Tietz and James Milaw, Inc., November 6 (New York), \$5,000. Jacob E. Schoenfeld, Esther Schoenfeld, Herman A. Schoenfeld, 605 West 115th street, New York City. Rubber drug sundries.

Eureka Tire Co., November 4 (New Jersey), \$50,000. Alexander Budson Norman T. Rogers, Malcolm G. Buchanan, Trenton, New Jersey. Office, 26 West State street, Trenton, New Jersey. To manufacture and deal in tires, tubes, etc.

Lake Ruth Manufacturing Co., Inc., The, November 5 (New York), \$20,000. Dr. Joseph D. Denelsbech, Trenton, New Jersey; Charles Gidney, Mercerville, New Jersey; Charles Londoner, 258 Broadway, New York City. Rubber specialties.

Lyall & Co., Inc., W. H., November 22 (New York), \$50,000. Chester V. Lyall, Fiddel Bigler, H. B. Vosburgh, Poughkeepsie, New York. Auto and tire business.

McNaull Tire Co., The, November 10 (Ohio), \$2,500,000. W. D. McNaull, M. W. McNaull, A. H. Emerson, A. C. Wanamaker, Gustav A. Strub. To manufacture tires and rubber goods, etc.

Mason Tire & Rubber Co., October 19 (Ohio), \$250,000. D. M. Mason, M. B. Mason, Robert G. Berlekemp, W. E. Sexton, O. M. Mason. Office, Cleveland, Ohio. To manufacture auto tires and rubber supplies. This corporation was listed by mistake in the November issue as the Marion Tire & Rubber Co.

New Castle Rubber Co., of New York, Inc., The, October 15 (New York), \$5,000. Richard S. Ireland (president), Alexander T. Counts (secretary and treasurer), Ella P. Edelstein, 237 Fifth street; Max Rosenfeld, 890 Beck street; H. J. Kearns, 52 West 65th street, New York. Office, 1662 Broadway, New York City. To deal in the "New Castle" and "Lehigh" tires.

News Manufacturing Co., Inc., November 5 (New York), \$5,000. Joseph Oxenberg, 261 Broadway; Hyman Mates, 141 Stanton street; H. David Frackman, 148 West 111th street, New York City. Rubber and gum business.

Penn Rubber Co., William, November 4 (Pennsylvania), \$5,000. E. E. Gallup, Herbert Patterson, Wilkinsburg; Robert E. Bradburn, Pittsburgh, Pennsylvania. Office, Penn Station, Pennsylvania. To manufacture and deal in tires and tubing, etc.

Pittsburgh Tire & Accessories Co., November 9 (Delaware), \$10,000. J. J. McGeary, Berch and Hilf streets, Mt. Lebanon; J. F. McNaull, 822 N. Euclid avenue; G. E. Evans, 197 Watson street, Pittsburgh, Pennsylvania. To deal in automobile tires, tubes and accessories.

Republic Tire Company of New Jersey, October 1 (New Jersey), \$125,000. James W. Pettit (president), 58 Amherst street, East Orange; Marcel R. Clodio (vice-president), 77 Bleeker street, Newark; Harold H. Wilcox (treasurer and secretary), 8 West Overroad, Montclair, New Jersey. To deal in automobile shoes and tubes.

Rubber Insulated Metals Corporation of New Jersey, November 13 (New Jersey), \$100,000. Charles P. L. Huston, 15 East 40th street; William E. Conley, 52 William street, New York City; J. Stuart Eakin, Englewood, New Jersey. Office, 902 North avenue, Plainfield, New Jersey. Its objects are the electrochemical and metallurgical preparation of surfaces, metallic and otherwise, for the chemical attachment of india rubber and its compounds, and the attachment of india rubber and its compounds to any and all such surfaces, etc.

Stowe Rubber Co., September 24 (California), \$20,000. William J. Stowe, Ada F. Stowe, Perry W. Stowe, Los Angeles, California. To deal in automobile supplies, rubber fabric, etc.

Tire Company of Rochester, Inc., November 4 (New York), \$10,000. Milton Gladstone, 1774 Madison avenue; Joseph J. Jacobs, 2010 Seventh avenue, New York City; William Reissfeld, 830 Fox street, Bronx, New York. Auto tires, supplies, etc.

United States Rainproof Manufacturing Co., Inc., November 11 (New York), \$10,000. Benjamin Katz, 27 East 10th street; Jacob Singer, 690 East 158th street; Morris Weshköff, 986 St. Johns avenue, New York City. To manufacture raincoats, etc.

U. S. Wheel & Tire Co., September 15 (Illinois), \$30,000. E. S. Glasman (president), S. D. Ross (secretary), Rockton, Illinois. Office, Bridge street, Rockton, Illinois. To manufacture and deal in automobile tires, etc.

TRADE NOTES.

The United States Tire Co., according to President Samuel P. Colt, is bringing out a new "non-skid" tire, to be known as "Union Tread," at a price not much higher than plain tread tires. With the well-known "Chain" and "Nobby Tread" types, the company's line of tires is now complete.

The newspapers have of late bristled with the news that some \$80,000 worth of pneumatic tires had been stolen to keep them from being shipped to the Allies and used on motor trucks, etc., in the war zone. They also claimed that some of these tires were once the property of The B. F. Goodrich Co. From that company, however, comes this disclaimer: "So far as we know none of our tires were included in this theft." The fact that the size of the tires said to have been stolen was indicated in metric measures, would arouse suspicion if they were offered for sale in the United States. Several arrests are reported to have been made in connection with the theft.

At a meeting of the stockholders held at Toledo on November 15, the corporate name of the Toledo-Ford Tire Co., Findlay, Ohio, was changed to the Toledo-Findlay Tire & Rubber Co. This course was necessary owing to the objection of the Ford Motor Co. to the use of the word "Ford" in the original name. It was also agreed that the word "Ford" on other than Ford sizes was not desirable.

The Akron Tire Co., Inc., New York, informs us that its appeal from a decision of Judge Sulzberger in the Court of Equity, Philadelphia, Pennsylvania, enjoining the company, on application of the Akron Tire Co., Philadelphia, from using that title when doing business in Pennsylvania, as recorded in the September issue of THE INDIA RUBBER WORLD, has been sustained. The New York Company was able to furnish indisputable evidence of the transaction of a large amount of business in Pennsylvania for several years and the expenditure of considerable sums for advertising and other propaganda.

The Gordon Tire & Rubber Co., Canton, Ohio, has recently opened a branch in New York at 1737 Broadway, of which W. A. Young is manager.

The A. L. A. Tire Co. is reported to be erecting a 275 x 100 foot factory building in Flint, Michigan, where they contemplate starting manufacturing operations with a capacity of 200 tires daily. The company is capitalized at \$500,000.

The Marion Tire & Rubber Co., Marion, Ohio, whose incorporation was mentioned in the October issue, has elected the following officers: W. W. Holverstott, president; Charles W. Fairbanks, vice-president; D. H. Lincoln, treasurer, and Wilbur Jacorhy, secretary.

A convention of Firestone salesmen and representatives of Des Moines, Iowa, was recently held in that city to discuss trade matters. President H. S. Firestone, the speaker of the evening, stated a few reassuring facts in regard to the available supply of crude rubber. Other prominent members of the Akron organization who attended the convention were R. J. Firestone, sales manager; Edward Babcox, advertising manager; F. C. Blanchard, Henry Wallace, Henry Ingham and C. C. Carlton.

Trustees in Bankruptcy of the New York Commercial Co. have sent out a circular letter announcing that 627 shares of the 7 per cent., cumulative preferred stock of the Seamless Rubber Co., New Haven, Connecticut, are included in the assets of the bankrupt concern and asking for bids on all or any part of the shares. The bids (sealed) will be received up to 2 p. m., December 20, 1915, at the office of Hon. J. Townsend, Referee in Bankruptcy, at 45 Cedar street, New York, and must be accompanied by 10 per cent. of the amount in cash, or certified check.

The Victor Rubber Co., Springfield, Ohio, has increased its capital stock from \$150,000 to \$300,000 to finance its rapidly

growing business. During the past year this company has added a complete line of pneumatic tires, tubes and motor truck tires. The plant is operating night and day, and enlargements are being considered which will more than double the present capacity.

American Rubber Co., Chicago, Illinois, has increased its capital stock from \$10,000 to \$15,000.

After January 1, 1916, the Mishawaka Woolen Manufacturing Co., Mishawaka, Indiana, will manufacture a full line of rubber boots and shoes, including light weight shoes not heretofore made by the company. For this purpose a building 400 x 100 feet and four stories high has been erected.

The estate of the late Isaac B. Kleiwert, of the I. B. Kleiwert Rubber Co., whose obituary appeared on page 121 of the May, 1913, issue of THE INDIA RUBBER WORLD, has recently been appraised at \$1,811,209. Mr. Kleiwert gave \$174,736 to his widow and, in a codicil, \$75,000 in Kleiwert bonds. His daughters, Belle Sessler and Hermine Kleiwert, each received \$296,099, and to Henrietta K. Guinzberg and Leonie K. Guinzberg he left \$266,805 each.

The Republic Rubber Co., Youngstown, Ohio, has taken a lease on a 4-story building to be erected at 806 North Broad street, Philadelphia, Pennsylvania. The new building will contain over 10,000 square feet of floor space—more than five times that of its present Philadelphia premises—and will be completed about January 1.

The Racine Rubber Co., Racine, Wisconsin, has begun a \$75,000 three-story addition, 52 x 77 feet, to be used as a mill room and crude rubber storage. It will be finished February 1.

It is the intention of the Converse Rubber Shoe Co., Malden, Massachusetts, early in 1916, to increase the capacity of its mill from 8,000 to 15,000 pairs of shoes a day, in order to keep pace with the demand for its goods.

A NEW OHIO TIRE FACTORY.

The Mason Tire & Rubber Co., Cleveland, Ohio, recently incorporated, has offices at 1836 Euclid avenue, pending the selection of a location for the plant, which will be in the Cleveland-Akron district. The company plans to erect a building containing 30,000 square feet, to be finished in four months, and it is hoped that the factory will be in operation by April 1. A full line of strictly handmade tires and tubes of a 4,500-mile quality will be manufactured. The officers of the company are: O. M. Mason, president; W. E. Sexton, vice-president; M. B. Mason, treasurer; J. R. Davies, secretary; D. M. Mason, general manager. B. E. Frantz, a practical tire man, is superintendent.

NON-EXPLOSIVE NAPHTHA BENCH CAN.

A new "safety first" appliance is the McNutt floating valve naphtha bench can.

A floating valve rests on the naphtha or gasoline, as the case may be, and permits the operator to use either a light brush, a sponge, or a cloth where a small quantity is desired. The pressure upon the float automatically forces the naphtha up through a fine screen to the brush or sponge, the excess flowing back in the same manner when the pressure is released.

A lighted match may be dropped into the can and the vapor will burn slowly. It is immediately extinguished, however, by closing the top. There is absolutely no danger of an explosion, for the evaporation is but slight even when the top is open. [United Shoe Machinery Co., Boston, Massachusetts.]

THE RUBBER CLUB OF AMERICA, INC.

UNDER date of November 1, 1915, a circular letter was sent out by the Rubber Club addressed particularly to export departments, and calling renewed attention to the importance of a strict observance of the seventh paragraph of the guarantee, which reads as follows:

If we export any manufactured or partly manufactured goods to a destination outside of Europe, not being a British possession, we will, prior to or simultaneously with the shipment, give you particulars of the goods so shipped and their destination.

The fact that the Rubber Club had prepared and was supplying to rubber manufacturers a form of notification to the British consul of such shipments, is also referred to.

The circular then goes on to state that a number of firms are selling rubber goods to export houses in New York, without notifying the British consul of the fact, such goods finding their way to non-European countries other than British possessions.

To prevent this, which would practically amount to an evasion of the guarantee, it is pointed out that American manufacturers should report such sales to the British consul on the form provided, giving the name of the concern to whom the goods were shipped.

The fact that the continuation of the present arrangement with Great Britain depends on compliance with the spirit of the agreement is emphasized in the circular, which closes with a renewal of the offer to supply copies of the notification form.

In another letter, dated November 11, the Rubber Club informs rubber manufacturers of a ruling by the British Government, dated October 26, 1915, to the effect that samples of rubber goods having no real commercial value should be forwarded to neutral European countries by way of the United Kingdom, no license for sending such samples from the United Kingdom to the country of their final destination being necessary.

It is stated in the communication from the British Government, that if it can be shown that existing conditions impose any "real hardships" on those engaged in legitimate trade, the government will consider any arguments on the subject.

MECHANICAL RUBBER GOODS MANUFACTURERS' MEETING.

The annual meeting and dinner of the Mechanical Rubber Goods Manufacturers' Division of The Rubber Club of America, Inc., was held November 3, 1915, at the Union League Club, New York.

The meeting was a social and business success and many important matters were discussed by the members in session. The guest of the evening was W. E. Bowers, of the Bowers Rubber Works, San Francisco, California. Those present were President William T. Cole, Fabric Fire Hose Co., New York; Vice-President John J. Voorhees, Voorhees Rubber Manufacturing Co., Jersey City, New Jersey; George E. Hall, Boston Woven Hose & Rubber Co., Cambridgeport, Massachusetts; Howard E. Raymond, The B. F. Goodrich Co., New York; J. S. Broughton, United & Globe Rubber Manufacturing Cos., Trenton, New Jersey; Henry Spadone, Gutta Percha & Rubber Manufacturing Co., New York; A. Boyd Cornell, Empire Rubber & Tire Co., Trenton, New Jersey; A. H. Elder, Boston Belting Co., Boston, Massachusetts; J. A. Lambert, Acme Rubber Manufacturing Co., Trenton, New Jersey; C. D. Garretson, Electric Hose & Rubber Co., Wilmington, Delaware; Charles E. Stokes, Home Rubber Co., Trenton, New Jersey; Edgar H. Wilson, Hamilton Rubber Manufacturing Co., Trenton, New Jersey; John J. Voorhees, Jr., and F. D. Voorhees, Voorhees Rubber Manufacturing Co., Jersey City, New Jersey; George A. Wies, Eureka Fire Hose Man-

ufacturing Co., New York; Alfred Whitehead, Whitehead Brothers Rubber Co., Trenton, New Jersey; C. Hutzman, Jr. and H. F. Smith, Peerless Rubber Manufacturing Co., New York; J. H. Cobb, New York Belting & Packing Co., New York; W. F. Bowers, Bowers Rubber Works, San Francisco, California; J. T. Moore, Quaker City Rubber Co., Philadelphia, Pennsylvania; Charles Hardin, Republic Rubber Co., Youngstown, Ohio; Henry B. Hering, New York Rubber Co., New York; Harry S. Vorhis, secretary of the Rubber Club of America, Inc.

MEETING OF EXECUTIVE COMMITTEE, RUBBER SUNDRIES DIVISION.

A meeting of the executive committee of the Rubber Sundries Manufacturers' Division of The Rubber Club of America, Inc., was held November 4, 1915. The members present were Chairman Russell Parker, Parker, Stearns & Co., Brooklyn, New York; Charles J. Davol, Davol Rubber Co., Providence, Rhode Island; George B. Hodgman, Hodgman Rubber Co., New York City; Frederick H. Jones, Tyler Rubber Co., Andover, Massachusetts; Edward E. Huber, Eberhard Faber, Brooklyn, New York.

ANNUAL MEETING OF THE RUBBER TRADE ASSOCIATION OF NEW YORK.

THE annual meeting of the Rubber Trade Association of New York was held at 82 Beaver street, New York, on Thursday, November 11, 1915, at 3 p. m. President W. E. Bruyn called the meeting to order, and Secretary E. Weber read the minutes of the last meeting. A board of directors was elected to serve during the year, consisting of William T. Baird, W. G. Ryckman and William E. Bruyn. The following amendments to the constitution and by-laws, providing for both active and associate memberships, dues and fees, were adopted:

ARTICLE I.

MEMBERSHIP.

SECTION I. Membership shall consist of active and associate members.

SECTION II. Any co-partnership, corporation or individual engaged in the business of crude rubber shall be eligible to active membership.

SECTION III. Any co-partnership, corporation or individual connected with the rubber industry shall be eligible to associate membership.

SECTION IV. Every member of the association shall conform to and be bound by the regulations and rules of the association for the time being in force, and shall on becoming such member sign these regulations and, on signature of the same, shall be deemed to have entered into a covenant and contract to that effect with each and every other member for the time being of the association, and with all firms, corporations or individuals becoming members thereafter.

SECTION V. Any co-partnership or corporation shall designate the member or officer who shall represent it in the association. Such member shall have the right to appoint another member of the co-partnership or corporation as his substitute, if not able to be present. Each individual co-partnership or corporation holding an active membership shall be entitled to one vote in the association.

ARTICLE IV.

MEMBERSHIP DUES AND FEES.

SECTION I. Initiation fee for active membership to the Association shall be \$25.00.

Subdivision (a) The annual dues for active membership shall be \$50.00.

Subdivision (b) The annual dues for associate membership shall be \$35.00.

SECTION II. The annual dues shall be payable in advance on the first day of November.

SECTION III. All new members, immediately upon election, shall pay to the association the annual dues for the then current year.

SECTION IV. The initiation fee of active members shall be paid to the Treasurer within ten days after written notice has been

given a member-elect of his election, and in default of payment thereof, he shall be deemed to have declined membership.

Sections V. Members failing to pay their annual dues within 30 days may be subject to suspension from the privileges of the association in the discretion of the Membership Committee.

The question of classifying and standardizing the various grades of crude rubber, and the necessity of a well-defined nomenclature that will be approved and recognized by the rubber trade, was fully discussed. A committee will be appointed at the next directors' meeting to further the project.

The following were present:

W. E. Bruyn, chairman, L. Littlejohn & Co.; Robert B. Baird, Rubber Trading Co.; F. Mullen, United Malaysian Rubber Co.; A. B. Beers, A. B. Beers; H. A. Gould, Gould Commercial Co.; E. Maurer, E. Maurer Co., Inc.; F. H. Peaty, F. H. Peaty; W. G. Ryckman, W. G. Ryckman; W. H. Stiles, W. H. Stiles; Karl Schroder, Karl Schroder; L. M. Byles, L. M. Byles; George E. Pell, Pell & Dumont; A. V. W. Tallman, A. V. W. Tallman; George Muller, Muller, Schall Co.; A. B. MacNamara, A. B. MacNamara Co., Inc.; F. G. Gove, Gove & French; F. R. Henderson, Henderson & Korn; C. T. Wilson, C. T. Wilson Co., Inc.; M. Calvet, Pablo, Calvet & Co.; R. L. Chipman, R. L. Chipman; H. De Lanie, Robinson & Co.; L. P. MacMichael, L. P. MacMichael; H. S. Hammesfahr, W. Hammesfahr & Co.; R. W. Earle, Earle Bros.; W. Weber, Rubber & Guayule Agency, Inc.

THE ASSOCIATED MANUFACTURERS OF ELECTRICAL SUPPLIES.

RECOGNIZING the necessity of active coöperation throughout the electrical manufacturers' industry, the manufacturers of electrical supplies appointed a committee to report on a plan for the organization, and, by its adoption, the Associated Manufacturers of Electrical Supplies was formally organized.

The objects of the organization, as stated in its constitution, are "to advance and protect the interests of the manufacturers of electrical supplies and of the materials entering into electrical construction, in manufacturing, engineering, safety and other problems, to promote the standardization of electrical material, to collect and disseminate information and to promote coöperation among the members."

Following the adoption of the plan of organization and constitution and by-laws submitted by the committee, the following officers were chosen:

President—R. K. Sheppard, Simplex Wire & Cable Co., Boston, Massachusetts.

Vice-President—H. B. Crouse, Crouse, Hinds & Co., Syracuse, New York.

Treasurer—J. W. Perry, H. W. Johns-Manville Co., New York.

General Secretary—Charles E. Dustin, 62 Cedar street, New York.

GOVERNORS.

A. W. Berresford, Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin.

Charles L. Blizard, Electric Storage Battery Co., Philadelphia, Pennsylvania.

Le Roy Clark, Safety Insulated Wire & Cable Co., New York.

H. B. Crouse, Crouse-Hinds Co., Syracuse, New York.

D. C. Durland, Sprague Electric Works, General Electric Co., New York.

J. J. Gibson, Westinghouse Electric & Manufacturing Co., Pittsburgh, Pennsylvania.

H. R. Holmes, R. Thomas & Sons Co., East Liverpool, Ohio.

J. F. Kerlin, National Carbon Co., Cleveland, Ohio.

J. W. Perry, H. W. Johns-Manville Co., New York.

W. C. Robinson, National Metal Moulding Co., Pittsburgh, Pennsylvania.

Walter Robbins, Wagner Electrical Manufacturing Co., St. Louis, Missouri.

B. E. Salsbury, Pass & Seymour, Inc., Solvay, New York.

R. K. Sheppard, Simplex Wire & Cable Co., Boston, Massachusetts.

Thomas M. Debevoise, Counsel, New York.

three sections that are in active operation, with officers and committees as follows:

THE INTERIOR CONDUIT SECTION.

Chairman—F. C. Hodgkinson, Safety Armortite Conduit Co.
Treasurer—D. H. Murphy, American Conduit & Manufacturing Co.

Secretary—Alexander Laughlin, Jr., Central Tube Co.
Executive Committee—F. C. Hodgkinson, chairman; D. H. Murphy, Alexander Laughlin, Jr., C. E. Corrigan, Russell Dart, Oscar Hoppe, J. H. Trumbull.

SUB COMMITTEES.

Rigid Conduit Committee.
Non-Metallic Flexible Conduit Committee.
Metallic Flexible Conduit Committee.
Metal Molding Committee.

THE WIRE AND CABLE SECTION.

Chairman—W. A. Connor, Standard Underground Cable Co.
Secretary—W. S. Clark, General Electric Co.
Treasurer—Edward Sawyer, Atlantic Insulated Wire and Cable Co.

Executive Committee—W. A. Connor, chairman; F. J. Newburg, W. F. Field, Everett Morris, R. E. Lucas.

SUB COMMITTEES.

Industrial Conference Committee (to act with underwriters).
Committee on Special Specifications and Enquiries other than those of the Industrial Conference Committee.

The Rubber Covered Wire Engineers' Association, which has been 17 years in existence and has been active in the work of standardization, in coöperation with the Underwriters' Laboratories, has voted to transfer its activities to the Wire and Cable Section of the association.

Plans are being laid for five or more other sections, of which due notice will be given.

The Board of Governors will hold its next meeting on December 2, 1915, at 8 p. m., at the Hotel Biltmore, New York.

WIZARDS IN A GROUP.

Thomas A. Edison, the world's foremost inventive genius, Henry Ford, who builds automobiles for all the world, and Harvey S. Firestone, president of the Firestone Tire Co., Akron, Ohio—friends of long standing, who had been "doing" the San

A GROUP OF MODERN WIZARDS.

Francisco and San Diego fairs in company—met Luther Burbank, who does wonderful things with plants and fruits, at San Francisco, and were entertained by him at his experimental farm at Santa Rosa. The illustration of the group of "wizards" shows, left to right: Henry Ford, Thomas A. Edison, Luther Burbank, H. S. Firestone.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

THERE is little let-up in the various lines of rubber goods production. All are busy; none below normal for this time of year and some finding more demand than capacity to supply. Among those in this latter condition the clothing trade is perhaps at the head of the list. The manufacturers of rubber coats and similar goods are so far behind their orders that they are rushing their working forces on overtime work as far as possible consistent with proper quality of the output. The makers of high-class coats are particularly busy. The makers of rubber footwear are busy on all lines, the only exception seeming to be in low felt overshoes, which have been growing in smaller demand for the last three or four seasons. This is more than balanced by an increased call for high arctics of the "emperor" variety. Tennis shoes are to be seen in all colors, plain and in combination, and with heels of all heights, even up to covered wooden heels with rubber "toplifts." There is a genuine boom in rubber soles—straight rubber and various composites and combinations—and rubber heels are in increasing demand. The hose business is quiet. There was less demand than usual for garden hose, and dealers have carried over pretty full stocks. Fire hose business is not heavy, but one or two makers of heavy vacuum hose have filled contracts. There is some increased call for rubber belting. Makers of molded goods and drug sundries are busy.

* * *

A new rubber factory is to be erected in Malden. The ground has already been broken preparatory to building. H. H. Kelley & Co., dealers in shoe findings and shoe store supplies of Boston, have taken title to several plots of ground at Maplewood station in Malden, which will be transferred to a new corporation about to be formed, under the name of the Malden Rubber Co. The new factory will be a two-story building, 125 x 40 feet, and is so planned that it can be added to and extended as the demand for their goods may warrant. L. H. Williams, who knows rubber manufacturing from one end to the other, both in Europe and here, will be the president of the new company and have charge of the manufacture of the product, which will be mechanical rubber goods and rubber soles and heels. Franklin P. Gowing, of the firm of H. H. Kelley & Co., will be the treasurer of the company. It is expected that the factory will be completed and in operation in January next.

* * *

The question of the legality of a franchise tax is to be tested by the bringing of a bill in equity in the United States Court, seeking to restrain the Tax Commissioner, the State Treasurer and the Attorney-General from collecting a franchise tax of \$40-161.59 from the Boston Rubber Shoe Co., of Malden, Massachusetts. This bill alleges that the company, in 1914, paid a tax of \$5,036.41, and that in March of the present year it received notice of an additional tax of \$40,161.99, purporting to be a franchise tax. This, the company contends is illegal and unconstitutional. The rate of the franchise tax for 1915 is \$18.55 per thousand dollars. This would make the assessed value of the stock of the Boston Rubber Shoe Co. about \$2,112,000.

* * *

Speaking of taxes, it may be of passing interest to the many readers of THE INDIA RUBBER WORLD who knew Robert Dawson Evans, to learn that Mrs. Marie A. Evans, his widow, pays the largest individual tax in Beverly, Massachusetts, her bill this year being \$83,589.92.

Mrs. Evans has made excellent use of her money in the way of public benefactions; the Evans Memorial Building being her gift to the Massachusetts Homeopathic Hospital, where are given weekly, during the winter, free public health lectures. In this beautiful building are housed the departments of clinical research and of preventive medicine. Another and finer gift, which

has been pictured in this journal, is the Evans addition to the Museum of Fine Arts in this city—one of the noblest pieces of architecture to be found in New England. But this is not all. Last month the trustees of the Museum of Fine Arts announced a further gift of \$50,000 from Mrs. Evans, to establish a memorial fund to the memory of her mother, Mrs. David Hunt. As Mrs. Hunt was interested in sculpture, Mrs. Evans has chosen that this fund shall be for the benefit of sculpture and modeling in the school of the museum. Part of the income of this fund is to be used for scholarships, to be awarded each year to promising students in sculpture. There will be two scholarships of \$250 each, these awarded yearly, and a traveling scholarship of \$1,200, awarded not oftener than once in three years, for a year of study in Europe by some gifted graduate of the school. The balance of the income is to be used toward paying the salary of the instructor in modeling.

* * *

The George P. Cox Last Co., of Malden, has been somewhat unfortunate of late. On October 1, one of its drying houses was burned. On November 17, another dry house met the same fate. Both were well filled with last blocks in the rough, which were being seasoned before being turned into lasts. The second fire destroyed 15,000 blocks, and the first nearly as many. Notwithstanding this loss, the manager of the plant states that there will be no interruption of the business, which will be carried on as usual, supplying lasts to the manufacturers of rubber boots and shoes. There were ten such dry houses on the premises, and thus it will be seen that while the loss was considerable, the company was but little inconvenienced by this double conflagration.

* * *

The Bemis Rubber Co.'s plant, situated on the Boston & Maine Railroad at Bemis, a section of Watertown, Massachusetts, has been sold to Everett C. Tarr of this city, and H. R. Berry of New York. From other sources it is reported that extensive alterations and improvements will be made, and that it will be occupied by the Pan-American Cicle Co.

The plant occupies a lot of over 80,000 square feet of area, with buildings covering 20,000 feet, all equipped with boilers, engines and rubber working machinery. There is a railroad siding along the premises, to accommodate six cars. The location is a desirable one, and the plant, with the improvements contemplated, will have a large capacity.

* * *

The Avon Sole Co., of Avon, Massachusetts, began, not so long ago, manufacturing a sole compounded of rubber and shredded leather. After the sole was just right it was exploited among the shoe manufacturing trade. The prices were high, higher than some others tending towards a similar combination; but having proved that they were worth the prices, the company held to them, and kept up the quality, consistently refusing to cheapen their product. The consequence is that they have had to double their capacity to supply the demand, and the new addition to their plant is just completed, a new power house being also added to furnish heat, light and power.

* * *

The J. H. Stedman Co., the well-known scrap rubber house, announces the removal of its Boston office to South Braintree, Massachusetts, where it will be joined with the general office in the commodious new quarters recently erected. In the future all buying and selling inquiries should be addressed to the South Braintree address.

* * *

Harry M. Gordon, who for 19 years has been identified with the White Co., even before it made motor cars, was tendered a testimonial dinner by his past and his future business associates at the Engineers' Club on the evening of November 13. Mr. Gordon was with The White Co. in the old bicycle days, when he traveled and established agencies all over New England, and managed

the retail store at that company in this city. When the company, following the trend of the times, began manufacturing automobiles, he did his share in the sales department, until 1905, when he became purchasing agent for the company.

On November 15 he assumed the management of the sales department of the Kelly Springfield Tire Co. in this city. His many friends predict for him an assured success in his new position.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

FIRE of mysterious origin swept through one of the great wire rope shops of the John A. Roebling's Son's Co., November 15, resulting in a loss of about one million dollars. In addition to the damage sustained by the company, 29 houses in the vicinity of the shop were badly damaged. It is said that a large order of wire for one of the big tire companies was destroyed.

Rumors were rife that the blaze had been started by German agents on the supposition that material for the allied armies was in process of manufacture. The company denies that any war

PART OF THE PLANT OF JOHN A. ROEBLING'S SONS' CO., DESTROYED BY FIRE.

material was being turned out in the plant, and scouts the idea that a spy started the fire. They are, nevertheless, unable to account for the start of the conflagration.

The insulated wire department of the Roebling's, which was destroyed by a mysterious blaze some months ago, is about ready to begin operations in a building erected on the site of the old structure; and it is pointed out as significant that the second fire should have occurred just at this time. It was commonly reported that war supplies were being made in the insulated wire department at the time it was destroyed. The work of rebuilding the wire rope shop on the site of the old structure will be begun without delay.

* * *

The labor trouble which for a time threatened to tie up the plant of the Essex Rubber Co. has been adjusted and most of the old operatives are back at work. A United States commissioner visited Trenton and talked the matter over with the strikers, who then decided that the offers made to them by the Essex company two weeks before the strike was declared were perfectly satisfactory. At the time of the settlement of the trouble the company agreed to take back the old employees as rapidly as possible. Announcement was made, however, that none of the men who went to work in the places of the strikers would be dismissed to make room for the old employees. The strike is said to have actually

been a benefit to the company, as it served to clear up, to the satisfaction of the men, many of the imaginary ills under which they had been convinced by outside labor agitators that they were working. Among other things, it was charged that the plant was unsanitary. An inspector from the State Department of Labor, on invitation of the factory officials, visited the plant, and after an extended inspection declared that conditions were highly satisfactory in every respect.

The Essex company report an extraordinary increase in the sale of rubber quoits during the past six months.

* * *

Several of the rubber manufacturers who maintain their own machine shops have been affected by a strike of the Machinists' Union, which is demanding an eight-hour day. The men are still out at some of the places, including the shops devoted exclusively to the making of rubber machinery. It is thought, however, that in a majority of cases a compromise will be speedily arrived at. The Mercer Automobile Co. and The United & Globe Rubber Manufacturing Cos. reached an agreement with their men, who promptly returned to their places.

* * *

The John E. Thropp's Sons' Co., manufacturer of presses, tire-making machinery, etc., has had plans drawn for an addition to complete its new machine shop, which will then be 65 x 325 feet, with a gallery on one side 23 feet wide. It is completing a power plant which will be equipped with two 300-hp. boilers, a 450-hp. engine, with a 250-kw. generator, steam pumps and one 750-foot air compressor, all of which have been contracted for.

* * *

The Royal Rubber Works, which has been operating in a small frame structure, is erecting a new brick and steel plant 50 x 150 feet, to take care of increased orders. About seventy-five people will be employed when the new plant opens. This concern manufactures druggists' sundries. In its new plant a specialty will be made of a particular type of ice bag. S. Reinhart, head of the company, told THE INDIA RUBBER WORLD correspondent that he visited several other cities before deciding where to erect the new plant and came to the conclusion that no other locality offered anywhere near the advantages of Trenton for the production of rubber goods.

* * *

The Lakeside Rubber Co., Messrs. McCue & Pierce, are building a larger boiler room and installing a boiler and engine of increased capacity.

* * *

A new addition is being erected at the plant of the Joseph Stokes Rubber Co., to help take care of their increased orders for hard rubber goods. The addition, as planned, will be 75 x 90 feet and two stories high. When it is completed the firm will give employment to about 100 additional hands.

* * *

The Lambertville Rubber Co. has about completed the erection of an addition to the factory costing several thousands of dollars. The product of this company appears to be steadily increasing in popularity and the outlook for the coming year is bright.

* * *

Charles L. Hinton, of New York, has bought at receiver's sale the automobile tire manufacturing plant at Plainfield, of Leon Jaffress, bankrupt, for \$23,300, in addition to a mortgage for \$15,000.

* * *

The Ogren car, driven by Tom Alley in the 350-mile Astor Cup race, which finished fourth, was fully equipped with the Thermoid Rubber Co.'s Nassau tires. Not only did these tires require no change during the race, but at the finish they were in almost perfect condition—"good for another race," as Mr. Alley stated it.

Trenton's rubber industry was well represented at the recent annual convention of the Atlantic Deepwater Waterways League, held in Savannah, Georgia. An exhibition of Trenton-made goods was held in the parlors of one of the hotels of Savannah. The display attracted much attention. While it was not intended that any trading should be done, a number of orders were actually booked. Included among the firms which maintained displays were: United & Globe Rubber Mfg. Cos., Woven Steel Hose & Rubber Co., Ajax-Grieh Rubber Co., Joseph Stokes Rubber Co., Empire Rubber & Tire Co., Acme Rubber Manufacturing Co., Thermoid Rubber Co., DeLion Rubber Co., Mecca Tire Co., Semple Rubber Co., L. M. Anderson Raincoat Co., and John A. Roehling's Sons' Co. It seemed a revelation to the people of Savannah to learn that so many products were made in the New Jersey capital, and considerable Southern trade may be influenced as a result. Secretary Salter, of the Trenton chamber of commerce, presided at the display, which was under the direction of Mayor Donnelly.

Among the delegates named by Mayor Donnelly to represent Trenton at this convention were: George F. Eberhard, Empire Rubber & Tire Co.; C. H. Oakley, Essex Rubber Co., and representatives from the Hamilton Rubber Manufacturing Co. and the John E. Thropp's Sons' Co.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THERE is continued and consistent activity in the rubber industry throughout the State, every line being unusually busy, and with little prospect for any slack period during the next six months, at least. Orders are reported as being plentiful and the majority of available workers are employed in one or another of the different plants. In fact, the number of calls in the daily newspapers for persons to learn the work in the various branches have become noticeable by their frequency. Some of the concerns are said to be at the limit of their present facilities and have been forced to refuse additional orders. In this connection the concerns are delaying the erection of additional buildings until the present status and future conditions of business indicate exactly what may be expected.

* * *

It is reported that at the Narragansett Rubber Co., Bristol, where 450 hands are engaged in making rubber shoes and tennis footwear, a number of orders have recently been turned away because the company, which is represented solely by Terrence McCarthy, is not able to take over any additional contracts at present. After the installation of a new vulcanizing plant, the shoe output was increased fifty cases daily.

* * *

A number of additions and improvements are being made at the plant of the National India Rubber Co., Bristol, upon which a large force of men are at work. An addition of considerable size is being placed on the east end of the calendaring department building, and ground was broken a few days ago for an addition to the north boiler room. The paper box and printing departments are also to be enlarged and to receive additional equipment.

The unusually large amount of business that is being done at present at the National's factory and the large quantities of rubber shoes to be made, to fill future orders, necessitates the material enlargement of several of the departments, and in order to do this new buildings, or additions to present structures, must be erected. It is reported that orders for tennis shoes alone, that will require several months to fill, have already been received. At the present time there are about 3,200 persons employed at the plant.

It is planned by the National Co.'s officials to equip the watchmen, both day and night, with uniforms, and to have night watch-

men to patrol the streets and squares in the vicinity of the company's plant.

The Revere Rubber Co. has just completed the installation in its plant on Valley street, Providence, of one of the largest Bolland patented sand-blast machines made by the manufacturers, for use to sand-blast automobile steel truck rims. Before the solid rubber tire is put on the rim every particle of rust must be removed, and this is done by sand-blasting. The new machine is double. Each part is fitted with a revolving spool, on which the different sized rims are placed, and as the rim revolves, the sand is forced against the face of the rim.

The blower that furnishes the air blast is a four-cylinder Bolland patented positive pressure, which discharges seven hundred cubic feet of air per minute. It occupies a floor space of 24 by 76 inches, the weight of the machine being 3,000 pounds and the speed 150 revolutions per minute. A 10-hp. motor is used to operate the blower and sand-blast. This new machine is dustless and self-contained. The operator simply places the rim to be sand-blasted on the revolving spool, closes the door, and the operation proceeds.

* * *

The International Rubber Co., Barrington, is defendant in a damage suit for \$25,000 filed recently in the Superior Court for Providence County by lessees of oyster beds. Another corporation in Barrington is sued in similar proceedings. Eddie B. Blount and Mary E. Blount, of Warren, Rhode Island, are the plaintiffs in the cases. They claim that refuse from one or both of the corporations named flowed across the oyster beds and destroyed the shell fish during a period of five years, causing great damage.

* * *

The Washburn Wire Co. is preparing to erect an addition to its plant at Phillipsdale, which will be 81 x 86 feet on the ground and 31 feet in height.

* * *

The George C. Moore Co., Westerly, has been incorporated under the laws of Rhode Island to manufacture elastic webs, with a capitalization of \$100,000. The incorporators are George C. Moore, Eleanor C. Moore, Emma C. Moore, Thomas F. Moore and John V. Moore.

* * *

Edward M. Guild, widely known throughout New England, left his home at Bristol, on the evening of November 9, for New York, on his way to San Francisco. He sailed November 20, on the "Shinyo Maru," for Sumatra, where he will enter the employ of the General Rubber Co. at its great rubber plantations.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

THE outlook for the rubber factories is as bright as a new dime. But a dime is a poor simile—they're dealing in dollars, followed by a pleasing array of plump and prosperous zeros. The war, of course, has added its quota to sales, but there is a large and growing demand for rubber products that have nothing to do with war requirements. The growth in the domestic sales of automobiles is notable, and rubber factories look forward to an exceptional spurt in this industry next year—which of course means more tires. Price cutting in automobiles has gone to great extremes, but it is reported that tires will not follow suit by any further reduction than that made at the beginning of 1915, any change in price being in the opposite direction. Increase in the cost of fabric and crude rubber has been lessening tire profits for the last half of the year.

* * *

The B. F. Goodrich Co. is erecting a new machine shop, and additional machinery has been ordered. Although the present

capacity of the plant is over 14,000 tires a day, the directors intend bringing it up to 20,000.

Goodrich common dividends will not be declared before the January meeting, in order that the result of the full year's operations may be considered.

The Goodrich company is now using a black tread on all tires. This tread has been used on "Silvertowns" for the past two years and proved highly satisfactory. It also gives a distinctive appearance to the car.

The pension plan adopted by the Goodrich company is deservedly popular among the employees, one of whom was recently given absolutely free life and accident insurance and a retirement pension proposition.

At the Taisho Exposition in the island of Nippon during the past year, all the Japanese manufacturers, and also the companies doing a considerable business in Japan, exhibited their products. For the excellence of its display of safety treads, wireless truck tires, belts, packing, etc., the Goodrich company has received a gold medal.

* * *

In addition to the five buildings begun last spring and now nearing completion, the Firestone Tire & Rubber Co. has placed contracts for floor space amounting to nearly three acres. When the latest additions are completed, the total floor space of the Firestone plant will be over 31 acres. A new storage and warehouse is being added, and two other factory buildings.

The clubhouse for employees built by the Firestone company is rapidly being completed. A tunnel will be constructed, leading from the plant to the clubhouse, to prevent the crowding and congestion among the employees at the noon and evening hours.

* * *

The fiscal year of the Goodyear Tire & Rubber Co. ended October 31, with gross receipts of over \$36,000,000. This is \$5,000,000 in excess of the total of last year and \$11,000,000 over that of 1913. Over 2,000,000 tires were made during the year, and the present rate of production nearly doubles that amount.

The forthcoming report of the Goodyear company, it is predicted, will show earnings of more than 40 per cent. on the common stock.

A new 7-story addition to the Goodyear plant is being constructed, at a cost of \$125,000.

Following a tire mileage investigation among Goodyear users, 1,000 tires were found that averaged a mileage of 9,974 miles. The Goodyear company displayed the investigated tires in the windows of its various branches, each tire being tagged with the name of the owner, the size of the tire, and the number of miles service it had given.

Over 100 couples attended the Goodyear dance given by the social committee of the company on November 18, the Goodyear orchestra playing the entire evening. These dances are to be a regular feature, and another will be held in three weeks' time.

* * *

The Kelly-Springfield Tire Co., which prides itself upon making only a high-priced automobile tire, is turning out 1,500 a day, keeping its factory constantly going on a 24-hour schedule. The company is in the truck tire field, also, and expects to make 400 truck tires daily after January 1.

* * *

At the annual meeting of the Miller Rubber Co. on November 11, a quarterly dividend of 3 per cent. was declared, increasing the common stock dividend from 10 to 12 per cent. President Jacob Pfeiffer reported that sales for the year ending June 30, 1915, were \$25,000,000—an increase of 30 per cent. After paying 7 per cent. on \$400,000 preferred stock and 10 per cent. on \$1,000,000 common, the company added \$303,243 to surplus, making a total reserve of \$832,000. In one year the Miller company has increased its floor space from 6½ to 21½ acres. One of the new buildings, containing 98,358 square feet, will be ready for operation by January 1.

The Aluminum Flake Co. is building a new factory on its property at Barberton, which will give three times the present capacity. The company still maintains offices in the Ohio Building at Akron.

The Portage Rubber Co. is adding to its plant at Barberton, and will increase its tire capacity to about 800 tires per day.

The General Rubber Manufacturing Co., whose incorporation was mentioned on page 78 of the November issue of THE INDIA RUBBER WORLD, has offices in the Ohio Building, with a factory in East Akron. The company will manufacture automobile accessories.

The Adamson Machine Co. is putting up a 160 x 80 foot addition to its steel foundry for a 10-ton open hearth furnace, to make open hearth steel castings.

* * *

Bertram G. Work, president of The B. F. Goodrich Co., has purchased 30 acres of land at Oyster Bay, Long Island, where he plans to build a summer home.

At the dinner given on November 15 at the Portage Club by President George Bates of the chamber of commerce, F. A. Seiberling, president of the Goodyear Rubber Co. and a director in the national chamber, spoke on the work of the latter organization.

As chairman of the Community Christmas Committee, Mr. Seiberling presided at a committee meeting in the chamber of commerce rooms on November 17 which was attended by 30 representatives of Akron public organizations, for the purpose of deciding upon plans for the holiday entertainment. It is planned to abandon the idea of having one large Christmas tree, as was done last year, and, instead, to hang illuminated electric stars at downtown street intersections as a reminder of the Christmas spirit.

"Johnny Y.," a 5-gaited saddle horse that has won many blue ribbons and is worth thousands of dollars, has recently become the property of Mr. Seiberling.

Roy G. Harris, of the Firestone Tire & Rubber Co., returned recently from an extended stay in Russia, where he has been selling tires.

* * *

The rubber companies, especially those manufacturing tires, will exhibit at the second annual automobile show to be held in the Akron Winter Garden, December 11 to 18.

Many of our rubber men are planning to attend the annual banquet of the Rubber Club of America, Inc., in New York, on January 28.

The police department is considering installing tandem cars in place of the motor cycle now used for pursuing the wrongdoer. The tandem cars can carry two policemen, one sitting behind the other. The frame of the car is formed like that of an automobile and is mounted on four light wheels. These cars were introduced into this country from England. It is said they are capable of making 80 miles an hour.

CHICAGO RUBBER NOTES.

The Illinois Rubber Co., whose incorporation was mentioned on page 26 of THE INDIA RUBBER WORLD for October, is located at 214-216 W. Kinzie street, and is making a general line of mechanical rubber goods.

The Chicago Mold & Machine Co., 970 Montana street, is making a general line of molds and cores for mechanical rubber goods and tires. They are specializing in a pad mold for making composition, canvas, or leather backs for horse shoe pads.

The Dutch Guiana Culture Co., of which L. C. Lawton is president, with offices in the Lytton Building, recently shipped 12,000 glass rubber latex cups to the company's plantation in Dutch Guiana. The cups were made by the United States Glass Co., Pittsburgh, Pennsylvania.

The Williams-Bowman Co., formerly of 171 N. Greene street, is now located in its new plant at 1947 S. Fifty-fourth avenue. This company makes molded plumbers' specialties.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

RUBBER AND THE BUDGET, ETC.

THE effect of the Excess Profit Tax of 50 per cent on the various rubber plantation companies is the only matter in connection with the rubber interest which is being actively and acrimoniously discussed. It certainly does not seem fair that a small company which has made an increased profit of a thousand or two should have to pay up while an older one, which has made large profits at about the same figure for the previous three years should pay nothing. The suggestion that all rubber companies should pay a tax of 20 per cent. or so has been proposed as being much more equitable and as likely to bring in a larger sum. If this proposal is not accepted it would only be on the ground that other industries would probably claim the same sort of thing and necessitate an extensive alteration in the whole scope of the tax.

Turning to another topic, it is noteworthy that although our army has increased in the last year and is still increasing, supplies and equipment are well in hand and there is an absence of the rush and get-things-anywhere spirit noticeable a year ago. Practically all rubber goods, including hospital requirements, can now be bought by the public at ordinary prices. This applies to army clothing, some contracts for which were placed in America a year ago, and to all equipment, it is understood, except rubber thigh boots. An order for 70,000 pairs of these was placed in the United States during the last few months and this only because it was impossible to obtain the required number in British and Canadian factories. The labor question has not been acutely felt so far in our rubber works, because in normal times women are always largely employed. Now, however, with Lord Derby's recruiting scheme in operation, it is inevitable that some deficiency and dislocation will be manifest, and we may expect that women will invade departments to which they have been strangers hitherto.

Reverting for a moment to the Excess Profit Tax, two important concessions by the Chancellor of the Exchequer may be mentioned: first, the average of two years' profits in place of three may be taken as the datum line; second, new plantation companies just emerging from the development stage are to be compensated for past losses by the allowance of a high datum line varying with the length of development period.

The recent advance in price of plantation rubber is due to steady buying by manufacturers fearful of being found short. Some little nervousness no doubt exists in certain quarters as to the maintenance of the open waterway from the East, in view of the recent development of the war, but apart from this there certainly seems only two good reasons to apprehend a further rise in freight, and also shipping delays. The details of the new government control of merchant shipping are not yet announced, but it may be taken for granted that the present increased requisition of shipping by the allied governments will lead to further delay and expense in obtaining goods from the Far East. On a former occasion I referred to the regulations specially drawn up by the Manchester Chamber of Commerce to guide the authorities with regard to the exportation of cotton cloth suitable for aeroplane use. Now, however, it is announced that special permits relating to this class of goods will not be operative, and that all applications for the export of cotton goods will be dealt with by the War Trade Committee in London. An agitation is on foot for the establishment of a

branch office of this committee in Manchester, as being conducive to saving of time and the interests generally, of the important cotton trade.

LAWN TENNIS BALLS.

The feature of the past season was, as might have been expected, the dearth of tournament and match play, and the consequent small demand for balls, and at the present time there seems little likelihood of a happier state of affairs for next year. Although the well-known brands of balls were on the market, there were numerous complaints that the quality of some of them was not up to the accustomed standard, though the prices were unaltered. Complaints, it is said, met with no response or sympathy, which presumably may be attributed to the small amount of business doing. It is the purveyors of luxuries who have been the hardest hit by the war and, among such, sport-outfitters are prominent. I hear that dealers have been advised of a rise of 1s. per dozen balls for next season, owing to the advance in price of materials and labor. The ordinary ball has the felt or melton cover sewn on after the rubber ball is completely finished, and in the case of best quality balls I have not heard of any complaints arising from this procedure. In a recent patent of E. C. Wisden-Luff and John Wisden & Co., Limited, sport-outfitters, the cover is put on with rubber cement and the vulcanization of the ball is afterward effected, or if previously semi-vulcanized, it is then completed. Among other claims for this ball I note that it is said to be less porous and will consequently last longer. If this claim is substantiated in practice, the patent should prove of more value than many patented improvements in rubber manufacture.

The obituary notice in the October issue of THE INDIA RUBBER WORLD of Mr. A. G. Spalding has been read with interest by many, who, though familiar with the sports depots of Spalding Bros. in London and the provinces, knew nothing of the rise and development of the firm. The Spalding make of lawn tennis balls is well known, though it has not yet been officially adopted by the Wimbledon authorities.

RUBBER CHEMICALS.

There has been a considerable rise in solvent naphtha, which has gone from 10d. per gallon to 2s. 4d. The makers say that this is entirely due to the large demand from the rubber works, which seems rather surprising, because the proofers are by no means so rushed with work as they were a year ago, when solvent was at a much lower level. It is a significant fact that the rise in solvent naphtha has synchronized with the withdrawal of benzol from the open market, the whole supplies of this commodity now having been requisitioned by the War Office in connection with a certain development in the manufacture of explosives. Solvent naphtha, which should consist of xylol, but has, according to the state of the market in the past, often contained benzol and toluol, is now exclusively xylol and is not in demand for the manufacture of explosives, and only to a limited extent for the coal tar color industry. But it can be used for certain purposes instead of its lighter homologues mentioned above. These other uses, as well as a reduction in the output, have no doubt had an effect upon the price. With regard to solvent naphtha the future will depend somewhat upon how much Scotch shale spirit is available, this solvent being largely used in Scotland. That lower prices are not in prospect, however, is evidenced from the

fact that contracts for the supply of solvent naphtha over 1916 have been entered into at the price of 2s. 2d. per gallon.

The exportation of aniline, hitherto permitted under license, is now entirely prohibited. The price has soared up to 2s. 6d. per pound, a fact which I may say is not due to any increased demand, but because of decreased production, owing to the non-availability of benzol, from which it is made.

Another chemical used by rubber manufacturers and reclaimers which has advanced considerably in price, is caustic soda. The British production has been in demand by neutral countries formerly supplied from Germany, and this, coupled with a good home demand, has led to a shortage. A good deal has been coming from America despite the rise in freight from 12s. 6d. to 43 per ton, and has been sold here at prices varying from £20 to £27 per ton for 74 to 76 per cent. c. i. f. Liverpool. In the case of several chemicals, of which there is a shortage for one reason or another, market quotations must not be read to literally, as urgent wants in individual cases have had to be met, with the result that varying prices have been recorded in a limited period of time.

Sulphur, which up to recently has been exported by permit, cannot now be exported at all, a matter which affects some of our rubber chemical manufacturers.

Zinc oxide at 9d. per pound is now a luxury and it has not experienced the fall in price shown by the metal.

Litharge is another compounding ingredient which has risen in price, and altogether it will be seen that the rubber manufacturer who is buying now and not getting deliveries of naphtha and other requirements under contracts made some time ago, has a good deal to worry him. Similarly, those who are still supplying naphtha and other chemicals which have risen, under contracts made a year ago, are not unnaturally grumbling at the position in which they find themselves.

In these strenuous times, one never knows what the next week may bring forth with regard to the disposition of chemical products, the needs of the state, rather than of the individual, having necessarily to be satisfied first. I am not going to enlarge upon this somewhat cryptic utterance except by saying that it is not altogether improbable that difficulty may be experienced in getting supplies of certain chemicals, unless they are required for government contract.

AFRICAN WORLD AND RED CROSS FETE.

A. Staines Manders and Miss D. Fulton, whose organizing ability the rubber trade knows and appreciates, are preparing to hold, in London, a "Cape to Cairo Fair and Red Cross Fete". This is in the line of special work they have been doing, free, since the great war began. The fair will be a direct and very effective aid to the "African World and Red Cross Work" which, since August, 1914, has done a great deal for Red Cross and hospital work in England, Belgium, France, Russia, Italy, Egypt, etc. The "African World Work" is under the patronage of the Queen of the Belgians and the honorary president is Mrs. Louis Botha, of Pretoria. The fair will be held at the Great Central Hall, Westminster, London, December 15, 16 and 17. It will, in a word, be "Africa in London" and a wonderful collection of native works and curios from nearly every country in Africa will be on exhibition. There will also be a series of special lectures and moving picture films covering such industries as gold and diamond mining, ostrich feather farming, etc., etc.

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

"UNDER GOVERNMENT CONTROL."

The influence of the war on British manufacturing industries capable of executing war orders, and the activity of the Hon. David Lloyd George, Great Britain's Minister of Munitions, in making such establishments subservient to campaign requirements, is revealed in recent communications received at this office from well-known British rubber manufacturing concerns. The following legends were conspicuously displayed on their stationery: "Under Government Control," "Controlled Establishment Under Munitions of War Act 1915," "This Establishment Is Controlled Under Munitions of War Act 1915."

RUBBER REGENERATING CO., LIMITED, FURNISHES AMBULANCE.

A very practical charity, particularly at the present time, is the war ambulance. The illustration shows a modern ambulance furnished and operated by the Rubber Regenerating Co., Limited, Manchester, England. This particular ambulance, by the way, is not only non-sectarian, but it is international in its charities.

AMBULANCE DONATED BY RUBBER REGENERATING CO., LTD.

"ARTIFICIAL RUBBER" IN ENGLISH TIRES.

Rubberine, Limited, London, England, the manufacturers of "Rubberine," a special tire filler, advise THE INDIA RUBBER WORLD that nearly one-half of their product of late has been taken by the government for filling the tires of armored cars, lorries, kitchen cars, and ambulances. An interesting point is that pneumatic tires returned from the front for refilling, although riddled with shrapnel bullets, had served their purpose until the car had gotten safely back to its base.

Dr. Joseph L. Torrey, of the Northwestern Rubber Co., Limited, of Liverpool, England, was a recent visitor to the United States. E. E. Buckleton, the president of the company, usually makes the annual American trip, but as he is suffering from an accident, not serious, happily, Dr. Torrey took his place.

Bertram G. Work, president of The B. F. Goodrich Co., sailed the latter part of November for London. It is understood that he plans a brief absence only.

Hard rubber goods when exposed to sunlight a considerable length of time, turn gray, due to the action of sunlight on the rubber compound. This can easily be remedied. The shop-worn hard rubber article is first freed of dust and then washed with ammonia, after which it is well rinsed in pure cold water, thoroughly dried and finally polished with whiting and a soft cloth. It is important that no hot water be used, for the heat would cause the hard rubber article to warp and lose its shape.

The French Rubber Situation.

By Our Regular Correspondent.

HERE in France, news and information circulate more by word of mouth than through publication channels, and for this reason it is no easy matter to give a complete review of conditions, as one cannot ask too many questions or make too extensive inquiries without raising uncomfortable suspicion. The whole country is heart and soul in the war and commercial as well as industrial conditions, though secondary, are improving daily.

When the order to mobilize came, a year ago last August, all able-bodied men, regardless of rank or occupation, were called to arms from factories and commercial institutions. This state of affairs continued until after the battle of the Marne, when the situation was mastered and steps taken to repair past mistakes.

We had an army for defensive purposes only, and a new one had to be created.

That done, we started reorganizing and adapting ourselves to new conditions. Technical experts and skilled labor were released from the armies and put to work in the factories. Attention was first given to factories working for the essential needs of our defenders. Heavy artillery was created, railroad lines constructed, the production of ammunition organized, the aviation corps provided not only with great numbers of new machines, but also with new types of planes and motors, and our motor transportation service increased and perfected.

Like other industries, the rubber industry was paralyzed by the mobilization. But rubber is essential to modern warfare, and so our rubber factories were soon reorganized and set to work again with skilled labor and technical management, as were also the munitions factories which, by the way, like our most important rubber factories, are in Central France and the Paris district well behind the "front."

The leading branch in our rubber industry has always been the manufacture of tires, and of all rubber articles, tires are the most important in modern warfare. Soldiers now ride in motor cars, and motor cars and trucks keep them supplied with food and munitions. Motor tractors draw the big guns that are constantly changing positions and motor trucks supply these monsters of destruction with ammunition. These motors all use tires, either solid or pneumatic, but always rubber. For this our factories were well prepared and as soon as the needed labor and staffs returned from the army, work went on night and day, so smoothly and effectively that our factories supply all our rubber needs and are now able to extend their trade in the Orient, in South America and in Africa. Our rubber factories are now abundantly provided with skilled workmen and technical experts. They are not only producing tires, but also all the rubber sun-

dries and surgical goods required by our army and navy medical service. The only branch somewhat curtailed is the mechanical, and this is because the Germans still occupy the most important market for mechanical rubber goods in Northern France.

As a rubber manufacturing district, the Northern departments were never as important as those of the Paris district or of the central part of this country, but they were our largest consumers of manufactured rubber. The mines of the Nord and of the Pas-de-Calais produced at least two-thirds of our total output of coal. Our spinning industry was in Lille, our linen industry in Armentiers, Lille and St. Quentin, our cloth and woolen industries were in Roubaix and Tourcoing. Enormous furnaces, rolling mills, steel works, electrical and mechanical construction works, glass

works, etc., were scattered along the Belgian frontier throughout the districts now occupied by our enemies. These districts were second only to the Paris district in industrial wealth, while agriculturally they were the richest in France. All these industries were great purchasers of mechanical rubber goods; likewise the great distilleries, breweries,

INNER TUBE DEPARTMENT IN FRENCH FACTORY.

sugar factories and other industries of Northern France.

The fine pleasure cars as well as the ponderous trucks that traversed the northern "pavés"—the cobble-paved roads of Northern France—all used rubber tires, and their number was exceeded only by those of the Paris district. This once beautiful and wealthy part of our country is closed to us now, but we hope to have it back before many months.

Although the invaded provinces were not great producers of rubber goods, it may be of interest to your readers to know that there were about 50 plants in these districts engaged in the manufacture of rubber goods and the production of chemicals, ingredients, accessories and machinery used in the manufacture of rubber and gutta percha. The following are some of the leading concerns:

SOFT AND HARD RUBBER GOODS.

Bans, Lhonné, Nord; Gustave Boinet & Cie., St. Quentin, Nord; E. Degraeve, Roubaix, Nord; Buttrille & Masqueler, Tourmignies, Nord; Usines du Coq Français, Roubaix, Nord; Destriez & Cie., Pont-à-Marcq, Nord; Michel Jackson, Halluin, Nord; Lefebvre, Pont-à-Marcq, Nord; Mazure, Roubaix, Nord; F. Montreux & Tyberghe, Halluin, Nord; Voller Valley, Aisne; Flinois, Colmant & Cuvelier, Lille, Nord; Dedale-Rivelois, Roubaix, Nord; and Colonial Rubber Co., Thiant, Nord.

CHEMICALS AND COMPOUNDING INGREDIENTS.

Société Anonyme des Mines de Malhdano, Noyelles-Godault, P. D. C. (chalk); Gortschalk, St. Amand-les-Eaux, Nord (chalk); Société Française La Baryte de Commines, Commines, Nord (barytes); Luffrey & Chardonner, Chauny, Aisne (rub-

ber substitute); Madame J. Lefrant & Cie., Ham, Somme (chemicals).

RUBBERIZED GARMENTS.

G. Boinet & Cie., St. Quentin, Aisne; Coustoux, Roubaix, Nord. Tires.

Durandal, Lécuse, Nord (pneumatic); Lecerf, Péronne, Somme (pneumatic); Vittu, Lille-St. Maurice, Nord (pneumatic); Colonial Rubber Co., Thiant, Nord (pneumatic); Lecoutre, St. Quentin, Aisne (solid rubber tires).

NON-SKID TREADS, TIRE STUDS, ETC.

Dutrieux & Cie., Le Quesnoy, Nord; Place & Meurisse, Lille-St. Maurice, Nord; Vittu, Lille-St. Maurice, Nord; Colonial Rubber Co., Thiant, Nord; Le Vulcain, Péronne, Somme.

TIRE FABRICS.

Coisne & Lambert, Armentières, Nord; Destrie & Cie., Pont-à-Marcq, Nord; Dutilleul, Armentières, Nord; Laroche & Lechat, Lille, Nord; Legault, Armentières, Nord; Trèves, St. Quentin, Aisne.

RUBBER WORKING MACHINERY.

A. Questroy & Fils, Lille, Nord; Delattre & Cie., Ferrière-la-Grande, Nord.

Belgium and the districts now invaded furnished practically all the cotton, linen, hemp and jute fabrics used by our rubber manufacturers, and under present conditions we are obliged to import these from America and Great Britain. We are also importing large quantities of compounding ingredients from your country. In this connection I wish to inform you that much of these commodities that figure in your statistics as exports to England are re-shipped to France.

IMPORTS OF CRUDE RUBBER.

France has always been, comparatively speaking, a large user of Brazilian rubber, and most of this was imported through Havre; but now Havre is no longer in direct communication with South America and our direct imports of Brazilian rubber have almost totally ceased. The following comparative statistics will give you a fair idea of our crude rubber market as it now stands.

Imports During the First Five Months of			
From—	1913.	1914.	1915.
Brazil.....pounds	5,369,980	3,133,900	264,440
Great Britain.....	6,191,900	9,005,920	7,318,300
French Congo.....	263,560	223,520	99,660
Senegal.....	21,560	2,420	16,940
Other colonies (French).....	2,757,700	1,255,760	985,820
British Indies.....	535,920	1,639,440	241,780
Other countries.....	7,029,880	5,181,660	1,221,000
Total.....	22,361,900	20,442,620	10,147,940

If you compare the first two lines of these statistics you will note that the large decrease in Brazilian imports is compensated by a substantial increase in our imports from England. I believe much Brazilian rubber reaches us via English ports. The fact that Para rubber now passes through England before reaching this country has increased its cost to us by at least 5 cents a pound, and our importers are now endeavoring to obtain the re-establishment of direct communication between France and Brazil.

Although the war has somewhat increased the cost of raw materials, there has been no radical increase in the prices of rubber goods here. Tires, hose, belting, packing, rubberized garments, etc., can all be had at normal prices.

There have been reports of gasoline shortage and, in fact, prices have increased. But the real cause is the difficulty in securing exchange, and the rubber industry has not been affected. There is no reason for alarm, for all our gasoline comes from America, which in normal times furnished as high as four-fifths of our requirements for this commodity.

Many trade papers have ceased, or at least curtailed the scope of their publications, but the old-established papers are still going strong, among these your contemporary, "Le Caoutchouc et la Gutta Percha," which, although obliged to delay publication at first, has recovered wonderfully. The October issue of our only rubber paper contained 67 advertisements, of which 9 were British, 3 American, 1 Dutch, 3 Swiss, 1 Spanish and 1 from a firm in the

invaded territory. This compares very favorably with the average of this paper previous to the war, when of 146 advertisements published, 22 were German, 1 Austrian, 5 Belgian, 2 Dutch, 5 American, 15 British, 2 Swiss, 1 Italian, 1 Russian, and 15 from French territory now invaded.

Our government has prohibited the exportation of the following commodities of interest to rubber and gutta percha manufacturers:

Rubber, balata, gutta percha, whether crude, reclaimed or in

HYDRAULIC PRESS MOUNTED ON TRAILER TRUCK.

the shape of waste, including hard rubber scraps; amyl, methyl, and ethyl alcohols; pitch tar rosin, turpentine; cotton and cotton waste; copper ore, pure metal or alloys; sulphuric and acetic ether; insulated wire and cables; mineral oils, crude or refined; benzene, benzol, toluene, etc.; fabrics suitable for making balloons; motor vehicles and pneumatic tires. Sulphur, copper, motor vehicles and rubber tires can be exported under special license to America, Great Britain, her colonies and possessions; to the French Colonies, Japan, Montenegro, Russia, Servia and to that part of Belgium still held by the gallant Belgian army.

The poisonous gas used by the Germans, which at first worked such havoc, has now been minimized by anti-gas helmets, impermeable to chlorine gas, made of light rubberized fabrics, closed at the throat by a draw string, and completely covering the wearer's head. Goggle-like mica plates afford vision to the wearer, who breathes through a perforated detachable cup containing a cloth saturated with a solution of hyposulphite and bicarbonate of soda, which react with chlorine and hold it in harmless combination.

It has been said that modern war is motor war, which is certainly very true. As I stated in the beginning of this letter, motor vehicles are indispensable and have greatly lessened the importance of railroads in military operations.

MOBILE REPAIR SHOPS.

The wastage of motor vehicles has been far less than many of your war correspondents would lead you to believe. Our armies are well equipped with means for making necessary repairs. Besides large permanent repair shops at the bases in the rear, we maintain flying repair stations immediately behind the battle lines. The mobility of these "parcs" is secured by mounting the machine tools on special trailer trucks coupled behind the travelling workshops which are arranged on large motor trucks. These flying repair shops are able to do all repairs, even those of the most complicated nature.

Tires, of course, are used up in enormous quantities. The heavy solid rubber tires, used on motor trucks, are mounted on steel detachable rims which are forced on the permanent rims of the

wheels by a hydraulic press. For this work we have designed self-contained hydraulic presses mounted on trailer trucks, and adjustable to any size solid rubber tire.

The war has greatly modified conditions in France, even to the remotest districts, but we have adapted ourselves to war conditions and it has become part of our every-day life. Confidence is general—no one doubts our final victory. Before the battle of the Marne we had little hope. Since that great success, however, confidence has returned, and although it is not manifested in a boisterous manner, it is firm in the hearts of our countrymen.

RUBBER TRADE IN JAPAN IN 1914.

By Our Regular Correspondent.

IN my contribution to the April issue of THE INDIA RUBBER WORLD I endeavored to give as complete statistics as possible of the rubber trade of this country during the calendar year 1914, but I will take up the subject again to give your readers more detailed information which I have obtained from statistics published recently by our Department of Finance and by the Customs authorities in Kobe.

Although no large rubber factories existed here during 1914, there were in operation quite a number of small plants, with the result that our consumption of crude rubber increased substantially in spite of war conditions and the incidental hindrance to commerce. The war embargo on rubber injuriously affected our rubber manufacturers. It stopped the supplies of crude rubber we were in the habit of obtaining from Singapore, until the latter part of October, when small quantities were obtained from the Straits Settlements port. The decrease in arrivals of crude rubber was soon felt by our manufacturers, for here in Japan it is not customary to speculate in crude rubber, especially when prices have a downward tendency. Purchases are made only as the material is needed; so that when the embargo came there were no large supplies of crude rubber on hand in this country.

Singapore being practically closed to us we endeavored to obtain crude rubber from Dutch India, only to find that the entire production there had been bought up by American interests. America and England were still open as sources of supply, but the distance and the high freight rates made purchases there impracticable. We did buy some crude rubber in England, but not in sufficient quantities to keep all factories going, and before the end of the year quite a number of our small rubber manufacturing concerns were obliged to close their plants. The larger factories were able to hold out until February and March of the present year when many of these were obliged to shut down because no crude rubber was available.

In former years we purchased much Borneo and British Indian wild rubber through the Singapore market, chiefly because our manufacturers were under the impression that wild rubber was better than the plantation product, but also because the former was cheaper. We now recognize that in the end plantation rubber is cheaper than the wild varieties because there is no loss in washing and refining, as there is with Borneo and British Indian rubber which come to us in a very impure state. Of course, the prices for plantation rubber are not as high as formerly, but the same applies to wild rubber and to South American and African grades. We have a good opinion here of African rubbers, but most of our manufacturers are not equipped to handle them advantageously. The following table shows the prices we paid for the most popular grades of crude rubber at different times during the year 1914:

	January and February.	July.	August and Sep- tember.	November and December.
Borneo rubber....per 100 pounds	\$52.50	\$67.50
British Indian rubber.....	70.00	67.50
Plantation sheet.....	62.50	\$57.50	\$56.00	67.50
Fine Para hard cure.....	75.00	105.00

Pale crêpe is the plantation type most used here, followed by smoked crêpe and scrap, in order of importance.

During the past year the following rubber factories were our principal consumers of crude rubber: The Yokohama Electric Wire Works, Limited, Yokohama; the Mitatsuki Rubber Manufacturing Co., Tokio; the Toyo Rubber Co., Limited, Tokio; the Nipon Rubber Co., Limited, Tokio; the Fujikura Electric Wire & Rubber Co., Limited, Tokio; the Nipon Wire & Cable Co., Limited, Tokio; the Kakuichi Rubber Co., Osaka; the Osaka branch of the Yokohama Electric Wire Works, Limited, Osaka; the Sumitomo Rubber Works, Osaka; the Hirana Rubber Works, Osaka; the Mutsuda Rubber Works, Osaka; the Asai Rubber Works, Osaka; the Shimada Rubber Works, Osaka; the Asuma Leather Co., Osaka; the Bando Belt Co., Osaka; the Dunlop Rubber Co. (Far East), Limited, Kobe; the Naigai Rubber Co., Limited, Kobe; the Kawaji Rubber Co., Kobe; the Settsu Rubber Co., Limited, Nishinomiya and Hyogo; the Kamenofuchi Rubber Co., Fack and Hyogo; the Kyushu Electric Wire Co., Limited, Fukuoka, and the Chugoku Rubber Works, Hiroshima. Of the total of our imports of crude rubber two-thirds were consumed in Osaka, Kobe and other western parts of Japan and the rest in Tokio and Yokohama.

During 1914 a new application for rubber was discovered here and now rubber solution is being used for coating the thongs of the wooden clogs which almost all Japanese wear when out of doors. The widespread use of wooden clogs and this application of rubber to them is bound to increase our consumption of crude rubber.

The Japanese Imperial Steel Works at Wakamatsu, Japan, have placed a contract with a British firm for the installation of a benzol plant with an annual output of 2,400 tons of benzol.

JAPANESE EXPORTS OF RUBBER GOODS.

The most important items of our exports of manufactured rubber goods are rubber insulated electric wires and jinrikisha and bicycle tires, which we ship in quantities to China, Kwangtung Province, Hong Kong, British India, the Straits Settlements, Dutch India, Great Britain and other countries. From the statistics I gave in my April contribution you will note that our exports in these articles increased more than 50 per cent. in 1914 as compared with the preceding year. The increase in these exports started in August, which goes to show that they were largely due to the stoppage of European shipments in these lines. By December the orders in hand were far in excess of our capacity to deliver; our output, as before said, being curtailed by the crude rubber embargo of our allies. Prices, however, were good and our manufacturers made substantial profits.

The following table shows weights and values of our exports of rubber goods through the leading ports of this country for 1914:

From	Pounds.	Value.
Kobe.....	872,594	\$536,970
Yokohama.....	6,930	4,214
Other ports.....	3,262	1,951
Total.....	882,786	\$543,135

As will be noted, most of these exports were made through the port of Kobe. The following table shows the destinations of exports of rubber goods through this port for 1914:

From—	Pounds.	Value.
China.....	341,244	\$199,823
Kwangtung Province.....	2,305	1,139
Hong Kong.....	2,913	1,345
British India.....	37,689	30,644
Straits Settlements.....	221,572	141,041
Netherlands India.....	250,223	158,327
Great Britain.....	5,758	3,805
Other countries.....	10,890	846
Total.....	872,594	\$536,970

RUBBER PLANTATIONS.

Rubber plantations here promise well for the future. We now have some 88,000 acres under *Hevea*, which will produce about 5,000 tons of rubber per year when in full yield. Our present consumption of crude rubber amounts to about 2,000 tons per annum.

Rubber Planting Notes.

RUBBER AND INTERPLANTED COFFEE.

STATEMENTS that the growth and yield of *Hevea* trees were adversely affected by interplanting with coffee have in several instances induced Java planters to cut out the interplanted coffee. This not only meant the direct loss of the coffee—cost of original planting and cultivation and annual yield—but in many instances the rubber trees were injuriously affected. As a result of experiments conducted at the Besoeki Experiment Station, Djember, Java; Director A. J. Ultee issues a circular in which he admits that the interplanted coffee apparently retards in some degree the growth of *Hevea* trees, according to the planting distance, the method of working employed and local circumstances. Also cutting out of the interplanted coffee often injuriously affects the rubber and before deciding upon this step planters should ascertain by careful experiment the probable effect the removal of the coffee would have on future rubber production.

RUBBER EXPORTS FROM UGANDA IN 1914-15.

The Department of Agriculture of the Uganda Protectorate has published its annual report, covering the year ending March 31, 1915. So far as rubber growing is concerned, the situation there is certainly not what it might be with proper attention and enterprise.

The report discloses that "all the rubbers are neglected with the exception of Para, and, although the area ready for tapping is comparatively small, the results obtained give every encouragement to persevere, as it is an excellent standby and costs comparatively little to bring into bearing when coffee is grown as a catch-crop."

Apparently there are no circumstances peculiar to the soil or climate tending to obstruct abundant and profitable growth, the state of the business being mainly due to neglect. The tabular statement at the end of the report bears this out so far as the wild rubber is concerned. In 1911, 898 hundredweight of wild rubber was exported and in 1914, the banner year, 123,984 pounds; while for the year ending March 31, 1915, none is recorded. On the other hand, plantation rubber amounting to but 552 pounds in 1911, has gained steadily, and by the latest figures, was exported during 1914-15 to a total of 22,056 pounds, valued at £1,838 (\$8,944).

Of course Uganda has suffered by the past slump in the market, the harvest of 1913-14, amounting to 19,454 pounds of plantation rubber, bringing £2,934 (\$14,278).

EFFECT OF TAPPING SYSTEMS ON RUBBER YIELD.

At a well-attended meeting of the Committee of Agricultural Experiments recently held at the Peradeniya Agricultural Experiment Station, Ceylon, L. E. Campbell, the rubber research chemist, explained the relation between the physiological effects of tapping on *Hevea* and the production of dry rubber; or, in other words, the connection between rubber yields and storage of reserve starch. Some of the trees under examination were tapped with the half-herringbone to left of the channel, over one-fourth of the tree's circumference. The first section of the tree, tapped continuously on alternate days, gave a yield equal to that tapped daily in alternate months. In the second section there was an advantage of 4 per cent. in favor of daily tapping in alternate months. In the case of the full herringbone on half the circumference there was an advantage of 16 per cent. in favor of regular alternate day tapping in the first sections, but in the second

sections the advantage was much smaller. The yields from trees tapped daily in alternate months and those tapped continuously every other day were apparently about equal. The experiment demonstrated that with the systems under observation it makes little difference as far as latex yield is concerned, whether the trees are tapped continuously on alternate days, or daily in alternate months throughout the year.

INDIVIDUAL PLANTATION BRAND.

On his return from England to Ceylon recently, M. Kelway Bamher reported that some large manufacturers expressed the opinion that estates should have an individual mark stamped on all rubber produced, thus enabling the manufacturer to know the estate which produced the rubber best suited to his purpose.

RESTRICTION ON BELGIAN CONGO RUBBER EXPORTS.

An ordinance of the acting Governor-General of the Belgian Congo, dated August 1, 1915, prohibits the exportation of rubber from the colony, except to Great Britain, France, or to the port of New York. It is necessary to obtain special permits for exports to New York, which must be consigned to the Belgian Consul at New York, subject to the terms of the rubber guarantee.

AFRICAN RUBBER AND PLANTATION COMPETITION.

For some years past African wild rubber exports have displayed a consistent tendency to decrease in volume, largely owing to the low prices prevailing in rubber markets and the ever-increasing production of well-prepared plantation rubber. The average price during 1914 was the lowest in the last five years. Exports of crude rubber from the British Gold Coast Colony fell from 3,223,365 pounds in 1910 to 654,133 pounds in 1914, the value of the exports declining during this period from £385,875 [\$1,877,861] to £21,632 [\$105,272]. It is also claimed that the prices offered are no longer sufficient to encourage enterprise in this languishing industry.

DYNAMITE TO FERTILIZE RUBBER PLANTATIONS.

Experiments are being conducted in Malaya to test the value of dynamite for liberating the plant-foods in the soil. The Department of Agriculture of the Federated Malay States is conducting these experiments and reports that the trees in dynamited plots increase more rapidly in girth than trees in similar plots not dynamited. The average increase of girth of trees in dynamited plots was, at the end of six months, .48 inch, and, at the end of nine months, .71 inch greater than trees in neighboring plots. The plot treated with dynamite comprised two acres and was blasted in March, 1914.

RUBBER EXPORTS FROM TRINIDAD AND TOBAGO

The exportation of rubber has been prohibited during the war, but, according to the report of the Agricultural Society of Trinidad and Tobago, 810 pounds of this commodity was shipped, on special permits, in June. Exports from January 1 to July 1 of 1914, amounted to 3,785 pounds; for the same period in 1913, 1,505 pounds, and for the first six months of 1912, 2,076 pounds.

"Rubber Machinery," Mr. Pearson's newest book, filled with valuable information, is now ready. Price \$6.

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED OCTOBER 19, 1915.

- N**O. 1,157,141 Demountable tire rim. R. C. Ball and L. E. Younie—both of Portland, Ore.
- 1,157,156. Vehicle wheel rim. R. W. Dick, assignor to Louis Rastetter & Son, a partnership existing between E. Rastetter and W. C. Rastetter both of Fort Wayne, Ind.
- 1,157,202. Surgical apparatus with elastic lining. U. C. Bates and J. McLeland—both of Seattle, Wash.
- 1,157,439. Combined hot water bottle and syringe. M. E. Starr, Mason City, Iowa.
- 1,157,447. Hair curler having an elastic member. M. W. Stoddard, Minneapolis, Minn.
- 1,157,536. Self-retaining hose washer formed of resilient material. H. P. Herron, Los Angeles, Cal., assignor to H. Mueller Manufacturing Co., Decatur, Ill.
- 1,157,559. Rim with tire retaining flange. J. W. Lewellen, Ridal, Pa.
- 1,157,564. Dust cap for tire valves. H. A. Mason, assignor of one-fourth to S. G. O'Neill and one-fourth to W. E. Quigley—all of Taunton, Mass.
- 1,157,574. Self-retaining coupling washer. R. Mueller, assignor to H. Mueller Manufacturing Co.—both of Decatur, Ill.

ISSUED OCTOBER 26, 1915.

- 1,157,763. Tire tool. J. P. Cunningham, York, Neb.
- 1,157,822. Valve for pneumatic tire. R. E. Taylor, Oak Park, Ill.
- 1,157,905. Soft rubber stopper. W. G. Rodiger, Chicago, Ill.
- 1,157,928. Non-skid attachment for tires. J. L. Duff, Cambridge, Ohio.
- 1,158,039. Pneumatic closet seat buffer. T. J. Florey, Washington, N. J., assignor to American Sanitary Works, New York, N. Y.
- 1,158,053. Rubber heel insert. O. T. Hutchison, Wagon Mound, N. Mex.
- 1,158,075. Tire protector with an inner permanent rubber layer and an outer renewable rubber layer. J. Richardson, Buffalo, N. Y.
- 1,158,139. Truss with an inflatable body. R. P. McCollum, Philadelphia, Pa.
- 1,158,183. Wheel having a solid tire. N. Cornfield, New York, N. Y.
- 1,158,206. Toy balloon. R. Griffith, assignor to Miller Rubber Co.—both of Akron, Ohio.
- 1,158,373. Springwheel. D. Cave, assignor of one-third to H. M. George and one-third to H. Bowman—all of Lincoln, Neb.

ISSUED NOVEMBER 2, 1915.

- 1,158,526. Shoe having an elastic fabric upper. T. W. Meredith, New York, N. Y.
- 1,158,573. Device for attaching rubber heels to shoes. G. B. Sinclair, Georgetown, Me., and L. O. Whitman, Marlboro, Mass.
- 1,158,604. Inner tube for a pneumatic tire. J. J. Webster, Haverhill, Mass., assignor to Reliance A. C. Co., Inc., New York, N. Y.
- 1,158,607. Anti-skidding armor for tires. H. W. White and A. T. Sheldon—both of Atchaf, Cal.
- 1,158,780. Gas dispensing dental device. R. M. Bolton, Chicago, Ill.
- 1,158,850. Tire carrying wheel. U. S. Renne, Smithland, Iowa.
- 1,158,859. Washboard with rubber attachment. B. Rudloff, Bayonne, assignor to E. Porcison, Jersey City—both in New Jersey.
- 1,158,897. Composition of matter, including gutta percha, to be used for rendering paper impervious to air and moisture. E. S. Coleman, Beatrice, Neb.
- 1,158,943. Combination tip for crutches and canes. S. E. Loudon, Riverside, Conn.
- 1,159,015. Hoz nozzle. H. Gibbs, assignor to W. D. Allen Manufacturing Co.—both of Chicago, Ill.
- 1,159,026. Tire. W. M. Hill, Minnate, Neb.
- 1,159,027. Fountain pen feed bar. J. W. Hobson, Jr., Bayonne, N. J.
- 1,159,068. Anti-skid mat. G. M. Motter, assignor of one-half to G. R. Perry—both of Washington, D. C.
- 1,159,086. Life preserver. J. J. Puskane, Chisholm, Minn.
- 1,159,091. Vehicle wheel with annular flexible tread. T. Rhodus, Chicago, Ill.
- 1,159,092. Vehicle wheel with annular flexible tread. T. Rhodus, Chicago, Ill.
- 1,159,125. Diver's helmet. H. Stelzner, assignor to the firm of Drägerwerk, Heintz & Bernh. Dräger—both of Lubek, Germany.
- 1,159,143. Patch for tires. R. W. Wheeler, Akron, Ohio.
- 1,159,160. Hot water belt. A. C. Beringer, Bellwood, Neb.
- 1,159,244. Tire. T. Mingley, Sr., assignor to The Mingley Tire & Rubber Co.—both of Lancaster, Ohio.
- 1,159,250. Vaginal irrigator. F. Moulton, Simmsville, Wash.
- 1,159,310. Valve stem shell for pneumatic tires. L. C. Woelz, Los Angeles, Cal.
- 1,159,313. A demountable rim. E. K. Baker, assignor to Universal Rubber Co.—both of Chicago, Ill.
- 1,159,320. Retainer for tire repair devices. W. B. Lashar, assignor to American Chain Co., Inc. both of Bridgeport, Conn.
- 1,159,324. Bath fixture. C. A. Minnie, Wellsburg, assignor of two-ninths to F. Seltner, McMechen, and two-ninths to G. Ordan, Wellsburg—all of West Virginia.

ISSUED NOVEMBER 9, 1915.

- 1,159,362. Catamenial appliance. F. C. Cornell, New York, N. Y.
- 1,159,414. Reinforcement for pneumatic tire. M. Patrick, Geraldine, South Canterbury, New Zealand.
- 1,159,438. Elastic in drop-seat undergarment. C. M. Walker, Kansas City, Mo.
- 1,159,496. Rubber dam clamp. J. W. Ivory, Philadelphia, Pa.
- 1,159,503. Fountain brush. B. D. Knickerbocker, Chicago, Ill.
- 1,159,507. Shower bath curtain. A. E. Lang, Buffalo, N. Y.
- 1,159,538. Cushion tire. W. Shimom, Pocatamos, Iowa.
- 1,159,738. Rubber heel. F. X. Bibeault, Waterbury, Conn.
- 1,159,758. Rubber heel for shoes. C. Gambino, Birmingham, Ala.
- 1,159,760. Elastic tire for wheels. C. H. Genth, Philadelphia, Pa.
- 1,159,797. Wheel rim. J. A. Reid, Wentville, Mo.
- 1,159,799. Shock absorber. F. T. Roberts, Trenton, N. J., assignor to The Paramount Rubber Co., Cleveland, Ohio.
- 1,159,864. Pneumatic tire. A. L. Pearce, assignor to Pearce Arrow Tire & Rubber Manufacturing Co.—both of Philadelphia, Pa.
- 1,159,882. Toy comprising rubber cord and ball. E. C. Zipfel, Omaha, Neb.
- 1,159,925. Wheel tire. A. Geering, New York, N. Y.
- 1,159,961. Resilient wheel. H. Kuperian, Milwaukee, Wis.
- 1,159,972. Rubber heel. G. K. Mally, New York, N. Y.
- 1,160,007. Tire. W. F. Stark, Mauretown, Va.
- 1,160,023. Swimming appliance. H. White, Ho-nan fu, China.
- 1,160,112. Artificial foot. O. L. Savitz, assignor of one-third to E. S. Rabenold and one-third to H. E. Wink—all of Allentown, Pa.

UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent upon the filing of the application.

*Denotes Patents for American Inventions.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 6, 1915.]
- 13,907 (1914). Spring wheel with inflatable inside cushions. R. T. Park, York street, South Melbourne, Victoria, Australia.
- 13,926 (1914). Swimming appliance. J. D. Russell, 9 Victoria Road, High Road, Kilburn, London.
- 14,045 (1914). Detachable rim. E. Goody, Glenhorth, Trinity Square, Llandudno.
- 14,079 (1914). Detachable rubber pads for horseshoes. G. Hardman, Wharf Street Shoeing Forge, Preston, Lancashire.
- 14,336 (1914). Armored tire covers. C. M. Gautier, 24 Bangalore street, Putney, London.
- 14,244 (1914). Respiratory mask or face piece with pneumatic cushion. S. A. Richards, Hereford House, Craig avenue, and J. E. Spickett—both in Pontypriid, South Wales.
- 14,257 (1914). Renewable rubber-faced wearing parts for horseshoes. A. Boydell, Hacken Farm, Daresbury, and J. Longworth, 525 Blackburn Road, Astley Bridge—both in Bolton, Lancashire.
- 14,356 (1914). Spring tire with rubber tread blocks. R. J. Wickham, 74 Southview Road, Hornsey, London.
- *14,412 (1914). Wheel tire. H. B. Gillette, 328 Lyon street, N. E., Grand Rapids, Michigan, U. S. A.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 13, 1915.]
- 14,465 (1914). Rubber and wire tire armor and repair material. A. H. Greenfield, 92 Earl's Court Road, London.
- 14,633 (1914). Tire inner lining. J. W. H. Dew and Azuly Syndicate—both of 8 Laurence Pountney Hill, Cannon street, London.
- 14,649 (1914). Wheel tire. W. H. Williams, Bromford Lane, Erdington, Birmingham, and O. Parkash, 145 Pilgrim street, New-castle-upon-Tyne.
- 14,989 (1914). Pneumatic massage appliance. F. Winton-Charteris, 25 Devonshire street, Higher Broughton, Manchester.
- 15,052 (1914). Rubber protectors for the glass in headlights of electric motor cars. L. Renault, 15 Rue Gustave Sandoz, Billancourt, Seine, France.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 20, 1915.]
- 15,172 (1914). Garter. A. W. MacLeod, 32 Victoria street, Westminster.
- 15,184 (1914). Non-skid hand comprising rubber plugs. A. T. Hughes, 27 Gloucester Road, New Green, Surrey.
- 15,295 (1914). Spring wheel with rubber block cushions. J. G. Daw, Wellfield, Llanelli, Carmarthenshire.
- 15,330 (1914). Golf club with rubber insert. W. Hillman and F. M. Hillman—both of Kereley, near Coventry.
- 15,351 (1914). Rubber heel. E. K. Czarnowski, 7 Garbarska, and A. Siekacz, 32 Kopernika—both in Cracow, Galicia, Austria.
- 15,402 (1914). Syringe. H. E. Moul, 1 St. Ann's Chambers, Orchard street, Westminster.
- 15,439 (1914). Wheel tire. F. W. Howorth, 10 New Court, Lincoln's Inn Fields, London.
- *15,458 (1914). Tire valve. M. C. Schweinert, 225 Palisade avenue, West Hoboken, New Jersey, U. S. A.
- 15,476 (1914). Regenerative breathing apparatus. R. H. Davis, 187 Westminster Bridge Road, London.

- *15,581 (1914). Spring wheel with pneumatic cushions. W. M. Hoffman, 25 Gallatin avenue, Buffalo, New York, U. S. A.
- 15,583 (1914). Waterproof bandage having a pocket for compresses. P. Nebel, Schonau, near Chemnitz, Germany.
- *15,625 (1914). Rubber closet seats and lids. M. J. Whelan, Muskegon, Michigan, U. S. A.
- *15,626 (1914). Vulcanite coated wooden closet seats and lids. M. J. Whelan, Muskegon, Michigan, U. S. A.
- *15,627 (1914). Closet seats and lids. M. J. Whelan, Muskegon, Michigan, U. S. A.
- *15,628 (1914). Rubber coated wooden closet seats. M. J. Whelan, Muskegon, Michigan, U. S. A.
- 15,660 (1914). Tire tube lined with puncture sealing device consisting of a rubber honeycomb structure and rubber filling. D. J. Clappell, 32 College Hill, Llanely, Carmarthenshire.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 27, 1915.]
- 25,592 (1913). Eye and ear protector. G. de Bobory, Gyöngös, Hungary.
- 25,711 (1913). Chain comprising blocks of rubber. P. Roderwald, 35 Tempelhofer-Ufer, Berlin.
- 27,652 (1913). Vehicle wheel having removable rubber plates. G. Silvestri, 22 Wehrgrasse, and A. Findenig, 23 Belvedere-gasse—both in Vienna.
- 28,009 (1913). Ebonite device for teapot handle. Mappin & Webb and R. E. Smith—all of Royal Works, Sheffield.
- 28,806 (1913). Corset with section of elastic webbing. H. Bunte, 22 Grabenstrasse, Dusseldorf, Germany.
- 1,902 (1914). Breathing apparatus having rubber diaphragm and breathing bag. J. Parker, Stenhouse street, Cowdenheath, Fifeshire.
- 2,548 (1914). Galvanic battery. Van Raden & Co., 567 Foleshill Road, and M. Metz, 50 Berkeley Road, both in Coventry.
- 4,175 (1914). Massage appliance comprising a compressible ball. C. Greb, 40 Holczollernstrasse, Cassel, Germany.
- 4,614 (1914). Rubber in apparatus for modelling felt. C. J. Angeli, 11 Schulstrasse, and L. Russ, 4 Grafenstrasse—both in Darmstadt, Germany.
- *7,786 (1914). Elastic protector and cleaner for tobacco pipes. H. E. Hagmueller, 626 Washington street, Hoboken, New Jersey, U. S. A.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 3, 1915.]
- 15,694. Waterproofed canvas air bag to increase ships buoyancy. J. W. Cook, Milford, Stafford.
- 15,708. Illuminating signal with rubber strips between the glass plates. A. E. Lucas, 61 City Road, Birmingham.
- *15,737. Rubber in filter of vacuum cleaning apparatus. L. L. Ferguson, 6501 South State street, Chicago, U. S. A.
- 15,756. Fly swatter. C. E. Hodson, West street, Bourne, Lincolnshire.
- 15,771. India rubber capsules for bottles. F. W. Ingram, Felstead street, Hackney Wick, London.
- 15,798. Ebonite electrode covering for electric resistances. H. Herapath, 255 Hampstead Road, and M. J. Railing, 67 Queen Victoria street—both in London.
- *15,834. Air tubes for wheel tires. W. M. Reason, Pontiac, Mich., U. S. A.
- 15,869. Game appliance comprising a light inflated ball. E. M. Maxwell, Manor House, Clapham Common, London, and E. L. Allen, Fairview, Beccles, Redditch.
- 16,004. Ebonite buttons. Firm of F. Everts, Bad Homburg von der Höhe, Germany.
- 16,106. Detachable rim. G. B. Filmer, 83 Sillock street, South Hill, Moose Jaw, Saskatchewan, Canada.
- 16,115. Tire valve. H. P. Kraft, 219 Godwin avenue, Ridgewood, N. J., U. S. A.
- 16,129. Shaving stick cases. W. A. Gatten, 23 Haus, Grünwald im Isartal, near Munich, Germany.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

- 476,444 (November 5, 1914). Improvements in elastic wheels. A. Spreight and E. W. Meredith.
- 476,457 (April 23). Anti-mud tire casing. E. Lapointe.
- 476,479 (April 24). Rigid and floating metallic casing for pneumatic wheels with buttons and holes for attaching. J. A. Meunier.
- 476,514 (November 14). New perfected system for attaching spare automobile wheels and tires. W. J. Parker.
- 476,571 (April 27). Pneumatic wheel. J. O. Strashbach.
- 476,622 (November 28). Improved vehicle tires. C. Halle.
- 476,695 (December 8). Armored casing for pneumatic tires. A. Rosa.
- [NOTE.—Printed copies of specifications of French patents can be obtained from R. Bostel, Ingénieur-Conseil, 16 avenue de Villiers, Paris, at 50 cents each, postpaid.]

THE GERMAN EMPIRE.

PATENTS ISSUED (With Dates of Validity).

- 288,249 (January 13, 1914). Hollow truss. Frantz Dieckmann, Wormserstrasse, Berlin.
- 288,457 (November 13). Tire casing. Bruno Salzmann, Feldstrasse, 16, Berlin-Steglitz.
- 288,632 (March 19). Nipple. Supplement to patent No. 287,382. Carl Cade, Herford-in-Westfalen.
- 288,200 (June 30). Nipple. Carl Erwin Martin, Seumestrasse, 75, Leipzig-Schleissig.
- 288,418 (May 12). Objects made of rubber or similar substances. Dr. Emil Franz, Vienna. Represented by J. Apitz and F. Reinhold, Patent-lawyers, Berlin SW 11.

- 288,688 (April 16, 1913). Method for attaching interchangeable heels of rubber shoes of similar material. Richard Volkner and F. Hermann Sieg, Bielefeld.

TRADE MARKS.

ISSUED OCTOBER 19, 1915.

- 73,675. Heimbach Rubber Heel Co., Duluth, Minn. Illustration of a circle with a hand holding a rubber heel. For rubber heels.
- 79,996. Union Lock Stitch Co., Boston, Mass. Illustration of a circle with the words *Comfort and Service* in white letters on a black background and the words *The Merrick Welt* in black letters on a white background. For boots and shoes made of rubber, leather and canvas.
- 81,667. United States Rubber Co., New Brunswick, N. J., and New York, N. Y. Illustration of a circle with an inner circle of black with the initials *U S* in white letters on same. For rubber boots and shoes.
- 82,317. United States Rubber Co., New Brunswick, N. J., and New York, N. Y. Diamond design with the words *Knu-Shu* in white letters on a dark background, the letters being increased successively in size so that the initials *U* and *S* stand out. For boots and shoes having black uppers and rubber soles.
- 83,381. The Charles Williams Stores, Inc., Brooklyn, N. Y. Diagram of the East River with the Brooklyn Bridge. For bathing caps, rubber caps, raincoats and rubber coats, etc.
- 84,772. The Republic Rubber Co., Youngstown, Ohio. Picture of old Father Time with the words *Old Man Mileage* on his hat. For a monthly periodical publication.
- 87,272. The Goodyear Tire & Rubber Co., Akron, Ohio. Illustration of a tire with a black background with the words *Goodyear Tire* and a white center with the initials *S F*. For elastic vehicle tires.
- 88,463. The Frederick W. Lipps Co. of Baltimore City, Baltimore, Md. The word *Society*. For chewing gum, etc.
- 89,182. Hood Rubber Co., Watertown, Mass. The word *Daysha*. For rubber boots and shoes, rubber overshoes, and rubber soled canvas boots and shoes.
- 89,314. Hood Rubber Co., Watertown, Mass. The word *Leisure*. For rubber boots and shoes, rubber overshoes, and rubber soled canvas boots and shoes.

ISSUED OCTOBER 26, 1915.

- 77,642. American Heyl Co., Inc., New York, N. Y. A swastika with the words *American Heyl Company, Colors, Quality*. For rubber, etc.
- 81,471. National India Rubber Co., Bristol, R. I. Illustration of a camping lamp with a melting pot. For rubber and canvas boots and shoes.
- 81,472. National India Rubber Co., Bristol, R. I. The word *Campfire*. For rubber and canvas boots and shoes.
- 86,408. The Republic Rubber Co., Youngstown, Ohio. A plate with the words *The Republic Rubber Co., Youngstown, O., Oil, Producer and Well*. For belting made of rubber and cotton.
- 88,280. The Miller Rubber Co., Akron, Ohio. The words *Miller Tires Geared To The Road*. For rubber tires.

ISSUED NOVEMBER 2, 1915.

- 87,804. The Goodyear's Metallic Rubber Shoe Co., Naugatuck, Conn. The words *Rub Job*. For massage machines.
- 87,993. Rezendell & Weil, Chicago, Ill. Illustration of a feather with the words *No-Water*. For rubberized sheeting or fabric.
- ISSUED NOVEMBER 9, 1915.
- 85,761. A. G. Spalding & Bros., Jersey City, N. J. The word *Perma*. For vulcanizable cement for golf balls.
- 88,362. Hood Rubber Co., Watertown, Mass. Illustration of a horseshoe. For pneumatic and custom tires of rubber and rubber and fabric.
- 88,533. C. A. Crane, Cleveland, Ohio. The words *Chin-Chin*. For chewing gum.
- 89,265. The Clark Manufacturing Co., Boston, Mass. Picture of a Scotchman in his native dress with the words *Hoot Men*. For hose supporters.
- 89,450. C. B. Shane Co., Chicago, Ill. The word *Arerente*. For rain coats.
- 89,535. The Clark Manufacturing Co., Boston, Mass. The word *Superba*. For elastic webbing.

DESIGNS.

ISSUED OCTOBER 19, 1915.

- 47,999. Garter. M. E. Hammond, Bridgeport, Conn., assignor to The Thos. P. Taylor Co., a corporation of Connecticut.

ISSUED OCTOBER 26, 1915.

- 48,029. Tire tread. Del. P. Harris, New York, N. Y.
- 48,040. India rubber sole pad for boots and shoes. W. W. Phillips, assignor to Phillips' Patents, Limited—both of London, England.
- 48,041. India rubber sole pad for boots and shoes. W. W. Phillips, assignor to Phillips' Patents, Limited—both of London, England.
- 48,042. Rubber heel pad for footwear. W. W. Phillips, assignor to Phillips' Patents, Limited—both of London, England.

ISSUED NOVEMBER 2, 1915.

- 48,066. Vehicle wheel tire. M. D. Kuhlke, Akron, Ohio.
- 48,068. Garter. D. E. Latham, assignor to Double Grip Garter Co., Inc.—both of New York, N. Y.

ISSUED NOVEMBER 9, 1915.

- 48,138. Garter. C. J. White, assignor to The C. J. White Manufacturing Co.—both of New Britain, Conn.

Review of the Crude Rubber Market.

NEW YORK.

NOVEMBER began with a quiet, steady market, reflecting the firmness in plantation sorts on the London market.

First latex and smoked sheet sold at 62 cents for spot, January-March deliveries at 61 cents. Upriver fine was quiet at 57 cents.

On November 6 heavy buying was reported in London and prices commenced to advance. During the following week the rise was so rapid that on Thursday, November 11, quotations were withdrawn. This New York movement was evidently due to actual buying orders and continued to develop strength, owing to persistent bidding by buyers in the London market. November 23, First latex and prime ribbed were quoted in a strong market at 85 cents and January-March deliveries at 82 cents. Upriver fine was firm at 76 cents for spot.

This sudden buying movement, attended by an advance of 20 cents a pound in the price of representative plantation grades, has been attributed to various causes. For instance, the Panama Canal is hopelessly blocked and the Suez canal closed indefinitely; German submarines are operating in the Mediterranean. So much for rumors; the facts are that the local market is simply marking time, with the dealers "sitting tight" and watching the London cables. Little actual business was done in spot and nearby and the bargains in futures, quoted a few days ago, have been marked up by the rising tide of higher prices.

Later in the month, the market weakened and prices declined as the strong London buying movement ceased. Plantation grades showed a loss of eight to ten cents a pound from the high levels of a few days before.

LONDON.

The activity that set in late in October has continued into November and the demand is strong and urgent. Available supplies appear to be somewhat limited, despite the fact that stocks are increasing. The arrivals are about 2,000 tons above the average for the month, but deliveries are slow and uncertain. Official figures for the week ending November 6, 1915, show arrivals of 1,311 tons and deliveries of 1,027 tons. Corrected stock figures are 6,417 tons against 3,262 tons on the same date a year ago. Prices have advanced strongly from 2s. 6½d. (62.3 cents), the price last week for spot Standard crêpe, to 2s. 9½d. (67.9 cents), quoted for the same grade on November 12, 1915. January-June crêpe was quoted at 2s. 7½d. (63.5 cents). Hard fine Pará advanced 2s. the pound. Activity in the market continued and considerable business was done for Russian account. The demand for futures covering all of next year has also been quite noticeable.

November 18, the market advanced sharply and closed strong with Standard crêpe and Smoked sheet spot selling at 2s. 11½d. (71.9 cents). The upward trend of prices continued, supported by active buying orders, and on November 24, Standard crêpe and Smoked sheet spot were 3s. 4d. (81 cents).

JAVA.

At the private auction held in Batavia on September 10, 1915, 34,239 pounds were offered and 14,382 pounds sold, crêpe bringing 59.5 cents. On September 17 there were 51,533 pounds catalogued and 36,498 pounds sold at normal prices. The auction of September 24 brought out 33,383 pounds, of which 3,348 pounds were sold. The only grade of crêpe offered sold for 55.5 cents. On October 1 there were 17,908 pounds offered and 13,303 pounds sold at lower prices.

SINGAPORE.

At the auction held on September 22, 1915, 275 tons were offered and 178 tons sold. Smoked sheet ribbed and Fine pale crêpe sold up to 54 cents per pound. On September 29 there were 256

tons catalogued and 207 tons changed hands. Prices for prime qualities were unchanged from last week. The auction of October 6 reflected the better tone of the London market, and prices advanced in an active market. Fine pale crêpe sold for 62.5 cents per pound.

NEW YORK QUOTATIONS.

Following are the quotations at New York one year ago, one month ago, and November 29, the current date:

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "The situation as regards commercial paper remains unchanged from what we have reported for several months past, the demand continuing good and the best rubber names going freely at 4¼ per cent. (with occasionally something extra choice a little lower), and those not so well known 5@5½ per cent."

(Same period, 1913, 19,656,353 pounds; same period, 1912, 10,058,285.)

The export figures of rubber given in the above table for 1915 include the imports re-exported. (These amount to 3,037,159 pounds.) To arrive at the total quantity of Ceylon rubber exported for that period deduct these imports from the total exports. The figures for 1915 are for Ceylon rubber only.

SINGAPORE.

Guthrie & Co., Ltd., report [October 6, 1915]:
Advices received from London during the past few days have indicated a better tone in the rubber market, and this was reflected at the auction held today, prices all round showing substantial improvements.

Bidding was very brisk, and for many lots there was keen competition. Fine pale crepe was again in exceptional demand, one lot fetching \$133, an increase of \$4 on last week's best. Fine ribbed smoked sheet was \$3 better at \$132. Plain smoked sheet was wanted, the highest price paid, viz. \$123, being \$2 up on the week.

The lower grades shared in the general improvement, all parcels meeting with a ready sale.

Virgin and loose scraps marked increases of \$1 and \$10, respectively.

Of 222 tons offered, 193 tons changed hands.

The following was the course of values:

	In Singapore	Sterling equivalent	Equivalent
	Picul.	per pound	per pound
		in London.	in cents.
Sheet, fine ribbed smoked,	\$130 @ 132	2 5/8 @ 2 5/8	61.32 @ 62.33
Sheet, fat to good ribbed	125 @ 128	2 1/4 @ 2 1/4	59.29 @ 60.56
Sheet, plain, smoked,	122 @ 125	2 1/4 @ 2 1/4	58.02 @ 59.29
Sheet, unsmoked	116 @ 124	2 1/4 @ 2 1/4	55.49 @ 58.79
Crepe, fine pale,	131 @ 133	2 5/8 @ 2 5/8	61.83 @ 62.84
Crepe, good pale,	127 @ 129	2 5/8 @ 2 5/8	60.03 @ 61.06
Crepe, fine brown,	123 @ 127	2 1/4 @ 2 1/4	58.53 @ 60.03

Scrap, loose	66 @ 106	1 4/8 @ 2 1 1/4	34.20 @ 51.18

*Picul = 135 1/2 pounds.

[Quoted in S. S. dollars = 2/4 1/2 cents].

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official cablegram received from the colonial secretary, Singapore, announces that the exports of plantation rubber from the Straits Settlements during the month of October amounted to 2,641 tons, as compared with

4,725 tons in September, and 2,006 tons in the corresponding month last year.

The following is a comparative table showing the export for three years:

	1913.	1914.	1915.
January	784	1,181	2,576
February	743	1,703	2,741
March	898	1,285	2,477
April	762	1,548	1,978
May	814	1,309	3,588
June	1,112	1,490	2,349
July	1,120	1,584	2,324
August	1,315	1,325	2,295
September	1,057	1,602	4,725
October	1,144	2,006	2,641

Total 9,449 15,023 27,594

These figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements, such as Java, Sumatra, Borneo, and the non-Federated Malay States, as well as rubber actually exported from the colony, but do not include rubber exports from the Federated Malay States.

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram received from Kuala Lumpur announces that the export of plantation rubber from the Federated Malay States during the month of October amounted to 4,120 tons, as compared with 3,544 tons in September, and 2,897 tons in the corresponding month last year.

The following is a comparative table showing the export for three years:

	1913.	1914.	1915.
January	1,311	2,542	3,473
February	1,257	2,364	3,411

THE RUBBER SCRAP MARKET.

A REVIEW of the rubber scrap market for the first week of November failed to disclose any particular feature of interest to the trade other than the firm tone that has persistently prevailed. The mills disclaimed any shortage in stocks, and buyers generally are apparently indifferent to attractive offers based on large deliveries. Inquiries for boots and shoes developed a surprisingly strong market and in several instances quotations of 9 cents delivered were made. The mechanical goods manufacturers were reported as active buyers and therefore matting, black scrap, and hose stocks developed firmer prices. The balance of the list appeared to be unattractive to buyers and prices remained practically unchanged.

Boots and shoes continued to be the leading feature during the second week, as far as prices were concerned, and mills were asked to pay 84¢ to 87¢ cents delivered. The tire situation developed firmness, and sales of white tires were reported at 6½ cents to consumers and mixed auto tires in desirable lots were offered at 5¼ to 5½ cents.

As the month progressed, the tendency of the market to advance, with boots and shoes leading, was very evident. Large buyers were obliged to divide their orders to avoid the creation of higher levels; but in every instance unexpected strength and firm price were encountered.

Crude rubber prices advanced rapidly in the beginning of the third week, and by November 20 the active buying in London had advanced prices 15 cents a pound. This of course was reflected in the rubber scrap market and prices rose accordingly.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

TRADE in heavy chemicals and pigments and fillers has been very active during November, accompanied by a distinct rise in prices, week by week, in certain important lines, notably in lead pigments and caustic soda.

Pig lead was in strong demand at the beginning of the month at 5 cents per pound, due largely to export buying. With foreign markets holding at high levels there is small prospect of a decline in the American market. Exports of white lead have been unusually heavy this year. The official figures for last August are 2,161,680 pounds. This is practically double the amount exported in August, 1914. On the basis of the white lead exports for eight months, ending with August, 1913, the increase for the same periods in 1914 and 1915 were, respectively, 16½ per cent, and 52 per cent. These figures sufficiently explain the steady rise of one quarter cent per pound per week which has taken place in each of the lead products in common use by rubber manufacturers.

In the case of caustic soda the market is unusually strong, due to shortage of supply in the face of active demand. The contract price of caustic soda has advanced fully one cent per pound during November.

Acetic acid has advanced about three quarters of a cent per pound for 28 per cent, owing to the influence of a corresponding rise in acetate of lime. Glacial acid has risen from 25 cents to 35 cents per pound. Sulphuric acid is limited in supply and the price for 66° advanced early in the month about three quarters of a cent per pound. This level has been maintained.

Domestic zinc oxide has risen somewhat since our last report. Contracts for green, red and white seal French zinc oxides are offered for delivery during the first three months of 1916 at about double the present prices of domestic zinc oxide.

Aniline contracts are quoted at 60 cents per pound. A few large users in the rubber industry are equipped with aniline manufacturing plants and others are being erected.

The market on solvents is firm, with a tendency to advance.

PRICES OF CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK, NOVEMBER 29, 1915.

Subject to change without notice.

Acetone (drums)	lb.	\$0.30½ @ \$0.35
Acetic, 28 per cent. (bbls.)	lb.	.03½ @ .05

MARKET FOR COTTON AND OTHER FABRICS.

THE November market has been most active and all grades of cotton fabrics used by the rubber mills were in demand. It is now evident that instead of laying in stocks at the usual time, buyers have been waiting for easier market conditions and better prices. The appearance of heavy buying orders covering all grades of cotton fabric indicate that the mills are now replenishing their depleted stocks. The principal condition in these orders that cover all grades of fabrics used by the rubber manufacturers from sheeting to tire fabrics, is that of delivery.

STOCKINETTES.

The cotton stockinette situation shows evidence of heavy foreign buying and the market has been stripped of the cheaper grades. The mills refuse to take orders for anything less than 50 cents, preferring to run the looms on more profitable and better grades. The scarcity of colors has already been felt and in consequence blue and red stockinettes are selling at advanced prices. The volume of domestic business is large and mills are well sold ahead.

Wool stockinette has not been greatly affected by foreign buying; however, domestic business is good and deliveries are being promptly called for. The fact that raw cotton, wool and dyes have advanced would indicate higher, rather than lower prices for stockinettes.

TIRE FABRICS.

The demand for tire fabrics has continued unabated during the past month and as a matter of fact manufacturers have been most urgent in their calls for deliveries. The increased business in tires that will follow the rapidly expanding production of automobiles is doubtless a factor in the steady demand. Reserve stocks were being bought in anticipation of this new business and also to meet the requirements of increased factory production.

HOSE AND BELTING DUCK.

The heavy grades of hose and belting duck were in good demand and steady buying for foreign as well as domestic account continues, particularly the latter. The railroads have commenced buying large supplies of air brake hose for both old and new equipment and are likely to take a large part of the available hose and belting duck for the next six months. Hose duck has advanced to 25 cents and belting duck is now quoted at 24 cents.

SHEETINGS.

Sheetings have advanced and no spot lots were to be had—wide grades, in particular, have been sold into next year.

CARRIAGE CLOTH DUCK.

Carriage and enameling duck have been practically sold up and there are no spot stocks to be had. The cause is the production of automobiles, that continues to increase steadily. Large quantities of this particular grade of duck are also used for tops and cushions in the carriage trade, which is noticeably improving. Despite the steady demand prices have not changed.

YARN DYED GOODS.

Yarn dyed imported goods have been bought very largely for 1916. Foreign mills are not accepting new accounts and are refusing business unless contracts are written for deliveries in June, 1916, and later. Domestic mills are practically sold up to deliveries in May, 1916. Trade has been active and prices are firm with a tendency toward higher levels. The scarcity of dyes has directed the attention of manufacturers to the better grade of goods.

For the fiscal year ending March 31, 1915, Canada imported from the United States, stockinette for the manufacture of rubber boots and shoes, value \$54,174, and from the United Kingdom, stockinette, value \$21,945. For the same period, seamless cotton or linen duck for hose was imported from the United States, value \$71,635, and from Great Britain, value \$2,790.

The following are New York quotations on November 24, 1915:

GUAYULE BOOM NOT LIKELY.

The newspaper reports that the guayule industry is on the verge of the greatest boom in its history cannot be verified. We have learned from an authoritative source that no new concerns are entering the guayule business in Mexico at the present time and that the rush for leases of guayule lands is without foundation in fact. It is true, however, that, due to the war, certain titles to large tracts of guayule land claimed by the Mexicans have been questioned. Until such titles are shown to be clear, particularly those held by the "cientificos," operating would be out of the question.

The companies already in the field are preparing to resume operations, despite the adverse conditions that prevail in certain districts. For some years past, the Mexican guayule business has not been an attractive one financially, but the producers now have hopes that they will be permitted to operate without interruption and with ultimate success.

The adoption by the government of Cuba of a new form of consular invoice is now under consideration. It would, if adopted, require the shipper to furnish accurate information as to the component parts of the merchandise; for instance, in a shipment of tires, the percentage of rubber, fabric, etc., in each tire. It is recommended that manufacturers interested communicate with the Department of State at Washington, D. C., protesting against such an unreasonable customs regulation.

TABLE OF CONTENTS ON LAST PAGE OF READING.

THE SEASON'S GREETINGS.

TO our friends at home: A happy and prosperous New Year.

To our friends at the European war front, of whatever nation: May this year, begun in battle and blood, attended by sufferings untold and calamities inconceivable, end in peace. May a greater freedom, a broader humanity and a lasting concord be the world's inheritance through succeeding years.

DOING WITHOUT DYES.

THE wonderful adaptability of the rubber trade to unusual conditions has often been remarked. Fresh emphasis is laid upon it at the present time in the substitution of colors, as black for white, in such products as motor tires, for example.

That is not difficult and is in the line of accepted practice. That such substitution should be carried into the field of colored fabrics is, however, novel and opens up a wide and profitable field. Such a problem was successfully met by a rubber company making carriage cloth.

Their product, normally, should be pebbled black rubber on one side and black uncoated fabric on the other, an effect that the customer desired. As no black cloth was to be had, the manufacturer used white, spreading the pebbled side, as usual, and skin-coating the other with a dull black rubber. The result was even more satisfactory than the usual type and bids fair to become the usual thing. If dye shortages and embargoes persist it is possible that similar substitutions will occur in many lines where colored fabrics are used. The possibility of the colored rubber surface, and perhaps a revival of the cemented, flocked surface, is not at all remote.

HIGHER PRICES, AND WHEN?

THE fact that rubber has already reached the dollar figure, combined with the higher cost of fabrics and compounding ingredients, certainly point toward higher prices in finished goods. The smaller manufacturers are apparently most anxious for the change, for as a class they are burdened with a heavier overhead, and owing to more limited capital cannot anticipate their requirements in rubber and materials as far in advance as do the larger interests.

That there is a feeling of unrest is evidenced by the opinions expressed in the trade. Many manufacturers do not hesitate to state that, at present prices, they are not seeking orders with their accustomed diligence. Orders for future deliveries at current prices, it is said, are not desirable, and one case may be cited where an order from a distributor amounting to \$10,000, for 1916 delivery on the basis of recent prices, was turned down. The tendency of the market may also be observed from the fact that certain manufacturers have reduced discounts to dealers and a few have slightly advanced prices.

It is interesting to note that with the present keen competition, all manufacturers are compelled to observe uniform trading practices to guard the interests of their customers. There seems to be a consensus of opinion that should some of the prominent manufacturers advance prices, the example thus set would be universally followed. If any held out, their lower prices would attract orders that would soon exhaust their stocks and they would then be unable to take care of their regular trade, which would be forced into other channels and alienated. On the other hand, it has been suggested as not impossible that large concerns with plentiful supplies purchased when prices were below those now current, may hold off for three or four months. While it may be said that manufacturers' representatives and dealers are looking for an advance sooner or later, realizing that present costs will demand some action, there appears to be a wide difference of opinion as to the probable date of such change, however, in some quarters the guess is hazarded that it will come early in January.

The prevalent opinion is that the advance in tires will probably be one of 25 per cent, although some expect a 15 per cent rise at an early date, to be followed by an additional 10 per cent later. An increase of 15 per cent in the price of mechanical rubber goods is generally expected.

Glancing back but a few years in the tire industry, it will be recalled that the regular practice was to produce tires by hand. Gradually machinery, replacing manual labor, reduced the cost of manufacture. This, combined with greater factory efficiency, largely increased production, the lower cost of rubber, and keen competition, have served in securing repeated price reductions to distributors and dealers.

The repeated reductions in the past were justified by the conditions, and now the indications are that the rapidly increasing material cost will force manufacturers to adopt a higher selling price standard.

WITH CHARITY FOR NONE AND WELFARE FOR ALL.

THE welfare of the worker, the rubber worker, to be specific, has been on the conscience of the rubber employer, to a degree, from the beginnings of the industry, since, shall we say, 1828. For years acknowledgments of such responsibility took the form of turkeys at Thanksgiving or Christmas, with sporadic remembrances to those who in the fallible judgment of the boss appeared worthy. In the shop and out, the workers were almost wholly the architects of their own fortunes, and to their credit, be it said, they built uncommonly well.

The enormous growth of the rubber trade, the broadening of its outlook, a definite formulation of the rules that govern efficiency, however, resulted in organized welfare work. Nor was this confined to any one division of the industry. It developed coincidentally in the great tire, footwear, insulated wire, clothing, hard rubber and druggists' sundries factories. In each line, and indeed in each factory, the work took on its own individuality, and in all the results were an appreciable betterment. This improvement, be it noted, was not confined to the mental, moral or physical condition of the worker alone, but extended to the work both in quantity and quality.

The patent needs of rubber-working communities are model houses, hospitals, garden plots, ball fields, casinos, club houses, special reading courses, lectures—all of which are excellent and are in use today. But they have to do with the welfare during the hours of relaxation only, and efficiency demands more. It provides for the workers' welfare in the factory and during working hours, and outside as well. Thus safety, light, ventilation, are all made as nearly perfect as may be. Dust, because it clogs the human machine and renders it less efficient, is

"vacuumed" away. Glaring lights, because they produce eyestrain, which results in damaged work, are shaded, or walls are tinted, and, when necessary, goggles are supplied, and so on in infinite detail. In the big plants there are also physicians and nurses in attendance who quarantine all who have infectious troubles, from colds to small-pox, render first aid in scores of cases, and do preventive work without end.

"A wonderful charity," say you?

"Charity"—not a bit of it. Efficiency, not charity, is the basis of this work. The human machine is kept clean, sober, amused, interested, because thus it is the best producer. The extra goods produced pay for all these items many times over. Rubber manufacturers do not offer, nor do their help desire, charity. Today's motto is, "With charity for none and welfare for all."

COMMERCIAL SYNTHETIC RUBBER.

THE news comes from Germany—is even affirmed by the German Chancellor in a speech before the Reichstag—of the use of synthetic rubber in lieu of the natural product. The statement is undoubtedly true. At the same time it is probably of no importance to those interested in rubber outside of the countries controlled by the Germanic allies. Before the war synthetic rubber in ton lots was made in Germany. It cost so much, however, that it could not compete in price with either the wild or the plantation product. At the present time, because of the rubber famine in Germany, the price of plantation crêpe is between \$10 and \$12 a pound. At such figures synthetic rubber can be profitably produced. With rubber at 86 cents, however, and no famine, synthetic rubber would still be commercially impracticable. The rubber planter may, therefore, rest secure on a product that costs from one to two shillings, as against one that costs several dollars a pound. The fact that Germany is actually making and using synthetic rubber will, of course, startle some readers. It is for their comfort, therefore, that the foregoing is written. As to further reassurance, there is the fact that the German Colonial Association, in a recent resolution, laid emphasis on the future need to the Fatherland of colonies in which could be grown rubber and gutta percha. They advise plantations, not laboratories. The inference would seem to be sufficiently plain.

UNUSUAL INTEREST ATTACHES TO THE DECISION OF Judge Lacombe, of the United States Circuit Court of Appeals in which he upholds the validity of the Marks patent on the alkali process for reclaiming rubber. Based as it is on a common sense review of the inventor's claims, the decision ranks in importance, as regards the rubber manufacturing industry, second only to the famous decision by which the Goodyear patents were confirmed to the inventor.

Standard Tire Fabrics.

It is not an exaggeration to say that the automobile tire has demanded quite as much thought, inventive skill and scientific development as any other part of the modern motor car. The tire is not a mere cushion, with the road on one side and the wheel with its burden on the other. It is not a passive medium of translation even when placed upon a forward wheel, and when attached to the rear axle its service is virtually that of a prime mover.

Its stresses and strains are many. When driving straight ahead, the blows delivered to the tire differ in magnitude according to the size and nature of the road's inequalities, the speed, the weight of the car and its load. Then there is another series of stresses, lateral ones, when the forward wheels are turned from side to side in steering. Finally come the reverse stresses produced by skidding and the application of the brakes.

Because of its elasticity and resiliency rubber is peculiarly fitted for the cushioning service required; but rubber possesses little strength. Therefore, in order to keep its yielding within bounds, it is necessary to incorporate with the rubber a suitable restraining material. Cotton fabric is universally used for this purpose, as it is not so sensitive to high temperatures, and is not likely to chafe.

Tire fabrics are made today either of Sea Island or of Egyptian cotton. The former originated upon a single island off our southern seaboard. The filament is a long, fine, silky one, and it contains more natural wax, and is whiter and better than the Egyptian staple. But there is not enough of the original island crop to supply the demand, and substantially all of it goes into the fabrication of expensive yarns used in making fine lace. But seeds of the original island staple have for years been planted in suitable soil on the mainlands of Florida and Georgia, and thence comes the present supply of this superior cotton, which is used in the best tires. According to figures, Sea Island cotton enters into something like 25 per cent of the tire fabrics, while the remaining 75 per cent are woven out of Egyptian cotton.

The cross-section of any standard pneumatic tire makes clear at a glance the general arrangement of the different plies of fabric, the duty of each varying with the position occupied in the finished product. The purpose of this fabric and rubber carcass is to protect and hold the inflated inner tube and, at the same time, transmit to the outermost part of the tire, called the tread, the driving impulse exerted at the hub of the wheel. The carcass serves as a barrier between the inner tube and the blows incident to irregularities of the roadbed, and here resiliency is desired to obtain the cushioning effect which makes for the comfort of the occupants of the car.

The greatest care is exercised in the building of the carcass, and in order that it may do efficiently the work expected of it, tire fabrics have undergone an evolution which has demanded a

great deal of experimenting. Originally, a heavy, square-woven canvas was employed, but even when made of the very best material it failed to give satisfaction. This was particularly so when speeds increased and the weight of the cars was augmented. The ordinary square weave, with single threads in the warp and the filler, did not answer, and this was noticeably so when the successive plies were laid straight, i. e., with the warp running parallel with the circumference of the rim and the filler spanning the tire at right angles to the tread. When subjected to the varying stresses of service, one set of threads would be taut and the other slack, and, in consequence, there was a lack of coöperation.

This was in part overcome by cutting the material on the bias,

and laying it on the tire core so that both warp and filler threads crossed it diagonally the texture representing a series of multiple diagonals, criss-crossing so that they pointed in the direction in which the wheel revolved. As a result, all of the threads took the stresses more nearly in line with their lengths, and offered a longer bearing surface. Also, they spanned a bigger arc, and were supported by a larger underlying volume of air within the inner tube. This meant a wider distribution of the blow or a bigger area of contact in surmounting a stone, or any other road inequality, and reduced to just that extent the chance of a bruise or rupture.

As a matter of fact, cotton thread is not inherently elastic, and it is quite apparent that a suitable tire fabric should possess this characteristic.

Army duck or square-woven canvas is devoid of this desideratum; in truth, stiffness is commonly found in sailcloth. How, then, have the makers of tire fabrics secured strength, in the first place, out of a weak filament, and then so combined the threads that the carcass might better perform its part and approach closer to the ideal requirements for an envelope that should "bend or suffer distortion of its normal circular shape without friction or resistance other than the contained air-pressure?" The automobile tire does not perfectly meet this ideal standard, but it is a good approximate, thanks to the ingenuity of the fabric builders.

The desired degree of elasticity is imparted by a process of weaving, the threads being subjected to tension that gives to the warp and filler threads a wavy form. This is technically called "crimp." In short, the thread is virtually thus converted into a spring. It is this crimping that does the trick and provides the necessary measure of elasticity. In weaving this type of tire fabric the warp threads are given about 6 per cent more crimp than those in the filler, the purpose of this being to offset one of the consequences of calendaring. As the fabric passes between the rolls, some of the crimp in the warp is always ironed out. To balance this, additional crimp is put in the warp threads at the time of weaving, and when the frictioned fabric issues from

the calender the crimp of both the warp and the filler is alike.

It should be noted just here that the carcass is built, not of one type of fabric, but of several. These are the building fabric, the breaker strip fabric, the chafing strip fabric and the bead fabric.

The standard carcass fabric which has been under consideration is 17½ ounces in weight per square yard, and is made of

cross above and below the large warp yarn in a way to lock or steady it.

The "chafing strip" is a fabric used to cover the beads and the lower part of the casing. The name is self-explanatory. The weave is square, the weight varying according to the size of tire and the threads are crimped. In some it is an 8½-ounce fabric, in others 9½ ounces, etc.

STANDARD BUILDING FABRIC,
17½ OUNCES.

BREAKER STRIP FABRIC,
SQUARE WEAVE.

BREAKER STRIP FABRIC,
LENO WEAVE.

Sea Island cotton, from combed and carded Egyptian yarn, and sometimes from carded Peeler yarns.

Upon the outside of the carcass is a wall of rubber, and upon this is laid what is known as the "breaker strip." The purpose of this strip is to bind the carcass and the tread intimately together; or, to put it popularly, to rivet them. The breaker strip fabric is of square weave and an open mesh composed of heavy warp or cords, and weighing anywhere from 11 to 13 ounces per square yard. The breaker strip is a single layer, and in the best tires is made of Sea Island cotton and heavily coated with high-grade rubber. The fabric has to be strong and capable of standing up under the sidewise and the lengthwise stresses, and must support the tread of the tire effectually.

In the older style of breaker strip material, the square weave, with the open mesh, did not give the fabric stability or stiffness. It was so yielding that it could not be run evenly through the calender, and it was hard to apply the rubber coating uniformly

Tire beads are built up on a rubber core; or, in the case of a clincher tire, on a wire core, and covered with fabric. The bead is then given its proper shape by molding. The fabrics used in the beads are not standardized. However, 8 to 14-ounce fabric is recommended by many builders of reliable tires.

In addition to the regular bead fabric, what is known as thread fabric is used for tire beads. The base of this fabric is a single yarn that is twisted two-ply and reversed, and then twisted three-ply. Such fabrics used are loosely woven materials consisting primarily of single heavy warp cords held in place by widely spaced thin threads, the sole duty of which is to hold the warp in place. This fabric is calendered without regard to the fact that the threads may ride one another. The elasticity of thread fabric is increased by cabling, which means twisting with other threads, and crimping.

When thread fabrics are used for building up the carcass, which is rarely, they are proofed on a spreading machine and

CHAFING STRIP FABRIC,

14 OUNCE.

BEAD THREAD FABRIC,
8 OUNCE.

and satisfactorily. Because of this a modification was necessary, and the present improvement, called the "Leno" weave, is now extensively employed. In this fabric the warp and the filler yarns are locked so that the material resists the spreading effect of the calender rolls without distortion. There is a single heavy warp yarn running in one direction with two smaller fillers that

then cut on the bias and rolled up with liners ready for the building machine.

Thus it is seen that the fabric or fabrics of which a motor tire is formed are fully as important as the rubber. As the United States is today by far the greatest tire making country in the world, and as the promise for the New Year is for even

greater production, a look ahead at the tire fabric demand and supply is in order.

The estimated needs of the tire producers, as the trade see it, are shown in the following table, which relates to standard 17½-size building fabric:

TIRE BUILDING FABRIC REQUIREMENTS FOR 1916.

	Width of Cloth.	
	48.50 inch.	72.84 inch.
Tire Company A.....pounds	10,000,000	4,000,000=14,000,000
Tire Company B.....	14,000,000=14,000,000
Tire Company C.....	8,000,000	2,000,000=10,000,000
Tire Company D.....	10,000,000=10,000,000
Tire Company E.....	4,000,000	2,000,000= 6,000,000
Tire Company F.....	3,000,000	1,000,000= 5,000,000
Tire Company G.....	1,000,000	300,000= 1,300,000
Tire Company H.....	1,000,000= 1,000,000
Tire Company I.....	1,000,000= 1,000,000
Tire Company J.....	750,000= 750,000
Tire Company K.....	600,000= 600,000
Tire Company L.....	500,000= 500,000
Other Tire Companies.....	500,000= 2,000,000
Total.....	15,000,000	41,100,000 10,050,000=66,150,000

In addition to the above, the breaker, bead and chafing fabrics must be considered; and 8,850,000 pounds would be a conservative estimate of the amount required for these special fabrics. Thus a total of 75,000,000 pounds of tire fabric will be required for the production of tires in 1916.

Now as to supply, the mills devoted to tire fabrics can produce about as follows:

ESTIMATED PRODUCTION OF FABRIC MILLS FOR 1916.

No. 1 Mill.....pounds	12,500,000
No. 2 Mill.....	10,500,000
No. 3 Mill.....	10,500,000
No. 4 Mill.....	10,500,000
No. 5 Mill.....	7,500,000
No. 6 Mill.....	7,500,000
No. 7 Mill.....	4,500,000
No. 8 Mill.....	4,500,000
No. 9 Mill.....	3,500,000
No. 10 Mill.....	2,000,000
No. 11 Mill.....	1,500,000
Total.....	75,000,000

While it would appear that the supply of tire fabrics is sufficient to satisfy all demands and still have stocks to spare, a condition of actual shortage is not a remote possibility. In the event of long-continued strikes at the fabric mills, the production would be heavily curtailed, and the balance between supply and demand dangerously reduced.

However, the mills have increased their capacities anywhere from 50 to 75 per cent, and, in some cases, they have doubled their plants, which would indicate that fabric manufacturers are prepared to meet the market demands for tire fabrics.

RUBBER LINED SAFETY TIRE LOCK.

The ease with which spare tires may ordinarily be detached from the sides or rear of an automobile invites their loss, a fact which has led of late to an increased use of devices for locking the tire to the car. A new variety of this accessory has just

Besides the bracelet form shown in the cut, for attaching the tire to the rear of the machine, other styles—both for single tires and pairs—are made, with brackets of different forms to be attached to the sideboard, etc. Extra links can be added to make the chain as long as desired; and a different style of key is made for each lock. [Safety Tire Lock Co., Pawtucket, Rhode Island.]

A MACHINE FOR TESTING THE CRIMP OF WARP AND FILLER THREADS.

In the making of tire fabrics and, for that matter, hose and mechanical fabrics, although in a less degree, the trick of crimping the warp and filler threads is important. This gives a certain spring to the goods, and when perfectly done in the weaving, the resulting fabric is capable of equalizing to a great extent the unequal strains placed upon it when in use as a tire or hose.

Crimping being such a necessity, a machine has been devised to determine the amount of crimp in the fabric threads.

These can be tested before the fabric is frictioned and then again after the

fabric has been frictioned and skim-coated on the calendar.

The method of using the crimp tester is as follows: Mark on the fabric two parallel lines eight inches apart and cut the fabric so that the threads with the marks on them can be reaveled out. Test the warp and filler threads separately. One end of the thread with the mark on it is placed exactly under the clamp on the cylinder. The cylinder is then released and the dead weight winds the thread around the cylinder until the other mark on the thread comes even with the straight edge at the bottom of the machine. The warp now presents the appearance of a straight thread and the percentage of crimp is read directly from the dial.

THE THROPP TIRE MOLD PATENT NOT SUSTAINED.

The Thropp tire core mold patent has again appeared in the courts. This time Judge Hand, of the United States District Court of the Southern District of New York, upheld the former decisions that the patent is not valid.

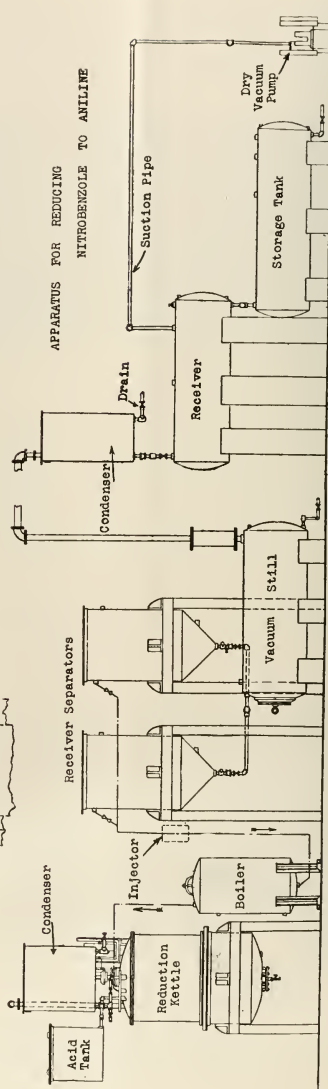

The action was brought by the DeLaski & Thropp Circular Woven Tire Co., against the United States Tire Co., and was really a continuation of an earlier suit in which the patent was declared invalid because anticipated, which decision was subsequently sustained by the Circuit Court of Appeals. The recent trial before Judge Hand was granted on the plea for the admission of new evidence.

The patent covers the molds generally used in building up, wrapping and vulcanizing tires, and is commonly used by tire manufacturers.

The successful defense of this case adds another to the list of notable cases won by Ernest Hopkinson, attorney for the United States Rubber Co., of which the defendant, the United States Tire Co., is a subsidiary. Mr. Hopkinson was assisted by his associate, Livingston Gifford.

Judge Hand, in reviewing the testimony, ruled that the mold books of The B. F. Goodrich Co. showed that open tire molds and double cure were used in 1905. He accepted the contention that Thropp made the molds he claimed in 1904, but ruled that neither curing nor semi-curing were practiced in any part of the tire that was not in contact with the mold. He held that Thropp's press of 1904 was antedated by the Fisk cold press of 1903 and 1904.

APPARATUS FOR MAKING NITROBENZOLE

The Manufacture of Aniline Oil.

WITHIN the past five years the use of aniline in rubber goods manufacturing has increased to a marked degree the world over. Of late, special attention has been drawn to it by governmental investigations, as, for example, that cited in the December 1915 number of *THE INDIA RUBBER WORLD* on "Industrial Poisons in Rubber Manufacture." The nature, source and method of manufacture of aniline is therefore of present interest.

The chemist, Unverdorben, discovered the liquid now known as aniline in 1826, among the products of the dry distillation of indigo. In 1834 it was found by Runge in coal tar and was named by him kyanol or blue oil because it produced a blue coloration with hypochlorite. Fritzsche in 1841 gave it the present name of aniline after the indigo plant anil, from which he obtained it by distilling with potash. Commercially, aniline is obtained by a series of chemical transformations, beginning with coal tar. Among the products liberated from coal tar by distillation is benzole. Benzole, when acted upon under suitable conditions with mixed nitric and sulphuric acids, is converted into nitro-benzole. Nitro-benzole may further be acted upon and chemically "reduced" to aniline oil. The illustration, for which we are indebted to the courtesy of the J. P. Devine Co., Buffalo, New York, represents, in elevation, the assembly of a modern aniline manufacturing plant. The apparatus is in two groups, each operated continuously in 8-hour shifts.

MAKING NITRO-BENZOLE.

In the nitro-benzole section there are two nitrating units alternated in service for continuous production. Each kettle has connection with an independent acid tank and both discharge their contents into the same "acid egg" or reservoir from which, by compressed air, the nitro-benzole is elevated into either of the two washers for purification, preparatory to going into the storage tank. The capacity of each nitrating kettle is, of course, the same, since they are designed to be operated alternately. This capacity should not exceed, say, 200 gallons, in order that the heat of the reaction may be safely regulated by the water jacket circulation.

The nitrating kettle is built of acid-resisting cast iron, with extra heavy walls. Mounted upon the kettle, with suitable connections to it, is a water-cooled condenser for cooling the vapors arising from the reaction and returning them to the kettle. A hopper is also provided for introducing saltpeter in lieu of nitric acid, when desired. The contents of the kettle are mixed by a mechanical agitator operated by a tight and loose pulley on a shaft bevel-gear to the vertical shaft of the agitator. In some forms of nitrating apparatus the control of the temperature is obtained by means of water circulation through a long lead coil located within the kettle.

In operation, a mixture of nitric and sulphuric acids, of specified strengths, is intimately mingled by air agitation. The mixed acid is then run into the charge of benzole in the nitrating kettle and the agitator set in motion at about 60 revolutions per minute. The heat of the reaction is not allowed to rise above 140 degrees F. This is effected by regulating both the rate of entrance of the acid and the cooling circulation in the water jacket. Agitation is continued for about 4½ hours after the final addition of acid, when the benzole has been fully nitrified or changed into nitro-benzole. At this point the contents of the kettle are allowed to settle for several hours. The waste acid goes to the bottom and is run off into the air pressure "acid egg" below, thence it is

blown to a concentrating department for rectification. The nitro-benzole is next run into the egg and transferred to one of the washers; here it is cleaned by water agitation, settled out by standing, and finally discharged into the storage tank. In practice the yield of nitro-benzole from benzole is 154½ per cent by weight. The theoretical yield is 157.6 per cent.

MAKING ANILINE OIL.

The aniline section of the plant is somewhat more extensive than the nitro-benzole part. There is an acid tank connected to the reduction kettle; also a condenser mounted upon the latter, and various connections for the introduction of the nitro-benzole and the iron borings used in the reaction of reduction. A mechanical stirrer is operated by a tight and loose pulley, bevel-gear to the shaft of the stirrer or agitator. The kettle itself is made of extra heavy cast iron, with its bottom section provided with a removable lining of special, hard and acid-resisting cast iron. This is essential for protection of the body of the kettle from the grinding effect of the mass of iron borings in long continued movement, as well as from the corrosive effect of the acid. The agitator or stirrer has a tubular shaft to permit the access of steam to the contents of the kettle.

To produce aniline, the reduction kettle is charged with nitro-benzole and, from the acid tank, diluted hydrochloric acid is next admitted, followed by a slow feed of common cast iron borings, both acid and borings being in definite proportion to the charge of nitro-benzole to be reduced. The iron borings are fed progressively, as required, and it takes several hours for the admission of the total amount needed.

The reaction having been started, distillation proceeds and the distillate entering the condenser is returned to the kettle. The materials are added to maintain a constant level in the kettle. If the reaction becomes too violent, loss is occasioned by the formation of benzene. The reduction is complete when the kettle contains only aniline oil, water and oxide of iron. The supply of steam, at this point, is increased so as to distill over the aniline oil and water, both of which are piped to the receiver separators. Here the water and aniline oil separate by standing for 48 hours. The water contains about 3 per cent of aniline oil and is removed to a boiler, located near the reduction kettle. Here it is steam-heated and passed over into the reduction kettle to save the contained aniline from waste.

The oxide of iron from the reduction kettle is dried and may be prepared for use in the purification of coal gas from sulphur, or for the manufacture of cheap black paint.

The settled aniline oil in the separators is charged into the vacuum still for purification before storage. The total yield of pure aniline oil obtained from nitro-benzole is 71¾ per cent. As pure benzole yields 154½ per cent nitro-benzole, and the latter 71¾ per cent of pure aniline oil, the total yield of pure aniline oil from pure benzole is practically 111 per cent.

Aniline oil has a boiling point of 364.6 degrees F., specific gravity of 1.0265 at 60 degrees F. If sold as pure it should not contain over one-half of one per cent of water, and should be free of nitro-benzole. A delicate test for the presence of nitro-benzole in aniline oil is to shake a sample violently for a few minutes, and notice the color of the froth so produced. The merest trace of nitro-benzole present will give a very distinct yellow coloration.

What the Rubber Chemists Are Doing.

PROGRESS OF RUBBER CHEMISTRY IN 1915.

A LEADING feature of the work of rubber chemists in 1915 is the development of vulcanization accelerators. The researches which resulted in the production of synthetic rubber developed the value of certain organic chemical compounds for improving the quality of synthetic rubber and hastening its vulcanization. Organic accelerators are not indispensable to good manufacturing results and so far are practically prohibitive in price. These are, however, decidedly interesting from a chemical point of view, and have been noticed in the patent literature and in special articles in *THE INDIA RUBBER WORLD* (December, 1914, March and June, 1915).

Methods of reclaiming waste have been much studied the past year and some results have been embodied in patented processes.

The published methods of analysis of vulcanized rubber perfected and issued by the United States Bureau of Standards, afford the best standard practical instructions on the subject for the rubber works laboratory. The gain in this regard is very great.

Every phase of the rubber industry, from the plantation to the finished product, is undergoing careful study and research, and knowledge of rubber is steadily increasing in consequence. Much of this new knowledge has been gathered and classified in the columns of this paper.

ISOPRENE FROM BETA-PINENE.

A. W. SCHORGER and R. Sayre, of the Forests Products Laboratory, Madison, Wisconsin, in the "Journal of Engineering Chemistry" (November, 1915), publish their researches on the production of isoprene from beta-pinene. The chemical relation between isoprene, the terpenes, and caoutchouc may be represented by the following reversible reaction:

The authors used a modified form of the isoprene lamp of Harries (See *THE INDIA RUBBER WORLD*, December, 1914, page 129) for conducting their experiments. Their results show that turpentine and beta-pinene, under the same conditions, yield about the same amount of isoprene, approximately 10 per cent. They consider that the isoprene obtained from turpentine is not due to the cracking of dipentene or limonene originally present in the turpentine, but that the isoprene results indirectly from dipentene.

Alpha-pinene can be converted into dipentene by heat; the condition in the apparatus would be favorable to such a transformation. The change may be represented thus:

It is not probable that either alpha-pinene or beta-pinene can be made to yield directly sufficient isoprene for the commercial production of rubber. Since good yields of isoprene are possible from dipentene, an attempt to obtain an approximately quantitative conversion of pinene into dipentene is worthy of further consideration.

RUBBER OF UNIFORM COLOR.

Beadle and Stevens have shown that the darkening of raw rubber is due to the presence of an oxydase. Pale rubber can be produced by coagulating with an excess of acetic acid, creping, and drying rapidly, preferably by heating in a vacuum, or by placing freshly coagulated rubber in boiling water from 10 to 15 minutes; but in both cases the product yields vulcanized rubber of inferior quality. By adding to the latex small quantities (1 part per 500 to 1 part per 1,000, or even less) of substances such as sodium bisulphate or formalin, which arrest enzyme action, pale rubber of uniform color is obtained and the treatment has no injurious effect on the vulcanized rubber.

The "Bulletin of Agricultural Intelligence" (1915, page 1064) recounts a simplified Schadt's process for preparing rubber. It consists in spreading a thin layer of latex over tin plates with re-curved edges. When the latex has dried, the rubber films are smoked in a revolving drum covered with perforated sheet iron, and then compressed into blocks. The cost of the process is very low, and the rubber is fit for transport two days after tapping.

PREPARATION AND PROPERTIES OF PURE RUBBER.

The investigations of F. Heim and R. Marquis on the preparation and properties of pure rubber have been published in the "Bulletin of Agricultural Intelligence" (1915, page 874). Their method was to coagulate wild Para rubber by smoke, and plantation Para rubber by acetic acid. These were purified by maceration, washing in cold water in a darkened tube and washing with acetone. When the latter had evaporated, the rubber was dissolved in ether or benzene, the solution filtered through a Buchner funnel, and precipitated with alcohol or acetone. After removing traces of benzene by digesting with alcohol, the pure caoutchouc was dried over sulphuric acid in the dark. The pure substance is white, that obtained from smoked rubber slightly yellow. Analysis confirmed the absence of resins and proteins, and the fact that pure caoutchouc is a polymer of isoprene. Solutions of it were less viscous than those of impure rubber, and the pure substance oxidized more rapidly in air than the impure, particularly when dissolved in chloroform.

TACKINESS OF RUBBER.

According to Spence, tackiness is caused by change in the aggregation of the rubber molecule and is not due to chemical change. K. Gorter finds that rubber exposed to light in sealed tubes remains unchanged when the tubes are filled with hydrogen or carbon dioxide, but becomes tacky in air or oxygen, and he concludes that tackiness is due to oxidation. In one of his experiments 3 per cent of oxygen was absorbed. Absorption of oxygen proceeds slowly for the first 6 days; it then increases and attains its greatest rapidity in about thirty days. Oxidation does not appear to be due to enzyme action, for it occurs in rubber which has been boiled in water. Aldehydes were detected in tacky rubber.

METHODS OF ANALYSIS.

DETERMINATION OF TOTAL SULPHUR IN RUBBER.—The method for determining the total sulphur in vulcanized rubber, as given by A. Hutin, consists in decomposing from 1 to 2 grams of rubber by means of 30 c.c. of fuming nitric acid, added 2 to 3 c.c. at a time. The liquid is evaporated to a syrup, made alkaline with caustic soda, and mixed with sufficient calcined magnesia to form a stiff paste, which is dried, first on a water bath and then in an air oven, at 140 degrees C., and finally ignited cautiously over a small flame so as to avoid an explosion. After ignition the mass is dissolved in hydrochloric acid and the sulphur determined by precipitation as barium sulphate in the usual way.

DRYING ACETONE EXTRACT OF RUBBER. A. Hutin holds that the acetone extract should be vacuum dried in order to obtain a residue of constant weight. Unless this is done serious errors may occur, owing to the increase in weight of the residue on drying in the ordinary way; even drying in carbon dioxide appears to be unsatisfactory.

ESTIMATION OF MINERAL MATTER IN VULCANIZED RUBBER.—A simple method for this purpose is given by H. W. Jones in "Rubber Industry," London, 1914. Two grams of the sample are heated with 40 to 50 c.c. of nitrobenzene in a 200 to 300 c.c. flat-bottom flask, connected to a reflux air-condenser. The solution of the rubber is complete, the flask is allowed to cool, the

contents diluted with acetone, stirred with a glass rod, and allowed to stand. The mineral matter is deposited rapidly and separated by decantation, transferred to a weighed filter-paper, and washed well with acetone. In some cases it is advantageous to wash further with alcohol and chloroform, then to moisten the filter with water so as to obtain a moist and uncaked residue for further examination. Little or no carbon dioxide is eliminated from calcium or magnesium carbonate by boiling for one hour in nitrobenzene.

CHEMICAL TREATMENT OF RUBBER.

UNITED STATES OF AMERICA.

RUBBER-LIKE SUBSTANCES FROM ALCOHOLS. 1,161,904. David Spence and Alexander P. Clark, assignors to The B. F. Goodrich Co.—The process consists in heating an alcoholic body (pinacone) in the presence of a dehydrating agent (acetic anhydride) at such temperature that there is yielded a rubber-like body after prolonged heating.

UNITED KINGDOM.

COAGULATION OF LATEX.—16,096 (1914). E. Mosinger. Latex is coagulated by the addition of a solution of aluminum, bismuth or zinc chlorides, or mixtures of these. About 1 gram of one or more of these salts is dissolved in 10 c.c. of water, and the solution is stirred into 100 c.c. of latex. The rubber thus prepared is said to have physical qualities which considerably improve its commercial value.

PREPARATION FOR COAGULATING LATEX. 16,840 (1915). C. de C. Pinto, Para, Brazil. A coagulating preparation consists of a solution in alcohol of preferably 2 kilos of creosote, 1 kilo of quinine hydrochloride and 1 gram of sodium carbonate, which is diluted with water or the whey of rubber latex. It is recommended that 10 grams of this solution be used with 200 grams of whey for coagulating 2 kilos of latex.

SYNTHETIC CAOUTCHOUC SUBSTANCES. 17,253 (1915). A. Heinemann.—The polymerization of butadiene, isoprene, dimethylitadiene, and other hydrocarbons having double bonds, is affected by dissolving them in acetone or one of its homologues and passing sulphur dioxide into the solution. The product is freed from oily impurities by subjecting it to high pressure in a mold. It may be vulcanized or mixed with metal oxides or other fillers.

THE GERMAN EMPIRE.

PROCESS FOR OBTAINING PURE BUTADIENE. 286,640 (April 25, 1913). Bayer & Co. "Butadiene containing gas" is treated with fluid sulphurous acid for solution of the butadiene. Subsequently purified by evaporation and caustic soda.

OTHER CHEMICAL PATENTS.

UNITED STATES OF AMERICA.

ISSUED NOVEMBER 16, 1915.

- 1,160,362. Method of making a plastic body. L. H. Bakeland, Yonkers, N. Y., assignor to General Bakelite Co., New York.
1,160,363. Waterproof article of manufacture. L. H. Bakeland, Yonkers, N. Y., assignor to General Bakelite Co., New York.
1,160,365. Method of making a paper-like product. L. H. Bakeland, Yonkers, N. Y., assignor to General Bakelite Co., New York.

THE GERMAN EMPIRE.

PATENT ISSUED (With Date of Validity).

- 288,968 (June 3, 1914). Process for manufacturing rubber substitute. Dr. Hugo Bayer, Vienna, Austria. Represented by Fr. Schwenkerley, Berlin, SW 68.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

- 476,662 (December 7, 1914). New use of rubber in footwear. J. J. Sausset.
476,826 (December 22). Vulcanized fiber sole for footwear. P. Rouanne.
476,990 (December 8). Improved threads for elastic ties. W. Henry.
476,995 (May 18). Product serving to prevent the deflation of pneumatic tires. Robin du Breuil.

LABORATORY APPARATUS.

TORSION BALANCES FOR WEIGHT AND YARDAGE OF FABRICS.

IN every rubber factory where textile fabrics are components of the manufactured goods, as for example, those making footwear, automobile tires or proofed goods, it is a matter of constant interest and importance to keep track of fabric weights and yardage and the rubberizing upon them, expressed in weight per yard, or yardage per pound. Simple and direct means for making these determinations are available in two adaptations of the sensitive torsion balance.

WEIGHT TO THE RUNNING YARD OF FABRIC.

The balance for determining the weight in ounces or grams of a running yard of fabric is provided with a carrier and graduated scale upon which an accurately cut sample, 2 x 2 inches, of the

fabric to be tested is held in place by a wire clip. The right edge of this sample must be set exactly at the graduation on the carrier that corresponds with the width of the cloth. The scale is then brought to balance by means of the slide weight on the beam. The beam graduation thus indicated is the

weight in ounces or grams of the running yard or meter of the fabric. The graduations read to the fifth of an ounce, or to five grams.

YARDS TO THE POUND OF FABRIC.

The yardage of fabric to the pound is correlative to the weight per yard and is determined by a second special balance. In this instance the sample of fabric is cut 3 x 3 inches.

The right edge of the sample is adjusted exactly at the graduation on the carrier, shown in front of the scale box, that corresponds with the width of the fabric. The scale is then brought to balance by means of the slide weights on the beams. If the scale does not balance with the upper slide weight at the extreme right, then the weighing is continued with the lower weight, leaving the upper one to the extreme right. The position of the weight when the scale balances indicates the number of yards per pound of sample. [The Torsion Balance Co., 92 Reade street, New York.]

EXTRACTION APPARATUS.

This form of extraction apparatus is compact, simple and efficient.

It is also inexpensive and durable. All rubber, cork, ground glass or mercury seal connections are eliminated. The flask is sufficiently light to be accurately weighed, is easily cleaned and of such form that

all the extract can be transferred. The condenser is entirely of metal. [Eimer & Amend, New York.]

The Marks Reclaiming Patent Sustained.

THE Philadelphia Rubber Works Co., Philadelphia, Pennsylvania, announces that the United States Circuit Court of Appeals has overruled the decision of the District Court in Ohio and affirmed the decision of the District Court in Buffalo, sustaining the validity of the Marks or "Alkali" patent, for rubber reclaiming. The importance of the case renders the decision of Judge Lacombe of great interest.

The claim upon which the patent (No. 635,141) stands reads as follows:

The described process for devulcanizing rubber waste which consists in submerging the finely ground rubber waste in a dilute alkaline solution in a sealed vessel, in heating the contents of the vessel to a temperature of 344 degrees F. more or less substantially as specified, and in maintaining said temperature for 24 hours more or less substantially as specified.

Reviewing this and the decisions of the district courts, Judge Lacombe says:

There is a mass of testimony in the record, dealing technically and scientifically with the theories as to just how the solution of the patent acts upon the rubber scrap when the mixture is heated as prescribed in the patent. It is interesting, perhaps, but of no especial importance since it is in no way helpful towards finding the answer to the simple question: what did the patentee disclose? He advanced no theory in his specifications; it was not necessary for him to do so. All that the law required of him was a plain statement of his process set forth in sufficient detail to be understood by a person skilled in the art. If the result of his process is a product which he describes as "devulcanized rubber having substantially the characteristics of fresh rubber and capable of being used in like manner and for like purposes," and if it further appears that this is the first time that this particular process was disclosed to the world, Marks was entitled to his patent. Whether he had some theory when he applied or has one now, whether the experts have conflicting theories or not are matters of no importance.

The description of the process is couched in plain and simple language. Finely ground rubber waste is put into a vessel. This vessel itself is located in an outer receptacle capable of containing it and of being tightly closed. No special shape is prescribed for either the vessel or receptacle, they may be cylindrical or square, high or squat; it is sufficient that one shall contain the other with a space to spare between the two. Upon the rubber waste that has been put into the inner vessel there is poured a dilute alkaline solution, a three per cent solution of caustic soda being preferred. The patentee does not state the relative proportions of waste and solution, but he does give very clear and definite instructions as to the quantity of solution which shall be used. There is to be enough of the solution to permeate the finely ground rubber waste and completely submerge it. The inner vessel is then sealed up to prevent evaporation of the solution and steam is let into the outer receptacle under a pressure of 125 pounds, more or less, equivalent to a temperature of 344 degrees F. This steam-pressure is maintained for the time necessary—say 20 hours.

There certainly seems to be no obscurity about these directions. The rubber waste is to be finely ground; the patentee does not say through what size mesh its particles should pass, but it might be supposed that a person skilled in the art would know what would be the range of finely ground waste; and the art of reclaiming rubber from waste (or trying to do so) was an old one. The solution is stated to be "a dilute alkaline solution"—3 per cent of caustic soda is given as preferred—but it might be supposed that one skilled in the art would know within what limits he might depart from 3 per cent and still have "a dilute alkaline solution." Presumably all rubber waste is not absolutely identical; some may require a stronger solution than others, and it might be supposed that a person skilled in the art would know how much he should vary the strength of the dilute solution in order to obtain results with the kind of finely ground waste he was treating. Certainly the patentee's statement as to

temperature and period of steam application is quite specific. Examination of the record indicates that the suppositions above postulated as to what one skilled in the art would know about "finely ground rubber waste" and "a dilute alkaline solution" are fully warranted. There is no vagueness about the patentee's disclosure of his process.

Does it accomplish its intended result? Out of the mixture of waste and solution does there, when the process is complete, remain "devulcanized rubber having substantially the characteristics of fresh rubber and capable of being used in like manner and for like purposes?"

Defendant put his expert witness on the stand to prove a series of experiments he had made, following the directions of the patent and not producing the result which the patentee claimed. This expert had never had any experience in treating rubber; practically he was not skilled in the art. It is not infrequent in patent cases to find that experiments conducted to show that a patentee lacks utility turn out as it was expected they would. Plaintiff calls attention to the statement of a witness who had large experience in treating rubber, that by following the Marks patent exactly he had produced a fair product. This defense—inoperativeness—is usually determined by the fate of another defense—infringement. If a patented process fails to produce a fair result, it will not be used commercially. Conversely if a defendant is found to use the patented process commercially, it will be presumed that he gets a fair product by its use; and it will take more than a series of laboratory experiments to show that no such product results. Reaching as we have the conclusion hereinafter expressed as to infringement, we are satisfied that the patent sufficiently discloses a process which enables a person skilled in the art to produce the result which the patentee indicates. What is the showing of the prior art? Hall No. 19,172 states that ground rubber waste should be submitted to the "operation of boiling water in caldrons, kettles, or tanks of any description." He says that lime-water or alum can be used; but the method of using is manifestly remote from Marks. Hall No. 22,217 submits the ground waste "in a close or proper vessel to the action of steam direct upon the rubber, or in connection with water, for the space of 48 hours." This is not the Marks process.

Hall 25,160 provides for placing the waste "in a close steam boiler or other suitable vessel, into which steam is conducted through a steam pipe. In its passage through the pipe the steam is superheated." This also is not the Marks process. It would be a waste of time to enumerate all the prior patents in the record, some suggesting one element, some another of Marks' process. We may proceed at once to the patent to Mitchell No. 395,987, January 8, 1889, which both Judge Clarke and Judge Hazel concur in holding comes nearer than any other to suggesting the process of the patent in suit. The discussion of this patent in their several opinions may be read; they reached opposite conclusions. Judge Clarke finds that it "comes very close to being, if indeed it is not, a clear anticipation of the process of the Marks patent." Judge Hazel finds that Mitchell's process "debeirized rubber waste by the use of acid and pressure and then devulcanized it by an additional step after washing out the caustic soda"; while Marks, on the other hand, "debeirized, desulphurized and devulcanized waste rubber by a single operation and in so doing achieved a different result from Mitchell." After a careful study of the two patents in the light of the discussion of them by experts and counsel, we entirely concur with Judge Hazel's conclusions. This Mitchell patent cannot be transformed from a two-step process to a one-step process merely because in an English patent (20,289 of 1889) Mitchell recommended a one-step process to be carried out by the use of other agents than those specified in Mitchell 395,987, and in Marks. In this English patent we find recommendations to use iron in the form of borings or filings, or even larger pieces, turpentine, bisulphide of carbon and naphtha. The following excerpts from the Mitchell patent 395,987 indicate to us quite clearly that Judge Hazel's construction was a correct one. After describing a process for removing fibre and mineral matter, Mitchell says:

Where the waste is unvulcanized this ends the process. * * * When, however, it is desired to devulcanize the rubber, I subject it to further treatment, as follows: Immediately after washing out the mud and

before the contents of the vessel have had time to cool I again close the cock of the blow-off pipe E and force in steam until a pressure of say 125 pounds and a temperature of 383 degrees F. have been reached, by maintaining which for a period of from 12 to 36 hours the rubber will be devulcanized.

Before the steam is thus applied the defiberized waste has been thoroughly washed first with hot and then with cold water. It is the subjection of this thoroughly cleaned waste directly to steam under pressure which, as Mitchell's patent states, "devulcanized" the rubber. We are unable to see how such a process can be held to anticipate Marks' process, or even to approach it so closely as to negative invention.

As to the defense of alleged prior uses it seems unnecessary to add anything to Judge Hazel's discussion of this branch of the case.

The only witness available to show what process defendant employs was a detective; such process being carried on in secret. We concur with Judge Hazel that his testimony made out at least a *prima facie* case of infringement. Inasmuch as defendant introduced no evidence to show either what its process was or what it was not (Badische Anilin v. Klipstein, 125 F. R., 543), we think infringement was sufficiently proved.

INSURING RUBBER PROFITS AND COMMISSIONS.

It is generally acknowledged that insurance can be written covering almost every known risk. That the importer can be insured against loss of profits accruing from sales of crude rubber, and brokers protected against loss of commissions, is comparatively new to the American rubber trade.

Should an insured rubber shipment be lost in transit, the importer is protected and collects the full value from the insurance company. That is all very well as far as the value of the goods is concerned, but it does not satisfy the customer for whom the goods were bought under contract. The order must still be filled. In the meantime something may have sent rubber prices sky-rocketing and the importer is obliged to fill his contract with rubber purchased at a higher price, resulting in a substantial loss instead of the expected profit.

To guard against this he insures his importation at an increased price over the value of the goods or, in other words, insures his profits. So, too, the rubber broker insures against loss of commissions due him on shipments of rubber in transit that may never reach their destination.

If rubber manufacturers could also insure themselves against loss in manufacture, such as blistering, over and under cure, general damage in making up, etc., as well as against claims for wear, returned goods and adjustments, the insurance cycle would be nearly complete.

CRUDE RUBBER AS PASSENGERS' BAGGAGE.

Some idea of the desperate straits to which Germany has been reduced by the British rubber blockade was obtained when a search by members of the neutrality squad of the United States secret service, of the baggage of a woman passenger to Holland on the steamer *Ryndam*, revealed the presence of nearly 3,500 pounds of crude rubber. It was subsequently learned that the rubber had been purchased through a dealer in New York, by agents of the rubber department of the Deutsche Bank, Berlin, a government institution. Its purchase and shipment were in accordance with a scheme worked out by one Max Jaeger, an accredited agent of the bank, which, with the arrest of Jaeger and the *Ryndam's* passenger, has been nipped in the bud. The offense with which the prisoners will be charged is failure to manifest goods exported to foreign lands in the course of trade, for profit. It is asserted that had the first shipment been successful, other passengers with similar consignments would have followed at regular intervals.

CONTRABAND RUBBER SHIPMENTS BY PARCEL POST.

THE seizure by British authorities of parcel post mail, on steamers flying the flag of a neutral nation, has caused many protests against this interference with the sacredness of the mails as guaranteed by international postal conventions to which Great Britain is a party. This is not, however, the main question involved.

When the rubber manufacturers of the United States undertook, in consideration of being supplied with plantation rubber from British possessions, to guarantee that such rubber, either crude or in manufactured form, should not pass into the hands of an enemy nation, the engagement was accepted in good faith by Great Britain. Under the circumstances, it would have been a breach of faith on the part of those who had signed the guarantees to connive at or close their eyes to deliberate attempts to evade the agreement. And, moreover, the discovery that rubber in considerable quantities was being thus diverted might cause an immediate re-establishment of the "embargo," with effects on the American industry that can readily be imagined.

A profitable traffic in shipping by parcel post is undeniable, when rubber bought in New York at approximately 80 cents per pound is sold in Berlin at \$12 per pound, at a cost for transportation of 12 cents for 11 pounds. The protest against the seizure of the parcel post rubber no doubt emanates from those engaged in this profitable business.

RESULTS OF THE INTERDICTION OF RED CROSS RUBBER SUPPLIES.

The refusal of the British to allow the shipment of rubber goods for hospital purposes to Germany and Austria, referred to in the last number of *THE INDIA RUBBER WORLD*, is already bearing fruit. Miss Emma Duensing, a young woman of German birth, a graduate in nursing of the German Hospital, New York, who had served six months in Porto Rico, during the Spanish-American war and a year in the Philippines, as a volunteer nurse, lost her life while nursing the wounded at Oppeln, Silesia. Miss Duensing contracted septic fever, it is believed as a result of lack of the protection rubber gloves would have afforded her in handling an infectious case.

MUCH LITIGATED RUBBER.

An interesting case, in which the price of imported rubber figures, was recently decided by the Appellate Division of the Supreme Court in New York. The Mansfield Tire & Rubber Co., Mansfield, Ohio, contracted to purchase from Rossbach & Bros. 24 tons of brown crepe at 98 cents, and 9 tons at \$1.05 per pound, delivery to be made monthly from the date of contract, August, 1912, until September, 1913, on requisition. The price of rubber increased materially and the rubber company claimed that deliveries were not made as required and that the sellers sought to change the terms of payment, to which they would not consent. Deliveries then ceased until the following May, when the price of rubber declined heavily. The rubber company then refused to accept tenders of the rubber made at the contracted price, on the ground that the contract had been violated by previous non-delivery of the goods by Rossbach Bros. Thereupon the latter firm brought suit against the rubber company for \$34,226, in the Supreme Court, New York, claiming that this represented the difference between the contract price of the rubber and the price they had eventually been compelled to accept for it, viz., 47 cents per pound. After a trial that lasted a week, during which the facts and evidence were fully presented by each side, the jury brought in a verdict in favor of the rubber company, with costs against the plaintiffs, on the ground that the plaintiffs had broken the contract when they failed to deliver the rubber.

The plaintiffs carried the case to the Appellate Division, which affirmed the verdict of the inferior tribunal.

New Goods and Specialties.

LEWIS "NOJAR" RUBBER RETAINED AUTO CLOCK

If an automobile clock is to prove a reliable timepiece and not a mere ornament, it must be very securely encased to prevent all danger of jarring or vibration. Rubber is the ideal casing, as it absorbs vibration, is non-conducting and therefore keeps the clock free from the effects of any electrical disturbance. The heavy red rubber casing fits firmly around the clock, which is attached by drilling holes in the dash at a distance matching the stationary bolts attached to the steel plate embedded in rubber. A special style for Ford cars is also made. Seneca G. Lewis, general manager of the Pennsylvania Rubber Co., is the inventor. [Pennsylvania Rubber Co., Jeannette, Pennsylvania.]

THE "AUDUBON" UMBRELLA HANGER.

Umbrellas invariably rust out at the peak; they are always falling down, or, if left with others in an umbrella stand, they are injured by rubbing against them, if not actually torn by the peak of an umbrella carelessly placed in the stand. The "Audubon" umbrella hanger is a simple and convenient device, which provides a rubber holder in which the peak of the umbrella is inserted, and a ring in the top of the holder to hang upon the closet hook, as shown in the accompanying illustration. The umbrella hangs in an inverted position, thus preventing the ends of the frame from catching on clothing. The holder protects the umbrella, as coats are protected by coat hangers and shoes by shoe trees, and its life is, therefore, greatly prolonged. [The Cantine Co., Inc., New York.]

A CONVENIENT MUCILAGE APPLIER.

The B & S mucilage applier is a very modern device, designed to prevent the petty annoyance and waste of material incidental to the use of mucilage pots or paste jars. It is made of hard rubber, 5 inches long, 1 inch wide and $\frac{3}{8}$ of an inch thick. Slight projections on both sides, at each end, keep it off the paper if laid down carelessly. The soft rubber tongue at one end bends back as it is pressed against the surface to be gummed, uncovering an opening in the hard rubber underneath and allowing the mucilage to flow. It has a pneumatic feed, a slight pressure on the sides accelerating the flow when desired. As the tongue is lifted from the paper it springs back into place, stopping the flow and sealing the opening like a cork. To refill, it is only necessary to unscrew the cap at the other end and screw on a collapsible tube of mucilage, reversing the operation after squeezing the mucilage out. If it is desired to carry the applier in the pocket, a hard rubber cap is supplied. [Sengbusch Self-Closing Inkstand Co., Milwaukee, Wisconsin.]

THE CAMDEN WATERPROOF COAT.

Automobile clothing have reached a high point of combined comfort and good looks. They are no longer clumsy or inelegant, yet they excellently serve the purpose for which they are intended. The black Para rubber-coated garment in the first illustration has elastic cuffs at the sleeves and a drawstring at the neck, affording the absolutely close protection needed against driving rain and that aggravating kind of snow which sifts gently in at the smallest opening. The coat fastens with clasps, folding over, double-breasted fashion. The length is 52 inches, and it is supplied in three sizes and three weights, for both men and women, and is folded in a compact rubber bag. Its eminent suitability as a fishing coat also will be readily seen.

The rubber apron shown in the second illustration thoroughly protects the clothes when washing the car or doing

ing the unavoidably dirty work about a garage. It is black in color, and is strongly made, to suit its utilitarian purpose. This apron is supplied in light, medium or heavy weights, 44, 46 or 48 inches in length, the width being about 34½ inches. [The B. F. Goodrich Co., Akron, Ohio.]

SOAKING AND POULTICING BOOTS FOR HORSES.

A great majority of equine ills are due to foot and tendon troubles, and it is no easy matter to attend to these ailments properly. A thoroughly practical aid in their treatment, here illustrated, is a bag, or boot, as it is called, which can be used in fomenting the foot or leg of a horse with hot or cold water or any medicinal preparation; also for an ice pack. It is impossible for the animal to get out of the boot once it is attached, yet he is

able to move about the stall without annoyance and requires little attention.

In the three larger sizes there is a valve, placed near the bottom, through which the water is released before removing the boot. A narrow strap gathers the soft top of the boot tight to the leg, preventing the radiation of heat when hot water is used; but if it should become too cold, some of the water may be al-

lowed to escape through the valve and the temperature may be raised by the addition of more hot water.

These boots are 6, 8 and 10 inches in diameter and range in height from 10 to 30 inches. They are made of heavy canvas with an increasing number of plies toward the bottom, to above the top of the hoof, and have an inside lining and an outside covering of rubber. In addition there is a removable reinforcing bottom which protects the boot in case it should be necessary to soak the foot without removing the shoe. Canvas and rubber straps are used as fastenings, the strap on the three larger sizes passing over the animal's back, while the small-sized boot fastens above the fetlock. [Voorhees Rubber Manufacturing Co., Jersey City, New Jersey.]

AUTOMOBILE STEERING WHEEL.

An improvement on the ordinary steering wheel for automobiles is one made of Condensite, a product which comes

very close to being synthetic hard rubber. The edges are notched, which prevents the hands of the driver from slipping. The wheel is jet black and finely polished similar to that of hard rubber, and the manufacturers claim that it retains this appearance; also, that it is very elastic, and will

not crack on the spider. [Essex Rubber Co., Inc., Trenton, New Jersey.]

RUBBER BOOTS WITH MUFFLER TOP.

The novel feature in this child's rubber boot—pleasingly named the "Red Bird"—is the muffler top, made of knitted red wool and as cosy and comfortable in feeling as it is in looks. When playing out in the snow or wet, rubber boots are the best protection a child can have. But cold winds can enter at the top, and—if youthful enthusiasm reaches a high enough pitch—even snow, or the aftermath of a particularly enjoyable splash in a puddle. The woolen muffler top is therefore a very practical innovation for that friend of children's playhours, the ever-useful rubber boot. [Canadian Consolidated Rubber Co., Limited, Montreal, Canada.]

INDOOR EXERCISING APPARATUS.

The horizontal exercising bar here illustrated is provided with rubber cushions at each end. When the bar is fitted into a doorway and turned with the hands it makes a wedgelike contact between the rubber and the sides of the doorway sufficient

to sustain the weight of a heavy man. The bar is made of selected hickory, and has steel tubular ends into which the iron sockets holding the rubber cushions screw. It is used for chinning exercises and also for abdominal work, being adjustable to any height. [A. G. Spalding & Bros., New York.]

Another indoor apparatus for athletic exercise, in which rubber is used, is a vaulting pole of bamboo, wound at short intervals with friction tape. [Wright & Ditson, Boston, Massachusetts.]

TRIPLEXED STEAM HOSE

A new hose, that combines the flexibility of rubber hose and the resistibility to pressure of the all-metal hose, has lately appeared on the market, and is of interest to steam users.

It is built as follows: The metal inner tube is of special ball-bearing construction, overlaid with a magnesia composition, around which is spun a woven insulated fabric, covered by a coating of rubber with a woven jute covering for protection.

The metal tube carries the pressure, while the magnesia is to prevent heat conduction, and the next layer is for insulation. The woven fabric prevents kinking of the hose by being woven to the maximum bend that the hose will describe—the smallest circle that may be permitted without strain. [Metal Hose & Tubing Co., Brooklyn, New York.]

RUBBER MAT FOR REVOLVING DOOR.

This rubber mat is specially designed for use with revolving doors, and can be obtained in any size by giving the diameter of the circle required, the size of the center post on which the door revolves, and the distance from the center post to front and back. It is made in four sections. The front and back sections are perforated, and the two side sections are made of solid rubber, which gives additional weight to the mat and insures an absolutely safe foothold when passing through the door. [New York Belting & Packing Co., New York.]

ALL-RUBBER SIPHON.

In transferring liquid from a cask with a piece of hose or tubing, the air must first be expelled before the flow commences. The old method of starting the flow by inserting the hose in the liquid and sucking on the other end is of course a very unsanitary one. The labor, the waste of material, and, most im-

portant of all, the lack of hygiene in this method can readily be seen. All these undesirable factors are eliminated by a modern device called the "Queen City Siphon," in which a rubber bulb at the end of the tube performs the necessary service. Two compressions of this bulb will start the flow, which can be in-

stantly stopped and started again by turning the hard rubber stop cock. The construction is simple and there are no metal valves to clog, corrode, or otherwise get out of order. These siphons are made in four sizes, the flow varying from $\frac{3}{8}$ of an inch to 1 inch. [The Schaefer Rubber Co., Cincinnati, Ohio.]

THE MONARCH ADJUSTABLE AUTO LAMP DIMMER.

City ordinances require that the glaring headlight on automobiles be subdued, and this requirement has brought on the market many types of "dimmers" in the form of opaque shields covering half the light. A practical device for this purpose, which can be attached to the lower or upper part of the lamp, is shown herewith. The shield is made of strong, rubberized cloth, to withstand the rains that drive in upon it. A coil spring gripping the lamp holds the dimmer in place in spite of the constant jarring of the machine. This dimmer is made in five sizes, to conform to almost any size or style of lamp. [The Monarch Carriage Goods Co., Cincinnati, Ohio.]

THE "HELDTITE" SHAVING BRUSH.

Every man who shaves himself has no doubt experienced the uncomfortable sensation brought about by the lather running down his wrist from the brush. The shaving brush here illustrated prevents this annoying occurrence by means of a drip cup made of pure rubber, which surrounds the brush at its base. The handle is suitably shaped so that the brush can be placed in a standing position. The ferrule is made of aluminum. The manufacturers claim that the specially made lather brush is the only one that will both spread the lather and rub it in at one operation; also that the ferrule and handle will not swell, shrink, crack or loosen.

The many practical features of this useful article will appeal to every man who shaves himself. [Heldtite Brush Co., Inc., Troy, New York.]

AN ELECTRIC CLEANER WITH A SOFT RUBBER BRUSH.

Rubber has lately been made use of in improving the almost indispensable vacuum cleaner. The Premier is an electrically driven cleaner, very compact

and light, weighing only nine pounds. Bristle brushes are generally used to stir up lint and dust, but in this machine the lint, hairs, etc., are picked up from the floor by a revolving brush made of rubber and metal, the rubber being in the form of little fingers. These rubber fingers just touch and loosen hair, lint, thread and ravelings which could not be removed by suction alone. After loosening, this material is carried into the dust-proof bag by the strong air current. [The Franze Premier Co., Cleveland, Ohio.]

THE McCORMICK WEATHERSTRIP.

This is used on an automobile windshield, and is claimed by the makers to eliminate all danger that cold wind, rain, hail or sleet may find its way through the space between the upper and lower panes to the occupants of the car. It is designed to fit the upper edge of glass on the lower section of the windshield.

The single flange, or lip, is forced against the outside face of the upper glass, as the shield is brought in a vertical position, and a water-tight connection is thus established between the panes. Or, if it is desired to have the upper glass swing forward freely, the strip holds equally tight on the inside. A light pressure of the thumb adjusts the strip, and it is removed with corresponding ease. When not in use it can be coiled and placed in the door pocket, under the seat, or in any other place where it will be out of the way and yet readily accessible. [The Robinson Manufacturing Co., Louisville, Kentucky.]

THE WATROUS BATH FIXTURE.

In the bath spray attachment here illustrated it is possible to adjust the volume and temperature of the water as desired before it is released from the spray. The water flows through a relief valve *A*, which prevents all danger of the hose blowing off and insures a uniform flow. It is kept from passing through the spray by a regulator *B*. When properly adjusted, a slight pressure of the thumb at *B* starts the spray, the relief valve *A* closing automatically. This fixture is easily attached to any bathtub, and a fountain syringe attachment is also supplied, which can be interchanged, as desired, with the bath spray head. [The Watrous Company, Chicago, Illinois.]

PNEUMATIC PENHOLDER.

The special feature in this latest addition to a well-known line of pneumatic penholders lies in the extra length of the pneumatic rubber tip, which extends over half the length of the holder. "Writer's cramp" is a common ailment among constant wielders of the weapon accredited mightier than the sword. The

device of a heavy, soft, pneumatic rubber cushion for the fingers greatly lessens the strain and, consequently, the danger of ill effects from long continuance of a certain position of the hand. The rubber cushion on this penholder is a veritable pneumatic air cushion, made by a patented process. [American Lead Pencil Co., New York.]

SHOES WITH ELASTIC SIDE GORE.

Among the manifold novelties of a season of fascinating footwear, several manufacturers are showing boots in which a side gore of silk elastic is used. In the "Parade Boot," here illustrated, this elastic side gore gives a close-fitting top that is exceptionally neat and yet supremely comfortable, while the unbroken front line adds to the slender appearance of the foot. The "Parade Boot" comes in patent leathers and colored kid. The one shown is piped with white kid.

A dancing boot for men, called the "Austrian Officer's Full Dress Dance Boot," also makes use of the convenient silk elastic side gore. This boot does not slip at the heel in dancing, like the ubiquitous pump, and cannot bind the instep like the laced Oxford. As a rule, men's dancing shoes are notably lacking in comfort, and this boot should prove a popular innovation.

The Editor's Book Table.

CHEMICAL TECHNOLOGY AND ANALYSIS OF OILS, FATS AND WAXES. By Dr. J. Lewkowitsch, M.A., F.I.C. Fifth edition. Macmillan & Co., Limited, London, 1915. [3 vols., cloth, 8vo, 483, 688 and 944 pages. Price, \$6.50 per volume.]

THIS book deservedly stands in high esteem among chemists, and its author is an acknowledged authority on the subject of oils, fats and waxes. The plan of the work is progressive.

The first volume begins with the classification of oils, fats and waxes, and discusses their physical and chemical properties, followed by a chapter on saponification, and one on the various series of fatty acids, and the series of alcohols derivable from fats. Preparation of fatty matter for physical and chemical examination, and the application of these methods, occupy the next four chapters, both quantitative and qualitative methods being given. Methods for the examination of mixed fatty acids occupy a section of 80 pages, succeeded by chapters on examination of unsaponifiable matter; detection and determination of rosin. The first volume concludes with the application of the methods to the systematic examination of oils, etc., and a discussion of examination by strictly scientific methods.

The second volume is devoted to the technology of the natural oils, fats and waxes, taking up the commercial preparation of the raw materials used in those industries, the methods of refining them and detecting adulterations. In this section the oils are classified as vegetable and animal; and so also are the solid fats and waxes.

Each oil, fat or wax is treated individually in the sub-division of its proper group, where its characteristics are indicated, its properties fully discussed, tests given and commercial value indicated. In this part are descriptions of the rubber seed oils from *Manihot*, *Pantonia* and *Hevea* rubber tree seeds. These are all classed as drying oils. The *Hevea* seems to be the most important source of rubber seed oil. "Since the productive plantations in the East have become very extensive, a larger supply of seeds is available and their export for purposes of oil production may increase, especially so as the vitality of the seeds for production of seedlings is very feeble. * * * It is estimated that one ton of kernels [414,400 seeds] delivered in England would cost £6 10s. [\$31.60]." The cake would be unsuitable for cattle feeding, and would have to be used as manure. These figures do not seem to indicate that *Hevea* seed oil may be expected to become an extensive article of commerce.

The third volume takes up the consideration of the technology of manufactured oils, fats and waxes, and commercial examination of the products of the oil, fat and wax industries; concluding with the technology of waste oils, fats and waxes and the commercial products derived from them. Under the first division are considered the industries having for their object the refining of oils and fats, and their application to commercial use; as, for example, edible oils, illuminating oils, paint oils and lubricants. Next follows consideration of the industries in which the glycerides undergo a chemical change, but are not saponified, namely, polymerized oils, boiled oils, oxidized oils, vulcanized oils or rubber substitutes, etc. In the latter instance the processes of manufacturing both the dark substitute and white substitute are given in general terms.

The candle, fatty acid, soap and glycerine industries are similarly treated. The technology of waste oil products is important and interesting. These products are chiefly greases.

The set of three volumes is fully indexed in the third and last volume. This work on oils, fats and waxes is a valuable work for any chemist's library, especially to the rubber works chemist who is often called upon to examine oils and products containing oils used in rubber goods manufacture.

CHEMICAL CALCULATIONS. BY R. HARMAN ASHLEY, Ph.D., New York: D. Van Nostrand Co., 1915. [Cloth. 8vo, 276 pages. \$2.00 net.]

The author, in his preface, states that this text-book on Chemical Calculations follows more closely than usual the needs of students who will later find occupation in chemical laboratory work. The book, therefore, contains constant reference to chemists' handbooks, particularly to "Van Nostrand's Chemical Annual for 1913." It will be found a valuable source of help by practical chemists and laboratory analysts in their routine work. The text-book is entirely mathematical, the problems treated relating to ratios, approximate numbers, interpolation, heat, specific gravity, gas calculations, calculations of atomic weights and formulae, gravimetric and volumetric analysis and the use of specific gravity tables and acid calculations.

TRADE DIRECTORY OF CENTRAL AMERICA AND THE WEST Indies, 1915. Published by the Department of Commerce, Washington, D. C. [Cloth, 8vo, 255 pages.]

Printed in legible type in well-arranged and not overcrowded pages, and neatly bound in dark-red buckram, this work was compiled in the Bureau of Foreign and Domestic Commerce of the Department of Commerce from information supplied by United States consular officers. It is a directory of Central America and West Indian buyers and is a supplement to the Trade Directory of South America, published by the Department in 1914. Classification is according to countries, principal cities and trading centers, and the nature of the goods handled, with index and classification schedule and concise notes regarding the location, population, transportation facilities and exports of each point. It is easy of reference and should be a valuable addition to the library of every manufacturer, merchant or exporter doing business with these countries. Copies are obtainable, at 60 cents each, from the Superintendent of Documents, Government Printing Office, Washington, D. C.

THE RUBBER INDUSTRY OF THE AMAZON, AND HOW ITS SUPREMACY CAN BE MAINTAINED. Based on the experience of Joseph F. Woodroffe, author of "The Upper Reaches of the Amazon," edited and with additions by Harold Hamel Smith, editor of "Tropical Life." John Bale, Son & Danielsson, Limited, London, 1915. [8vo, 435 pages, with statistical tables and 48 illustrations.]

The authors of this compilation of interesting and valuable information on the Amazon rubber industry are abundantly qualified in knowledge and experience to speak with authority.

How Brazil's supremacy can be maintained when she has occupied second place as a rubber producer since 1913, is puzzling, to say the least; however, many potential theories are advanced whereby Brazil's rubber supremacy may be ultimately regained. The book in general is an earnest appeal for the development, preferably by English capital, of the languishing Amazon rubber industry along the practical lines suggested and supported by many facts and figures.

The labor question, as it should, occupies the first place and is treated with the careful consideration due this subject, upon which the success of tropical ventures invariably depends. The natives are to be encouraged to greater effort, that will result in better laborers, rubber tappers and planters of food-stuffs. Large numbers of Japanese, Chinese and Siamese agriculturists must be imported to form colonies and intermarry with the natives to produce the new blood and sinew that are so urgently required.

The pages devoted to the history and description of the industry from the early days of the *seringas* of the aborigines to the present-day methods of collecting the milk and the preparation of modern *pelles* of upriver fine rubber are particularly accurate and interesting.

The *Scringuero* is quite the most heroic figure in all that vast land of jungle and river. The reader is brought in close touch with his humble home, his daily life and the unequal struggle that he is constantly waging against overwhelming odds in his effort to make a living for himself and family. The government does little or nothing for this intrepid and deserving type, that will in time entirely disappear unless healthy surroundings and better conditions are provided for their welfare. How this should be done is told in the chapter on "The Future Homestead of the *Scringuero*" in a convincing and practical manner that leaves little to be said on the subject of Brazil's salvation. The last chapter is an excellent review of the common interpretation of the Monroe Doctrine from the British viewpoint, and its adverse effect on Latin American trading possibilities.

NEW TRADE PUBLICATIONS.

THE Quaker City Rubber Co., Philadelphia, Pennsylvania, issue catalog No. 17, covering their mechanical rubber goods, prefaced with a modest introduction in relation to the magnitude and complete modern equipment of their plant. Glancing over the 180 artistically printed and profusely illustrated pages of this handsome publication, it would seem that the company's productions cover a most complete line of mechanical rubber goods. In the line of packings the assortment is notably complete, the description accompanying each variety being highly instructive and interesting; neatly bound, with a frontispiece in color, showing the company's extensive plant, also front views of its branch stores in New York, Chicago, Pittsburg and Philadelphia.

Wearing Candee Rubbers, conspicuously displayed and flaunting a banner with the legend, "Candee Kids," two rosy-cheeked youngsters on a flying sled, announce the Candee Rubbers in a very appropriate and artistically printed standing card, sent out as a seasonal reminder by the United States Rubber Co., Fifty-eighth street and Broadway, New York. Accompanying it is a standing figure of a typically rubicund and rotund Santa Claus, bearing, as an appropriate gift for the young folks, a "Unika" brand St. Nick rubber boot, which, with its red moire shaft, in delightful contrast to the shining black foot, would captivate any youngster of either sex.

"Saving Dollars on Truck Tires" is the title of a series of eight interesting and instructive bulletins recently published, in folder form, by the Goodyear Tire & Rubber Co., Akron, Ohio. The first covers the subject of truck tire conservation and abuses that must be guarded against to obtain big mileage. The other bulletins are devoted to simple precautions against the following: Overloading, Speeding, Car Tracks, Rough Roads, Neglected Cuts, Non-Skid Devices, and Wheel Irregularities.

A UNIQUE ADVERTISEMENT.

Through the courtesy of A. W. Smith, western representative of the Goodyear's India Rubber Selling Co., Chicago, Illinois, we are able to present a reproduction in full size of a hard rubber disc, issued in 1863, as an advertisement by the Rubber Clothing Co., 347 Broadway, New York. The reverse side of the disc bears, in relief, a complete calendar for that year; but although perfectly preserved and to sharp eyesight quite clear, the figures are so minute that their reproduction in natural size was not possible. The little rubber "card," of which there is hardly likely to be another in existence, was in its time doubtless a unique and highly prized advertising novelty.

APPROPRIATE AND ARTISTIC HOLIDAY GREETINGS.

WE were agreeably reminded of the near approach of the holidays and the opening of a new year, by the appearance, on the editorial desk, of useful and attractive objects, in infinite variety, from friends desirous of expressing kindly remembrance. For these reminders, which we enumerate below, we take this means of expressing our thanks and our collective and cordial reciprocation of the good wishes with which these many attractive and enduring forms of greeting are accompanied.

SOUVENIRS AND NOVELTIES.

A handy wallet of rich brown leather, stamped in gold with the sender's compliments, comes to us from the Monatiquot Rubber Works Co., manufacturers of reclaimed rubber, at South Braintree, Massachusetts. Accompanying the gift is an appreciative greeting, on a neatly printed card displaying the company's trade-mark.

"Vac," in the person of a jet-black Boston bull terrier, comes with the season's greetings from the Pennsylvania Rubber Co., Jeannette, Pennsylvania. "Vac" probably derives his name from the Vacuum cup tires, made by his donors, and will make an attractive paper weight for any desk, besides serving as a reminder of the sender's good wishes for 1916.

Accompanied by a note of greeting and explanation, the Standard Emarex Co., New York, distributed to its friends and customers a miniature rubber tire paper weight, packed in an attractive box. The stock used in the paper-weight tire is described as containing 50 per cent of M. R. X., the mineral rubber which the company manufactures, and the specimen is sent out to show how admirably M. R. X. combines with rubber.

CARDS AND CALENDARS.

S. Birkenstein & Sons., dealers in scrap rubber, Chicago, Illinois.

E. H. Clapp Rubber Co., manufacturers of reclaimed rubber, Boston, Massachusetts.

J. W. Coulston & Company, importers of chemicals, New York City.

The J. H. Day Company, mixers for rubber compound, Cincinnati, Ohio.

Dominion Rubber System of Canadian Consolidated Rubber Co., Ltd., manufacturers of rubber goods, Montreal, Canada.

Gibney Tire & Rubber Co., wireless solid tires, Conshohocken, Pennsylvania.

Kelly-Springfield Tire Co., manufacturers of tires and tubes, Akron, Ohio.

L. J. Muttly Company, rubber cloths and tubing, Boston, Massachusetts.

New Jersey Rubber Co., Lambertville, New Jersey, dealers in all kinds of reclaimed rubber.

The Portage Rubber Co., manufacturers of tires, Akron, Ohio.

Quaker City Rubber Co., manufacturers of Quaker tires and mechanical rubber goods, Philadelphia, Pennsylvania.

DRY COST CALCULATOR.

The Acushnet Process Co., New Bedford, Massachusetts, issue a very neat dry cost calculator for crude rubber. By its use the net cost of crude rubber, up to \$2.50 per pound, can easily be ascertained at a single setting on the instrument of the purchase price and percentage of shrinkage. The instrument is circular, of heavy celluloid and may be obtained gratis by representatives of rubber companies on application.

New Machines and Appliances.

BIRMINGHAM PNEUMATIC TIRE TREAD MACHINE.

THIS machine is of special interest to tire manufacturers, as it turns out treads superior to the hand-laid product, and at a lower cost. Another advantage is in its adaptability for laying up inner flaps—an item which is very large in some mills.

For treads the stock is prepared in the usual manner, and is then sheeted and cut into strips on a calender. The rolls of stock are taken to the tread room, mounted on a let-off, and carried through a stripping mechanism by which the rubber is separated from the liner. After passing over the driven roller at the top of the machine, the rubber strips make a quarter turn and pass down over idler rollers through chutes, which guide them to the center of a series of iron rollers running on a belt. The widest strip is first rolled on, then the next widest and so on until the required number have been plied up for the tread. By this method of laying each tread separately, all possible entraining of air is prevented, and a more uniform tread is obtained. [Birmingham Iron Foundry, Derby, Connecticut.]

INSTALLATION OF WILLS' OVERFLOW TRIMMER.

The perspective sketch illustrated herewith shows how the Wills' overflow trimmer (described in THE INDIA RUBBER WORLD, July, 1915, page 544) should be installed to gain an increase of 20 per cent in speed and output on such articles as heels, soles, valves, etc.

The feed box, the trimmer, and the chute for the finished heels are so arranged that the operator can readily take the

heel from the feed box, trim it on the rotary shears and drop it into the chute. Thus the cycle can be completed without lost motion or time by the operator.

As many as 3,000 pairs of heels per day can be trimmed by the machine set up in this way, whereas, by hand, an experienced operator can trim less than 1,000 pairs per day. [A. J. Wills, North Brookfield, Massachusetts.]

MILLER'S BOOT AND SHOE REPAIR VULCANIZER.

This vulcanizer is apparently capable of doing almost any sort of repair job, from leaky water bottles to bicycle tires. Specifically, the manufacturers recommend this machine for repairing footwear, footballs, hot water bottles, inner tubes and single tube tires.

The platen that carries the various clamps, plates and special appliances is mounted on a strongly built frame, supporting the gasoline-heated boiler, which is provided with a steam gage, water gage, safety valve and a fuel tank.

At the left is a steam-jacketed cylinder for repairing circular surfaces, and a plate, curved to receive any size boot or shoe sole, is cast on the back of the platen. The device for repairing heels is

next to the curved sole mold, and the upright projection is an inside boot or shoe mold specially adapted for inside curing on repairs that are so tedious by other methods. There is a flat surface (6 x 10 inches) for vulcanizing, at one time, from three to six tubes for automobiles or motorcycles, and in addition there is one sectional bicycle mold for repairing bicycle tires. [Charles E. Miller, Anderson, Indiana.]

A MAGNETIC SEPARATOR PULLEY.

This is designed to remove pieces of iron and steel from powdered rubber waste.

The device consists of two pulleys mounted on a steel I-beam frame with a conveyor belt running over them. One is a split pulley of ordinary construction. The other is the magnetic pulley, which is composed of electro-magnetic windings on steel bobbins, placed between and doweled to steel discs keyed to the shaft. The coils of the standard pulleys are wound for 110 and 220-volt direct current, and are connected in series. The terminals are brought through a hole in the center of the shaft to a pair of collector rings placed beyond the bearings. These magnetic pulleys are regularly made in sizes from 12 to 30 inches in diameter.

The electric current passing through the coils converts the pulley into a powerful electro-magnet, which attracts and holds any pieces of iron or steel contained in the rubber waste that is being carried along on the conveyor belt. As the normal speed of this belt is 100 feet per minute, the waste and fiber are shot off into a box as the belt turns around the magnetic pulley. The iron and steel pieces adhere to the belt until they pass under and beyond the pulley, when, losing the magnetic attraction, they drop into another box under the belt. [Cutler-Hammer Clutch Co., Milwaukee, Wisconsin.]

ANTI-WRINKLING DEVICE FOR SPREADERS.

To prevent wrinkling of the cloth while it is passing through the spreading machine, the following devices are of interest:

The one shown first in the illustration is used on top of the machine and rests on the pipe coil directly in front of

the tail roller, special grooves being provided on the under side of the device for this purpose.

The other is used on the spreading machine. It is attached under the frame several feet ahead of the wind-up roller. The cloth runs under the angle rollers and the proper tension is gained by the movable counterweight on the projecting arm. [The American Tool & Machine Co., Boston, Massachusetts.]

MACHINERY PATENTS.

A UNIVERSAL TIRE BUILDING AND WRAPPING MACHINE.

HARRIS has invented a universal wrapping machine designed to make cord tires, frictioned fabric tires, to cloth-wrap tires for open curing and, finally, to wrap the finished tire with paper strips to avoid damage in shipping and while in stock.

The diagram is a front elevation. Belt rollers *A* are elevated, as shown by the dotted lines, and a pair of steel bead rings *B* are introduced into the side grooves of the endless belt *C*. This belt *C* now serves to rotate the bead reinforcing members *B* in the direction shown by the arrow. A bobbin *D* carrying a supply of rubberized cord or tire fabric is rotated together with shuttle *E*, and the end of the

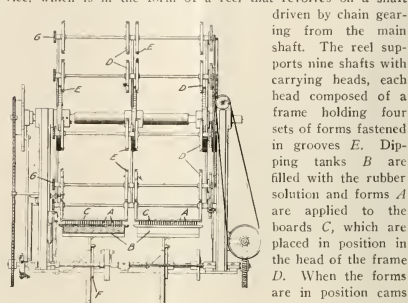

cord is led over tension rolls to one bead ring. When the driving mechanism is started, the shuttle *E* and the bead rings will be rotated in a clockwise direction at varying speeds in interlinked relation, the cord being thus wound in closely adjacent loops over and around both reinforcing head rings until the entire space is covered by adjacent parallel strands collectively forming a hollow, flat, tube-like, two-ply annular body material for the tire. A repetition of this winding process will produce a four-ply body material built upon the same bead rings, and so on, until any desired number of superimposed layers of rubberized cord or tire fabric have been added. By varying the relative speed of the shuttle and the bead rings, a different angle of applying the cords may be obtained—a feature very desirable in a carcass built up in this fashion. [A. H. Harris, Youngstown, Ohio, United States patent No. 1,160,075.]

DIPPING MACHINE FOR MAKING NIPPLES.

This is Mahoney's newest machine for forming nipples, medicine dropper bulbs, finger cots and similar articles by dipping.

The side elevation shows the more novel features of the device, which is in the form of a reel that revolves on a shaft

driven by chain gearing from the main shaft. The reel supports nine shafts with carrying heads, each head composed of a frame holding four sets of forms fastened in grooves *E*. Dipping tanks *B* are filled with the rubber solution and forms *A* are applied to the boards *C*, which are placed in position in the head of the frame *D*. When the forms are in position cams *F* raise the tanks *B*,

causing the forms to be immersed in the solution to a predetermined depth, after which the tanks recede. Then the pinion *G* is moved through about 140 degrees, and the ratchet mechanism advances the carrying head *D* one step, thus bringing the next set of forms in position over the dipping tanks. When this has been accomplished, the set of forms which have already been immersed have been moved forward about 36 degrees, placing the forms almost vertically above their original positions, thus permitting each deposit of solution to dry.

When a sufficient number of immersions have taken place to produce the desired thickness on the forms, the lowermost dipping board of the frame is removed and a new one inserted. In this way the operation of the machine is made continuous. [J. L. Mahoney, New Haven, Connecticut, United States patent No. 1,160,923.]

BOOT AND SHOE SOLE ROLLING MACHINE.

Instead of using the pressure of a hand-roller in attaching the unvulcanized sole to the bottom of a rubber shoe, Hemenover has invented a machine to do this work.

The sole *A* is applied to the last and is clamped down against the flexible pad *B* by the pivoted hold-down bar *E*, the underside of the

knitted fabric diaphragm *C* resting on the bottom of the chamber *D*. Compressed air is admitted to this chamber through the pipe *F*, and its pressure causes the diaphragm and pad to be wrapped around and pressed tightly against the lower parts of the shoe, thereby causing an evenly distributed pressure on all parts of the sole, which in turn causes the latter to adhere closely to the shoe body. The vertical latch lever *G* holds bar *E* in clamping position and is pivoted to the frame *H*. The teeth *I* on this bar engage abutment *J* on the hold-down bar, thus making it easy to apply the latter to the last.

After the pressure has been left on for a short time, the valve *K* is turned to exhaust the chamber *D*, and a further turning of the handle *L* then automatically releases the last when the extension of this handle engages the lever *G* and releases the hold-down bar *E*. [W. E. Hemenover, assignor to The B. F. Goodrich Co., Akron, Ohio, United States patent No. 1,160,983.]

MACHINE FOR COVERING INVERSOLES OF THE GEM TYPE.

With Hall's new machine, inner soles of the Gem type are finished by pressing the canvas layer into the angle formed by the lip and feather of the inner sole, to produce a smooth and finished inner sole. The novel features are contained in the drawing which is an enlarged detail in section showing the operating tools, sole and canvas. *A* and *C* are two working tools which cooperate and firmly press together the layer of adhesive cloth *D* applied to the inner sole *E*, which has a lip *F*. The adhesive cloth is first applied to the inner sole by the Gem machine. A hacking tool *B* is used to support the lip *F* and to limit its outward movement. Thus, by not allowing the upper end of the lip free movement, it will not move beyond a predetermined angle in relation to the inner sole.

The tools *A* and *C* are positively rotated and act as feed rollers to feed the inner sole *E*, drawing the canvas over the lip. The tool *B* is made as a disk or wheel and is loosely mounted, to be turned freely by the lip as the inner sole is fed forward by the feed tools and rolls *A* and *C*. The tool *A* is detachably secured to a rotatable shaft *G*, thus permitting a movement of the working tool to or from tools *B* and *C*. By depressing a foot treadle (not shown), tools *B* and *C* may also be moved away or towards *A*, thus giving any desired angle to the lip of the sole. [Bicknell Hall, assigned to Panther Rubber Manufacturing Co., Stoughton, Massachusetts. United States patent No. 1,160,711.]

OTHER MACHINERY PATENTS.

UNITED STATES OF AMERICA.

ISSUED NOVEMBER 16, 1915.

- 1,160,364. A machine element. L. H. Backeland, Yonkers, N. Y., assignor to General Bakelite Co., New York, N. Y.
1,160,724. Apparatus for treating coated fabrics. C. J. Landin, Boston, Mass.

ISSUED NOVEMBER 23, 1915.

- 1,161,044. Means for repairing pneumatic tires. J. R. Gay, Toronto, Ontario, Canada.
1,161,376. Recording pressure gage. B. B. Bristol, Naugatuck, Conn., assignor to The Foxboro Co., Foxboro, Mass.
1,161,414. Portable tire vulcanizer. W. G. Sanford, assignor to Positive Tire Vulcanizer Co., both of Davenport, Iowa.

ISSUED NOVEMBER 30, 1915.

- 1,161,892. Footwear vulcanizing apparatus. E. W. Rutherford, Naugatuck, assignor to Goodyear's Metallic Rubber Shoe Co., both in Connecticut.
1,161,906. Tire building machine. C. W. Stultz, Indianapolis, Ind., assignor to G. & J. Tire Co., a corporation of New Jersey.
1,161,946. Apparatus for wrapping pneumatic tire casings. T. Midgley, assignor to The Hartford Rubber Works Co., both of Hartford, Conn.
1,161,947. Tire building machine with shaping tool. T. Midgley, Worthington, Ohio, assignor to Morgan & Wright, Detroit, Mich.
1,161,948. Tire building machine with smoothing arm. T. Midgley, Worthington, Ohio, assignor to Morgan & Wright, Detroit, Mich.
1,161,949. Tire building machine. T. Midgley, Worthington, Ohio, assignor to Morgan & Wright, Detroit, Mich.
1,161,950. Fabric stretching machine. T. Midgley, Worthington, Ohio, assignor to Morgan & Wright, Detroit, Mich.
1,161,951. Apparatus for producing dipped articles. P. I. Murrill, New York, N. Y., assignor to Revere Rubber Co., a corporation of Rhode Island.
1,162,072. Spring finger tool for tire building machines. W. Kearns, assignor to Morgan & Wright, Detroit, Mich.
1,162,235. Repair vulcanizer. D. S. Hershon, Chelsea, Mass.
1,162,306. Process of filling tires. F. Oliver, Daytona, Fla.
1,162,360. Apparatus for centering tire treads. H. J. Hoyt, assignor to Morgan & Wright—both of Detroit, Mich.
1,162,380. Hammer for fixing tire treads. T. Midgley, Worthington, Ohio, assignor to Morgan & Wright, Detroit, Mich.
1,162,397. Electric tire vulcanizer. R. B. Price, New York, N. Y., assignor to Rubber Regenerating Co., a corporation of Indiana.
1,162,425. Tire builder's tool. D. A. Wilcox, Garden City, N. Y., assignor to Morgan & Wright, a corporation of Michigan.
1,162,535. Tire repair vulcanizer. C. A. Willey, Battle Creek, Mich.

ISSUED DECEMBER 7, 1915.

- 1,163,053. Heated form for dipped goods. C. S. Williams, New York, N. Y., assignor to Revere Rubber Co., a corporation of Rhode Island.
1,163,089. A mixing mill. H. J. Hoyt, assignor to Morgan & Wright—both of Detroit, Mich.

- 1,163,219. Means for vulcanizing pneumatic tires. J. J. Cleaver, Carnegie Borough, Pa., assignor of one-fourth to S. L. H. Morris; one-fourth to H. W. Hedgdon, and one-fourth to E. T. Baron—all of Pittsburgh, Pa.
1,163,589. Sole pressing machine with hard rubber core. H. A. Davenport, Brockton, Mass., assignor to United Shoe Machinery Co., Paterson, N. J.
1,163,629. Portable repair vulcanizer. A. B. Low, Denver, Colo.
1,163,629. *Re-issued.*
1,163,629. Apparatus for use in reclaiming vulcanized rubber waste. C. S. Heller, Barberton, assignor to The Moore Architectural & Engineering Co., Akron—both in Ohio.

UNITED KINGDOM.

ISSUED NOVEMBER 17, 1915.

- 16,627 (1914). Rubber belt fastening. F. Sinclair, 39 Orchard Road, Erdington, Birmingham.
17,110 (1914). Ebonite in insulated electric bearings. C. E. Wieselgreen, 26 Viktoriagatan, Gothenburg, Sweden.
17,158 (1914). Devices for making rubber corer golf balls. J. R. Gameter, Portage Path, Akron, Ohio.
17,164 (1914). Rubber strips used with paving blocks. British Murac Syndicate, and M. M. Dessau, 60 London Wall, London.
17,187 (1914). Seam reinforcing strip for bladders, hot water bottles, etc. C. H. Gray, Silvertown, Essex.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

- 476,720 (December 11, 1914). Improved tire making machine. E. Sloper.

THE GERMAN EMPIRE.

PATENTS ISSUED (With Dates of Validity).

- 389,119 (June 30, 1914). Die-press and vulcanizing apparatus for manufacturing tire casings. Henry James Dougherty, Edgewood, Providence, Rhode Island, U. S. A., Represented by H. Neubart, patent-lawyer, Berlin, SW 61.

NEW MANUFACTURING PROCESSES.

UNITED STATES OF AMERICA.

ISSUED NOVEMBER 23, 1915.

- 1,161,093. Method of making tires. J. J. Webster, Haverhill, Mass., assignor to Reliance A. C. Co., Inc., New York, N. Y.
1,161,213. Packing. F. A. Headon, assignor to H. W. Johns-Manville Co., both of Milwaukee, Wis.
1,161,549. Tire tread. T. B. Tiefenbacher, New York, N. Y.
1,161,603. Process of drying colloidal substances. G. B. Bradshaw, Brooklyn, N. Y.
1,161,614. Marking vulcanized rubber articles by a heated die. M. H. Clark, Hastings-on-Hudson, N. Y.

Adjudicated Patent.

- (U. S. D. C.) The Marks patent No. 635,141 for a process for devulcanizing rubber waste. Held not anticipated and valid. Philadelphia Rubber Works Co. vs. United States Rubber Reclaiming Works, 225 Fed. Rep. 789.
(U. S. D. C.) The Bakeland patents Nos. 954,666, 1,018,385 and 1,037,219 for varnishes. Held not anticipated and valid. General Bakelite Co. vs. Nikolas. 225 Fed. Rep. 539.

ISSUED NOVEMBER 30, 1915.

- 1,161,965. Treatment of plastic material. R. B. Price, New York, N. Y., assignor to Rubber Regenerating Co., a corporation of Indiana.
1,161,966. Manufacture of vulcanized articles. R. B. Price, New York, N. Y., assignor to Rubber Regenerating Co., a corporation of Indiana.
1,161,967. Method of producing vulcanized plastic articles. R. B. Price, New York, N. Y., assignor to Rubber Regenerating Co., a corporation of Indiana.
1,162,384. Method of making valve packing. F. Y. Nichols, Chicago, Ill.
1,162,396. Anti-slipping and anti-wear material. R. B. Price, Mishawaka, Ind., assignor to Rubber Regenerating Co., a corporation of Indiana.
1,162,454. Method of manufacturing footwear. M. H. Clark, Hastings-on-Hudson, N. Y., assignor to Goodyear's Metallic Rubber Shoe Co., a corporation of Connecticut.
1,162,479. Method of manufacturing tires. A. H. Harris, Youngstown, Ohio.

ISSUED DECEMBER 7, 1915.

- 1,162,745. Method of manufacturing reinforced air tubes. J. W. Blodgett, Chicago, Ill.
1,163,525. Method of manufacturing rubber articles. T. Gare, New Brighton, England.

UNITED KINGDOM.

ISSUED NOVEMBER 10, 1915.

- 16,359 (1914). Method of covering golf balls. A. C. B. Bell, 17 Lansdowne Crescent, Edinburgh.
16,626 (1914). Rubber bolting. F. Sinclair, 39 Orchard Road, Erdington, Birmingham.

ISSUED NOVEMBER 24, 1915.

- 17,193 (1914). Process for making rubber articles. R. B. Price, 830 Park Avenue, New York, N. Y., U. S. A.

THE GERMAN EMPIRE.

PATENTS ISSUED (With Dates of Validity).

- 288,935 (July 11, 1915). Air tube with fabric inlay. Brown Perfection Tube Co., New York City, U. S. A., Represented by Dr. L. Gottschow, patent-lawyer, Berlin W 8.
288,992 (September 25). Tire casing. Bruno Salzmann, Feldstrasse, 16, Berlin-Steglitz.

The Obituary Record.

JAMES MAPES DODGE.

THE chairman of the board of directors of the Link-Belt Co., Chicago, Illinois, James Mapes Dodge, known to the rubber industry of the United States, died at his home in Philadelphia, Pennsylvania, on December 4, 1915, in the 64th year of his age.

Mr. Dodge was born at Waverly, New Jersey, his grandfather being Professor James J. Mapes, his mother Mary Mapes Dodge, well known in literary circles and for a number of years editor of the St. Nicholas magazine. He spent three years at Cornell University and a year at Rutgers College, where, under the late Professor George H. Cook, State Geologist of New Jersey, he took a special course in chemistry. His active work in the business world commenced with a brief engagement at the Morgan Iron Works, New York. He then entered the shops of John Roach, the shipbuilder, at Chester, Pennsylvania, where his marked mechanical ability and ingenuity took him rapidly through the stages of journeyman and foreman to the post of superintendent of erection.

In 1876 he left the shipyard, and after several years' experience in the East, went to Chicago, where he became acquainted with William D. Ewart, inventor of the Ewart Link-belt, with whom and his associates Mr. Dodge entered on the development of the chain belt business.

Later he returned East and, with Edward H. Burr, formed the firm of Burr & Dodge. This partnership resulted in the organization in 1888, of the Link-Belt Engineering Co.

In the planning and arranging of equipment to secure the most economical and efficient handling of products in both the raw and finished state, Mr. Dodge was notably successful; his system of handling coal, in and out of storage, bringing him the Elliott Cresson gold medal of the Franklin Institute of Philadelphia, Pennsylvania.

When it is remembered that while developing inventions on which upwards of 100 letters patent were granted, he at the same time directed the operations of such important corporations as the Link-Belt Engineering Co. and the Dodge Coal Storage Co.—of which companies he was elected president in 1892, to become chairman of the board of directors of the Link-Belt Co., when it was organized in 1906 as a result of the merger of the allied companies—the Link-Belt Engineering Co., Philadelphia, Pennsylvania, the Link-Belt Machinery Co., Chicago, Illinois, and the Ewart Manufacturing Co., Indianapolis, Indiana—some idea of his diligence and versatility may be formed.

Among his designs and inventions were the links and attachments of all link-belt in use, the bushed joint that made the silent chain possible, etc.

With all these activities, he took deep interest in the personal

J. M. DODGE.

welfare of his employees and encouraged in them the development of a spirit of ambition and responsibility. Mr. Dodge was recognized as a leader in the various societies and clubs of which he was a member, including the American Society of Mechanical Engineers, of which he was a past president; Franklin Institute, vice-president; Stevens Institute of Technology, Hon. Sc.D.; School of Design, Philadelphia, trustee; Union League Club, Philadelphia; University Club and Zeta Psi Fraternity.

CHARLES H. WILLIAMS.

Charles H. Williams, vice-president of the Williams Foundry & Machine Co., Akron, Ohio, died on December 3, at a hospital in Cleveland, Ohio, where he had undergone an operation. Deceased, who came to Akron from Footville, Wisconsin, 12 years ago, engaged in the foundry and machine business with his brother, J. K. Williams. The firm was notably successful in the manufacture of special machinery, molds and dies for rubber manufacturers, including hydraulic and hand presses, patent steam vulcanizers, etc. Lloyd Williams, son of the deceased, is master mechanic for the Williams company.

EDMUND R. HAWKINS.

Edmund Richard Hawkins, for the past four years a partner in the firm of H. A. Astlett & Co., crude rubber dealers and export commission merchants, 117 Pearl street, New York, died November 30, 1915, at his residence in White Plains, New York.

E. R. HAWKINS.

Mr. Hawkins, who was 45 years of age, was born in India, where his father held an important government post. His early life was spent in Leicester, England, and he was educated at the Leicester grammar school. As a young man he entered the employ of the London & Brazilian Bank, of London, and was first sent to Lisbon, Portugal, then to Rio Grande do Sul, Para and Manaus, Brazil, where he filled the position of accountant. Coming much in contact with the crude rubber dealers, he acquired a knowledge of the trade, and ultimately resigned his accountancy to engage in business in Manaus, and later in Para, as a rubber broker. Here he made many friends, by whom he will be remembered with affection and esteem. Keenly interested in athletics, he was often instrumental in diverting the attention of the younger members of the foreign colony from unprofitable pursuits to healthful, outdoor sports and exercise. When he came to New York he left many friends, who greatly regretted the loss of his genial companionship.

Mr. Hawkins possessed a fine tenor voice, and frequently took

part in musicales and church entertainments at White Plains. He leaves as his immediate family a widow, and two sons, aged respectively, two and seven years, to whom the sincere sympathy of his many friends is extended.

WILLIAM ANDREW CONNER.

William Andrew Conner, first vice-president of the Standard Underground Cable Co., Pittsburg, Pennsylvania, died suddenly at his office in Perth Amboy, New Jersey, on December 6, 1915.

Mr. Conner was born at Baltimore, Maryland, September 12, 1859. He began his business career in Pittsburg in 1876, in the oil reining industry, and ultimately became assistant manager for

the Standard Oil Co. In 1885 the Standard Underground Cable Co. built its first plant in Pittsburg. Mr. Conner took charge, and from that time until his decease, remained at the head of the company's manufacturing business. During this period he planned and supervised the erection of the company's extensive plants at Pittsburg, Pennsylvania; Perth Amboy, New Jersey; Oakland, California, and Hamilton, Canada. Since 1909 he has been vice-president of the Standard

W. A. CONNER.

Underground Cable Co., of which he was a director for ten years. He was also vice-president and a director of the Standard Underground Cable Co. of Canada, Limited, and was actively interested in the organization of the Perth Amboy Trust Co., Perth Amboy, New Jersey, of which he was vice-president.

Mr. Conner had been a resident of Plainfield, New Jersey, since 1904, when he moved there from Pittsburg. He leaves a widow, who was a Miss Tupper, of Michigan; a brother, Edward Conner, of Orange, New Jersey, and a sister, Mrs. Roak, of Brooklyn, New York.

A 32nd degree Scottish Rite Mason and a Knight Templar, a member of the Duquesne Club, of Pittsburg, the Hamilton Club, of Hamilton, Canada, and the Plainfield Country Club, Mr. Conner had many warm friends, by whom he was highly esteemed. The officers and principal employees of the Standard Underground Cable Co. and many friends attended the funeral services conducted at his late residence by the Rev. Dr. Phillip B. Strong, Plainfield, New Jersey, and the Rev. Dr. Lemuel C. Barnes, New York.

A PRIZE SHOW OF RUBBER FOOTWEAR.

With a view to assisting the weather bureau in interesting the pedestrian in rubber footwear, a National Rubber Sole and Heel Week is suggested by the "Boot and Shoe Recorder." The scheme is to devote the week of January 3-11 to a publicity campaign on behalf of rubbers, rubber boots, rubber heels and soles, and similar rubber devices for protection against wet feet and eliminating the shock and jar incidental to pounding hard leather shoes on harder pavements. The weather usually prevalent at this period is almost certain to be helpful to the plan and make an attractive window display of rubber footwear timely. Our contemporary offers prizes for the best display made during the period in question.

THE EFFECTS OF THE LOGWOOD EMBARGO.

THE present situation as regards the dyestuff question is an embarrassing one in many lines of industry, and, as is usually the case under such conditions, the rubber trade suffers in some of its manifold classes of production. When the supply of coal tar dyes was cut off through the discontinuance of German commerce the use of logwood, or its extract, partially filled the gap. About the first of last month the British Government declared an embargo and no logwood could be sent out of Jamaica—the principal source of supply—except to British ports. In fact one or two ships were unloaded which were almost ready to sail to the United States, and the last cargo leaving that island for this country was sunk off Delaware breakwater. Textile men, dyers and felt manufacturers held a meeting in New York, and the United States Government was petitioned to use its influence to remove the prohibition, but about the middle of the month the embargo was further extended to include logwood chips and extract, thus further emphasizing the crisis. Several industries must suffer from the almost total absence of these dyestuffs and it is stated that they are so scarce that some mills and dyeing establishments must cancel their orders and shut down.

Several branches of the rubber industry will suffer. The rubber footwear industry will be affected, much textile and felt goods being used in making overshoes and arctics. The felting mills are using logwood dyes and have some supplies on hand. When these supplies are gone they will be forced to rescind their contracts unless the embargo is modified. However, there seems to be a falling off in the demand for arctics, though this may be balanced by a larger demand for high buckle overshoes, which are now being called for in place of rubber boots. Linings for rubber boots are principally of knit goods in light or natural colors, and felt linings are not dyed. Many rubber plants now turning out great numbers of black canvas tennis shoes are likely to be affected.

The manufacturers of mackintoshes use large amounts of cotton, worsted and woolen textiles, and the larger manufacturers are well supplied with these fabrics, though more are contracted for. Prices advanced when the scarcity of aniline dyes became noticeable, and immediately the embargo was placed upon logwood cotton goods in blacks and some colors advanced from 30 to 50 per cent., and woolens and worsteds from 15 to 30 per cent., which must affect prices of garments as soon as present stocks of textiles are exhausted.

Carriage cloths come under the same general conditions. These are mainly of such colors as need aniline or logwood dyes, and prices of treated textiles so largely used in the automobile trade are similarly affected.

The elastic fabric manufacturers will undoubtedly feel the effects of the embargo in the near future. While some concerns purchase their yarns already dyed, one of the largest producers in this country purchases its yarns in the natural color, and has them dyed to order. At present the dyers have large amounts to color and deliver, and are under contract, which will make present advanced costs fall upon the dyers instead of upon the weavers.

It is expected, however, that the British Government will later remove the embargo, or so modify it that our industries may again be placed in as effective a position as they were previous to this latest prohibitory enactment.

District managers of The Fisk Rubber Company, Chicopee Falls, Massachusetts, to the number of about 100, met in conference on December 17 at the Hotel Kimball, Springfield, Massachusetts. The purpose of the gathering was to bring the company's representatives in all parts of the country into closer touch with each other and to discuss important questions of commercial policy. A dinner given by the company to the visiting managers and heads of departments brought the convention to a close.

News of the American Rubber Trade.

FISK RUBBER CO. SECURES CONTROL OF THE FEDERAL RUBBER MANUFACTURING CO.

CONTROL of the Federal Rubber Manufacturing Co., Milwaukee, Wisconsin, has been purchased by the interests of the Fisk Rubber Co., Chicopee Falls, Massachusetts, which will in future direct the policies of the first named corporation.

Byron G. Douse has disposed of his holdings of Federal stock and resigned as president and general manager of the company. At a meeting of the stockholders, directors were elected as follows: H. T. Dunn and J. A. Kepperley, Toledo, Ohio; B. H. Pratt, H. A. Githens and R. C. Ward, Milwaukee, Wisconsin; and H. G. Fisk, E. H. Broadwell, G. A. Ludington and E. N. Bogardus, Springfield, Massachusetts. The directors elected officers as follows: H. T. Dunn, president; B. H. Pratt, vice-president and general manager; H. A. Githens, assistant general manager; H. G. Fisk, treasurer; R. C. Wood, secretary and assistant treasurer; E. M. Bogardus, comptroller.

This acquisition of the Federal plant by the Fisk company is of considerable interest to the trade. The Fisk plant at Chicopee Falls, comprising some 29 acres of floor space, is said to be the largest exclusive pneumatic tire making plant in operation. The Federal company, in addition to pneumatic and solid tires, manufactures general mechanical lines, such as baby carriage tires, hoof pads, rubber heels, matting, etc. Its plant is located at Cudahy, Wisconsin—a suburb of Milwaukee—and comprises five acres of floor space.

The two organizations will be conducted separately, in both manufacturing and selling departments, the efforts of the Federal organization being especially directed towards building up and developing the jobbing and mechanical lines.

RUBBER COMPANY DIVIDENDS.

The quarterly dividend of \$2 per share has been declared by the Boston Belting Co., Boston, Massachusetts, payable January 1, 1916.

The quarterly dividend of $1\frac{3}{4}$ per cent on the preferred stock of the Goodyear Tire & Rubber Co., Akron, Ohio, has been declared, payable January 1, 1916, to holders of record December 20, 1915.

The Firestone Tire & Rubber Co., Akron, Ohio, has declared a quarterly dividend of $1\frac{3}{4}$ per cent on preferred, and 5 per cent on common stock, payable January 15, 1916.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of the shares of rubber manufacturing companies on November 7 last are furnished by John Burnham & Co., 31 Nassau street, New York, and 41 South La Salle street, Chicago:

	Bid.	Asked.
Niak Rubber Co., new.....	70	70½
Firestone Tire & Rubber Co., common.....	690	705
Firestone Tire & Rubber Co., preferred.....	112	113
Goodrich Co., The B. F., common.....	74½	76
Goodrich Co., The B. F., preferred.....	112	112½
Goodyear Tire & Rubber Co., common.....	335	338
Goodyear Tire & Rubber Co., preferred.....	114	..
Kelly-Springfield Tire Co., common, old.....	297	298
Kelly-Springfield Tire Co., common, new.....	74	75
Kelly-Springfield Tire Co., 1st preferred.....	95	98
Kelly-Springfield Tire Co., 2nd preferred.....	72½	74
Miller Rubber Co., common.....	235	243
Miller Rubber Co., preferred.....	112	114
Portage Rubber Co., common.....
Portage Rubber Co., preferred.....
Rubber Goods Manufacturing Co., preferred.....
Swinehart Tire & Rubber Co.....	87	90
United States Rubber Co., common.....	55	55½
United States Rubber Co., preferred.....	109	110

NATIONAL ASSOCIATION OF WASTE MATERIAL DEALERS.

The various divisions of the National Association of Waste Material Dealers held meetings at the Hotel Astor, New York, on December 14 and 15. The meeting of the members of the Scrap Rubber Dealers' Division was to have been held on the 15th, but the inclement weather interfered with travel to such an extent that there were not sufficient members on hand to constitute a quorum, and the meeting was deferred until the following month.

RUBBER DEALERS BUY A RAILROAD.

Theodore Hofeller & Co., Buffalo, New York, dealers in old rubber and metals, acting in conjunction with C. A. Finnegan, of that city, and A. Weber, of Louisville, Kentucky, have purchased, from the bondholders' committee, the Buffalo & Susquehanna Railway, the purchase price being quoted at \$800,000. The property includes right of way, tracks and stations of an 80-mile steam railway, from Buffalo to Wellsville, New York, with rolling stock, etc., and some valuable real estate, including a 25-acre plot, fronting on the inner harbor at Buffalo, with 2,000 feet of dockage space. It is the present intention of the purchasers to continue the operation of the road.

RUBBER TRADE INQUIRIES.

143. A new American rubber specialty company desires the name of a manufacturer of coloring or ink, such as is used for printing advertising toy balloons.

144. A correspondent wishes to be placed in touch with manufacturers of collapsible tubes and tube-filling machines.

145. A New York export house desires to secure the agency in Spain for rubber collars and cuffs.

146. A dealer in rubber goods desires names of manufacturers of metal shut-offs for fountain syringes.

147. A correspondent in Denmark desires names and addresses of manufacturers of valves for inner tubes for use in bicycle, motor and auto tires.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A Brazilian firm wishes to communicate with manufacturers of suspenders, garters and other articles. Report No. 19,303.

A man in the United States desires samples and prices on rubber heels and other articles for firms in Uruguay. Report No. 19,340.

A man in Norway wishes to establish commercial relations with manufacturers of machinery for making pneumatic automobile and cycle tires and tubes. Report No. 19,341.

A company in France desires catalogs, prices and terms for sole agency of caoutchouc articles for medicinal use. Report No. 19,371.

A man in France desires to represent American firms manufacturing rubber sponges, garden and fire hose, pipes in hard rubber or vulcanite, and other articles. Report No. 19,397.

The agency of American manufacturers of rubber goods and other supplies is desired by a man in Mexico. Report No. 19,407.

A man in Brazil wishes to represent manufacturers of rubber goods, toys and chemicals. Report No. 19,414.

A man in South Africa desires catalogs and full information from American manufacturers regarding machinery for fiberizing, spinning and weaving asbestos for fabrics made from this product, with a view to installing such machinery. Report No. 19,604.

A firm in Argentina desires to represent American manufacturers of rubber goods and other lines. Report No. 19,629.

PERSONAL MENTION.

An American contemporary speaks thus pleasantly of the editor of this paper: "Henry C. Pearson, editor of THE INDIA RUBBER WORLD, has been elected a Fellow of the Royal Geographical Society, London, an honor to which he is fully entitled, for the many investigations he has made in rubber-producing countries on four continents. Mr. Pearson well deserves this distinction, though, being a modest man, it is probable that he will refrain from adding F.R.G.S. to his signature."

B. T. Morrison, formerly at the head of the Reading Rubber Mills, Reading, Massachusetts, who has been quite ill, has so far recovered that he has gone to his winter home in Pasadena, California.

On Tuesday, December 28, Clarence H. Low, secretary of the U. S. Rubber Reclaiming Co., Inc., was married to Miss Madeline Mayer at the home of the bride's parents, the Hotel Blackstone, Chicago, Illinois. Mrs. Low is the daughter of Mr. and Mrs. Levy Mayer, a graduate of Smith College ('14) and an enthusiast in outdoor sports. Her father is a prominent corporation attorney. The happy couple will tour California and Hawaii, after which they will make their home in Westchester County, New York.

L. K. Rittenhouse, who has been connected with the Diamond and Goodrich rubber companies for the past ten years, in charge of a number of their branch-houses, resigned as manager of the St. Louis, Missouri, branch of The B. F. Goodrich Co. on December 31. It is stated that he is returning East.

R. J. Evans has resigned as president and general manager of the Franklin Manufacturing Co., Franklin, Pennsylvania, to become vice-president of the Perfection Tire & Rubber Co., Fort Madison, Iowa.

L. H. Taylor, formerly salesman at the Denver, Colorado, branch of The B. F. Goodrich Co., has been appointed Western manager for the New Jersey Car Spring & Rubber Co., with headquarters at Denver.

F. Haskell Smith, for the past four years factory superintendent of the plant of the Federal Rubber Manufacturing Co., Milwaukee, Wisconsin, has severed his connections with this company. He has not as yet announced his plans for the future.

Antonio Parra, vice-president of the Venezuela Trading Co., Ciudad Bolivar, was in New York recently and reported that 1,200 men were employed by his company in gathering balata and gum chicle from the Bajo Orinoco and the river Yuruari, Venezuela.

George S. Miller, formerly connected with the American Rubber Co., has been appointed manager of the footwear department of the United States Rubber Export Co., Limited.

Edgar B. Davis, vice-president, in charge of the General Rubber Co.'s plantations in Sumatra, recently presented to Colonel Samuel P. Colt an ivory tusk taken from an elephant killed on one of the company's estates. The tusk has been beautifully polished and bears a gold cap with the following inscription:

Colonel Samuel Pomeroy Colt, Serbangan Estate, H.A. P.M., 1914.

The other tusk taken from this same elephant was presented to one of the native sultans of Sumatra.

Commodore E. C. Benedict, on his yacht "Oneida," with a party of friends reached Havana, Cuba, on December 17. Next day the "Oneida" party, as guests of President Menocal of the Cuban Republic, went on a fishing trip along the north coast.

Dr. Frederic Dannerth, well known to the rubber trade, is now in California on a business trip. He will remain at the Coast a month or more.

Charles Howard Newman will represent Pell & Dumont, crude

rubber brokers; 68 Broad street, New York, as salesman, after January 3.

Bertram G. Work, president of The B. F. Goodrich Co., returned from Europe December 22, 1915, on the Rotterdam.

A. G. SPALDING & BROS.: NEW OFFICERS.

A. G. Spalding & Bros., New York, have elected First Vice-President J. Walter Spalding, president, to succeed the late Albert G. Spalding. He is succeeded by Second Vice-President J. W. Curtis. H. B. Spalding, son of the newly elected president and formerly counsel to the company, and G. A. Phelps, who has for years had charge of the firm's Eastern branches, have been elected vice-presidents. C. S. Lincoln, formerly in charge of the company's Western branches, with headquarters in Chicago, is now secretary, and W. T. Brown, for many years treasurer of the concern, has been re-elected to that office.

GROWTH OF A RUBBER MILL SUPPLY BUSINESS.

WHEN S. J. HOGGSON started in business in New Haven, Connecticut, as a die-sinker and engraver in 1849, he probably had no idea that his enterprise would develop into an important rubber mill supply business. But his work was in demand by rubber goods manufacturers, and his trade grew with the rapid expansion of that industry. In 1879 he formed a partnership

PLANT OF HOGGSON & PETTIS MANUFACTURING CO.

with George C. Pettis, with the firm name of Hoggson & Pettis, which, as it continued to expand, was incorporated in 1882 as The Hoggson & Pettis Manufacturing Co. The firm has always made a specialty of engraving and die-sinking for rubber manufacturers, and of the supply of such small tools as they use, and the business has grown to large proportions, as the accompanying illustration of the New Haven plant will show.

THE PANTHER RUBBER MANUFACTURING CO.

IN 1909, Frank Berenstein and Miah Marcus, formerly of the sales force of the Foster Rubber Co., Boston, Massachusetts, at the suggestion of some of their customers, started, at Trenton, New Jersey, the manufacture of rubber heels, under the trade name of "Panther." Soon afterward, William Bernstein was admitted to the business, which was ultimately incorporated as The Panther Rubber Manufacturing Co., with Frank Berenstein as president; Miah Marcus, vice-president, and William Bernstein, treasurer—offices they still retain.

The company prospered from the start, and by 1912 the demand for its product had assumed such proportions that its accommodations were inadequate and it eventually located in the plant at Stoughton, Massachusetts, which the Plymouth Rubber Co. had shortly before vacated. Since the removal to Stoughton, the company's business has continued to expand, the original 75 hands, with four in the office, having been increased to a working force of about 200, and it requires an office force of 12 to handle the business. Several large additions have also been made to the plant, in spite of which, night and day work has been necessary to keep up with the orders. A new power plant was added, but only recently a new engine had to be installed, with new machinery, that more than doubled the output, which now amounts to 2,000 to 3,000 pairs of heels per day.

The demand for the company's goods in Canada showing a consistent development, it was determined to manufacture in that country, and in 1914 a plant was established at Sherbrooke, Quebec, Canada, which now supplies the Canadian trade with the same goods that are made at Stoughton.

The company manufactures Panther Tread, Indian, Elwell, Surety and Yankee rubber heels, special heels for the shoe manufacturing trade, rubber soles, rubber soling and rubber molded specialties, the goods being sold extensively by a staff of twelve salesmen, throughout the United States, Canada, Cuba, Porto Rico, Central and South America and the Far East.

ANNUAL MEETING OF THE S. A. E.

The Society of Automobile Engineers will hold their annual meeting January 5 and 6, 1916, at the Engineering Societies Building, 29 West Thirty-ninth street, New York.

Members and guests, including ladies, are requested to register promptly on arrival in the city. The registration bureau will be open Wednesday and Thursday. Upon registration, badges, programs and papers will be supplied.

A session of the Standards Committee will be held in the rooms of the Society, January 4, at 9:30 A. M.

A Business and Standards Session of the Society will be held, January 5, at 9:30 A. M.

Professional sessions of the Society will be held, January 6, at 9:30 A. M. and 12:30 P. M. in the auditorium. The president's address will be delivered at the beginning of the Thursday morning session.

The members will be glad to learn that the annual dinner and entertainment will take the form of the gala occasions of 1913 and 1914, and will be held at the Hotel Plaza, Thursday, January 6, at 8 P. M.

TRADE NEWS NOTES.

The Nearpara Rubber Co., Trenton, New Jersey, has recently installed an up-to-date reclaiming equipment which is motor-driven and includes a special drying process. The reclaimed rubber turned out by this company contains a particularly high per cent of rubber, and the product has become very popular with rubber manufacturers.

Charles E. Wood, 24 Stone street, New York, has appreciably increased his office space and force. Mr. Wood, formerly identified with the New York Commercial Co., has been uniformly successful since his retirement from that concern, and among his many present activities is expert examining for a number of manufacturers.

The Continental Rubber Co., New York, has recently removed its offices to the Equitable Building, 120 Broadway. This company, which specializes in guayule, was formerly located at 17 Battery place.

The Loewenthal Co., 37 West Thirty-ninth street, New York, will remove its offices to the Brooklyn warehouse about January 1. The object of combining office and warehouse is the promotion of the company's service to its customers, as the increased facilities for handling, buying and selling will, in the opinion of the executives, greatly enhance the efficiency of "Loewenthal Co. Service" to its trade. The address is 747 Wythe avenue.

The Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut, has extended its welfare work by building a fully equipped moving picture theater for its employees.

The Omo Manufacturing Co., Middletown, Connecticut, maker of dress shields, won suit brought in the Federal court to restrain another manufacturer from using a similar appearing trade-mark on the same sort of goods. The Omo company's goods are marked "oMo." The other manufacturer used the mark "DMD," written in a way that, in the opinion of the court, decidedly resembled the trade-mark of the Omo company.

At the meeting of stockholders of the Bucyrus Rubber Co., held at Bucyrus, Ohio, December 9, the following officers and directors were elected: P. J. Carroll, president; George Donnem-wirth, vice-president; Anson B. McVay, secretary; W. A. Blicke, treasurer; Col. C. W. Fisher, A. G. Stoltz, H. A. Paxton, M. R. Lewis, Jacob Colter.

The General Electric Co., Schenectady, New York, is erecting a one-story factory addition, 60 x 208 feet, which will cost \$25,000. C. F. Hulth is superintendent of buildings.

A Schrader's Sons, Inc., Atlantic avenue, Brooklyn, New York, has recently added a seven-story building, which adjoins the original factory. The entire plant is constructed of concrete and is conspicuous among the modern factories of Brooklyn.

The Laurel Co., operating at Garfield, New Jersey, has added a line of plumbers' supplies and tubing to its general product of molded goods and erasive rubbers. The general manager of the Garfield company is George Dyer, Produce Exchange Annex, New York.

The plant of the S. & L. Rubber Co., Chester, Pennsylvania, has been sold for \$34,825 to Clark W. Harrison, of the Bloom- ingdale Rubber Co., Butler, New Jersey.

As Akron manager for Charles T. Wilson Co., Inc., New York, dealers in crude rubber, L. N. Le Pan has succeeded Henry Perlish.

THE NEW UNITED STATES TRUCK TIRE.

After thorough tests, under the most severe working conditions, on trucks of all kinds and roads of all descriptions, a new truck tire is offered by the United States Tire Company to truck owners as affording the maximum wear under heaviest loads and a degree of resiliency that is not only lasting but which affords the greatest protection to the mechanism of the truck. A new type of hydraulic press is used in vulcanizing this tire, under a pressure of 800 tons, which forces all gas and every atom of moisture out of the rubber. The extreme depth of the dovetailed serrations in the steel base into which the hard rubber compound is forced, and there vulcanized, makes an inseparable union between the rubber foundation and the steel rim.

These advantages, combined with a rubber compound of exceptional toughness and in larger volume than in most truck tires, are features impressed on the truck owner as insuring longer life to tires—the most expensive item in his truck equipment.

The sectional form of the tire is likewise claimed as an improvement on previous patterns, insuring the retention of the shape until the tire is quite worn out, side stripping of the tread being impossible. [United States Tire Co., New York.]

PERSONAL MENTION.

Jesse E. La Dow, as representative of the Mansfield Tire & Rubber Co., Mansfield, Ohio, has been appointed chairman of the press and publicity committee of the Ohio Manufacturers' Association. Mr. La Dow presented a report at the fifth annual meeting of the association held at Columbus, Ohio, on December 14.

John W. Conway, superintendent of the Bridgeport, Connecticut, branch of the Polack Tyre & Rubber Co., New York, is making an extended trip abroad, to investigate conditions as related to the English and German factories of the Polack company.

Charles E. Ross has been made manager of the Columbus branch of the Midgley Tire & Rubber Co., Lancaster, Ohio.

At a meeting of the Board of Directors of the United States Tire Co., New York, held December 15, Ernest Hopkinson, patent counsel of the United States Rubber Co., was elected vice-president and a member of the executive committee of the United States Tire Co.

George B. Hendrick, of Winthrop, Massachusetts, has been appointed manager of the newly established publicity department of the Fisk Rubber Co., Chicopee Falls, Massachusetts. In addition to publicity matters, he will have charge of printing and will edit the company's house organ, but the new department will have no connection with the advertising department, the management of which remains unchanged. Mr. Hendrick is well known among newspaper and advertising men of the East, having been, successively, advertising manager of the Boston "Traveler and the Pittsburgh "Post" and "Sun," and sales manager of the A. Muford Corporation, of Hartford, and of the George H. Ellis Co., of Boston. He goes to the Fisk company from the latter concern.

Arthur E. Friswell, who returned to the United States early last summer after several years' stay in Bermuda, as recorded in THE INDIA RUBBER WORLD of June 1, 1915, is to engage again in the tire manufacturing business. He has accepted a position with the Northern Rubber Co., Retford, Nottinghamshire, England, to reorganize and extend the business of its Sheffield branch in the engineering machinery and colliery districts of the North of England.

The Michelin Tire Co., Chicago, Illinois, informs us of the advancement of R. B. Tracy, formerly central manager, to the position of factory representative, with supervision over the following branch territories: Philadelphia, Cleveland, Chicago, St. Louis, Des Moines, Kansas City and Minneapolis.

TRADE NEWS NOTES.

In a circular letter, dated December 1, 1915, Haart M. Brunn announces the dissolution, by mutual consent, of his partnership with Paul Bertuch, under the firm name of Hagemeyer & Brunn, and that the business will be continued by him, at the same address, 9 Stone street, New York, under the same firm name. Paul Bertuch, under the same date, announces his intention to continue in business as a rubber merchant, under his own name, at 25 Beaver street, New York.

A meeting of the American Society for Testing Materials, Committee D-11 on standard specifications for rubber products, was held in New York, December 14, 1915.

The directors of the Canadian Connecticut Cotton Mills, Limited, Sherbrooke, Quebec, Canada, have authorized a large addition in the equipment, doubling the production of the mill. Additional buildings will also be erected. Although the consumption of tire fabric in Canada has heretofore been insufficient to warrant this expansion, evidence of an era of better times now leads the company to anticipate conditions and prepare for more economical operation.

Fire broke out in the plant of Julius Schmid, manufacturer of druggists' sundries at Long Island City, New York, on the night of December 10, 1915, the three-story frame building and entire contents being totally destroyed, with a loss of \$20,000, fully covered by insurance. The flames spread to the residence of C. F. Schmid, secretary of the company, adjoining the factory, and this, with its contents, was also destroyed.

The L. H. Butcher Co., San Francisco and Los Angeles, California, will act as selling agent on the Pacific Coast for Katzenbach & Bullock Co., New York, Chicago and Trenton. The latter concern imports and deals in chemicals, colors and compounding ingredients, making a specialty of supplying the requirements of rubber manufacturers in these materials.

At a meeting of the board of directors of the Rubber Goods Manufacturing Co., Jersey City, New Jersey, held on December 1, 1915, the regular quarterly dividend of 1 1/4 per cent on the preferred stock was declared, payable December 15 to stockholders of record December 10.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, announces the payment on January 1, 1916, at the office of the Guaranty Trust Co., of New York, 140 Broadway, of the convertible sinking fund five per cent gold bonds of the company, issued and outstanding, under the trust indenture of March 30, 1906. Holders of the bonds who wish to anticipate said date of redemption, may surrender them for cancellation at the above address and will receive, in cash, the face value of their bonds, with a premium of five per cent and interest on such face value at the rate of five per cent per annum, from July 1, 1915, to the date of surrender.

The Converse Rubber Shoe Co., Malden, Massachusetts, has established a western sales department in Chicago, Illinois, with Morton L. Paterson, well known in shoe trade circles, as manager. Premises at the corner of Peoria street and West Jackson Boulevard have been leased for the purpose.

ROBERT BADENHOP, RUBBER DEALER, RETIRES.

The firm of Robert Badenhop, dealers in crude rubber, at 67-69 Wall street, New York, enters into liquidation January 1, 1916, the head of the firm, Mr. Badenhop seeking rest and recuperation of his health, overstrained by close attention to business. The interests of the firm will be transferred to a new corporation, organized for this purpose, of which H. W. Holcombe and Sloan Lamont, Jr., will have the active management. They have both been associated with Mr. Badenhop for several years and are well known in the trade. The title of the new concern will be the Robert Badenhop Co. The offices will remain at the same address and the branch office in the Second National Building, Akron, Ohio, will also be maintained.

TRADE NEWS NOTES.

On application of the president, Wilmer Dunbar, a receiver has been appointed for the Dreadnaught Tire & Rubber Co., Baltimore, Maryland. President Dunbar states that the receivership is only temporary and will in no way interfere with the company's business. Eli Frank has been named as ancillary receiver. The company is a Delaware corporation with \$1,000,000 capital stock.

Music enters conspicuously into the "social uplift" at the Morgan & Wright branch of the United States Tire Co., Detroit, Michigan. With the aid of a player-piano, donated by the corporation, and the musical talent that appears to be well represented in the working force, a daily vocal and instrumental concert is given during the noon hour in the dining room, patronized by some 2,000 employees.

The Cleveland-Ford Tire Co.'s new plant at Ashtabula, Ohio, is reported as progressing steadily. All the foundations are complete, and work will go on rapidly. The main building will be 73 x 182 feet, two stories high, of reinforced concrete with brick facing. Provision will be made for its extension and the addition of a vulcanizing plant. A separate building will accommodate the company's several offices, but an office will also be retained in Cleveland, Ohio.

The Bowers Rubber Works, San Francisco, California, is equipping its plant at Pittsburg, California, with an outfit for making automobile tires.

Toledo Tire & Supply Co., Toledo, Ohio, is enlarging its present store facilities, and will put in a modern multiplex display system.

Leigh-Peck Tire & Rubber Co. will occupy a new building nearing completion on Second avenue, Cedar Rapids, Iowa. The company will handle exclusively the products of the Firestone Tire & Rubber Co., Akron, Ohio, and will control their sale in eight counties adjacent to the city.

UNITED STATES TIRE CO.'S CONVENTION IN DETROIT.

Four days of tire enthusiasm marked the gathering of the salesmen and branch managers of the United States Tire Co., assembled at Detroit, Michigan, during the week ending December 18, 1915, for their regular convention. The tire company's Morgan & Wright plant was the place of meeting, and there J. Newton Gunn, recently chosen president of the company, made the acquaintance of the members of his selling staff, gathered to the number of about 400, from all parts of the country, in spite of storms and snowdrifts.

The convention assembled in Building K of the plant, and among the many interesting addresses, technical or otherwise, C. B. Whittlesey, vice-president of the Hartford Rubber Works Co., read a paper on "The History of Rubber," and Factory Manager McMahan spoke on "How Tires Are Made."

The social features of the convention proved thoroughly enjoyable. They included a business dinner at the Hotel Pontchartrain, and a banquet at the hotel on Friday evening, at which many of the automobile manufacturers were present as guests.

THE GOODRICH "BAREFOOT" TIRE.

A new Goodrich tire has been christened the "Barefoot" and is recognizable by its black tread. This tread or sole of the new tire is made of "hyper-rubber," a compound evolved by The B. F. Goodrich Co., Akron, Ohio. This hyper-rubber tread has a certain amount of stretch, between the outer surface contact with the ground and the inner surface, which is cemented to the cotton fabric. This stretch or "spring," it is claimed, reduces the grind, the frictional heat and wear, between tire and roadway, that is so severe on tires. It is described as lessening the strain on the rubber layers between the fabric occasioned by starting or stopping suddenly. Maximum traction with minimum friction is what the new tire stands for and the manufacturers expect it to result in maximum mileage from every ounce of material used.

EXPANSION OF THE FISK RUBBER CO.'S PLANT.

The Fisk Rubber Co., with the completion of the new buildings in course of construction, will have in its plant at Chicopee Falls, Massachusetts, 29 acres of floor space devoted to the manufacture and distribution of tires. With the completion of the exterior construction, a fair idea may now be obtained of the magnitude of the plant. The new administration building, of stone, steel and tapestry brick, is 50 x 200 feet, and seven stories high; the new mill building of brick and steel, 108 x 60 feet, has five stories and basement; the new storehouse, of reinforced concrete and steel, with brick panels, 108 x 300 feet, has five stories and basement, and there is also a new garage and service station, 60 x 100 feet, with separate accommodations for private cars and trucks. The administration building is unusually complete as to arrangement, equipment, etc. It contains more than 50 office apartments, rest rooms, three dining rooms that will accommodate 200 people, kitchens, refrigerating and ice-making apparatus, etc. With the recent additions, the plant will comprise 20 separate structures, and the output of tire casings alone will be increased to 12,000 per day.

KELLY-SPRINGFIELD REDUCES PAR VALUE OF COMMON STOCK.

At a special meeting of stockholders held in Jersey City, New Jersey, on November 30, the Kelly-Springfield Tire Co., New York, authorized a reduction in the par value of the common stock from \$100 to \$25 a share. This will increase the number of shares outstanding four times. Holders of new common stock will be entitled to one vote for each share of \$25 par value, and, in order to equalize the voting power of common and preferred, the preferred stockholders will have four votes for each \$100 share.

Quarterly dividends of $\frac{1}{4}$ per cent on the 6 per cent preferred stock and $\frac{1}{4}$ per cent on the 7 per cent second preferred stock have been declared, payable January 3, 1916, to stockholders of record December 15, 1915.

TO MAKE CRATES FOR TIRE SHIPMENTS.

There is a large demand for crates made of hardwood, for the shipment by freight, or express, of rubber tires. Two of the leading concerns engaged in their manufacture as a specialty, The Steele Bros. Lumber Co., Cuyahoga Falls, Ohio, and the Alderfer Crate Co., Sharon Center, Ohio, have recently combined to form a new corporation, the Steel-Alderfer Co., with a capital of \$50,000. Both companies formerly did a large business with tire manufacturing concerns all over the country, especially those at Akron, Ohio, and the recent destruction by fire of the Alderfer plant made the combination timely and judicious. A large and completely equipped manufacturing plant, of fireproof construction and more than double the capacity of the two former plants, will be erected at Cuyahoga Falls to handle the joint business of the combined companies.

SANITARY SUPERVISION FOR FISK RUBBER CO. EMPLOYEES.

The conservation of the health and hygienic welfare of employees as an important factor in business success, has led the leading rubber manufacturing concerns to devote constantly increasing attention to this important subject. The Fisk Rubber Co., Chicopee Falls, Massachusetts, which is adding extensively to its plant, has not overlooked this important point. Dr. William Hall Coon has been placed in charge of the department of industrial hygiene that will look after the health of the army of Fisk employees. Dr. Coon is admirably fitted by experience and professional ability for this important position. For upwards of eight years he was connected with the State Board of Health as district health officer, during part of the time in charge of one of the most populous districts in the State, where he was constantly in touch with industrial conditions. In supervising remedial and prophylactic work and sanitation at the Fisk plant, he will find a wide field for the exercise of his ability as a physician and in an executive capacity, and the company is to be congratulated on being able to secure his services for this important work.

TRADE NEWS NOTES.

During the past year the McGraw Tire & Rubber Co., East Palestine, Ohio, has established both pneumatic and truck tire branches in most of the principal cities of the United States. The most recent addition is at Detroit, Michigan, located in the Dime Savings Bank Building, and is under the supervision of G. W. Tiffany, formerly with the Gilbey Tire & Rubber Co.

The Brooklyn, New York, branch of the Firestone Tire & Rubber Co., Akron, Ohio, will remove soon after January 1 to a building at Sterling Place and Bedford avenue, recently purchased from the Ford Automobile Co. The building will be utilized solely for the distribution of Firestone goods for Brooklyn and Long Island. A portion will be used as a service station, with a complete shop equipment for the repair and application of solid motor truck tires.

The Eastern Rubber Co., 1529 Ridge avenue, Philadelphia, Pennsylvania, which has been experimenting for some time, announces that a compound that makes a perfect inner tube joint, without the use of acid or heat, has been perfected.

An issue of \$850,000 in 7 per cent preferred stock of the Goodyear Tire & Rubber Co. of Canada, Limited—a subsidiary of the Goodyear company of Akron, Ohio—has been put on the market for the purpose of enabling the Canadian company to redeem common stock which is owned entirely by the Akron company. This will give the Canadian company greater financial independence, but the business connection between the two companies will still be continued. The Canadian company was organized to overcome the high tariff rates of rubber goods that are in effect between the United States and Canada.

The Schelp-Budke Tire & Rubber Co., St. Louis, Missouri, has recently acquired the agency in Missouri and Southern Illinois for the pneumatic and solid tires of the Victor Rubber Co., Springfield, Ohio.

The Dry Climate Tire Co., Denver, Colorado, intends to establish a branch plant at El Paso, Texas, for the manufacture of casings and inner tubes for automobiles and bicycles.

The Mason Tire & Rubber Co., Cleveland, Ohio, has decided to locate at Kent, Ohio, and will erect a concrete building with a floor space of 30,000 square feet. The estimated cost is \$60,000.

The plant, property and equipment of The Morgan & Marshall Rubber & Tire Co., manufacturer of automobile tires and tubes, was sold on November 30, to J. C. McLean, president of the M. & M. Co., Cleveland, Ohio, by the receivers. The price paid is stated to have been \$47,600. It is expected that the M. & M. Co., which is a supply house, will take up the manufacture of tires.

The McNaull Tire Co., Toledo, Ohio, whose incorporation was mentioned in the December issue of THE INDIA RUBBER WORLD, succeeds the McNaull Auto-Tire Co. The new company proposes to erect larger buildings and employ 1,000 additional men. W. D. McNaull is the president of the company; M. W. McNaull, vice-president; A. B. Laskey, secretary, and Ole Hilmer, sales manager. Mr. McNaull is the patentee of the McNaull boiler, built by the McNaull Manufacturing Co.

The Standard Tire & Rubber Co., with offices in the Hippodrome building, Cleveland, Ohio, and factory at Willoughby, Ohio, is manufacturing a line of tires and tubes with a 5,000-mile guarantee. This is one of the newer companies of the Middle West, and is said to be operated under particularly capable management, as the executive force, factory superintendent, and various heads of departments have had long and successful experience in tire manufacture. The president of the company, Mark Gillen, is well known in rubber circles, having been identified with some of the largest rubber mills of the country for many years.

AN INGENIOUS WINDOW DISPLAY.

A method of displaying goods in a show window that is alike unique, original and calculated to prove profitable to the retailer has been devised by Charles E. Miller, Anderson Rubber Works, Anderson, Indiana. The drum, which we show, is four feet in diameter, octagonal in form, and fills the show window of a 36-foot store, having a display surface of about 432 square feet. The goods are attached to the drum in such a manner as to preserve

REVOLVING WINDOW DISPLAY.

its balance, the figures being so written and displayed as to be plainly legible from outside. Other index figures refer to the bin, etc., in which the article is to be found.

By means of an electric motor, operated from a 16-candle power lighting socket, the drum is slowly revolved, making a complete revolution in about 40 seconds. By this means the display of a large assortment of goods is made possible, while the novelty of the device and the steadily appearing and disappearing lines of goods is certain to attract the attention of the passing pedestrian, with the possibility of its presenting something that he wants.

A CHANGE THAT MEANS EXPANSION.

The Lee Rubber & Tire Corporation, the incorporation of which is noted elsewhere in the present issue of this paper, held a meeting for organization on December 20, 1915, at which officers were elected as follows: President, Albert A. Garthwaite, formerly president of the Lee Tire & Rubber Co., Conshohocken, Pennsylvania; vice-president and chairman of board of directors, John J. Watson, Jr.; assistant secretary and assistant treasurer, William McCaw. The new corporation has acquired all the bonds, and the preferred and common stock of the company it succeeds. The bonds will be retired, and with extra capital, its business in the manufacture of tires, surgical and miscellaneous rubber goods, carried on at its plants at Spring Mill and Conshohocken, Pennsylvania, will be greatly extended, the tire making capacity alone to be increased from 1,500 to 3,000 per day.

GILLETTE SAFETY TIRE CO.'S NEW PLANT.

The Gillette Safety Tire Co., Inc., formerly of Grand Rapids, Michigan, has commenced operations on the erection of a new plant at Eau Claire, Wisconsin. The initial one-story building is to be 60 x 250 feet, of brick and reinforced concrete. It is located and constructed to permit additions being made at any time. The latest improved machinery will be installed, and the initial output will be 100 tires and tubes daily. The company will also manufacture solid tires for trucks and heavy vehicles, and everything in the line of tire accessories. A temporary office has been opened in Eau Claire, with Vice-President H. B. Gillette and Secretary J. S. Wilson in charge.

NEW INCORPORATIONS, WITH AUTHORIZED CAPITAL, ETC., 1915.

Airless Auto Wheel & Tire Co., Inc., The, December 20 (New York), \$10,000. Antonio Martone, Rachele Sciano and J. Russell Borvilleri—all of Rochester, New York. Airless auto wheels and tires.

Ajax Rubber Co., Inc., December 20 (New York), \$5,000,000. Charles E. Lynch, 514 West 182nd street; William J. Jackson, 945 East 18th street—both in New York City; Charles L. Morris, 201 Baldwin avenue, Jersey City, New Jersey. Tires, rubber goods, etc.

Atlas Arabicum Co., Inc., December 1 (New York), \$10,000. J. Blair Cameron and Samuel M. Cameron—both of 49 Broadway; Gustave M. Marcus, 8 Greene street—all in New York City. Rubber and leather goods.

Bond Tire Co., November 12 (Massachusetts), \$100,000. Albert B. Weld, Wilbur M. Doullens—both of 107 Massachusetts avenue, Boston, and Edwin Cook, Danvers—both in Massachusetts. Office, Boston, Massachusetts. To manufacture and deal in tires, tubes, etc.

Bronx Rubber Co., Inc., December 17 (New York), \$5,000. H. K. Halikman, 1209 Bedford avenue, Brooklyn, New York; Isidore Teitelbaum, 446 Westchester avenue, Bronx, New York; and William J. Gannon, 937 East 22nd street, New York City. All kinds of vehicles and motors.

Cassidy Co., Inc., Edward A., December 2 (New York), \$20,000. Edward A. Cassidy, 1022 Pelhamdale avenue, Pelham Manor, New York; George E. Coughlin, 546 Eighth avenue, New York City, and Herbert R. Rising, East Orange, New Jersey. Automobiles, tires, etc.

Lee Rubber & Tire Corporation, December 16 (New York), Robert E. J. Corcoran, 328 Union street, James Gru, 17 Fourth street—both in Brooklyn, New York; Edward Roeder, 366 Teaneck Road, Ridgely Park, New Jersey. Carry on business with \$750,000. Shares of stock having no nominal or par value.

McTernan Rubber Manufacturing Co., November 9 (Massachusetts), \$150,000. August H. Goetting, Springfield; Lawrence F. Sherman, 249 Castle Road, Nahant; Charles S. Johnson, 44 Breed street, Lynn; Andrew McTernan, Andover, and Osborne R. Witter, Swampscott—all in Massachusetts. Office, Boston, Massachusetts. To manufacture rubber goods, tubing, etc.

Marion Tire & Rubber Co., The, October 9 (Ohio), \$15,000. A. J. Berry, W. H. Holverstott, S. B. Lippincott, N. J. Jones, J. L. Price, W. F. Moyer and R. T. Lewis. To deal in tires and accessories.

Miller Tire Corporation, December 24 (New York), \$2,500. Benjamin F. Bogart, Asbury Park, New Jersey; Wilson R. Hunter, 224 West 105th street, New York City, and Miles P. Gordon, 537 First avenue, Astoria, Long Island, New York. Rubber tires of all kinds.

Morong Shoes, Inc., November 12 (New Jersey), \$25,000. Grace C. Morong, 189 Grafton avenue, Newark; David R. Thomson and Benjamin Thomson—both of 85 Park avenue, Paterson—all in New Jersey. To deal in rubbers, etc.

Nelson Truck Tire & Wheel Shop, Inc., November 24 (New York), \$5,000. Lincoln Tyler, 25 Liberty street, Harry D. Nelson and Jesse L. Nelson—both of 173 Lexington avenue—all in New York City. To manufacture autos, tires, etc.

Parker-Wood Manufacturing Co., October 22 (Massachusetts), \$15,000. Edward E. Wood, Jr., Brookline, Arthur S. Brock, 57 Broad street, Boston; George C. Parker, 339 Lincoln avenue, Cliftondale—all in Massachusetts. Office, Boston, Massachusetts. To manufacture and deal in rubber and rubber goods, etc.

Savage Tire Co., November 10 (Oregon), \$1,000,000. Arthur W. Savage (president), John D. Spreckles (first vice-president), Harry L. Titus (second vice-president), Claus Spreckles (sec-

retary), A. J. Savage (treasurer)—all of San Diego, California. Office Main and Sicard streets, San Diego, California. To manufacture and deal in tires, tubes and accessories.

Schafer-Bowlus Tire & Rubber Co., The, November 12 (Ohio), \$10,000. H. B. Schafer, H. D. Bowlus, William J. Lennon, William Schaefer, and C. A. Suhr. To manufacture and deal in rubber goods.

Transparent Rubber Works Inc., December 7 (New York), \$5,000. Morris Goldman, 1346 Lyman Place, Bronx, New York; Charles G. Newman, 644 Snediker avenue, Brooklyn, New York, and Herman A. Schoenfeld, 309 Broadway, New York City. To manufacture rubber goods, druggists' sundries, etc.

Traveller Tire & Tube Co. of New England, November 18 (Maine), \$150,000. Horace Mitchell (president), H. A. Paul (treasurer), M. G. Mitchell (director)—all of Kittery, Maine. Office, Kittery, Maine. To manufacture and deal in tires, tubes, etc.

Yates Tire Co., Inc., December 20 (New York), \$25,000. R. K. Cavanaugh, Ernest F. Talmitch and Garrett Smith—all of Rochester, New York. General tire business.

Yorkville Waterproof Footwear Co., Inc., December 15 (New York), \$1,000. Benjamin Levy, 1728 Second avenue, Morris Sodickson, 1752 Second avenue—both in New York City, and Sophia Gordon, 515 Gravesend avenue, Brooklyn, New York.

REMARKABLE UNIFORMITY IN TWO BIG BELTS.

The two big belts shown in the accompanying illustration were made by Gutta Percha & Rubber, Limited, Toronto, Canada, as part of the belting equipment of the new Government Terminal Grain Elevator at Vancouver, British Columbia, and are claimed

TWO BELTS MADE IN CANADA.

to be the largest ever made in Canada. A remarkable fact in connection with these belts is the uniformity in manufacture they represent. One, 1,410 feet 8 inches in length, weighs 9,421 pounds; the other, 1,411 feet long, weighs 9,423 pounds—a difference in weight of but two pounds, which the four inches difference in length easily accounts for. Considering that each belt was more than a quarter of a mile long and weighed nearly five tons, this uniformity in weight for length is more than remarkable. That it is not merely fortuitous is proved by the fact that in all the 36-inch, five-ply belting, the variation from the manufacturer's average weight did not exceed one per cent, and in the six-ply, did not exceed two-thirds of one per cent. There were three other belts in the outfit nearly as large as those illustrated, and the total net weight of belting furnished on the contract was 52 tons.

Welfare Work in a Modern Rubber Shoe Factory.

WELFARE work in rubber factories has made great progress in the last few years, perhaps as much as in any other branch of American industry.

Take the Hood Rubber Co., as an example. At its great group of factory buildings at East Watertown, Massachusetts, it employs upwards of 4,500 hands. In March, 1911, a welfare department was established for this army of workers. A hospital was first established and placed in charge of a registered physician and surgeon, a graduated nurse and a secretary. This hospital is furnished with all the most approved appliances for the treatment of sickness, accidents and surgical cases, except what are termed major surgical operations. There is, besides the doctor's office, a prescription department, an eye, ear, nose and throat section, an operating room, a dental department, a hospital ward with two beds, and a rest room with two couches.

The dental department has three chairs and is really a branch of Tuft's College dental clinic, and each forenoon an instructor and three advanced students give their services. The Hood Rubber Co. gives the patients their time, and the patients pay only the cost of the material. In the single year this department has been established, more than 1,000 treatments of extracting, filling and cleaning have been given.

In the hospital more than 10,000 emergency treatments were given the first year, and the number increased to 18,000 last year. Of these, two-thirds were medical and one-third surgical. This department is in charge of Dr. R. S. Quinby, a graduate of Tuft's College and Medical School and of St. Elizabeth's Hospital. Dr. Quinby came here four years ago, as assistant to Dr. Dennon, who instituted the department, and succeeded him at his retirement in July, 1914.

A pulmotor provided for asphyxiation emergencies has never been in service and, fortunately, serious accidents have been rare. Safety appliances have been installed, and special attention has been paid to ventilation, lighting and sanitary arrangements; while new employees are given special instructions as to proper care and caution in their work.

All water for drinking purposes is filtered, purified and cooled, and distributed to fountains installed on all the floors. There are rules regarding expectoration. There are rest rooms on each

floor, and three matrons see that all the sanitary rules are enforced.

Lead poisoning is the most prominent danger in the mill room of a rubber factory. Special precautions are taken to guard against this danger. Exhaust fans are placed over each grinder. The floors are wet down before sweeping, and all employees are cautioned to thoroughly cleanse their hands before eating, or before leaving the factory. Every six months those workmen who come in contact with lead, or other deleterious substances or chemicals, are examined thoroughly for traces of poisoning.

Plans are developing rapidly along social, athletic and educational lines. There are two bowling leagues for men, one of 14 teams and another of 12 teams, and a ladies' bowling league of six teams. At the end of the season the company furnishes prizes and provides a banquet at which these are awarded. In the winter there is arranged an elaborate indoor athletic affair for all of the Hood teams, and in the summer a monster picnic to which all of the employees and their friends are bidden.

A mutual benefit association is carried on by the employees, that provides sickness, accident and death benefits. The company has not interfered with this department, believing it to be of educational value to the workers in developing self-reliance.

The large dining room is also used as a meeting place for the foreign-speaking work-people, where lectures are given in Italian and Armenian languages on American history, citizenship, and other helpful topics. At these meetings an Italian or an Armenian band, composed of workmen in the factory, furnishes music. Stereopticon illustrations usually accompany the lectures.

The indirect result has been better attendance at the evening schools provided by the city, the formation of an amateur dramatic club, and a large number of the foreign born workers have taken out naturalization papers and become American citizens.

The restaurant is a large, well-lighted room with mission tables and seats for two hundred people. The clerical force can obtain at cost a wholesome midday meal prepared in the modern kitchen furnished with the latest up-to-date appliances. The bill of fare is changed each day and the variety comprises appetizing and

OPERATING ROOM, WELFARE DEPARTMENT HOSPITAL.

seasonable dishes. Soups are furnished at 7 cents; cold meats with potatoes, 17 cents; hot roast meats with "fixin's," 23 cents; sandwiches, pies, puddings, tea and coffee, 5 cents.

The restaurant is run on the cafeteria plan (a self-serving system), and employees may purchase a full meal, or any part of a meal from the menu. Those who prefer to bring their lunches are required to eat them in the restaurant, where they have the use of the tables free. This rule is made in order to bring the workers together socially. A secondary result is cleaner offices and less refuse in the waste baskets.

RESTAURANT USED AS LECTURE ROOM.

There is also a private dining room where the heads of departments and the salesmen are served, and where any customers visiting the factory may be invited. Here a course dinner is served. Adjoining this is a rest room with current magazines and the nucleus of a library.

Thus the company is caring for the health and comfort of its employees and the results are mutually beneficial. The workers are healthier and happier, and give more efficient service to their employers.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

EVERY branch of the rubber trade is getting a share of the country's prosperity. In many lines production slows down the last two weeks in the year, but instead we hear of cases where demand is making overtime necessary. The clothing business is one of these, and the leading companies have orders enough ahead to keep them running full time, and also immediate or delayed orders which make full output imperative. Rubber heels and soles are in demand, and one company, at least, is working nights, and even holidays to keep abreast of orders. The mechanical goods people usually slow down the whole month of December, but the month just closed has proved a notable exception. The demand for rubber belting is greatly increased by the tremendous advance in leather belting costs, though this is in part supplied, where applicable, by rope transmission. Druggists' sundries manufacturers are about as busy as usual at this season. They have had good business, but it generally drops off about the first of December, to start up again after the year is really going. Boot and shoe men had an unusual streak of business the middle of the month, when a big snow storm made a consumer's demand which caused the shipping forces of the wholesale houses several nights' extra work.

* * *

As is very generally known, the Stoughton Rubber Co. and the American Rubber Co. are subsidiary to the great United States Rubber Co. Following the newly established policy of

concentration, these two companies have been merged into one big corporation, which will continue to run the rubber clothing factories in Cambridge and in Stoughton, but will consolidate the sales departments into one, centrally located and fully equipped for carrying on the combined business of the two companies. The same officers will manage the business, which is expected to be the most complete, best systematized organization in this line in the United States. The goods will be sold under the same trade brands, namely Stoughton Rubber Co., American Rubber Co., and Boston Rubber Co. The location for the new selling department has not yet been decided upon, but will be at some point in the district where large buyers congregate, who visit the clothing trade.

* * *

The Stoughton Rubber Co. has for years been the Boston agent for the New York Belting and Packing Co., and this agency occupies one half of the large floor at 232 Summer street. Now that the previously mentioned merger is practically effected, the New York corporation will take over the management of its Boston business, and this will be transferred to some new location as soon as the right one is found.

* * *

One of the special advantages of the United States Rubber Co.'s consolidation of the boot and shoe units of distribution in Boston under one roof was proved during the middle week of last month, when the storm caused such an influx of rubber shoe orders that only a thorough system enabled Manager Porter to get out the goods with the despatch demanded by the emergency. For instance, on Friday, the 17th, nearly one thousand different shipments were packed and sent out, and these lots were considerably larger than the average orders. This company has an immense store and storehouse of ten large floors, and the shipping department is proving its efficiency in busy times.

* * *

The storm emphasized what was most evident for weeks before it happened, namely, the vexatious delays caused by freight congestion. Both shipments and deliveries have been so delayed as to cause actual loss of business, supplies failing to arrive when expected, and the car shortage interfering with the forwarding of orders. The Monaquot Rubber Co., at South Braintree, solved the shipping problem most satisfactorily, by trucking their goods over the road to Boston, and shipping by boat to their customers who could be reached advantageously that way. Mr. Turner is in receipt of several most commendatory letters because of this accommodation to the customers of the company.

* * *

The last week in December was a busy one with the branch store footwear salesmen of the United States Rubber Co. They gathered from Omaha, St. Louis, Indianapolis, Des Moines, St. Paul, Milwaukee, Chicago, Detroit, Toledo, Columbus, Pittsburgh, Rochester, Buffalo, Syracuse, Baltimore and New York, meeting in Boston on Tuesday, the 28th.

On that day the salesmen selling "American" rubber shoes visited the mill at Cambridge, and the Banigan men proceeded to Woonsocket. The next day they visited the National mill at Bristol.

The Candee, Hubmark and Wales-Goodyear salesmen inspected the Bristol factory, Tuesday, and their respective factories in New Haven, Malden and Naugatuck on Wednesday.

Thursday the clothing salesmen had a session at the American mill in Cambridge, and after a lunch at the American House, the afternoon was spent there at a business meeting.

Thursday night a reception was given to Colonel Colt, followed by a dinner in the great banquet hall of the City Club, at which nearly 500 were present. Felicitous addresses were made

by President Colt and by J. Newton Gunn, George H. Mayo, William E. Barker, E. S. Williams, Harry B. Hubbard, Charles C. Chase, Raymond B. Price, George W. Perry and Homer E. Sawyer.

Every participant in this conference was presented with a handsome gold badge, a *fac simile* of the trade-mark of the company.

The whole affair was a most successful one. All present were filled with enthusiasm as they left for their homes, determined to beat their last year's record.

Another event in the rubber footware trade was the dedication of the new building recently added to the Apsley Rubber Co.'s plant at Hudson, which occurred too late to be fully chronicled here. The event was celebrated by a banquet, and a ball, in which all the employees of the company were invited to participate.

Owing to the demand for rubber heels and soles, I am informed that orders were so heavy and so pressing that the B. & R. Rubber Co., of North Brookfield, asked many of its employees to work Thanksgiving Day, paying extra wages to those who availed themselves of the opportunity. The busy season continuing, the workers themselves asked permission to put in Christmas Day at the factory, an offer gladly accepted. Mr. Richards promising to pay them double wages for this extra time, they to work ten hours and receive pay for two 12-hour days.

The creditors' committee of the Walpole Tire & Rubber Co. announced the sale of the land, buildings and equipment of the company at Walpole and Foxboro, Massachusetts, to the Standard Woven Fabric Co., Framingham, Massachusetts, for \$188,000, which was to be paid on or before December 15, 1915. The Standard Woven Fabric Co. issued \$500,000 worth of 6 per cent preferred stock, to pay for the plant and take care of re-equipment for its purposes, and the entire issue was promptly underwritten. The Walpole plant includes 70 acres of land and 16 buildings, having 175,000 feet of floor space. It will be utilized by the purchasers in the manufacture of Multibestos brake lining and other specialties. Eventually the company expects to erect additional buildings, consolidate its business at Walpole and dispose of the Framingham property.

As a result of an all around increase in its business, the Empire Rubber & Tire Co. has removed its headquarters to more commodious accommodations in the large, new fireproof building at 179 Massachusetts avenue.

In the suit brought by the Boston Rubber Shoe Co., which applied for an injunction to prevent the State treasurer, the tax commissioner and attorney-general from taking steps to enforce payment of an additional tax of \$40,161.99, levied as a franchise tax, as reported in THE INDIA RUBBER WORLD of December 1, Judge Pierce, in the Supreme Court, dismissed the bill applying for the injunction, on the grounds that the company could raise the question as to the constitutionality of the statute under which the tax is assessed in defending the proceedings which have been commenced by the State officials above mentioned, to enforce payment of the tax.

This year's annual meeting and dinner of the New England Wholesalers' Association was held at Young's Hotel, on December 8, 1915. The usual annual reports were presented and officers elected for the ensuing year. One of the post-prandial orations was an interesting address by William E. Barker, manager of sales of the United States Rubber Co., who recently returned from a business trip to Europe and spoke on the subject of "Rubber Trade Conditions at Home and Abroad."

Bankruptcy proceedings were instituted against the Columbia Rubber Co. on December 22, by its creditors. The claims of the petitioners amount to \$2,140.79.

E. S. Kidder, manager of the United States Tire Co., in this city, attended the conference of the branch managers in Detroit.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

THERE is a seeming incongruity in the statement that an unusual degree of prosperity caused the shutting down this week of the Ajax Rubber Co.'s plant and two departments of the John A. Roebling's Sons' Co., yet such was the case. The odd situation was brought about by the congestion of the freight yards and tracks in and around Trenton, preventing the movement of carloads of coal destined for the establishments referred to. Operations have been resumed, however, at both the Ajax and the Roebling plants and they are unusually busy. Not in many years have the railroads been so severely taxed to take care of both incoming and outgoing shipments of raw materials and manufactured goods. The rubber manufacturing companies are seriously inconvenienced by existing freight conditions. Recent orders of the Pennsylvania Railroad Co. prohibit the agents from accepting consignments destined for New York with the exception of foodstuffs. In many sections not a train of cars can be moved, and it is estimated that 20,000 loaded cars are blocked on the tracks between Jersey City and Pittsburgh. Trenton rubber manufacturers generally agree that 1916 holds promise of unusual prosperity for the trade, as many substantial orders for next year have already been booked.

The Ajax Rubber Co. has been incorporated, under the laws of New York, with a capital of \$5,000,000—all common stock of \$50 per share par value—to take over the business of the Ajax-Grieb Rubber Co. Of the total stock, \$3,000,000 will be issued at once to exchange for outstanding Ajax-Grieb shares, and of the remainder, part will be sold and the proceeds employed in enlarging the Trenton plant. It is stated that this company's contracts, with 300 dealers, aggregate \$3,000,000, and for the period ending August 30, 1916, gross sales of \$4,500,000 to \$5,000,000 and net earnings of \$750,000 are predicted. The company's annual earnings for four years ending August last, approximated \$450,000, equivalent to \$7.50 per share on the stock.

The Essex Rubber Co. announces that the department in which condensate was manufactured has been sold to the Pouvaill-Smith Corporation, Poughkeepsie, New York, organized with \$2,500,000 capital by J. Wilson Poucher, Elias C. Vail and Grant E. Smith, all of Poughkeepsie, to manufacture electrically heated steering wheels for automobiles and other automobile parts. The transaction was prompted by the fact that this department had outgrown the accommodations the Essex Rubber Co. were able to afford it. The Pouvaill-Smith Corporation will have the best of manufacturing facilities, and H. S. Morgan, manager of the department for the Essex company, goes with the new company as factory manager, besides being interested in the corporation financially.

The Roebling plant, which was recently visited by a very disastrous fire, was again threatened this week when a blaze was discovered in one of the cleaning departments. The prompt discovery of the blaze was all that prevented a serious conflagration, as the flames were making rapid headway when the alarm was turned in.

General C. Edward Murray, head of the Empire Tire Co., was one of the leading contributors to the poor children's Christmas Fund raised in Trenton.

Alfred Whitehead, secretary of the Whitehead Brothers Rubber Co., has taken possession of his new \$15,000 home on Perdix avenue in this city.

C. C. Ferry has been appointed sales manager of the Delion Tire and Rubber Co., and will make his headquarters at the Trenton factory.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

THE big Auto and Industrial Show held at the Akron Winter Garden, December 11 to 18, 1915, evidenced in highly attractive form the growth and prosperity of this exceedingly live town. This exposition, which was the second annual affair of its kind, outvalued the one of the year before—a natural sequence to the immense growth, during the intervening period, of the industries represented. The attendance also was doubled, and the scheme of lighting, the decorations, the exhibits and their arrangement, all received most favorable comment.

Akron rubber men concur in the widely prevalent report of an early rise in tire prices. As all the materials have gone up in price, if quality is to be maintained the completed product will naturally share in the upward tendency.

This picture shows the present plant of the Firestone Tire & Rubber Co., covering 31 acres of floor space.

The original Firestone factory was built in 1902. The entire office force then consisted of H. S. Firestone and six others. Now, over 700 persons are required to handle the office work of the company, while the total of officers, department heads, branch managers, superintendents and other helpers connected with the organization reaches 6,000.

In the last four years, since the new factory, consisting mainly of four large wings, was built, the race between production and demand has necessitated constant additions to the plant. Last year alone showed an increase in output of 78 per cent. Among

On December 16, 1915, in the Court of Common Pleas, Cuyahoga County, Ohio, the Firestone company was granted a perpetual injunction against a raincoat company using the name "Firestone." The raincoat company was operating stores under the name "Firestone Raincoat Co."

The American Hard Rubber Co. has sold the factory building and site where it has been located for so many years to The B. F. Goodrich Co. This transaction was recently consummated and will necessitate a change in the original plans for the new buildings now being erected at East Akron for the American Hard Rubber Co. Two buildings, 400 x 50 feet, will be built, according to the most approved ideas of modern factory construction, and possibly further additions will be made to accommodate the removal of the entire plant from its historic home.

It is estimated that the business of The B. F. Goodrich Co. has expanded in a remarkable degree—150 per cent increase since 1912. The regular quarterly dividend of 13½ per cent has been declared, payable January 1 to holders of record December 1, 1915. Further action on dividends is anticipated early in the year.

The Goodrich company had the honor of supplying trucks equipped with Goodrich safety tread tires to convey the famous Liberty Bell to and from the special cars in which it traveled to the San Francisco Exposition and down to the San Diego Exposition. The ancient and honored emblem is now at rest again in Independence Hall, Philadelphia, after a triumphant and much lauded journey.

The Akron Pigment Co. is making a filler of recognized excellence, which is extensively used in rubber mills all over the world. The company has a substantial gray stone plant on Miller avenue. George Probert, general manager, has an extensive acquaintance throughout the trade in the United States and Canada, and excellent connections in Europe.

PLANT OF FIRESTONE TIRE & RUBBER CO., COVERING 31 ACRES OF FLOOR SPACE.

the most recent extensions are those on three of the big main wings, and the doubling of a six-story separate factory building.

The three-story club-house which is being built for employees will contain every modern facility for the comfort and pleasure of its users, including a large swimming pool, bowling alleys, barber shop, shower bath and lockers in the basement, and club rooms and a large auditorium on the top floor, which can be used as a theater, assembly hall, dance pavilion, etc. The two intermediate floors are equipped as restaurants for the factory and office force.

The completion of the additions now in progress will allow for an increase in tire output from 7,500 to 12,000 per day.

The distinctive trade-mark of the latest Firestone tire is a black tread combined with a red side wall.

The Lincoln Rubber Co. has purchased the plant and furnishings of the Summit Rubber Co. at Barberton.

The Star Rubber Co. recently obtained a permit to add a \$30,000 building to its present plant. This extension means employment for 50 more men.

The Mohawk Rubber Co. celebrated the opening of its new factory building by a Christmas dance, held on the third floor of the factory, December 28, 1915.

At a luncheon given by the Akron Automobile Club at the Hotel Portage, December 14, 1915, attended by many well-known automobile men, C. R. Raymond, of The B. F. Goodrich Co., acted as toastmaster.

Herman Haase, rubber testing expert of the Goodrich company, gave an interesting lecture on "Crude Rubber" before members of the Akron Real Estate Board at their luncheon on December 7.

On the theory that some inducement should be given for exercise of brain as well as body, J. P. Loomis, director in the Goodyear Tire & Rubber Co., and trustee of the University of Akron, has donated a solid silver trophy cup, to be awarded to the high school whose students make the best showing in grades during their freshman year at the University of Akron. The cup will become the permanent property of the school which wins it five times.

* * *

At the annual meeting of the Goodyear Tire & Rubber Co. held at Akron, December 4, 1915, there were several promotions among the staff. S. M. Stadelman and P. W. Litchfield were elected vice-presidents, continuing in their former positions as sales and factory managers; H. J. Blackburn was made second assistant treasurer, and A. F. Osterloh, formerly assistant secretary, was elected secretary. He is also assistant sales manager.

Following is the balance sheet of the Goodyear company, as compared with that of the previous year:

ASSETS.		1915.	1914.
Real estate and buildings.....		\$3,883,946	\$3,606,537
Machinery and fixtures.....		3,962,366	3,308,107
Patents, trade marks, etc.....		1	1
Securities owned.....		809,336	777,640
Preferred stock purchased.....		258,459	344,593
Notes receivable of officers, employees, capital stock.....		1,045,816	805,283
Inventory.....		7,763,189	4,567,460
Accounts and notes receivable.....		4,759,246	3,328,693
Advances to agents, etc.....		278,070	280,655
Cash on deposit.....		1,766,352	2,861,702
Advances to Goodyear Imp. Co. and Goodyear Heights Realty Co.....		1,047,661	885,315
Unsecured assets.....		371,259	352,893
Prepaid rentals, etc.....			
Total.....		\$26,279,937	\$21,459,335
LIABILITIES.			
Preferred stock.....		\$6,650,000	\$7,000,000
Common stock.....		8,377,300	7,991,110
Purchase accounts payable.....		1,565,705	410,575
Sundry accounts payable.....		378,894	257,509
Res. for doubtful accounts.....		558,956	564,327
Depreciation of plant.....		1,717,250	1,183,418
Surplus.....		7,031,940	4,052,395
Total.....		\$26,279,927	\$21,459,335

Plans are in progress for three more additions to the Goodyear plant: a five-story factory, 60 x 150 feet; a garage for employees' automobiles, 105 x 60 feet, and a three-story time office, 60 x 20 feet. The basement of the time office will be used for shower baths, toilets and wash rooms, the upper floor for a restaurant and rest room. The estimated cost for these additions is \$110,000.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE year that has just closed will be recorded as one of the most notable in the history of the rubber industry of Rhode Island. There has been no time during the entire twelve months of 1915 when the rubber factories of the State have not been rushed to their fullest capacity, or when there has been a sufficient number of skilled employees to fill all demands for help. While the regular volume of business indicated conditions that would have afforded the various factories ample employment for a normal force and schedule, the extraordinary volume of war orders from Europe increased the demands upon the plants to an extent never before equalled.

Those factories manufacturing rubber boots, secured numerous large-sized orders from Europe early in the year, so that many of the regiments composing the forces of the Allies were supplied with Rhode Island boots for trench work, orders for which have been duplicated in a majority of instances. For several months, during the earlier part of the year, the factories were handicapped to a greater or less extent by the embargo

that was placed on plantation rubber, but this was modified later, so that the local factories had little difficulty in securing all the rubber they needed.

During the year several of the mills have been enlarged, and in all plants there have been extensive alterations and improvements. At the present time the different concerns are working on a full-time card, or better, in nearly every department, and the outlook is said to be good. Evidences of this are seen in the fact that none of the plants were closed for the Christmas holidays, as has been the custom for many years. In some instances the number of orders on hand is sufficient to maintain a full working schedule for several months to come.

One feature of this unusual activity among the rubber factories located at Bristol is the increasing dearth of suitable tenement houses and boarding places for the employees. There are no houses for rental, and an unusually large number are contemplating building homes for themselves. The necessity for more houses is seen each morning in Bristol when large numbers arrive from Warren, Riverside, Barrington and other neighboring places.

Recognizing the lack of accommodations, the officials of the National India Rubber Co. several months ago leased the De Wolf Inn—a large hotel that for several years was used as a summer resort—and had it fitted and equipped as a boarding place for their women employees who were not otherwise provided for. Thus suitable accommodations were afforded for nearly 75 operatives and the experiment has proven a success, both for the corporation and the operatives, and has gone a long way toward solving this difficult problem.

* * *

The plant of the National India Rubber Co. at Bristol was the scene, on December 28 and 29, of a meeting of the salesmen of the United States Rubber Co., when upwards of 400 representatives from the different branches in the United States gathered to attend the meetings arranged at the big factory by Vice-President LeBaron C. Colt and other officials.

Rooms at the plant had been fitted up for the display of the many styles and qualities of goods, including sporting and outing shoes and insulated wire, manufactured by the company. Here the sessions were held and, following inspections of the various lines, the managers and other representatives of the various sales departments connected with the United States Rubber Co. addressed the men, with the view of making them better acquainted with the processes of manufacture, from the beginning to the shipping of the finished products.

One of the most important and interesting features of the meeting was a tour of the big plant, conducted by the officials, which gave the visitors a closer acquaintance with the goods they sell. All of the methods, machines and processes of making, from the raw material to the finished product, were explained.

* * *

A few days before Christmas, the employees of the National India Rubber Co. contributed \$788.08 as a donation to the poor and unfortunate in Bristol. This money was distributed through the various charitable organizations and clergymen of the town, irrespective of denomination.

The following is the detailed list of the different departments, together with the amount contributed, from each department: Officers, \$50; office, \$18.75; gaiter and quarter room, \$230; calendar room, \$23.05; shipping department, \$13.60; cutting room, \$17; yard, \$19.50; heater room, \$10.35; shoe department, \$114; night gang, \$10.75; watchmen, \$3.50; stitching room, \$127.85; packing room, \$24.50; check room, \$10; machine cutting department, \$9.25; printing department, \$15.13; carpenter shop, \$12.10; machine shop, \$5; engineers and firemen, \$5.50; wire department, \$68.25; total, \$788.08.

* * *

A final meeting in bankruptcy was held a few days ago in the case of Edward R. Young, retailer in rubber goods in this city, and the trustee, Norman S. Case, was discharged, the creditors having received 2½ per cent.

ANNOUNCEMENTS FROM THE RUBBER CLUB.

DELAYS in shipments to neutral European countries, complained of by American exporters, are often due to neglect of the shipper to carefully observe directions, especially in the preparation of the invoices that must accompany the application for permission to ship. Trade terms and abbreviations—sometimes, in the case of druggists' sundries, for instance, comprehended only by the trade, must not be used; weights and values must be given according to British as well as American standards. The English hundredweight, for example, is 112 pounds, and both English and American hundredweights, as well as pounds sterling and dollars and cents, should be shown on the invoices. Six copies of these invoices are required by the British War Trade Department and should be made out at once to meet the British departmental requirements. If these conditions are not carefully observed, a delay of a month, at least, is inevitable in obtaining the license applied for.

In the case of rubber goods destined for Sweden, annoying delays were often reported. These, it was ascertained, were due to the anxiety displayed by Great Britain that such goods should not be re-exported to enemy countries. A certificate from their governments to this effect was in many instances required. This source of trouble has in large part been obviated, but manufacturers should scan, with the greatest care, all orders received from neutral European countries, in order to avoid violation of the bonds and agreements into which they have entered.

Attention of rubber manufacturers is called to the fact that the British government has ruled that Madeira and the Cape Verde Islands, Portuguese possessions off the African coast, must be regarded as neutral European territory when making shipments of rubber goods. Accordingly, all consignments for these islands must be shipped in the usual manner, by way of the United Kingdom.

To Gibraltar and Malta, shipments may be made without restrictions, in the same way as to any non-European possessions.

Licenses to ship rubber goods to neutral countries being good for six weeks from the date of issue, it is advisable to make application in advance, as, should the time expire, an extension will be granted. Licenses are obtainable only from the War Trade Department, 4 Central Building, Westminster, London, S. W., England, and applications should be filed there, with invoices and all the evidence required to prove the ultimate destination of the goods. They will be dealt with strictly on their merit and in consecutive order.

When the license is granted, the London agent, or forwarding agent, should at once cable the fact to the manufacturer, so that there may be no loss of time in obtaining cargo room and making the shipment before the license expires.

Arrangements are being made whereby the granting of licenses for tire equipments for automobiles shipped to Europe will be greatly facilitated.

"RUBBER CLUB DAY" IN NEW YORK.

The Rubber Club of America, Inc., and the various divisions, are to hold their annual meeting and dinner at the Waldorf-Astoria, New York, on January 28, and President Hodgman would like to distinguish the day in question as "Rubber Club Day" in the annals of the city and the trade.

The meeting of the Mechanical Rubber Goods Division and Rubber Sundries Division, will be held at the hotel in question at 2 p. m. At 4 p. m. at the same place, will be held the meeting of the Rubber Club of America, Inc., and at 5 p. m. the meeting of the directors of that organization will be held. At 7 p. m. the dinner of the Rubber Club will take place in the Astor Gallery and Myrtle Room of the hotel. Every effort is being made to insure an unprecedented success for both meetings and dinner,

and if a large attendance, an attractive program and interesting speakers may be regarded as factors, it is already certain. The key note of the occasion will be American patriotism and American rubber industry. Members of the Rubber Club are earnestly requested to remember "Rubber Club Day," January 28.

RUBBER CLUB DIRECTORS FOR 1916.

The Nominating Committee of The Rubber Club of America, Inc., met at the Union League Club, New York, December 9, 1915, at 3:30 p. m. Those in attendance were: Homer E. Sawyer, chairman; Charles T. Wilson, Henry C. Pearson, Russell Parker; Bertram G. Work, being absent, was represented by Howard E. Raymond. The following nominations were unanimously made:

DIRECTORS FOR 1916.

Van H. Cartmell, New York City.
William E. Bruyn, New York City.
J. S. Lowman, New York City.
W. O. Rutherford, Akron, Ohio.
George E. Hall, Boston, Massachusetts.
P. W. Litchfield, Akron, Ohio.
Henry Spadene, New York City.
Charles T. Wilson, New York City.
H. Stuart Hatchkiss, New Haven, Connecticut.
William J. Kelly, New York City.
Frederick H. Jones, Andover, Massachusetts.
Harvey S. Firestone, Akron, Ohio.

These nominations will be voted on by members of the Rubber Club at the annual meeting, January 28.

DELEGATES TO INTERNATIONAL TRADE CONFERENCE.

The following delegates were appointed by The Rubber Club of America, Inc., to attend the International Trade Conference, held under the auspices of the National Association of Manufacturers of the United States of America, at the Hotel Astor, December 6, 7 and 8, 1915: William G. Grieb, Ajax Rubber Co., Trenton, New Jersey; J. A. Lambert, Acme Rubber Manufacturing Co., Trenton, New Jersey; Henry D. Reed, Bishop Gutta Percha Co., New York; Russell Parker, Parker, Stearns & Co., Brooklyn, New York.

A HARMLESS POLICE CLUB.

The invention of a rubber-covered police club is reported from Christiania, Norway, on which a United States patent has been granted. Unlike a somewhat similar device, a description of which appeared in THE INDIA RUBBER WORLD of January 10, 1897, and which consisted of a practically rigid core of hickory encased in rubber, the present device, which is the invention of a Christiania policeman, has a flexible metallic core of cabled wire, terminating in ferrules, covered with rubber or gutta percha. Such a baton, in the hands of a stalwart policeman, is capable of delivering a stunning blow, without causing wounds or broken bones. Thus, while more effective, it is more humane than the weapon with which the policemen in large cities are usually equipped. The police force of Christiania now carries the Wel-fens club, the patent on which is controlled by Anton Berg, 72 Munkedamsveia, Christiania, who is connected with the rubber and balata interest in that city and who is desirous of exploiting the patent or selling rights for the United States, Canada and Great Britain.

THE AUTO SHOW FOR 1916.

The Grand Central Palace, New York, is to be transformed, for the Annual Automobile Show, to be held there during the week commencing December 31, into the "Palace of Motoria," the goddess who watches over the destinies of the automobile and its votaries, and will present a gorgeous spectacle. The technical features will be in keeping with the decorations and everything new and meritorious in automobiles and accessories will be on exhibition, displayed in the artistically accessible style to which the building so admirably lends itself. The show opens on the evening of December 31 and will remain open for a week.

The India Rubber Trade in Great Britain.

Our Regular Correspondent.

FOR some time most of our large cable works have been on the list of controlled works under the Ministry of Munitions. Now, in addition, some of the large rubber works—notably, the Dunlop Rubber Co. and the North British Rubber Co.—have been added to the list. This means that government work and demands have priority over private business and, further, that strikes are not allowed, and that work-people who lose time or transfer their services elsewhere are to be dealt with by the local munitions tribunal and not by the management of the rubber firm. Again, with regard to recruiting such men as are considered indispensable to the business of the controlled works: they are "starred," as unavailable for enlistment. Outside the above, the rubber firm maintains its individuality and carries on its business as usual, with the exception of having more or less prolonged visits from government officials on much the same lines as have long been laid down in the government specifications for rubber goods.

Certain firms making necessary chemicals for the trade have also been recently put on the controlled list. The effect of this has been to increase the difficulties previously experienced by rubber works not engaged on government work in getting their supplies; or, if they get them, it is at an increased cost. It does not appear that the fact of being controlled is looked upon in the light of a hardship. It is rather the other way, as the firms have less to apprehend from the natural and necessary visits of the recruiting officers as regards depletion of staff.

With regard to the general volume of business being done, one hears but little in the nature of complaint. The transit difficulty, however, is still acute, abnormal time being required for the delivery of raw materials and finished goods which have not the right of being labeled "on government service"; and there is no present prospect of a better state of affairs.

The main feature with regard to raw rubber has been the rapid rise towards the end of November to 3s. 7½d. per pound. This rise is due to the shortage of rubber for immediate delivery, combined with an uneasy feeling among manufacturers as to impending greater difficulties at the docks and on the seas, and it is generally expected that a 3s. level will be maintained for some time. There has been considerable activity lately in obtaining permits in London for direct shipments of rubber from the Far East to America, both by the New York and San Francisco routes. With the collapse of the German export trade and the restrictions which hamper the French output, it is not surprising that British manufacturers have received inquiries and orders on a greatly increased scale from practically all over the world. To such an extent is this the case with some of the more prominent firms that new business is not keenly welcomed. In fact, some important orders have only been accepted on the terms that cash must be paid before delivery and that no complaints can be considered if the goods do not come up to expectations. The principle of attending to the wants of old and regular home customers first is being strictly adhered to, as it is well recognized that the panic buying from new customers abroad is only because the latter cannot get the goods elsewhere and that in the future they will revert to their old channels of supply. With regard to sporting requisites, although the home demand has certainly fallen off, I am informed that the business done for abroad shows little diminution, so that the rubber manufacturers are not suffering, whatever may be the case with the home shops and stores which specialize in the retail sale of such goods. And although it may be a fact, stated in THE INDIA RUBBER WORLD for Sep-

tember, that England has lost half her export rubber trade, the very satisfactory state of business reported all around shows that the loss is not felt.

RECLAIMED RUBBER.

All permits to ship reclaimed rubber to Sweden were withdrawn in October, but from negotiations which are now proceeding, it is considered probable that this restriction will be shortly withdrawn.

An interesting and informative article—as far as the general public is concerned—on reclaimed rubber appeared in "The Engineer," of London, on November 5. Attention is drawn to the fact that by the introduction into England of the alkali process as worked on a large scale in America, the British reclaiming industry has now developed very largely and is a much more important and progressive business than was the case 20 years ago.

GOLOSHERS.

The winter has set in exceptionally early this year in Great Britain, and to judge by reports, severe weather has been very general on the Continent at an unusually early date. We have had heavy snowfalls, and skating on the deep Cumberland lakes in November, so that the prospect of a good season for such goods as goloshes and overshoes is assured. With regard to the source of overshoes, competition is keen between the home-made article and the imported American, which has strong adherents, not altogether due, I must confess, to its having been longer in the field. Overshoes are now generally stocked by shoe stores, as well as by the shops which deal in rubber goods only, and in nearly all cases both the British and American makes are on sale. Similar sizes and makes for men cost 5s. for American, or "Bostons," as they are usually termed, and only 3s. 11d. for British. In women's goloshes, the prices are 3s. 6d. and 2s. 11d. A popular make for women is that furnished by the Bay State Rubber Co. at 3s. 6d. It is somewhat lighter than the British and, like other Boston makes, can be obtained in half sizes. This matter of half sizes, which seems to have been ignored by British makers, is undoubtedly in favor of the sale of "Bostons," both for men and women.

HOT-WATER BOTTLES.

So as to neutralize any possible further straining of the present relations between Great Britain and America, which might be apprehended from the remarks on goloshes, I now refer to an article in which the trend of public opinion is in the reverse direction. This is the hot-water bottle which, after being under a cloud for a few years, seems to have quite regained its former popularity. This is in a large measure due to the prevalence of hospitals, both military and Red Cross, up and down the country. Although some of our largest rubber manufacturers still announce that while their bottles are of the highest quality, they give no guarantee against bursting, others have modified their attitude in this respect and plenty of bottles are on sale bearing guarantees. The retail prices range from 4s. 6d. to 6s. 6d., according to sizes of 8 x 6 inches to 12 x 10 inches. Lower-priced bottles are not guaranteed. The rubber stores complain that discredit has been brought upon the goods owing to druggists putting them in the windows until decay is setting in and then getting rid of them quickly by lowering the price. This sounds quite probable, but there has also been carelessness on the part of purchasers, both in using boiling water and leaving them lying about anywhere. Instructions are now issued by the retailers with regard to proper use and storage. The complaint about the American hot-water bottles is with

regard to the seams, the overlap being one-quarter inch as compared with the customary one-half inch of the British makes. A point to which considerable importance is attached in the hospitals is the fitting of the stopper with a small washer, this having frequently been overlooked in the past. To refer to a matter of history, I may say that the interruption of the British business was due to a legal action a few years ago, when the chemist who sold a defective hot-water bottle was mulcted in damages resulting from its bursting when in use.

TRENCH CAPES AND STOCKINGS.

Trench capes are in considerable demand from the men at the front. The garment may be described as a general utility article that a man in the trenches would be likely to find handy. Besides being a good waterproof cape, it can be made to serve as a waterproof sleeping bag, a ground sheet, and a supplementary kit bag or "hold-all." Large numbers have been ordered by the government and issued to the men, but many requests are being made by the men to their friends at home to send them a "trench cape" and there is consequently a large demand for them. Leg boots are being sent out in large numbers on the same plan, and Charles Macintosh & Co., Limited, are making a waterproof stocking for the protection of the soldier in the wet trenches, to sell at 14s. 6d. per pair.

RUBBER ERASERS AND STAMPS.

German compulsory withdrawal from the rubber eraser business has furnished an opportunity to British firms, who have not been slow in stepping into the breach. One concern, the Mountford Rubber Co., Birmingham, has introduced a triple-layer eraser in red, white and blue rubber, the patriotic colors greatly encouraging to the sales.

Rubber stamp manufacturers also have not been backward in taking advantage of the war situation. "War emergency stamps" in infinite variety have been turned out, which some day may have special value to the collector of "curios." Here are some of the legends borne by standard stamps, impressions of which are becoming common on business documents: "This quotation is not binding"; "Business as usual"; "Do please help us and remit by return"; "The crisis has hit us hard"; "Owing to the present circumstances, we cannot commit ourselves in any way"; etc., etc.

NEW WORKS.

The company which has for some time been exploiting the John Bull tire, which has been manufactured at various rubber works, has now started manufacturing on its own account. The works are known as the Leicester Rubber Co., of the Granby Rubber Works, Post Office Place, Leicester. H. H. Burton is the managing director and Mr. McGhee the manager. The machinery, which is new throughout, is electrically driven. A sort of tram tire used for hand trucks is one of the specialties of the company.

PERSONAL MENTION.

J. Martindale Davies, late works manager of the New Liverpool Rubber Co., Limited, has now taken up a position at the works of J. Lyne Hancock, Limited, Goswell Road, London.

Lieutenant-Colonel Fallows, of the Leyland & Birmingham Rubber Co., who was killed at the Dardanelles, has been accorded the posthumous honor of being mentioned in dispatches by General Sir Ian Hamilton.

Sir Frederick Smith, Baronet, chairman of Charles Macintosh & Co., Limited, has been appointed to represent rubber and banking on the Manchester Recruiting Appeals Tribunal. This body has the duty of deciding *inter alia* as to which men are to be considered as indispensable for the carrying on of home industries during the war.

The new 2½-ton commercial car built by the Wells Motors, Limited, England, has many interesting features. One in particular is that rubber-impregnated canvas is used for the universal joint.

UNITED STATES ENGLAND'S BEST RUBBER CUSTOMER.

At a recent annual meeting of an English rubber plantation company, the chairman gave some interesting details concerning the export of rubber from the United Kingdom, together with its approximate value. On this point he spoke as follows:

It is perhaps not generally recognized what an important factor rubber is in our exports to America and in assisting to adjust the exchange with that country at the present time. The amount of rubber exported from the United Kingdom to the United States last year amounted to nearly eight millions sterling, and if that going direct from the Middle East is added, the total reaches between ten and eleven millions. In the first case it represents about one-sixth and in the latter one-fifth of the total exports from this country to the United States. Rubber is two and a half times the value of any other item in the list of our exports to America, and occupies the fourth place in value among the imports of the United States from the whole world. Probably about 70 millions of British capital is invested in the rubber industry in the Middle East, and although at the present time not more than about half of this large capital outlay is productive, it will return for the present year produce of the value of from 18 to 20 millions sterling. The development of the plantation rubber industry and the investment of this capital in the Middle East has also enabled this country and our Allies to have at their disposal and under their control by far the largest part of the world's supply of one of the things essential for carrying on the present struggle. The past year has served to place the industry in a still stronger position.

RUBBER GROWERS' ASSOCIATION, INC., EXTENDS ITS SPHERE OF OPERATIONS.

At an extraordinary general meeting of the Rubber Growers' Association, Inc., held in London recently, provisions were made for certain alterations in the memorandum and articles of association that will result in an important addition to the scope of the association's activity. The Malaya and Ceylon research funds—the former in existence for six, the latter for five years—have hitherto been administered by firms who guaranteed the funds. While the entire body of members profited by the research work, the onus of maintaining and directing it rested upon a comparatively small number, an association as it were, within the parent body. It was proposed to remedy this condition by amalgamating the research fund with the association, readjusting the subscriptions so that they will cover the funds. The resolutions were adopted unanimously, without discussion.

By these changes in the memorandum of association power is taken to engage in research and experimental work in connection with the cultivation and manufacture of rubber and rubber goods; to distribute among the public information as to the possible uses of rubber; to collect and circulate statistics and other information; to improve the technical knowledge of persons engaged in the industry by means of lectures, classes, examinations and scholarships; to form a museum and library, and to establish or contribute to any benevolent fund for the assistance of persons engaged in the industry.

Republic Rubber Co., Limited, has been registered with a capital of £25,000 [\$121,662] to manufacture and sell at wholesale solid and pneumatic tires of all kinds, mechanical goods, cables, etc. The capital is issued in shares of £1 [\$4.86] each. The office of the company, of which E. A. Gleich is a director, is at 5 Giltspur street, London, E. C.

Campbell, Achnach & Co., manufacturer of waterproof and india rubber goods, Glasgow, Scotland, has had plans prepared for additions made necessary by the growth of business.

The official receiver of the Margetts British Sectional Tire Co., against which a compulsory winding-up order was issued on July 13, reports total liabilities of £9,346 [\$45,482], assets nil. The company was organized to manufacture a sectional tire, for the patents, rights, etc., of which it agreed to pay £169,000 [\$822,438], and a royalty of 6 pence [12 cents] on each section or "cuff" of tire sold.

THE RUBBER SITUATION IN FRANCE.

By Our Regular Correspondent.

THE general position here remains much as it was at my last writing. Manufacturers producing tires and other rubber goods required by the army and navy continue to be very busy while other rubber mills are comparatively idle.

The evening of the day I mailed my last letter, a fire broke out in the boiler-house of the Torrilhon rubber works at Chamalières, near Clermont-Ferrand, Puy-de-Dôme, and a serious conflagration would no doubt have resulted had it not been for the promptness of the company's fire brigade.

The workmen had left the factory at 6 o'clock and only a few clerks were at work in the offices when at a quarter past seven fire was discovered in an old brick building used as the boiler room. The firemen on duty were prompt and intelligent enough to open the steam blowoff valve, thus preventing an explosion, which probably would have demolished the whole plant. The property loss resulting from the fire was large; however, it will not interfere with the operation of the plant or result in laying off any of the employees.

The Torrilhon company, or Société Anonyme des Anciens Etablissements J. B. Torrilhon, as it is registered, is one of the oldest rubber manufacturing companies in this country and has a capital of 6,000,000 francs [\$1,158,000].

MACHINERY IMPRESSMENT.

Official notices were posted recently on the walls of every town, village and hamlet throughout this country, calling for the compulsory declaration to the local authorities of all lathes, planers, drill-presses, hydraulic presses and steam hammers, with the exception of those to be found in State workshops. This declaration is incumbent on the owners, or in their absence, the landlords, guardians or other persons in charge of the buildings in which the machinery is to be found. Penalties varying from \$19 to \$400 are imposed for failure to declare or for false declaration. Obviously the object of this measure is to obtain the use of all machine tools which are standing idle or at present in use for other than military purposes. These idle tools are being requisitioned or in certain cases being put into use where they stand. The tire presses at the Continental factory near Paris have been taken over by the military authorities for the manufacture of 75 millimeter shells. It will be remembered that this factory is a branch of the Continental Caoutchouc & Gutta Pehcha Co., Hanover, Germany. The French factory of the British Dunlop Rubber Co., Limited, is being almost entirely used for shell making, and other tire factories possessing hydraulic presses not absolutely needed for the tire business have been turned over to the manufacture of shells.

GASOLINE SHORTAGE.

In my last letter I stated that the gasoline famine was not affecting the rubber industry here. This also applies to the use of motor vehicles generally, the supplies of gasoline are ample for military purposes and, owing to war conditions, there are very few motor vehicles in private use; so the shortage is not very severely felt except in Paris, where it has interfered with the taxicab service.

As a general rule, Paris taxi-drivers purchase their own fuel and retain a certain percentage of their receipts. In some instances the companies operating taxis are able to supply gasoline to chauffeurs at better prices than it could be obtained by them in the open market. Prior to the war the amount supplied was about 3½ gallons per day. This has been cut down to 2½ gallons, with which the chauffeurs are expected to travel 60 miles. The taxi-drivers claim that they cannot average more than 50 miles with this quantity of fuel and when they have used up their allowance of 2½ gallons they return their cabs to the garage, refusing to purchase gasoline in the open market. The result is

that taxis are very scarce after nightfall, when they are most needed by theatergoers and others. Motorbus services in Paris are now practically non-existent and this, coupled with the lack of taxis, is causing great loss to theaters and restaurants and bringing protests both from the public and from the owners of these establishments. Appeals have been made to the municipal authorities who, however, have no power to ameliorate the situation. The few refiners who monopolize the gasoline supply of France are being much criticised, as it is maintained that an abundant supply can be obtained from America and therefore there is no reason for the present shortage. The French Government has not imposed any additional taxes upon gasoline since the war started, yet prices have increased more than 35 per cent. The retail price is 270 francs [52 cents] per gallon outside Paris, where there are no local taxes, while the "octroi," or city tax, raises the price to 425 francs [82 cents] per gallon within the fortified walls of the capital.

SEQUESTRATION OF TEUTONIC FIRMS.

The Chamber of Commerce of Paris published last December the first list of German and Austro-Hungarian concerns whose property in France has been sequestered by the French authorities. The following thirteen firms engaged in the rubber and allied trades are taken from this list:

Société des Jointes de Caoutchouc (rubber packing); Peter's Union (tires); Société Continentale (tires, etc.); Compagnie Continentale (tires and other rubber goods); Dusendschon et Cie (crude rubber); Bernhard Von Delden (rubber matting and linoleum); Delmenorster (linoleum); Glaser (rubber garments); Traun (rubber goods); Straus (rubber); Scherr (rubber heels); Lazlo (rubberized fabrics and linoleum); and Charles Nathan (electric wires and rubber).

SPORTING GOODS.

The practice of outdoor sports, which for a number of years has been receiving increased attention in France, is not languishing, as might be expected under war conditions. Football, tennis, hockey are still popular and tournaments are almost as frequent as in time of peace. The government encourages sports among the soldiers and every regiment of our army has several Rugby or Association football teams.

THE RUBBER SITUATION IN SWITZERLAND.

By Our Regular Correspondent.

THE position of Switzerland in the present struggle of nations is peculiar. The war has been the cause of great loss to this country; it is stated that the hotel industry alone has lost over 300,000,000 francs [\$100,000,000] since the outbreak of hostilities, while the fact that it is necessary to keep the army mobilized is a source of great expense. But these are not all our troubles. This neutral country is like a little island in the midst of the surging sea of fire and death by which it is surrounded on all sides. We have commercial treaties with all the fighting nations and do not wish to see any of these contracts broken, so our position is very difficult.

The Swiss national industries are all practically what might be termed converting industries: they are engaged in improving and increasing the value of raw materials and partly manufactured goods imported from abroad. Raw and partly manufactured materials are received from or through all the countries now engaged in a struggle for life or death, for manufacture and improvement, chiefly for re-exportation.

Practically from the beginning of the war there have been the Allies, on the one side, willing to furnish all the raw materials our industries could use and also all the manufactured goods Switzerland is accustomed to import, on condition that all these materials and goods be used at home and none exported to the central European powers. England, for instance, is willing to

furnish both crude rubber and rubber goods on condition that no rubber or rubber goods are sold to Germany and Austria-Hungary. The central European powers, for their part, offer to furnish what surplus goods and materials they can spare after their own needs are satisfied, and in exchange demand the supply of the merchandise of which they are deprived through the Allies' blockade.

The delicacy of the position in which Switzerland is placed can easily be imagined.

It is believed that the problem has been solved by the organization of an import trust known as the "Société Suisse de Surveillance Economique," or "S. S. S.," as it is briefly termed. This import trust has been chartered by the Swiss Federal Council to supervise the importation of merchandise and its distribution in the country and, under certain conditions, its re-exportation.

The "S. S. S." (Swiss Association for Economic Supervision) will attend to the importing of raw materials, partly manufactured materials and manufactured goods, for the account of third parties, and distribute these imports for use or manufacture in Switzerland, according to rules and conditions agreed upon at the time of the importation.

In deciding what quantities and kinds of merchandise should be imported, the "S. S. S." will be guided by information drawn from the statistics of Swiss imports for the years 1911, 1912 and 1913, which will be obtained from the Federal Council of our republic. In other words, the imports for 1911, 1912 and 1913 will serve as standards for determining the present needs of our country. To receive merchandise from the "S. S. S." the several trades and industries of Switzerland will have to organize responsible syndicates or associations which will have to guarantee that the merchandise furnished will be used as directed by the rules and regulations of the "S. S. S."

Raw materials imported by the "S. S. S." and goods manufactured from these raw materials will be allowed to be freely re-exported as follows:

1. To the countries from which the raw materials were obtained for importation into Switzerland, or to allies of these countries.

2. To neutral countries, as long as it is guaranteed that they will be consumed in these countries. If, however, the neutral country to which the merchandise is destined cannot be reached from Switzerland, without passing through the territory of a nation or nations at war with the country which furnished the raw materials to Switzerland, license to export will be withheld unless the latter country gives its consent to the transaction.

3. No merchandise can be re-exported to countries at war with the nation that furnished the raw materials for making it. Exceptions to this rule are merchandise in which the chief value is not the material imported. Thus, machinery and apparatus into which imported copper does not enter to the extent of more than 15 per cent of the total value, may be exported freely. Electrical machinery and apparatus can be freely exported on condition that the value of the copper it contains does not exceed 30 per cent of its total value.

Farming products that are purely Swiss and all other merchandise containing nothing but native materials can be exported freely, if not under embargo of the Swiss government.

Reports and statistics of the dealings of the "S. S. S." have to be furnished monthly to the governments agreeing to furnish merchandise through its intermediation.

The metal, textile, chemical and foodstuffs industries are already planning syndicates to avail themselves of the services of the "S. S. S."

The Swiss manufacturers were very anxious to see the "S. S. S." in general operation, for conditions were very trying, especially in the rubber trade and industry, where shortage in both crude rubber and rubber goods was creating much inconvenience. All kinds of tires were scarce and prices were rapidly

becoming prohibitive. The lack of motorcycle tires was most severely felt because motorcycles are very extensively used in Switzerland.

RUBBER FOOTWEAR.

It is winter now, the season during which quantities of rubber boots and shoes are needed in Switzerland. Russia, Germany and Austria-Hungary formerly furnished us large consignments of rubber footwear, but cannot supply them as long as this war lasts; and French and English manufacturers have all they can do to supply their own military and civil needs. We are told that America cannot deliver rubber goods to us on account of an agreement with Great Britain.

Some time ago an important rubber concern here attempted to place a big order for rubber goods in America and was informed by cable that all shipments of rubber and rubber goods from America are prohibited unless they be addressed to England, to her possessions or to her allies. This cable was given wide publicity here and was variously discussed by all our press organs. The following is a list of Swiss rubber and gutta percha manufacturers which may be of interest to your readers:

Tannerie Maennedorf, Staub & Cie, Maennedorf; solid rubber truck tires.
 Aussler & Cie, Feuerthalen; pneumatic tires.
 P. Buchet, Geneva; pneumatic tires.
 Chapins, Geneva; pneumatic tires.
 Charles Faure, Geneva; pneumatic tires.
 Albert Muffert, Geneva; pneumatic tires.
 Dubied & Cie, Convry; tire studs and rivets.
 Aubert, Crenier & Cie, Isletta; electrical cables.
 Suhrner & Cie, Herisau; electrical cables.
 Zürcher, Draht & Kabelwerke, Zurich; electrical cables.
 H. Weidmann, Rapperswil; rubber insulators.

A NEW WATERPROOF CLOTHING FACTORY IN AMSTERDAM.

At Amsterdam, Holland, a factory is being erected for the firm of L. A. & F. L. Kattenburg, manufacturers of waterproof garments and wholesale clothiers of that city. Rotterdam, and Manchester, England. The foundation stone of the new factory was laid on December 1, 1915, by Alfred Kattenburg, Jr. The building will be 270 feet in length, with three stories and basement. It will furnish room for 800 to 900 operatives, and the site allows space for doubling the size of the building. In addition to up-to-date show rooms, offices, etc., the provisions made for the comfort and health of the employees are of the most modern character, including commodious dining rooms, well-equipped kitchens, dressing rooms, etc. The establishment is one of the most important in the Netherlands engaged in the manufacture of rubber garments and raincoats.

SWEDEN PROHIBITS RUBBER EXPORTS.

Sweden has prohibited the export of the following articles: Manufactures of soft rubber, excepting belting and boots and shoes; manufactures of hard rubber, ebonite, etc., or combinations with other materials; rubber toys and parts of toys; rubber in solution or in paste form (but not rolled into sheets or further manufactured), with or without compounding ingredients; also artificial soft rubber.

Following upon this action, the temporary suspension by the Rubber and Tin Exports Committee of the issue of licenses for shipment of rubber goods to Sweden has been, to a certain extent, removed. The India Rubber Manufacturers' Association has been informed that the Exports Committee cannot undertake to discuss the conditions under which applications for licenses will be dealt with, but they will consider any individual application on its merits.

LARGE TIRE ORDER PLACED IN JAPAN.

According to a clipping from a Yokohama, Japan, newspaper, orders aggregating 1,000,000 automobile and bicycle tires have recently been placed in Japan.

The Rubber Trade in Germany.

By Our Regular Correspondent.

THE only article in which original qualities are jealously maintained—the rubber tire—has been placed under strict embargo, as far as domestic trade is concerned. Every owner of rubber tires was ordered, as a preliminary step, to register them. The next step was their inspection by government officials and, if found suitable for military use, they were "commandeered," at a government appraisal, by the Power Wagon Department of the German Army. To prevent any tires slipping through its fingers, the government issued a decree prohibiting the sale of rubber tires of any description without the consent of the military authorities. Add to this the requisitioning of all motor vehicles that could be used by the army, and the position of the tire industry in Germany may easily be understood.

A "war meeting" of tire manufacturers was recently held in Berlin to discuss means for the relief of the tire scarcity and the advisability of establishing a central office, through which manufacturers could conduct all their purchases of crude rubber and thus prevent "corners" and speculation.

Tire and automobile manufacturers recently addressed a memorial to the war minister, calling his attention to the fact that while the casings made in German factories answered all requirements, the quality of the inner tubes was unsatisfactory, it being impossible, from the material at their command, to make good tubes. It was suggested that, at regular intervals, stipulated quantities of crude rubber of suitable quality be released to inner tube manufacturers, to enable them to maintain the average of quality.

Before the war broke out competition between German and foreign tire manufacturers in Germany was so bitter that prices were cut and overhead expenses increased to the extent that no reasonable margin for profit was left. The initial cause of the trouble appears to have been the opening by tire manufacturers of too many branches. As soon as a company opened a branch office with stock in a new place

smiths and retail dealers in cigars and cigarettes, not to mention the tremendous number of cycle dealers who handled automobile tires. The principal object of all these dealers was to make a showing. The sale of automobile tires

WOMEN TESTING INNER TUBES.

was merely incidental to their business and they were satisfied with extremely small profit, but the legitimate trade suffered. Prices were cut and under-cut, many people selling tires only for "beer money". In many instances tires worth \$40 were sold with from 50 cents to a dollar profit.

Tire manufacturers, at first, thought that the small dealer was of little importance to them, that people had to have tires and would buy them and that the dealer would have to sell even if he made no profit. They soon found out, however, that the price-cutting was as detrimental to their interests as it was to those of the dealer. The automobile tire trade was profitable to no one, not even to the consumer, who was at a loss to know what tire to buy and often bought the wrong one.

A movement is now under way in Germany to remedy this evil, and it is expected that dealers and manufacturers will cooperate in placing the automobile tire business on a solid commercial basis. German tire interests are also advocating the boycott of all foreign-made tires and an endeavor will be made to prevent dealers selling foreign-made tires, even if the tires are profitable to them. Attempts are being made to place all the former troubles of the trade at the door of foreign manufacturers, whether maintaining factories in Germany or not.

SOLID RUBBER TIRES.

The increasing demand of our army trucks for solid rubber tires led many of our manufacturers to take up this line, with which, in many cases, they were not at all familiar. Many costly mistakes were made in this way, the most common being the selection of compounds on the sole merit of their cheapness. Mileage guarantees were handed out indiscriminately, with the result that many have spent fortunes to learn that a rubber compound can never be too good for a solid rubber motor truck tire.

Our tire manufacturers are all very busy and expect exceptionally good business to follow the war. Horses will be scarce, and it is very likely that the use of motor vehicles will be further extended by the low prices at which used, but still serviceable machines will be sold by the army. Special companies have already been formed for rebuilding war automobiles. Automobiles require tires, and our manufacturers are going to see that foreign competition does not get the business. The lack of crude rubber will inconvenience our tire manufacturers for some time after the close of hostilities, but other branches of trade and

WOMEN RUBBER WORKERS—CALENDERING.

another company would do the same thing, with the result that one factory after another was obliged to support an ever-increasing number of branches and small stores, the turnover of which was very often too small to pay expenses.

In small places, where regular tire or automobile dealers did not exist, and even in places maintaining garages, stocks of tires were turned over to grocers, bakers, butchers, black-

industry will also be slow in getting under way and our manufacturers are organized and will see that the government protects their interests. Tire manufacturers and dealers here are continuing their efforts to obtain the unification and the reduction of the numbers of tire sizes.

RUBBER CLOTHING.

Manufacturers of rubber clothing are also feeling the pinch of war times, and recently a deputation from the industry sought an interview with the head of the War Materials Bureau, Berlin, to request the release of enough crude rubber to enable them to carry on their business. He replied that he would deal only with a central organization of the industry, and the manufacturers thereupon took steps to form such an organization, with a central bureau and distributing depot in Berlin. The members are pledged to obtain their supply of rubber solution from this depot, the distribution being based on the number of seamecenters employed. A kilogram of rubber, or its equivalent in rubber cement, for each 50 garment cements, is apportioned, and for this the manufacturer must pay cost, plus 7 per cent.

ARTIFICIAL LIMBS.

Many skilled workmen have lost a limb or limbs in the war, and our Association of German Engineers, realizing that these crippled workmen could still be made useful citizens, has offered a first prize of 10,000 marks [\$2,380] and a number of lesser prizes for improved artificial hands, arms and legs, that will enable maimed soldiers to be useful in the mechanical industries. The prizes will be awarded on February 1, 1916, by a jury composed of representative members of the technical, manufacturing, medical and orthopedic professions.

EMBARGO.

Our export embargo has been extended to cover all so-called rubberized materials, garments and the like, whether coated, impregnated or inlaid with rubber, or made up with rubber threads.

The controversy in regard to the placing of cotton on the contraband list by the Allies will be to some extent simplified by the action of the German Government in placing an embargo on all exports of raw or ginned, or otherwise manufactured cotton, yarns of cotton, with or without mixtures of vegetable or animal fibers (excepting silk and cotton thread and sewing thread), and coverings for hose, of woven cotton or flax.

In regard to the scarcity of rubber, I note in a recent issue of THE INDIA RUBBER WORLD, the French claim that E. Ronxeville's reclaiming process is the secret of our being able to continue to use rubber tires, in spite of the fact that we have been cut off from sources of crude rubber supply for more than 12 months. This is an error. We have just as good, perhaps better, reclaiming processes than the Ronxeville method, and we are clever enough to obtain some crude rubber from time to time. We admit that we are suffering from a scarcity of crude rubber that obliges us to collect waste rubber in every form, for reclaiming. The use of automobiles is now limited to the army and to physicians for use in attending to their increased practice, caused by the absence of many medical men called to the military service. But these are only precautionary measures, and the rubber question alone will not end the war. Our official and semi-official organizations for purchasing, collecting and conserving raw materials are doing wonders in distributing them judiciously and supplying any pressing needs which become manifest. As an example of the care these organizations take in the exercise of their duties: jute sacks, formerly used for shipping sugar, salt, cement, hops, etc., are no longer permitted to be used for such purposes, on account of the scarcity of jute. Barrels, cellulose sacks and metal containers are used instead.

"WAR QUALITY" RUBBER GOODS.

On the principle that "necessity knows no law," manufacturers and dealers handle and consumers use substitutes for raw ma-

terials and the finished product, without question. The food, clothing and other commodities we thus accept as an unavoidable result of the war would, in time of peace, be made of better and even altogether different materials.

Substitutes are used extensively in the rubber manufacturing industry, and rubber manufacturers, lacking a sufficient supply of raw material, are turning out war hose, war transmission and conveyor belts, war rubber garments, etc., etc. While not by any means as good as the regular lines, these "war qualities," as they are termed, answer their purpose and relieve us from absolute want.

An exhibition of substitutes was recently opened by the "Housewives' Association of Greater Berlin" to reassure the public by showing how completely the lines made from unavailable imported materials have been covered by resourceful manufacturers. There were substitute food supplies, raiment and other articles of everyday use, including, of course, substitute rubber articles in great variety, from garden hose to nipples for nursing bottles, squeezegs, rubber sponges, etc.

TAXATION OF WAR PROFITS.

A topic much discussed here is the proposed special taxation of all profits made on contracts for supplies to the army and navy. The levying of such special taxes would be an injustice to manufacturers who have reorganized their plants and equipped them with special machinery for serving our defenders. No system of taxation could take account of the cost of these transformations, nor could it allow for what it will cost these manufacturers to return to their peaceful pursuits when the war is over.

AUSTRIA-HUNGARY.

We learn from Austria that the government has taken possession of all rubber tires, regardless of size, quality or condition. It is presumed that partly worn tires will be repaired and used for military purposes, while those past repairs and unsuited for army use will be reclaimed and re-manufactured for the government.

TRADE NOTES.

A recent meeting of the Vereinigte Gummiwaren-Fabriken Harburg-Wien, held in Hamburg, was attended by 18 shareholders, representing 1,968,900 marks [\$468,598] capital and 6,563 votes. An 18 per cent dividend was declared.

SCANDINAVIAN NOTES.

NORWAY, like some other neutral European countries, has been suffering from the effects of the British embargo on rubber and rubber manufactures. The automobile tire famine prevailing in Norway was mentioned in a recent issue of THE INDIA RUBBER WORLD. The situation has now been relieved, thanks to the joint efforts of the Association of Norwegian Automobile Tire Importers and the Royal Norwegian Automobile Club, who sent a delegate to London recently and obtained permission to import 9,000 automobile tires per annum into Norway.

The United Rubber & Air Ring Co., of Copenhagen, Denmark, recently acquired the rubber plantations of the Copenhagen East Asiatic Rubber Plantation Co., which are located near Utarah, in Johore, Malaya. These plantations produce sufficient quantities of crude rubber to supply all the demands of the United Rubber company's plant.

From Kjøge, Denmark, a correspondent writes that they are manufacturers of reclaimed rubber, but an embargo has been placed on the exportation of their products, except to neutral countries, nor can they purchase sufficient rubber waste to carry on their business, owing to the exportation of this material being prohibited by the warring nations; so they are making tires.

CEYLON AND MALAYA CROP PERCENTAGES AND RAINFALL.

THE Rubber Growers' Association, London, England, has issued two comprehensive charts and statements showing the percentages of crop harvested, and of rainfall recorded monthly by representative estates in Ceylon and Malaya. The figures are computed on annual crops of from 17 to 20 million pounds of Malaya rubber, and from five to seven million pounds of Ceylon rubber.

It appears from these charts that the wintering period, which occurs in February and March, coincident with the lowest rainfall, has a much greater effect on the crop of rubber in Ceylon than in Malaya; but the figures are no doubt

not show any extreme fluctuation, than in Ceylon, where as much as one-seventh of the year's crop is harvested in a single month.

The charts show that there is no great variation in crop percentages between 1913 and 1914 in either country.

COAGULATION OF LATEX.

A WRITER (L. E. C.) in the "Tropical Agriculturist" (October, 1915) submits some remarks on rubber latex coagulation. There seem to be several well-defined stages in the degree of coherence of rubber separated from latex. These are creaming, flocculence, agglutination and coagulation.

Creaming is the condition observed in the early stages of slow coagulation when the latex thickens.

Flocculence refers to the formation of small particles of rubber without coalescence into lumps. This state is observable in latex to which much formalin has been added.

Agglutination applies to local or lumpy coagulation observed when latex coagulates spontaneously, or when certain mineral salts are added.

Coagulation proper is the final stage observed on careful addition of acids to latex, the rubber forming in one clot and leaving a clear liquid.

In rubber latex there is a suspension of rubber particles which subsequently form rubber; also at the same time there is present, in solution, a number of bodies which are of the protein class. These proteins are in colloidal solution and are capable of being precipitated by certain reagents, notably acids. It seems probable that this protein acts as a protective colloid to the pure caoutchouc present. The theory of this protective action is that a combined solution and suspension, such as this, acquires many of the characteristics of the substance in colloidal solution. It has been suggested that this protective action is due to the absorption of a layer of the dissolved protective agent over the surface of each of the suspended particles. It seems probable that this is so in the case of the rubber particles, in view of the fact that it does not behave as a pure suspension, but that its coagulation reactions resemble in many respects those of certain proteins. Not all the nitrogenous constituents of latex, however, are precipitated with the rubber during the ordinary process of coagulation.

The effects of anti-coagulants involve the action of many factors. The anti-coagulant may be an alkaline substance acting to neutralize acid formed in the latex by decomposition or fermentation, or as a retarding agent on the coagulating enzyme said to exist in the latex. When formalin has been added to latex in certain proportions it apparently acts as a retarding agent, since the latex will retain its milky appearance and the rubber does not form a clot; but, actually, the latex loses its original nature and consists of a number of particles of rubber in suspension in a clear liquid. In this connection it may be noted that formalin is a coagulant of certain protein bodies.

In the coagulation of rubber latex by the Brazilian and other processes of smoking, the effect of heat enters very largely into the operations. In the Wickham process the author finds that, if the temperature of the jet of smoke impinging on the layer of latex be less than 140 degrees F., coagulation is not obtained. Heat alone, at this and slightly higher temperatures, will coagulate fresh latex. Latex heated to 140 degrees F. will coagulate with a certain quantity of acid almost immediately, whereas normally it would have required some hours.

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

CHART SHOWING THE PERCENTAGE OF CROP HARVESTED, AND OF RAINFALL RECORDED MONTHLY IN 1913 AND 1914 BY REPRESENTATIVE ESTATES IN MALAYA AND CEYLON.

affected by the practice on some Ceylon estates of ceasing or reducing tapping operations during the wintering season. The variation in the daily distribution of rainfall in the respective countries and in the different districts must also be taken into account.

The heaviest yielding month in Ceylon produced more than four times the quantity of rubber harvested in the poorest month (13.30 per cent in December, 2.91 per cent in March, 1914) and the crop of the Ceylon estates for the first six months of 1914 was only 36.26 per cent of the total. In Malaya the fluctuations between highest and lowest yielding months are much less pronounced (9.94 per cent in December, 6.87 per cent in March, 1914), while in the first six months of 1914 the Malaya estates harvested 45.49 per cent of the total crop.

It would also appear that machinery and drying space required should be less in Malaya, where monthly outputs do

Rubber Planting Notes.

CEYLON FORWARD CONTRACTS FOR 1916 EXEMPT FROM TAX.

THE decision of the British Colonial authorities to place a duty of 10 shillings (\$2.42) per 100 pounds, or about 2.5 cents a pound, on all Ceylon rubber exports, was reported and commented upon editorially in the November issue of THE INDIA RUBBER WORLD.

Recent information shows that this decision has caused much unrest among the rubber buyers of Colombo, many of whom, as commission agents acting for principals in other countries, had contracted for future delivery of rubber still to be gathered and delivered month by month. The government's intention was to tax the producer, but the absence of any clause in the contracts for future delivery, relating to duty payments, caused the liability to fall on the buyer.

Meetings of buyers were held and much correspondence was exchanged between the Ceylon Chamber of Commerce and the Colonial Government with the result that the latter has consented to exempt, for a period not to extend beyond December 31, 1916, payment of the new tax on all rubber still to be delivered to shippers month by month under formal contracts entered into before October 1, 1915.

CRUDE RUBBER EXPORTS FROM SUMATRA.

The latest report published by the Chamber of Commerce of Medan, Sumatra, covers the first six months of 1915, and from it we have compiled the following table, showing the destination and quantities of crude rubber exported from Sumatra during this period:

To	pounds
London	4,918,332
United States	1,281,027
Netherlands	749,773
Singapore	392,081
Penang	207,429
Java	44,801
Other destinations	339,876
Total	7,833,219

A DISEASE OF MALAYA PLANTATION RUBBER.

A fungoid disease of plantation rubber in Malaya is the subject of Bulletin No. 22, of the Federated Malay States Department of Agriculture, by Mr. F. T. Brooks, M.A., who states:

This disease is caused by a fungus known as *Ustilina zonata* and is easily distinguished from root diseases caused by *Fomes semitostus*, *Sphacrostilbe repens* and *Hymenochaete noxia*. Its fructifications present themselves in the shape of greyish and blackish plates on the collar and on exposed lateral roots mostly of old rubber trees, though five-year-old trees are also attacked. It is believed that the fungus begins to grow on rotten roots, but in some cases it has been observed to follow attacks of white ants. The development of the disease can often be arrested by cutting off and destroying all discolored tissues when the fungus is in its early stages.

A rubber "goldbrick" is reported as offered for sale in the Far East, where the government of the Federated Malay States has issued a warning to "get-rich-quick" investors against the purchase, from designing individuals, of seeds of the "paint tree," said to yield a latex from which rubber-paint can be made. The seeds are those of a *Manihot*, the cultivation of which proved a failure in Malaya.

The Imperial Ethiopian Rubber Co., Limited, an English corporation that received from the Emperor Menelik of Abyssinia an exclusive concession for the collection and exportation of rubber, covering the whole of his empire, has been placed in liquidation. The monopoly was withdrawn in 1908.

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

MALAY PRODUCTION COSTS.

The following list, taken from "Grenier's Rubber News," Kuala Lumpur, shows the progress made by 20 leading companies in reducing the cost of producing plantation rubber during the past three years:

Plantations.	1912.	1913.	1914.
Batu Caves	36.6	25.5	18.6
Kapar Para	36.1	29.8	19.8
Patalang	33.0	26.2	19.8
Selangor	34.0	27.7	20.1
Kuala Selangor	39.7	31.1	20.3
Straits Rubber	38.0	26.8	20.5
Sungei Kapar	35.9	27.1	20.8
Harpenden	36.6	30.7	21.8
Highlands	39.0	28.4	22.2
Seafeld	42.5	32.8	23.3
Nordana	37.5	32.1	23.3
Klanang	39.2	26.2	23.6
Kepong	48.4	33.3	24.1
Scottish Malay	43.3	26.9	24.1
Lanadron	47.6	38.9	24.3
Ledbury	40.6	30.5	24.3
Damansara	37.4	30.4	24.7
Gula-Kalumpang	50.5	36.5	24.9
Golconda	43.0	30.4	24.9
Anglo-Malay	41.1	30.3	25.3
Average cost	35.0	30.5	23.9

THE RUBBER PLANTATION INDUSTRY IN THE STRAITS SETTLEMENTS.

The total area under rubber cultivation in Malacca is 117,200 acres, and evidence of the steadiness and good future of the industry is shown in recent reports from the Far East, which state that various rubber estates throughout the country are opening up fresh areas to rubber plantations.

It has long been a practice in the Straits Settlements' plantations to interplant rubber with tapiooa. Now, however, these catch crops under rubber are being abandoned.

VIEWS OF R. DERRY ON HEVEA PLANTING.

In a paper on the "Life of a Rubber Estate," R. Derry, ex-officer of the Federated Malay States Agricultural Department, sets forth in detail a plan to utilize the advantages of different methods in *Hevea* planting. In part, Mr. Derry states that the primary tree is the best form to cultivate but that in close planting this advantage is lost, owing to the fact that in the struggle for light the strong branches do not develop. The "pollard" tree is a fast grower and bears early, but is the first exploited. Early tapping is necessary, but injurious to subsequent growth, leading to early exhaustion of the estate. Mr. Derry advises planting one set of permanent, primary trees wide apart and leaving them untapped; at the same time inter-planting another set of subsidiary, pollard trees, to be kept pruned and brought into bearing early. The primary trees should be left untapped for the term of the subsidiary crop—10 to 11 years after transplanting.

PRUNING RUBBER TREES ON PLANTATIONS.

Writing on the subject of wholesale pruning of rubber trees, as practiced on Malayan plantations, an expert correspondent of our Far Eastern contemporary, the "Malay Mail," is of the opinion that it is not good practice unless carried out with sufficient discrimination. On many plantations the lower branches of trees are removed, not only from closely planted trees where the branches have met, but also on open plantations where the trees have not yet completely shaded the ground. Indiscriminate pruners are guided more by routine than by the theory that the lower branches which they destroy prevent light and air reaching the tree stems, thus retarding the growth of the plants. In closely planted areas the additional shade provided by lower branches may preserve humidity and thus retard bark renewal

on tapped areas and increase the risk of fungoid diseases. But, generally speaking, indiscriminate pruning is more likely to retard than to hasten bark renewal because the bark is formed from within the tree, not from without. The leaves create the substances the tree uses for repairing its bark wounds and, therefore, to lessen the number of leaves, which is often the clearest result of pruning, is to decrease the tree's output of bark-renewing substances. Branches that are useless will, as a rule, be shed spontaneously by the tree. Reasons for pruning may be sound in the particular case of an individual tree, but they do not justify the indiscriminate sacrifice of branches as practiced generally on the Malayan plantations.

CHICLE DISPLACING RUBBER IN VENEZUELA.

The British consul at Cindad Bolivar reports that the balata industry of Venezuela reached its high-water mark in 1913, and quotes the following export statistics as proof of the beginning of a decline in the industry:

	1913.		1914.	
	Pounds.	Value.	Pounds.	Value.
Balata	4,851,104	\$2,018,079	1,511,944	\$557,603
Rubber	443,004	750,326	339,416	152,073

In comparison with this decline, which the consul attributes to the decreasing profitableness of rubber gathering and the development of other fields of employment for labor, the production and export of chicle, which is sold to the United States for the manufacture of chewing gum, has increased almost five times.

HEVEA AND HURRICANES IN JAMAICA.

WERE it not for hurricanes, Jamaica would show up well for *Hevea* culture. There are but few plots of rubber—100 trees here, 60 there, and so on. The product is good and

Hevea, 7½ YEARS OLD, JAMAICA.

abundant. In the tapped tree shown, a tree 7½ years old, one pound of first-grade rubber was secured in three months, tap-

ping every other day. But the plantation upon which this grew lost 50 per cent of its trees in a recent hurricane. The twisted

Hevea TREE DESTROYED BY A HURRICANE, JAMAICA.

stump of the *Hevea* here shown is eloquent evidence of force of the wind. In a few of the near-by islands protected from wind, and in Central America and the Guianas, for example, *Hevea* does as well, perhaps better, than in a great many places where it is now grown on a large scale.

BALATA EXPORTS FROM FRENCH GUIANA.

Statistics for the fiscal year 1914-15 show that the total exports of crude balata from French Guiana during this period amounted to 52,274.50 kilograms (115,004 pounds), as compared with 41,694.50 kilograms (91,728 pounds) exported during the preceding fiscal year.

BALATA EXPORTS FROM DUTCH GUIANA.

Exports of balata from Dutch Guiana, from January to September, 1915, amounted to 120,050 kilograms (264,110 pounds), as compared with 639,469 kilograms (1,406,832 pounds) exported during the corresponding period of 1914.

CRUDE RUBBER INDUSTRY IN LIBERIA.

Frequent mention has been made in THE INDIA RUBBER WORLD of the crude rubber industry in Liberia. Recent reports from the African republic state that the exports of crude rubber, though comparatively small, are steadily increasing, thanks to the organized methods of the British association in which is vested the supervision of the rubber royalties throughout the republic. A subsidiary of this association now has a plantation of about 1,100 acres containing 135,000 *Hevea* trees, the majority of which are producing; and the entire plantation will have reached maturity by the tapping season of 1916. This plantation was started about six years ago, on strictly modern lines, from seed received from the Botanic Gardens of Ceylon, and has constantly been under expert supervision. All of Liberia's rubber goes to Great Britain.

- 1,162,568. Uterine supporter. D. G. Carey, Elmira, N. Y.
- 1,162,610. L. saving belt. A. Jacobson and H. Rubin—both of New York.
- 1,162,668. Safety valve and tire signal. H. E. Van Ness, Elmira, N. Y.
- 1,162,671. Pneumatic tire. I. J. Webster, Haverhill, Mass.
- 1,162,709. Cushion bed. A. K. Pomeroy, Williamstown, N. J.

Re-issue.

- 14,024. Water bag. R. B. Whitmarsh, Los Angeles, Cal.

ISSUED DECEMBER 7, 1915.

- 1,162,744. Valve for pneumatic tires. J. W. Blodgett, Chicago, Ill.
- 1,162,749. Pneumatic tire. W. H. Burritt, assignor to J. T. Burritt—both of St. Louis, Mo.
- 1,162,758. Air conveying device in a pneumatic tire wheel. W. S. Estle, New York, N. Y.
- 1,162,786. Rubber stamp for printing characters of multiple colors. W. Kieck, Albuquerque, N. Mex.
- 1,162,852. Flexible ball tank valve of rubber. W. J. Eggers, New York, N. Y.
- 1,162,875. Valve for pneumatic tires. M. J. Payne, Staunton, Va.
- 1,162,900. Vehicle tire. B. H. Brown, Marion, Ind.
- 1,162,909. Life preserver. E. Goldbach, Winfield, N. Y.
- 1,162,979. Demountable tire. J. H. Coffey, Jr., and J. H. Coffey, assignors of one-half to Gutta Percha & Rubber, Limited—all of Toronto, Ontario, Canada.
- 1,163,000. Vehicle tire. C. F. Forster, Oak Park, Ill.
- 1,163,001. Belt cleaner comprising a block of rubber. R. S. Gibson, Lock-hart, S. C.
- 1,163,055. Collapsible demountable tire. H. W. Wirtz, Los Angeles, Cal.
- 1,163,151. Tire holding rim for wheels. H. L. Hosterman, Parkersburg, W. Va.
- 1,163,195. Spring wheel with rubber tread. P. A. Angeski, Lilly, Pa.

- 1,163,219. Means for inflating pneumatic tires. F. J. Cleaver, Carnegie borough, P. assignor of one-fourth to S. L. H. Morris; one-fourth to H. W. Hodges, and one-fourth to E. T. Baron, Pittsburgh, Pa.
- 1,163,257. Collapsible tire rim. A. L. Ottenad, St. Louis, Mo.
- 1,163,258. Vehicle wheel with rubber tread. W. H. Parkman, Knoxville, Tenn.
- 1,163,311. Non-skid tire. P. Bernstein, Roxbury, Mass.
- 1,163,319. Fountain tooth brush. W. O. Campbell, St. Louis, Mo.
- 1,163,338. Pneumatic tire. W. D. Harris, assignor to Harris Tire & Rubber Co.—both of Philadelphia, Pa.
- 1,163,343. Rubber coated hair curler. N. Flouay, New York, N. Y.
- 1,163,368. Doll having an inflatable air receiving element within head. S. H. Rodsky, Fort Richmond, N. Y., assignor of one-half to A. Cone, Toronto, Canada.
- 1,163,395. Arch support. E. P. Cushman, Methuen, Mass.
- 1,163,408. Tire armor. S. Hunter, Syracuse, N. Y.
- 1,163,456. Operating device for split wheel rims. D. J. Raymond, Cranston, Wis.
- 1,163,478. Door stop. J. H. Snow, Indianapolis, Ind., assignor to A. Y. Wright, Douglas, Ariz.
- 1,163,490. Toe separator. A. Weil, New York, N. Y.
- 1,163,518. Tire armor. E. Farr, Lancaster, Ohio.
- 1,163,567. Needle for talking machines having rubber vulcanized to its shank. L. K. Scottford, Chicago, Ill.
- 1,163,577. Rim for vehicle wheels. P. S. Whiting, Akron, Ohio, assignor to M. E. Whiting, Wayne county, Mich.
- 1,163,619. Chain tire grip. W. B. Lashar, assignor to American Chain Co., Inc.—both of Bridgeport, Conn.
- 1,163,630. Tire grip. W. B. Lashar, assignor to American Chain Co., Inc.—both of Bridgeport, Conn.

UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent upon the filing of the application.

*Denotes Patents for American Inventions.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 10, 1915.]
- 1,29,291 (1914). Size adjusting rubber hat band. W. L. Jordan, 66 Bessien Park Road, Shepherd's Bush, London.
- *16,346 (1914). Hammer, with rubber head. J. Davis, Erie, Pennsylvania.
- 16,366 (1914). Rubber impregnated diaphragm for cow milkers. A. Sabroe, Hadersleben, Germany.
- 16,373 (1914). Elastic hat band. M. M. Kempley, and E. Beaugard, 30 Cromwell Grove, West Kensington Park, London.
- *16,382 (1914). Rubber parts for pipe couplings and valves. E. J. Rohrbacher, 701 East Pike street, Seattle, Washington.
- 16,403 (1914). Rubber tubes in sheet-piling joints. E. W. Moir, 10 Victoria street, Westminster.
- *16,475 (1914). Rubber former for producing a raised pattern on felt hats, etc. A. Turner, Danbury, Connecticut.
- *16,579 (1914). Spring wheels with continuous outer resilient suspension ring. W. A. Lee, A. White, and A. H. Shoemaker—all of 402 Panama Building, Portland, Oregon.
- *16,596 (1914). Inflatable pneumatic tubes in life boat construction. J. Kertesz, 110 Madison street, Pottstown, Pennsylvania.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 17, 1915.]
- 16,645 (1914). Vacuum cleaning apparatus. C. E. Cherry, 401 Anlaby Road, Kensington-upon-Hull.
- 16,715 (1914). Tire protector. H. G. Powell, "The Myrtles," Melish Road, Walsall.
- 16,740 (1914). Elastic band closure for military coat sleeve pockets. E. Court, 70 Osselt Road, Wakefield, Yorkshire.
- 16,772 (1914). Tire elastic covering. E. Sandow, 32 St. James' street, London.
- 16,789 (1914). Detachable rim attachments. H. Wade, 111 Hatton Garden, London.
- 17,019 (1914). Tire attachments to rims. R. T. Smith, 111 Lovely Lane, Warrington, Lancashire.
- 17,035 (1914). Securing solid rubber tires to rims. M. Polack, Waltershausen, Gotha, Germany.
- 17,045 (1914). India rubber apparatus for aerating liquids. Akt.-Ges. Metzler & Co., Westendstrasse, Munich, Germany.
- 17,150 (1914). Toy projectile having a rubber head. H. Sauer, 5 Fuchsstrasse, Nürnberg, Germany.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 1, 1915.]
- 17,614 (1914). Elastic garter. F. Dawkins, 64 Belgrave Gardens, Chester.
- *17,631 (1914). Elastic fabric for corsets. W. Kops, 490 West End avenue, Manhattan, New York.
- *17,637 (1914). Valve comprising a rubber face. W. H. Taylor, 503 Market street, San Francisco, and L. L. Peterson, Burlingame—both in California.
- *17,642 (1914). Dress shield. F. Guinzburg, 725 Broadway, Manhattan, New York.
- 17,647 (1914). Rubber in joint-making packing. J. T. Billson, Upper Toll street, North Shields, Northumberland.
- 17,660 (1914). Golechies. Seifriede Co., 400 Oxford street, and L. H. Nordon, 38 Midway Park—both in London.
- *17,666 (1914). Non-skid devices. J. Kopecky, 1113 Herik avenue, Racine, Wisconsin.
- 17,740 (1914). Improvement in teat cup for cow milkers. J. Wierbach, Mount Hobson Road, Remuera, Auckland, New Zealand.

- 17,766 (1914). Pneumatic tire. D. R. Shewan, 1541 22nd avenue East, Vancouver, Canada.
- 17,815 (1914). Rubber snare traps. J. Murphy, 223 School Road, Crookes, Sheffield.
- 17,883 (1914). Apparatus for washing drinking vessels. J. C. Sumner, 145 Church street, Preston, Lancashire.

NEW ZEALAND.

- [ABSTRACTED IN THE PATENT OFFICE JOURNAL, OCTOBER 28, 1915.]
- 36,239 (1915). Combined tire valve and patch of india rubber. C. E. Baker, 34 Blue street, Carmarthen, Wales.
- 36,258 (1915). Pneumatic tire reinforcement or repair. F. W. Farr, Reclaim Works, Henry street, Northampton, England.
- 36,599 (1915). Hollow rubber valve in closet flushing apparatus. R. W. H. Ramsay, Palmerston North, New Zealand.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

- 476,791 (December 17, 1914). Method of protecting auto tires. R. di Martino.
- 476,825 (December 22). Pneumatic vehicle wheel. G. R. Taylor and R. Whyte.
- 476,866 (November 11). Mudguard for automobiles. W. Curtis.
- 476,875 (May 13). Improvement in shock absorbers for aeroplanes. R. Esnaul-Peleterie.
- 476,924 (December 30). Wheel for road vehicles. O. E. S. Huss.
- 477,018 (January 4, 1915). Improvement relating to pneumatic tire rims. The Dunlop Rubber Co., Limited, and J. V. Worthington.

(NOTE.—Printed copies of specifications of French patents can be obtained from R. Bolet, Ingénieur-Conseil, 16 avenue de Villiers, Paris, at 50 cents each, postpaid.)

TRADE MARKS.

ISSUED NOVEMBER 16, 1915.

- 81,489. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The words *Yukon Musher*. For footwear of rubber or in combination with other materials.
- 88,176. The Tire Store, Greensburg, Pa. Illustration of a truncate pyramid. For tires, inner tubes, bicycle tires composed of rubber and fabric or rubber or fabric.
- 88,532. C. A. Craze, Cleveland, Ohio. The word *Auto-O-Mint*. For chewing gum, etc.
- 88,983. Globe Rubber Tire Manufacturing Co., Inc., Trenton, N. J. Representation of a globe with the word *Globe*. For rubber tubes and tires.
- 89,446. E. W. Remick, Boston, Mass. The word *Exerciser*. For footwear made of rubber.
- 89,473. United & Globe Rubber Manufacturing Cos., Trenton, N. J. The word *Efficiency*. For rubber shoes, rubber belting, rubber valves, rubber packings, etc.
- 89,544. H. Goodman & Co., Inc., New York. The word *Tour-Rain*. For coats.
- 89,590. The Mechanical Rubber Co., Jersey City, N. J.; Cleveland, Ohio, and New York. Representation of a bench vice. For friction tape.

ISSUED NOVEMBER 23, 1915.

- 88,343. Seabury & Johnson, East Orange, N. J., and New York. Representation of a gold Maltese cross. For impermeable surgical dressings, guta percha tissue, mackintosh cloth, etc.
- 88,344. Seabury & Johnson, East Orange, N. J., and New York. The words *Gold Cross Brand*. For impermeable surgical dressings, guta percha tissue, mackintosh cloth, etc.
- 88,956. Goodyear's India Rubber Glove Manufacturing Co., New York, and Naugatuck, Conn. The word *Atoz*. For water bottles, syringes and combinations of the two.
- 89,522. J. H. Price, Columbus, Ohio. The words *Stride Righter*. For rubber and leather shoes for men and women.
- 89,583. M. L. Marston, New York. The word *Armands*. For armbands.
- 89,769. O'Sullivan Rubber Co., Portland, Me., and New York. The words *Next To Wings*. For rubber heels for boots and shoes.

ISSUED NOVEMBER 30, 1915.

- 89,199. Traveller Tire & Tube Co., Inc., New York, N. Y. The word *Traveler*. For rubber tires and tubes.
- 89,581. Alfred A. Kohn, New York, N. Y. Illustration of a wheel cart tandem. For boots and shoes of leather, cloth and rubber.
- 89,931. S. S. & Co., Chicago, Ill. Illustration of a gentleman putting on a garter. For garters.

ISSUED DECEMBER 7, 1915.

- 87,843. Goodyear Rubber Co., Middletown, Conn. The words *Tri-Sole Steward*. For rubber boots and shoes.
- 88,174. Remort Manufacturing Co., Seattle, Wash. The word *Remort*. For rubber valve packing or gaskets.
- 89,157. Onedica Community, Limited, Onedica, N. Y. The word *Community*. For fountain pens, rubber pens, rubber composition erasers, etc.
- 89,324. The Rubber Products Co., Barberton, Ohio. The word *Stronghold*. For elastic vehicle tires.
- 89,532. Revolver Rubber Co., Providence, R. I. The word *Nobby*. For rubber horseshoe pads.
- 89,884. I. W. Hoyer, Philadelphia, Pa. The word *Vel-To-Loid*. For a synthetic rubber compound to be used in the waterproofing of textile fabrics.

DESIGNS.

ISSUED NOVEMBER 16, 1915.

- 48,150. Toy balloon. F. F. Brucker, assignor to The Miller Rubber Co.—both of Akron, Ohio.
- 48,159. Bowl for fountain syringes. R. B. Newcome, Amarillo, Tex.
- ISSUED DECEMBER 7, 1915.
- 48,244. Elastic vehicle tire. M. J. Del Grego, Akron, Ohio.
- 48,427. Vehicle tire. M. J. Gillen, Cleveland, Ohio, assignor to The Standard Tire & Rubber Manufacturing Co., a corporation of Ohio.
- 48,253. Tire tread or similar fabric. J. S. Patterson, Boston, assignor to Needham Tire Co., Needham—both in Massachusetts.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

BUSINESS in heavy chemicals, pigments and fillers was good during December and prices in all lines were steady. The advances made during November have been maintained in practically every instance. Pig lead was quoted at 5½ cents per pound, most of the month, advancing in the fourth week to 5.4 cents per pound. There was no immediate corresponding rise in the lead products, although it may be expected shortly.

The soda situation is described as exceedingly strong, with the basic material in an oversold condition. The supply of caustic soda is short.

There is an enormous demand for sulphuric acid, and prices are nominal. The official valuation of sulphuric acid exported in September of 1915 is \$93,664, while that corresponding for September a year ago is \$4,682. Valuations of sulphuric acid exportations for corresponding nine months' period ending September 30 were, for 1914, \$70,705; for 1915, \$774,747—an increase of about 996 per cent.

The conditions of last month still obtain with regard to prices and supply of lithopone and zinc oxides, both foreign and domestic. Aniline (spot) is declining somewhat, although still excessively high. Benzol is practically unobtainable. Solvents are higher than a month ago.

The supply of chalk for whitening manufacture is short and prices uncertain.

Barytes remain very steady, at slightly higher prices than a month ago. Domestic sources are supplying the entire American demand.

Future supplies of some materials are uncertain, and therefore consumers have no reliable basis for calculating costs. In the case of lead and zinc pigments, prices are fairly well defined for the first half of 1916.

PRICES OF CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK, DECEMBER 30, 1915.

Subject to change without notice.

Acetone (drums)	lb.	\$0.35	@ \$0.40

MARKET FOR COTTON AND OTHER FABRICS.

SEA ISLAND COTTON.

AN advance of a cent and a half a pound during the month just closed has resulted in a firm market and advancing prices for manufactures, the demand, generally speaking, having been good for the entire month. In the last week of December fancies were quoted at 27½ cents, extra choice at 27¼ and choice at 26½. The crop in sight at all points, under date of December 17, is 50,777 bales, against 45,626 for the corresponding period a year ago.

EGYPTIAN COTTON.

Recent cables from Alexandria report as follows:

Bullish market result of good export demand and general reduction of crop estimates to 4½ million cantars. Total shipments 314,000 bales—shipments to America 82,000 bales. These figures compare as follows.

Dec. 24	Shipments to America.
1912	bales 50,446
1913	18,012
1914	48,650
1915	82,000
Total Shipments.	
1912	bales 461,956
1913	414,295
1914	232,962
1915	314,000

COTTON DUCK.

Owing to the urgent call for more fabrics, the market continues active, the foreign demand being a factor in demanding the production of certain grades and having a stimulative effect on the local market. Heavy grades of mechanical duck are now in particular demand and prices have advanced a half-cent to a cent per pound for the entire list. Mills that have not already laid in stock will probably find it difficult to arrange for short-time delivery. Increased cost is a matter to be lightly considered compared with the difficulty of securing immediate deliveries.

DRILLS.

Cotton drills are so well sold ahead that June, 1916, is the month that is now being written into the delivery contracts for 52 and 60-inch widths. Similar conditions practically prevail in all grades of ducks and sheetings, regardless of style, quality or width, though it is invariably the wide stocks that are first to be sold out.

For Welford cloth, made in England of water-proofed linen, No. 4 water-proofed duck is now being substituted here.

TIRE FABRICS.

Reports from the fabric mills indicate that a shortage in tire fabrics is not an impossibility. The labor troubles that still continue, with strikes, etc., must seriously curtail the output. The mills are running full capacity in the endeavor to keep up with requirements and in many instances night work has been necessary to meet the heavy demand for certain building fabrics.

YARN DYED GOODS.

The imported grades of yarn dyed goods are now being sold for delivery during August and September, 1916. Owing to the difficulties of delivery and the dye stuffs situation which is now as acute in England as it is here, there has been a noticeable hardening of prices during the month. The mills are reported entirely cleaned up as to stocks of every quality, color and weave. This shortage will be felt seriously when normal conditions return, as it will take several years to replenish the supply.

The following are New York quotations on December 30, 1915:

Aerplane and Balloon Fabrics:

(Same period 1913, 22,336,349 pounds; same period, 1912, 12,083,717.)
The export figures of rubber given in the above table for 1914 include the imports re-exported. (These amount to 3,369,319 pounds.) To arrive at the total quantity of Ceylon rubber exported for that period deduct these imports from the total exports. The figures for 1915 are for Ceylon rubber only.

SINGAPORE.

Guthrie & Co., Ltd., report (November 3, 1915):

There was a falling off in the quantity offered at the auction, some 226 tons being catalogued, 190 tons of which changed hands.

At the outset bidding was slow, but demand improved considerably during the course of the forenoon.

In the afternoon the tone was quieter.

Fine pale crepe was in exceptional demand and sold up to \$136, an increase of \$2. Fine ribbed smoked sheet fetched the top price of the sale, viz., \$137, all parcels selling readily.

Unsmoked sheet was wanted, ribbed and plain, at \$127 and \$125 showing improvements of \$2 and \$3 respectively.

The lower grades moved off freely at an average increase of \$3.

There was very little scrap on offer.

The following was the course of values:

	In Singapore Pical.	Sterling equivalent per pound in London.	Equivalent per pound in cents.
Sheet, fine ribbed smoked....	127@131	2/ 5½@2/ 6½	60.65@61.83

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram received from Kuala Lumpur reports that the export of plantation rubber from the Federated Malay States during the month of November amounted to 4,636 tons, as compared with 4,120 tons in October, and 4,699 tons in the corresponding month last year.

The following is a comparative table showing the exports for three years:

	1913.	1914.	1915.
January.....tons	2,131	2,542	3,473
February	1,757	2,364	3,411

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official cablegram received from Singapore announces that the export of plantation rubber from the Straits Settlements during the month of November amounted to 4,292 tons as compared with 2,641 tons in October and 2,370 tons in the corresponding month last year. The total for eleven months of the present year is 31,886 tons compared with 17,393 tons last year and 10,672 tons for the corresponding period in 1913. The following is a comparative table showing the exports for three years:

	1913.	1914.	1915.
January.....tons	784	1,181	2,576
February	743	1,763	2,741
March	898	1,283	4,477
April	762	1,548	1,978
May	814	1,409	3,588
June	812	1,249	2,249
July	1,120	1,584	2,324
August	1,815	1,325	2,295
September	1,057	1,602	4,725
October	1,144	2,006	2,641
November	1,223	2,370	4,292
Total	10,672	17,393	31,886

These figures include trans-shipments of rubber from various places in the neighborhood of the Straits Settlements, such as Borneo, Java, Sumatra and the non-Federated Malay States as well as rubber actually exported from the colony, but do not include rubber exports from the Federated Malay States.

In addition to the above the following were exported during the same period: To Great Britain, aeroplanes, value \$200,216; balata, value \$1,865; chicle, value \$1,047, and India rubber, value \$24,797. Aeroplanes valued at \$5,000 were exported to Argentina, and India rubber valued at \$30 was exported to Mexico.

Hitherto these import figures were issued weekly, showing the imports for the preceding week. Since the end of November, 1915, however, the statistics, also issued weekly, include all import figures available on the date of issue not specifying the period covered by those figures.

The first set of figures issued under this system appeared on Saturday, December 11, 1915. The export figures were formerly issued so as to specify the clearances each day. Since November 23, 1915, all figures issued are only those available on the day of issue regardless of the day or days of clearance. Evidently the figures issued on November 23 include all those available from November 1 to November 23, 1915.

UNITED STATES IMPORTS OF RUBBER AND RUBBER MANUFACTURES FOR YEAR ENDING JUNE 30, 1915.

	July 1, 1914, to June 30, 1915.	
	Pounds.	Value.
India rubber, gutta percha, etc.

THE RUBBER SCRAP MARKET.

QUIET best describes the market for scrap rubber of late, following the excitement that prevailed over prices at the beginning of the month. In some quarters shoes were reported easier, though current quotations do not bear this out. The flurry in prices served to bring out some unexpected lots, but not in sufficient quantity to affect the market, the figures consumers offered being no inducement to dealers. Some reclaimers asserted their ability to pick up small quantities at ten cents and even a little lower.

Tires being in fairly liberal supply the situation and immediate outlook in this branch are irregular and uncertain, though prices are quite strong. Dealers, however, report increasing stocks on hand, which does not make for higher prices, and unless the price of crude rubber makes the advance foretold tires are likely to remain at prevailing figures.

Mechanical scrap is very firm in price and in good demand, particularly matting, packing and hose, garden hose being in special request.

WHY RUBBER DEALERS ARE NOW ON THE "BULL" SIDE OF THE MARKET.

An explanation of the apparent anomaly of a "rising market on increasing stocks" is afforded by the changed attitude of dealers. Under the auction system, before the war, rubber was constantly coming into the market in unlimited quantities to be sold at any price the dealer chose to give. The effect of this was to make persistent bears of the dealers who were interested in getting the rubber at lowest figures for subsequent re-sale to consumers at a profit. The war changed things. The embargo on exports, delays and uncertainties in transportation and delivery, so interfered with supplies that the dealers became interested in obtaining better prices for the stocks on hand, and from bears were transformed into bulls.

TABLE OF CONTENTS ON LAST PAGE OF READING.**RUBBER CLUB DAY.**

WEDNESDAY, February 2, is slated by The Rubber Club as a day apart. With New York as a center and the Waldorf-Astoria as a rallying place, the rubber trade will assemble to listen to committee reports, discuss trade topics, elect officers and enjoy the annual banquet. For all this, extensive preparation has been made and a most enjoyable and profitable reunion is assured. The subject that the distinguished speakers will discuss is that vital of all topics, "National Defense."

TIRES AND THE RUBBER SUPPLY.

IF prophets are not false, the quantity of rubber required in 1916 by the United States alone for its automobile tires will amount to practically half of the world's production last year.

Taking the figures of the Automobile Chamber of Commerce, that 2,400,000 cars were in use in the United

States during 1915, and increasing it by 1,200,000 for 1916, as estimated by the same authority, the indications are that in this country there will be 3,600,000 automobiles by the end of 1916, less perhaps 200,000 withdrawn from service.

Allowing five casings and five tubes for each of these 3,400,000 automobiles and figuring 42 pounds as the amount of crude rubber contained in the average car's tire equipment, 71,400 tons of rubber will be needed in 1916 for tires.

In the world outside of the United States, according to "The Horseless Age," there were 714,000 automobiles in 1915. Discarding 10 per cent. of these and allowing an increase of 25 per cent. for new cars, the indications are that about 17,243 tons of crude rubber will be required for tire equipment. This, added to the amount of rubber needed for casings and tubes in the United States, will bring the world's demand to nearly 89,000 tons for rubber to be used in tires this year.

The supply of rubber from all sources amounted to approximately 146,000 tons in 1915 against 120,380 tons in 1914, and 108,400 tons in 1913. Allowing for an increase of 22 per cent. in the rubber production during 1916, the yield will amount to 178,000 tons. These figures indicate that this year tires will consume a larger percentage than ever before of the world's largest crop of crude rubber.

Assuming that the number of tires scrapped in 1916 will amount to two-thirds of the year's equipment of casings and all of the inner tubes, there will be approximately 183,000 tons of scrapped tires—the rubber from which will be a goodly addition to the world's supply.

FIRE HAZARDS IN RUBBER FACTORIES.

WHILE the extensive conflagrations that in the olden times wiped out complete rubber plants have not occurred of late, the fire peril still exists.

The greatest fire hazard in the rubber factory is solvent naphtha, which is fairly safe when liquid but dangerous when vaporized. The explosive properties of naphtha, when mixed with air, are well known and too often disregarded. The need of ample means of ventilation to draw this explosive mixture from workrooms cannot be too strongly emphasized. Properly ventilated factories are more free from fire, more pleasant and healthful for the employees. In modern rubber factory construction much attention is given to the providing of adequate heating and ventilating systems with the object of obtaining greater efficiency from the employees than was possible

with methods in use some years ago. This incidentally greatly reduced fire hazards.

Spreader fires, one great danger in the proofing of rubber, apparently occur during periods of low atmospheric humidity, according to the examination made by F. J. Hoxie, a prominent insurance investigator, which is printed elsewhere in this issue. From his findings it would appear that there is a reasonable probability that this class of fires may be largely prevented by artificially maintaining sufficient humidity.

These fires occur chiefly during the winter months, the period of dry air, of low relative humidity. Summer, with its moisture-laden atmosphere, with high relative humidity, appears to be practically free.

It would seem that manufacturers should determine whether Mr. Hoxie's theory is correct. If it is, the number of spreader fires can be materially reduced, perhaps entirely eliminated. Adding moisture to the air in the spreader room, or in any part of the factory where low humidity may increase the fire hazard, is a simple matter.

A small jet of steam opened in the room when the relative humidity drops below 40 per cent. will accomplish the purpose, although a moistening device in connection with a blower heating system, if warmth is provided by that approved method, will be found equally efficacious and will transfer the responsibility of humidifying the air from the foreman to the engineer.

The addition of a direct reading hygrometer, an inexpensive instrument showing humidity, will form an acceptable addition to the equipment of the spreader room, or any room in which rubber cement is used. This would enable the foreman to tell at a glance whether more moisture is required in the air, not only with a view of reducing fire risk but also to improve the quality of the product, which is said to be better when made under conditions of the higher humidity.

Of course, as a rule rubber manufacture is better done in dry than in moist air. Indeed, much time and money are spent in taking all moisture from rubber compounding ingredients and fabrics and the goods are the better for it. It is a question, therefore, if damping the air of even a spreader room will be looked upon with favor. Certainly the suggestion that dry heaters be equipped with sprinklers will not appeal to the manufacturer.

Since the insurance interests have made material reduction in rates for factories possessing fire protection equipment and have added charges for those offering particular hazard, rubber manufacturers have found it to their advantage to add sprinkler systems, standpipes with hose, extinguishers and numerous pails of sand. They have taken precautions never before practiced, and perhaps previously thought unnecessary. The results have been a saving of money

in premiums and of that loss attendant to every fire that cannot be covered by insurance—delay, worry, extra work, cancelled orders.

Manufacturers will find it well worth while to reduce fire hazards to the minimum, to supply proper fire fighting equipment and to train men in each department how to act in case of emergency. Constant vigilance is the only safeguard.

THE TRIUMPH OF THE "SCULPTURED" TREAD.

FOR some years past anti-skid treads, were they "Bailey," "Nobby," "Staggard" or "Squeegee," were things abhorred by the great Michelin company. "Sculptured" treads they called them and most wittily they lampooned them in prose and verse. In serious earnest, also, their experts proved that the "sculptured" tread was not the equal of the smooth tread, and their reasoning seemed sound. In spite of this, however, every tire company kept its special anti-skid, new companies added theirs until it seemed as if all possible designs had been exhausted. Then, and only then, the Michelin company, realizing perhaps what they had known all along, that tire users craved anti-skids, brought out one of their own. It isn't exactly a "sculptured" tread, but it is recessed, and it is an anti-skid. The Michelin company gracefully and effectively bowed to the inevitable.

WHERE CABLE STRIPPINGS ARE WELCOME.

OF all types of scrap rubber the condemned rubber-covered cable is the most undesirable. It is utterly, obstinately intractable. It bulks big and bends with reluctance. The owner dislikes to feed it to the alligator shears for fear that some half mile of it may pass muster as good enough for an economical borough or bankrupt republic. Among junk men stories are rife of lots gathered in this fair republic, refused by local reclaimers, shipped to England, sent back, ballasted to Venezuela, sequestered for debt, and finally brought back to rest in a Brooklyn junk yard as far from reclaiming as in the beginning.

But with rubber at \$12 a pound in Germany it is a safe bet that there, at least, no cable strippings are going begging. Too bad the embargo—but that is a forbidden topic.

MANY WONDER JUST WHY THERE SHOULD BE ANY hesitation in allowing hospital supplies of rubber to go into Germany for Red Cross use. They do not appreciate the fact that for purposes of remanufacture for tires, inner tubes or ground sheets, these goods, either new or scrapped, are equivalent to a certain amount of crude rubber. With raw rubber at its present price in Berlin rubber scrap quotations per pound should be as follows: red scrap, \$2; white scrap, \$2.20; automobile tires, \$1; inner tubes, \$.5.

Fire Hazards in Rubber Mills.

IN the matter of fire hazards, every industry has its own individual peculiarities. The manufacture of rubber goods is no exception. Besides the possibilities which are common to any and every manufacturing establishment of similar build and of equal size this industry is subject to some special risks, and therefore the study of the causes of fires is an important one, and the better known they are, the more satisfactorily can they be guarded against, or more quickly extinguished when they occur.

Very thorough and exhaustive researches have been made by insurance adjusters, as well as by chemical experts, as to the principal causes of fires in rubber factories. The result of these studies seems to show that outside of those causes common to all factories, the principal dangers peculiar to rubber manufacture come from the inflammability of the solvents used in the industry, from spontaneous combustion of some of the materials, and from excessive heat in some of the operations. The two latter, however, are but minor hazards; practically the all-important one is in the use and storage of naphtha and similar solvents, and the preparations in to which these enter.

A careful and comprehensive study of all the processes in the manufacture of rubber, made by Charles E. Macomber, Jr., of the N. F. P. A., has led him to the following conclusions as regards rubber footwear factories:

There is no fire hazard in crude rubber, nor in the process of washing. In drying, he recommends that if the ordinary system of steam coils is used, care should be taken that the pipes are properly installed, resting on iron, bushed where they pass through wooden partitions or floors, and protected by screens, so there will be no danger of stock coming in contact with them. Should a system be in use requiring a fan, additional precautions should be taken.

In the vacuum system of drying there would seem to be no more hazard than there would be in the installation of a steam pump or similar piece of apparatus.

The lowest rooms there is no material hazard, as the temperatures of the material in process of compounding cannot be carried high, on account of the possibility of spoiling from this cause.

The storage of the various ingredients may constitute a hazard, however. As a rule these materials are stored in the compounding room only in sufficient amounts for immediate use, the bulk being kept in original packages, which are stored in a warehouse or portion of the factory reserved for that purpose. Among the materials which may cause trouble, this investigator mentions lampblack, which, he says, should be kept dry and stored in small quantities, preferably in metal containers with tightly fitting metal covers, for there are cases when, under cer-

tain conditions, it has been known to heat and ignite spontaneously.

While sulphur is always found, it in itself presents no special hazard, except that its presence would add fuel with the evolution of objectionable gases. There are also stored various oils, resins, waxes and the like, but with proper care these should give no trouble. In fact, this is true of all the material used in the compounding of rubber. He considers that there are no special hazards in calendaring, frictioning or impregnating, as the degree of heat is low, owing to the danger of spoiling the compound.

In the making, however, comes the hazard of the use of rubber cement, and to this one preparation is laid the blame for the vast majority of fires in rubber mills. The hazard both of the manufacture and use of this article is due to the solvent used to get the rubber in solution. This is naphtha. The kind generally used and most preferred is that having a specific gravity of .706, 70 degrees Baumé, boiling at 180 degrees F. and flashing and burning at ordinary temperature.

It is recommended that the manufacture of cement should always be conducted in a detached building away from the main plant, well ventilated, and carried on without the aid of artificial light.

If light be necessary, incandescent light should be used, the sockets to be keyless, the wiring run in conduit, the lamps enclosed

DISTRIBUTION OF RUBBER FACTORY FIRES REPORTED FOR SEVEN YEARS.

The upper curve is the monthly average mean of dew points at 8 A. M. and 8 P. M. at Boston, thus representing fairly well daytime conditions or "working hours" in southern New England.

The second curve is the aggregate number of rubber fires reported in twelve factories, distributed by months, in the same seven years.

The lowest curve shows the aggregate number of rubber spreader fires reported in seven factories distributed by months during the same period.

in vaporproof globes, and the switches and fuses located outside of the building. The naphtha should be stored in an underground tank located 30 feet or more distant from any building, and pumped as needed to the cement mixing room.

Power for churns (these are best of the enclosed type) should be furnished from outside by means of shaft or some kind of a drive permitting a cut-off opening. While the speed of the churns is necessarily slow (owing to the ease with which rubber is electrified by friction and pressure), as a precautionary measure it would seem advisable to "ground" all of the machinery.

The cement, except that in immediate use, should be stored in tightly covered metal cans. There are cans on the market designed for this purpose.

If the plant be sprinklered the cement house should contain a standard system of automatic sprinklers, and in all cases the cement room should be provided with a steam jet of ample size for smothering fire, having an easily accessible valve located on the outside of the building.

A day's supply only should be brought into the factory, and only enough distributed to the operators for immediate use. At the close of the day that remaining in the small pans should be returned to the container, which should be removed to the cement house.

In some factories naphtha is used for thinning the cement at

the benches. This would seem to present a needless hazard, for the cement is easily made of the proper consistency, and if used in small quantities at a time there should be very little evaporation and thus no call for the addition of naphtha.

Lighting there should be incandescent electric. The making room should have at least half of its fire pails filled with sand and supplied with a scoop for using it, as cement fires are best put out by smothering.

Some of the hazards above mentioned are also applicable to varnish. Some factories manufacture their own varnish. This should always be made in a well-detached building. The building used for the manufacture of cement could be made large and a section of this building could be used, cut off by parapet fire walls, with no openings into the cement section. The varnish is made from linseed oil, which is bought, generally, in the raw state and boiled here.

It is the opinion of this investigator that this section should be made thoroughly fireproof, and that sprinklers might be omitted. Floor should be concrete and fitted with a drain leading to a blind pit of ample capacity, located 50 feet or more from any building.

The vessels in which the oil is boiled should be sufficiently large, so that the oil can in no way boil over. Coke or hard coal, it is believed, is best for fuel. Gas is sometimes used, but might cause danger, owing to drafts.

Varnish also contains rosin or some cheap varnish gum; also sulphur in small amounts.

After the varnish is boiled for a proper length of time it is thinned down with naphtha. This hazard is similar to the cement hazard, and the naphtha should receive the same treatment here.

Varnish should be stored in strong metal tanks, and pumped out as needed. It is often brought to the factory in pails. The best way would seem to be a system by which it can be pumped to the place where it is used. The investigator has seen an installation where the pump is controlled by an electric device in the varnish room, arranged so that the pump can be started up or shut down at will. The piping is arranged to pitch back to the pump, so all varnish drains back to storage tank when pump is stopped. The amount of varnish in the factory should be limited to a day's supply.

Lighting in this department should be incandescent electric. Varnish room should be well ventilated and cut off from the main plant and vulcanizer room. Dip tanks, if used, should be installed to conform, where practicable, to the rules and requirements of the National Fire Protection Association.

Dry heaters for vulcanizing should be located in a well cut-off section. The tin lining should be standard, and attention should be given steam pipes to prevent contact with all inflammable material. They should be provided with a steam jet having an easily accessible valve, so they could be flooded with steam if necessary.

They should also be protected by a standard system of automatic sprinklers, although the manufacturers, almost without exception, take issue to this, owing to the fear of premature opening of the sprinklers, as the presence of water during the vulcanization process would ruin the goods.

The foregoing hazards, or some of them, and the precautions recommended apply practically to all rubber factories. But besides these are others applicable to the manufacture of rubber-coated fabrics. Our readers are familiar with the operation of the spreading machines, and know of the danger of ignition of the naphtha fumes from sparks of static electricity, which is generated in the fabric by friction and pressure. This, according to another investigator, has been found to be very largely a matter of humidity, which will be referred to later.

The dough or spreading mixture is simply compounded rubber which by means of naphtha and churning has been made of a dough or cement-like consistency. The hazard of manufacture of this material should be safeguarded in the same manner as described for the manufacture of cement.

Spreading machines should be located in a detached or well

THE CHAPMAN NEUTRALIZER.

In the application of the Chapman neutralizer to spreading machines, the transformer is located on some convenient wall and a single heavily insulated wire leads to the several machines to be treated. Each spreading machine is fitted with two "inductors" extending across the machine over the fabric. One is placed just back of the spreading knife and the other near where the fabric is rolled up. The positions of these inductors are shown above.

These inductors are placed so that the fabric passes them at a distance of from two to four inches. The influence of the inductors extends through the air for several inches around them, and every portion of the fabric as fast as it comes within this region of influence is imperceptibly but instantly deprived of any electric charge existing upon it.

The result of this action is that the inductor at the head end of the spreader instantly and completely neutralizes every part of the fabric as fast as it leaves the spreading knife, before any charge imparted to the fabric can accumulate sufficiently to discharge to the roll, knife, frame or pipes in the form of a spark.

The object of the other inductor, treating the fabric just before it is rolled up, is to remove any slight charge redeveloped by the other rolls over which the fabric passes before winding up.

cut-off section of the plant. The hazard of the operation is entirely due to the presence of the naphtha used in the spreading compound. Rubber being easily electrified by friction and pressure, and as it is thought by some engineers that the evaporation of naphtha also causes this phenomenon, the spreading machine should be equipped with devices for removing these static charges.

The methods in use for guarding this hazard are as follows: All metal and moving parts of the machine are well grounded. Directly in front of the knife is located a steam jet. Bearing on the underside of the fabric is a wire which collects any charge which is not broken up by the steam jet.

In some factories the speed machines are equipped with an electric device known as the Chapman Electric Neutralizer, which distributes alternating charges at high voltages in minute quantities to the places where the static charges collect. This works on the principle of the simple law of attraction and repulsion, that the static charge in any insulating material selects for itself the kind and quantity to exactly neutralize itself.

According to investigation made by the Inspection Department of the Associated Factory Mutual Fire Insurance Companies, it has been concluded that if the humidity of the room where the spreading machine is conducted is kept at about forty per cent, there will be little danger of fire from this cause.

As a proof that the chief hazard in rubber factories is due to ignition of the spreading material through sparks of static electricity F. J. Hoxie, a well-known insurance inspector and engineer, gives in graphic form the number of all fires in twelve factories during the seven years previous to 1915, and the number of spreader fires in seven factories during that same period. It will be seen that a very large percentage of all occurring in the

winter were spreader fires. This engineer believes that this fact suggests some peculiarity in the condition of the atmosphere, such as dryness as the probable cause, and calls attention to the humidity of the inside air in the different months. It will be observable that the line thus represented follows remarkably near parallel with that representing the total fires in those months.

Humidity measurements were made on a winter's day in the spreading room of a rubber factory in Canada, while the relative humidity of the room was gradually increasing after a cold morning in which excessive electrification was noticed. Just after static electricity had ceased to be conspicuous on the goods, and at a temperature of 58 degrees F., this engineer found a relative humidity of only 28 per cent. In summer the air from the outside entering this room would have an average relative humidity of from 60 to 80 per cent., or would contain five times as much water per cubic foot.

The observations plotted in the foregoing diagram suggest that a comparatively low atmospheric humidity is sufficient to stop most of the fires caused by static electricity, and that the natural humidity is enough to present fairly safe conditions during the greater part of the year.

The remedy suggested is a simple humidifying device or a small steam jet opened in cold, dry weather. This would be sufficient to raise the humidity in the room above the danger point; also it appears probable that in rubber factories, in addition to preventing fires, a carefully regulated humidity will improve the quality of the goods, although no conclusive data on this point are yet available.

In the rubber spreading room, above referred to, the distribution of electric charge on goods being spread was roughly determined by the use of cotton candle wicking, as an electroscope, while the relative humidity in the room was at about 20 per cent. The following sketch shows the distribution of the electrical charge. An electroscope of worsted fibres would have been somewhat better, but cotton was used, as being at hand. A gold leaf electroscope would probably be found too sensitive for indicating the comparatively large differences of charge.

DISTRIBUTION OF STATIC ELECTRICITY ON FABRIC ON A RUBBER SPREADING MACHINE ON A COLD DAY.

The cause of the electric charge on spread rubber has been attributed to friction at the knife. This may contribute to it, but its distribution would indicate that it is more probably caused by the evaporation of the solvent from the cement or from some unknown chemical action, such as oxidation or change in hydration of the rubber or fabric. For example, kerosene passed through wool filter bags can develop a sufficient charge of electricity to ignite the kerosene.

Some experiments carried out in the Factory Mutual Laboratories by Mr. Lawler and Mr. Turkington show that the act of withdrawing a piece of loose wool from a pail of benzene leaves an appreciable electric charge both on the wool and the benzene.

Electrical devices making use of very high voltage alternating current have been applied successfully for neutralizing the static charge on calendared paper. This device has been tried in a few cases on rubber spreaders with doubtful success, and sometimes fires have been directly caused by it.

Ozone from electrical devices, or from the electrified goods themselves, may also have a detrimental effect on rubber, for

ozone appears to be a natural enemy of rubber. One of the old-time practical tests for durability of a sample of rubber was to place it in a closed jar in which ozone was slowly generated by the presence of a small piece of phosphorus.

Last winter, one rubber factory installed a recording hygrometer in a room where much rubber cement is used and where fires have frequently occurred. Whenever the humidity falls below 40 per cent., moisture is blown in or the air is artificially humidified. No fires of importance have occurred in this room since these precautions were taken.

Systematic observations of the relative humidity are now being made along the lines suggested above at several rubber factories. Until more reliable data are available, it will undoubtedly be safe to assume that with a relative humidity of not less than 40 per cent., the tendency to fires from static electricity about rubber cement will be much reduced, with no damage to the goods.

Mr. Hixie advises that a reliable hygrometer be kept in each churn room or spreading room of a rubber factory, and, when the natural humidity falls below 40 per cent., artificial humidity should be introduced. This can be done by a steam jet or by some of the various forms of humidifiers used in cotton spinning rooms and weave rooms.

THE RUBBER CLUB BANQUET.

ON account of the change in the date of the sixteenth annual banquet of The Rubber Club of America, Inc., from January 28 to February 2 to better suit the convenience of the members, the annual and other meetings were postponed to February 1 and 2, as shown in the accompanying schedule:

- FEBRUARY 1, 6:00 P. M.—Meeting of Executive Committee of The Rubber Club of America, Inc., at the Union League Club.
- FEBRUARY 1, 7:00 P. M.—Meeting of Executive Committee of the Rubber Sundries Manufacturers' Division at the Union League Club.
- FEBRUARY 1, 7:30 P. M.—Meeting of the Present Board of Directors of The Rubber Club of America, Inc., at the Union League Club.
- FEBRUARY 2, 2:00 P. M.—Annual meeting of the Rubber Sundries Manufacturers' Division at the Waldorf-Astoria.
- FEBRUARY 2, 2:00 P. M.—Annual meeting of the Mechanical Rubber Goods Manufacturers' Division in the East Room of the Waldorf-Astoria.
- FEBRUARY 2, 3:00 P. M.—Annual meeting of The Rubber Club of America, Inc., in the Myrtle Room of the Waldorf-Astoria.
- FEBRUARY 2, 4:00 P. M.—Meeting of the newly elected Board of Directors of The Rubber Club of America, Inc., at the Waldorf-Astoria.
- FEBRUARY 2, 7:00 P. M.—Annual banquet of The Rubber Club of America, Inc., in the Astor Gallery of the Waldorf-Astoria.

With a good attendance assured, the banquet promises to be a notable occasion. The following speakers, who have been announced, are men of national reputation: Edward N. Hurley, Chicago, Illinois, vice-chairman of the Federal Trade Commission; Edward D. Estabrook, New York City; Hon. Harry M. Daugherty, Columbus, Ohio, and Rev. W. Warren Giles, East Orange, New Jersey. The invocation will be given by Rev. George R. Van De Water, rector of St. Andrews Protestant Episcopal Church, New York.

Dr. E. E. Pratt, chief of Bureau of Foreign and Domestic Commerce, Washington, D. C., has accepted an invitation to be present.

For the convenience of club members and also of the press, there will be a complete stenographic report made of the speeches and addresses given at the banquet.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World

The New York Automobile Show.

ALL records in attendance and number of exhibits were broken at the sixteenth annual National Automobile Show held at the Grand Central Palace, New York City, from December 31 to January 8. As generally expected, the most prominent tire manufacturers did not exhibit, but the many cars shown were equipped with standard tires and tops made of standard fabrics. Among the many exhibits of tires

Louisville, Kentucky, attracted much attention on account of its puncture-closing qualities.

In the booth of the Essex Rubber Co., Inc., Trenton, New Jersey, there was exhibited an attractive line of blue, red and gray inner tubes, together with patches, reliners and other automobile accessories.

Shown in a prominent position on the fourth floor, a large

MICALITE EYE SHIELD.

and automobile accessories that helped to make the show interesting and instructive were the following:

TIRES AND TUBES.

The new tread of the Dayton tire, illustrated herewith, which has a heavier central rib than the former design, was shown, together with the Dayton airless tire, by the Dayton Rubber Manufacturing Co., Dayton, Ohio.

The Marathon "Whip-Cord" tires and tubes attracted attention to the booth of the Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio.

Many people were interested in watching a tire-maker build up "Sterling" tires on a tire core jack at the exhibit of the Rutherford Rubber Co., Rutherford, New Jersey. Beside tires and tubes, this company displayed the "Sterling" red fiber mat for Ford cars.

Double fabric tires and "Anti-Pinch," "Double Rubber" and red "Interlock" inner tubes constituted the display of the Double Fabric Tire Co., Auburn, Indiana.

The "Victory" tire, of molded cellular construction, sealed by the base strip and the tread, was exhibited by the Milne Tire Co., Inc., New York City.

Story & Reed, New York City, demonstrated the air-retaining qualities of the "Brown Scientific" tube, which is claimed to be self-closing when punctured, and of which a cross section view is reproduced. This tube, which is made with an extra thick tread, has a strip of non-stretchable fabric vulcanized into the tread close to its inner surface. The tube is then turned inside out and the ends joined. As the larger outside circumference becomes the inner circumference, the rubber on the inside is always compressed, thus rendering puncture holes self-closing. The "Miller" pneumatic tire was shown in the same booth.

Another inner tube of thick rubber, called the "Compression," and manufactured by the Compression Inner Tube Co., Inc.,

line of tubes, patches, reliners, cushions and specialties manufactured by the Voorhees Rubber Manufacturing Co., Jersey City, New Jersey, received much attention from the visitors.

REPAIRING DEVICES.

The Adamson Manufacturing Co., East Palestine, Ohio, made an attractive exhibit of its various vulcanizers, kits and repairing devices, including the new "Model H" vulcanizer, designed to accommodate three tubes at a time and provided with a hood for carrying off fumes.

"Magic Rubber Mend," a quick vulcanizing rubber preparation for repairing tubes, boots and other rubber goods, was shown by the Eastern Rubber Co., Philadelphia, Pennsylvania, and attracted much attention, as did the "Cementless Cure" patches manufactured by Charles O. Tingley & Co., Rahway, New Jersey.

For the prevention of tire troubles, the Newmastic Co., New York City, exhibited sections of tubes that had been filled with "Newmastic," a preparation injected through the air valve, and the Woodbridge Chemical Co., New York City, demonstrated its preparation, "Air-In-Air."

Re liners, boots, patches and accessories were shown by Paul G. Nichoff & Co., Chicago, Illinois; the Polson Rubber Co., Kansas City, Missouri, and the General Tire & Rubber Co., Akron, Ohio.

Stevens & Co., New York City, exhibited the "Sampson Feather-Edge" inner tube plug for tube repairs; the Spitzer Puncture Plug Co., New York City, showed its line of "Spitzer" puncture plugs, and C. A. Shaler Co., Waupun, Wisconsin, presented a display of repair vulcanizing outfits.

OTHER TIRE ACCESSORIES.

An exceedingly interesting exhibit of the Schrader "Universal" tire pressure gage, valves, valve accessories and repair tools

and outfits was made by A. Schrader's Son, Inc., Brooklyn, New York.

The following is a list of other tire accessories of interest with the names of the manufacturers or agents making the exhibits:

"Off-An-On" tools for clincher tires and Stewart "Correct" tire carriers; Stewart Accessories Co., Detroit, Michigan.

"Warland" dual rims; Fryer-Auster Co., Providence, Rhode Island.

The "Twin-Rim"; Be-Be-Co., East Cambridge, Massachusetts.

Friedstied rim contractor for straight side and clincher split rims; Friedstied Rim Contractor Co., Chicago, Illinois.

"Utility" tire pump, to be attached to the spark plug hole; Hill Pump Valve Co., Chicago, Illinois.

"Detroit" gearless, motor-driven tire pump; Detroit Accessories Corporation, Detroit, Michigan.

Portable and stationary air pumps for garages and tire shops; Lipman Air Appliance Co., Beloit, Wisconsin.

ACCESSORIES FOR AUTOMOBILES.

The Stanwood safety step plate, intended to prevent the tracking of mud or dirt into the car and to insure a secure foothold, as shown in the accompanying illustration, consists of a perforated steel plate covered with rubber and having 24 ribs. This was displayed by the Onguard Auto Necessities Co., Detroit, Michigan.

Another device to protect the automobilist is the Micalite eye-shield. As will be observed in its illustration, this eye-shield, which is made in two colors in one piece, is bound with split rubber tubing and is held in position on the head by rubber bands. It is manufactured by Strauss & Buegeleisen, New York City.

Charles E. Miller, New York City, with branches in the principal cities, showed a large number of automobile sundries, among which was the "U-Can-C" windshield protector, a celluloid hood, to be attached to the glass windshield by means of rubber vacuum cups, in order to prevent rain and snow striking the part of the glass thus protected.

The "Presto Car-Cool" for Ford cars, a device to prevent heat from radiating through the lever slots, was shown by the Metal Specialties Manufacturing Co., Chicago, Illinois. From the illustration, it will be observed that the lever slots are closed by rubber strips held in position by a metal frame. These strips, while permitting free use of the levers, prevent the heat from passing through the slots.

Among the electrical exhibits were the General Electric Co., Schenectady, New York, showing mercury rectifiers in operation, and the Westinghouse Electric & Manufacturing Co., Pittsburgh, Pennsylvania, displaying lighting, starting and ignition devices. The magneto and storage battery manufacturers were well represented and made attractive exhibits of their products.

An automobile cigar lighter, to be connected with the lighting system of a motor car, was shown by the Electric Automatic Cigar Lighter Co., New York City, and a self-winding electric clock was exhibited by the Hartford Clock Co., Hartford, Connecticut.

The Lowe Motor Supplies Co., New York City, displayed its line of automobile sundries.

OTHER INTERESTING EXHIBITS.

Much interest was shown in the Elkin hose clamp, here illustrated. As will be seen, the hose to be connected is slipped over the metal nipple of the clamp. The hinged arms are then folded over the hose and the ferrule is screwed down over these arms, which are thus securely impressed into the hose, forming a tight joint. This clamp is manufactured by Charles Elkin, New York City.

A large space was occupied by the General Bakelite Co., New York City, in which many samples of bakelite were shown, including the process of molding with a hydraulic press.

The "Bull Dog" and other waterproofed fabrics manufactured by the L. J. Mutty Co., Boston, Massachusetts, constituted an attractive display of samples of materials for automobile tops.

Among the novelties which attracted attention was the "B-P-C" clothes protector, an apron-like garment fastening over the front of the coat and trousers by means of springs, and made of a material which it is claimed is not affected by oil, gasoline or water.

Samples of automobile trimming, covered with jet black hard rubber, were exhibited by the Rubber & Celluloid Harness Trimming Co., Newark, New Jersey. At the same booth "Roxlyte" dressing for real and artificial leather was demonstrated.

The Standard Woven Fabric Co., Framingham, Massachusetts, and the Woven Steel Hose & Rubber Co., Trenton, New Jersey, made attractive displays of brake lining and friction materials.

The Morse "Rocker-Joint" silent chains, as used on the motors of many of the higher-priced cars, were shown in position on automobile engines, by the Morse Chain Co., Ithaca, New York.

COLONEL COLT PREDICTS UNPARALLELED ACTIVITY.

Prosperity in the rubber industry and an increase in prices are predicted by Colonel Samuel P. Colt, president of the United States Rubber Co., New York City, in his review of the rubber situation printed in the "Journal of Commerce." He said in part:

My firm belief is that we may witness unparalleled activity in general business as a result of the European war, while it lasts, and for two or three years after it culminates. We are today feeling the stimulating effect of the European upheaval.

So far as the rubber industry itself is concerned, it has in general responded to this change for the better. Our mills, over 40 in number, which are located in different parts of the United States and Canada, are running fuller and employing more men and women today than ever before in the history of the company, and with every indication that our plants will be kept busy for some time to come. In fact, we are so encouraged by the present condition that we have taken steps to put in operation certain unused manufacturing facilities as well as to enlarge the capacity of other plants in operation. Although direct war orders have helped the position of the rubber manufacturers' market, it is gratifying to point out that the improvement in large part has been in our domestic demand for goods.

Touching the 1915 prediction, it is estimated that Brazil turned out 35,000 tons, the Far East 100,000 tons of plantation grades, and various other points, 15,000 tons of wild rubber. It is anticipated that the consumption of the world has increased 20 to 30 per cent. I look for this to be taken care of by the enlarged production during 1916. The present high values are an incentive to all producers to increase their output to the maximum capacity. In the East the largest planting was done in 1910, which will come into bearing in 1916. We look for that output to be 140,000 to 150,000 tons. Brazil will not increase in the same ratio, although I look for a decided increase there and in other countries where wild rubber is gathered.

Without doubt, existing conditions will necessitate an advance at an early date in all lines of rubber manufactures. The demand and consumption of crude rubber was never as great as at present. I look for general good business in all lines of rubber manufactured goods for the next two or three years to come.

THE ROLL OF HONOR OF THE MALAY STATES.

"The Roll of Honor and List of Malay States Men Serving" is the title of a 16-page supplement to the "Malay Mail" of October 25, 1915, that contains the names of 788 officers and men who are serving in the war. These names are divided into three lists, the English born containing 723, the French born 30, and the native born 35 names. The name, profession, local address, rank and regiment of each person is noted. Information is also given regarding the wounded, killed and missing. It is particularly noticeable that the majority of those listed hold commissions, some of which are of high rank. The majority of the names appearing are those of planters, although persons in all walks of life are listed.

What the Rubber Chemists Are Doing.

PRESIDENT RICHARD C. MACLAURIN, of the Massachusetts Institute of Technology, in a recent address before the New York Section of the American Chemical Society, said:

We are hurt here (in America) by the prevalence of the spirit of trade secrecy. Of course, we recognize a large part of what is thought of as "secret" is really widely known, and there is much knowledge of value that could be disclosed without any detriment whatever to the reveler.

There is still with us too much of the spirit of the pre-scientific days and too much reliance on "rule of thumb." Old-fashioned superintendents are still constantly employed who have no knowledge of science and little faith in it. Practical men must not be so scornful of what is obvious to men of science.

When the war is over the conditions of competition will be peculiarly severe, but the war should have given our chemical industries a new start and a fresh impetus, and if our range of vision is long and our enterprise does not fail, the future of chemical industry in this country should be bright indeed.

* * *

ARTIFICIAL RUBBER FROM VODKA.

Since the outbreak of the war, when the sale of vodka in Russia was prohibited, the Imperial Minister of Finance has instituted researches to adapt the national intoxicant to technical purposes which would permit the government to profitably dispose of the 260,000,000 or more gallons now in stock. In a recent issue of the Petrograd "Nowje Wremja," a chemist named Ostromyslensky is credited with having discovered a process for making artificial rubber from vodka so successfully that the government has decided to erect a large plant for manufacturing "vodka rubber."

In this connection it should be noted that United States patent 1,161,904, recently granted to David Spence and Alexander P. Clark, assigns to The B. F. Goodrich Co., covers a process for obtaining rubber-like substances from alcohols. [THE INDIA RUBBER WORLD, JANUARY, 1916, page 169.]

METHODS OF ANALYSIS.

DETERMINATION OF SULPHUR IN RUBBER.—The following method was devised by Dr. Ludwig Rosenstein:

Weigh out exactly 0.5 gm. of the finely ground sample in a 300 cc. Erlenmeyer flask. Add 15 cc. of a saturated solution of arsenic acid, 10 cc. of fuming nitric acid and 3 cc. of saturated bromine water. Cover with a watch glass and boil until the sample is completely oxidized and a clear solution is obtained, adding more fuming nitric if necessary to complete the oxidation. Evaporate to syrupy condition, then add a few crystals of potassium chlorate to insure complete oxidation and to expel oxides of nitrogen. Continue the evaporation almost to dryness to insure complete expulsion of oxides of nitrogen. Cool and take up with 50 cc. of 10 per cent hydrochloric acid, heat on steam bath until solution is complete, filter to free from any insoluble matter and dilute the filtrate to about 300 cc. From this solution the sulphur, which has been converted to sulphate, may be precipitated with barium chloride. Filter and weigh, observing the usual procedure and take special precaution that precipitate be filtered from the hot solution and washed with hot water to remove any lead salts.

The function of the arsenic acid is to raise the boiling point of the solution during the oxidation, thus making it more complete and rapid. It may be prepared by adding C. P. arsenic oxide to boiling water until boiling point of the solution is 140 degrees C.

This method has been found rapid and accurate to within less than 0.1 per cent on rubber mixings, both cured and uncured containing known amount of sulphur, with and without various compounding ingredients.

ELECTROLYTIC METHOD FOR LEAD AND ZINC IN RUBBER COMPOUNDS.—The following method, by Elmer D. Donaldson, is of interest. The portion relating to the deposition of zinc on platinum direct is adapted from a recently published method by W. S. Kinley used for determining zinc in bronze and brass.

Donaldson's method consists of digestion of the ash in nitric acid and precipitation of lead as peroxide (PbO_2), followed by evaporation and precipitation of zinc as metal, both on platinum. The electrolytic apparatus was equipped with a rotating electrode and pole-reversing switch. The larger electrodes were of platinum gauze $1\frac{1}{2}$ inches wide by 2 inches high, sand blasted, and the rotating gauze $\frac{1}{2}$ inch wide by 2 inches high. The apparatus was connected to a 110 volt direct current generator and lamp resistance.

Lead—Weigh 1 gram rubber, wrap in a 7 centimeter ashless paper and incinerate in a 20 to 30 cc. porcelain crucible. Brush the ash into a 200 cc. electrolytic beaker, add 25 cc. concentrated nitric acid, and digest on hot plate for 15 minutes. Boil to expel nitrous fumes and dilute to about 125 cc., having solution at 158 degrees to 176 degrees F. Electrolyze with rotating cathode, using direct current of two to three amperes. The lead will appear on the large gauze anode as peroxide, black when in large amounts, bronze colored when in small amounts. Electrolyze 30 minutes and wash anode thoroughly with water to remove mechanical impurities, then with alcohol and ether. Dry for 30 minutes at 338 degrees F. Weigh as peroxide of lead (PbO_2) and for convenience calculate to litharge (PbO), using the factor 0.933. No metals present in rubber mixings will interfere with this determination.

Zinc—Wash the solution and the insoluble matter from the electrolytic beaker, from which the lead has been removed, into a litre beaker. Add 5 cc. concentrated sulphuric acid, evaporate dry, and drive off most of the sulphuric acid. This is done to insure complete removal of nitric acid, which would interfere with the electro deposition of zinc. After evaporation, cool and digest residue, which usually contains considerable insoluble, with 50-75 cc. water. The zinc is now present as zinc sulphate and is readily soluble. Filter and wash. If the zinc oxide content is known to be low use entire filtrate, but if 20 per cent or over, catch filtrate in 200 cc. volumetric flask. Make up to mark and take 50 cc.

Wash this portion of solution representing 0.25 grams of rubber sample into a 200 cc. electrolytic beaker. Add considerable excess of saturated solution of sodium hydroxide over that necessary to redissolve the zinc hydroxide. Electrolyze at ordinary temperature at 2 to 2.5 amperes, rotating the anode for 20 minutes. Remove and wash with water, alcohol and ether. Dry at 212 degrees F. for a few minutes, cool and weigh.

Zinc is deposited on the cathode and is weighed as metal. The weight of zinc is calculated to zinc oxide. Aluminum will not interfere even if the solution is gelatinous from the precipitated aluminum hydroxide. In event that iron is present, filter off the iron hydroxide after adding just enough sodium hydroxide solution to insure solution of the zinc hydroxide. Then add further sodium hydroxide solution to this filtrate. Lead peroxide and zinc can be dissolved from the platinum gauze by concentrated nitric acid saturated with tartaric acid.

PREPARATION OF RUBBER SAMPLES FOR ANALYSIS.—Soft vulcanized rubber of high grade requires to be finely divided for successful analysis by extraction methods. It has recently been suggested by John H. Link to use for this purpose an "Enterprise" food masticator, No. 1 size. Repeated passage through the machine will, in a few minutes, cut an ounce of soft cured rubber sufficiently fine to pass through a 20-mesh sieve.

CHEMICAL TREATMENT OF RUBBER.

THE UNITED STATES.

VULCANIZING RUBBER-LIKE MATERIALS, 1,166,777. Paul I. Murrill, assignor to Revere Rubber Co. Rubber or rubber-like materials are cold cured by subjection to the action of sulphur monochloride and gasoline characterized by the absence of olefins.

RECVLCAIZING RUBBER, 1,166,784. Raymond B. Price, assignor to Rubber Regenerating Co. The process consists of exhausting, heating, and compressing the finely divided material and compressing it under excessive compacting pressure to minimize destructive distillation, then subjecting it to vulcanizing heat, and finally quickly cooling it to check surface vulcanization.

DEVULCANIZING RUBBER, 1,167,359. Henry J. Mayers, assignor to the Empire Rubber Co. The process consists in subjecting the vulcanized rubber to the action of a bath containing de-resinated and de-turpenated oil of pine.

MANUFACTURE OF FROTH FILLINGS, 1,167,518. Fritz Pfeumer. The process comprises the steps of vulcanizing rubber material under a hot high gas pressure, then cooling it under a gas pressure at least equal to that applied during vulcanization, inserting the cooled filling into a casing, and then heating the filled casing to expand the filling until it occupies the interior of the casing. An illustrated article on the material produced by this process will be found in *THE INDIA RUBBER WORLD*, August, 1915, page 610.

MANUFACTURE OF ISOPRENE AND HOMOLOGUES, 1,168,070. Henry S. A. Holt, assignor to Badische Anilin & Soda Fabrik. The process of producing butadiene hydrocarbons by heating in the vaporized condition while in a state of dilution and in the practical absence of other organic hydrocarbons, the mixture of polymerized products other than caoutchouc-like matter resulting in the polymerization of butadiene hydrocarbons.

RECLAIMING WASTE RUBBER, 1,168,230. Gray Staunton.—Finely ground vulcanized waste rubber is mixed with about 25 per cent. of alkaline carbonate. This dry mixture is heated in an oven for two or three hours at 300 degrees F. The material is then heated to remove excess of alkali.

THE GERMAN EMPIRE.

HARD RUBBER SUBSTITUTE, 289,597 (1915). Hans Blücher and Ernest Krause. By the process yeast is converted into a horn-like substitute for hard rubber by the action of formaldehyde with or without the addition of other substances.

THE SWISS REPUBLIC.

PREPARATION OF FABRICS FOR RUBBERIZING, 68,858. W. E. Muntz, London, England. Fabrics are impregnated with alkaline salts, sodium carbonate and borax, or with basic metallic salts or basic hydroxides which unite with the sulphurous product of vulcanization and prevent injurious effect on the fabric.

PRODUCING BENZOL FROM MINERAL OIL, 69,342. Continental Caoutchouc & Gutta-Percha Co., Hanover, Germany. Mineral oil is subjected to the action of a halogen-aluminum hydrocarbon as a catalyst. It is claimed that the process has important advantages over the cracking process, since it does not require to be operated under pressure; in fact, can be conducted in a vacuum, the benzol obtained being free from disagreeable odor.

LABORATORY APPARATUS PATENTS.

THE UNITED STATES.

ISSUED DECEMBER 14, 1915.

1,163,830. Repeated stress testing machine. J. B. Koppers, Madison, Wis.

ISSUED DECEMBER 28, 1915.

1,166,266. Attachment for fabric tensile strength testers. S. N. Senna, assignor of one-half to C. E. Torrance—both of Holyoke, Mass.

THE GERMAN EMPIRE.

PATENT ISSUED (With Date of Validity).

289,545 (December 31, 1913). Viscosimeter. New York-Hamburg Rubber Goods Co., Hamburg.

LABORATORY APPARATUS.

A CONSTANT LEVEL FILTER RESERVOIR.

THE constant level filter reservoir here figured possesses the advantage of being easily constructed from materials at hand in every laboratory. The principle involved is old, but its application in the present way is believed to be new.

The method of constructing, due to R. R. Turner, is evident from the diagram to the left. Any size of flask or bottle

may be used. The straight tube *a* may be slipped up or down in the stopper, the position of its lower end regulating the level of the liquid in the filter. To start the flow it is only necessary to blow into the tube *a*.

A special convenience of this device lies in the possibility of making precipitations in the same vessel which is later used as a filter reservoir, thus avoiding a transfer. For precipitations by gases the apparatus, as shown at the right, may be arranged by disconnecting tube *c* and substituting *d* for *a*.

SULPHURETTED HYDROGEN GENERATOR.

all times. No acid is wasted; there is no clogging of sulphide.

MODIFIED PIPETTE.

The accompanying sketch shows a very useful form of pipette suggested by Sidney Born. It is made by fusing a stopcock and a piece of bent glass tubing to a pipette. The advantages over the ordinary pipette are:

1. Safety—there is no danger of sucking up acid or dangerous liquids.
2. Ease of manipulation—the stopcock insures tighter closing and greater accuracy than use of a finger.
3. Accuracy—the line of demarcation is level with the eye when using.
4. The pipette can be carried around full without losing any liquid.

Some Molds for Seamless Rubber Goods.

THE desire of manufacturers to produce better and more satisfactory rubber goods has encouraged study of the ways for making seamless articles to replace those formerly turned out with cemented seams.

SHAPING MOLDS FOR SEAMLESS HOT WATER BOTTLES.

The manufacture of seamless blown goods such as hot water bottles offers many interesting problems. These must be intelli-

FIG. 1. HOT WATER BOTTLE FUNNEL SHAPING MOLD AND CORE.

gently considered and accurately solved before the finished product can be placed on the retailers' shelves with any degree of confidence in the stability of the goods.

It would seem that the building up of hot water bottles by hand, formerly the exclusive method of manufacture, would result in a more perfect article than can be produced by standardized mechanical means. This may be so in a few specialized instances. There are many who still stand by the time-honored hand method; but the trend is toward the mold shaped and cured bottle as a more perfect and less costly article. Just how these are made is interesting and instructive.

FIG. 2. HOT WATER BOTTLE SHAPING MOLD.

In making one class of bottles, shaping molds are used which are in reality dies that make all the would-be seams, seamless, and at the same time bite off the overflow of surplus rubber from the edges. These dies consist of two sets, one for shaping up the funnel with its threaded socket for the stopper and another which forms the body of the bottle.

Fig. 1 shows the two-part funnel mold and core. In use, a piece of regular sheeted rubber stock, cut approximately to the required size, is laid on the lower mold. A metal reinforcement for the stopper socket is then placed in the constricted end of

the mold and the core with the threaded end, covered completely with a special rubber compound, is slipped over the vertical pins that hold the core in place in the lower mold. Another piece of regular stock cut to suitable size is placed over the upper half and the two parts aligned by dowel pins are then fitted together, with the core between them, and placed under a hydraulic press.

Thus, the seamless funnel and stopper socket with its soft, hard rubber threads and hanging tab are shaped up ready to be attached to the body portion of the bottle. By the way, the stopper is also made of this special stock, but in separate molds that are very like those just described. The metal reinforcement

FIG. 3. FLUSH TANK BULB AND METAL CAP.

of the stopper and threads is covered with stock of the same compound as that of the funnel socket.

The next step in the process is to shape up the body portion of the bottle and at the same time attach the funnel which is done by the dies shown in Fig. 2. A sheet of regular stock is laid over the lower mold or die and the funnel core supporting the shaped-up funnel itself is placed in the constricted part of the mold with the threaded portion occupying its proper position in the neck of the bottle mold. The other end of the core extends outside of the molds and is provided with a valve through which air is pumped or "blown" through a hole in the core, into the interior of the bottle.

When the funnel core has been properly arranged in the lower mold another sheet of regular stock is laid on the upper mold

FIG. 4. TANK BULB HINGED SHAPING MOLDS AND CONE PLATE SHAPER.

and pressed in place, after which both molds are placed together and subjected to hydraulic pressure. At the same time air is forced into the bottle to prevent the sides from sticking together. The action of the dies is not only a forming one, shaping and practically welding all joints into a homogeneity, but a shearing one by which the overflow is smoothly and neatly trimmed from the outside edges.

The seamless water bottle is now almost finished; however, there still remains the final curing or vulcanizing process, which

is performed in a different set of molds and is therefore another story.

NOVEL SHAPING MOLD FOR TANK BULBS.

In the making of relatively small hollow rubber articles such as bulbs of various sorts and sizes, the component parts are usually cemented together by hand and finished in molds under pressure. If any defects are developed in goods made in this way the weakness is invariably shown by breaks or leaks in the seams.

That inventive thought and marked mechanical skill have been brought to bear correctly on these inherent faults in bulb construction, is forcibly shown in the following description of a new tank bulb and the novel molds for making them.

The old type of flush tank bulb was just an ordinary round hollow rubber ball suspended by a lift rod that was fastened to the ball in any convenient way and was usually inefficient and a constant nuisance. Marked improvements are indisputably possessed by the newest type of tank bulb with the rigid top. In the first place it keeps its shape, for the reason that the upper half is rigid. Then the lower half is half round and made of good quality soft, flexible rubber that insures a positively watertight contact between the bulb and valve seat.

In Fig. 3 will be seen the object in question with the metal reinforcement on the right that imparts rigidity to the upper half of the bulb by being securely vulcanized therein. Then comes the hinged shaping mold—that is shown in the position for filling and emptying by the two following illustrations. Referring first to Fig. 4 will be seen the mold open with the cone plate shaper in front of it. The ball plate shaper is not shown in either illustration as its function will be clearly understood by the description of its use that follows in the context.

FIG. 5. TANK BULB HINGED SHAPING MOLD—OPEN.

A round disk of suitable diameter is cut from a sheet of regular stock and pressed into the lower mold by the cone shaper. The metal cap then follows, and over this another disk of thin rubber is placed and pressed home by the shaper, thus forming the rigid cone shaped half of the bulb.

The lower half or ball part is then covered with a round disk of sheeted stock of suitable thickness which is pressed in place by the ball plate shaper. The two mold parts, which in reality are cutting as well as forming dies, are then placed together—the upper and lower halves being aligned by dowel pins—and the whole subjected to hydraulic pressure. In this way the edges are homogeneously united and the bulb, therefore, is made absolutely seamless, a feature, it would seem, that up to the present time is unique in articles of this description.

Now that this bulb has been satisfactorily shaped there remains still the question of getting it safely out of the mold without injury, as crude rubber stock is soft and easily damaged. This is accomplished by an ingenious construction of the shaping mold, the two halves of which are divided longitudinally and hinged at one end. Thus by the simple process of opening the mold along its vertical plane the completed bulb is easily removed, as can be clearly seen in Fig. 5.

SHAPING MOLDS FOR AEROPLANE INNER TUBES.

Just how far the use of dies and molds can be carried in the actual production of inner tubes for automobiles remains to be seen; however, the scheme apparently has practical possibilities capable of further development. The following description and

illustrations relate to the forming and vulcanizing of inner tubes used in the tires of aeroplane wheels.

The molds, or rather dies, are shown in the illustrations, Fig. 6 and Fig. 7. In the former the ring core and mold for shaping up

FIG. 6. AEROPLANE TIRE INNER TUBE SHAPING MOLD AND CORE.

FIG. 7. AEROPLANE TIRE INNER TUBE PRESS MOLD.

one half of the tube is illustrated, the other half mold not being shown. In practice, the sheeted stock is cut in circular or ring form and laid on the lower shaping mold and upon that the circular core is pressed, thereby shaping up one-half of the tube. The other half is formed by another circle of rubber placed as before in the upper mold half and pressed home by the same circular core that was previously used.

Now the two halves of the inner tube are in their respective molds, seen in Fig. 7, and ready to be placed together. Before this is done the air valve must be fixed in its proper position. This is carefully inserted in the cavity provided for it and then the two mold halves, aligned by dowel pins, are placed together and subjected to hydraulic pressure. The result is an absolutely seamless, endless inner tube being formed by pressure and the action of the edges of the upper and lower shaping molds. The complete inner tube is then removed and placed in special vulcanizing molds in which it is cured by heat and pressure.

"SIMPLEX" PIPE JOINT CLAMP.

Pipe joint leaks cost money and often make it necessary to take down the entire line, an expensive procedure when the mill is rushed with orders and working overtime. A handy device that can be quickly applied and one that it is claimed will effectively stop the leak is the "Simplex," which consists of an outside two-part ring, an inside split ring and a square packing ring. To use, the packing ring is first forced against the leaky joint, the inside split ring is next forced against the packing, and the outside ring is bolted around the pipe to prevent slipping. [Yarnall-Waring Co., Philadelphia, Pennsylvania.]

SHALER'S NEWEST REPAIR VULCANIZER.

A new garage electric vulcanizer with capacity for 200 tubes and 12 casings a day differs from the larger steam vulcanizers in that the heat is generated from the city service by connecting with any lamp socket. [C. A. Shaler Co., Waupun, Wisconsin.]

ENGLISH SCHOOLS OF REPAIR VULCANIZING.

The instruction classes held at the City and West End Vulcanizing Schools of Harvey Frost & Co., Limited, London, are intended for those who wish to have actual instruction in the general repair of tires and inner tubes, according to the Harvey Frost process. As the cost of tuition and materials is considerable, a nominal fee is charged, and when the pupil is proficient, he is given a certificate. A certificate can also be obtained by submitting satisfactory repairs executed in accordance with the printed instructions issued by the company. The Harvey Frost Diploma of Merit is further granted by the directors of the schools to those pupils who have shown exceptional ability in making repairs.

PLANTATION SMOKE HOUSE PRACTICE.

THERE is a phenomenon in connection with plantation sheet rubber known as "stretching rusty or resinous," according to B. J. Eaton in "The Tropical Agriculturist" (November, 1915), that brokers frequently attribute to excess resin in the particular rubber. Although this condition probably has no effect on the real quality of the rubber, it affects its market value and should be remedied.

The appearance which is usually produced when the dry rubber is stretched or lightly scratched resembles powdered resin. This phenomenon is due to a sweating or exudation of the serum left in the rubber, which comes to the surface as the sheet of rubber contracts on drying. If this is unable to drain off or if it is not removed it evaporates and leaves a thin film on the surface. This film is not obvious until the rubber is stretched or scratched when it breaks up and on account of the reflection and refraction of light caused by the small particles its appearance is indicated by a deposit resembling powdered resin.

An investigation has been made of surface slime formation on slab rubber. The fresh coagulum from the ordinary pans, which had been only rolled or pressed lightly and contained a large proportion of residual serum, showed a large amount of this deposit. An analysis of the slime after drying completely in a desiccator yielded nitrogen corresponding to a total protein content of over 60 per cent. The remainder was chiefly resin and mineral salts.

The remedy for this fault is simply after machining and making the sheets to wash in one or two changes of water and if necessary to scrub the surface slightly with a stiff brush before placing them in the smoke house.

SMOKE ROOM CONTROL.

Temperature.—The usual method of controlling the temperature in a smoke house is by means of a maximum and minimum thermometer. It is preferable, however, to use an automatic recording instrument to check the work of the operator.

Dampness.—In the case of "sweating" of the rubber in the smoke houses and the deposition of moisture on the interior of the building, it has been found that outside smoking arrangements were employed with a flue leading into the smoke room. As a rule, exterior smoking arrangements are unsatisfactory. The principle of smoking is slow combustion, producing a product rich in antiseptic constituents; consequently to obtain a good smoke the fuel must burn at a comparatively low temperature. Many of the products of this slow combustion, although volatile, are easily condensed, and with an exterior furnace and long flue, these products condense in the flue or near the end entering the smoke room, and the water vapor which passes through condenses in the smoke room itself, on the rubber and on the walls and roof of the room and causes "sweating" or deposition of moisture. Where the fuel is burnt in the smoke house itself in boxes or holes in the ground there is sufficient heat to drive the water vapor out and only the other products are left to diffuse into the rubber.

One factor in connection with smoking which is frequently not realized is that the drying caused by the heat is far more effective as a preventive of mold than the actual smoke products, creosote, etc.

It has been actually stated by scientific workers that where mold appears on smoked sheet the rubber could not have been properly smoked. This is entirely erroneous, as the common mildews will grow most readily on the best smoked sheet if given the proper conditions of moisture.

RUBBER FOOTWEAR PRICE LISTS.

FOR a decade or more, previous to last year, the United States Rubber Co. sent out its new price lists of footwear, its terms to retailers and to jobbers, so that they got into the hands of the wholesale trade all over the country on January 1. Last year, because of the expressed desire of a majority of the wholesale shoe dealers, the announcement was postponed to March 1. This year the company reverted to its previous policy, and the new price lists of footwear made in the several factories of the company were so mailed that they reached the customers January 1.

These new lists are practically the same in detail, as regards prices, as those sent out March 1, 1915, the only changes, which were few, being a variation of five cents or less in individual lines.

As has been the custom in most years the company offers an extra discount of five per cent. for early orders, thus practically making prices that much less than those prevailing during the last half of 1915.

Other rubber footwear manufacturers, as in previous years, were but a few days later than the United States Rubber Co. in publishing prices.

The Hood Rubber Co. in its price list varies in minor details, some lines being slightly higher, others a few cents lower, but on the whole it is much the same as that of the older company.

The Beacon Falls Rubber Shoe Co. will issue a net price list, instead of gross price list with discount, and here also prices are nearly the same.

The B. F. Goodrich Co. issues a wholesale price list of its "Hipress" goods which varies somewhat from the prices of patent pressure process goods manufactured by the United States Rubber Co. In some instances the Akron prices are considerably higher, while in others the variation is only two or three cents, generally higher, but in a few instances lower.

It is evident that when these prices were made it was on a basis of cheaper cost than is possible at this writing. It seems as if these prices must have been determined upon as early as December 1, or thereabouts, when crude rubber was quoted at below the present prices.

The increase in the cost of plantation and wild rubbers would seem to justify an early revision of the price lists, and as all these are "subject to change without notice" the wholesale trade is placing orders to an extent unprecedented for so early in the year. In fact, some manufacturers have already enough orders for early delivery to keep their mills extremely busy for two or three months, and some anxiety is expressed as to the possibility of securing sufficient crude rubber to cover requirements.

THE NEW TENNIS PRICES.

On Friday, January 21, the United States Rubber Co. withdrew its price list of sporting and outing shoes, which had been in operation since September 1. A new list was sent out to reach the wholesale trade by January 24. This list showed an advance in practically all lines of rubber-soled canvas footwear, with the single exception of basket-ball shoes.

The general advance is about five per cent, though some lines, mainly the low-priced ones, show a higher percentage. The Admiral oxfords and bals, which were priced respectively at \$2.25 and \$2.50 net, are now \$2.40 and \$2.65. Other lines show an advance of from two cents to ten cents a pair, most of them being either five or ten-cent advances over September prices.

NEW RESILIENT WHEEL WITH SOLID RUBBER TIRES.

A western concern is manufacturing a new resilient motor track wheel to be used in connection with solid rubber tires. The elastic mechanism is enclosed in the hub of the wheel, which, otherwise is of standard type and can be quickly attached to any car.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients: Rubber Machinery: Rubber Trade Directory.

Proposed S. A. E. Rubber Standards.

At the meeting of the Society of Automobile Engineers, held January 5 and 6 in the Engineering Societies' Building, New York City, the Standards Committee made many recommendations. Those on insulated wire and cable, rubber hose and clamps, industrial truck tires and solid tire diameters, which are of special interest to rubber manufacturers, are printed below.

It should be noted that these recommendations were favorably received and will be voted on for adoption by a letter ballot of the society which will be polled early in March.

INSULATED WIRE AND CABLE.

The following standards for insulated wire and cable to be used on gasoline cars, were formulated:

CLASS A—RUBBER COMPOUND INSULATED SECONDARY CABLE.

The insulation of this cable shall consist of a vulcanized compound of virgin rubber containing not less than 30 per cent by weight of good dry Upriver Para or Hevea rubber which will stand the following tests:

A test-specimen of rubber compound taken from a cable having a length of not less than 6 inches shall have marks placed upon it two inches apart. The sample shall then be stretched at the rate of 12 inches per minute until these marks are 6 inches apart; the test-specimen shall then be released within 5 seconds and a measurement taken one minute thereafter, when the distance between these marks shall then not exceed 2½ inches. The test-specimen shall then be stretched until marks are 9 inches apart before rupture. This test shall be made at a temperature of not less than 10 degrees C. or 50 degrees F.

The ultimate tensile strength of the rubber compound shall not be less than 1,000 pounds per square inch calculated upon the original cross-section of test-specimens before stretching. This test shall be made at a temperature of not less than 10 degrees C. (50 degrees F.).

Each specimen of rubber insulated cable shall successfully withstand a voltage test of 12,000 A. C. for 5 minutes after 12 hours submersion in water and while still immersed.

After the voltage test, the cable while still immersed shall have an insulation resistance of 2,500 megohms per mile at 15.50 degrees C. (60 degrees F.) after one minute electrification. These two tests shall be made in accordance with the standard rules of the A. I. E. E.

Any one-foot sample of this rubber insulated cable must show a dielectric strength sufficient to resist through 5 minutes the application of 20,000 volts A. C. This test shall be made as specified in the National Electric Code.

The following aging test should be made to determine the life of the cable: Take a length of cable, preferably 5 feet, remove insulation from both ends, solder one end of cable to the end of a steel rod of same diameter as outside diameter of cable, wrap the cable tightly around this rod and solder the other end of cable to the rod so that it will retain its tightly wrapped condition. Leave exposed in this condition to the elements. If cable is not properly compounded and properly vulcanized, deterioration effects, such as hardening, becoming brittle and cracking will begin to be apparent in from one to three months.

Secondary cable is to be made in two sizes as shown by Table I. The overall diameters are 7 mm. and 9 mm. respectively for plain rubber insulation. If a varnished cotton braid is desired the same dimensions are to be used with the addition of glazed cotton braid approximately 1/64 inch thick, making the overall diameters 3/16 inch and ¼ inch respectively. The braid is to be treated with at least two coats of insulating varnish dried separately.

TABLE I—SECONDARY CABLE.

Nominal Size	No. of Wires	Diam. of Wires	Circular over Mils	Diam. of Wire	Diam. of Rubber (Max.)	Thickness of Rubber (Min.)
.....	36	.010	2600	.065	.280	.100
.....	37	.010	3700	.072	.360	.125

CLASS B—RUBBER COMPOUND INSULATED PRIMARY CABLE.

The insulation of this cable shall consist of a rubber compound and two thicknesses of fabric. The compound is to be evenly applied in thickness as specified in Table II, and must conform to the physical and electrical requirements of the National Electric Code (latest edition).

The rubber compound to be covered first either with an overlapping strip of varnished cambric .008 to .010 inch thick, or a cotton braid at least 1/64 inch thick, so saturated as to make it oil and moisture-proof.

The first fabric is to be covered with an outer braid of strong protective character and at least 1/64 inch thick, preferably glazed and treated with at least two coats of insulating varnish dried separately.

The completed cable shall be capable of withstanding for one minute one thousand volts A. C. applied between the copper conductor and a metal foil wrapped around the outside of insulation. The frequency of the test circuit shall be in accordance with the standard rules of the A. I. E. E.

TABLE II—RUBBER COMPOUND INSULATED PRIMARY CABLE.

Cable Size	No. of Wires	Diam. of Wires	No. of Strands	Circuit for Carrying Mils Cap. Amp.	Diam. over Rubber Wire	Thickness of Rubber (Min.)
No. 14	41	.01003	1	4,100	.080	.132"
No. 12	49	.0113	1	6,208	.102	.132"
No. 10	49	.0142	1	9,854	.128	.132"
No. 2	133	.0226	19	67,764	.230	.364"
No. 1	133	.0254	19	85,466	.280	.60 1/16"
No. 0	133	.0285	19	107,743	.327	.65 1/16"
No. 00	133	.031	19	135,926	.380	.71 1/16"

Stranding—Number 14 to be bunched; numbers 12 and 10 to be bunched or rope lay; numbers 2, 1, 0, 00 to be rope lay.

RUBBER-HOSE AND CLAMPS.

Sizes for hose and hose-clamps are submitted (see table) for standardization. They cover hose in all sizes commonly used for water connections and tire-pumps. There is considerable variation in thickness of hose of the same ply, but generally 1/32 inch of hose thickness is allowed for the inside rubber lining, 1/32 inch for the outside, and 1/16 inch for each ply of fabric. The table was prepared accordingly with the addition of the tolerance limits.

SIZES OF HOSE CLAMPS AND HOSE-FITTINGS.

Inside Hose Diameter	Outside diameter of hose and extended inside diameter of clamps.				Length of Fitting for Lap of Hose
	Single-ply	Two-ply	Three-ply	Four-ply	
3/16	7/16	1/2	9/16	5/8	1
1/4	1/2	9/16	5/8	11/16	1
5/16	9/16	5/8	11/16	3/4	1
3/8	5/8	11/16	3/4	13/16	1
1/2	3/4	13/16	7/8	15/16	1
5/8	1	1 1/16	1 1/8	1 3/16	1
3/4	1 1/16	1 5/16	1 3/8	1 7/16	1 1/8
1 1/4	1 1/2	1 9/16	1 5/8	1 11/16	1 3/4
1 1/2	1 3/4	1 13/16	1 7/8	1 15/16	1 3/4
1 3/4	2	2 1/16	2 1/8	2 3/16	1 3/4
2	2 1/4	2 5/16	2 3/8	2 7/16	1 3/4
2 1/4	2 3/4	2 9/16	2 5/8	2 11/16	1 3/4
2 1/2	2 3/4	2 13/16	2 7/8	2 15/16	1 3/4
3	3 1/4	3 5/16	3 3/8	3 7/16	1 3/4

Limits on inside diameter of hose $\pm 1/64$. Limits on thickness of hose $\pm 1/64$. All dimensions in inches.

INDUSTRIAL TRUCK TIRES.

It is recommended that the standard nominal diameters of industrial truck wheels shall be 10, 16, 20, 22 and 27 inches. On the data sheet with the wheel diameters shall be printed a footnote indicating the present tire sections recommended by the Association of Railway Electrical Engineers.

SOLID TIRE DIAMETERS.

It is recommended that the 32-inch diameter be dropped from the standard list of truck wheel diameters. This is done because it is found that commercial cars with wheels as small as 32 inches are almost always fitted with pneumatic tires, and 32-inch tires form a very small percentage of the total output of solid tires.

The 34-inch tire is recommended for inclusion in the list of sizes. There has been considerable demand for the inclusion of this size in the S. A. E. standards, and the recent circulation of a document signed by tire and wheel makers has served to draw out comment and results in this recommendation.

The data sheet is to be rearranged to indicate that only tires of 34, 36 and 40 inches are S. A. E. Standard, although data on the other sizes is to be printed as a guide for tires of other than standard sizes.

Continuous Process Tire Manufacture.

THE two things that all of the manufacturers of motor tires have been working toward for the past five years have been, first, an ideal fabric for the carcass and, second, a continuous mechanical process in the making and curing.

In the attempt to produce the strongest and most durable fabric

LOOM FOR WEAVING FABRIC EXACT SHAPE AND WIDTH FOR TIRE CARCASS.

there have been evolved two distinct types, the woven fabric and the cord fabric. Of the former hundreds of different weaves were tried before the present standard weave was adopted. In use this fabric is frictioned, cut into strips on a bias cutter and the strips pasted end to end and wound into rolls ready to be applied to the tire core. The cord fabric is, of course, built up by special cord laying machines.

BUILDING THE TIRE CARCASS WITH FABRIC DIRECT FROM THE FRICTION CALENDER.

While many tire making machines have been invented and scores of others are in use as accessories to tire manufacture, only one has made the loom and the calender a part of the continuous process. That one is the Doughty process, owned by

the Doughty Tire Co., Providence, Rhode Island. When the Doughty patents were issued some few months ago they were described in this publication from the patent office drawings. Now we are able to show views of the most important machines in operation.

STEAM HEATED, HYDRAULIC TIRE PRESS MOLD WITH ELECTRICALLY HEATED EXPANSIBLE CORE.

The process begins with the weaving of the fabric in bands, the exact width of the tire carcass. The weave is so arranged that the strip comes from the loom shaped as it will be when made up into a tire.

This strip of fabric is next passed through a calender, the rolls of which are shaped to it, where it is frictioned. Directly from the calender it is wound hot upon the tire core.

The carcass next goes to the tire press mold where, with an expansible electrically heated core on the inside and the usual

SPECIMEN OF THE DOUGHTY FABRIC.

steam heat in the platens, it is cured in 15 to 20 minutes. The time required for the whole process is about 30 minutes.

So far tests of tires made show unusual mileage, while the owners of the process claim that they save 50 per cent in time and labor over existing processes.

These machines are now assembled in Providence. So far the company have not attempted to manufacture tires for general use, as the plan is to lease the machinery on a small royalty basis.

New Machines and Appliances.

SAFETY STOP AND MAGNETIC CLUTCH-BRAKE FOR MILLS.

THIS is a safety stop device for use in rubber mills where a quick and reliable means of throwing off the driving power and applying a powerful brake to stop the mill line is necessary to prevent injury or loss of life of operators who may be caught in the mill rolls or gearing.

A highly perfected safety device that has been subjected to most rigorous tests in millroom requirements is illustrated herewith. The equipment consists of a synchronous motor drive mounted on a common sub-base with a driven rope sheave, the magnetic clutch-brake furnishing the connection between the motor and the rope sheave. The motor is rated at 650 horsepower, runs at 240 R. P. M. and under normal conditions carries practically full load when the mill line is operating.

Throughout the millroom safety switches are mounted on the frame of each mill and trip rods are located above the rolls

within easy reach from each side of the mill. The safety switches are arranged in series electrically so that the magnetic clutch will be disengaged and the brake simultaneously applied when this safety rod is tripped in case of an accident. To start the machinery again with its heavy load a single push button is provided in the motor room which engages the clutch energized by an automatic rheostat in such a way that the load is picked up gradually. [The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin.]

"JUMBO" STEAM JACKETED MIXER.

The improvement during recent years in machines for building tire casings has been so radical that manufacturers of machinery and appliances have been extremely busy in meeting the present demands for improved machinery. Gammeter's galvanized steel tire machine drum was specially designed to meet the urgent requirements of modern tire building. It is used for handling the fabric or rubber stock from which tire casings

are made. In construction it is strong, rigid, light and durable. It is 8 inches in diameter and 16 inches long and will fit any size mandrel. [W. F. Gammeter, Cadiz, Ohio.]

SCREW PRESS AND ROTARY DRYER FOR RUBBER WASTE.

In reclaiming, the process of drying washed rubber waste has been greatly facilitated and production cost materially reduced

by the automatic continuous screw press and direct steam heated air dryer shown in the accompanying illustrations. As the machines are installed together the process therefore is a continuous one.

The American screw press consists of a horizontal tapered screw built up on a hollow perforated shaft arranged to allow the admitting of steam to the material if desired. The screw fits closely inside a similarly tapered, slatted curb and rotates. The wet waste is delivered from the washers to

the feed hopper of the press where the material is mechanically measured and forced into the straight, purely conveyor part of the screw. This carries the waste into the tapered curb, where it is slowly and positively pressed, forcing out the liquids. The press is fitted at the discharge end with an adjustable cone arrangement by which the desired pressure is produced in the press.

The waste after passing through the press is delivered to the hopper of the rotary dryer and comes in contact with the air, heated by being blown over steam coils in the heater. The waste falls to the bottom of the dryer, is caught up and lifted to almost the highest point of rotation

and is then showered through the hot air. This cycle of operations is repeated until the material, in a dried condition, is discharged from the lower end of the dryer. It is claimed that by this method waste can be dried in less than half an hour. [American Process Co., New York City.]

"JUMBO" STEAM JACKETED MIXER.

This mixer and churn is made in sizes of from 1 to 25 barrels capacity, and with or without a steam jacket.

Designed especially for rubber manufacturers and to withstand

hard usage, the "Jumbo" mixer is of unusually heavy construction. It is a machine that can be adapted for many uses as, for mixing, heating and drying powdered materials, for mixing pastes of all kinds, and for dampening preparations under heat. This

type of machine is made with special agitators adapted to the various materials to be mixed, including the rubber cements used by manufacturers of rubber goods.

The gearing on the mixer is made to suit any class of material, from the lightest liquid pastes to the heaviest cements that can be drawn off through a 6 or 8-inch opening. As shown in the illustration the mixer is provided with a tight and a loose pulley for belt drive. [J. H. Day & Co., Cincinnati, Ohio.]

ELECTRIC CLOTH CUTTER.

For cutting up many plies of materials such as cotton goods used in the manufacture of rubber clothing, the power driven cloth cutter is a necessary and indispensable part of the factory equipment.

The vertical blade machine shown in the illustration possesses many excellent features in construction and is claimed to have successfully withstood the most rigorous tests in many rubber clothing factories. The foot or standard which supports the machine is made interchangeable to any desired size; that is, the machine can be equipped with a very narrow standard for cutting sharp curves, as in collars, cuffs, neckbands, belts, pocket flaps, etc.

The vertical knife is reciprocated by a powerful air cooled motor from either direct or alternating current, and the weight is so placed that perfect balance and ease of manipulation is obtained. The blade can be readily removed at the front of the machine and the presser foot is easily adjusted to the work, requiring no readjustment when sharpening the blades.

A novel feature is the shaded electric light that illuminates the work, thereby greatly aiding the operator in accurate cutting. The switch, of an approved type, is controlled from the handle, and the base is provided with ball bearing rollers that reduce the friction in passing over the goods to a minimum, thereby insuring facility and accuracy in operation.

The Universal cutter is made in sizes that will cut lays from 3 to 6 inches high and is guaranteed by the makers against mechanical or electrical imperfection for one year. [Universal Cutter Co., St. Louis, Missouri.]

MACHINERY PATENTS.

DEVINE'S SPREADING MACHINE.

In this machine for proofing fabrics the spreading and drying operations and the recovery of the volatile solvents are conducted in a closed chamber under a partial vacuum.

Referring to the diagram, a longitudinal cross-section view,

A represents the vacuum drying chamber, *B* openings for the pipes leading to the condenser and air pump, *C* delivery drum, *D* receiving drum, *E* a removable front plate for introducing the fabric and *F* a back plate for removing the roll of proofed fabric. The other main parts include the feed hopper *G*, the spreading knife *H*, the heating table *J* and the fabric *K*.

In operation the coating material flows from the feed hopper upon the fabric and is spread as it passes under the

knife or doctor. This coating material is dried as the coated fabric passes through the drying chamber and the vapors of the volatile solvent released in this drying operation are drawn off by a pump and recovered in a condenser. As this operation is carried on in a vacuum, the solvent is evaporated at a comparatively low temperature and the drying is effected quickly and thoroughly, preventing the escape of the vaporized solvent. [J. P. Devine, United States patent No. 1,164,174.]

HEATED FORM FOR DIPPED GOODS.

To obviate the necessity of drying by exposing the dipped form to the air after each dipping operation, Williams has invented a form, heated on the interior, to cause the solvent to evaporate rapidly from the coat of material on the form.

The present invention provides for uniform heat throughout the form and a reduction of the time necessary for drying.

The drawing shows a hollow glove form *A* made of bronze. At the wrist portion is a closure *B* with an opening *C*, through which is poured the volatile liquid *D*. Tube *E* is threaded at its open end and heat is transmitted to the liquid by this tube and the inner pipe *F*, which is connected to the supply pipe *G*.

In practice the form is inverted and filled about two-thirds full with liquid, which is preferably gasoline. When still in this position, the form is heated in any suitable manner until the liquid boils freely and vapor passes off through the opening. The opening is sealed while the liquid is still boiling so that only the vapor and the liquid itself exist inside the form. Then the form is attached to the pipe from the heating source and a uniform heat throughout will result and be maintained during the dipping operation by the washing back and forth of the liquid. [Carl S. Williams, assignor to Revere Rubber Co., United States patent No. 1,163,053.]

ELECTRIC TIRE MOLD.

By the use of a mobile material as soapstone or sand instead of the tire core and the usual two-part mold or cloth wrapping, Price claims to overcome many of the present difficulties in curing tires. To accurately shape beads it is

necessary that they should be clamped and to prevent sagging of the tread it should be supported, especially during the initial vulcanization heat.

Referring to the drawing, the beads *A* are clamped in the

plates *B*, to the lower one of which is attached a box-like structure *C* inclosing the tread *D*. The soapstone, sand or mica *E* surrounds and incloses the tread completely as shown. If pressure is to be exerted in the box, cover *F* is bolted down and the shoe thus arranged is ready for vulcanization which is accomplished by means of the electric resistance coils *G* and steam or electric coils in plates *B*.

In a modification of the above a hollow metal core is used instead of the soapstone or like substance, in which either steam or electric coils are the vulcanization agents. [R. B. Price, assignor to Rubber Regenerating Co., United States patent No. 1,162,397.]

FOOTWEAR VULCANIZING APPARATUS.

In Rutherford's vulcanizer, articles may be subjected to the action of a controllable pressure which establishes and maintains the same pressure conditions in all parts of the chamber.

The accompanying cut shows a vertical section of the vulcanizing chamber *A*, which accommodates four cars. The car *B* consists of a tubular frame that runs on tracks *C* and is connected by union *D* to pipe *E* leading to the suction pump. Arranged on the frame are hollow forms *F* supporting the articles to be vulcanized. These forms or lasts are provided with

fluid ducts *G* to permit the withdrawal of moisture in the article. The pipe system is so arranged in the chamber that the openings *H* into each of the four cars are equidistant from the pump. By this arrangement the effective suction or pressure will be equal at all the openings and the vulcanized articles will show a greater uniformity of quality. [E. W. Rutherford, assignor to Goodyear's Metallic Rubber Shoe Co., United States patent No. 1,161,892.]

PNEUMATIC TIRE CASINGS are made by laying on the core, diagonally, transversely, or circumferentially, strips of leather impregnated with rubber solution. [A. M. Kobiolk, Kew, near Melbourne, Australia. British patent No. 23,320, 1914.]

OTHER MACHINERY PATENTS.

THE UNITED STATES.

ISSUED DECEMBER 14, 1915.

- 1,163,651. Cementing machine. L. W. G. Flynt, Rochester, N. Y., assignor to United Shoe Machinery Co., Paterson, N. J.

- 1,167,009. Thread vulcanizer. E. Nail, assignor to The Goodyear Tire & Rubber Co.—both of Akron, Ohio.
- 1,167,036. Thermostatic regulation for heated rolls. G. S. Whitman, Sr., Hudson Falls, and A. Rosch, Brooklyn, assignors to C. J. Tagliabue Manufacturing Co., Brooklyn—all in New York.
- 1,167,165. Exhaust heated repair vulcanizer. C. W. Griffith, assignor of two-thirds to I. Neason and S. A. Trees—all of Altoona, Pa.
- 1,167,172. Repair vulcanizing core. W. L. Heine and M. A. Johnston—both of Denver, Colo.

ISSUED JANUARY 11, 1916.

- 1,167,396. Process of making a golf ball core. J. R. Gammeter, Akron, Ohio, assignor to The B. F. Goodrich Co., a corporation of New York.
- 1,167,976. Overflow trimming machine. D. R. Campbell, assignor of one-half to F. Rumrill—both of Boston, Mass.
- 1,168,390. Apparatus for manufacturing rubber tubing. B. B. Goldsmith, New York, N. Y.
- 1,168,820. Repair vulcanizer for tires and other articles. W. H. Miles, London, England.

THE UNITED KINGDOM.

ISSUED DECEMBER 8, 1915.

- 18,196 (1914). Roller for removing creases and stretching textile fabrics. J. Matter, Laeken, near Barmen, Germany.
- 18,259 (1914). Cloth cutter. J. Sanderson, 27 Scarisbrick street, and H. Wheeler, 102 Kensington Road—both in Southampton.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 30, 1915.]
- 19,026 (1914). Tire fabric tensioning device. S. G. S. Dicker, 20 Holborn, London. (Miller Rubber Co., Akron, Ohio.)
- 19,142 (1914). Machine for coating tapes with rubber. J. W. H. Dew, and Arday Syndicate—both of 8 Laurence Pountney Hill, Cannon street, London.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 31, 1915.]

- *19,509 (1914). Tire wrapping machine. H. J. Doughy, Edgewood, Rhode Island.
- 19,542 (1914). Circular loom for weaving tubular fabrics. E. C. R. Marks, 57 Lincoln's Inn Fields, London. (Chernack Manufacturing Co., Pawtucket, Rhode Island.)

THE FRENCH REPUBLIC.

PATENT ISSUED (With Date of Application).

- 477,402 (January 26, 1915). Device for inflating pneumatic tires. C. W. Tarbet.

NEW MANUFACTURING PROCESSES.

THE UNITED STATES.

ISSUED DECEMBER 14, 1915.

- 1,163,987. Manufacture of rubber articles. W. J. Eggers, New York, N. Y.
- 1,163,999. Process for making treads for tires. W. Henry, Nottingham, England.
- 1,164,196. Process of manufacturing water bags or bottles. I. F. Kepler, Akron, Ohio, assignor to The B. F. Goodrich Co., a corporation of New York.

ISSUED DECEMBER 21, 1915.

- 1,164,860. Process for eliminating porosity in rubber goods. W. E. Piper, Melrose, assignor to Boston Rubber Shoe Co.—both in Massachusetts.
- 1,165,198. Process of manufacturing seamless rubber gloves. T. W. Miller, assignor to The Faultless Rubber Co.—both of Ashland, Ohio.

ISSUED JANUARY 11, 1916.

- 1,167,759. Process of making bulbs for tank valves. A. T. Hopkins, Cleveland, Ohio, assignor to The Mechanical Rubber Co., a corporation of New Jersey.

ISSUED JANUARY 18, 1916.

- 1,168,807. Packing and process of making. C. L. Hill, Lancaster, assignor to United States Asbestos Co., Manheim—both in Pennsylvania.

THE UNITED KINGDOM.

ISSUED DECEMBER 8, 1915.

- 17,981 (1914). Packing for piston rods and plungers. W. J. Mellersh-Jackson, 28 Southampton Buildings, London.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

- 477,204 (June 3, 1914). Process and apparatus for vulcanizing rubber by means of ultra-violet rays. H. Olivier.
- 477,238 (June 5). Process and apparatus for treating rubber latex. E. Ripeau.
- 477,422 (January 27, 1915). Dress shields and process of manufacture. Madam P. Oettinger.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 31, 1915.]

- 19,413 (1914). Asbestos and rubber packing. G. W. Beldam, Boston Lodge, Ealing, London.

The Editor's Book Table.

PHYSIOLOGICAL PRINCIPLES FOR DETERMINING THE VALUE of the Various Rubber Tapping Methods. Founded on some experiments made on *Hevea Brasiliensis*. By Professor Dr. Hans Fitting, "The Times of Ceylon" Co., Limited, London, England. [Paper covers, 51 pages, with four diagrams. Price, 1s. and R. 1.]

THE rubber planter is interested not only in bringing his property to a state of commercial productiveness, but is equally concerned in prolonging the period of its return upon his outlays. In other words, he wants to get as much as he can and as long as he can out of his trees through proper handling.

Vitaly involved in this problem is the question of how best to tap them. This subject has been treated suggestively by Professor Dr. Hans Fitting, one of Germany's foremost physiological botanists. The learned savant studied the subject at close range in the Malay States and in Java, and as a result of many experiments came to certain definite and valuable conclusions. These he put forth in an admirable brochure, which for the first time is now rendered in English.

PRACTICAL EXPORTING. A HANDBOOK FOR MANUFACTURERS AND MERCHANTS. By B. Olney Hough, The Johnston Export Publishing Co., New York City, 1915. 8vo, 632 pages, with 39 inserts of forms. [Flexible leather, \$5; cloth, \$4.]

For the manufacturer about to branch out into export trade, this book will prove of inestimable value, while the firm with an established department will find it a compendium of useful information.

The book has been arranged with the object of making possible quick and direct reference to any special problem. Each phase of the business is treated in a separate chapter, with frequent side heads. The volume opens with a brief summary of the growth of American export trade and a description of the immensity of the world market that lies at our gates.

The manufacturer hesitating to enter this market will find ample encouragement and guidance in the exhaustive presentation of the subject. He will learn of the facilities for export trade, of the customs and methods that are advantageous. The basic rules for exporting are given so that misunderstandings of the export problems are explained and mistaken ideas of credit terms corrected. The relative values of foreign markets are discussed, as are the requirements concerning patents and trade-marks.

Emphasis is laid on the specialized attention that the export business requires, even if a separate department may be deemed unnecessary and suggestions are given concerning proper organization and conduct. The author, whose practical export experience has extended over 20 years, goes into detailed description of the machinery for developing export demand and trading, which consists of correspondence, traveling salesmen, commission houses and advertising.

He especially urges the consideration due export orders in the matter of prompt attention. There is an interesting presentation of the methods of making price quotations, and a description of foreign ratings. Much detailed information is given concerning the preparation of merchandise for shipment, calculation of export weights and measurements, the addressing of packages and the rendering of invoices. Methods of marketing shipments are described and incidental ocean freight rates, consular and other formalities are explained, together with marine insurance.

The book closes with an excellent presentation of the methods of financing foreign business and systems of credits and collections. The text is supplemented by 39 inserts, which are reproductions of documents in actual use, comprising a compilation of the papers and forms usually involved in every step of an export transaction, from the receiving of the order to the final payment.

A HANDBOOK OF WEAVES. BY G. H. OELSNER, DIRECTOR OF the Weaving School at Verdun. Translated and revised by Samuel S. Dale, The Macmillan Company, New York, 1915. [8vo, 397 pages, 1,875 illustrations, including a supplement, "Analysis of Weaves and Fabrics," by the translator.]

The student of textiles and in fact all who are interested in the production of fabrics should take advantage of the technical knowledge this volume affords. The book is confined practically to the complicated art of weave construction which is described in clear, concise language that can readily be understood. The illustrations are particularly clear and graphically convey to the reader a complete understanding of the various weaves used in fabric construction.

The book begins with the very important subject of drawing-in drafts; that is, drawing the warp yarn into the harness, an operation upon which depends the successful production of the weave pattern. Then follow explanations of the weave draft or plan for interlacing the warp and filling. The twist of the yarn and the set of the threads are explained graphically, followed by clear-cut descriptions of all sorts of weaves—plain, twill, satin rib and crepe.

Back warp fabrics are weaves, with an extra set of warp threads on the back. While single, double and tubular fabrics are familiar to the layman by name only, all of these many fabric weaves are made clear by orderly context and illustration. Each succeeding chapter carries the interested reader along through the labyrinth of special weaves and fabrics and finally closes with a description of how to determine the weave and fabric construction of a certain woven cloth.

NEW TRADE PUBLICATIONS.

NEW CATALOGS OF THE UNITED STATES RUBBER CO.

THE new footwear catalogs of the various factories of the United States Rubber Co. were issued so as to reach the dealers on January 1, as has been the custom.

This year the number of booklets has been materially decreased, due to the fact that the various main catalogs contain on the last pages of each book the net price lists. These principal catalogs, each measuring $4\frac{1}{2} \times 8\frac{1}{2}$ inches, are attractively printed on heavy coated paper and illustrated with half-tone cuts that faithfully reproduce the extensive lines of goods shown. Each book has a distinctive cover design, printed in attractive colors. These nine catalogs used to describe footwear bear the names of the following companies: American, Banigan, Boston, Candee, Goodyear Glove, Lycoming, Meyer & Jersey, Wales-Goodyear, and Woonsocket.

In addition to these United States Rubber Co. has issued the following literature in booklets $3\frac{1}{4} \times 6$ inches in size: 24-page booklet describing miscellaneous goods; 16-page gross price list of miscellaneous goods; 16-page catalog and price list of "Empire" brand rubber boots and shoes; 24-page net price list of "Unika" brand rubbers; 12-page catalog and price list of the Everstick rubbers; 16-page catalog and net price list of Wales-Goodyear patent pressure process goods and United States Rubber Co.'s "Naugasole" goods; the unlisted list; leaflets of bathing and sporting shoes, and the net price list of the Medford Woolen Manufacturing Co.

* * *

A new catalog issued by the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, which has 28 service branches throughout the Dominion, is an attractive book of 90 pages, well printed on good quality coated paper, in black and colors. Many of the illustrations, which are particularly good, show the articles in natural colors, greatly adding to the pleasing appearance of the catalog, in which the titles and descriptions are printed in both English and French.

The B. F. Goodrich Co., Akron, Ohio, has sent out its wholesale price list of "Hlipress" rubber footwear, a neatly printed booklet showing in appropriate colors the company's brown and white rubber specialties with the red line round the top. Felt boots and socks are also included in the price list.

* * *

The Apsley Rubber Co., Hudson, Massachusetts, has sent out a small booklet, dated January 1, giving net prices of its Granger line of red and white boots and lumbermen, made by special process.

* * *

"Echoes from the Convention," is a little 12-page booklet containing the address given by Colonel Samuel P. Colt, president of the United States Rubber Co., to the footwear salesmen of that company at a convention held in Boston late in December. In his address Colonel Colt stated that the business of the world is to be carried on by great corporations which, because of the magnitude of business, can employ men of the highest order. There are many concerns, managed on most magnificent principles, that are building up our country and have enabled us to compete with the world in the manufacture of rubber goods.

CALENDARS AND SOUVENIRS.

IN addition to the calendars and souvenirs that were noted in the January issue of THE INDIA RUBBER WORLD as having been distributed to the rubber trade at the holiday season, attention may be called to the following:

An attractive 9 x 13 inches, delicately colored sepia print, depicting an old music master at the piano with his pupil, a quaintly costumed little girl, is mounted on a large white background which bears a calendar pad and, in modest lettering, the name of the Adamson Machine Co., manufacturer of rubber working machinery, Akron, Ohio.

A calendar in which each month is featured and the previous and coming month are shown less prominently, thus affording a convenient business reference, was distributed by George F. Lufbery, Jr., manufacturer of chemicals, Elizabeth, New Jersey.

With a separate leaf for each day of the year and with a date printed in 3-inch prominent figures, the pad being securely attached to a dark blue card which may be hung on the wall, the calendar of the Stamford Rubber Supply Co., manufacturer of rubber substitutes, Stamford, Connecticut, forms a useful adjunct to a business office.

Hamilton E. Bast, manager of the Hamilton Rubber Manufacturing Co. and the Acme Belting Co., Chicago, Illinois, has distributed a pleasing art calendar with a sepia print of "The Lass That Loves a Sailor."

The Hygienic Rubber Works, manufacturer of dental vulcanite, Muskegon, Michigan, has sent its friends an attractive art calendar.

Among the most useful calendars of the season is the desk memorandum or engagement pad that has been distributed by the Electric Hose & Rubber Co., manufacturer of rubber hose, Wilmington, Delaware.

Keystone tubes, boots and patches are attractively advertised by the pictorial calendar distributed to the trade by the Keystone Rubber Manufacturing Co., Erie, Pennsylvania.

A nicely made diary for 1916, containing colored maps and much interesting and useful information, has been issued by John Royle & Sons, manufacturers of looms, tubing and insulating machines, and strainers, Paterson, New Jersey.

Stanley Doggett, dealer in chemicals, New York City, distributed a large office calendar, with a leaf for each month on which the preceding and following months are conveniently displayed in lighter type.

A brass holder for scratch paper for desk use was distributed

with the compliments of the Katzenbach & Bullock Co., importer and dealer in chemicals, Trenton, New Jersey.

A large wall calendar illustrating the modern Rip Van Winkle has been sent to the trade by the R. J. Caldwell Co., Inc., dealer in tire fabrics, New York City.

Perhaps no more acceptable New Year's souvenir was distributed than the combination brass calendar and clip mounted on an attractive base that was sent to friends by Ernest Jacoby, dealer in crude rubber and compounding ingredients, Boston, Massachusetts.

RUBBER TRADE INQUIRIES.

[148] An inquiry has been received from South Africa for masticated rubber and rubber compounds for manufacturing purposes.

* * *

[149] If a manufacturer of machines for inflating toy balloons will send his name to this office we will be pleased to forward it.

* * *

[150] Where can aluminum forms for making nipples by dipping be obtained?

* * *

[151] An inquiry is received for a tough, rubber-like composition not affected by heat or cold, and with some resiliency.

* * *

[152] A correspondent seeks a rubber manufacturer who will make about 10,000 rubber dolls, according to a given design.

* * *

[153] An inquirer desires the names and addresses of manufacturers of rubber specialties.

* * *

[154] An inquiry has been received for Pontianak resin.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A commission agent in France desires to purchase 20,000 bottle-shaped tin cans with screw stoppers and rubber washers. Report No. 19,647.

An English firm is in the market for large quantities of superior quality black rubber bellows. Report No. 19,650.

A business man in Peru desires to purchase a repairing outfit for vulcanizing tires. Report No. 19,722.

An agent in Switzerland desires to represent American manufacturers of sanitary rubber goods and other articles. Report No. 19,808.

A firm in South Africa desires to secure agencies from American manufacturers of waterproof bathing caps and other articles of wearing apparel. Report No. 19,822.

A Danish firm wishes to represent manufacturers of tires and general accessories. Report No. 19,865.

Communication with American manufacturers of rubber stamps, fountain pens, etc., is desired by a firm in India. Report No. 19,867.

A Central American firm desires catalogs and samples from American manufacturers of rubber belting and other articles. Report No. 19,869.

Quotations from American exporters of rubber-covered wires are desired by a firm in India. Report No. 19,885.

Automobile dealers in an insular possession desire to represent American manufacturers of automobile tires. Report No. 19,892.

Commercial relations are desired by a firm in Spain with American manufacturers of hard rubber irrigators. Report No. 19,900.

A surgeon in Spain would like to purchase medical rubber goods from American manufacturers. Report No. 19,911.

A firm in Spain desires to import waterproof cloth in wholesale quantities for making clothing. Report No. 19,919.

New Goods and Specialties.

PERFORATED MATTING IN ROLLS.

RUBBER matting, as a substitute for the old-style fiber matting, or carpet runners, have grown steadily in favor as a floor covering, especially for use in public buildings. Its wearing qualities are excellent, and it is pleasant to walk upon, being soft and yielding to the step. Easily cleaned, and non-absorbent, it is especially well suited for use in damp or wet places. Perforated rubber matting has been used for years, with

uniform success, but a new development in this line is shown herewith, in the form of rolls of matting, from which mats can be cut in any length desired, the widths manufactured ranging from 18 to 36 inches. This form of matting is convenient for dealers, since they do not need to keep a supply of the various sizes, and can accommodate their customers with a greater latitude in size than the cut mats allowed. [The Mechanical Rubber Co., Cleveland, Ohio.]

CONVENIENCES FOR DISH WASHING.

Dish washing is evidently becoming one of the fine arts. The mop superseded the cloth, to the decided benefit of women's hands, and now there is a device which not only does away with the necessity of immersing the hands in the water, but supplies clean water. As shown in the illustration, the cotton mop is attached by two small screws to the hexagonal-shaped handle connected to the rubber tube, thus allowing the mop to be taken off and renewed. The rubber tube is fastened to either the hot or cold water faucet, carrying the water through the mop and affording a constant flow of clean water, regulated to any volume.

In another similar brush there is a self-soaping device, the water flowing down the rubber tube and driving through a soap box before reaching the bristle brush used for dish washing. [Fuller Brush Co., Hartford, Connecticut.]

THE AQUA-PHONE.

This name might in justice be changed to the Aqua-Detector-Phone, if a descriptive title be desired, for the instrument is designed first to detect escaping water and then to telephone the information to the operator. In appearance and size it is an exact counterpart of the standard telephone receiver. The outer part is made of hard rubber, and it is composed entirely of this material and aluminum. It is used to detect leaks in water pipes, and its operation is simple. A metal rod is driven into the ground,

or the key placed in position on a street surface valve, as the case may be; the point of the Aqua-Phone is touched to the rod, when, if there is a leak nearby, the sound of escaping water can be heard through the receiver. It may also be used in factories and other places where the continued wastage of metered water is costly. [Aqua-Phone Co., Cincinnati, Ohio.]

THE "SANITARY" FLEXIBLE RUBBER FLY SWATTER.

Many different materials, wire perhaps being the most general, have been utilized in destroyers of that persistent enemy of peace and good temper, the fly. Rubber as used in the "Sanitary"

fly swatter, illustrated herewith, has many advantages over other materials, as it will not rust, no matter how salty the atmosphere, or injure the furniture. The soft, flexible rubber adapts itself to any angle, conforms to the shape of the surface against which it is struck and can be washed and kept perfectly clean. This fly swatter is supplied with a straight or turned handle as desired. [Standard Vending Machine Co., Hazleton, Pennsylvania.]

THREE NEW RAINCOAT MODELS.

The latest models of raincoats for men and women show style and individuality as created by the well-known makers of "Kenreign" garments, combining modish cut with high quality.

These raincoats are made in single and double texture rubberized fabrics, proofed by the "Kenreign" process. The single texture goods have a fancy art design proofing of pure Para rubber on the back of the material which gives a very pleasing effect. They are made in various colors, light and dark tan, however, being the most popular.

The style and quality of these coats are such that they are actually worn as much in fair, as in rainy weather. As an automobile garment they are unsurpassed, being dustproof as well as rainproof, and can easily be slipped on over the usual cloth, affording a comfortable and highly presentable protection. [C. Kenyon Co., Brooklyn, New York.]

A NOVEL SHAVING BRUSH.

For the traveler, to whom economy of space and convenient availability of shaving materials are necessary, this all rubber device has been invented. On the left in the illustration is the brush holder that also contains the soap and which fits into the massage brush shown on the right. Sufficient hot

water for producing a foamy lather is contained in the holder shown in the center of the picture. When the sartorial function is finished the two active parts of the brush can be compactly fitted into one another and finally into the holder. [Robert Webb, Brooklyn, New York.]

MODEL AEROPLANES DRIVEN BY RUBBER STRANDS.

Model aeroplanes are now made that are perfect reproductions of their larger prototype and on an exact scale reduction. The three-foot model appears to be the most popular and is furnished in the various types that are now familiar to everyone. A popular model is that of the famous monoplane, Bleriot XI, which made the first successful flight across the English channel. Another is a perfect replica of the famous Taube monoplane used by the German and Austrian armies.

Our illustration shows the Curtiss military biplane tractor that

is used by the United States government, and is rapidly replacing the pusher type of aeroplane. An excellent flyer is the three-foot model Curtiss flying boat that, owing to its waterproof and sturdy construction, makes a splendid motor boat. The Wright biplane and the Curtiss convertible hydro-aeroplane are supplied in the three-foot model sizes and are very popular types, particularly with the older devotees of the game. There are also gliders, speed-planes, aero-tops and various other flying toys that are primarily designed for amusement, but doubtless could all be used effectively for demonstrating the principles of aviation.

The motive power of these miniature flying machines is developed by rubber strands that are twisted or wound up like a spring and which, when released, drive the propeller shaft for a period of time, depending on the length and thickness of these rubber strands. As shown in the illustration rubber tired wheels are

also used and stream-line disc wheels add to the apparent realism of these clever mechanical toys. [Ideal Aeroplane and Supply Co., New York City.]

A JAPANESE NOVELTY.

The new Japanese novelty shown in the illustration is the figure of a "danky" made of a papier-mâché-like composition and finished in natural and attractive colors. To the back of the figure is attached a small rubber tube and a cylindrical bulb. By pressing this, air is forced to the figure, causing the "danky" to open and close his mouth as though about to enjoy a luscious bite from the realistic slice of watermelon held in his right hand. [A. A. Vantine & Co., Inc., New York City.]

A RUBBER DOLL THAT TALKS.

One of the unique novelties of the season, shown in the illustration, is a rubber doll, with a semblance of cozy winter costuming in the shape of mittens and a high, pointed hood tied under the chin. The feature that children most appreciate in this toy is that when the head is squeezed by a pressure of the hand, the doll responds by uttering sounds in a squeaky voice.

PHILLIPS' "MILITARY" SOLES AND HEELS.

A timely innovation in rubber soles and heels designed with especial regard to the needs of military service consists of thin rubber plates, provided with raised studs that are attached

to ordinary soles and heels, as shown in the accompanying illustration. The manufacturer claims that the rubber used in these plates is six times more durable than leather and that they not only keep the feet dry, no matter what the weather, but by their gripping qualities and the smoothness they impart to the tread greatly lessen the fatigue of long marches. This form of heel and sole protection is equally adapted for athletic sports and country wear. [Phillips' Patents, Limited, London, England.]

POCKET SCREW DRIVER WITH RUBBER HANDLE.

In this compact tool there are four blades of different widths, any of which may be readily taken from the telescope handle as required and inserted in the end where it locks automatically and is firmly held for use. The handle is covered with hard rubber for insulation from electrical currents, and its ribbed surface insures a firm grip for the hand.

The blades may all be kept in the handle, a spring pressure preventing them from rattling when carried in the pocket or being lost when the cap is off. [The L. S. Starett Co., Athol, Massachusetts.]

The tendency of the end of the suction tube of a bulb syringe to close by adhering in contact with a smooth surface has been effectually obviated in this type of syringe by vulcanizing to the inlet a flat loop or ring of rubber of the same quality as that of the tube. [Mechanical Rubber Co., Cleveland, Ohio.]

PHONOGRAPH DIAPHRAGM WITH RUBBER RING.

The old method of holding the mica diaphragm of a phonograph sound box in place possessed many inherent defects. For instance, the invariable rubber gasket usually held the delicate sheet of mica rigidly, thereby depriving this vibrating membrane

of complete efficiency. The new idea, shown in the accompanying cut, consists of molding a ring of rubber stock around the mica disk and thus vulcanizing it in a mold. The result is increased tone production and the elimination of troublesome mechanical noise. [Wm. Eggers & Sons, Brooklyn, New York.]

THE THRASHER TRENCH COAT.

This overcoat is especially adapted for war purposes and has received the commendation of the British War Office. It is

double-breasted, with an extra high collar, and while waterproof and windproof, it combines warmth with lightness in weight. A chrome-dressed sheepskin lining is used or, if preferred, a detachable "Kamelcote" or detachable sheepskin lining is supplied. Knee flaps and saddle gussets are provided for mounted officers. [Thrasher & Glenny, London, England.]

THE "GNIDROC" COAT.

A somewhat similar waterproof overcoat, especially suited to war uses, called the "Gnidroc," is shown in the second illustration. This coat is made in the raglan style, and comes in three weights, with or without fleece lining. [Geo. Cording, Limited, London, England.]

THE "SANDERSON" RUBBER TRIPOD SHOE.

In photography, after the correct focus has been obtained, the slightest movement of the camera will necessitate a repetition of the entire operation. When a tripod is used on slippery ground or polished floors, merely taking hold of the ball and tube, or inserting the plate-holder is apt to cause the tripod legs to slide, thus

upsetting the camera. The rubber tripod shoe here shown presents a simple means by which all danger of these accidents may be avoided. It is made in three sizes, and will stretch to fit tripod feet of any shape. When not in use it may be left in position or removed by rolling back the rounded edge. [The Altrincham Rubber Co., Altrincham, England.]

NUT CRACKING DEVICE WITH RUBBER RINGS.

We used to crack nuts in the kitchen, with a flatiron between our knees, and the floor was apt to be strewn with shells before

we finished. A way to overcome this difficulty is presented in the novel nut-cracking device here illustrated. The bowl is made of highly polished hard wood, with an attractively plated steel anvil center, and a hammer also plated to match the anvil, the wooden hammer handle being finished the same as the bowl.

This outfit is intended for use on the finest dining room table, and the hammer is encircled at each end with rubber rings, which overcome all danger of scratching or marring any polished surface upon which it may be laid. [Parsons Nut Bowl Co., Indianapolis, Indiana.]

THE "UNIVERSAL" TUBULAR BED.

An improvement in the air or water cushion beds so useful in hospitals and sick rooms is the tubular bed that is illustrated herewith. Instead of only one compartment, this bed is composed of ten separate tubes. The advantages of this construction are that the patient's comfort is more readily secured, as the tubes can be regulated so as to relieve pressure on the body;

additional tubes may be added so any part of the body can be raised, or the tubes, even when filled with water, can be inclined to any desired angle, while the ordinary water bed can be used only in a horizontal position.

An important point of superiority that is claimed over the old form lies in the fact that in case of injury or accident to any section, the entire bed is not put out of commission, the imperfect tube simply being withdrawn and an extra one inserted, without disturbing the patient. [The Altrincham Rubber Co., Altrincham, England.]

THE "UMBRELLA TIDY."

In order to keep an umbrella cover from fraying at the edges, it is recommended that the ribs be fastened firmly together when

OPEN.

CLOSED.

touch of the finger tips is all that is needed to reverse the position of the holder for the release or attachment of the umbrella ribs. [Reliance Rubber & Hardwood Co., London, England.]

The Obituary Record.

WATSON H. LINBURG.

WATSON H. LINBURG, president of the United & Globe Rubber Cos., and prominent in the business activities of his state, died after a long illness on January 5 at his home in Trenton, New Jersey, aged 76 years.

Mr. Linburg was born December 5, 1839, in Conshohocken, Pennsylvania. In his early manhood, during the Civil war, he enlisted in the Union Army, was taken prisoner at Chancellorsville and spent a long time in Libby prison. After the war he engaged

found but little time for outside interests. He was, however, a member of the Woonsocket Business Men's Association, the Friendly Sons of St. Patrick and the Christian Doctrine Society of St. Charles' Church.

After the funeral, which was conducted by the Rev. John H. Whitaker, 150 employees from the factory formed two lines between which the mourners marched, followed by bearers conveying the casket. The pallbearers, who were all men holding responsible positions in the Woonsocket factory, were as follows:

WATSON H. LINBURG.

WILLIAM LYALL.

MICHAEL M. FLYNN.

in the dry goods business until he transferred activities to the rubber field.

Mr. Linburg's connection with the rubber industry dated from 1878, when he became a member of the Hamilton Rubber Co. With characteristic thoroughness, he mastered all the details of the business and it was not long ere he was regarded as an authority in his line. In addition to filling the office of president of the United & Globe Rubber Cos., he was president of the Globe Tire Co., vice-president of the Spring Lake Hotel Co., and served as director of the First National Bank of Trenton, the Standard Fire Insurance Co., the Inter-State Fair Association and the Mercer Hospital. He was vice-president of the Lotus Club of Trenton and member of the following organizations: Trenton Country Club, Golf Club of Spring Lake, Railroad Club of New York, Historical Society of Pennsylvania, Pennsylvania Society and the Trenton Masonic Lodge. He is survived by his widow and a daughter, Mrs. Horace B. Tobin.

MICHAEL M. FLYNN.

Michael M. Flynn, general manager and superintendent of the Woonsocket factory of the American Wringer Co., died on December 30, 1915, after a brief illness.

Mr. Flynn was born in Woonsocket, Rhode Island, January 3, 1858. When a mere lad he entered the employ of the Bailey Wringing Machine Works, which factory later became the Woonsocket factory of the American Wringer Co. He gradually worked himself through the different departments of the concern and was made superintendent in 1890, and for the last quarter century he has devoted all his energies to the promotion of the wringer business. Ever absorbed in his family, Mr. Flynn

Jesse P. Walsh, John F. Sweeney, John T. Gahan, William Makins, Samuel N. Greenwood, James W. Quinn, Charles Yahraus and William Fogarty.

Mr. Flynn is survived by his widow, two sons and two daughters.

WILLIAM LYALL.

William Lyall, venerable president of the Brighton Mills, Passaic, New Jersey, designer of innumerable types of tire fabrics, died suddenly on January 13 in the seventy-sixth year of his age. He was the son of Charles Lyall, of Dunfermline, Scotland, and Mary Cooper, of Perth, Scotland. The father came to the United States in 1839, and soon laid the foundations of a prosperous commercial career.

William Lyall was born on October 28, 1840, in Jersey City, New Jersey, and in 1861 commenced his commercial career. Success marked his efforts from the start, and he rapidly built up a thriving business, being successively connected with the Planet Mills, the United States Corset Co., the Chelsea Jute Mills and other manufacturing enterprises.

In later years he established the J. & W. Lyall Loom and Machine Works, for the manufacture of textile machinery, particularly the positive motion loom, of which his brother and partner, James Lyall, now deceased, was the inventor. This loom was a marked improvement in weaving machinery, and was the basis of many other textile enterprises. Associated with his brother in the early development of special fabrics, he was the pioneer in tire fabric making, that has developed from the hose pipe bicycle tire of 1895, to the present day auto tire of exacting requirements.

William Lyall will long be remembered by his many friends in the rubber tire trade with genuine appreciation and regard. His inherent courtesy of manner and genial kindness endeared him to those who were fortunate enough to come within the sphere of his influence.

At the time of his decease, Mr. Lyall was senior member of the firm of J. & W. Lyall and also president of the Brighton Mills, manufacturers of standard and special tire fabrics, Passaic, New Jersey. He was a director in several banks and fire insurance companies, and identified with various social and charitable organizations, and also a member of the Union League Club, and the Chamber of Commerce of New York City. He has had a long and intimate connection with St. Andrew's Society, having served as manager, second vice-president, first vice-president and president.

Mr. Lyall is survived by his widow and six sons and daughters: William L. Lyall, treasurer of the Brighton Mills; Charles E. Lyall, Herbert J. Lyall, Kitty E. Lyall, Earl H. Lyall and Pamela W. Lyall.

GEORGE H. F. SCHRADER.

George H. F. Schrader, formerly president of A. Schrader's Son, Inc., Brooklyn, New York, died on November 15 on ship-board while en route from Iceland to Norway.

Mr. Schrader, who was 57 years of age, was the inventor of the Schrader valve for pneumatic tires. He withdrew from the business in 1904 and he devoted his attentions largely to philanthropic and humanitarian work. In 1907 he gave the "Caroline Rest" to the New York Association for Improving the Condition of the Poor, and since then supported this home practically unaided.

He spent his last few years abroad. In Iceland he interested himself in the 50,000 ponies that in winter are turned out to forage for themselves. He built shelters for the ponies and conducted a campaign of education among the people. He also established a "Caroline Rest" for needy Icelanders.

FREDERICK J. ALDEN.

On January 14 Frederick J. Alden, who had been in the employ of the Boston Belting Co. for thirty-seven years, passed away at his home in Winthrop, Massachusetts, after a four months' illness.

Mr. Alden was born in Somerville, Massachusetts, 60 years ago, and was educated in the public schools of that city. He started in the grocery and provision business in that city, and was quite successful, until a fire totally destroyed his business establishment. He then entered the employ of the Boston Belting Co., and later was promoted to the position of traveling salesman. For 30 years he represented the company in New England, the Maritime Provinces and the North Atlantic states. Possessed of a genial nature he was counted as a personal friend by his host of customers. He was an Elk, and a member of the United Commercial Travelers' Association. He married Miss Alice C. Olmstead, of Chelsea, who survives him.

J. K. LINDSAY.

J. K. Lindsay, office manager of the Toronto branch of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, died on December 26 after a brief illness.

Mr. Lindsay's business experience began with the Munster Bank in Ireland. After five years' service, he developed the spirit of adventure, traveling extensively for several years. Finally he settled down in Canada, where he obtained employment in the Canadian Bank of Commerce. Later he was offered the position of financial manager by a Montreal shoe manufacturing and jobbing house, where he acquired considerable experience in the footwear trade. Leaving this, he became secretary-treasurer of the J. D. King Co., where he remained until 15 years ago, when he entered a partnership in the rubber

and leather footwear business. On the dissolution of this partnership four years ago, he became accountant and office manager of the Toronto branch of the Canadian Consolidated Rubber Co., Limited.

During his entire life Mr. Lindsay was a keen student of men and affairs, and his dealings typified honor, fair-mindedness and zeal.

ERNST ULE.

A late number of the "Tropenpflanzer" chronicles the death in Berlin of Ernst Ule, one of the leading authorities on Brazilian rubber trees.

Professor Ule, who for many years held an important scientific position at the Botanic Gardens in Rio de Janeiro, from 1900 to 1903, explored not only the upper Amazon as far as the Peruvian frontier, but also the tributaries of that great river. On this tour he studied rubber plants and discovered a number of the *Hevea* varieties. He is credited with having first discovered the *Castilloa Ulei*, which bears his name. His account of the results of these studies is given in Engler's "Botanischen Jahrbüchern," XXXV, Fifth Edition, under the title of "The Rubber Plants of the Amazon Expedition and Their Meaning to the Geography of Plants." In the "Tropenpflanzer" (1905 Supplement I) he told of this expedition in an article entitled "Rubber Gathering and Rubber Trading on the Amazon," and in the same publication (page 788, 1907) he contributed "The *Hevea Discolor* as Producer of Rio Negro Rubber." An important book of his is entitled "The Vegetation of the Amazon Country."

On his return to Germany from Brazil, Professor Ule arranged and classified his extensive collections of tropical plants, and in 1906, the Bahia Rubber Syndicate of Leipzig sent him as expert to investigate the home of the Ceara rubber. On this expedition he discovered three new species of the *Manihot* variety and brought their seeds to Europe whence they were distributed to plantations throughout the world. He also wrote a book on these plants which he called *Manihot Dichotoma*, *Manihot Heptaphylla* and *Manihot Piahyensis* and which produce Jequie, Sao Francisco and Piahy rubber, respectively.

Professor Ule made his last long trip from 1908 to 1912, when he explored the northern branches of the Amazon and went as far as British Guiana. It is said he was the first expert to explore the Acre territory, which of all Brazilian land is richest in rubber. As a recreation during this tour in 1910 he visited Ceara and found time to make a thorough study of the "Boll Disease" of Ceara rubber. He was continuing the work on this subject when death overtook him.

Botanic science loses in Professor Ule a man of unusual strength, a tireless, energetic worker, a reliable investigator and a careful collector. He possessed a constitution that adapted itself to the damp, mosquito infested climate of the Amazon wilderness which enabled him to accomplish results where others have failed. Unlike many explorers he was equipped for his work by a thorough botanical education.

G. LEONARD PORTER.

G. Leonard Porter, managing partner in the Market Harboro Rubber Co., died December 11, 1915, in London, after a short illness. Mr. Porter belonged to a well-known Leicester family and was for 20 years associated with the company, during the latter portion of which period he served as managing director. He was about 40 years of age and unmarried.

HENRY SPEAKMAN.

Henry Speakman, head of the firm of Henry Speakman & Sons, rubber and asbestos merchants, Manchester, England, died suddenly at Brooklands in the 73rd year of his age. As a young man, over 50 years ago, Mr. Speakman started on his own account as a rubber merchant and mill furnisher, and later admitted his two sons to membership in the firm.

News of the American Rubber Trade.

ANNUAL MEETING OF THE REPUBLIC RUBBER CO.

THE fifteenth annual meeting of The Republic Rubber Co., Youngstown, Ohio, was held January 24 at the general offices in Youngstown.

The management reported that the tire business of the company had increased 69 per cent in 1915 over the previous year, and that all mechanical goods departments, which constitute about one-half of the concern's business, showed satisfactory increases, with the exception of the railroad supply department for air brake hose, steam hose, etc. In this line, demand and prices were very poor until the latter months of the year. At present there is marked improvement in volume and a little betterment in prices.

Taking all departments into consideration, the company had more business on its books January 24 than on any date in its history, and prospects are good.

The usual cash dividends at regular rates were declared. The old officers were re-elected as follows: Thomas L. Robinson, president; L. T. Petersen and J. H. Kelly, vice-presidents; C. F. Garrison, secretary; M. I. Arms, 2nd, treasurer. There were two additions to the board of directors: Henry M. Garlick, president of the Standard Oil Cloth Co., and R. E. Cornelius, president of the Mahoning National Bank.

David Tod, who has served on the board for some years, was not re-elected, at his own request, owing to the many calls upon his time; this being done with the understanding he will return to the board at an early date.

The board of directors is as follows: M. I. Arms, Robert Bentley, C. H. Booth, J. H. Kelly, L. T. Petersen, Thomas L. Robinson, John Tod, H. K. Wick, John C. Wick, H. M. Garlick and R. E. Cornelius.

WASTE MATERIAL DEALERS HAVE NEW QUARTERS.

The headquarters of the National Association of Waste Material Dealers have recently been removed from 170 Summer street to 185 Summer street, Boston, Massachusetts, where a suite of offices on the top floor of the Brown Building has been equipped with all the conveniences which members could desire. One of the offices has been fitted up especially as a room for members, with telephone and other conveniences, and should prove an attraction to those visiting Boston.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of the shares of rubber manufacturing companies on January 25 last are furnished by John Burnham & Co., 31 Nassau street, New York, and 41 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new).....	71	71½
Firestone Tire & Rubber Co., common.....	730	..
Firestone Tire & Rubber Co., preferred.....	113	..
Fisk Rubber Co., common.....	117	120
Fisk Rubber Co., 1st preferred.....	109	112
Fisk Rubber Co., 2nd preferred.....	120	..
Goodrich Co., The B. F., common.....	71¼	71¾
Goodrich Co., The B. F., preferred.....	110	112
Goodyear Tire & Rubber Co., common.....	340	345
Goodyear Tire & Rubber Co., preferred.....	114	..
Kelly-Springfield Tire Co., common.....	Old 292	298
	New 73½	74
Kelly-Springfield Tire Co., 1st preferred.....	96	96½
Kelly-Springfield Tire Co., 2nd preferred.....	74½	75
Miller Rubber Co., common.....	270	275
Miller Rubber Co., preferred.....	113	115
Portage Rubber Co., common.....	70	72
Portage Rubber Co., preferred.....	102	106
Swinehart Tire & Rubber Co.....	87	89
United States Rubber Co., common.....	54	54½
United States Rubber Co., preferred.....	107¾	108½

THE HODGMAN NEW YORK OFFICE MOVES UPTOWN.

The completion of the interior furnishing and final preparations for occupancy of the Hodgman Rubber Co.'s new general office building at Tuckahoe, New York, marked an epoch in the history of that progressive company.

A full description, with an illustration of the building, then being erected, was published in the September issue of THE INDIA RUBBER WORLD, when it was stated that this company would move its entire office force from 806 Broadway, New York, to the new quarters, by January 1.

This, however, was impossible, owing to delays in construction work, and the removal was therefore deferred until January 29, when it was systematically accomplished without the slightest inconvenience to the routine of business.

A New York sales office has been established at 8 West Fortieth street, where the goods manufactured by the company will be displayed and customers served by an adequate sales force. This very central location, in the heart of the growing up-town business district, is most convenient. The nearby New York Central and Pennsylvania Railroad terminals, and the hotel district, make access easy to out-of-town buyers. Here the New York City trade will be handled by direct wire connection with the factory and an efficient auto-truck service will insure prompt delivery to local New York points. Out-of-town freight and express shipments will also reach their destination without appreciable loss of time, due to superior advantages afforded by effective co-operation of salesroom, general offices and factory.

VIOLATORS OF UNITED STATES CUSTOMS LAWS FINED.

When the neutrality squad of the United States Secret Service discovered that rubber constituted the contents of various trunks and boxes belonging to Mrs. Annie Dekkers, a passenger booked for Holland on the steamship "Ryndam," an interesting state of affairs was revealed. The sequel of this story as recorded in THE INDIA RUBBER WORLD, January 1, found an ending last month before Judge Clayton, of the Federal Court of the United States.

Subsequent to the indictment of the five persons found guilty of conspiracy in violation of the United States customs laws, by the federal grand jury, the following fines were imposed by Judge Clayton: Max Jaeger, \$1,500; Edward Weber and Paul Schmidt, \$750 each; Richard Wohlberg, \$100, and the Rubber & Guayule Agency, Inc., \$50. Mrs. Annie Dekkers, who was also indicted, but unable to appear in court on account of sickness, was later fined \$250, by Judge Clayton.

RUBBER CLUB INTERMEDIARY FOR RUBBER & GUAYULE AGENCY, INC.

When the British consul at New York refused to accept guarantees from the Rubber & Guayule Agency, Inc., recently fined in the federal court for breaking the customs laws, the Rubber Club of America, Inc., foresaw that an injury to innocent manufacturers would result. Accordingly it took up the matter vigorously with the British consul, who finally accepted the club's offer to act as intermediary. The result is that all contracts entered into with the Rubber & Guayule Agency, Inc., prior to December 21, 1915, will be handled through the Rubber Club.

PEACE SHIP CARRIED RUBBER IN PARCELS POST.

From a recent report issued by the British Foreign Office it appears that on searching the steamship "Oscar II.," of erstwhile peace fame, 55 bags containing rubber were discovered in the parcels post mail. It is estimated that the amount of rubber thus apprehended was 4,000 pounds.

RUBBER COMPANY DIVIDENDS.

A quarterly dividend of 2 per cent on the first preferred stock and a quarterly dividend of 1½ per cent on the second preferred stock of the United States Rubber Co. was paid January 31, 1916, to stockholders of record January 15, 1916.

A quarterly dividend of 1¼ per cent on the preferred stock of the Westinghouse Electric & Manufacturing Co. was paid January 15, 1916, and a dividend of 1½ per cent on the common stock, January 31, 1916, both to stockholders of record December 31, 1915.

The directors of the Ajax Rubber Co. have declared a quarterly dividend of 3 per cent on the common stock of the company, payable February 1, 1916, to stockholders of record January 15, 1916.

A quarterly dividend of 3 per cent on the common stock of the Kelly-Springfield Tire Co. has been declared, payable February 1, 1916, to stockholders of record January 15, 1916.

THE NEW SHIPPERS' EXPORT DECLARATION.

Attention has been called by the Department of Commerce to the "Shippers' Export Declaration and Export Procedure," issued December 14, 1915, containing regulations superseding those issued on September 15, 1915. The new order becomes effective February 1, 1916, instead of January 1, as originally planned, and as mentioned in THE INDIA RUBBER WORLD of December, 1915. As this pamphlet gives complete instructions and samples of blank forms for export shipments, it is important that all rubber manufacturers doing export business should have a copy, thus avoiding inconveniences and delay. Copies may be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C., on application.

CRUDE CHICLE.

The Board of United States General Appraisers sustained the protests of Schutte, Bunemann & Co., New York City, and the American Chicle Company, St. Louis, Missouri, claiming that certain importations of chicle, which were returned as "refined chicle" should have been classified as "crude chicle." The merchandise was returned at 20 cents per pound under the provision in paragraph 36, act of 1913, providing for "chicle, refined or advanced in value by drying, straining, or any other process or treatment whatever beyond that essential to the proper packing." Under the same paragraph, it is claimed to be dutiable at 15 cents per pound as "crude chicle."

CHANGES IN AMERICAN CHICLE CO.

At the annual meeting of the American Chicle Co., Darwin R. James, Jr., C. D. Smithers, Warren C. Hayden, Silas B. Adams, Adam P. Leighton and George H. Worthington were elected directors. Mr. James was chosen president and Mr. Adams, vice-president.

TIRE REPAIR MATERIALS.

"Rie-Nie" is a new self-vulcanizing rubber compound for use on tire tubes, rubber footwear, etc., which is said to be an improvement on the customary patch. It is tough, strong, elastic and when it dries becomes a part of the rubber. [Durkee-Atwood Co., Minneapolis, Minnesota.]

Another new repair material is "Jovo," a tire seal claimed to preserve the rubber of the tire while preventing punctures. It is injected into the tube, the motion of which distributes it over the inner surface, and when a puncture occurs the air in the tube forces Jovo into the hole, as a sort of plug. A \$2 can is supposed to be sufficient for a 3½ to 4½-inch tube. [Joseph A. Vogel Co., Wilmington, Delaware.]

PERSONAL MENTION.

Theodore Hofeller, president of Theodore Hofeller & Co., Buffalo, New York, accompanied by Mrs. Hofeller, is spending the winter in Pasadena, California. Their son, Eugene D. Hofeller, is looking after his father's interests in the waste material business and also in the New Columbus Buggy Co., the Buffalo Electric Vehicle Co., and the Wellsville & Buffalo Railroad Corporation.

E. E. Wadbrook, of the firm of Arnold & Zeiss, New York City, has gone to Pinehurst and will spend his winter vacation golfing.

Kenneth Elwell, formerly with the Walpole Tire & Rubber Co., has accepted the position of factory manager of the Mechanical Rubber Co., Chicago, Illinois.

Freeman Carey has been appointed manager of the rubber department of The Carborundum Co., Niagara Falls, New York. He will have charge of the manufacture of vulcanite emery wheels.

The trade will be glad to know that C. H. Arnold, of the firm of Arnold & Zeiss, who for some months has been exceedingly ill, has recovered and is again at the Boston office.

S. P. Woodward has been promoted from the position of manager of the tire department of the New Jersey Car Spring & Rubber Co., Jersey City, New Jersey, to that of general manager.

Harry D. Dean, formerly assistant purchasing agent of the Davol Rubber Co., Providence, Rhode Island, resigned on January 1 to become purchasing agent of the Davidson Rubber Co., Charlestown, Massachusetts.

F. W. Dunbar, manager of Aldens' Successors, Ltd., New York City offices, spent a short vacation last month in the mountains of South Carolina.

Dr. L. H. Baekeland, on January 11, was awarded the Perkin medal for applied chemistry, by the New York Section of the Society of Chemical Industry.

H. B. Niblette has resigned his position as general manager of the Buffalo, New York, branch of The F. B. Goodrich Co., Akron, Ohio, with which company he was connected for seventeen years.

E. Stevenson, managing director of Aldens' Successors, Ltd., returned to London last month after a short business trip to New York.

A. H. Sommers, formerly with the New Jersey Car Spring & Rubber Co., Jersey City, New Jersey, has become associated with the Peerless Rubber Manufacturing Co., New York City, as its representative in Tennessee, Arkansas, Mississippi, Alabama, Kentucky and Missouri, with headquarters at Memphis, Tennessee.

Charles W. Harris has been appointed Western manager, with offices in the Hearst Building, San Francisco, California, for the Perfection Tire & Rubber Co., Chicago, Ill., and has resigned as district sales manager for the Seattle branch of the Kelly-Springfield Motor Truck Co. to re-enter the rubber trade, with which he was formerly connected for 18 years.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, announces the appointment of William Jameson as power superintendent. Mr. Jameson has been with the company since its inception.

R. F. Valentine has been appointed sales manager of the Standard Tire and Rubber Co., Cleveland, Ohio.

Roger Hardy, New York salesman for A. G. Spalding & Bros., has had a good deal of practical experience in the rubber business, from plantation to factory, a decided advantage in selling rubber sporting goods specialties.

ENLARGEMENT OF THE J. P. DEVINE CO.'S PLANT.

The J. P. Devine Co., Buffalo, New York, is constructing, as an addition to its plant, a steel and tile building 203 feet long, 60 feet wide and 60 feet high.

This extension will be devoted entirely to the manufacture of special apparatus for the chemical industry. This branch of the company's business has increased extensively during the past two years, and its apparatus has become well and favorably known.

Since undertaking the above extension the Devine company has also taken over the entire plant of the Pitts Agricultural

STEEL CONSTRUCTION OF J. P. DEVINE CO.'S NEW FACTORY.

Works of Buffalo, to do special casting work made necessary by the unprecedented activity of the chemical industry.

The Devine company is building plants for manufacturers for the production of various chemicals including all dyestuffs and higher intermediate colors, the making of which was confined to Germany prior to the present war. The development of this industry is most important not only because the attainment of the necessary standard in the production of colors will render this country independent of foreign sources of supply, but with suitable apparatus American workmen can nitrate with equal facility benzol, toluol or phenol for the manufacture of aniline oil, or high explosives.

NEW INCORPORATIONS, WITH AUTHORIZED CAPITAL, ETC.,
1915 AND 1916.

Akron Repair & Tire Co., The, January 12 (Ohio), \$5,000. P. J. Hooker, S. D. Brewster and A. Q. Ross. To deal in new and second-hand automobile tires and supplies, etc.

American Auto Accessories Co., December 24 (Delaware), \$5,000,000. Joseph F. Curtin, S. A. Anderson and Samuel B. Howard—all of 36 Nassau street, New York City. To manufacture and deal in pneumatic tubes, tires, etc.

American Tire Fabric Co., December 28 (Massachusetts), \$1,500,000. John L. McIver, 15 Ridge Road, Mattapan, Francis L. Auld, 403 Sudbury Building, Boston—both in Massachusetts, and Howard K. Wood, 36 Nassau street, New York City. Offices, Boston, Massachusetts, and New York City. To manufacture, buy and sell cotton yarns and other textile fabrics.

Badenhop Co., Inc., Robert, December 28 (New York), \$100,000. Robert Badenhop, 13 Jones street; Harold W. Holcombe, 147 Bostwick avenue, and Sloan Lamont, Jr., 115 Wayne street—all in Jersey City, New Jersey. Brokers in goods of any kind.

Cooper Metal Co., Inc., A., January 4 (New York), \$25,000. Abe Cooper, 815 South State street; John J. Hughes, 307 Clarendon street; Abraham Rubenstein, 374 West Onondaga street—all in Syracuse, New York. To deal in metals, rubber, etc.

De Mattia Bros., January 10 (New Jersey), \$100,000. Peter De Mattia and Barthold De Mattia—both of Clifton, and Frederick W. Gaston, Passaic—both in New Jersey. Office, River Road and Prescott avenue, Garfield, New Jersey. To manufac-

ture metal molds to be used for manufacturing rubber goods, etc.

Duralex Co., The, January 18 (New Jersey), \$250,000. Frederic E. Kip, Crestmont Road, and Herbert M. Lloyd, 24 Lloyd Road—both in Montclair, and Ira A. Kip, Jr., Ridgewood Road, South Orange—both in New Jersey. Office, 768 Frelinghuysen avenue, Newark, New Jersey. To manufacture and deal in rubber, rubber substitutes, textile fabrics, etc.

Excelsior Raincoat Co., Inc., January 26 (New York), \$10,000. Julius S. Levy and David N. Levy—both of 20 East 111th street, and Joseph Levy, 504 West 122nd street—both in New York City. Rubber apparel, etc.

Habirshaw Electric Cable Co., Inc., January 26 (New York), \$925,000. Edwin W. Moore, 17 Battery Place, Joseph W. Murphy, 40 Wall street—both in New York City, and James B. Gauraglia, Hoboken, New Jersey. To manufacture insulated wire, etc.

Jaffess, Inc., Leon, December 30 (New York), \$5,000. Leon Jaffess, 1837 Clinton avenue; Otto Pershitz, 673 East 176th street, and John M. Detjen, 61 Broadway—all in New York City. To manufacture tires, rims, auto parts, etc.

Johnson Tire Co., F. H., December 15 (Texas), \$10,000. Frank H. Johnson, William G. Bell, R. P. Tyler and Leonard D. Ormsby—all of Austin, Texas. Office, Austin, Texas. To purchase and sell goods, wares and merchandise, etc.

McClurg Tire Sales Co., Inc., January 4 (New York), \$10,000. James J. Fero and William Miller—both of 792 Seventh avenue, and Thomas F. McMahon, 1400 Broadway—all in New York City. Tires, tubes, auto accessories, etc.

Nesco Corporation, January 3 (New York), \$25,000. Rena A. Manes and Isabelle Manes—both of 7 Manhattan avenue, and Joseph P. Nolan, 25 Broad street—all in New York City. Rubber goods, steam packing, etc.

Northern Rubber Corporation, December 27 (New York), \$100,000. John E. Doane, 27 West Forty-third street, and James E. Taylor, 294 West Ninety-second street—both in New York City, and Knut Wideem, 1710 Catoen avenue, Brooklyn, New York. Rubber and synthetic rubber manufacture.

Perfection Tire Sales Co. of West Virginia, December 1 (West Virginia), \$25,000. W. M. Faw and E. H. Faw—both of Albert; J. C. Faw, Elkins; R. D. Heironimus, Davis, and H. F. E. Hinebaugh, Thomas—all of West Virginia, and C. J. Simpson, Cumberland, Maryland. To manufacture tires.

Release Tire Valve Co., Inc., January 4 (New York), \$10,000. Norman A. Crumb, 622 Gurney Building; Erwin G. Nichols, 540 Gurney Building, and Abraham Edelstein, 622 Gurney Building—all in Syracuse, New York. To manufacture tires, valves, etc.

Rock Tire Manufacturing Co., Inc., The, January 18 (New York), \$500,000. George E. Whipple, 1845 Coney Island avenue; Thomas M. McGrath, 133 Rogers avenue—both in Brooklyn, New York, and Harry J. Welbel, 171 Sixteenth avenue, Long Island City, New York. To manufacture automobile tires, etc.

Story, Browning & Trainer, Inc., December 30 (New York), \$75,000. Ernest D. Story and Elmer G. Story—both of 1328 Broadway, and J. N. Trainer, Jr., 381 Fourth avenue—both in New York City. Rubber tires, automobiles, etc.

Surinam Rubber & Wood Plantation Co., December 6 (Delaware), \$250,000. Joseph F. Curtin, H. O. Coughlan, and S. A. Anderson—all of 36 Nassau street, New York City. To deal in rubber, metals and minerals and products of all kinds, etc.

Tire Service Corporation, Inc., January 4 (New York), \$10,000. Rex C. Northwood, Jules E. Hut and Rose Greenwald—all of 1779 Broadway, New York City. Auto supplies, pneumatics, tires, etc.

Tubelless Tire & Rubber Co., The, January 3 (Ohio), \$75,000. O. J. Hicks, G. B. Helmutz, J. Lemmon, D. R. Messner and W. R. Price. Office, Millersburg, Ohio.

Universal Raincoat Co., Inc., January 10 (New York), \$3,000. Marcus Berman and Lonis Berman—both of 136 East 112th street, and Max Herman, 414 East Tenth street—all in New York City. To manufacture rubber clothing, etc.

THE MANAGER OF THE CRAVENETTE CO.

THE trade generally is familiar with the term cravenette, but all are not so well acquainted with the fact that the improved processes by which textiles, felt goods and even leathers are made water-repellent or waterproof are to a large extent due to one man, Herbert P. Pearson, the subject of this sketch.

H. P. PEARSON

Mr. Pearson was born in Manchester, England, in 1877, and received his education in that city, graduating from a four years' course at Manchester University, with degree of Master of Science in chemistry. Then he spent a year in Germany, studying dyeing, and at a mill in Alsace, familiarizing himself with spinning, weaving and finishing.

Returning to England he associated himself as chemist to the Bradford Dyers' Association, Limited. This position he occupied for seven years, spent largely in the works, where he gained unique practical experience in all the processes through which textile piece goods pass after weaving.

Then he went to London as consulting chemist, specializing in bleaching and waterproofing textiles, and as manager of Pearson Patents, Ltd., and so remained until, in 1910, the Cravenette Co. U. S. A., secured his services in establishing in this

country processes of his invention for waterproofing straw hats. The next year he again visited this country to start a process for damp-proofing shoes, which he had been investigating in England.

In 1912, at the invitation of the late Langdon Geer, Mr. Pearson entered into the management of the business of the Cravenette Company, and since Mr. Geer's death in June, 1915, he became managing director of the company.

The Cravenette Company has recently broadened its policy and added to its lines of output. In September a new plant was established, devoted solely to the cravenette finishing of silk goods, to render them spot-proof. Recently this company has cravenette finished some rubberized cotton and silk goods, making the surface repellent, so that water does not cling to, or spot the cloth. A garment thus treated needs only to be shaken to become quite dry. This gives some indication of the extension of the field of endeavor of this company, an expansion due almost solely to the study and experimentation of Herbert P. Pearson.

TRADE NOTES.

The yarn department of J. Spencer Turner Co., 86 Worth street, New York City, has been consolidated with the business of C. H. & R. L. Stevens, Inc. Hereafter cotton yarns of all counts and descriptions will be supplied to the trade under the personal direction of C. H. and R. L. Stevens.

The Passaic Cotton Mills, Passaic, New Jersey, has purchased from the New England Cotton Yarn Co., one of the large spinning plants at New Bedford, Massachusetts, known as the Rotch mill. It has been entirely renewed to the extent of 55,000 spindles. Taylor, Armitage & Co., 346 Broadway, New York, selling agents for the Passaic Cotton Mills, are now in a position to protect their contracts.

If political conditions in Mexico permit, the Intercontinental Rubber Co. plans to start operations at its plant at Torreon, Mexico, this month, on a scale considerably above that possible at any time since 1913.

The Atlantic Transport Line, 9-11 Broadway, New York City, the well-known steamship company, has added four fast express

steamers flying the American flag to its trans-Atlantic service; an obvious advantage to both rubber importers and manufacturers.

The Continental Rubber Works, Erie, Pennsylvania, has just completed a new machine shop of steel and concrete, dimensions of which are 75 x 110 feet. It is equipped with an electric crane running the full length of the building. The company has also added to the plant a new factory building, 75 x 226 feet, four stories high, of steel and concrete construction, to be exclusively devoted to the production of automobile, motorcycle and bicycle tires. The company employs about 800 workmen.

At the second Annual Industrial Safety Exposition at Cleveland, Ohio, January 22 to 29, The B. F. Goodrich Co. made one of the largest displays, showing safety and sanitation methods in use at its Akron factory. These included a gear guard and safety switch box, an anti-scalding wash basin, a non-slipping ladder and a sanitary drinking fountain. A replica in miniature of the medical dispensary of the Goodrich plant was also shown.

The Mechanical Rubber Co., Chicago, Illinois, has opened an office in Detroit, Michigan, which will be especially devoted to the automobile lines of the company, and is in charge of W. G. Lindsey.

The Batavia Rubber Co., with factory at Batavia, New York, and general sales and financial offices in New York City, has recently increased its capital in order to extend its development. Charles M. Marvin, formerly of Blake Brothers & Co., has been elected treasurer of the company, and George W. Hodges, of Remick, Hodges & Co., has been added to the board of directors, both of New York City.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, announces that a readjustment of wages and a change in working hours have been made which affect all departments. Under the new schedule the working hours have been decreased from 55 to 50 hours a week, and overtime on week days will be paid for as time and a half, and on Sundays as double time. New piece work schedules for machine operators have also been adopted.

A fire occurred recently in the cloth drying room of the L. Candee & Co., New Haven, Connecticut, the damage being less than \$3,000.

Since the middle of January the B. & R. Rubber Co., North Brookfield, Massachusetts, has been obliged to resort to burning cord wood for steaming purposes owing to irregular receipts of coal via Albany. From 25 to 30 cords of wood have been required daily.

A serious fire is reported as having destroyed the shops of the Albany Tire Repairing Co., Albany, New York, on January 27.

The B. F. Goodrich Co., Akron, Ohio, has brought action against the Norwalk Tire & Rubber Co., Norwalk, Connecticut, manufacturer of a tire with white sides and a black tread in which the letter "N" is worked. The plaintiff claims that the trade design and color scheme is a close imitation of a tire it has been marketing, that the public is apt to be deceived by the new product, and that its business has suffered on account of this.

The Miner Rubber Co., Limited, Granby, Canada, has opened a wholesale warehouse in charge of Angus W. Douglas at Edmonton, Alberta, where a full line of rubber footwear will be carried.

The Pierce Co., East Rochester, New York, claims to have increased its output of "Vorite" 30 per cent. in 1915, and has made substantial additions to its plant.

The Batavia Rubber Co., Batavia, New York, is putting out a red tread tire.

TRADE NOTES.

During the holiday season the Chicago Rubber Clothing Co., Racine, Wisconsin, used for its correspondence its regular lithographed letterhead, in the lower left-hand corner of which was specially printed a green and red holly wreath inscribed with appropriate season's greetings.

The Faultless Rubber Co., Ashland, Ohio, has erected a new addition of modern fireproof construction to its factory which adds 30,000 square feet to the 135,000 square feet of floor space now in use. In the mill room, which will occupy the ground floor of the new structure, the mills and calenders will rest on concrete foundations extending to bed rock. The second floor will be devoted to various manufacturing departments. All machinery will be driven by electricity made in the factory from steam generated in 250 horse-power boilers by local natural gas.

The plant at Lowell, Massachusetts, formerly occupied by the Patterson Rubber Co., has been taken over by the R. B. Phillips Co., manufacturer of munitions.

The Okonite Co., New York City, has established at its factory a research department with J. P. Millwood in charge. Mr. Millwood was head of the Chemical Research Department of the United States Navy Yard at New York for 20 years, and is held in high esteem as a rubber chemist. Dr. Comfort A. Adams, professor of electrical engineering at Harvard University, is retained as consulting engineer of the new department.

Philip De Ronde, president of the Oriental Navigation Co., announces the removal of the company's offices to Room 1134, 17 Battery place, New York City.

A remarkable record of efficiency was made recently by the Quebec division of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, when 55,100 pairs of hip rubber boots required by the British army in Flanders, were finished in 45 days. These boots had special features, that added considerably to the work of making such as an extra heavy skirt and much wider mouth than the standard style and special straps at ankle and knee, with automatic buckles. A supplementary order has since been received by the company.

The rubber overflow trimmer made by Arthur Jackson Wills, North Brookfield, Massachusetts, has evidently qualified with the rubber trade. It is reported that 33 of these machines have recently been installed in the finishing room of one of the largest manufacturers of mechanical goods in the country.

In addition to the storage warehouse recently completed for the Electric Hose & Rubber Co., Wilmington, Delaware, on the eastern end of its mill, a second story, 30 x 225 feet, is being erected over the braiding room on the western side for the purpose of installing new braiding machines. Additional machinery is also being installed to take care of the demand for molded hose, which, when in place, will increase the daily capacity to about 125,000 feet.

At the thirteenth annual meeting of the Electrical Contractors' Association of Wisconsin, held in Milwaukee, January 17, 18 and 19, Henry A. Mors, vice-president of the Simplex Wire & Cable Co., read a paper on "The Manufacture of Insulated Wires and Cables," which was illustrated with motion-pictures and lantern slides.

In the announcement of promotions and changes in office and factory staffs of the Standard Underground Cable Co.'s plant at Perth Amboy, New Jersey, it is noted that H. W. Fisher continues as chief electrical engineer of the company, and in addition becomes manager of the lead-cable works and rubber wire and cable factories. Tracy D. Waring will be assistant manager of the lead-cable works and of the rubber-wire factory, and Albert C. Meyers will be superintendent of the rubber-wire factory.

THE NEW "USCO" TIRE.

The successful combining of rubber and fabric has never been a simple proposition, but in the new "Usco" tire it is claimed a practically perfect union has been effected and that the plies of fabric are so unified by the rubber that they cannot possibly separate.

This new tire, which has been subjected to the most severe tests, is adapted for use on small or large cars. The very attractive tread design is said to offer protection against skidding. The letters "U," with their curves and angles, grip and cling to the slippery roads. From the illustration it may be seen that the tread rubber is of unusual thickness, which feature adds to endurance and mileage. The company will also offer to the trade this season a new high grade cord tire under the name of "Royal Cord." [United States Tire Co., New York.]

THE MATTSON HAND-MADE TIRE.

The Mattson Rubber Co., one of the oldest rubber manufacturing companies in the United States, began chiefly as a druggists' sundries concern. From time to time it has, however, added other lines. One of its specialties today is the Mattson hand-made tire. The illustration shows the depressed type of non-skid used. This tire adds one more to the large list of distinctive American motor tires. [Mattson Rubber Co., Lodi, New Jersey.]

THE SIMMONS TIRE.

A new tire known as the "Simmons" promises to interest owners and manufacturers of auto trucks.

As will be seen in the accompanying illustration, this tire is made up of cylindrical rubber blocks, held in place by flanges and by rough-faced steel forgings that are tightly bolted through the rim of the wheel. After the rubber cylinders have shown wear, the bolts holding the forgings are loosened and the rubber blocks are turned, thus presenting a new wearing surface to the tread.

It is claimed that the rubber blocks can be turned at least six times and that each time the tire will be practically as good as new, that skidding is overcome and that better traction is obtained than with a dual tire. Each tire is guaranteed for 30,000 miles. [Modern Railway Appliances Co., Albany, New York.]

SMALL TIRES IN THE MOTOR INDUSTRY.

The tendency toward lighter weights in automobile construction is reflected in the reduced size of tires. The "Automobile" finds that, taking the average for all cars, the nearest regular tire size corresponding to this average figure is now 33 x 4 1/2 inches. In 1910 and 1911 the average size was 34 x 4 inches. This increased until 1914, when the average was raised to 35 x 4 1/2 inches. Since then it has declined.

NEW BUILDINGS OF THE FISK RUBBER CO.

THE three new buildings of the Fisk Rubber Co., Chicopee Falls, Massachusetts, mention of which was made in the last issue of THE INDIA RUBBER WORLD, are illustrated in the photographs reproduced herewith. These buildings all lie on the tract of land situated between Grove street and the railroad and bring the total number of buildings comprising the plant up to 20.

The administration building, of impressive appearance, is built of stone and tapestry brick and contains 70,000 square feet of floor space.

The five stories and basement of the new mill building have 388,800 square feet of floor space. This is said to be one of the best lighted mill buildings in New England. More than 90

continuing as assistant superintendent. E. A. Krannich, who is superintendent of the Columbia Tire & Rubber Co., Columbiana, Ohio, which company is composed of the same stockholders and directors as the Mansfield company, will have charge of the "compounds" of both organizations. Mr. Krannich will be assisted at the Mansfield plant by A. J. Bethea, chemist.

The Universal Rim Co., Chicago, Illinois, has removed from 1301 to 1502 Michigan avenue, increasing its floor space about five times that previously used.

We are informed by the Akron Tire Co., Inc., Philadelphia, Pennsylvania, that the decision concerning the use of this name by a New York company operating in Pennsylvania, recorded in the December, 1915, issue of THE INDIA RUBBER WORLD, has been reversed. At a final proceeding before Judges Shoemaker, Pat-

NEW BUILDINGS OF THE FISK RUBBER CO.

per cent of its exterior surface is made up of windows fitted with prism glass, and four fire towers afford an unusual safeguard for the employees. The storehouse, which is also equipped with fire towers, sprinklers and prism glass windows, has half of the floor space of the new mill building. Tunnels connect it with the adjacent buildings, and a spur track on the south side will facilitate the handling of freight.

TRADE NOTES.

A new building is being erected for the Detroit, Michigan, branch of the Firestone Tire & Rubber Co., Akron, Ohio. It is to be a four-story structure, 181 x 300 feet, located at Woodward and Canfield avenues, and is expected to cost between \$30,000 and \$50,000.

The floor space of the Omaha, Nebraska, branch of the Goodyear Tire & Rubber Co., Akron, Ohio, is being increased to about 14,000 square feet. Last spring, when the branch first moved into its present quarters, it occupied about 5,000 square feet of floor space. A credit and a mechanical rubber goods department have been established.

The Norwalk Tire & Rubber Co., Norwalk, Connecticut, has purchased the land and buildings of the Norwalk Woolen Mills Co. at Winnipauk, a suburb of Norwalk, and reports selling its unused preferred stock, amounting to \$300,000, thereby securing a total working capital of \$500,000.

The Goodyear Tire & Rubber Co. of Canada, Limited, Toronto, Canada, has recently purchased 27 acres of land in New Toronto, about seven and one-half miles from the center of the city of Toronto. The company plans to build a new plant on this property for the manufacture of tires, continuing the plant now in operation at Toronto for manufacturing mechanical goods.

Several changes have been made in the factory management of the Mansfield Tire & Rubber Co., Mansfield, Ohio, owing to the resignation of George McConnell, formerly superintendent. Garth A. Dodge, a man of experience in the tire business, who has acted as mechanical engineer at the plant for the past eighteen months, had been appointed superintendent, George Whalon con-

tinued as assistant superintendent. E. A. Krannich, who is superintendent of the Columbia Tire & Rubber Co., Columbiana, Ohio, which company is composed of the same stockholders and directors as the Mansfield company, will have charge of the "compounds" of both organizations. Mr. Krannich will be assisted at the Mansfield plant by A. J. Bethea, chemist.

The Fisk Rubber Co. has opened a branch at 1313 New York avenue N. W., Washington, District of Columbia.

The Chester Rubber Tire & Tube Co., Chester, West Virginia, will receive bids in March for a plant to cost \$720,000. Three structures will be included, one 50 x 170 feet, another 40 x 75 feet, and the third 42 x 75 feet.

The Tubeless Tire & Rubber Co., Millersburg, Ohio, the notice of whose incorporation appears elsewhere in this issue, will make the King tire, which is claimed to be punctureless and which will be sold with a guarantee of 8,000 miles. The company expects to have employment for 100 men at the start, and an output of at least 100 tires a day. The officers are as follows: W. R. Price, president; O. J. Hicks and G. B. Helmuth, vice-presidents; G. A. Jordan, secretary and treasurer; C. T. Rood, assistant secretary; John Lemmon, assistant treasurer.

THE STANDARD FOUR IS MANUFACTURING TIRES.

The Standard Four Tire Co., Keokuk, Iowa, whose incorporation was mentioned in the October, 1915, issue of THE INDIA RUBBER WORLD, began operations on January 3. The company has erected a modern factory building which has been equipped with the latest tire-making machinery. It purchased its mill equipment from the Birmingham Iron Foundry, Derby, Connecticut, and its mold equipment and vulcanizers from the Adamson Machine Co., Akron, Ohio.

The officers are as follows: J. R. Beaver, president; C. F. McFarland, vice president; A. L. Higbee, secretary; E. A. French, treasurer, and W. J. Richards, formerly with the Jonesboro Tire & Rubber Co., Jonesboro, Indiana, general manager. The other directors are H. S. Charles and C. M. Rich. R. H. Sotherland, formerly factory manager of the Mansfield Tire & Rubber Co., Mansfield, Ohio, is superintendent, and has associated with him a number of practical men from Akron, who have charge of the different departments in the new plant.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

BUSINESS continues good in nearly all lines of rubber manufacture. The clothing men are not taking many orders just now, but their factories are running full time on orders and some overtime. Mechanicals are in pretty good demand, but really are busier than usual at this season of the year.

Footwear people have more business on their books than ever before at this particular season. The call for tennis goods has been unusually good, and while the withdrawal of prices on the 21st had a tendency to hold back orders, the manufacturers are confident of a big season's business. Drug sundries are being called for. Tires are being made in many cases to full capacity of the factories, and the advance of 10 per cent seems to have stimulated rather than retarded business.

* * *

The United States Rubber Co. will remove its Boston offices about March 1. It has leased the entire five-story building, 130 Essex street, corner of Columbia street, recently vacated by the Singer Manufacturing Co. Extensive alterations are in progress at this writing, which will greatly alter and improve the front of the building. The interior is being thoroughly modernized and arranged to house the footwear department on the first floor, while the four upper stories will be occupied by the clothing department in charge of N. Lincoln Greene.

The building is so close to the present offices of the footwear department and which until recently was the salesroom of the American Rubber Co.'s clothing sales department, that old customers will easily find it, while the patrons of the Stoughton Rubber Co. find it right in the heart of the ready-made clothing section and much more central than the old headquarters of that company on Summer street extension.

The contemplated consolidation of the Stoughton Rubber Co. with the clothing department of the American Rubber Co. has been consummated under the name of the American Rubber Co. The officers are: Lester Leland, president; Ira F. Burnham and N. Lincoln Greene, vice-presidents; H. H. Nance, treasurer; Homer E. Sawyer, general manager. N. Lincoln Greene will be manager of the clothing department, E. H. Hicks serving as assistant manager.

* * *

The Stoughton Rubber Co. has for years been the New England agents for the New York Belting & Packing Co. Now the latter company has decided to operate a branch store at 65 Pearl street, Boston, similar to the branches in several other leading cities. Fred J. Pickard has been appointed manager, and is now overseeing the changes to fit the new premises for the incoming stock. Mr. Pickard started with the Stoughton Rubber Co. 20 years ago and for 16 years has sold mechanicals in this territory.

* * *

The dedication of the new building added to the plant of the Apsley Rubber Co. at Hudson took place New Year's eve, when nearly 2000 employees and their families were entertained royally. This new factory building of 40 x 192 feet was given over for the occasion. Each floor was profusely decorated with bunting, evergreens and electric colored lights. A floor each was used for games, a musical and dramatic entertainment, refreshments, and a grand ballroom. Music was supplied by a band, an orchestra and a concert company. In every way the arrangements were carried out in the liberal manner which has always characterized Mr. Apsley's entertainments for his employees. The disappointment of the evening was that Mr. Apsley was unable to participate, as he was confined to his room at the Waldorf-Astoria, New York, where he has been ill with the grip for over a month. At present writing, however, he has so far recovered that he is expected to return to Hudson almost any day.

We shall soon have, in Massachusetts Bay, the largest crude oil motor yacht yet constructed in this country. This yacht is being built for Arthur H. Marks, vice-president of The B. F. Goodrich Co., Akron, O., and will measure 151 feet on the water line, 22 feet beam, and 7.6 feet draft. It is of steel construction and will have ten spacious staterooms for the owner and guests, besides ample accommodations for the crew. On the deck are located the dining, chart, music and smoking rooms. The motors are designed to develop 750 H. P. and the fuel tank capacity is sufficient for a trip across the Atlantic and return.

Mr. Marks is a yachting enthusiast and a member of the Eastern Yacht Club.

* * *

J. H. Learned, for the last 14 years sales manager of the Revere Rubber Co., will hereafter confine his efforts entirely to a few of the specialties of the company, turning over the general sales management to Walter B. Rigdon, who comes here from the San Francisco office. Previous to his going to the Pacific coast Mr. Rigdon was in the Pittsburgh office of the company.

The Revere Rubber Co., which is now occupying a portion of the office floor of the United States Rubber Co., will remove about March 1 to larger quarters.

* * *

Richard H. Rice, General Electric Co., Lynn, is president of the Associated Industries of Massachusetts, an organization recently formed for the purpose of studying proposed legislation affecting the industrial prosperity of the state and promoting beneficial measures. William H. Gleason, Revere Rubber Co., Chelsea, is president of the executive council, and Harry G. Fisk, Fisk Rubber Co., Chicopee Falls, and George E. Hall, Boston Woven Hose & Rubber Co., Cambridge, are members of the executive committee.

* * *

The new year brought substantial recognition to some two hundred employees of the Boston Woven Hose & Rubber Co., who had served the company for from 10 to 35 years. These workers assembled in the Cambridge works on New Year's afternoon and received gold coin to the total value of several thousand dollars, that was distributed according to length of service to those on the honor list. Addresses were made by J. W. Fellows, factory manager; Henry B. Sprague, treasurer, and George E. Hall, vice-president and general manager.

The annual election of officers of the Boston Woven Hose & Rubber Co. Mutual Benefit Association was held on December 13 with the following results: W. A. Briggs, president; W. H. Nolan, vice-president; George A. Mather, financial secretary; William Burgess, treasurer; Joseph I. Taylor, recording secretary; William G. McCarthy, Edward Butcher, F. R. Rowe, Thomas Gormley, J. C. Long, Charles Lavery and Jack Kelley, directors. The organization was started but little more than a year ago, has over 600 members, no obligations, and over \$1,000 in the treasury.

In recognition of 25 years of service with the Boston Woven Hose & Rubber Co., a dinner was recently tendered to John E. Laffey, a department head, by officers of the company, department heads and other business friends. He was presented with a gold watch and chain as a token of esteem from his associates.

* * *

In the United States District Court Judge Morton has appointed John E. Eaton and Louis A. Frothingham receivers of the Columbia Rubber Co., upon a petition filed by Stoneman, Gould & Stoneman. The bonds were fixed at \$9,500. Mr. Eaton was suggested by David Stoneman as a result of agreement of attorneys representing various creditors. Mr. Frothingham was the choice of Judge Morton.

* * *

The Peerless Rubber Co., which has been represented in Boston by the Enterprise Rubber Co. and later by the United States Rubber Co., will open its own branch store in this city

about the middle of February. It will also take the agency for New England of the Mechanical Rubber Co., of Cleveland. R. J. Barker, formerly with the Enterprise and United States companies, will be manager of the new branch.

W. E. Barker, manager of sales of the United States Rubber Co., addressed the members of the National Association of Shoe Wholesalers, at its luncheon incident to its annual meeting and election, at the Copley Plaza Hotel on Friday, January 14.

Francis H. Appleton, of the rubber reclaiming firm bearing his name, will spend the month of February at Miami, Florida.

Mr. Alexander, formerly in the efficiency department of the Tyer Rubber Co., Andover, Massachusetts, has resigned from that position to accept a similar one with the Apsley Rubber Co., Hudson, Massachusetts, where he will make a thorough investigation into costs of production, methods of manufacture, and plan for greater efficiency throughout the factory.

The Tyer Rubber Co. reports a steadily increasing demand for its new soling material, "Leatherex." One particularly striking advertisement shows a picture of a sportsman on skis "leaping into popularity," the skis being represented as exaggerated specimens of "Leatherex" soles, with the trade-mark on the bottom.

Howard B. Clifford, who for several years was in the Boston office of the United States Rubber Co., was married on Christmas day at St. Paul's church in Malden to Miss Iola G. Smith. He has been transferred to the Minneapolis, Minnesota, branch of the company.

The Kelly-Springfield Tire Co. is now located in its new branch and service station at 698 Beacon street.

Edward F. Bragg, of the Alfred Hale Rubber Co., who has been confined to his home by a long period of illness, is said to contemplate retiring from the treasurership of that company in the interest of his health.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE rubber factories throughout Rhode Island are so busy that the usual annual January vacations were passed and present indications are that it will be some time before any of the plants will be closed down excepting for necessary overhauling and repairing. One of the greatest drawbacks that the concerns are experiencing is the decided shortage of help which is becoming so serious that some superintendents are considering what they are going to do to keep pace with the demanded production. There is an exceedingly heavy call for all kinds of rubber goods that is constantly increasing.

Business has increased to such an extent at the several manufacturing plants at West Barrington, including the International Rubber Co., that enlarged railroad facilities have become necessary. Recently the New York, New Haven & Hartford Railroad, in response to the request of these concerns, lengthened sidings at the West Barrington freight yard several hundred feet, to admit of improved loading and unloading facilities. Now the increased output makes further extensions obligatory.

The Revere Rubber Co. has recently completed the installation of a Boland automatic sand blast at its plant on Valley street, Providence, by H. J. Astle & Co. This piece of machinery was specially designed for the Revere company and it is to be used for sand blasting steel automobile truck rims, making them perfectly smooth so as not to cut the rubber tires. The new machine, which removes the rust and imperfections from the rims more quickly than was formerly done, is double, each side being fitted with a spool to take the different sizes of rims. The rims

are revolved in order that every portion of the face may come into contact with the blowing sand, which operation is done entirely within the machine.

Although this sand blast has been in operation but a short time, the Dunlop Rubber Co., Limited, of Birmingham, England, has placed orders for a number of similar machines, the first shipment of which was made about the middle of the past month. Other shipments are to be made later to several of the Dunlop factories throughout Europe. These sand blast machines are 14 feet long by 4 feet wide and 8 feet high. A Boland four-cylinder blower is used to supply the blast to each machine.

The factory of the National India Rubber Co., at Bristol, did not have the usual January shut-down this year on account of the pressure of business. The plant was recently closed from Friday afternoon until the following Monday morning, during which necessary repairs were made to machinery. During the past few weeks considerable new machinery has been installed, including stitching, eyelet and stenciling machines.

Several hours are taken up each night in making up freight trains of rubber goods at the yards of the New York, New Haven & Hartford Railroad.

Colonel Samuel P. Colt, president of the United States Rubber Co., who reached his sixty-fourth birthday on January 10, entertained a few friends at his home, Linden place, Bristol, that evening in honor of the event.

Theodore Wood, for the past two years agent of the American Yarn Co., at Pawtucket, has removed to Akron, Ohio, where he has accepted a position as head of the textile department of The B. F. Goodrich Co. Before coming to Pawtucket he was an official at the Dartmouth Mills, New Bedford, Massachusetts.

Jefferson F. Galvin, for several years foreman of the calendaring department at the National India Rubber Co., Bristol, but now engaged in a responsible position with a rubber concern in Watertown, Massachusetts, is at his old home in Bristol, convalescing from a serious illness.

The Hill & Lacrosse Co., manufacturer of elastic webbing materials, Howard, because of increasing orders, is erecting a one-story addition to its plant. The new structure is 83 feet in length by 27 feet wide.

The Co-operative Auto Supply Co. has removed from 134 to 166 Washington street, corner of Empire street, Providence, where they are specializing in Racine tires.

The Republic Tire agency, Frank Glover, proprietor, formerly located on Washington street, has moved to larger quarters in the new building, 165 Empire street, Providence.

A contract has been given for a lounging and rest room to be fitted up at the plant of the Phillips Insulated Wire Co., Pawtucket.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

TIRE and accessory manufacturers are deeply interested in the automobile show to be held in the Trenton armory some time in the month of February. Arrangements will be made with automobile dealers in a number of surrounding counties to co-operate in making the show a success. R. V. Kuser is chairman of the committee in charge of the preparations. In this connection it may be interesting to state that there are more than 90,000 motor cars in use in New Jersey, of which about 79,000 are passenger cars and about 11,000 are trucks.

Work has been begun on a three-story tire-making wing for the Ajax Rubber Co., Inc., which will be 250 x 350 feet in size, with foundations built to hold additional stories. Rapid progress is being made on the additions to the vulcanizing works. A new

power house, with stacks, boilers, engines and dynamo units is to be erected, and equipment for the new rubber mill is now being built. By early spring it is expected that all the buildings will be completed, thus increasing the daily capacity to 5,000 tires.

* * *

The new inner tube department of the Essex Rubber Co., which has placed on the market three styles of automobile inner tubes, blue, red and gray, is said to be meeting with much success, as the demand for the goods is steadily growing.

The Eagle Rubber Cement Co. has been acquired by the Essex, and the cement is now made at the Essex plant. Adolph Biller, former head of the Eagle company, is directing the manufacturing of this cement at the Essex factory. The cement is one item in the line of automobile accessories which the company will push this season.

* * *

The Mercer Rubber Co. is erecting a large water tank to supply its recently installed automatic sprinkler system. This tank, which will be 125 feet high, will hold 80,000 gallons of water. About \$15,000 is being expended in installing the system.

* * *

The automatic sprinkler system of the Vulcanized Rubber Co., at Morrisville, probably saved that plant from a bad fire recently. The blaze started from an unknown cause in the carpenter shop, and the prompt operation of the sprinklers extinguished it before anyone learned there had been a fire.

* * *

The Lake Ruth Manufacturing Co., at Spotswood, making a line of druggists' sundries, lost its plant by fire January 5. Crossed electric light wires are said to have started the blaze. Dr. J. G. Donelsbeck, of Trenton, is one of the principal stockholders in the company, which, it is said, was rushed with orders. No announcement as to the rebuilding of the plant has yet been made.

* * *

The Mecca Tire Co. has begun operations in its newly acquired plant on Mulberry street. Goods are now being turned out in a limited way, but the installation of additional machinery will shortly enable the firm to greatly increase its output.

* * *

The Thermoid Rubber Co. began night work this week. The plant is unusually rushed with orders, and prospects for the coming season are considered most encouraging.

* * *

During the last month, since the evangelist arrived in Trenton, practically all of the rubber factories have had "Billy" Sunday services at the noon hour, which has generally been extended for the purpose.

* * *

The claim of Mrs. T. A. Foley for damages under the New Jersey Workmen's Compensation Law for the death of her husband, an employee of the Home Rubber Co., who lost his life on the "Lusitania" while on his way to the London office of the company, was dismissed by Judge Marshall in the Mercer county court. Mrs. Foley is making a further effort to obtain damages from the company, and the matter will probably be tried at the February term of the Supreme Court.

* * *

General C. Edward Murray, of the Empire Rubber & Tire Co., has been named by the Trenton Chamber of Commerce as a member of a special committee to consider the proposed establishment of a commission to work in conjunction with the permanent tariff commission.

* * *

Clifford H. Oakley, president of the Essex Rubber Co., is enjoying a vacation in Cuba.

* * *

Alfred Whitehead, secretary of the Whitehead Bros. Rubber Co., has been chosen a director of the Trenton Banking Co., to

take the place of the late William S. Hancock, who, it will be recalled, was also identified with the rubber business.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

AKRON is suffering from a severe case of "growing pains." The city limits have been extended. Real estate activity is unprecedented. Building cannot keep pace with the demand for houses occasioned by the arrival of factory workmen and their families anxious to share in the opportunities afforded by the mammoth industrial expansion now in progress.

* * *

It is reported that the Firestone Tire & Rubber Co. is interested in the half-million dollar Coventry Land & Improvement Co. recently incorporated, Robert F. Todd and John F. Rowe, of the general offices of the Firestone company being among the incorporators. It is expected that the two tracts of land owned by the rubber company, which would provide building lots for 600 homes, will be developed in a manner similar to the plan of Goodyear Heights, for the benefit of the Firestone employees.

The rim plant of the Firestone company is being enlarged by the addition of a building 50 x 100 feet in size, and some remarkable figures are presented with reference to the company's business in demountable rims. During December 4,000,000 pounds of special steel were used for rims, supplied on contracts with 79 car manufacturers. It is stated that present orders and production facilities assure an output of 1,000,000 demountable rims during 1916.

* * *

The books of The B. F. Goodrich Co. have just been closed for the purpose of compiling the full annual report for the year 1915. The results are as follows, subject only to the verification of public accountants and auditors:

After making proper provision for maintenance charges, depreciation, bad debts, and other items which it was deemed wise to take out of the year's earnings, the net profits for the period amount to approximately \$12,200,000.

This amount, added to the surplus carried over as of December 31, 1914, of \$3,100,000, shows undivided profits of approximately \$10,500,000 after deducting the four quarterly dividends of 1 1/4 per cent. on preferred stock outstanding, together with a provision of \$1,100,000 for the redemption of preferred stock, and a further amount of \$1,700,000 set aside for various reserves which will be shown in detail in the annual report.

The company's financial position has again improved during the past year, as the amount of quick assets over current liabilities shows a gain of approximately \$8,100,000.

The current assets amount to approximately \$31,250,000, and the current liabilities to \$4,200,000.

At the regular quarterly meeting of the directors held on January 26 a dividend of 3 1/2 per cent. was declared on the preferred stock, payable 1 1/4 per cent. April 1 and 1 1/4 per cent. July 1. A quarterly dividend of 1 per cent. was declared on the common stock, payable February 15, 1916.

The directors voted to retire 7,000 shares of preferred stock prior to July 1, 1916. This makes a total retirement of 27,000 shares covering the charter provision for retirement of preferred stock up to July 1, 1916.

While the directors are highly gratified over the results of 1915, they have taken into consideration that a part of the increased earnings for the year were due to causes which may not be permanent.

One contributing factor was the large increase in volume of sales compared with those of 1914, with the result that the overhead expenses consumed a smaller percentage of the gross earnings than could reasonably be expected under normal operating conditions from year to year.

In addition to this, purchases of crude materials during the past year were rather more fortunate than usual.

These conditions may or may not prevail in the future and the directors are not disposed to base the dividend policy of the company upon results that might prove to be temporary in character.

While the company has done its share of the so-called war business, the total amount exported direct and through customers has probably not exceeded 5 per cent. of the total gross business of the year.

A new garage is being built by the Goodrich company, 169 x 315 feet in size, and six stories high. Hugh elevators will be installed, making possible the use of the first two floors as a garage both for company and employees, who own over 600 automobiles, valued at about \$600,000. The upper stories of the garage will be used as service stations and workshops.

The boot and shoe salesmen of the Goodrich company held their annual convention at the Akron plant during the last few days of December. Nearly 200 were present.

The Goodrich company has issued a public challenge, declaring itself willing to throw open its books and records to an independent audit company in order to prove that it manufactures more auto and truck tires combined than any other concern in America.

The new Diamond tires are made of "Velvet-Rubber," a recently developed rubber composition for which exceptional qualities are claimed.

* * *

The annual meeting of the Portage Rubber Co., Barberton, Ohio, was held on January 4, at 10:30 a. m., followed by a luncheon for the stockholders that was served in a recently completed addition to the plant.

By vote of the stockholders the number of directors was reduced from ten to eight, and the following directors were elected for 1916: James Christy, M. S. Long, W. W. Wildman, John Kerch, J. D. Raw, Fred H. Snyder, Dr. O. S. Welty and David Reed. The directors elected as officers, James Christy, president; M. S. Long, vice-president; W. J. Anderson, secretary, and W. W. Wildman, treasurer and general manager. A quarterly dividend of 1 1/4 per cent. was declared on the common stock. Following is the condensed statement of the company, covering the period from December 1, 1914, to December 1, 1915:

ASSETS.

Cash on hand and in bank.....	\$60,184.56
Notes receivable.....	43,940.72
Accounts receivable.....	206,756.09
Stock on hand (raw and finished).....	284,842.36
Real estate, buildings and machinery.....	337,979.97
Patents, trade marks, patents and good will.....	496,000.00
All other assets.....	15,536.76

\$1,445,240.46

LIABILITIES.

Accounts payable (pay roll not due).....	\$10,806.57
Reserve fund (depreciation).....	6,992.77
Capital stock (preferred).....	750,000.00
Capital stock (common).....	500,000.00
Surplus.....	177,441.12

\$1,445,240.46

Total sales for year 1915.....	\$1,067,858.30
Total sales for year 1914.....	661,848.53
Increase in volume 1915 over 1914.....	61.35
Total profits for year 1915.....	129,085.76
Total profits for year 1914.....	88,102.13
Increase per cent. of profit.....	46.45

Since this statement was made the item of trade-marks, patents and good will has been reduced to \$396,000 by taking \$100,000 from the surplus.

* * *

The Goodyear Tire & Rubber Co. has established a plan of retirement awards by which provision is made for stated monthly payments for life to men employees who have reached the age of 70, and women who have reached 65. There is also a condition under which old employees may retire, with awards, under the age limits mentioned. A group insurance plan has been in-

augurated, which allows an insurance policy for \$1,000, free of all cost, to any employee who is or becomes a member of the Goodyear Relief Association, a Goodyear institution of long standing which provides sick and disability insurance.

In order to keep up with orders, it is necessary for the Goodyear factory to work every hour of the day and night. The problem of night work has been met by introducing a six-hour shift and a bonus system for the special force of men who are to work during the hardest part of the night, from midnight to six a. m. This force will work permanently at night, and in return will gain a bonus of 40 per cent. of the amount earned in the six hours of labor.

A unique feature of the Goodyear factory is a large tire-finishing room where the sound of a human voice is rarely heard. The 60 men in this department—said to be the only one of its kind in the city—are all deaf-mutes, and it has been found that they are more skillful in lines of work that require keen sight and quick observation than men who can voice their speech.

The carriage tire department and the fire truck department of the Goodyear company have been combined under one head and placed in charge of F. H. Sawyer, who has had charge of the fire truck department.

* * *

The Adamson Machine Co. will manufacture practically all of the machinery and equipment to be installed in the new plant of the Gillette Safety Tire Co., Eau Claire, Wisconsin.

* * *

The Miller Rubber Co. is to add to its plant an eight-story building, 110 x 175, and a three-story building, 80 x 135 feet, construction of which will begin in the spring. Facilities for the company's manufacture of toy balloons have been increased.

Stockholders of the Miller company have been offered the right to subscribe to \$500,000 worth of stock in the company to the extent of 50 per cent. of their holdings. This stock has been held as treasury stock and is now to be sold.

* * *

The addition to the plant of the Star Rubber Co. mentioned last month will comprise a three-story building 70 x 100 feet. This company has been making automobile sundries and is now to begin the manufacture of tires.

* * *

The Mohawk Rubber Co. has doubled its capital stock, which is now \$500,000.

* * *

The first official meeting of the McLean Tire and Rubber Co., Cleveland, Ohio, was held on January 22. The following officers were elected: John C. McLean, president; W. B. Davis, vice-president, and T. J. Holmden, secretary and treasurer. This organization has purchased the building and equipment of the Morgan & Marshall Rubber & Tire Co., East Liverpool, Ohio, and will commence operating the plant early in February.

* * *

The Keystone Rubber Manufacturing Co., Inc., Erie, Pennsylvania, is making the "Keystone Universal" inner tube, in black with a red reinforced rim strip adapted for either 30 x 3 or 30 x 3 1/2-inch Ford tires.

* * *

The Aluminum Flake Co., with offices in the Ohio Building, Akron, Ohio, has recently completed its new factory on East High street, Barberton, Ohio. The building is 76 x 96 feet. A new drying process and a line of up-to-date machinery have recently been installed.

* * *

The General Rubber Manufacturing Co., mentioned last month, has changed its name to the General Tire & Rubber Co., and is now making tires and tubes at the daily rate of 400 and 1,000, respectively, as well as a large output of tire accessories.

* * *

F. A. Seiberling, president of the Goodyear Tire & Rubber

Co., was one of the 11 men, nationally prominent, who were chosen directors of the World Court League, with the object of ending of war through arbitration.

Ralph Upton, head of the balloon department of the Good-year company, sailed for Europe on January 18, officially representing the Ohio National Guard as special observer of military aeronautics.

Walter W. Price, who is connected with The B. F. Goodrich Co., has been appointed a national deputy, with rank of major, on the staff of General H. Oden Lake, national commander of the Army and Navy League.

John Herron is now associated with the Akron office of Henderson & Korn, assisting H. H. Henderson.

H. A. Price, formerly with The B. F. Goodrich Co., and the Kelly-Springfield Tire Co., has been appointed sales manager of the tire division of the Rubber Products Co., Barberton, Ohio.

H. T. Keating, representing W. R. Grace & Co., dealers in crude rubber, New York City, has recently opened an office in Akron.

W. Armour Johnston, Jr., until recently in charge of rubber manufacture at the Staten Island factory of the S. S. White Dental Manufacturing Co., has accepted a position with the Miller Rubber Co., Akron, Ohio.

WESTERN TRADE NOTES.

THE accompanying illustration shows the plant of the Dry Climate Tire Manufacturing Co., Arvada, Colorado, mentioned in the November, 1915, issue of THE INDIA RUBBER WORLD. At a recent meeting of the directors, E. A. Austin, of Boulder, was chosen president in place of C. W. Clark, resigned; A. L. Davis, of Arvada, vice-president, and W. H. Davis, of Fort Lupton, secretary and assistant treasurer. John F. White, of

less, who has been in charge of the San Francisco territory, is now manager of the northern district, including Oregon, Washington, Idaho and Wyoming. C. O. Mars has been given full charge of the central district, comprising all the territory in California lying north of Bakersfield, and R. L. Sargeant is promoted to the head of the southern district, which comprises the remainder of California and Arizona.

Silas H. Jenkins has become the Western manager of the New York Mackintosh Clothing Co. Mr. Jenkins will make his headquarters in the Lytton Building, Chicago, Illinois. Besides directing the sales force in the Western territory, he will personally cover the Central West, Southwest, Northwest and Pacific Coast. Mr. Jenkins is widely known throughout this territory and the South, where he has a host of friends who will no doubt help to make his new position a profitable one.

SILAS H. JENKINS.

Irwin Reed, formerly manager of the Los Angeles branch of the Republic Rubber Co., Youngstown, Ohio, has been appointed president of the Republic Rubber Co. of California.

Tom Wilkenson, formerly Los Angeles manager for the United States Tire Co., New York City, has been made manager of the San Francisco branch, which is the Pacific Coast headquarters of the company, and also controls the Hawaiian and Oriental trade. H. A. Farr, who has been with the United States Tire Co. for many years, will assume managership of the Los Angeles branch.

MOLDED OR FORMED INSULATION SECTION.

The Molded or Formed Insulations Section of the Associated Manufacturers of Electrical Supplies was organized on December 8, 1915, with the following officers: E. B. Hatch, Johns-Pratt Co., Hartford, Connecticut, chairman; R. W. Seabury, Boonton Rubber Manufacturing Co., Boonton, New Jersey, secretary, and Joseph Steinberger, General Insulate Co., Brooklyn, New York, treasurer.

Standing committees were appointed with the following chairmen:

Molded Rubber Insulation: Philip H. Campbell, American Hard Rubber Co.

Fibre Insulation: E. M. Grant, American Vulcanized Fibre Co.

Suspension and Third Rail Insulation: Lonis Steinberger, Electroase Manufacturing Co.

High-Heat Molded Insulation: J. G. Miles, Westinghouse Electric & Manufacturing Co.

Molded Composition Insulation: C. F. Siemon, Siemon Hard Rubber Co.

Miscellaneous Insulation: H. S. May, General Bakelite Co.

At a meeting held on January 12 at the Biltmore, the following subcommittee on Molded Rubber Insulation was appointed: R. W. Seabury, Boonton Rubber Manufacturing Co., Boonton, New Jersey; McConnell Shank, The B. F. Goodrich Co., Akron, Ohio; and C. D. Wilson, Luzerne Rubber Co., Trenton, New Jersey.

FACTORY OF DRY CLIMATE TIRE MANUFACTURING CO.

the First State Bank of Arvada, is treasurer, and William J. Kreuder factory manager.

The Federal Rubber Manufacturing Co., Cudahy, Wisconsin, has opened a direct factory branch in Seattle, Washington, at 1921 Fifth avenue. F. B. Bloom, well known in the tire business on the Pacific Coast, is in charge of the branch.

B. H. Pratt, known through the Pacific Coast territory as factory representative for the Fisk Rubber Co., Chicopee Falls, Massachusetts, has been elected vice-president and general manager of the Federal Rubber Manufacturing Co., Cudahy, Wisconsin, whose recent acquisition by the Fisk company was noted in the January issue of THE INDIA RUBBER WORLD. D. E. Bay-

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE rise in price of rubber to 4s. per pound is naturally a topic of much discussion in trade circles, though one does not hear so much about rigging the market as was the case when the advance commenced. Shortage of the commodity in hand and uncertainty as to the further effect of enemy submarines have led to a rush of buying orders from manufacturers, not only in this country, but also from America and Europe.

No figures are available as to the amount of rubber lost at sea, no details having appeared in the press, and it is quite possible that the amounts referred to in trade circles are exaggerated.

So far the rise in price of raw rubber has not been reflected in the scrap and reclaimed markets or only to a trifling extent. Of course the reclaimers are not grumbling at the altered state of affairs, which will certainly lead to increased business.

Though there has naturally been some increased activity in plantation shares in the market, it has not amounted to anything like a boom and very little speculation is being indulged in by those who at one time were always discussing the subject. Extra taxation has limited the amount of money available for investment and then there is the excess profits tax on the companies to check fabulous dividends.

Naturally, with the advent of conscription, though in a somewhat modified form compared with continental countries, the labor question tends to become more acute. The local tribunals will shortly have to decide which particular employees of rubber works are indispensable for the business, and their verdicts are being awaited with considerable interest.

No doubt we shall shortly have a general increase in the price of rubber goods, but at the time of writing the only notification I have to this effect is from The B. F. Goodrich Co., Limited, of London, announcing that owing to the general increase in costs they are reluctantly compelled to make a 10 per cent. advance on all mechanical, druggists' and cycle sundries from January 1.

The greatly increased cost of freight across the Atlantic must of course affect the American business, and will act as a set off to our increased cost of labor and coal.

The case of the Daimler Co., Limited, against the Continental Tyre & Rubber Co. (Great Britain), Limited, is to be heard before the House of Lords shortly. The divisional court and the appeal court have held that the Continental is a British company with corresponding rights, despite the fact that all the directors and practically all the shareholders are enemy aliens, and it is sought to have this decision upset. Considerable interest is taken in the case within and without rubber circles.

Many notices have appeared in the press regarding synthetic rubber in Germany. From what I can gather the position is much what it was three or four years ago when motor tires were made of it—at a cost.

The Bayer company is reported to be spending £100,000 on a plant for the manufacture, but it is difficult to conceive how this can pay when the natural product is again available in bulk. The case is on the same lines as cracking petroleum for toluol. This can be and is being done to supply a shortage, but at a cost which would be entirely prohibitive except in war time. Still, with regard to synthetic rubber, one cannot but acknowledge the great discoveries which have been made by German chemists in various fields, and the war is undoubtedly proving a spur to greater activity in the laboratory.

OILSKINS.

One of the latest developments is the trench stocking, which is retailed at 4s. 11d. the pair, obviously for use at the front. It

comes into direct competition with last year's novelty, the trench stocking made of thin waterproofed cloth similar to fishing stocking material and intended to be worn in conjunction with woolen socks and leather boots.

Regarding oilskin stockings, it may be interesting to note that the experimental work as to their suitability has been done by Professor Delcpeine, of the Public Health Laboratory, Manchester University, the experiments in the manufacture of the goods being carried out by Messrs. Storey, of Lancaster, the original makers of oil baizes for table use.

It will be interesting to see how the oilskin competes in practice with the more expensive rubber. Oilskin hats and hat covers for ladies have come into favor recently.

INDUSTRIAL POISONS IN RUBBER MANUFACTURE.

The communication under this heading in the December issue of THE INDIA RUBBER WORLD has been read with much interest.

All said and done the rubber worker who takes any care of himself and is intelligently supervised has only one real enemy, and that is carbon disulphide. It is satisfactory to find that its very insidious and malevolent nature is now recognized in all civilized countries and its use is mostly under government control through the medium of factory acts. Very different was the state of affairs at the distant period which my memory can recall when the only precautions taken had reference to danger from fire and not to the employees' health.

The cold curing of waterproof cloth having been largely superseded by the dry-heat process, has left the dipping room, where small articles were cold cured, the main theatre for reform, and I must say that the present conditions in works I have visited in Britain and in Germany show a vast improvement on those of the "bad old days."

The American report refers to the danger of carbon tetrachloride. In this case the toxic effect did not come into notice in England until a lady of position died from the effects of its application in a hairdressers' establishment, the result being an inquiry and special regulation. Much the same may be said of the new solvent tetrachlorethane, which after two or three deaths of workmen has now been declared to be much more dangerous than chloroform.

These cases seem to suggest that a more humanitarian method of procedure would be to have new chemicals for manufacturing processes officially examined for toxic properties before they are passed for use instead of waiting for inquests. I am all the more inclined toward this opinion on account of a suggestion in THE INDIA RUBBER WORLD that now is the time for the inventive mind to bring forth new compounding ingredients for the rubber trade to replace those which the war has rendered either unprocurable or unsuited to the modest purse.

Returning to the report it is stated that the two most dangerous poisons are encountered in the acid or cold cure and in the vapor cure. This is modified by saying that the sulphur chloride itself is not really dangerous, being merely an irritant. This then should absolve the vapor cure—where the chloride is vaporized by heat and not by mineral acid—because carbon disulphide is not used in the vapor cure as evolved and practised in this country.

NEWS PARAGRAPHS.

An explosion of naphtha vapor occurred on a foggy morning in December at the proofing works of Lindsay & Williams, Limited, Manchester, whereby one man was killed and another seriously injured. At the inquest the jury found that the ex-

plosion was caused by the contact of naphtha fumes from the solution vessels with naked gas jets, and recommended that all lights, whether electric or gas, be enclosed by globes and that naked lights should be prohibited.

Mr. Morton, of the laboratory staff of Pirelli & Co.'s new cable works at Southampton, has accepted an appointment at Birmingham with the Dunlop Rubber Co., Limited.

J. W. Shaw, late of the Paragon Rubber Manufacturing Co., Hull, is now director and works manager of the Pomona Rubber Co., Limited, Manchester.

The British Foreign Office has reported that out of 300 bags of parcels post mail seized on the steamship "Hellig Olav," 109 bags contained nothing but crude rubber. The estimated weight of the rubber seized was 8,000 pounds.

The Goodyear Tyre & Rubber Co., Limited, London, has recently opened a sales branch in Dublin, to take care of its increasing trade in Ireland.

OBITUARY NOTES.

The position of commercial manager at the works of the Leyland & Birmingham Rubber Co., Limited, Leyland, vacant by the death in active service of Lieutenant-Colonel Fallows, has been filled by the appointment of Mr. Pratt, late with G. MacLellan & Co., Glasgow.

Kenneth Pelmore, whose death at the early age of thirty years I regret to record, was better known to the rubber trade as Kurt Pfeleider of the well-known Peterborough firm specializing in rubber-washing machines.

Lieutenant Walter Wild, late of the Wood Milne, Limited, has suffered a severe bereavement in the death at the Dardanelles of his son, Trooper John Wild, of the North Auckland Mounted Rifles, New Zealand expeditionary force.

THE DUNLOP RUBBER CO., LIMITED, REPORT.

The Dunlop Rubber Co., Limited, reports net profits for its last fiscal year of £411,639, making, with £33,241 brought forward, a total of £444,880 [\$2,165,013]. After paying dividends on the preference and ordinary shares and writing off £175,000 [\$851,637] on real estate, plants and equipment, the net balance of £75,528 [\$367,557] is carried forward to this year's account.

To insure a constant and uniform supply of the best cotton fabrics the company has entered into arrangements whereby spinning and weaving mills of the most modern construction, operating nearly 50,000 spindles and 200 heavy looms, have been built at Rochdale, near Manchester, England, on the purchase of which the company has an option.

The directors expressed the opinion that the outlay for the new establishment at Bromford, to cost about £330,000 [\$1,605,945], and the purchase of the cotton goods mills, with the expenses entailed by the excess-profits tax law and the redemption of the balance of the parent tire debentures, can be accomplished without the issue of new capital or affecting dividends, but recommended that they should be given that power to increase the authorized preference capital from £800,000 to £1,000,000.

TRADE NOTES FROM SCANDINAVIA.

SWEDEN.

THE Liljeholmens Hampspunerei och Kabelfabrik, Liljeholmen, manufacturers of insulated wire and cables, has recently increased the salaries of its employees 10 per cent.

A new tire and general rubber goods repairing company has been incorporated in Gothenburg, under the name of Göteborgs Gummireparationsverkstad, Einar Lundström.

Victor Anderson, owner of a large belt, packing and general rubber mechanical goods business in Malmö, died recently, aged forty-three years. The business, which was founded by Mr.

Anderson in 1902, will be continued under his name at 4 Jörgen Kocksgatan, Malmö.

The Trelleborgs Gummifabriks Aktiebolag, Trelleborg, engaged chiefly in the manufacture of rubber tires, has increased its capital stock from 300,000 to 800,000 crowns [\$80,400 to \$214,400].

O. Nelson, formerly of the Hartford Rubber Works Co., Hartford, Connecticut, has been appointed factory manager of the Gislaveds Gummifabriks Aktiebolag, manufacturer of automobile tires, Gislaved.

A serious fire recently destroyed more than \$30,000 worth of crude rubber and other materials of the Viskafoss Rubber Works, Viskafoss.

NORWAY.

The Norwegian Government is spending 100,000 crowns [\$26,800] in erecting and equipping an aeroplane factory with a shop large enough to assemble four machines simultaneously.

A circular issued by the government, dated November 12, 1915, places an embargo on all exports of woolen or cotton rubberized fabrics and also on garments made of these fabrics.

Aktieselskabet Skandinaviske Kabel og Gummifabriker, a new company planning to manufacture cables and general rubber goods, was recently incorporated in Christiania with 1,200,000 crowns [\$321,600] capital stock.

DENMARK.

During the year 1913, Denmark imported \$112,947 worth of crude rubber from France. Since the outbreak of the war this trade has entirely ceased.

Aktieselskabet DeForede Gummi og Lufttrinfabriker, Copenhagen, recently declared a 25 per cent dividend. This company's production of automobile tires has been increased from 25 to 60 tires per day in spite of the many difficulties that have been experienced in obtaining sufficient quantities of crude rubber and other raw materials. Dr. Alfred Benyon has been elected president of the company.

Through the joint efforts of the Danish "Landbank" and the British Ambassador at Copenhagen, the Copenhagen Auto Cab Co. has obtained a large consignment of tire casings and inner tubes.

Aktieselskabet Unmack & Pedersen, Aalborg, wholesale dealers in transmission belts, packings and mechanical rubber goods, have increased their capital stock from 140,000 to 200,000 crowns [\$37,520 to \$53,600].

SMUGGLING RUBBER INTO GERMANY FROM HOLLAND.

The smuggling of rubber from the Netherlands into Germany has become a profitable business, according to a report printed in a Paris paper. On account of the high prices obtainable in Germany much rubber has been sent there, the Dutch consumer being compelled to do without.

The government of the Netherlands, in striving to maintain strict neutrality, requires owners of automobiles desiring new tires to turn in their old ones, regardless of how damaged and dilapidated they may be, in order to prevent them being sent to Germany.

It is said that much smuggling is being indulged in, although smugglers, when apprehended, are subject to a fine of 16 florins [\$6.43] per pound. It is intimated that the Germans are glad to pay a price that makes rubber smuggling profitable, even if the smuggler is occasionally apprehended.

Weisse & Co., large importers and dealers in crude rubber and gutta percha in Rotterdam and Amsterdam, Holland, have announced that M. J. Overeynder has withdrawn from the firm and has been succeeded by Mr. F. A. F. De Gruyter, who has been granted power of attorney at the Amsterdam branch.

The Rubber Trade in Germany.

By Our Regular Correspondent.

THE opening up of the route through the Balkans to Turkey and the Orient eclipses all late events in its importance to our commerce and industry. Our industries are suffering from lack of orders as much as from lack of raw materials and the clearing of the road to the Orient will enable us to obtain not only the needed raw materials but will permit us to reach a market for the sale of our manufactured products. The importance of the event escapes no one and this explains the joyous celebrations that marked the announcement of our latest victories.

Before our troops had cleared the way our Balkan Association was organizing and by the time this letter reaches you we will again be trading with the Orient. Our rubber industry, closely allied as it is with other industries, will be able to supply practically all demands and will therefore participate in this prosperity.

Our rubber manufacturers can only produce a limited number of articles from crude rubber, but they are able to make almost anything in "war qualities," that is to say, in qualities containing no crude rubber, but only reclaimed and substitute stock mixed with the necessary fillers and vulcanizing ingredients. Though not as elastic and durable as standard quality rubber goods, these "war qualities," under the circumstances, are satisfactory substitutes that answer the purposes for which they are used.

Some articles cannot be made in "war qualities." Surgeons' gloves, for instance, must contain pure rubber, because no substitute will stand the high heat necessary in sterilizing. "War quality" jar rings recently caused large quantities of preserves to become useless by letting air into the containers. All this is unfortunate but the fact remains that our rubber manufacturers are producing thousands of serviceable articles which, without their intelligence and initiative, would not be available at all.

COMMERCIAL EXPANSION PLANS.

Of late various commercial and industrial organizations have been holding meetings to discuss developments of great importance. The Commercial Treaty Association, which represents practically all the commercial and industrial interests of the empire and has for its object the advising of the government in making commercial treaties, met on November 26 in Berlin. The action taken was not made public and, therefore, cannot be reported. All that may be said is that the commercial concessions to be exacted from our enemies were discussed at length and that the association has sent confidential representatives to Russian Poland, Holland, Turkey, the United States, Argentina, Uruguay, the Far East, and other places of commercial importance. Their duties are strictly commercial in character and involve nothing political or military.

Other meetings of less importance were held by the Union of German Bicycle Manufacturers and by the Association of German Cycle & Motor Vehicle Dealers.

Automobile and automobile tire interests here and in Austria-Hungary are giving much attention to the possible danger of an American motor car invasion following the war. It has been seriously suggested that German and Austro-Hungarian automobile and tire manufacturers combine together to produce a standard model motor car to compete in price as well as in quality with anything America can produce.

Our manufacturers recognize that quantity production is the secret of American low-priced automobiles and that, to compete, they must find means for following the "American system."

CHRISTMAS PREPARATIONS.

We are now preparing for our second "war Christmas." Most of the gifts went to the men at the front. The majority were useful presents, among which, judging from show windows, rub-

ber goods were prominent. Many of our large stores had elaborate window displays of "Christmas in the Trenches." Rubber goods were much in evidence. Garments, footwear, ground cloths, cushions, tobacco pouches, sponges, sponge bags, folding wash basins and bath tubs, combs, etc., all in "war qualities" of rubber are shown as desirable presents.

One war novelty attracting much attention is a combination of elastic bands and an elastic fabric cap, all impregnated with powerful chemicals. These are known as "vermin guards," and are intended to be worn next to the skin to prevent vermin entering underneath the clothing and scattering over the body of the wearer. Soldiers say that these "guards" are much more practical and more effective than the powders and salves heretofore used for the same purposes.

TRADE NOTES.

Edward Pohlman, of Varel, Oldenburg, has founded a transmission belt factory to be known as the North German Transmission Belt Works.

The North German Cable Works, Neukölln, reports 10 per cent. profits.

The B. Pollack Co., rubber manufacturer, Walterhausen, has declared a 6 per cent. dividend.

The German Cable Works, Alt-Boxhagen, near Berlin, reports a satisfactory year and has declared a 6 per cent. dividend.

The Humboldt Machine Works, Cologne-Kalk, recently held its annual meeting of shareholders at which 9,813,000 marks (\$2,335,494) capital was represented. A 7 per cent. dividend was declared and ordered paid immediately.

The Imperial Chancellor has ordered the sequestration of the property of the Alsatian Rubber Goods Manufacturing Co., Steinbach, Alsace.

PERSONALS.

Dr. Konrad Delbrück, formerly collaborator of Dr. Hoffmann, at the Bayer Chemical Works, Elberfeld, well known for his work relating to the production of synthetic rubber and the production of acetone by direct refining, has been killed at the front. He was 31 years old and just previous to the war had erected for the Bayer company a large acetone distilling plant.

The iron cross for bravery was recently awarded to Captain of Reserves Osterwald, manager Excelsior Rubber Works, Hanover, who is now at the front.

NOTES FROM AUSTRIA-HUNGARY.

The proposed increase of 25 per cent. in domestic postal rates is being bitterly opposed by manufacturers and traders through their organizations.

The latest reports from Vienna tell that many bankruptcies are occurring among cycle manufacturers and dealers.

Hugo Goldschmidt and Marcel Herzeg, directors of the Semperit Austro-American Rubber Works, have organized a new company at Vienna, the Sembusto Elastic Tire Co., which will not conflict with the Semperit company.

The Hungarian Rubber Goods Manufacturing Co. recently issued new stock, which increases its capital from 4,500,000 to 6,000,000 crowns (\$913,500 to \$1,218,000). The new stock has been offered to the present shareholders.

The Japanese are now extending their planting activities in the Ulu Selangor district. Y. Hasegawa, of Kuala Kubu, has recently acquired a large acreage in Ampang Pechah Mukim with a view to planting rubber.

Rubber Planting Notes.

FRENCH INDO-CHINA RUBBER PLANTATIONS AFFECTED BY WAR MEASURES.

FRENCH INDO-CHINA is one of the latest on the list of plantation rubber-producing countries, and it is only in the last few years that attention has been given to the creation of modern plantations. The first rubber from this colony was obtained from wild plants, mostly of the vine variety. In the second half of 1913, when the crash came in rubber prices, most of the French Indo-China *Hevea* plantations were merely in course of creation. Many had just finished planting.

Coming at this stage, the crisis made it very difficult for these non-producing plantations to obtain credit and, in view of the slump in rubber values, very little money could be raised by the sale of stock of companies that would not produce for a number of years to come. All the estimates of future income and future profits on crops were discredited by the general depreciation of the market value of crude rubber. In the face of these difficulties the Indo-Chinese planters and plantation companies applied to the French Bank of Indo-China for loans to enable them to insure the upkeep of their property until the trees would come into bearing. The French colonial laws authorize banks, under governmental supervision, to loan money on future crops, but it was discovered that the provisions of the laws did not cover rubber crops that would not be available for a number of years. Consequently it was decided to obtain long-date loans that could be repaid in annuities, to begin at a date when the plantations would be in bearing. Arrangements were made on this basis and, as the government's sanction was essential, it was requested to give consent. This was early in 1914, and the government has not as yet given any definite reply.

Serious conditions have developed; lack of funds has caused the plantations to be seriously neglected; trees that now could be tapped for small quantities of latex are not touched because tapping would be unprofitable at present prices. Many plantations have been obliged to discharge their entire staff. The moratorium resulting from the war in Europe has stopped the periodical remittances that were coming forward from the sale of shares and from small loans obtained in France. To complete the havoc, the French government has prohibited all exports of rubber to other than French ports, thus closing to Indo-Chinese rubber its principal market, Singapore. This embargo is causing much discontent among the planters who, apart from resenting this reflection on their honor and patriotism, believe that the British Government has taken adequate measures to prevent rubber reaching the enemies of the Allies, and, therefore, it is unnecessary to bar Indo-Chinese rubber from the Singapore market.

A new Governor-General has recently been appointed to Indo-China, and hopes of relief are renewed. Should the government continue to ignore the plantation interests, a very serious condition is likely to develop.

PLANTATION RUBBER IN GERMAN WEST AFRICA.

The cultivation of rubber in German West Africa began about 15 years ago with plantings of *Funtumia Elastica*, the indigenous rubber tree. *Hevea* was not introduced until 1907, when seed was obtained from the East. By 1911, about 25,000 acres were planted in rubber, this area being divided equally between *Funtumia* and *Hevea*. Since 1911 *Funtumia* has been steadily losing favor as a plantation tree, chiefly on account of its poor yield in latex as compared with *Hevea*.

No new plantings have been recently made and, as the trees become exhausted, they are cut out and *Hevea* is planted instead. The latter demands less from the soil than *Funtumia*, yields more rubber, and is better suited for interplanting with cocoa.

Lack of seed and other planting material as well as lack of labor and the sowing of the seed in abnormally wet weather have retarded the development of *Hevea* plantings.

It is stated that both *Funtumia* and *Hevea* on German West African plantations suffer from a species of root disease and that in addition to this the *Funtumia* has to contend with "stag beetles"; however, the principal difficulty on these plantations has always been labor.

Hevea was first tapped in the season 1912-13. The exports of plantation rubber from German West Africa have been comparatively small, though increasing steadily, as shown by the following figures: 1909, 5,922 pounds; 1910, 5,795 pounds; 1911, 23,912 pounds; 1912, 53,040 pounds.

The forests of German West Africa produced good qualities of wild rubber, but this production has been on the decline for a number of years and is now practically a thing of the past.

THE RUBBER INDUSTRY OF ANGOLA, PORTUGUESE WEST AFRICA.

Angola, the largest of Portugal's African possessions, a rubber producing country of comparatively great importance 20 years ago, is today affected by a similar crisis as the Congo, Brazil and other countries producing wild rubber.

At times rubber has formed as high as 75 per cent. of the total value of Angolan exports. In 1910, the shipments of rubber amounted to 2,438 tons and were valued at \$6,007,200; in 1911, 1,968 tons, value \$2,972,400; in 1912, 2,188 tons, value \$3,470,000; in 1913, 1,489 tons, value \$1,993,905; and in 1914, 1,336 tons, value \$725,206.

The primitive methods employed by the natives in gathering, cleaning and drying the rubber resulted in the product arriving on the European markets in poor condition. However, owing to the great demand, Angolan qualities still obtained profitable prices until quantities of clean plantation rubber made their appearance.

Angolan rubber comes mostly from the remote interior of the Benguela district, where it is obtained by the natives from vines; *Landolphia Kirkii*, *Landolphia florida*, etc.; and is sold at the trading stations which buyers have established in many parts of the Benguela plateau.

Recently an Englishman has established a modern rubber cleaning plant at Bihé which will probably lead to an improvement in Angolan wild rubber qualities.

As to plantation rubber, the friable soil of Angola and the rainfall, are very favorable to *Manihot*, two varieties of which have been successfully cultivated at an altitude of from 2,500 to 3,000 feet. On December 31, 1914, *Manihot* plantation rubber was selling at 2s. 7d. per kilogram [29 cents per pound] in the Benguela market.

HEVEA RUBBER YIELDS IN SOUTH INDIA.

The *Hevea* plantations in South India have been producing for the past six years, but, compared with Ceylon and Malaya, the yields in dry rubber per acre have never been very satisfactory, due apparently to climatic conditions.

Of late, however, an experienced planter has openly taken the view that the climate is not wholly to blame and that it should not be made the scapegoat for past sins and mistakes of planters who have failed to adapt the proper methods of cultivation and tapping to the climatic conditions.

In the early days of rubber planting in South India most of the planters had no practical knowledge of the task they were undertaking and overtapping was much indulged in, so that to-day many trees must be allowed to rest until damaged bark is renewed by nature. This process of bark renewal in many cases

takes seven years, so bad is the state of the overtapped trees. Another cause of the comparatively low yields per acre is the overcrowded state of many plantings. It is not unusual to find as many as 200 trees to the acre in spite of the fact that estates, thinned down to 105 trees have produced more rubber than the overcrowded ones.

The opinion is advanced that future yields would be materially increased were tapping operations stopped each year from June 15 to the middle of August—during the southwest monsoon—when fully 50 per cent of the annual rainfall occurs. During this wet, windy season the trees experience a second leaf-fall quite distinct from the regular seasonal leaf-fall, which occurs in the early part of the year. However, the trees do not shed all their foliage as in the regular wintering season. Some are more affected than others; one may be almost totally denuded while its neighbor will retain its foliage.

Several theories have been advanced to explain this occurrence. Some believe it to be due to disease; others hold that it is a physiological response of the tree to climatic conditions.

REVIEW OF RUBBER CULTIVATION IN NETHERLANDS EAST INDIA.

SOUTHEAST ASIA and Netherlands East India were the only producers of cultivated *Ficus* rubber previous to 1900.

The first attempts to plant rubber trees in Java were made with *Ficus elastica*, and thereafter with other kinds, including *Hevea Brasiliensis*, *Castilloa elastica* and various *Manihot* species. The cultivation of the latter species attained considerable importance, but compared with *Hevea* these varieties are given small attention.

It was not until 1905 that the cultivation of rubber was undertaken to any great extent in Netherlands East India. From that

diseases, by proper precautionary measures. Leaf diseases, however, have not proven to be of as malignant a character as in other colonies.

The important problem of tree planting distances has been settled by adopting a more open spacing than formerly and interplanting with catch crops of *Robusta* coffee. The usual planting distances for *Hevea Brasiliensis* in recently opened plantations have been increased to 18 x 18, 20 x 20, or 12 x 24 feet apart.

At the beginning of 1913 the planted acreage of *Hevea* in Netherlands East India was as follows:

	In Java.	In the possessions beyond Java.	Total.
<i>Hevea</i>	63,387	168,151	231,538
<i>Hevea</i> interplanted	129,788	53,986	183,774
Total	193,175	222,137	415,312

In addition to the above 1,000,000 *Hevea* trees are to be found distributed on estates in the whole colony.

The *Hevea* is considered tappable when $\frac{3}{4}$ to 4 years old, but in Java the trees are sometimes not tappable before their fifth year.

The preferred method of tapping young trees is a V incision covering half the circumference of the stem. The stems of older trees are tapped by quarters on the "Half Herringbone system." The tapping process of each quarter is extended to $\frac{1}{4}$ to $\frac{1}{2}$ years, thus requiring 5 or 6 years to tap the full circumference of the stem.

Plantation labor expense has greatly increased, due to shortage of laborers, but in comparison with other rubber producing centers, the cost of labor in Netherlands East India is not excessive.

The following statistics show the exports of *Hevea* rubber from Java and the East Coast of Sumatra during 1912 and 1913:

	Java.		East Coast Sumatra.	
	1912.	1913.	1912.	1913.
Holland	194	1,006	35	384
United Kingdom	255	1,000	102	759
Elsewhere	37	339	1,185	1,893
Totals	486	2,345	1,322	3,036

*Tons of 2,200 pounds.

In regard to the other possessions of the Archipelago, the total exports of those islands in 1912 were 536 tons of 2,200 pounds.

EXTENT OF PLANTING AREA.

In Java the area planted with rubber cannot be extended, because of topographical and climatological circumstances and the fact that only small plots of suitable land are now available. In Sumatra, however, the area for the cultivation of *Hevea* could easily be extended to even three times the present space. The same can also be said of Borneo.

The area and exports of *Ficus elastica*, *Castilloa* and *Manihot Glaziovii* rubber are practically negligible.

GUTTA PERCHA.

Gutta percha is only to be found in East Asia. In Netherlands East India it grows in the Rhio Archipelago, in Banka, Borneo, Sumatra and in New Guinea, besides a few other islands. The product is principally obtained from the *Palaquium* species. The bulk of the product is from wild trees, which are felled for the purpose of tapping.

To prevent the extinction of the *Palaquium* species plantations have been opened up in Netherlands East India since 1885, namely, the Government Gutta Percha Plantations at Tjipetir, where practically only trees of this species are grown.

The exports of plantation produced gutta percha from Java totaled 6 tons in 1912 and 25 tons in 1913.

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

LATEX FACTORY AND CARRIERS IN THE FAR EAST.

date the investments in this branch of agricultural industry gradually increased, and numerous plantations were opened up where rubber was cultivated on a large scale.

HEVEA BRASILIENSIS

Starting in a small way in 1876, experiments were made in propagating this tree, and in Java and Sumatra an opportunity was afforded to gather data respecting growth, etc., which have been of great assistance in cultivation later undertaken on an extensive scale.

The acclimatization of *Hevea* in Netherlands East India has been entirely successful. The trees look very healthy and the growth appears to be satisfactory.

It has been found possible to reduce parasitic root and stem

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED DECEMBER 14, 1915.

- N**O. 1,163,701. Rubber jacketed wheel rim. W. F. Stearns, Evanson, Ill.
 1,163,732. Bath apparatus. J. T. Barlow, Oak Park, Ill.
 1,163,736. Rim for vehicle wheels. R. S. Bryant, assignor to The Standard Welding Co.—both of Cleveland, Ohio.
 1,163,805. Bottle closure. F. R. Bonn and B. D. Hamill—both of Salt Lake City, Utah.
 1,163,835. Bed pan cushion. A. R. Logan and M. A. L. Barrelle—both of Chelmsford, Mass.
 1,163,908. Air bag. R. T. Griffith, assignor to Miller Rubber Co.—both of Akron, Ohio.
 1,163,927. Valve stem. G. Hughes and D. F. Givens—both of Syracuse, N. Y.
 1,163,938. Horseshoe pad. J. H. Matchett, Oakland, Cal.
 1,163,993. Hard rubber plug for storage battery. B. Ford, Philadelphia, Pa.
 1,163,995. Hose coupling. G. P. Frank, Roselle, N. J.
 1,164,157. Fountain pen. S. Zollinger, Woodhaven, N. Y.
 1,164,177. Heel pad. H. M. Eaton, Hudson, Mass.
 1,164,190. Pneumatic tire. H. Janocovich, Pittsburgh, Pa.
 1,164,214. Anti-skid device. F. S. Roberts, Yonkers, N. Y., assignor to Kelly-Springfield Tire Co., Jersey City, N. J.
 1,164,219. Insect guard with rubber center. F. J. Rush, New York, N. Y.
 1,164,279. Anti-skid device. W. Grus, Jr., assignor to Grus Leaf Spring Oiler Co.—both of Chicago, Ill.
 1,164,303. Laminated tube of rubber and fabric. E. S. Nicewarner, Chicago, Ill.
 1,164,304. Laminated tube of rubber and fabric. E. S. Nicewarner, Chicago, Ill.
 1,164,312. Life saving garment. W. R. Pike and T. S. Morton—both of Tuxedo Park, N. Y.
 1,164,316. Arch support. F. Roehl, assignor to The Scholl Manufacturing Co.—both of Chicago, Ill.
 1,164,321. Protective covering for cable or hose. O. P. Houben, Akron, Ohio.
 1,164,545. Protective tire covering. A. J. Moonen, Denver, Colo.
 1,164,554. Vehicle wheel. T. C. Shepherd, Jr., Joliet, Ill.
ISSUED DECEMBER 21, 1915.
 1,164,642. Garment. V. Guinzburg, assignor to The I. B. Kleinert Rubber Co.—both of New York, N. Y.
 1,164,654. Fountain pen. G. M. Kraker, assignor to Kraker Pen Co.—both of Kansas City, Mo.
 1,164,834. Pneumatic tire casing. J. A. MacMillan, Dayton, Ohio.
 1,164,928. Elastic arm band. C. F. Corcoran, Williston, N. D.
 1,164,946. Solid tire. R. L. Lynch, Campbellsburg, Ky.

 1,164,985. Golf practicing device. C. S. Britton, Cleveland, Ohio.
 1,165,045. Dress form combining an outer elastic envelope and inflatable sacks. C. A. Ufford, Boston, Mass.
 1,165,052. Rubber cushion or buffer. W. J. Williams, La Grange, and J. C. Bowman, Chicago—both in Illinois.
 1,165,057. Tire inflating device. T. Bayly, assignor of one-half to D. Alford—both of Clearwater, Fla.
 1,165,094. Demountable rim. C. C. Harbridge, Chicago, Ill., assignor to Detroit Demountable Rim Co., Detroit, Mich.
 1,165,095. Demountable rim. C. C. Harbridge, assignor to Detroit Demountable Rim Co.—both of Detroit, Mich.
 1,165,096. Demountable rim. C. C. Harbridge, assignor to Detroit Demountable Rim Co.—both of Detroit, Mich.
 1,165,145. Cushion tire comprising a collapsible wearing shoe. F. V. Uezzi, assignor to Transcontinental Wheel Co.—both of New York, N. Y.
 1,165,153. Tire chain. L. W. Klaska, Grand Valley, Idaho.
 1,165,216. Rubber covered club. E. E. Wefen, Christiansburg, Norway.
 1,165,235. Rubber heel. E. J. Emery, Portsmouth, N. H.
 1,165,275. Anti-colic nurse. M. Montgomery, Mankato, Minn.
 1,165,282. Automatic tire inflater. J. H. Pearson, Indianapolis, Ind., assignor of one-third to W. O. Jackson, and one-third to J. U. Baughman.
 1,165,283. Handle for air brake coupling. C. M. Petty, Oxford, N. C.
 1,165,322. Blower patch. M. Copps and A. B. Crewdson, Charter Oak, Iowa.
ISSUED DECEMBER 28, 1915.
 1,165,390. Rim for solid tires. W. E. Copithorne, Natick, Mass.
 1,165,398. Cushion tire. M. Dickerson, assignor of one-half to F. L. Luz—both of Newark, N. J.
 1,165,449. Tubular collapsible diaphragm for hose couplings. E. W. Rietz, assignor to Chicago Car Heating Co.—both of Chicago, Ill.
 1,165,464. Hose clamp. F. C. Stuckel, assignor to Universal Fastening Co.—both of St. Marys, Ohio.
 1,165,484. Rubber grip for handles. W. E. Zimmerman, Owosso, Mich.

- 1,165,486. Packing for rods and the like. R. Allen, Caversham, England.
 1,165,512. Resilient tire. T. N. Jordan, Long Beach, Miss.
 1,165,533. Sanitary apron. C. G. Nelson, Pittsburgh, Pa.
 1,165,576. Vehicle tire. H. Dech, assignor to Eureka Tire Co.—both of Trenton, N. J.
 1,165,577. Vehicle tire. H. Dech, assignor to Eureka Tire Co.—both of Trenton, N. J.
 1,165,630. Pneumatic tire casing. E. C. Seward, Jr., New York, N. Y., assignor to Eureka Tire Co., Trenton, N. J.
 1,165,631. Pneumatic tire casing. E. C. Seward, Jr., New York, N. Y., assignor to Eureka Tire Co., Trenton, N. J.
 1,165,687. Innersole. C. B. Mangsback, assignor of one-half to F. L. Price—both of Brockton, Mass.
 1,165,780. Transmission belting. K. W. Jappe, Brooklyn, N. Y.
 1,165,810. Demountable wheel rim. Q. L. Sparks, Stamping Ground, Ky.
 1,165,845. Resilient vehicle tire. J. Cairns, Hove, Brighton, England.
 1,165,847. Rubber heel cushion. C. E. Casman, Fitchburg, Mass.
 1,165,876. Pressure indicator for pneumatic tires. W. E. Heberling, Youngstown, assignor of one-fourth to G. Goodman, Struthers—both in Ohio.
 1,165,888. Armored tire. W. F. Macklin, Appleton, Wis.
 1,166,026. Tire and inner tube. I. J. Webster, Haverhill, Mass., assignor to Reliance A. C. Co., Inc., New York, N. Y.
 1,166,043. Demountable rim. S. J. Dobzynski, Cuyahoga Falls, Ohio.
 1,166,059. Repair coupling for air hose. R. W. Ledbetter, Birmingham, Ala.
 1,166,065. Cushion tire. A. M. Livelsberger, Kalamazoo, Mich., assignor of one-half to A. Bair, Tiffin, Ohio.
 1,166,152. Telephone receiver. T. Rhodus, Chicago, Ill., assignor to The Magniphone Co., a corporation of Arizona.
 1,166,158. Hose clamp. C. A. Simmons, Albany, N. Y.
 1,166,223. Hose coupling for fire hydrants. G. W. Killin, Huntington, W. Va.
 1,166,248. Internal heel cushion. J. Patten, New York, N. Y.
 1,166,314. Cushion tire. C. L. Beckham and H. C. Beckham—both of Toledo, Ohio.
 1,166,338. Urethritic syringe. G. J. Duggan, assignor to Beekton, Dickinson & Co.—both of Rutherford, N. J.
 1,166,368. Puncture proof tire. J. H. Harvey, Scranton, Pa.
 1,166,374. V. W. Jackson—both of Springfield, and one-fourth to F. C. Jackson, Akron—all in Ohio.
 1,166,406. Nursing bottle. R. R. Baker, assignor to H. H. Baker—both of Buffalo, N. Y.
 1,166,407. Air brake hose coupling. W. E. Benn, McAdam Junction, New Brunswick, Canada.
 1,166,416. Cushion wheel. G. W. Smith, assignor to The Elastic Wheel Co.—both of Baltimore, Md.
ISSUED JANUARY 4, 1916.
 1,166,478. Suspender. E. E. Peck, Hugo, Okla.
 1,166,548. Cushion wheel. H. J. Sewell, Highland Park, Mich.
 1,166,622. Nozzle out patch. E. H. Morehouse, Culver City, Cal.
 1,166,662. Nozzle for syringes. R. R. Crump, Hoboken, N. J., and J. Bernstein, New York, N. Y.; said Bernstein assignor to said Crump.
 1,166,741. Dimple fountain pen. A. Brochetti and J. Familet—both of Dunkirk, N. Y.
 1,166,761. Medicine container with bulb. A. C. Higgins, assignor to H. K. Mulford Co.—both of Philadelphia, Pa.
 1,166,811. Rubber mat. W. F. Dowers, San Francisco, Cal.
 1,166,861. Pneumatic tire armor. F. W. Simon, Vallejo, Cal.
 1,166,862. Rubber power flask. S. B. Smoot, Dimmock, assignor of one-half to W. E. Decans, Mount Hope, West Virginia.
 1,166,863. Fountain pen. H. Stein, Vienna, Austria-Hungary.
 1,166,946. Croquet mallet having a core and filaments of rubber wound thereon. T. Taylor, Jr., Hubbard Woods, Ill.
 1,166,972. Vehicle wheel rim. B. Darrow, assignor to The Goodyear Tire & Rubber Co.—both of Akron, Ohio.
 1,166,984. Surgical bandage. E. Gulacsi, Youngstown, Ohio.
 1,166,990. Wheel rim for pneumatic tires. P. J. Johnson, Danville, Pa.
 1,167,062. Dental saliva ejector. F. Grosbans, Baltimore, Md.
 1,167,103. Heel pad for shoes. M. J. Nolan, Chicago, Ill.
 1,167,113. Flitch reducing garment. T. W. Rogers, Columbus, Ohio.
 1,167,196. Pencil holder. C. B. Mercer, North Pittston, Pa.
 1,167,210. Rotary shaft or rod packing. S. Orr, Tarpen Springs, Fla.
 1,167,226. Garter. L. M. Spauld, Columbus, Miss.
 1,167,236. Apparatus for promoting the growth of hair. L. J. Widness, New York, N. Y.
 1,167,306. Receptacle closure. C. R. Keeran, Bloomington, Ill.
ISSUED JANUARY 11, 1916.
 1,167,497. Collapsible bucket. F. C. Hayes, Altamont, N. Y.
 1,167,596. Metal chain tread tire. A. Rich, Stamford, Conn.
 1,167,669. Hose supporter. R. E. Ward, Kansas City, Mo.
 1,167,836. Mileage indicator for tires. A. C. Pratt, Glen Ridge, N. J.
 1,167,849. Infant's folding bath tub. M. C. Sherman, Ben Avon, Pa.

- 1,167,885. Heel and sole blank. E. E. Carll (known as E. C. Edwards), West Haven, Conn., assignor to Cooperative Rubber Co., a corporation of Maine.
- 1,167,930. Life-saving appliance. A. C. Rasmussen, Chicago, Ill.
- 1,167,968. Teat cup. O. Anderson, Lancaster, Pa.
- 1,167,979. Vaginal irrigator. M. B. Clarke, Akron, Ohio.
- 1,167,980. Indicator for pneumatic tires. S. F. Cole, Purcellville, Va.
- 1,167,992. Brassiere with elastic fabric strips. E. Guggenheim, assignor to M. W. Schloss, both of New York, N. Y.
- 1,168,056. Nursing nipple. H. V. Brumley, Plandome, N. Y., assignor to Whitall Tatum Company, New York, N. Y.
- 1,168,219. Hose sprinkler. F. B. Miller, Los Angeles, Cal.
- 1,168,222. Hose-mending device. J. E. Peck, Logan, W. Va.

RESISTANCE

- 14,046. Hose construction. J. T. Fack, Akron, Ohio, assignor to The B. F. Goodrich Co., a corporation of New York.
- 14,049. Resilient heel. J. F. Tufford, assignor to The I. T. S. Rubber Co.—both of Elyria, Ohio.

ISSUED JANUARY 18, 1916.

- 1,168,287. Wheel comprising an annular pneumatic tube. J. B. Cumming, Ellerslie, Auckland, New Zealand.
- 1,168,306. Rubber footwear. A. Johnson, Duluth, Minn.
- 1,168,354. Hard rubber stem for tobacco pipes. O. Wartemann, New York, assignor to Traun Rubber Co., College Point, N. Y.
- 1,168,381. Package for toy balloons. H. A. Dodge, Newark, N. J.
- 1,168,426. Automatic air-hose coupling. J. Roy, Los Angeles, Cal.
- 1,168,597. Anti-slipping attachment for tires. H. O. Branton, Cincinnati, Ohio.
- 1,168,644. Milk testing tube with rubber stopper. H. Jone, Brooklyn, N. Y.
- 1,168,674. Tire casing. G. J. Reuter, Newark, assignor of five-twelfths to A. M. Herman, West Orange, and three-twelfths to L. R. Freund, Newark—all in New Jersey.
- 1,168,679. Rubber napkin holder. C. H. Rutherford, Jerome, Ariz.
- 1,168,709. Pneumatic and cushion tire for automobiles. W. H. Clay, Cameo, Colo.
- 1,168,732. Elastic topped brassiere. C. Mayer, assignor to Natures Rival Co.—both of Chicago, Ill.
- 1,168,842. Pad for head rests with elastic tapes. B. Albrecht, New York, N. Y.
- 1,168,998. Finger stall tooth brush of rubber. C. K. Brandenburg, Klamath Falls, Ore.
- 1,169,085. Web strip composed of rubber. O. C. Davis, assignor of one-half to G. E. Keith—both of Brockton, Mass.

THE UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent upon the filing of the application.

*Denotes Patents for American Inventions.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, DECEMBER 8, 1915.]
- 17,951 (1914). Rubber tipped blades to prevent escape of dust from scavenger cars. A. F. Oates, 129 Royal Road, Kennington Park, London.
- 17,977 (1914). Rubber pad for preventing rattling of windows, etc. W. M. Still & Sons, and W. C. Still, 29 Charles street, Hutton Gardens, London.

- 477,050 (January 7, 1915). Improved anti-skid devices. Neverskid Manufacturing Co.
- 477,410 (January 27). Improvements in tires. J. H. Knight.
- 477,463 (February 1). Improvement in dual-tire wheels. Wolseley Motors, Limited.

THE GERMAN EMPIRE.

PATENT ISSUED (With Date of Validity).

- 289,382 (March 22, 1914). Hard rubber syringe with a hollow piston open at both ends. Dr. Vittorio Emanuele Malatè, Milan, Italy.
- J. Wassermann, Berlin S 86. Patented in Italy, October 31, 1913, M. 35,573.

TRADE-MARKS.

ISSUED DECEMBER 14, 1915.

- 86,091. C. Milton, Los Angeles, Cal. The word *Milmore*. For a composition of matter for preventing and sealing punctures in pneumatic tires.
- 87,177. Wright & Ditson, Jersey City, N. J., and Boston, Mass. Representation of a man standing on a ball with a tennis racket in his hand. For golf, tennis and gymnasium shoes, diving and swimming caps, waterproof bathing suits, etc.
- 88,713. C. L. Meyer, Pittsburgh, Pa. The word *Kestine*. For garters, armbands and trouser belts.
- 89,326. M. F. Robbins, Rudolph, Wis. Illustration of an elm tree with the words *Elm Circle Brand*. For ladies' garters.
- 90,083. Glendale Elastic Fabrics Co., Easthampton, Mass. Illustration of a seal with the words *French Model American Made*. For suspenders.
- 90,296. The Vulcanized Rubber Co., New York, N. Y. The word *Leonora*. For toilet combs made of rubber or composition.
- 90,511. The Goodyear Tire & Rubber Co., Akron, Ohio. The word *Xodion*. For soles and heels for boots and shoes, formed of an artificial composition.

ISSUED DECEMBER 31, 1915.

- 88,953. Foster Rubber Co., Kennebunk, Me., and Boston, Mass. Picture of a cat. For rubber heels.
- 88,954. Foster Rubber Co., Kennebunk, Me., and Boston, Mass. Picture of a cat. For rubber heels.
- 88,955. Foster Rubber Co., Kennebunk, Me., and Boston, Mass. The words *The Heel With Nine Lives*. For rubber heels.
- 89,935. Vaughan Rubber Co., Detroit, Mich. Illustration of a heel with the initials R I P. For rubber heels.
- 90,696. National Hoof Pad Co., Brooklyn, N. Y. The word *I'll*. For rubber pads for horses' hoofs.
- 90,188. National India Rubber Co., Bristol, R. I. The word *Emmy-Lou*. For rubber and canvas shoes, boots and slippers.
- 90,189. National India Rubber Co., Bristol, R. I. The words *Sister Sue*. For rubber and canvas boots, shoes and slippers.
- 90,497. Bishop Gutta-Percha Co., New York, N. Y. Illustration of an Indian's head. For backing cloth, sometimes called plumping cloth.
- 90,546. Simplex Wire & Cable Co., Boston, Mass. The word *Fibrex*. For electric wire and cables, insulated wire and woven covered wire and cables for electrical use.
- 90,947. W. F. Mayo & Co., Boston, Mass. The word *Whip*. For rubber and rubber and canvas boots and shoes.

ISSUED DECEMBER 28, 1915.

- 90,657. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Lura*. For light weight rubber shoes.
- 90,658. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Okay*. For rubber shoes.

ISSUED JANUARY 4, 1916.

- 72,390. Bourn Rubber Co., Providence, R. I. Representation of the bottom of a shoe. For rubber boots and shoes.
- 81,938. The Gordon Rubber Co., Canton, Ohio. Representation of a triangle. For rubber tubes and tires.
- 82,130. C. A. Daniel, Philadelphia, Pa. Illustration of a diamond design with the words *Daniel's Ebenezer* in white letters on a black background. For rubber machinery packing.
- 89,444. E. T. Packard, Avon, Mass. Illustration of two shells. For rubber heels.
- 89,734. Lambertville Rubber Co., Lambertville, N. J. The word *Redskin*. For rubber boots and shoes.
- 90,176. W. H. Horn & Bro., Inc., Philadelphia, Pa. Illustration of a diamond design. For trusses, supporters, surgical belts, elastic stockings, etc.
- 90,332. Harris & Berntz Co., Philadelphia, Pa. The words *Prevents Colic* in red letters on a black background. For nursing bottle nipples.
- 90,344. McFadden Bros., Wheeling, W. Va. Pictures of three little boys holding a plate with the words *Three Brothers*. For shoes and boots of leather and rubber, rubberized and oiled waterproof clothing, etc.
- 90,410. The Goodyear's Metallic Rubber Shoe Co., Naugatuck, Conn. The word *Unluck*. For leeching rings, rubber bead softeners and rubber complexion cloths.
- 90,412. The Goodyear's Metallic Rubber Shoe Co., Naugatuck, Conn. The word *Naukhyde*. For foot balls and basket balls.

ISSUED JANUARY 11, 1916.

- 90,157. Spottless Co., Inc., Richmond, Va. The word *Spottless*. For rubber roofing.
- 90,549. Abercrombie & Fitch Co., New York, N. Y. The initials *A F & Co.* For tents, ground cloths and rubber blankets, etc.
- 90,960. Standard Underground Cable Co., Pittsburgh, Pa. Illustration of a cable. For electric cables.

ISSUED JANUARY 18, 1916.

- 87,178. Wright & Ditson, Boston, Mass. Illustration of a man standing on a ball with a tennis racquet in his hands. For golf and tennis balls and sporting goods.
- 88,812. A. Y. Osterhout, Port Washington, N. Y. The word *Everywoman's*. For ladies' shoes of leather, rubber, etc.
- 90,165. Automobile Tire Co., Inc., New York, N. Y. The word *Nomad*. For rubber pneumatic automobile tires and tubes.

DESIGNS.

ISSUED DECEMBER 21, 1915.

- 48,341. Auto pedal pad. J. Winkler, assignor to Auto Pedal Pad Co.—both of New York, N. Y.

ISSUED DECEMBER 28, 1915.

- 48,348. Vehicle tire. H. G. Ellis, assignor to Hood Rubber Co.—both of Watertown, Mass.

ISSUED JANUARY 4, 1916.

- 48,374. Tire. G. W. Greene, assignor to Ten Broeck Tyre Co.—both of Louisville, Ky.

ISSUED JANUARY 11, 1916.

- 48,437. Miner's shoe. J. T. Crowley, Beacon Falls, Conn., assignor to The Beacon Falls Rubber Shoe Co., a corporation of Massachusetts.
- 48,438. Miner's shoe. J. T. Crowley, Beacon Falls, Conn., assignor to The Beacon Falls Rubber Shoe Co., a corporation of Massachusetts.

ISSUED JANUARY 18, 1916.

- 48,473. Elastic fabric. C. A. Lapworth, West Bridgewater, assignor to The Lapworth Webbing Co., Brockton—both in Massachusetts.

THE RUBBER SCRAP MARKET.

THE sensational advance in the price of crude rubber has promptly reflected in the January rubber scrap market and prices developed substantial gains in the entire list. The break in crude rubber prices that occurred early in the month will doubtless be followed by a reaction in shoddy and values will eventually decline in sympathy with the crude material.

The scarcity of all grades of stock has been a dominating feature of the market that is generally conceded to be of the dealer's making, and the mills have refused to buy largely at the higher level now prevailing.

Boots and shoes lead the activity that began about the middle of the month and prices sought new levels supported by the prevailing "bullish" sentiment. Quotations were firm at 103½@11 cents and few sales reported, due to the unsettled conditions; however, several orders were taken at 11½ cents.

Auto tires advanced strongly with G and G tires leading. Sales were reported at 8½ cents. However, quotations were made at figures close to 9 cents for mill delivery.

Under advancing prices inner tubes developed a speculative following that supported the market firmly at 29 to 30 cents for No. 1 tubes.

Later in the month the market experienced an unsettled feeling, attributed to the recent break in crude prices, and in consequence there was less speculative buying. Consumers came forward about this time for supplies of boots and shoes and sales were made at 11½ cents delivered.

The market for tires continued to be active, but prices in certain grades had shown considerable weakness. During the last week G and G tires were selling for 8¾ cents and standard white tires were weak at 6½ cents.

In mechanical scrap there has been little change other than the price advances recorded in the following list.

NEW YORK QUOTATIONS FOR CARLOAD LOTS DELIVERED.

January 29, 1916.

	Per Pound.
Boots and shoes	\$0.114 @ .115½
Trimmed articles	.09 @ .09½
White tires, Goodrich and Goodyear	.08¾ @ .09

No. 2	.10 @ .11
Red scrap, No. 1	.09½ @ .10½
No. 2	.07½ @ .07¾
Mixed black scrap, No. 1	.03¾ @
No. 2	.03½ @
Rubber car springs	.03½ @
Horse shoe pads	.04½ @ .04½
Matting and packings	.01 @ .01½
Garden hose	.01½ @
Air brake hose	.05½ @
Cotton fire hose	.02½ @
Large hose	.01½ @
Hard rubber scrap, No. 1, bright fracture	.24 @
Battery jars (red compound)	.02½ @
Insulated wire stripping	.02 @
rubber heels	.03¾ @

A NEW BLOW-OUT PATCH.

A new inside blow-out patch, manufactured by the Polson Rubber Co., Kansas City, Missouri, encircles completely the tire tube and is fastened by a special self-adjusting strap. It is claimed that when the tube is inflated, the patch expands at its ends and tightens in its center, thus preventing pouching and the consequent enlargement of the hole in the casing. Such a patch can be used for rim cuts as well as for side blow-outs.

Crude Rubber During 1915.

THE crude rubber market for the year 1915 opened in a most unsatisfactory condition, with the British embargo in force and uncertainty existing as to whether the United States would be able to secure its necessary supply. In New York there were small stocks on hand. With prices steady and fewer buyers, the manufacturers kept out of the market for fear that any buying movement would force prices up, and a feeling of hopefulness existed that the negotiations to have the embargo lifted would result favorably.

The year began with First latex crêpe selling at 86 to 87 cents and Upriver fine at 75 cents a pound. On January 8 called information was received that rubber could be shipped to New York subject to special guarantees, and prices declined from then to the end of the month, when both First latex crêpe and Upriver fine were quoted at 60 to 61 cents a pound. The first crude rubber reaching New York after the lifting of the embargo was 200 tons that arrived on the "Lusitania" on January 23. At the end of the month much rubber was afloat, including 2,500 tons from England.

February opened with demand from manufacturers light, but with plantation rubber arriving regularly and with ample supplies in London to draw on. Shipments from Brazil were also coming in steadily. During March, delayed shipments, partially due to the London dock strike, tended to limit trading, and manufacturers were not attracted by the low price of Upriver fine, which had dropped to around 58 cents. The general impression prevailed that there was plenty of rubber for everybody and nobody seemed anxious to invest.

In May a lively interest developed and considerable business was done, owing largely to the desire of manufacturers to stock up in anticipation of possible political disturbances that might result in cutting off the supply. The buying movement, however, soon ceased. Although most rubber being imported was sold before it arrived, The Rubber Club of America, Inc., agreed to handle and release such shipments as might arrive unsold and to sign the usual guarantee.

During June, arrangements were completed by which plantation rubber might be shipped to any Atlantic port of the United States, consigned to the British consul, the usual form of guarantee being required and passed upon by the Rubber Club. Arrangements were also perfected by which shipments to Pacific ports could be consigned to the British consul at San Francisco and cleared in the same manner as those at Atlantic ports.

Prices had gradually advanced, with the ordinary fluctuations, until July opened with First latex crêpe at 63 cents and Upriver fine at 62½ to 63 cents. The market evidenced slowness in New York, but the price reflected the strong position of plantation in the London market. Beginning with August a general downward tendency manifested itself, due to plentiful supplies and

unstable conditions of foreign exchange, and on October 1, First latex crêpe was quoted at 59½ to 60 cents and Upriver fine at 56 to 57 cents a pound.

The most interesting movement commenced on November 6, when heavy buying in London was reported, and prices began to soar. On November 11 quotations were withdrawn, and on November 23, First latex crêpe and prime ribbed sold at 85 cents in a strong market and Upriver fine at 76 cents spot. Real buying was done at these advanced prices, which were generally credited with being influenced by the closing of the Suez and Panama canals and the submarine activity in the Mediterranean. During the last week of the month prices weakened considerably.

December, which will long be remembered for its spectacular rise in prices, opened with First latex crêpe at 75 cents and Upriver fine at 68 cents a pound. Before the month ended, the former advanced 25 cents and the latter 20 cents a pound. With prices steady and a strong market, rapid advance was made when cables brought the news of the sinking of the "Langton Hall" in the Mediterranean with 500 tons of rubber aboard. Encouraged by heavy buying in London, the upward price movement continued as the month progressed, higher prices being quoted almost daily. The news that two rubber ships had been routed around the Cape instead of by the Suez Canal encouraged the upward movement.

On the last day of the year the prediction of "dollar rubber" was realized, for First latex crêpe sold at that price, and Upriver fine at 87 and 88 cents a pound. The local December market has been characterized as a creation of dealers, but it is understood that manufacturers needed stock and bought at high prices.

Compiled by Gould Commercial Co.

THE LONDON VIEW OF THE 1915 MARKET.

DURING the year that has just closed the use of rubber has increased beyond all expectations, due in large measure to the heavy demands for military purposes and to the large number of automobile tires turned out by American manufacturers.

The supply of crude rubber has increased about 22 per cent. over that of 1914, thus making the great gain in manufacturing possible. Estimates show that plantations now supply about two-thirds of the world's crude rubber. Of the year's production, as estimated by leading authorities, at between 144,750 and 147,000 tons, 98,000 tons, or about two-thirds of the total, came from the plantations. In 1914 the total production was 120,380 tons, of which 71,380 were plantation grades. Back in 1910, six years ago, the plantations yielded but 8,200 tons of the world's supply.

THE MARKET.

The year's market has been dominated largely by emergency regulations arising out of the unusual war conditions. The trade has been chiefly with the neutral countries and strict precautions have been taken to prevent the raw material from reaching the enemy.

Until the middle of September the market presented no features of striking interest. About that time, however, fear began to be felt that there might be a shortage of tonnage both from the East and to America. The situation of the canals also excited no small influence on conditions.

In December speculators who had oversold near delivery rubber, quickly covered their requirements in part and advanced prices 1s. per pound, 3s. 7½d. being paid for pale crépe and 3s. 6½d. for ribbed smoked sheet. After a rapid decline of 7d. per pound prices again were forced up to 4s. 1d. and 4s., many interested in sales being frightened about obtaining figures for their rubber contracts.

Manufacturers and speculators bought freely for distant delivery and large sales for 1916 were made. The market closed

with crépe at 4s. 1d. and sheet at 4s., an advance on a year ago of 1s. 6d. to 1s. 9d. on spot and near. Pará, which is much less speculative, closed at 3s. 9d. for fine hard.

Estimates place £16,000,000 as the value of the enormous quantity of rubber that was shipped to the United States during 1915. This should serve as some indication of the abounding prosperity in America.

The following table shows the production of crude rubber for the last three years:

THE WORLD'S PRODUCTION.

	1915.	1914.	1913.
Ceylon and India.....	20,600	14,800	11,830
Malaya, etc.....	72,800	49,700	36,200
Amazonas (Brazil, Bolivia and Peru)....	30,700	28,345	29,380
Peruvian and Caucho.....	6,800	8,655	9,620
West Coast, Africa.....	2,500	2,650	3,900
Benguela and Mossamedes.....	1,900	1,500	1,300
Loanda.....	600	450	400
Congo, French Congo and Soudan.....	3,000	3,900	4,400
From other sources.....	7,100	10,380	11,410
Totals.....	146,000	120,380	108,440

Wild rubber has decreased, although Brazil has sent an average supply. The Pará and Manáos markets were not controlled, as in some former years, and showed but little speculation. Prices have not been maintained relatively to plantation rubber, but the entire Brazilian supply has been readily taken by consumers.

The following closing prices for recent years may be of interest:

	Hard	Negrohead	Negrohead	Caucho
	Fine Pará.	Scrappy.	Island.	Ball.
1913.....	3s. 1½d.	2s. 6d.	1s. 5d.	1s. 11d.
1914.....	2s. 10½d.	2s. 1½d.	1s. 3d.	2s. 4d.
1915.....	3s. 9d.	2s. 10d.	1s. 7d.	3s.

The lowest price at which hard fine Pará was sold during 1915 was 2s. 4½d. and the highest 3s. 9d.

The South American exports of medium grade have fallen off considerably. The supply of Caucho Ball shows a heavy decrease, with price relatively high. Bolivia sent a fair quantity; Mollendo and Venezuela, via Orinoco, very little, and Ceara and Manicoba rather less. Matto Grosso shipped a fair crop. The supply from Mexico was very small. Good qualities of West Coast African grades have sold well, but the yield shows decline. English and German East Africa sent but little.

PLANTATION RUBBER.

It is said that any planting which may have been done in 1915 has been fully counteracted by the falling out of cultivation and the thinning of some of the previously planted areas. The following estimate shows the acreage of the chief plantations from 1913 to 1915:

	1913.	1914.	1915.
Ceylon.....	220,000	220,000	235,000
Malaya, Malacca.....	500,000	500,000	550,000
Borneo.....	20,000	20,000	25,000
Dutch East Indies, Java, Sumatra, etc.,...	400,000	400,000	450,000
India and Burma.....	45,000	65,000	60,000
German colonies, Samoa, East and West Africa.....	60,000	40,000	25,000
Totals.....	1,245,000	1,245,000	1,345,000

The plantations, principally of *Castilloa*, in Mexico, West Indies and Central and South America have not progressed and have yielded insignificant supplies. India, Burma and the Mergui have increased and are extending, but the East African plantations of Ceara have sent but little.

The following table shows the annual receipts and shipments at Pará during the years 1913 to 1915:

	1913.	1914.	1915.
Receipts of Pará.....	29,750	28,170	30,595
Receipts of Peruvian.....	9,620	8,655	6,800
Shipments of Pará and Peruvian to Europe.....	22,110	15,985	14,440
Shipments of Pará and Peruvian to America.....	17,050	21,690	29,960

DISTRIBUTION.

The consumption of crude rubber of the various grades has been estimated as follows:

	1913.	1914.	1915.
England	18,000	18,000	24,000
Germany, Austria, etc.	16,600	16,430	3,000
France	9,000	5,000	7,000
Russia	11,500	11,610	16,000
Italy, etc.	1,370	4,000	2,500
Japan and Australia	2,000	2,400	4,000
America and Canada	47,200	62,940	89,500
Totals	105,670	120,380	146,000

It is interesting to note the great increase of the demands made by the United States, England, Russia, Japan and Australia and the great curtailment in the supply that went to the Teutonic nations.

[The figures and information used in the above review have been supplied by S. Figgis & Co.; Gow, Wilson & Stanton, Limited, and W. H. Rickinson & Son, all of London.]

FEDERATED MALAY STATES RUBBER EXPORTS.

A cablegram from the Government to the Malay States Information Agency gives the exports of plantation rubber from the Federated Malay States for the month of December as 5,111 tons, compared with 4,636 tons in November and 3,361 tons in the corresponding month last year. Appended are the comparative statistics for three years:

	1913.	1914.	1915.
January	2,131	2,542	3,473
February	1,757	2,364	3,411
March	2,737	2,418	3,418
April	1,636	2,151	2,727
May	1,225	2,069	2,708
June	2,005	2,306	3,403
July	1,781	2,971	3,687
August	2,363	1,850	3,796
September	2,079	2,984	3,984
October	2,160	2,897	4,420
November	2,062	2,889	4,136
December	2,618	3,361	5,111
Totals	23,465	30,697	44,524

From these statistics it will be seen that December establishes a new record for monthly export, eclipsing the November export (the previous record) by no less than 475 tons and being only 341 tons below the total export for the year 1910. The total for the year is also a record, surpassing last year's total by 13,827 tons. For the sake of comparison it is interesting to note the aggregate export of plantation rubber from the Federated Malay States for the past seven years: 1909, 34,411 tons; 1910, 54,525 tons; 1911, 87,922 tons; 1912, 15,006 tons; 1913, 23,465 tons; 1914, 30,697 tons; 1915, 44,524 tons.

EXPORTS OF INDIA RUBBER AND CAUCHO FROM PARÁ, MANAÓS, IQUITOS AND ITACOATIARA IN 1915, AND FOR EIGHTEEN YEARS.

[The figures indicate weights in kilograms.]

Review of the Crude Rubber Market.

NEW YORK. JANUARY 29, 1916.

THE steady advance in crude rubber that commenced in November continued in the beginning of January and recorded prices that had not been equaled since the spectacular advance in August, 1914. First latex had gained 5 points since December 31 and on January 4 was selling at \$1.05 for spot and near by. Futures were quoted at \$1.04 for January 1 and 99 cents for July-December.

Small stocks were responsible for the firm tone in Upriver fine, which had continued to advance steadily with plantations, and sales were reported at \$1 on January 4.

It was clearly evident that the market was top heavy and fundamentally lacking in permanent support from the large buyers. Local dealers realized the speculative character of the situation caused by the uncertainty of arrivals due to the many difficulties surrounding transport service. The reported sinking of two steamers, rubber laden, from the Far East and damage by

fire of another, gave added support to the bullish influence that prevailed in the market.

Despite the artificial support that was given to the already weakening market by speculative interests in London, the decline commenced on January 7 and continued steadily downward in a generally quiet market until January 29, when First latex was quoted at 78 cents and Upriver 76 cents.

The report that Great Britain had decreed that henceforth all shipments should be routed by the way of London cannot be verified. It is obvious that the best interests of England are greatly concerned in obtaining as little interruption as possible in her advantageous rubber trade with the United States. The imports received at the port of New York for the first 17 days of January would apparently indicate a greater tonnage for this month than that of December.

The arrivals will be found in detail in the following pages and in round numbers the totals are as follows: Plantation Pará,

3,700 tons; Pará from Pará and Manáos, 700 tons; Pará from Europe, 51 tons; Africans, 300 tons; Centrals, 150 tons; Manicoba and Cauchó, 200 tons. From these incomplete figures an estimate of 10,000 tons will represent the New York imports for January. Incidentally 90 per cent. of the total United States rubber imports are received at New York.

LONDON.

The first week of January witnessed a four shilling market and an insistent demand for spot rubber. Inquiries were sufficient to carry prices to higher levels and were steady on January 7, with First latex spot selling for 4s. 3½d. Futures were quoted at 4s. 3d. for April-June deliveries.

Delay in issuing permits continues. Applicants who pad up their figures in order to obtain the release of more rubber than they are entitled to receive would prevent delay by making an honest statement of their requirements. This applies to permits for shipments from the Far East as well as London and Liverpool.

That Great Britain has no intention of impeding shipments to neutral countries is evidenced by the recent order concerning government regulation of cargoes. Necessities are to be given preference over luxuries and rubber is classed as a necessity.

Weakness developed in the market about the middle of this month and prices gradually declined with minor fluctuations until January 29, when First latex was quoted at 3s. 1d. to buyers.

PARA AND MANAOS.

The Federal tax on exports from Brazil has been reduced to 12 per cent., taking effect January 1. The state tax on exports from the state of Matto Grosso has been reduced from 15 to 14 per cent., taking effect on the same date.

RUBBER AFLOAT.

The following formidable fleet of rubber carriers are afloat from the Far East: "Merton Hall," "St. Bede," "Inverclyde," "Suruga" and "Kathlamba." "The Saxon Monarch" and the "Kentigern" are due early in February from London. It is estimated that 2,000 tons will arrive on these steamships.

That rubber is being shipped from Singapore by the way of Hong Kong, China, and Kiobe, Japan, to Pacific ports, whence it is forwarded by rail, is a well known fact in the trade.

NEW YORK QUOTATIONS.

Following are the quotations at New York one year ago and one month ago, and January 29, the current date:

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, New York City), advises as follows: "Just around the turn of the year there was not much demand for paper for a few days, but since then it has picked up again, with a good market for the best rubber names at 4@4 1/2 per cent, and those not so well known at 4 1/4@5 1/2 per cent, about the same as in December." Mr. Beers supplied the following statistical tables, which are of interest:

NEW YORK PRICES FOR DECEMBER (NEW RUBBER).

	1913.	1914.	1915.
Upriver fine.....	\$0.72 @ 0.76	\$0.70 @ 0.76	\$0.68 @ 0.87
Upriver coarse.....	.44 @ .47	.31 @ .58	.57 @ .72

Plantation Rubber from the Far East.

EXPORTS OF CEYLON GROWN RUBBER.

(From January 1 to December 13, 1914 and 1915. Compiled by the Ceylon Chamber of Commerce.)

	1914.	1915.
Great Britain.....	19,564,359	22,895,044
United States.....	9,175,991	17,856,681
Belgium.....	2,984,009
Germany.....	1,037,415	844,977
Australia.....	119,175
France.....	320,152	559,202
Japan.....	269,014	362,661
Russia.....	105,215	322,200
Straits Settlements.....	42,746	119,933
Italy.....	1,772
India.....	1,050	1,850
Canada and Newfoundland.....	392,495

Totals..... 34,120,895 43,264,723

(Same period 1913, 24,579,664 pounds; same period, 1912, 13,167,917)

The export figures of rubber given in the above table for 1914 include the imports re-exported. (These amount to 3,581,356 pounds.) To arrive at the total quantity of Ceylon rubber exported for that period deduct these imports from the total exports. The figures for 1915 are for Ceylon rubber only.

SINGAPORE.

Guthrie & Co., Ltd., report [December 9, 1915]: For this week's auction 310 tons were catalogued, and unfortunately it was again found impossible to complete the sale in one day.

On Wednesday morning there was a good demand which was maintained until the lunch interval, but in the afternoon proceedings dragged to some extent. Today the market was much quieter and prices generally marked a material decline from yesterday's levels.

Ribbed smoked sheet averaged about \$187 per picul, an advance of \$24 on the week. For one lot \$200 was paid, but this was of course a purely artificial price. The market was in great demand at about \$187 per picul, all lots readily finding buyers. The lower grades also moved off freely at substantially increased figures.

Of the quantity catalogued 262 tons were sold.

The following was the course of values:

	In Singapore Picul.*	Sterling equivalent per pound in London.	Equivalent per pound in cents.
Sheet, fine ribbed smoked.....	\$179 @ 200	3/ 4 @ 3/ 9	82.35 @ 91.22
Sheet, fair to good ribbed smoked.....	166 @ 179	3/ 1 1/2 @ 3/ 4 1/2	76.77 @ 82.35

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

DURING January the market has maintained the same features which characterized the business for December. The demand in all lines has been steady and prices have remained very firm. The advances in prices in all lines being retained without exception. There is an excess of demand over production in such lines as lithopone, zinc oxide, aniline oil and benzol. Lithopone and zinc oxide supplies, both domestic and foreign, are practically fully contracted for several months to come.

The following are spot prices current on the London market, January 8: Benzol, 90%, 25@26 cents; red lead, English, per ton, \$171; white lead, English, \$179 per ton; flowers of sulphur, \$58 per ton.

MARKET FOR COTTON AND OTHER FABRICS.

EGYPTIAN COTTON.

LATE in the month the cables announced the indefinite closing of the cotton exchange at Alexandria, Egypt, due to the highly speculative character of the market that had become demoralized by the difficulties encountered in shipping.

COTTON DUCK

The mechanical duck situation has not materially changed during January and the market activity, particularly in the heavy grades that prevailed during the past month, continues at present. The mills are all running at full capacity and the question of delivery rather than price is the principal factor in writing contracts.

Hose and belting duck have advanced; the former selling at 26-27 cents and the latter at 25-26 cents. The mechanical goods trade has been improving steadily and several large buyers have been written up for delivery, covering the greater part of 1916.

DRILLS AND OSNABURGS.

The demand continues to be heavy* and severely taxes the efforts at the mills to meet the situation with increased production. The calls for wide drills, particularly the 52 and 60-inch, are insistent and deliveries are now being written for July. Prices have undergone an upward change of one-quarter to one-half cent the yard, in the entire list and are firm at the quoted figures.

There are no stocks of osnaburgs in sight and prices have advanced a half cent and one cent the yard on certain grades. Deliveries can not be made before May.

TIRE FABRICS

The shutting off of the supply of Egyptian cotton has strengthened the position of Sea Island fabrics and still higher prices are frankly predicted. Sea Island building fabric has advanced 6 cents and Egyptian combed shows a gain of 5 cents during the past month. Inquiries from recently formed firms indicate that the number of new tire plants is steadily increasing, giving added support to the fabric manufacturers' estimate of 15,000,000 tires as the production for 1916.

YARN DYED GOODS.

The general condition has undergone little change during the past month with the exception of prices which are still advancing. All former quotations have been withdrawn and new business is done at prices ruling on the day the orders were taken. Until the present time it has never been necessary on the part of the mills to accept orders conditional on the supply of materials. But now all orders are taken subject to the condition that the mills will be able to procure the necessary dye stuffs to complete the contract.

The following are New York quotations on January 29, 1916:

BENZOL PRODUCTION.

Before the European war the demand in the United States for benzol and toluol products was so small and the price so low that but one company sought to recover them on a large scale. Late in 1914 the price of benzol, and particularly toluol, rose to such a point that many other companies began to build plants to recover these oils, and by the end of 1915 there were 19 new plants for benzol recovery in operation and others in course of erection.

Reports indicate that the output of benzol and other light oils in 1915 amounted to 13,942,763 gallons. In the 6,620,093 gallons of oils refined at the place of recovery, there were 4,833,939 gallons of 100 per cent benzol, 1,315,727 gallons of toluol, and 470,425 gallons of solvent naphtha.

The annual capacity of the benzol recovery plants now in operation is estimated at over 20,000,000 gallons, and with the completion of plants now building will probably exceed 22,000,000 gallons. The value of these products is indicated by the price currently reported during the year. Benzol, normally selling for 20 cents or less a gallon, in September brought as high as \$1.25 for immediate shipment and 65 cents on contract; toluol, with a normal price of 25 cents, was sold for as much as \$6 a gallon for immediate delivery and was contracted for at \$4.25 per gallon.

with scarcity of materials and
 es, is the chemist more neces-
 ever to the rubber manufacturer.

TABLE OF CONTENTS ON LAST PAGE OF READING.**PREPAREDNESS AND THE RUBBER TRADE.**

THE rubber manufacturers of the United States, through the action and intelligent work of the Preparedness Committee of the Rubber Club, are rapidly getting into line for a most vigorous and practical campaign. They have not been side-tracked by such questions as how many atomizers could be mobilized for hospital use in the event of war. They are driving straight at the mark, which is men, munitions, in fact, the real factors of national defense.

The first committee of four, Messrs. Price, Work, Mitchell and Colonel Townsend, has been expanded until it takes in all of the firm members of the Rubber Club.

President Firestone, ex-President Hodgman and Secretary Vorhis with the Preparedness Committee, are hard at work organizing a campaign that shall be so comprehensive, forceful and sane that it will appeal to every true American.

To quote from one of the big rubber companies: "The safety of America depends upon the part which the business world plays in the immediate future in achieving industrial mobilization, and assisting the government towards a more business-like administration."

THE AMERICAN RUBBER EXPORTS IN 1915.

THE year 1915 broke all records for American exports, the value of which amounted to \$3,550,915,393, against \$2,113,624,050 for 1914, and \$2,484,018,292 for 1913. It is, however, hardly fair to judge the volume of the 1915 exports by their money value, as many of the products were sold at "war prices," materially in advance of those obtainable in normal times.

Exports of rubber goods in 1915 were made on an extensive scale according to official reports that have just come to hand. They amounted to \$24,415,906, more than double those of 1914, and nearly double those of each of the three previous years. An examination of the statistics, published elsewhere in this issue, exhibits some interesting comparisons.

The increased exports of automobile tires in 1915 is really stupendous. During last year \$11,415,481 worth was shipped, against \$3,315,116 in 1914 and \$3,910,688 in 1913. A comparison of the destination of these tires is interesting. England bought \$6,689,584 worth against \$1,458,777 the year previous; Canada received one-third more than in 1914 and Mexico and the Philippines twice as much. Tires valued at \$920,542 were exported to Cuba and Australia in 1915. The statistics for 1914 show no exports of tires to these countries. In 1914 Germany and Belgium received \$82,218 worth of tires, but none are shown for 1915. To other countries not enumerated the report shows exports of \$2,165,112 in 1915 against \$674,306 in 1914.

The above represent only automobile tires. Exports of all other tires, truck, motorcycle, bicycle, etc., in 1915, amounted to \$1,995,319 or over four times that of the previous year.

Spectacular increase was also exhibited in rubber boots which were exported in 1915 to the value of \$1,228,681, practically twice the 1914 value of \$616,602, and more than four times that of 1913, when \$282,598 represented the exports.

The value of rubber shoes slightly exceeded that of previous years, the exports being \$1,475,697 in 1915, \$1,402,503 in 1914 and \$1,008,167 in 1913.

Belting, hose and packing were sent out in slightly reduced amounts. The comparative figures are: \$2,012,556 in 1915, \$2,098,506 in 1914 and \$2,486,843 in 1913.

Under the classification of all "other rubber manufactures" in which druggists' sundries and insulated wire and cables play an important part, the exports in 1915 amounted to \$5,100,959 against \$3,016,098 in 1914 and \$3,767,554 in 1913.

Scrap rubber exports show material losses. The exports for the year were \$356,350, which is about \$52,000 less than in 1914, and less than half as much as in 1913. Reclaimed rubber also exhibits a slight decrease, although during 1915 it was exported to the value of \$830,836.

The statistics represent a condition that is exceedingly gratifying. Whether the high record of the present year will equal or exceed that of 1915, is yet to be determined. The countries to which the greatest amount of rubber goods was sent in 1915 are placing their factories in condition to supply more and more of their war requirements. Money in Europe is being spent less freely than a few months ago, and unless American rubber manufacturers make a strong effort to increase their export trade in markets other than European, it would not be surprising to see the 1916 figures smaller than those for 1915.

THE RUBBER CLUB'S NEW PRESIDENT.

THE rubber trade is to be congratulated upon the election of Harvey S. Firestone to the presidency of The Rubber Club of America, Inc. Heretofore, the chief executives of the association have been eastern men drawn from the rubber centers close to Boston or New York. Mr. Firestone comes from Akron, the greatest rubber city in the world. Accustomed to big things accomplished with the speed of magic, he is not likely to be too much hampered by precedent or controlled by convention.

He is also a self-made man who has known the day of small beginnings. He has fought his way upward, not by pulling others down, but by helping them up with him. Today, as the head of one of the great rubber companies, he is the same capable, friendly, unassuming gentleman that he was at the beginning.

A wonderful organizer, he has surrounded himself with young enthusiastic "live wires," and this same faculty is sure to be of value to the Rubber Club.

Finally, he is fortunate in having a breadth of view

that is unusual. His pioneers long ago explored and reported upon the sources of wild and planted rubber in tropical America and the Far East, and have kept in touch ever since. When, therefore, the question of rubber preparedness really comes to the front, the head of the world's greatest rubber organization will be amply fitted to handle it.

Welcoming the new president should not lead to forgetfulness of the very capable gentleman whom he succeeds. For more than two years, Mr. Hodgman has lived with and for the Rubber Club. His concentrative attention to detail, his courtesy, his full appreciation of the work of others have left an impress for good upon the association that will not soon be effaced. None the less sincere because unspoken, he has the confidence and thanks of the whole trade.

CRUDE RUBBER DISTRIBUTION.

BASED on the estimates of the distribution of crude rubber that appeared in our February issue, a comparison between 1915, a war year, and 1913, a peace year, shows some very interesting facts.

England in 1915 received 33 $\frac{1}{3}$ per cent more rubber than in 1913. Germany and Austria 82 per cent less and France 22 per cent less. Russia showed an increase of 39 per cent and the United States and Canada together gained 90 per cent. The world's total crop in 1915 was 38 per cent larger than in 1913, a most satisfactory increase.

Statistics are very useful as an aid in determining probabilities if all important factors are obtainable. If not, deductions made are not only useless, but sometimes lead to absurd conclusions. For example, suppose one should take the percentages of increase or decrease above as a means for calculating the distribution of rubber in 1925.

Figured thus, England would consume over 100,000 tons of crude rubber. Germany and Austria, by the same process, would distribute two-thirds of a ton between them, and France's apportionment would be 2,000 tons. Russia would get about 80,000 tons, Italy, 50,000 tons, and 128,000 tons would be divided between Japan and Australia. The United States and Canada, by the same reasoning, would obtain 2,216,000 tons, about 25 times the 1915 receipts.

The percentage of increase in plantation and wild rubber for the two years shown above is 38 per cent, which would give for a world product in 1925 (perhaps) 730,000

tons, or less than one-third of the total which the United States and Canada together are estimated to receive. *Reductio ad absurdum.*

THE PROPOSED TARIFF COMMISSION.

TARIFFS up to this time, with the exception of the Act of 1883, have been the work of the Ways and Means Committee of the House of Representatives, assisted in a greater or less degree by business men. Then going to the Senate, these measures were recast and often greatly changed by its Finance Committee. Finally, a conference committee of the two bodies made additional revisions and compromises so that the bill could receive the approval of Congress. The resulting measures have generally been inadequate, unbalanced, and abounding in incongruities that brought justice to neither manufacturer nor consumer.

During the past few years a strong movement has developed to take the tariff out of politics. Business men and some politicians have concluded that more deliberate and exact knowledge was requisite for the proper enactment of future tariff legislation. The war has brought home the realization that, when peace is again declared, prompt measures will be needed to meet the changed conditions and to properly guard the interests of American producers.

With the approval of President Wilson, Representative Rainey of Illinois, the ranking Democratic member of the Ways and Means Committee of the House, has introduced a bill providing for a commission of five members, not more than three of whom shall be of the same political party. This measure, which the best opinion in Washington expect will become a law before the end of the present session, gives broad powers for the investigation of customs laws and their effects and on all questions relating to tariffs, with a view to arrangement of schedules. Commercial treaties, statistics, and unfair foreign competition are among other subjects to be looked into.

The unusual powers of examination and investigation, as proposed in this bill, have rightly met with some criticism, such as, "The right to copy any documentary evidence of any person * * * engaged in the production, importation or distribution of any article under investigation * * * and to require any person * * * to produce books or papers." The production of documentary evidence and the attendance of witnesses under the terms of the bill may be

required "from any place in the United States to any designated place of hearing." Penalties are provided to enforce compliance.

Manufacturers of rubber goods, like those in other lines, will not endorse the features of this bill that make attendance at hearings compulsory and that require the opening of their books to the commission whenever demanded. They will, however, be glad to have the next tariff adjustment made on an intelligent and scientific basis.

The creation of a permanent tariff commission is a step in the right direction. Some day, perhaps, its powers will be extended to the fixing of tariff rates, somewhat in the way that the Interstate Commerce Commission determines transportation charges. Then the tariff commission, if judiciously conducted, should prove a power for developing an increased national prosperity and would prevent the unfortunate business slumps that usually accompany tariff revisions.

THE GOLF BALL.

THE golf ball as used for centuries was made of feathers compressed within a leather case. Then for a few decades solid gutta balls were generally used. They were good, but better were demanded, and America supplied the need.

The feather ball had a peculiar slow resilience that helped to secure long flight; the gutta had a better slow rebound; but the stretched rubber threads of the "Haskell" gave a slow resilience, better than that of its predecessors.

The Haskell patent expires next month and this country is threatened with an invasion of English-made balls. How seriously this will interfere with the American product is a question.

When the Haskell ball was invented, there was comparatively little golf played here. Now, Jerome D. Travers, the national open golf champion, estimates there are 1,300 golf clubs in the United States with a combined membership of 350,000. He says that the average player spends \$20 a year for balls—a total of \$7,000,000.

Assuming that the average golf ball costs 50 cents, 14,000,000 balls are required annually to supply American players alone. And golf is becoming more and more popular every year.

The amount of tire scrap is increasing—183,000 tons of casings and tubes are estimated for the United States this year.

SIXTEENTH ANNUAL BANQUET OF THE RUBBER CLUB OF AMERICA, INC., AT THE WALDORF-ASTORIA, FEBRUARY 2, 1916.

The Rubber Club's Sixteenth Annual Banquet.

"PREPAREDNESS" was the keynote of the gathering, the talk of the diners and the principal topic of the excellent after-dinner speakers at the sixteenth annual banquet of The Rubber Club of America, Inc., which was held in the Myrtle Room of the Waldorf-Astoria, New York City, on Wednesday evening, February 2.

Most of the same leaders in the rubber industry who have attended the previous dinners were present, but the number of diners was increased to 288, nearly 100 more than assembled in the same place in 1914. Many of the members had come from long distances to attend the function, whose influence was to weld closer friendships and promote mutual good will.

The diners met in a reception room and many reunions of friends were witnessed before the banquet was served. On entering the banquet hall, decorated with American flags, the guests found at each place souvenirs in the form of a silk American flag and a silver pencil, and also an attractive programme and menu on the front of which was handsomely embossed an American flag.

After an invocation by the Rev. George R. Van De Water, D. D., the diners enjoyed an excellent repast and enthusiastically participated in popular and patriotic songs.

TOASTS TO THE DEFENDERS.

After the dinner Ex-President Hodgman proposed three toasts: one to the President of the United States, another to "our first line of defense, the United States Navy," and the third to "our next line of service, small but willing to grow, the United States

Army." These were drunk with much enthusiasm amid great applause.

He then read a cablegram of kindly greeting and good wishes from the chairman and council of the Rubber Growers' Association and a telegram from Dudley Field Malone, collector of the Port of New York, regretting that official business had called him from the city.

MR. HODGMAN'S ADDRESS.

Ex-President Hodgman continued with the following address to the assembly:

Since our last banquet two years ago, history has been in the making at a rapid rate, more so than ever before in the memory of man. When we met together before, the whole world was at peace; now over one-half of it is plunged in war.

In these days of the supposedly higher civilization, it almost seems impossible that this should be, but we have evidence on every side that it is only too true, and our own country, although remote from the scene of actual hostilities, cannot but feel the influence of the conflict which is raging on the other side of the earth.

Our own industry, like many others, has been affected, for we have seen during the past 18 months practically all of the raw materials which enter into the manufacture of our products increase in price, some to an unprecedented degree, and there have been times when the uncertainty of procuring the necessary supplies to run our mills has been very acute.

This all goes to prove that, in spite of the immense resources of the United States, there are industries, such as ours, which are entirely dependent upon foreign sources for the essentials which enable us to make our livelihood. While this is a situation which in the nature of things cannot be remedied, it certainly furnishes much food for thought.

In the crisis which arose in the latter part of 1914, when it seemed possible that we might be deprived of the greater part of our supply of crude rubber, because of the activities of the Rubber Club of America this peril was averted, which clearly shows that an organization such as ours is a real necessity, and not only in a crisis like this, but in many other ways can serve and foster the industry which we represent.

While the United States has been, and we fervently hope will remain, at peace, yet we cannot but give serious attention to the lessons which the great conflict in Europe has taught us. To the vast majority of the people, two years ago, the thought of such a war was impossible, almost unbelievable, but nevertheless the war *did* come, and has developed into the most stupendous conflict of the ages. As the unbelievable has once happened, who can now predict that it may not happen again, and some time involve this fair land of ours?

With these facts before us, it behooves us as a nation to awaken, and place ourselves where we will be able with full confidence adequately to defend ourselves against a foreign attack, and not subject ourselves to the humiliation which in our present defenseless condition would be inevitable.

I, therefore, fervently hope that the patriotism, which has shown itself in crises in the past, may rise again to the same lofty heights, and that we as a people, irrespective of party or creed, may make it our absorbing purpose to let nothing stand in the way of preparing ourselves to defend our country and our flag against the worst that may come.

In this worthy cause the rubber industry of the United States should do its part, and I trust that the action taken

"Good night. My grief lies onward and my joy behind!"—SHAKESPEARE.
"Now I deal with water and not with wine!"—BEN JOHNSON.

at our annual meeting this afternoon will merit the hearty approval and receive the enthusiastic support of our membership.

Although this is a social and not a business occasion, I wish at this time to extend my appreciation for the cordial support which has aided me during my term as president of the Rubber Club of America. I bespeak for your new president the same cooperation and consideration which you have given me.

Many of the attempts to regulate our business affairs by Congress, during the past decade, have been based upon theory rather than on facts. The Federal Trade Commission is making a serious effort to secure actual facts concerning business on which intelligent legislation may be based, and at the same time is in position to advise the manufacturer or merchant on any proposed action which might be open to question.

EDWARD N. HURLEY ON THE FEDERAL TRADE COMMISSION.

Edward N. Hurley, vice-chairman of the Federal Trade Commission, after calling attention to the fact that the Rubber Club, as a strong and active organization, had grasped the modern idea

of collective business effort, told of ways in which the commission hoped to assist American industries. Then, speaking regarding the conditions in manufacturing industries he said, in part:

In a brief survey which we made of a typical manufacturing industry, which is well and favorably known and sells its product in every state in the Union, figures received, covering the year 1914, showed that 27 of the larger manufacturers, all shipping over \$100,000 worth of goods a year, with an aggregate capital stock of \$9,000,000, bonds and other indebtedness of \$3,500,000, and total sales of \$8,500,000, had a net income of only \$300,000, which is three and one-third per cent on the capital stock, or three and one-half per cent on the sales. This does not indicate a very profitable business.

PHOTO BY MURPHY.

HON. EDWARD N. HURLEY.

The most striking feature which appeared, however, was the fact that these concerns, with a total investment of about twelve and a half million dollars, and net sales of eight and a half millions, charged off only \$69,000 for depreciation. Furthermore, this amount was charged off by 12 of the 27 concerns, which represented an investment of four and a half million dollars and sales of four million dollars. The other 15 concerns, with an investment of eight million dollars and sales of four and a half million dollars, did not charge off one penny for depreciation. This example is typical of other industries. Similar conditions have existed in many lines for years.

Leaving out of consideration the banking, railroad and public utilities corporations, and referring only to those that have to do with trade and industry, we find that there are about 250,000 business corporations in the country. The astonishing thing is that over 100,000 of these report no net income whatever. In addition 90,000 make less than \$5,000 a year, while only the 60,000 remaining, the more successful ones, make \$5,000 a year and over.

In tabulating the data for the large and successful corporations in the United States, comprising all the corporations doing a business of \$100,000 a year or over, we found that, out of a total of 66,000, 30,000 charged off no depreciation whatever.

How can the Federal Trade Commission help to improve conditions?

The Commission has no intention and no desire to use compulsory methods. But it does hope to reach the desired end by encouraging improvements in accounting practice, by indorsing standard systems of bookkeeping and cost accounting, and by assisting in devising standard systems, either at the request of individual merchants and manufacturers or through the association that represents the industry.

We must get down to the hard facts of business, to learn precisely what they are, where the weakness and losses exist, and practice the same thoroughness which characterizes trade and industry in Europe. We must be improving our methods of production, changing our designs to meet the new conditions both at home and abroad, and always endeavoring to adopt some new method that will reduce the cost of operation. We also need to standardize our products and processes.

In Germany every important industry is organized into trade associations and 85 per cent of the manufacturers engaged in those industries are represented in their respective trade associations. More than 600 independent associations of manufacturers, producers and merchants exist in Germany today and besides the entire industrial system of that country is honey-combed with about 5,000 subsidiary business organizations.

The war has brought to us great opportunities and equally great dangers. The thought that we must keep in mind is: "After the war, what?" Shall we grow and expand while the growing is good, or calmly wait the time when peace in Europe will be followed immediately by keen competition not only in foreign markets, but in our domestic markets as well?

Let us seek better organization and greater efficiency at home; let us push our trade abroad; let us develop our industry so strongly that no foreign competition can dislodge it. Industrial preparedness must be our watch-word.

HENRY D. ESTABROOK ON
PREPAREDNESS.

Henry D. Estabrook, of New York, was introduced and made a strong and eloquent plea for preparedness, extracts from which follow:

I would rather scrap every gun and warship we own, if we are not going to add to them, for if we were without strength to repel invasion, we could at least plead the privilege of the weak and surrender with discretion, and rely on the moral claim on the part of the invader, but to fight half-armed and with a certainty of losing would be nothing short of murder for which you and I and every taxpayer in the United States would be measurably responsible.

We are admitted no alternative. We must spend money for defense forthwith, and lots of it. We must know we are safe even from the temptation of attack. Our peace and future happiness depends upon it.

"To prepare for war," said Washington, "is one of the most effective ways of preserving peace. A free people should not only be armed, but disciplined. To that end a uniform and well digested plan is requisite."

This plan should come from our military experts. In so far as their recommendations were unanimous, they should be adopted without much debate, and regardless of cost, with the understanding always that the sole purpose to be subserved is defense and not aggression.

This obviously means a big navy, as big as any navy in the world, with every flying, diving, amphibious auxiliary that can add to it. It means ammunition to boot, ammunition, at least, for a year's campaign always in cold storage. It means enough officers and men easily to operate the machinery of the government. And, inasmuch as this machinery will be complicated and scientific, it means officers and men of technical training and brains. Men like these can always obtain lucrative employment in civil lines. The government must outbid that market.

Insurance costs money. America has more things of value to insure, and more money to pay the premium than any nation in the world.

There is no better auxiliary to a navy than a merchant marine, nor is there any instrumentality that adds more to the riches and glory of a nation. Time was when our flag covered the seven seas; when the ocean highways, costing nothing for repairs, were as much ours as England's.

(C) Woodward & Underwood.
HENRY D. ESTABROOK.

The government cannot compel Americans to build ships. The government can only tempt and coax them. The cheap-est encouragement it can offer is to permit them to compete on an even keel with the shipowners of the world. If to do this involves subsidies, then the government must equalize conditions or go without the ships.

REV. W. WARREN GILES.

millions of men who do not know a quick-firing gun from a ton of coal. We have some good soldiers, but they are not good soldiers to-night.

The thing that burdens me more than anything else today is our loss of chivalry. As a nation we have no national ideals. Over in Germany they are all Germans; in France, all French; if you go into Canada tonight you won't find a thing but Canadians; and less than nine millions are able to raise an army of five hundred thousand men; and you may be assured they are good soldiers.

But in this country tonight we have Anglo-Americans, and German-Americans, and we have French-Americans, and

HON. HARRY M. DAUGHERTY.

THE REV. MR. GILES PROVOKED MUCH GOOD HUMOR.

The Rev. W. Warren Giles, of East Orange, New Jersey, who has the well earned reputation of being one of the most entertaining after-dinner speakers in the country, followed Mr. Estabrook with an address full of rare wit and humor intermingled with serious and thoughtful appeals for adequate preparedness. Referring to this subject, he said:

It is foreign invasion that I am afraid of, and I do not know of anything to prevent it, that I have seen on this side of the ocean, as yet. Certainly not an army of fifty thousand men, certainly not a quick-firing gun from a ton of coal. We have some good soldiers, but they are not good soldiers to-night.

Over in Germany they are all Germans; in France, all French; if you go into Canada tonight you won't find a thing but Canadians; and less than nine millions are able to raise an army of five hundred thousand men; and you may be assured they are good soldiers.

HON. HARRY M. DAUGHERTY ON COMMERCIAL PREPAREDNESS.

The Hon. Harry M. Daugherty, of Columbus, Ohio, was introduced by Ex-President Hodgman as standing for "bread, butter and business; also for peace, protection and prosperity." Mr. Daugherty called attention to the fact that during recent years envy, avarice and suspicion had grown throughout the world.

After a broad review of the political situation, he said:

Coming from Ohio and seeing here tonight men who come from my proud state, I can say to you that Ohio is in favor of an ample preparedness, of the establishment of a merchant marine, and in lending governmental aid and assistance to the construction of utilities upon the oceans that will carry American trade to every market in the world.

We are in favor of enacting such laws as will take care of the situation in this country industrially when this war is over, of protecting America and American capital and American labor.

I do not tonight have any fear of an attack upon us, yet to avoid any attack I believe in preparedness, but when this war is over, the invasion that we had better look after is the industrial invasion. Every soldier on the battlefield

and in the trenches in this war, when he returns to his devastated country, will go into the mills and shops and work for wages lower than he ever worked for before and the foreign manufacturer will be willing to sell cheaper than he ever sold before, and ours, excepting his own home market, will be the greatest market in the world. We will have the money, and this is the market they will invade.

MAYOR MITCHEL IS FOR A CITIZEN RESERVE.

John Purroy Mitchel, mayor of New York City, the next speaker, pointed out that regardless of how high the devotion of a people for peace or how high a nation stands for justice, that it is a fundamental duty of every citizen to take such steps as will secure peace and perpetuate the institutions that have been built up. He then made a strong plea for preparedness, in which he said in part:

Copyright 1913 by Campbell Studio.

HON. JOHN PURROY MITCHEL.

warfare comes that is inevitable, defending American interests at home and abroad a navy that will be second to that of no other nation.

However good our navy, however effective our coast defenses, every military and naval expert will tell you that we must have at least the material out of which an effective

CAPTAIN ERNEST E. BUCKLETON.

CAPTAIN BUCKLETON ON THE BELGIAN CONTRIBUTION.

Captain Ernest E. Buckleton, president of the Northwestern Rubber Co., Liverpool, England, who was relieved from service at the front when injured by the explosion of a mine, was asked by the toastmaster to speak. Referring to the contribution made last year by the Rubber Club for the Belgian refugees, he said:

I would like to take this opportunity first of expressing to you the thanks of the Belgian refugees in Liverpool for the magnificent gift which the members of this Club, collectively and individually, sent to me last year to be used on their behalf.

There are a great many of you perhaps that do not know

We want defenses. We want an adequate navy, and an effective citizen reserve out of which we can constitute a mobile army not to make war, but to prevent war. We want to make ourselves so potentially formidable to any nation and to all nations that no nation will seek a quarrel with us.

With the seaboard that we have to defend, with the commercial interests that are now fast growing, with the commercial relations that will exist when the war in Europe is over, when that commercial we should have as a means of

mobile army can be made within a reasonably short period of time. That material does not exist today. We have the barest nucleus of a standing army. We have at the utmost, with standing army and militia combined, not more than ninety thousand effective troops who could be put in the field today, and behind that today there is no citizen reserve. We ought to have federal control over the national guard.

We ought to have a citizen reserve made up of all the male citizens of the United States, within reasonable age limits, trained to the use of arms. That means neither militarism nor a great standing army, but the realization of the American ideal of a citizenship capable of bearing arms in case of need.

that a number of refugees came to Liverpool, and when I was over here in 1914, I made a remark to Mr. Pearson, of THE INDIA RUBBER WORLD, that it was my intention to do what I could for them. He took up the matter with the members and they made a most generous gift, which I can assure you has been thoroughly appreciated by those poor refugees. It has enabled me with the help of a great many other friends to take care of 30 or 40 women and children of the best class of Belgium who were forced to come to England on account of the war in their country.

THE "GAS MASK"

I am only a rubber manufacturer, but the rubber industry has enabled the world to help the unfortunate soldiers at the front, who are fighting today for what each one considers his duty and his right.

Photo Underwood & Underwood.
THE RUBBER GAS MASK.

The mask (shown in the accompanying illustration) is used to neutralize the chlorine gas used by the Germans in their attacks. They have it stored in large cylinders and at a favorable opportunity this gas is discharged and comes along in a low cloud. Immediately the discharge takes place, every soldier immediately puts on his helmet and he lives with it. He is never in the trenches without it. Perhaps the most curious sight in the world is to see a battalion with these helmets on.

The rubber industry is to be congratulated in being able to produce something which has saved the lives of thousands and thousands of men.

MEETING OF RUBBER SUNDRIES MANUFACTURERS' DIVISION.

The Rubber Sundries Manufacturers' Division of The Rubber Club of America, Inc., on February 2 held its annual meeting at the Waldorf-Astoria and re-elected the following officers for the ensuing year: Russell Parker, Parker, Stearns & Co., chairman; Charles J. Davol, Davol Rubber Co., vice-chairman; Harry S. Vorhis, secretary and treasurer. The members of the executive committee of this division are as follows: Russell Parker, chairman; Charles J. Davol; George B. Hodgman, Hodgman Rubber Co.; W. O. Rutherford, The B. F. Goodrich Co.; Frederick H. Jones, Tyler Rubber Co.; A. C. Eggers, Good-year's India Rubber Glove Manufacturing Co.; E. E. Huber, Eberhard Faber.

MEETING OF MECHANICAL RUBBER GOODS MANUFACTURERS' DIVISION.

The Mechanical Rubber Goods Manufacturers' Division held its meeting on February 2 at the Waldorf-Astoria, and re-elected the following officers: William T. Cole, Fabric Fire Hose Co., chairman; John J. Voorhees, Voorhees Rubber Manufacturing Co., vice-chairman; Harry S. Vorhis, secretary and treasurer. The executive committee membership is as follows: William T. Cole, chairman; C. C. Case, Revere Rubber Co.; George E. Hall, Boston Woven Hose & Rubber Co.; J. H. Kelly, Republic Rubber Co.; C. Edward Murray, Empire Rubber & Tire Co.; W. O. Rutherford, The B. F. Goodrich Co.; Henry Spadone, Gutta Percha & Rubber Manufacturing Co.; John J. Voorhees; George A. Wies, Eureka Fire Hose Manufacturing Co.

THE RUBBER CLUB GAINS MANY MEMBERS.

ANNOUNCEMENT has been made of material increase in membership of The Rubber Club of America, Inc. The firms together with the firm representatives are given below:

FIRM MEMBERS

Akron Rubber Mold & Machine Co., 917 Sweitzer avenue, Akron, Ohio; S. W. Harris.
Alden, Frank G., 29 Broadway, New York City.
Asbestos & Rubber Works of America, 1790 Broadway, New York City; Edward H. Garcin.
Batavia Rubber Co., Batavia, New York; W. P. Berrien or A. W. Caney.
Boston Yarn Co., 60 Federal street, Boston, Massachusetts; A. B. Greenough.
British-American Manufacturing Co., Springdale, Connecticut; L. C. Himebaugh.
Delton Tire & Rubber Co., Trenton, New Jersey; H. H. Coleman.
India Rubber Co., New Brunswick, New Jersey; Raymond B. Price.
Otto Isenstein & Co., 90 Wall street, New York City; Otto Isenstein.
LaCrosse Rubber Mills Co., LaCrosse, Wisconsin; A. S. Funk.
Mexican Crude Rubber Co., 625 Penobscot Building, Detroit, Michigan; Walter E. Parker.
National Rubber Co., 284 Hanover street, Pottstown, Pennsylvania; J. G. Feist.
Pharis Tire & Rubber Co., West Main street, Newark, Ohio; Carl Pharis.
Swinehart Tire & Rubber Co., 21 West North street, Akron, Ohio; Thomas F. Walsh.
Taylor, Armitage & Co., 346 Broadway, New York City; R. P. M. Eagles.
Werner & Pfeleiderer Co., 41 Park Row, New York City; F. H. Banbury.
Winter Son & Co., 64 Wall street, New York City; Arthur E. Winter.

ASSOCIATE MEMBERS

Parker R. Browne, Boston Rubber Shoe Co., Malden, Massachusetts.
Frank L. Slazenger, 12 East 43d street, New York City.
Alpheus W. Smith, 819 Royal Insurance Building, Chicago, Ill.
W. B. Stewart, Allcock Manufacturing Co., 274 Canal street, New York City.
Samuel Wright, 706 Fayette street, Conshohocken, Pennsylvania.

RETIRING EXECUTIVE COMMITTEE AND DIRECTORS MEET.

On February 1 a meeting of the executive committee of the Rubber Club was held at the Union League Club, New York City, with the following members present: President, George B. Hodgman; Frederic C. Hood, Henry Spadone, William E. Bruyn and Van H. Cartmell. Raymond B. Price, chairman of the temporary committee on preparedness, the other members of which were Bertram G. Work, Colonel Arthur F. Townsend and John K. Mitchell, rendered an interesting report.

The committee then met with the board of directors, the following being present at this meeting: Augustus O. Bourn, William E. Bruyn, Harry G. Fisk, George E. Hall, George B. Hodgman, Frederick H. Jones, William J. Kelly, Henry C. Pearson, Henry Spadone and Elisha S. Williams.

The Annual Meeting of The Rubber Club of America, Inc.

THE annual meeting of The Rubber Club of America, Inc., was held on February 2 in the Myrtle Room of the Waldorf-Astoria, New York City.

After the reading of the minutes of the previous meeting, President George B. Hodgman presented the following interesting report, in which the activities of the club are described in detail:

REPORT OF THE PRESIDENT.

At the end of my term as your president, I submit for your consideration the official report due from me, as a mere outline of the accomplishments of your organization.

To your Board of Directors, to your Executive Committee and to the Rubber Control Committee is especial credit due for what you may find of merit in the transaction of the past year, such as increasing membership benefits, broadening the scope and work of the organization, and adding to its prestige and standing in trade circles. In this work you have had the gratuitous services of responsible men of affairs, singularly disinterested in their efforts to advance this organization to a position of dignity and worth in the commercial world. Since the last annual meeting of the Rubber Club, on April 21, 1914 (as our meeting of 1915 was omitted owing to the radical changes in our organization), the story of our progress is replete with interest.

Rubber Embargo:—The most important event during this period was the placing of the embargo by Great Britain on plantation rubber produced in her colonies. This unforeseen and sudden action brought consternation to our manufacturers, who saw before them the possibility of crude rubber supplies being so materially reduced that serious hardship would be imposed upon the industry, and in the light of subsequent events, to which I shall only briefly refer, the necessity and worth of your organization was proven.

Following the embargo, your Executive Committee appointed a committee of four, consisting of A. H. Marks, W. E. Bruyn, H. Stuart Hotchkiss and myself, to whom was delegated the task of endeavoring to find some means to alleviate the situation. This committee made frequent visits to Washington, covering a period of two months, and there made dignified representations to the State Department and to the British Embassy, and also co-operated with the Rubber Trade Association of London. B. G. Work also made a special trip to England, as a representative of the Rubber Club of America.

In the month of January, 1915, Great Britain raised the embargo on rubber, but because of the war, her necessities and her control of the situation, she dictated and imposed the conditions under which manufacturers were to secure their supplies. She devised a system whereby permits were issued in London for the shipment of rubber to the United States, consigned to the British Consul-General in New York, where such shipments were only to be released in consideration of the manufacturers and importers giving individual guarantees binding themselves not to export crude rubber, or manufactured, or partly manufactured rubber goods to the enemies of Great Britain, and also binding themselves to observe other requirements in respect to the shipments of manufactured goods to other countries.

The details necessary for the recording of guarantees and tracing the shipments covered thereby were found to be of such a cumbersome nature that the British Consul-General at New York requested the Rubber Club of America to assist him in the handling of this matter. Accordingly, and with the acceptance of this work by your association, it was deemed necessary to enlarge our facilities to meet increasing activities. We therefore moved from our small quarters, at 17 Madison avenue, to 17 Battery place, where we have an office sufficient in size and a clerical force sufficient in number to handle the great volume of business. Your Board of Directors also deemed it advisable to constitute and appoint a committee whose duties would be to keep in touch with this work and to assist in clearing any possible misinterpretations of the letter and spirit of the British rubber guarantee.

This committee is known as the Rubber Control Committee. The problems which it has been called upon to meet have been many and intricate, and have called for the exercise of the utmost care and judgment. Violations of the terms of the British rubber guarantee have occurred, as was to be expected, but the British authorities are apparently assured that, in spite of them, the great mass of American manufacturers and importers are fulfilling their promises.

The rubber embargo was one of the most serious situations that ever threatened the American rubber industry. Its subsequent modification, however, makes it possible for us to secure our supplies of rubber. I cannot tell what future conditions in this connection will be, as new complications, due to the war, may arise. Considering, however, the abnormal and extraordinary conditions existing during 1915, we have little cause for complaint.

The members of this committee, often at the sacrifice of their personal and business interests, have given freely of their time, and are truly discharging a most important and unselfish service—how important and unselfish will only be realized when this great war is at an end and the complete history of the rubber embargo has been written.

Reorganization:—When the Rubber Club of America adopted its constitution and by-laws at a meeting in April, 1913, it was thought that adequate provision had been made to carry out the purpose and objects of the club as a business organization. After our main office had been established in New York City, and it was realized that we were to occupy a more important position in the commercial world, the necessity of possessing broader corporate powers became plainly apparent. With the assumption of the duties incident to the British rubber embargo, this need became imperative.

Under our former charter it was mandatory to hold our meetings in Boston, but as New York became the center of our activities, it was thought advisable to hold our annual meetings there. Accordingly, proper legal steps were taken to annul our Massachusetts charter, and to apply for the charter of a new corporation to be known as The Rubber Club of America, Inc. This incorporation was effected under the laws of the State of Connecticut on March 19, 1915. Its constitution and by-laws were adopted at a meeting held in April, 1915, which gave all of the powers required. Coincident with this reorganization, the annual dues of firm members were increased to \$50.00 per year, thus providing a sufficient income to meet our growing needs without, as in the past, levying extra assessments.

Legislation:—For the purpose of protecting the interests of the rubber trade against legislation, which might seriously and unjustly affect it, provision has been made in our new constitution for the formation of a standing Committee on Legislation. The duty of this committee is "to keep in touch with local, state and federal legislation affecting the rubber industry." When, in the opinion of this committee, and its counsel, proposed legislation is deemed to be of special interest to certain members, those affected will be furnished with a copy of the same. Our members are asked to co-operate with this committee, and to advise it of any matters which should be properly brought to its attention.

It is not without the range of possibility that the matter of tariff revision may again come before the country in the next few years, in which case your Committee on Legislation may find a larger field for usefulness. In connection with the tariff, it may be mentioned that our association is on the lookout for undervaluations and improper customs appraisements. I may add that the Rubber Sundries Division secured the adoption by the Board of General Appraisers of a list of such articles as should be entered under the druggists' sundries schedule of 15 per cent, thus clearing misunderstandings under this rather ambiguous schedule.

Group Membership:—In the last annual report I referred to the advantage of group membership, recommending the adoption of a clause in our constitution under which this could be accomplished. Such provision has been made in our new constitution and subdivisions of the manufacturers of mechanical rubber goods and of druggists' sundries have already been formed. These divisions have their own officers and have adopted rules and regulations harmonious with those of the main organization, and each is working out the particular problems which are peculiar to its own line. This division or group plan I consider of great value, and I hope that in the coming year other branches of the trade may join under it. As an example of the benefits of group membership, I may refer to the Credit Experience Bureau, which has been established by the Rubber Sundries Division, and which has proven of great value.

Arbitration:—The subject of commercial arbitration is one which is continually attracting more interest. This method of settling disputes, where decisions are based on submitted facts, has advantages that no one will seriously question. The Rubber Trade Association of New York has provided a plan of arbitra-

tion whereby disputes arising between members in the sale of crude rubber may be adjusted by this very satisfactory method.

It appears to me, however, that facilities for securing arbitration should be made easy and available to all of our members, and I sincerely trust that serious consideration may be given to the amendment of our constitution providing for the formation of

during the existence of the New England Rubber Club. We have continued the very excellent practice of holding a mid-summer outing in New England each year. An outing was held at the Vesper Springs Country Club in July, 1915, which brought together in an informal way many of our members from all sections of the country, and was indeed a successful affair.

a Committee on Arbitration, which will furnish the necessary facilities for the settlement of business disputes not only as between manufacturers and importers, but as between manufacturers and those to whom they sell and from whom they buy.

National Preparedness.—The subject of national preparedness is one of the vital topics of the day, and is in no manner a political question. A temporary committee has been formed to consider this important subject, and to report its recommendations.

Social.—The increasing activities of the Rubber Club along business lines have not resulted in any curtailment of the social features in connection with the club, which were so popular

Following the precedent established by many business and social organizations after the outbreak of the present war, we did not hold our annual banquet of 1915, but made contributions through subscriptions to the amount of \$2,623.60 to the American Red Cross, Belgian Relief Fund and other funds for the relief of the sufferers in Europe. Our banquet, which will be held this evening, will, therefore, be the first banquet held since that of 1914, and, of course, the first given under the auspices of our new organization.

Membership.—The Rubber Club has shown a most satisfactory growth in membership since our last annual meeting. At that time, April 21, 1914, we had 66 firm members and 258 active and

associate members, making a total of 324; on January 1, 1916, there were 191 firm members and 227 associate members, making a total of 418. It is significant that firm membership increased nearly 200 per cent. during this period, proving the need of this organization, and a recognition by the trade of its useful work. Unquestionably our future growth as to members will not be as marked as in the past. There are, however, desirable manufacturers who should be brought within our ranks, and each and every member should use his best endeavors to interest any concern whose membership would tend to strengthen our organization. Recent statistics collected by your secretary show approximately 430 rubber manufacturers in the United States.

Legal.—The necessity safely to legally guide your board, officers and committees becomes of increasing importance with the growth of the association. With the creation of your new organization your Board of Directors retained Sidney S. Meyers, Esq., as counsel. To Mr. Meyers our appreciation is due for the very able manner he has handled the association's legal business, but more importantly for his excellent and skillful service in handling many novel and delicate matters submitted by the Rubber Control Committee in connection with the British rubber embargo situation.

Conclusion.—I desire to call attention to the very satisfactory manner in which the work at our office is being performed, and particularly to give recognition to the capable and faithful services of our secretary, Harry S. Vorhis. In the handling of delicate situations Mr. Vorhis has exercised tact and discretion in the promotion of the usefulness of this organization he has shown untiring zeal. Under his direction all branches of our work are going forward with smoothness and efficiency.

Our appreciation is also due to the members of the Executive Committee for the energy and interest they have shown. The meetings of the Executive Committee have been well attended, despite the fact that some members have been obliged to travel a considerable distance to attend. Due recognition should be given to each member of the committee for his earnest and impartial service in your behalf.

In conclusion I take this opportunity of expressing my deep appreciation to the members of the Board of Directors, to the members of the several committees, and to the membership for their assistance, support and cooperation. On behalf of my successor and your new Board of Directors I ask that they be given the same admirable support and cooperation that has been accorded me.

NEW DIRECTORS ARE ELECTED.

The names put in nomination met with no opposition, and the following is a list of the new Board of Directors, which was elected by unanimous vote:

William H. Bruyn, L. Littlejohn & Co., New York City.
 Van H. Cartmell, Kelly-Springfield Tire Co., New York City.
 Harvey S. Firestone, Firestone Tire & Rubber Co., Akron, Ohio.
 George E. Hall, Boston Woven Hose & Rubber Co., Cambridge, Massachusetts.
 H. Stuart Hotchkiss, United States Rubber Co., New York City.
 Frederick H. Jones, Tyer Rubber Co., Andover, Massachusetts.
 William J. Kelly, Arnold & Zeiss, New York City.
 P. W. Litchfield, Goodyear Tire & Rubber Co., Akron, Ohio.
 J. S. Lowman, Philadelphia Rubber Works Co., Akron, Ohio.
 W. O. Rutherford, The B. F. Goodrich Co., Akron, Ohio.
 Henry Spadone, Gutta Percha & Rubber Manufacturing Co., New York City.
 Charles T. Wilson, Charles T. Wilson Co., Inc., New York City.

NATIONAL PREPAREDNESS.

President Hodgman announced that the question of national preparedness had been called to his attention in such a way that he had taken the responsibility of appointing a temporary committee to consider this matter. This Committee on Preparedness consisted of R. B. Price, B. G. Work, Colonel A. F. Townsend and J. K. Mitchell.

The report which was read by the chairman, Raymond B. Price, treated the subject of preparedness in a broad and comprehensive manner. The meeting directed that it should be printed and distributed, so that all in the rubber industry may gain benefit from it. This report was as follows:

REPORT OF COMMITTEE ON PREPAREDNESS.

When in August, 1914, the great European war broke out all the theories of the altruists were "knocked into a cocked hat," and the world was confronted with a condition. President Wilson has finally come to realize that this condition brought serious

responsibilities to his administration and it brings equally serious responsibilities to every intelligent American. Quoting President Wilson's speech of last Saturday in Cleveland, "Wherever there is contact there is friction," he referred to international contact. In this country we have insufficient contact. America to-day is a mob of individuals filled either with indifference or with pet theories, when the great need of the nation is for self-sacrifice and unity of thought and action. This is no time for half way measures. Either we must follow the lead of China, or we must prepare immediately to face the world with all the thoroughness and all of the organized resources of this country.

Last week I spent an evening with a group of leading naval, military and civil authorities, and the note of the evening seemed to be one of hopelessness—the fear that America could not and would not, because of her very habits of extravagance, indifference and lack of unity, rise in time to meet the present emergency. President Hadley, of Yale, who cannot be accused of being an alarmist, ten years ago prophesied that unless America changed its habits the end of democracy was in sight.

The need in this country is to arouse the public conscience, and for the business and scientific men of the nation to insist upon this country being run along scientific business lines. I shall not bother you with numerous details; but if you will read the pamphlets which have reached you, or which will reach you in a few days, those who have not already posted themselves will learn something of the military inefficiency of this country for the past 140 years. The lawyer and the politician plus the indifference of you and me have permitted the critical condition which exist to-day.

When one pauses to consider that in the face of the dangers visibly confronting us, our army and navy are still administered as separate and frequently antagonistic units, that in the Philippines we are constructing defenses approved by the Naval Board and opposed by army experts as inadequate defense against land attack, and those defenses are costing \$34,000,000; when we learn officially that the two battleships voted by Congress last March are not yet under construction, and that they have been apportioned to navy yards which cannot begin work on them for months to come; that the official intimation is that private yards that too busy to private work to handle government work; when reliable authority states that the private ship yards are in position to lay down 13 capital vessels immediately; when we remember that of the three largest battleships now under construction, the "Idaho," being built by the New York Shipbuilding Co., is 50 per cent. advanced as to hull and 36 per cent. as to machinery, but that the "California," authorized at the same time, and being built in the Brooklyn Navy Yard, is only 13½ per cent. advanced as to hull and 4 per cent. as to machinery; when we listen to the arguments in favor of Government-owned munition and shipbuilding plants because the private yards and manufacturers make excessive profits, and then listen to what our experts say that in case of need the combined public and private yards and plants will be inadequate to our needs, every thoughtful American must stop to think what this means to him, to his family and to his country.

Japan is building battleships in half the time that we require, and building both merchant and naval vessels to the limit of her financial and building resources. During the past year she added 650 sea-going steamers to her fleet, while we have surrendered our last important fleet on the Pacific Ocean. Again, consider that of the \$850,000,000 spent on waterways by Congress, a half billion dollars has been thoroughly wasted without benefit to the nation, and when we think how we ourselves smile at the mere mention of the public barrel and tolerate such rottenness, which is flaunted openly in our faces, the American business man has indeed an accumulated responsibility to meet.

Some years ago Senator Aldrich claimed that the Federal Government could save \$300,000,000 per year by applying ordinary business efficiency. About the same time Louis Brandeis claimed that the railroads of the country could save \$1,000,000 per day by adopting demonstrated efficiency methods. Since then, under the pressure of an inefficient government, the railroads have become efficient. It is now time that the efficient railroads should force an inefficient government to become efficient.

The business men and industrial leaders of this country in general, partially for political reasons, are in bad repute. Those of us who believe that American industries are founded essentially upon integrity and service have a right to take such action as will tend toward a just public opinion, without which business men will not be in position to do their full share in leading the nation towards safer conditions. When railroad men were unjustly assailed, they united and fought back, and to-day have won public sympathy.

The automobile industry represents an unprecedented industrial achievement. This has been accomplished by standardization, the result of scientific thoroughness, open-mindedness and willing-

ness to make distinct sacrifice on the part of individuals for the good of all. The industry, as it exists to-day, would have been utterly impossible with the jealousies, lack of cooperation and self-sacrifice common in the rubber industry. One small company in New Jersey at one time had 800 different styles of lock nut washers between the sizes of $\frac{1}{4}$ and $\frac{5}{8}$ inch. By standardization this number was reduced to 20. Many manufacturers were obliged to scrap expensive supplies to achieve this benefit of standardization, the result of which was that all manufacturers were able to obtain standardized supplies in large quantities at low cost, and in minimum time.

Something can be achieved along this line in the rubber industry by co-operation with the Government; but probably the greatest opportunity for the rubber industry is to set an example to other industries of this country, indicating that we, as rubber men and as individuals, realize our responsibilities and are prepared to make sacrifices to live up to them.

Figuring that there are over a quarter of a million people directly engaged in rubber work, and that these workers have an average of only three persons dependent upon them, there are 1,000,000 people directly dependent for their very existence upon uninterrupted supply of crude rubber, most of which comes half way around the world, and practically none of which is produced within our own borders. Even if this country is prepared against invasion, is it prepared to insure that uninterrupted supply of crude rubber, upon which a million lives depend? At least three maritime nations stronger than ourselves could stop that flow, even if we were nominally at peace.

Those who have had the responsibilities of facing embargo conditions a year ago realize better than the rest of us what this means to America. The adequate supply of crude rubber to the United States under the complicated international conditions now existing is by no means assured; and it is up to us of the Rubber Club of America to do our part wisely and well to prevent disaster. This cannot be accomplished by leaving the work to be done by any individual or by a committee. If every man is not willing to contribute his part the men conducting the rubber industry, which is more susceptible to injury than most other American industries, may have to face a terrible responsibility to employees, customers and stockholders.

Aside from the million directly involved and the other millions indirectly concerned, think of what a calamity it would be if the advantages of the beneficent services of rubber were suddenly eliminated! It has been stated that the country would be paralyzed if the telephone and the telegraph were suddenly destroyed. The day is almost here when the same can be said of rubber, and what depends upon rubber; and this is especially true of the needs of modern warfare.

We may think that the tariff question does not concern us as much as it does other manufacturers. Is it not conceivable, however, that the foreign countries which control the entire rubber supply of the world might easily manipulate their export regulations so that this country should receive little or no crude rubber, or at such prohibitive prices as to spell disaster to the industry?

Our present tariff contains no provision for international bartering or privilege. Our pork barrel, pension expenses and general governmental extravagance are preventing this country from having the visible naval power which chiefly compels concessions in time of extreme need. We have deliberately and voluntarily turned over to foreign nations the carrying of our products and the bringing of us of our raw material.

We have permitted our employees by hundreds of thousands to be misinformed and misled by agitators to their own ultimate danger and have not made the slightest effort to present to them the other side of the question. In a country where millions of people care not what flag they are under, we, the business people, have been strangely indifferent to our responsibilities in the field of patriotism, education, humanity and even common safety.

Much of the agitation for preparedness has been emotional. If the business and scientific men will unite in a thorough, persistent campaign, based upon logical business common sense, no man can foretell the result. What can the business and scientific men do? President Wilson and Secretary Daniels build better than they knew in forming the Naval Consulting Board, which is composed of conscientious scientific men trained to do things, and to do them thoroughly and quickly. They have organized themselves for results regardless of political pressure, and have secured the cooperation of the 38,000 members of the five leading scientific societies of the country.

Their plans are well under way, first, to investigate the manufacturing facilities of this country, and then to organize them. While I am not privileged to disclose their plans in detail, such as have come to me I can vouch for as being feasible and thor-

ough. Many scientific men occupy subordinate positions; so it becomes essential for the greatest speed in obtaining results to have the sympathetic cooperation and support of business men in this mobilization of American industries.

It is believed that a body of representative business men may be created and recognized by Federal executives, who can cooperate with the government experts and scientists of the country, not only to mobilize American industries, but to teach efficiency to the government itself. Each industry must be so organized within its own sphere as to be able to cooperate in this national scheme; and this is one of the opportunities for the committee on preparedness which is today proposed for the Rubber Club of America.

Every individual and every company has a direct and distinct opportunity to assist in this movement. The United States Rubber Co., for instance, has made an initial appropriation of \$1,000 to assist in the education of its employees. As a first move, specially chosen pamphlets are being sent to 4,500 of its most intelligent members, indicating the seriousness of conditions, pointing out some of the weaknesses, and suggesting that each individual should investigate the facts, form his own opinions, write to his congressman and senators, and talk with his friends and customers.

There must gradually be formed an intelligent public opinion crystallized along several specific lines. All of our resources for defense must be coordinated and directed by a national council of defense. Universal military training must be eventually recognized as the only safe and democratic support for our regular army. Every section of the country must be compelled to subordinate local advantage to national safety. General governmental efficiency and economy in administration at the expense of the pork barrel must be quickly achieved.

The budget system for appropriations must be generally applied. The tariff must be scientifically studied, and so applied as to stabilize industry in this country, and protect the interest of Americans both at home and abroad. An adequate merchant marine must be developed in conjunction with naval auxiliary needs along such lines as to standardize and insure the most speedy and economical production and operation.

Cooperation, rather than antagonism, must be fostered between government and private shipyards, factories and other activities. Trade and business associations should be encouraged and officially recognized as important media for coordination, mobilization and efficiency.

Thorough study must be made of the laws and conditions, whether state or federal, which unnecessarily restrict and hamper business activity. Where legislators are antagonistic to national welfare, dispassionate investigation of the causes should be undertaken to the end that the public shall know the facts.

Study should be made of the American cable system to make sure that foreign cable communication shall be as little as possible affected by international quarrels in which we are not directly involved.

An American navy, adequate to protect the 30,000 miles of coast line in this hemisphere, and to sustain the honor and ideals of America at home and abroad, must be built in the shortest possible time. American education and American patriotism must also feel the influence of the present need for unification. Human welfare, the greatest undeveloped asset of mankind, must receive sympathetic and thorough attention.

We have aliens in our factories and stores, and can help to make them safe. American citizens or more intelligent residents in our American atmosphere. The people who do not care what flag they are under can be shown that the working people suffer most when the enemy strikes.

Posters containing a concise statement of salient facts, based on well-known advertising principles, are being prepared for distribution in factories, offices, stores, etc. These offer the best means yet suggested for reaching the man who scoffs at literature and will not read a pamphlet. The fact that, of all nations in the world, America has more international policies, which challenge and antagonize the rest of the world, must be brought home to every American, whether from the point of view of taxpayer, voter, or of the one who desires to live in peace.

THE EXECUTIVE COMMITTEE ELECTS OFFICERS.

Immediately after the annual meeting of The Rubber Club of America, Inc., the new board of directors met and elected the following officers for the ensuing year:

President: HARVEY S. FIRESTONE, Akron, Ohio.
First Vice-president: VAN H. CARTMELL, New York City.
Second Vice-president: H. STUART HOTCHKISS, New York City.
Secretary and Treasurer: HARRY S. VORHIS, New York City.

HOW THE RELIEF FUND FOR BELGIAN REFUGEES WAS SPENT.

It will be recalled that the usual annual dinner of the Rubber Club was not held in 1915, the members having decided by a large majority to contribute the money generally spent for this purpose to the American Red Cross, the Belgian Relief Fund and other humane agencies that were relieving suffering caused by the war in Europe. The contributions were prompt and generous.

The money for the relief of Belgian refugees was turned over to Captain Ernest E. Buckleton, president and general manager of the Northwestern Rubber Co., Liverpool, England, who at that time was spending a few weeks in the United States. Captain Buckleton, who was well known among the rubber trade both in England and in this country, in addition to liberal contributions of money donated the use of a house that he owned in Liverpool for the refugees. This house, which was opened on October 17, 1914, gave hospitable accommodations to thirty-one refugees, principally women and children of the better class. The Rubber Club of America, Inc., through its generous contributions, has aided materially in supporting this worthy work.

The home is under the management of a housekeeper, and at present has but fourteen inmates. Sufficient funds are reported in hand to run it until April 1, when it is proposed to close the house and turn the refugees over to the Liverpool committee, together with any remaining funds. It is interesting to note that of the 200,000 Belgian refugees in England over 1,300 were taken care of in Liverpool, whose citizens, like Captain Buckleton, responded freely to the call of humanity.

REUNION OF THE EMBARGO COMMITTEE.

The New York members of the Embargo Committee, consisting of George B. Hodgman, H. Stuart Hotchkiss and William E. Bruyn, held a reunion dinner on Wednesday, February 9, at Sherry's, in New York City, at which Arthur H. Marks, of Akron, Ohio, the other member, was the guest of honor. It will be recalled that this committee was largely responsible for the successful lifting of the rubber embargo in January, 1915.

THE TIRE FACTORY SERVICE BUREAU ORGANIZES.

The Tire Factory Service Bureau, Akron, Ohio, has been organized to assist tire manufacturers by furnishing expert advice and supervision. It supplies a want frequently felt by manufacturers, of a source from which assistance necessary to adjust complications or remedy defects can be secured. The service given by the bureau consists of mold and core designing, purchasing and installing equipment, selecting crude rubber, compounding, tire construction, overcoming manufacturing defects, promoting efficiency, scrap utilization, experimental service, etc.

ANALYSIS OF RUBBER FLOOR COVERINGS.

The amount of rubber used in commercial samples of floor tiling has been made the subject of investigation and report by the International Association for Rubber Cultivation in the Netherlands East Indies.

Slight wear and softness combined with elasticity are considered the chief advantages of rubber tiling over other floor coverings. Grinding tests were made for ascertaining the wearing qualities and the hardness of the samples was determined by the Breuil "elasto-durometer." The percentage of rubber in the samples was determined by deducting the sum of the resin, alcoholic extract and the part insoluble in paraffin from 100.

The author presents a tabulation of his analytic results, including thirty-five samples, seventeen of which are commercial products and the balance samples made in the Government Experimental Station at Delft. The conclusion presented is that minimum percentage of new rubber for a mixture for floor covering should be from twenty to thirty per cent. The recommendation is made that the purchaser make the rubber content a matter of specification to be checked by analysis.

CAUSES OF SPREADER FIRES.

To the Editor of THE INDIA RUBBER WORLD:

I have had the fires on which the curve, published in your issue of February 1, 1916, on Humidity and Rubber Spreaders, looked up and they are as follows:

JANUARY, SIX FIRES.

- January 23, 1893. Cause unknown.
- January 25, 1909. Friction.
- January 10, 1911. Static electricity, from the electro-static capacity of a man's body when handling gasoline.
- January 26, 1912. Static electricity, due to cloth friction on spreaders.
- January 9, 1913. Cause unknown.
- January 31, 1913. Static electricity from a knife in the hand of a workman on a rubber spreader. Static capacity of the man's body probably a factor.

FEBRUARY, SIX FIRES.

- February 3, 1911. Cause unknown.
- February 15, 1911. Cause unknown.
- February 16, 1911. Friction in machinery.
- February 15, 1912. Cause unknown.
- February 17, 1912. Cause unknown.
- February 8, 1913. Static electricity.

MARCH, FOUR FIRES.

- March 24, 1911. Cause static electricity.
- March 2, 1912. Cause static electricity.
- March 5, 1913. Cause unknown.
- March 5, 1913. Cause unknown.

APRIL, THREE FIRES.

- April 7, 1909. Static electricity.
- April 26, 1911. Static electricity.
- April 29, 1912. Static electricity.

MAY, TWO FIRES.

- May 1, 1912. Static electricity.
- May 17, 1912. Static electricity.

JUNE, ONE FIRE.

- June 11, 1907. Cause unknown.

SEPTEMBER, TWO FIRES.

- September 21, 1910. Cause, static electricity.
- September 27, 1912. Cause unknown.

DECEMBER, THREE FIRES.

- December 8, 1907. Cause unknown.
- December 7, 1908. Cause unknown.
- December 8, 1908. Cause unknown.

Yours very truly,

F. J. HOXIE,

Engineer and Special Inspector,

Boston, Mass.

Associated Factory Mutual Fire Insurance Cos.

NEW TRADE PUBLICATIONS.

Katzenbach & Bullock Co., Trenton, New Jersey, has issued a convenient pocket catalogue of chemicals and colors. The list includes a line of industrial chemicals, oils, colors, etc., employed in the rubber trade.

An interesting method of tire repairing which really consists of rebuilding the injured part of the casing, is described in the January issue of "The Goodrich," distributed by The B. F. Goodrich Co., Akron, Ohio.

The net price list of Beacon Falls Rubber Footwear, issued under date of January 1, by the Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut, is a 40-page booklet, illustrating the "Top Notch" footwear.

"Insuring the Coal Supply" is the title of a new pamphlet just issued by the Link-Belt Co., Chicago, Illinois, showing methods of handling coal in large industrial works. "Wagon and Truck Loaders" is another pamphlet sent out by the same concern describing small mechanical loading conveyors.

Development and Changes in the Golf Ball Industry.

At the present time considerable attention is being attracted to the golf ball industry owing to the fact that the Haskell patent, under which most of the popular golf balls are manufactured, is about to expire in the United States, and also that announcement has been made that The B. F. Goodrich Co., Akron, Ohio, has disposed of its golf ball business to A. J. Reach Co., Philadelphia, Pennsylvania.

When the Haskell patent expires on April 11, it is expected that balls of English manufacture will be imported into the United States in large quantities to compete with American balls now on the market. Announcement has been made that

prohibitory duty upon imported golf balls because they were taking too much gold out of the country.

Three or four hundred years ago golf was played with a leather covered feather ball. The leather was of untanned bull's hide, the covering consisting of two round pieces for the ends, and one zone piece for the middle. After being softened, these pieces were shaped and then firmly sewed together, a small hole being left through which the feathers were afterwards inserted.

Before stuffing the ball the cover had to be turned inside out through this little hole, thus bringing the seams on the inside—an operation not without difficulties. The making of this feather

"DIMPLE" BALL.

the high-grade American balls, such as the "Whippet" and the "Dimple," will be sold at the same price as formerly, \$9 per dozen, and that the "Silver King," a popular English ball, will be offered to the public on April 13 at the same figure. To compete with other English balls that may be imported, it is said that American made balls formerly selling for 65 cents each will be offered this season for 50 cents, that 50 cent balls will sell for 40 cents, while others may be marked as low as 25 cents each.

It will be remembered that in 1905 the English courts decided that the Haskell patent on golf balls did not hold in England because of prior uses of the same principle. Then the English balls began to make their appearance in this country through mail deliveries to individuals, but few sales were actually made by this method, and it was soon discontinued.

THE HISTORY OF THE GOLF BALL.

There is no record as to the age of golf. It is known that it became fairly popular in Great Britain during the fifteenth century. It is also recorded that golf was denounced from the pulpit in Scotland because it was played "in time of sermones," leaving only empty benches in the "kirk" and in parliament, because it led to neglect of the art of war so necessary for defense against the English. One of the Scotch kings imposed a

ball was considered one of the most arduous labors of the day, because in the packing, the feathers were inserted through the small opening in the leather cover, and pressed in with an iron rod, one end of which had a small, flat breast-plate, which enabled the maker to use the weight of his body to compress the feathers. This work was so severe that golf ball makers in those days seldom lived past 38 years.

The balls cost about 5 shillings each, and were an expensive item, for money was of more value then than now. Golf was only played by the very rich, as the other classes could not afford to buy the balls, and it was referred to as the "gentlemen's game." The size of the old feather ball was the same as the balls now in use, approximately twenty-seven and one-half sixteenths of an inch in diameter.

In 1848 gutta percha balls were first introduced into Europe, Sir Thomas Moncrieff, an English enthusiast, being generally credited with having conceived the idea of making golf balls of this material, although the Rev. Robert A. Paterson claimed to have rolled gutta percha clippings into a ball, which he painted and used on the links in 1845.

Gutta percha balls soon became popular as their price was about one-fifth of that of the original feather balls, thus bringing golf within the reach of many. The number of devotees

rapidly increased. In making the earlier gutta percha balls, the gutta was boiled until soft and then rolled by hand until smooth and round, but its flight was never true and, strange to relate, the more it was played with and hacked about, the better its flight seemed.

Then some one suggested that the surface of the ball might be nicked into lines with a shoemaker's hammer, and this was done with good results. The flight of the "hand hammered" ball was now all that could be desired, and the feather ball was doomed. The demand for balls grew to such an extent that ball makers, who formerly were situated at the links, selling every ball direct to the players, were forced to produce balls in larger quantities and by a quicker method. By this new procedure, when the gutta was softened, a quantity sufficient to make one ball was kneaded and rolled in the palms of the hands, then put into a steel mold and pressed in a vise until sufficiently cool to be taken from the mold and dropped into cold water to harden.

The problem of marking more quickly than by the hand hacking method was solved by the use of a mold made with the markings cut inside. The ball was dipped into hot water, put into the marking mold and squeezed again in the vise, with the result that the ball was regularly marked all over.

By this time the manufacturers of gutta percha goods, who were chiefly large rubber concerns, began to interest themselves in the golf ball industry, and made the gutta percha into rods of sufficient size to make one dozen balls. The small makers bought these especially, as the gutta was then already cleaned and massed, and only required to be cut and stuffed into the molds, painted and sold.

Freshly made balls, however, were so soft that they soon lost shape, and seasoning was found necessary. The small makers could not afford to put their manufactured balls aside for any length of time, so large manufacturers with plenty of capital took up the making of golf balls.

The India Rubber, Gutta Percha and Telegraph Works Co., Silvertown, London, was among the first to do this. When the products from the large manufacturers were placed on the market, the game which had been held in check for want of supplies began to forge ahead, and even working men took up golf.

In 1884 the "Eclipse" ball, made of a composition of cork, rubber and gutta percha, was introduced, and many thought it would meet the demand. It did not chip or lose shape, but it proved to be too heavy, and would not rise, but rolled along the golf course and into every bunker on the links. The paint did not stick properly, and the ball became black when a few holes had been played. This disgusted the players and the ball died a natural death.

The "A1" ball, made of pure gutta percha, followed the "Eclipse" and for a time was popular. The Silvertown company then brought out the "No. 4" ball, made of black gutta. This displaced the "A1," as it was harder and more serviceable. The first pebbled ball was called the "Ocobo." It had a harder surface than any of its predecessors and soon met with favor. All of these balls of this period sold at one shilling each, which was considered a high price, until the Silvertown company once more came to the front in 1890 with a new ball called the "4 S's," composed of pure gutta percha, which possessed the greatest driving qualities of any ball yet produced. It had a pinkish shade before painting, kept its shape, held its own against competitors, and sold for a guinea (\$5.10) a dozen. This relatively high price did not stop the sale, and the demand was so great that it became difficult to fill orders.

At this time America was being smitten with the golf fever, and the ball question was taken up seriously, and good solid gutta balls were produced by the Boston Belting Co., the Davidson Rubber Co. and others. After experimenting with the comparatively unsatisfactory balls of that time, Bertram G. Work,

of Akron, Ohio, and Coburn Haskell, of Glenville, Ohio, devised a ball which was patented April 11, 1899. Their patent provides for "a golf ball, comprising a core composed wholly or in part of rubber thread wound under high tension, and a gutta percha inclosing-shell for the core, of such thickness as to give it the required rigidity," and also in the second claim, for "a golf ball, comprising a central core section of relatively non-elastic material, rubber thread wound thereon under tension," etc.

The extra distance resulting from this new ball called the "Haskell" won the hearts of all golfers. The only drawback to it was that it did not have a "click" when hit by the club, and to golfers in those days, half the pleasure was that fascinating sound. This difficulty, however, was soon overcome. The "Haskell" ball when first made was produced laboriously by winding rubber threads on the core by hand, and the total output for one man was three balls a day. After experimenting, The B. F. Goodrich Co. devised a machine that in three minutes accomplished the same work that one man formerly produced in a day.

This ball has a core of soft rubber about the size of a small marble around which are wound seven hundred feet of tightly stretched rubber thread, and the whole is covered with gutta percha about one-eighth of an inch thick. All patent infringements were successfully stopped except in England. Licenses for the manufacture were granted by the Haskell Golf Ball Co., of Akron, Ohio, to several manufacturers desiring to make balls under the Haskell patent.

In 1902 the Kempshall Manufacturing Co., Arlington, N. J., took out sixty patents on golf balls, of which the main features were the use of plastic material forced into a hollow sphere of rubber or gutta percha, and also a sphere expanded by liquid gutta percha and covered with celluloid. Later, in 1905, a "Pneumatic" golf ball was introduced by the Goodyear Tire & Rubber Co., Akron, Ohio. This consisted of a core which was a retainer into which air under pressure of eight hundred pounds per square inch was forced. The "Bogey" ball, made by the Seaman Manufacturing Co., Milwaukee, Wisconsin, appeared in the same year, and had a non-elastic center on which were tightly stretched small rubber rings over which was the usual gutta percha cover.

The latter day balls include the "Colonel" of the St. Mungo Manufacturing Co., Glasgow, Scotland, and New York City, and the green, red and black "Circle" balls of Wright & Ditson, Boston, Massachusetts, which appeared in 1911. The next year saw the advent of the "Dimple," made by A. G. Spaulding & Bros. in both this country and Great Britain. Other well-known golf balls are the "Whippet," formerly manufactured by The B. F. Goodrich Co., Akron, Ohio, and now by A. J. Reach Co., Philadelphia, Pennsylvania; the "Diamond" balls of the Worthington Ball Co., and the latest balls, "Bullet Honor," "Vitch," "Wizard" and "Orange Domino" of A. G. Spaulding & Bros. The "Whippet," "Stag," "Meteor" and "Scotty" balls, all made under the "Haskell" patent, have been sold by The B. F. Goodrich Co. to the A. J. Reach Co.

A FRENCH TRADE STAMP.

Symbolic stamps or "stickers" are extensively used by European concerns for attaching to correspondence. The stamp here shown is used by the Société des Etablissements Bergougnan, Clermont-Ferrand, Puy-de-Dôme, manufacturers of "Le Gaulois" tires. The golden sun of prosperity, rising over the peak of the Puy-de-Dôme, casts its light upon the effigy of Vercingetorix, the great Gaulois, hero of the struggles of the Gauls against Roman domination and adopted as the symbol of the "Gaulois" tires. The graceful folds of the French tri-color add to the picture and indicate that "Le Gaulois" tires are of French production.

What the Rubber Chemists Are Doing.

VULCANIZATION EXPERIMENTS.

DURING the past year B. J. Eaton and J. Grantham, of the department of agriculture of the Federated Malay States, have continued their experiments in vulcanization on the extent of variability caused by lack of uniformity in factory methods, which are reported in the "Agricultural Bulletin."

EFFECT OF CREPING.

Samples of rubber were prepared, which had been creped as follows: A, 5 times; B, 10 times; C, 15 times; D, 20 times; E, 25 times. These were mixed and cured under uniform conditions, time of cure in all the experiments being the only variable. The resulting physical tests gave no indication of any differences between the rubbers due to the amount of creping they had undergone.

Although the differences in creping in this experiment were insufficient to produce any effect, it was thought a more severe treatment of the rubber would produce deterioration. A sample of crepe treated in the normal matter, and one severely macerated on the creping machine, when compared gave physical test figures which revealed no effect as regards the mechanical results. The effect of very severe maceration was merely to slightly retard the rate of its cure.

It was therefore concluded that the effect of creping on rubber, both as regards optimum mechanical properties and rate of cure, is negligible unless excessive. The slight effect in retarding the rate of cure in excessively worked rubbers is probably due to removal of traces of a catalytic substance or something necessary to its formation; in other words, to over-washing rather than over-working.

EFFECT OF EXCESS OF ACID.

Two samples were prepared from bulked latex to ascertain the effect of adding an excess of acid when coagulating the latex. Sample A was coagulated by 3 ounces of 5 per cent acetic acid per gallon of latex, and Sample B 15 ounces of 5 per cent acetic acid per gallon of latex. The subsequent manipulation was kept as constant as possible.

The results showed that the use of an excess of acetic acid for coagulation of the latex has a well marked effect in retarding the rate of cure. Probably the acid has the effect of reducing the amount of the catalytic substance finally present in the dry rubber. The mechanical properties are not affected.

EFFECT OF SODIUM BISULPHITE.

No effect was produced by sodium bisulphite on crepe rubbers. There is reason to believe that the use of sodium bisulphite in the preparation of sheet rubbers, and other forms in which the bisulphite is not afterwards completely removed, is injurious.

PREPARATION OF THIN CREPE.

Samples were prepared on an estate normally turning out thin, pale crepe, and each represented a stage in the ordinary process adopted by the estate. The samples were:

- A. The coagulated slab allowed to drain.
- B. The coagulum rolled once.
- C. Rough crepe.
- D. Thick crepe.
- E. Thin crepe.

The samples were kept for 20 days, and then A, B and C were made into thin crepe and dried. D and E were dried without subsequent creping. All the samples contained sodium bisulphite. The tests showed time of satisfactory cure by load-stretch curves as follows: A, 1½ hours; B, 2 hours; C, 2¾ hours; D, 2¾ hours, and E, 3 hours.

UNIFORMITY.

An experimental study was made to ascertain how far uniformity is possible under ordinary estate conditions. The latex was bulked in a large tank and coagulated by the addition of 3 ounces of 5 per cent acetic acid per gallon of latex. The rubber was creped the same day, an hour or two after coagulation. It was found necessary at this time to add a small quantity of formalin to the latex in order to prevent spotting. The resulting thin crepe was of a golden color, and brought top prices.

The experiments on thin crepe and uniformity of preparation are thus summarized: The effect of each stage in the preparation of a thin crepe is to retard the rate of cure. It has previously been shown that passing a thin crepe a number of times through a creping machine, beyond that necessary first to produce thin crepe, had little or no effect. When the retardation of the rate of vulcanization reaches a limit, as in the preparation of thin crepe machined on the day of coagulation, a very uniform rubber is obtained, although the rate of cure is very slow and the mechanical properties suffer slightly.

PREPARATION OF BLOCK RUBBER.

The process of preparing block rubber is to thick crepe the coagulum on one machine and thin crepe it on another, and then "worm" it by passage through a perforated plate by pressure. The wormed rubber is then placed in hot air driers for 7 to 8 hours at about 130 degs. F. until completely dry. It is then blocked while still warm in a hydraulic press.

Twelve samples were taken representing the stages from coagulum to the final block, mixed, vulcanized and tested in two sets, the samples of corresponding stages in each set varying as regards age and the use of sodium bisulphite.

These experiments indicated a convenient method of producing a rapidly curing rubber with good physical properties, namely, the slab from the coagulum, with or without sodium bisulphite, should be left ten days to "mature" or develop a rapid rate of vulcanization, previous to being converted into block form. The uniformity of the rate of cure thus produced remains to be tested.

MIXING RAW RUBBERS.

The effect of mixing raw rubbers having different rates of cure was demonstrated, and showed a gradation in rate of cure according to the proportion of fast or slow curing rubber in the mixture. These results are of importance as confirming the probable reason for the uniformity of fine hard Pará, namely, that it is due to averaging of latex collected and cured on different days through long intervals.

A method of averaging could be adopted on any estate to obtain similar results, and would be of marked advantage, but the problem of sampling the mixed rubber for testing would probably be complex.

VELOCITY OF SOLUTION OF LIQUIDS IN RUBBER.

From available data relating to the velocity of the absorption of various liquids by rubber, P. Bary concludes that for any given liquid, the weight, p , of the liquid contained in a unit weight of the rubber (*i. e.*, rubber plus absorbed liquid) after absorption has proceeded for t minutes is given by the formula,

$$p = \frac{tp_s}{(A + t)}$$

in which p_s is the value of p corresponding with the saturation of the rubber with the liquid, and A is a constant depending upon the nature of the liquid and the conditions of experiment, particularly the thickness of the rubber sheet.

The values for p_s for some of the liquids as used in experiments were: carbon disulphide, 0.916; chloroform, 0.940; toluene, 0.870; ether, 0.718; benzol, 0.840; xylene, 0.849; light petroleum spirit, 0.763; oil of turpentine, 0.848; benzyl chloride, 0.841; nitrobenzene, 0.639.

It follows from the formula that the velocity of absorption in any one experiment is proportional to $(p_s - p)^2$.

SOLVENTS OF GUTTA PERCHA.

Herman Prinz has found that oil of eucalyptus and oil of cajuput dissolve gutta percha due to the presence of cineole. Oil of cloves and oil of cinnamon do not contain cineole and apparently have no solvent effect on gutta-percha.

CHEMICAL TREATMENT OF RUBBER.

THE UNITED STATES.

ELASTIC PRODUCTS. 1,159,257 and 1,159,258. Georges Nuth.—The process consists of producing from a sulphurized oil factice by the action of a compound (amin) capable of removing loosely combined chlorine, a resulting body more resistant to heat, water and acids than natural gums, and with a greater elasticity than the corresponding chlorinated factice.

ISOPRENE. 1,159,380. A. Heineman. Vapors of turpentine oil are passed over silver heated to about 450 degrees F., giving a yield of isoprene equal to 25 per cent. of the turpentine oil used, together with about an equal amount of other depolymerization products. About 2000 cc. of vapor per hour may be passed through a silver tube of 6 mm. diameter, 4 meters long, wound into a close coil.

PIGMENT. 1,169,253. Henry A. Gardner. Process for making a pigment containing lead and barium carbonates, which consists in forming a basic carbonate of lead and precipitating barium carbonate in intimate association therewith.

RUBBER SUBSTITUTE. 1,171,187. Alfred A. Glidden, assignor to Hood Rubber Co. The process consists of heating vulcanized rubber waste with an unsaturated hydrocarbons of the series to which butadiene is the lowest member, and stearic acid in definite proportion, the operation taking place in sealed vessels at 212 to 248 degrees F. for periods of one to three weeks.

THE UNITED KINGDOM.

WATERPROOF COMPOSITIONS. 24,106 (1914). C. L. E. Melsom-Brixton. A resilient waterproof composition is obtained by steeping gelatin or glue or both in skimmed or separated milk, then mixing with glycerin, applying heat to produce liquefaction, and finally adding potassium bichromate, ground leather, and other ingredients, such as dextrin, paraffin wax, Venice turpentine, linseed oil varnish, glucose, and a preservative with or without coloring matter, the mixture being heated and stirred.

THE DOMINION OF CANADA.

PROOFING FABRIC WITH RUBBER. 165,820. William Muntz. The process consists of impregnating with two solutions, successively introducing with the second solution substances capable of forming harmless compounds in the fabric by neutralizing the sulphurous and sulphuric acid present.

ELASTIC MATERIAL. 166,177. Maurizio Baricelli. A combination of a gelatinous substance, water, glycerine, antimony pentoxide, acetic acid. Before using there is also added formalin and a substance of high thermal conductivity such as powder of aluminum.

OTHER CHEMICAL PATENTS.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

477,586 (February 10, 1915). Process for accelerating the vulcanization of natural or artificial rubber or similar materials. S. J. Peachy.
477,789 (February 24, 1915). A mastic filler for pneumatic tires, and process of manufacture. S. Ephrussi and S. Bernstein.

LABORATORY APPARATUS.

MELTING POINT OF PARAFFIN WAXES.

AN apparatus and method for studying the melting point of paraffin waxes, as proposed by F. H. Small, will be of interest in rubber laboratories.

Commercial paraffin is not a chemical individual but a mixture of related compounds. Its so-called melting point is merely the average of the melting points of the numerous waxes making up the composite whole. Two samples of paraffin wax, designated as of the same melting point, may be of radically different composition. A so-called crude may consist of individual waxes whose melting points cover a wide range of temperatures,

while a refined wax may consist to the extent of over 90 per cent of waxes whose melting points lie within a range of 5 degrees. Naturally these two waxes will not behave in the same way, will not show the same plasticity and physical qualities. It was to secure a more definite idea of the composition of commercial paraffin wax than was afforded by a simple melting point determination that the apparatus here described was constructed.

In the accompanying diagram—

A is a glass tube, the smaller part being of uniform bore and graduated in equal divisions; *B* is a glass plunger the disk of which fits easily the bore part of the enlarged part of *A*. *C* is a brass disk bored to fit the stem of *B* and of the same external diameter as the disk of *B*.

In use *B* is inserted in the upper part of *A*. Enough of the wax is shaved and introduced into *A* so that when melted it will nearly fill the graduated tube of *A*. The brass disk *C* is then slipped on *B* and allowed to press down the shaved wax. The lower end of the graduated tube *A* is closed with a cork reaching just to the zero mark and the apparatus as prepared is inserted in a tall one-liter breaker filled with water to above the level of the wax as shown in *D*.

The water is warmed by a burner below and is stirred at frequent intervals. The warming process is continued until such time as the wax shows signs of softening. The temperature is then raised very gradually, the plunger *B* being moved slightly up and down to facilitate the flow of any melted wax into the graduated tube. When some of the wax melts and runs down, the temperature at which this occurs is recorded. The temperature is then raised a degree at a time and held at each degree for seven minutes, the plunger *B* being moved slightly up and down at intervals, as before, to free the melted wax. At the end of each seven-minute period the temperature and scale reading are recorded. The process is continued until the wax is all melted.

From the scale readings a simple calculation shows the percentage of the wax melted at any given temperature. The temperature at which 50 per cent was melted corresponds to the melting point as usually determined. If the melted wax is allowed to harden in the tube its inspection will usually show whether the wax contains an appreciable amount of oil.

The apparatus and method have been found sufficiently accurate for commercial purposes.

New Machines and Appliances.

ROTARY VACUUM DRYER FOR RUBBER SCRAP.

THE illustration shows a new Stokes rotary vacuum dryer which has recently been installed and is now being operated in the works of a large rubber company. The rubber is claimed to be dried uniformly, economically and quickly.

The apparatus is equipped with an agitator so that any material carried over with the next charge will not become hard by over-drying. This agitator, which requires very little power to operate, discharges practically the entire contents of the

machine and insures uniformly dried material, containing an exact percentage of evenly distributed moisture. The rubber is dried in vacuo at a very low temperature, thus giving a soft and strong product.

It usually takes six men over two hours to spread and take off the rubber when screens are used, but it is said that with this vacuum dryer, three men can do the work in a half hour. The drying is accomplished in from one to six hours, varying with the nature of the scrap. The machine is fifteen feet long by four feet in diameter and has a capacity of from 4,000 to 12,000 pounds in ten hours. [F. J. Stokes Machine Co., Philadelphia, Pennsylvania.]

MULTIPLE EXPANSION JOINTS.

Multiple plate vulcanizing presses that are used in the manufacture of molded rubber goods have from two to seven heating platens. To turn out reliable goods exact temperatures are now required in most rubber manufacturing plants. It is therefore necessary that all plates in vulcanizing presses should be maintained at the same temperature. This is practically impossible, however, where the steam is passing directly through the press, as the drop in temperature is usually about 2 degrees F. from one platen to the other. The multiple expansion joint shown in the accompanying illustration supplies steam to each plate independently, thereby maintaining an even temperature throughout the press. The advantage in thus being able to obtain definite cures will appeal to every manufacturer of molded rubber goods. [Utility Manufacturing Co., Cudahy, Wisconsin.]

SEWING MACHINE FOR RETREADING TIRE CASINGS.

For tire repair shops that make a specialty of repairing tire casings, the machine illustrated herewith should prove useful.

If the re-treaded casing is cemented and vulcanized as well as stitched it is claimed it will give additional mileage equal to or greater than the original tires. Two discarded casings are used, one with a good foundation of fabric and bead and the other with a good rubber exterior to be utilized as the tread. After an inch has been trimmed from its clincher edges, the improvised tread is placed outside of the fabric foundation and the two are firmly stitched together by the machine. Being laid in a perfectly normal position and supported by the end of the machine and two projecting rollers, the casing and tread cannot become distorted during the stitching operations.

As the casing and tread are moved forward at each stitch, the needle and bobbin threads are passed through a lubricating wax solution to insure a uniform and tight lock stitch.

When repair patches are being sewed on tires, a lever at the top of the machine can be depressed to cause a reversal of the feed. The machine can be driven by either a one-horse power motor or by belting. [Singer Sewing Machine Co., New York City.]

TRABUE'S LABEL GUMMING MACHINE.

A label gumming machine fills a long-felt want among manufacturers who have been gumming or moistening dry gum labels by hand. Little attention has been paid to the up-keep

of the labeling department, but now that labor and materials are high, a machine of this sort should be welcomed by the trade.

These machines can be driven by hand or by small motors. They are made entirely of brass, except the reservoir, and this

can be easily cleaned by putting into a bucket of water. The label or strip is drawn under the feed roller from the projecting horizontal table and passes out onto the receiving table ready for use.

By filling the reservoir with gum, the machine can be used to gum labels, and by using water, it can be used to moisten dry gummed labels. Where labels are to be put on packages or boxes such as those containing inner tubes and similar articles this gummer should prove a valuable adjunct to the factory equipment. It is made for labels or strips from $\frac{1}{2}$ to 16 $\frac{3}{4}$ inches in width. [W. H. Trabue, 32 West 83d street, New York City.]

MACHINE FOR PANNING RUBBER COVERED WIRE.

This machine "pans" the wire after the rubber has been applied to it for insulation by the tubing machine, and handles all sizes up to No. 6 B. & S. gage.

Referring to the cut, *A* is the friction drive that revolves the pan *B* in which the rubber covered wire is coiled. The speed of

the pan is increased and decreased by the friction drive *A*, controlled by the screw *C*. Chain *D* is the drive for the knuckle joint shaft *E*, and brass tube *G*, through which the wire runs, is moved back and forth by chain *F*, while sprocket *H* drives the rubber feed rolls *I*.

The rubber covering machine and the above device are driven together so that when the variable speed cones are adjusted for the speed at which the wire is to be delivered, it will be coiled layer for layer in the pan. Then talc or soapstone is sifted over each layer, after which the covered wire is ready for vulcanization.

It is claimed by the inventor that the cost of handling wire may be materially reduced, and that a maximum output of a uniform product may be obtained. [T. J. Seward, Bridgeport, Connecticut.]

HYDRAULIC VALVE FOR RUBBER MILLS.

This hydraulic valve is constructed to withstand the hard usage of rubber mill work. It is made of a special bronze composition for pressures up to 2,500 pounds per square inch. There are only four parts to the valve; all parts being made extra large, the specially packed stem, large hand wheel or lever furnished makes the valve an easy one to operate. [Utility Manufacturing Co., Cudahy, Wisconsin.]

A GARVIN HARD RUBBER LATHE.

In the manufacture of hard rubber pumps, piping and fittings, the lathe here illustrated is frequently used. It is known as a No. 1 screw cutting lathe and has a plain turret head, automatic collet and a bar feed. Two solid floor legs support the bed of the lathe, which is of box form, and the pan which is fitted with double strainers, and oil or water reservoir. The spindle is hollow and will admit rods up to $\frac{3}{4}$ inch in diameter, with the bar feed attachment, and rods 13/16 inch in diameter, without

the bar feed. The collet that holds the work is opened and closed by a hand lever. When it is open the feed advances the rod through the spindle and against the stop in the turret head which determines the length of stock to be turned. The cross slide carries a front and back tool post and is operated by a hand lever. The turret head is 4 $\frac{5}{8}$ inches in diameter and has six 11/16 holes for tools, it revolves by hand in either direction and long rods up to $\frac{1}{2}$ inch in diameter can be passed freely through it.

The machine occupies a floor space of 42 x 22 inches and is driven by a three-step cone pulley from a double friction countershaft that is supplied with the lathe. [Garvin Machine Co., New York City.]

MACHINERY PATENTS.

PRICE'S DIPPING AND VULCANIZING APPARATUS.

In this machine, the forms are dipped and then subjected to the action of a partial vacuum to aid in the evaporation of the solvent while at the same time they are heated from the inside to further increase evaporation.

The accompanying cut shows a hermetically sealed chamber *A* in which the forms *B* are mounted on nipples *C*. Steam is admitted to the forms through the hollow support *D* and the rubber solution *E* is forced into the chamber through pipe *F*. The dipping, which is accomplished by turning the handle *G*, is repeated a suitable number of times before the rubber solution is withdrawn into a nearby container. At this stage a vacuum is produced through pipe *H*, the effect of which is to produce a very rapid evaporation of the solvent and drying of the coating on the forms.

By suitable connections and valves, pipe *H* may also be used to cause condensation of the volatile gases so that they may be recovered. A repetition of these operations will give the article on the forms the required thickness, after which heat may be introduced through pipe *H* for vulcanizing. [R. B. Price, assignor to Rubber Regenerating Co., Naugatuck, Connecticut, United States patent No. 1,169,733.]

TIRE FLAP MAKING MACHINE.

A simple and efficient apparatus for the manufacture of tire flaps is shown in the accompanying illustration.

The motor *A* rotates the fabric supply spools *B*, *C*, *D*, *E*, *F*, *G* and *H* by pulley *I*, sprocket *J* and chain drive to each spool. Upon the supply spool *B* is wound a strip of fabric *K* of a width

corresponding to the greatest width of the flap to be produced, and upon the supply spools *C*, *D*, *E*, *F* and *G* are wound strips of fabric decreasing in width while spool *H* carries a strip slightly less in width than the bottom layer *K* of the finished flap.

Fabric from roll *B* with the strip from roll *C* are introduced between the first feed roll *L* and its pressure roll, not shown, whereby the two are brought into intimate pressure contact. This process is continued at each spool until the resultant stock passes through tension rolls to guide *M*. As the fabric passes through the guide it is drawn into the cupping drum *N* and because of the concave shape of the bottom of the drum, will assume the desired transverse curvature which is fixed by curing. [W. C. Stevens, assignor to the Firestone Tire & Rubber Co., Akron, Ohio, United States patent No. 1,169,204.]

AUTOMATIC MIXING MILL.

Hoyt's mixer is designed to do away with considerable hand labor and also the necessity of an adjustable apron for collecting and returning to the rolls the ingredients that are not at first caught up by the rubber. The material that

falls to the bottom of the chamber is scooped up by revolving blades and carried around so that it drops upon the mass being mixed. A further object is to subject the plastic material to a vacuum pressure during the mixing process.

The illustration is a cross-sectional view

main chamber at a definite rate. The mixing rolls *D* are hollow and are provided with suitable connections for the inlet and outlet of steam and are revolved at slightly different speeds to give a grinding or kneading action to the material as it passes through. The doors *E*, which are hermetically closed, permit access to the interior of the casing and also permit inspection of the contents by means of the glass windows *F*. The device for conveying the material from the lower to the upper side of the rolls consists of two annular gears *G*, connected by rods to which are attached the paddles *H*. As the gears are rotated in a counter-clockwise direction the material is scooped up from the bottom, carried up on the right side of the chamber and then dropped to the rolls when the paddle has reached a position directly under the feed hopper. [Homer J. Hoyt, assignor to Morgan & Wright, United States patent No. 1,163,089.]

OTHER MACHINERY PATENTS.

THE HUNTER DRY KILN—A COMPARISON.

A ROOM for drying is a very important adjunct in the manufacture of rubber goods that in these days of competition and close prices are generally sold under a guarantee. It is well known that the materials, which make up the compounded rubber, must be intelligently prepared in order to produce reliable goods.

Many of the modern drying systems are highly inefficient and unsatisfactory because of the time and space required or the inferior quality of the stock after being dried. That the old drying principles are wrong is claimed by the Hunter Dry Kiln Co., Indianapolis, Indiana, in the following description and comparative tests of the Hunter process and dry kiln:

The kiln is constructed to bring about a rapid circulation of conditioned air by purely natural means, thus eliminating the possibility of mechanical disorder and lack of uniformity of conditions in the drying room. These conditions are automatically controlled, thereby making every day a perfect drying day regardless of atmospheric irregularities.

An ordinary dry room, perhaps, 85 feet long and 17 feet wide, with forced air circulating and condensing system, has a capacity of 14,000 pounds of dry rubber each 7 to 14 days, according to the moisture content of the crude material.

THE HUNTER DRY KILN.

A Hunter dry kiln is 18 feet wide and 35 feet long, inside measurement, and has a capacity of 15,120 pounds of rubber each twenty-four hours. This time allows from 6 to 9 hours for emptying and re-filling the room, the actual drying time being from 15 to 18 hours.

In order to arrive at a figure whereby the efficiency of the two systems may be compared, space, quantity and time must be taken into consideration. The ratio of efficiency will be inversely proportional to the product of the figures representing space, quantity and time of each system. Substituting the minimum time (7 days) of the dry room, and the maximum time (24 hours) of the dry kiln, the efficiency factor is:

$$\frac{\text{Dry Kiln } 157}{\text{Dry Room } 1}$$

Disregarding space and simply considering the possible capacity of each system under existing conditions, the output of the kiln is 7.5 times that of the dry room.

COMPARATIVE RUBBER DRYING TESTS.

The following comparative tests on washed and compounded stocks show interesting differences in favor of the dry kiln:

A batch of rubber was washed, careful attention being given to insure uniformity of mixing on the mills. Of the resultant crêpe sheet, one-half was dried in the regular dry room, and the other half was placed in the Hunter dry kiln. After drying, test batches were mixed from each of the samples, checks being kept on each one. The following data were the results obtained:

PREPARATION OF SAMPLES.

Dry Kiln	15 hours	Moisture	.079 per cent.
Dry Room	184 hours	Moisture	.28 per cent.

GREEN TESTS.

	Break. Pounds.	Stretch. Inches.	Efficiency.	Cure at 40 Pounds. Hours.
Dry Kiln	1,325	6.56	8,692	2½
Dry Room	1,275	6.12	7,802	2½
Dry Kiln	1,562	6.56	10,246.72	2½
Dry Room	1,536	6.43	9,805.75	2½

AGED TESTS.

Samples of above cures were aged in circulating dry heated air for three hours at 235 degs F.

	Break. Pounds.	Stretch. Inches.	Efficiency.	Cure at 40 Pounds. Hours.
Dry Kiln	762	5.75	4,381.5	2½
Dry Room	825	4.75	2,493.75	2½
Dry Kiln	1,075	5.91	6,245.75	2½
Dry Room	637.5	5.12	3,264	2½

	Moisture. Per Cent.	Sulphur Mix. Efficiency.	Oil Mix. Efficiency.
Dry Kiln	.21	1,510	1,720
Dry Room	.59	1,350	1,375
Dry Kiln	.30	1,675	1,800
Dry Room	.43	1,410	1,290

DRYING PONTIANAC.

When Pontianac is washed and milled in one-fourth inch sheets, it presents a dense, dough-like mass. After hanging these sheets in the dry room at 96 degrees F. for ten days, the stock presents a hard, brittle external crust of a creamy white color, and is apparently dry, but contains from 2½ to 4½ per cent moisture by test. The material is shown to contain 1.44 per cent of moisture after twenty-one days under the above conditions, and becomes so crumbly that it is difficult to handle. However, when placed in the dry kiln, Pontianac is dried from 0.75 per cent to 1 per cent moisture in 38 hours, and from 0.3 per cent to 0.5 per cent in 48 hours. This material is then a brown colored, flexible mass, which is slightly tacky, is easy to handle and not injurious to the stock in which it is used.

DRYING COMPOUNDING INGREDIENTS.

Zinc, lithopone, whiting and barytes are dried in from 24 to 90 hours by placing the barrels in the kiln in an upright position and permitting a circulation of air on all sides. These compounds, especially zinc, and lithopone, after being thus dried, do not form in sticky lumps which are hard to pulverize, but powder very readily through the sieve, and seldom cake on the mixing rolls.

DRYING CEMENTED SURFACES.

Two to three hours, depending largely upon weather conditions, are required to dry the cement on inner tube splices and valve bases. In the dry kiln this operation is accomplished perfectly in 25 minutes. Life is apparently given to the cement by this process, and tight, firm splices are the result.

In the construction of double operation motorcycle casings, it has been the custom to paint a heavy coating of cement on a carcass, and a period of from three to five hours was required before the cement was sufficiently dry to permit of the application of the tread. By the Hunter process, however, the carcass is ready for the application of the tread after one hour in the dry kiln, and this period can be shortened if necessary.

All of the above data was taken under actual working conditions.

THE AMSTERDAM CRUDE RUBBER MARKET IN 1914.

Official industrial and commercial reports of the Netherlands for 1914 have recently been published. They contain interesting facts relating to the effect of the war on the Amsterdam crude rubber market during the first five months of the war.

The year 1914 opened very favorably for the Amsterdam rubber market; business was active and the number of buyers increasing. War came early in August and, from then on, very little crude rubber was received. That which arrived was sold without the usual sorting, sampling and careful examination, thereby preventing the levying of the usual taxes, as it was impossible to determine values regarding which no indications were available.

Prices increased with a bound. *Hevea* rubber was especially sought for and brought prices as high as 7 florins per half kilogram [\$2.55 per pound], which was about equal to the highest prices paid in 1910, during the rubber boom.

Shipments which arrived after the stocks included in the auction of July 29, amounted to 499,956 kilograms [1,099,903 pounds], of which 418,924 kilograms [921,633 pounds] were *Hevea*; 61,543 kilograms [135,395 pounds], plantation *Ficus*; 8,255 kilograms [18,161 pounds], *Castilloa*; 1,384 kilograms [3,045 pounds], *Manihot* and 9,850 kilograms [21,670 pounds] of various kinds of forest rubber.

The Editor's Book Table.

TECHNOLOGIE DER KAUTSCHUKWAREN. BY DR. KURT GÖTTLOB. Friedrick Vieweg & Sohn, Braunschweig, Germany, 1915. [Large 8vo, 256 pages, 92 illustrations.] Published in German.

THIS work is the tenth volume in a series known as "New Handbooks of Chemical Technology" under the editorship of Dr. C. Engler, of Karlsruhe.

The author in his preface states that his object is to supply the technical man with knowledge of the scientific aspects of the rubber industry and the fundamental principles of rubber manufacture, as applied in typical classes of goods. He has also endeavored to aid practical rubber men to correlate their personal experience and observation by a comprehensive treatment of the industry.

No attempt is made to explain the details of manufacture, nor is the question of manufacturing costs treated. The aid of able specialists has been enlisted in the preparation of certain chapters, and thus the value of the discussion of various important topics is enhanced.

The book follows a natural order of arrangement, beginning with historical matter and the chemistry of pure rubber. The work is divided into two parts, general technology and special technology of rubber goods.

In the first section the origin, gathering, washing and drying of crude rubber are treated, together with a chapter on resins and albumens. Tests of crude rubber are given, and the subjects of mastication, fillers, mixing and calendering are considered. Under chemistry and methods of vulcanization is a resumé of the work of the leading chemical investigators of this phase of rubber manufacturing. The technical operations of vulcanization, hot and cold, methods of analysis, tests and apparatus for chemical and physical examination of vulcanized rubber are also given careful attention. The chapters devoted to the tests for crude rubber, and on analysis and testing, are written by Dr. E. Kinscher.

In the second section of the book, which is devoted to the special technology of rubber manufacturing, two chapters are devoted to cold cured goods and seven to hot cured. Under cold cured goods, the chapter on cut sheet is written by E. Herbst, of Vienna, and includes governmental regulations on the plan and equipment of cold cure plants. The author of the volume wrote the chapter that follows on seamless rubber goods, which treats of solvents, dipping, etc.

Under hot cured goods the subject of mechanicals is treated by Mr. Herbst and the author, who review the applications of rubber and discuss the proper arrangement of rubber factory workrooms. K. Misch, of Petrograd, contributes a chapter on rubber heels and rubberized fabric in which the various processes of manufacture are described. Rubber toys are discussed by Dr. Dorogi, of Budapest, who tells of the principles of manufacturing and finishing these products. Two chapters by Mr. Herbst are devoted to all types of solid and pneumatic tires and anti-skid devices, and to the manufacture of rubber footwear. The final chapter is on hard rubber, and is prepared by Engineer Ballog and the author.

TRANSACTIONS OF THE RUBBER GROWERS' ASSOCIATION. 1915, London, England. The Rubber Growers' Association. [Paper 41 pages.]

This is the seventh report of the Council. It comprises lists of the officers, committees, the members and the representatives of the Association on committees of the Rubber Trade Association of London; also officers and committees of the International Association for Rubber Cultivation in the Netherland Indies. The membership of the Rubber Growers' Association has rapidly increased since organization in 1908; it now includes 412 company and 250 individual members. During the past year (1915)

the activities of the Association have expanded with the importance of the rubber growing industry and in consequence reorganization of the Association has been necessitated.

The administration of the Malay and Ceylon Research Funds has been assumed. The work of these funds has greatly benefited the plantation rubber industry by chemical and botanical research. The work of each of the association committees is detailed in the body of the report. Record is made of many gifts made through the Association to the British War Department, of much equipment such as an ambulance, 4000 life saving collars for the Australian navy, rubber boots to the Royal Flying Corps, cushions and pads and rubber flooring to various hospitals.

AGRICULTURAL BULLETIN OF THE FEDERATED MALAY STATES. Department of Agriculture, F. M. S., Kuala Lumpur. 1915. [Monthly parts 50 cents each. Annual subscription \$5.00.]

This publication is the organ of the above mentioned department and of the Planters' Association of Malaya. In it is published a wide variety of scientific and statistical reports relating to tropical agricultural interests, notably rubber and other important plantation products. The papers record the laboratory and field investigations of the large scientific staff of the Federated Malay States department of agriculture.

Notable among the published papers of the past year is the series by B. J. Eaton and J. Grantham entitled "Vulcanization Experiments on Plantation Rubber," an important study of the influences affecting the standardization of plantation *Hevea* as regards curing quality and physical characteristics after vulcanization.

STUBBS' BUYERS' DIRECTORY FOR THE WHOLESALE DRUG, Chemical and Allied Trades, 1916. Alfred Stubbs, 30 Cliff street, New York City. 1916. [8vo, 350 pages. Price, \$3.00.]

The revised and enlarged edition of this trade directory is a valuable reference book for the purchaser of drugs and chemicals. It comprises two sections, both arranged alphabetically by materials. The first section contains a list of manufacturers and first-hand dealers in drugs, chemicals, essential oils, laboratory machinery, etc.; and the second a similar list relating to druggists' sundries, glassware, etc.

Many of the articles listed are of interest to the rubber chemist and compounder who will find the directory of practical value in locating sources of supply.

DICTIONARY OF TEXTILES. BY LOUIS HARMUTH. FAIRCHILD Publishing Co., New York City, 1915. [Cloth, 8vo, 174 pages. Price, 85c.]

This dictionary, the result of over seven years of collecting and compiling, contains the definitions of over 6,000 terms relating to textile fibers and fabrics. These are arranged in alphabetical order, each term being discussed independently. While essentially designed for those engaged in the textile industry, rubber manufacturers will find it a helpful reference.

PREDICTS 200,000 TONS OF HEVEA RUBBER IN 1919.

Based the average production of *Hevea* rubber at 400 pounds per acre, it was estimated at a meeting of rubber planters held in Bandung, Java, that the world's production of *Hevea* rubber in 1919 would amount to 200,000 tons.

A RUBBER BRAKE FOR ROLLER SKATES.

One of the latest safety devices in which rubber is employed is a guard for roller skates, to prevent the skater from tipping backward. This is in the form of a steel, rubber-tipped apron, which extends from the top of the heel or counter of the skate to within a very short distance of the floor. Should the skate suddenly attempt to fly out in front of the wearer, the rubber tip comes in contact with the floor and prevents a bad fall.

New Goods and Specialties.

THERMO STEAMING BAG.

MOIST hot compresses are of great benefit in many cases of sore muscles, stiff joints, for reducing purposes, complexion improvement, etc. The old method of application by means of towels dipped in hot water is troublesome, and only partially effective. The towels need constant replacing, as they do not properly retain the heat.

The novel device shown in the accompanying illustration combines a hot water bag and steam compress, a soft cloth pad being fitted in a pocket made in the bag. In this manner moist heat may be retained for a considerable period, avoiding all the annoyance of the old method and giving better results. These steaming bags are supplied in five sizes, from $4\frac{1}{2} \times 6\frac{1}{2}$ inches, designed to apply to a small space, for tooth, car or headache, to 5×17 inches, suitable for tying around the face, neck, or even the arm or leg, if required. [Dr. Jeanne Walter, New York City.]

DROP BOTTLE WITH RUBBER CAP AND BULB.

In using the ordinary dropper and medicine bottle it is difficult to keep the dropper in a sanitary condition. When left outside the bottle it should be washed off each time, before and after using, and placed in a tumbler or other receptacle; and even when the bottle is adapted for holding the dropper in place of a cork, it is by no means as convenient a method as the device here illustrated affords. The bottle and dropper are combined in the form of a glass receptacle with a spout and rubber bulb top, and by this means medicine and liquids of all kinds may be dispensed with perfect cleanliness and ease. A small rubber cap is also provided for closing the dropping end when not in use. [J. Austin Dunn Specialty Co., Chicago, Illinois.]

THE GOODRICH SAFETY RESPIRATOR.

In mines, vaults and places where the air is foul or dust-laden, the health of workmen is menaced to a dangerous degree. But

the modern employer is alive to the fact that safeguards for the health of employees are an economic necessity, and the respirator here illustrated is of interest as an effective means of eliminating danger in many occupations where the kind of protection it affords is necessary.

This appliance consists of a well-molded, perforated outer casing of rubber, provided with adjustable straps, which allow for comfortable fitting over the mouth and nose. The interior contains a sponge, which may

be used dry or saturated with water or any medicated preparation as required. [The B. F. Goodrich Co., Akron, Ohio.]

THE JONES PNEUMATIC TIRE SPRING.

The Jones pneumatic tire spring utilizes the principle of a pneumatic cushion used in conjunction with the spring of an automobile. It consists of a shoe and inner tube made in the

same manner as the usual pneumatic tire and is installed so as to act between the axle and springs of a car as shown in the accompanying illustration to reduce vibration and shock. Adjustments to various weights are made by inflating or deflating.

This device is claimed to make riding easy and pleasant and to permit the substitution of solid tires on the wheels, thus eliminating the troubles common to pneumatic tires. [The Jones Pneumatic Tire Spring Co., New York City.]

THE VEEDER CLUTCH SPEED COUNTER.

The illustration shows the Veeder clutch speed counter, a convenient instrument for determining revolutions per minute

made by a shaft or other revolving part. One of the rubber cushion caps is placed on the spindle of the counter, and the counter is pressed against the end of a shaft, causing the spindle to revolve and the counting device to register. Speeds as high as 5,000 r.p.m. can be safely measured. Two rubber tips, one pointed and the other flat, are furnished with each instrument. [Veeder Manufacturing Co., Hartford, Connecticut.]

THE "DU-TELL" PUNCTURE FINDER.

It is sometimes not easy to locate the small puncture in a tube which a nail or sharp stone can inflict. A common method is to partially submerge the tube in water so as to discover the leak from the resulting air bubbles. But this method entails considerable trouble and delay.

The "Du-Tell" device here illustrated is designed to locate these elusive leaks with the least possible trouble. It consists of a nickel plated frame or box, curved to conform to the tread of the tire. On the under side is a fine mesh screen, and on top a transparent protecting celluloid window. On the screen are small fingers made of very thin cork shavings.

The puncture is located by placing the finder tightly against the tire and sliding it around, meanwhile observing the pieces of cork, which will fly up against the celluloid when the leak is reached. [J. W. Anderson, New York City.]

A DAINTY RAINCOAT.

Owing to the scarcity of dyes, rubber manufacturers are favoring styles that do not require the colors that are costly and hard to procure. The result has been some pleasing novelties.

Photo Underwood & Underwood.

The raincoat shown in the illustration is notable as a triumph of the rubber worker's art in proofing. Hitherto such garments have been unattractive, as regards color. Here, however, a remarkably pleasing color effect has been secured which rivals the colored raincoats known as slickers. The material employed in the illustration shown is Japanese mummy silk proofed on the outer surface with white rubber. The garments are made in a variety of pale colors such as white, green, rose and blue. It is possible that the new garment will rival in popularity among collegians the oiled silk raincoats introduced last season. This coat will certainly be appreciated as much for its dainty appearance and light weight as for its utility and will entirely remove the dislike that many women entertain for raincoats. [Harris Raincoat House, New York City.]

"ON THE LEVEL" RUBBER HEEL.

Rubber heels usually wear down on one side, causing discomfort in walking and having to be renewed while there is still a portion of the surface comparatively unworn. The new type of revolving heel here shown does away with this disadvantage by an ingenious device.

The revolving portion, in circular form, is sunk in a flat rubber casing, which forms a frame at the forward end. The heel is attached to the shoe with cement and three nails, one in the center of the circular piece, which turns on a grommet with the pressure of the shoe on the ground. In this way the surface of the heel remains level, wearing evenly, and consequently outlasting the ordinary heel. [E. S. Helwitz, New York City.]

THE 1916 "GOODRICH CHAMPIONSHIP" TENNIS BALL.

The Goodrich tennis balls have long been esteemed by tennis players, who appreciate the heavy, close-woven, high grade felt surface for the racket to bite into. The cover is sewed by a hand under-stitch, the gilling is strong, and the stitches are close. Every ball is guaranteed a rebound of 50 to 60 per cent on a 100-inch drop. The output is gaged to the actual demand so that fresh, live balls are always supplied. [The B. F. Goodrich Co., Akron, Ohio.]

THE "VACU-VAS" FOR FLOWERS.

In these days, when floral decorations are playing an important part in many homes the "Vacu-Vas" should be especially appreciated. This device, which is made in a variety of designs, consists of a pleasing vase to which is attached one or more vacuum suction cups by which it is said the vase may be securely attached to a mirror or to varnished woodwork.

Flowers displayed in this manner may be placed in such position as to obtain the best decorative effect. The "Vacu-Vas" may be placed against the glass of an automobile without fear that the jolting of the car will lessen its adherence. [Daniel Low & Co., Salem, Massachusetts.]

THE RUBIN DUPLEX WATER BOTTLE.

The accompanying illustration shows a water bag so constructed that an infant's nursing bottle can be placed within a central opening and its contents thus kept at the desired temperature. If filled with hot water the bag holds the bottle in a warm pocket until required, while during the hot season, when babies are taken to the park or visiting, the bag may be filled with ice water or chopped ice to prevent souring the milk.

The advantages of this device are many. The weight of the nursing bottle fixed in this manner is too great for a baby to throw it out of the crib or carriage—a common habit—and the bag forms a support for the bottle, which prevents it from rolling under the baby's head or body. If a ribbon or bandage is passed through the opening, the water bag may be attached in a stationary position to any part of the body. [The Vulcalose Co., Chicago, Illinois.]

WATCH HOLDER FOR STEERING WHEEL.

The automobilist is usually running against time and the old dashboard clock has frequently proven unsatisfactory. The device shown is a jet-finished holder and rubber cushion for a watch. This is attached directly on the steering wheel, the rubber cushion preventing vibration. These holders are made to fit any watch and any steering wheel. [Motor Car Specialties Co., Boston, Massachusetts.]

"BUDDY" INSIDE LACE PACS.

The "Buddy" inside lace pacs are new half boots of rubber that lace on the inside, thus preventing the laces from cutting the shoes and making them leak, as is customary with those that lace in front. It is claimed that these pacs are made of pure rubber in a way that tends to resist wear. Wearers appreciate the ease with which they are laced, which is conveniently done by placing the foot across the knee. [Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut.]

RUBBER-COATED PATIENTS' BIB AND LABORATORY APRON.

The first illustration shows a bib that is specially designed for convenience, complete protection, and quickness of adjustment in the sick-room, and it is also very practical for dental use.

There are no strings, clamps or buttons to get out of order—simply a spring which adjusts itself and saves the necessity of tucking a towel around the neck. These bibs are 28 inches wide and 36 inches long, and are made of high-grade white cloth, heavily coated with rubber. They can be had in white, black, or maroon.

In the convenient and thoroughly practical laboratory apron, also shown, two self-adjusting spring attachments (marked A and B) serve the same purpose as the one in the bib and do away with annoying and time-consuming fastenings. It is made of heavy, rubber-coated sheeting, universal size, and of the same colors as the bib. [Frank Betz, Hammond, Indiana.]

SILK OUTING PUMP.

Within the last few years outing shoes have undergone a remarkable transformation. With the spread of interest in athletic sports, especially among women, comfort, combined with good looks and variety in style, have been added to the old requirement of mere utility.

A recent development is the outing pump of silk, with white rubber sole and heel and neatly tailored bow or plain colonial buckle. The pump here shown is of black silk, but they are also supplied in white, blue and other pleasing and fashionable colors. [Converse Rubber Co., Malden, Massachusetts.]

THE "BI-PLANE" SIDEWALK COASTER.

Sidewalk coasters are a source of never-ending amusement for children, and their use does not overtax the muscles, as in the case of many childish sports. The rider stands on the platform between the wheels and pulls the handle back and forth, slight effort being required to run the coaster. The new model here shown, called the "Bi-Plane," has 10-inch, full ball-bearing, rubber-tired wheels, with spokes set into the rims with nipple bolts. Finished in maroon enamel, striped in silver, it forms a durable and highly attractive plaything. [F. A. O. Schwarz, New York City.]

FORD AIR BREAK.

In a Ford car the openings at the clutch and brake are very large. This, as well as the fact that there is no pan under the car, permits the air to come through at these points in such volume as to render the driver's position one of considerable discomfort, at any season of the year.

A contrivance to overcome this unpleasant feature is shown in the "Ford Air Break" here illustrated. The openings are encased in a covering of specially prepared double texture material which is very strong and heavy and which effectually prevents the entrance of air. [Franklin Rubber Co., Boston, Massachusetts.]

RUBBER TATTING SHUTTLE AND THIMBLE.

Tattooing, which is the name for attractive, lace-like designs worked in fine thread and used as edgings and trimmings, is coming again into popularity after years of comparative neglect. This work demands a special shuttle, and the first illustration shows a new tattooing shuttle of highly polished black hard rubber.

Lightness is an important feature in the hard rubber thimble, also shown. It is claimed for this thimble that it will not tire the finger of the user. It is inexpensive and durable, and is supplied in all the standard sizes. [American Hard Rubber Co., New York City.]

WORK SHOE WITH RUBBER HEEL AND ROCKER BAR.

Improvements are constantly being made to meet the demand for shoes that will be waterproof, possess unusual durability, and yet not burden the feet of the wearer unnecessarily with their weight and clumsiness. A recent candidate for favor utilizes aluminum for the lower portion of the shoe, thus providing a strong waterproof shoe of the minimum weight, while the solid rubber heel and rocker bar, here shown, are to provide comfort, both in standing and walking. [Racine Aluminum Shoe Co., Racine, Wisconsin.]

RUBBER SEWING FINGER.

In sewing, especially when working with heavy, unwieldy materials, it is not only the thimble finger that suffers if unprotected. The forefinger is apt to be pricked and becomes callous and sore. A convenient protection is shown in the rubber sewing finger here illustrated. Ventilation at the small end avoids sweating or drawing, while the inside ribbing holds it securely on the finger. When counting bills or handling papers of any sort, the operation will be greatly facilitated by the use of these rubber fingers with the ribbed side turned outward. They are made in three sizes, small, medium and large. [C. J. Bailey & Co., Boston, Massachusetts.]

The Obituary Record.

CHARLES H. ARNOLD.

CHARLES HENRY ARNOLD, for years a leading figure in the crude rubber business, died at the Hotel Manhattan, New York City, February 20. He had been an invalid for over a year, having never fully rallied from a severe attack of pneumonia. Some three weeks ago he left his home in Stoneham, Massachusetts, and came to New York to arrange certain business affairs prior to a visit to Augusta, Georgia. The effort was too much for him in his enfeebled condition, and the end came from physical exhaustion.

Mr. Arnold was born in Roxbury, now a part of Boston, November 14, 1860. He attended the Boston public schools, and when 14 years of age entered the employ of Henry A. Gould, who was then a Boston commission merchant. Soon after Mr. Gould began to import gutta percha, and later india rubber. Both of these commodities were sold to rubber manufacturers by the enterprising young clerk.

CHARLES H. ARNOLD.

During his visits to the rubber factories he met Colonel N. Chapman Mitchell, who was just beginning the reclaiming business that later became the great Philadelphia Rubber Works Co. With Mr. Gould's consent, Mr. Arnold began on his own account to purchase "gossamer" rubber scrap from the Conants, Klous, Columbia, Mystic and other New England factories, having it reclaimed and reselling the product.

This became so profitable that at the age of 21 he embarked in business for himself under the firm name of C. H. Arnold & Co., with Frank H. Atwood as partner, selling gutta percha and reclaimed rubber. This business prospered, but in 1894 he liquidated it and became Boston representative of the firm of Reimers & Meyer, later Reimers & Co. On the retirement of Hermann Reimers in 1903 the firm of Poel & Arnold was formed, representing Heilburt, Symons & Co., of London, the headquarters being in New York City. In 1911 Mr. Poel retired, and the firm name was changed to Arnold & Zeiss, which it has since remained.

Mr. Arnold was widely known and universally respected by the rubber trade at home and abroad. A man of marked individuality he impressed all with his sturdy common sense, rigid uprightness and uncompromising fairness. Serious and often reserved, he nevertheless made firm friends, and where he gave his own friendship it was loyal, frank and enduring.

Of the five sons who survive him two are connected with the rubber trade: W. H. Arnold, who is the Boston representative of Arnold & Zeiss, and H. C. Arnold, who is the assistant superintendent to the Converse Rubber Shoe Co.

In accordance with Mr. Arnold's last wishes the funeral services held at his home in Stoneham, Massachusetts, were of the

simplest character. Many prominent men in the rubber trade were present, including members of the Rubber Club, Mr. Arnold having been one of the founders of the New England Rubber Club, a charter member of the Rubber Club of America, and a director in both organizations.

JAMES H. McKECHNIE.

James H. McKechnie, president of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, died at his residence in that city on February 8 after an illness of ten days.

Mr. McKechnie was born in Granby, Quebec, in 1849. He received a public school education and early in life was engaged in a general store business. While interested in a saw mill near Granby he went to Montreal to arrange for a purchase of rubber belting. Visiting the Goodyear store, he noticed a large quantity of gossamer coats that had been made in the States. He obtained his belting and also a suggestion that resulted in the large business he later developed.

JAMES H. McKECHNIE.

When he returned to Granby he started a factory for making gossamer coats. That was in 1877. In 1883, in company with the late S. H. C. Miner and others, he organized and became general manager of the Granby Rubber Co., Limited. This corporation, as every one knows, was very successful and had built up a large and profitable trade when it was merged with the Canadian Consolidated Rubber Co., Limited, and Mr. McKechnie became a vice-president. In April of last year he was made president of the company and since that time he was elected president of the Canadian Consolidated Felt Co., Limited.

For nearly two score years, Mr. McKechnie devoted his time and energies to the study of the rubber industry. Much of the remarkable success of his undertakings is due to his indomitable will and indefatigable energy. A number of improvements in rubber footwear have been the result of his inventive genius. His keen foresight and wise judgment have been recognized as a benefit to the companies with which he has been associated. Mr. McKechnie possessed sterling qualities and his noble character exerted an influence not only on business conditions, but on the community in which he lived. He stood for courage, integrity, intelligence and prudence, and his death is mourned by many personal and business friends.

SIR CLEMENTS ROBERT MARKHAM.

Sir Clements Robert Markham, K.C.B., F.R.S., F.S.A., D.Sc., late president of the Royal Geographical Society, the distinguished scientist, who was prominent in the movement that developed rubber cultivation in the East, died at his home, London, England, on January 30, aged 85 years.

Born at Stillingfleet in Yorkshire, England, on July 20, 1830, of a noted naval family, he entered the navy in 1844. After eight years of service, during which he visited Peru, and also took part in the expedition of 1850-1, that searched for Sir John Franklin,

Photo by Bain News Service.

SIR CLEMENTS R. MARKHAM.

he resigned his commission in 1852 to devote himself to travel and scientific investigation. While in Peru in 1852-4, he became acquainted with the *Cinchona* trees yielding quinine, and with *Siphonias* (*Heveas*), yielding rubber. He introduced the cultivation of *Cinchona* into British India in 1859-62, with the result that the price of this drug was reduced from one pound to one shilling an ounce in London, and it became available for general use.

From 1858-87 Sir Clements served as assistant secretary in India. It was during this period that his rubber activities are of interest. According to an article contributed by him to the March, 1894, issue of THE INDIA RUBBER WORLD, he came to the conclusion in 1870 that it would be desirable to establish plantations of *Ficus elastica* in British India, and also to introduce the best yielding plants from South America. The first step was the planting of native Indian trees in Assam and other parts. He also planned for the introduction of South American varieties yielding better rubber. He decided that the *Castilloa* seed should first be obtained as these plants thrive in a greater variety of soil and climate than the *Hevea*. The collecting of the needed *Castilloa* plants and seed—a difficult task—he assigned to Robert Cross, who, in 1875, gathered six hundred young plants of the best species. Again in 1876 Mr. Cross was sent to Brazil where he collected 1,080 *Hevea* plants. H. A. Wickham gathered 70,000 seeds the same year. Mr. Cross also proceeded to Ceará where a few young *Manihot* plants were collected together with 700 seeds.

Sir Clements hoped that *Castilloa* trees would find a congenial home in western Ghat, that *Hevea* would thrive in Burma and that Ceará would be extensively grown in the drier plains of India.

His watchful attention to the subject of rubber cultivation had much to do with the establishment of the eastern plantations.

He was secretary from 1863-88, and president from 1893-1905 of the Royal Geographical Society. He wrote books on various subjects as well as editing 25 volumes. His recreation was traveling and topographical research. Sir Clements was Commander of the Order of Christ, Commander of the Pole Star of Sweden and of St. Olaf of Norway.

MORIZ JOSEF REITHOFFER.

Moriz Josef Reithoffer, senior member of the firm of Josef Reithoffer's Söhne Gummi- und Kabelwerke, Vienna, Austria, one of the pioneers in the Austrian rubber industry, died at Vienna, on December 14, 1915, aged 77 years.

Mr. Reithoffer, together with his brothers, Gustav and Robert,

in 1856, continued the small rubber textile business which his father had started in 1832. From a very small workshop in an old residence in the suburbs of Vienna, there was developed the large rubber manufacturing business that today employs many hundreds of hands in its factories at Garsten and Pyrach, near Steyr, in Upper Austria, and at Treusein, in Hungary, where soft rubber articles, insulated wire and cables, tires and general mechanical rubber goods are manufactured.

For years a leading figure in Austrian industrial and commercial circles, Mr. Reithoffer was a "counselor of commerce," a title conferred only on distinguished financiers and men of large business. He possessed exceptional ability, a fine character and strong personality.

RICHARD S. BRYANT.

Richard S. Bryant, factory manager of the Standard Welding Co., Cleveland, Ohio, died at the Post-Graduate Hospital, New York City, on January 28, aged 46 years.

Mr. Bryant was an authority on automobile rims, of which he invented several special types. He organized the Bryant Rim Co., Columbus, Ohio, which was later absorbed by the Diamond Rubber Co., Akron, Ohio. He was then appointed consulting engineer of the United Rim Co., of Akron, a holding company for several rim patents owned by large rubber companies. Later he became consulting engineer of the Standard Welding Co., and also its factory manager. Mr. Bryant was a member of the Standards Committee of the Society of Automobile Engineers.

TH. L. A. RUNGE.

Th. L. A. Runge, said to be the first to introduce rubber planting in Sumatra, died on December 28, 1915, in Hanover, Germany, from injuries received in a street car accident. In 1890 he planted "Boeloe" *Ficus* on the west coast of Sumatra, and in 1900 introduced *Hevea* into his plantations. Two years ago he took up his residence in Hanover, but retained the management of his plantations.

HOLLAND PROHIBITS RUBBER EXPORTATION.

A royal decree issued on January 27, 1916, prohibits the exporting of rubber from Holland. It is understood that this measure will result in Great Britain ordering no further interference with shipments of rubber to Holland. Heretofore rubber cargoes have been held up until it was conclusively proved that they were not consigned to German agents in the Netherlands.

RUBBER CLUB ANNOUNCEMENT REGARDING EXPORTING.

It has been announced by the Rubber Club of America, Inc., that it has recently come to the attention of its Rubber Advisory Committee that some export managers are not familiar with the provisions of the British Rubber Guarantee with respect to export shipments of manufactured rubber goods.

Many manufacturers have obtained lucrative export orders from Scandinavian countries on the express stipulation that the goods be shipped by direct steamer. Members of sales organizations will often go ahead with such orders in evident ignorance of the guarantee which the executive head of their firm has signed, and it is only when they find that the steamship company refuses to take the goods that they come to a proper understanding of the situation.

It makes no difference who the customer in the neutral European country may be, whether it be the Government of that country or anyone else, for under Great Britain's restrictions, all rubber goods must be shipped to a consignee in the United Kingdom and a license obtained from the War Trade department in London for reshipment therefrom.

News of the American Rubber Trade.

THE KELLY-SPRINGFIELD TIRE CO. REPORT.

THE annual report of the Kelly-Springfield Tire Co., New York City, for the year ending December 31, 1915, shows very gratifying profits. The statement in detail is as follows:

STATEMENT OF INCOME AND PROFIT AND LOSS.

Gross profits	\$2,880,080.06
Less: Operating expenses, including selling, administrative and general expenses	1,195,873.81
Net operating income	\$1,684,206.25
Other income, net: Cash discounts, interest and miscellaneous	22,537.52
Net income for year	\$1,706,743.77

BALANCE SHEET.

ASSETS.	
Cash in banks and on hand	\$705,051.33
Notes receivable	104,227.20
Accounts receivable	\$1,261,238.73
Less reserve for bad debts and discounts	143,556.40
Inventories at cost	1,117,682.33
Deferred charges to operations	1,634,607.92
Current assets	30,036.29
Sinking fund on debenture bonds: Cash and debenture bonds purchased	\$3,581,605.07
Sinking fund for redemption of first preferred stock	131,750.82
Treasury stock 6 per cent first preferred	82.00

THE ANNUAL MEETING OF THE FISK RUBBER CO.

At the annual meeting of the Fisk Rubber Co., Chicopee Falls, Massachusetts, held February 16, lack of time prevented action being taken on the proposition to increase the capital stock of the company by \$10,000,000, consisting of \$5,000,000 in second preferred stock and \$5,000,000 common stock. This matter will probably be taken up at the meeting to be held on March 8.

The regular quarterly dividends of 1¼ per cent. on preferred stock, payable May 1, and on second preferred stock, payable June 15, were declared.

H. G. Fisk was re-elected treasurer and clerk, the re-elections to the board of directors being as follows: Stedman Buttrick, E. H. Broadwell, J. C. Cole, H. T. Dunn, H. G. Fisk, Fred T. Ley and G. A. Ludington. At the directors' meeting the following officers were elected: H. T. Dunn, president; E. H. Broadwell, G. A. Ludington and John Kearns, vice-presidents; R. B. McGaw, secretary and assistant treasurer; E. M. Bogardus, comptroller. J. D. Anderson, E. H. Broadwell, H. T. Dunn, H. G. Fisk and G. A. Ludington compose the executive committee. The appointment of J. D. Anderson as sales manager was confirmed.

HABIRSHAW WIRE & CABLE CO. AND ELECTRIC CABLE CO. MERGED.

The Habirshaw Wire & Cable Co., Yonkers, New York, and the Electric Cable Co., Bridgeport, Connecticut, have merged their financial interests in the new corporation known as the Habirshaw Electric Cable Co. The officers of the new company are: Edwin W. Moore, president; R. S. Satterlee, vice-president; J. Nelson Shreve, treasurer, and G. N. Waterbury, secretary.

Both plants will remain under the same management, but the operating forces will be increased, and extensive plant improvements made to meet the rapidly growing demands for the Habirshaw products.

The machinery of the Waterbury Co., Brooklyn, New York, has been purchased, and will be installed in the Yonkers plant. Here the large underground, high and low tension wire and submarine cables will be made, while the small size insulated wire will be made at Bridgeport, Connecticut.

The general offices of the company are at 10 East Forty-third street, New York City. James B. Olson has been appointed general sales manager. The Habirshaw company was founded 28 years ago by Dr. W. M. Habirshaw, and is one of the oldest concerns in America engaged in the manufacture of rubber-covered wire.

ANNUAL MEETING OF THE PENNSYLVANIA RUBBER CO.

At the annual meeting of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, held on February 23, the following officers were elected: Chairman of board, Herbert Du Puy; president and treasurer, H. W. Du Puy; vice-president, C. M. Du Puy; general manager, Seneca G. Lewis; secretary, George W. Shively; assistant treasurer, C. G. Morrill; directors, Herbert Du Puy, H. W. Du Puy, C. M. Du Puy, Seneca G. Lewis and George W. Shively.

The company's report for the season of 1915 shows approximately a four million dollar volume of business, with earnings the most satisfactory in the history of the company. The already heavy demand experienced for their new product, the "Ebony Tread" tire, necessitates increase in building and heating capacity, and this new business, together with the already heavy fixed demand for vacuum cup tires, necessitates preparation for the production of not less than 2,000 casings daily.

BOILER EXPLOSION IN HOWE RUBBER PLANT.

The Howe Rubber Co., New Brunswick, New Jersey, recently suffered a severe disaster in consequence of a boiler explosion in the boiler-house adjoining the main factory building. The cause remains unexplained, the engineer having been killed by the explosion, which wrecked the boiler-house and destroyed the main factory building by fire. One of the mill men was struck with some bricks and died on his way to the hospital, and five others were injured by flying bricks. The new reinforced concrete factory, which the company planned to use for the manufacture of tires is almost completed, and additions are now being made to this building to care for tubes also, which will be manufactured by March 1.

THE CONTINENTAL RUBBER WORKS.

The new machine shop of the Continental Rubber Works, Erie, Pennsylvania, is shown as completed in the accompanying illustration. The equipment of the building, which is of steel and

NEW MACHINE SHOP OF CONTINENTAL RUBBER WORKS.

concrete construction, was described in the February issue of THE INDIA RUBBER WORLD.

At the semi-annual meeting of the directors, held on February 7, W. J. Surre, manager of the tire sales department, was elected to the newly created office of second vice-president.

CRIMSON SULPHURET OF ANTIMONY.

American rubber manufacturers should be pleased to learn that in the future they will not have to rely upon a foreign source of crimson sulphuret of antimony. After several years of study and investigation, the Rare Metal Products Co., Glen Ridge, New Jersey, announces that it is making a crimson sulphuret which is in every way equal to the best of European manufacture.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on February 25 are furnished by John Burnham & Co., 31 Nassau street, New York City, and 40 South La Salle street, Chicago Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new).....	70 1/2	71
Firestone Tire & Rubber Co., common.....	740	750
Firestone Tire & Rubber Co., preferred.....	113	114
The B. F. Goodrich Co., common.....	71	71 1/2
The B. F. Goodrich Co., preferred.....	113	114
Goodyear Tire & Rubber Co., common.....	342	347
Goodyear Tire & Rubber Co., preferred.....	116	117 1/2
Kelly-Springfield Tire Co., common (new).....	70	71
Kelly-Springfield Tire Co., first preferred.....	95	97
Kelly-Springfield Tire Co., second preferred.....	225	240
Miller Rubber Co., common.....	113 1/2	116
Miller Rubber Co., preferred.....	68	71
Portage Rubber Co., common.....	106	108
Portage Rubber Co., preferred.....	88	89
Rubber Goods Mfg. Co., preferred.....	51	51 1/2
Swinehart Tire & Rubber Co., common.....	106	108
United States Rubber Co., preferred.....	110	113
Fisk Rubber Co., common.....	112	115
Fisk Rubber Co., first preferred.....	110	112
Fisk Rubber Co., second preferred.....	110	112

SECRET RUBBER TRADERS FINED.

Heinrich Bachmann and Mrs. Elsie Schroeder pleaded guilty on February 21 of conspiring to violate the customs laws by attempting to carry rubber from this country as personal baggage without manifests. The defendants, according to the assistant United States attorney, said they were private traders, and Judge A. G. Dayton, in the Federal court, find them \$300 each.

INDIANAPOLIS BRANCH OF THERMOID RUBBER CO. REMOVES.

The Thermo Rubber Co., Trenton, New Jersey, announces that the location of its Indianapolis, Indiana, branch has been changed from 128 East New York street to larger quarters, at 409 North Capitol avenue, where a complete stock of mechanical rubber and automobile goods will be carried. The mechanical rubber department is in charge of L. T. Kuhl, formerly of the main office.

Warren B. Wheeler and Stillman Shaw, who operated as Wheeler & Shaw, Inc., charged with fraudulent use of the mails some years ago in connection with the promotion of the North American Rubber Co., will soon be brought to trial in Boston, Massachusetts, according to reports. This company, it will be recalled, was capitalized for \$5,000,000 to manufacture rubber by chemical means.

The American Coal Products Co., New York City, parent organization of the Barrett Manufacturing Co., has united both concerns under the name of The Barrett Co. The new company will have the same amount of stock as the American Coal Products Co., all outstanding certificates being exchanged share for share.

At the annual meeting and banquet of the American Museum of Safety, held February 3 at the Waldorf-Astoria, New York City, the Anthony N. Brady Memorial Medal was awarded to the Union Traction Co., of Indiana, H. A. Nicholl, general manager.

A NEW AUTOMOBILE BUSINESS ASSOCIATION.

The National Automobile Trade Association has been organized at Chicago, Illinois, as a successor of the Associated Garages of America, to create closer harmony between manufacturer, jobber, dealer and garage owner. The officers are as follows: Robert Bland, Evanston, Illinois, president; Robert A. Wilson, Chicago, Illinois, secretary; F. A. Bean, Detroit, Michigan, treasurer. The board of directors is composed of Jacob Friedman, Dyersville, Iowa; E. T. Jones, Akron, Ohio; Walter B. Taylor, Rockford, Illinois; Carl R. Baught, Indianapolis, Indiana, and L. C. Steers, Detroit, Michigan.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A firm in Colombia desires to represent American manufacturers and exporters of rubber goods. Report No. 20,051.

Representation of American manufacturers of automobile tires is desired by a firm in the Netherlands. Report No. 20,066. Communication with American importers of African rubber is sought by a man in France. Report No. 20,067.

A Brazilian firm wishes to represent American exporters of rubber goods. Report No. 20,132.

An inquirer in Spain desires to purchase waterproof cloth in wholesale quantities from American manufacturers. Report No. 20,231.

A man in the Netherlands is in the market for a large quantity of automobile tires, complete with tubes. Report No. 20,240.

A correspondent in the Netherlands desires to be placed in touch with American manufacturers of flax hose, with and without rubber lining, for use on fire engines. Report No. 20,242.

TRADE NOTES.

The United States Rubber Co., New York City, has reopened the plant of the Lyscoming Rubber Co., Williamsport, Pennsylvania, as an overflow factory for its tennis business.

At a stockholders' meeting on February 1, the Mason Tire & Rubber Co., Kent, Ohio, increased its capital stock from \$250,000 to \$1,000,000, the increase of \$750,000 consisting of \$600,000 preferred stock and \$150,000 common stock. The company's new plant is now under way and it is expected that it will be completed on or before May 15. The building contract has been let to the Akron Storage & Construction Co., Akron, Ohio, for \$49,750.

The Stoddard Rubber Co., Millbury, Massachusetts, is enlarging its plant by an addition of 100 feet to the present building, in which will be installed about \$10,000 worth of tire making machinery. The Stoddard Rubber Co., of New York City, which is to maintain branches in Boston, Chicago and St. Louis, will have charge of sales.

The La Crosse Rubber Mills Co., La Crosse, Wisconsin, will erect two brick, steel and concrete additions, for which plans are being drawn by V. L. Page, consulting engineer, Rockford, Illinois. One will be a four-story building, 60 x 200 feet, and the other, two stories, 40 x 120 feet.

The Gutta Percha & Rubber, Limited, Toronto, Canada, is erecting an addition to its factory on West Lodge avenue.

The Dunlop Tire & Rubber Co., Toronto, Canada, is extending its plant.

The Inquoins Rubber Co., Buffalo, New York, a subsidiary of the United States Rubber Co., operating as a branch store, will hereafter be known as the United States Rubber Co., Buffalo branch.

At the recent annual meeting of the Alling Rubber Co., Albany, New York, the capital stock was increased to \$150,000, and the following officers elected: N. E. Alling, president; S. N. Blakeslee, vice-president; W. C. Minor, secretary and treasurer, and H. A. Sheldon, assistant secretary and treasurer.

The directors of the Ajax Rubber Co., Trenton, New Jersey, have declared a quarterly dividend of 2½ per cent. This dividend is payable March 15, 1916, to stockholders of record February 28.

At its recently held annual meeting the Cincinnati Rubber Manufacturing Co., Cincinnati, Ohio, re-elected last year's officers. The company is erecting new buildings for the accommodation of added lines.

The Schaefer Rubber Co., Cincinnati, Ohio, devised a clever Washington's Birthday souvenir in the form of a rubber hatchet combined with artificial cherries boxed and offered as a memorial to the "Father of his Country."

S. Birkenstein & Sons, 409 West Ontario street, Chicago, Illinois, operators in waste rubber, have recently opened a branch office and warehouse at 134-6 North Front street, Philadelphia, Pennsylvania, with Emil J. Schwab in charge. M. Straus for many years prominently identified with waste rubber interests has become associated with the house of Birkenstein.

The Vulcalose Co., manufacturer of hard rubber substitutes, is now located at 216 West Kinzie street, Chicago, Illinois.

The National Cement & Rubber Co., Toledo, Ohio, will remove to Cincinnati, Ohio, in May.

The Panama Rubber & Equipment Co., St. Louis, Missouri, has recently extended its facilities by leasing further space in the building it now occupies on Locust street. This company manufactures waterproof garments, both in rubberized and cravenetted materials, and also the "Panama Punctureless Cushion" for auto-

mobile tires. The officers are as follows: Carl G. Schwarz, president; G. G. Giese, secretary and treasurer.

A new building is being erected for the Hanover Rubber Co., West Hanover, Massachusetts, which will be used for the trimming, packing, inspecting, stock and shipping departments. Upon completion of this addition, the company expects to have a daily output of from 12,000 to 15,000 pairs of heels and 1,000 pairs of soles.

At the annual meeting of the stockholders of the Chicago Rubber Clothing Co., Racine, Wisconsin, held January 22, the following directors and officers were elected: David G. Janes, president; George G. Bryant, secretary and general manager; E. V. Laughton, treasurer, and James Murphy, Charles E. Wells and Louis Nelson, directors.

President Birkenstein of the National Association of Waste Material Dealers called a meeting on February 14 at the Sherman House, Chicago, Illinois, for the purpose of organizing the Western division, as agreed upon at the last regular meeting of the Association, held in New York City.

The Chicago Rubber Clothing Co., Racine, Wisconsin, is to erect a building 125x65 feet, to be devoted entirely to proofing for the trade. It is expected that the new addition will be completed about April 1, giving an added output of 30,000 yards a week.

The Pouvaillism Corporation, Poughkeepsie, New York, mentioned in the January issue of THE INDIA RUBBER WORLD as the purchaser of the Condensate department of the Essex Rubber Co., Trenton, New Jersey, has begun the erection of three buildings which will total 60x340 feet.

The Russian-American Chamber of Commerce, Moscow, Russia, is preparing recommendations on the terms of a proposed Russian-American commercial treaty, and desires information that will assist it in this work.

H. J. Halaburt & Sons, Chicago, Illinois, have removed their offices to the Lytton Building, State street and Jackson boulevard.

The Stamford Rubber Supply Co., Stamford, Connecticut, has increased its capital from \$50,000 to \$100,000.

At the annual meeting of the H. W. Johns-Manville Co., New York City, L. R. Hoff, W. R. Seigle, T. T. Lyman, H. R. Trainer, Harry Gillett, F. B. Smith, J. E. Meek, H. R. Wardell and J. W. Perry were elected members of the board of directors.

Brocmhall's Imperial Combination Code has been added to the list of those authorized for use in foreign cable messages by the British Postmaster-General, although it is not available for use to Argentine Republic, Brazil, Paraguay, Uruguay and the Republic of Honduras.

By a court order obtained by Salvador Madero, a shipment of crude rubber from Mexico to Detroit, Michigan, worth \$50,000, has been held up at San Antonio, Texas, awaiting the establishment of rightful ownership.

The General Engineering Co. has opened an office at 323 Second National Bank Building, Akron, Ohio, and is prepared to handle work in rubber and mechanical engineering.

Under the auspices of the United States Rubber Co., New York City, representatives of the various military organizations in the city gave short talks to the employees of the company on February 24 in the Auditorium of the West Side Y. M. C. A. on the value of military training.

Raymond B. Price, vice-president of the company, urged the men to affiliate themselves with some military organization, both from the view of efficiency as well as patriotic duty. Full time, in addition to their regular vacation, would be allowed to those who joined, as has been the policy of the company in the past.

PERSONAL MENTION.

George B. Hodgman, president of the Hodgman Rubber Co., Tuckahoe, New York, is planning a three weeks' trip to Bermuda early in March.

George H. Pickercell, consul-general at Para, Brazil, is in the United States on a three-months' leave of absence. He can be seen in New York City at the United States Customs House, room 409, Department of Commerce and Labor, mornings between 11 and 12.

Charles B. Whittlesey, vice-president and secretary of the Hartford Rubber Works Co., Hartford, Connecticut, was a passenger on one of the New York, New Haven & Hartford Railroad trains wrecked on February 22, near New Haven, Connecticut, but fortunately escaped injury.

Matthew Hawe, for many years treasurer of the Gutta Percha & Rubber Manufacturing Co., New York City, has retired from the company. The board of directors on February 5 elected to the vacancy, George B. Dickerson, formerly vice-president of the New Jersey Car Spring & Rubber Co., Jersey City, New Jersey.

Henry L. Arbogast, chief chemist of the Portage Rubber Co., Akron, Ohio, has resigned to accept a similar position with the Alliance Rubber Co., Alliance, Ohio.

Thomas G. Richards, president of the B. & R. Rubber Co., North Brookfield, Massachusetts, has been elected a member of the local school board. He has previously served on the town's board of selectmen.

C. H. Williams has been made manager of the Chicago branch of the Goodyear Tire & Rubber Co., Akron, Ohio, and J. A. Leatherman has been appointed manager of the Portland, Oregon, branch.

N. L. Jones, of the Peerless Seamless Rubber Co., Richmond, Surrey, England, was in New York early in February, buying machinery.

Charles R. Haynes has been appointed superintendent of the factory of the Goodyear Metallic Rubber Shoe Co., at Naugatuck, Connecticut.

S. P. Woodward, formerly tire sales manager of the New Jersey Car Spring & Rubber Co., Jersey City, New Jersey, has been appointed vice-president and sales manager to succeed C. B. Dickerson, resigned.

F. E. Titus, branch manager of The B. F. Goodrich Co. at Pittsburgh, Pennsylvania, has been appointed general manager of the Buffalo, Rochester and Syracuse branches of that company. Mr. Titus' headquarters will be in Buffalo, where for eight years he served as assistant manager of the Buffalo branch, leaving here a year and a half ago to assume charge of the Pittsburgh organization. The Buffalo territory comprises thirty-one counties in western New York and nine in Pennsylvania, as well as the Province of Ottawa in Canada.

Wilson C. Dold, who for the past five years has been connected in an important capacity with the Kansas City branch of The B. F. Goodrich Co., Akron, Ohio, has been appointed manager of the St. Louis, Missouri, branch.

G. W. Pritchett has been placed in charge of the North and South Carolina territory of the Morse Chain Co., Ithaca, New York, with headquarters at 805 Ashboro street, Greensboro, North Carolina.

A. J. Fox has been made manager of the Toledo, Ohio, branch of The B. F. Goodrich Co., Akron, Ohio, succeeding H. W. L. Kidder, who was promoted to the Cleveland district.

On February 2 Otto Basten was elected a director of the Rutherford Rubber Co., Rutherford, New Jersey.

H. T. Richards, although with The B. F. Goodrich Co., Akron, Ohio, less than a year, has been appointed branch manager at Memphis, Tennessee.

D. LORNE MCGIBBON.

D. Lorne McGibbon, who retired last spring from the presidency of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, is now interested in the formation of a syndicate to exploit Canadian industries.

Starting his career as a salesman, he had risen above the salesman stage in the rubber business and was accumulating a modest little fortune when lung trouble developed. Determined to fight the disease before it was too late, he went to live in a camp at Saranac Lake, in the Adirondack Mountains. Finding life there dull and lonesome, he had a special wire run up from Albany and began to watch the stock market. There was no one around to influence him, no one to divert his attention at critical moments. He played the market as his reason dictated, and won, becoming worth several millions. Also, his lungs were entirely cured in less than a year and he is now in perfect health. The popular term "a good mixer" aptly describes Mr. McGibbon's social qualities, and he possesses countless friends.

THE BUILDINGS OF THE LOEWENTHAL CO.

The new warehouse building of The Loewenthal Co., dealer in scrap rubber, at 23 Heyward street, Brooklyn, New York, is seen in the accompanying illustration. This shows the group of

THE BUILDINGS OF THE LOEWENTHAL CO.

buildings used for the handling of material. With large facilities and with all conveniences for work the company feels that with the office now joined to the warehouse, even better service will be rendered to customers than when the office was located in Manhattan.

ANNUAL MEETING OF RACINE RUBBER CO.

At the annual meeting of stockholders of the Racine Rubber Co., Racine, Wisconsin, on January 25, the following directors were elected to serve for the ensuing year: L. B. Patterson, Chicago, Illinois; J. W. Bate, H. L. McClaren, J. Weissbach, L. T. Vance, Stuart Webster and H. C. Severance, all of Racine.

A meeting of the newly elected directorate immediately followed, at which H. L. McClaren was elected president and advisory manager; Stuart Webster vice-president, general manager and treasurer, and H. C. Severance secretary and general sales manager.

The Kansas City Tire & Rubber Corporation, Kansas City, Missouri, which recently acquired the property, plant and business of the Chester Rubber Tire & Tube Co., Chester, West Virginia, announces it will continue the operation of the Chester plant in conjunction with the rubber tire factory now being built and equipped in Kansas City, where the general offices of the corporation are located. W. W. Wuchter, as factory manager, will have charge of all manufacturing departments and Philip Freshwater, former general manager of the Chester company, becomes assistant general manager.

On February 15 an involuntary petition in bankruptcy was filed against the American Tire Co., Saugus, Massachusetts, assignment being made for the benefit of creditors to Arthur P. French.

NEW INCORPORATIONS, WITH AUTHORIZED CAPITAL, ETC., 1915.

Alliance Tire Co., Inc., February 9 (New York), \$5,000. David and Samuel W. Wallach—both of 903 Prospect avenue, and Henry W. Blumberg, 1574 Madison avenue—both in New York City. Auto tires, etc.

Aluminum Rubber & Tire Co., February 14 (Delaware), \$1,600,000. F. L. Buehler, K. M. Dougherty and L. S. Dorsey—all of Wilmington, Delaware. Office, 927 Market street, Wilmington, Delaware. To manufacture rubber tires, tubes, heels, shoes and all other kinds of rubber goods.

American Rubber & Tire Co., The, January 22 (Ohio), \$500,000. L. P. Mauger, G. W. Kratsch, F. H. Snyder and Frank Snyder.

Armor Tread Co., Inc., The, February 23 (New York), \$35,000. John A. Thomas and Jacob W. Holler—both of Fort Edward, and O. S. Humphrey, 159 Bainbridge street, Rochester—both in New York. To manufacture armor treads for auto tires, etc.

Associated Rubber Co., The, January 22 (Ohio), \$150,000. Frank J. Dunkle, Albert D. Wismar, Charles N. Olds and Lawrence J. Johnson.

Automobile Raincoat Co., Inc., February 18 (New York), \$15,000. Isidor I. Zeeman, 400 Manhattan avenue, and Arthur Zittel, 1462 Fifty-third street, both in New York City, and Julius M. Zittel, 1427 Fifty-second street, Brooklyn, New York. To manufacture rubber automobile apparel.

Century Tire Agency of New York, Inc., January 29 (New York), \$600. John Burlinson (president), 700 West One Hundred and Seventy-ninth street; Mortimer P. Arnold (vice-president and secretary), 415 Madison avenue—both in New York City, and John Stuart Eakin (treasurer), Englewood, New Jersey. Office, 15 East Fortieth street, New York City. To represent the Rubber Insulated Metals Corporation of Plainfield, New Jersey, in the sale of its pneumatic automobile tires and tubes in the metropolitan district.

Continental Rubber Co., January 21 (Ohio), \$500,000. G. W. Doerzbach, S. Frohman, J. Dauch, J. T. Sloat and C. E. Sprague. To manufacture automobile tires.

Cosmic Rubber Manufacturing Co., February 4 (Massachusetts), \$10,000. Frederick S. and Elizabeth M. Bryant, and Arthur White—all in Reading, Massachusetts. Office, Reading, Massachusetts. To manufacture and deal in tires, accessories and all kinds of rubber goods.

Dunbar Co., Inc., E. J., February 9 (New York), \$100,000. Etta Mayer, 914 Union avenue, Bronx, New York City; Herman Mendes, 400 Linwood street, and Harry E. Kaplan, 238 Christopher avenue—both in Brooklyn, New York. To manufacture rubber goods of all kinds.

Eureka Cement Co., The, January 27 (New Jersey), \$125,000. James A. Law, 1158 Broad street, and Ross G. Marley, 241 North Eleventh street—both in Newark, and William F. Law, Maplewood—both in New Jersey. Office, 6 Avenue A, Newark, New Jersey. Rubber cement and other goods.

Eureka Rubber Manufacturing Co., Inc., February 16 (New York), \$30,000. Rose Goodman, 264 North Sixth street; Harris Hyman, 366 South Fifth street, and Sal Benjamin, 6022 Nineteenth avenue—all in Brooklyn, New York. To manufacture rubberized goods.

Gordon Webbing Co., Inc., February 21 (New York), \$15,000. Milton Gordon, 700 West One Hundred and Eightieth street; Irving and Alexander S. Gordon—both of 75 East One Hundred and Twenty-first street—both in New York City. Elastic webbing.

Hill Insulating & Manufacturing Corporation, February 24

(New York), \$25,000. Robert R. Hill, 302 Convent avenue, Abbott Leach, 124 West One Hundred and Twenty-third street, and Charles G. Vogel, 2040 Seventh avenue—all in New York City. To manufacture accessories, auto parts, insulation, etc.

Kenton Shoe Repairing & Auto Tire Vulcanizing Co., Inc., February 18 (New York), \$3,000. Frank R. Kenton, 849 Jefferson avenue; William J. Grange, 666 Decatur street, and John M. Wiswall, 515 McDonough street—all in Brooklyn, New York.

Lion Tire & Rubber Corporation, The, February (Indiana), \$150,000. Ferdinand Dryfus, Thomas Follen, William A. Klepper, Patrick F. Freel, Russell K. Bedgood, Harry J. Haarey, George B. Smith, John T. Cullen, Edward Taylor and Thomas Crane. To manufacture tires, casings and tubes.

Mineralized Rubber Manufacturing Corporation, February 7 (New York), \$100,000. Theodore E. Larson, 227 Bowne street, City Island, New York; Samuel C. Worthen, 14 Davis avenue, East Orange, and Henry T. Randall, 26 Woodland Road, Maplewood—both in New Jersey. To manufacture articles from rubber, bakelite, condensate and other substances.

Monarch Tire Co., Inc., February 24 (New York), \$1,000. Fred and William Rothschild—both of 3569 Broadway, New York City, and Joseph Siskins, 971 Westchester avenue, Bronx, New York City. To manufacture tires, tubes, etc.

Muehlstein & Co., Limited, H., January 20 (Canada), \$10,000. Francis Ethelbert McKenna, Joseph Arthur Perodeau, Paul Servillan Conroy, John Mulcair and Henri Baby—all of Montreal, Quebec. Office, Montreal, Quebec. To deal in scrap rubber.

Norka Rubber Co., January 19 (Ohio), \$20,000. J. J. Dildine, W. C. Washburn, H. W. Heckman, C. E. Tounts and W. Dildine. Office, 47 Central Office building, Akron, Ohio. To manufacture a patent inner tube for tires.

Northwestern Tire Co., The, January 25 (Ohio), \$10,000. Carl and E. K. Lemster, C. E. and Otto L. Hankison.

Perfection Tire & Motor Co., Limited, The, (Canada), \$1,500,000. J. H. Christian (president), Fort Madison, Iowa; R. J. Evans (vice-president), Wabash, Indiana; L. A. Rockwell (secretary), and E. A. Stickelman (treasurer)—both of Chicago, Illinois. To manufacture automobile tires, etc.

Sterns Tire & Tube Co., The, January 26 (Delaware), \$500,000. Olin and H. E. Bryan—both of Philadelphia, Pennsylvania, and H. B. France, Wilmington, Delaware. Office, 804 Orange street, Wilmington, Delaware. To manufacture and trade in tires and tubes for automobiles, etc.

Travellers Tire & Rubber Co., January 26 (Delaware), \$500,000. E. P. Dickinson, T. L. Jennings and E. Penuel—all of Philadelphia, Pennsylvania. Office, Bankers' Trust Co., Ford building, Wilmington, Delaware. To purchase, manufacture or otherwise deal in rubber in its raw state.

Union Packing & Rubber Co., Inc., February 15 (New York), \$2,000. Samuel Netwiter, Frank H. Hallefas and Wm. C. Weiss—all of 38 Park Row, New York City. Engine packing materials.

Warwick Rubber Manufacturing Co., January 13 (Ohio), \$20,000. L. Y. Croft, Amos Engleback and J. H. Adams. To reclaim rubber.

The record time for transmitting a message by wireless from the Akron, Ohio, office of the Goodyear Tire & Rubber Co. to its Detroit, Michigan, office and receiving the answer, is four minutes.

The large demand for white footwear will greatly increase the usual sale of white cemented sole tennis shoes for the summer season.

OTIS R. COOK.

OTIS R. COOK, general sales manager of the Kelly-Springfield Tire Co., New York City, who has his offices at Cleveland, Ohio, when a mere lad, back in 1893, started to learn the rubber business. He was first employed by The B. F. Goodrich Co. When H. E. Raymond became sales manager of that concern, he took young Cook out of the office, believing that he

OTIS R. COOK.

possessed qualities that would win success on the road as a bicycle tire salesman. His success was marked and finally earned for him the position of general representative of the company.

In 1906 Mr. Cook became connected with the Firestone Tire & Rubber Co. as special representative. Two years later he accepted a position with the Federal Rubber Co., Milwaukee, Wisconsin, where he remained until 1910. He then was made general representative of the Kelly-

Springfield Tire Co., and in one week he is said to have sold more tires than the company had manufactured during the whole period during which it had made pneumatics.

In 1912 Mr. Cook decided to open a branch in Cleveland, of which he took personal charge. This venture was looked upon with doubt by some officers of the company, but two years later the report is that the business of this office reached the million dollar mark.

In recognition of his valued services, he was then advanced to the position of general sales manager, and in March, 1915, he was made a director of the company. Besides being a salesman of unusual ability, Mr. Cook is a natural leader who inspires the confidence of all with whom he comes in contact. His resourcefulness and ability are shown by the splendid sales organization that he has built up.

MID-CONTINENT CO. ENLARGES DIRECTORATE.

The directorate of the Mid-Continent Tire Manufacturing Co., Wichita, Kansas, has recently been enlarged from five to seven members. A. O. Rorabaugh, a prominent merchant of Wichita, was elected to fill the vacancy caused by the resignation of R. E. Price, former director and general manager of the company. L. H. Powell, president of the Board of Trade, and Henry Lassen, President of the Kansas Milling Co., were elected to the board as additional members. The other directors are: Ransom Stephens, C. D. Darrigrand, C. A. Matson and W. T. Watson.

BRAENDER RUBBER & TIRE CO. OPENS TWO BRANCHES.

The Braender Rubber & Tire Co., Rutherford, New Jersey, has established two new branches. One is located at 1327 Race street, Philadelphia, Pennsylvania, and is under the management of W. L. Porter. The other at 1350-1354 South Michigan avenue, Chicago, Illinois, is under the management of W. J. Heathcock, formerly of the New York branch.

TRADE NOTES.

The Firestone Tire & Rubber Co., Akron, Ohio, held a convention at Columbus, Ohio, on February 17 for the Columbus district, at which 275 dealers and representatives were present. At the banquet, President H. S. Firestone was among the speakers, and E. W. BeSaw, district manager of the Columbus territory, acted as toastmaster.

The Dryden Rubber Co. has purchased property adjoining its present plant at Twelfth street and Kildare avenue and will erect an automobile tire and inner tube factory in the spring.

At a special meeting of the stockholders of The Savage Tire Co., San Diego, California, held January 27, the capital stock of the company was increased from \$1,000,000 to \$5,000,000. Arrangements were also perfected at this meeting for extended additions to the factory buildings and equipment which will allow for a material increase in output.

The Michelin Tire Co., Milltown, New Jersey, is adding about 30,000 square feet of floor space to its plant.

The name of the Cleveland-Ford Tire Co., Ashtabula, Ohio, has been changed to the Pearce Tire & Rubber Co. This change was thought advisable owing to the fact that the name "Ford" created the impression that only Ford sizes would be manufactured, whereas it is the intention of the company to manufacture all standard sizes of tires.

The authorized capital stock of the Worcester Tire Fabric Co., Worcester, Massachusetts, has been increased from \$50,000 to \$100,000; \$36,000 of this increase to be issued and paid for in cash in full.

The Samuel Cupples Wooden Ware Co., St. Louis, Missouri, is going into the manufacture of inner tubes and casings for automobile tires.

The offices of the Favary Tire & Cushion Co., New York City, have been removed from Fifth avenue and Fifty-seventh street to 30 East Forty-second street.

The Hardman Tire & Rubber Co., Belleville, New Jersey, announces the opening of a new tire store at 2728 South Michigan Boulevard, Chicago, Illinois, under the management of J. W. Culver, formerly district manager at St. Louis, Missouri, for the Boston Woven Hose & Rubber Co., Cambridge, Massachusetts.

The Baltimore Sewed Tire Co., recently formed in Baltimore, Maryland, has purchased the tire equipment of the Service Tire & Rubber Corporation of that city. It will enter into the manufacture of tires in a three-story building, which is being prepared for that purpose. T. James Curtin, an Akron, Ohio, man will take charge of the plant.

The Syracuse, New York, branch of the Firestone Tire & Rubber Co., Akron, Ohio, has removed to the spacious new building the company has purchased at the corner of Genesee and State streets. S. E. Douglass continues as manager of the Syracuse branch.

A plant is being erected at Wakefield, Massachusetts, by Thomas E. Dwyer, licensed representative for the Motor Tire Re-Construction Co., New York City, for the establishment of the reconstruction tire business. It will be equipped with modern machinery, sufficient to care for 200 to 250 tires a day.

The Akron Repair & Tire Co., Toledo, Ohio, recently increased its capital to \$5,000 and elected new officers. P. J. Hooper, former manager, is now president; S. D. Brewster, vice-president; Raymond Gates, secretary, and William C. Braatz, treasurer. These men, together with Emil J. Ernst, form the board of directors. The company, which is the exclusive agent and distributor of Swinchart tires for northwestern Ohio, maintains a complete vulcanizing plant for repairs.

R. B. TRACY.

The subject of this sketch, R. B. Tracy, has recently been appointed factory representative of the Michelin Tire Co., Milltown, New Jersey. Mr. Tracy's connection with the rubber industry dates from the time he became connected with the Pope Manufacturing Co., Hartford, Connecticut. Eight years ago he joined the forces of the Michelin Tire Co., starting as manager of its Cleveland, Ohio, branch. Four years later he was favored with promotion to the management of the Chicago branch, which included supervision over the Minneapolis, St. Louis, Des Moines, Cleveland and Kansas City branches. Last October his industry and ability were rewarded by his appointment as factory representative. Now all branches west of Philadelphia come under his direction. Mr. Tracy is widely known in both the east and west, and possesses many friends.

R. B. TRACY.

LOUIS H. PERLMAN WINS RIM PATENT SUIT.

Judge Lacombe in the United States Circuit Court of Appeals, New York City, on February 15 rendered a decision affirming the findings of Judge Hunt in the United States District Court, who held that the Louis H. Perlman's demountable rim patent (United States patent No. 1,052,270) was valid and infringed by the Standard Welding Co., Cleveland, Ohio.

This is considered one of the most important patent decisions affecting automobiles, as it is estimated that 700,000 of the 1,200,000 automobiles to be constructed this year will use demountable rims. Mr. Perlman has stated that it is not his intention to embarrass private automobile owners and that he will require a moderate royalty from manufacturers of rims.

The Jennings-Sullivan Rubber Co., East St. Louis, Illinois, has become local distributor for the Acme "Red Letter" tires, manufactured by the Acme Rubber Manufacturing Co., Trenton, New Jersey.

PERSONAL MENTION.

E. St. J. Clark, well known in England and Australia in the development of Dunlop tires, was in New York City last month.

F. W. Sherwood, formerly manager of the solid tire department of the Firestone Tire & Rubber Co.'s New York branch, has been appointed New York manager for the Gibney Tire & Rubber Co., Conshohocken, Pennsylvania.

A. C. Galbraith, formerly with the Firestone Tire & Rubber Co., has been appointed district sales representative for the New York State territory of the Knight Tire & Rubber Co., Canton, Ohio, the New York City sales having been placed in charge of Marcus Allen.

E. C. Newcomb has taken the agency for Dayton pneumatic tires, made by the Dayton Rubber Manufacturing Co., Dayton, Ohio, for Boston, Massachusetts, and vicinity. He has organized the Dayton Tire Co. of New England, with quarters at 589 Boylston street, Boston, Massachusetts.

F. Haskell Smith, for several years superintendent of the Federal Rubber Manufacturing Co., Milwaukee, Wisconsin, has accepted the position of superintendent of the Lee Tire & Rubber Corporation, Conshohocken, Pennsylvania.

H. H. Hubbard has been appointed assistant manager of the pneumatic automobile tire department of the United States Tire Co., New York City, for the territory west of the Mississippi river.

THE "GIANT" TIRE TWELVE INCHES WIDE.

The chief object of this tire is to replace dual equipment for special services, such as on roads with a decided crown, or on unpaved roads.

The "Giant" tire is made in the channel steel hard base pressed-on type in three sectional sizes, 8, 10 and 12-inch. The 8-inch is oversize for dual 4's having about the same volume of rubber as 5-inch duals. The 10-inch is oversize for 5-inch duals; that is, the same volume of rubber as 6-inch duals. The 12-inch is oversize for 6-inch, comparing in rubber volume with the 7-inch.

As originally made, this tire had an extremely high tread. After thorough experimenting, the design was changed and instead of the solid, round section, the present "Giant" has a flat tread, with two circumferential flutes in the 8 and 10-inch sizes and three flutes in the 12-inch. [Firestone Tire & Rubber Co., Akron, Ohio.]

VACUUM CUP SHOCK ABSORBING LINERS.

By the insertion of vacuum cup shock absorbing liners, rim-cut tires that are practically worthless may be used until the carcass is worn threadbare. It is claimed for the vacuum cups that they eliminate at least 85 per cent of the bearing surface, and thus do away with friction, which is always detrimental to the life of a casing.

The vacuum cup liner acts the same as an inner shoe and entirely envelops the tube. The feather-edge coming between the two beads and channel of the wheel, laps over three rows of vacuum cups. Inflation of the tube automatically locks the liner, which is held in position by the action of the vacuum cups. [F. S. Bryant, Reading, Massachusetts.]

THE "CLINCHER CROSS" TIRE.

The "Clincher Cross" tire shown in the accompanying illustration is claimed to possess unusual non-skidding qualities under all conditions of road, owing to the unique formation of the tread design. On roads rendered dangerous by ice or wet asphalt, this tire is said to possess qualities that render its use safe where steel-studded tires are often dangerous. The increased thickness of the tread offers large wearing surface, reduces liability to puncture and tends to produce high mileage. This tire has seen severe military service upon the continent and the manufacturer claims to possess records showing 15,000 miles on ambulance work without changing the tires. [The North British Rubber Co., Limited, London, England.]

The McGraw Tire & Rubber Co., East Palestine, Ohio, has recently placed on the market a new S. A. E. American type truck tire in addition to its "High Profile" European type tire. A black tread with white side walls will be a distinguishing mark of the McGraw tires this year.

The Gordon Tire & Rubber Co., Canton, Ohio, has appointed A. W. Senz manager of a branch recently opened at the corner of East Ohio and St. Clair streets.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

AT the annual meeting of the board of directors of The B. F. Goodrich Co., B. G. Work was elected president; A. H. Marks, E. C. Shaw and H. E. Raymond, vice-presidents; C. B. Raymond, secretary, and W. A. Means, treasurer. The offices of second vice-president and general manager have been abolished. W. O. Rutherford, formerly assistant sales manager, was made general sales manager, which position was relinquished by H. E. Raymond, who will, however, continue to exercise active supervision over sales and advertising policies.

Mr. Rutherford has been connected with the company for 17 years. Starting as a salesman, he has served as branch manager at Denver, Detroit and Buffalo. From Buffalo he came to the home office nine or ten years ago as assistant to H. E. Raymond, then general sales manager.

It is estimated that The B. F. Goodrich Co. is spending \$25,000 yearly for the protection of the health of its employees, which is twice what the entire city spends for the health of its citizens.

The Goodrich company is making extensive additions which, it is said, when completed, will make its plant the largest rubber factory in the world.

From the surplus at December 31, 1915, the directors voted to set aside \$1,700,000 to increase the reserve for contingencies from \$300,000 to \$2,000,000, together with a sum of \$100,000, as an initial amount, for a pension fund. The directors were led to appropriate this amount for contingencies on account of the general unsettled conditions existing throughout the world and the consequent desire to reinforce the fund available to meet unfavorable conditions should they arise.

The following tabulated statement of the year 1915 shows larger net earnings than the advance statement published in the February issue of THE INDIA RUBBER WORLD:

	1915.
Net sales	\$55,416,866
Manufacturing, selling and general administration expenses	42,825,908
Net profit from operation	\$12,590,957
Miscellaneous income	467,690
Total income	\$13,058,648
Depreciation	\$734,544
Reduction of preferred stock	11,878
Interest on bills payable	46,546
Net profit	12,265,679
Preferred dividend	1,960,000
Surplus	*10,305,679
Appropriation for contingencies	1,700,000
Preferred stock redeemed	1,100,000
Pension fund	100,000
Previous surplus	3,177,910
Profit and loss surplus	10,583,589

*Equal to 17.17 per cent earned on \$60,000,000 common stock, against 5.62 per cent on same stock previous year.

Reduction of treasury preferred stock from cost to par value.

The consolidated balance sheet as of December 31, 1915, compares as follows:

ASSETS.	
	1915.
Real estate, buildings, plant, good will, etc.	\$71,502,099
Inventory of other costs	1,213,477
Preferred stock in treasury	775,700
Societe Francaise B. F. Goodrich	2,121,140
Current assets	31,242,023
Deferred charges	231,793
Total	\$107,086,232
LIABILITIES.	
	1915.
Common stock	\$60,000,000
Preferred stock	28,000,000
Current liabilities	4,402,642
Reserve for contingencies	2,000,000
Pension reserve	100,000
Surplus	10,583,589
*Appropriation	2,000,000
Total	\$107,086,232

*Appropriation from surplus for redemption of preferred stock.

The Goodyear Tire & Rubber Co. has purchased a large tract on Market street, opposite its plant, and will erect a garage, estimated to cost \$50,000.

English and citizenship classes are being organized for the benefit of the 1,000 men of alien birth employed at the Goodyear factory. Announcements of the proposed classes have been printed in seven languages and distributed throughout the plant. In the English classes speaking, reading and writing will be taught, and for citizenship the instructor will cover such subjects as history, the fundamental principles of American government, and the geography of our country.

A new organization of general office employees of the Goodyear company has taken over "The Colony," the old F. A. Seiberling residence on Market street, for a community club house. A steward and housekeeper have been installed and the building is newly furnished. Present accommodations limit the membership to 27 men.

C. W. Seiberling, vice-president of the Goodyear Tire & Rubber Co., gave a dinner on January 28 to 165 employees of the company, including foremen and department managers. The meeting is the beginning of a plan to bring employees of the company into closer touch with department heads and foremen, and to interest them in educational movements and hygiene.

The General Tire & Rubber Co.'s new plant of steel and concrete construction, located in East Akron, is equipped with the latest machinery and devices, and has both water and rail facilities. M. O'Neil, the president, was formerly owner of a local department store and is prominently identified with tire fabric and other interests in Akron. W. O'Neil, the vice-president and general manager, formerly operated the Western Tire & Rubber Co., with which organization W. E. Fouse, the secretary, was also connected. T. T. O'Neil, son of the president, is the manager of publicity. The factory staff is as follows: Charles Jahant, superintendent; Robert Jredell, assistant superintendent, and H. B. Pushe, chemist. The latter was formerly chemist for the Goodyear Tire & Rubber Co.

An orchestra has been organized among the employees of the Firestone Tire & Rubber Co., with S. W. Dickinson, of the other department, as director.

The swimming pool of white glazed tile for the new Firestone club house will be 61½ feet long, 20 feet wide, 8 feet deep at one end and 4 feet deep at the other.

The American Tire & Rubber Co. has recently reorganized. The newly elected officers are: F. H. Snyder, president; Charles Dietz, vice-president, and George W. Kratch, secretary and treasurer. The new directors are: Fred H. Snyder, Frank H. Snyder, J. M. Taggart, A. J. Waltz and Louis P. Mauger. The company will make tires, tubes and accessories.

A Sunday school class for rubber workers has been organized at the Grace Methodist-Episcopal Church in East Akron. It is the first of its kind in the city and is known as the Rubber City Men's Bible Class. Its activities are to be social as well as religious.

The Akron Double Tread & Tire Co. is planning the construction of a two-story reinforced concrete factory addition, to cost \$30,000.

The Miller Rubber Co. has taken out a permit for a new three-story factory building, to cost \$18,000, at Getz street and Cole avenue.

The Mo-hawk Rubber Co. has increased its output from 250 to 350 tires per day.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

GENERAL PROSPERITY is visiting the various branches of the rubber trade, and the expectations are that he will make a lengthy stay. Mechanicals are having a good call. There is joy for the belting men in the scarcity of leather, and the consequent increased demand for rubber belting. A call for fire hose is always expected soon after town-meeting days in March. Orders for garden hose begin to flow at the same time. Clothing manufacturers already have more business than they can comfortably handle and salesmen now out are sending orders for more. The tire manufacturers are busy right along with orders ahead, and no trouble has been found in securing business at the advanced prices. Druggists' sundries are, at least, normally active.

THE STOUGHTON RUBBER CO.'S FACTORY.

Since the second week in February, New England has had all the snow it cared for, and while the general public may not have been pleased with the snow, thaw and slush, the rubber boot and shoe trade has flourished.

Occasionally a traffic policeman is run over or crowded between moving vehicles, and some have been severely injured. It is claimed that the dark uniforms they wear, especially the black rubber coats, blend too easily with rain and fog. Some time ago a prominent rubber clothing man endeavored to interest the police officials in the matter of apprelling their crossing officers in white rubber uniforms on rainy and dark days, but no sale was made.

Late in January a mechanical traffic regulator was put on trial at Winter and Tremont streets. This was in charge of its inventor, who, on a rainy day, donned a complete suit of white rubber, a cap with shoulder cape, overcoat with cape, and rubber boots. This man was so much more conspicuous than the police officer stationed near him that the question was at once on the lips of pedestrians, teamsters and motorists, "why shouldn't the police be so dressed?"

Undoubtedly there are arguments in favor of making the "Traffic King" more conspicuous than he is today, encased in a black rubber coat. It would be a good sale for some concern to outfit 130 or 140 policemen with white rubber helmets, coats and boots, but so far, no one has been smart enough to secure such an order.

The Revere Rubber Co., whose main office and factory are at Chelsea, has leased the second floor in the handsome new business building, 62 High street, where it will move its Boston office. The accounting and sales departments will be located here, and stock will be carried to fill detail orders. This new location is especially appropriate for the business, being situated in a section very largely devoted to machinery and lines to which this company caters.

The American Rubber Co. exhibited its line of clothing samples to its western jobbing customers at Chicago, Illinois, on Feb-

ruary 14, and to its middle states customers at New York City on February 23 and 24. On these dates the orders are taken for samples, and these are combined and put through the factories as one order, and then all shipped simultaneously, so that no favoritism is shown. All the jobbing houses thus receive their samples on approximately the same date.

Mention was made last month of the consolidation of the American Rubber Co. and the Stoughton Rubber Co., and the removal to new offices and salesrooms early this month. This combined concern is the largest manufacturer of rubber and rainproof clothing in the world. The first-mentioned company manufactures 3,000 garments per day, and the latter 1,200. It is the intention of the new management to increase this by about 20 per cent. in the near future.

THE AMERICAN RUBBER CO.'S FACTORY.

This merger will remove from the trade lists the time-honored name of the Stoughton Rubber Co., though only in name will the change be noted. All its specialties will be made as heretofore, and its customers served as they have been in the past. The history of the Stoughton Rubber Co. is interesting. It began in 1877 as the Mystic Rubber Co., with a capital of \$13,000. Ira F. Burnham, who at the time of its organization became one of its two traveling salesmen, was made superintendent and manager in 1881. This company was the second to manufacture rubber gossamer garments, the cloth being coated in Stoughton and the garments made up in Boston. In 1883 the manufacture of calendered clothing was begun and much machinery was added.

In February, 1889, the Stoughton Rubber Co. was organized, with a capital of \$100,000, to succeed the Mystic Rubber Co. In April of the same year the capital was increased to \$200,000, and the company took over the assets and good-will of the Hall Rubber Co., of Watertown, Massachusetts. New buildings were added, and the stitching department removed to Stoughton, where this company was the first to discard foot-power sewing machines for steam power in the manufacture of rubber clothing. In 1893 the company started the manufacture of mackintosh clothing, and two years later a line of cravenette rain garments was added. Mr. Burnham became president and general manager in 1903. Since then the history has been one of steady progress. Large additions to the plant have been frequent, tenement houses for its workmen have been built, and the works now employ between 300 and 400 hands.

The history of the American Rubber Co., of East Cambridge, is too well known to need telling here. This immense plant is devoted to the manufacture of footwear and clothing. The latter department has been under the sales management of N. Lincoln Greene, who is well known throughout the entire trade. In the new organization, in which both Messrs. Burnham and Greene are vice-presidents, Mr. Greene will be manager of the clothing department, while Mr. Burnham will have general oversight of manufacturing. Mr. Greene will have as assistant manager of the clothing department Ellsworth H. Hicks, who was vice-president and principal salesman of the Stoughton Rubber

Co. Lester Leland remains president of the company, Homer E. Sawyer general manager, J. H. Nance treasurer and E. F. Dewing clerk. The remaining directors are A. L. Comstock and H. E. Converse.

The Converse Rubber Shoe Co. has let the contract to enlarge its present factory building, making its width 90 feet, instead of 60 feet. There will also be built a four-story, reinforced concrete addition 150 feet long, 68 feet wide. The present storehouse on the west side of the Boston & Maine Railroad track will be used exclusively for the increasing tire business of the company. A new four-story storehouse 300 feet long is now being erected. This will give the company much needed storage room. The capacity of its footwear department will be increased from the present output of 8,000 pairs to a daily capacity of 15,000 pairs.

The stockholders recently voted to increase the capital stock from \$700,000 to \$950,000 by selling 2,500 shares of non-redeemable, 7 per cent. cumulative preferred stock.

The Boston Woven Hose & Rubber Co. will advertise its business by a series of moving picture films, showing all the processes pertaining to the various lines of goods it makes. The photographs are being taken under the direction of Mr. Conder, who is preparing a lecture to accompany them. When the factory films are added to those illustrating the various stages of gathering, smoking and shipping the crude rubber, every step will be shown from the trees in the forests of South America or on the plantations of the Far East, to the perfected goods as made in the rubber factory in Cambridge. Such an illustrated lecture will be instructive as well as entertaining, and at the same time should prove a practical advertisement.

Artistic window cards and posters announce the Automobile Show, which will be held at Mechanics' Building beginning Saturday evening, March 4, and lasting through the following week. From present indications this will be far more elaborate than any previous show.

Among the members of the trade who have been fleeing from the frozen north to summer climes, we might mention E. H. Clapp, who, at last accounts, was playing golf at Bellair, Florida.

Francis H. Appleton is at Miami Beach, Florida. Friends are expecting him to send north a few dozen tarpon.

W. H. Porter, manager of the United States Rubber Co., of New England; D. E. Gray, manager of the Beacon Falls Rubber Shoe Co., and Horace G. Cressenger, manager of the Aero Rubber Co., were special guests at the meeting of the New England Shoe Wholesalers' Association held February 2 at Young's Hotel.

The Monaquiot Rubber Works Co., of South Braintree, manufacturers of "Naturized" rubber, has completed additions to its plant, which will increase its output 25 per cent. This factory is running day and night, and it is understood that plans are under way for additional equipment.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent

THE Rubber Manufacturers' Association of Trenton has been formed in this city and its membership list includes the representatives of every plant in Trenton. The main object of the organization is to promote cooperation between the men of the shops and the heads of the concerns. It is believed the formation of the association will prove mutually beneficial to the employers and employees alike.

At the first meeting the following officers were elected: John A. Lambert, treasurer of the Acme Rubber Manufacturing Co.,

president; John S. Broughton, president of the United & Globe Rubber Manufacturing Cos., vice-president; Robert J. Stokes, secretary of the Thermoid Rubber Co., secretary; Alfred Whitehead, treasurer of the Whitehead Bros. Rubber Co., treasurer. A constitution and by-laws were adopted and a number of committees will shortly be named to look after the various activities of the association. A permanent meeting place will also be provided shortly. Meetings are to be held monthly.

John S. Broughton is the new president of the United & Globe Rubber Manufacturing Cos., having been chosen at a recent meeting of the stockholders to succeed the late Watson H. Lin-

JOHN S. BROUGHTON.

burg, whose death was chronicled in the last issue of THE INDIA RUBBER WORLD. Mr. Broughton is one of the best-known rubber men in the country. He has been connected with the trade for the past 25 years, having become associated with the United Rubber Co. before it was consolidated with the Globe company about 15 years ago. H. B. Tobin, a son-in-law of the late Mr. Linburg, has been elected secretary and treasurer of the company.

There will be no change in the policy of the concern, and the same lines as formerly will be manufactured. The ownership of the extensive plant is now vested in the estate of Watson H. Linburg and Mr. Broughton. The company is prospering and found it necessary not long ago to erect a three-story building 200 x 50 feet to take care of increasing business.

E. B. De Vere, who has been covering the Middle West as a traveling man for the Essex Rubber Co., has been placed in charge of the Chicago, Illinois, office of this firm. No announcement is made as to a successor to Mr. De Vere on the road.

The Essex Rubber Co. is running night and day, turning out orders. The new inner tube department is working at capacity.

The Royal Rubber Co. will shortly begin manufacturing a line of rubber toys. If the venture is a success the business will be taken up on an extensive scale. Considerable new machinery has already been installed in the plant for this purpose. The company is now making a specialty of ice bags.
