General C. Edward Murray, treasurer of the Empire Rubber & Tire Co. and of the Crescent Insulated Wire Co., was informed that the employees of his plants intended taking up a collection to be given as a "free will offering" to Billy Sunday. He promptly announced that whatever sum the men raised he would double. It is said the men were most generous in their donations. The General had to write a pretty fat check, but he kept his word.

The late William S. Hancock, who was extensively identified with the rubber trade, was honored at a meeting of the board of Directors of Mercer Hospital, when a bronze memorial tablet was unveiled. Mr. Hancock was a director of the hospital for 20 years and contributed generously toward the support of the institution. By his will, he made the hospital the residuary legatee of his estate.

At the annual meeting of the Globe Rubber Tire Co., which was held on February 1, the following officers were elected: Horace B. Tobin, president; John S. Broughton and Henry L. Joyce, vice-presidents; Harry B. James, treasurer, and Joseph P. Hall, secretary and assistant treasurer.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

CONTINUED and, if anything, increasing activity is the rule in the rubber industry of this state. All of the manufacturing plants through Rhode Island are being rushed to the limit of present facilities. There is plenty of opportunity for several hundred additional employees, if competent, and more than one concern would immediately increase its factory capacity if desirable help could be obtained. That Rhode Island is not the only place where a shortage of desirable help is being experienced may be gathered from the number of advertisements appearing in the local newspapers calling for experienced rubber workers to take positions in plants in other sections of the country.

* * *

Orders for hundreds of cases of rubber footwear came to hand after the stormy weather in the early part of February, materially accelerating conditions and causing heavy inroads on stocks.

* * *

The 500 employees at the Woonsocket plant of the American Wringer Co. the first of the month received an increase of 5 per cent in wages. The new superintendent, Jesse P. Walsh, is making changes and improvements beneficial to the employees. Mr. Walsh, who was chosen to succeed the late Michael M. Flynn, has been with the company 43 years, 35 of which he has been either foreman or assistant superintendent.

At the annual meeting held a few days ago no change was made in the list of officers, the six former directors being re-elected. The statement for the year ending December 31, 1915, shows gross earnings, \$179,597.75; reserve from 1915, \$15,000; expenses, \$116,676.92; surplus on January 1, 1915, \$180,000; dividends paid, \$85,125; dividend declared payable January 15, 1916, \$28,375; depreciation, \$4,420. The surplus on January 1, 1916, is \$140,000.

* * *

The Phillips Insulated Wire Co., of Pawtucket, is seeking to have its capital stock increased to \$2,500,000. A bill to authorize the issuing of 25,000 shares of common stock with a par value of \$100 has been introduced in the Rhode Island legislature, and referred to the Senate committee on corporations. The company was chartered at the May session, 1892, with a capital stock of \$100,000. The incorporators were Herbert O. Phillips and Edgar B. Phillips.

* * *

The plant of the National India Rubber Co. at Bristol is being operated almost exclusively to the production of tennis shoes, though large quantities of insulated wire are being shipped for export. The tennis shoe production of this plant during February was far in excess of any previous month in the history of the concern.

Edward E. Bunn, secretary to Vice-President Le Baron C. Colt, of the National India Rubber Co., who was confined to his house at Bristol since the middle of the month by an attack of diphtheria, is slowly convalescing.

* * *

Colonel Samuel P. Colt, president of the United States Rubber Co., is planning numerous improvements and additions to his country estate at Bristol, and has engaged Frank A. Crabb, an engineer from Williamsburg, Ohio, as superintendent. The new barn is practically completed on the exterior, and work is being pushed on the interior of the building, which is to cost approximately \$100,000.

Colonel Colt left Providence about the middle of the month in his private car, with a party of friends, for Washington and Palm Beach, Florida. They remained a couple of days at Washington, and will stay at Palm Beach about ten days.

AUTOMOBILE SHOW CALENDAR FOR MARCH.

- March 1-7.—Fargo, North Dakota. Auspices, Gate City Automobile Show Corporation. W. M. Bell, manager.
 March 4-11.—Boston, Massachusetts. Fourteenth annual show. Mechanics' Hall.
 March 8-11.—Davenport, Iowa. Tri-City sixth annual show. Coliseum, G. F. Bermeister, manager.
 March 8-11.—Mason City, Iowa. Second annual show. Auspices, Local Automobile Dealers. Armory, W. H. Hathorn, secretary.
 March 8-11.—Moline, Illinois. Annual Tri-City show. Promoter, Tri-City Automobile Trade Association.
 March 8-11.—Rock Island, Illinois. Annual Tri-City show. Promoter, Tri-City Automobile Trade Association.
 March 8-15.—Brooklyn, New York. Annual show. Auspices, Brooklyn Motor Vehicle Dealers' Association.
 March 13-18.—Reading, Pennsylvania. Berkshire Hotel.
 March 15-18.—Trenton, New Jersey. Armory, J. L. Brock, manager.
 March 21-25.—Deadwood, South Dakota. Auditorium. Auspices, Deadwood Businessmen's Club, G. K. Kilter, manager.
 March 28-April 3.—Manchester, New Hampshire. Auspices, Couture Brothers' Academy.

INFLAMMABILITY OF GASOLINE VAPOR WITH AIR.

Interesting data on the inflammable limits of mixtures of gasoline vapor and air, together with the method of determining the gasoline content in such vapor are given in Technical Paper 115, recently issued by the Department of Interior, Bureau of Mines, Washington, D. C.

The tests for the range of explosion were made in a Hempel explosion pipette. Combustion was deemed complete when upon the ignition of the mixture, flame filled the vessel as far as could be judged by the eye. Measuring the percentage of gasoline vapor in the mixture it was found that no visible results were obtained until somewhere between 1.9 and 2 per cent. gasoline vapor. At 2 per cent. there was complete inflammation. Experiments showed that complete inflammation resulted up to as high as 6 per cent., after which only incomplete inflammation resulted.

Another set of experiments brought the figure at the lower limit down to 1.5 per cent. gasoline vapor. This was for gasoline of 73 degrees Baume. A new set of experiments was made to determine if the low limit for 73-degree gasoline was different from that of what is known as cleaners' naphtha which has a Baume rating of 59 or 60 degrees. It was found that complete inflammation started between 1.4 and 1.5 per cent. gasoline vapor. Roughly, it may be stated therefore, that a mixture is explosive between the ranges of 1.4 and 6.4 per cent. gasoline vapor as far as complete combustion is concerned.

SIX USES FOR AN OLD RAINCOAT.

Wearing apparel discarded by the original owner as unsuitable for further service is often made over for the use of another, but seldom is any garment capable of conversion into quite so many articles of utility as those suggested for the worn-out raincoat. These suggestions, which were evidently compiled by some housewife become adept by long experience in the art of "making ends meet," are as follows: First, rip the raincoat apart and wash it thoroughly, after which it may be turned into: A large apron for household use—when scrubbing or washing; a chemistry apron for the daughter in high school; a dusting cap and sleeve protectors; cases for sponges, brushes and toilet articles; a cover to tie over the laundry basket, and a lining for the laundry basket when the soiled linen is sent to the "wet wash." Thus, whenever father and the boys come out in new up-to-date raincoats, mother and the girls may indulge in comfort and protection limited only by their ingenuity and the sizes of the discarded garments.

The Rubber Trade in Germany.

By Our Regular Correspondent.

SINCE our country settled down to war conditions commercial and industrial progress has been regular and from month to month conditions have slowly but steadily improved. With the exception of the building trade and the textile industries all has been moving on as smoothly and as satisfactorily as could be expected considering the many difficulties incidental to war. Our rubber industry is in some instances more busy, in others less occupied than it would be at this season in normal years. Most tire factories are well provided with orders and the cable and insulated wire industry is doing well.

The readers of THE INDIA RUBBER WORLD will no doubt be interested in the following brief review of the past year.

REVIEW OF THE YEAR.

In spite of the war which had been progressing for five months, the year 1915 began under conditions that were not unpromising to our commercial and industrial life.

The available supplies of both crude and manufactured materials were surveyed, and in some instances, were taken over by the government or by organizations created by our rulers, and their distribution was made to the best of all interests. While our armies were fighting, the inventive, resourceful German minds were working and creating serviceable substitutes for materials and goods that threatened to be scarce.

Trade was throughout the year confined to the domestic markets and to the neutral countries; Sweden, Norway, Denmark, Holland and Switzerland. Towards the end of the year, however, Great Britain began to exercise so close a control over the trade of these countries that they stopped sending us raw materials and we were obliged to curtail our sales to them.

THE RUBBER SITUATION.

The rubber manufacturers who had orders for the army and navy, were very busy at the beginning of the year, while the others had very little to do, chiefly on account of the high cost of raw materials and the scarcity of skilled labor.

Manufacturers, who had finished goods in stock, did a good business, because the public realized the situation and purchased heavily, providing for the future. Payments were generally satisfactory although long credits were frequently looked for.

The heavy purchases and the measures taken by the government to preserve sufficient crude rubber for the needs of the army and navy forced rubber manufacturers early in 1915 to begin extensive manufacturing of substitute or "war qualities" and many rubber factories abandoned most of their rubber goods to take up the manufacture of other lines of merchandise. Such changes were not unaccompanied with great difficulties, as will be readily realized by practical rubber men.

No novelties in rubber goods appeared during the year, but their absence was more than made up for by the almost complete lines of substitute goods provided by our manufacturers who justly consider these "war qualities" as the greatest achievement of the German rubber industry. Our people have learned that they can do without imported rubber goods and our manufacturers believe that in the future they will have a far greater share of the home business than formerly. The war has, further, done away with many evil practices in systems of delivery and payments that had grown into our rubber trade and which we trust will not appear again in the future.

TIRES.

The enormous consumption of solid and pneumatic tires by our army has given our manufacturers all they could handle in this line. Towards the end of the year, however, army orders were mostly completed and factories became less busy. The cycle tire

industry, however, was not favored by war conditions. Only reclaimed rubber was available for making casings and only very limited quantities of crude rubber were allowed for inner tubes. Then came the restrictions on the use of cotton fabrics which practically stopped the manufacture of cycle tires for other than military purposes.

RUBBER TOYS AND DRUGGISTS' SUNDRIES.

There was practically no call for rubber sporting goods, toys, articles of luxury and the like and had a demand existed the lack of the necessary raw materials would have greatly curtailed manufacturing even in substitute qualities. As an instance of the effect of the crude rubber shortage, nipples, which prior to the war were being made of transparent stock, have reverted to the old-fashioned red and black qualities.

Business throughout the year was very slack in sanitary and surgical rubber goods, because the essential, fine crude rubber could only be had for military purposes and skilled labor, which is very important in this line, was really scarce.

MECHANICAL GOODS.

Some manufacturers of mechanical rubber goods report good business, while others are dissatisfied. As few new machines were installed, and most old machines worked far less than in normal times, there naturally was no great demand for rubber mechanical goods. Their sale was further reduced by the stagnancy that prevailed in the building trades. During the summer much was expected of increased agricultural activity and from the extensive use of machinery in this line but this field did not prove to be sufficient to offset the lack of business in other lines.

RECAPITULATION.

In spite of the lack of crude rubber, of the shortage of skilled labor, the lack of naphtha, alcohol, sulphur and other accessory materials, in spite of the increased cost of coal and of lighting material, not to mention the curtailed home trade and the almost total interruption of foreign intercourse, our rubber industry is still healthy and full of life. It has learned the value of substitutes and will use its knowledge in the future if any one attempts to withhold crude rubber supplies.

TRADE NOTES.

The Verband Deutscher Gummiwaren-Industrieller, G. m. b. H. was recently organized at Barmen with 20,000 marks [\$4,760] capital, to promote the commercial interests of German manufacturers of textiles for the rubber industry.

Gollert-Reifen, G. m. b. H., is the name of a new 50,000 mark [\$11,900] corporation recently formed in Berlin to manufacture and deal in automobile tires in general and the Gollert patent tire in particular.

The Vereinigte Durener Treibriemenfabriken G. m. b. H. at Duren has been incorporated with a stock capital of 60,000 marks [\$14,280] to manufacture transmission belts, waterproof covers and tents.

At a recent joint meeting of the leading organizations of manufacturers and dealers in cycles and motor vehicles, a resolution was passed emphasizing to dealers the importance of economy and advising them to exercise a maximum of care in repairing worn tires, to be cautious to discard none unless absolutely beyond repair and informing them that they should not stock too much rubber solution because the present qualities dry up fast even when sealed in tubes and should therefore be sold rapidly. The attention of dealers was also drawn to the necessity of holding old and worn tire valves which they are permitted to sell only in lots and after obtaining permission. A petition to the

Imperial Chancellor was prepared asking that he permit the release for private use of sufficient quantities of rubber solution and rubber sheet to make inner tubes.

The Erste Deutsche Special Hartgummifabrik G. m. b. H. was recently incorporated at Königstein with 30,000 marks [\$7,140] stock capital, for manufacturing hard rubber goods.

Imhof, Rocholtz & Vogeler, Barmen, manufacturers of rubber bands, presented their employes with a week's pay on the day before Christmas. Wives of workmen now in the field received a money present amounting to more than one week's salary, and the men at the front were also remembered.

Dr. William Berghegger and Paul Jander have been made substitute directors of the Reinische Gummi & Celluloid Fabrik, Mannheim, Neckarau.

Arthur Schalkau has been made business manager of the Gummifabrik Westend, Spadau.

PERSONALS.

Professor Dr. Harries, director of the chemical laboratories of the Kiel University and noted for his works on synthetic rubber, has resigned to become a director of Siemens-Schuckert Werke, Berlin.

Georg Oehlschlägel, of the Asbest-und Gummiwaren-Firma Reinhardt Leupolt, Dresden, was recently presented with a diploma of recognition by the Dresden Chamber of Commerce.

AUSTRIA.

The Helsingborgs Gummifabriks A. G. recently held its annual meeting of shareholders in Vienna and declared a 6 per cent dividend.

It is reported from Buda-Pest that, in spite of the cutting off of all imports of crude rubber, the Hungarian Rubber Goods Manufacturing Co. has, by modifications of its methods, been able to produce the most needed rubber articles. An extraordinary meeting of shareholders was held recently, and it was decided to increase the capital stock from 1,500,000 to 6,000,000 crowns [\$304,500 to \$1,218,000]. A dividend of 16½ per cent. was declared.

THE SITUATION IN RUSSIA.

By a Special Correspondent.

WAR has brought about great changes here in Russia. The impossibility of any extensive exports and the difficulties of domestic transportation, coupled with enormous wheat crops, have resulted in great congestion and in the accumulation of enormous quantities of foodstuffs and other merchandise. In many districts the accumulation of wheat has become so large that it has been found necessary to turn even the churches into granaries, while in other districts famine is rampant, due to a lack of shipping facilities.

Generally speaking, the masses are more prosperous now than in normal times. The mobilization has made labor less plentiful than heretofore and wages all have greatly increased. Unskilled labor that formerly earned less than 50 cents per day is now receiving as high as \$3, and the prohibition of the sale of intoxicants prevents the lower classes from turning the bulk of their wages into vodka, as in the past.

The result is clearly shown in the operations of the Government Savings Banks. During the month of November there was an increase in deposits of 47,600,000 rubles [\$24,514,000], and the total deposits on December 1, 1915, amounting to 2,384,200,000 rubles [\$1,227,863,000]. The increased prosperity is evidenced by greater expenditures for wearing apparel, including greater consumption of rubber footwear. It is now common to see galoshes worn by people who before the war could not afford "rubbers," which here in Russia, even in normal times, cost practically twice what they do in the United States.

EFFECT OF WAR ON RUBBER FACTORIES.

Prior to the war our two largest rubber manufacturing companies, the Russian-American India Rubber Co., "Treigolnik,"

Petrograd, and the Russian-French India Rubber, Gutta Percha and Telegraph Works, "Prowodnik," Riga, as well as most of our smaller rubber manufacturing concerns were in the hands of Germans. The management was German, and Germans were at the head of the different departments.

When war came all these foreigners had to be eliminated and Russians found to fill the vacancies. This alone amounted to almost total reorganization. After our troops had evacuated Warsaw, the German armies pushed forward into Courland and threatened Riga so that the vast supplies of material, machinery and finished goods of the great Prowodnik works had to be removed to the neighborhood of Moscow. The magnitude of this operation will be realized when it is known that the Prowodnik works employed more than 18,000 hands and required 20,000 horsepower.

The class of labor at the Riga works was what is known here as Baltic labor, composed of Russians, Finns, Hebrews, Scandinavians, Germans and Poles. The war made it necessary to reorganize and new help had to be recruited and instructed. This was successfully accomplished with practically no interruption in manufacturing operations. Prowodnik has materially increased its capital, has practically joined hands with Treigolnik and has opened large offices and salesrooms in Moscow and in Petrograd.

Our leading rubber manufacturing companies are tremendously wealthy and had large quantities of crude rubber and other raw materials on hand when the war broke out. Before Turkey joined in the struggle much raw material was imported by way of the Black Sea, but since the Bosphorus was closed most of our supplies have come via Vladivostok and by way of Archangel. These imports via Vladivostok alone amounted to 112,000 pounds [4,044,633 pounds] during the first six months of 1915, so we have experienced no shortage of crude rubber.

Our large rubber factories have been able to maintain their enormous production. During 1914, in spite of war conditions which affected the latter portion of the year, Russia exported \$1,196,000 of rubber footwear and \$1,466,000 of other rubber goods. We are able to produce both solid and pneumatic tires in quantities sufficient for all our needs: the tires we have been importing are mostly of American measurements for the equipment of the motor vehicles we purchased in quantities from America after the war started.

RUBBER FOOTWEAR REPAIR SHOPS.

The high cost of our rubber footwear and the natural frugality of our people has created in this country a trade unknown in America, the repairing of rubber boots and shoes. In all our cities, towns and villages there are shops where "rubbers" are repaired "while you wait." These shoe menders state that the public now discards "rubbers" which in normal times they would have repaired.

RUBBER STATISTICS.

Statistics for 1914, recently published, show that our imports of crude rubber and gutta percha amounted in value to \$14,807,000, of which \$6,881,000 were imported from Great Britain, \$3,182,000 from Germany, \$797,000 from the United States, \$500,000 from the Netherlands and \$164,000 from France. During the same period our imports of manufactured rubber and gutta percha only amounted to \$714,000.

RUBBER SCRAP.

Comparatively speaking, very little rubber scrap is reclaimed here. Our leading companies can handle little more than 200 tons per day. Practically all of the rubber scrap produced is collected for export to England, the United States and Germany. Exports to the United States alone, averaged 6,235,916 pounds in weight and \$492,425 in value per annum during the last three normal years previous to the war. This consisted chiefly in

worn-out rubber footwear and thousands of men, women and children found a livelihood in collecting, sorting and packing rubber scrap. Under present conditions this industry is practically dead.

The total exports for 1914 amounted to only \$73,000. This state of affairs is due to the lack of transportation, the practical impossibility of export trade due to high freight rates, and to the lack of sufficient demand for rubber waste. It is also due to the fact that other fields are far more remunerative at present. For example, much of the unskilled labor employed formerly at gathering and preparing rubber scrap, is now chopping and selling fire wood and earning almost five times as much as formerly. Enormous quantities of rubber scrap are accumulating throughout the country.

THE RUBBER TRADE IN GREAT BRITAIN.

By Our Regular Correspondent.

MANUFACTURERS in nearly all branches of the trade report being extremely busy, many of the larger works continuing to be mainly engaged upon governmental work. Two of the largest plants in the Manchester district have recently been added to the list of factories "controlled" by the Ministry of Munitions, which means, *inter alia*, that their profits are limited to 20 per cent above their normal pre-war profits.

The position with regard to the raw rubber market is more tranquil than in the immediate past, it being generally recognized that there is sufficient rubber for all likely demands.

The rush up to the dollar line occurred without any good reason, a fictitious market being created owing to the fact that both Russia and the United States were large buyers at the same time. The freight question of course remains, and will continue to influence the market, though too much has been made in some quarters of the diversion of the traffic from the Suez Canal to the Cape route, which only takes seven or eight days longer. Manufacturers generally are looking forward to rubber at 2s. 6d. or 3s. per pound.

Busy as rubber manufacturers are, they have plenty of worries to contend with, such as shortage of labor, high prices of chemicals, internal transit difficulties, etc. Women are being increasingly employed in place of men, and with quite satisfactory results.

THE EDITOR.

The modest announcement in the January INDIA RUBBER WORLD of the election of Henry C. Pearson as a Fellow of the Royal Geographical Society of London came as an interesting and appreciative item of news to British readers, to many of whom Mr. Pearson is personally known. It has been said of some of the Fellows that they have obtained their entry to the society too easily; in other words, that the amount or the nature of the ground they have covered has been too limited. No objection of this sort can be justly made in the present case by those who know Mr. Pearson's wanderings in rubber producing regions.

SIR CLEMENTS R. MARKHAM.

The society has come into prominence lately by reason of the death of one of its oldest and most prominent fellows. I refer of course to Sir Clements R. Markham. By the way, in the various obituary notices which I have read I have not seen any reference to his journey to Panama in company with Robert Cross, of Liverpool, to obtain seeds and cuttings of the *Castilloa* tree. No doubt this was not of as much importance as the quinine business, but the ultimate outcome of this journey has proved by no means of an insignificant nature.*

*It was our belief that, while Sir Clements R. Markham was the active head of the Panama expedition, he did not go with it, but sent Mr. Cross. THE EDITOR.

RUBBER COLLARS.

I have never worn a rubber or celluloid collar, though they have long had admirers. One of the numerous changes of procedure which the war has brought about is the greater use of these collars, mainly by the better class of workmen, and sales have been very brisk. This is not attributable to the higher cost of linen collars because these, if anything, have been cheaper, owing to the number of men wearing khaki collars. The cause is due rather to the increase in laundry charges, which have shown a substantial rise.

WRINGER ROLLS.

Specializing in the rubber industry has long been a feature of American practice, while in Great Britain it has been customary for factories to make a wide range of goods. Wringer rolls for domestic washing machines were at one time largely imported from America, and for all I know this may be the case today. There is now, however, a small rubber works, the Acme Rubber Co., situated in a suburb of Glasgow, where these goods are the sole product. It has by no means a monopoly of this business as many of our large works also make these goods. I mention the case as an interesting example of specialization—a procedure which is uncommon with us.

REMOVAL OF WORKS.

Some months ago I mentioned that the Burnett Motor Tire & Rubber Co. had commenced manufacturing at the Limpley Stoke Works, formerly occupied by Wallington, Weston & Co., Limited. The premises, being too small, the Burnett company has removed a few miles to larger works at Trowbridge.

LETTER FROM FRANCE.

By Our Regular Correspondent.

UNDER war conditions solid rubber tires have not been averaging better than from 1,500 to 2,000 miles, less than one-tenth of what is expected from them in commercial use. These low war mileages have been attributed to bad roads, overloading, over-speeding, constant exposure to the elements and to lack of proper attention. Some trouble is being experienced with quality which is far below the average peace time standard. This condition is not due to lack of crude rubber, for we have more than we can use, but to lack of skilled labor which for a time was scarcely felt.

From a mechanical point of view trucks in our army use are in much better condition than is usual in commercial service. Wheels out of parallel which grind the life out of tires and which are fairly common in commercial trucks are rare. One feature of war service that certainly helps to explain low mileages is that trucks are constantly under heavy loads. Temporary shortage of correct sizes and the necessity of keeping trucks in constant service have often led to the use of too small tires.

Interesting results have been obtained by using oversize tires: 110 millimeter (4½-inch) tires have in many instances outlasted two sets of 90 and 100 millimeter (3½ and 4-inch) tires for identical service.

In spite of many difficulties French tire manufacturers have been well able to supply all demands. Rubber has always been plentiful, but certain other raw materials have often been scarce.

In the early months of the war numerous American trucks were imported with American tires and American rim sizes. Our army has been altering these inch-size rims so that they can receive standard French-made tires. All new American trucks now coming into the country are built to receive French tire sizes.

The Société Française B. F. Goodrich is the only American tire concern with a plant in France, but the United States Tire Co. has for some time had a representative studying conditions here. The Goodrich plant near Paris manufactures both solid and pneumatic tires and inner tubes and also imports finished tires. The French customs-duty makes the profitable sale of American

tires difficult. While American demountable solid rubber tires have been received here with little confidence, they have developed no serious troubles.

GENERAL NOTES.

The "Bulletin du Caoutchouc," the only rubber plantation financial paper published in France, recently resumed publication. This journal, which was founded five years ago, is devoted exclusively to the promotion of Malaya rubber plantation shares. Writing on exchange this paper states that rubber plantations cause 400,000 francs [\$77,200] of gold to come each month into France. In this manner rubber plantations indirectly do their share in improving the rates of exchange.

The Société Industrielle des Téléphones, which owns and operates several large cable and general rubber goods factories in this country, recently held its annual meeting of shareholders. The report submitted for the fiscal year 1914-15 showed that, after deducting all costs, including 350,000 francs [\$67,550] distributed among the families and dependents of employees now under arms, the net profits to be distributed among shareholders amounted to 1,800,155 francs [\$347,430].

The city of Lyons, which in France is second only to Paris in population, is organizing sample fairs to occur each year during the first fortnight of March. As indicated, these fairs will be strictly for showing samples and taking orders for future delivery. It is hoped to restore to Lyons the immense trade that was done there at fairs held in the Middle Ages. It is announced that a number of French, Swiss, Italian and British rubber firms will be represented.

New patent legislation here gives power to the Ministers of War and Marine to exploit, either in State or private factories, inventions of interest to our army and navy which are patented or deposited for patent. French subjects or foreigners domiciled in France are prohibited from applying abroad for patents referring to inventions of interest to any branch of our military services.

EUROPEAN TRADE NOTES.

SWITZERLAND.

Heinrich Stadelmann has started to manufacture rubber elastic fabric in Egg.

DENMARK.

The firm of Augustinus and Hansen, commission agents in waterproof garments, 29-31, Pilestrade, Copenhagen, was recently incorporated under the name of Augustinus and Hansen A. G., to manufacture rainproof garments. The directors are Ejnar Hansen and Kay Heiberg-Jürgensen. The stock capital, fully paid, is 50,000 crowns (\$13,400).

Vald. Foersom has taken over the business of Fritz Christensen, at 27, Amagertor, Copenhagen, and will deal in rubber footwear and general rubber goods.

According to the "Kraks Vejviser 1916," a directory published in Copenhagen, the following wholesale rubber goods concerns were organized in Copenhagen during 1915:

A. Alexander, Vester Boulevard 36.
A. Dahl & Nielsen, Aktieselskab, Kjøbmagergade 63-65. Capital stock 200,000 crowns (\$53,000).

Max Möller, Havnegade 55 (mechanical rubber goods, packings and asbestos goods).

Hjalmar Maaß, Kjøbmagergade 9 (general agents and dealers in surgical instruments and fittings).

SWEDEN.

The Boras Band och Hängslefabriks Aktiebolag, Boras, manufacturer of rubber bands and garters, reports 300,000 crowns [\$80,400] profits earned during the year 1914-1915, and an 8 per cent dividend.

Aktiebolaget P. Ericsson & Co., Gothenburg, manufacturers of waterproof tents, covers and the like, have paid a dividend of

12 per cent out of 400,000 crowns [\$107,200] profits earned during the year 1914-1915.

The firm of Alfred Lindahls Import Aktiebolag, Västergatan 33, Malmö, importer, manufacturer and dealer in rubber and rubber proofed garments has divided 102,000 crowns [\$27,336] profits among its shareholders which amounts to a dividend of 7 per cent.

Aktiebolaget Birlinger is the name of a new 50,000 crown [\$13,400] company recently incorporated in Stockholm to deal in automobile tires and accessories.

Herman Kunze, founder of Herman Kunze's Maskinföröndenhetsaffär, 5 Hamngatan, Gothenburg, wholesale dealers in asbestos goods, belts, packings and general rubber mechanical goods, has been elected to the first chamber of the Swedish parliament.

Stockholms Gummifabrik has been organized in Stockholm by Paul A. Person.

THE RUBBER SITUATION IN THE GUIANAS.

By a Resident Correspondent.

MISLEADING statements have been made concerning *Hevea* diseases here which I am glad to say have been disproved in many quarters in these colonies. If these statements were left uncontradicted the rubber industry in the Guianas would have suffered materially.

The Governor of British Guiana at a meeting held on December 2, 1915, said:

There is no reason to fear that the diseases now prevalent in some districts will prove more formidable than others which have been successfully fought and conquered here and elsewhere. The Director of Science and Agriculture has informed me he is certain C. K. Bancroft, M.A., F.L.S., the government botanist, can tackle it successfully.

The disease must be fought. In Dutch Guiana every effort is being spent in stamping it out. Efforts must be made to conquer it at its first appearance. All the rubber growers in British Guiana are advised the moment they suspect the presence of this or any other disease to get at once into communication with the Department of Agriculture.

At one time the tendency existed, if any planter was under the impression that his cultivation was being attacked by disease, to keep the matter as quiet as possible and avoid communication with the responsible authorities. Disease was looked upon as something that was bound to come but would in the course of time disappear. We now know that whenever a large number of plants of the same species are brought together by artificial means, it is almost a certainty that disease of some kind will creep in. A plant under plantation conditions foreign to its natural habits, is particularly liable to disease. What is not so clearly recognized by the planter is that if disease is to be successfully fought it must be tackled at once. If the planters delay adopting remedial and preventive methods, should the conditions happen to be favorable to the development of any particular disease, that disease will surely spread, or it will take so firm a grip upon his plantation that the expense of eradicating it may possibly cause his ruin.

So, too, with this leaf disease of Para rubber, said to be prevalent on certain plantations in the Guianas. Immediately it appears steps should be taken to combat with it. In all probability it may prove a disease of no great danger, but on the other hand sufficient is known of it to conclude that it can, under certain conditions, prove a grave menace to the rubber planter.

We in the Guianas, so far as we can learn, do not suffer from root disease of *Hevea*, which causes so much anxiety in the East. Hence, if our plantations are free from *Fomes semitostus* we should be all the more prepared to get rid of a leaf disease

which is so obviously more easily detected and treated than a root disease.

An example of the damage that can be done by certain diseases is seen in the witchbroom disease of cacao. This disease, where conditions are favorable, can and does prove most disastrous. The cacao industry of Dutch Guiana was practically ruined by the witchbroom disease, and in British Guiana the planter here and there were also victims to this terrible plague. The coffee industry of Ceylon was ruined many years ago by disease which would probably in these days have been tackled and the industry saved.

From exhaustive investigations in the Guianas, it has been discovered that the soil in neither of the colonies is responsible for the leaf disease. The Department of Agriculture at Dutch Guiana is at present very busy with its examinations, and it is expected by the middle of 1916 its report will appear before the world.

In British Guiana, 1,932 pounds of rubber were exported in 1914-15 as against 1,292 pounds exported in 1913-14, an increase of 640 pounds. Of this amount 380 pounds was collected from crown lands and paid royalty, the rest was from private properties.

The rubber cultivation on leased crown lands at the Hills Estate, right bank of the Mazaruni river, and of the Consolidated Rubber and Balata Estates, Limited, at Alik, right bank of the Essequibo river, have been maintained. Cultivation of rubber has been commenced by the latter company on 43 acres of the recently leased land, Koriabo, on the left bank of the Aruka river, North West district, adjoining the Government Experimental Station at Issorora, the rubber being interplanted with catch crops.

The tapping of rubber trees was carried out at the Government Experimental Station at Christianburg and Issorora, and at the David Young's property, Aruka, now owned by the Consolidated Rubber & Balata Estates, Limited, and excellent biscuits obtained from the latex.

A showcase owned by the Permanent Exhibitions Committee of the Board of Science and Agriculture and containing samples of rubber and balata, has been placed in the Museum buildings, with the consent of the directors of the Royal Agriculture and Commercial Society.

The cultivation of rubber on the sugar estates in Demerara and other freehold properties in that colony have been maintained, and the production from such sources ought soon to be apparent.

The estimated area under rubber cultivation in the whole colony of British Guiana, according to the reports from the Department of Lands and Mines, on March 31, 1915, was 4,962 acres.

The low price of rubber has had the effect of diverting attention from the cultivation of this product, and there has been no large increase in area cultivated, but it is possible that interest may be revived after the war, when an improvement in the market is looked for.

In Dutch Guiana, the industry during 1915 cannot be said to have suffered any material loss. The trees on most of the estates are all nearly ready for tapping and, had it not been for the war in Europe, many planters would have reported good shipments. It would seem, however, that the trouble in Europe is a blessing in disguise for the industry in the Dutch colony for, after the war, prices are expected to be high. The estates will be then in a better position to profit by the long cessation from tapping and the trees will, it is hoped, be entirely freed from the leaf trouble.

It is unfortunate, however, for Dutch Guiana, that the Holland element introduced from the East Indies to fill responsible positions are men of very little feeling for the country. A recent importation, who arrived a few weeks back to report on a rubber estate, has discovered already that Dutch Guiana is unsuited for rubber and that the Far East is ideal. I could quote instances

where these East Indian experts are prejudiced against the country long before they set foot on the soil.

The balata industry in the Guianas suffered considerably during 1915 and bleeding operations were practically suspended. In British Guiana, however, the royalty collected on this product during the year was \$24,946.35, as against \$29,590.86, or a decrease of \$4,644.51. Notwithstanding the adverse conditions in that colony caused on account of the war, the production was very satisfactory and had the war not occurred, the year would have bid fair to have been a record one.

The following are the companies that carried on operations during the year with the quantity of balata on which royalty was paid by each:

Consolidated Rubber & Balata Estates, Limited.....	pounds	788,061½
Garnett & Co., Limited.....		143,286
Thom & Cameron, Limited.....		73,614
M. Boyle & Co.....		63,771
British Guiana Balata Co., Limited.....		26,271
H. L. Rongeroon.....		14,554
A. A. Garrett.....		11,121
Adward Maurer.....		9,191
Evan Wong.....		8,536
E. F. Smith.....		5,654
W. H. Paton.....		5,463
Total.....		1,148,724½

It will be seen that the chief operators were the Consolidated Rubber & Balata Estates, Limited, whose holdings represent the tracts formerly owned by Garnetts, McKinnon, Downer, Davson—chief balata pioneers of the past. Four new balata collecting licenses were issued and 65 licenses canceled for failure to pay the rentals due thereon, leaving 678 in existence at the close of the year.

The bleeding of balata by Indians on the reservations was continued from April to October, 1914, when the issue of permits was discontinued owing to the difficulty in disposing of the substance on account of the war. There was, notwithstanding, collected by the Indians from the Berbice and Pomeroy reservations, 19,559 pounds of balata which produced in revenue to the government \$1,955.90.

Dutch Guiana's balata crop began in May, 1915, owing to the new regulations which upset the entire machinery of the industry, but fortunately an order to cancel the laws reached the colony just in time to avert a crisis. However, from May to December 31, 1915, the colony produced 564,380 kilograms [1,128,760 pounds].

The war severely hampers the industry, as it is not possible to export balata to Europe and, there is no demand from the United States; if, however, the prices were attractive, good business could be effected by sending the bulk of balata produced in the Guianas to the United States.

French Guiana produced a fairly large crop during 1915, but no figures have yet come to hand. Very much activity, however, is displayed by the French people and there is a great rush for the balata forests on the Maroni, where very extensive tracts are untouched, especially on the Mini and Spinning creeks, where the trees are within easy reach from the landing places.

GERMAN IMPORTS AND EXPORTS OF WASTE.

Under paragraph 98d of the German tariff, rubber waste is included with gutta percha and balata waste. The latest available statistics of this trade, which are for the year 1913, are reprinted from the "Gummi-Zeitung," which says that no statistics have been given out since the beginning of the war.

GERMAN IMPORTS AND EXPORTS.

	IMPORTS.	EXPORTS.
Belgium.....	pounds 407,000	306,460
France.....	1,236,180	298,540
Great Britain.....	1,861,200	4,217,400
Holland.....	319,220	443,960
Austria-Hungary.....	1,406,020	146,020
Russia.....	496,600	187,000

United States.....	603,460	2,508,000
Other countries.....	1,443,320	173,140
Totals.....	8,006,020	8,881,100
Total Values.....	\$649,502	\$658,308

Rubber Planting Notes.

RUBBER TAPPING IN SOUTH KURG, INDIA.

CONSIDERABLE falling off in the yield of latex from the Ceara rubber trees has been noted in South Kurg, India, during the prevalence of overcast wet weather. Better yields are obtained when the nights are clear and dewy, provided there be no wind to dry up the latex in the cuts and stop its flow. The latex that is thus dried in the wounds is sometimes collected as scrap rubber, other times it is left to assist bark renewal. Vertical tapping is most easily performed by the coolies, who are expected to bring in 60 to 80 ounces of latex a day. It takes less time and they can attend to a greater number of trees than with the herring-bone or half herring-bone systems, but the most economical method has to be determined by the quantity of latex the trees yield under each system.

The vertical system consists in cutting a vertical channel from a height of about 6 feet to within 6 inches of the ground and then paring off one side of this channel. It has been found impracticable to tap during the southwest monsoon so that, allowing for one inch in breadth of the surface to be pared away in a month, three inches breadth is necessary for the three months season during which Ceara is tapped. Tapping can be continued for an extra month in May, after the growth of new leaves, but the best yields are always obtained during November, December and January.

If the consumption of bark surface is 6 feet by 3 inches a season, it will allow only two wounds being made in a tree 36 inches in circumference, one on each half of the tree a season, as the tapping must be arranged so that the newest bark will not be cut until it is three years old.

Paring of the bark on each side of the vertical channel is not advisable because it leaves too large a wound.

Another method of vertical tapping is to leave strips of cortex between the cuts in order to assist in bark renewal. The advantage of this system is that the guards of the tapping knives can be set so as to guard against injury to the cambium. Where strips of bark are left between the cuts, the guard of the tapping knife moves over the hard upper rind in advance of the cutting blade. If this guard has been properly set the cambium can not be touched. A tapped surface never recovers the smoothness of the original bark except when new layers of wood and bark grow in from the sides over bad wounds.

The best yields have so far been obtained from full herring-bone tapping, but the drawback is that half of the tappable surface has to be worked on each season and the Ceara tree is too delicate to stand such treatment. Experts are of the opinion that coolies should not be ordered to bring in a fixed quantity of latex daily, as they are likely to be led to make too deep cuts thus damaging the trees. Daily tapplings are preferable for Ceara to tapping on alternate days.

FRENCH AFRICAN RUBBER.

Writing on the subject of commercial relations between French Equatorial Africa and the Russian Empire the "Petit Bulletin de l'Office Colonial," published in Bordeaux, France, states that rubber is probably the only product of this French colony that possibly could be sold in almost unlimited quantities in Russia. Up to the outbreak of the war, this trade was monopolized by German traders and brokers who imported the rubber, mixed it with other qualities, and resold it to the Russian manufacturers. The purchasers were thus unable to appreciate the qualities of "nerve," elasticity and strength of the French African wild rubber.

YIELDS OF RUBBER PER ACRE.

Occasional references to exceptionally heavy yields of rubber per acre by plantation companies tend to cause the fact to be overlooked that the average production of the whole planted area of any given estate is on quite a moderate scale, says the London "Financial Times." Some interest was aroused a few years ago by a yield of 1,300 pounds per acre on a small part of one estate, but this excessive output was followed by a drop in the following year. Even the giant producers do not as a rule average 300 pounds per acre over the whole planted area, although this is generally explained by the inclusion of large areas not in bearing.

Anglo Malay reached 345 pounds per acre over the whole planted portion last year, Batu Caves 356 pounds and Batu Tiga 367 pounds per acre, and others which exceed the 300 pounds limit include Ulu Rantau, Tremelbye, Sungei Salak, Sungei Buloh, Seafield, Rubber Estates of Johore, Perak, Pataling, London Asiatic, Kuran, Kuala Selangor, Kamuning and Chersonese.

The following table shows the yield per acre of a number of companies whose reports have recently appeared:

POUNDS PER PLANTED ACRE.

	1914.	1915.
Braunton	162	214
Swillinghall	73	132
Langen (Java)	154	223
Lumut	173	226
Ratanui	235	251
Sendayan	194	243
Tapiing	186	249
United Serdang	190	257

The above list may be regarded as a representative selection of good class companies. It will be seen that on the basis of a yield in full bearing of 400 pounds to 500 pounds per acre there exists plenty of scope for increase from the present planted acreage.

ILCKEN-DOWN LATEX COAGULATING METHOD.

The acetic acid and similar methods of coagulating rubber latex have long been the accepted process in the Far East, therefore a new method, recently patented, is interesting. A. C. Ilcken and St. V. B. Down are the inventors.

The apparatus consists of a circular zinc latex tank provided with a cover and stirring device. An injector with a 1/32-inch opening is fitted to the bottom of the tank, and connected by a rubber tube with another tank that contains benzene and methylated spirit—the precipitating mixture.

The latex is first measured, and then put in the tank and stirred. When it commences to thicken the precipitating mixture is forced into the tank by a foot pump, stirring being continued in the meantime. The coagulum forms rapidly, and after a short interval it is removed from the tank and crépé.

FLOODS AND LANDSLIDES IN JAVA.

Some anxiety was recently caused among those interested in Java rubber plantations by news from Batavia of landslides and floods. The opinion is expressed in the London rubber share market that the disaster will not affect the rubber planting industry as most of the rubber estates are remote from the scene of the inundations.

VODKA SYNTHETIC RUBBER AND THE CEYLON PLANTERS.

The story that the Russian Government was going to use its vast stock of vodka for making synthetic rubber created no more than passing comment in Ceylon. The rubber planters still remember artichoke rubber and other vague synthetic rubber announcements and require something more definite to make them believe that synthetic rubber manufacturing had been established on a commercial basis.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED JANUARY 25, 1916.

- N** 1,169,123. Combination hot water bottle and ice bag. M. E. Burns, Chicago, Ill.
- 1,169,218. Solid tire. W. W. Wildman and E. A. Tinsman, assignors to The Portage Rubber Co.—all of Barberton, Ohio.
- 1,169,277. Tire valve. J. N. Newsom, assignor to W. H. Morgens—both of St. Louis, Mo.
- 1,169,301. Valveless atomizer. S. Trask, San Francisco, Cal.
- 1,169,324. Horseshoe pad. C. W. Dunning, Los Angeles, Cal.
- 1,169,361. Inflatable floating device for flying machines. P. Siparott, Brooklyn, N. Y.
- 1,169,380. Self-adjusting hat conformer with elastic tube and cord. L. Cohen, St. Louis, Mo.
- 1,169,389. Hose coupling. H. Forsman, Fresno, Cal.
- 1,169,455. Supporter comprising an elastic belt. C. F. Bennett, assignor to Sharp & Smith—both of Chicago, Ill.
- 1,169,459. Air brake coupling with electrical conductor. A. J. Campbell, Marion, Ind.
- 1,169,500. Child's garment with elastic garters. N. C. Leavitt, Newark, N. J., and I. Mink, Brooklyn, N. Y., said Mink assignor to said Leavitt.
- 1,169,524. Hose sprayer. L. S. Baker, Pasadena, Cal.
- 1,169,525. Antiskidding device. M. P. Bixby and F. C. Reimer—both of Great Falls, Mont.
- 1,169,562. Rubber overshoe with elastic retaining toe band. F. W. Ostrom, Newark, N. J.
- 1,169,575. Wheel tread comprising a body of resilient material. W. Seidel, Chicago, Ill.
- 1,169,585. Billiard table cushion rail and rubber cushion. M. J. Whelan, Muskegon, Mich., assignor to The Brunswick-Balke-Collender Co., Chicago, Ill.
- 1,169,603. Self-filling fountain pen with soft rubber tube. D. W. Beaumont, Brooklyn, N. Y.
- 1,169,712. Lathering device with a rubber bulb. G. Zingali, Montclair, N. J.
- 1,169,746. Sectional tire. C. F. Lighthouse, New York City, assignor to Lighthouse Tire Co., Guttentberg, N. J.
- 14,056. Self adjusting inner tube protector. C. L. Witsaman, Cuyahoga Falls, assignor to the Firestone Tire & Rubber Co., Akron—both in Ohio.

ISSUED FEBRUARY 1, 1916.

- 1,169,757. Hose supporter. I. G. Allen, Racine, Wis.
- 1,169,804. Toy balloon. T. M. Gregory, Akron, Ohio.
- 1,169,888. Waterproof cover or shield for cycles. J. S. Tulloch, Cashmere, Christchurch, New Zealand.
- 1,169,908. Rim with pneumatic tire carrying ring. H. J. Arend, Quincy, Ill.
- 1,169,918. Inner tube testing device. B. S. Bowers, Laprairie, Minn., assignor to J. Clorz, St. Ansarg, La.
- 1,169,964. Inner tube protector. W. N. Kelley and J. C. Porter—both of Pittsburgh, Pa.
- 1,169,984. Elastic wheel with solid tire. M. Mettler, Leipzig, Germany.
- 1,170,173. Hose rack. C. O. Lund, Brooklyn, N. Y., assignor of one-half to Carlund Manufacturing Co., New York, N. Y., and one-half to W. D. Allen Manufacturing Co., Chicago, Ill.
- 1,170,185. Rubber covered button for hose supporters. V. Price, New York, and J. H. Sanderson, Brooklyn, assignors to C. J. Higley, New York—all in New York.
- 1,170,220. Rubber eraser. J. A. Coyle, Baltimore, Md.
- 1,170,222. A package of elastic garter. J. P. Crossade, Berwyn, assignor to Pioneer Suspender Co., Philadelphia—both in Pennsylvania.
- 1,170,354. Nipple for nursing bottles. J. Skydel, New York City.
- 1,170,412. Valve for tires. W. A. Campbell, Maricopa, Cal.
- 1,170,477. A chain for a tire guard. A. E. Chernaek, Providence, R. I.
- 1,170,497. Solid tire tread. W. T. Bogan, assignor of one-half to W. W. Porter—both of Philadelphia, Pa.

ISSUED FEBRUARY 8, 1916.

- 1,170,597. Pneumatic cord tire. C. L. Archer, Council Bluffs, Iowa.
- 1,170,695. Demountable rim band. H. A. Souils, assignor of one-half to W. T. Souils—both of New York City.
- 1,170,781. Elastic garter. H. E. Penn, assignor to Penn Brothers Suspender Co., Inc.—both of Madison, N. C.
- 1,170,825. Fountain pen with rubber ink sack. J. A. Kraker, assignor to Kraker Pen Co.—both of Kansas City, Mo.
- 1,170,828. Game apparatus operated by elastic cord. S. R. Lamb, New York City.
- 1,170,875. Hose supporter with elastic webbing. S. Buyer, New York City.
- 1,170,923. Fountain shaving brush with rubber bulb. C. Malkin, San Francisco, Calif.
- 1,170,937. Automobile wheel having an alternating elastic and non-elastic block tire. E. H. Kunde, Longmont, Colo.
- 1,170,957. A tubular metal tire with rubber tread. A. B. Burt, San Francisco, Calif.
- 1,171,090. Stuffing box packing. G. H. Cook, Poplar, London, England.
- 1,171,147. Tire valve. M. C. Schweinert, West Hoboken, N. J.

- 1,171,214. Spring tire with rubber tread. H. M. Lambert, assignor to Lambert Multiplex Co., both of Portland, Ore.
- 1,171,238. Football cover. G. L. Pierce, Brooklyn, N. Y., assignor to A. G. Spaulding & Bros. Manufacturing Co., Jersey City, N. J.
- 1,171,247. Rubber thread or cord. H. K. Raymond, Akron, Ohio, assignor to The F. Goodrich Co., New York City.
- 1,171,373. Demountable rim. F. S. Whiting, Akron, Ohio, assignor to M. F. Whiting, Wayne county, Mich.

THE DOMINION OF CANADA.

ISSUED NOVEMBER 30, 1915.

- 165,768. Combination pneumatic and solid tire. T. A. Hall, Bethlehem, Pa., and C. G. O. Hall, Cleveland, Ohio.
- 165,809. Wrapper for tire casings. E. Hopkinsden, New York City.
- 165,819. Rubber footwear holder. A. G. Moore, Pownall, Prince Edward Island, Canada.
- 165,861. Rubber sole. United States Rubber Co., assignee of F. Boyle—both of New York City.
- 165,868. Rubber heel. Goodyear Tire & Rubber Co., assignee of I. R. Bailey—both of Akron, Ohio.
- 165,917. Rubber soled boot or shoe. G. F. Butterfield, West Newton, Mass.
- 165,974. Rubber heel. A. C. Rightor, Pittsburgh, Pa.
- 165,979. Demountable rim. S. E. Siggekow, Marbury, Ala.
- 166,021. Demountable rim. The Standard Welding Co., assignee of R. S. Bryant—both of Cleveland, Ohio.
- 166,119. Rubber boot. The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, assignee of A. H. Steen and H. McNulty—both of Berlin, Ontario—all in Canada.
- 166,249. Pneumatic tire. The American Tire Co., assignee of M. A. Dees—both of St. Louis, Miss.
- 166,270. Solid tire. The Gutta Percha & Rubber Co., Ltd., assignee of J. H. Coffey, and J. H. Coffey, Jr.—all of Toronto, Ontario, Canada.
- 166,281. Inner tube for pneumatic tires. The Reinforced Inner Tube Co., assignee of J. H. Poole—both of Brockton, Mass.
- 166,333. Armored pneumatic tire. R. W. Davis, Philadelphia, Pa.
- 166,381. Puncture proof pneumatic tire. J. A. Shearer, Methuen street, Prospect, South Australia.
- 166,384. Pneumatic tire casing with a layer of compressed cotton. C. V. Roberts, Ocala, Florida.
- 166,391. Pneumatic tire protector. A. F. Tiedge, Bay Bridge, Ohio.
- 166,393. Tire with elastic cushion. P. C. Traver, Far Rockaway, N. Y.

THE UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent upon the filing of the application.

*Denotes Patents for American Inventions.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JANUARY 12, 1916.]
- 19,821 (1914). Method of detachably securing heels and soles. A. E. Layton, Mill House, Winterton, Norfolk.
- 19,888 (1914). Non-skid plates for dual solid tires. G. H. Green, 25 Ouseley Road, Balham, London.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JANUARY 19, 1916.]
- 20,187 (1914). Photographic developing device comprising rubber tubing and bulb. J. A. L. Gimblette, 110 Cambridge Gardens, and G. V. Rowden, 31 Longridge Road—both in Kensington, London.
- 20,311 (1914). Rubber ball valve for feeding bottles and invalid cups. W. F. Carr-Hill, 37 Walbrook, London.
- 20,378 (1914). Method of attaching covers to tennis or rubber balls. E. C. Wisden-Luff, and J. Wisden & Co.—both of 23 Cranbourn street, London.
- 27,654 (1914). Tread attachments to rims. C. F. Forster, 235 South Grove avenue, Oak Park, Ill.
- 12,170 (1914). Footballs, etc. J. Nielson, 485 Clarkston Road, Cathcart, Scotland.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JANUARY 26, 1916.]
- 20,468 (1914). Block tire. L. Linden, 117 rue Belliard, Brussels.
- 20,519 (1914). Inhaler with rubber buffer. E. A. Mays, 35 Newhall street, Birmingham.
- 20,549 (1914). Lead covered cable. C. J. Beaver, Rangemore, Crescent Road, Hale, and E. A. Claremont, Broom Cottage, High Leigh—both in Cheshire.
- 20,570 (1914). Life belt with inflatable bags and elastic bands. W. Portsmouth, Windham House, Windham Place, Southampton.
- 20,630 (1914). Inflatable life-saving armet. R. F. Hislop, Greenhill House, Epsom, Kent.
- 20,659 (1914). Rectangular waterproof sheet for use as a coat, tent or stretcher. E. Terry, 117 Loughborough Park, Brixton, London.
- 20,600 (1914). Boats and toy fishes propelled by rubber cord. H. J. Chart, Weybury, Carlton Road, Putney, London.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, FEBRUARY 9, 1916.]
- 21,035 (1914). Tire valve. R. Walsley, Clyde Road, and G. C. Dagnall, Rushton street—both in Didsbury, Manchester.

- *1,060 (1914). Rubber fabric protector in making patent leather footwear. J. A. Kelly, 2039 North Park avenue, Philadelphia, Pa.
 *1,164 (1914). Toy submarine, with rubber bladder. T. Burney, 101 Gloucester Place, Portman Square, London.
 *2,173 (1914). Pneumatic tire with leather puncture protector. A. F. Tiedge, Bay Ridge, Ohio.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

- 477,513 (February 3, 1915). Improvements in vehicle wheels. A. Wallace.
 477,537 (June 19, 1914). Improvements in revolving heels for footwear. D. Klein.
 477,617 (December 12, 1914). Fabric composed of thin superposed layers, intersecting one another and joined together by an adhesive substance. L. A. Subers.
 477,647 (February 10, 1915). Pneumatic suspension for automobile bodies. W. G. Wood.
 477,657 (February 11, 1915). Elastic wheel. W. H. Dane and de Lencac-sevies.
 477,666 (February 12, 1915). Elastic wheel. G. F. Pinsuti and Miss Talvard.
 477,669 (February 13, 1915). Improvements in elastic bandages. W. H. Heina.
 477,785 (February 24, 1915). Pneumatic tire with a non-continuous, detachable tread, with or without a metallic armor, and provided with a puncture-proof inner tube. M. J. B. Maubon and F. C. G. Carré.

NEW ZEALAND.

ISSUED DECEMBER 9, 1915.

- 35,742. Milking machine teat cup. T. N. Fletcher, Hamilton, New Zealand.
 35,786. Milking machine teat cup. A. B. Robertson, Westown, New Plymouth, New Zealand.
 36,466. Pneumatic tire cover. The Asulay Syndicate, Ltd., 8 Laurence Pountney Hill, Cannon street, London, E. C., England.

TRADE-MARKS.

THE UNITED STATES.

ISSUED JANUARY 25, 1916.

- 89,172. Perry-Malcolm Co., Haverhill, Mass. The word *Pymal*. For shoes made of rubber, etc.
 90,030. The International Rubber Co., Denver, Colo. The words *Half-Sole Tire*. For rubber tires.
 90,484. The Miller Rubber Co., Akron, Ohio. The word *Sanitate*. For nipples, non-collapsible.
 *1,048. The United States Asphalt Refining Co., New York, N. Y. The word *Rubdur*. For asphalt base filler used for mixing with rubber, etc.
 *1,049. The United States Asphalt Refining Co., New York, N. Y. The word *Infuldur*. For an asphalt base filler used for insulating wire, etc.
 91,079. National India Rubber Co., Bristol, R. I. The word *Week-End*. For rubber and canvas boots, shoes and slippers.
 91,352. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Plato*. For light weight rubber shoes.
 91,436. The B. F. Goodrich Co., New York, N. Y. Illustration of a double circle with the words *Double Duty* in the inner one. For soles composed of rubber and a fibrous filler for boots and shoes.
 91,521. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Kalo*. For light weight rubber shoes.

THE RUBBER SCRAP MARKET.

THE sentiment of the rubber scrap market for the month that has just passed has been decidedly bullish. Last month's excitement subsided early in February, but the general situation has remained unchanged and firm throughout and the expected downward trend of prices has not materialized.

Boots and shoes continued to be the leading feature in the market. The extremely inclement weather and consequently slow collections from outlying sources resulted in firm prices. Sales were made to the mills early in the month at 11½ cents delivered but for large quantities, 11¼ to 12 cents was asked. During the last week of the month the market weakened due to the arrival of considerable stocks, and boots and shoes were sold at 10¼ to 11 cents.

The tire situation has been quite uninteresting. Values have remained firm with the same levels as last month; however, during the latter part of the month the market eased off and lower prices were freely predicted. G. and G. white tires were quoted at 8¼ cents; auto tires mixed at 6¼ cents. Inner tubes were selling at 29 to 30 cents in a firm market supported by the strong position of crude rubber. Bicycle tires have shown a slight gain during the month and 4 cents is the present price to the mills.

The balance of the list has recorded slight advances in price since our last market report and actual buying has only been normal in volume. Mechanicals, however, were in good demand at prices that show advances of ¼ to ½ cent a pound.

It is estimated that 183,000 tons of casings and tubes will be scrapped during 1916.

Review of the Crude Rubber Market.

NEW YORK.

It was freely predicted early in the month that February would very likely be a period of comparative quiet in trading and that lower prices would rule. With the exception of values, however, the above forecast has been fairly well supported by the market conditions that have prevailed during the past month.

On February 1, First latex and Smoked sheet nearby, were quoted at 76 cents, with very little difference in prices for future deliveries of these sorts. Upriver fine was selling for 73 cents.

The generally quiet tone that has dominated the market during the month would justify the belief that the manufacturers had already bought heavily during the recent period of high prices. The small orders that had been placed this month by the large consumers would indicate an interest only in immediate requirements.

Forward deliveries were very uncertain due to the lack of cargo space and shipments from the Far East were very slow—90 days is not unusual when shipments are routed via Cape of Good Hope.

Values, however, have ranged upward, and strongly reflect the firm market that has generally prevailed in London. Prices continued to advance steadily and on February 18, First latex, nearby, was quoted at 91 cents. Smoked sheet, prompt shipment, was 89 cents and Upriver fine, nearby, was firm at 77 cents. Then the market developed an easier tendency and prices declined due to lack of local support and heavy arrivals from London.

The last week of the month witnessed considerable activity in Beaver street and prices again advanced. This condition is evidently due to the scarcity of rubber in the primary markets and the steady demand from the consuming interests. On February 29, First latex, spot was quoted at 93 to 94 cents and Upriver fine, 77 to 78 cents.

The arrivals at the port of New York for the first 17 days of February total 5,000 tons in round numbers. Plantation imports head the list, with 2,200 tons from London and Liverpool and 1,200 tons from Colombo and Singapore. Other imports were 23 tons Para rubber from London and Liverpool; 84 tons Para from Para and Manaos; 110 tons, Centrals; 87 tons Plantation, from Rotterdam; 540 tons, Africans; 1,500 pounds Plantation from Paramaribo, Dutch Guiana.

There is every indication that the New York imports for February, 1916, will fall short of 9,400 tons, the figures for January—the largest monthly receipts since March and April, 1915, when 10,500 tons and 10,150 tons, respectively, were imported.

LONDON.

This market has been well supported at critical periods during the past month and prices in all positions have recorded steady advances. This firmness of the market is due in part to American requirements and the recent heavy buying orders from Russian sources. These movements have had a steadying effect on values at this time when large stocks are accumulating and arrivals are congesting the docks at Liverpool and London.

An unusual circumstance was noted during the past month in that futures were at a premium over spot rubber.

That sufficient rubber is being produced to meet the world's requirements is not doubted. That rubber prices should be normal is theoretically true. But, the fundamental difficulty that constantly threatens the rubber market is the question of shipping.

PARA AND MANAOS.

There has not been much demand for spot rubber in the Amazon markets for the past month. February is one of the months when heavy rubber receipts are expected, which thus far have been abundantly realized. Rubber has been steadily coming in for the past three weeks and consequently prices are weak and

easier. There is a difference of 15 cents per pound, according to New York quotations, February 24, between First latex, Plantation and Upriver fine in favor of the former. Another reason why there is so little buying movement in Para sorts.

SINGAPORE.

Competitive buying seems to have been the cause of recent price advances in Singapore. It is reported that representatives of the large rubber manufacturers, with open buying orders, were bidding against each other with the effect of bulling the market.

It is almost impossible to secure sufficient cargo space to accommodate the demands of rubber shippers. There is an increasing amount of rubber going to the United States by the way of Kobe, Japan, and Hongkong, China.

The following are the freight rates from Singapore to Boston and New York via the Suez or Panama Canal on rubber and allied products:

Rubber scrap (cases).....	\$36.45 per 50 cubic feet.
Gutta jelutong (cases) (Pontianak).....	38.88 per 50 cwt.
Gutta, balled or mixed not exceeding 24 cents per pound (c. i. f. in cases).....	41.31 per 50 cubic feet.
Borneo rubber (baskets).....	48.60 per 12 cwt.
Borneo, Para and rubber, genuine (cases).....	48.60 per 50 cubic feet.
Gutta percha (cases).....	51.03 per 50 cubic feet.
Rubber, genuine (bags or bundles).....	72.90 per 20 cwt.

The through rate on rubber in cases from Port Swettenham is \$52.25 per 50 cubic feet. The rate on rubber in cases by steamers calling at Port Swettenham is \$48.60 per 50 cubic feet. [The equivalent of a ton (2,240 pounds) is figured at 40 cubic feet, a hundred weight (cwt.) 112 pounds.]

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, New York City), advises as follows:

During February the market for commercial paper continued about the same as in January, there being a good general demand for city bankers' and out of town, the best rubber names selling readily at 4 per cent, and those not so well known at 4½ to 5½ per cent, according to grade.

EXPORTS OF CEYLON GROWN RUBBER.

(From January 1 to 17, 1915 and 1916. Compiled by the Ceylon Chamber of Commerce.)

To—	1915.	1916.
Great Britain	253,956 pounds	876,530
Canada and Newfoundland	122,290	
France	6,720	
United States		1,069,361
Australia		22,416
Totals	382,966	1,968,307

(Same period 1914, 521,357 pounds; same period, 1913, 481,560.) The export figures for 1914 include the imports re-exported. (These amount to 63,815 pounds.) To arrive at the total quantity of Ceylon rubber exported for that period deduct these imports from the total exports. The figures for 1915 and 1916 are for Ceylon rubber only.

SINGAPORE.

Guthrie & Co., Limited, report (January 12, 1916):

The rubber auction held today opened slowly and proceedings were very dull throughout.

Some very heavy declines in values have to be reported, the most notable being in fine pale crepe which, at \$186, was down \$23. Fine ribbed smoked sheet was neglected and most parcels were quickly withdrawn. One lot fetched \$187, but the average price obtained for the grade did not exceed \$179.

Ribbed and plain unsmoked sheet were \$20 and \$23 lower, at \$170 and \$167 respectively.

The lower grades came in for special attention and most parcels put up found ready buyers although at lower prices, the average decline being about \$14. Scrap shared in the general depression.

Of some 350 tons catalogued only 10 per cent. changed hands. The following was the course of values:

	In Singapore.	Sterling equivalent per pound in London.	Equivalent per pound in cents.
Sheet, fine ribbed smoked.	\$187 @ 187	3/ 4 3/4 @ 3/ 6 3/4	82.60 @ 85.64
Sheet, fair to good ribbed smoked	170 @ 181	3/ 2 3/4 @ 3/ 5	78.55 @ 81.61
Sheet, plain smoked	175 @ 180	3/ 3 3/4 @ 3/ 4 3/4	80.58 @ 82.60
Sheet, ribbed, unsmoked	167 @ 170	3/ 2 @ 3/ 2 3/4	77.00 @ 78.55
Sheet, plain, unsmoked	165 @ 167	3/ 1 3/4 @ 3/ 2	76.27 @ 77.00
Crepe, fine pale	184 @ 186	3/ 5 3/4 @ 3/ 6	84.37 @ 85.14
Crepe, good pale	170 @ 182	3/ 4 3/4 @ 3/ 5 3/4	82.35 @ 83.12
Crepe, fine brown	177 @ 183	3/ 4 3/4 @ 3/ 5 3/4	81.33 @ 83.87
Crepe, good brown	164 @ 178	3/ 1 3/4 @ 3/ 4 3/4	75.76 @ 81.84
Crepe, dark	140 @ 169	2/ 9 3/4 @ 3/ 2 3/4	68.00 @ 74.00
Crepe, bark	120 @ 157	2/ 4 3/4 @ 3/ 2	57.27 @ 72.98
Scrap, virgin	112 @ 113	2/ 2 3/4 @ 2/ 3 3/4	53.75 @ 54.22
Scrap, pressed	125 @ 126	2/ 5 @ 2/ 5 3/4	59.80 @ 60.12
Scrap, loose	75 @ 107	6 1/4 @ 7 1/4	38.01 @ 51.70

*Pulc = 133 1/3 pounds.

(Figured at standard rate of exchange 1s. = 24.3 cents. Quoted in S. S. dollars = 2/4 (56 cents).)

STRAITS SETTLEMENTS RUBBER EXPORTS.

A cablegram from the government to the Malay States Information Agency gives the exports of plantation rubber from the Straits Settlements for the month of December as 3,005 tons compared with 4,392 tons in November last and 2,344 tons in the corresponding month of 1915. The total export for the year 1915 was 34,891 tons compared with 19,727 tons in 1914 and 11,889 tons in 1913.

It is interesting to note the enormous development of the rubber industry during the past few years in the Malay Peninsula. So recently as 1912, the total export from British Malaya (Straits Settlements, Federated Malay States and Unfederated States) amounted to 13,005 tons. In the year just closed the total export was 79,415 tons, or more than half of the whole world's production of wild and plantation rubber.

Appended are the comparative statistics for three years:

	1913.	1914.	1915.
January	784	1,181	2,576
February	743	1,703	2,741
March	898	1,285	2,477
April	762	1,548	1,978
May	814	1,509	3,588
June	812	1,480	2,229
July	1,120	1,584	2,324
August	1,315	1,822	2,332
September	1,057	1,602	4,725
October	1,144	2,606	2,641
November	1,127	2,370	4,292
December	1,217	2,334	3,005
Totals	11,889	19,727	34,891

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram from Kuala Lumpur announces that the export of plantation rubber from the Federated Malay States during the month of January amounted to 4,471 tons compared with 4,473 tons in the corresponding month last year and 2,542 tons in 1914.

CRUDE RUBBER IMPORTS AND EXPORTS OF THE UNITED KINGDOM FOR JANUARY, 1916.*

*Included in "Rubber" prior to 1915. After 1914 "Rubber" is separated into "Crude" and "Waste and Reclaimed."

BURMA'S PACKING TRADE.

Engine and boiler packing materials, including asbestos, are imported through the port of Rangoon, Burma, to the value of \$45,000 a year, reports Consul Moorhead at Rangoon. Great Britain supplies close to \$40,000 worth and the United States around \$3,000 worth. In 1914 the value of exports of these goods from the United States to Burma was inordinately swelled by one big shipment of rubber packing to a Rangoon oil company.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

IN general the February market has been characterized by continued firmness due to shortage of supply. All advances have been retained with higher tendency. Manufacturers dependent on spot stocks are said to be paying almost prohibitive prices in some cases. Not many are thought to be so situated, especially among the larger buyers, as most wants have been anticipated.

ZINC OXIDE.

Contract deliveries are taking the bulk of the domestic output of zinc oxide into consumption and sellers have but little to offer. Stocks in second hands have been selling for 17 to 18 cents per pound. Producers claim that consumers who took supplies in the past are obtaining their usual amounts and even beyond that supply, as their requirements increased. The production of zinc oxide in this country is larger than ever before.

LITHOPONE.

Small lots of foreign lithopone are on the market, but arrivals are limited, and no sales have been noted under 14 cents per pound. Domestic lithopone sells at 13½ cents per pound. A large part of the production is sold ahead and this causes a strong situation in the spot market.

Samples of a French pigment have reached New York and the claim is made concerning the material that it serves many of the purposes of zinc oxide and lithopone.

LITHARGE.

There is a scarcity of stock in all lead products, causing reduced offerings and firm prices. Litharge has shown a fractional advance.

NAPHTHA.

The report of the investigation by the Bureau of Mines on the rise in prices of gasoline, has been made public by Secretary Lane. The upshot of the matter is that the consumption of gasoline as motor fuel is rapidly increasing and the production of crude oil has reached a maximum. It is stated that there are no world's figures available on the production and consumption of gasoline.

There is reason to anticipate still higher prices for gasoline which may ultimately affect the prices of proofed fabrics unless relief is found in a practical method of solvent recovery.

CAUSTIC SODA.

Prices have advanced during the month. It is stated that recent sales of about 1,000 tons have been made to France, Italy and other foreign countries.

MARKET FOR COTTON AND OTHER FABRICS.

EGYPTIAN COTTON.

THE reports from Alexandria indicate very unsettled market conditions. The exchange is still closed and trading is wholly confined to individual operators. Speculation has been very active and the situation is temporarily in favor of the bull side of the market. Spot stocks of all available qualities are daily decreasing due to the active demand, and prices have advanced 6 cents since the first of February—26 cents being the quotation at this writing. The great difficulty surrounding cotton shipments from Alexandria is really the underlying cause of the present market disturbance.

SEA ISLAND COTTON.

This market has been very strong during the month, largely due to the scarcity of Egyptians. The crop has nearly all been marketed—only crop lots remaining unsold for which there has been some demand on account of northern mills at 27 to 30 cents. The net receipts at southern shipping ports from August 1, 1915, to February 19, 1916, were, in round numbers, 67,000 bales, of which 47,000 bales were taken by northern mills.

COTTON DUCK.

There has been a marked demand during the month that has just passed, for 29-inch cotton duck for European account. Domestic business, as reported from various sources, is very good and consistently improving. Hose and mechanical duck are in active demand and the question of delivery is now the first consideration in buying orders. Balata belting duck has been noticeably active of late, contracts having been written for this material covering the balance of the year. The wide ducks are most active which has resulted in a scarcity of these stocks which in normal times are plentiful. This makes for higher prices on belting duck and accounts for the present advanced prices.

Prices on all ducks, drills and osnaburgs are very strong and indicate higher levels. Mills are working at full capacity on orders that bespeak active operations until October next. Spot stocks are not to be had with the exception of an occasional run over, and mill and warehouse stocks are the smallest in years.

TIRE FABRICS.

The domestic consumption of tire fabrics continues in increasing volume and suggests the possibility of demand exceeding production. The mills are exerting every effort to meet the situation with prompt deliveries, despite the besetting difficulties in securing raw materials, and the delays caused by continued labor troubles. The spindle capacity of the mills is taxed to the utmost and new equipment is difficult to obtain and install promptly.

Prices on all building fabrics have advanced 2 cents per square yard since our last report and there appears to be no reason to expect lower prices for some time.

The following are New York quotations on February 26, 1916:

RUBBER-TIRED AUTO TRAILERS.

An unexpected effect of the war now raging in Europe has been the bringing into evidence of the value of small rubber-tired automobile trailers. The tremendous number of wounded which the warring nations have been obliged to handle caused them to resort to these trailers for increasing the capacity of their motor ambulances.

Various types of trailers have been produced, but aside from the large ones with capacities of from 5 to 15 tons, they were nearly all made to order or the work of amateurs. Now the manufacture of trailers susceptible of being drawn by ordinary popular and low-priced touring cars and roadsters has been taken up on a commercial scale, and there are several American concerns offering rubber-tired trailers capable of carrying from 750 to 1,250 pounds, at prices that put them within the reach of those who are most interested in this economic and practical device for hauling freight by automobile. Now the small tradesman can hook a rubber-tired trailer to the back of his pleasure car and deliver substantial loads without soiling his machine.

with scarcity of materials and
ces, is the chemist more neces-
ever to the rubber manufacturer.
to you.

PREPAREDNESS AND RUBBER.

THE mobilization of American industries for purposes of defence—this, on paper, is without doubt an excellent plan. It gives work for more commissions, shows us where we are weak and where strong, and guessing frankly, that is the end of it.

As for the ability of existing rubber plants to supply what our army and navy may need in peace or in war, that is easily gotten at. A competent government clerk with an able-bodied mimeograph could get the whole story in a week. The result would be the assurance that for the great essentials, rubber blankets, coats, boots, hospital supplies and tires, existing factories are fully prepared to swamp the war department at the very shortest notice.

Preparedness in manufactured rubber goods is solved. Not so, however, with crude rubber preparedness. Any eventuality that cuts off our supplies from

the Far East and from the Amazon would effectually stop the manufacture of all rubber goods. A commission to solve the problem of our supply of crude rubber, to report in favor of a government-owned supply of crude rubber sufficient to last a year, with another of rubber scrap to last two years, or a plant equipped to make 1,000 tons of synthetic rubber a day would be a heap more interesting. And who shall say that it would not be more practical?

THREE HUNDRED MILLIONS IN RUBBER.

THE preliminary report of the census of the rubber manufactures sent out the middle of last month gives some striking figures as to the magnitude of this important industry. It is a matter of congratulation that those in charge of the census adopted, at least in part, the suggestions offered by THE INDIA RUBBER WORLD in 1911. Previous census figures gave but three groups for this industry, namely: "belting and hose"; "rubber boots and shoes"; and "rubber goods not elsewhere specified."

It was suggested that it would be valuable to the trade, were separate figures given for automobile and cycle tires, solid tires, druggists' rubber sundries, hard rubber, reclaimed rubber, cements, coated fabrics (including mackintoshes, clothing, etc.), and dental and stamp rubber. While not all these suggestions were adopted, in place of the three headings, we have thirteen. Rubber tires, which hitherto were included in "goods not elsewhere specified" are now given the prominence their importance warrants, as nearly one-half the entire product of rubber manufactures. Separate totals are given for automobile casings, inner tubes, solid tires, and motorcycle, bicycle and aeroplane tires. Boots and shoes, belting, hose, packing, clothing, druggists' and stationers' supplies are the other divisions, after which comes "all other manufactures of rubber," and "all other products."

These latter divisions are most comprehensive. They probably include hard rubber (sheet and rod), battery jars, insulating apparatus, carriage cloth, dental rubber, stamp rubber, notions (such as dress shields, etc.), cements, shoe findings (soles, heels, inner soles, sole fillers, etc.), sporting goods, general mechanical goods (such as deckle straps, couch rolls, etc.), mats and matting, and brewers', plumbers' and bottlers' supplies. Undoubtedly manufacturers of these lines would like to have them separately enumerated, but perhaps this is asking too much, and we should be thankful that we are getting far more details this year than ever before.

The figures for insulated wire were given in the census of previous years, but are not separately given in this preliminary report. It is safe to say, however, that this branch of manufacture has grown proportionately, owing to the substitution of electric power

and consequent decreased use of belting. (The 1909 census figures are, \$51,625,000.)

Belting is given separately, but in previous years was grouped with hose. These two branches show but a fractional increase over 1909 figures, doubtless in part due to above-mentioned change in power transmission.

This is the first time scrap rubber and reclaimed rubber are given in the census reports. These materials are valued at over \$12,500,000. This reckoned at seven cents per pound, a very low average, would mean nearly 90,000 tons of scrap and reclaimed rubber, showing how important are these materials in the rubber industry.

In a report of the census of the industry taken in 1909, we compiled figures of the principal accessory industries, in which the rubber is used to a large extent. A similar calculation with such figures as are now available from the 1914 census, without adding insulated wire, brings the total beyond \$300,000,000. More than a million dollars each productive day of the year puts the rubber trade among the great industries of the country.

TIRE TEXTS.

THE beginnings of texts, or advertising catch phrases, for tires were in the early bicycle days when a simple rectangular card bore the legend "Morgan & Wright Tires Are Good Tires." This text on posters, letter-heads, catalogs and in advertisements was, in its way, a bit of genius.

It was most natural, therefore, that when the motor tire made its bid for popular approval, the alert minds that planned the selling campaigns should cast about for motor tire texts equally apt. One of the cleverest, "The Best In The Long Run," was also one of the first to appear. It was closely followed by "Time To Re-tire," a picture of a very sleepy youngster, giving the needed double entendre. Indeed, it is possible that the pleasant picture forestalled the pang that re-tiring costs the average motorist.

"Mightier Than The Road," has a certain oratorical flavor that is impressive. A captious critic might complain that, strictly speaking, roads do not possess might. It may also be suggested that American roads are mighty bad, but of course that is slang. "Made To Make Good" was well intentioned, but hardly euphonic. "Made To Make" hits one's sense of consecutiveness where it is particularly tender. "The Man With A Red Tire Knows" is a bit mystical, but not more so than its suggested alternate, "The Man With A Red Nose Tires." There are many more, all more or less clever, all doing their best. Be they praised or criticized, they are very difficult sentences to create. Further than this, whether praised or criticized, the end is attained,—attention is drawn to the special tire to which the text belongs.

THE PASSING OF THE DRY HEATER.

FROM the time of Leverett Candee to the present, rubber shoes have been made up, varnished and cured in one uniform, orthodox manner. Minor innovations such as sole-cutting machines and ten-roll calenders came in, to be sure, but in no way affected the established order of things. The rows of making-up tables with crowds of busy-fingered girls, the dripping varnish room, the cavernous dry heater, were integral parts of a system that was founded solidly on experience. No change was needed, none was imminent; nay, none seemed possible. Especially was this true of the curing. And yet almost in a day came the pressure cure and the most important part of rubber shoemaking was revolutionized. The question that at once obtrudes itself is, "Where will the innovation stop?" The mechanical goods manufacturers, the hard rubber men, the makers of druggists' sundries, have long been dominated by pressure in vulcanization, and their goods have been the better for it. And now that rubber shoes are pressure-cured, what of other goods of the dry heat kind? How about surface clothing, mackintoshes, carriage cloth? Is it a good guess that the pressure cure will in time enfold them, too, in its warm embrace?

THERE ARE SOMEWHAT GRAVE FEARS, BOTH IN GREAT Britain and in this country, that at the conclusion of the European war Germany will at once endeavor to regain its export trade by offering, in foreign markets, manufactured goods which have accumulated, either as such, or made from materials thus collected, at prices so low as to kill all competition.

In Great Britain an active movement has been started in favor of an anti-dumping law. In this country similar legislation has been agitated. Doubtless there are lines of industry which may be thus affected, but a perusal of "The Rubber Situation in Germany," as reported by our correspondent, on another page, will allay such fears, if any are entertained by manufacturers in the rubber trade. Germany has no such surplus. In fact, her manufacturers could find immediate use for thousands of tons of crude rubber, were they able to procure it. This industry, at least, can rest assured that there will be no post-bellum ruinous competition from Germany.

IT IS CERTAINLY GRATIFYING TO READ THE words of so able a man as Vice Chairman Hurley of the Federal Trade Commission in appreciation of the trade journal and the trade association, both of which he deems most important factors in the progress and prosperity of the trade. His address given on other pages in this issue, is worthy of careful perusal by manufacturers and business men. He points out some of the disadvantages under which American industries are laboring, advises conservation and co-operation, and outlines some of the work being done by the Government Commission, of which he is an important officer.

Pressure Cure of Rubber Footwear.

A RUBBER boot or shoe is made by assembling upon a form or last the various pieces of unvulcanized rubberized fabrics and sheeted stock which form the lining, stay pieces, exterior waterproof and wearing parts of the boot or shoe. This work is done by hand, and the thoroughness with which the tacky stock is made to adhere by the process of hand rolling has much to do with the length of service obtainable from the goods.

Boot and shoe making is generally done by piece work and hurriedly, therefore there are liable to be some small places in the goods where adhesion is imperfect and any air confined between the plies, prevents contact and weakens the structure.

Such faulty work may not always be discovered by inspection, and is liable to develop unlooked-for failures in service.

The usual method of curing rubber boots and shoes consists in exposing them on racks in large, dry heaters where the temperature of the air is slowly raised by steam circulating in coils beneath the racks. Moisture and volatile products escape by natural ventilation through openings in the roof of the heater. The air, a poor conductor of heat, circulates slowly and without pressure. The working conditions are therefore not under positive control, and the time of vulcanization is long, usually from eight to ten hours. The fact that the goods, during vulcanizing, are not under pressure permits the formation of blisters wherever included air or moisture is present. The loss from this cause is sometimes very considerable, and difficult to remedy. Other defects of the dry heater system of curing are irregularity of cure, due to faulty circulation of the air; excessive space required to handle the goods, because the cure is protracted unduly, and large cost for operation. Notwithstanding these defects and drawbacks, the dry heater has remained the standard method for curing footwear since the earliest days of rubber manufacturing.

The rubber boot and shoe industry is indebted to Hon. A. O. Bourn of Bristol, Rhode Island, for the introduction of the first practical process for the pressure cure of footwear, which he developed in his own works at Providence, R. I. Since his invention several others have been perfected, the work chiefly of American manufacturers. These methods of pressure cure mark the most important recent advance in the boot and shoe branch of the rubber industry, because they bring under control and obviate many of the troubles and inconveniences inherent in the older process of curing footwear.

Manufacturers are now able, by these inventions, to control the vulcanized process and produce better goods with fewer

"seconds." It is now possible to expel all air trapped between the plies in making, and under pressure to cure the shoe structure compactly together. Pressure cure, by direct steam, also allows the use of tough wearing and oil resisting mechanical stocks, such, for example, as automobile tire tread compound.

Other important advantages, due to these improved methods, are great economy of space formerly devoted to

heaters, and a very important saving of time in vulcanizing. These points materially increase the curing capacity of a factory while the effectiveness of the process not only produces better goods, but permits the manufacture of boots and shoes of any desired color. This matter of freedom in color selection is an important one from a trade viewpoint, adding markedly to the variety and attractiveness of the goods.

No data are available for ascertaining the reduction in cost attributable to pressure cure, over open cure for footwear. Undeniably a favorable margin exists which makes it possible for the manufacturer to readjust qualities and values; a matter of first importance to the users of the goods. That such a readjustment does take place may be illustrated by the authentic account of a pair of pressure-cured boots worn by a certain car inspector. The story is to the effect

that he subjected these boots to 26 months of actual service, or 760 days of wear, walking in this period 5,728 miles. The boots were provided with soles of tough automobile tire tread stock, but their endurance is justly credited, in part, to the compactness attained by reason of the pressure used in curing. Such wearing quality would not be expected from the best rubber boot vulcanized by the customary process.

In the manufacture of mechanical goods the standard methods of cure have commonly been pressure methods by steam heat, applied either in an atmosphere of steam or by steam heated molds. The patented processes of pressure cure for boots and shoes are adaptations of these means to the special conditions of footwear manufacture by evolving certain general methods for removing trapped air and curing the goods compactly.

These methods may be considered in three groups:

1. Consolidation of structure of the goods by pressure of air or non-oxidizing gases and the application of their heat or that of steam.
2. Removal by vacuum of entrapped air and vulcanization by pressure and heat applied by air, non-oxidizing gases or steam.
3. Compression of the goods by inflation or otherwise, in a mold heated internally or externally, by steam, for vulcanization.

REGULATION DRY HEATER FOR FOOTWEAR.

GROUP 1

1. **BOURN'S AMMONIA METHOD.**—By the evaporation of ammonium carbonate in a vulcanizing chamber adapted to retain pressure, an atmosphere is secured in which boots and shoes are cured in about three-quarters of an hour. The vulcanizing heat is derived from steam circulating in a jacketed space surrounding the curing table.

BATTERY OF PRESSURE PROCESS VULCANIZERS, CLOSED.

2. **BOURN'S COMPRESSED AIR METHOD.**—Compressed air in the curing chamber is employed to solidify the goods and to hasten vulcanization by its increased conductivity. Heat is supplied by steam circulating in a surrounding jacket.

3. **DUNCAN TOUTSLEY METHOD.**—The goods, upon lasts, are sealed against the contact of air or steam. With this protection they are placed in a vulcanizing chamber which is hermetically closed. Air, heated to 280 degrees F., is introduced until the pressure reaches 60 pounds. The air is retained in the chamber about 45 minutes, until the goods attain approximately 270 degrees F. The air supply is then cut off and the confined air displaced by steam at about 80 pounds pressure. Vulcanization takes place in dry steam. At the completion of the process the steam is displaced by air to cool the goods before opening the vulcanizer.

4. **HILL'S METHOD.**—The goods, upon lasts, are vulcanized in an atmosphere of dry carbon dioxide maintained at any desired pressure up to 100 pounds per square inch. The walls of the vulcanizing chamber are heated by a steam jacket, and the interior of the vulcanizer by a steam coil.

5. **COCKBURN'S METHOD.**—An ordinary single or double-jacketed vulcanizer is employed in which the goods, on lasts, are placed and heated by dry steam in an atmosphere of compressed air.

6. **RUTHERFORD'S METHOD.**—The goods are made upon special lasts provided with ducts for the withdrawal of moisture from the shoes, and adapted for connection as part of a tubular frame car attachable to an air pump inlet in the shell of the vulcanizer. Thus connected the moisture can be withdrawn from the goods and vulcanization effected subject to the action of a controllable pressure.

GROUP 2

1. **WARNER'S METHOD.**—The goods, on lasts are placed in a vulcanizer which has been previously heated. By means of a vacuum, all the confined air and volatile gases are removed from the heated goods, after which a constant pressure of pre-heated air or inert gas replaces the vacuum during the period of vulcanization, and the required temperature is maintained until completion of the cure.

2. **CROWLEY'S METHOD.**—The goods are built on lasts adapted for attachment to a device for removing the trapped air or moisture. The goods may then be vulcanized by any suitable means, using hot air or gases with or without pressure.

3. **HILL'S METHOD.**—One of the objects of this process is the exclusion of the air from contact with the rubber during vulcanization, to avoid oxidation. To attain this, a thin, steam-tight, rubber-and-fabric envelope is provided to fit over the shoe and from this the air is removed, causing it to conform snugly to the contour of the shoe. It is then tightly sealed in that position. With each boot or shoe thus prepared, the goods are cured in an atmosphere of steam.

4. **PRICE'S METHOD.**—The shoe or boot is built up on a special last or boot tree with perforated walls and mounted so that the interior and exterior pressure conditions can be controlled, the interior pressure being less than the exterior pressure either before or during vulcanization, or both. By this means, air is removed from the materials and the structure of the goods. Hot air, hot gases or other means may be employed as the vulcanizing medium. The method also provides for pressure control in connection with the heating medium during vulcanization.

GROUP 3

1. **HIGGINS' METHOD.**—A special list is provided with an inflatable surface section and serves as a core for an internally

PRESSURE CURE VULCANIZER RECEIVING A CAR OF BOOTS.

steam-heated mold. Against the interior of this mold the shoe is compressed by air to solidify the plies of material.

2. **FIELD'S METHOD.**—The goods are compressed on metallic

lasts by enclosure in three-part separable molds, against the interior of which they are forced by an inflating pressure of air.

3. DOUGHTY'S METHOD. This consists essentially of molding the goods upon a metal last or core in a three-part, steam-heated mold and exerting pressure on the rubber goods by mechanical means.

METHODS OF CONSOLIDATING FOOTWEAR PREVIOUS TO VULCANIZATION.

Two recent United States patents, having an indirect connection with the pressure cure of rubber footwear, should here be mentioned.

The object of both is to compact the structure of the goods by removing the wrinkles and interlaminated air, by fluid pressure, preliminary to vulcanization. The latter may be effected by any appropriate means. Both are improvements on the common hand roller process of making rubber shoes.

Randall's apparatus consists of a device for holding boots on lasts, under pressure in an adjustable, bell-shaped tank. A pressure of 90 to 100 pounds of air is exerted upon the unvulcanized goods. This effectively solidifies their structure,

expels all contained air, and secures perfect adhesion between the rubber plies and seams.

Piper's apparatus for a similar purpose is particularly adapted for the treatment of rubber shoes by either pneumatic or hydraulic pressure. It is a bench machine operated by the individual shoemaker and consists of a base plate to which is hinged a dome-like cover; the enclosed space is large enough to contain a rubber shoe on its last. The shoe rests on a diaphragm secured to the edges of the lower section of the base and is surrounded by another diaphragm similarly secured to the edges of the dome or cover section. These surrounding diaphragms have a combined internal contour approximating that of the last. The diaphragm arrangement is such that it is capable of handling a wide range of sizes and styles of shoes.

The process is essentially one of cold-molding the goods. Air or hydraulic pressure is admitted back of the upper and lower diaphragms which close snugly upon the shoe, compacting the plies of unvulcanized stock and expelling the air, which escapes between the edges of the shoe cavity. Subsequently the goods are vulcanized as usual by dry heat without pressure.

The Rubber Industry and the Census of 1914.

DIRECTOR S. L. Rogers of the Bureau of Census, Department of Commerce, has sent out a preliminary statement of that portion of the 1914 census of manufactures which refers to the rubber industry. This gives a somewhat detailed statement of the quantities and values of the various products manufactured, and is subject to such changes and corrections as may be found necessary from a further examination of the original reports.

The report is a summary of statements received from 331 establishments. The products of 23 of these establishments were rubber boots and shoes; of 18, rubber belting, hose, packing, etc.; and of 290, automobile tires or casings and inner tubes, motorcycle and bicycle tires, rubber clothing, druggists' and stationers' sundries, and other miscellaneous rubber goods. The products reported for 331 establishments for 1914 were valued at \$300,251,827. At the census of 1909, 267 establishments were reported, with products valued at \$197,394,638. The increase in value of products, therefore, was \$102,857,189, or 52.1 per cent. In addition, rubber products to the value of \$446,688 were reported in 1914 by 14 establishments engaged primarily in other lines of manufacture but which produced rubber goods as subsidiary products.

This report is, in some respects, far more satisfactory as regards details than similar reports of previous census years. In those reports but three divisions were made, namely: "belting and hose," "boots and shoes" and "rubber goods not elsewhere specified." The output of the tire business, which today represents nearly one-half the total value of manufactures of rubber, has been in former reports lumped with all other manufactures, except belting, hose and footwear. Therefore no exact comparison of the growth of this branch of the rubber industry is available, but it may be safely assumed that the increase of 52.1 per cent in the total annual output of rubber goods during the five-year period is accounted for in very large part by the enormous growth of this branch of the industry. There was reported the manufacture of 8,020,815 automobile tires or casings, valued at \$105,671,223; of 7,906,993 automobile inner tubes, valued at \$20,098,936; of solid tires for motor and other vehicles, to the value of \$13,735,681; and of 3,728,138 motorcycle, bicycle, and aeroplane

tires, valued at \$6,905,852. The total value of tires produced in 1914 was \$146,411,692, which was 48.8 per cent of the total value of all kinds of rubber goods produced.

Second in importance is the manufacture of rubber footwear. There were manufactured during the year 4,024,486 pairs of boots, and 57,211,728 pairs of shoes. These totaled in value \$50,506,156, which is rather disappointing when compared with the figures of the last decennial census which were 49,721,000. This comparison judged only by the figures, would indicate an almost entire absence of progress in the rubber footwear trade, but this industry is so dependent upon weather conditions that no one year is likely to give a fair and just estimate. The year 1914 was a comparatively light one, as regards rubber footwear trade. Had the census given 1915 figures, the comparison would have been more favorable, and more just.

Belting and hose were lumped together in the last decennial census, the amount reported produced in 1909 being \$24,729,000. The value of these in 1914 is placed at \$28,340,749. Packings were given as worth \$12,160,000 in 1909, and only \$3,507,651 in 1914.

The 1914 statistics are summarized as follows:

Number of establishments	331
Total value of products	\$300,251,827
Boots:	
Pairs	4,024,486
Value	\$12,647,934
Shoes:	
Pairs	57,211,728
Value	\$37,858,222
Tires:	
Automobiles—	
Casings—	
Number	8,020,815
Value	\$105,671,223
Inner tubes—	
Number	7,906,993
Value	\$20,098,936
Solid, all kinds—	
Value	\$13,735,681
Motorcycle and bicycle (including aeroplane tires)	
Number	3,728,138
Value	\$6,905,852
Belting	\$7,989,405
Hose	\$16,853,693
Packing	\$3,507,651
Clothing	6,396,810
Druggists' and stationers' sundries	7,527,755
All other manufactures of rubber	39,983,969
Scrap and old rubber (sold or on hand)	1,297,487
Reclaimed rubber (sold or on hand)	11,252,133
All other products	8,525,076

Financing Imports of Plantation Rubber.

CRUDE rubber, like other raw products, may be purchased in the Far East, transported to this country, manufactured and sold before any money is paid by the importing manufacturer, if a banker esteems the importer's reputation, financial standing and responsibility such as to warrant the issuance of a

commercial letter of credit and subsequently the releasing of the raw material under the conditions of a trust receipt.

To clearly understand the general system of import credits as applied to the rubber industry an imaginary transaction will be described in which fictitious names are used.

Let it be supposed that John Jones & Co., of New York City, are rubber manufacturers who import at least some of the crude rubber they use. William

Smith & Co. are rubber dealers at Singapore, Straits Settlements. When the New York representative of the latter concern arranges with John Jones & Co. for the sale of a certain lot of crude rubber, Smith's New York representative cables in code to the Singapore house that the sale has been consummated, the understanding being that William Smith & Co. will receive payment in the form of a draft at 90 days' sight, drawn under a commercial letter of credit on the London correspondent of John Jones & Co. Previous arrangements had, of course, been made that William Smith & Co. would be provided with such a banker's letter of credit under which the draft would be drawn to finance the purchase.

While the Singapore exporter is completing his arrangements for shipping the rubber, John Jones & Co. go to their bankers in New York, with the statement of the conditions under which purchases are to be made and request the issuance of a commercial letter of credit. The form used in making this application is shown in Fig. 1.

This application requests cable advice of the credit, which is customary for rubber dealings in the Far East on account of the distance. The amount of the credit desired is, say £5,000, although this first purchase costs about one-third of that amount, the idea being that the balance of the credit may be drawn to pay for other purchases up to the total amount of the credit at any time before the date of its expiration, which is July 1, 1916. This is done to avoid the issuing and cabling of small credits for each subsequent transaction.

At the time of issuing the letter of credit John Jones & Co. are required to sign an agreement or "obligation" shown in Fig. 2, which provides that they will supply funds to meet

SPECIMEN AGREEMENT
New York, *February 16th 1916*

To the

----- Trust Company -----

Gentlemen:

Having received from you the Letter of Credit of which a true copy is on the other side, I hereby agree to its terms, and in consideration thereof I agree with you to provide in New York, within days previous to the maturity of the bills drawn in return thereof, sufficient funds on cash, or in bills on London satisfactory to you, at not exceeding sixty days' sight, and endorsed by me to meet the payment of the same with *three* per cent commission and interest as hereinafter provided, and I undertake to ensure at *my* expense, for your benefit, against risk of fire or loss, all property purchased or shipped pursuant to said Letter of Credit, in compliance satisfactory to you.

I agree that the bills to all property which shall be purchased or shipped under the said credit, the bills of lading thereon, the policies of insurance thereon and the whole of the proceeds thereof, shall be and remain in your custody until the payment of the bills referred to and of all sums that may be due or that may become due on said bills or otherwise, and until the payment of any and all other indebtedness and liability now existing or now or hereafter created or incurred by me to you on any and all other transactions now or hereafter had with you, with authority to take possession of the same and to dispose thereof at your discretion for your reimbursement as aforesaid, at public or private sale, without demand or notice, and to charge all expenses, including commission for sale and purchase.

Should the market value of said merchandise in New York, either before or after its arrival, fall so that the net proceeds thereof (all expenses, freight, duties, etc., being deducted) would be insufficient to cover your advances thereon with commission and interest, I further agree to pay to you on demand any further security you may require, and in default thereof you shall be entitled to sell said merchandise forthwith, or to sell "to arrive," irrespective of the maturity of the acceptance under this Credit. I being held responsible to you for any deficit, which I bind and oblige myself to pay you in cash on demand.

It is understood that in all payments made by me to you in the United States, the Pound Sterling shall be calculated at the current rate of exchange for Bankers' Bills in New York on London existing at the time of settlement, and that interest shall be charged at the rate of five per cent per annum, or at the current Bank of England rate in London if above five per cent.

Should I anticipate the payment of any portion of the amount payable, interest is to be allowed at a rate one per cent under the current Bank of England rate.

In case I should hereafter desire to have the credit confirmed, altered or extended by cable (which will be at my expense and risk), I hereby agree to hold you harmless and free from responsibility from errors in cabling, whether as the part of your clerks or your Agents, here or elsewhere, or on the part of the cable companies.

This obligation is to continue in force, and is to be applicable to all transactions, notwithstanding any change in the composition of the firm or firms, parties to this contract or in the use of the credit, whether such change shall arise from the accession of one or more new partners, or from the death or cessation of any partner or partners.

It is understood and agreed that if the documents representing the property for which this said Credit has been issued are surrendered under a trust receipt, notational security satisfactory to the Company, such as stocks, bonds, warehouse receipts or other security, shall be given to the Company, to be held until the terms of the credit have been fully satisfied and subject in every respect to the conditions of this agreement.

It is further understood and agreed that in the event of any suspension, or failure, or assignment for the benefit of creditors on my part, or of the nonpayment at maturity of any acceptance made by me, or of the nonfulfillment of any obligation under said credit or under any other credit issued by the ----- Trust Company ----- on my account, or of any indebtedness or liability on my part to you, all obligations, acceptances, indebtedness and liabilities whatsoever shall thereupon, at your option then or thereafter exercised, without notice, mature and become due and payable.

It is understood and agreed that you shall not be held responsible for the correctness or validity of the documents representing obligation or shipments, nor for the description, quantities or quality of the merchandise declared therein.

(Signed) John Jones & Co.

FIG. 2.—AGREEMENT OF PURCHASER.

drafts against the letter of credit 12 days prior to their maturity in London, together with the banker's agreed commission; that they will insure the shipment for the banker's interest; that the title of the merchandise, bills of lading and insurance policies shall remain vested in the bank until all indebtedness is paid; that the bank is permitted to sell the merchandise for debt or for failure to supply security demanded in case the value of the merchandise falls; that the importer has the privilege of paying prior to maturity, interest being allowed at 1 per cent, under the Bank of England discount rate. The allowance of interest varies, and is a matter of agreement between banker and importer.

The letter of credit shown in Fig. 3 is issued and handed to the importer who in turn gives it to the representative of Wil-

SPECIMEN CREDIT confirming cable.
 Order No. 6743 ----- Trust Company -----
£ 5000 Foreign Department
 Pay to the order of Messrs William Smith & Co
Singapore, Beach Settlements
 New York January 16 1916
 Gentlemen
 We hereby authorize you to raise on the ----- Trust Company -----
 London, for account of ----- Messrs John Smith & Co New York
 up to an aggregate amount of Five thousand Pounds Sterling
 against your drafts in 90 days deep sight
 Insurance including War Risk for North Borneo, United States
including War Risk effected in New York
 Bills of Lading for such shipments must be made out to the order of ----- Trust Company
 unless otherwise specified in this credit
 CONSULAR INVOICES AND BILLS OF LADING MUST BE SENT BY THE PAYEE OR PAYEE'S NEGOTIATING
 DRAFTS DIRECT TO THE ----- TRUST COMPANY ----- NEW YORK FOR ADVANCE TO
 TRUST COMPANY ----- LONDON
 The remittance of drafts must accompany the drafts drawn on ----- Trust Company
 London
 The amount of each draft, negotiated, together with date of negotiation, must be endorsed on back
 hereof
 We hereby agree with bona fide holders that all drafts drawn by virtue of this Credit, and in
 accordance with the above stipulated terms, shall meet with the honor upon presentation at the City of the
 ----- Trust Company ----- London if drawn and negotiated prior to July 1916
 ----- Trust Company -----
 (Signed) W. S. Smith & Co New York
 (Signed) John Doe - Manager
 N B Drafts drawn under this Credit must state
 that they are "Advance under Letter of
 Credit No. 6743
 Dated January 16 1916"

FIG. 3.—LETTER OF CREDIT.

lian Smith & Co. of Singapore. Being a cable credit, the bank issuing it cables the essential particulars to its Singapore correspondent either directly or via London. The Singapore bank then notifies William Smith & Co. of the issuance of the credit and they are free to make drafts against it under the conditions set forth in the credit.

It might properly be noted here that the letter of credit costs William Smith & Co. nothing at the time of issue, the bank receiving as remuneration a percentage of the amount of the draft actually drawn against the credit. John Jones & Co. pay this commission when they settle for the draft.

William Smith & Co. in the meantime are arranging for the shipment of rubber, which may be sent in one or two regular ways, according to the terms of purchase. One method is "f. o. b.," meaning free on board, or "c. i. f." (often pronounced "Sif"), the abbreviation for cost, insurance and freight. Large importers find as a rule at the present time that they can make more satisfactory purchases on the f. o. b. basis.

With bottoms scarce and freight high, sellers are not particularly anxious to go to the extra trouble and expense of c. i. f.

shipments even if remunerated for the cost. If the terms are f. o. b. all the seller has to do is to make delivery to the dock, secure the necessary papers and get his money. As this rubber is sold f. o. b., the shipper on delivery of goods to the dock pro-

cures steamer bill of lading showing consignment to the banker,
and consular invoice from the American Consul.

He has nothing to do with the insurance in this case, because by the terms of the credit, insurance, including war risk, is to be effected in New York. Many New York importers place their own insurance in the form of a blanket policy or a special policy to cover each shipment, as they can usually obtain better rates here than in the Far East, being in close touch with both the New York and London companies.

All arrangements having been made, William Smith & Co. draw a draft in duplicate, as shown in Fig. 4 (without the "acceptance"), at 90 days' sight, and attach it to all documents, which are the consular invoice and all negotiable copies of the bill of lading, and if insurance is not covered in New York, the insurance policies or certificates, usually in duplicate.

Taking these to any local bank in Singapore that buys such drafts, the draft is sold at the prevailing rate of exchange for bankers' 90 days' sight drafts on London. The bank will, of

SPECIMEN ADVICE OF MATURITY

-----Trust Company-----

New York. *April 3rd 1916*

*To Messrs John Jones & Co
New York City*

Dear Sirs:

We have received from our London Office the following advices of maturities for your account

L/C No.	Name of Vendor	Foreign Currency	Due in New York	Due in London	Remarks
<i>6743</i>	<i>Clearway</i>	<i>£ 1763 11 6</i>	<i>June 12th</i>	<i>June 24th</i>	

FIG. 5.—ADVICE OF MATURITY.

course, be particular to see that all documents conform in every particular with the terms of credit. William Smith & Co. thus receive their money, but neither John Jones & Co. nor the New

York bank have as yet advanced any payment in the transaction.

The bank at Singapore is required by the terms of the letter of credit to send one bill of lading together with consular invoice directly to the New York bank. The remaining documents, which include duplicate bills of lading and insurance certificate, if required, are attached to the original draft and sent forward to London by the Singapore bank.

As soon as the draft reaches the London correspondent of the Singapore bank its messenger takes it to the London branch of the New York bank, which accepts it by writing on the face the word "Accepted," the date of presentation and the date at which it matures, which is 93 days after the first presentation (three days of grace being allowed in London), and finally signing the acceptance officially. The London bank notifies its New York office of the amount of the draft and the date of its maturity, and forwards the shipping documents.

In the meantime the bill of lading and consular invoice have gone direct from Singapore to the New York bank, which holds them pending the arrival of the goods. On receipt of advice from London they advise John Jones & Co. of the date that the draft is due in London and also in New York. The form shown in Fig. 5 is used for this notification.

If John Jones & Co. should so desire, they may pay cash at any time before the draft is due and receive an allowance of interest, according to the agreement with the banker at time of issuance of the credit.

If this is not done the rubber is cleared and warehoused in the bank's name until the obligation is met.

By this method the importer is permitted to remove the rubber and sell it, but is bound to turn over immediately to the New York bank enough money coming from such sale or sales to pay the relative obligation to the bank. Furthermore the bank is privileged at any time to cancel the agreement and take over

SPECIMEN STATEMENT

FIG. 7.—STATEMENT RENDERED.

the goods for which they have given their obligation. This trust agreement in no wise interferes with the obligation to meet the draft when due in New York.

The final form, illustrated in Fig. 7, is the statement rendered to John Jones & Co. on the date the draft is due in New York. The original amount drawn in Singapore is converted at the current selling rate of exchange for bankers' checks on London on the date the draft is due in New York. To this is added the commission, usually $\frac{1}{4}$ to $\frac{1}{2}$ of 1 per cent per month of the tenure of the draft. The total amount as shown by the statement is charged against John Jones & Co.'s account or they remit their check to the banker, and the transaction is ended.

This system of credits has been found to be a most logical and satisfactory way of financing imports, inasmuch as the importer has the assurance that the goods must be shipped before the seller receives payment, and the seller is sure of obtaining his money immediately on delivery of the goods to the steamship company.

The documents that are reproduced have been supplied through the courtesy of George Weston, manager of the Foreign Department of the Guaranty Trust Co. of New York, one of the largest and most prominent institutions in the commercial letter of credit business.

SPECIMEN TRUST RECEIPT	
Received from THE ----- TRUST CO. ----- the following goods and merchandise, their property, specified in the Bill of Lading per S.S. "Manxway", dated Singapore, February 25 th 1916 marked and numbered as follows:	
WSC JSC	1/70 Sixty cases Grade Rubber
and, in consideration thereof, $\left[\frac{1}{16} \right]$ HEREBY AGREE TO HOLD SAID GOODS IN TRUST for them, and as their property, with liberty to sell the same for their account, and further agree, in case of sale to hand the proceeds to them to apply against the acceptance of THE ----- TRUST CO. ----- on $\left[\frac{my}{our} \right]$ account, under the terms of the Letter of Credit No. 6743 issued for $\left[\frac{my}{our} \right]$ account and for the payment of any other indebtedness of $\left[\frac{mine}{ours} \right]$ to THE ----- TRUST CO. -----	
THE ----- TRUST CO. ----- may at any time cancel this trust and take possession of said goods, or of the proceeds of sale of the same as may then have been sold, whenever the said goods or proceeds may then be found and in the event of any suspension, or failure, or assignment for the benefit of creditors, on $\left[\frac{my}{our} \right]$ part, or of the non-fulfillment of any obligation, or of the non-payment at maturity of any acceptance made by $\left[\frac{me}{us} \right]$ under said credit, or under any other credit issued by THE ----- TRUST CO. -----	
----- $\left[\frac{my}{our} \right]$ account or of any indebtedness on $\left[\frac{my}{our} \right]$ part to them, all obligations, acceptances, indebtedness and liabilities whatsoever shall thereupon (with or without notice) mature and become due and payable. The said goods while in $\left[\frac{my}{our} \right]$ hands shall be fully insured against loss by fire.	
Dated, New York City April 3 rd 1916.

FIG. 6.—TRUST RECEIPT.

If the importer is of sufficiently good standing, the bank may permit the goods to be released on a trust receipt. One form of trust receipt is shown in Fig. 6.

MACHINE FOR INFLATING TOY BALLOONS.

Toy balloons are made by the dipped process, that is, the small pear-shaped form is dipped into a solution of rubber, after which the balloons are vulcanized and finally inflated. It is for the latter process the apparatus here shown is designed. The vessel on the right is the generator, and here hydrogen gas is generated by the action of sulphuric acid upon zinc, this gas being conveyed by a rubber tube to the vessel on the left, which is the gas reservoir. This is surmounted by a pipe with a stop-cock. The neck of the balloon is pressed over the end of this tube, the stop-cock turned on, the balloon inflated, the stop-cock closed; then the neck of the balloon is tightly wound with strong thread, after which it is varnished in the usual manner. Two sizes are made, one for inflating 8 dozen balloons at each charge, and the other for 12 dozen balloons. [Brazel Novelty Manufacturing Co., Cincinnati, Ohio.]

The Trade Press and Our Present Problems of Business.

Extracts from a Notable Address by Edward N. Hurley, Vice-Chairman, Federal Trade Commission, Before the New York Trade Press Association.

IT affords me great pleasure to address that branch of the Fourth Estate which speaks directly to, and for, the manufacturers and business men of our great country. The trade journal, as the complement of the trade association, is an instrument in enforcing that collective effort which is an essential of modern industry; while the trade press as a whole is a prime factor in establishing fraternity among all groups of business men, and thus uniting them in the common work of achieving and maintaining national prosperity.

PREPAREDNESS, TRADE AND MODERN METHODS.

Industrial preparedness, foreign trade, and more efficient methods of manufacture seem to be the most important questions before the American people today. You are vitally concerned. Your trade papers are devoting pages to the necessity of improving conditions in our factories, for the purpose of getting our share of the trade in manufactured goods that are sold in foreign markets. There is no question that your efforts will be productive of results.

I sometimes wonder if the efforts of your editorial writers, and your technical experts, are appreciated by the average manufacturer engaged in the industry which the trade paper represents. I do know that any manufacturer or employer who does not read the trade paper representing the industry in which he is engaged is not keeping abreast with the times. It is impossible for him to know what his competitors are doing; what new development is being made in the improvement of his product; what progress is being made in new inventions and designs; and the factory or company that does not have numerous trade journals scattered through its plant, so that employees may read them and keep well informed, is not a very progressive concern.

THE STARTING POINT IN PUBLICITY.

Progressive business men realize that trade-journal advertising produces results. If a manufacturer or business man will first start advertising in his trade journals, and become educated to the advantage of good copy—paying special attention, of course, to reaching his dealer—his next step, if his product will warrant it, is a national advertising campaign; but the first step is his trade journal or business magazine.

ASSOCIATION WORK.

Trade associations that are putting forth a special effort to improve their systems of cost accounting, bettering their processes of manufacture, obtaining credit information, and endeavoring to improve the welfare of their employees, will be important factors in our country's development in the next few years. It is recognized that individual groups which are working intelligently through trade associations and trade journals, will embrace the industries that can compete in price and quality in the markets of the world.

All of us are talking a great deal these days about mobilizing American resources. Mobilizing means simply organizing to achieve a common purpose. Many manufacturers seem prone to associate mobilization with expansion; and I venture to suggest that you gentlemen of the trade press profitably may devote some attention to the psychology of this error, with a view to getting the true situation indelibly impressed on the minds of the man of the business world.

EXPANSION BY EFFICIENCY.

I hope, now that our business has become normal and our factories are running on full time, that our manufacturers will place capacity ahead of expansion. I hope that, instead of rushing to build additions to their plants, they will ascertain that their present equipment has reached the maximum of day work, and then develop the night shift so that every piece of machinery will be working to its limit. We have an example of what American manufacturers can do along this line in the automobile industry.

We should get away from that old-fashioned notion that the night crew is lacking in efficiency, and that its workmanship is not up to the standard.

THE CAPACITY PROBLEM.

There has been over-anxiety to enlarge our industrial plants before we have worked our present equipment to its capacity.

Consequently, when there is depression in business in this country, we have an overproduction for our home requirements, and, with no large foreign markets for our surplus of manufactured goods, we immediately start to cut prices on the plea that such action is necessary in order to keep our large plants running. This always results in a general demoralization of our industries.

If we can stop this overproduction of our industries we will have a surplus of money to invest in foreign countries, instead of having millions tied up in plants that are running three days a week to supply our domestic market, with no returns on the investment.

TODAY'S INDUSTRIAL PROSPERITY.

With present business and profits holding through this year our industrial concerns will reach that commanding position which is given by great and ready cash resources. Among some of our larger concerns this position already has been attained. The United States Steel Corporation began the present year with \$105,000,000 in cash. This largest of our industrial companies never before reported cash holdings in excess of \$68,000,000. Other concerns, especially those engaged directly in war business, have immense cash holdings.

Our industrial concerns, in short, are fast getting into condition to finance greater business than ever before, not only at home but abroad. They are getting to be able to make contracts, say, with South American countries, on a basis never before possible to Americans, and to do it without arranging with bankers in special ways.

FOR FOREIGN TRADE EXPANSION.

One of the commanding holds upon foreign trade which the German dyestuffs manufacturers had, before the war, set a barrier against them was, their immense power in working capital, which enabled them to extend credits and to conduct all sorts of aggressive campaigns to get world business. We are getting into position to profit from this example. You are vitally interested in presenting to the practical business men who read your papers, facts and suggestions that will aid in getting the greatest possible profit out of the situation that is developing.

There is no question more interesting to ponder, at this time, in considering the betterment of business conditions, than that of foreign trade. It is a most important question to our country. Our mines and forests, and our factories are turning out products for which there is a demand abroad, and it is not merely a question of increasing this demand, but the question of creating conditions that will enable us to get good prices for our wares, and produce them at the lowest possible cost, that should particularly command our attention.

Conservation is the handmaiden of prosperity so far as our foreign trade is concerned. Right here I want to emphasize the fact that the owners of our vast natural resources are the trustees of the American people. You gentlemen of the trade press should make it ring in their ears like a cathedral chime. When they sell their products at ridiculously low prices, the lumber, the copper and the coal that come from nature's storehouses—they are violating their trust, for ruinous trade spells a waste that brings nothing in exchange. Let me call your attention to a few facts pertaining to our foreign trade in its relation to natural resources, and to facts concerning the methods that are employed by some of our competitors in the commerce of the world, to prevent waste.

FOREIGNERS CONTROL AMERICAN PRICES.

Frankfort-on-the-Main is the home of a combination of German metal buyers who control the world market for copper, lead, zinc, and various other metals. It is a family affair, and has subsidiary companies in England, France, Belgium, Switzerland, Australia, Africa, Mexico, and the United States. It owns zinc mines in Oklahoma, smelters in Colorado, and controls one of the greatest metal trading companies in New York City. This giant organization with its affiliates dominates the metal markets of the world. Time and again it has depressed the price of our copper. It is a notorious fact that it has compelled our producers to sell copper to foreign buyers at lower prices than to our home users. The combination has been able to do this in spite of the fact that this country sup-

plies two-thirds of the world's copper, and ought to set the prices, because it deals with our producers as individuals and plays one against the other.

We don't export much coal, but we sell a great deal to foreign ship-owners to bunker their vessels which call at our ports. At Newport News the Pocahontas and New River operators of West Virginia are dumping some of the finest coal in the world into foreign bunkers. The price is set for a year by a combination of English brokers. Last year it was \$3.30 per ton, but this year, in the face of rising labor costs, the combination was able to cut that price to \$3.10 because it could get certain mine operators to make low bids. When freight and other charges are deducted that nets \$1.38 to \$1.43 per ton at the mine, an average of 6 to 7 cents per ton under that charged our own manufacturers. And that advantage will be handed to foreign ship-owners on nearly 2,000,000 tons of West Virginia coal this year.

A LESSON IN CONSERVATION.

When conditions arise to threaten waste of the natural resources of our commercial rivals, prompt remedial measures are undertaken. Several years ago the German potash miners were competing between themselves and selling potash to foreign countries at a ridiculously low price. Finally they formed a cartel to regulate prices, and were encouraged by the German Government. After this cartel had been in existence for several years a difference of opinion developed and several members withdrew and started negotiations with American buyers for the sale of their potash. One of the largest opened up negotiations with Armour & Co., of Chicago, and a contract was made with this firm below the cartel prices. After the contract was sealed, signed and delivered, the German Government notified the independent potash producers that they would have to break the contract; that the prices quoted to Armour & Co. were too low; that while the individuals were the owners of the mine they were in reality the trustees for the German people, and that the selling of potash to American packers at the price quoted affected every man, woman and child in Germany; that while the potash was gone one of the most valuable resources for Germany's future was destroyed.

That is what Germany does with one of her natural resources. We have a precisely similar opportunity. Down in Tennessee and Florida, and out in the Rockies are the greatest known deposits of phosphate rock, a fertilizer material even more essential to general agriculture than is potash. We produce nearly half the world's output of phosphate rock, and 40 per cent of our production, made up of high grade, goes abroad, chiefly to Europe. Under normal conditions we send 1,000 tons to Germany every day of the year. Do we follow the wisdom of Germany, charging the prices we ought, and conserving our limited supply of this vital natural resource, so necessary to the future of our agriculture and the low cost of living here? You know the answer. We are selling the best we have as fast as we can at Europe's price.

There are many instances where foreign nations have taken governmental action to prevent waste of natural resources. Italy thus saved its sulphur industry in Sicily from ruin, threatened by overproduction and unbridled competition. Rumania has safeguarded its rich oil fields in the same way.

OUR DISADVANTAGE EITHER WAY.

The outstanding fact that confronts us is this: When we buy abroad we are at the mercy of the foreign seller, and when we sell abroad we are at the mercy of the foreign buyer. In the language of the street, they "get us a-comin' and a-go-in'." And the reason is that the European industries are organized scientifically to capture foreign trade and to get all there is out of it, while we in America have suffered the consequences of this one-sided organization.

Our method of disposing of our natural products, containing our valuable raw materials, and constituting the chief wealth of our country, should be stopped by the adoption of some practical, reasonable business method. For every dollar's worth of additional wealth that we receive for these products the people of the United States profit, and when we do not receive a fair price for the products that we ship abroad we are impoverishing our people, and our country is that much poorer.

AMERICA'S CHANCE AFTER THE WAR.

Competition is the same the world over, and it will be particularly keen when the business of peace is resumed among the nations. America's chance at the trade of the world will be helped beyond what it was before by reason of a new, even start with the others in the race, but we must be prepared to match systematized industry against the effective systematized

industries of our competitors. We must meet conditions as they exist.

In European countries manufacturers and merchants, aided by their governments, have developed a high state of efficiency, which enables them to sell their goods in the markets of the world. Our buyers, seeking raw and finished materials in foreign countries, who formerly had a free competitive field from which to receive bids, now find that the great manufacturing industries have been formed into combinations or cartels; and, instead of receiving bids from several concerns, the American buyers now have to do business with central selling agencies, each representing a whole industry. But when the foreign buyer seeks material here he finds our unsystematized market—much to his own satisfaction.

If the American manufacturer and merchant are forced to purchase their materials abroad at a higher price because of the elimination of the old competitive system, is it fair that our business men engaged in the foreign trade should be subjected to the rumous features of the old system here at home? When the foreign buyer seeks material here he has hundreds of firms to bid on his order. When the first bid is received, back comes the cable: "Your price is too high." Then our business men start to cut prices in their endeavor to get the order, particularly if domestic business is dull. And so, instead of setting a fair price on his product and selling at a profit, the American business man takes what the foreign buyer dictates, frequently at an actual loss.

WORK OF THE FEDERAL TRADE COMMISSION.

The Federal Trade Commission will have a report ready in the next few weeks to submit to Congress showing further facts regarding our foreign trade conditions.

It is my belief that the time has arrived for some definite concrete action, and I feel confident that the sentiment is most favorable for some practical immediate relief.

Within the next few weeks the commission will mail to each corporation in the United States a letter and a list of questions, and the success of our efforts will in a measure depend upon you gentlemen. We are going to mail each trade paper in the United States a copy of this letter, as well as the questions, and we would like very much to have each trade paper endorse and urge the business men in their industry promptly to fill out the form and send it to the Federal Trade Commission. I wish particularly to call your attention to the fact that we are compiling this information for the business men engaged in every industry, and that our whole thought is to do the work in a manner that will be helpful to all.

A SERVICE TEST.

Electric storage battery jars must be made of an extremely tough compound to stand hard usage without breaking.

Storage batteries are now used by thousands of electric, pleasure and commercial vehicles. Storage batteries are hauling coal from the mines, lighting railway trains, operating railway switches and signals; indeed they are now used in every field of electrical development.

In the illustration an "Exide" hard rubber jar is shown supporting a 217-pound man, who holds a complete "Exide" baby battery of 48 pounds in his hands. This jar, while badly bent by the weight of 265 pounds, was not broken or cracked. It was taken from stock to demonstrate the extraordinary strength, toughness and flexibility of "Exide" hard rubber storage battery jars.—[The Electric Storage Battery Co., Philadelphia, Pennsylvania.]

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

Machines For Making Bathing Caps.

THERE was a time when the bathing cap was plain and unattractive. Today it is made in a score of shades and shapes, and so beruffled and trimmed that it is a most attractive part of the bathing costume.

These changes have turned the old-time hand process work into a line of rubber manufacture for which a number of labor saving machines have been designed. The present day processes begin, of course, with the preparation of the stock.

First, latex plantation rubber is massed and mixed with the desired dry aniline color, be it yellow, orange, red, violet, blue or green.

It is here that the scarcity of imported dyes has seriously affected the industry. Most of the brilliant colors formerly came from

Germany, and are therefore not obtainable. However, satisfactory results are attained by proofing both sides of bright colored plaids, figured cowlings, taffetas and crepe de chimes, with a transparent coating of pure rubber. Indeed, beautiful effects are thereby obtained, and it is further true that the colors will not run.

The rubber stock is next calendered and dusted with corn starch. It is then cut into 25-foot lengths, which are laid on a smooth surface shrinking table, one upon the other for a period of 48 hours. Whether the material from which the caps are to be made is calendered sheet or waterproofed cloth, the following methods of manufacture are practically identical in both cases.

The metal patterns for the bathing cap body are 18, 19 and 20 inches in diameter. When the shrinking is complete the pattern is laid on the sheet and the body of the cap cut out by hand.

The edges of the cap body are then "hemmed." This operation is performed on an ordinary sewing machine, but without needle and thread, the hemming device simply folding over the edges of the cap body while the feed and the presser foot solidly unite them.

Up to this point the work has been with soft, uncured rubber that requires careful handling as it is easily distorted and damaged, besides being sticky. As the operations that follow require a certain amount of firmness in the material, this quality is obtained by semi-curing the rubber in the rotary vapor vulcanizer shown in Figure 1. This is a box-like chamber heated by steam coils and enclosing a belt-

FIG. 1.—ROTARY VAPOR VULCANIZER.

drive perforated wooden cylinder. In this the cap bodies are tumbled for an hour at a temperature of 110 degrees F., and exposed to monochloride of sulphur vapor, which effects a semi-cure.

FIG. 3.—PLEATING AND FORMING MACHINE, OPEN.

while the narrower, upper strip is semi-cured. In this position they are fed to the small 2-roll calender shown in Figure 2, meanwhile the operator pulls on the elastic upper strip, thereby ruffling the lower uncured strip as it passes between the rolls. The inside head-band is a plain strip of unvulcanized rubber about 7/8 inch wide.

The cap is formed and the lower part pleated on a machine especially designed for this purpose. Before this is done the points of the pleats, where they will come in contact with the inside and outside head-band, are brushed with cement made of pure rubber dissolved in naphtha, and allowed to thoroughly dry.

FIG. 4.—PLEATING AND FORMING MACHINE, CLOSED.

Making the inside and outside head-band and the ruffled trimming that forms part of the latter is the next step to be considered. The unvulcanized sheet, that has been previously dusted with corn starch, is rolled on a mandrel, which is placed in a speed lathe, and the head-band strips are cut into separate rolls of the proper width. The edges of the band strips are folded by passing through metal folders. The lower strip forming the ruffled part of the outside head-band is

wider than the upper one, and is unvulcanized, while the narrower, upper strip is semi-cured. In this position they are fed to the small 2-roll calender shown in Figure 2, meanwhile the operator pulls on the elastic upper strip, thereby ruffling the lower uncured strip as it passes between the rolls. The inside head-band is a plain strip of unvulcanized rubber about 7/8 inch wide.

The cap is formed and the lower part pleated on a machine especially designed for this purpose. Before this is done the points of the pleats, where they will come in contact with the inside and outside head-band, are brushed with cement made of pure rubber dissolved in naphtha, and allowed to thoroughly dry.

The next step in the operation is pleating, forming and assembling, which is done on the machine shown on Figure 3. The round semi-vulcanized and cemented cap body is placed evenly on the lower folding blades *A*. These are 36 in number, and arranged in circular form with their inner ends pivoted to the hollow plunger *B* that is reciprocated vertically by action of the treadle *C* and coil spring *D*. The inside head-band, which has been previously brushed with cement, is placed around

FIG. 2.—HEAD-BAND RUFFLING CALENDER.

the head-block *E* and the ends joined, making the band endless. The upper pleating blades *F*, 36 in number, are arranged in circular form around the flange *G*, and turn on their vertical axes when the ring *H* is partly revolved. They also alternately register with the lower blades. The upper blades are then

the head-block *E* and the ends joined, making the band endless. The upper pleating blades *F*, 36 in number, are arranged in circular form around the flange *G*, and turn on their vertical axes when the ring *H* is partly revolved. They also alternately register with the lower blades. The upper blades are then

lowered by depressing the vertical shaft *I*, controlled by the counter-weight *J*, until the blades are 3 inches below the inside cap-band that is attached to the head-block. The foot is then placed on the treadle, which lowers the hollow plunger and forces the lower pleating blades upward. These accurately fold the rubber sheet between the upper blades, and firmly attach each pleat to the inside head-band. The treadle is then released, allowing the lower blades to fall back and resume their original posture, as illustrated in Figure 4.

The cemented part of the cap has now been folded on and over each one of the upper blades, and cemented fast to the inside

FIG. 5.—DRYING TUMBLER.

head-band. The ring to which the blades are attached is moved to the right, which simultaneously folds the pleats one upon the other, after which the blades are released by raising the upper blade-head. The outside head-band and trimming is then attached, and the cap and head-block are removed from the machine. An operator with ordinary intelligence and a little experience can turn out one complete cap a minute on this machine.

The final cure is then given, which is tumbling for 60 minutes at 110 degrees F. in monochloride of sulphur vapor in the vulcanizing chamber already described. The washing process which follows is performed in an ordinary rotary washing machine common in every steam laundry. Cold, clear water, with a small amount of 26 degrees liquid ammonia, and a pint of neutral chip soap serves to remove the corn-starch from the caps and restore the original brilliant colors. The final drying is done in a rotary octagon tumbler covered with open mesh wire cloth, as shown in Figure 5. About one hour's tumbling in this machine is sufficient to thoroughly dry the finished caps.

Foreign Import Duties on Rubber Tires.

THE following table, corrected to February 7, shows the foreign import duties on rubber tires of all descriptions imported into various countries from the United States.

The column marked "Weight" shows whether duties are levied on net or gross weight, or include simply the inner packings. The next two columns give the rate of the duty per 100 pounds in United States currency and the rate per cent ad valorem.

COUNTRIES.	Weight.	Rate per 100 Pounds, U. S. Currency.	Rate Per Cent—Ad Valorem.	Remarks.
NORTH AMERICA:				
Canada			42.5	{ Imports of articles invoiced at prices less than the market value in the country from which exported, are liable to a "dumping" duty of 5 per cent if such articles are also made in Canada.
Central America:				
British Honduras	Gross		15	
Costa Rica: Port Limon	Gross	\$4.43	
Other ports	Gross	\$4.30	In addition, there is a wharfage tax of 10.5 cents per 100 pounds.
Guatemala	Gross	\$7.21	
Honduras	Gross	\$4.86	A surtax of 18.6 per cent is included.
Nicaragua:				
Atlantic ports—Auto tires	Gross	\$3.81	
Solid tires	Gross	\$2.86	
Motorcycle tires	Gross	\$5.72	
Pacific ports—Auto tires	Gross	\$4.08	
Solid tires	Gross	\$2.99	
Motorcycle tires	Gross	\$12.25	
Panama			15	
Salvador	Gross	\$13.65	
Mexico—Tires	Net	\$5.16	{ A surtax of 10 per cent is included. The value of the Mexican peso, used in getting the converted value, was \$0.156.
Inner tubes	Net	\$3.53	A surtax of 10 per cent is included.
Newfoundland			49.5	
West Indies:				
British—				
Antigua			13.33	Cost of packing is excluded.
Bahamas			22	A surtax of 10 per cent is included.
Barbados			11.25	Cost of packing is excluded.
Dominica			12.5	
Grenada			10	
Jamaica			16.67	
Montserrat			13.33	Cost of packing is excluded.
St. Christopher-Nevis			11	Cost of packing is excluded.
St. Lucia			16.5	A surtax of 10 per cent is included.
St. Vincent			15	A surtax of 20 per cent is included.
Trinidad and Tobago			10	
Turks and Caicos Islands			10	
Virgin Islands			10	
Cuba			25	
Danish:				
St. Croix			12.5	Duty, based on invoice price, increased 25 per cent.
St. Thomas and St. John			6	Duty, based on price F. O. B. at port of export.
Dominican Republic	Net	\$36.29	
Dutch			3	
Haiti			29.1	{ A surtax of 94.53 per cent is included. The duty was based on the import price + 10 per cent to allow for freight and insurance.
SOUTH AMERICA:				
Argentina—Tires and tubes		\$10.51	{ Weight includes inner packing. Automobile tires only. A surtax of 2 per cent is included.
Bolivia	Gross	\$20.29	{ A surtax of 15 per cent and also a statistical tax of one-tenth of 1 per cent of the valuation are included.
Brazil		\$10.71	{ A surtax of 2 per cent is included. The conversion into U. S. currency is made on the basis of \$2.45 to the milreis.

COUNTRIES.	Weight.	Rate per 100 Pounds. U. S. Currency.	Rate Per Cent. Ad Valorem.	Remarks.	
SOUTH AMERICA:					
British Guiana			18.15	{ This rate includes 10 per cent surtax, but for articles subject to specific rates only 5 per cent surtax is added, making the rate 17 1/3 per cent.	
Chile—Pneumatic tires		\$39.74			{ Including inner packing.
Solid tires		\$19.87			{ Including inner packing.
Colombia	Gross	\$0.93		{ A surtax of 2 per cent is included. Articles imported by way of Buenaventura and Guapi pay only 95 per cent of the duty, while those imported through Tumaco pay only 70 per cent of the duty during 1916.	
Ecuador		\$9.96		{ A surtax of 125.5 per cent is included and the weight includes inner packing.	
Paraguay		\$36.77		{ Automobile tires only. A surtax of 7 per cent is included.	
Peru—Automobile tires	Gross	\$24.28		{ A surtax of 10 per cent is included at ports of Callao, Salaverry, Paita and Pisco, other ports only 8 per cent (\$35.76).	
Other tires		\$36.42		{ A surtax of 8.5 per cent is included, but the license fee of .15 per cent and the statistical tax of .35 per cent of the valuation of all goods are not included.	
Uruguay	Gross		39.5	{ A surtax of 56.55 per cent is included.	
Venezuela	Gross	\$10.28			
EUROPE:					
Austria-Hungary	Net	\$13.81		Casings only.	
Belgium—Solid tires	Net	\$5.69			
Auto tires	Net	\$10.16			
Inner tubes	Net	\$14.88			
Bulgaria—Tires and tubes	Net	\$5.25		A surtax of 20 per cent is included.	
Denmark—Auto tires	Net	\$6.08			
Solid tires	Net		Free		
Finland	Net	\$9.55			
France—Auto tires and tubes	Net	\$13.13		A surtax of 3 per cent is included. Casings only.	
Motorcycle tires	Net	\$21.89			
Germany	Net	\$6.48			
Greece	Net	\$1.03		{ This duty is exclusive of the 4 per cent. tax which the various municipalities are authorized to impose.	
Iceland		\$0.24			
Italy—Tires and tubes	Net	\$5.25			
Netherlands			5		
Norway	Net	\$3.65		Casings only.	
Portugal	Net	\$2.13		{ Conversion to U. S. currency is based on the average quotation of the paper milreis for July 1914.	
Roumania		\$9.06			{ Weight includes inner packing. A tax of .5 per cent is included.
Russia	Net	\$32.09			{ Automobile tires only.
Servia	Net	\$10.51			
Spain—Solid tires	Net	\$17.51			
Casings and inner tubes	Net	\$23.64			
Sweden—Auto tires	Net	\$14.59			
Solid tires	Net	\$9.73			
Switzerland	Gross	\$0.70			
Turkey			30		
United Kingdom			33.33		
ASIA:					
British—				{ The basis of this duty is the wholesale cash price in bond, less trade discount at the port of entry.	
Ceylon			5.5		
Federated Malay States			Free		
Hongkong			Free	See note for Ceylon.	
India			5		
Straits Settlements			Free		
China			5	{ Duties are collected on the current import value.	
Chosen (Korea)			8		
Dutch East Indies			10		
French Indo-China	Net	\$13.13		{ Duties are based on the fair market value of the goods in the country from which exported.	
Japan (including Formosa)	Net		25		
Persia			10		
Siam			3	{ Automobile tires only.	
AFRICA:					
Abyssinia			10		
Belgian Congo			10		
British—				Duties are collected on the current import value.	
Mauritius			12		{ Duties are based on the fair market value of the goods in the country from which exported.
Nigeria			Free		{ Duties are based on the current value for home consumption at the place of purchase, including value of packing and the agent's commission if it exceeds 5 per cent.
Union of South Africa	Gross		15	{ The dutiable value of imports is taken to be the cost price with charges, increased by 5 per cent or the invoice price without charges, increased by 15 per cent.	
Zanzibar			7.5	{ At Alexandria an additional tax of .5 per cent is added, while different additional taxes are imposed at other ports.	
Egypt			8		
French Algeria	Net	\$13.13			
Italian—				{ Duties are based on fair market value F. O. B. at port of export, plus 10 per cent. On casings weighing over 2 1/2 pounds and inner tubes over 1 pound each, 36 cents per pound, if higher than the ad valorem rate.	
Eritrea			8		{ Imports of foreign origin are taxed 25 per cent of their value.
Libia			11		
Somaliand			15	{ Duties are based on the fair market value of the goods in the country from which exported.

What the Rubber Chemists Are Doing.

EXPERIMENTS IN VULCANIZATION.

NITROGEN and the rate of vulcanization of rubber has been studied by J. Grantham, who presents his results in the "Agricultural Bulletin" of the Federated Malay States (October, 1915). The investigation was conducted on several slices of smoked and unsmoked plantation rubbers representing conditions of standard practice in the preparation of rubber from its latex.

Although there is a wide difference in rate of vulcanization between smoked slab and smoked sheet, no difference is noticeable in the nitrogen content. Comparison of the unsmoked sheet and unsmoked slab showed that low nitrogen is connected with rapidity of vulcanization.

These observations were confirmed by a second series of experiments which yielded the following results:

Type of Rubber.	Percentage of Nitrogen.	Optimum Time of Vulcanization in Hours.
Thick smoked slab.....	.425	1½
Thin smoked slab.....	.398	1¼
Thick smoked sheet.....	.400	2½
Thin smoked sheet.....	.416	3
Thick unsmoked slab.....	.210	1¼
Thin unsmoked slab.....	.352	1½
Thick unsmoked sheet.....	.386	2½
Thin unsmoked sheet.....	.394	3

All estimates were made on the crêpe prepared prior to vulcanization. Again no relation can be traced between the nitrogen content and rate of vulcanization in the smoked rubber, and the differences are probably experimental errors. The unsmoked rubbers, however, show a regularly increasing percentage of nitrogen, with a decreasing rapidity of vulcanization. The increase is not regular, however, the difference in nitrogen percentage between the two unsmoked slabs being much the greatest.

The loss of nitrogen in the unsmoked rubber is probably due to decomposition of the protein, and the rapidity of vulcanization appears to be associated with this decomposition. As far as the author is aware this relation between rapidity of cure and low nitrogen content has not been recorded before, probably on account of the predominance of smoked rubbers and crêpes on the market, in which the relation is not apparent. Smoking has the effect of preventing the loss of nitrogen. It does not, however, prevent a slab rubber developing a rapid rate of vulcanization since the smoked slab cures in 1½ hours. Hence it cannot be the actual loss of nitrogen which produces rapidity of vulcanization.

Experiments to determine at what stage in the preparation of slab rubber the nitrogen is lost showed that a large loss occurs when the slab is crêped previous to vulcanization. It also appeared that most of this nitrogen is in such a form in unsmoked slab that it is lost in the gaseous form when heated to 212 degrees F.

Other experiments were carried out with fresh coagulum. These showed a large loss of nitrogen during the drying of the slab. This is accounted for partly by the loss in the serum which drains away, and partly by the loss in the gaseous form due to decomposition.

The author summarizes his results as follows:

In smoked rubbers from the same latex the nitrogen content is constant, although the rate of vulcanization varies considerably between slab and sheet. Smoking appears to fix the nitrogen.

In unsmoked rubbers from the same latex there is considerable

variation in the nitrogen content of the rubber after crêping preparatory to the vulcanization process. It is small in the case of rapidly vulcanizing rubbers, and larger in that of the more slowly vulcanizing ones.

The low percentage of nitrogen in rubber prepared as unsmoked slab is attributed partly to loss in the gaseous form during the superficial drying of the slab, and partly to the washing out of nitrogenous decomposition products when the slab is crêped prior to vulcanization.

Since rapidly vulcanizing smoked slab rubber contains as high percentage of nitrogen as slowly vulcanizing sheets, the actual loss of nitrogen cannot be the cause of rapidity of vulcanization, although it would appear from the results of the unsmoked rubbers that rapidity of vulcanization and loss of nitrogen are in some way associated.

SYNTHETIC RUBBER AND SAWDUST.

In a recent number of "Le Caoutchouc & la Gutta Percha," G. Noyer reviews the work of Harries and other investigators on the relation between levulinic acid and rubber, and the value of sawdust as a source of levulinic acid. Harries has shown that the ozonide of rubber yields levulinic acid by the action of water.

No satisfactory source has yet been discovered that will yield levulinic acid in abundant quantity and at low cost. The author considers it possible that an abundant cheap source of levulinic acid may be found in sawdust, and that the alcohol to be derived would pay the cost of treatment. It has been estimated that a ton of sawdust will give by Simoussen's method, dilute sulphuric acid at 8 atmospheres, 250 kilos of levulinic acid.

It is possible from levulinic acid to derive isoprene; consequently it will furnish a synthetic rubber identical with natural rubber, and not one with unknown properties.

VULCANIZING EXPERIMENTS.

Eaton and Grantham have shown (THE INDIA RUBBER WORLD, March, 1916, page 289) how a particular method, which normally produces a uniform rubber with a very slow rate of cure and inferior mechanical properties, can be altered so that a rapidly curing rubber may be obtained possessing considerably superior physical properties after vulcanization, equal in fact to the best samples of First latex rubbers. This is accomplished by allowing the coagulum to remain for about ten days before it undergoes the usual procedure for conversion into block. Experimental results show that the rate of cure increases till the sixth day, after which little or no change takes place. It has been established that it is perfectly safe to crêpe the slab after ten days, since the change causing maximum rate of cure is effected during this period. Examination of several old samples of slab rubber indicate that the substance causing this acceleration in rate of cure does not apparently decrease.

DETERMINING PROTEINS IN RUBBER.

A convenient method for the separation of the nitrogenous bodies contained in rubber has been perfected by Spence and Kratz.

A solution of rubber in benzene, chloroform or toluene when treated with acid loses viscosity. The decrease may reduce the viscosity to that of the solvent. At the same time the insoluble nitrogenous compounds in the rubber are precipitated and readily separated. The reaction is hastened by sunlight or heat. The method has been applied to determinations on plantation and hard cure Para rubber. The results appear to demonstrate that the insoluble nitrogenous residue found in rubber is not pure protein, but a complex of protein and carbohydrate, probably a gluco-protein. The work of Spence and Kratz indicates

that the correct factor for calculating the protein content of plantation and wild Para rubber is 10 rather than 6.25, which has previously been taken.

The process of isolating the nitrogenous composites of rubber also permits their further study and analysis.

The details of the method are thus stated: 100 grams of washed and dried rubber are treated with 1,000 cc. of benzene containing from 0.3 to 0.5 per cent of trichloroacetic acid. The mixture is exposed to sunlight or heated in a vessel immersed in boiling water and thoroughly shaken at intervals. After 48 hours the solution is allowed to settle and the clear liquid decanted. The insoluble is subjected to two extractions, 500 cc. each, of the mixture of benzene and trichloroacetic acid. The residue is washed with pure benzene, dried, powdered and again extracted with benzene. Following this it is washed with alcohol, dried and weighed.

THE STRUCTURE OF RUBBER.

In "Le Caoutchouc & la Gutta Percha" (February 15, 1916) André Duboscq discusses at length the various theories of the structure of the rubber molecule and its attachments in the complex rubber agglomerate. The author recognizes the extreme difficulty of the problem, and reviews impartially the work of the eminent chemists who have investigated the subject. He presents a concise discussion of the leading theories, as analyzed by the Russian chemist Koudhakow, and sustains the theory of Barrow as the best thus far advanced.

Barrow holds that no formula of the constitution of rubber can be admitted unless it is compatible with the following experimentally demonstrated facts:

1. Rubber gives, by action of ozone, an ozonide which results from the addition of O^2 to a product of depolymerization.
2. Rubber, treated with bromine, gives a tetra bromide, which is an addition product.
3. Rubber, heated in high boiling point solvent, depolymerizes, not to a cyclooctadiene, but to dipentene containing a cycle in C^8 .
4. Rubber subjected to pyrogenation gives a series of products of decomposition.
5. Rubber, by hydrogenation, changes into a saturated carbide.
6. Rubber can be obtained by polymerization from isoprene, whereas the dipentene does not give rubber.
7. Rubber, left to itself, passes by a superior degree of polymerization, this process being reversible.
8. A small quantity of sulphur is sufficient for complete vulcanization.

Barrow proposes a very ingenious formula, which practically harmonizes the ideas of Harries and Pickles. This he has done by the conception of a spiral formula for the rubber complex, with double connections mutually saturated. The diagrams (here omitted) show that such a spiral molecule would be in close relation with that of the cyclooctadiene, since the double connections are in the same situation.

Harries' formula explains the rubber molecule, but is vague regarding complex or polymerized rubber.

Barrow's spiral formula scheme supplements Harries' theory by uniting and explaining the reactions that have been experimentally noted concerning rubber, and gives the best idea of what the structure of rubber may be, notwithstanding certain obscure points and the difficulty of comprehension that the scheme involves.

ACETONE SUBSTITUTE.

Solvent mixtures containing ethyl alcohol, ethyl acetate and formic ethers have been proposed in place of acetone for the treatment of resinous rubbers by extraction. The presence of a large amount, 40 per cent, of ethyl acetate in such a solvent serves to hold considerable of the rubber in solution. This action is aided by the heat, which increases the reaction of the acetic and formic ethers upon the rubber. The solution thus

formed can only be precipitated by the addition of a large quantity of ethyl alcohol.

The use of such acetone substitutes is not economical, and can not be recommended. (G. Noyer in "Le Caoutchouc & la Gutta Percha.")

A NEW METHOD OF COAGULATION.

Eaton and Grantham, chemists of the department of agriculture of the Federated Malay States, have published in the "Bulletin" (November, 1915) an account of their experiments on the coagulation of Hevea latex and a new method of coagulation:

"If Hevea latex be allowed to stand in open vessels, the amount of coagulation depends on the shape of the vessel and the depth of the latex. A thin layer of latex does not coagulate, but changes to a peculiar slime with a yellow surface scum. If latex be placed in tall cylinders, coagulation is much more complete and the slime formation is much less, constituting only a small depth of the latex near the surface. The surface scum is also found to be alkaline in character and the scum below acid, showing two distinct processes of decomposition. This is the basis of the so-called "anaerobic" process of coagulation for which a patent has been taken out in the Federated Malay States. This process may thus be explained by a bacterial theory. The conditions are such as to inhibit a large number of bacterial species, including most of the putrefactive ones, while other species, including the coagulating ones, free from the competition of purely aerobic species, are encouraged. To find an explanation on the enzymic hypothesis is more difficult. We have since found that coagulation under these conditions is variable, on some days the coagulation being complete and on other days not quite complete, indicating a variable factor in the latex itself."

A series of experiments was conducted in which the effect of putrefactive and non-putrefactive changes in the latex was studied. Treating latex with various antiseptics and heat delayed or prevented coagulation.

The authors summarize their experimental results as follows: "These experiments indicate a possible explanation of the natural coagulation of the latex of *Hevea Brasiliensis*, viz.: That it is due to certain bacteria which infect the latex after collection.

"There are two distinct types of organisms, one favored by aerobic conditions, which tends to inhibit coagulation and produces an alkaline slime in the presence of air, and the other favored by anaerobic conditions which affect the coagulation of the latex.

"The coagulation of latex under anaerobic conditions is not constant; on some days complete coagulation occurring, and on other days being much less complete, possibly due to a variation in the constituents of the latex.

"By the addition of various sugars, coagulation under both aerobic and anaerobic conditions always occurs, and is caused, in our opinion, by the fact that a medium is formed more favorable for the organisms which produce coagulation, and less favorable to those producing putrefactive changes."

ANALYTIC METHOD.

DETERMINATION OF TOTAL CHLORINE IN RUBBER SUBSTITUTE.—The method of A. Hutin is as follows: From 0.2 to 0.5 grams of the substitute is covered in a porcelain crucible with the usual mixture of sodium carbonate and potassium nitrate. The mixture is heated slowly to quiet fusion. When cold the melt is dissolved in water to which nitric acid has been added, and the chlorine determined by titration.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World.

CHEMICAL TREATMENT OF RUBBER.

THE UNITED STATES.

RESTORING RUBBER. United States patent No. 1,172,158. Frederick Moench. The process consists in heating the vulcanized old rubber waste in a closed retort out of contact with the air, while enveloped with a plastic mixture containing linseed oil, turpentine and an earthy material.

RUBBER LEATHER SUBSTITUTE. United States patent No. 1,174,734. Benjamin Kepner. The process comprises treating a fabric with a solution composed of glycerin, gelatin, an oil and tannin, and thereafter drying the fabric in sunlight at a temperature not over 120 degrees F. The softness and flexibility of the product is increased by treatment with water and applying oil to the surface of the goods.

VULCANIZABLE SUBSTITUTE FOR LEATHER AND RUBBER.—United States Patent No. 1,174,967, John Stewart Campbell. The process consists in cooking a mixture of finely divided leather and animal fats or fatty oils with caustic alkali, adding fibrous material, magnesia, a filling material, and solution of elastic gum during progress of the boiling of the mass. After removal from the boiler the mass is dried and milled on rollers, with the addition of a vulcanizing agent. The product is formed into sheets and subjected to a vulcanizing operation.

THE UNITED KINGDOM.

COAGULATION OF LATEX. 22,138 (1914), S. C. Davidson. Rubber latex is coagulated by adding an "alkalized" cresol, cresylic acid or higher tar acids, or other "alkalized" phenoloid, and an aqueous solution of a thiosulphate, sulphite or other compound capable of evolving sulphurous acid on treatment with acid or acid substance, and finally coagulating by adding an acid or acid substance to liberate the preservative substance in the phenoloid, and also to liberate sulphurous acid. (Compare United States patent No. 1,145,351 and 1,146,851, THE INDIA RUBBER WORLD, September, 1915, page 648.)

TRADE PUBLICATIONS ON LABORATORY APPARATUS AND SUPPLIES.

GENERAL LABORATORY APPARATUS AND SUPPLIES. Lenz & Naumann, Inc., New York City. This is a new well-indexed catalog of 499 pages, in which all the well-known standard apparatus, as well as many specialties are illustrated and described. The lines carried include chemical, medical, surgical and physical apparatus, glassware, specialties and chemicals.

VITROSIL. The Thermal Syndicate, New York City. Pure fused silica in numerous forms of tubes, plates, dishes, etc., designed for laboratory purposes.

CENTRIFUGES. International Instrument Co., Cambridge, Mass. An extensive line of centrifuges and other apparatus, including Kjeldahl racks and bottle shakers for analytic work.

ALUMINUM CRUCIBLES. Norton Co., Worcester, Massachusetts, manufacturers of combustion boats, filtering covers and disks, electric laboratory furnaces, etc.

OPTICAL INSTRUMENTS FOR INSPECTION AND TESTING OF MATERIALS. Bausch & Lomb Optical Co., Rochester, New York. Microscopes and accessories.

MEASUREMENT OF CONDUCTIVITY OF ELECTROLYTES. Catalog 48. The Leeds & Northrup Co., Philadelphia, Pennsylvania.

BULLETIN 12. Hoskins Manufacturing Co., Detroit, Michigan. Electric furnaces, pyrometers and hot plates.

LABORATORY APPARATUS.

AN IMPROVED CALORIMETER.

CALORIMETERS for industrial laboratory use are not usually adiabatic, permitting an appreciable loss or gain of heat because of relatively imperfect insulations, which fail to prevent the interchange

of outside and inside temperatures. The Riche calorimeter is so free from complicated details that it is said a person with only ordinary mechanical knowledge of the principles can carry out perfect determinations with it in half the time required by other calorimeters.

This instrument is encased in a cork-lined cabinet of wood, and equipped with electrical

means for igniting the material being tested. The special feature which should be noted is that a glass vacuum cup is used to contain the water and bomb. By this arrangement the entire heat of combustion is confined for a period of at least one-half hour.

The bomb is a two-valve, porcelain-lined type, guaranteed for 3,000 determinations, but with proper care good for 8,000 or more combustions, the two-valve arrangement allowing for carbon dioxide determinations. Any style of bomb, however, may be used in this calorimeter. [Lenz & Naumann, Inc., New York City.]

DEVICE FOR READING BURETTES.

A simple and effective device for reading burettes is thus described by R. S. Poindexter:

Take a piece of white rubber tubing 5 cm. long, and of a diameter of about one-half that of the burette. Slit it down one side, open it out, and with a ruling pen and black ink make a 1 mm. line down the center.

When placed on the burette it will hold tightly, and may be pushed up and down when the reading is made. The refraction of the solution in the burette causes a distinct pointer at the bottom of the meniscus, making the reading very easy.

NEW JERSEY ZINC CO.'S ANNOUNCEMENT.

The New Jersey Zinc Co., New York City, announces the following prices on Florence brand, French process, oxide of zinc, for shipment on contract, during the second three months of 1916:

	Carloads.	Less Carloads.
White Seal	25 cents	25½ cents
Green Seal	24½ cents	24¾ cents
Red Seal	24 cents	24½ cents

The above prices are based upon shipments in barrels f. o. b. shipping point, with freight allowance as heretofore on carload lots only. The above prices effective from March 2, and subject to change without notice.

Contractors are requested to advise promptly the quantity desired to be covered by contract.

Processes of Rubber Footwear Manufacture.

THE INDIA RUBBER WORLD for December, 1915, contained an article on "Modern Industrial Methods in the Rubber Industry," which attracted the attention of a well-known rubber superintendent, who at once wrote the Editor of THE INDIA RUBBER WORLD, commending the article, at the same time suggesting that the beginning of efficiency was in the arrangement of the factory. He submits the general plan or layout, shown in the adjoining column, outlining the general flow of materials. In this instance it applies to the manufacture of rubber footwear which affords a typical opportunity for co-ordinated systems of cost accounting and efficient operation. Certain of the departments named would require sub-division in actual operation to take care of special features of stock preparation and other work preliminary to actual shoe making. The plan is actually a basic one and with modifications could be utilized for a variety of lines of rubber manufacture.

MANUFACTURING PROCESSES.

The general process of rubber footwear manufacture are briefly described below in the order indicated in the departmental plan, omitting all details descriptive of machinery, tools or appliances necessary to the work :

WASHING.—Crude rubber is softened by soaking in warm water; cut and washed for removal of soluble and mechanical impurities. It is delivered in rough sheet form to the drying department.

DRYING.—Washed rubber is prepared for further treatment by air or vacuum drying.

MILLING.—The dry rubber is masticated on warm mills to average its quality.

WEIGHING.—Rubber, reclaimed rubber and mineral ingredients are weighed for mixing in standard lots or batches.

MIXING.—Standard batches are mixed, and refined as rubber stocks.

FABRICS.—Fabrics are machine dried and rolled on shells preliminary to calender coating.

WARMING.—The refined mixed rubber stocks are softened on warming mills preparatory to calendering.

CALENDERING.—Rubber stocks are sheeted for uppers, soles and heels.

Fabrics are coated with rubber to prepare them for use as linings, stay pieces or outside finish for shoes.

CUTTING.—Calendered materials are cut by hand or machine to specified patterns.

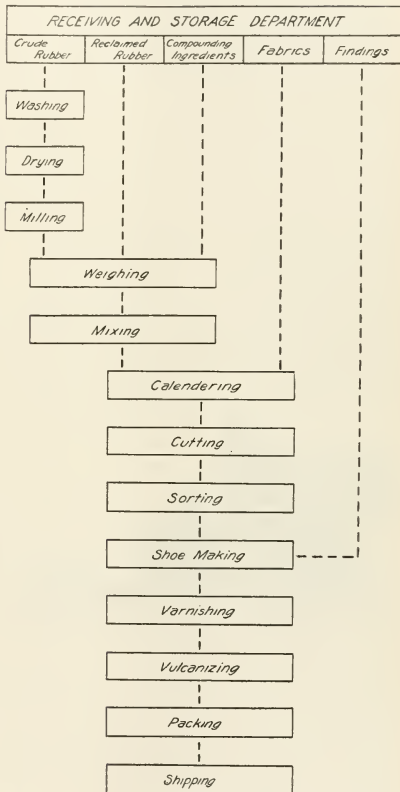

SORTING.—The various shoe parts of rubber and rubberized fabrics are counted and grouped in parcels by shoe makers' numbers, in accordance with printed tickets of instruction, proceeding from the order department.

CONSTRUCTION.—The rubber and rubberized parts are built in proper sequence on wooden or metal lasts, into boots and shoes.

VARNISHING.—The unvulcanized goods are varnished either by hand or by dipping machine. Dull surfaced goods proceed direct from making to vulcanizing department.

VULCANIZING.—Goods, racked in cars, are vulcanized in chambers heated by dry steam heat or by various pressure cure systems.

PACKING.—Goods are removed from the lasts, paired, marked, inspected and boxed. The lasts are returned to the making department if needed immediately; otherwise they are stored until required.

MANUFACTURING PLAN FOR RUBBER FOOTWEAR, SHOWING STORAGE
AND FLOW OF MATERIALS.

Auxiliary to this plan there are required the following departments:

1. Power, light and heating.
2. Designing department for goods, patterns and lasts.
3. Press department for molding boot heels.
4. Cement making department.
5. Varnish making department.
6. Dye house for coloring linings.
7. Printing office for tickets, labels and factory forms.
8. Repair department, including machine, roll engraving, carpenter, pipe-fitting, blacksmithing and electrical shops.
9. Last making department.
10. Box making department for wood and paper boxes.
11. Rubber reclaiming department for waste.

New Machines and Appliances.

ALLEN 10-INCH TUBING MACHINE.

THE steady growth and expansion of the rubber industry is reflected in the insistent demand for larger capacity machines used in the making of rubber goods. That the tire business is no exception to this rule is shown in the illustration of a large and powerful tubing machine, designed for making solid truck tires.

The machine is of extra heavy design. The feed box measures 9 by 10 inches, and is capable of handling large quantities of stock without forcing the feed. The length of the cylinder has been increased to allow greater bearing surface for the worm, thereby increasing the compression and giving greater density to the stock. The stock worm is made from a solid forging, bored for water circulation, the delivery end being counter-bored, thereby reducing the metal at this point so the circulating water will more readily cool the worm.

The stock worm spur gear has a 12-inch face and a bronze bushed hub bearing directly on the thrust block. This is 22 inches in diameter at this point, resulting in a large and rigid bearing that greatly relieves the worm from the usual side thrust strain. The reduction gears are double helical cut, with semi-steel gear and forged steel pinion. The outboard bearing pedestal is en bloc, the three bearings being cast in one piece with large oil reservoirs and self-oiling devices. All gears are entirely protected by heavy steel guards. The bed plate is

continuous and provides space for the motor, which is supplied by the purchaser. A 60 h.p. variable speed D. C. motor is considered good practice. [Allen Machine Co., Erie, Pennsylvania.]

A MACHINE FOR TRADE-MARKING FABRICS AND PROOFED RUBBER GOODS.

The manufacturers of tire fabrics, proofed fabrics and carriage cloth will be interested in the following illustrated description of a machine that has recently been adapted to the rubber industry.

The Kaumagraph machine takes the cloth from the roll or loose fold, trade-marks it, measures it and delivers the goods in the roll. Moreover, the fabric can be inspected at the same time.

The trade-marking attachment is mounted above at the right hand end of the machine and stamps on the upper surface of the cloth, so that the impressions may be inspected immediately after being struck and without stopping the cloth.

The machine is fitted with a hand wheel and screw to adjust the attachment for different widths of goods. The cloth will, therefore, always run in the center of the machine. The adjustment is so quick that various widths of pieces may follow each other without inconvenience. The trade-marks may be spaced at any distance apart and convenient means are provided to place a trade-mark close up to the ends of each piece.

The double drum rolling mechanism at the back of the machine has guide stands with quick adjustments to take any gudgeoned roller within the machine's capacity. The cloth may be threaded direct from the stamping table to the roll, or may first

pass under both drums, around and outside of the outer drum to the roller. The latter threading gives the stronger drive and a harder roll. Those who market their fabrics wound in the open width on any kind of a roll or tube, can adapt this as a final packaging machine.

The following are the specifications: Widest cloth capacity, 66½ inches; driving pulley diameter, 10 inches; revolutions per minute, 60; belt width, two inches; length over all (right and left), 98 inches; depth (front and back), 50 inches; height, 68 inches; shipping weight, 1,500 pounds. [Parks & Woolson Machine Co., Springfield, Vermont.]

MACHINE FOR SLITTING AND REWINDING RUBBER.

Cameron's slitting and rewinding machine can be used on all sorts of rubber goods such as sheet rubber, coated fabric, canvas belting, insulation, etc.

The slitting wheel, which presses rather than cuts through the material, is a disk having a V-shaped edge, blunt and mounted

on a ball-bearing center, pressed against a highly polished steel cylinder. Very little attention is required to keep it in good working order. The fabric passes between the cutter roll and

the slitter wheels, and is severed into strips of the desired widths, which go forward side by side to the rewinding mandrel. The cutter gives a clean, smooth slit, does not stretch the edge of the fabric, and can quickly be set for spacing. Strips of any width or any combination of widths may be cut at the same time. The apparatus for rewinding the goods following the slitting is of the drum type, and is so arranged that the resulting rolls are very firm and compact. Provision is also made for removing a wrapper or separate cloth from the material previous to slitting, and for reinserting a wrapper in the rewound coils as they are rolled up after the slitting process. A variation is the making of slitting wheels with zigzag edge, by which strips can be cut which will not fray at the edges, and are especially suitable for surgeon's bandages, with the result that at one process, goods can be converted from piece form into finished bandages. [Cameron Machine Co., Brooklyn, New York.]

HAND OPERATED CLOTH OR RUBBER TESTER.

This is an inexpensive fabric tester that is now being used to advantage in the rubber trade, particularly in the manufacture of footwear. The resulting tests obtained by this very simple machine are extremely accurate.

As illustrated, it is 5 feet long, and is mounted on a strong oak back-board, fitted with three malleable brackets for

fastening to the wall. Built on the dead weight or swinging pendulum principle, it has no springs to affect the test and therefore remains accurate, but can be easily calibrated without the use of special apparatus. The clamps are designed to make various styles of tests and the open space back of the flat gripping surfaces allows any number of tests to be made on large samples without cutting or stripping. Special clamps can be applied for making rubber tests which would make this machine very useful in checking results.

The test is made by turning the large hand wheel which moves the stretching screw through powerful, machine-cut, spiral gears. The pendulum or weight lever is suspended from two finely-made, self-aligning, hardened steel ball-bearings which insure against friction and unnatural resistance. The dial registers in pounds and the test is shown by the pointer which remains at the position of the break until rest by the handle suspended from the curved quadrants.

Very little effort is required to make tests and experience has shown this to be a very quick machine for practical work. All parts of this machine are built to United States standards and are interchangeable. [Henry L. Scott & Co., Providence, Rhode Island.]

APRON FEED FOR MIXING MILLS. This latest invention of Welton's automatically holds both edges of the apron sufficiently tight to effect positive forward movement when lumpy or sticky compounds are mixed. [P. E. Welton, Cuyahoga Falls, Ohio. United States patent No. 1,173,625.]

Two patents granted to the same inventor, for similar devices, were described in THE INDIA RUBBER WORLD, June 1, 1915.

MACHINERY PATENTS.

GAMMETER'S PNEUMATIC TIRE CORE REVOLVING MACHINE.

THE heavy cast-iron cores used in making tire casings require scraping and brushing after each molding operation to remove accumulations of adhering rubber. Moreover, a coating of thin rubber cement is finally applied to the side faces of the core where the beads are to be placed. These very necessary operations are greatly facilitated by a recent invention, herewith illustrated and described.

The frame comprises an upright *A* and base *B*, provided with bearings *C* and *D*, in which revolve two core-supporting rollers *E* and *F* having V-shaped peripheries—the former being belt driven, and the latter an idler. Between these rollers is mounted a Y-shaped core rest *G*, that is raised and lowered by the treadle *H*. The upper guide roller *I*, with a V-shaped periphery supports the core in an upright position, and is journaled on the swinging arm *J*, which can be raised and lowered to accommodate cores of various diameters.

The machine is operated by first raising the core rest, which is done by the foot on the treadle; then the core is rolled up the incline by the operator and placed on the idler roller and core rest. The latter is then lowered until the core rests on the driving roller, when the upper guide roller is lowered into operative position to maintain the core upright. The operator then starts the machine and performs the various cleaning operations with the use of scraping and brushing tools, while the core is being rapidly revolved. A coating of thin rubber cement is finally applied to the side faces of the core, which completes the operation. [John R. Gammeter, Akron, Ohio, assignor to The B. F. Goodrich Co. of New York, New York City. United States patent No. 1,172,883.]

BOOT TOP LAYING AND CUTTING MACHINE.

Cutting and laying boot top linings, and in fact all other similar operations in footwear manufacture, are invariably performed by hand. This hand labor is laborious, tedious and costly, and besides, the product is often defective, due to the well-known fallibility of the human factor in manual operations.

The machine shown in the accompanying illustration has been recently invented to do the work of applying the fabric lining, used to reinforce footwear parts, to the sheeted rubber stock.

Side frames *A* and *B* support the revolving drum *C*, on which are removably fastened forms or dies similar to the one shown at *D*.

A sheet of stock is fed between the drum and the pressure roller *E*, one of the fabric linings being previously placed in the form *D*. The drum is then revolved and passes under the roller *E*, which firmly presses together the lining and superimposed rubber sheet, passing under heated roller *F*. As the drum continues to revolve, the boot top with attached lining is cut out

of the rubber sheet by heat and pressure of the roller against the edges of the form. After the form has passed beyond the roller *F* the reinforced boot top is removed by the operator. The scrap pieces are stripped from the drum by the action of belt *G*, which delivers them to the hopper under the machine. [E. B. Herman, East Watertown, Massachusetts, United States patent No. 1,173,426.]

SOLID TIRE DRILLING MACHINE. Solid and cushion tires may be drilled on this machine, to accommodate cross wires that engage the side wires holding the tire to the rim. [William C. Stevens, assignor to Firestone Tire & Rubber Co.—both of Akron, Ohio, United States patent No. 1,171,552.]

TIRE BEAD CENTERING DEVICE. This consists of a ring provided with an annular recess conforming to the contour of the finished bead. The ring is centered by three shouldered brackets or arms which slide within the inner circumference of the core. When the ring is revolved the bead is laid on the casing and accurately centered with relation to the tire. The other bead is applied in the same way. [John R. Gammeter, Akron, Ohio, assignor to The B. F. Goodrich Co., New York City, United States patent No. 1,164,804.]

METHOD OF MAKING A CORD CARCASS FOR PNEUMATIC TIRES. Two layers of rubberized cord are laid spirally on the core, at a reverse angle, forming the carcass. This is slit around the inner circumference and the bead cores interposed between the open plies. The core is then removed from the winding machine and a section ring attached to the inner periphery of the core, supporting the beads. The casing and tread are then built up, the two side rings for molding the beads applied and the whole wrapped and vulcanized by the open cure process. [Walter R. Denman, assignor to Miller Rubber Co.—both of Akron, Ohio, United States patent No. 1,172,115.]

MANDREL FOR MAKING INNER TUBES. This invention comprises a mandrel provided with a depression for receiving materials for the valve patch which is made homogeneous with the tube. [Charles E. Foutts, East Liverpool, Ohio, United States patent No. 1,173,944.]

FOOTWEAR REPAIRING OUTFIT.—A new arrangement for repairing rubber footwear consists of a portable vise upon the anvil of which the shoe is placed, with the portion to be repaired uppermost. If the sole is to be renewed, a piece of rubber is placed over the old sole, and upon this is clamped a sheet of lead with any desired surface configuration, and having a projecting flange. This is hammered down against the edges of the sole or heel piece, thus giving a rolled edge similar to that of a new shoe. Then the shoe is removed from the vise, and after the parts are clamped in any suitable holder it is vulcanized. The result is a finished sole or heel substantially equal to that of a new shoe in neatness and finish. [James W. Arthur, Warren, Ohio, United States Patent No. 1,174,799.]

HYDRAULIC TIRE VULCANIZING MOLD AND PRESS.—The object of this apparatus is to partially vulcanize the tire cover before the curing operation which gives the tire its final shape. This relates more particularly to those having beaded edges, which are not rigid in the uncured condition. [Colin Macbeth of Birmingham, England, assignor to The Dunlop Rubber Co., Limited, Westminster, England, United States patent No. 1,174,885.]

A complete description of this machine was given in *THE INDIA RUBBER WORLD*, December 1, 1915, page 122, British patent No. 11,732 (1914).

OTHER MACHINERY PATENTS.

THE UNITED STATES.

ISSUED FEBRUARY 29, 1916.

- 1,173,424. Rubber working machine. E. B. Herman, East Watertown, Mass.
1,173,449. Mold for making innersoles. C. B. Mansbach, assignor of one-half to F. L. Price—both of Brockton, Mass.

- 1,173,626. Feed mechanism for mixing mills. P. E. Welton, assignor to K. B. Welton—both of Cuyahoga Falls, Ohio.

ISSUED MARCH 7, 1916.

- 1,174,095. Machine for compacting parts of reinforced innersoles. E. S. Simson, North Scituate, and P. M. Vayette, Quincy, assignors to Clifton Manufacturing Co., Jamaica Plain—all in Massachusetts.
1,174,738. Slitter and rewinder. S. M. Langston, assignor to Samuel M. Langston Co.—both of Camden, N. J.

THE DOMINION OF CANADA.

ISSUED DECEMBER 31, 1915.

- 166,409. Tire mold core. The Gutta Percha & Rubber Limited, assignee of J. H. Coffey and J. H. Coffey, Jr.—all of Toronto, Ontario, Canada.

THE UNITED KINGDOM.

ISSUED FEBRUARY 16, 1916.

- 21,478 (1914). Machine for cutting jar rings and washers. Bertrams, Limited, St. Katherine's Works, Sciennes, and R. F. Gillespie, 58 Arden street—both in Edinburgh.
A similar machine was illustrated and described in *THE INDIA RUBBER WORLD*, May, 1915. British patent No. 1,916. Jar ring lathe. Bertrams, Limited, and R. F. Gillespie.

ISSUED MARCH 1, 1916.

- 22,105 (1914). Cooling roll for mixers. J. H. Nuttall and D. Bridge & Co.—both of Castleton, Lancashire.

ISSUED MARCH 8, 1916.

- 22,489 (1914). Machine for coagulating latex. S. C. Davidson, Sirocco Engineering Works, Belfast.

THE GERMAN EMPIRE.

PATENTS ISSUED (With Dates of Validity).

- 290,322 (March 5, 1915). Strip cutting machine for rubber sheets and similar materials. Dr. Karl Lehmann, Karlstrasse 4, Berlin-Lichterfeld.
290,295 (October 21, 1915). Kneading installation for working plastic masses. Albert Sigwart, Karlstrasse 7, Ludwigshafen-on-the-Rhine.
290,856 (December 28, 1915). Apparatus for coagulating crude rubber. Th. L. Adolf Runge, 61, Podbielskistrasse, Hanover.

NEW MANUFACTURING PROCESSES.

THE UNITED STATES.

MANUFACTURE OF HEELS. Scrapped solid tires are cut transversely and made into heel blanks which are built up and formed into finished heels provided with washers and nail holes by heat and pressure. [U. S. Patent No. 1,172,919. Henry C. Weber, Port Jefferson, New York.]

MOLDING AND VULCANIZING TIRES. Pneumatic tires are molded on a core in a sectional mold. The tread portion is removed radially, while the sides and edges of the tire are stretched in a direction away from the tread. The tire is subsequently removed from the mold and vulcanized in any suitable manner. [United States patent No. 1,166,326. J. H. Coffey and J. H. Coffey, Jr., Ontario, Canada, assignors of one-half to Gutta Percha Rubber, Limited, Toronto, Canada.]

UNITING HARD RUBBER AND METAL. Hard rubber and a threaded metal member are united by heating the former and screwing the latter into an opening in the heated hard rubber, which is then allowed to cool. [United States patent No. 1,165,680. George C. Knauff, Chicago, Illinois.]

UTILIZING WASTE RUBBER. Soles and heels of footwear are made by disintegrating unvulcanized scrap, and subjecting this material to pressure and vulcanization. [British patent No. 21,445. G. W. Beldam, Ealing, and A. U. B. Ryall, Brentford, both in Middlesex.]

OTHER MANUFACTURING PROCESS PATENTS.

THE UNITED KINGDOM.

ISSUED FEBRUARY 23, 1916.

- 21,768 (1914). Hot water bottle. T. Rowe, 52 Harold Road, Leytonstone, London.

THE GERMAN EMPIRE.

PATENT ISSUED (With Date of Application).

- 290,713 (April 11, 1915). Process for making hollow objects out of rubber. Dr. Carl Därschner, 21 Gilbachstrasse, Cologne.

THE EDITOR'S BOOK TABLE.

HANDELDING VOOR DE BEREIDING VAN RUBBER. BY DR. P. Arens. Published in the Dutch language as a communication of the Malang Test Station, Malang, Dutch East Indies. [8vo, 45 pages. Paper bound.]

AS indicated by its title, "Manual for the Preparation of Rubber," this work is intended to serve as a handbook for the use of planters in preparing their rubber for market. It is especially intended for planters in the Dutch colonies but can be used to advantage by all rubber planters acquainted with the language of the Netherlands. A clear idea of its scope can be formed from the following titles of its several chapters:

Latex in the Gardens and in the Factory; Determination of the Rubber Content of Latex; Preparation of Rubber Sheet; Mistakes Made in Preparing Rubber Sheet; Preparation of Rubber Crêpe; Mistakes Made in Preparing Rubber Crêpe; Preparation of Inferior Sorts (of rubber); Mistakes Made in Preparing Inferior Sorts; The Sorting and Packing of Rubber; Prescriptions for Making Solutions Used in the Preparation of Rubber.

NEW TRADE PUBLICATIONS.

THE Miner Rubber Co., Limited, Granby, Quebec, Canada, has issued its catalog No. 7 for 1916-17. It is a handsomely illustrated 64-page book showing the many styles of rubber footwear made by this company. A decided innovation in printing pictures of rubber footwear is the showing of the rubber overshoe in full black, while the exposed portion of the shoe is printed in a soft gray half-tone effect, making a striking illustration. Beside the regular line of rubber boots and shoes several specialties are shown, one being a rubber boot of heavy gum with leather sole quilted with hob-nails. There are also boots with red soles and boots entirely of red gum. A list of the new pressure-cured goods in gray finish is illustrated, and also a large list of outing shoes in white, gray, tan and blue canvas with self-colored or contrasting rubber soles. The book contains other information of interest to dealers in this brand of rubber footwear.

Link-belt machinery is fully described and pictured in a finely printed book published by the Link-Belt Co., Chicago, Illinois, in which are shown many fine half-tones of the lines of conveyors and elevators made by this company. Of special interest to the trade are the conveyor belts offered by this concern, which are rubber belts from three to ten ply, with an extra rubber cushion on the carrying side $1/16$ th of an inch in thickness. This cover or cushion is turned around the edges and vulcanized on the under side, and thus is less liable to crack or peel off than might be the case with belts where the rubber edges are molded on separately. There is much information of a general character for concerns handling coal, stone, gravel, sand or similar products.

W. G. Brown & Co., Cincinnati, Ohio, dealers in crude rubber, distribute monthly a picturesque little calendar, the one for March bearing a striking lithograph of two midnight visitors with burglarious intent arousing a sleeping couple. While, perhaps, the picture is not particularly appropriate to the business of the firm, the calendar is an attractive and convenient desk ornament.

Decreasing truck vibration is treated in a booklet issued by The B. F. Goodrich Co., Akron, Ohio, explaining the "De Luxe" and regular solid truck tires made by that company. Illustrations and diagrams, together with suitable

text, are intended to prove that these tires decrease truck vibration and tend to give more comfortable as well as much longer and more durable service than ordinary tires. The booklet, though a small one, is gotten out in very attractive form and reflects great credit on the advertising department of the Goodrich company.

The Kokomo Rubber Co., Kokomo, Indiana, is sending out to the trade a rather striking folder which shows a half-tone reproduction of the first automobile built in America and which was equipped with the first automobile tires made in America or in any other country. The folder is devoted to advertising the Kokomo Gridiron Non-Skid and the Kokomo Smooth Tread tires, both of which are pictured and explained. In a corner of the folder is a form which can be detached, then becoming a post-card directed to the company, which needs only the signature and address of the sender to receive further information regarding these tires.

A very attractive piece of advertising comes from the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, it being a folder bearing the question: "Who Wears Rubber Footwear?" and answering that question by showing about 30 pictures of people in various walks and rides of life wearing rubbers. The vacuum process of vulcanizing is explained with a cut showing a hand holding a piece of the pressure cure soling and another piece vulcanized by the old method, thus contrasting strongly the difference between the two. The folder is as attractive in its text as it is in its illustrations, and is one which will be given more attention than the average piece of circular mail matter.

Another folder gotten out by this company that is worthy of special mention is one showing a rolled edge lumberman's over, and one with a plain edge sole, but of red rubber. A fine looking young man is represented as showing the differences between these two, being photographed in various positions, the accompanying argument being that as each has the same amount of rubber in the sole, the plain edge sole necessarily has more wear where the wear comes than if a portion of the material was surrounding the upper. Some argument regarding the vacuum vulcanization is also given. The circular is attractively displayed in three colors of ink, and is a worthy companion of the previously mentioned one.

The Raw Products Co., New York City, is sending out to its customers a very comprehensive sheet giving the india rubber statistics for the year ending December 31, 1915, which shows the United States imports and stocks on hand of the various kinds each month in the year, the same facts regarding England, and the monthly quotations, the arrivals at Para, stocks at Para and Manaos and the plantation production. There is also a diagram showing the fluctuations of fine and coarse Para and of First latex crêpe for 1913, 1914 and 1915. It will make a very convenient and comprehensive document for ready reference.

Owing to the seizure by the British Government of many of the motor vehicles for war purposes, there has been a remarkable increase in the importation of American trucks and other commercial vehicles. As the tires for these are measured in inches, while tires made upon the continent or in Great Britain are almost invariably given in metrical measurements, The B. F. Goodrich Co., Limited, London, England, has issued a booklet entitled "Goodrich Solid Rubber Band Tyres. Inch Sizes for American Vehicles." Besides a general description, with half-tone illustrations and diagrams, it gives in tabulated form the size in inches, the diameter over permanent steel band, maximum load for tire, price, and code word for facili-

tating ordering. There is also included considerable information regarding the care and abuse of solid tires and some hints regarding alignment, with simple means for testing, this being illustrated by diagrams. The book also contains the guarantee which the company furnishes with each sale of its solid tires.

* * *

"Rubber Facts and Figures" is the title of a compact little book of about 140 pages published at somewhat irregular intervals by Frederic C. Mathieson & Sons, London, England. Number 13, bearing date of February, 1916, is at hand. While small enough to go in the pocket, a vast amount of information has been crowded into it regarding rubber planting corporations in the Far East, telling the authorized capital, highest and lowest prices and number of shares, number of acres planted in rubber, dividends paid, etc. The increases in the outputs month by month during the past two years are given in tabulated form. The number of forward sales announced for 1915 and 1916 is also given. In fact, the book is one which will be found of use as a ready reference by all interested in plantation rubber, either as consumers or investors.

DETERMINATION OF BARIUM SALTS IN VULCANIZED RUBBER GOODS.

SPECIFICATIONS for purchasing rubber goods frequently permit the use of barytes (barium sulphate) as a mineral filler without having the sulphur which it contains count as part of the specified total sulphur. In such cases, in order to properly correct the total sulphur, the barium sulphate must be determined. The Bureau of Standards, of the Department of Commerce, has recently completed a careful study of the question and has just published the results in "Technologic Paper No. 64."

When barium sulphate only is used, the amount present is readily ascertained by determining the total amount of barium present. If barium carbonate is used, it is necessary to separate the two salts. By means of tests made on compounds of known composition prepared at the Bureau of Standards, a method has been devised which permits the quantitative determination of barium carbonate in the presence of either lead sulphate or barium sulphate, the two sulphates most commonly used in rubber goods. The accuracy of the determination is satisfactory for all practical purposes. This method of analysis for barium carbonate, which is the work of John B. Tuttle, is as follows:

One gram of the rubber is ignited in a porcelain boat in carbon dioxide, the residue finely ground in an agate mortar, transferred to a 250 cc. beaker, and treated with 5 to 10 grams ammonium carbonate, 15 to 20 cc. of strong ammonia water, and about 50 cc. of distilled water. The mixture is boiled for 15 to 30 minutes, filtered and the precipitate thoroughly washed to remove all soluble sulphates. The residue on the filter paper is washed back into the original beaker with distilled water. About 10 cc. of glacial acetic acid and sufficient water is added to make the total volume of the solution about 100 cc. By this procedure lead, barium, calcium and zinc carbonates pass into solution, while barium sulphate and lead sulphide are not attacked.

Hydrogen sulphide is passed into the filtrate, the lead sulphide filtered off, the filtrate heated on the steam bath, and 10 cc. of 10 per cent sulphuric acid added. The following day the precipitate is filtered, ignited, cooled and weighed.

The final step is to determine the total barium in the rubber compound, as barium sulphate, by the method for determination of barytes used at the Bureau of Standards [THE INDIA RUBBER WORLD, December, 1914, page 128.] Barium carbonate is determined in a separate sample by Mr. Tuttle's method, just described, and an equivalent amount of barium sulphate is deducted from the total barium sulphate. The sulphur in the remaining portion of barium sulphate is calculated, and the total sulphur determination corrected by this amount.

RUBBER TRADE INQUIRIES.

[155.] A correspondent seeks an American manufacturer who can furnish 5,000 valves for bicycle inner tubes, to be shipped from America to Singapore.

[156.] An inquirer desires to be placed in touch with a manufacturer of waxed paper, such as is used in wrapping inner tubes.

[157.] We are in receipt of an inquiry for Pontianak refining concerns.

[158.] An inquiry has been received for the name of a manufacturer of flexible rubber curry combs.

[159.] A correspondent wishes to be placed in touch with American firms who can supply crude rubber stock (washed, compounded and rolled into sheets but not cured) for use in the manufacture of about 15,000 inner tubes for automobiles.

[160.] The name of a company making and selling the hard rubber clincher bead which is the center of the bead used in making tires is desired.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Representation for American manufacturers of rubber goods is desired by a man in Argentina. Report No. 20,291.

* * *

A Portuguese firm, which exports rubber, desires to secure an import agent in New York City. This firm also wishes to represent American exporters of goods for Portuguese African colonies. Report No. 20,295.

* * *

Quotations from American manufacturers of jinrikisha tires are solicited by a firm in China using about 6,000 tires annually. Report No. 20,329.

* * *

A Norwegian firm would like samples and quotations f. o. b. New York on rubbers and arctics. Report No. 20,352.

* * *

A man in Italy wishes to purchase American jam jars and bottles for preserves or fruits, with tin lids and rubber rings. Report No. 20,369.

* * *

A Canadian firm would like to be placed in touch with American manufacturers and exporters of rubber window cleaners. Report No. 20,412.

* * *

Vulcanized fiber and other insulating materials are desired by a firm in England. Report No. 20,435.

* * *

A traveling agent in Norway desires to receive samples, catalogs, quotations, etc., from American manufacturers of rain-coats for both men and women. Report No. 20,448.

DRAWBACK FOR RUBBERIZED AUTO-TOP CLOTH.

The exportation of auto-top cloth has reached such proportions, due to war requirements, that the Treasury Department has prepared drawback regulations to meet the situation. As in the case of other classes of drawbacks, manufacturers are required to keep a detailed record of all data necessary for government agents to base a decision as to whether a drawback accrues or not. It is specified that the allowance shall not exceed the quantity of imported cloth used in the manufacture of the exported auto-top cloth, as shown by the abstract from the manufacturing record, the allowance to be reduced according to the quantity of imported cloth which the value of the waste, if any, will replace. The American Rubber Co. and the Stoughton Rubber Co. have been authorized to receive drawback under these regulations.

New Goods and Specialties.

THE DEAN NON-LOSABLE STOPPER.

THE stopper of a hot water bottle is always getting lost or misplaced just when the family comforter is most needed.

A stopper that is always on the job; that cannot be lost; that does not depend on a chain or exterior attachment, would be a boon indeed, and such apparently is the device described and illustrated as follows:

The inventor has reversed the principle of the old arrangement by placing the stopper inside the bottle instead of outside. A wire handle serves to operate the stopper. To open the bottle simply unscrew and push the stopper down far enough to allow free passage of the water either in filling or emptying. To close the bottle, just pull up on the handle and screw the stopper in place, the rubber washer making a water-tight joint when forced against the upper part of the outer metal socket. This device can be attached to a hand-made bottle as well as a molded bottle with a wide neck. [H. D. Dean, Boston, Massachusetts.]

SOFT-LITE HEADLIGHT DIMMER

The laws of many states compel the use of automobile headlight dimmers to reduce the glare that is confusing and dangerous. The device we are now describing is made of a single disk of frosted pyralin that diffuses and effectively eliminates the glare of the headlight, yet illuminates the roadway fully 100 feet in advance of the car.

The quick, easy and secure method of attaching this dimmer is a feature that will be appreciated by the motorist. It is held securely in place on the inside of the headlight glass by a single vacuum cup of soft rubber. [The Harry H. Reynolds Co., 1326 Michigan avenue, Chicago, Illinois.]

RUBBER COVERED TIRE INFLATOR VALVE.

Garage men who have been annoyed by the carelessness of patrons, who, after inflating tires at their free air station, have neglected to shut off the flow of air, will welcome the new Schrader automatic inflating valve, which has just been put on the market, and which prevents any waste, either before, during or after inflation. The valve is covered with rubber for protection.

This device, which can be furnished with connections suitable for different sized hose, from 1/4 to 5/8-inch diameter, fits into the tubing of the garage air line, and permits the egress of air only when it is applied to the valve of the tire to be inflated. All that is necessary is to hold the inflating valve's nozzle against the tire valve. This opens the valve check in the angle valve, and allows the air

to come from the rubber tubing into the tire. Immediately the pressure on the tire valve is removed, the valve in the hose automatically closes, and the air pressure remains in the tank. [A. Schrader's Son, Inc., New York City.]

LIGHT SPORTING BOOTS.

Many sportsmen would wear rubber wading boots were it not that they are so heavy and clumsy as to be uncomfortable when not actually required for going through the water. An improved, light-weight, storm king style sporting boot named "The Angler" is now manufactured, which can be worn over the leather shoe, and which, when not in use, is so light and flexible that it can be rolled up into a small enough package to be carried in the coat pocket. The advantage of such a boot is obvious without further comment. This particular boot is made of pure gum, is fusion lined and has an elastic top, thus fitting tightly around the leg. [Canadian Consolidated Rubber Co., Limited, Montreal, Canada.]

A HANDY RUBBER STAMP.

The pencil cap here reproduced, actual size, is designed for use as a convenient rubber stamp for marking initials on cloth, paper, or articles of any kind. The desired initials are cemented on the plain, broadened base of the rubber cap, which fits easily and securely over the end of the pencil. In clerical work the advantage in the lessening of time and energy consuming motions can readily be seen, as the user does not have to put down his pencil to pick up a rubber stamp, but simply turns the pencil about and applies the stamping end. [The William Stern Manufacturing Co., Chicago, Illinois.]

Actual Size

PNEUMATIC REVERSIBLE LANDING MAT.

When a fire call is received at an engine house, stairs are too slow a method for the firemen in the upper story to gain the main floor. The vertical sliding pole gives the desired speed. The necessity of a landing mat that will minimize the shock of contact with the floor can readily be seen, and rubber mats are invariably used for this purpose. But in order to afford the proper yield and recovery the mat here shown has been specially constructed. It is claimed that a perfect pneumatic mat is thus secured, offering a soft, safe and durable landing at the base of the sliding pole. Each of the tubes supporting the wearing surface of the mat has a vent into the main air chamber, which is also provided with one or more vents

in the side wall. This permits a uniform escape of air which gives an even yield and recovery. Both sides of this mat are alike, so that it may be reversed and thus give double service. [Bowers Rubber Works, San Francisco, California.]

STAIR TREAD WITH RUBBER STUDS.

In the stair tread here illustrated, interchangeable studs, molded of tough, dark grey rubber, in a new design, fit into the grey-white, non-corrosive, cast metal plate which forms the body of the tread.

The studs are easily fitted by simply screwing down and are arranged in lateral rows, facilitating the operation of cleaning or sweeping. When the center studs are worn down, and this it is claimed does not occur until after considerable usage, it is a simple matter to rearrange them by the use of a screw-driver. When the treads are fastened on the stair an empty space is left behind the rear edge which may be filled with rubber matting, if desired. [The Reliance Rubber & Harwood Co., London, England.]

THE "TESTOID" RADIATOR HOSE.

In the radiator hose here illustrated the manufacturer claims to have secured a motor hose that will not harden, soften, crack or collapse, or be in any way affected by the heat generated from the motor. It is also guaranteed to withstand the action of oil, hot or cold water, and anti-freezing solutions. The cover is black, and the tube, cover and friction are all thoroughly tested compounds. The hose is furnished in either two-ply or three-ply duck, with plain or capped ends, or capped ends beveled; also with enlarged or tapered end, if desired. A similar variety of hose, called the "Thermoid," has a white cover.

The hose is packed according to a new system which is said to find favor with dealers. Six pieces, three feet long, each piece of a different diameter, or all of the same diameter, are packed in a box. The six largest selling sizes of hose are $\frac{1}{4}$, $\frac{1}{2}$, $\frac{3}{4}$, $1\frac{1}{4}$, 2 and $2\frac{1}{2}$ inches, respectively, these sizes making a convenient assortment for a box. [Thermoid Rubber Co., Trenton, New Jersey.]

THE "ROYAL" SPARK-PLUG TESTER.

The "Royal" tester for spark plugs on automobiles, motorboats, motorcycles, etc., consists of a crotch containing the spark gap and two legs containing the terminals. One leg is three inches longer than the other, facilitating contact. The tester will show the regular spark when the plug is good, and if it is short-circuited there will be no spark. An irregular spark will indicate defective porcelain; a clear spark, lack of power in the motor. This convenient accessory is covered with hard rubber. [Pittsburgh Electric Specialties Co., Pittsburgh, Pennsylvania.]

GEAR GUIDE-MAT.

Owing to the number of different gear positions on different cars, the unaccustomed driver frequently has difficulty in finding the right gear. In a 1916 model car all doubt and hesitancy is eliminated by the simple expedient of marking the gear positions in large, clear letters on the rubber mat in the driver's compartment, as shown in the accompanying illustration. [Grant Motor Co., Findlay, Ohio.]

A FLEXIBLE RADIATOR SUPPORT.

A novel feature of the Menominee truck is the radiator support, which forms a flexible joint between the chassis and radiator. A hollow rubber ball encased in each connection,

guards the radiator against road shocks, vibration and all warping stresses. The device is protected against dirt and grit, and the brackets carrying the head lamps are also supported on this pneumatic shock absorber. [D. F. Poynter Co., Menominee, Michigan.]

THE TURNER AVIAPHONE.

Noiseless flying machines have still to be invented. The propeller and motor of flying craft, in its present state, create so much noise that a pilot and passenger cannot hear each other

speak. This difficulty has finally been overcome by the invention and perfection of an instrument called the "Turner Aviaphone." A rubber face mask with an aluminum mouthpiece, connecting with the breastplate transmitter by means of a hard rubber tube, is used only during conversation. There are two helmets, or caps, two specially wound receivers for each user, connecting cords, battery, plugs and jacks; the entire outfit weighing only 5 pounds

5 ounces. Caps, as shown in the illustration, are furnished but the receivers can be adjusted to any type or size of headgear. This instrument is of especial value to army and navy aviation corps, as it leaves the hands entirely free. [General Acoustic Co., New York City.]

BATHING COSTUME NOVELTIES.

RUBBER accessories for the bathing costume have grown more numerous every year, and also more attractive. The innovations of this season far surpass those of former years in utilization of this product for combined ornamental and practical purposes.

The first illustration shows a charming costume for the trip to and from hotel or bathing house, conforming to the regulations of some seaside resorts requiring that the bathing suit be covered. The smock worn over the bathing suit is made entirely of rubber, in a pleasing

shade of light blue with a white collar. The smocking on the front, back and sleeves is accomplished by clever cementation of the rubber instead of sewing.

With this highly becoming yet utilitarian garment is worn a "Chin-Chin" hat in black and white, the under part forming a skull cap, which affords adequate protection for the hair.

In the Spanish costume shown in the second sketch a novel style in bathing suits is inaugurated. It is intended to be worn over an Annette Kellerman suit, and comprises a one-piece rubber tunic in a clear, light red, with black

rubber fringe trimming. The coquettish swathed turban is also in red with black fringe.

The sash worn in the form of a knotted girdle with tasseled ends, and the Tam O' Shanter cap in the third illustration are made of black and white striped rubber and are striking adjuncts to the bathing costume. Within the Tam O' Shanter and cemented at the edges is a skull cap of gold-colored rubber, which fits snugly over the hair.

Still another novelty is a hat-brim of rubber, the inner edge encircled with rubber flowers, that can be placed over the skull cap as a protection from sunburn when not in the water. [L. C. Studios, New York City.]

BATHING SUIT CASE.

Department stores are showing this very presentable case for carrying a wet bathing suit. It is made of black satcen, fitted with a separate rubber lining. It has snap fastenings, and is tastefully decorated with an embroidered flower motif in varying shades of pink, with green stems.

S. S. WHITE BUFF RUBBER DAM.

The rich cream or buff color of this improved rubber dam for dental use helps to light the oral orifice. It is claimed that the texture is exceptionally elastic, strong and durable and that when placed around the tooth which is to be operated upon, it clings closely, excluding all moisture and keeping the cavity in the absolutely dry condition necessary for successful filling. The dam is highly useful in abdominal operations where the surgeon makes his incision through the rubber into the tissue. There is no risk of injurious contamination through direct contact of the dam with the body secretions. It is recommended for the following uses in surgery: As surgical sheeting, in oral dental surgery, in abdominal surgery, for abdominal dressings, for surgical bandages and pressure bandages, for moist dressings or Priestness dressings; or it may be cut in small strips and used for ligaturing, as it is strong enough to allow any pressure that may be desired. This dam is made in rolls of two widths, five and six inches, and two thicknesses—thin and medium. [The S. S. White Dental Manufacturing Co., Philadelphia, Pennsylvania.]

THE "KLEENWAY" AUTO BRUSH.

Washing an automobile with an ordinary sponge and water bucket is a tiresome and unpleasant operation. In the "Kleenway" auto brush, here illustrated, a convenient and also more efficient method is afforded. Attached to five feet of rubber hose, with coupling for attaching to house hose, is a specially constructed brush containing a soap chamber of nickelled brass tubing. A brass two-way valve in the handle is operated by thumb pressure, giving suds or clear water, as desired, and the flow of clean suds or water through the brush automatically frees the bristles of grit, grease, etc. The bristles are rubberset, and therefore cannot fall out, and being of

Tampico fiber, will not scratch. The handle is of white wood. Any good automobile soap can be used with this brush; it is easy to operate, and, it is claimed, cleans the car in half the usual time, with much less than the customary consumption of soap. [The S. & E. Co., New York City.]

The Obituary Record.

A PIONEER RUBBER MANUFACTURER.

THEODORE H. VIDETO, who for more than 30 years was connected with various New England rubber manufacturing enterprises, died at his home in South Framingham, Massachusetts, at the age of 82 years. He was born in Wilmot, New Brunswick, February 23, 1834. At the age of 17, so proficient was he in the higher mathematics, Latin, Greek and the modern languages, that he was

THEODORE H. VIDETO.

given a professorship in a New Brunswick seminary. After teaching there for 10 years he came to the United States for further study. In 1879, however, he forsook scholastic life, and began manufacturing light-weight solarized rubber clothing. His first position was with the Globe, later the Readville Rubber Co., "gossamer" rubber proofer. At this time all of these goods were plain black surfaced. Soon English rubber men began to send in beautiful silvered "electric" garments, the effects gained by surfacing with potato starch. In attempting to imitate this, an American company, the Solarized Rubber Co., brought out garments in checks and stripes, but lost money and gave up the business. Mr. Videto, however, after much experimenting, evolved a cheap and simple process for producing what was known as the "India stripe." In 1886 he secured the assistance of L. D. Apsley, who was then operating the Goodyear Gossamer Co. at Hudson, Massachusetts, and entered his employ. Later he went to South Framingham with the Gossamer Rubber Co., where his son was employed as superintendent. Upon the death of Ira M. Conant, the founder of the business, he left and took an advisory position with the Conant Rubber Co. The "gossamer" garments once sold by the million, were, however, being rapidly displaced by light-weight calendered, vulcanized goods, and in time the Conant Rubber Co. went out of business.

Mr. Videto did not seek another engagement, but devoted the remainder of his life to study and public work.

For nine years he served as chairman of the Framingham school committee, and was chairman of the town's committee having charge of the construction of its new high school. He was a member of the board of trade, and of the town's committee on the separation of street and railroad crossings.

Mr. Videto was for many years a deacon of the First Baptist Church, Hyde Park, and was also deacon and clerk of the Park Street Baptist Church of Framingham. He was chaplain of Alpha Lodge of Masons, and belonged to Concord Royal Arch Chapter of Framingham. As a Knight Templar he was affiliated with the Natick Commandery. He was a charter member and past commander of Cyprus Commandery, Knights of Malta.

He married in 1857 Rebecca Homan Dodge, of Charleston, daughter of John and Sarah (Pedrick) Dodge. Four children survive, John F. Videto, Mount Vernon, New York; Nathaniel

E. Videto, Mrs. William Johnson, Framingham, Massachusetts, and Theodore E. Videto, Montreal, Canada.

MELVILLE HAZEN BARKER.

Melville Hazen Barker, general manager of the American Tool & Machine Co., Boston, Massachusetts, died on March 9 at his home in Dorchester, Massachusetts, after a short illness, of pneumonia. Mr. Barker was born in Bridgton, Maine, but when only three years old was taken West by his family, his early education being in the public schools of Chicago, after which he took an architectural course at the Wisconsin State University. Later he removed to Lawrence, Massachusetts, and became connected with the repair department of the Everett Mills, afterwards going into retail business. His store being burned out, he went to the repair department of the Atlantic Cotton Mills. In 1874 he became connected with the American Tool & Machine Co. and 20 years later became general manager, the position which he held at the time of his death. Mr. Barker was a charter member of the National Metal Trades Association and its president in 1907. He was a member of the Massachusetts Charitable Mechanics' Association, the City Club, Engineers' Club and Art Club, of Boston, and the Engineers' and Machinery Clubs of New York; also a Mason, an Odd Fellow and a Knight of Honor. He is survived by a wife and two children.

EDWIN R. HALL.

Edwin R. Hall, chief experimental engineer of the Goodyear Tire & Rubber Co., Akron, Ohio, died of pneumonia at Mt. Clemens, Michigan, March 17, where he had been taking treatments for rheumatism. Mr. Hall was born in Somerville, Massachusetts, in 1885, and educated in the grammar and

EDWIN R. HALL.

high schools of that city and at the Institute of Technology, from which institution he graduated as mechanical engineer in 1908, going directly to Akron to the Goodyear company in its experimental department, which he has seen develop from a one-man bureau to a department employing 125 men. He was very active in the Society of Automobile Engineers and the Clincher Automobile Tire Manufacturers' Association.

In the former organization he served on several committees and contributed a number of important papers, and at the time of his death was a member of the council of the Society and chairman of the Standards Committee. In the Clincher Automobile Tire Manufacturers' Association he was chairman of the Engineers Committee, and the present excellent condition of inspection, and satisfactory rims for

pneumatic tires in this country, is due largely to Mr. Hall's efforts. He was also a member of the University Club of Akron and of several Masonic bodies. Mr. Hall was acknowledged a man of keen perception in matters relating to mechanics and engineering practices, and his judgment along these lines was greatly respected. He is survived by a wife and two daughters.

JOHN HOPEWELL.

As we go to press word comes of the sudden death of John Hopewell in Washington, D. C., at the age of 71 years. Mr. Hopewell was one of the leaders in the industrial and financial circles of New England.

JOHN HOPEWELL.

He was born in Greenfield, Massachusetts, but spent his boyhood days at Shelburne Falls, removing to Springfield at the age of 21 and working on munitions at the armory there. A few years later he associated himself with the important firm of L. C. Chase & Co., Boston, Massachusetts, and five years later became a member of the firm, of which he was the senior member at the time of his death. He was formerly president of the Reading Rubber Manufacturing Co., Reading, Massachusetts, a director of the Sanford Mills, Sanford, Maine, a director of the First National Bank, Boston, and was connected with scores of other important corporations. He was a member of the Algonquin Club, the Boston Art Club, the Merchants' Club, the Boston Merchants' Association, the Boston Chamber of Commerce, the Boston Athletic Association, the Hunnewell, the Newton and the Brae-Burn Clubs. He also was a Mason. He was an active, public-spirited, shrewd man of affairs, and had a remarkably wide acquaintance with the leaders in American business. He leaves a widow, two daughters and three sons, one of whom, Frank B. Hopewell, is actively engaged in the L. C. Chase Co. and the Reading Manufacturing Co.

BENJAMIN L. ANDREWS.

Benjamin L. Andrews passed away Sunday, March 5, at his home in Beverly, Massachusetts, after an illness of several months' duration. Mr. Andrews was born at Essex, Massachusetts, on March 6, 1854. His first experience in rubber trade was with the Clifton Manufacturing Co., with which he worked for a short time as salesman for garments, but in 1894, desiring to enlarge his line, added some samples from the Globe Rubber Works of Boston, under a commission arrangement, and the next year he became the regular New England salesman for the Globe Rubber Works, which position he has held up to his death.

He was methodical in his habits, careful in his business dealings and anxious at all times to give service and satisfaction to his customers, all of whom he numbered among his personal friends. To many of them he was familiarly known as "Doctor." He was a member of Liberty lodge of

Masons, Amity chapter of Royal Arch Masons, St. George's commandery, Knights Templars; Alepco temple, Mystic shrine; Bass River lodge of Odd Fellows and the Beverly Republican Club. He leaves a widow and one son.

ROBERT P. PARKER.

Robert P. Parker, who for several years was prominent in the bicycle business and for nine years in the employ of the Hartford Rubber Works Co. at Hartford, Connecticut, his home town, becoming sales manager and, later, New York branch manager for that company, died, aged 45 years, at his home in Pittsfield, Massachusetts, March 10. After leaving the rubber industry he removed to the latter mentioned city where he became prominent in insurance, real estate and building lines. He is survived by a wife and three children.

THOMAS KING.

Thomas King, who died recently at the New York Post Graduate Hospital, following an operation, was a veteran employee of the New York Belting & Packing Co. at its factory in Passaic, New Jersey. He was born in Norfolk, Virginia, in 1842, and during the Civil War was a member of the Ninth Virginia Cavalry. Coming north, after the war, he worked in the calendar room of The Okonite Co., but for over 25 years has been with the first mentioned concern. He is survived by a widow and two sons, James and William E. King, both of whom are employed by the New York Belting & Packing Co. in its Passaic plant.

JAMES E. BAXTER

James E. Baxter, of the firm of J. E. Baxter & Co., Limited, rubber manufacturers, Leyland, England, died early in February, at his home at Farington, near Preston, Lancaster, England, at the age of 54 years.

Mr. Baxter's connection with the rubber industry began in 1874 with the old firm of Jos. E. Quinn & Co., of Leyland, which, through successive amalgamations, became the Leyland & Birmingham Rubber Co., Limited, with Mr. Baxter as chairman. After about 12 years in this capacity he resigned

JAMES EDGAR BAXTER.

in order to establish the concern of J. E. Baxter & Co., Limited, Leyland.

Mr. Baxter was a keen sportsman, and one of the first motor car owners in England. About 14 years ago he took his car to South Africa, making a business tour and paying special attention to the rubber requirements of the gold-mining firms there. It is believed that this arduous trip somewhat affected his health, and possibly may have had something to do with his final illness. He was chairman of the Rubber Manufacturers' Association, Manchester, in 1901-1902, and was one of the first rubber manufacturers to take a practical interest in planting rubber in the East, at one time acting as a trustee of the Manchester & North Borneo Rubber Co.

DECEASED RUBBER JOURNALISTS.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

We have read with appreciation your sketch of the late E. Uke, whose death is a loss to the whole scientific world. In connection with it we have the impulse to mention other distinguished men connected with the "Tropenpflanzer," who have passed away within the twelvemonth. For example there was

RUDOLPH ENDLICH

one of the oldest of the "Tropenpflanzer's" contributors, who died in Ghent, Belgium, of appendicitis, while connected with the commissary department of the German army.

Mr. Endlich traveled extensively in Brazil, Paraguay and Argentina, and added to the botanic museum of Berlin a rich collection of exotic plants. His most notable contributions to the "Tropenpflanzer" were: "The Present Condition and the Future of the Guayule Industry" and "The Euphorbia Elastica—A New Rubber Tree."

As plantation manager for the Kilimandjaro Plantation Co. he spent three years in German East Africa, where he laid out a large *Munhot* rubber plantation.

KARL SUPF.

Founder and manager of the "Tropenpflanzer," who died on January 27, 1915, at the age of 59, was born in Nuremberg October 8, 1855, and came to Berlin in 1892. He founded the Colonial Commercial Committee, which resulted in 1914 in an organization composed of German princes, scientific institutes, chambers of commerce and of agriculture, colonial and commercial corporations, workmen's unions, missions, etc., all with headquarters in Berlin and branches in German East Africa; an organization of not less than 1,100 commercial, industrial and scientific institutes, corporations and firms.

In 1906 he was prominent in the establishment of the "cotton commission," and just previous to the war he did the largest part in organizing the production of this most important raw material in the German colonies.

Furthermore, there was

FRANTZ MATTHIEN

general secretary of the German Colonial Commercial Committee and editor of the "Tropenpflanzer."

At the beginning of the war he was sent to Königsberg, and then to the frontier as officer of a reserve regiment. He was badly wounded in the chest and legs, and after receiving the Iron Cross died from his wounds in the hospital at Insternburg. He was born in Sallion (near Metz) June 5, 1878, and passed his youth in different parts of the annexed provinces where his father was called by his profession. He graduated in Metz and entered the Kommerz und Diskonto-Bank, Hamburg. After his military service he did not return to banking, but took up botanical work. After graduating as Doctor in Botany (Munich), he obtained employment with the Colonial Committee and later became editor of the "Tropenpflanzer."

ANALYSIS OF POWER COSTS.

The following letter, of interest to manufacturers, has been sent to THE INDIA RUBBER WORLD by a superintendent whose wide experience in rubber factories renders his expression worthy of consideration:

TO THE EDITOR OF THE INDIA RUBBER WORLD:

Every rubber factory, to successfully compete and not suffer by competition, requires a cost system which will take actual manufacturing costs with promptness and with accuracy. Cost finding is really a very simple matter if one will take the trouble to prepare a system to meet the special factory requirements and then see that the system is kept up.

Most people understand in a general way how to figure the cost of a job that consists principally of labor and material. They may, however, consider the problem difficult when the cost of power and machine time predominates over the wages of hand labor. From the case described below, it will be seen that when the method is once really understood, this problem resolves itself into a very simple matter.

For an example, let us take the milling and mixing of rubber. Making no attempt to give details, I submit the following practical description of the method that is in actual use.

Each purchase of material is manufactured as a separate lot and is so entered in the general as well as the stock ledger account. When entered for manufacture, each job is identified by a separate production number, and all materials and labor used on it are reported on stock requisition slips, or time slips.

All power costs, inclusive of fuel, repairs, depreciation, wages of foremen and engineers, are determined on a monthly basis. The total factory horse-power is divided into separate horse-power units and each power division is assigned an hourly rate in ratio to the total horse-power. It is thus possible to charge each production order with the cost of power employed. At the end of the month the totals of these power charges are checked by the actual power costs. This method is applicable only where it is possible to charge each job as a separate unit.

In the case of a process where it is impracticable to determine the power cost for any particular job, because several are in the works at the same time, the power item, together with superintendence and cost of cleaning machines and surroundings between jobs, are combined into a monthly total. The ratio which this sum bears to the monthly total of productive labor determines the proper amount to charge each job for power cost, according to its share of productive labor.

The foregoing essentials furnish the basis for a monthly statement of profit and loss which can be prepared without taking a physical inventory. In a well-ordered factory these figures for one month should be ready early the next month.

Efficiency is the keynote of present-day industry, and there can be no efficiency without organization. It is the work of the accountant to devise accurate and adequate systems of accounting which will automatically show leakages and fluctuations, thus organizing a business to indicate where costs may be decreased and efficiency increased. The day when a manufacturer can reasonably risk selling on "cost guesses" is over. A knowledge of production costs is absolutely necessary if dividends and surplus are to be maintained.

Under the ordinary plan of accounting, a physical inventory is taken once a year, the books are closed and profit or loss determined. The accuracy of the result is largely based on the correctness of the inventory. This brings about a condition of uncertainty and often exhibits results which come too late for remedy.

An adequate system of cost accounts, free from "red tape" and dealing only with essentials, is the only kind worth consideration. It should harmonize with the general records and provide a perpetual inventory with a statement of profit and loss rendered monthly. Price making by such a system is safe and intelligent. Losses are detected and eliminated, and profit substituted.

KARL SUPF.

The Annual Report of the United States Rubber Co.

THE annual report of President Samuel P. Colt, of the United States Rubber Co., was mailed to the stockholders early this month and shows a most satisfactory condition in the affairs of the company.

Among the interesting features may be noted the increased business of the company and the profits thereon. The net sales during 1915 were more than \$92,000,000, an increase of more than \$9,000,000 over those of the previous year, and as the prices of goods were less than during 1914, the increased volume of goods sold was proportionately greater than is indicated by these figures.

Regarding the net profits of the company, the figures for 1915 were over \$1,800,000 above those of 1914, a most excellent showing. Dividends were paid in full on the preferred stock, and one dividend, amounting to 1½ per cent, was paid upon the common stock.

As was decided the previous year, all export activities were brought under one department, and this move has proven advantageous, the export business during the year amounting to approximately 5 per cent of all the business done.

All will be interested in the note in Colonel Colt's report regarding preparedness. This shows that the company is among the foremost in fostering the movement to place this nation upon a proper basis to meet any international emergency.

It will be noted that the principal factory which is devoted to tires, has been doubled in capacity, while other plants have been enlarged and all are being operated to full capacity.

Last September the directors voted that the stockholders should be furnished hereafter with semi-annual instead of annual reports and, therefore, another report will be issued as of June 30.

The list of directors has been increased to 18 by the election of Edgar B. Davis, Brockton, Massachusetts, who, it will be remembered, was vice-president in charge of the General Rubber Co.'s plantations in Sumatra, and who has traveled extensively over the Malay Peninsula and adjacent territory. Mr. Davis is an authority on rubber planting and is a distinct acquisition to the directorate of the company.

President Colt's report is as follows:

To the Stockholders of the United States Rubber Co.:

In conformity with the by-law which provides that the president "shall make a report in writing to the stockholders at their annual meeting, reviewing the general business and condition of the company," your president submits the following as such report for the year 1915:

The treasurer's report, appended hereto, which is made a part hereof, gives the consolidated general balance sheet as of December 31, 1915, and the consolidated income statement for the year ended December 31, 1915, of the United States Rubber Co. and all its subsidiary companies.

FINANCIAL POSITION OF THE COMPANY.

As a proper safeguard and in view of the floating indebtedness of the company, the policy has been continued of carrying a substantial amount of cash.

During the past year the bonded indebtedness of the company has been modified as follows: Nine million dollars of debenture bonds of the General Rubber Co. (our crude rubber company), which fell due July 1, 1915, were paid by the issue of \$9,000,000 of 5 per cent debenture bonds of the same company, maturing December 1, 1918. Two and one-half million dollars of 5 per cent debenture bonds of the Canadian Consolidated Rubber Co., Limited (whose stock is largely owned by us), maturing December 1, 1918, were issued and sold, and three million dollars of an issue of five million dollars of 5 per cent debenture bonds of Morgan & Wright (our largest tire manufacturing company), maturing December 1, 1918, were sold—the proceeds of the two latter issues being used in reduction of the floating debts and for extensions of the plants of those companies.

The object of having these obligations mature December 1, 1918—that being the date of the maturity of our collateral trust 6's, which through sinking fund will then be reduced to \$15,000,000—is that then we may issue one class of security for such amount and on such time as then may seem desirable for the retirement of all these obligations.

VOLUME OF BUSINESS.

The net sales of the company for the year 1915 were \$92,861,015.98, as against \$83,678,812.05 the previous year, or an increase of about \$9,000,000. As the average selling price of rubber goods was less in 1915 than in 1914, the increase in volume of goods sold was proportionately greater than the increase in cash received therefor.

PROFITS AND DIVIDENDS.

The net profits from the business of the year, before deducting interest charges, amounted to \$11,486,704.53; after deducting interest charges the profits were \$8,696,089.15. These profits, if applied in full to dividends, would cover the dividends upon the preferred stocks, and leave a sum equivalent to about ten per cent upon the common stock. Full dividends upon the preferred stocks for the year were paid, and one and one-half per cent was paid upon the common stock in April, 1915. Any further application of profits to dividends under existing conditions would be most unwise and against the permanent interests of all our stockholders.

Indeed, notwithstanding that the earnings of the year have proved to be better than in last July they promised to be, the wisdom of the decision of your directors then made to suspend dividends upon the common stock has been fully justified. Owing to the European war many uncertainties have been created and still exist, notably the uncertainty as to the price of crude rubber and the hazards affecting its transportation to this country. In consequence of prevailing conditions, we have felt it incumbent to purchase a much larger stock of crude rubber than would be necessary in ordinary times, and this alone necessitates the employment of larger quick capital. Moreover, it is most desirable, in connection with the funding of our debt December 1, 1918, that we should continue to strengthen the financial position of the company.

DEPRECIATION.

In addition to maintaining the fixed properties of the company in the highest state of efficiency, and charging the cost of such maintenance to expense account, as heretofore, your directors have deemed it wise to apply to the reduction of certain fixed properties, \$2,000,000 of the \$7,000,000 reserved for depreciation, and have further charged \$1,175,479.62 against income on items existing prior to 1915.

BASIS OF INVENTORIES.

Following our usual practice, inventories of manufactured goods and materials have been taken at cost where cost was below market, and at market where market was below cost. Market value of crude rubber and other materials inventoried December 31, 1915, exceeded cost by a substantial amount.

UNITED STATES RUBBER EXPORT CO., LIMITED.

As stated in the report of last year, our export business has been largely consolidated under one organization, and is being satisfactorily expanded under the management of the able men in charge thereof. Our export business the past year has been approximately 5 per cent of our entire business.

UNITED STATES TIRE CO.

The organization of the United States Tire Co., under which we transact our tire business, has been recently enlarged and strengthened. In addition to the distribution of tires through the fifty-one branches of the United States Tire Co., provision has been made for a very much wider distribution than heretofore through the many stores of the United States Rubber Co. The addition to our former brands of tires of the new "Royal Cord" tire and the new non-skid "Uco" tire gives us the most complete line of tires manufactured by any company. Our well known "Nobby Tread" and "Chain Tread" are still having a wide and increasing demand, and are acknowledged the best non-skid tires in the market. Our tire sales for January and February of this year show a very large increase over the same period last year.

OUR SUMATRA RUBBER PLANTATIONS.

We have continued the further development of our rubber

plantations in Sumatra during the past year. The amount of crude rubber received therefrom in 1915 was relatively small compared with our requirements, but was in excess of previously estimated production. From now on the increase in production of our Sumatra estates will be rapid as the great number of young trees arrive at the bearing age. I cannot speak too strongly of the efficiency and loyalty of those in charge of our plantations, and so far all their predictions of success have been more than borne out, and the outlook for the future is most flattering.

PREPAREDNESS.

Your directors believe that the unselfish efforts of every corporation are needed to achieve adequate preparedness in the United States, whether for peace or defense. Accordingly they have approved of our employees joining the National Guard, and have agreed to give them the necessary time for camp and other military duties without prejudice to their salaries or to their positions with the company. It is also believed that through the fostering of trade associations and the cooperation of such associations much may be accomplished in the direction of industrial mobilization, without which true preparedness is impossible. Finding that the Navy Department of the United States was in need of some research work in aeronautics, but was without an appropriation for carrying on the investigation, your company volunteered to do this work for the government. This was done, and has proven a useful and practical contribution to preparedness.

THE OUTLOOK FOR THE FUTURE.

At no time in the history of our company has there been greater activity in its business. All our factories are now being operated at full capacity, and steps for enlargement of certain plants and for increase of production are being taken, and the work pushed forward with all dispatch. One of the plants now in process of enlargement is the tire factory of Morgan & Wright at Detroit. This work is under way, and when completed will double the capacity of that plant. Since the beginning of the year a property adjoining that plant has been acquired to better carry out this enlargement.

SEMI-ANNUAL REPORTS.

In accordance with the action taken by the directors on September 16, 1915, the stockholders will be furnished hereafter with semi-annual reports, as of June 30 and December 31.

CONCLUSION.

It again gives me much pleasure to refer to the continued fidelity and ability shown by the officers, heads of departments and employees of the company and its subsidiaries.

TREASURER'S REPORT.

UNITED STATES RUBBER CO. AND SUBSIDIARY COMPANIES.

Consolidated General Balance Sheet, December 31, 1915.

Property, plant and investments, including rubber plantations	\$126,347,930.90
Inventories, manufactured goods and material	339,768,295.77
Cash	13,102,407.57
Notes and loans receivable	1,560,083.74
Accounts receivable	20,830,333.79
Securities, including stock of U. S. Rubber Co. held by subsidiary companies	2,272,430.99
Sinking fund cash in hands of trustees	476,251.32
Miscellaneous	2,300,809.32
	<u>80,203,512.50</u>
Total Assets	\$206,551,443.40

LIABILITIES.

Surplus, December 31, 1915	\$22,962,321.79

Respectfully submitted,

W. G. PARSONS, Treasurer.

ANNUAL ELECTION.

BOARD OF DIRECTORS FOR 1916.

The annual meeting of the stockholders of the company was held at New Brunswick, New Jersey, March 22, and the following directors were elected:

Walter S. Ballou, Providence, R. I.
 James C. Brady, New York City.
 Nicholas F. Brady, New York City.
 Middleton S. Burrill, New York City.
 Samuel P. Colt, Providence, R. I.
 Harry E. Converse, Boston, Mass.
 Edgar B. Davis, Brockton, Mass.
 James Deshler, New Brunswick, N. J.
 James B. Ford, New York City.
 Francis L. Hine, New York City.
 Henry L. Hotchkiss, New Haven, Conn.
 Lester Leland, Boston, Mass.
 Samuel M. Nicholson, Providence, R. I.
 Raymond B. Price, New York City.
 Homer E. Sawyer, New York City.
 William H. Truesdale, Greenwich, Conn.
 Theodore N. Vail, Boston, Mass.
 Elisha S. Williams, New York City.

OFFICERS.

At a meeting of the board of directors on March 23 the following officers were elected for the ensuing year:

Samuel P. Colt, president.
James B. Ford, vice-president.
Lester Leland, vice-president.
Raymond B. Price, vice-president (Development Department).
Homer E. Sawyer, vice-president (Footwear Department).
Elisha S. Williams, vice-president (Mechanical Department).
J. Newton Gunn, assistant to president.
Samuel Norris, secretary.
John D. Carberry, assistant secretary.
W. G. Parsons, treasurer.
E. J. Hathorne, assistant treasurer.

EXECUTIVE COMMITTEE.

Samuel P. Colt, James B. Ford, Lester Leland, Walter S. Ballou and Nicholas F. Brady.

MEETING AND BANQUET OF NATIONAL ASSOCIATION OF WASTE MATERIAL DEALERS.

THE third annual meeting of the National Association of Waste Material Dealers was held at the Hotel Astor, New York City, March 15. President Louis Birkenstein called the meeting to order at 11 A.M. The minutes of the last meeting and the reports of the secretary and treasurer were read and approved.

The chairmen of the different divisions then submitted reports that reflected the very favorable conditions now existing in the trade. The Rubber Scrap Division recommended certain changes in the circular for packing which will be revised and hereafter known as Circular B. Item No. 4, covering standard automobile tires, now reads practically as follows: "Must be free of unguaranteed tires, heavy headed tires, filled tires, burned or overcured and oxidized, single tube, stripped, badly worn, leather or metal."

The report of the committee to arrange for new and larger quarters reported the establishment of new offices at 185 Summer street, Boston, Massachusetts. The invaluable service rendered by the traffic committee during the past year was called to the attention of the members by the president, and a vote of thanks extended to the chairman for his good work. President Birkenstein and Secretary Haskins then read their annual reports, which were received with marked appreciation and approved in due form.

The nominating committee then submitted the following ballot for officers and directors for the ensuing year:

Louis Birkenstein, president; H. H. Cummings, first vice-president; James Rosenberg, second vice-president; William Van Der Koogh, third vice-president; Edward A. Stone, fourth vice-president; Henry Lissberger, fifth vice-president; Newell J. Lewis, sixth vice-president; Chas. M. Haskins, secretary; Mark Sherwin, treasurer. Directors: Simon Weil, Leo Loeser, F. W. Reidenbach, R. D. Cunningham, Herman Sonken, Ike Grodin, R. M. Milligan, Paul Loewenthal, Ivan Reitler.

The secretary was authorized to cast one ballot for each of the selections made, which he did, and the president declared elected the officers and directors as nominated.

Thus the third year of the National Association closed with most gratifying results to everyone. The association now has 110 members and has accomplished inestimable benefit for the waste trade, showing a development in growth and influence that has been felt in every branch of the business. Much praise is due the worthy president of the association, Louis Birkenstein, now elected for the third time. Much credit is due him for the progress, growth and accomplishment during the past year, and it is a source of satisfaction that Mr. Birkenstein has consented to serve for the ensuing year.

THE BANQUET.

In the evening about 230 members and guests assembled in the north ballroom of the Hotel Astor to participate in the third annual banquet. The hall was appropriately decorated with American flags and the flowers and table decorations tastefully arranged. Each member and guest received a souvenir in the shape of a small silk American flag.

There was orchestral music, popular songs and a mixed quartette to entertain the company while the courses were served. Following President Birkenstein's address, the speaker of the evening, Nathaniel Elsbeg, congratulated the members on the success of the association.

Interesting talks were given by other speakers, who entertained the members until the small hours of the morning. The banquet was pronounced a most enjoyable affair by everyone there.

MANUFACTURERS OF TIRE FABRICS EXPAND.

The recent expansion of the Connecticut Mills Co. and Canadian Cotton Mills, Limited, again emphasizes the steady growth of these allied concerns. The Connecticut Mills Co. was organized in 1910 at Danielson, Connecticut, and the Canadian Connecticut Cotton Mills, Limited, controlled by the same group, followed in 1913. Each year since the Connecticut Mills Co. was first put into operation it has been found necessary to make extensions in the plant to accommodate increasing business.

The reorganization of the Connecticut Mills Co. has just been effected, whereby the capital becomes \$1,000,000, and provision has been made for a thirty-thousand-spindle spinning plant, which, however, will only supply a part of the Connecticut Mills Co.'s requirements. Other units will follow later at Danielson, Connecticut, where the company's plant is located, and is the largest factory in the town.

The Canadian Cotton Mills, Limited, located at Sherbrooke, Province of Quebec, has just had its capital increased to \$1,500,000 to finance an extension, tripling the capacity of the plant in anticipation of the future of Canada. The Sherbrooke company does all of its own spinning and enjoys the distinction of being at the same time the youngest member of the manufacturing circle of that city, and the largest. The products of both of these mills have been foremost in the market on the score of quality and are favorably known to every large user.

The men directing the affairs of both companies are Tracy S. Lewis, R. J. Caldwell, H. L. Burrage and O. Butler. To this staff has just been added the name of L. W. Cuddy, formerly of New Bedford. The selling agent is R. J. Caldwell of 15 Park Row, New York City.

The Dunlop Rubber Co. has recently completed the installation of a tire manufacturing plant at Melbourne, Australia, said to be the largest in the southern hemisphere. It is stated this plant will employ 1,400 hands, and it will manufacture many of the English specialties of the parent company.

LOUIS BIRKENSTEIN.

News of the American Rubber Trade.

ANNUAL STATEMENT OF THE HOOD RUBBER CO.

THE annual statement, recently issued, shows the condition of the company on December 31, 1915. The important items are given in the condensed balance sheet shown below:

CONDENSED BALANCE SHEET. December 31, 1915.

ASSETS.		
Plant (real estate, machinery, etc.)	\$2,425,000.00
Merchandise	1,361,820.30
Accounts receivable	3,138,887.99
Cash	238,341.98
Investments in other corporations	189,800.00
Patents	1,000.00
		<u>\$7,354,850.27</u>
LIABILITIES.		
Capital Stock—Common	\$2,000,000.00
—Preferred	2,500,000.00
		<u>\$4,500,000.00</u>
Notes payable	1,580,000.00
Surplus	1,274,850.27
		<u>\$7,354,850.27</u>

Merchandise in process of importation and letters of credit in connection therewith are not included in the foregoing statement.

MIDOLEY COMPANY CHANGES NAME AND ENLARGES CAPITAL.

At a special meeting of the stockholders held recently, the name of the Midgley Tire & Rubber Co., of Lancaster, Ohio, was changed to the Lancaster Tire & Rubber Co. The capital stock was increased from \$550,000 to \$850,000, the increase being 7 per cent. cumulative stock.

The new directors are:

F. A. Miller, Columbus, Ohio, general manager of the H. C. Godman Shoe Co.

H. B. Peters, Lancaster, Ohio, president of the Fairfield National Bank.

C. S. Hutchinson, Lancaster, Ohio, assistant secretary of the H. C. Godman Shoe Co. and vice-president of the Lancaster National Bank.

Harry Davis, Pittsburgh, Pennsylvania, president of the Harry Davis Enterprises.

E. E. Lerch, Columbus, Ohio, secretary of the H. C. Godman Shoe Co.

H. V. Blaxter, Pittsburgh, Pennsylvania, of Lazier & Blaxter, attorneys at law.

J. T. Rose, Lancaster, Ohio, president of the Lancaster Tire & Rubber Co.

The officers of the company are:

J. T. Rose, president.

C. S. Hutchinson, vice-president.

G. A. Stephenson, secretary and treasurer.

Walter H. Hermann, factory manager.

T. B. Davies, manager of sales.

Orders for additional equipment for the making of full molded tires have been placed; presses have been purchased, and within the next 60 days the company will be producing, in addition to its present product, wrapped wire tread and plain tread tires, full molded plain and non-skid tires and a complete line of inner tubes.

CANADIAN CONSOLIDATED RUBBER CO. ACTIVITIES.

During the past month a shipment of 1,000 hot water bottles was sent by the Canadian Consolidated Rubber Co., Montreal, Canada, to the Queen's secretary at Buckingham Palace, London, England, for distribution through the military hospitals of England. These bottles were provided from the proceeds of a special fund instituted through the efforts of Mrs. L. Mitchell-Henry, of Montreal, and funds for further shipments are being collected. This company has reopened and remodeled the factory of the Granby Rubber Co., Granby, Quebec, for the manufacture of a

general line of rubber footwear. C. K. Hutchinson is factory manager.

GOODRICH ANNUAL MEETING.

At the annual meeting of stockholders of The B. F. Goodrich Co., held at the company's office in New York City on March 8, the following five directors whose term expired this year were re-elected for a period of three years: C. C. Goodrich, F. H. Mason, W. A. Means, A. H. Noah and Guy E. Norwood. Provision was made for four additional directors, increasing the board membership from 14 to 18. The following directors were elected to fill the new places on the board, also the vacancy caused by the resignation of A. H. Wiggin: W. O. Rutherford, A. B. Jones, Dr. W. C. Geer, H. E. Joy, H. K. Raymond. The directors also re-elected the old officers.

The stockholders in a special meeting authorized the reduction of the authorized preferred capital stock from \$28,000,000 to \$27,300,000.

The quarterly dividend of 1 per cent on the common stock was declared, payable May 15 to stockholders of record May 4.

RUBBER COMPANY DIVIDENDS.

The Boston Woven Hose & Rubber Co. paid the regular dividend of 3 per cent on March 15 to stockholders of record March 6.

The usual quarterly dividend of $1\frac{3}{4}$ per cent on the preferred stock of the Republic Rubber Co. was paid March 1.

The Rubber Goods Manufacturing Co. paid the regular quarterly dividend of $1\frac{3}{4}$ per cent on its preferred stock March 15 to stockholders of record March 10.

A quarterly dividend of $1\frac{3}{4}$ per cent on the preferred stock of the Plymouth Rubber Co. was paid March 1.

A quarterly dividend of $1\frac{1}{2}$ per cent on the 6 per cent preferred stock of the Kelly-Springfield Tire Co. has been declared, payable April 1, to stockholders of record March 18.

The Goodyear Tire & Rubber Co. has declared a quarterly dividend of $1\frac{3}{4}$ per cent on its preferred stock, payable April 1.

The regular quarterly dividend of the Boston Belting Co., \$2 a share, will be paid on April 1.

The Firestone Tire & Rubber Co. has declared a quarterly dividend of $1\frac{3}{4}$ per cent on preferred and 5 per cent on common stock, both payable April 15 to stockholders of record April 1.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on March 25 are furnished by John Burnham & Co., 115 Broadway, New York City, and 40 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new)	68 $\frac{1}{2}$	70 $\frac{1}{2}$
Firestone Tire & Rubber Co. common	74 $\frac{1}{2}$	75 $\frac{1}{2}$
Firestone Tire & Rubber Co. preferred	113	113
The B. F. Goodrich Co. common	72 $\frac{1}{2}$	73 $\frac{1}{2}$
The B. F. Goodrich Co. preferred	114	116
Goodyear Tire & Rubber Co. common	340	345
Goodyear Tire & Rubber Co. preferred	112	116
Kelly-Springfield Tire Co. common (new)	74 $\frac{1}{2}$	75 $\frac{1}{2}$
Kelly-Springfield Tire Co. first preferred	96	98
Kelly-Springfield Tire Co. second preferred	102	104
Miller Rubber Co. common	234	240
Miller Rubber Co. preferred	112	116
Portage Rubber Co. common	70	72
Portage Rubber Co. preferred	106	107
Rubber Goods Manufacturing Co. preferred	88	90
Swinnhart Tire & Rubber Co.	52 $\frac{1}{2}$	53 $\frac{1}{2}$
United States Rubber Co. common	109	111
United States Rubber Co. preferred	109	111

WILLIAM J. KELLY.

HAS anybody here seen Kelly?

In response to this orchestral query, a big-boned, rangy American, with a look of eager youthfulness contradicting the gray in his close-clipped hair, rises, bows to right and left, and one of the old-time customs of a Rubber Club dinner is complete. Needless to say this is William J. Kelly, known to the rubber trade far and wide.

WILLIAM J. KELLY.

To quote one of his own biographical phrases: "I came within three days of being born a fool," which means that he first saw the light on April 4, the year being 1861. His home was in Old Roxbury, Massachusetts, just a few doors from that of the late Charles H. Arnold.

It was quite natural, as the boys grew up together and attended the same schools, that when they came together in business later in life, there should have been a very strong bond of affection between them.

Young Kelly showed his first interest in rubber when as a boy he often strayed to the Boston Belting Co.'s factory in Roxbury, and wheeled bits of pure rubber from the workmen to use as chewing gum.

In 1880 he secured a position with Henry A. Gould in his Boston office. Later he went with Geo. A. Alden & Co., and in 1903 became associated with his old friend Charles H. Arnold, first as a rubber salesman, and a successful one, and later as a member of the firm of Arnold & Zeiss. He is known from one end of the country to the other, is popular, respected and successful. Incidentally, Mr. Kelly is something of a golfer, an enthusiastic baseball fan, and one of the fathers of the Rubber Club.

AN IMPORTANT TRADE-MARK DECISION.

The decision of the District of Columbia Court of Appeals in sustaining the decision of the commissioner of patents in *ex parte* United Drug Co., according to the "Bulletin of the United States Trade-Mark Association," establishes a precedent which may easily be the cause of far-reaching confusion in commercial fields as to what constitutes unfair competition. The United Drug Co. attempted to register the word "Stork" as a trade-mark for rubber nipples, and the commissioner refused registration because of the existence of the Stork Co., a corporation engaged in the manufacture of waterproof goods, although the latter company does not make rubber nipples and does not oppose the registration of the word by the United Drug Co.

The American consulate at Mombasa, Africa, desires to receive from American manufacturers and exporters, catalogs of rubber goods for its commercial library and reading room.

PERSONAL MENTION.

Harvey S. Firestone, president of the Firestone Tire & Rubber Co., Akron, Ohio, left for Florida late last month, where he will remain for a few weeks.

W. H. Bell has been made manager of the Chicago, Illinois, district by the Kelly-Springfield Tire Co., New York City, having formerly managed the company's Pacific Coast territory.

J. E. Redman has been made assistant sales manager of the Chicago, Illinois, territory by the Michelin Tire Co., Milltown, New Jersey.

Frank C. Stover, formerly of the Star Electric Co., Chicago, Illinois, has been appointed manager of the municipal department of the United States Tire Co., with headquarters at 1222 Michigan avenue, Chicago.

Franklin Kesser, well known in the tire trade, has recently become Eastern district manager of the Batavia Rubber Co., with headquarters at their New York branch, 1906 Broadway. Mr. Kesser's experience covers a period of ten years as manager of the Hartford Rubber Works Co.'s branch in Philadelphia; five years in an executive capacity at the Hartford factory; three years in executive positions with Akron tire companies, and for the past year jobbing representative of the Batavia Rubber Co. for the Philadelphia market, which experience entitles him to be called one of the deans in the tire world.

Ernest Brandt has become connected with the Ajax Rubber Co., Inc., New York City, to assist J. C. Matlack in the conduct of the sales department. Mr. Brandt was with the Hartford Rubber Works Co. for many years, later joining the Fisk Rubber Co. in an important capacity. He then became sales manager of the Corbin Motor Vehicle Co., was one of the district managers of the United States Motor Co., and still later, eastern district manager for the Hudson Motor Car Co.

Charles G. McCullough, New York manager for the Pennsylvania Rubber Co., Jeannette, Pennsylvania, is engaged to marry Miss Isabelle Matlack, daughter of J. C. Matlack, sales manager of the Ajax Rubber Co., Inc., New York City.

E. B. Sigerson has been appointed manager of the Buffalo branch of the Goodyear Tire & Rubber Co., Akron, Ohio. In 1910 Mr. Sigerson joined the Goodyear forces as salesman in the New England district. Since then he has risen by rapid stages to his present post.

FOUNDER OF BATAVIA RUBBER CO. RETIRES.

Ashton W. Caney, president and active manager of the Batavia Rubber Co., Batavia, New York, and one of the original incorporators, retired from an active position with the company on March 1, having sold the greater portion of his stock. He will, however, still be connected with the company as a member of the board of directors.

Mr. Caney came to Batavia 29 years ago, and has been a prominent figure in its industrial affairs ever since. He has been actively engaged in the rubber industry for 17 years. In 1900 he became interested in the Batavia Rubber Tire Co., introducing the Sweet patent solid rubber carriage tire. The business was successful and in connection with the Batavia Carriage Wheel Co. it was sold to the Standard Anti-Friction Co. of New York. Mr. Caney remained with the latter company until August 1, 1902, when he resigned as manager of the rubber department and, with other Batavians, organized the Sweet Tire & Rubber Co. of Batavia. In 1908 the property of this company was sold to a representative of the present Batavia Rubber Co., which was formed by Mr. Caney, and a number of other officers of the old concern.

BLOOMINGDALE RUBBER CO. BUYS S. & L. PLANT.

The Bloomingdale Rubber Co., reclaimers, with general offices in the Singer Building, New York City, and works at Butler, New Jersey, purchased on December 17, 1915, at receiver's sale, the entire plant and assets of the S. & L. Rubber Co., Chester, Pennsylvania, for \$34,825, estimated to be one-third the actual value of the plant.

The Chester plant has a capacity of eight to ten tons per day, according to the kind of scrap reclaimed. It is located on the Delaware River and occupies an area 180x1,400 feet, adjoining the Pennsylvania and the Philadelphia & Reading railroad tracks, sidings from both roads running into the grounds of the plant. The Bloomingdale company's business having outgrown its Butler establishment, it is intended to run both plants. Alterations at Chester are now completed and the plant is running 20 hours a day.

AMERICAN CHICLE CO.

The full list of officers recently chosen by the directors of the American Chicle Co. includes Darwin R. James, president; Silas B. Adams, vice-president; M. D. Bromberg, secretary; F. A. Hubbard, treasurer. Walter Bauer is general manager, in charge of production, and George W. Hopkins, formerly vice-president of the Loose-Wiles Biscuit Co., has taken the position of general sales and advertising manager. This company manufactures over 100 brands of chewing gum, having factories in 10 American cities, and one each in Toronto, Canada, and London, England. It owns its chicle plantations, located in Yucatan.

AN INNOVATION IN SALES PLANS.

The United States Rubber Co., New York City, is equipping its footwear salesmen with an outfit which should prove of interest to all their customers. A neat package contains a folding stereoscope of aluminum and two sets of photographs, one of which comprises views taken at one of the large footwear factories of the company, and showing every process in detail of manufacturing boots and shoes. The other set represents a little journey to the National India Rubber Co.'s factory and illustrates the manufacture of sporting and outing shoes. Each of these sets consists of 50 stereoscopic views, and these are accompanied by a little address which the salesman is supposed to deliver in explanation of the photographs as they are presented one after another in the stereoscope. This practically takes the customer through the mills, showing him exactly each step in manufacture, and is really almost as good as a journey to Naugatuck, Malden, New Haven, Bristol, or to some other mill of the company. It should certainly hold the customer's attention and enlarge his knowledge of the "how" of rubber footwear production. As a selling proposition, it is an experiment which will be watched by manufacturers in other lines of business, with a view to determining its success.

RUBBER SOLED SHOES SAVED A LIFE.

A peculiar accident is reported in a technical paper on "Safety in Stone Quarrying," issued by the Bureau of Mines, Washington, District of Columbia. A transformer supplying a stone quarry burned out, permitting 4,000 volts to pass to the hoisting motors. The man in charge placed his hand on the lever, and as the machine was electrically charged he could not let go. As he was wearing rubber-soled shoes he sustained no injury. He called for help, and the man who came to his assistance, instead of pulling the switch and cutting off the current, took hold of the engineer's hands and tried to pull them free, and in so doing completed the circuit and was killed. The man with the rubber-soled shoes was uninjured except for slight burns.

TRADE NOTES.

The Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut, has leased the entire building at 106 Duane street, New York City, for their New York office, having formerly occupied only a part of it. The extended quarters will be thoroughly remodeled.

To care for its growing business in Canada, the F. S. Carr Co., Boston, Massachusetts, has purchased the factory property, including equipment, formerly owned by the Walpole Rubber Co., Limited, Granby, Quebec.

The Southwark Foundry & Machine Co., Philadelphia, Pennsylvania, has nearly quadrupled its capacity and is now very busy, especially in the manufacture of hydraulic presses and turbines. Machinery costing \$250,000 has already been installed and about as much more is contracted for, in order to bring the plant up to its proposed capacity.

J. E. Gramlich, formerly engineer and superintendent of the Chase Motor Truck Co., Syracuse, New York, has become associated with the Thermoid Rubber Co., Trenton, New Jersey, as engineer. Mr. Gramlich will give exclusive attention to the development of the lately patented Thermoid-Hardy Laminated Disk, for which this company has the exclusive American rights.

The Ideal steering device, a recent addition to the numerous specialties designed for Ford cars, is made by Charles E. Miller, Anderson Rubber Works, Anderson, Indiana.

A contract has been awarded to the New Jersey Car Spring & Rubber Co., Jersey City, New Jersey, by the fire department committee, Pittsfield, Massachusetts, for 1,100 feet of hose, at a price of 67 cents a foot.

The number of stockholders of the United States Rubber Co., New York City, on January 15 totaled 16,636, as compared with 15,572 on January 15, 1915.

The Aetna Rubber Co., Cleveland, Ohio, has sold its Perkins avenue property to the Ford-Clark Co., and will build a new plant on East Seventy-ninth street. The foundation is started, and the plans are for a three-story building 55x140 feet, with an addition of 50x60 feet. The new factory will be equipped with the latest improved type of machinery for the manufacture of electricians' and acid-proof gloves.

The De Silva Rubber Co., 310 East Seventy-fifth street, New York City, manufacturer of rubber heels and other mechanical goods and specialties, is building a two-story factory, 60x70 feet, on Harris avenue, Long Island City, New York.

The Canton Rubber Co., Canton, Ohio, has recently removed its New York City offices from 1326 Broadway to quarters at 240 Broadway, where the premises now occupied are three times the size of the former offices. L. P. Jones is manager.

The Warren Cotton Mills, West Warren, Massachusetts, will erect a two-story addition to its dyehouse and make alterations on the adjoining building. The addition will be approximately 114 x 36 feet; the foundation will be of concrete, and there will be a reinforced concrete floor and a tar and gravel roof. Work will be started immediately and will be completed within about two months. This corporation manufactures, besides other cotton fabrics, goods for mackintosh linings, etc.

Canadian Consolidated Rubber was selling at 91 when the war started, and there it remained until the middle of the month, when 99 was bid and 105 asked, with no sales reported. The last dividend on the common was paid October 1, 1914, and it is thought that the unusual demand for its products, in the regular trade, as well as its army contracts, make this rise in the value of its stock justifiable. The annual meeting takes place early next month.

PERSONAL MENTION.

David L. Kubie, son of Samuel Kubie, president of the Raw Products Co., has been elected secretary and director of the company. Mr. Kubie was formerly identified with the Raw Products Co., but resigned for the purpose of making an outside connection. His preference for the rubber business was stronger than for any other line, consequently he has returned to the fold. He will represent his father in a great many transactions to which Samuel Kubie previously had to give personal attention. The young man matriculated at the Wharton School of Finance, University of Pennsylvania. He made an excellent record from both a scholastic and athletic standpoint.

A party, consisting of directors and guests of the Atlantic Coast Lumber Corporation and United Timber Corporation, including Colonel Samuel P. Colt, Francis Lynde Stetson, James B. Ford, Lester Leland, John D. Carberry, M. J. Quinn, R. J. Clifford, E. J. Hathorne, Walter S. Ballou, H. Stuart Hotchkiss, United States Senator LeBaron B. Colt and Edgar B. Davis, left last week in private cars over the Pennsylvania Railroad via Atlantic Coast Line, for Georgetown and Charleston, South Carolina, on a tour of inspection of the various properties in South Carolina in which they are interested.

George B. Hodgman of the Hodgman Rubber Co., Tuckahoe, New York, returned March 21 from a three-weeks' visit to Bermuda.

John Scott McClurg, president and general manager of the McClurg Rubber Co., Coshocton, Ohio, was married on February 23 to Mrs. Anna Barry Cunningham.

W. H. Palmer, for several years in charge of the advertising department of the United States Rubber Co., New York City, has assumed a new position in the sales department and will devote his efforts to the development of the canvas rubber sole shoes manufactured by the company. L. E. Seddon, formerly assistant cashier, succeeds Mr. Palmer as manager of the advertising department.

The New Jersey Zinc Co., New York City, announces the appointment of A. H. Peck as sales manager, in place of Alfred W. Dodd, resigned, and E. V. Peters as assistant general sales manager.

Announcement has been made of the promotion of A. M. Jack to manager of the Pittsburgh branch of The B. F. Goodrich Co. Mr. Jack, whose home is in Dayton, Ohio, was engaged in newspaper work several years. For six months he was court reporter for the old "Dayton Press"; later he did reportorial work in Cincinnati for eight years. Ten years ago Mr. Jack was admitted to the Ohio bar, and he has been employed by the Goodrich company for the past five years, during which time he has made steady advance to his present position as manager of the Pittsburgh office of the company.

J. E. Duffield has become identified with the United States Rubber Co. interests as sales manager for the Mechanical Rubber Co., Chicago, Illinois. Mr. Duffield's activities as western manager for the Thermoid Rubber Co. have made him well known in Chicago.

W. F. Bilger, for a number of years advertising manager of the T. Eaton Co., Limited, Toronto, Canada, succeeds R. W. Ashcroft as advertising manager of the Canadian Consolidated Rubber Co., Limited, Montreal.

Nathan Owitz, sales department of the Wheeler Condenser & Engineering Co. of Carteret, New Jersey, has been elected sales manager of the J. P. Devine Co. of Buffalo, New York.

Mr. Owitz has been with the Wheeler company for 11 years; 5 years at their general office and works at Carteret, 2 years as manager of their Cincinnati district, 2 years as their Pittsburgh district manager, and manager of the Philadelphia territory for

1914 and 1915, handling their entire line of equipment; an experience which will qualify him for his new position.

Frederick C. Hood, vice-president and general manager of the Hood Rubber Co., Watertown, Massachusetts, will spend a few weeks at Bermuda early in April.

Dr. Eugenio Dahne, who has planned a remarkable exhibit of Brazilian products at the Panama-California Exposition, San Diego, California, leaves on the "Vestris" for Brazil on April 1. The doctor has been somewhat handicapped by the blocking of the Panama Canal. Only a part of the notable exhibit has arrived, therefore, with characteristic energy, he is going after it, and undoubtedly he will come back with shiploads of coffee, rubber and a great variety of interesting Brazilian products.

William L. Wadleigh, of Wadleigh Co., Limited, Singapore, Straits Settlements, who has been in Malaya since November of last year, starts for home April 8 by the Pacific route. He ought to arrive in New York by the first of May, and will certainly receive a warm welcome from his many friends.

Russell W. Earle has retired from the firm of Earle Brothers, crude rubber dealers, 66 Broad street, New York City. The business will be continued at the same location, under the same firm name, by William P. Earle, Harry W. Laird, William P. Earle, Jr., and Everett W. Laird.

J. F. Douse, for many years in the tire business with headquarters in San Francisco, California, recently assumed the management of the Seattle, Washington, branch of the Fisk Rubber Co., Chicopee Falls, Massachusetts.

RUBBER MEN ESCAPE IN SUSSEX DISASTER.

Among the passengers on the steamer *Sussex*, damaged by explosion in the English Channel, were president of the United States Rubber Export Co., and Francis E. Drake, European manager of that company, both of whom had exciting experiences. We are pleased to record that both gentlemen escaped injury. Mr. Huxley gave one of the clearest and most graphic accounts published of the explosion and the excitement which followed, and the many details mentioned by him show him to be a close observer. His story of the affair was cabled by the Associated Press to all the leading papers in this country.

Another passenger on the *Sussex*, who, however, did not escape so easily, was Joshua D. Armitage, of Taylor, Armitage & Co., of New York City. Great anxiety was felt by his partners and friends at first, because of the absence of any word regarding him, but later reports stated that he was suffering from shock and bruises, but was not seriously injured.

EDWARD H. HUXLEY

BRAZIL AIDS TRAVELLING SALESMEN.

The annoying delay occasioned by the customs officials of Brazil in entering and releasing travelling men's samples is well known to the fraternity. Recent legislation has been enacted through the efforts of Ambassador Morgan, whereby in place of the usual duty, 5 per cent is levied on the value of the samples according to the accompanying consular invoice. Advertising samples will pay regular duties less 50 per cent.

The Fifth National Textile Exhibition will be held in Mechanics' Building, Boston, April 24 to 29, and the National Association of Cotton Manufacturers will hold its 100th meeting at Copley Plaza Hotel during the same week. Many men well known to tire manufacturers will participate.

NEW INCORPORATIONS. WITH AUTHORIZED CAPITAL. ETC. 1916.

Amazon Tire & Rubber Co., The, February 29 (Ohio), \$100,000. Louis J. Shott, C. E. Bettler, L. F. Smith, E. H. Clinedinst and Frank B. Burch.

American Aircraft Co., Inc., March 21 (New York), \$10,000. Ladislav Von Keviczky, 181 Claremont avenue, Joseph C. Kadane, Broadway, and Henry Waldman, 778 Prospect avenue, all of New York City. To manufacture aerial craft of every kind.

Baltimore Rubber Tire Manufacturing Co., February 18 (Maryland), \$200,000. William-Albert S. Mauk, Orangeville, Baltimore County, George W. Habberset and Harry W. Reeve—both of Baltimore City,—both in Maryland. Office, Baltimore City, Maryland. To manufacture automobile tires.

Banner Tire & Supply Co., The, February 8 (Ohio), \$250,000. T. J. Mills, F. L. Woodbridge, Charles A. Wobbe, S. W. Kirts and J. O. Crawshaw.

Bartlett-Yates Insulation Co., Inc., The, March 17 (New York), \$10,000. Henry N. and Bertha L. Bartlett, both of 312 Park street, Westfield, New Jersey, and John S. Yates, 381 West End avenue, New York City. Electrical supplies, insulating materials, etc.

Bentley-Eves Rubber Co., February 25 (Illinois), \$15,000. W. A. Bentley, Roy Physioc and Henry L. Blum. Office, 142 West 27th street, Chicago, Ill. To manufacture and deal in tires, casings, tubes, automobile accessories, etc.

Burke, Inc., Walter V., March 21 (New York), \$1,000. Walter V. Burke, 241 West 54th street, Thomas F. MacMahon and Bailey C. Elliott, both of 1400 Broadway, both in New York City. To manufacture auto tires, etc.

Fellsen Tire Co., Inc., The, March 21 (New York), \$10,000. William N. and Carmen V. Callahan, both of 171 West 71st street, and John McEwan, 61 East 76th street, both in New York City. Auto tires, etc.

Firestone Tire & Rubber Co., March 4 (Maine), \$50,000. George S. Soule (president), South Portland, J. P. O'Donnell (treasurer), and James E. Manter (clerk), both of Portland, both in Maine. Office, Portland, Maine. To manufacture and deal in tires, rubber hoof pads, etc.

Luck Tire & Manufacturing Co., The, March 1 (Delaware), \$500,000. D. A. and C. M. Walker, both of San Antonio, Texas, and C. J. Davis, East Palestine, Ohio. Office, 311 South State street, Dover, Delaware. To manufacture and deal in tires, tubes and automobile accessories.

Mason Motor Car Co., Inc., March 7 (New York), \$30,000. Norris N. Mason, Waldo avenue, Arthur W. Logan, Bayside avenue, both in Bayside, Queens, New York; and Julia Ward, 16 East 48th street, New York City. Office, 1746 Broadway, New York City. Motor cars, tires, etc.

Millbury Rubber Goods Co., Inc., March 21 (New York), \$50,000. Edward E. Reardon, 246 East 49th street, Edward J. Rathens, West 204th street and Harlem River, both in New York City, and Irving V. W. Williams, 661 Madison street, Brooklyn, New York. To manufacture tires, etc.

Modern Tire & Repair Co., February 5 (Texas), \$25,000. F. M. Van Brunt, T. E. Armitage and E. E. Patterson, all of Houston, Texas. Office, Houston, Texas. To deal in tires, tubes and automobile accessories.

Mohawk Valley Supply Co., Inc., March 1 (New York), \$100,000. Charles O. and Josephine B. Terwilliger, and Ethel H. Plumb, all of Herkimer, New York. Auto tires and accessories.

Moore Braiding Co., Inc., March 6 (New York), \$3,000. John V. and George C. Moore, both of Westerly, Long Island, and Edward Weintraub, 151 Second avenue, New York City. To manufacture elastic cords, etc.

Motor Accessory & Tire Co., The, January 13 (Colorado),

\$50,000, divided into 50,000 shares of one dollar each. A. V. Fagerstrom, R. J. Weaver and W. T. Mathis, all of Pueblo, Colorado. To deal in tires, tubes, sundries, etc.

Motor Tire & Accessories Co., March 6 (Delaware), \$75,000. W. H. and A. H. Sponsler, and W. A. Sponsler Jr., all of New Bloomfield, Pennsylvania. Office, Equitable Building, Wilmington, Delaware. To manufacture automobiles and supplies for same.

National Rubber & Specialties Co., The, March 2 (Ohio), \$25,000. J. E. Bancroft, G. M. Allen, Gustave W. Drach, C. L. Bonfield and H. L. Gordon. To manufacture vulcanizers and specialties.

Overland Tire & Rubber Co., Ltd., February 22 (Canada), \$50,000, divided into five hundred shares of one hundred dollars each. John Joseph O'Reilly, Neil Francis MacNeil, William Raymond MacKay, Julius Day-Luce and William Henry Wickham. Office, Montreal, Quebec. To manufacture and deal in rubber, tires, tire fabrics, etc.

Paige & Co., Inc., H. Ray, March 24 (New York), \$100,000. Albert T. Maurice, Rye, New York, Paul B. Barringer Jr., 4 West 53rd street, and Samuel Kaltman, 532 West 152nd street—both in New York City. To manufacture auto tires, rubber goods, etc.

Perlman Rim Corporation, March 15 (New York), \$500,000. Jerome A. Lederman, Edward H. Kelly and Ralph G. Coad, all of 43 Cedar street, New York City. Tires, rims, auto accessories, etc.

Phoenix Rubber Co., The, March 11 (Ohio), \$125,000. J. E. Whigam, J. R. Brown, F. Hopper, S. H. Rosh and A. J. Noble.

Ravenna Rubber Co., The, February 2 (Ohio), \$100,000. L. E. Yaggi, H. Hill, W. Ragcliff and H. M. Boyle. To manufacture clothing, etc.

Safety First Auto Parts Co., Inc., March 21 (New York), \$25,000. Paul U. Daniel, George H. Hutchings and Fred S. Jackson—all of 417 Law Exchange Building, Buffalo, New York. Auto parts of all kinds.

Southwestern Tire Manufacturing Co., March 2 (Oklahoma), \$250,000. W. A. McClelland, J. T. Wheatley, John L. McClelland, Charles W. Gunter, C. Charles Jones and W. F. Westcott—all of Oklahoma City, Oklahoma. To manufacture tires and tubes, etc.

Sturdy Tire & Rubber Co., Inc., March 16 (New York), \$1,000. Benjamin J. Laxer, 1537 43rd street; Frank P. Hayes, 373 Tompkins avenue—both in Brooklyn, New York, and Michael Laxer, 338 East 88th street, New York City. To manufacture auto supplies, tires, etc.

Tireoid Co., The, March 14 (Maine), \$1,500,000. T. L. Croteau (president), A. B. Farnham (treasurer) and Albert F. Jones (clerk)—all of Portland, Maine. Office, Portland, Maine. To manufacture and deal in Tireoid and other compounds and compositions for rendering rubber tires puncture proof, etc.

Upright Tire & Rubber Co., Inc., March 1 (New York), \$1,000. Sydney Bernheim, 305 West 72nd street, New York City; Catherine Weldon, 591 7th street, and Harry H. Jacobson, 555 Grand street—both in Brooklyn, New York. To manufacture tires and rubber goods.

Walters Rubber Co. of New York, Inc., March 7 (New York), \$5,000. Howard S. Walters, 182 Miller avenue, Freeport; John H. Jube, 928 East 18th street, Brooklyn—both in New York, and Albert R. Jube, 638 Mount Prospect avenue, Newark, New Jersey. Auto tires, etc.

Unecda Tire Co., March 13 (New Jersey), \$10,000. Nathan Rosenberg, Max Roth—both of 22 Prospect Place, and A. Milton Jacobs, 532 Market street—both in Newark, New Jersey. Office, 9-15 Clinton street, Newark, New Jersey. To manufacture and deal in automobiles, etc.

CLASSIFICATION OF UNCOVERED TENNIS BALLS.

A recent decision of the Board of General Appraisers regarding shipments of uncovered tennis balls by George Borgfeldt & Co., New York City, overruled the collectors' action at New York and Philadelphia in classifying them as "toys," as they were largely used for playing tennis on wet courts and not exclusively for the amusement of children. This decision is of interest to dealers, since under the appraisers' classification as "manufactures of rubber not specially provided for" the duty is reduced from 35 to 10 per cent.

TEXTILE COMMITTEE OF AMERICAN SOCIETY FOR TESTING MATERIALS MEETS.

Committee D-13 of the American Society for Testing Materials held an interesting meeting on Friday and Saturday, March 17 and 18, at the United States Rubber Co.'s building, 1790 Broadway, New York City.

William D. Hartshorne, chairman of the committee, called the meeting to order, and after the routine business had been disposed of, recommendations for standard tests of hose, belting and similar fabrics were discussed.

While substantial progress was made towards unifying the theory and practice of testing the fabrics under consideration, nothing definite was determined. The whole matter will be further considered at the meeting to be held at Atlantic City, New Jersey, next July.

CANADIAN RECLAIMING PLANT BURNED.

The reclaiming works of the Rubber Regenerating Co. of Canada, Limited, Montreal, were almost entirely destroyed by a fire on the 19th of last month from a cause which has not yet been determined. It is stated that there was no inflammable material on the floor where the fire started, nor anything to cause so rapid a progress of the flames as was experienced. Its start was traced at or near the outside window, and there are some suspicions of incendiarism. The building was a four-story one, the floors being of pine wood, which, with the contents, burned rapidly, leaving the walls almost intact, but the inside practically destroyed. This was a comparatively new department, which was so successful that an extension was contemplated. It is estimated the loss was between \$40,000 and \$50,000. The company has on hand sufficient stock so that no delay is likely to be caused by this conflagration. The shoe factory of the Canadian Consolidated Rubber Co., Limited, was separated only by a heavy party wall, which prevented further spread of the flames. Otherwise the entire block would probably have been destroyed.

A SPECIAL RUBBER NUMBER.

We congratulate our good friend, James Acton, publisher, *The Shoe & Leather Journal*, Montreal, Canada, upon his "Rubber Special," which appeared in March 1. In addition to the regular interesting matter of leather footwear, the department devoted to rubber boot and shoe matters is very complete. It covers the new Canadian list with comments upon them, a review of the Dominion stocks and the prospects for the season. Incidentally, the new rubber price lists are given, in detail, for every type made in Canada, and the rubber news is very comprehensively covered. It will be remembered that early in the spring there is often a banquet of the shoe men in Toronto—this year no exception. In the chronicle of it contained in the "Rubber Special" many old friends among the rubber manufacturers were noted as being present. Among the speakers was R. H. Greene, of Gutta Percha & Rubber, Limited, who reviewed the development of the rubber industry very interestingly.

The cover of the "Special" was graced by a fine portrait of W. H. Miner, of the Miner Rubber Co., Granby, Quebec.

THE ADOPTED LIST OF DRUGGISTS' SUNDRIES.

A TENTATIVE list of soft rubber, druggists' sundries, suggested by the Drug Sundries Division of The Rubber Club of America, Inc., was published in *THE INDIA RUBBER WORLD*, August 1, 1915. With but two exceptions this list has been approved by the United States Customs Service. The revised list is as follows:

SOFT RUBBER DRUGGISTS' SUNDRIES.

Air Beds.	Empyema Tubes.
Air Pillows and Mattresses.	Ether Bags.
Applicators.	Face Masks.
Aprons (Surgeons', Sanitary).	Finger Cots.
Atomizer Bulb Sets.	Fittings for Nursing Bottles.
Baby Pacifiers.	Funnels (Soft Rubber).
Bags (Breeder, Gonorrhea, Ear,	Gloves (Autops, Household, Ob-
Throat, Mastoid, Intra-gastric,	stetrical, Surgeons', Veterinary,
Face, Gas, Sterile Dressing, Ice,	etc.).
Pulitzer, Sponge, Blood-Pressure,	Gum (Bandages).
etc.).	Hospital Blankets.
Bandages.	Ice Helmets.
Basins.	Invalid Cushions.
Bath Sprays.	Medicine Droppers (unless glass
Bed Pans.	chief value).
Belts (Umbilical, Abdominal, Gum,	Nasal Feeding Tubes.
Perforated Frictional Belts, etc.).	Simple Shields.
Bibs.	Nipples.
Bougies.	Obstetrical and Operating Cushions.
Breast Pumps.	Obstetrical Slives.
Breast Shields.	Operating Caps and Pads.
Bulbs (Atomizer, Syringe, Complex-	Pessaries.
ion, Dental, Breast Pump, etc.).	Rubber Corks and Chemist Stoppers.
Caps (Operating Head Caps, Test	Sheeting.
Tube Caps, Ice Caps, etc.).	Spinal Ice Bags.
Catheters.	Sponges (Rubber).
Coils (Head, Abdominal).	Sprinklers (Disinfecting).
Complexion Caps.	Stethoscope Tubes.
Covers (Drainage, Gauze, Dilator,	Stoppies.
Segregator, Sanitary).	Syringes (Bulb and Bag).
Crutch Tips.	Teething Rings.
Cupping Caps.	Tourniquets.
Cushions (Obstetrical, Operating,	Tubes (Rectal, Colon, Stomach, etc.).
Chair, Hospital, Embalming, etc.).	Tubing (Rubber).
Dam (Dental).	Urinals.
Diapers.	Water Bottles.
Dilators.	

RUBBER CLUB STANDING COMMITTEES RECENTLY APPOINTED.

EXECUTIVE COMMITTEE.

Harvey S. Firestone, chairman, Firestone Tire & Rubber Co., Akron, Ohio.

George B. Hodgman, Hodgman Rubber Co., Tuckahoe, New York.

Van H. Cartmell, Kelly-Springfield Tire Co., 227 West 57th street, New York.

H. Stuart Hotchkiss, United States Rubber Co., 1790 Broadway, New York.

William E. Bruyn, L. Littlejohn & Co., 138 Front street, New York.

Paul W. Litchfield, Goodyear Tire & Rubber Co., Akron, Ohio.

LEGISLATIVE COMMITTEE.

Frederick C. Hood, chairman, Hood Rubber Co., East Watertown, Massachusetts.

H. Stuart Hotchkiss, United States Rubber Co., 1790 Broadway, New York.

Jesse E. La Dow, Mansfield Tire and Rubber Co., Mansfield, Ohio.

AUDITING COMMITTEE.

Edward E. Huber, chairman, Eberhard Faber, 37 Greenpoint avenue, Brooklyn, New York.

William G. Grieb, Ajax Rubber Co., Inc., 1796 Broadway, New York.

TIRE SHIPMENTS TO NEUTRAL EUROPEAN COUNTRIES FACILITATED.

The issuance of London permits for the shipment of tires to neutral European countries by the way of England has been greatly facilitated by the adoption of a plan formulated by the advisory committee of the Rubber Club. The British authorities will now recognize shipments certified by the Rubber Club and issue permits promptly. Thus tires can be shipped from England, arriving at their destination before or at the same time as the automobile or motorcycle for which they are intended.

TRADE NOTES.

The Standard Tire & Rubber Co., manufacturers of tires, mill supplies and mechanicals, with offices in the Hippodrome Building, Cleveland, Ohio, and factory at Willoughby, Ohio, has appointed R. F. Valentine, for 12 years sales manager for the Mechanical Rubber Co., Cleveland, Ohio, as director of sales. The newly elected board of directors is as follows: Mark J. Gillen, Christian Narten, D. O. Summers, Robert S. Winsley, E. L. Thompson, John F. Schulte, Charles F. Groth, Charles B. Shaw and R. F. Birch.

The Williams Tire & Rubber Co., McKeesport, Pennsylvania, whose new plant at Lavista, Pennsylvania, is about one-half completed, expects to begin manufacturing by July 1.

The Goodyear Tire & Rubber Co., Akron, Ohio, has enlarged the storage facilities of its branch at Philadelphia, Pennsylvania, by the addition of a new warehouse at 24th and Locust streets, which has a capacity of 25,000 tires. The Philadelphia branch is under the management of Woodson Reese.

The Brooklyn, New York, branch of the Firestone Tire & Rubber Co., Akron, Ohio, whose prospective removal was mentioned in the January issue of THE INDIA RUBBER WORLD, is now occupying its new quarters at the corner of Bedford avenue and Sterling place. The building is of brick, two stories high, and contains 8,000 feet of floor space. E. L. Bixby is manager.

The Empire Rubber & Tire Co., Trenton, New Jersey, is now producing red tires exclusively. Four years ago the company made its first red case and for the past two years the Empire red tire has been featured so successfully that it has now been decided to concentrate on this well-known type.

At the annual meeting of the Kelly-Springfield Tire Co., New York City, held on March 14, at the office of the company at Jersey City, New Jersey, the directors were reelected as follows: Stephen Peabody, Jacob Oppenheim, Arnold L. Scheuer, Gustavus Maas, Austin M. Poole, Otis R. Cook, Frederick A. Seaman, and Van H. Cartmell. Mr. Cartmell is president and Mr. Seaman secretary.

The Luck Tire & Manufacturing Co., which once proposed to build a factory in San Antonio, Texas, has located at Jonesville, Michigan. Special machinery is being installed and the company expects shortly to begin the manufacture of a new tire.

The Federal Rubber Manufacturing Co., Milwaukee, Wisconsin, has discontinued its Denver, Colorado, branch, arranging with the Federal Rubber Tire Works Co. of Denver to act as its distributor for Colorado and adjacent territory. E. R. Cumbe is president of the new distributing concern.

The Marathon Tire & Rubber Co. of New York, Inc., has taken over the business of the Akron-Marathon Rubber Co., Omaha, Nebraska, formerly owned and operated by H. H. Replogle, who remains as manager in charge of this branch, which will handle the business of the company in the Middle West.

The McGraw Tire & Rubber Co., East Palestine, Ohio, has increased its capital stock from \$1,400,000 to \$3,000,000.

The National Tire Service Association, recently organized at Indianapolis, Indiana, will hold its second meeting at Louisville, Kentucky, April 15. The association is composed of tire distributors who endeavor to provide road service for tourists and it is planned to establish tire service stations throughout the United States. The officers of the association are as follows: Roy E. Warner, Louisville, Kentucky, president; Frederick C. D. Dobson, secretary; B. O. Leftwich, treasurer—both of St. Louis, Missouri. Membership committee: Clem T. Strauss, Indianapolis, E. J. Goetze, Kansas City, Missouri, and L. P. Hallaran, Cleveland, Ohio.

The Mason Tire & Rubber Co., Cleveland, Ohio, has increased its capital stock from \$250,000 to \$1,000,000.

The Baltimore Rubber Tire Manufacturing Co. has been organized, and expects to be ready to manufacture tires and inner tubes about July 1. The company has secured a plant at Orangeville, Maryland, which was formerly occupied by the Maryland Mantel & Manufacturing Co. The capital stock of the Baltimore company is placed at \$200,000, all common. George W. Habberset is president, Harry M. Rever secretary-treasurer, and Albert S. Mauk vice-president and general manager. Mr. Mauk, who will be superintendent of the factory, is a rubber expert, and holds several patents for improvements in tires, which will be exploited by this new corporation.

The Niblette Rubber Co. has secured location at 1777 Broadway, New York City, and will distribute through dealers the "Stronghold" tires and tubes manufactured by the Rubber Products Co., Barberton, Ohio, handling in addition thereto a line of mechanical rubber goods over a large section of eastern territory. H. B. Niblette, the proprietor of this company, was for 17 years associated with The B. F. Goodrich Co., Akron, Ohio, and for the last six years managed the Buffalo branch of that concern, previous to which time he was a salesman connected with the New York branch. He has a large acquaintance in the territory which he will cover in this new connection.

JOHN B. MAUS JOINS FISK RUBBER CO.

John B. Maus, formerly Eastern district manager of the Batavia Rubber Co., Batavia, New York, has joined the Fisk Rubber Co., of New York City, and will have charge of the export department at the general office in Chicopee Falls, Massachusetts. Mr. Maus began his career in the tire industry ten years ago, as special factory representative of the Goodyear Tire & Rubber Co., Akron, Ohio, later coming to New York as district manager for that company. Four years ago he became connected with the United States Tire Co. and remained with that company until he joined the Batavia force in 1914.

FISK RUBBER CO. OPENS NEW WELFARE DEPARTMENT.

Dr. William Hall Coon, whose affiliation with the Fisk Rubber Co., Chicopee Falls, Massachusetts, was mentioned in the December issue of THE INDIA RUBBER WORLD, has recently announced the completion of a plan to center all activities which concern the relation of the Fisk company with its employees under a department of Industrial Relations. The work of this department will be arranged in three main divisions, under the following heads: Division of Safety and Hygiene, Division of Medicine, and Division of Labor.

The Division of Safety and Hygiene will strive to reduce the number of accidents occurring within the plant; to educate the employee in habits of safety and caution, and will take those measures necessary to secure in all parts of the factory the best of working conditions.

The Medical Division will, through a well-equipped hospital and corps of physicians and nurses, care for all those who may become injured or ill during working hours. Visiting nurses will give assistance in the homes to those who may require or wish their services.

The Division of Labor will concern itself with the relations of the company to the individual employee, and through this division an attempt will be made to bring about conditions of labor within the factory which will react with equal benefit to the employee, to the company and to the community.

In the furtherance of this plan, and without any cost to the employee, the company has provided for the compensation of all those in its employ who may become ill for any reason or who may be disabled through accidents foreign to their occupation.

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

Progress in the Tire Trade.

THREE NEW INITIALED TREADS.

WHILE it seems almost impossible that any new designs in anti-skids could be produced, three of the big tire companies are out with absolutely new ones. These might be described briefly as initialed tire treads. The Revere Rubber Co., Chelsea, Massachusetts, for example, runs a double row of

R's ar- and the circumference. The Hartford Rubber Works Co., Hartford, Connecticut, does the same with the letter H; while the G. & J. Tire Co., Indianapolis, Indiana, uses the initials of its corporate name in the same way. The effect is very artistic, and, aside from that, there is no doubt that they will provide protection against slipping just as well as any other pattern.

A NEW GUARANTEED TIRE.

The new "Ebony Tread" tire has a ribbed tread of tough black rubber, which commends itself to those who desire some marked individuality and distinction in their outfits.

This tread is the result of exhaustive experimentation, and such thorough and severe tests have been applied to the finished product that the manufacturer places confidence in its endurance to the extent of attaching to every tire a warranty tag, guaranteeing the tread good for 5,000 miles. [The Pennsylvania Rubber Co., Jeannette, Pennsylvania.]

BOWERS BUILDS TIRES.

The Bowers Rubber Works, San Francisco, California, long a manufacturer of mechanical rubber goods, has entered the tire field, bringing out a hand-built tire with a new and effective non-skid tread design. The Bowers company makes a point of the fact that this tire is the result of study and experiment that has gone on for a long time, and feels that it has produced a winner, both in appearance and service.

Headquarters of the Standards Committee of the Society of Automobile Engineers are now in New York City at the offices of the Society in the Engineering Societies Building, instead of in Detroit, Michigan, where a separate office has been maintained for the past year. A. C. Woodbury, recorder of the committee, who has active charge of the routine, has removed his home from Detroit to New York.

THE DOUBLE SEAL TIRE VALVE.

Every one knows that pneumatic tires must be air tight in order to be serviceable. And almost every one knows that a tire cannot be air tight when it is afflicted with a leaky valve.

It is claimed that the double seal tire valve will not leak, which is largely due, no doubt, to the use of rubber washers and packing where leaks are liable to occur.

The valve cap, for instance, which is shown above on the right, is provided with a rubber washer. The valve inside, shown under the cap, has a rubber washer just below the head, where it is seated on the end of the valve stem. Also there is a small sleeve packing of rubber near the lower end of the valve that snugly fits the bore of the valve stem. Thus it will be seen by referring to the illustration on the left how

effectively the valve is sealed.

These valves are interchangeable with all standard stems. They can be removed and seated without tools, simply by the fingers. They operate so smoothly that the disagreeable labor of pumping up the tire is greatly reduced. [Double Seal Tire Valve Co., New York City.]

A RUBBER TIRE FILLER.

Unlike the various preparations that are pumped into the tire for the purpose of avoiding punctures, this filler is made of rubber. Small pieces are cut up, treated by a special process, and

molded into cylindrical annular forms, which are subsequently vulcanized. These forms are made to fit all the different casings, thereby eliminating the inner tubes. The filler is placed in the casing in sections, after which it is pressed on the wheel-rim by special tools provided for that purpose. Several advantages are thereby claimed—saving inner tube expense, prolonging the life of the casing, and immunity from puncture troubles. [National Rubber Filler Co., Midlothian, Texas.]

IMPROVED TIRE-TESTING TANK.

The tire-testing tank in garages is usually a wooden tub, or barrel sawed in two, partly filled with water, which is generally quite dirty—a condition due to the fact that the water is rarely renewed, as the tub has no drainage connection. A new tire-testing tank made of glazed porcelain has been placed on the market. The white porcelain background reflects the bubbles as they rise from the leak in the inflated tube, and the glazed surface facilitates keeping the tank clean. It stands on a porcelain pedestal, which brings it about 30 inches from the ground, relieving the repair man from the necessity of stooping over while testing a tube. The tank is provided with an outlet that can be connected with sewer or drain. [The Trenton Potteries Co., Trenton, New Jersey.]

CHANGES IN THE FIRESTONE ORGANIZATION.

F. W. Suhr, special factory representative of the Firestone Tire & Rubber Co., Akron, Ohio, for a number of years, has been made manager of the New York tire department.

A. L. Manley, formerly manager of the Buffalo, New York, branch, now manages the Newark, New Jersey, branch, and has charge of the export business of the company handled in Newark.

H. W. McFadden has been transferred from Dallas, Texas, to succeed Mr. Manley as manager of the Buffalo branch.

H. A. Grubb, formerly manager of the Cleveland, Ohio, branch, has been appointed Texas manager, with headquarters at Dallas.

F. M. Moore, who was connected with the office at Chicago, Illinois, has been promoted to managership of the St. Louis, Missouri, branch.

C. W. Sullivan will act as traveling representative, with headquarters at Syracuse, New York.

G. A. Richards, formerly manager of the Columbus, Ohio, branch of the Firestone Tire & Rubber Co., Akron, Ohio, has been made manager of the company's branch at Pittsburgh, Pennsylvania.

G. E. Ranney, formerly of the Chicago, Illinois branch, has been appointed manager in Mr. Richards' place at Columbus.

E. R. Wood, formerly connected with the Los Angeles, California, branch, has been promoted to managership of the branch at Seattle, Washington.

PREST-O-TORCH FOR BRAZING SOLID TIRE WIRES.

It is claimed that the Prest-O-Torch, shown in the illustration, will be the natural successor to the gasoline blow torch and its multifarious uses. This little device consists of a metal nozzle and bent tube, connected by rubber tubing to an ordinary Prest-O-Lite gas cylinder.

It is easy to operate; simply turn on the gas, light it with a match, and an intense flame is produced that can be used for brazing, soldering connections and lead burning in storage batteries. Recently blacksmiths, carriage-makers, buggy repair men and wheel manufacturers have become interested in the use of this torch for brazing the retaining wires of solid tires. For this work a prepared spelter consisting of a brass flux, and brass in granular form is used as a filling material. [The Prest-O-Lite Co., Inc., Indianapolis, Indiana.]

THE DOBBINS REPAIR PATCH.

A new tire repair device consists of four cross chains attached at each end to a metal plate, and an inner patch. When a puncture occurs and the tire is deflated, the patch is placed over the hole, on the inside of the shoe, with the sticky side next the casing. The chains are then placed over the tire, by means of hooks fastened to the rim, between it and the tire bead, the plates to which the chains are attached being slipped over the ends of these hooks. When the tire is inflated the chains hold the edges of the puncture firmly together. This device is made for both straight side and clincher tires, and a curve in the slots in which the chains are inserted in the plates provides for a variety of adjustments. [The Weed Chain Tire Grip Co., Bridgeport, Connecticut.]

CONTINENTAL RUBBER CO. TO BUILD.

The Continental Rubber Co., Sandusky, Ohio, whose incorporation was noted in the March issue of THE INDIA RUBBER WORLD, expects to let the contract for the construction of its factory by May 1. The present offices of the company are in the Laurence building, Sandusky. Directors not mentioned in the incorporation notice are: C. B. DeWitt and W. F. Seitz. J. J. Dauch, president of the company, is an influential man at the head of several other important industries; J. T. Sloat, treasurer, is prominently identified with drydock and shipbuilding interests. Sidney Frohman is vice-president. C. E. Sprague, secretary, and L. J. Wedock, field manager, are under contract to act as sales managers when operations are begun.

PORTER RUBBER CO. BUILDS NEW PLANT.

The Porter Rubber Co., Salem, Ohio, whose incorporation was noted in the November, 1915, issue of THE INDIA RUBBER WORLD, is erecting a new plant which will have a capacity of 400 tires and 400 tubes per day. The factory has about 30,000 feet of floor space and is equipped with a system of traveling cranes for handling material and machinery. The steam plant consists of four 250 horse-power Caldwell water-tube boilers, with Jones under-feed stokers. The power plant consists of an 800 horse-power Harris engine for mill line drive, Erie City variable speed engines for calender drive, and motor drive for the lighter machines. The Banner Machine Co.'s tire building machines with individual motor drive will be used exclusively. Manufacturing will begin by April 1. The officers of the company are as follows: J. C. Porter, president; A. H. Boyd, vice-president; E. E. Boyd treasurer; Grant Hill, secretary and general manager. C. F. Pickton is engineer.

FIRESTONE MANUFACTURES BICYCLE TIRES.

The Firestone Tire & Rubber Co., Akron, Ohio, has recently begun the manufacture of bicycle tires. After months of careful experimenting and testing, two grades of single tube bicycle tires have been brought out by the company, in 28 x 1 1/2-inch size only.

One is a blue tread, white side-wall tire, built with two plies of 9-ounce motorcycle fabric, with an extra strip inserted under the tread. The fabric is frictioned on both sides and skim-coated with pure gum, which it is claimed gives combined lightness, resiliency and strength. The tread is of the well-known Firestone Non-Skid design, and a heavy flannel rim strip prevents creeping on the rim.

The other bicycle tire has a black tread and red side-wall and is made for heavy service, being noticeably oversize. It has two plies of 14-ounce fabric, heavily frictioned on both sides and with an extra skim coat. The tread is of the same Non-Skid design but larger and heavier, and the inner layer of pure extra thick rubber.

MISTAKEN FOR AN OFFICER.

At the recent convention of salesmen of the United States Rubber Co., handsome gold and enamel buttons were distributed bearing the trade mark recently adopted by the company, the letters "U. S." being most conspicuous. This led to a funny mistake recently when a salesman riding on a train and wearing this button conspicuously on the lapel of his coat was asked by the conductor where he expected to find his next victim. Rather resenting a question which seemed to imply a rather uncomplimentary relation between the salesman and his customers, an explanation was demanded, which caused the conductor to more closely examine the button, which resulted in an exclamation: "Aw, shucks! I thought you were a United States post office inspector."

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

ALL branches of the rubber trade in this section report a most prosperous business. In fact, there has hardly been a time since the writer has represented the INDIA RUBBER WORLD in this section that the story has been so universally one of prosperity. The belting manufacturers are benefiting by the scarcity and consequent high cost of leather. Factories which hitherto have used leather belting almost exclusively, are now buying rubber belting as a matter not only of economy but of necessity. This is a season when contracts are usually made for fire department hose, and there is evidence that there is more business in prospect this spring than on any previous one. In the tire business, manufacturers report orders ahead and some of them are increasing their capacity. The footwear trade has been especially favored. Not for years has New England been so thoroughly covered with snow for so long a period, and the consequence has been that trade here in rubber footwear has fully doubled that of any normal season, and every rubber footwear company has been entirely cleaned out of stock goods and has more orders ahead than at any time in its history. The clothing trade has been especially active, and factories making clothing are running along to full capacity. Drug sundries' manufacturers are having their share of the prosperity and, taken altogether, the trade could hardly be in a better condition.

* * *

The chief feature of the past month has been the Automobile Show, which this year was a great success, not only as an exhibition, but also as a business bringing project. A record number of machines were sold. The general prosperity of the country seems to be reflected in the demand for new machines, both from veteran motorists and from those who this year are buying their first car. Some considerable trouble was encountered by exhibitors on account of the freight embargo, but, taken as a whole, the exhibition of cars, both for pleasure and business purposes, was far ahead of any previous one. The halls were handsomely decorated, perhaps in a more picturesque manner than at any previous exhibition of any kind given in this great building. The central feature, which would at once attract members of the rubber trade, was a gigantic tire placed in the center of the grand hall, this tire being at the intersection of the center aisles and supported by four mammoth figures, representing Invention, Progress, Industry and Success. Manager Campbell may well be proud of the result of his labors.

Not many tire manufacturers had special exhibits, but the majority of the leaders were represented, their tires being shown upon the machines exhibited. Several companies manufacturing specialties in the accessory business had interesting exhibits. Not many novelties were presented, but many of the booths were very attractive, and the attendants most enterprising in the presentation of the values of their specialties. It would be an injustice to others were I to mention any particular exhibit and, therefore, it may be best to say that, taken altogether, the accessory features of the show were fully as thorough as were the automobile exhibits themselves.

* * *

Readers of THE INDIA RUBBER WORLD will recall the fact that a new philanthropy was made possible by the munificence of Thomas Alexander Forsyth and the late John Hamilton Forsyth, of the Boston Belting Co., by the erection of the Forsyth Dental Infirmary in this city. The first annual report of this important institution is at hand and briefly states the object for which the infirmary was founded and the work done during the year 1915. That it must have been and will continue to be a wonderful benefit in its field of usefulness is shown by the fact that an average of 413 patients per day were treated; that the operations amounted to over 130,000, and that these were performed on 19,930 patients. Added

to this there were a large number of clinical cases, while professional lectures to the infirmary staff and free public lectures were given, all on dental subjects. The lectures for the public are held every Sunday. No one can read this concise report without realizing that Mr. Forsyth has set an example of public benevolence which might well be followed by philanthropists in other cities, large and small, in this country.

* * *

The United States Rubber Co.'s new premises at 130 Essex street are approaching completion, and undoubtedly the offices will be moved to the new location early this month. This removal, which is simply across the street, will be no inconvenience to the many customers who usually called at the old location, while the change to the more modernized building will be a welcome one to those occupying, and also those visiting, the offices.

* * *

The American Rubber Co. is already settled in its new quarters, and certainly the premises show a splendid adaptation to the needs of that business.

Ellsworth H. Hicks, assistant manager of the clothing department of this company, has recently returned from a very successful trip over a large portion of the United States. Mr.

ELLSWORTH H. HICKS.

Hicks is well known from one end of the country to the other and is one of the leading salesmen in this trade. He has been interested in the waterproof clothing trade his whole business life. Even as a mere lad, so to speak, in 1883, he began his business career with the American Rubber Co., later traveling for the company as far west as the Missouri River, also taking in Canada and the South. He was with that company for 12 years and then went to the Boston Gossamer Rubber Co., representing that concern on the road for four years. For the last 15 years he has been with the Stoughton Rubber Co., occupying most of that time the position of vice-president and assistant manager. Upon the recent consolidation of the Stoughton and American companies he was made assistant manager of the clothing department. Mr. Hicks is a thorough, wide-awake business man who has friends in the trade wherever he has traveled, and that has been far and wide over the United States and Canada, with an occasional trip across the water, and I am pleased to be able to show his face in this connection, knowing that it will be welcome to all those who know him.

* * *

C. J. Bailey, the proprietor of the oldest rubber store in this city, tells me that his is the only surviving one of 24 similar stores which were in existence when he began business or have started since. Mr. Bailey is one of the youngest old men in the business and shows his enterprise by inventing and exploiting some new device in rubber with surprising regularity. H. E. Bailey, his son, is an able assistant in the business and attends to the publicity department, while C. J. Bailey II, now a lusty youngster of four months, is already destined to succeed his grandfather and father as the leading rubber goods retailer in New England.

* * *

The Plymouth Rubber Co. is reported to have increased its sales for January, 1916, 73 per cent over those of January of the previous year, and this increase is the more noteworthy since the business in January, 1915, increased 35 per cent over that of the corresponding month in 1914.

Arthur W. Stedman, the well-known crude rubber man, has just announced to the trade his removal to a new office at 727 Atlantic avenue. This is in the handsome new building at the corner of Beach street, opposite the South Terminal station and within a block of the Hotel Essex, thus being most convenient and accessible to his many patrons and friends in the trade.

* * *

A large delegation from the Firestone Tire & Rubber factory was in attendance at the Automobile Show early last month. Among them were: D. S. Swander, district manager; E. S. Babcox, advertising manager; C. H. Sorrick, manager of pneumatic sales, and C. H. Gerhold, manager of accessory sales.

* * *

W. H. Piggott has become manager of the local branch of the Federal Rubber Manufacturing Co., at 173 Massachusetts avenue, succeeding Charles Langmaid, resigned. Mr. Piggott is a Milwaukeean, who has been in the Federal factory service for some time.

* * *

A new mill is to be erected at Newburyport by the American Tire Fabric Co., which is successor to the American Textile Co. The mill is to be of brick, 186 feet in length, the width varying from 20 to 64 feet. The orders for machinery have already been placed, and it is expected that the mill will be completed within two months.

* * *

In my December letter I mentioned the fact that the Bemis Rubber Co.'s plant in Watertown had been sold. I understand that this plant will be equipped to manufacture coffee and breakfast foods from bananas, and also high-grade confectionery, a new company having been formed to exploit this enterprise. Everett C. Tarr, president, and E. Carleton Greenwood, treasurer of the Pan-American Chile Co., are prominent in this new enterprise.

* * *

The Meade Rubber Co. is the name of a new concern, which is now building a two-story brick factory at Stoughton, which is expected to be finished and occupied early next month. James Meade, the head of this company, was until recently superintendent of the Plymouth Rubber Co.

JAMES MEADE.

During his years in the rubber business he has invented several improvements in processes for rubberizing fabrics, and it is his purpose to begin the manufacture of hospital sheetings, rubber heels and soles, and some other specialties, such as Gem inner soles for the shoe trade. He has secured a large tract of land close to the New York, New Haven and Hartford railroad tracks, excellently situated for business, and sufficiently large to allow for considerable expansion. The machinery is being installed as fast as the building progresses, and manufacturing will begin almost immediately after the factory is completed. Mr. Meade is a thorough rubber man, having been for over 20 years in the business, going first with the Stoughton Rubber Co. and afterwards with the Mystic Rubber Co., which later became the Plymouth Rubber Co., and from the position of workman in the mill he rose to be superintendent and vice-president of that corporation, a position which he held up to the time when the plant of the Plymouth Rubber Co. was removed to Canton, he deciding to remain in Stoughton and establish a new industry.

* * *

David A. Cutler has purchased the business, factory and real estate of the Alfred Hale Rubber Co. in South Boston. The

company will continue to make diving suits, wading pants, rubber cement and molded specialties. Mr. Cutler, who is a recognized progressive, will develop this business along up-to-date lines, and is already erecting new buildings. The company as it stands affords an excellent nucleus as it has always enjoyed a steady, moderate volume of business and high credit. W. D. Lamond, for many years with the Revere Rubber Co., is the superintendent, and Kirk L. Moses, prominently identified with rubber interests, is sales manager. The directors are Edward F. Bragg, Richard C. Storey, Francis H. Swift, Parker G. Stevens and David A. Cutler.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE several rubber factories throughout Rhode Island are at present rushing their plants at the same top-speed that has characterized their activities during the greater portion of the past year, and there is the same insistent demand for additional operatives, both experienced and inexperienced hands, that has been heard for a number of months, notwithstanding that the number of operatives now on the payrolls is far in excess of any previous period in the history of the rubber industry in Rhode Island.

Never in the history of the industry in this State has there been such a continued period of capacity business, and there does not appear to be an immediate prospect of any diminution in the demands upon the resources of the factories. This extraordinary demand is noticeable from both the foreign and domestic sources, and is for goods of all kinds, including the automobile tires, shoes, boots and medical supplies that are turned out at the local plants. The insulated wire business is also very brisk with all producers here.

From all the factories, especially those making rubber shoes, reports are at hand that orders continue to come in, and that every concern has large bookings ahead. These factories are turning out thousands of pairs of rubber shoes every day, in addition to other goods that are being made here, and the result is the greatest output that the industry has ever known in this State. The long, steady spell of bad weather underfoot has greatly accelerated the demand for rubber footwear, and the supply has been very greatly depleted.

* * *

The first annual dinner of the Providence factory organization of the Revere Rubber Co. was held at the Crown Hotel on Saturday evening, March 11, and was well attended. The occasion was one of a general "get-together" nature, and called forth a hearty spirit of comradeship and good cheer, which prevailed during the entire evening among the hundred or more employees of the company, who sat down for the first time at their own banquet. Later in the evening they enjoyed a number of addresses and a vaudeville entertainment.

Harlow W. Waite acted as toastmaster at the post-prandial exercises, and introduced as speakers of the evening Dr. T. Whittlesey, director of the New York laboratories of the United States Rubber Co.; Lieutenant James B. Littlefield, Rhode Island coast artillery corps, who spoke on "Our Country's Defenses"; Albert W. Perkins, Superintendent Arthur H. Carr and Foreman W. Ross Gates, the last three being affiliated with the Providence branch. During the serving of the dinner popular selections were played by the orchestra, and many parodies on popular songs pertaining to their own particular business were sung with a zest that left no room for doubt as to their enthusiasm.

Dr. Whittlesey gave an interesting and instructive illustrated lecture on the raising and collection of rubber on the great plantations of South America and Sumatra, referring especially to the 90,000-acre plantation maintained by the United States Rubber Co. on the latter island, half of which is already

yielding raw material. The lecture was illustrated with numerous lantern slides, which showed the young trees from the time they are planted until ready to receive their first "tapping."

He showed and explained the various processes by which the latex, after it is secured from the rubber tree, is cured and made ready to be shipped to the market, and spoke of the practice followed by the United States Rubber Co. in the care of its employees and laborers on the Island of Sumatra. He also spoke at considerable length on the work in the laboratory department, which has by various experiments succeeded in getting the most out of the plantation home products.

Albert W. Perkins gave a short talk on "Employment," and was followed by Arthur H. Carr, superintendent of the plant, who discussed "Production," and W. Ross Gates, a department foreman, who talked on "Safety First" measures. During the brief business meeting which preceded the dinner the following members of the dinner committee were elected: For two years, Frank O. Miles, office manager; Luther T. Benyon, clerk in office, and Albert E. Ludlam, assistant superintendent; for one year, A. N. Smith, William Enright, foreman, and J. Congdon. The committee of arrangements for the first banquet consisted of W. R. Gates, J. T. Brogden, M. L. Coffey, A. N. Smith, H. A. Waite and A. E. Perkins.

* * *

Between forty and fifty operatives employed in the new tennis shoe department of the Millville plant of the Woonsocket Rubber Co., which is owned by the United States Rubber Co., became dissatisfied with the piece rate the company was paying in the manufacture of this line of work, and quit work on March 18. They were immediately paid off and discharged, following which the management paid off all the help in the department, which has been in operation only about a month, and the announcement was made that the manufacture of this class of work at Millville would be suspended.

On the day in question some of the help in the new department, who were mostly young men and women, went to the management and demanded five cents a pair for their work instead of 4 cents, the price that they had been receiving. They refused a compromise offer of 4½ cents a pair and a number of them left. The management claims that employees in the new department, who had previously earned about \$9 a week, had been able to earn about \$12 when the trouble came. The people discharged were mostly of Polish extraction. The principal output of the Millville plant is rubber shoes and "humblers'."

* * *

The National India Rubber Co. is placing a new pressure vulcanizer of the most improved modern type and size in its factory at Bristol. Other vulcanizers of a similar type were placed in the factory a few years ago, and found to be very satisfactory. The brick foundations for the new machine were completed about the middle of the past month, and the work of erecting the machine is being pushed as rapidly as possible, and it will be in operation in a short time. The output of tennis shoes and insulated wire from this plant has increased greatly since the first of the year.

* * *

As has already been mentioned, the United States Rubber Co. has resumed manufacturing at the Lycoming rubber mill at Williamsport, Pennsylvania. Thomas S. Walker, for several years prominently identified with the rubber industry in Woonsocket, but more recently at Naugatuck, Connecticut, has been sent to the Williamsport plant, where he will be employed as chief pattern-maker.

* * *

Aubrey C. Bartlett has filed notice with the city clerk that he is the owner of the McNaul Tire Co., 50 Franklin street, Providence.

The Fisk Drug Co., which opened a new store at Weybosset and Union streets, Providence, the first of last month, will specialize on Davel rubber goods.

THE RUBBER TRADE IN AKRON

By Our Regular Correspondent.

WHAT was almost a local holiday for the entire city was the gathering of the salesmen at the B. F. Goodrich Co. convention on the second and third of last month. The selling forces of this company in all parts of the country, with the exception of the Pacific Coast, were brought to Akron, as much for the purpose of engendering good fellowship and loyalty to the company as for instruction. The affair was a wonderful success from beginning to end, every participant showing enthusiasm during the two days of the convention and departing with an even higher estimation of the company which they represented.

Four special trains of Pullman cars brought the visitors to this city in the early morning when they were greeted by the committee chosen for that purpose, and taken in auto-

AUTOMOBILE PROCESSION OF GOODRICH SALESMEN.

mobiles on a trip through the principal streets of the city, where many citizens had decorated their stores or residences with bunting and flags as a welcome to the visitors. Of course the Goodrich plant was quite elaborately decorated, as was also the convention hall, in each case the general scheme being green and white, with a large amount of imitation rubber leaves, while the entire route from depot to factory was marked with Goodrich sign-posts. After the parade the salesmen were taken to the Portage and Howe hotels, which had been specially ornamented for the occasion, the entrances and lobbies of each being transformed by decorations of rubber leaves covering the walls and ceilings giving them a semblance of an Amazon rubber forest. The decorations of the hotels and factory were designed by F. C. Ingelhart, of the advertising department. Some of the delegations carried appropriate pennants or banners, while others wore distinguishing costumes, a peculiarly appropriate example being the Quaker hats of the salesmen from Philadelphia; and many amusing banners served to show in a humorous way the homes of several of the delegations.

The conference was held at the plant of the Goodrich company. The Thursday morning session was opened by W. O. Rutherford, whose recent appointment as sales manager of the company made him the subject of many congratulations. In his opening address he stated that this was not to be considered as simply a business convention, but rather a returning home of the members of one big family; for, as he said, in no other way could an appreciation of the good fellowship existing and the growth of the institution and the modernizing of manufacturing methods be realized.

The afternoon session was devoted to a trip through the factory, and here the salesmen were shown not only in a general way the magnitude of the works, but each group was specially shown the manufacture of the lines of goods which they sold.

On Friday short talks were given by the various department managers. "Advertising" was discussed by E. C. Tibbitts. J. C. Lawrence spoke on "Credits." Dr. W. C. Geer, head of the developing department, explained briefly how crude rubber is successfully compounded and adapted to the many commercial uses to which it is put today. His talk was fully illustrated by lantern slides.

In connection with this convention a special edition of "The Goodrich," the house organ of the company, was printed and this is one of the handsomest specimens of such trade publications which we have seen. It consists of 40 pages, with a colored cover showing a bird's-eye view of the 57 buildings comprising the Goodrich group in connection with a giant figure typifying the Goodrich institution. He is represented as studying the world, its wants and its needs—a very striking idea, well carried out. The pages, of course, have much to say regarding the company, its management and its goods, and every page is appropriately and some are profusely illustrated. The most striking of these are the two middle pages, which when unfolded occupy a space nearly a yard long and contain individual portraits of all the members of the sales organization of the company. The department directors' and branch managers' pictures are shown grouped around that of General Sales Manager Rutherford, while the rest of the space contains small but effective portraits of 620 salesmen from the different branches, these being all numbered and tabulated, thus enabling the face of any one of this big sales force to be found at once. There are quite a number of amusing cartoons, each characteristic of the person so represented, and some other features which make the magazine more than usually interesting to its many readers.

The Portage Rubber Co., at Barberton, has just completed an addition to its plant and is now erecting another, 61x100 feet and three stories high, to be used for manufacturing tires. These additions increase the output of the Portage plant by 50 per cent.

The Service department of the Firestone Tire & Rubber Co., which is under the management of L. Greenwald, held its fourth annual conference March 16 to 18. From all over the United States the men gathered together at the home plant to review the work of the past year and discuss the problems connected with tire usage. "Courtesy, Friendliness and Fair Dealing to Each Customer Spells Real Service" is the slogan of these Firestone service men, and motorists throughout the country will share in the benefit of improved methods of service and increased effort engendered by this meeting.

L. GREENWALD

The women employees who have worked for the Firestone company three years are rewarded if they leave to be married by two weeks' vacation with full pay and two weeks' additional salary.

Early last month district sales managers of the Goodyear Tire & Rubber Co. met at the home offices to review past development and plan for the future. The reports of these managers showed a remarkable growth in the sales and popularity of the Goodyear tires.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

JOHN A. LAMBERT, of the Acme Rubber Manufacturing Co., is the head of the Manufacturers' Committee named to cooperate with a committee of the Trenton Chamber of Commerce to arrange for a big industrial show in the Second Regiment Armory sometime next fall. The unusual success attending the recent automobile show held in the armory has inspired a movement to hold the industrial show.

Those who financed the automobile show went into the project with the idea that they would be satisfied if they got back their original investment. The event was so successful, however, that the executive committee declared a dividend of 50 per cent. Many of the rubber companies have already made tentative plans to take part in the proposed industrial show and there is every reason to believe that it will prove even more of a success than the automobile show.

One of the features of the automobile show was an exhibit of tires made by the Thermoid Rubber Co., and which were used by Resta, De Palma, Burman and other "speed kings" in some of the recent auto classics. In spite of the crucial tests to which they had been subjected the tires were all intact.

* * *

The Globe Rubber Tire Manufacturing Co. had an interesting exhibit of its tires and tubes at the auto show. This concern's display occupied two booths and thousands of people were attracted by it.

The Essex Rubber Co. exhibited at the show and featured some of the newer products it has added to its already extensive line.

* * *

Workmen from the various tire manufacturing factories in Trenton have formed an organization. One of the objects of the organization, the men say, is to promote cooperation between the employees and the heads of plants.

* * *

Trenton rubber manufacturers are in some instances considerably embarrassed by the long-continued strike of the workmen in the local foundries. It has been difficult for some time to obtain molds. Five foundries are affected by the strike.

* * *

John A. Lambert, of the Acme Rubber Manufacturing Co., as chairman of the Manufacturers' Committee of the Chamber of Commerce, has taken up with the Inter-State Commerce Commission the question of the embargo on freight transportation, as it at present exists along the Atlantic coast, from Baltimore to Boston. The railroads are handling practically no shipments from factories between New York and Philadelphia and the situation is becoming intolerable. It is thought the Inter State Commerce Commission may be able to obtain some relief for the manufacturers.

The Philadelphia and Reading company lifted the embargo in Trenton for a time this week and as soon as this news was noised about the local station was swamped with shipments.

WESTERN NOTES.

Katzenbach & Bullock Co., of New York, Trenton and Chicago, announce the opening of an office in San Francisco, California, in conjunction with the L. H. Butcher Co., to care for largely increased business in the West.

W. D. Albright has been appointed manager of the Seattle, Washington, branch of The B. F. Goodrich Rubber Co., Akron, Ohio, with supervision of the firm's interests in Portland, Spokane and Vancouver, B. C. He succeeds W. S. Bloomer, who has been advanced to the position of special mining representative for the Goodrich company.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

NEXT to the war, with its various fortunes, the main topic of late has been the weather. The heavy rainfall of the earlier part of February was followed in the last week of the month and the first week of March by a series of snowstorms of unusual severity. There has been a great run on goloshes and snow boots, and the dealers must have ended the season well. I myself have invested for the first time in a pair of Boston storm slippers, and am very well satisfied with my purchase. These are retailed by the boot shops at 5s. per pair, against 3s. 9d. a pair for home-made goloshes, and I am told that they are becoming very popular. Owing to scarcity of labor, it has not been possible to clear the streets of snow with anything like the accustomed celerity, and this has made the wearing of goloshes more of a necessity; and again there is the fact that, while the price of leather boots has advanced, their wet-resisting properties have not improved, but, if anything, have shown a retrogression. All the circumstances, therefore, have been in favor of better rubber footwear trade.

ALL MANUFACTURING LINES ACTIVE.

With regard to business there is little of novelty to report. One cannot find a manufacturer who confesses to being slack, not even in the rubber heel trade, which is not supported by government orders as are the great bulk of the rubber manufacturers. A considerable amount of proofing for various classes of goods is still being done on government contracts, and the factories have very little opportunity to work for the home and export trade, although plenty of business is to be had owing to the depletion of warehouse stocks held by dealers and shippers. The labor question is becoming increasingly acute, owing to the demand for men by the military authorities, and the imminent severe revision of those engaged in "starred" trades will inevitably tend to further difficulties. Several important rubber works are now controlled by the ministry of munitions, and as there seems to be some misunderstanding as to the meaning of this, I may say that the control extends only to the particular article or articles which the firm is turning out for this ministry. Regarding the rest of the firm's business, whether it is concerned with other government departments or with private trade, the management remains, as before, entirely in the hands of the firm's officials, with no more supervision than is customary in the care of government contracts, and which is referred to in the specifications.

FOREIGN BUSINESSES CLOSED DOWN.

The fact that orders have been issued for the closing down of various British houses of enemy origin will remove a good deal of competition from the path of neutral and allied firms now trading in Great Britain. Four prominent firms to be wound up are the Calmon Asbestos & Rubber Works, Limited; the Peter Union Tire Co., Limited; the Harburg-Vienna Rubber Co., Limited, and the Rhenish Rubber & Celluloid Co., Limited. As I am confining my pen to the bare retelling of news I do not propose to make any comments on the personalities, whether of British or Teutonic origin, who have been so long known to many of us in their conduct of these businesses.

TRADE AFTER THE WAR.

A good many meetings have been held in the country to discuss the important question of trade after the war, and, although party politics are supposed to be defunct for the time being, or at any rate moribund, the main controversy underlying all the discussion is the old political one of free trade versus protection, a matter in which neutrals, allies and enemies are all

concerned. An important matter has been the defeat of the free trade directors of the Manchester chamber of commerce on a no change policy in the cotton trade. The majority of the members who brought about this defeat, which caused the resignation of most of the directors, belong to a great variety of trades, and cotton is poorly represented in the 29 nominations for the new board of 22 directors. Among these nominations is P. A. Birley, of Charles Macintosh & Co., and a director of the North Borneo Rubber Co., and Marshall Stevens, a director of the Xylos Rubber Co., Limited, though better known in America as the chairman and managing director of the Trafford Park estates. It may be taken that the great majority of the new board will be strong advocates of protective duties in manufactured goods, and development of interest may now be expected.

NORTH BRITISH RUBBER CO., LIMITED.

The new chemical research laboratory being erected by this concern is a model one. The room is very lofty, and is lighted by windows on three sides. The benches are designed to accommodate four research workers each. Artificial illumination on the "eye-rest" indirect system has been specially arranged to avoid shadows and glare. A few direct lighting units, installed for special purposes, are shaded to avoid any naked light sources in the line of vision. An electric blower has been installed for ventilation purposes. Steam, gas and electric power are supplied to the extraction bench, and high pressure water from the mains is supplemented as a precaution by a low pressure supply from a storage tank in the roof. Special attention is being devoted in the balance room to obviating the effect of vibration from the factory.

RUBBER BELTING.

At a meeting of the Manchester Association of Engineers held on March 4 a paper on "Rubber Belting" was read by Mr. James Tinto, of the Irwell & Eastern Rubber Co. The history of the rubber belt in England and America was given, and special mention was made of the large conveyor belts, which, originating in America, are being made by his firm and others on a scale quite equal to the mammoth products of America.

THE INDIA RUBBER MANUFACTURERS' ASSOCIATION.

J. T. Goudie, of the Leyland & Birmingham Rubber Co., Limited, occupied the chair at the annual meeting held in Manchester on February 22. There was a good attendance, and the various matters dealt with in the chairman's speech showed that the work of the past year had been largely concerned with matters which had arisen through the war, and were of great importance to the trade generally. The matter of import duties on foreign-made goods has been under discussion during the year, but beyond saying that complete harmony does not reign in the committee on this point I shall not enlarge on the topic. It is generally acknowledged that Mr. Goudie has made an excellent chairman, bringing wide business knowledge and considerable energy to his duties, which have been by no means light, and it is not surprising to find that he has been re-elected chairman for the current year. Peter Bate, manager of the Castle Rubber Co., Warrington, was re-elected vice-chairman, the following being elected to the committee: P. A. Birley, (Charles Macintosh & Co.); I. H. C. Brooking (St. Helens Cable & Rubber Co.); R. Eccles (F. Reddaway & Co.); Viscount Grimston (Grimston Tires); W. M. Henderson (Ancoats Vale Rubber Co.); F. Webster (Avon India Rubber Co.); David Moseley

(David Moseley & Sons), and J. Tinto (Irwell & Eastern Rubber Co.). Mr. Eccles continues to act as treasurer, and Reginald Moseley and James Henderson are the auditors unprofessional. No new firms are represented on the committee, which indicates that the abstention of several important rubber works in London and Scotland still continues.

BOOTS FOR THE BOYS IN THE TRENCHES.

Malcolm C. Cumming, the well known planter and chairman of the Planters' Association of Malaya, who some time ago started a scheme to purchase knee rubber boots for the British troops in the trenches, at a recent meeting of the Rubber Growers' Association, of the council of which he is a member, secured the support of that organization, which voted £150 [\$730] towards his fund, while individual members present at the meeting subscribed a further £800 [\$3,892], and the sum has been considerably increased since then. Mr. Cumming has also circularized rubber companies for help in cash and in rubber scrap. If the latter is donated a manufacturer has agreed to purchase it all at market prices, and furnish boots to its value at about 10s. [\$2.40] a pair. The retail price of this class of boots here is now 22s. 6d. [\$5.40] a pair. In case funds continue to be received Mr. Cumming will make trips to the continent to see that the boots reach the units for which they are intended.

RUBBER GROWERS' ASSOCIATION.

Apocryphal of the Rubber Growers' Association, the general meeting, which was held February 18, was a most interesting one. E. L. Hamilton, chairman of the association, presided, and in an extended address gave a complete review of the work of the association and its various committees during the year, covering among other points the reorganization, in which he spoke of the great value of the research work, commending the formation of local committees in Ceylon, Malaya and Southern India. He criticized the excess profits duty which has been levied by the government and which in the opinion of various members worked a hardship upon those companies in the intermediate stage of development. He told of the opening of a new fund for rendering assistance to those who have gone from British Malaya to take part in the war. Up to the time of the meeting, £12,000 had been donated or promised, and nearly 1,000 men have left Malaya to join His Majesty's forces, of whom over 600 are planters, while Ceylon has provided at least an equal number of men.

He highly praised the work of Malcolm Cumming, mentioned above, and gave some very interesting statistics of plantation rubber. He told of the demands for rubber created by the war, and called attention to the endeavors to induce the war office to experiment with rubber for tires on artillery and supply wagons, and as armor for vessels.

The chairman called attention to the devices resorted to by Germany to obtain rubber, and gave some interesting statistics of the plantation industry which are quoted here:

It is estimated that about 70 millions sterling of British capital is invested in the plantation industry, this figure representing the issued share and debenture capital, with the premium on shares and reserves put back into the estates.

The total area under rubber is approximately 1½ million acres, Malaya leading with 670,000 acres; Ceylon 224,000 acres; the Netherlands Indies 517,000 acres; Southern India and other countries 90 to 100,000 acres. Approximately 80 per cent of the total is British.

The world's production of rubber for 1915 is estimated at 146,000 tons, of which 98,000 tons are plantation; and for this year the estimated production of plantation rubber is between 130,000 and 135,000 tons, thus showing the remarkable development of the industry. For 1914 the production was but 71,380 tons and for 1910, 8,200; while in 1905 there were only 145 tons produced on plantations.

According to the Board of Trade figures, Great Britain retained 15,000 tons for home use against 18,500 for 1914. Russia's demand

was 16,000 tons for 1915 against 11,000 tons in the previous year, while France increased her consumption over 1914 by 2,000 tons. All these figures are approximate.

Shipments from Malaya to America increased from 5,700 tons in 1914 to 23,000 tons in 1915. With regard to Ceylon, there were 4,096 tons shipped direct to America as against 8,209 tons in 1915.

After speaking of the great prosperity of the rubber industry in America and estimating that the United States would need 75,000 tons for the manufacture of automobile tires alone, he concluded as follows:

As to the future of the rubber industry, I am afraid I must be excused from prophesying. This industry takes a high place in the world's commerce, and we must aim at making the plantation industry take the premier position. Cooperation is necessary to achieve success, and so long as we keep together and work with the ultimate object of benefiting the industry, that success is assured. We have common interests at stake, and our Association has been of infinite service in bringing us together to discuss many matters of policy and principle.

The industry is still, comparatively speaking, a young one, and therefore there is much for us to do. There is one thing to be said, I do not think we could have kept pace with the rapid strides made during the past years unless we had had the Rubber Growers' Association to represent the plantation industry.

The election resulted as follows: Charles Emerson, chairman; Sir Edward Rosling, vice-chairman; ordinary members of council, W. Arthur Addinsell, James F. Anderson, Sir John Anderson, F. W. Barker, Noel Bingley, Frank Copeman, E. L. Hamilton, T. G. Hayes, Captain W. R. Hoare, Arthur Lampard, John McEwan, Lieutenant R. K. Mayor, W. P. Metcalfe, H. K. Rutherford, G. A. Talbot, Noel Trotter; P. R. Rutherford, Auditor.

TRADE-MARK DECISION.

An interesting question regarding the use as trade-marks of names spelt backwards is brought up in the case of the "Gnidroc" trade-mark. J. C. Cording, Limited, and George Cording, Limited, are two firms, each making and selling waterproofs. J. C. Cording, as the older firm, objected to the registration by the George Cording firm of the word "Gnidroc" (Cording spelt backwards) as a trade-mark for rubber goods. Justice Neville in the lower court held, with the registrar, that the mark was an invented word, and therefore capable of registration. The Court of Appeals has recently reversed this decision, concluding that the use of the word "Gnidroc" was intended to secure the advantage of the word "Cording," and therefore calculated to deceive.

THE LATE J. E. BAXTER.

It is with great regret that I have to record the death of J. E. Baxter, principal of the firm of J. E. Baxter Co., Limited. Mr. Baxter was a well known personality in the trade, having been connected with the rubber industry during his whole business life. Some years ago he made a most strenuous trip to South Africa, and it seemed to me and to others that his health was somewhat seriously affected, and that he never really recovered the good health he enjoyed previous to that time. He was one of the first of our manufacturers to take a practical interest in rubber planting, and I remember, many years ago, being told by a mining engineer in London that he had been at a rubber plantation meeting in the city, when a man named Baxter got up in the hall and spoke about rubber in such an authoritative way that it made the remarks of the chairman and other speakers seem rather poor in comparison. Mr. Baxter was of a genial disposition, and will be much missed by a wide circle of friends.

George A. Morton, formerly assistant works manager of Pirelli & Co.'s cable works at Southampton, England, has resigned and accepted a similar position with the Dunlop Rubber Co., Limited, at its Birmingham factory.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World.

THE RUBBER TRADE IN GERMANY.

By Our Regular Correspondent.

CONDITIONS here have not improved since my last writing. We are still isolated from those parts of the world which could furnish us the raw materials we need, and we all know that this state of affairs will continue until victory is won by our brave troops. In the meantime we continue to do as best we can with substitutes for all those materials which are no longer to be had. We have sufficient crude rubber for our military requirements, but none is available for other purposes. This situation is very difficult for those of our manufacturers who have not the good fortune to have orders for the army or for the navy.

WAR RUBBER QUALITIES.

I have already written much regarding war quality rubber goods, which are made wholly or largely of substitutes for crude rubber.

It cannot be denied that our rubber manufacturers have done wonders, and we can rely upon their doing better still. Our rubber industry has prevented the wheels of our other industries coming to a full stop, and at the same time it has kept our army and navy adequately supplied with the rubber goods they require in enormous quantities.

Prior to the war, crude rubber prices were so low that our manufacturers used less and less reclaimed rubber. Bitter necessity has obliged them to reverse this policy, and they are now using reclaimed rubber and substitute with the same skill that previously characterized their handling of crude rubber. Of course the substitute quality goods are not as good as standard qualities but, nevertheless, they answer their purpose. The regrettable feature of it all is that consumers generally fail to comprehend that present prices have little relation to quality. They are too ready to believe that war quality goods, because higher priced, should be at least as good as before-the-war standard qualities. The increasing demand for reclaimed rubber has naturally caused the prices to advance until now it costs much more than did crude rubber prior to the war. Of course goods made of such material are far less durable, and manufacturers cannot be blamed if the war qualities do not give the service that was obtained from normal products.

In this connection our rubber manufacturers should be grateful to your German contemporary, the "Gummi-Zeitung," for its incessant efforts to instruct dealers and consumers as to what they reasonably can expect from the goods the manufacturers have so much difficulty in producing.

War qualities vary considerably, their durability being naturally affected by the origin of the substitute used in manufacturing them. The variations in the quality of reclaimed rubber make it impossible for manufacturers to work on established formulas. The manufacturer has to take what he can get, and the claimer is not always able to obtain the chemicals he would prefer in order to turn out the best possible product.

CEMENT DIFFICULTIES.

One of the most difficult problems our manufacturers had to solve was the making of rubber cements from reclaimed rubber, especially those to be used in the manufacture of such articles as inner tubes for pneumatic tires, for which purpose the cements made from the best crude rubber are used in normal times.

POSSIBLE EFFECTS OF WAR QUALITIES.

Our rubber manufacturers and dealers in rubber goods are much concerned regarding the effect war quality goods may have upon the future of their business. Our rubber industry has proved that it is independent of foreign countries, and can do wonders even without importing crude rubber. As war qualities do not materially differ in appearance from standard qualities, there is much conjecture among dealers and consumers as to qualities after the end of the war. It is feared that manu-

facturers will continue to produce substitute goods along with regular qualities, and thus bring all qualities into disrepute. There is really no basis for this fear, for all our factories will return to crude rubber as soon as it is available at reasonable prices because of the fact that it is far more simple and less expensive to use crude rubber than it is to work as they are now doing with its substitutes.

TAXES AND WAR LOANS.

The authorization of war loans by the Imperial Parliament is generally considered as a matter of course, but it is not quite so with the imposition of new taxes, which will be necessary to cover these loans. Here opposition is evident, and to avoid it as long as possible the government is first turning its attention to taxing persons who have profited by the war. Thus we have the proposed "Excess Profit Tax," which, though it will not directly affect the masses of the people, is of much concern to our leading industries. This proposed "Excess Profit Tax" is very likely to become a law, and it is to be expected that it will prove especially severe upon our rubber manufacturing companies who have been put to great expense by the war, and who have already contributed their share to the defense of the fatherland by generously subscribing to the several war loans. Our rubber manufacturers are receiving high prices for their products, but it must not be forgotten that much has been expended for special machinery for handling war orders, and for experiments with substitutes, while the cost of both materials and labor is infinitely higher than in normal times.

CUSTOMS UNION.

A subject which is attracting much attention here is the agitation in favor of a customs union or "zollverein" between the Central European powers. Generally speaking such a proposition has always been favorably considered by German interests, whereas, in Austria-Hungary, many leading people were bitterly opposed to any closer economic union with Germany than existed before the war. In October last, however, the Vienna chamber of commerce adopted a definite policy in this connection, and gave the first official outlines of the proposition, at the same time bringing forward specific demands, and establishing a basis for negotiations, which have been making good headway and regarding which I hope to be able to write more at length in my next communication.

TRADE NOTES.

The Globus Gummi und Asbestwerke, G. m. b. H., Ahrensbock, near Lübeck, manufacturer of rubber and asbestos goods, has increased its capital from 200,000 marks [\$47,600] to 780,000 marks [\$185,640].

The Gummiwerke Max Bühlung, G. m. b. H., was recently incorporated at Eschweiler, near Aix-la-Chapelle, with a capital stock of 60,000 marks [\$14,280], to purchase and sell crude rubber, gutta percha and similar materials, also to reclaim scrap rubber, and to manufacture and sell rubber goods.

The Norddeutsche Gummi und Asbestmanufaktur Müller & Eggeling, Hanover, has been dissolved, and Gustav Eggeling, of the firm, has been made liquidator.

Karl Flothow has retired from the board of directors of the B. Pollack Co., Walterhausen, and the vacancy thus created has been filled by the election of Paul Strobel.

AUSTRIA-HUNGARY.

The Kaiser Franz Josef's Akademie der Wissenschaften (Kaiser Francis-Joseph's Academy of Sciences), Prague, Bohemia, has offered a prize of 5,000 crowns [\$1,015] for the best work on a substitute for rubber automobile tires.

DUTCH EMBARGO ON RUBBER EXPORTS.

The Netherlands Government has placed an embargo on all exports of rubber and gutta percha and goods made of or containing these materials.

EUROPEAN TRADE NOTES

SWITZERLAND.

GOTTLOB KELLER has formed a company for the wholesale distribution of rubber mechanical and surgical goods at Biel, in the Canton of Berne.

FINLAND.

A special meeting of shareholders was recently held in Helsingfors by the Suomen Gummitehdas Osakeyhtiö, manufacturers of rubber footwear and general rubber goods. This company's paid-in capital now amounts to 908,200 Finnish marks [\$174,283].

NORWAY.

The great fire which on January 15, last, destroyed a large section of the city of Bergen destroyed the premises of the firm of Klaus Reimer, 7 Olaf Kyrresgate, wholesale and retail dealers in packings and rubber mechanical goods.

SWEDEN.

The Svenska Gummifabriksaktiebolag, Gislaved, has resumed its manufacturing operations which for some time were suspended on account of the lack of crude rubber.

The Ryska Gummifabriksaktiebolag, Malmö, which had suspended its manufacturing of rubber footwear for the same reason, has also been able to resume operations.

Gustaf Janson has been made managing director of the firm of F. Reddaway & Co., Stockholm, wholesale dealers in belting and rubber mechanical goods.

The Skandinaviska Gummiaktiebolag, Viskafors, whose rubber footwear manufacturing department was burned in the latter part of 1915, has purchased the machinery and rented an abandoned footwear factory in Lidköping, and will resume the manufacture of rubber footwear.

Aktiebolaget Stockholms Gummifabrik is the name of a 200,000 crowns (\$53,600) corporation recently organized in Stockholm to manufacture rubber goods.

HOLLAND.

Wiese & Co., importers of crude rubber and gutta percha at Rotterdam and Amsterdam, Holland, call our attention to recent changes in that firm. M. J. Overeinder, who had for many years power of attorney for the firm, has been admitted to the partnership, and F. A. F. De Gruyter has been granted power of attorney at the Amsterdam branch of the concern.

RUSSIA.

The Russian correspondent of THE INDIA RUBBER WORLD, in a letter published in the March, 1916, issue of this paper, stated that the Russian-French India Rubber, Gutta-Percha and Telegraph Works "Prowodnik," formerly of Riga, now in Moscow, had materially increased its capital. Subsequent information shows that this increase amounts to 5,000,000 rubles (\$2,575,000), the company's capital now being 23,000,000 rubles (\$11,844,000), instead of 18,000,000 rubles (\$9,270,000).

JAPAN'S COMMERCE IN CRUDE RUBBER AND RUBBER GOODS.

By Our Regular Correspondent.

THE official statistics of Japan's commerce in crude rubber and manufactured rubber goods shows a very gratifying increase over that of 1914. The volume of crude rubber imported amounted to nearly 4,000,000 pounds, as compared with less than 1,000,000 pounds the previous year, while in value the increase amounted to \$708,479. The official figures of the imports with their sources, as compared with those of 1914, are as follows:

From—	1914.		1915.	
	Pounds.	Value.	Pounds.	Value.
British India	406,676	\$223,637	1,114,441	\$470,329
Straits Settlements	1,646,556	\$787,300	2,017,176	\$863,593
Dutch India	13,034	1,678	299,774	113,083
Great Britain	234,500	159,312	352,164	136,285
United States	11,914	8,166	98,430	58,819
Other countries	2,582	1,786	21,565	13,109
Total	2,305,262	\$1,073,319	3,903,550	\$1,715,798

The first of the year importations were small on account of the embargo placed by the British government on all crude rubber exports from the British colonies. But this embargo was raised early in March, when an agreement was made with the Japanese government whereby it ruled that no crude rubber nor manufactured rubber goods should be exported from Japan to any country without the sanction of the British authorities. The result was that crude rubber was directly imported in April from the Straits Settlements and British India into Japan.

The main reason for the increased demand for crude rubber was due to the heavy exports of Japanese rubber goods to Russia, China, Great Britain and other countries, as well as to supply the deficiency at home because of the falling off of imports of rubber goods of foreign manufacture. The official figures of the imports of rubber goods show this decline of imports in many of the items of the following table:

IMPORTS OF RUBBER GOODS INTO JAPAN.

	1914.		1915.	
	Pounds.	Value.	Pounds.	Value.
Reclaimed and unvulcanized rubber	285,269	\$43,368	168,060	\$26,822
Dental rubber	20,464	39,142	15,527	29,003
Soft—				
Rods and cords	105,193	44,264	55,910	22,941
Plates and sheets	88,856	25,195	72,641	18,656
Tubes	73,460	30,525	49,004	15,120
Belts and beltings for machinery	39,432	17,677	28,490	10,356
Thread, strips, bands, rings and washers	57,473	52,924	36,878	45,660
Other soft goods	30,105	21,774	5,878	4,386
Hard—				
Lumps, bars or rods, plates and sheets	36,395	23,544	7,777	7,868
Other hard goods	15,080	10,541	11,304	2,512
Bicycle tires	182,226	215,950	37,348	40,735
Insulated electric wires:				
Armored with metals—submarine telegraphic and telephonic cables		463,245		154,637
Other armored cables	1,760,118	187,113	531,390	53,956
Flexible cords	14,330	4,730	40	31
Other cords	99,969	29,998	4,693	2,440
Rubber boots (pairs)	5,699	9,576	4,434	7,270
Overshoes (pairs)	25,343	12,488	21,500	11,454
Beltings and hoses	389,370	183,635	173,984	94,984
Waterproof tissue	19,874	14,933	24,740	16,637
Elastic webbing, cords and braids		32,178		26,592
Insulating tapes	56,532	21,267	48,118	18,524
Total		\$1,489,057		\$610,584

In addition to the above imports of foreign goods into Japan, automobiles and parts (including tires) were imported to the value of \$82,613 in 1915, against \$249,211 in 1914, and bicycles and parts (exclusive of tires) to the value of \$156,501 in 1915, against \$517,548 in 1914.

It will thus be seen that the imports of rubber goods decreased 59 per cent from those of 1914, and about 77 per cent from 1913 figures. This decrease is a source of congratulation to Japanese manufacturers owing to their greatly enlarged trade, showing that they are now producing rubber goods recognized by the people of this country as equal to those of foreign make, or nearly so, the exception being some special goods on which, however, it is hoped they will be enabled to improve their production so as to almost entirely replace those of foreign manufacture. It is a notable fact that as soon as the embargo was raised against exporting Japanese manufactured goods to any country at war with Great Britain, Japanese manufacturers took advantage of the opportunity to fill orders which they already had on hand for export, and immediately started to give a wider scope to their foreign trade in China and other parts of Asia, Russia, and also to Australia, England and the United States.

Figures showing exports of goods manufactured of rubber, as given in the official report include:

	1914.		1915.	
	Pounds.	Value.	Pounds.	Value.
Insulated electric wire,	993,999	\$196,928	1,920,654	\$449,776
Rubber tires for jirikishas and bicycles		\$43,135	2,512,969	1,706,315
Total		\$740,063		\$2,156,091

Other export figures include waterproof cloth for surgical use in the Russian army, to the value of \$50,000; various soft rubber articles for British India, to the value of \$15,000; dolls, balls, balloons, toys, etc., to the United States and other countries, to the value of \$100,000, and similar articles to Russia, to the amount of \$50,000; the aggregate total value of these and other goods wholly or partly of rubber amounting to over \$210,000.

The prices of Pale sheet plantation rubber varied considerably during the year, as will be seen by the following table:

PLANTATION RUBBER.

	Prices per pound.		Equivalent in cents.		Prices per pound.		Equivalent in cents.
	Yen.	Sen.			Yen.	Sen.	
January 20.....	1	10	55	July 21.....	1	26	63
February 27.....	1	21	61	August 26.....	1	20	60
March.....	1	21	61	September 22.....	1	16	58
April 27.....	1	20	60	October 27.....	1	24	62
May 21.....	0	20	60	November 26.....	1	50	75
June 22.....	1	23	63	December 16.....	1	53	79

MANUFACTURING SITUATION IN 1915.

Naturally, manufacturers were greatly hindered the first of the year by the shortage of crude rubber, but after the first of April imports were sufficient to enable them to run their factories to full capacity. Tire manufacturers benefited by the shortage of European goods, owing to the seizure of factories for uses of the armies. Some of the hard rubber manufacturers received orders for several thousand gross of poker chips and similar articles from Russia, and manufacturers of nursing nipples were enabled to export some 30,000 gross to British India. The United States sent orders for several hundred thousand gross of toy balloons, and Russia gave orders for waterproofed fabrics which required the consumption of more than a ton of crude rubber per month from May until the end of the year. All these, together with the very notable increase in the domestic demand, required manufacturers to push their works to full producing capacity. They had the same difficulty as manufacturers in other countries, owing to the greatly advanced cost of compounding ingredients. For instance, golden antimony and crimson antimony, because of the absence of imports from Great Britain, rose from 1 yen 20 sen [60 cents] a pound, to 4 yen [\$2] by the end of the year. These materials became so scarce that cinnabar was used as a substitute, and this has also advanced greatly in price because of the heavily increased demand for mercury. Zinc white, which cost 12 yen [\$6] per hundred weight in March and April, was quoted at 42 yen [\$21] by the end of the year, and machines, molds—in fact, nearly everything in the way of equipment, show proportionate advances.

CHANGES IN THE INDUSTRY.

Quite a number of new rubber factories were established in Japan during the past year. Seven of these are in Tokyo, eight in Osaka, Kobe and Hyogo. They are here listed.

Taisho Rubber Co., Ltd., Kitakamata, Tokyo. Capital \$25,000. Rubberized fabrics and goods.

Saito Rubber Cloth Works, 3 Chome, Kayabacho, Honjo, Tokyo.

Nipon Cristall Rubber Works, Tarashima, Tokyo. Dipped goods.

Chuo Rubber Co., Ltd., Komagomi-Sakashitacho, Tokyo. Capital, \$100,000. Molded specialties.

Kamada Rubber Works, Kami-Komagomi, Tokyo. Toy balls, heels, etc.

Taiheiyō Rubber Co., Kami-Meguro, Tokyo. Capital, \$6,000.

Kimura Rubber Works, 812 Somei, Tokyo. Soles, etc.

Hanhoku Rubber Works, Ebie, Sagisu-gun, Osaka. Capital, \$25,000.

Sango Shokai Rubber Works, Imamiya, Osaka.

Hinomaru Electric Wire & Rubber Co., Satsumabori-Minamicho, Osaka. Tires and insulated wire manufacture.

Kamada Rubber Manufacturing Co., Osaka.

Niwa Shoten Rubber Works, Osaka.

Futaba Rubber Co., Ltd. Fukiai-Kunika-dori, Kobe. Tires.

Toa Rubber Industry Co., Sugawara-dori, Hyogo. Capital, \$7,250.

Morinaga Rubber Works, Shiri-ike, Hyogo.

During the year the following concerns ceased business:

Nakajima & Co. (Tokyo), sold out to Saito Rubber Cloth Co.

Chuo Rubber Co. (Kami-Orchiae, Tokyo), whose factory was destroyed by fire and not rebuilt.

Kanto Rubber Cloth Co. and Teikoku Rubber Co., Limited (both in Tokyo), and Osaka Rubber Works, failed in business.

Teat & Co. (Kobe) is succeeded by the Standard Rubber Co.

It will thus be seen that though there were some trade misfortunes during the year, there is really an increased number of concerns in Japan who are manufacturing rubber goods of one description or another.

RUBBER CONDITIONS IN CEYLON.

By a Special Correspondent.

THE year 1915 was a very prosperous one for the rubber trade in Ceylon. Export figures show a remarkable expansion over 1914. Rubber exported from the island in 1915 amounted to 45,143,735 pounds as compared with 36,235,114 pounds in 1914, showing an increase of 8,908,621 pounds. Considering the restricted facilities of freight, these exports are truly remarkable, in regard to both demand and production.

A striking feature of our exports of crude rubber in 1915 is that the United States figures show an increase of 100 per cent over the previous year's record, being 18,585,890 pounds in 1915, as compared with 9,187,191 pounds in 1914.

Australia took 844,977 pounds of Ceylon rubber, as compared with 619,175 pounds in 1914. Offsetting these increases in part, the exports of crude rubber to the Continent of Europe show a decrease from 4,448,560 pounds in 1914 to only 925,732 pounds in 1915.

Russia purchased more Ceylon rubber in 1915 than in 1914. During 1915 we shipped to Russia 332,200 pounds of crude rubber as against 105,212 pounds in the previous year.

A feature of the Ceylon rubber trade in 1915 was the forward contracts by private treaty, large sales having been effected for 1916 at a rate of about 2.05 rupees [\$0.67] per pound. The subject of these forward contracts is being much discussed. We learn from London that shareholders rarely fail to criticize such contracts if there be a subsequent improvement in the price of rubber; at the same time, complaints are usually recorded if no contracts are made and the price of rubber afterwards declines. It is generally believed here that forward sales should be made whenever the price secured insures a reasonable profit. It is argued that selling forward is of importance to manufacturers, who can thus cover contracts for delivery of manufactured goods extending over a very long period and that, therefore, forward sales induce manufacturers to give preference to plantation rubber.

SCHOOL OF TROPICAL AGRICULTURE.

Probably one of the greatest events in the modern history of agriculture in Ceylon occurred on Saturday, January 15, when the School of Tropical Agriculture at Peradeniya was formally inaugurated by Sir Anton Bertram. The scheme was nearly 16 years old and was originated by Sir West Ridgeway, who first appointed a commission to consider what should be done with the Agricultural School then at Colombo. The object of the new school is to bring agricultural education within the reach of the natives.

COAPUSSELLAWA PLANTERS' ASSOCIATION.

This association held its annual meeting on January 16. According to its report the year just closed was an exceptional one, the crops of every estate showing a gain over 1914. This was doubtless due to a continuance of rainfall during June, July and August.

SALE OF RUBBER SHARES.

When the little boom of rubber shares in London occurred, late in 1915, colonial holders of such shares were placed at a distinct disadvantage, compared with their British fellow-investors, because of the ruling of the Home Government that unless holders of stock residing abroad could prove physical possession in Great Britain on September 14, 1914, they would not be permitted to sell their holdings in the London market. Because of this disadvantage shares can be purchased in Ceylon at a lower rate than is possible in London, but, as a matter of fact, there are practically no sales of sterling shares here. The British Government can prevent the sale of rupee shares in London, but they cannot prevent London purchasers remitting money to Ceylon and having rupee shares purchased here on their account.

CEYLON TAPPER PARING THE CUTS.

Thus the purpose of the government's restriction, the prevention of sending money out of Great Britain, is frustrated, and purchases of shares continue, in spite of this legal obstacle.

RUBBER EXPORTS TO AMERICA.

In the latter part of January a rumor reached us from London that the export of crude rubber direct to America from British ports in the East was to be prohibited. This report caused some commotion, but was generally received with skepticism, for many of us believe that Mincing Lane has certain reasons for readily accepting any reported embargo on direct shipments from the East. As far as I have been able to learn from investigations here, all that has happened up to the present is an increased difficulty in obtaining permits from London. Should the rumored prohibition actually go into effect, shippers here would find themselves in the same position as at the outbreak of the war, when a similar prohibition was actually put into effect. This embargo was short-lived, but, had it lasted, it is probable that its effects would not have been too severe upon

our exporters, as our rubber would have continued to reach the United States via London.

Here at Ceylon, we are aware that some rubber has found its way from the United States to Germany, but we cannot see in this the necessity of discriminating against direct exports from Eastern ports, and it is difficult to see how there can be less control over shipments received in America from the East direct, than over those passing through London. We feel that it is entirely a question of the American manufacturers keeping their faith with the British Government and not permitting rubber to get into the hands of German agents. If the American manufacturers have failed to protect what are in fact their own interests we cannot blame the British Government for taking whatever steps they believe necessary to prevent our rubber reaching the enemy.

However, from all one is able to learn here, there is no question of prohibiting the export of rubber from here to America, but the applications for export permits have become so numerous that it has been found necessary to do something to check the movement. Already this year large quantities of rubber have been loaded here for New York, San Francisco, Seattle and other American ports. During the past few weeks applications for export permits have been received in such large quantities in London that, had all of them been granted, the result would have been that practically the entire output of the East in the period in question would have been shipped to the United States.

BROOMHALL'S RUBBER CODE.

Soon after the outbreak of the war, the British Government prohibited the use of cable codes in foreign cablegrams. Later, concessions were allowed for all recognized codes, including Broomhall's Code for general purposes, but not the Rubber Edition. This omission, which was solely due to lack of agitation on the part of those interested, has been corrected and the British authorities now sanction the use of Broomhall's Rubber Code, which is much used by the rubber interests here.

PLANTERS' ASSOCIATION OF CEYLON.

The 62nd annual meeting of this association was held recently, and the report submitted by the committee for the year 1915 touched several interesting subjects. The first half of the year was quite favorable for harvesting rubber crops, but the remainder was decidedly inopportune, the production of most of the rubber estates being far behind their estimates. It has been found that the cost of tapping decreases as the yield increases, and the following table was submitted as giving the average costs for several years:

200 pounds per acre.....	20 cents per pound
300 pounds per acre.....	17 cents per pound
400 pounds per acre.....	13-14 cents per pound
Over 400 pounds per acre.....	10-13 cents per pound

It was found that some of the diseases which attacked the rubber trees were more virulent the past year, the principal ones being bark canker, leaf fall or *gleo sporium*, and die-back or renewed bark. This latter was the most serious, and was particularly severe during the wet weather. Various remedial treatments are being used experimentally, but no definite report as to their success was given. The increase of acreage under cultivation was very small. Thinning out is being continued on most estates, and it is believed that later on not more than 80 to 100 trees will be the rule, it having been found that in properly thinned out estates disease is less common and bark renewal much more rapid. The shortage of potash has brought about changes in fertilizing mixtures. A fair average yield per acre was pronounced to be 350 pounds where estates had been intelligently thinned out and cultivated. A few cases showed yields amounting to 500 pounds per acre.

RUBBER PLANTING IN THE FEDERATED MALAY STATES.

THE growth of the automobile industry has brought about a steadily increasing demand for high grade rubber. The world was long dependent upon South and Central America and the Congo region in Central Africa for its supplies of wild rubber. This condition is greatly changed today due to the successful cultivation in the Far East of the Para rubber tree (*Hevea Braziliensis*). The original experiments in rubber cultivation made in Kew, England, resulted in a new and prosperous development in the Far Eastern tropical regions. Nowhere in the world has the rubber tree been found to thrive more luxuriantly or to yield a more abundant flow of latex than in the Malay Peninsula. The growth of the industry has been so rapid in the past decade that it seems destined to outstrip tin mining as the leading industry of the Federated Malay States.

Rubber is the leading agricultural product of Malaya and the government, recognizing the importance of the new industry, has done much to encourage the taking up of land by planters. In the early days, loans were granted from the public funds, repayable on easy terms, and loans are still granted to approved applicants. One of the handicaps to the development of the country was the scarcity of labor. The native population was altogether inadequate to cope with the rapid rise of the rubber planting industry. The pioneer planters endeavored to overcome this difficulty by importing labor, mostly from India and China, and, to a lesser extent, from Java. The government has cooperated in this effort to increase the labor supply and now there is a steady influx of free imported labor supervised and regulated by government officials. There is a fairly constant ebb and flow among these laborers, but the treatment and wages they

and medical treatment of the laboring classes throughout the country. Water supply systems have been installed in new planting districts as fast as conditions permit. The ex-

COOLIES GATHERING LATEX.

cellent road system is rapidly extending to give access to new estates, and the railway department keeps pace with the agricultural development by opening up new territories and providing new sidings at convenient centers. An agricultural department under a highly qualified director and a staff of trained mycologists, entomologists and chemists cooperates with the planters in detecting and combating enemies of the rubber tree.

For all purposes other than mining, State land is alienated by the issue of a grant in perpetuity, or of a lease for a term not exceeding one hundred years, upon payment of premium or purchase money, in amount according to the position and nature of the property. An annual quit rent is also reserved in all cases, which rent may be revised periodically at intervals of thirty years. Everything is done by the government to facilitate opening up the land by planters.

In order to encourage small capitalists to take up land in the Malay States, the government has set aside small blocks of land for planting purposes, and arrangements have been made for assigning four young men to the forests and agricultural departments for periods of six months. During this time they have the opportunity of acquiring knowledge of the country, the people, their language and customs, as well as familiarizing themselves with market conditions.

Bulletins of the agricultural department give valuable information in regard to rubber cultivation and other agricultural subjects.

The following statistics show the growth of the rubber industry in British Malaya:

Malaya.	Acreage under Rubber.	Quantity Exported, Pounds.
1905.....	38,000	1,977
1906.....	89,230	935,056
1907.....	179,227	2,278,879
1908.....	241,138	3,539,922
1909.....	292,035	6,741,509
1910.....	362,853	14,368,863
1911.....	542,877	24,904,043
1912.....	621,621	42,462,401
1913.....	637,747 approx.	52,557,409
1914.....	653,873 approx.	68,761,280
1915.....	670,000 approx.	99,733,760

TAPPING ON A MALAY PLANTATION.

receive causes every man and woman returning to India or China to advertise favorably the Malay States, which results in bringing an increasing supply of laborers to the country.

Quarantine stations have been established by the government, which also exercises a praiseworthy care in the housing

Rubber Planting Notes.

DECLINE OF WILD RUBBER IN FRENCH INDO-CHINA.

WITH the development of Eastern rubber plantations, the gathering of wild rubber is becoming a rapidly declining industry. The recently published report of a French military, geological and topographical commission which explored the Laos country of French Indo-China in 1913, contains interesting notes on rubber gathering.

The Laos country is located in the French protectorate of Annam and Siam and embraces all the upper reaches of the Mekong river. Rubber vines, which furnish most of the crude rubber that is exported from Vinh and other parts of Annam, grow wild in the forests covering the slate hills of the central districts of the Laos country.

In these rubber districts most of the natives neglect all agricultural pursuits to devote themselves exclusively to the gathering of rubber, which they sell to French traders in such centers as Luang-Prabang, Vientiane, Nienkhong, Kham-Keut and Na-Pe.

The rubber sold at Luang-Prabang comes from Muong-Phoun, from the valley of the Nam-Ta (Vien-Ponkha) river and also from the forest districts of Siam. The Siamese rubber is carried on pack elephants to Thadua and from there down the river to Luang-Prabang.

The rubber marketed at Vientiane is obtained partly from the Muong-Phoun district and from the Pou-Nien mountains, which are parallel to the Mekong, south of Muong-Phoun. Nienkhong, Kham-Keut and Na-Pe receive their rubber from the mountains near Muong-Mo as well as from the Muong-Phoun district. The Muong-Phoun rubber reaches Nienkhong by pack horse caravans. The rubber purchasing season begins in January. In 1913 the natives were receiving from 1.20 to 2 Straits Settlements dollars per kilogram [30 to 50 cents per pound] for dry rubber.

From the trading centers the rubber is sent by river boats and parcel post to the ports of shipment on the seaboard.

The French explorers were unable to obtain any definite figures as to the quantities of rubber handled at the different trading points, but they learned that Nienkhong was by far the leading center and that Luang-Prabang was second in importance. Also that the industry was fast declining owing to the destructive methods of the native gatherers.

RUBBER WASHING IN WEST AFRICA.

At the present time difficulty is being experienced in the *Manihot* rubber industry in West Africa, apparently due to the over-washing of the product. *Manihot* rubber should be treated differently than *Hevea*, as it is much more resinous than the latter and is consequently softer. Repeated washings are said to result in loss of "nerve" and cause the formation of oxidized films, rendering the rubber unsuitable for first-class manufacture. Too extended drying in the producing country has been suggested as the cause of the oxidation of the rubber, as the water in *Manihot* rubber is supposed to contribute to its preservation.

South Cameroon rubber acts in a somewhat similar manner. It comes in small cubes that are damp and lose 30 per cent in weight. This rubber has long given good results to manufacturers. It is purchased by trade-marks and without samples.

EXPORT TARIFF ON CRUDE RUBBER FROM BRITISH EAST AFRICA.

The British "Customs Tariff Amendment (No. 3) Ordinance of 1915" reduces the export duty on rubber other than plantation rubber, from the British East Africa Protectorate, from 10 per cent ad valorem to 4 per cent ad valorem.

PUBLICATION OF "ALL-IN" COSTS BY RUBBER PLANTATION COMPANIES.

Rubber plantation companies, in general, place the so-called "all-in" cost of production of rubber before their shareholders. Opinions are divided, however, as to the wisdom of giving these details to the public. Officials of some plantation companies believe it injudicious to enable purchasers to learn the cost of production, reasoning that a buyer paying \$1.00 for an article which to his knowledge costs but 25 cents to produce will naturally make it his aim to reduce as much as possible the profit he knows the seller is making. By boasting of the low cost of production the rubber grower arms the rubber dealer with a weapon which the latter will use against him. The practice of publishing "all-in" costs is certainly peculiar, for in few other lines of business it is customary to take the public so completely into confidence as to the costs of production.

WORLD'S ACREAGE OF PLANTATION RUBBER.

It is estimated by the Rubber Growers' Association of London that the total area of planted rubber is approximately one and a half million acres, which is divided as follows: Malaya, 670,000 acres; Ceylon, 224,000 acres, Dutch East Indies, 517,000 acres; Southern India and other countries, 90,000 to 100,000 acres.

PARA RUBBER SEED.

According to the "Gardens' Bulletin," Straits Settlements, from observations over a period of eighteen years at the Botanic Gardens, Singapore, it is estimated that about 1,400 trees are required to yield 2,000 pounds of Para rubber seed, or 1,200 pounds of kernels. It was further noted that a large crop of seed is usually followed by an insignificant crop at the next seeding.

RUBBER PLANTING IN ST. LUCIA. B. W. I.

According to the annual report of Archibald J. Brooks, F.L.S., F.C.S., agricultural superintendent for St. Lucia, British West Indies, labor conditions in that island render the cultivation and preparation of rubber unprofitable although both *Castilleja elastica* and *Hevea Brasiliensis* grow and thrive well on the island. Samples of *Castilleja* rubber grown in St. Lucia were sent to the Imperial Institute in London, which reported it to be of good quality although of undesirable dark color and a rather high percentage of resin.

THE BATAVIA, JAVA. RUBBER TRADE ASSOCIATION.

This association recently published its first report, which covers the year 1915. Starting with 40 subscribers, 67 new ones were registered in the course of the year, bringing the total on December 31, 1915, to 107.

During the year covered by the report 21 auctions were held, rubber to the amount of 262 tons was offered, and 136 tons sold.

The report makes no mention of forward sales in Java during 1915, although there are reasons to believe many such sales were made.

BALATA POACHERS.

Some time ago seven or eight balata bleeders deserted from the service of the British Guiana Companies, crossed the Rupunni Savannah to the Brazilian side of the Takutu river, and there began bleeding operations on their own account. Using the old-time destructive methods of cutting down the bullet-trees, they soon had collected a considerable quantity of balata, estimated at 10,000 pounds, and are now reported to be on their way down the Rio Branco for Manaus.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED FEBRUARY 15, 1916.

- N**O. 1,171,449. Retreading old casings. Cornelius D. McGiehan, Jersey City, N. J.
- 1,171,202. Vehicle tire rim. W. L. Burgess, assignor to the Firestone Tire & Rubber Co.—both of Akron, Ohio.
- 1,171,503. Demountable rim. H. N. Carragher, Fall River, Mass.
- 1,171,597. Hard rubber storage battery separator. J. N. Davis, Denver, Colo.
- 1,171,652. Fountain pen. V. V. Riesberg, assignor of one-half to F. H. Dougherty—both of Philadelphia, Pa.
- 1,171,664. Metal reinforced rubber valve disk. W. F. Sebach, Huntington, Ind.
- 1,172,100. Fountain pen. C. M. V. Allenon, Nantes, France.
- 1,172,153. Spring wheel with cushion tire. C. S. Martin, Rockville, Md.
- 1,172,197. Hot water bag. C. P. Cook, Marshalltown, Iowa.
- 1,172,234. Resilient wheel with rubber cushioned hub. J. B. Drahonovsky, assignor to J. B. D. Holding Co.—both of Milwaukee, Wis.
- 1,172,242. Demountable rim. C. H. McKendree, assignor of one-tenth to E. H. Smith, one-tenth to F. P. Lane, one-tenth to W. A. Massingill, one-tenth to C. D. Arthur, and one-tenth to M. Sanders—all of Lakeview, Ore.

ISSUED FEBRUARY 22, 1916.

- 1,172,287. Locking device for demountable automobile wheel rims and the like. F. D. Miller, Jr., Webster Groves, assignor to Hill-Ko Rim Lock Co., St. Louis—both in Missouri.
- 1,172,392. Rubber heel plate. H. G. Robinson, Oakland, Cal.
- 1,172,425. Rim for vehicle wheels. R. S. Bryant, assignor to The Standard Welding Co.—both of Cleveland, Ohio.
- 1,172,450. Pneumatic suction cleaner employing a length of rubber tubing. W. T. Griffin, assignor of one-third to A. A. Hancock—both of Washington, D. C.
- 1,172,477. Safety valve for pneumatic tires. G. Mizener, Decorah, Iowa.
- 1,172,509. Rubber footwear retainer. T. C. Wilder, Cattaraugus, N. Y.
- 1,172,543. Piston rod packing formed of alternate interlocked layers of fabric and rubber. C. I. E. Mastin, Midland Park, N. J.
- 1,172,552. Waterproof girth guard. G. L. Pierce, Brooklyn, N. Y., assignor to A. Spaulding & Bros., New York City.
- 1,172,573. Emergency tire composed of links and block fillers. A. J. Westburg, Springfield, Ill.
- 1,172,610. Resilient wheel. M. F. Kettler, assignor to Downing Pneumatic Wheel Co.—both of Houston, Tex.
- 1,172,671. Detachable rubber heel for footwear. C. H. Chapman, Winchester, Mass., assignor to Chapman Detachable Rubber Heel Co., a corporation of Maine.
- 1,172,879. Apparatus for administering oxygen to persons in a state of collapse by asphyxiation or other causes. R. H. Davis, London, England.
- 1,172,889. Dyeing comb having a compressible reservoir. C. M. Holden, San Francisco, Cal.
- 1,172,927. Combination bathing cap and bag. F. A. Bloch, New York City.
- 1,172,996. Elastic waist adjusting band. W. C. Hynard, assignor to Hynard & Jung Co.—both of New York City.
- 1,173,008. Pressure regulator for pneumatic tires. G. D. Lewis, Genesee, Pa.
- 1,173,032. Tooth brush formed of a plurality of indented elastic layers. H. Reiche, Millstone, N. J.
- 1,173,061. Fire hose coupling. T. Trelogan, Hancock, Mich.
- 1,173,085. Moistening device with perforated rubber top. D. G. Beeching, New York City.
- 1,173,088. Friction plug rubber heel. F. Berenstein, Chelsea, Mass.
- 1,173,124. Rubber tread vehicle wheel. E. G. Schleicher, Stamford, Conn.

ISSUED FEBRUARY 29, 1916.

- 1,173,176. Nursing bottle and nipple. M. C. Coombs, New York City.
- 1,173,211. Spring hose coupling. W. F. O'Donnell, Trenton, N. J.
- 1,173,221. Split rim for vehicle wheels. N. Schenk, St. Louis, Mo.
- 1,173,222. Demountable rim for vehicle wheels. N. Schenk, St. Louis, Mo.
- 1,173,243. Combination demountable rim and inflexible band. E. K. Baker, assignor to Universal Rim Co.—both of Chicago, Ill.
- 1,173,287. Rubber welt for shoes. J. E. Lucas, Brockton, assignor to F. E. Woodward, Yabon—both in Massachusetts.
- 1,173,349. Pocket flask comprising an endless elastic band. J. W. Hawkins, Mundfordville, Ky.
- 1,173,424. Detachable tire tread. G. A. Hagstrom, Kansas City, Mo., and E. Hagstrom, Chicago, Ill.; said E. Hagstrom assignor to said G. A. Hagstrom.
- 1,173,482. Inflatable life preserver. C. O. Carlson, Manor, Tex.
- 1,173,502. Combined pneumatic tire and protector. J. F. Geisendorfer, Weimar, Calif.
- 1,173,538. Typewriter pad of cellular or spongy rubber. L. R. Roberts, Rutherford, N. J., assignor to Underwood Typewriter Co., New York City.
- 1,173,561. Bath mat. E. R. Crooker, Los Angeles, Calif.
- 1,173,696. Health shoe comprising a strip of elastic material adapted to act as an arch support. J. Zerg, assignor of one-half to H. J. Roseant—both of Philadelphia, Pa.
- 1,173,755. Collapsible drinking cup. W. O. Straight, Pullman, Wash.

- 1,173,790. Vehicle wheel comprising a plurality of cushions interposed in annular formation. F. A. Frommann, assignor to O. Frommann—both of Chicago, Ill.
- 1,173,814. Resilient wheel tire. J. L. Plant, Malone, N. Y.
- 1,173,853. Protector for pneumatic tires. W. H. Paul, Baltimore, Md.
- 1,173,865. Fountain pen. F. C. Ries, Macon, Ga.
- 1,174,028. Resilient vehicle tire. W. B. Buckley, Washington, D. C.

ISSUED MARCH 7, 1916.

- 1,174,054. Boot or shoe comprising a rubber inner-sole of silk and a sole of rubber vulcanized to the sheet. G. F. Butterfield, assignor to G. L. Butterfield—both of West Newton, Mass.
- 1,174,109. Hard rubber mouthpiece for smoking pipes. O. Wartemann, New York, assignor to Traun Rubber Co., College Point—both in New York.
- 1,174,117. Tire valve. J. A. Bowden, Los Angeles, Cal., assignor to A. Schrader's Son, Inc., New York City.
- 1,174,166. Rubber hip boot. W. P. Kilner, Buffalo, N. Y.
- 1,174,168. Tire valve. H. P. Kraft, New York, and M. C. Schweinert, West Hoboken, N. J.
- 1,174,170. Pneumatic tire comprising superimposed laminations of rubber and metal. M. E. Lessem, Cape Girardeau, Mo.
- 1,174,179. Hot water bottle, stopper and heating attachment. C. A. Rickards, Chicago, Ill., assignor to A. Schrader's Son, Inc., New York City.
- 1,174,238. Pneumatic tire casing. B. C. Dowse, Cudahy, Wis.
- 1,174,254. Tire repair device. C. F. Jenkins, Washington, D. C.
- 1,174,350. Twin tire wheel rim. A. A. Remington and J. G. Sweeney—both of Birmingham, England.
- 1,174,359. Rubber gasket with inner ring. G. M. Shaffer, Denver, and E. A. Franklin, Fort Morgan—both in Colorado.
- 1,174,380. Wheel rim. W. P. Bailey, Mill Valley, Calif.
- 1,174,397. Sole pressing form comprising a rubber pad. H. A. Davenport, Brockton, Mass., assignor to United Shoe Machinery Co., Paterson, N. J.
- 1,174,430. Horseshoe pad. A. McTernan, Andover, and J. A. Hale, Boston, assignors to McTernan Rubber Manufacturing Co., Reading—both in Massachusetts.
- 1,174,476. Pneumatic life preserver. B. Cohen, New York City.
- 1,174,556. Inflatable life preserver. B. Franklin, assignor to American Life Buoy Co.—both of Chicago, Ill.
- 1,174,557. Inflatable life preserver. B. Franklin, assignor to American Life Buoy Co.—both of Chicago, Ill.
- 1,174,619. Rubber heel retaining grip. W. M. Scholl, Chicago, Ill.
- 1,174,620. Cushion heel. W. M. Scholl, Chicago, Ill.
- 1,174,621. Resilient heel. W. M. Scholl, Chicago, Ill.
- 1,174,780. Smoke helmet with air tube and respirator. J. A. Tychon, Cloquet, Minn.
- 1,174,799. Method of repairing boots and shoes. J. W. Arthur, Warren, Ohio.
- 1,174,856. Filler for automobile tires. F. A. Hager, Portland, Ore.
- 1,174,909. Tire shoe or casing patch. G. L. Stuart, San Diego, Cal.

ISSUED MARCH 14, 1916.

- 1,174,954. Rubber tire in hand form. M. O. Anthony, assignor to The Tagograph Co.—both of New York City.
- 1,174,968. Wheel rim. D. I. Canary, Oak Park, assignor of one-half to C. M. Richter, Chicago—both in Illinois.
- 1,174,976. Adjustable elastic band for garments and the like. T. R. Gains, Montreal, Quebec, Canada.
- 1,175,054. Nipple for nursing bottle. H. C. Dunfee, St. Albans, W. Va.
- 1,175,055. Resilient wheel comprising a pneumatic tube. J. L. Firm, Berwyn, Ill.
- 1,175,095. Spring. S. G. Walker, assignor of one half to R. Ruffner—both of Welch, W. Va.
- 1,175,151. Resilient vehicle wheel with solid rubber tire. S. Johnstone, Sacramento, Calif.
- 1,175,154. Cushion tire. A. S. Krotz, Janesville, Wis.
- 1,175,240. Elastic garment support. F. A. Cook, Grand Rapids, Mich.
- 1,175,249. Detachable massaging device for brushes and the like. F. Eisenhut, Newark, N. J.
- 1,175,373. Elastic tube for fire hose. H. C. Noack, Chicago, Ill.
- 1,175,387. Pedal pad. J. Stanley, Newark, N. J.
- 1,175,411. Demountable rim for tires. F. J. Croop, Warsaw, Ind.
- 1,175,431. Cushion tire. J. R. Gammeter, Akron, Ohio, assignor to The B. Goodrich Co., New York City.
- 1,175,491. Bathing appliance. J. Wald, New York City.
- 1,175,532. Hose coupling. C. H. Lambkin, New York City.
- 1,175,606. Cushioning material for absorbing shock. L. P. Clutter, Beaver Falls, Pa.
- 1,175,624. Tire casing formed of layers of rubber and granular particles of aluminum distributed between the layers of fabric. J. H. Fawkes, Portland, Ore.
- 1,175,671. Resuscitator comprising a sheet of flexible elastic material. T. E. Acklen, Memphis, Tenn.
- 1,175,684. Detachable resilient heel. A. Beckelman, New York City.
- 1,175,799. Respirator. F. Niessner, Johnstown, Pa.
- 1,175,866. Internal rubber sole comprising a forepart, a thicker heel portion and a connecting shank portion. C. H. Hill, Lynn, Mass.

- 1,175,884. Rust cap for valve stems. G. E. Fisher and A. Bailey—both of Plainfield, N. J., assignors to Revere Rubber Co., Providence, R. I.
- 1,174,995. Apparatus for impregnating tire fabric. F. W. Kremer, Carlstadt, N. J.
- 1,175,517. Machine for forming hose bands. H. Gibbs, assignor to W. D. Allen Manufacturing Co.—both of Chicago, Ill.
- 1,175,681. Pneumatic tire mold. G. E. Batcheller, New York City.

THE DOMINION OF CANADA.

ISSUED DECEMBER 31, 1915.

- 166,425. Rubber glove. The Sterling Rubber Co., assignee of J. B. Ahler—both of Guelph, Ontario, Canada.
- 166,468. Tread for footwear. P. G. Dunham, Tilbury, Ontario, Canada.
- 166,497. Vehicle tire fitted with interior spring blocks in place of an inner tube. V. Mongeau, Outremont, Montreal, Quebec, Canada.
- 166,515. Suction tread for footwear. R. Smith, Sherbrooke, Quebec, Canada.
- 166,521. Tire pressure regulator. C. H. Thayer, Elmira, New York City.
- 166,554. Hollow resilient automobile tire. The Ruckings Tyre Syndicate, Limited, Westminster, assignor to H. Diamond, 14 Westbourne Terrace Road, Middlesex—both in England.
- 166,593. Elastic inserts for skirt bands. E. Caslar, Philadelphia, Pa.
- 166,597. Pneumatic tire for automobiles. W. Henry, Clay, Cameroon, Colo.
- 166,633. Nursing brace having a front portion of light waterproof material. L. Lawrence, Vancouver, British Columbia, Canada.
- 166,671. Military coat. The Canadian Consolidated Rubber Co., Limited, assignee of L. Federman—both of Montreal, Quebec, Canada.
- 166,718. Air tube for pneumatic tires. J. A. Burgess, Toronto, Ontario, Canada.
- 166,754. Curtain device for bath tubs. A. E. Lang, Buffalo, N. Y.
- 166,879. Tire core. H. J. S. Keim, Catspaug, Pa.
- 166,899. Automobile tire tool. W. J. Reid, Gananque, Ontario, Canada.
- 166,905. Tire inner tube. E. L. Scranton, Rising Sun, Ind.
- 166,906. Cushion tire. W. Shimon, Pocahontas, Iowa.
- 166,920. Tire comprising an outer casing of rubber and a filler of hollow rubber balls. H. E. Wolken, Leigh, Nebraska.

THE UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent upon the filing of the application.

*Denotes Patents for American Inventions.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, FEBRUARY 16, 1916.]
- 21,241 (1914). Device for wiping automobile glass wind shield. E. Black; 188 Clarendon Park Road, Leicester.
- 21,312 (1914). Parachute with waterproof casing and rubber rings. E. R. Calthorp, Eldon Street House, Eldon street, London.
- *21,386 (1914). Life saving apparatus comprising a waterproof bag. P. M. McElroy, 1 Bonner place, New York City.
- 21,458 (1914). Toy with rubber tubular legs. J. Isaacs, Highgate Park Works, Alcester street, Birmingham.
- 21,489 (1914). Apparatus with rubber mouthpiece and gas bag for administering gases. P. S. O'Donnell, Plaza Hotel, Chicago, Ill.; H. E. C. Van Ick, 36 Hinde Road, Harrow, Middlesex, and A. D. Wheatley, 26 South Audley street, London.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, FEBRUARY 23, 1916.]
- 21,502 (1914). Inflatable swimming belt, etc. J. J. Pritchard, 4 Reddings Road, Musely, Birmingham.
- *21,535 (1914). Tire casing with cork filling. E. M. Deal, 5713 Spruce street, and I. J. Brooks, 304 South Tenth street—both in Philadelphia.
- 21,616 (1914). Rubber padded non-slip attachment for horseshoes. A. J. Sumner, Blanford Villa, Cheltenham, Gloucestershire.
- 21,633 (1914). Protective band for inner tubes. E. K. Fuller, Hemmingsford Grey, St. Ives, Huntingdonshire.
- 21,656 (1914). Combined waterproof cloak and sleeping bag. M. Earle, 53 Queen's Road, St. John's Wood, London.
- 21,767 (1914). Endless bathband, belt, garter, etc., having an elastic section. R. Neill and P. J. Des—both of 20 Great Charlotte street, Liverpool.
- 21,778 (1914). Flexible rubber connection for coupling metal pipes. J. S. Spring, Kentworth, Osborne Road, South Farnborough, Hampshire.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, MARCH 1, 1916.]
- 21,850 (1914). Waterproof trench coat adapted for wear under an overcoat; also for use as a ground sheet. A. H. Mills (trading as A. H. Mills & Co.), 9 Grace street, and E. C. Laverack, 130 Hyde Park Road—both in Leeds.
- 21,867 (1914). Milking machine test cups, the lining of which consists of a plain rubber tube. C. H. Davis, 10 Church Place, Wanganui, New Zealand.
- 21,874 (1914). Balata impregnated driving and conveyor belts. Aktieselskabet Rolund's Fabrikker, 19 Sortebroetorvet, Odense, Denmark.
- *21,800 (1914). Fountain syringe for irrigation purposes. Meinecke & Co., 48 Park Place, New York City, assignees of C. W. Meinecke, 31 Sherman Place, Jersey City, N. J.
- 21,930 (1914). Waterproof apron for use on carriages, etc. A. W. Austen, 48 A Station Road, Maidstone.
- 22,031 (1914). Blanket capable of being converted into a sleeping bag or waterproof cape. D. F. Burrage, "Langmoor," Egmont Road, Sutton, Surrey, and Louthby Supply Association, 5 Moorgate street, London.

- 22,059 (1914). Guard for fountain pens to be attached to the wearing apparatus by an elastic cord. W. Farquhar, 40 Westbourne Gardens, Bayswater, London.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, MARCH 8, 1916.]

- 22,117 (1914). Device for lessening effects of collisions comprising rubber ring and jacking. P. Penza, 17 Via Barbaziana, Bologna, Italy.
- 22,214 (1914). Hose made with rubber skin. M. Buckley, 8 Brook street, Thornton Lodge, Huddersfield.
- *22,262 (1914). Vehicle spring with rubber bumpers. J. Frosig, 751 West Fourth street, and L. W. Walstrom, 611 Eureka avenue—both in Reno, Nev.
- 22,267 (1914). Life-saving waistcoat with an inflatable tube of rubber. Gieve, Matthews & Seagrove, 22 The Harb, Portsmouth, and J. W. Gieve, 65 South Molton street—both in London.
- 22,401 (1914). Toy. H. D. Evans, 8 Brockenhurst Gardens, Addiscombe, Croydon.
- 22,433 (1914). Rubber bands used in laying subterranean mines. Soc. Schneider et Cie, Le Creusot, Saone-et-Loire, France.

THE GERMAN EMPIRE.

PATENTS ISSUED (With Dates of Validity).

- 290,213 (August 19, 1913). Surgical sewing material. Supplement to patent No. 287,150. Firm of M. Esbach, Klingenthal-in-Sa.
- 290,216 (May 8, 1914). Packing disc. Firm of Paul Lechler, Stuttgart.
- 290,217 (December 16). Resilient tire. Eann McDermott Deal and John Joseph Brooks, Philadelphia, Pa. U. S. A. Represented by M. Schmetz, patent lawyer, Aix-la-Chapelle.

- 290,730 (March 19, 1912). Stamped fastening button for attaching rubber sheets to stone in earth dams. Adolf Pochwaldt, 162, Hauptstrasse, Berlin-Schöneberg.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

- 477,823 (June 26, 1915). Elastic tire for vehicle wheels. T. H. Kep.
- 477,853 (March 2). Elastic wheel for automobiles, motor cycles and other vehicles. Miss E. Murray.
- 477,887 (March 5). Improved elastic tires. L. E. Pickett.
- 477,997 (May 12). Improved buffer springs, coupling springs and others, made up with rubber. F. Spencer.
- 478,059 (March 16). Pneumatic tire casing. D. R. Shewan.
- 478,067 (March 17). Improved anti-skid devices for automobile wheels. The National Steam Car Co., Limited, and Crawley-Booevy.
- 478,093 (March 19). Elastic wheel with a hollow rim. DeLaudance y Salazar.
- 478,100 (March 20). Improvements in vehicle wheels. S. Ramsbotham.
- 478,161 (March 26). Mud guard for automobiles and other vehicles. P. Christensen.
- 478,216 (March 31). Improvements in elastic wheels for vehicles. B. O. Bergensen.
- 478,224 (July 24, 1914). New application, to the wheels of automobiles and other vehicles, of means to decrease the heating of the rubber, the "blowing-out" of pneumatic tires and to make and replace parts of tires. L. A. Mousseau.
- 478,231 (April 1, 1915). Elastic tire with segments (rings), for vehicle wheels. E. Thorez.

NEW ZEALAND.

ISSUED JANUARY 20, 1916.

- 36,807. Puncture proof inner tube. A. E. Henderson, 503 Kent Building, Toronto, Canada.

TRADE-MARKS.

THE UNITED STATES.

ISSUED FEBRUARY 15, 1916.

- 81,399. Abercrombie & Fitch Co., New York City. The initials A & F. For tennis balls, footballs and sporting goods.
- 88,841. The Mechanical Rubber Co., Jersey City, N. J. The word *Champion*. For garden hose composed of rubber and rubber fabric.
- 90,098. The Portage Rubber Co., Barborton, Ohio. The word *Summit*. For rubber vehicle tires.
- 90,620. Samstag & Hilder Bros., New York City. Illustration of a seal with a crown and lion with the word *Colonial*. For dress shields, hose supporters, rubber hair pins, rubber hair pins, etc.
- 91,163. Franklin-Caro Co., Richmond, Va. Representation of a beehive and a bee with the words *Honey Fruit*. For chewing gum.
- 91,775. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Celia*. For light weight rubber shoes.
- 91,776. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Ada*. For light weight rubber shoes.
- 91,777. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Sheba*. For light weight rubber shoes.
- 91,882. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Amey*. For light weight rubber shoes.
- 91,884. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Inez*. For light weight rubber shoes.
- 91,885. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Samuel*. For light weight rubber shoes.
- 91,886. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Kemo*. For light weight rubber shoes.

- 91,887. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Fawn*. For light weight rubber shoes.
- 91,888. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Cherub*. For light weight rubber shoes.
- 91,973. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Nemo*. For light weight rubber shoes.
- 91,974. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Tris*. For light weight rubber shoes.
- 91,975. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind. The word *Le*. For light weight rubber shoes.

ISSUED FEBRUARY 22, 1916.

- 84,001. The B. F. Goodrich Co., New York City. The initial *G* between two sprigs. For raincoats and rubber boots and shoes.
- 90,685. United & Glue Rubber Manufacturing Co., Trenton, N. J. Illustration of a circle with the word *Outproof*. For rubber hose, belting, packings, rubber dredging sleeves, etc.
- 90,782. Automatic Selling & Advertising Co., New York City. Illustration of a diamond printed in red and blue with the words *Al-Chew-Tra-Bis-Gum*. For chewing gum.
- 90,900. J. P. Gorman, New York City. Illustration of a chaffeur with the casing of a tire in his hands and the words *Rubber Putty First "Fires Everlasting of Rubber"*. For plastic compounds, called "Rubber Putty" for mending rubber articles.
- 91,959. Garter Plate Co., Inc., New York City. Representation of a garter with the word *King*. For garters.

ISSUED FEBRUARY 29, 1916.

- 88,743. G. W. McGann, Bristol, R. I. The word *Vulcan*. For a pipe joint compound.
- 95,531. Pirrelli & Co., Milan, Italy. Illustration of a circle with a star in the center same as the initials *P & C M* and the word *Stella*. For surgical syringes.
- 90,857. United Drug Co., Boston, Mass. Illustration of a signet with the word *Sigret*. For rubber goods.
- 91,666. J. P. Smith Shoe Co., Chicago, Ill. The illustration of a spear with the word *Chicagoan*. For shoes of canvas and rubber and of leather and rubber, etc.

ISSUED MARCH 7, 1916.

- 79,715. Maryland Rubber Co., Baltimore, Md. Illustration of a man with a globe on his shoulders with the word *Afraz*. For druggists' supplies.
- 90,670. The British Aeroplane Varnish Co., Limited, Newcastle-upon-Tyne, England. The word *Planoline*. For preparation for the preservation and waterproofing of textile fabrics, leather, etc.
- 90,671. The British Aeroplane Varnish Co., Limited, Newcastle-upon-Tyne, England. The word *Titanine*. For filling and waterproofing material for the textile wings of aeroplanes, airships, and other aircraft.
- 91,069. The Goodyear's Metallic Rubber Shoe Co., Naugatuck, Conn. The word *Naugosole*. For rubber boots and shoes.
- 91,488. E. L. Swaine, Los Angeles, Cal. Illustration of a series of miniature pictures with the words *Magic Gum*. For chewing gum.
- 92,030. United States Tire Co., New York City. The word *Usco*. For rubber tires for vehicles.
- 92,072. United States Tire Co., New York City. The word *Royal*. For rubber tires for vehicles.

ISSUED MARCH 14, 1916.

- 90,769. C. W. Meinelcke, New York City. Illustration of a nippie with a band around the neck of same and the words *Anti-Colic Brand*. For nippies.
- 91,428. Independent Gum Co., Memphis, Tenn. The word *Spearmint* in white letters on a black background. For chewing gum.
- 91,471. F. V. Canning, New York City. The word *Pepinets*. For chewing gum.
- 92,306. Samstag & Hilder Bros., New York City. A coat of arms with the word *Colonial*. For elastic webbing, etc.

THE DOMINION OF CANADA.

ISSUED DECEMBER 31, 1915.

- 21,282. Canadian Consolidated Rubber Co., Limited, Montreal, Quebec. The word *Rubberhide* on the outline of the sole of a shoe. For footwear.
- 21,318. Gutta Percha & Rubber, Limited, Toronto, Ontario. The word *Efficiency*. For mechanical rubber goods.
- 21,334. Willard's Chocolate's Limited, Toronto, Ontario. The words *Butter Nut* on disk encircled by band bearing the words *Cheering Gum Brand*. For chewing gum.

DESIGNS.

THE UNITED STATES.

ISSUED FEBRUARY 15, 1916.

- 48,561. Tread surface for tires. P. S. Malickson, Philadelphia, Pa.
- 48,571. Pneumatic vehicle tire. R. G. Nall, Indianapolis, Ind., assignor to G. & J. Tire Co., a corporation of New Jersey.
- 48,586. Rubber brush. O. Eick, St. Louis, Mo.

ISSUED FEBRUARY 29, 1916.

- 48,627. Rubber boot. M. H. Clark, Milford, Conn., assignor to The Good-year's Metallic Rubber Shoe Co., a corporation of Connecticut.
- 48,636. Pneumatic tire. R. Griffith, Akron, Ohio.
- 48,690. Rubber tire. E. C. McGraw, East Palestine, Ohio.
- 48,730. Rubber tire. E. C. McGraw, East Palestine, Ohio.

THE DOMINION OF CANADA.

ISSUED DECEMBER 31, 1915.

- 3,948. Tread surface for rubber tires. Hyslop Brothers, Limited, Toronto, Ontario.

Review of the Crude Rubber Market.

NEW YORK.

GENERALLY quiet tone has prevailed in the crude rubber market during the month of March. Trading has been steady and the volume of business comparatively small. The large manufacturers appeared to be limiting their purchases to moderate quantities, while dealers were equally conservative in their operations. Quotations were generally firm with minor fluctuations that resulted in an average decline of 2 to 3 cents during the month.

Shipments of plantation rubber from the East by way of the Pacific coast continue to increase. This is an entirely new route and just when the rubber in transit will reach its destination is uncertain. The intercontinental railroads are short of cars and congested with freight. Rubber that was shipped from the East in December last, is only just arriving, having consumed 8 to 10 weeks in transit across the continent. It is extremely doubtful, therefore, that very much rubber will be shipped in the future by this route.

New York arrivals have shown increasing volume. The total figures for the first three weeks of March were 6,200 tons divided as follows: Plantations from Singapore and Ceylon 1,670 tons; Batavia 645 tons; London and Liverpool 1,435 tons; Paras from Brazil 1,990 tons; West coast 35 tons; Africans 350 tons; Centrals 75 tons. Para sorts from Brazil appear to be in the lead thus far for the month. The present indications are that March arrivals will exceed those of February, which amounted to 6,885 tons. The steamship Suldanza da Gama cleared from Para for New York on February 5, with about 200 tons of rubber. This steamer has not yet arrived and according to rumors, never will, as the cargo is destined for Germany.

On March 1 First latex, nearby, was quoted at 92 cents, May-June deliveries sold at 90 cents and July-December at 86 cents. Amber and Brown crepes ranged from 87 cents to 90 cents, depending on the color and position. Smoked sheets, nearby, sold for 91 cents. May-June deliveries sold for 89 cents and July-December for 86 cents. Nearby Upriver fine and Upriver coarse were quoted at 77 cents and 60 cents, respectively. Nearby Islands fine and Islands coarse were quoted at 70 cents and 38 cents, respectively. Upper cauchó ball, nearby, was 60 cents. Cameta spot sold for 40 cents.

During the month the decline was noticed in the various sorts, and on March 30 First latex, nearby, sold for 88½ cents. Futures were not quoted. Amber and Brown crepes sold at 86 to 87 cents. Smoked sheets, nearby, were quoted at 88 cents. Futures were not quoted. Upriver fine and Upriver coarse were 74½ cents and 58 cents. Nearby Islands fine and Islands coarse were 69 and 38 cents. Upper cauchó ball, nearby, sold for 59 cents, and Cameta, nearby, 40 cents.

LONDON.

A review of the London market for the past month failed to disclose any unusual features worthy of special mention. The underlying tone has been quiet with prices firm and practically unchanged. The actual rubber movement during the past few weeks has been comparatively small. London plantation imports during February amounted to only 3,831 tons, as against 5,360 tons in January, and 5,722 tons in February, 1915. Stocks for February last were 7,342 tons, as compared with 7,351 tons in January and 7,172 tons in February, 1915.

SINGAPORE.

The effective solution of the freight situation seems to be as remote as ever. Ocean rates have advanced and may go higher. The relief promised by the government's proposed plan of commandeering the entire British tonnage is too far distant. Meanwhile shipments to the United States are being diverted by the way of Japan and the Pacific coast. Between January 6 and

February 1, 4,400 tons were shipped from Singapore by this route.

We are advised by cable that 955 tons of rubber were sold at the Singapore auctions on March 9, 16 and 23. Average price obtained for Pale crépe was 78 cents and for Smoked sheet 80 cents. Market steady and prices firm.

CEYLON.

During the period of February 17 to February 26, 7,822,641 pounds of rubber were exported, against 5,297,000 pounds in the same period of 1915, an increase of 2,525,641 pounds.

New York

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, New York City), advises as follows: The market for commercial paper has continued very free through March, there being a good general demand, the best rubber names selling readily at 4 per cent, and those not so well known 4½ to 5½ per cent, according to grade.

NEW YORK PRICES FOR MARCH.

	1916	1915	1914
Upriver fine	\$0.70-78	\$0.58-0.60	\$0.73-0.76
Upriver coarse	56-59	45-47	43-46
Islands fine	68-71	51-53	48-50
Islands coarse	34-40	30-32	31-33
Camra	36-40	34-37	35-36

* Figured only to March 27.

Plantation Rubber from the Far East.

TOTAL EXPORTS FROM MALAYA.

(From January 1, 1915, to dates named. Reported by Barlow & Co., Singapore. These figures include the production of the Federated Malay States, but not of Ceylon.)

To—	Singapore.	Malacca.	Penang.	Port Swettenham.	Totals.

EXPORTS OF CEYLON GROWN RUBBER.

(From January 1 to February 14, 1915 and 1916. Compiled by the Ceylon Chamber of Commerce.)

To—	1915.	1916.
Great Britainpounds 3,494,859	2,096,550
Canada and Newfoundland340,140
Russia947,919	18,695
France35,840
Japan21,656	56,576
Australia17,101
United States	3,290,537
Totals	4,004,315	5,462,358

(Same period 1914, 3,623,505 pounds; same period, 1913, 1,839,521.) The export figures of rubber given in the above table for 1914 include the imports

re-exported. (These amount to \$41,650 pounds.) To arrive at the total quantity of Ceylon rubber exported for that year, deduct these imports from the total exports. The figures for 1915 and 1916 are for Ceylon rubber only.

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram from Kuala Lumpur gives the export of plantation rubber for the Federated Malay States for the month of February at 5,307 tons. This is the highest amount exported in one month from these States, and compares with 4,471 tons in January, and 3,411 tons in the corresponding month last year. Appended are the comparative statistics for three years:

	1914.	1915.	1916.
Januarytons 2,542	3,473	4,471
February2,354	3,411	5,207
Totals4,906	6,884	9,678

SINGAPORE.

Guthrie & Co., Limited report [February 9, 1916]:

The rubber catalogued for today's auction met with a good inquiry and of 298 tons offered 270 tons changed hands.

Demand throughout was good and all prices show substantial improvements.

Fine ribbed smoked sheet sold up to \$174, an increase of \$19, while

Fine crepe at \$172 showed an advance of \$15 on the week.

Fine and good brown crepes were wanted and for most parcels there was keen competition.

The following was the course of values:

	In Singapore Picul.*	Sterling equivalent per pound in London.	Equivalent per pound in cents.†
Sheet, fine ribbed smoked	\$165@174	3 1/8 @ 3 3/8	76.27@80.07
Sheet, fair to good ribbed
Sheet, fine ribbed smoked	160@165	3 0/8 @ 3 1/8	74.24@76.27
Sheet, plain smoked	161@166	3 0/8 @ 3 1/8	74.50@76.27
Sheet, ribbed, unsmoked	159@167	3 0/8 @ 3 1/8	73.73@77.03

* Picul = 133 1/3 pounds.

† Figures at standard rate of exchange, 1s. = 24.3 cents.

Quoted in S. S. dollars = 2/4 1/2 (55 cents).

MARKET CABLE SERVICE FROM SINGAPORE.

The following reports of the weekly auctions held at Singapore have been cabled by the Waterhouse Co., Ltd.:

Date.	Crepe.	Smoked Sheet.	Total	Market.
Mar. 9, cents	78.5	78.5	851,000	Prepared for an advance.
Mar. 10.....	79.3	78.5	804,000	Steady, improved demand.
Mar. 23.....	77.7	77.7	504,000	Weak demand.

STRAITS SETTLEMENTS RUBBER EXPORTS.

The Colonial Secretary cables from Singapore that the export of plantation rubber from Straits Settlements ports for the month of February amounted to 3,359 tons compared with 4,443 tons in January and 2,741 tons in the corresponding month last year. Appended is a comparison of the statistics for three years:

	1914.	1915.	1916.
Januarytons 1,181	2,576	4,443
February1,703	2,741	3,359
Totals2,884	5,317	7,802

These figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements such as Borneo, Java, Sumatra and the non-Federated Malay States as well as rubber actually exported from the Straits, but do not include rubber exports from the Federated Malay States.

RUBBER AND GUTTA EXPORTS FROM JAVA AND MAURA.

CUSTOM HOUSE STATISTICS.

PORT OF NEW YORK—JANUARY, 1916.

Imports:	Pounds.	Value.
India rubber	19,452,793	\$11,306,390
Balata	261,764	96,437
Gutta percha	136,936	54,786
Gutta jelutong (Pontianak)	1,333,876	16,710
Rubber scrap imported	640,336	94,848
Totals	21,835,705	\$11,529,071

Exports:	Pounds.	Value.
India	7,947	2,982
Rubber scrap	225,381	32,968
Totals	333,328	\$35,950

PORT OF NEW ORLEANS—JANUARY, 1916.

Imports:	Pounds.	Value.
India rubber	29,109	\$15,982
PORT OF SAN FRANCISCO—JANUARY, 1916.		
Imports:		
India rubber	235,076	\$141,403
Gutta percha	22,471	1,741
Totals	257,547	\$143,144

PORT OF BOSTON—FEBRUARY, 1916.

Imports:	Pounds.	Value.
India rubber	53,004	\$36,064
Gutta percha	78,866	7,351
Gutta jelutong (Pontianak)	315,600	14,612
Manufactures of india rubber	8,250	4,851
Rubber scrap	8,250	752
Totals	455,720	\$63,630

PORT OF CHICAGO—FEBRUARY, 1916.

Imports:	Pounds.	Value.
Manufactures of india rubber	48,546	\$800
Rubber scrap	48,546	2,314
Totals	48,546	\$3,314

PORT OF CLEVELAND—FEBRUARY, 1916.

Imports:	Pounds.	Value.
India rubber	659,337	\$375,892

PORT OF DETROIT—FEBRUARY, 1916.

Imports:	Pounds.	Value.
Rubber scrap	3,247	\$130

PORT OF NEW ORLEANS—FEBRUARY, 1916.

Imports:	Pounds.	Value.
India rubber	292,847	\$124,444

PORT OF NIAGARA FALLS—FEBRUARY, 1916.

Imports:	Pounds.	Value.
Manufactures of india rubber	61,821	4,125
Rubber scrap	61,821	\$4,273

PORT OF PHILADELPHIA—FEBRUARY, 1916.

Imports:	Pounds.	Value.
India rubber	111,257	\$72,628
Reclaimed rubber	83,230	10,745
Rubber scrap	18,648	1,282

PORT OF PHILADELPHIA—FEBRUARY, 1916.

Imports:	Pounds.	Value.
India rubber	34,586	\$2,680
Beltting, hoses, etc.,	34,586	1,738
All other manufactures of india rubber	34,586	6,373
Totals	34,586	\$10,791

*During December, 730,600 pounds of rubber waste was exported to United States, making a total of 6,628,100 pounds for the nine months ending December, 1915.

*During December, 109,414 pounds of gum chicle was exported to the United States. During the nine months ending December, 1915, 20,000 pounds of gum chicle was exported to Great Britain, 1,187,999 to the United States, and 66,834 pounds to other countries.

THE RUBBER SCRAP MARKET.

NEW YORK.

GENERALLY speaking, the rubber scrap market has been quiet during the past month, with firm prices ruling at practically the same levels of a month ago. Prices for boots and shoes early in the month had an easier tendency than the week before, and declined $\frac{1}{4}$ cent per pound. This, however, failed to interest the large buyers, although enough business was indulged in at 10 $\frac{1}{2}$ to 11 cents to support the market. Toward the end of the month trading of a fairly active nature resulted in considerable business being done at 11 cents and a shade under that price.

The month's transactions in mixed auto tires appeared to be confined to small sales, at prices around 6 $\frac{1}{2}$ cents. However, sales to the mills at 6 $\frac{1}{2}$ cents were reported later in the month. G. and G. tires have had some call at prices ranging from 8 $\frac{1}{2}$ to 9 cents, but the large buyers were not interested. Inner tubes continued to be a largely speculative feature and the price to the

mills of 30 to 31 cents for No. 1 tubes is nominal. Solid tires were unchanged.

The mechanical grades have gone very well with No. 1 white scrap leading at 13½ cents but the demand, which included black scrap, fell off toward the end of the month.

A new circular setting forth the changes in packing rubber scrap that were adopted recently by the rubber scrap division, can be obtained from Chairman Paul Lowenthal or from Secretary Haskins of the National Association of Waste Material Dealers.

United States imports of rubber scrap for the year ending December 31, 1915, were 12,342,117 pounds, value \$877,026. Exports of domestic scrap for the same period was 3,117,750 pounds, value \$356,350.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

THE market during March has maintained the same characteristics as that for February. The tendency, in most lines, to advance has become effective. Spot stocks of the principal materials are small and manufacturers dependent on them are paying almost prohibitive prices. Not many, however, are so situated, as there are probably none among the large buyers without the protection afforded by contracts.

LITHARGE.

An advance of 1½ cents per pound has taken place during March, based on the demand which advanced pig lead.

ZINC OXIDE.

The domestic supply is practically used up in filling contract orders, leaving very little surplus for new accounts. There are no fixed quotations for spot sales which are all in second hands.

New contract prices for French process zinc oxide for the second quarter-year took effect March 1. They are as follows in cents per pound: white seal 25¢@25½¢; green seal 24½¢@24½¢; red seal 24¢@24½¢.

LITHOPONE.

Lithopone is almost out of the market. Consumers not covered by contract are unable to obtain large amounts and are obliged to pay excessive prices to obtain any supply.

CAUSTIC SODA.

The output is heavily sold ahead and stocks are scarce. Prices are firm, but have not advanced materially over those ruling a month ago.

SULPHURIC ACID.

The production is believed to be increasing. Stocks are at very low level. There is no evidence of a weakening in prices.

MARKET FOR COTTON AND OTHER FABRICS.

EGYPTIAN COTTON.

MAIL advices from Alexandria, dated February 15, state that the market has advanced steadily, recording the highest prices since 1910-1911. F. G. F. Sakelariades has brought from 28 1/4 to 28 1/4. The continued demand for spot cotton and the high prices obtaining appear to be the primary causes of this recent advance. The insufficiency of the crop is already being felt, resulting in a bullish speculative market that may continue to support the present high prices during the coming month. However, later in the week the appearance on the market of about 50,000 bales served as a check to the speculators.

SEA ISLAND COTTON.

The bulk of unsold cotton is said to be held by exporters and interior dealers who are holding for higher prices. All the lower grades have been sold and now the better sorts are in demand. During the last week of the month Islands extra fine was firmly held at 34 cents landed. The market for Florida and Georgia was very steady with hardening prices and limited offerings. The last sales reported were on a basis of 32 3/4 cents for Fancy landed.

FABRICS.

The fundamental reasons that now influence the general conditions of the fabric market are equally reflected in tire fabrics, hose and belting, duck, yarn, dyed goods and cotton raincoat cloth. In fact, the great demand continues to engage the energetic efforts of the producers in meeting contract obligations promptly and handling the large volume of new business.

Fabric mills have sold their production for a year ahead and new contracts are now being written with a war clause covering the uncertainty of raw cotton shipments. The freight congestion has increased the difficulties of obtaining raw material and general mill supplies. The same cause in many instances

has resulted in factory shipments being delayed, causing the consequences serious loss. Fabric mills that are located near munition plants are unable to keep a full complement of labor on account of the high wages offered by the manufacturers of war materials. Moreover, strikes and labor differences continue to beset the manufacturers of fabrics.

It is therefore not at all surprising that prices have advanced throughout the entire list with small prospect of lower values for the immediate future, at least.

A NEW BATTERY JAR COVER.

An improved battery jar cover, illustrated herewith, is made entirely of hard rubber. The outside lower edges are formed

in the shape of a channel that fits over the top of the jar. This method of construction adds greatly to the stiffness of the jars, thereby reducing the danger of breakage. A little sealing compound is used to make the connection between the cover and jar perfectly tight and acid proof. The cover is easily removed when necessary by simply heating the joint with a gasolene torch. [Victor Storage Battery Co., Rock Isl-
and, Illinois.]

TABLE OF CONTENTS ON LAST PAGE OF READING.**UNPROFITABLE INFRINGEMENT NO EXCUSE.**

THE decision of the United States Court of Appeals in the Grant patent case, some account of which appears in this number, is one of far-reaching importance, not only to the tire trade, but every branch of business which in any way relies upon patents which may be the subjects of infringements.

The question of the amount of damages due the patentee has always been a mooted one. Usually such damages have been limited to the amount of profits made by the infringers, or to such damages as could be distinctly shown, based on license fees, loss of sales or diminution of price, caused by such infringing competition. This has, time and time again, resulted in completely nullifying such verdicts, owing to the difficulty of proving that the infringers made any profit, or that the patentees would have made sales, had there been no infringers in the field. Then again, in case the patentee did not grant licenses, the basis for damages for loss of license fees could not be computed.

This decision, however, is to the effect that a plaintiff in an infringement case may recover what to the court or jury seems fair and reasonable, whether the defendant may or may not have made any profits, whether the defendant did or did not grant licenses and without the necessity, on the part of the defendant, of actually proving loss of sales or reduction of price because of the infringement.

DEMONSTRATIVE PUBLICITY.

AS a rule, public opinion is influenced through certain means of publicity, by letters sent direct to individuals, by pamphlets distributed where they will do the most good, by newspaper articles, and by public meetings and eloquent speakers. A certain proportion of the people are influenced by these, but while each and all are to a certain extent effective, there are many people, particularly among certain classes, who are not reached by such exploitation. A band of music followed by marching men attracts the attention of such, and sets them to thinking, much as the printed propaganda does the other classes. That is why a parade is a good thing. It brings publicity to a movement. Former parades of this kind have been beneficial in influencing public thought. The preparedness parade to be held in New York next week is of value in extending public thought on this important question. Also in the past, the rubber trade will do its share in making the parade a success. Indeed, it is said that it will contribute between two and three thousand to the ranks of marching men.

THE SOLVENT NAPHTHA PROBLEM.

THE price of gasoline, which is a present subject of comment, investigation and speculation, is a very vital question to rubber manufacturers. The fact that they use automobiles and motor trucks, which cost much more to operate, is of minor importance. Where the shoe really pinches is the greatly increased price of solvent naphtha, and this is problematical—the lessened use of tires, inner tubes and motor accessories that may come through a letting up in general motoring.

Naphtha, from the days of Macintosh, has been almost a necessity in rubber manufacture. The lines most dependent upon it are cements for leather shoe manufacture and tire repair; dipped goods; spreader work, as proofing, rubber clothing and mackintoshes; rubber footwear; tires; druggists' sundries and mechanical rubber goods. Indeed wherever any union of parts is desired, naphtha is the usual agent to bring it about.

The gasoline production in the United States for 1915 was 41,600,000 gallons. Of this, 6,500,000 gallons was exported, leaving 35,100,000 gallons for home consump-

tion. Foljambe, of the S. A. E., estimates that the automobile trade will need 42,000,000 gallons for 1916, and that other industrial uses will call for 21,000,000 gallons.

The users of this amount will be motor boats, stationary internal combustion engines, dry cleaning establishments, rubber manufacturers and chemical manufacturers. Just what proportion of this is used in the rubber trade is only a guess. Supply men off hand say from 4,000,000 to 5,000,000 gallons. Rubber manufacturers think it is very much more. One who uses 3,000 gallons a day puts the amount at twice 4,000,000.

Whatever the amount needed, the increased price is serious, not only to the dipped goods, spreader and cement producers, but to all rubber manufacturers. With cheap gasoline it has hardly been thought worth while to try to recover the solvent which evaporates. Now, however, in spreader work, that will undoubtedly be done more or less completely in the near future.

The price of gasoline, which was as low as 9 cents a gallon in 1911, gradually rose to 16 cents, dropped back to 13 cents, and finally rose to 20 cents and is now 28 cents. Nor is there any immediate relief promised. Of other solvents in sight, benzol is that to which the trade, in normal times, would turn. But its use in warfare has put its price so high that it is at present out of reach.

In the meantime, economy in the use of gasoline, governmental investigations and cracking processes, may keep the price down to its present level. Of course, continued high prices would, in time, stimulate the production of gasoline from natural gas and from the shales, or the establishment of benzol plants simply for rubber use. But all that takes time and the plants devoted to such work might not be able to compete when gasoline returns to its ten cent level.

PRACTICAL PATRIOTISM.

THERE have been many Americans who, honest and fair in their dealings with individuals, have taken every advantage of the government. "The State has no friends" was a proverb among such. The same has been true of corporations big and little. That a decided awakening has come about, however, is shown by the work that many business men, heretofore indifferent, are doing to make the country better. This is not confined to any one industry, but a notable case points these remarks, and it is in the rubber trade, too.

The Federal Government needed much expert advice in connection with aeronautics, such as balloon fabrics. No money was available for such work. The splendidly equipped research laboratory of one of the great rubber corporations was at once put at the service of the government, without cost, and the problems solved. Such willing, broad-gage patriotic service is one of the most hopeful signs of the times.

THE SEPTENNIS SYNTHETICUS.

IT is a disease that occurs in the rubber trade at frequent intervals, but in its most virulent form about once in seven years. Since the discovery of vulcanization it has broken out badly ten times. The symptoms are profound secrecy, feverish avarice and alternating fits of marked exaltation and deep depression. Its victims are capitalists, half-educated chemists, occasional rubber manufacturers, widows and orphans. It breaks out in widely separated localities. Massachusetts, New Jersey, New York, Ohio have been afflicted at intervals and have both recovered and suffered relapses. At the moment of writing the disease has broken out in Brooklyn. The attack is in this instance not of the most virulent type. One patient is still in a very feverish condition and bewails the loss of some \$31,000. Another, possibly under temporary aberration, has disappeared leaving only a huge tank containing a sticky tar-like mixture. Federal specialists, having been called promptly, hope to localize the outbreak and predict speedy convalescence if not recovery—of the money.

COLOR IN TIRES.

THE non-technical press is at the moment questing for information as to how tires are colored. A non-conscientious expert could flood the country with the statement that tire colors were obtained by dyeing after vulcanization, or by the chemical action of the violet ray, and the tale would obtain credence.

Instead, the reply is after this fashion, although the analogy is not quite perfect: For white bread the baker uses white flour; for brown bread, brown; for black bread, black. And if red bread were desirable red flour would be used. So with tires, white rubber tires contain white flour (zinc oxide); black tires, black flour (carbon black); red tires, red flour (sulphuret of antimony). There are, to be sure, many other whites, blacks and reds that may be used, but the principle remains the same. The rubber dough is simply colored by mixing a dry color in it before baking.

ONE OF OUR INTERESTING AND POLYSYNTHETIC CONTEMPORARIES advises purchasers of rubber packing to insist upon the floating test as a guide to its value. In other words, pure rubber and sulphur is what the writer believes the buyer should aim to secure. The facts, however, run a trifle contrary to such assumption. Sponge rubber floats, also rubber compounded with floating substitute, and would last about as long in steam as a slice of Swiss cheese. On the other hand, rubber weighted down with plumbago, asbestos, infusorial earth, and other heat resisters, while it will sink like lead in water, will outlast and outpace anything else in the world. But then, no engineer would try the test anyhow. He buys of a friendly salesman who has bully cigars and never mentions water.

The Manufacture of Balloon Fabrics in Europe.

Special Correspondence.

DOUBLING.

LINED or "doubled" fabric is so made that each of the fabrics which are brought together is coated separately, one sufficiently to be gas-proof, the other but lightly gummed. After being prepared in this manner the fabrics are passed together through a "doubler," and vulcanized.

A buffing calender is used in lining balloon fabric; this calender being composed of two hardened steel cylinders. The under cylinder is geared, while the upper one is free and presses on the lower one. The pressure between the cylinders is adjusted by weights and springs. It must be perfectly regulated, as excessive pressure causes wrinkles to form in the fabric, while insufficient pressure causes the cylinders to draw the fabrics at varying speeds and the finished material has a tendency to separate.

The sheet of fabric coated with the thick gas-proof solution must pass over the upper cylinder of the calender, while the sheet coated with the thin solution passes over the lower one. In Germany they prefer to line or double their balloon material with diagonal warp fabrics. In France, on the contrary, straight-thread fabrics are usually employed for this purpose; in the latter case, the warp as well as the weft threads of both plies of fabric are parallel to each other. Great care must be exercised in calendering straight-thread combinations. The threads of both layers must be perfectly parallel and the tension on the fabrics must be even, for should some threads be tighter than others they will be subjected to a greater strain when in use and their tensile strength will be impaired. They also will warp and endanger the rubber connection between the layers of fabric. The total tensile strength of a doubled fabric is never equal to the sum of the tensile strengths of each layer; and diagonally-lined fabrics are not as strong as fabrics lined parallel, because of the fact that it is almost impossible to obtain even tension throughout. By tearing a sample of diagonally lined fabric it is quite evident how irregular this fabric really is. But diagonal or cross-thread linings

A LATE TYPE OF ZEPPELIN

VULCANIZATION

Heat-cured balloon fabrics are vulcanized in steam or in a steam-jacketed vulcanizer in hot air under pressure. The latter method is employed when colors used are sensitive to the effects of steam, also for silk and flax fabrics which cannot stand steam. When ready for steam vulcanization the balloon fabric is wound on a hollow iron drum, about 5 yards in circumference, and

open at both ends. This drum is first covered with several layers of thick, rubber-coated fabric, which are vulcanized at the same time with the balloon fabric. The object of these extra layers is to protect the balloon fabric from any steam that might find its way through the rivet holes of the drum and also prevent over-vulcanization of the lower layers of balloon fabric. Previous to wrapping, the rubberized surfaces are thoroughly powdered with talc. In fabric colored with chrome yellow it is essential that it be wound so that yellow comes upon yellow, even if the material only has one intermediary coat of rubber. Wrapped in this manner, fabrics colored with lead chromate give better colors than if the yellow surface had come in contact with the layer of rubber while being vulcanized.

Should the color of the rubber-coated inner surface be damaged, it is of but little consequence, but for the outer side, which ultimately will be the outside of the balloon, it is essential that the material be perfectly uniform and yellow in color. Several layers of fabric rubberized on one side, or several plies of material rubberized on both sides, are wound with the balloon fabric so that the rubberized surfaces of the latter are wound against rubberized surfaces. Talc prevents sticking. Several layers of material, rubberized on one side only, are also wound over the whole, to prevent steam reaching the balloon fabric. When dry air vulcanization is used the rubberized coverings are not necessary and a few layers of ordinary material afford sufficient protection, except in cases where chrome yellow is used for coloring, when it is preferable to retain the gummed wrappings, for the least humidity that might penetrate to the fabric during vulcan-

ization would decompose the lead chromate.

from 50 to 90 minutes and the temperature should never be allowed to exceed 133 degrees C. (342 degrees F.). When vulcanization is finished the drum is run out and allowed to stand until the fabric is completely cool. Upon being removed from the vulcanizing drum the fabric should be thoroughly powdered with talc and then carefully brushed. Fine paraffined talc should be used. Dry vulcanization in a jacketed heater is difficult, as the heat often fails to penetrate all the layers of fabric. If vul-

A LATE TYPE OF ZEPPELIN IN FLIGHT (RIGID).

*The second installment of this article has just come to hand, having been unavoidably delayed.

canization is pushed too rapidly the outer layers are vulcanized before there is any action at all on the inner layers. A sheet of tin-foil inserted between the layers of fabric, and just as wide and as long as the fabric, will remedy this trouble and bring about uniform vulcanization. Even by injecting hot air under pressure into the heater good results would not be obtained, because the fabric is a poor conductor of heat. Low temperature and slow progressive vulcanization are therefore necessary. Even with this method there are differences in the degree of vulcanization of the several layers of fabric.

The old time dry heater is better. In this the material is hung in the heater and slowly and evenly vulcanized. In this connection, Worrington's continuous vulcanization oven is worthy of special mention. This heater, which is popular in England, has a quadrangular chamber 9 feet long and 15 feet high, at the top and bottom of which geared rollers are arranged. The fabric is placed on a drum outside of the chamber, into which it is drawn by an endless chain through a slit in the walls. The fabric comes out of the heating chamber through another slit at the top, and is again wound on a large drum. The chamber is heated by steam pipes and the fabric passes slowly through it, making zig-zags over rollers. It takes the fabric from 2 to 3 hours to go through this vulcanizer.

For very fine fabrics cold vulcanization is preferable. The usual process is that of a solution of chloride of sulphur in bisulphide of carbon. It is commonly held that fabrics vulcanized in this manner do not last. This is often true, though not always. Failure should not be attributed to the method but to the mixture of the solution with ingredients which do not act properly in contact with chloride of sulphur. Account must be taken of the fact that chloride of sulphur creates reactions with other materials than rubber. Oxide of zinc and hydrated lime must be left out when chloride of sulphur is used, for they give bad results. The rapidity with which chloride of sulphur adds itself to rubber depends upon the degree of penetration of the solvent. As a solvent carbon bisulphide has proven best because its boiling point is constant and not too high (being below 212 degrees F.). Further, it swells the rubber, penetrating it faster than the chloride can vulcanize it, and thus an even, regular vulcanization is obtained.

If the boiling point of the solvent is too low the rubber may not be very deeply penetrated; concentration increases very rapidly and the speed of the reaction between the chloride and the rubber is much increased. For this reason a homogeneous vulcanization cannot be expected. A too rapid evaporation of the solvent lowers the temperature of the surface, a sort of dew forms on the surface of the rubber, which decomposes the chloride of sulphur. Naphtha has no constant boiling point; it does not penetrate the layer of rubber fast enough and should

not be used. Benzol can only be used in a very pure state and then, like tetra-chloride of carbon, it is too expensive. It is important that the bisulphide of carbon and the chloride of sulphur be perfectly dry, for water decomposes the latter, generating hydrochloric acid and sulphur. For cold vulcanization the following installation is necessary: a boxwood cylinder running in a long, narrow wooden trough lined with lead.

A short time before beginning operations for vulcanizing, this trough is filled with a solution of carbon bisulphide and chloride of sulphur composed of from 1 to 2½ parts of the latter for 100 parts of the former. The coated fabric is stretched tight and slides over the cylinder; sufficient liquid being thus taken from the cylinder to cause vulcanization. Next the fabric is passed

over a heated drum to evaporate the solvent. Then the material is wound up. The wooden cylinder must be perfectly round and smooth, and must run true, so that the material is evenly coated. Otherwise a sort of marbled effect will be the result. Sometimes a porcelain trough and cylinder are used.

The more the material is wound the greater the speed, because the circumference of the roll is always increasing.

But this is of little importance, for the faster the cylinder turns the more vulcanizing liquid it picks up and the shorter the time of contact with the liquid. The material is thus perfectly covered from the beginning to the end.

Another method of cold vulcanization is by using the vapors of chloride of sulphur. The web of coated fabric is run up and down on rollers which keep it constantly moving in an airtight room, just as for hot vulcanization. This room must be wider than the material and provided with a perfect, controllable ventilating system.

Small heaters are placed under tanks containing chloride of sulphur to vaporize it. The temperature of the vulcanizing room must go above 77 degrees F. The vapors must not be generated too close to the material, and it is preferable that they be developed to the side and near the ground. The quantity of chloride of sulphur is based upon the size of the room, the thickness of the rubber coating and the time. A material with 100 grams (3.52 ounces) of inserted rubber is vulcanized in 30 minutes with chloride of sulphur at 5 per cent. When the vulcanization is finished, ventilators are opened, or, better, hot air is blown into the room to drive away the fumes. The material is then hung up to dry 24 hours in another perfectly dry room. Humidity must be avoided. Hydrochloric acid gas which is produced by dampness creates a combination that weakens the fabric by the formation of hydrocellulose. It is not advisable to use ammonia to neutralize the hydrochloric acid, for it has been proven by experience that an excess of ammonia has an unfavorable effect upon the fabric and the rubber coating. After vulcanization the material is measured and its weight to the meter determined.

CAUSES OF DETERIORATION OF BALLOON FABRICS.

Copper or its alloys coming in contact with the sulphurized

"CAPITAINE FEBER" (FRENCH NON-RIGID).

rubber of balloon fabrics, forms copper sulphide which rapidly deteriorates the rubber. For this reason, therefore, fittings and accessories should never be allowed to come into contact with the surface of a balloon. Further, rubber that has been handled in copper vessels should never be employed in proofing balloon materials. Even iron, especially when it is rusty, will cause trouble if it is allowed to touch rubberized balloon fabric for any length of time. The enormous surface a balloon offers to the contact of air and light is also a cause for the generation of sulphuric acid in the rubberized fabric of which it is made. One manufacturer attempts to lessen the effects of these agents by adding pitch, asphalt, or paraffin, to the proofing mixtures, but

STERN VIEW OF "L'ECLAIRNEUR CONTÉ" (FRENCH NON-RIGID).

it must also be borne in mind that the purer the rubber the better it will stand air and light. Another cause for the deterioration of balloon fabrics exists in the methods employed in bleaching and preparing the fibers used in the weaving of these materials.

To preserve the balloon itself, it is important that the place where it is kept be as dry and dark as possible. Yellow or red windows are desirable for the shed or hangar in which the balloon or balloon material is to be kept, especially if the windows have an eastern exposure. Balloons should always be dried, like the balloon material, by natural air, but not in the sun.

OUR NEW NAVY DIRIGIBLE.

THE first dirigible owned by the United States Navy is shown here as set up in the State Armory at Hartford, Connecticut. It is the first of several which it is hoped the government will order in its new issue of preparedness. The dirigible is 175 feet long, 35 feet in diameter and 50 feet high. It weighs 5,000 pounds and has a lifting capacity of 2,000 pounds more, or a total of 7,000 pounds. The envelope will contain 150,000 cubic feet of hydrogen and the craft will travel at a speed of 35 miles an hour. The car is 20 feet long and 5 feet wide, and will accommodate a crew of eight. It is built so that it will float on water. Motive power is provided by an 8-cylinder gasoline engine operating two propellers, one on each side of the car. The balloon proper consists of two parts, an outer envelope and two inner balloonets. The envelope is filled with hydrogen gas and balloonets are to hold air which is pumped into one or the other or exhausted, as is needed to elevate one or the other end of the balloon that it may rise or descend. The entire strain falls upon the outer envelope, which for this reason is made of a very strong, double texture fabric, about 2,500 yards being required. This fabric was furnished by the United States Rubber Co., and represents a large amount of study, time, effort and expense. The outer fabric is cut in pieces at an angle of 45 degrees from the line of weaving, joined together in a strip the same width as the inner fabric, which is run through straight with a warp when the two, already proofed, are cemented together and vulcanized. Great care has been taken that there are no thick threads or knots, and that it is thoroughly impermeable, no holes even of the smallest possible size being permitted. The inner fabric is dyed green and the outer, orange. It was manufactured under the direction of W. A. Gibbons of the United States Rubber Co.'s general laboratories. The balloonets are of single texture and of lighter weight, this being feasible as no heavy strain will come upon them. The shaping of the big bags, and the setting up of the balloon was done at the Nautuguck factory of the company. The preparation of the fabric was at the Cambridge factory. We understand that the company is now at work upon other orders for similar fabrics from balloon and aeroplane manufacturers, and that it has quite an extensive and varied line of similar fabrics of single and double texture, in a variety of colors especially suited to such purposes.

UNITED STATES NAVY DIRIGIBLE AIRSHIP DN-1.

Perlman Wins the Demountable Rim Suit.

THE final decision of the courts in favor of Louis H. Perlman establishing the validity of his patents, and enjoining the Standard Welding Co., is of great importance to the automobile trade. The advantages of the demountable rim are self-evident and well-known in the trade. The first public use of this invention was in June, 1905, when Thery substituted a new tire for a damaged one in 80 seconds, an unprecedented feat. He used the invention of Gaston Vinet, patented in March of

that year. Szisz won the Grand Prix in 1906 in a Renault car equipped with Vinet rims. About 1907 the Standard Welding Co. and other concerns began making demountable rims.

Louis H. Perlman, of New York City, applied for a patent for a "removable" rim on May 21, 1906. This application was continued and substituted by another filed June 29, in which the word "detachable" was used. Later "demountable" was advised by a patent examiner.

LOUIS H. PERLMAN.

Vinet's patent of 1905 was cited by the U. S. Patent Office.

Mr. Perlman conceived the need of some such invention away back in 1900. Several times, while riding in a friend's machine, he shared tire troubles with his host, and three years later the idea of a demountable rim shaped itself in his brain.

Mr. Perlman's first rim was completed by July 1, 1903. The first real road test was on a Royal car in August, 1904, after the preliminary rim had been improved by Mr. Perlman in some particulars. To be brief, Mr. Perlman's solution of the demountable rim problem lay in his invention of the separating wedge, the bolt and the nut, and the use of the short-stem lug and the air space between the rims. His idea was not to obtain the greatest measure of contact between the tire and the wheel rim which had been the aim of others. Although Mr. Perlman believed he had a perfectly original invention when he entered the Patent Office in May, 1906, it was not until February 4, 1913, that his patent No. 1,052,270 was finally granted. For the better part of five years he argued and argued in order to obtain claim No. 10. It took him that time to convince the authorities that he had a mechanical improvement of a patentable character. Then followed more delay before claims Nos. 11, 12 and 13 were allowed. His persistence was needful, because it was upon the infringement of claims 8, 11, 12 and 13 that he filed his memorable suit against the Standard Welding Co. in October, 1913.

Claim No. 8 covers the short-stem lug; and claims 11, 12 and 13 cover the means for locking a demountable rim to a wheel. The importance of these claims so far as the whole industry is concerned is such that they are quoted here in full:

8. The combination of a demountable rim having radially disposed clincher flanges, a tire shoe having beads engaging said flanges, a wedge-shaped clamping plate bearing against said

beads and adapted when moved to force said beads against said flanges, and means accessible from the inside of the rim for drawing the clamping plate radially toward the rim.

11. The combination, with a wheel body, of a demountable rim therefor, a locking element, having a tapering portion, that is adapted to be moved radially and to thereby exert pressure against the rim outwardly radially of the wheel body, and to act as a wedge laterally, said locking element having an engagement with the wheel body whereby it may be moved radially of the wheel body.

12. The combination with a wheel and its felly, of a demountable rim therefor, a locking element having a tapering end that is adapted to be moved radially and to thereby act as a wedge laterally and exert pressure against said rim radially of the wheel, said locking element having a threaded engagement with the wheel structure whereby it may be moved radially of the wheel.

13. The combination, with a wheel body, of a demountable rim therefor, and a locking element, having a tapering portion, that is adapted to be moved to exert pressure against the rim outwardly radially of the wheel body, and to act as a wedge laterally, said locking element having an engagement with the wheel body.

Upon appeal by the defendant, the Standard Welding Co., the case was decided in Mr. Perlman's favor by Judge William H. Hunt, of the United States District Court for the Southern District of New York, on August 18, 1915. Later, on February 15 of the present year, the Circuit Court of Appeals unanimously affirmed the decision of the District Court. On March 8, just passed, an injunction was issued by the United States District Court for the Southern District of New York by which the Standard Welding Co., Cleveland, Ohio, is enjoined from the further manufacture and sales of demountable rims. It has been variously stated that the Standard Welding Co. has been producing of late years anywhere between 50 and 60 per cent of the demountable rims supplied to car manufacturers. Its daily production has been stated to be in the neighborhood of 12,000 rims. This gives some idea of the increased demand for this feature of motoring convenience. The very words of the patent claims and the decision of the courts make it clear that almost every demountable rim maker in the country is affected by the suit.

Starting with the Perlman patent of 1906 and tracing the files down to November, 1915, the official records show the issuance of 52 so-called demountable rim patents—that is to say, for rims specifically designated as demountable; but, as a matter of fact, one will find nearer a thousand related rim patents. Curiously, 15 of the demountable rim patents appeared in 1913, the very year that the Perlman patent came out; and there were 13 others of this class, so officially designated, in the succeeding year. In 1915 ten were issued. These facts help to give the reader some idea of the inventive activity in this particular field and show how firm a grip the demountable rim has taken upon both the manufacturer and the motoring populace. While many of these inventions have been developed to a point, and a number of them placed upon the market, still but few of them have survived the test of service. According to one authority, the principal local wedge types of demountable rims that have received general application are the "Stanweld," "Empire," "Fisk," "Firestone" and "Michelin." Of course, there are others.

The rim problem has engaged the attention of automobile engineers and inventors ever since the machines gained popularity. The files of the United States Patent Office show 746 patents of all classes dealing with rims of one kind or another, and this leads logically to the broad question of the history of rim manufacture. As has been said by one of the foremost rim makers in this country: "There is no question that case was the greatest force back of the designing of a quick-detachable, demountable

rim. The old style rim, when puncture or blow-out occurred, many times meant hours of work in the putting on of new tires. With many rims it was necessary to send the wheel or car to the garage, before changes could be made. When a car owner started on a tour, or even on a short trip, he never knew whether he would reach his destination or not. All that is a thing of the past. The quick-detachable, demountable rim has removed the principal worry of motorists."

The rise of the demountable rim commercially dates back hardly more than five years when judged by a widespread demand. In the succeeding interval a very large percentage of car owners have either bought machines already equipped with rims of this sort or have later supplied them. This is easily explained. Tire changing has been one of the car owner's most troublesome bugaboos in the past. We have all seen him toiling by the roadside—sometimes under a broiling sun or in a pelting rain, and universally in anything but a pleasant mood. The development of the demountable rim altered all this; it made it possible for a damaged tire to be quickly removed, replaced by a good one, and then carried home to be repaired at leisure. Instead of working for half an hour or more to make a change, the substitution can now easily be effected inside of ten minutes. It is not a case of putting on a new tire and pumping it up, but, instead, the speedy adjustment of a tire already inflated for service. And it is also claimed that the demountable rim obviates the necessity of using over-sized tires, because the wedge feature and the initial loose fit make it simply part of the process to take care of the excess.

The present-day demountable rims are adaptations of the clincher rim of unit construction, so universally employed about fifteen years ago. It will be remembered that the beads of the earlier pneumatic tires were extensible to facilitate seating the tire within the clincher rim. Stability was added to the tire by stiffening or wiring the beads, and as these could not be seated readily within the clincher rim of unit construction, then came the separable rims out of which evolved the different so-called quick detachable rims. But the quick detachable rim did not obviate the pumping up of the new tire, although it did make it possible to remove a damaged tire and to put a good one on the wheel; but the substituted tire had then to be inflated more or less laboriously. A notable gain in convenience and simplicity was secured by the adoption of the demountable rim in place of the purely quick detachable rim, and in time followed what came to be known as the quick detachable, demountable rim. In the case of the demountable rim we have only to loosen a few bolts, six or eight, as the case may be, to make a change, and with equal speed another rim, bearing an inflated tire, can be shoved in place and locked firmly by the bolts.

Mr. Perlman has associated with him in this enterprise men prominent financially, and men well known in the automobile industry. Two manufacturing plants have already been secured and contracts have been signed to supply prominent automobile manufacturers with rims. Mr. Perlman estimates that the requirements for the season of 1917 will amount to one million sets, and he is confident that by August next the company will be in shape to supply that demand.

NATIONAL ASSOCIATION COTTON MANUFACTURERS' ANNUAL MEETING.

The National Association of Cotton Manufacturers held its annual meeting April 26 and 27, at the Copley-Plaza, Boston, Massachusetts. The principal address on Wednesday was by Frank A. Vanderlip of New York City, its subject being "Foreign Commerce in American Textiles."

During the Thursday session many subjects interesting to the textile industry were ably treated in carefully prepared addresses by experts in their several lines of work. In the afternoon, S. W. Stratton, Ph.D., Director, Bureau of Standards, Washington, D. C., read a paper on "Tests of Cotton Yarn and

fabrics," with illustrations. Then followed a paper, "The Washington Conference and Its Relation to Tire Fabric and Other Testing Requirements," by William D. Hartshorne, Chairman of Committee D-13, of the American Society for Testing Materials.

FIFTH NATIONAL TEXTILE EXHIBITION.

The Fifth National Textile Exhibition and Third National Power Shows occupied the Mechanics' Building, Boston, Massachusetts, during the week of April 24-29. A very interesting program was arranged, and the exhibits of textile machinery and allied trades were fully representative of this great industry.

Among the exhibitors the following firms, whose names are well known to readers of THE INDIA RUBBER WORLD, were noted: Curtis & Marble Machine Co., Worcester, Massachusetts; American Tool & Machine Co., General Electric Co., Morse Chain Co., and Westinghouse Electric & Manufacturing Co.—all of Boston, Massachusetts. The exhibition was well attended, and many new and improved forms of mechanism were shown for the first time. The exhibits represented the most important collection of textile machinery that has ever been arranged for public exhibition.

AUTOGRAPHIC FRICTION TESTING MACHINE.

THE Bureau of Standards, Washington, D. C., has developed an autographic machine for testing the adhesion or "friction" between the plies of canvas in rubber hose, belting, etc.

The machine is operated by a $\frac{1}{2}$ horse-power worm geared shunt motor, which is belted to a cone pulley. A worm on the pulley shaft drives a worm wheel which is geared to a spur inside of the vertical steel column. This spur drives a steel rack, to the upper end of which is attached the movable grip. From the top of the machine is suspended a spring which carries at its lower end a fork for holding the test piece. Between the spring and fork is a pencil holder, in front of which is a drum carrying a paper chart on which the record is drawn.

The capacity of the spring is 40 pounds, the extension being 1 inch for 10 pounds pull. The drum is driven by a cord which passes over a small guide pulley and thence to a spool on the spur gear shaft. The surface speed of the drum is the same as the rate of separation of the plies of fabric being tested.

The method of testing rubber hose is as follows: a 1-inch section is fitted over a mandrel and placed in the fork suspended from the top of the machine, and the detached end of the fabric is secured to the lower grip as shown.

To test rubber belting, a 1-inch strip containing 2 plies is used; the plies are separated for a short distance and the ends secured in the two grips, the upper grip being a clamp held in the fork above mentioned.

As separation of the plies takes place the pencil makes a continuous record on the drum, showing the adhesion between the plies of fabrics at all points of the fabric being tested.

European Pneumatic Tire Sizes.

FRANCE was the pioneer country in the manufacture of automobile tires and used millimeter dimensions conforming with the metric system which also originated in that country. All Europe followed the French lead by using metric measurements in manufacturing automobile tires.

America entered the field later, but, instead of metric measurements, inch sizes were adopted. So today there are French or metric tire sizes universally used in Europe while inch sizes prevail in America. This state of affairs is regrettable, and the probabilities are that for a long time to come American and European tire makers will continue to use different standards.

Nevertheless, with the tremendous impulse which the war has given to the export trade in American automobiles and automobile tires, and in view of the universal movement in favor of standardization, it is of interest to briefly review the evolution of European practice and tabulate those sizes now generally in use, together with their equivalents in inches.

EUROPEAN SIZES.

Not many years ago, when the automobile industry was still in its experimental stage, practically every constructor built his product entirely in his own shops and made wheels best suited to the general characteristics of his machine, regardless of styles and sizes used by other builders. This resulted in an unlimited range of tire sizes and designs which tire manufacturers were obliged to produce and for which the motorist had to pay.

With the growth of the industry and the desire of automobilists to have a minimum of difficulty in obtaining tubes and casings to fit their machines, automobile makers were gradually obliged to follow the lead of certain large concerns which had many machines in public use and for which dealers could afford to stock tires. In other words small automobile manufacturers, to satisfy their customers had to adopt sizes used by those makes of automobiles that were most widely distributed. This was a first step towards standardization, but the number of tire sizes remained very large.

A leading European automobile tire manufacturer publishes a catalog listing tire casings and inner tubes in 38 different metric dimensions, besides 6 American sizes in inches. Many of these tires are made in an extra strong and heavy variety under the name of limousine tires which are not included in the 38 sizes and this list does not include what are known as oversize tires, that is to say, there is no 815x120 millimeter variant of the 815x105 millimeter tire. So that, taking account of the great number of odd sizes still in use, it can be safely said that at least 50 different sizes of pneumatic automobile tires are now on the European market. The following table gives the European sizes most widely used, together with their equivalents in inch measurements:

FRENCH OR METRIC TIRE SIZES.

Sizes in Millimeters.		Equivalents in Inches.	
Interior Diameter.	Section Diameter.	Interior Diameter.	Section Diameter.
710	90	27.95	3.54
760	90	29.92	3.54
810	90	31.89	3.54
870	90	34.25	3.54
910	90	35.83	3.54
865	105	30.12	4.13
875	105	32.09	4.13
885	105	34.45	4.13
915	105	36.02	4.13
820	120	32.28	4.72
880	120	34.65	4.72
920	120	36.22	4.72
895	135	35.24	5.32
935	135	36.81	5.32

BRITISH PNEUMATIC TIRE STANDARDS.

Many unsuccessful efforts have been made in Europe to standardize tire sizes. The principal reason of this non-success has been because of the number of cars made under old conditions and which are still in use.

In England, during 1913, T. H. Woollen of the Society of Motor Manufacturers and Traders, initiated and carried through the work of reducing the number of standard rim sizes to 20 that would take 38 standard tire sizes. As there were 38 standard tire sizes, and several oversizes as well, with only 20 rims to accommodate them, in many cases two different standard sizes of tires would fit the same rim.

In 1915, the Tire Committee of the S. M. M. T. suggested reducing the number of tire rim sizes to 10 standards while 11 different sizes would be standardized for the tires themselves. Of this range of tires two of the smallest would fit the same rim while for each of the others there would be a corresponding rim. The suggested tire standards are shown in the following table:

PROPOSED BRITISH STANDARD SIZES.

Sizes in Millimeters.		Equivalents in Inches.	
Interior Diameter.	Section Diameter.	Interior Diameter.	Section Diameter.
* 700	80	25.5	3.14
† 700	85	27.5	3.34
† 710	90	27.9	3.54
760	90	29.9	3.54
810	90	31.9	3.54
815	105	32.1	4.13
820	120	32.3	4.72
880	120	34.6	4.72
895	135	35.2	5.31
935	135	36.8	5.31
915	175	36.0	6.88

* Fits 650 x 65 millimeter rims.

† These tires fit the same rim.

These standards are now before the Engineering Standards Committee, a semi-governmental institution which regulates British mechanical and electrical standards, and are now awaiting the final decision of this official body.

COLONIAL SIZES.

The proposed British standards, above given, do not include sizes that are specially made for rough service in the Colonies and known as Colonial sizes. The following sizes are most in demand:

COLONIAL TIRE SIZES.

Sizes in Millimeters.		Equivalents in Inches.	
Interior Diameter.	Section Diameter.	Interior Diameter.	Section Diameter.
1,010	90	39.76	3.54
1,020	120	40.16	4.72
1,080	120	42.52	4.72
1,000	150	39.37	5.91
1,050	150	41.34	5.91

Some British tire manufacturers consider a 915x105 millimeter (36.02x4.13 inches) tire as a Colonial size.

CONTINENTAL EUROPE.

The lessons of the war have emphasized the advantage of standardization, and reports from both France and Germany indicate that serious efforts will be made in these countries at least to standardize tire sizes after the war. All recognize that, although standardization pushed too far may lead to the stifling of originality, it is preferable to a chaos of tire sizes which leads to confusion and difficulty in obtaining air tubes and casings, not to mention the fact that lack of standardization makes tires more costly.

Hard Rubber in Automobile Construction.

THE following interesting and instructive paper by McConnell Shank, manager of the hard rubber department of The B. F. Goodrich Co., Akron, Ohio, was read at the meeting of the Cleveland Section, Society of Automobile Engineers, held at Cleveland, Ohio, December 17, 1915:

Although rubber of the hardness of an automobile bumper or of a solid tire is often referred to as "hard rubber," that term as used in this paper refers to rubber compounds hard enough to be machined and polished. In Europe hard rubber is known as "ebonite." "Vulcanite" was originally a trade name for a certain compound, but is now synonymous with "ebonite" or "hard rubber." "Vulcanized rubber" is a term often applied to such compounds, but speaking accurately, soft as well as hard rubber is vulcanized.

Vulcanized rubber compounds may be hard by reason of either a more complete chemical combination of the rubber with sulphur or the presence of ingredients other than rubber and sulphur. While the degree of hardness is controlled in both ways, the completeness of the combination of the rubber with sulphur is usually the greater factor. The finest grade of soft rubber, such as is found in a good rubber band, may contain 95 per cent rubber and 5 per cent sulphur and may have been vulcanized two hours, at a constant temperature. The finest grade of hard rubber such as is found in a good comb or fountain pen may contain 75 per cent rubber and 25 per cent sulphur and may have been vulcanized ten hours at the same temperature.

PROPERTIES OF PURE HARD RUBBER.

For the many purposes for which hard rubber may be used in automobile construction there are many qualities. The properties of hard rubber vary with the quality, of course. An idea of the properties of the various qualities can best be gained by taking as a standard and noting the variations of what might be called "pure hard rubber," which contains practically no ingredients other than rubber and sulphur.

Pure hard rubber ranges in specific gravity from 1.12 to 1.25. On account of the large percentage of sulphur necessary for proper vulcanization, it is impossible to make hard rubber with a specific gravity much less than 1.12. Hard rubber of fair commercial quality will usually have a specific gravity of 1.25 to 1.40.

The finest grades of hard rubber have a tensile strength as high as 7,000 pounds per square inch of cross section. Battery manufacturers who make tensile tests on their jars usually require a tensile strength around 3,500 pounds.

The United States Navy hard rubber sheet specifications which require a fair commercial quality, call for a dielectric strength of 10,000 volts per 1-32 inch of thickness. Some battery manufacturers test their jars electrically with a pressure of about 25,000 volts alternating current for $\frac{1}{8}$ inch of thickness. The finest hard rubber will withstand twice that voltage.

Hard rubber compounds, except some that contain organic substances other than rubber, are moisture proof. Pure hard rubber is unaffected by most chemicals. Concentrated nitric and sulphuric acids, carbon bisulphide, kerosene and benzol are the only chemicals used largely in a commercial way that affect it at ordinary temperatures. As compared with soft rubber, hard rubber deteriorates slowly.

Hard rubber compounds before they are vulcanized are usually of about the same consistency as soft rubber compounds, that is, they are of about the same consistency as stiff chewing gum.

EFFECTS OF TEMPERATURE VARIATIONS.

Pure hard rubber has a greater coefficient of expansion than most other substances, either organic or inorganic. In cooling from the ordinary temperature of vulcanization to 70 degrees F. it shrinks about 2 per cent. In molding, this shrinkage is not altogether uniform, so that regardless of how accurately the cavities of a mold are finished, the goods have to be turned, ground, buffed or polished after they are molded according to the accuracy of dimensions and character of polish required. The coefficient of expansion of pure hard rubber after it has once cooled is .0004278 per degree F., or about six and a half times that of steel.

At a temperature of 150 degrees F. pure hard rubber softens perceptibly. At 212 degrees F. it becomes so soft that it can be easily bent, and at 240 degrees F. it becomes leathery, so that it can be readily cut with a knife. Upon cooling, it remains in the shape in which it was bent and shrinks slightly from its

original size. When warmed again it tends to return to its original shape. Each time it is heated and cooled it shrinks less than the previous time until after a few times the shrinkage is negligible. While this is the effect of heat upon most hard rubber compounds, it is possible to make them withstand the action of heat to a much greater extent by scientific compounding.

On account of its resilience, hard rubber machines less readily than would be expected, but with good grades fine work can be done. In general, the better the grade, the more easily it can be worked. A good quality of hard rubber readily takes a fine jet-black polish. This color and polish are fairly permanent, but not absolutely so, for even the finest quality takes on a slight greenish tint, especially after it has been exposed for a long time to the bright sunlight. When the finish becomes dull or discolored, it can be restored by buffing and polishing.

On account of the large percentage of sulphur in hard rubber compounds, and the comparatively long time and high temperature under which they are vulcanized, it is impossible to make hard rubber in the large variety of colors in which soft rubber can be made, for the high temperature and sulphur tend to discolor pigments. Hard rubber can be made in a commercial way in black, red and intermediate shades. It cannot be made of a clear white color at all, and most of the other colors are not usually attempted.

The quality of hard rubber may be determined roughly by superficial examination in many ways—by its color and texture as shown by a polished or freshly-broken surface, by its strength, by the ease with which it machines, and by the toughness, color and grain of a shaving. The best way is to whittle it slowly with a knife, noting the color and toughness of the shaving. With practice, one can judge hard rubber fairly accurately in this way.

The parts of an automobile that may be made wholly or in part from hard rubber may be divided into three classes—handles, parts for the ignition system and battery parts.

RUBBER HANDLES FOR AUTOMOBILE SERVICE.

In the first classification may be included handles for starting cranks and control levers, caps for radiators and gasoline tanks and steering wheels. For these parts hard rubber is desirable on account of its strength, attractiveness and permanence of finish. Hard rubber for handles is usually molded except where the quantity required is so small as not to warrant the expense of a mold.

Hard rubber parts for automobiles are molded in two ways—from soft-metal or from hard-metal molds. Soft-metal molds are made from a matrix. The molds are stacked and clamped in racks and the vulcanization is done in a heater of the type formerly used for tires. Hard-metal molds for hard rubber are usually made from iron or steel the same as are those for bumpers and other soft rubber goods. The vulcanizing is also done in hydraulic presses.

For hard as compared with soft rubber, a long time is required for vulcanization so that for large production a great many mold cavities are required. With a comparatively inexpensive matrix it is an easy matter to make as many molds as may be required, but cavities in an iron or steel mold are expensive. Soft-metal molds have the advantage, therefore, of low cost of mold equipment, but they warp and stretch so that it is impossible to do nearly as accurate work with them as with hard metal molds. Furthermore, they will not withstand pressure and the result is that goods made of the same compound from hard metal molds under hydraulic pressure show greater strength. With hard-metal molds there are less defective goods and the work can be better arranged, so that iron or steel molds are the best, except where the quantity required is small.

Hard rubber steering rims have been used for the past ten years. The first ones were made entirely from hard rubber and screwed on the spiders. The screws did not hold well enough in the hard rubber and this led to the use of a hard rubber covered steel tube, also fastened to the spiders with screws. Objection was then raised to the projections beneath the rim where the arms of the spider joined it. This resulted in the use of the integral construction in which the hard rubber is molded on the rim of the spider. This type of rim is a little heavier than wood and more expensive, but it looks well when new and remains practically unchanged after years of use, without attention of any kind.

The parts in the ignition system that may be made wholly or in part from hard rubber are distributor blocks, collector rings and brush holders for magnetos, terminal connections and miscellaneous parts for magnetos, coils and switches. These parts are molded, as a rule, and the comments already made concerning the superiority of hard-metal over soft-metal molds apply.

It is a comparatively easy matter to make these parts from material that will withstand 10,000 volts per 1-32 inch of thickness and the insulation problem is therefore not difficult. To furnish material that will withstand a jump spark is another problem, for the heat of the spark tends to carbonize the rubber. The Germans are able to furnish a rubber compound that in this respect seems to be superior to any it has been possible to produce in this country.

HARD-RUBBER PARTS FOR BATTERY EQUIPMENT.

Parts for batteries include hard rubber jars, covers, vents, bushings and separators. The more complicated hard rubber covers must be molded. The less complicated ones may be molded or cut from hard rubber sheet. The greater accuracy of dimensions that can be maintained with hard-metal molds is of greater advantage here than in connection with the parts previously mentioned. Most of the other parts must be finished after they are molded in order to give them the required accuracy of dimensions or character of surface. It is customary to grind the edges of molded covers fairly accurately to dimensions, but to leave the other surfaces practically as they come from the molds. To finish the other surfaces would greatly increase the cost of manufacture. In other words, molded covers must be molded fairly accurately, and this can be done more satisfactorily with hard-metal than with soft-metal molds.

Flat covers are usually cut from sheet, but when large in size, and the quantity required is large enough to warrant the cost of equipment, it is often advantageous to mold them. When the same compound is used, a stronger cover can be made by molding than by cutting it from sheet, and this is a factor in determining the better method of manufacture in order to produce a cover of a given quality.

The cost per cover for operating the molds is practically the same, regardless of the size of the cover. Consequently it often happens that of a certain type of flat cover it is most economical to cut the small ones from sheet and to mold the larger ones. Hard rubber sheet from which covers are made is vulcanized between layers of tin in hot water. These sheets are about 20 x 48 inches, the exact size, of course, being determined so that there may be no excessive waste at the edges.

Battery manufacturers are probably more inclined to economize beyond the point of safety in the cost of covers than of other parts of a battery. The hard rubber cover is so small that the addition of a cent or two in the cost of material makes a considerable difference in its strength, and often a cent or two may make a very great difference in the breakage in service.

METHODS OF MAKING VENTS.

There are two types of hard rubber vents in common use, plain molded and blown. The "plain molded" is made in the same manner as the other molded parts previously mentioned. The "blown" vents are made hollow by the expansion of water or other liquids on the inside, this expansion being caused by the application of heat during vulcanization. It is more expensive to mold goods when they are hollow. More expensive material is required. Of course, in some designs it is essential that vents be made hollow, but wherever it is possible in order to reduce costs, vents should be so designed that all holes and irregularities can be made by the means of molds.

Such items as hard rubber terminal bushings and vent extensions are usually cut from hard rubber tubing, although here again if the design is complicated and the quantity involved is large it is more economical to mold them.

Hard rubber rods and tubes are made in much the same manner as soft rubber tubing that does not have cloth insertion. It is squirted through a die while hot, the die forming it into the desired shape. The material is then buried in soapstone, proper care being exercised to insure its being kept straight, the hard rubber rod by the way it is packed, and hard rubber tubing by mandrels on the inside. The standard length for hard rubber rod and tubing is 30 inches. As it comes from the process of vulcanization it is fairly rough and not altogether uniform in dimensions. With a grinding machine of rather simple design, the rubber rod and tubing can be ground accurately to outside dimensions and polished at no great expense. The actual cost of manufacture, per pound, of ground and polished hard rubber tubing varies according to the weight per foot, that is, according to the diameter and thickness of wall. This is due to the fact that labor cost for grinding and polishing depends

upon the length and number of pieces rather than upon the weight. The hole in hard rubber tubing can be kept accurately centered only by turning it on a mandrel in the lathe with a special grinding machine, which, of course, increases the cost considerably.

TYPES OF BATTERY SEPARATORS.

In lighting and starting batteries, hard rubber separators have been almost altogether supplanted by treated-wood separators. Battery manufacturers tell us that with a battery of a given size they can get a higher discharge rate with the wood than with the rubber separators, and that if they used the latter they would have to increase the sizes of their batteries.

Separators manufactured in Europe are usually made from corrugated perforated hard rubber sheet, or from perforated sheet with ribs molded integrally upon it. The corrugated separator is not altogether desirable because it will flatten out in service. The separators with the ribs molded integrally with the sheet have been too expensive for most American battery manufacturers. At the present time, however, hard rubber manufacturers are aiming to reduce their costs of manufacture for that type to a point where battery manufacturers can afford to use them.

Ribbed hard rubber separators as they are made in this country today usually consist of hard rubber sheet partly cured and perforated, and ribs vulcanized on the sheet afterwards. This type of separator is more durable than are the treated wood separators, while the separator with ribs molded integrally is still more durable.

Hard rubber jars as used in this country are formed over mandrels and vulcanized while still on the mandrels. The jars are not put into molds, but are simply wrapped with a layer of tin on the outside. The rubber manufacturer is frequently asked if this wrapping could not be dispensed with, thereby decreasing the cost of manufacture. The tin, however, is not a great item of expense, hence it can be used over and over again. It serves to hold the jars in shape during the vulcanizing process, and offers a convenient means for branding, for it is only necessary to make the impression with a die, and that is held by the tin in the compound while the jar is being vulcanized. Without the tin the jar would have a rough instead of a fairly smooth and well polished surface, dimensions could not be so well controlled, and the expense of straightening the jars after vulcanization would just about offset the cost of using the tin.

THICKNESS OF JAR WALLS.

The thickness of wall required for a hard rubber jar in automobile work in order to give the proper service depends upon the quality of rubber used. Walls $\frac{1}{8}$ inch thick are now fairly standard for starting and lighting work. Walls $\frac{3}{32}$ inch thick are sufficient, provided the rubber compound is good enough. In fact, $\frac{1}{16}$ inch thickness of wall, if only the finest grade of materials were used, might be satisfactory, but so thin a wall is not recommended because such thin material is difficult to handle satisfactorily in the manufacture of a jar, and the percentage of defective jars is too great.

There is a tendency on the part of some battery manufacturers to use walls $\frac{3}{32}$ inch thick in the smaller batteries for the smaller and cheaper cars. While the weight per cell of the elements is of course, smaller for a smaller battery, these batteries are usually used on small cars where the spring suspension relieves the ordinary strains upon a hard rubber jar to a less extent. To give the same service, the hard rubber jar for the small battery should have as thick a wall as in a large battery.

JAR BREAKAGE CAUSED BY ASSEMBLING.

A great deal of the breakage of hard rubber jars in service has been due not to the quality of the jar, but to the way it was assembled. If the wooden boxes are not square and fairly rigid, the bottom of the jar is frequently only partly supported. This is also true where the sealing compound is not distributed uniformly over the bottom of the battery box. In such cases a jar even of good quality will break either at the bottom or in the wall at the point where the top of the bottom rib joins the wall.

PHYSICAL AND ELECTRICAL PROPERTIES.

Many battery and rubber manufacturers have been inclined to talk loosely about tensile strength, elongation and dielectric strength. Statements in this connection mean practically nothing unless all the test conditions are known. To say that a hard rubber jar has a tensile strength of 3,600 pounds or more, does not necessarily mean that it is a serviceable jar. The tensile strength of a jar will vary according to the temperature of the test piece at the time the test is made. The usual temperature is 70 degrees F. At a lower temperature a piece of hard rubber

ber of a given composition and hardness will have a higher, and a piece at a higher temperature, a lower tensile strength.

A tensile test will vary as much as 25 per cent, according to the type of machine upon which the test is made. The faster the pull, the greater will be the tensile strength as indicated by the machine. To insure anything like accurate results, a motor-driven test machine should be used.

Furthermore, the tensile test will vary according to the amount the piece has been vulcanized. A compound that has been vulcanized until it is very hard will have a much higher tensile strength than the same compound vulcanized less. A jar with high tensile strength is usually too hard and brittle to give satisfactory service.

The results of elongation tests will vary according to the shape of the test piece, its temperature and the amount it has been vulcanized. The slower the speed of the test machine, and the higher the temperature, the greater will be the elongation. The harder the compound is vulcanized the smaller will be the elongation. The distance between the jaws of the test machine is usually taken as the basis of elongation tests. If the test piece is of uniform cross section, the percentage of elongation will be lower than if the test piece is of the usual shape, that is, small at the center and large at the ends. There is also the slippage in the jaws to contend with if the distance between the jaws is taken as the basis. To insure accurate elongation tests, the basis should really be the distance between two given points on a piece of uniform cross section.

The electrical test on a hard rubber jar is usually made by placing it on a mandrel inside a frame, the mandrel and frame being respectively the positive and negative poles. The results here will vary according to whether the current used is alternating or direct, the length of time during which the current is applied, and, in the case of alternating current, its frequency.

RIGID SPECIFICATIONS REQUIRED.

When battery manufacturers adopt specifications for hard rubber goods, there is an inclination to make them too rigid. Jars may be rejected that would really be more serviceable than many that might pass the test. A certain specification might call for a tensile strength of 3,600 pounds and an elongation of 3 per cent. A jar might have a much larger percentage of rubber than would be necessary to meet these specifications if it were cured to the degree of hardness necessary to meet them, or might happen to be slightly under-vulcanized so that it would have a tensile strength of only 2,500 pounds or an elongation of as much as 10 per cent. Such a jar, although rejected, would be more serviceable than a jar that would just meet the specifications.

It will be well to add a word of caution regarding the so-called flexible jars. Any rubber manufacturer can furnish a hard rubber jar that is flexible when it is new by simply making it from the compounds used in the manufacture of a rigid jar, but vulcanizing it for a shorter length of time or at a lower temperature. Such jars were put into service as many as seven or eight years ago, but their use was discontinued. They were flexible, and almost unbreakable when new, but were more easily affected by the acid than the ordinary rigid jar, and hardened up rapidly with age and from the effect of the acid, to the point where they were more brittle than if they had been vulcanized to the usual degree of hardness in the first place.

With flexible jars, therefore, the problem is to furnish a jar low enough in price to be used as a commercial way that will not become brittle too rapidly with age, and that will not harden so as to make it unserviceable. Whether any given jar meets these requirements is something that can be determined only by actual service for the ordinary life of a battery.

Hard rubber parts as they are now used in automobiles vary greatly in designs and sizes, and it is necessary that the hard rubber manufacturer have an enormous investment in special equipment. Costs could be materially reduced if these parts were standardized. There is already considerable standardization of hard rubber parts as used by railroads, and while in automobile construction standardization could not be carried to the same point, there is no reason why it could not be carried further than at the present time.

DISCUSSION.

R. J. Nightingale, sales manager, Willard Storage Battery Co., Cleveland, Ohio, then said: "We use a test on hard rubber storage battery jars exclusively, not so much to test the quality of the jar as to find the defects in workmanship. It has been our experience that the greater percentage of leaky jars was caused by breakage in transit to us from the jar manufacturers or failure of the jar where the workman had rolled the seams. The high voltage test does find defective seams and breaks, as well as thin spots in the walls of the jars."

WHY WOOD SEPARATORS ARE USED

"We have been told by the speaker that, because of their cost, storage battery manufacturers do not use rubber separators. This is not a fact. Wood separators are used in preference to wooden and rubber sheets, or all rubber separators, because the cell is of higher internal resistance with the rubber sheet or rubber separators. If we were to construct a starting battery with wooden separators and rubber sheets, it would be necessary for the car manufacturer, in order to maintain the same voltage characteristics at the lower temperatures, to purchase a battery of 50 per cent greater capacity than is the one he now has in which only wooden separators are used."

S. A. E. ELECTRICAL VEHICLE DIVISION CONSIDERS BATTERY-JAR DIMENSIONS.

A meeting of the electric vehicle division was held on February 25 in the offices of the Society of Automobile Engineers, 29 West Thirty-ninth street, New York City. Aside from members of the division and the standards committee staff, there were present representatives of five of the leading storage battery manufacturers.

The chief work of the meeting was in regard to dimensions of storage battery jars, as a preliminary to standardizing dimensions of trays to facilitate the interchange of batteries.

The work of the meeting was tentative, and has not been formally approved by the division. The suggested dimensions were as follows:

Heights, high-rib jars.....	13½ inches.
low-rib jars.....	12 7/16 inches.
Width	6 7/8 inches.
Thickness of walls	1/8 inch.

No conclusion was reached as to the length, which is variable, depending upon the number and thickness of plates. This problem was discussed at length, and plans were formulated for a tabulation of present practice to be submitted in an attempt to arrive at a reasonable list of standard lengths. This tabulation has now been prepared by a member of the division. It shows forty-five variations in the length between 2 and 8½ inches. It is suggested that the list be reduced to 27 lengths with 2½-inch sediment space, and to 15 lengths with 1¾-inch sediment space.

The division is thus making real progress toward a standard which promises to be of great value to the electric vehicle industry.

Another matter before the division is a revision of the present standards for charging receptacles consisting in a lengthening of the sleeve and insulating members.

S. A. E. ADOPTS STANDARDS RELATING TO RUBBER.

At a meeting of the Society of Automobile Engineers held in New York City, January 5-6, recommendations for new and revised standards were made. Those on insulated wire and cable, rubber hose and clamps, industrial truck tires and solid tire diameters were published in detail in THE INDIA RUBBER WORLD, February 1, 1916. These recommendations have now been adopted in their entirety by the letter ballot of the voting members, which was closed on March 6.

A PILLOW VENTILATOR.

A pillow full of light, fresh feathers affords an exceedingly comfortable head-rest, but the feathers are apt to become heavy and matted owing to lack of ventilation. A device designed to afford the necessary inlet of air consists of a small spool-like ventilator made of rubber, with holes at each end. In use several of these are sewed in each end of the pillow ticking. [The H. O. Canfield Co., Bridgeport, Connecticut.]

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

Foreign Import Duties on Boots and Shoes.

THE following table, corrected to April 1, 1916, shows the foreign import duties on rubber boots and shoes of all descriptions, imported into the various countries from the United States.

Owing to the frequency of tariff changes the figures and information given in this table should be periodically verified. It is also advised that small trial shipments be made in order to

test the rates prior to sending more extensive shipments.

In the first column is given the country, while the next column contains the articles with notes regarding surtaxes, basis of rates, etc. The third column specifies whether the weight is to be taken as gross or net and the last column gives the ad valorem duty and the rate of specific duty in United States currency.

Countries.	Articles and Remarks.	Weight.	Duty (U. S. Currency).
EUROPE:			
Austria-Hungary	Shoemakers' wares, with textile goods, per 100 pounds	Net	\$1.23
Belgium	Manufactures of india rubber, ad valorem	Net	10%
Bulgaria	Ordinary rubber boots and shoes (galoshes), per 100 pounds (includes 20 per cent surtax)	Net	\$10.53
	Other rubber boots and shoes, per 100 pounds (includes 20 per cent surtax)	Net	\$21.06
Denmark	Rubber boots and shoes, with textiles, per 100 pounds—including inner packing	Net	\$6.09
France	Rubber footwear lined with felt, wool or any partly woolen cloth, per 100 pounds	Net	\$13.13
	Rubber footwear lined with cotton, hemp or flax cloth, per 100 pounds	Net	\$10.51
	Footwear with soles of rubber, per pair	Net	\$0.14
Germany	Footwear, with or without rubber soles—Unvarnished, per 100 pounds	Net	\$7.57
	Varnished, per 100 pounds	Net	\$10.82
Great Britain	Manufactures of rubber		Free
Greece	Galoshes of rubber, per 100 pounds	Net	\$59.50
Italy	Rubber footwear, lined or trimmed with stuffs, per 100 pairs	Net	\$24.13
	Other rubber footwear, per 100 pounds	Net	\$4.39
Netherlands	Rubber footwear, ad valorem	Net	5%
Norway	Rubber footwear, per 100 pounds	Net	\$12.18
Portugal	Rubber footwear, per 100 pounds	Net	\$20.73
Roumania	Rubber footwear, per 100 pounds	Net	\$10.53
Russia	Rubber footwear, per 100 pounds	Net	\$26.35
Servia	Rubber footwear, per 100 pounds	Net	\$12.28
Spain	Rubber footwear, per 100 pounds	Net	\$26.32
Sweden	Rubber footwear, per 100 pounds	Net	\$12.18
Switzerland	Rubber footwear, per 100 pounds	Gross	\$26.32
Turkey	Articles of india rubber and gutta percha, ad valorem		30%
NORTH AMERICA:			
Canada and Nova Scotia	Rubber boots and shoes, ad valorem		32½%
	Boots, shoes, slippers, tennis shoes and insoles of any material not specified, ad valorem		37½%
	Imports of articles invoiced at prices less than the market value in the country from which exported, are liable to a "dumping" duty of 5 per cent if such articles are also made in Canada		
Newfoundland	Footwear and all manufactures in part or in whole of india rubber or gutta percha, ad valorem, including 10 per cent surtax		44%
SOUTH AMERICA:			
Argentina	Rubber footwear—includes surtax of 2%—duty based on valuation of \$54.79 per 100 pounds	Gross	40.8%
	Footwear of cloth and rubber, whose sole measures 25 centimeters (9.84 inches) or less, duty based on valuation of \$3.00 per dozen, includes surtax of 2 per cent		40.8%
	Same footwear, larger sizes, duty based on valuation of \$7.00 per dozen, includes surtax of 2 per cent		40.8%
Bolivia	Rubber footwear for men, surtax of 15 per cent is included, based on valuation of \$36.00 per dozen pairs		46.75%
	Rubber footwear for women and children: Overshoes, rubbers, boots, lined or not, including surtax of 15 per cent, based on valuation of \$1.55 per pound		46%
	Footwear for women and children with exterior lining with or without interior lining, including surtax of 15 per cent, based on valuation of \$2.27 per pound		46%
Brazil	Rubber footwear—based on value of milreis as \$0.245—per 100 pounds		\$5.18
	Rubber goods, combined with tissues of cotton, wool or linen, based on value of milreis as \$0.245 per 100 pounds		\$12.07
Chile	Footwear of any material, for sports, based on valuation of \$3.63 per pound		40%
	Shoes or overshoes, top boots, boots or tips of rubber, with or without interior lining or exterior part of wool or other material, finished or not, for the rain—based on valuation of \$1.815 per pound		30%
Ecuador	Rubber footwear, including surtax of 125.5 per cent, per 100 pounds	Net	\$29.83
Paraguay	Rubber footwear, based on valuation of \$54.79 per 100 pounds including weight of container	Gross	55%
	Other footwear (same as for Argentina)	Gross	55%
Peru	Rubber footwear, including weight of inner packing: at ports of Callao, Salaverry, Paita and Pisco, surtax of 10 per cent	Gross	\$31.90
	At other ports—surtax of 8 per cent	Gross	\$31.32
Uruguay	Rubber footwear, based on valuation of \$5.17 per dozen pairs—surtax of 14 per cent included		\$4.7%
Venezuela	Rubber footwear, including surtax of \$6.55 per cent	Gross	\$34.30
ASIA:			
China	Rubber boots, per dozen pairs	Net	\$4.88
	Rubber shoes, per dozen pairs	Net	\$1.22
Japan	Rubber boots, per 100 pounds	Net	\$18.82
	Rubber shoes, per 100 pounds	Net	\$13.79
	Rubber over-shoes, per 100 pounds	Net	\$19.43
OCEANIA:			
Australia	Galoshes, rubber sand boots and shoes and pinnisols, ad valorem		30%
	Golf shoes and walking boots, ad valorem		10%
New Zealand	Rubber footwear, ad valorem		33½%
AFRICA:			
South Africa	Rubber footwear, ad valorem		20%
	With a minimum per pair of		
	Men's		\$0.18
	Women's		\$0.12
	Children		\$0.06

RUBBER SOLES AND HEELS IN THE BRITISH SHOE INDUSTRY.

RECENTLY quite a number of samples of rubber soles, heels, tips, etc., have been brought before my notice from different manufacturers for inspection. The majority of these rubber soles and heels are of the cheap grades for use in the manufacture of cheap footwear. The majority of heels used in making cheap footwear are of the "cushion type," which has a small piece of leather, cut the same shape as the cushion, but smaller, attached inside the rim or edge of the cushion.

The following data gives some idea of the quality of the heels, soles and studs used in the cheap footwear factories.

No. 1 is for red seat studs about $\frac{1}{2}$ inch in height by $\frac{3}{4}$ inch in diameter.

	Percent.
Old door mats, pram tyres, gas pipes.....	64
Raw rubber.....	4
Codd rings.....	2
Sulphur.....	5
Preparation.....	10
Whiting.....	3
Red substitute.....	3
Red oxide.....	5
Red Vulcanine.....	4
	100

No. 2 is that of a grey mixing used in heels:

30 parts prams and mats, etc.
$\frac{1}{2}$ part raw rubber.
2 parts sulphur.
5 parts preparation.
1 part white substitute
$\frac{1}{2}$ parts whiting.

No. 3 is that of a mixing without any new rubber at all:

30 parts prams and mats.
2 parts sulphur.
5 parts preparation.
$\frac{1}{2}$ parts whiting.
1 part white substitute.

No. 4 was also a grey mixing used for cushion heels.

30 parts prams and mats.
$\frac{1}{2}$ part raw rubber.
$\frac{1}{2}$ part golf ball shells.
2 parts sulphur.
5 parts preparation.
$\frac{1}{2}$ parts whiting.
1 part white substitute.

No. 5 was found to be the best of a series of poor samples of rubber soles, and consisted of a grey mixing as follows:

15 parts prams and mats.
$\frac{1}{2}$ parts raw rubber.
$\frac{1}{2}$ part golf ball shells.
2 parts sulphur.
$\frac{1}{2}$ parts preparation.
2 parts whiting.
$\frac{1}{2}$ part white substitute.

The reader will no doubt have come to the conclusion by the time he has perused these mixings that the shoe trade can be catered for by a low grade of rubber commodities indeed. The mixings were prepared by grinding the old door mats, perambulator tires, etc., and passing the resulting mass through a fine riddle, and then mixing with an equal weight of tar. These mixings gave constant trouble when they were applied to the shoe, as they were very crumbly, and when the operator at the stitching machine tried to sew the heel or sole to the boot the groove made by the rubber manufacturer in the mold all broke out when the needle passed through.

Shoe manufacturers, of course, cannot expect to get superior quality goods at the price they pay.

[The foregoing contributed to "The India Rubber Journal," by Fred Ashworth, a well-known English analyst and consulting chemist, is interesting as throwing a side light on one of the old-time prejudices of rubber manufacturers, in favor of ground vulcanized scrap in the place of reclaimed scrap. It can be used, of course, and if a binder like tar is added, it may be sheeted and molded, but it would be a better product if the old pram tires, codd rings, etc., were put through an adequate reclaiming process before use.—Editor.]

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless, they are of interest, not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[161.] A correspondent wishes to know where he can purchase white castor oil substitute and black Russian substitute.

[162.] Prices and samples of "Vulcoline" have been requested.

[163.] Addresses of concerns making apparatus for the condensation of naphtha vapors are requested.

[164.] An export inquiry for 2,200 pounds of commercial gutta percha tissue, such as used by tailors, has been received.

[165.] An inquiry comes from Holland for machinery for making imitation rubber tiling.

[166.] A manufacturer wants to know where he can secure rubberized mummy silk.

[167.] Names of American manufacturers of gutta percha tissue are desired.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

An East African firm desires to receive catalogs, price lists and full information from American manufacturers of rubber-type printing sets. Report No. 20,553.

Communication with American manufacturers of rubber shoes and arctics is desired by a firm in Norway. Report No. 20,640.

An Italian concern would like to be placed in touch with American manufacturers of erasers of all kinds. Report No. 20,658.

An inquirer in Norway desires to be placed in touch with American manufacturers of brown, blue and black waterproof cloth for raincoats. Report No. 20,728.

A Swiss firm wishes to communicate with American manufacturers of hygienic rubber goods. Report No. 20,730.

Representation is desired in Central America for American manufacturers of suspenders, garters, raincoats, rubber over-shoes and other articles. Report No. 20,772.

An applicant in Spain wishes to receive catalogs and full information from American manufacturers of rubber goods. Report No. 20,774.

A Norwegian import firm would like to be placed in touch with American manufacturers of rubbers and arctics. This firm is prepared to give an immediate order for from 100,000 to 200,000 pairs and desires the agency for the whole of Norway. Report No. 20,831.

Quotations are desired by a Swiss firm from American manufacturers of rubber gloves for acid, electrical and medical purposes, rubber-lined canvas hose, high-pressure hose for pneumatic tools, vacuum-brake hose, garden and steam hose, gas tubing, beer tubing, rubber matting, fishing trousers and stockings, galoshes and rubber boots. Report No. 20,851.

"KANTLEEK" SEAMLESS WATER BOTTLE.

A hot water bottle is a source of comfort and healing in many human ailments, and a corresponding source of discomfort and distress if it leaks. The cemented seams of the usual type of water bottle are apt in time to open up or split, with a consequent leakage that, however small, renders them unfit for use.

As will be seen in the accompanying illustration, the "Kantleek" seamless water bottle is molded in practically one piece of rubber. The rubber is claimed to be of exceptional quality, and the bag is guaranteed for two years. [The Seamless Rubber Co., New Haven, Connecticut.]

What the Rubber Chemists Are Doing.

A SERIES of researches on the synthesis, structure and vulcanization of caoutchouc has been carried out by I. I. Ostromylenki. Abstracts follow from the "Journal of the Society of Chemical Industry" (March 31):

NEW METHOD OF COLD VULCANIZATION.

A mixture of a primary or secondary aliphatic amine with a metallic oxide either accelerates vulcanization of natural and synthetic caoutchoucs or considerably lowers the temperature of vulcanization. In the presence of such mixtures, vulcanization takes place at the ordinary temperature. The process is especially rapid with chemically pure caoutchouc obtained synthetically. In the air or ordinary molds the vulcanization occupies from a few weeks up to three months, according to the purity of the original caoutchouc. With natural caoutchoucs the vulcanization requires from two to six months at the ordinary temperature.

Vulcanization by means of trinitrobenzene or benzoyl peroxide also takes place at ordinary temperature, no special catalyst being necessary. Oxides of zinc, magnesium, and particularly lead accelerate the action when the nitro-compound is used, but these oxides retard cold vulcanization by benzoyl peroxide and also diminish the value of the vulcanized material. When trinitrobenzene is used, time is saved by preliminary heating of the mixture at 122 to 140 degrees F., or by preparing it with hot rolls. Rolling with benzoyl peroxide must be carried out at the ordinary temperature, otherwise a sticky mass results. Cautious heating of the mixed mass at 86 to 176 degrees F., for 10 to 40 seconds is also necessary in this case, but access of air must be avoided.

ACTION OF AMINES AND METALLIC OXIDES ON THE VULCANIZATION OF CAOUTCHOU.

In a mixture of caoutchouc, sulphur, amine and metallic oxide, the sulphur and the amine first react with formation of the corresponding thiozonide. This reaction proceeds only in the presence of a catalyst such as an oxide. The unstable thiozonide then transmits its sulphur to the caoutchouc, the amine being regenerated, or the amine residue, under the influence of the oxide, uniting with a fresh portion of sulphur to give thiozonide. The process is one of double catalysis. The metallic oxide catalyses the formation of the thiozonide of the amine, which in turn accelerates the formation of the caoutchouc thiozonide and so catalyses the vulcanization. Only primary and secondary amines give thiozonides and these are also the only amines which catalyse the vulcanization of caoutchouc. Thiozonides of aromatic amines are relatively stable compounds, incapable of functioning as sulphur carriers. An explanation is thus afforded of the observation that aromatic amines have practically no catalytic action on the vulcanization of caoutchouc.

From Bernstein's observation that the ordinary vulcanization of caoutchouc proceeds at the ordinary temperature under the action of ultra-violet light, it is concluded that, in the absence of air, this light activates sulphur by converting it into thiozone. The vulcanization is then effected partly by the latter and partly by the ozone formed simultaneously. Thiozone is also formed when ordinary sulphur is dissolved in a primary or secondary aliphatic amine, such as piperidine with a side chain, and the solution either heated for 20 to 50 minutes with lead oxide in a reflux apparatus on a water bath, or left at the room temperature.

VULCANIZATION OF CAOUTCHOUIC BY HALOGEN COMPOUNDS.

In the formation of vulcanite-like substances by the action of bromine, iodine or iodine bromide on caoutchouc, the first phase of the change consists in the formation of the caoutchouc halogenide. The unchanged caoutchouc then absorbs this new com-

pound or forms a swollen mass with it. This process may also be carried out by treatment of the caoutchouc with its halogenide. The latter acts either freshly prepared or old. All three halogenides of either natural or synthetic caoutchouc may be employed. Caouprene chloride or bromide exert a similar action on caoutchouc. The products obtained from the chloride are especially valuable because of their great stability and relatively low elastic point, and are easily obtained chemically pure. The amount of caoutchouc used need not exceed 7 to 10 parts per 100 parts of caouprene chloride. Similar vulcanization is effected by the action of the hydrochloride of natural caoutchouc, but not by that of aluminum chloride. The products obtained by the above methods have the black color of ordinary ebonite, are electrical non-conductors, may be scratched with the nail, keep well even in moist air, and take a high polish.

NATURAL GAS AND SYNTHETIC RUBBER.

In recent investigations by Singer, natural gas below the freezing point was subjected to successive pressures, according to "Le Caoutchouc & la Gutta-Percha." The first compression, of 3½ atmospheres, yielded liquids having a density of 0.6935 to 0.6720; and those of the second compression, of 24 atmospheres, showed a specific weight of 0.6365 to 0.6160.

The first part contained 30 per cent of pentane, 30 per cent of hexane and 7 per cent of butane. The second part was composed of ethane, propane and hexane, and appeared to be similar to the gas oil studied by Colson.

These products may serve as low cost material for transformation into isoprene or butadiene.

METHODS OF ANALYSIS.

ANALYSIS OF VULCANIZED RUBBER GOODS.

THE following scheme for analysis is reported by J. A. S. Morrison of Glastonbury, England:

The usual estimations are: rubber resins, free sulphur, mineral matter, vulcanized rubber and rubber substitutes.

RUBBER RESINS.—Rasp the sample into small pieces; weigh out 4 grams and extract with acetone in a Soxhlet extractor for two days. Dry the extract at 212 degrees F. and weigh. This extract contains the rubber resins and free sulphur, the latter being estimated in the extract as described later. The total extract minus the free sulphur gives the rubber resins. Keep the residue from the extraction in order to determine the rubber substitutes.

MINERAL MATTER.—To determine the mineral matter, 1 or 2 grams of the sample are boiled with 50 cc. of nitrobenzene in a fat flask with air reflux. It is then cooled and washed into a 300 cc. tall beaker with a mixture of 2 vols. sulphuric ether and 1 vol. ethyl alcohol. Dilute to about 250 cc. with this mixture, stir and stand over night to settle. Viscous deposits are due to insufficient ether, and more should be added if these occur. Filter the insoluble matter on a tared filter, dry and weigh. This gives organic matter insoluble in nitrobenzene plus mineral matter.

Wash the tared filter with warm dilute hydrochloric acid. Wash out acid with water, dry and weigh. Finally ash the paper and residue and weigh ash. Ash plus loss due to hydrochloric acid washing gives total mineral matter. The extraction with hydrochloric acid is carried out in order to extract carbonates as such.

The difference between the total nitrobenzene residue on the tared filter and the total mineral matter gives the organic matter insoluble in nitrobenzene. Carbon if used as a filling will be included in this figure.

FREE SULPHUR.—Take acetone extract (rubber resins) in a fat flask, moisten with water and cautiously add 25 cc. fuming nitric acid, cooling the flask in ice. Then gently warm and finally digest on steam bath, using a funnel as cover. When action is complete wash into a porcelain dish with a few cc. of fuming nitric acid and evaporate off all the acid. All the sulphur is now converted into sulphuric acid. Intimately mix the mass with 5 grams of a mixture of 3 parts sodium carbonate and 2 parts potassium nitrate; moisten slightly with water and mix well. Cover with a large dish and heat over a low flame till white. Cool and take up with concentrated hydrochloric acid, evaporate to dryness twice to precipitate silica and then finally dissolve in dilute hydrochloric acid, filter and precipitate as barium sulphate. Calculate to sulphur. This gives the figure for free sulphur.

RUBBER SUBSTITUTES (OXIDIZED OIL, ETC.).—The residue from the acetone extraction in the determination of rubber resins is digested with 100 cc. approximately half normal alcoholic potash for 4 hours at 140 to 158 degrees F. Pour off through a filter and digest residue twice with warm alcohol. Mix filtrate and alcoholic washings and evaporate off nearly all the alcohol. Take up the residue in a little cold water, transfer to a separating funnel, acidify and remove the fatty acids with ether. Ether extract is then taken to dryness and weighed. This gives fatty acids of oxidized oils, and is taken as the percentage of rubber substitutes.

VULCANIZED RUBBER.—This is obtained by subtracting the sum of the other determinations from 100.

TOTAL SULPHUR.—The method is the same as that described under free sulphur only one uses the original rasped rubber. The difference between total and free sulphur gives combined sulphur, but as this is included in vulcanized rubber, it is seldom separately expressed.

FREE SULPHUR IN RUBBER INSULATION.

The method for determining free sulphur in vulcanized rubber insulation as developed by Emile Baldeschwieler is as follows:

The weight of the finely divided sample varies, but generally 2 grams is sufficient. It is extracted for 8 to 10 hours in a Soxhlet apparatus with acetone at 131 degrees F. The apparatus is then disconnected, the excess of solvent evaporated, and the flask dried at 131 to 140 degrees F. Fuming nitric acid to the amount of 60 cc. is then added to the residue in the flask, which is covered with a watch glass, and contents boiled gently until most of the red fumes have been expelled.

The flask is then uncovered and a small pinch of potassium chlorate added to the boiling liquid. Continue the addition of small amounts of potassium chlorate until the liquid is entirely clear. When the greenish color has disappeared, remove the flame and cool the flask in ice water. If properly conducted the operations will yield a clear liquid with white flakes or a lump of paraffin floating on top.

This is separated by filtration and the filtrate, evaporated nearly to dryness, is taken up with hydrochloric acid. The operation is repeated several times to drive off the nitric acid. Dissolve the residue in water, add 1 cc. dilute hydrochloric acid and filter into a 500 cc. beaker. Make up to 400 cc. with water, heat to boiling and add, drop by drop, a slight excess of a 10 per cent solution of barium chloride. Filter and weigh as barium sulphate.

DIRECT DETERMINATION OF RUBBER IN VULCANIZED RUBBER GOODS.

A combustion method for the direct determination of rubber in vulcanized rubber goods has been developed by Robert W. Belfit. It is simple, quick and accurate for high grade compounds and preferable to those direct methods which depend upon the formation of compounds, the exact formulae of which are not constant or controllable.

The author states that his method is at present restricted to positively high grade stocks, which do not contain lampblack, reclaimed rubber or rubber substitutes. The method gives the

percentage of rubber too high in the presence of ground leather, egg albumen or other organic compounds insoluble in acetone, water and dilute hydrochloric acid.

In detail the procedure is as follows:

The sample is ground so that it will all pass through a 20-mesh sieve while but 20 per cent passes through a 40-mesh sieve. Then, 2 grams are extracted in a weighed tube for 5 hours with acetone kept continually at the boiling point. The tube containing the residue is inserted in an oven, kept at 212 degrees F., and a current of dry carbon dioxide is passed through the tube in order to aid rapid drying and prevent oxidation. The dried sample is weighed, and the percentage loss in weight calculated. About one-half of this extracted sample is weighed into a 250 cc. Erlenmeyer flask, and is cautiously boiled for 30 minutes with 150 cc. of hydrochloric acid (1 to 5 by volume). In this process all carbonates are driven off.

The liquid is decanted through an aluminum crucible and the residue is washed three times by decantation with water at about 140 degrees F., then washed ten more times with warm water. The residue is now placed in a tube and dried in a stream of dry carbon dioxide at 212 degrees F. for two to four hours. The tube is then removed and cooled in a desiccator.

This dry residue is next transferred to a weighing tube, from which 0.3-gram samples are weighed for combustion. The combustion is carried out in approximately the same manner as for any organic compound, except that no reduced copper spiral is used, as the water and nitrogen oxides are absorbed in a concentrated solution of potassium dichromate in sulphuric acid. A vessel of small volume is necessary for this solution, or otherwise it is almost impossible to displace all of the carbon dioxide after the sample has been completely burned. Beyond this tube is placed a U-tube containing zinc dust to absorb all possible acid gases other than carbon dioxide. The potassium hydroxide absorption bulb is next and last in the train. The rubber substance is burned in a stream of oxygen, and the potash bulb is always weighed when full of oxygen.

This method on pure, fine Para gum gave 96.16 and 96.57 per cent.

The value 0.96 is taken as the figure by which the weight of caoutchouc should be divided in order to obtain the weight of the rubber from which it came.

HASTENING EVAPORATION.

A piece of black tin tubing is made into a coil, which is put into a water bath, and to one end is attached a rubber tube connecting to a source of air. To the other end is attached a tubing connected to a right-angle glass tube, and which is passed through a stopper held in a clamp on a ring stand. By raising and lowering the clamp the distance of the air outlet from the surface of filtrate can be regulated. B. Freeman, of Clemson College, South Carolina, states that the heated air in the coil will hasten evaporation 50 per cent.

SCHOLARSHIP IN CHEMICAL ENGINEERING.

The Chemists' Club of New York City announces the establishment of a scholarship fund, the income from which, approximately \$500 per year, is to be devoted to assisting financially deserving young men to obtain education in the field of industrial chemistry or chemical engineering. This scholarship has been endowed by Dr. Victor G. Bloede, a prominent manufacturing chemist of Baltimore. Its benefits will be open to properly qualified applicants without restriction as to residence, and may be effective at any institution in the United States, which may be designated or approved by the Chemists' Club.

All inquiries should be addressed to the Bloede scholarship committee of the Chemists' Club, 50 East 41st street, New York City. Applications for the academic year 1916-1917 should be in the hands of the committee on or before June 1, 1916.

CHEMICAL TREATMENT OF RUBBER.

THE UNITED STATES.

DEVULCANIZING RUBBER. No. 1,178,483. Samuel E. Allen, assignor to the Empire Rubber Co.—The process of devulcanizing rubber by subjecting it to a bath having a boiling point above 392 degrees F., and containing oil derived by distillation from pine wood.

PRODUCING CAOUTCHOUC SUBSTANCES. No. 1,178,721. Fritz Hofmann; Konrad Delbruck and Kurt Meisenburg, assignors to Farbenfabriken Vorm Friedr. Bayer & Co., Elberfeld, Germany.—The process of producing a composite caoutchouc substance which comprises mixing a hydrocarbon of the butadiene series with about an equal amount of caoutchouc and polymerizing the hydrocarbon in such mixture to give a composite caoutchouc substance.

UNITED KINGDOM.

ARTIFICIAL LEATHER. No. 100,038 (1916). N. G. Schener, Copenhagen.—Artificial leather is made by impregnating linen duck with linseed oil or a varnish to which a little siccatif and Vienna red have been added, drying and sticking the sheets together with a mixture of 4 kilos heated wood tar pitch, 2 kilos india rubber dissolved in benzene or the like, 4 kilos Vienna red mixed to thick consistency with French turpentine, and 2 kilos of powdered cork. The compound sheet is finally passed through pressure rollers.

CANADA.

VULCANIZING PROCESS. No. 167,203. Paul I. Murrill, assignor to the Canadian Consolidated Rubber Co., Limited. Same as United States patent No. 1,166,777. THE INDIA RUBBER WORLD, February, 1916.

VULCANIZATION ACCELERATOR. No. 167,204. Paul I. Murrill, assignor to the Canadian Consolidated Rubber Co., Limited. Bone oil is added as an accelerator of the vulcanizing agent.

THE FRENCH REPUBLIC.

RECLAIMING RUBBER FROM TIRE FABRICS. No. 478,280. C. De Villers. The process consists in treating the rubber-coated waste fabric with boiling hot tetrachloride of ethane in two stages. The free sulphur is removed by a brief treatment, the solution of the rubber is accomplished by a second extraction with fresh solvent.

SPONGY RUBBER. No. 478,369. P. Schidrowitz and H. A. Goldsborough. Coagulating rubber latex under conditions producing a porous or spongy coagulum and fixing the pores by vulcanization. (THE INDIA RUBBER WORLD, July, 1915.)

THE GERMAN EMPIRE.

WATERPROOF FABRICS. No. 285,138 (1912). The material to be waterproofed is treated with hydrocarbons yielding synthetic gums by known process of polymerization. The result is a more uniform impregnation with gum than is possible with the use of gum solutions.

"BALATA" FROM NORTHERN NIGERIA.

The Imperial Institute has examined a sample of "balata" rubber from northern Nigeria. It contained considerable moisture and vegetable impurities; was white to red in color; tenacious; only slightly elastic and very sticky. The sample lost 26 per cent impurities by washing. Analysis of the residue showed 49.2 per cent caoutchouc, 47.4 per cent resin, 2.4 per cent protein and 0.7 per cent ash.

The caoutchouc when isolated was almost black and showed inferior physical properties. The "balata" rubber of northern Nigeria is probably derived from *Ficus vogelii*, the preceding data being in accord with the analyses, made by the Imperial Institute, of samples of the product obtained from this tree in Gambia and the Gold Coast

LABORATORY APPARATUS.

LIQUID SPECIFIC GRAVITY BALANCE.

A SPECIAL torsion balance has been perfected, designed especially for readily determining the specific gravities of liquids. The results are obtained direct from the reading of the beam without the use of loose weights or calculations. The scale

is adapted for specific gravities from 0.7000 to 1.4000, and is accurate to the fourth decimal place.

The operation of the scale is extremely simple. The bottle is filled with the liquid, wiped thoroughly clean on the outside and placed upon the scale. Balance is secured by means of the slide weights, and the result read from the beam. [Christian Becker, New York City.]

BURETTE ATTACHMENT.

A simple attachment to a stop-cock burette enables the operator to control perfectly the flow of reagent during titration.

The discharge may be regulated from a series of drops to a fraction of a drop, as may be required at the end of reaction, when too much may spoil the work of hours.

The device does not interfere with the ordinary use of the burette. It consists of an arm attachable to the stop-cock and an adjustable stop arranged around the burette. [E. P. Curtis, New York City.]

ANOTHER SYNTHETIC RUBBER SCHEME.

A writ of attachment against the property of Knut C. Widdien, of Brooklyn, New York, has been issued to recover \$31,200 advanced to him by the backers of his alleged synthetic rubber scheme. It is alleged that Widdien claimed he had a process for making synthetic rubber at a cost of 15 cents a pound, and that a demonstration was given in Brooklyn, where a big vat was shown containing some sticky substance which Widdien described as rubber made by his process. The proposition was to form a company to be called the Northern Rubber Corporation, with a capital of \$100,000, later to be increased, Widdien claiming that it would be easy to make 10,000,000 pounds of rubber per year, and offering the plaintiffs 51 per cent of the capital stock for \$31,200. The plaintiffs, Kuno B. Heberlein and Franz Rosenberg, put up the money, and finding the business lagging, hunted for Widdien only to discover that he had gone south and had left no word as to the date of his return.

New Machines and Appliances.

AUTOMATIC ELECTRICAL CONTROL FOR CALENDERS.

THE illustration shows the installation of an up-to-date automatic electrical calender control equipment, where the calender is used for various classes of work, such as frictioning, skim coating and sheeting tire stock. Each of the above operations is performed at different speeds, and in order to maintain a uniform quality of material it is necessary that the speeds of the rolls during the various processes should be constant.

Therefore a direct current adjustable speed motor is preferable for a calender drive. This type of control is fully automatic. It consists of three parts, the main panel, on which is mounted the operating contactors; the master panel, on which is mounted the field rheostat for speed control with 70 points to insure close speed adjustment, and a push button station, mounted on the side of the calender, from which the control is operated.

From this station the motor may be started, stopped, or slowed down without stopping for threading in. After once

The measuring wheel is three-quarters of a yard in circumference and rests directly upon the cloth, while it is prevented from slipping by minute pins in the rim. Should these pins

result in injury to the cloth, the measuring wheel can be covered with felt, leather or plush. [Parks & Woolson Machine Co., Springfield, Vermont.]

A NEW INNER TUBE SPICE VULCANIZER.

The Allen air-cooled vulcanizer is one of the newest devices for curing the joint of inner tubes. It consists of a two-part hinged cylinder cored for steam, and provided with heat radiating flanges. It is supported on standards for convenient operation from a bench or table. There are two handles for opening the vulcanizer, and a swinging bolt operated by a socket wrench for tightening the two halves together. The inside of the cylinder is bored to exact size of the inner tube. The ends, however, are closed and act as clamps, limiting the air to the confined part of the tube. An opening is provided in the lower section of the vulcanizer to accommodate the valve stem. The tube is skived, cemented and placed in the steam-heated cylinder, which is then closed, locked, and the part of the tube within the vulcanizer is inflated against the walls of the cylinder. When the cure is complete the steam is shut off, and after the vul-

setting the master controller for any desired speed, the operator can either slow down to the threading speed or stop and then start up again and return to the same speed without readjustment of the control.

The master field rheostat is provided with a dial stamped in yards per minute, so that the operator always knows the yardage at which he is running. The equipment also provides dynamic braking for quick stopping. The control illustrated is used with a 90-horse-power, 300 to 900 revolutions per minute, 230-volt motor driving a 24 x 66-inch 3-roll Farrell calender. [General Electric Co., Schenectady, New York.]

STANDARD CLOTH MEASURER.

The extremely simple and low cost cloth measuring machine shown in the illustration can be used to measure almost any fabric or rubber-covered goods. It is not designed for handling a large and continuous output, but is well adapted for inventory taking or where small yardage is measured daily or large yardage occasionally.

The cloth is simply pulled through by hand and, as the measuring wheel is turned, the measurement of the cloth is registered on the dial. The entire measuring mechanism is mounted on a hinged plate so the cloth can be easily introduced. An automatic lock is provided to stop the measuring dial when the cloth leaves the wheel. The pointer is set to zero by operating the thumb screw in the center of the dial.

canizer cools down, which is greatly facilitated by the heat radiating flanges, the tube is removed from the cylinder. [Allen Machine Co., Erie, Pennsylvania.]

SOUTHWARK 250-TON GOOSE NECK TIRE BEAD PRESS.

A six-cylinder tire bead press of the goose neck type is the subject of the accompanying illustration. It is designed according to the demands of modern tire practice for quality of work and maximum production.

The cast iron housing is heavily built and ribbed to withstand without deflection the full pressure of 250 tons when applied by the powerful rams. The cast steel ram cylinders are rigidly

supported in the base of the housings and the six hydraulic rams operate in perfect unison in raising and lowering the steam platen. This is 24 inches wide and 16 feet long, chambered for steam and attached so that the expansion due to the heat is provided for. The top platen is of the same dimensions, similarly constructed and attached to the upper part of the housing.

While this press is used for forming and curing tire beads,

it is equally serviceable in vulcanizing hose, matting and belting. [Southwark Foundry & Machine Co., Philadelphia, Pennsylvania.]

MACHINERY PATENTS.

THE WINKLEY SOLE CUTTING MACHINE.

THE machine illustrated in the drawing is specially designed to automatically cut shoe soles from sheets of rubber stock and to impress thereon the medallions which usually appear near the middle of the sole.

The frame of the machine is designated by *A*, while *B* are the extensions supporting the moving work table *C*, on which the cutting is done. This table is composed of thin, flat plates pivoted together, forming an endless carrier that is driven by the sprocket wheel *D*. The sheets of rubber stock are placed upon the table by the operator, and as they are advanced into position to register with the cutters they are operated upon by pressure rollers which press them uniformly and evenly upon the surface of the table.

The two cutting mechanisms *F*, *F*, which are mounted over this table, are driven by independent gearing, cams and levers operated from the main shaft. Each cutting mechanism comprises a form or pattern corresponding in outline to the sole to be cut, a cutter carrying head, and feeding and controlling mechanism which causes the cutter to travel in a path corre-

sponding to the outline of the pattern. Each cutter is operated and controlled independently of the other, and as each cutter finishes cutting a sole its operating and controlling mechanism is thrown out of operation. When both cutters have finished their operation the heads are raised to disengage the cutters from the stock, and mechanism for moving forward the table to present a new portion of the stock to the cutters is thrown into action. As the shifting movement of the table is completed the medallion impressing mechanism *G*, *G*, is operated to impress one or more medallions upon the cut soles. [Erastus E. Winkley, Lynn, Massachusetts. United States patent No. 1,177,577.]

APPARATUS FOR IMPREGNATING TIRE FABRICS.

Kremer's invention relates to a process and mechanical apparatus for impregnating cotton fabrics with rubber or other materials suitable in the preparation of fabrics for use in the manufacture of tire casings. A vertical section of the apparatus is shown in the illustration in which *A* is the solution tank, *B* the drying chamber and *C* the compartment where the saturated fabric is wound up on a roller.

In operation the fabric is fed from the roll *D* into the rubber solution, where the air is removed by a pair of rollers that also force the solution into the interstices of the cloth. As it passes out of the tank the excess rubber is removed by another pair of rollers.

The fabric (which is attached to the cross bar *E*) is then drawn through the drying chamber by the endless chain belt *F*, driven by a series of sprocket wheels, and is wound up on the roller *G*. Hot air is introduced to the drying chamber through valve *H*, and circulation is maintained through pipe *I* located at the top of the chamber. The condensed solvent is drawn off through a pipe provided for that purpose at the bottom of the chamber. [F. W. Kremer, Carlstadt, New Jersey. United States patent No. 1,174,995.]

COVERING HOSE WITH LEAD PRIOR TO VULCANIZING.

This machine is primarily adapted for forming a tube of lead around rubber hose to perform the services of a mold during the process of vulcanization. It may also be used with other machines for making metallic tubes, without regard to whether such tubing is formed around rubber hose or a tube of other character.

Referring to the illustration, *A* is the base of the machine that supports the block *B*, provided with a die chamber *C* in which the die *D* is supported by a threaded sleeve. The forward end of this die cooperates with the female die *E* supported in the die carrier *F*.

The molten metal is discharged into the passage *G* from the supply chambers *H* and *I*. The block *J* swings on a pivot and automatically closes the chamber *I* when pressure is applied by the plunger *K* to the molten metal in chamber *H*. When pressure is applied to the metal in chamber *I*, the opposite chamber is closed by the swinging block *J* and the metal from chamber *I* is discharged into the passage *G*. From here the metal is forced through the dies *D* and *E* which encase the hose in a tube of lead as it passes through the openings provided for it in the dies.

In order to partially cool the molten metal and head block, the latter is provided with angular chambers *M*, *M*, through which water is caused to flow. [C. D. Garretson, Wilmington, Delaware, assignor to Electric Hose & Rubber Co., Wilmington, Delaware. United States patent No. 1,177,097.]

"Rubber Machinery," by Henry C. Pearson—should be in the library of every rubber manufacturer and factory superintendent.

PNEUMATIC TIRE VULCANIZING BAG.

This invention relates to annular fluid pressure bags which are employed in vulcanizing certain types of pneumatic tire casings, such as cord tires, to hold them in an expanded condition while being cured. Referring to the illustration, *A* is an annular inflatable bag made of frictioned fabric, suitably reinforced and thickened at the base or inner wall by extra plies of fabric. The shield *B* is composed of the same materials and is attached by its inner margin to the base of the bag, forming a continuous annular flap. This is prevented from adhering to the bag during vulcanization by dusting the surfaces with talc.

Afterwards the collapsed bag is inserted in the casing *C*, the head ring *D* is applied and the tire placed in the vulcanizing mold *E*. The bag is then inflated by fluid pressure applied through the tube *F*, transmitting uniform pressure through the shield flap to all adjacent parts of the inner tire wall. Thus ridges in the latter are avoided, and at the same time the shield acts as a protector against possible overheating of the vulcanizing bag. [J. J. Johnson, Jr. and J. R. Gammeter, both of Akron, Ohio, assignors to The B. F. Goodrich Co. of New York City. United States patent No. 1,177,112.]

PACKING CUTTER.—Square or round packing can be accurately cut at the desired angle by this machine, producing smooth, perfect fitting ends. [R. A. Landry, Houston Heights, Texas. United States patent No. 1,176,838.]

PNEUMATIC TIRE MOLD.—It is a two-part annular mold with interchangeable tread forming rings and inside and outside rings for aligning the mold parts. Pressure is applied to the interior of the tire by a water inflated bag. [G. E. Batcheller, New York City. United States patent No. 1,175,681.]

BRITISH AND FRENCH PATENTS.

ELASTIC FABRICS. In making fabric for surgical elastic hosiery, rubber threads covered with ordinary cotton thread are arranged in pairs forming the warp, while non-elastic threads are used as the filler, thereby producing an open mesh elastic fabric. [A. F. Porter, 12 Aldersgate street, London, England. British patent No. 23,561 (1914).]

AERO-PLANE WHEEL AND RIM. The object of this invention is to permit rapid mounting and de-mounting of tires having wired or inextensible beads, yet prevent lateral displacement of the tire when fitted to the rim. [Dunlop Rubber Co., Limited, 14 Regent street, London, and Colin Macbeth, Aston Cross, Birmingham, England. British patent No. 2,638 (1915).]

OVERFLOW TRIMMING MACHINE.—This invention comprises a rotary cutter operating in conjunction with an adjustable table and a lever for holding the material in contact with the cutter. [Edwin Harrison, Brook College, Leyland, Preston, England. British patent No. 5,218 (1915).]

EMBOSSED SHOE CALENDAR WITH INTERCHANGEABLE DESIGN SLEEVES.—The embossing roller is removable and is provided with interchangeable sleeves bearing the engraved designs and patterns desired to be impressed on the rubber. [Charles Woollett, 176 Rice Lane, Walton, Liverpool, England. British patent No. 460 (1916).]

EXPANDING VULCANIZING MOLD.—In making linings for pneumatic tires an expandable body of zinc provides for the expansion of the mold parts when heated. [T. Sloper, Southgate Devizes, Wiltshire, England. British patent No. 22,995 (1916).]

METHOD OF MAKING TIRE CASINGS.—The outer covers of pneumatic tires are generally built up with fabrics coated with a rubber solution, and cut bias at an angle of about 45 degrees. The inventor inserts between the superimposed canvas layers a woven fabric cut bias. This fabric is coated and equally elastic in both directions, viz., in the plane of the wheel and in the direction perpendicular to the said plane. Its intended purpose is

to provide equal resistance in both directions. [M. Laroche. French patent No. 47,825 (July 25, 1914).]

MACHINE FOR MAKING INLAID OR MOSAIC WORK.—The material which forms the foundation or backing for the inlaid work, is supported by rollers which communicate to it a forward movement. A series of mechanically controlled "die" rollers arranged above the supporting rollers, cuts out the pieces forming the mosaic which are ejected and placed on the foundation to which they are firmly attached, forming the design. [E. T. Fenwick. French patent No. 478,210 (March 31, 1915).]

OTHER MACHINERY PATENTS.

THE UNITED STATES.

THE EDITOR'S BOOK TABLE.

STANDARDIZATION OF AUTOMOBILE TIRE FABRICS. TECHNOLOGIC Paper No. 68 of the Bureau of Standards, Washington, D. C. By Walter S. Lewis and Charles J. Cleary.

THIS pamphlet records the various steps taken by the authors in the study of the fabrics for the purpose of developing the best methods of testing 17½-ounce standard tire building fabrics. The chief causes of variations in test results were found to be due to different testing machines, size of test specimen, moisture in fabric at the time of test, method of selecting samples and differences in the fabric. Comparative tests were made to determine which of the several common methods for ascertaining each particular physical property of the fabric would give the most reliable results.

The difference in strength of the same fabric tested upon two different testing machines was often large. In one case it was 40 pounds and the strength of the fabric was about 225 pounds. Several kinds of test specimens prepared for the strength tests were carefully compared. The results indicated that a test specimen one inch wide and 3 inches long is fully as satisfactory as regards accuracy and reliability as any other dimension. The quantity of moisture in the cotton fabric has a marked influence upon the weight and strength. Methods of sampling for strength tests are, also, fully discussed and tables are given showing in detail the results of the various investigations.

THE AUTOMOBILE FUEL SITUATION. BY E. S. FOLJAMBE, Society of Automobile Engineers, New York City. [8vo, 18 pages, paper bound.]

An address on the present gasoline situation given by E. S. Foljambe, managing editor of the *Chilton Co.*, before the Metropolitan Section of the Society of Automobile Engineers at its March 16 meeting, has been published in pamphlet form. He claims that the present high price for gasoline seriously affects the automobile industry, which already shows a falling off in demand for new machines. He quotes from the report of Secretary Lane of the Interior, who gives as the causes for the phenomenal rise in the price of gasoline, increase in consumption and in exports, causing a depletion of stock on hand, and to these are added decreased production of crude oil, rich in gasoline, and the increase in the price of crude oil from which gasoline is made. The United States Bureau of Mines places the value of petroleum wasted at not less than \$50,000,000 a year, due largely to evaporation, nearly all of which is preventable. If no new oil fields are discovered, and even if the production of casing-head gasoline from natural gas continues to increase, the author figures that the total supply will be exhausted in 15 years. Alcohol, he deems, offers no relief at present. Benzol may be used—in fact, is used in Europe as a substitute, but sells at present at a higher price than gasoline. Natural gas under pressure has proven practicable for short runs. Kerosene may come into use, but it brings problems. The engines would need to be modified and low-grade fuel carburetors must be devised. Some form of thermostat must be installed. Gasoline would be needed even then to start the engine, and perhaps a mixture of fuels of high and low volatility might be used, a combination valve being provided which would allow any proportion of each in the mixture. Several special carburetors are described and their principal merits mentioned. The suggestions as regards remedies, or measures for relief, are a tax on exports, improvement and general use of more economical distillation processes, the curtailment of waste, the development of crude oil fields, oil-bearing shales and natural gas districts.

PEEPS AT MANY LANDS. SOUTH AMERICA. EDITH A. BROWNE, F.R.G.S. A. & C. Black, Limited, London, England. [Price, 1s. 6d.]

Many of our readers know Miss Browne, whose contributions to *THE INDIA RUBBER WORLD* have been read with interest. She

is the author of several books, one of which, in the series of "Peeps at Industries," is devoted to the rubber industry. Miss Browne is well qualified to write on these subjects, having visited many of the countries of South America, and having been associated with A. Staines Manders, the organizer of the International Rubber Exhibitions, to whom this book is dedicated. The book is one of the "Peeps" series of small, handsomely printed, concisely written books, and this one on South America is particularly attractive, having 12 full-page illustrations, reproductions of water-color sketches. In a volume of 88 pages only a fleeting view can be had of such a large country as South America, and Miss Browne is to be congratulated on getting so much in the way of facts concisely but entertainingly told in so small a compass. One of the chapters is devoted to "Para Rubber" and another to "A Voyage Up the Amazon." But, besides these, all the principal cities are briefly described, as is also the trip on the Trans-Andine railway to the West Coast. Four other trips—across Lake Titicaca, through the Panama Canal, up the River Magdalena in a house-boat to Bogota, and to the Kaieteur Fall of the Potaro River in British Guiana, are particularly interesting.

LIST OF PARA EXPORTERS AND IMPORTERS, 1915. PUBLISHED by the Associação Commercial do Pará (Commercial Association of Pará, Brazil), in Portuguese, French and English, for free distribution. [8vo, paper cover, 104 pages.]

Giving expression to part of a program traced for itself, the Commercial Association of Pará is distributing without charge a complete list of exporters and importers established in that important trading center of Brazil.

Besides being a handy and serviceable directory this publication contains valuable information regarding Pará, its climate, its trade and banking statistics, its school for practical commerce and its commercial association.

The list of exporters opens with the names and addresses of crude rubber exporters, while the importers' list contains the names and addresses of importers of electrical instruments and apparatus, automobiles, department stores, importers of footwear, commission merchants, druggists, importers of hardware, telephones, the commercial agents and representatives of national and foreign houses, banks and exchange brokers, and a list of foreign consulates.

The book will be found valuable to all interested in commercial relations with the great trading and rubber exporting center of Northern Brazil.

NEW TRADE PUBLICATIONS.

THE March number of "Footprints," the house organ of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, is really a catalog of the many lines of footwear manufactured by that corporation. It is a handsomely printed pamphlet of 120 pages, almost every page containing one or more half-tone illustrations of the lines of footwear, which are fully described, giving all particulars so that dealers can order understandingly. Some of the pages are in color, where the goods are manufactured in other than black or gray rubber. Besides the catalog proper, there is an explanation of the standard assortment of case packings, showing the number of pairs of each size packed in a case unless ordered otherwise. There is a description of each last and outline cuts showing a side and sole view. Some pointers are given wearers on the care of rubbers and to dealers regarding fitting. The cover, printed in blue and orange, carries out the idea of the name "Footprints," the sub-title being so arranged as to simulate a footprint by the shaping and placing of the letters.

The United States Rubber Co. has been sending out to its footwear customers some attractive cut-outs to advertise their "Champion" tennis shoes. A square frame showing styles of tennis

shoes and the brands used upon them is so arranged that the "Champion" tennis cut-out boy can be so hung as to swing in this frame, balanced by his legs extending forward under the frame, the feet showing white tennis shoes with the "Champion" trade-mark upon them. The boy is an amusing little fellow who swings back and forth at every puff of wind and thereby makes an effective advertisement for this line of footwear, if hung in a window or suspended in a store. Another cut-out simulates the United States Rubber Co.'s patent pressure process "Storm King" boot, which is represented standing upon a box appropriately labeled and having at one end the newly adopted trade-mark of the company. The boot is in bright red and also shows the trade-mark on the front of the leg.

* * *

The Hyde Manufacturing Co., manufacturers of specialties in knives and cutting tools, Southbridge, Massachusetts, has issued Catalog R, this being devoted entirely to knives for rubber workers. One would hardly suppose so great a variety and number of different cutting tools are required in the rubber industry. In the thirty or more pages are pictured, described and priced several hundred knives, with points of every conceivable shape for the hand worker, square, half round, round bevel and taper point, tire knives, lathe knives, circular and machine knives. The catalog is excellently arranged and should find a place in every rubber factory.

* * *

The Peerless Rubber Manufacturing Co., New York City, sends out its catalogs in specially folded stiff paper covers, which allow a new page to be inserted where changes need to be made in the lists. Two of these catalogs relate to belting and packing, and both are handsome specimens of typography, each page being printed in two colors, the goods pictured in excellent half-tones and the description thorough in all respects. The belting booklet gives a considerable amount of information regarding the application of belting, horse power rules, pulley diameters, belt capacity, etc. Both books are likely to prove useful to the many customers of this concern.

* * *

"The Romance of Rubber" is the title of a little 24-page booklet published by The B. F. Goodrich Co., Akron, Ohio, to exploit its products. The plan of the book is to show at the top of each page a fine half-tone picture relative to the gathering or manufacture of rubber, while at the lower outside corner of each page is an appropriate picture of something relative to the gathering of rubber, or scenery in tropical countries. The text is informative, though it contains practically little that is not known to every rubber manufacturer and to most people in the rubber trade. In typography it is up to the high standard of the publications emanating from this enterprising company.

* * *

The United States Tire Co., New York City, has recently published a small vest pocket brochure that will interest the motorist who really wants to know the facts about individualized tires. The title is "Judging Tires," and it treats very pertinent questions, such as "Which type of tire will last longest on your weight of car," "Which type of tire will last longest under your road conditions," and other factors to be considered in the selection of tires.

* * *

The business of repairing pneumatic tires has become an important one and any measure which will advance the ability of repairers is one which will be truly welcome. The Goodyear Tire & Rubber Co., Akron, Ohio, has published a "Manual of Tire Repairing" which gives in condensed form, in a book of less than 50 pages, directions for repairing every sort of tire injury,—cuts and punctures, breaks in fabrics, blow-outs, rim cuts, as well as splicing inner tubes, relining and retreading, vulcanizing, etc. There are given besides this a form of tag and return check for repairers, a system of accounting, and a

large number of illustrations showing the tools and machines necessary for the up-to-date repair business.

* * *

The Underwriters' Laboratories, Chicago, Illinois, whose work in connection with testing materials and appliances used in the prevention and suppression of fires is well known, has sent to all holders of its June, 1915, edition of "Standards for Rubber Covered Wires and Cables," 12 revised pages to take the place of the same number of pages in that edition. On account of the arrangement of the original edition these new pages can readily be inserted in their proper places and thereby render the book up to date. Most of the changes are explanatory, but some show changes of more or less importance. All changes are printed in italics and therefore can be easily and quickly distinguished.

* * *

The Institution of Electrical Engineers, London, England, has sent THE INDIA RUBBER WORLD a copy of "Wiring Rules" issued by that institution, with extracts from Board of Trade and Home Office regulations for factories and workshops. This, as its name indicates, is a compilation in compact form of all the rules which are required by the British Government as regards wiring factories, workshops, mines, theaters and private houses. It tells what is required for insulation, classing vulcanized rubber insulation as Class A, while hygroscopic dielectric insulation such as impregnated paper or fiber is in Class B. The pamphlet also gives the thickness of rubber insulation required, and much practical matter of interest to those having charge of installing electricity. Among other changes in this edition may be mentioned provisions made for conductors with hard-rubber-compound protection.

REGISTRATION OF TRADE-MARKS IN LATIN AMERICA.

The American exporter or manufacturer selling goods in Latin America should protect his trade-marks. Attention should be called to the difference in the legal point of view as to the ownership of trade-marks between the Latin American countries and the United States. By the common law, use is the basis of property in a trade-mark, and registration in the United States is merely an additional means of protecting that property right acquired by use. In the Latin American countries, on the other hand, the rights of property in a trade-mark are derived entirely from the law and depend on the registration of the mark. Registration is usually granted without investigation of the right to its use, though after due notice to those interested by publication of the application in the official gazettes. When once effected, registration is final against all later comers. The importance of registration is therefore greater in the Latin American countries than in the United States, in view of the possibilities for unfair registration under the trade-mark laws in effect in those countries.

MAKING DIVING CAPS.

The diving cap is a quiet and unassuming affair compared to the ornate modern bathing cap, of which it is the prototype. Utility, rather than beauty, is aimed at in its design, but what it lacks in appearance it amply repays in efficiency, as every swimmer knows.

These are always made entirely by hand. The two pieces forming the cap are cut from a sheet of raw unvulcanized stock and the cemented seams united by a hand stitcher on the seaming form shown on the left. This form is hinged and provided with a short locking arm. When this is released the form collapses, as shown on the right, and the cap is removed and vulcanized.

New Goods and Specialties.

BATHING CAP NOVELTIES.

A TIMELY novelty in bathing caps is shown herewith, aptly named the "Aviator" because of its resemblance to the helmets worn by the drivers of air machines. The body of the cap is seamless and it is trimmed by hand. The crown

is of natural pure gum color and the head-band of combination red and black, the decorative figures being either round, as shown in the illustration, or diamond or square-shaped. The turn-down piece, tied under the chin, protects the neck, ears and hair and renders this up-to-the-minute style of bathing cap thoroughly practical as well as ornamental.

The demure effect of the national headgear of Holland is cleverly obtained in the "Dutch Cap" also shown. It is hand-made, with a box-plaited crown and a tight head-band across the back. The pinked,

plaited edges becoming frame the face, and four rosettes, two at the top and two at the back, add the further adorning touch desired by feminine wearers.

This cap is furnished in a variety of colors—"Persian," red, blue, green, wistaria, tango, silver gray and pure gum.

Another popular cap simulates the bandanna handkerchief, being made with a two-colored bow and a two-piece body; while a turban cap is ornamented with buckles and a bow in front, and still another style has a crown fashioned in one-inch box pleats and a double head-band, the ornamental effect being obtained by the contrasting color of the outside band which is held in place by loops and has a flat, tailored bow on one side.

[Faultless Rubber Co., Ashland, Ohio.]

MOORING FOOTWEAR.

It is a somewhat sad commentary on the effect of the war that in Canada there is a demand for mourning shoes. Such footwear is now made in tennis lines, several styles, with

white duck tops, cemented rubber soles, and black trimmings being designed to wear with mourning costumes. The one shown has a white duck top, edged with black, a black Cuban heel and a black rubber sole.

Another style has a colonial buckle and tongue, edged with black, with a wedge heel and sole of smooth, white rubber. A steadily increased call is noted for these goods. They are made in women's sizes only. [The Canadian Consolidated Rubber Co., Limited, Montreal, Canada.]

WET WEATHER SPORT GARMENTS.

The young woman of today goes in for athletics and stormy weather has no terrors for her. Because of this, manufacturers vie with each other in producing apparel for special wet weather wear, and two recent creations in this line are shown herewith.

One is a golf coat, exceedingly light in weight, made of rubberized silk in a handsome olive tan shade. This is so cut as to give plenty of room for the free play of the arms necessary in the various strokes of the game, and in order that such a coat shall be more comfortable it is ventilated under the arms, thus allowing for the circulation of air between the coat and the clothing

of the wearer. With this a mannish hat of shower-proof gabardine is worn, and this, with a cravenetted skirt, or one of rubberized silk, completes the costume for the up-to-date player who wishes to go round the links in real Scotch golfing weather.

The other picture shows a female devotee of Izaak Walton, with her cravenetted thorn-tweed skirt and knickerbockers, Storm King rubber boots and leather coat. Thus appared, she can defy the spray of the ocean or can wade through brooks in pursuit of her limy victims. These garments will commend themselves to up-to-date sporting goods and clothing dealers. [Abercrombie & Fitch, New York City.]

THE DURST ANTI-SPLASHER.

The unusual feature of this accessory to the kitchen sink consists in the body of the anti-splasher being made entirely of rubber.

There is no metal sleeve to foul or rust and the threads that permit quick and easy attachment to the faucet are molded in the rubber body. The only metal in this device is the small tin-plated disk that forms the strainer that is located inside the body and protected by a rubber washer. Moreover, this anti-splasher and strainer also offers protection to the dishes and other breakable ware that through carelessness are broken by the unprotected metal faucet. [Durst Manufacturing Co., New York City.]

WATERPROOF PROTECTING TOWEL AND BATHING CAP.

The practical and convenient hair drying towel here shown is made of rubber and therefore affords complete protection while drying the hair after bathing or a shampoo. Or it may be used

to keep the hair from the wet bathing suit, as shown in the illustration. This rubber towel is made up in a soft, peach-blow color, which should make it very attractive to feminine buyers. It has a narrow black band around the neck and is securely fastened in front by means of a collar button. A similar style of hair drying accessory is edged with rubber fringe.

The rubber cap also shown is a novelty "College" bathing cap. The under part fits closely over the hair as do ordinary bathing caps, while

the top is stiffened to simulate the customary headgear of the college girl, a pendant tassel completing the resemblance. [L. C. Studios, New York City.]

AUTOMOBILE CAMP BED AND TENT.

There is an element of the nomad in many people. The get-back-to-nature desire is predominant in many minds. Gypsy life, with its freedom, has charms for thousands of urbanites. The automobile makes one independent of railroads, but not of hotels. Those who would carry their beds with them, and camp out where night overtakes them, will be interested in accompanying pictures showing an auto-touring sleeping device, a bed which

folds up in so small a space as to be readily transportable on the running board of the car, yet which when set up provides a comfortable bed for two people.

It is argued that the average collapsible cot sags to the middle, and is therefore uncomfortable for two sleepers. It is claimed this objection is overcome in this collapsible bed by producing a flexible spring mattress that will fold or roll into very small space, yet will not sag. The frame is of metal-capped wooden bars swiveled to the running-board, and a tent of heavy army khaki protects the sleepers. This gives the whole tonneau as a dressing room from which the tourists can step at once into the bed.

When collapsed the bed and tent roll into a compact space, as

shown in the minor illustration. [L. C. Schilling Co., St. Joseph, Missouri.]

DOUBLE TEXTURE SLIP-ON.

There is an amount of style put into waterproof and weatherproof garments nowadays which commends them to a much larger circle of wearers than in the old days when such garments were less artistically cut and less handsomely finished. A glance at this picture of a 1916 slip-on will confirm this statement. It is made with a convertible collar, thus fulfilling its mission for rainy weather and yet rolling back at the lapels much the same as a regular overcoat. It is made 48 inches long rather than the usual slip-on length, which gives it a more stylish appearance. This coat is of double texture material, the goods being of fine quality and made up in a number of weaves of popular mixed fabrics, and linings of vari-colored plaids. The cutting and making are on a par with fine clothing lines and the result is a line of garments which will commend themselves to fine dressers. [C. Kenyon Co., New York City.]

**PNEUMATIC RUBBER HEEL.**

One objection to full heel tennis shoes is the weight of the solid rubber heel. A heel which, besides obviating the heavy weight of a solid block of rubber, is so constructed as to allow pneumatic action, thereby adding to its resiliency, is well shown in the accompanying illustration. This heel is hollow, but has in it three longitudinal partitions which add to its rigidity while forming a number of compartments or air cushions. The partitions mentioned have vents, one to another, as has also the breast of the heel, so that the air can escape from each chamber slowly. It is claimed that this makes a better wearing heel than one of solid rubber, besides having the added advantages of lightness and resiliency. [Hood Rubber Co., Watertown, Massachusetts.]

**"THERMOID" GASOLINE HOSE.**

Gasoline hose of inferior grade is an actual menace to life and property, and extended experimentation has resulted in a superior hose for garage equipment in which the rubber compounds used are warranted to resist the action of gasoline to an unusual extent.

The "Thermoid" gasoline hose has been tested and approved by the Underwriters' Laboratories, Inc., and the quality and construction are examined and tested by them at regular intervals. This hose is made

with either three or four plies of high-grade duck, the tube being lined with one-ply duck, which is reinforced and held in place

by a flat, coiled steel wire. The wire-wound hose is machine wound with a very hard steel wire, which will not unwind if cut at any point and will not flatten under ordinary weight; yet the hose is very flexible and will not kink. [Thermoid Rubber Co., Trenton, New Jersey.]

"FRUNT-SEET" AUTO ROBE.

The new features of this auto robe, as indicated in the illustration, are the specially designed fastenings for attachment to the dashboard at the bottom of the windshield and to the sides of the car, and the special flap which fits around the steering wheel post. This robe will fit all automobiles, is quickly adjusted and detached, and not only keeps the cold out, but the heat of the engine in as well. It is made of black or green plush, lined with rubber and khaki cloth; also with heavy cloth lining and reversible, to fit right or left hand drive. [Automobile Apparel Co., Port Chester, New York.]

**A TAN MILITARY RUBBER BOOT.**

The standard rubber boot is designed mainly for utility, and its shape is such as to facilitate its easy drawing on and removal. Extra space is therefore allowed at the back, above the ankle, giving a rather clumsy appearance. However, close fitting and very shapely styles are made for military wear, and a recent novelty in this line is one in tan or brown rubber having the trim, straight lines which distinguish the military officers' leather footwear. This new color in the military boot is designed to harmonize with the modern field costume of the Canadian troops, and it has become very popular with the volunteers who have gone across the water to do their share in the fighting for the mother country. This boot is made only in men's sizes. [Miner Rubber Co., Limited, Montreal, Canada.]

**PNEUMATIC CUE FOR POOL.**

A novel use of a rubber bulb is for the propulsion of miniature ivory pool balls upon a small pool table, in all dimensions proportionate to the full sized tables. Any shot which is possible on a regular sized table can be made on this. The cues, instead of being used to strike the white ball, are tubular, and connected with rubber bulbs, the force of the compressed air making the stroke. It is evident that this calls for a special degree of skill to manipulate the ball, which thus places this form of pool-playing in a class by itself. The table is of mahogany, the rubber cushions are silk covered, and all the appointments are of fine quality and in excellent taste, comparing most favorably with those of the regulation size table. [F. A. O. Schwarz, New York City.]

**LORGNETTE ELECTRIC EAR-PHONE.**

The ear-phone shown in the right illustration is made complete in itself, the electric battery being contained in the handle, eliminating the cords and trappings customary in devices for the use of deaf persons. The transmitter is made of hard rubber. By means of a small metal switch at the top of the handle, the electric current is turned on or off at will, thus avoiding any waste of electricity. A slight touch of the thumb presses the switch against the metal band, effecting temporary contact, or by moving the switch until it rests upon a metal projection, permanent contact is secured and thumb pressure rendered unnecessary. A ten-ton regulator for sound adjustment at the base of the handle controls the electric current and makes it possible to regulate the tone according to the preference or requirements of the individual. The battery is of the type used in all flash-lights, and therefore can be readily renewed in any city or town.

A similar model with the additional attachment of a megaphone concentrator on the transmitter is also shown. This concentrator, which is made of hard rubber, focuses the sound waves direct to the instrument. Both these instruments are guaranteed by the manufacturer for a period of ten years. [Globe Ear-Phone Co., New York City.]

ICE PACKER WITH RUBBER BULB.

An improvement on the ordinary method of packing ice is shown herewith. The use of a stick to pack the ice between the coils of the ice chamber has frequently proved an expensive operation, owing to the breaking of the coils. The soft, white rubber bulb, of tough quality, and special shape and construction, at the end of this ice puncher prevents such accidents. Attached to a long handle, it affords a convenient and safe implement for packing ice. [The Schaefer Rubber Co., Cincinnati, Ohio.]

**A NON-SKID TRACTION BELT.**

A traction belt which the inventor claims will do the work of tire chains and more, has been developed by a Californian and tried out on both pleasure and commercial cars. It was designed at first to make traction in sand and was given its first tests in the unimproved roads of Arizona, where the loose, yielding surface makes it difficult for an ordinary tire to get a grip.

The endless balata gum belt is two inches wider, and considerably larger in diameter than the tire which it encircles. It travels over an idler roller, which revolves in bearings attached to the running board and keeps it in traction with the tire. In the illustration the device is shown ready for use. To remove the belt the outer bearing cap is unscrewed and the idler roller drawn out, leaving the belt free to be removed from the tire.

The Obituary Record.

PRESIDENT ALLIANCE RUBBER CO.

GEORGE C. RUSSELL, president and treasurer of the Alliance Rubber Co., Alliance, Ohio, died on March 30 at Los Angeles, California, having gone there in an endeavor to recuperate from an operation for cancer of the liver, to which he had submitted several months previous. Mr. Russell was born August 30, 1872, at Lockland, Ohio. He was at one time general manager of the Elliott-Fisher Typewriting Co., having his office in New York City. From there he went to the McCaskey Register Co., of Alliance, and in March, 1913, with Milton Bejach, who was also connected with the McCaskey company, he formed the Alliance Rubber Co., of which he was the president and treasurer, and started manufacturing molded specialties. Mr. Russell was a very energetic business man and interested in other manufacturing concerns in Alliance. He was also an enthusiastic collector of antiques and works of art, many of which he had gathered from all corners of the earth. He was twice married, and is survived by his second wife, who was Mrs. Ruby Jones McNair, of Newark, Ohio, and three children.

EXPLORED THE AMAZON.

Colin Mackenzie, whose explorations on the Amazon River were of material help to such men as Huber and others in botanical research in rubber lines, died in New York City on

April 10 at the age of 79 years. He was born in Glasgow, Scotland, and once ran for Parliament against Lord James Bryce, former ambassador to this country, but was defeated. He explored and mapped out regions along the Amazon River, where he engaged in the rubber business. When he came to this country he settled in California, where he was naturalized. Mr. Mackenzie later became a resident of New York City, where at one time he was reputed to be the

COLIN MACKENZIE

largest importer of coffee from South America. His Amazon experiences gave him a membership in the Royal Geographical Society, the Explorers' Club, and other scientific bodies. At the time of his death he was auditor of the Legal Aid Society, of New York City.

TWENTY-SIX YEARS AT WOONSOCKET RUBBER CO.

William Oswald Park, for seven years city clerk of Woonsocket, Rhode Island, and formerly mayor of that city, died recently of Bright's disease. Mr. Park was born in Roxbury, Massachusetts, December 28, 1863; was educated in the Boston public schools and moved to Woonsocket 33 years ago, entering the accounting department of the Woonsocket Rubber Co.,

of which plant his cousin, the late John F. Holt, was superintendent. Mr. Park remained with this company for 26 years, rising to the position of head office man and holding that position until he was elected city clerk in 1909. He was prominent in politics, having occupied the offices of councilman, alderman, mayor, clerk of the police commission, and city clerk. The last two offices he held at the time of his death. Mr. Park was also prominently identified with the Masons, the Woonsocket Business Men's Association and the Universalist Men's Club.

A PROMINENT CEMENT MANUFACTURER.

George David Hazen of the Hazen-Brown Co., manufacturer of rubber cement, died at his home in Brockton, Massachusetts, April 13, as the result of a long illness and a recent surgical operation. Mr. Hazen was born in Dixon, Illinois, nearly 50 years ago. His education in the public schools was supplemented by extensive reading and study. He was for several years employed as a chemist by Eugene Arnstein, Chicago, Illinois, manufacturer of cements, and about 10 years ago with Max Brown, who, until then, had been a salesman with the same concern, formed the Hazen-Brown Co., starting in a small shop in Brockton. As the business grew the factory has been repeatedly enlarged and branch offices were established in a number of manufacturing centers where the goods were in large demand. Mr. Hazen had long been a student and an investigator, and was an expert chemist. He took an active interest in politics, was a director in the Morris Plan Bank of Brockton, a member of the Commercial Club, Economic Club, Chamber of Commerce and Association of Superintendents and Foremen. He was an enthusiastic fisherman and knew well the best fishing places all over New England. He is survived by a widow and two daughters.

THIRTY-THREE YEARS WITH ONE CONCERN.

Edwin Wesley Deane, connected with the J. W. Buckley Rubber Co., New York City, for about 33 years, died recently at his home in Brooklyn, New York, aged 49 years. Mr. Deane came to the Buckley company from school, growing up in the rubber business. In 1910, when the concern was incorporated Mr. Deane was given an interest in the business and elected secretary of the company. He was well known to all the rubber trade and especially liked for his courteous treatment of every one with whom he came in contact. Mr. Deane was an example of a worthy, industrious and competent man, and his loss will be greatly felt, not only by his immediate associates but by many in the mechanical rubber trade. He was affiliated with high Masonic bodies, Royal Arcanum and Loyal Association. He is survived by a wife and daughter.

BUILT UP A LARGE WASTE BUSINESS.

Abraham Oppenheimer, senior member of the firm of Oppenheimer & Co., waste material and scrap rubber dealers, Buffalo, New York, died March 6 at his residence in that city. He was born in a small village in Messen, Darmstadt, Germany, in 1841, coming to America at the age of 14. He began his business career at Nunda, New York, removing to Westfield and then to Buffalo in 1871, where he built up an extensive business. He was a thirty-second degree Mason, a member of the Shrine and of the Acacia Club, and was an ex-president of Beth Temple Zion of Buffalo. He leaves a widow, three daughters and two sons, Nathan and Walter, who were associated with him in business.

PIONEER IN RUBBER STAMP BUSINESS.

George Kissam Cooke, the first man to manufacture rubber stamps in England, died at his home at Jamaica, Long Island, March 30, aged 72 years. Mr. Cooke was born in Hartford, Connecticut, and was a great grandson of Oliver W. Cooke, one of the founders of Yale University. He served in the Civil War, and being a man of much ingenuity, invented a number of simple devices which ultimately brought him a large competence. Regarding the rubber hand stamp, it is stated that he learned the process in New York and went to London about the year 1872, establishing the business of G. K. Cooke, Hurls & Co., at 170 Fleet street, London, E. C., and in 1873 he took out a British patent for a dry heat process.

Mr. Cooke spent several years in traveling in European countries, and of late years has lived at the Kissam homestead, Kissam Place, Jamaica, New York. He is survived by a widow and two sons.

INSULATED WIRE SPECIALIST.

Charles Warren Bassett, who established the insulated wire department of the Washburn & Moen Manufacturing Co., Worcester, Massachusetts, 25 years ago, died at his home in that city March 31, aged 72 years. Mr. Bassett was considered an expert in his line, and managed the sales division of that department after the absorption of the Washburn & Moen plant by the American Steel & Wire Co. He was born in East Braintree, Massachusetts, and previous to assuming the above position was in business in Boston. He leaves a widow and two daughters.

FORMERLY WITH THE INDIA RUBBER WORLD.

James W. Burke, for some years connected with THE INDIA RUBBER WORLD, died on March 30 at Christ Hospital, Jersey City, New Jersey, of arterial trouble and pneumonia. Mr. Burke was born in Dublin, Ireland, December 13, 1847, and although he had but a meager school education, he studied under his father's guidance and became so well versed in several languages as to have been awarded prizes in German and French. At the age of 14 he entered the service of the Spanish consul in London, England. Two years later he went to Murdoch's Nephews, London, who later sent him to New York to open a branch office here. He was in their service for 36 years. On the death of the head of this firm he was successively with Doull Miller Co. and the National Association of Manufacturers, New York City. From there he came to THE INDIA RUBBER WORLD in 1911, where he did excellent work in the statistical and foreign correspondence departments, retiring because of ill health in November, 1914, this being his last business connection. Mr. Burke was a careful and efficient worker in his chosen departments, and a valued member of the staff of this journal. He was a musician of marked ability, both instrumental and vocal. He leaves a widow and three children, besides six children by a former marriage.

A WELL-KNOWN ENGLISH MANUFACTURER.

The death is reported of William McLean Henderson, managing director of the Ancots Vale Rubber Co., Manchester, England. He went from Scotland about 40 years ago to this work, leaving to join, for some years, Broadhurst & Co., rubber manufacturers, a mile or so away, and afterwards returning to the Ancots company as whip hand, at a time when its affairs were not in an altogether satisfactory condition. The present condition of the works and business is eloquent testimony to the business acumen of the deceased. Mr. Henderson was chairman of the India Rubber Manufacturers' Association in 1908.

HEAD OF A PROMINENT SCOTCH RUBBER COMPANY.

Lieutenant-Colonel David C. Campbell, V. D., of Messrs. Campbell, Achnach & Co., Thistle Rubber Mills Co., Glasgow, Scotland, died March 8 at his residence in that city, aged 57

years. Colonel Campbell had been connected with the rubber industry practically all his business life, becoming, with his brother, proprietor of the Thistle Rubber Mills in Glasgow in 1905, and on the death of his brother the following year, he became sole proprietor of the business, which was formed into a limited liability company in 1915, he being senior director and chairman of the new organization. Colonel Campbell was a man of genial and courteous disposition and had a wide circle of friends throughout the trade who respected him for his business ability and sterling integrity.

HAD MANY FRIENDS IN THE EAST.

William Johnstone, lieutenant of the Royal Highlanders (Black Watch) and brother of J. T. Johnstone of J. T. Johnstone & Co., crude rubber importers and dealers, New York and Akron, was recently killed in France. Mr. Johnstone was born, April 21, 1888, in Birkenhead, England, educated in English private

schools, and later came to America where he attended the Newark High School at Newark, New Jersey.

He early developed a business talent that was recognized by a prominent American importing house dealing in wool and hides, and was sent to the Far East as their special representative and buyer.

At the outbreak of the war he returned to his home in America, and after a short visit, sailed April, 1915, for England, where he was gazetted to the 3d Battalion,

WILLIAM JOHNSTONE.

Black Watch. Later, he was transferred to the 8th Battalion, which he joined in France December, 1915, and was killed March 30, while on patrol duty.

The deceased, while not directly connected with the rubber business, was well known in the Far East, where his many friends will be greatly saddened by the news of his death.

WIFE OF A PROMINENT RUBBER MAN.

The many friends of William W. Weitting, vice-president and treasurer of the American Hard Rubber Co., New York City, will sympathize with him in the loss of his wife, who died at their home in College Point, Long Island, New York, last week.

J. C. Rockwell, for many years in charge of the New York warehouse of the United States Rubber Co., died at his home in Brooklyn, New York, on March 4. Mr. Rockwell had many friends in the rubber business and will be greatly missed.

The estate of the late United States Senator Nelson W. Aldrich is estimated to be worth approximately \$5,685,000. His son, Edward B. Aldrich, ex-president of the Continental Rubber Co., New York City, is executor of the estate, which he estimates as follows: Real estate in Rhode Island and Connecticut, \$488,150; bonds in corporations, \$600,214; personal property, \$63,564; cash on hand or in bank, \$100,154; accounts receivable, \$500,154; and stocks in corporations, \$3,932,870.

News of the American Rubber Trade.

SPECIALIZES IN RUBBER CUTTING KNIVES.

IN every rubber factory are likely to be found a variety of knives bearing a diamond-shaped trade-mark enclosing the name, I. P. Hyde. Mr. Hyde started the business of manufacturing shoe knives and shoe tools in Southbridge, Massachusetts, nearly 40 years ago, and that little business has grown until the plant of the Hyde Manufacturing Co., a picture of which is shown here, employs 75 experts in this special branch of manufacture. While this company's product includes many varieties of cutting tools for different trades, a very large proportion of its business is devoted to knives for rubber cutting. Probably this is the only concern in the country which issues a special catalog of such tools for use in rubber factories. The large business which is conducted by this company is the result of the

FACTORY OF THE HYDE MANUFACTURING COMPANY, SOUTHBRIDGE, MASSACHUSETTS.

great care used in the hardening and tempering of each article to specially adapt it to the exacting requirements of the use for which it is intended.

CHANGES IN FISK ORGANIZATION.

E. H. Brodwell, vice-president of the Fisk Rubber Co., Chicopee Falls, Massachusetts, announces the following important changes among the officials:

J. A. Anderson has been appointed factory manager and will supervise the manufacturing departments. Mr. Anderson was connected with the United States Rubber Co. for many years in an executive position, joining the Fisk organization a year ago to do special work.

W. H. Whitlock continues as superintendent in charge of production and George A. Ludington, who was elected vice-president last fall, will devote his entire time to the buying of crude materials. Mr. Ludington's life-long experience in the rubber industry well qualifies him for this important service.

John Kearns, also a vice-president, will take charge of a newly created research department. Mr. Kearns is well known as a rubber and compound expert, having had a comprehensive experience both in this country and abroad.

MANTAU CHEMICAL CO. SUCCEEDS CAMDEN WHITE LEAD WORKS.

Harrison Bros. & Co., Inc., the old-established and well-known paint, chemical and white lead manufacturers, of Philadelphia, have purchased from the N. Z. Graves Corporation the plant formerly known as the Camden White Lead Works, Camden, New Jersey, where they manufactured lithopone and lead products, and will continue the business, with offices at 3500 Gray's Ferry Road, Philadelphia, Pennsylvania, which will be known as the Mantau Chemical Co., although it is owned outright and entirely controlled by Harrison Bros. & Co., Inc.

UNITED STATES RUBBER CO.'S NEW TRADE-MARK.

The United States Rubber Co. has decided to use a "super trade-mark" on all its goods, and to make it a point of honor to market under this mark only the best product—one which, in the words of the company, would mean as much in connection with rubber as the mark "sterling" means in connection with silver.

It consists of a ribbon appearing either on the article itself or in the advertising about any given article of rubber for which the company assumes responsibility. The ribbon is made up of three equal stripes; the centre stripe is white and the other two are blue. Upon the ribbon is placed the United States Rubber Co. seal or the trade-mark of one of the various subsidiary companies of the United States Rubber System. This ribbon carrying the seal or a merchandise trade-mark will be used to distinguish cartons, tire wrappings, boxes, etc., in which rubber products of known quality are packed.

RUBBER COMPANY DIVIDENDS.

A quarterly dividend of 2 per cent on the first preferred stock and a quarterly dividend of 1½ per cent on the second preferred stock of the United States Rubber Co., was paid April 29 to stockholders of record April 15.

The directors of the Kelly-Springfield Tire Co. have declared a quarterly dividend of 4 per cent on the common stock, payable May 1 to stockholders of record April 15. This is an increase of 1 per cent, the previous dividend having been 3 per cent.

The B. F. Goodrich Co. has declared a regular quarterly dividend of 1 per cent, payable May 15 to stockholders of record May 4. On April 26 another quarterly dividend of 1 per cent on the common stock was declared, payable August 15 to stockholders of record August 4.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on April 25 are furnished by John Burnham & Co., 115 Broadway, New York City, and 40 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new).....	66½	67½
Firestone Tire & Rubber Co., common.....	80½	81½
Firestone Tire & Rubber Co., preferred.....	114	76
The B. F. Goodrich Co., common.....	75¾	76
The B. F. Goodrich Co., preferred.....	114	115
Goodyear Tire & Rubber Co., common.....	392	400
Goodyear Tire & Rubber Co., preferred.....	118	120
Kelly-Springfield Tire Co., common.....	71½	72½
Kelly-Springfield Tire Co., first preferred.....	97	98
Kelly-Springfield Tire Co., second preferred.....	113	115
Miller Rubber Co., common.....	285	300
Miller Rubber Co., preferred.....	113	115
Portage Rubber Co., common.....	84	86
Portage Rubber Co., preferred.....	108	110
rubber Goods Manufacturing Co., preferred.....	84	86
Swinhart Tire & Rubber Co., common.....	52¾	52¾
United States Rubber Co., common.....	107½	108½
United States Rubber Co., preferred.....	107½	108½

SILVER KING GOLF BALL TRADE-MARK CHANGED.

John Wanamaker, exclusive distributor of the Silver King golf ball, found that the colored dot used to designate the different Silver King qualities, was trade-marked by A. G. Spalding & Bros. This difficulty, however, was overcome by the latter firm allowing this first shipment of infringing balls to be sold without interference. In the future the Silver King will be marked with a colored dash, red, green, etc., to denote the several grades.

REPORT OF RUBBER GOODS MANUFACTURING COMPANY.

THE Seventeenth Annual Report of the Rubber Goods Manufacturing Co., New York City, has been sent to the stockholders. The president's report describes the special conditions, adverse the first part of the year, with a marked improvement during the last four months of the year, and continuing up to the present time. It also tells of the enlargement of the principal tire plant.

The treasurer's report gives briefly the assets and liabilities, the net profits and dividends and the surplus at the close of the year 1915.

Both reports are given in full below:

THE PRESIDENT'S REPORT.

TO THE STOCKHOLDERS OF THE RUBBER GOODS MANUFACTURING CO.:

While the sales of the company, both in quantity and value, were larger in 1915 than in 1914, the net earnings were less on account of special conditions in the tire department. These adverse conditions made themselves felt throughout the entire heavy buying season, but from September on and continuing from January 1 of this year up to date a marked improvement has occurred in the tire department.

Still further expansion of our tire facilities has become necessary owing to the rapid increase in this business recently, and on account of these changes, necessitating the enlargement of the Morgan & Wright plant and the providing of additional working capital needed for the larger business transacted, we issued during the year and sold to the United States Rubber Co. \$5,000,000 of 5 per cent debenture bonds of Morgan & Wright, maturing December 1, 1918.

The report of the treasurer appended hereto gives the consolidated general balance sheet and consolidated statement of the Rubber Goods Manufacturing Co. and its subsidiary companies for the fiscal year ending December 31, 1915.

Respectfully submitted,

ELISHA S. WILLIAMS, PRESIDENT.

THE TREASURER'S REPORT.

RUBBER GOODS MANUFACTURING CO. AND SUBSIDIARY COMPANIES.

CONSOLIDATED GENERAL BALANCE SHEET, DECEMBER 31, 1915.

ASSETS.	
Property, plants and investments.....	\$33,656,910.00

Surplus, January 1, 1915.....	9,003,042.03
Surplus, December 31, 1915.....	\$9,064,776.29

Respectfully submitted,

E. J. HATHORNE, Treasurer.

*Includes \$205,000.00 paid minority interests in subsidiary companies.

The officers remain the same as last year; also the directors, with the exception of Charles A. Hunter, resigned.

PORTRAIT AND BUST OF GOODYEAR.

A window display of interest to everyone connected with the rubber business was arranged in the building of the United States Rubber Co. at 1790 Broadway, New York City. The central attraction was an oil painting of Charles Goodyear, which was painted on a sheet of hard rubber, about 1850, by the celebrated artist, G. P. A. Healy. This picture is considered the finest portrait of Mr. Goodyear extant. At the left was the bronze bust of Charles Goodyear, made by Tiffany & Co., which usually stands in the directors' room of the United States Rubber

WINDOW DISPLAY OF GOODYEAR RELICS.

Co., a replica of which adorns the railway station at Naugatuck, Connecticut. Below was a very ornate piece of furniture, a desk or table made entirely of hard rubber. This piece of furniture was exhibited at the first World's Fair at the Crystal Palace in London in 1851, and was afterward used as a desk by Charles Goodyear. Besides this there were two canes, also made of hard rubber, one of which was carried by Mr. Goodyear in 1855 and the other was presented by him to Samuel Colt, grandfather of Samuel P. Colt, president of the United States Rubber Co. Below these, but not shown in our picture, were framed documents proving the authenticity of the articles.

REPORT OF THE CANADIAN CONSOLIDATED RUBBER COMPANY, LIMITED.

VICE-PRESIDENT and General Manager T. H. Rieder, of the Canadian Consolidated Rubber Co., Limited, under date of April 4 submitted his annual report covering the year ending December 31, 1915. He states that the volume of business done in 1915 was 20.43 per cent greater than in 1914. While the selling values of some classes of manufacture were advanced, others were reduced, so that the whole difference is very small. This increased volume was attained by the sale of automobile tires throughout the year, and by other lines especially during the last four months of the year.

Continuing, Mr. Rieder reports:

The stocks of raw materials show quite an increase, due to increased cost and somewhat larger supplies kept on hand. Manufactured goods show practically no change as a whole, although we were better prepared with tire stocks than the year before.

We have now completed a five-year period of our present sales plan and the position of your company in the rubber trade of Canada, as well as the profits, have progressively demonstrated the stability of this policy. Losses by bad debts spread over 15,000 active retail accounts have not been abnormal at any time during this period, and due to the policy pursued of making provision for possible bad debts, in proportion to sales, the unused reserve for bad debts is always ample.

Your directors sold November 1, 1915, 5 per cent short date debentures to the amount of \$2,500,000. The proceeds were used to reduce existing bank loans, and resulted in a slight saving of interest.

The continuity of staff and management of your company has progressively manifested itself in efficiency and loyalty to your company and in its desire and ability to serve the retail trade in Canada.

All your properties have been maintained in first class operating condition. Any expenditures for repairs and replacements have been charged to cost of operating.

For 1916 your directors anticipate a continuance of the confidence which the retail trade has in the past given to your company. The year has started with good prospects and your directors have found it necessary to reopen the Granby footwear factory, which had been non-operative for two years, as the requirements of our new export department promise to overtax our mills now operating.

Mr. Rieder closed his report with a brief reference to the death of President McKechnie, on February 8, and an expression of appreciation of his many years of valuable service.

The financial statement of the company is given in full below:

COMBINED STATEMENT CONSOLIDATED AND CONSTITUENT COMPANIES, DECEMBER 31, 1915.

ASSETS.	
Property and plants	\$5,607,314.22
Inventories, manufactured goods and materials.....	\$3,432,745.66

OFFICERS AND DIRECTORS OF THE CANADIAN CONSOLIDATED RUBBER CO., LIMITED.

At the annual meeting of the shareholders 11 directors were re-elected. The vacancies caused by the death of President McKechnie and the retirement of A. J. Kimmel were filled by the addition of R. C. Colt and W. A. Eden, both of Montreal, the full list being as follows:

Walter Binmore, Montreal, Quebec.
R. E. Jamieson, Montreal, Quebec.
E. W. Nesbitt, M.P., Woodstock, Ontario.
R. B. Price, New York City.
W. G. Parsons, New York City.
Homer E. Sawyer, New York City.
Elisha S. Williams, New York City.
Colonel S. P. Colt, New York City.
T. H. Rieder, Berlin, Ontario.
V. E. Mitchell, K.C., Montreal, Quebec.
R. C. Colt, Montreal, Quebec.
W. H. Robinson, Granby, Quebec.
W. A. Eden, Montreal, Quebec.

At a meeting of the directors following the shareholders' meeting the following officers were appointed: W. H. Robinson, president; T. H. Rieder, vice-president and general manager; W. A. Eden, secretary; Walter Binmore, treasurer; R. C. Colt, assistant secretary; A. Dwyer, assistant treasurer; J. P. B. Daigneau, assistant treasurer.

THE NEW YORK UNDERWRITERS' LABORATORIES.

The work of the electrical department of the Underwriters' Laboratories is conducted partly at the principal office and testing station in Chicago, and partly at the electrical testing station maintained in connection with the New York office. This arrangement, in effect since May, 1912, has been found to be very convenient and economical, inasmuch as a large proportion of the manufacturers of electrical wares are located in the east.

The electrical testing station in New York is located at 92 Vandam street, in a building adjoining a sub-station of the New York Edison Co. This location makes available for test purposes supply circuits of a range of voltage and current capacities that would be difficult to obtain elsewhere. When special apparatus requires facilities not furnished by the testing station equipment, arrangements are made for doing the work at the factories where the devices are made, or by means of special equipment arranged for the purpose. The station is provided with equipment for insulation resistance tests for rubber-covered wires, although most of this work is conducted at the Chicago office.

The New York office and electrical laboratory are in charge of Dana Pierce, vice-president; E. P. Slack and William Small, associate electrical engineers, and C. H. Holway, laboratory assistant.

UNITED STATES CUSTOMS RULING ON TOY BALLOONS.

A rubber balloon is a toy, even though it has an advertisement painted upon it. Such is the decision of Judge Sullivan in the case of Q. Nervione, Chicago, Illinois. This merchant imported small rubber balloons, some with and others without advertising matter printed on the sides. The collector levied 35 per cent duty on the articles on the ground they were "parts of toys." Entry at 10 per cent was asked under the provision for "manufactures wholly or in chief value of india rubber or gutta percha, not specially provided for." One of the protestant's witnesses testified that most of the balloons were sold for advertising purposes. The general appraiser claimed that nowhere in the record was there proof that the balloons were not used by children as playthings, or that they were reasonably fitted for other purposes. Affirming the collector, the decision held that advertising matter on balloons did not prevent a child from using them as playthings.

W. O. RUTHERFORD.

W. O. RUTHERFORD, the recently appointed general sales manager of The B. F. Goodrich Co., started with that company back in the nineties in a clerical position at the Akron office. From this position he advanced to a position in the sales organization at the Detroit branch. Early in 1910 he was made manager of the Denver branch. A year and a half later he was promoted to the position of branch manager in Buffalo, where his services during the eight years that followed were largely responsible for the popularity of Goodrich products in that district. In July, 1910, he was brought back to Akron as assistant to H. E. Raymond, who has relinquished the office of general sales manager, but will continue actively as vice-president, exercising general supervision over sales and advertising policies.

The title of assistant general manager of sales was formally conferred upon Mr. Rutherford in March, 1914, and his election as head of the Goodrich sales organization is the latest step in a career that has been an unbroken record of real achievement.

Unlike the duties of a sales manager who has one of a few products on which to concentrate his efforts, Mr. Rutherford directs nearly 500 salesmen of the most extensive lines manufactured in America, and there are seventy odd branches and depots scattered throughout the country.

Mr. Rutherford brings to his new position the ripe experience of a successful field salesman, together with a rare knowledge of men and how best to inspire them with his own enthusiasm and aggressiveness.

W. O. RUTHERFORD.

THE NEW YORK PREPAREDNESS PARADE.

A meeting of New York's representative rubber men was held at the Waldorf-Astoria on April 11 to organize the Rubber Division of the Preparedness Parade that takes place in New York City Saturday, May 13.

George B. Hodgman, Hodgman Rubber Co., presided, and introduced the several speakers. A committee was appointed, consisting of H. G. Cleveland, chairman, Harry S. Vorhis and W. G. Ryckman.

Through the exertions of this committee, a widespread interest and enthusiasm has been generated and the rubber trade will undoubtedly form an important part of the procession, and be most creditable to this industry.

Amadee Spadone, of the Gutta Percha Rubber Manufacturing Co., has been appointed marshal of the rubber division. He will appoint his own staff.

Two bands have been engaged for this division, which is expected to be assigned a position immediately after Mayor Mitchel and his escort, thus heading the parade. The Rubber Division will assemble at 8:30 A. M. on Duane street, with head

of column resting on Broadway, and will move at 9:30 sharp, which will enable this division to dismiss at noon.

Trade banners will lead the various divisions of representative rubber concerns, each man carrying an American flag, and wearing an arm band bearing the legend "The Rubber Club of America, Inc."

Many rubber concerns report their intention of being represented, and from present indications, there are likely to be between 2,000 and 3,000 men in this division.

RUBBER CLUB EXECUTIVE COMMITTEE MEETING.

The Executive Committee met on April 14 with the following members in attendance:

President Harvey S. Firestone, chairman; George B. Hodgman, William E. Bruyn, Van H. Cartmell and Henry C. Pearson.

The business relating to the election of standing committees resulted as follows:

NOMINATING COMMITTEE.

Homer E. Sawyer, chairman, United States Rubber Co., New York City.

Bertram G. Work, The B. F. Goodrich Co., Akron, Ohio.

Charles T. Wilson, Charles T. Wilson Co., Inc., New York City.

Henry C. Pearson, India Rubber Publishing Co., New York City.

Russell Parker, Parker, Stearns & Co., Brooklyn, New York.

BANQUET COMMITTEE.

George B. Hodgman, chairman, Hodgman Rubber Co., Tuckahoe, New York.

Henry C. Pearson, India Rubber Publishing Co., New York City.

William T. Cole, Fabric Fire Hose Co., New York City.

OUTING COMMITTEE.

Philip E. Young, chairman, Acushnet Process Co., New Bedford, Massachusetts.

Robert L. Rice, Hood Rubber Co., Watertown, Massachusetts.

Francis H. Appleton, Jr., F. H. Appleton & Son, Inc., Boston, Massachusetts.

The following were nominated as chairmen of district committees, with power to appoint the local members:

For Akron, Ohio, W. O. Rutherford, The B. F. Goodrich Co.

For Trenton, New Jersey, J. S. Broughton, United & Globe Rubber Manufacturing Cos.

For New York City, Clarence H. Low, United States Rubber Reclaiming Co.

The following were admitted to membership:

FIRM MEMBERS.

Goodyear Tire & Rubber Co., Newell C. Shepard, New York City.

Quality Tire & Rubber Co., Charles A. Besaw, Hartville, Ohio.

ASSOCIATE MEMBERS.

Samuel Rosenblatt, Boston, Massachusetts; Plymouth Rubber Co., Canton, Massachusetts.

William E. Green, Boston Belting Co., 100 Reade street, New York City.

CHANGES AND APPOINTMENTS, GOODYEAR TIRE & RUBBER CO.

R. W. Rost, Newark, New Jersey, salesman, has been promoted to managership of the Goodyear branch at Albany, New York, succeeding E. B. Sigerson, recently appointed manager of the Buffalo branch.

J. A. Leatherman, Portland, Oregon, salesman, has been made manager of the branch in that city.

L. H. Vaughan, former manager at Utica, New York, has been appointed manager of Goodyear's branch at Newark, New Jersey. He is succeeded at Utica by F. G. Richards, who has been connected with the Newark branch as salesman.

THE DEAN OF RUBBER ADVERTISING.

THE press of the country is taking note of the fact that E. C. Tibbitts has been advertising manager of The B. F. Goodrich Co. for twenty years. Incidentally the newspapers are saying some very nice things about the gentleman anent his twentieth commercial birthday. As a matter of record, Mr. Tibbitts has undoubtedly held down his special job longer than any

man in the trade. He came at a time when the company was just entering upon its wonderful and symmetrical expansion. When the young giant among rubber companies struck its gait it took a keen intellect in the publicity field to keep ahead of it. Those familiar with Goodrich advertising will agree that Mr. Tibbitts showed both the necessary speed and endurance.

A mental review of the publicity efforts that have come from under the deft hand of this advertising manager tells the story. They are all individual, are free from bombast, and are singularly sincere. They embrace all lines of publicity, replicas of notable portraits, beautifully illustrated booklets, libraries of route books, sign posts at every country cross roads, lectures, "movies," window displays, newspaper specials, a bright "house-organ" and so on, ad infinitum.

In all this Tibbitts is the suggester, writer, critic and editor. A huge task—it is well done—and we tender our congratulations and felicitations to that unassuming gentleman who signs himself "E. C. T."

E. C. TIBBITTS.

TRADE NOTES.

The Birmingham Iron Foundry, Derby, Connecticut, is remodeling its plant and adding a wing 62 x 208 feet, with bay 40 x 140 feet, the new part to be all steel construction, with Fenestra steel sash and mostly glass. There will also be a flask storage runway, 35 x 140 feet, with traveling crane. Contracts for these additions have been placed, including four traveling cranes, and it is expected that the work will be completed by August 1.

A permanent injunction has been issued in the suit of the Royal Equipment Co., Bridgeport, Connecticut, against Max Rich and the Rich Auto Supply Co., New York City, restraining Rich from infringing the Royal company's rights by using the Raybestos trade-mark and silver edging on brake lining, and calling for the destruction of all offending lining and literature.

J. P. Devine Co., New York City, manufacturer of vacuum dryers, vulcanizers and other specialties, will remove the first of this month to the 20th floor of the Forty-second street building, gaining thereby nearly three times as much floor space as in the old quarters on the third floor of the same building as well as the greater light and quiet obtainable higher up. The offices will be newly furnished, with special reference to a more convenient conduction of the company's New York business. L. W. Treichler will continue in charge, and Mr. Devine

will probably spend more time in the New York office than he has hitherto.

The Picher Lead Co., Joplin, Missouri, which has plans for a smelter at Henryetta, Oklahoma, will install equipment for a 4000-retort plant. M. R. Bump, Henryetta, is construction engineer in charge.

A serious strike situation is noted at the plant of the National Cable & Conduit Co., Hastings-on-the-Hudson, New York. This company has been manufacturing war munitions and employing about 3,500 hands. About one-third of the number walked out on the 13th and 14th, and on the 17th the strikers attacked the deputy sheriffs, stoned those who remained at work, broke every window on the front of the long factory, and threw stones through the windows of passing railroad trains. The militia was called out to preserve order and to protect the factory, which closed down, pending a settlement, which was reached on the 26th, by the workmen accepting the company's offer of an increase of 2 cents an hour. The plant resumed operations on the 27th ultimo.

The Durst Manufacturing Co., Inc., manufacturer of mechanical rubber goods and plumbers' specialties, has moved to 105-107 Chambers street, New York City.

Additions and improvements are being made in the Revere Rubber Co.'s New York offices at 59 Reade street, of which H. L. Williams is general sales manager.

Gustave Kusch, manufacturer of mechanical rubber goods, has removed from 60 Beekman street, New York City, to 3 Park Row, where he now has his office at room 41.

The I. J. Cooper Rubber Co., Cincinnati, Ohio, has increased its capital stock from \$100,000 to \$225,000.

The Textile Machine Works, Reading, Pennsylvania, has been authorized to increase its capital stock from \$60,000 to \$150,000.

Adolph Hirsch & Co., importers and dealers in crude rubber, have removed to new offices in the World Building. Their address is now Suite 717 to 722, 56 Park Row, New York City.

George E. Austin Co., mechanical and electrical goods, and the Imperial Rubber Co., George E. Austin, general manager, New York City, have removed their offices to the Equitable building, 120 Broadway.

On April 19 meetings were held simultaneously in New York City, Chicago, Illinois, and Los Angeles, California, by members of the Transcontinental Purchasing Agents' Association. The three cities were connected by telephone, and receiving instruments distributed to all who attended enabled them to listen to remarks made in each of these cities, also vocal selections, while the eastern members were enabled to hear the roar of the surf of the Pacific Ocean, thousands of miles away. The Chicago meeting was presided over by F. A. Marsh, purchasing agent for the Link Belt Co., Chicago. In the list of directors may be noted E. L. McGrew, of the Standard Underground Cable Co., and F. W. Lingley, of the American Hard Rubber Co.

At a meeting of creditors of the American Rubber Reclaiming Co. and the Germantown Almegum Manufacturing Co., both of Germantown, Philadelphia, Pennsylvania, a committee was appointed to investigate and recommend upon the prospect of reorganizing the first named company, whose assets were appraised at \$85,437.62. The liabilities amount to \$143,281.18, of which \$37,000 is doubtful. The assets of the Germantown Almegum Manufacturing Co. were appraised at \$33,586.50 and liabilities at \$234,455.42.

Commodore E. C. Benedict, formerly director of the United States Rubber Co., New York City, who has an extensive and beautiful estate at Greenwich, Connecticut, proposes at his own expense to convert it into a model bird sanctuary on plans laid down by the Greenwich Bird Protective Association, an organization of prominent and wealthy residents of that town.

NEW INCORPORATIONS, WITH AUTHORIZED CAPITAL, ETC., 1916.

Allen Tire & Rubber Co., The, March 21 (Ohio), \$10,000. Frank J. Allen, W. H. McMorris, Joseph N. Ackerman, David L. Shaw and S. Milder. Principal address, Cleveland, Ohio. To deal in rubber tires.

Allen & Reeves Shoe Co., Inc., March 6 (New York), \$25,000. William J. Allen, James E. Reeves and Harry E. Reeves—all of Watertown, New York. Shoes, rubbers, etc.

Buffalo Tire Service Co., Inc., April 7 (New York), \$1,000. A. Foshay, 120 Broadway, Russell Goldman, 1190 Madison avenue—both in New York City, and J. Oliver Murphy, Mount Vernon, New York.

Central Auto & Tire Co., Inc., February 11 (Iowa), \$10,000. T. L. Kennedy and O. R. Arnold. Office, Davenport, Iowa. To deal in second-hand automobiles, accessories, etc.

Dunlop Tire Sales Co., Inc., April 13 (New York), \$1,000. Otto and L. A. Braunwarth and Albert Bracht—all of 1808 Broadway, New York City.

Effpee Manufacturing Co., Inc., March 6 (New York), \$10,000. Max S. Levine, 321 Stone avenue and Beatrice Markowitz, 1272 41st street—both in Brooklyn, New York, and Harry Dohel, 483 East 170th street, New York City. To manufacture gaiters, rubberized materials, etc.

E-Z On Fastener Co., Inc., April 3 (New York), \$50,000. Seymour Bookman, 144 West 77th street, and Ethel Beneau, 17 East 105th street—both in New York City, and Samuel H. Harris, 449 Greene avenue, Brooklyn, New York. To manufacture devices for automobiles of rubber and other materials.

Fellsway Rubber Co., April 5 (Massachusetts), \$95,000. Louis H. Williams, Framingham; Franklin P. Gowing and Joseph E. Eaton—both of 230 Purchase street, Boston—both in Massachusetts. Factory and principal office, 30 Locust street, Medford, Massachusetts. Louis H. Williams, president. To manufacture mechanical molded goods, especially rubber soles and heels.

Giant Rubber Co., Inc., April 25 (New York), \$50,000. Abraham Feldman, 519 Willoughby avenue, Brooklyn, New York; Alexander Weiss, 711 East Twelfth street, and Norman N. Nacman, 233 Broadway—both in New York City. To manufacture rubber goods, tires, etc.

J. & D. Tire & Rubber Co., April 8, 1916 (North Carolina), \$500,000. Par value of shares \$100. C. C. Coddington and T. C. Guthrie—both of Charlotte, North Carolina, and H. O. Smith, Indianapolis, Indiana. Office, Charlotte, North Carolina. To manufacture pneumatic tires.

King Tire & Rubber Co., Inc., April 13 (New York), \$1,000. C. O. Henderson, 103 Kensington avenue, Herbert T. Auerbach, Statler Hotel, and John H. Trauter, 101 Crescent avenue—all in Buffalo, New York.

King Tubeless Rubber Co., March 15 (Delaware), \$300,000. E. D. Buck, George W. Dillman and M. L. Horthy—all of Wilmington, Delaware. Office, 328 du Pont building, Wilmington, Delaware. To sell and manufacture all forms of King tubeless patent tires for automobiles, auto trucks, etc.

Marathon Tire Co. of New England, April 12 (Maine), \$100,000. George F. Gould, president and treasurer; N. M. Kent, director, both of Portland, Maine. Office, Portland, Maine. To manufacture and deal in rubber goods, rubber tires, etc.

National Adhesive Co., Inc., The, March 17 (Massachusetts) \$15,000. Earl F. Olson, 86 Norfolk avenue, Swampscott, Massachusetts; Ethel J. Looke, 76 Michigan avenue, and Joseph F. McGrath, 28 High Rock street—both in Lynn, Massachusetts. Office, Lynn, Massachusetts. To deal in rubber cements of all kinds, rubber heels, etc.

New York Rubber Disc Co., Inc., April 21 (New York), \$2,000. Harry Kovinow and Morris Manofsky—both of 1713 Third ave-

nue, and Morris Kavenoff, 152 East 103d street—both in New York City. Rubber supplies and discs.

Peters-Tucker-Ilay Rubber Co., March 18 (Colorado), \$5,000. H. G. Peters, E. M. Tucker and R. E. Hay—all of Denver, Colorado. General auto accessories and filling station company.

Portland Vulcanizing Co., March 22 (Maine), \$10,000. Philip J. Lanicault, president; Conrad T. Beardsley, treasurer, and Harold H. Wish, director—all of Portland, Maine. Office, Portland, Maine. To manufacture and deal in rubber tires, etc.

Orange Vulcanizing & Supply Co., February 18 (New Jersey), \$50,000. James J. and Annie Davis, Peter T. and Elizabeth D. Loughlin—all of 225 Main street, Orange, New Jersey. To deal in automobile accessories, etc.

Never-Hole Tube Co., March 30 (Delaware), \$300,000. H. H. Waller, G. E. Touloupoulos and M. Friedberg—all of 140 Nassau street, New York City. Office, Capital Trust Co., Dover, Delaware. To manufacture and deal in inner tubes and automobile tires.

Quaker City Rubber Co., March 31 (Pennsylvania), \$5,000,000. Charles A. Daniel, William F. Metzger and James T. Moore—all of Philadelphia, Pennsylvania. Office, Philadelphia, Pennsylvania. To manufacture and deal in crude rubber, balata and gutta percha, and all and any of the products into which crude rubber, balata or gutta percha, in any form enters as a constituent part.

Rex Scrap Iron & Rubber Co., Inc., The, April 18 (New York), \$1,000. Morris Korn and Morris Jaffee—both of 336 Dumont avenue, and Frank Tindler, 482 Sackman street—both in Brooklyn, New York.

Robert Soltan & Co., Inc., April 24 (New York), \$50,000. George Hammerlund, 866 Forty-ninth street, Brooklyn, New York; Charles Oakes, 45 East Eighty-third street, and E. G. Reardon, 341 East Seventy-eighth street—both in New York City. To manufacture gutta percha tissue, rubber products including "Galalith," etc.

Standard Chicle Refining Co., April 7 (Delaware), \$110,000. Orja G. Corns, Valdamar A. Johnston, Jr., Matthew E. Hosely and Adolph P. Rapp—all of Chicago, Illinois. Office, Capital Trust Co. of Delaware, Dover, Delaware. To refine or manufacture a substitute for chicle, and to manufacture rubber or any article having for its base rubber, chicle or natural gum.

Triple Tread Tire Co., March 20 (Delaware), \$500,000. H. G. and M. Lund and Edward Grunich—all of Chicago, Illinois. Office, Guarantee & Trust Co., Ford building, Wilmington, Delaware. To manufacture and deal in automobile tires, tubes, etc.

Triumph Tire & Rubber Co., April 5 (New York), \$1,000. George L. Campbell, 415 West 141st street; George T. Bernard, 294 Sixth avenue, and Garrett Cooper, 166 West 72d street—all in New York City.

Tropical Shipping & Trading Co., Inc., The, March 17 (New York), \$40,000. Adrian Cairns, 4111 Ferris street, Woodhaven, New York; Oswald Carliss, Sterling, and W. A. Black, Montclair—both in New Jersey. To deal in rubber, precious woods, ivory and other tropical products.

White's Spring Tire Co., March 7 (Oklahoma), \$50,000. Jesse W. White, M. J. O'Connor, John F. Sumner, Elta H. Jane, H. S. Bruner and L. E. Jalbort—all of Edmond, Oklahoma, and F. H. Bean, Los Angeles, California. To manufacture and deal in automobile accessories and to manufacture and deal in White's cushion automobile tire.

Yankee Tire & Rubber Co., Inc., April 3 (New York), \$3,000. Randolph Russell, Livingston, Richmond County, New York; Harry E. Dodge 113 East 80th street, and Charles McAlpin Pyle, 11 East 68th street—both in New York City.

PERSONAL MENTION.

Edward H. Huxley, president of the United States Rubber Export Co., arrived from England on the steamer "St. Paul" on April 14. Mr. Huxley, it will be remembered, was a passenger on the "Sussex" when she was destroyed on March 24. His prompt and thorough report of the affair to the United States Government brought him commendation from newspapers all over the country.

J. P. Krentz, formerly superintendent of the foundry of the Buffalo Foundry & Machine Co., Buffalo, New York, has been appointed works manager of the company.

Eugene Pearl, the many-sided man—artist, attorney and inventor, whose corset shield and syringe nozzle patents have been mentioned in THE INDIA RUBBER WORLD, has just invented an anti-skid shoe support for bootblack stands, the idea being to hold the shoe steady under the manipulations of the polisher.

Victor von Schlegell was recently elected vice-president of the United & Globe Rubber Manufacturing Cos., Trenton, New Jersey, with headquarters in the Equitable building, New York City. Franklin Edson has been made assistant to Mr. von Schlegell.

R. L. Chipman, dealer in crude rubber, gutta percha and allied gums, has moved into more commodious quarters at 23-25 Beaver street, New York City.

The Rev. Dr. W. Warren Giles, of Orange, N. J., who has been a speaker at several dinners of The Rubber Club of America, Inc., while running for a train recently, failed to see a train approaching from the opposite direction and was knocked down and severely bruised. His many friends in the rubber trade will be glad to know that he is now as well—and as witty—as ever.

Albert Waterhouse, president, The Waterhouse Co., Limited, Honolulu and Singapore, was in New York last month on business pertaining to the various interests managed by his company. He reports that the Pahang and Jahore plantations, through the agency of the Waterhouse company, are progressing under most favorable circumstances.

W. Stuart Gordon, well known crude rubber man, formerly of Manaus, who recently arrived in New York from the Far East, sailed for Para April 26.

Francisco Conde de Athayde, a well known rubber merchant of Manaus, Brazil, is in New York on a two months' business trip.

Andrew Kangas, formerly with the commission house of Thomsen & Co., New York City, has become assistant export manager for the Fisk Rubber Co., Chicopee Falls, Massachusetts, assisting John B. Maus.

W. K. Frederick has been appointed assistant sales manager of the Batavia Rubber Co., Batavia, New York. Mr. Frederick was formerly special jobbing representative in the middle west for the Pennsylvania Rubber Co., and later with the McGraw Tire & Rubber Co.

The McGraw Tire & Rubber Co. of New York, Inc., with general offices and works at East Palestine, Ohio, announces that C. E. Wertman, formerly assistant branch manager, has been promoted to the position of resident manager of the New York office, succeeding R. F. Hobron, and that E. E. Cowan has been appointed sales manager of the New York territory.

The Associated Garages of America has changed its name, to represent its varied interests more accurately, to the National Retail Automobile Trade Association.

At the twentieth annual meeting of the National Fire Protection Association, to be held at Chicago, Illinois, May 9, 10 and 11, one subject to be considered and discussed will be "Standard Hose Couplings and Hydrant Fittings for Public Fire Service."

TIRE FABRIC TESTS SHOWN BY LANTERN PROJECTION.

THE wide difference of opinion regarding the testing of fabrics is doubtless due in a large measure to the inaccuracy of the apparatus employed. Great variations are obtained from the same fabric tested on the same dynamometer when held by different means. It is, therefore, obvious that the more data submitted under these varying conditions, the wider the difference of opinion may be. Textile fabrics, owing to their nature and lack of sharp outline, are difficult to reproduce by photo-

graphic means. Lantern slides, or motion pictures, when magnified and projected upon a screen are too indefinite to illustrate the actual effect of stress upon the fabric. The value of motion photography for this work is greatly lessened by the fact that a film is usually in con-

stant motion and a more deliberate study of the sample is impossible.

Henry L. Scott & Co., manufacturers of rubber testing machines, conceived the idea of reproducing or projecting upon a screen by means of an opaque projection lantern a highly magnified view of a fabric sample during a test. The apparatus shown in the cut was therefore constructed and exhibited before Committee D-13 of the American Society for Testing Materials in the office of the United States Rubber Co., New York City, on March 17.

Parts of a standard horizontal tire fabric tester were mounted upon an oak base A constructed to also support a Balocten lantern B. No recording head was used. The fixed clamp C was held rigidly in a horizontal position on a solid iron frame attached to the base. The moving clamp D was attached to a draw bar, or stretching screw E, operating through a gear box holding the driving mechanism. Hand wheels F on either side of the gear box were used to transmit power to the stretching screw and were geared to give any speed desired. The hand wheels G at each end of the machine permitted changing clamps quickly. Knurled and adjustment collars, movable upon the thread of the stretching screw, assured the return of the moving clamp to the same position for each sample.

In addition to the flat grip clamps shown in the drawing, other devices were used and by means of interchangeable anvils or gripping surfaces several methods of testing were illustrated. A device was also arranged for working two knives underneath the sample to cut the fabric in such manner as to produce the "gash" test.

The apparatus was installed in a darkened room and the projection made upon a special aluminum screen at a distance of approximately 20 feet. As nearly all tests were made on tire fabric, having 23 ends per inch, each end thus projected was about 1 inch in diameter. Samples were broken in a bone-dry, normal and saturated condition to note the effect of moisture. Tests showing the effect of varying speeds of the moving clamp were also made.

Elongation, number of threads broken, effect of tension, slip in the clamps and comparative values of different methods were readily observed. As innumerable tests could be made and any test repeated, the speed regulated, or the stretching motion stopped for any length of time desired, many interesting points were brought out.

THE GRANT SOLID TIRE PATENT LITIGATION.

THE Circuit Court of Appeals, in New York City, affirmed the decision of the lower court March 17 in the suit between the Diamond Rubber Co., New York City, and the Kelly-Springfield Tire Co., Akron, Ohio. Approximately \$210,000 damages were awarded to the latter company for infringement of the Grant solid tire patent owned by the Kelly-Springfield company. This sum includes five cents per pound on the sales of infringing tires, amounting to over \$130,000, \$27,000 for interest, and an additional \$50,000 "smart money," because of the flagrant character of the infringement.

As this famous patent has been the subject of almost constant litigation since 1896, and suits are still pending, a brief review of the principal facts furnished by a representative of the Kelly-Springfield company is interesting.

The Grant patent No. 554,675 covers the solid rubber tires now commonly used on horse-drawn vehicles throughout the world, and was granted to Arthur W. Grant February 18, 1896. At once, upon its introduction, it drove all other solid rubber tires out of the market, and after becoming established, its sales amounted to around 10,000,000 pounds of tires every year. The patent was infringed almost from the beginning, principally by rubber manufacturers, who endeavored to imitate it and avoid infringement, but their imitations were all short-lived and failures.

Many of the principal rubber companies were prosecuted for infringement, among them The B. F. Goodrich Co., Akron, Ohio; Diamond Rubber Co., Akron, Ohio; Firestone Tire & Rubber Co., Akron, Ohio; Pennsylvania Rubber Co., Jeannette, Pennsylvania; Republic Rubber Co., Youngstown, Ohio; Victor Rubber Co., Springfield, Ohio; Acme Rubber Manufacturing Co., Rutherford Rubber Co. and Thermoid Rubber Co., of Trenton, New Jersey; Hartford Rubber Works Co., Hartford, Connecticut; Morgan & Wright, Detroit, Michigan, and others.

In 1911 the Firestone Tire & Rubber Co. paid damages for infringement. This company also acquired a manufacturing license for the balance of the term of the patent, which expired February 18, 1913. Morgan & Wright acquired a manufacturing license about the same time and paid damages for past infringement.

In the case against the Goodyear Tire & Rubber Co. the defendant won and the patent was declared void in 1902, but subsequently it was adjudged valid by the Federal Courts in Milwaukee, Wisconsin, and New York City, and later on by the Supreme Court at Washington, D. C., after which settlements and adjustments were made.

The decision at Washington, while not directly in the Goodyear case, made the customers of that company liable for infringement and the Goodyear Tire & Rubber Co. made satisfactory settlement. The Thermoid Rubber Co., the Acme Rubber Co. and the Rutherford Rubber Co. also settled, the former paying damages and the other companies making satisfactory arrangements.

Cases are now pending against the Republic Rubber Co., Youngstown, Ohio; the Pennsylvania Rubber Co., Jeannette, Pennsylvania; two cases against The B. F. Goodrich Co., Akron, Ohio, and three cases against the Diamond Rubber Co., Akron, Ohio. Decrees in favor of the plaintiff have been entered in all of these cases and the matter is now before the masters on the accounting, except in the case against one of the Diamond Rubber companies, viz., the Diamond Rubber Co. of New York. In this case the plaintiffs have been awarded by the court five cents a pound on the number of pounds made by the Diamond Rubber Co., amounting to \$130,000, \$50,000 additional damages and \$26,000 interest and costs, a judgment for \$210,000. This is the case that was affirmed in March by the Circuit Court of Appeals in New York.

Besides the above, numerous suits were brought against other

infringers, all of whom acquired licenses and damages against them were not pressed.

The plaintiffs in all these cases have been the Consolidated Rubber Tire Co. and the Rubber Tire Wheel Co. The name of the Consolidated Rubber Tire Co. was changed on January 1, 1914, to Kelly-Springfield Tire Co. It is the same company, its name having merely been changed by amending its charter.

A very large pondage is involved in the suits now pending, that of The B. F. Goodrich Co. approximating five and one-half million pounds.

Suits over this patent have been pending since 1896, the first being against the American Rubber Tire Co. of New York City, wherein the patent was adjudged valid. Then came the decision at Cincinnati adjudging the patent void, which afforded an excuse for infringers. But in 1906-7 the patent was adjudged valid by the Circuit Court of Appeals in Milwaukee, Wisconsin, and New York, and was finally adjudged valid by the Supreme Court of the United States April 10, 1911.

STANDARD PNEUMATIC TUBES AND TIRES.

A tire which is guaranteed for 5,000 miles must have behind it a responsible organization and a corps of experts in every stage of its manufacture. The Standard hand-made tire has

such a guarantee molded right on the tire itself. The manufacturers' claims for superiority of these tires are that they are hand-made by experts, are full molded by a process original with them, at a temperature and pressure which produces a perfect cure. Fabrics and materials of superior quality are used in the carcass, and the rubber is carefully selected from uniform grades of the best quality. There is one ply more of fabric used in this tire than in some popular tires. The treads are of a specially tougher rubber, the result of years of study, test and development. They are furnished both smooth and non-skid, the latter bearing a combination of the letter S, the initial of the company. It is the same story regarding inner tubes, pure Para rubber, extra thick, cured by slow vulcanization, extremely tough and heat-resisting. [The Standard Tire & Rubber Co., Hippodrome Building, Cleveland, Ohio.]

MIDGLEY COLLAPSIBLE CORE

The novel method of making this core consists in stamping up a series of thin sheet steel plates that have been prepared so they will adhere to molten iron and casting them in the usual

core sand mold. The sections are held in alignment by four plugs that occupy the bolt holes and are cast integral with the core. These are afterward drilled out, forming holes for the retaining bolts of the core, which is then machined in the usual manner.

The interlocking joint is strong and well designed to withstand the severe strain to which cores are subjected. The method of assembling the core by means of the interlocking joints and retaining bolts is very clearly shown in the illustration. [Thomas Midgley, 85 East Gay street, Columbus, Ohio.]

W. A. Kirkpatrick, formerly connected with the Philadelphia branch of the Hardman Tire & Rubber Co., Belleville, New Jersey, has been appointed manager of the branch at Baltimore, Maryland.

DREADNAUGHT TIRE & RUBBER CO. SALE.

The plant of the Dreadnaught Tire & Rubber Co. at Orangeville, Baltimore County, Maryland, was sold on April 12 at public auction to H. James Lepper, a member of the stockholders' reorganization committee who had been designated to make a bid on behalf of the committee. The price paid was \$80,000, being the amount of the upset price fixed by the court. The sale will be ratified, unless cause to the contrary is shown, on May 18.

As indicated by its name, this committee intends to reorganize the business of the old Dreadnaught company and to continue the manufacture of tires at the plant.

THE PERFECTION TIRE ORGANIZATION.

The Perfection Tire & Rubber Co., which has a factory at Fort Madison, Iowa, a fabric plant at Wabash, Indiana, and is also purchasing a plant in California, and the Perfection Tire & Motor Co., of Canada, Limited, are under the same management. The latter company has purchased a plant at Guelph, Ontario. The tire plant of the Champion Auto Equipment Co. at Wabash, Indiana, is also under the supervision of the Perfection Tire & Rubber Co. All three companies have separate offices in the Marquette building, Chicago, Illinois.

LEE TIRE & RUBBER CO. EXPANDS.

Plans and specifications have been completed for a large new mill to expand the present plant of the Lee Tire and Rubber Co. at Conshohocken, Pennsylvania, and it is expected that this addition will be completed in three months' time. The new mill will be located 300 feet in the rear of No. 2 mill and will be two stories in height, 130 feet in length and 80 feet in width. The architecture will conform to the style of the other buildings, which are of the modern type of steel and concrete construction.

The new building will be used for the manufacture of miscellaneous rubber goods and hospital supplies, thus enabling the Lee company to materially increase its tire departments, enough space being available in the present plant to run the total output up to 2,000 tires per day.

TRADE MARK SUIT DISMISSED.

The suit for alleged infringement of trade-mark brought by the Pennsylvania Rubber Co. against the Dreadnaught Tire & Rubber Co. in the United States District Court at Wilmington, Delaware, was closed on March 23, when a decree was entered, dismissing the suit, the Circuit Court of Appeals sustaining the decision of Judge Bradford. The costs of the case were divided between the two parties interested.

VERDICT FAVORABLE TO TIRE COMPANIES.

In the suit of the Automobile Cooperative Association against The B. F. Goodrich Co., the Republic Rubber Co., and the Diamond Rubber Co., all of Akron, Ohio, the jury gave its verdict in favor of the tire manufacturers, and the judge strongly approved the verdict. This practically closes the litigation. Originally five companies were sued, but late in March the suit was dismissed against the United States Tire Co. and the Firestone Tire & Rubber Co. It may be remembered that the Automobile Cooperative Association was formed by automobile owners to buy tires and other supplies at wholesale. The companies refused to sell this association at the prices they sold to dealers. Hence the suit for "restraint of trade." It was proven that there was no combination in restraint of trade, each company acting independently.

COLORED STREAK TIRE TRADE-MARKS.

Among the rulings in regard to trade-marks, it is noted that "a red stripe or tread for rubber automobile tires is not to be rejected because of the prior registration of a blue stripe similarly used and apparently intended to suggest the name 'Blue Streak.'" There is enough doubt of the similarity of the marks to pass the application for publication, and register it, if not opposed." We understand this application was by the Fisk Rubber Co.

TRADE NOTES.

The Marion Tire & Rubber Co., Marion, Ohio, has plans under way for a new automobile tire and tube manufacturing plant, to be equipped with the most up-to-date machinery. The building will be constructed of steel and concrete, fireproof throughout, 60x150 feet in dimensions, two stories and basement, with an additional power plant of like construction, 40 x 80 feet in size. The architect is Mr. Dobbins and the contractor, E. Elford, both of Columbus, Ohio.

The Walters Rubber Co. of New York, Inc., recently incorporated, has for its secretary and treasurer Howard S. Walters, for seven years connected with the United States Tire Co. as a salesman and for three years with the Federal Rubber Manufacturing Co., resigning April 1 to organize and manage this new corporation, which will have the exclusive distributing agency for Long Island for Federal tires and tubes, as well as marketing tires and tubes bearing the company's name. The general office of the company is at 54 Main street, Mineola, New York.

The Gordon Tire & Rubber Co., Canton, Ohio, has commenced the manufacture of hard rubber parts for use in the extensive line of druggists' sundries which constitutes an important part of this company's output.

The Victor Rubber Co., Springfield, Ohio, is erecting two new buildings, one 150x40 feet and the other 50x40 feet. These additions are made necessary by the increased pneumatic tire business of the company. The present production of the Victor company is 150 hand-made tires per day, and the entire plant is being worked with a night and day force.

The Perlman Rim Corporation of New York has acquired the automobile rim business of the Jackson Rim Co., Jackson, Michigan. Ground has been broken for an additional building with 40,000 square feet floor-space.

The Western Union Telegraph Co. employs 8,200 messenger boys, it is said, and about 5,000 of this number use their own bicycles in delivering the company's messages. The increased cost of tires has added considerable burden to the upkeep of a wheel. In the future, however, the boys will be able to buy tires at wholesale prices, for it is announced that the company has made arrangements to supply tires at cost.

The Atlas Yarn Co., Globe Village, Massachusetts, recently incorporated with Fred L. Hewitt as president and Frederick J. Quinn as treasurer, has purchased the 16,000 spindle cotton yarn mill of the Hamilton Woolen Co. The mill is in full operation and the new concern intends to increase the output to include the manufacture of tire fabric yarn. Mr. Quinn, who will be the operating head of the new concern, is a practical cotton mill man, having been identified with the textile industry for many years.

Tires may last longer and motorists be less liable to accidents in New York state, now that the Slater bill has become a law. This makes it a misdemeanor to place an any road, highway or public place glass, tacks, nails or other articles which might injure an animal or person, or puncture a tire.

The United States Circuit Court of Appeals has decided that the name "Neverleak" applied to a tire fluid, the composition of which is secret, did not become public property upon the expiration of the patent because the tire fluid itself was never patented, and therefore the original owner of the preparation has the sole right to use this name on his goods.

An interesting computation of the cost of operating an industrial electric truck, as presented by C. E. Ogden, manager of the Walker Vehicle Co., gives as one expense 14 cents per day for tire renewals, or about 9 per cent of the total daily cost. The electric truck referred to is considered the logical successor of the ordinary hand truck used in warehouses, factories and railway terminals.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

A GOODLY percentage of all the automobile tires manufactured in the United States come from Ohio, and this State has come to the front so prominently in the manufacture of rubber goods that the suggestion has been made by an Eastern advertising agency to change its historic appellation, "The Buckeye State" to "The Rubber Plant State."

Men from all parts of the country are coming here, answering the call of the rubber factory boom. Over \$2,000,000 is being spent to solve the housing problem.

The first of last month Akron was host to the Ohio State Automobile Association, and every rubber company in the city united with the Akron Auto Club in entertaining the delegates representing the automobile clubs throughout the State.

An addition to the Ohio Building, now in progress, will be occupied by the Akron City Club, 33 to 50 per cent of the membership of which represent various branches of the rubber industry.

The addition of three great buildings which are nearing completion will make the plant of The B. F. Goodrich Co. much the largest rubber factory in the world. Before these new buildings were erected the Goodrich institution was among the world's largest plants devoted to the manufacture of rubber goods, but with the increased capacity provided by these additions, which are in themselves larger than many widely known rubber factories, the Goodrich plant now ranks far ahead of any others in the rubber trade.

An idea of the size of the Goodrich plant may be gained when it is said that the group of fifty-seven buildings have a floor space of nearly a hundred acres and that one would have to travel 3.8 miles to circle the grounds.

The largest of the new buildings is a finished goods warehouse, 320 feet long and 280 feet wide, with one wing six stories high and another of seven stories. This structure is nearly completed.

The second largest of the three new buildings is six stories high, 300 feet long and 100 feet wide. It will be used for manufacturing and storage purposes. The third is a building that will be utilized as a machine and pattern shop. It is five stories high, 260 feet long and 100 feet wide.

All the new buildings exemplify the latest ideas in factory construction. Lattice steel columns and girders encased in reinforced concrete are used throughout for the frame-work. Each of the buildings has concrete floors, brick walls and steel window-frames and sash. They are equipped with elevators and enclosed fire-escapes, and will have the same adequate sprinkling system that contributes to the safety of all the buildings which constitute the Goodrich plant.

formerly occupied by the Lincoln Rubber Co. and purchased the property used by the Woodruff Novelty Co. New machinery is being installed, and the company expects to more than double its capacity. The Lincoln company building will be used for the vulcanizing tire repair department of the Akron Rubber Mold & Machine Co., this department of its business having more than tripled in the last year.

The Firestone Tire & Rubber Co. is adding a fifth story to its entire plant.

Sherman L. Lewis has been placed in charge of sales promotion by the Firestone company. Mr. Lewis was formerly with the Niagara Lithograph Co. and also in charge of trade aid work for the Remington Arms-Union Metallic Cartridge Co.

The recently reorganized American Tire & Rubber Co., making tires, tubes and accessories, is installing new equipment to meet increased demand. On April 15, a liability contracted by the old company amounting to \$50,000 in mortgage bonds, matured and was taken care of by the present organization, whose personnel was given in the March issue of THE INDIA RUBBER WORLD. H. L. Houck, previously identified with the Firestone Tire & Rubber Co., and more recently with the Swinehart Tire & Rubber Co., is the general manager and assistant treasurer of the American company.

Four new buildings, comprising ten acres of floor space, have just been completed at the plant of the Goodyear Tire & Rubber Co. One is a three-story "L" shaped building, 180 x 160 feet, for the solvent department. An eight-story building, 300 x 80 feet, will be used for raw material and manufacturing, and two other buildings, each seven stories high and about 200 x 60 feet in dimensions, are for general manufacturing purposes. In addition, the Goodyear company has under construction, to be completed the first of next year, a crude rubber and manufacturing building comprising 275,000 square feet of floor space; a reclaiming plant, 200,000 square feet; a warehouse, 250,000 square feet; mechanical goods building, 280,000 square feet; a new power house and addition to the main power house of 12,000 horse-power; a garage, 25,000 square feet, and additions to the general office, 40,000 square feet.

The authorized capital of the Goodyear company has been doubled from \$25,000,000 to \$50,000,000, to take care of a 100 per cent dividend on common stock and a new issue of preferred stock to replace the present issue, retired by redemption.

George H. Picklerell, United States consul at Para, Brazil, has been visiting F. A. Seiberling, president of the Goodyear company, having come to Akron for the purpose of interesting the rubber concerns in the development of the Para rubber industry.

The Swinehart Tire & Rubber Co. is turning out a new motorcycle tire with a tread of special non-skid construction.

THE B. F. GOODRICH CO.'S PLANT.

The Biggs Boiler Works is building a brick addition, 100 x 125 feet, to its plant. This will include new offices for the company.

The additions to the plant of the Miller Rubber Co., mentioned in a previous issue, are progressing rapidly.

J. B. Bleier, formerly connected with the Diamond Rubber Co. and more recently vice-president of the Overman Cushion Tire Co., is now in charge of the truck tire department of the Miller company.

Frank Robinson, crude rubber dealer of New York City, has opened an Akron office in the Second National Bank building.

H. H. Henderson, Akron manager for Henderson & Korn, crude rubber dealers, New York City, has recently returned from a sojourn of several weeks in Cuba.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

THE rubber trade continues active in most lines. Clothing people have all the business they want for the present, but are making up new samples to show on the road early in the summer, when it is expected that even the large orders they now have on hand for fall delivery will be increased by further orders and supplementary ones. Boot and shoe manufacturers are fully supplied with orders and their factories will be kept busy until the usual summer shut-downs, and we understand that there is doubt about such shut-downs being any longer than is actually necessary to make repairs and alterations before starting anew on later deliveries. Mechanical goods people have had only moderate demand for hose. Evidently many of their customers are fairly well stocked because of the poor trade in this line last year. In belting, however, there is an added demand, evidently because of the scarcity of leather suitable for belting and its consequent high price. Druggists' sundries and molded goods people have a fair amount of business and are not complaining. The manufacturers have all their factories can attend to. Taken altogether, the trade is in a most satisfactory condition in every branch.

The double fabric which has gone into the first dirigible which has just been completed for the United States Navy was sheeted and cemented at the American Rubber Co. factory at Cambridgeport, and the factory is still manufacturing similar fabric on orders. The demand for carriage cloth is so heavy as to tax the facilities of this Cambridgeport factory and some similar goods are now being manufactured in Naugatuck, and it is hoped soon to add this line to the output of the Stoughton factory of the company.

Judge Morgan, in the United States District Court on April 12, allowed the motion to quash the indictment against Warren B. Wheeler and Stillman Shaw on the ground that the independence of the grand jury which indicted them had been seriously interfered with by the prosecuting officer of the United States Government. Readers of THE INDIA RUBBER WORLD are familiar with the case, whose progress during the last four years has been reported in previous letters. It now seems that the reason for thus finally disposing of the case, was because of the action of the Assistant Attorney General, who directed the grand jurors not to indict another party at the same time Messrs. Wheeler and Shaw were indicted. Judge Morgan holds that the attorney's conduct amounted to improper interference with the rights of the grand jury and that this interference directly affected its decision. He further says:

To uphold what was done by the prosecuting officer in this case is in effect to establish his right to direct the grand jury not to indict a person whom the grand jury had voted to indict. It would make a great inroad on the independence of the grand jury and one of peculiarly dangerous character.

It is hard to conceive of a plainer case of undue interference by the prosecuting attorney than shown by the evidence here. As the indictment returned was directly affected thereby in a substantial particular, it seems to me both upon principle and upon the authorities that it must be quashed.

Lester Leland, vice-president of the United States Rubber Co., and Mrs. Leland, are now on a trip to California.

George Wyman, assistant office manager of the Hood Rubber Co., gave a very instructive lecture on the gathering and shipping of rubber, and manufacture of rubber goods before the Shoe and Leather Class of the Boston Continuation School on the occasion of the graduation of that class on March 24. The lecture was profusely illustrated with lantern slides from negatives taken by Mr. Wyman, who is an expert photographer.

The United States Tire Co., at its New England branch on Commonwealth avenue in this city, celebrated Tire Show Week, the third week in April, the exhibition and management of the

E. H. KIDDER.

entire affair being in charge of E. H. Kidder, the manager of this branch. Fine window displays were shown on the two sides of the wedge-shaped building, which included artistic arrangements of the various tires which are made by this company, together with samples of the crude rubber from which they are made. Facing the front door was a life-sized cut-out of a man rolling a tire toward the visitor. The tire was a real one and the man, although made of cardboard, was so realistic that invariably people dodged out of his way when entering the door. Mr. Kidder and his assistants were present to explain the advantages of their specialties, "Royal Cord," "Nobby," "Chain," "Usco" and plain tread tires. That the affair was a success was proven by a large number of visitors who took advantage of the invitation to attend the exhibition, and I understand the result shows up splendidly on the sales books at Mr. Kidder's office.

A man having the appearance of being an Englishman called upon a rubber man in this city early last month and introduced himself as Mr. Bridge, a brother of two members of the firm of David Bridge & Co., Limited, well-known engineers and millwrights of Manchester, England. He reported that he had just come from Montreal, was in poor health and had been relieved of his money on the way. He needed to go to New York and borrowed a small sum to take him there, promising to return the loan on arrival. His failure to do so induced the lender to write a letter to the Messrs. Bridge, who replied that the man was an imposter and that no member of their family had been in New York since 1912. As the Messrs. Bridge have a large clientele among the rubber trade in this country, your correspondent feels impelled to notify the trade that they may be on the lookout and not be misled by the same story.

Many of the members of the rubber trade are well acquainted with Arthur D. Little, former president of the American Chemical Society. Although Mr. Little's special work has been more in the line of cellulose than rubber he was intimate with Dr. Weber and other rubber chemists and familiar with the trade. Mr. Little has been retained by the Canadian Pacific Railway to establish a central organization for research work in Montreal to carry out Lord Shaughnessy's proposal for a scientific investigation of Canada's mineral, metal, hydro-electric and chemical resources, and to stop waste in forests, mines and mills. This will be known as the Canadian Research Bureau, and its discoveries will be given out in bulletins to merchants and manufacturers.

More than 1,000 persons gathered at the plant of the Monatiquot Rubber Works Co. in South Braintree on Patriots' Day, to attend the flag raising in honor of the sixth birthday of this company. Treasurer James H. Stedman was master of ceremonies and addresses were made by Calvin Coolidge, Lieutenant-Governor of Massachusetts; Grafton D. Cushing, former Lieutenant-Governor; Division Superintendent F. S. Hobbs, of the New York, New Haven & Hartford Railroad, and State Senator Langeier, a member of the Massachusetts Prison Commission. The program included a fine luncheon, which was served to the invited guests, among which were many state, town and corporation officials and prominent citizens. Music was rendered during the afternoon by the Stetson Shoe Band. The entire works were then thrown open for inspection. They were in full operation, and the visitors inspected the different processes used in manufacturing "Naturalized" rubber, the product of this mill. Many congratulations were received by President Harlow, Sales Manager Turner and Treasurer Stedman on the progress which has been made by the company in its six years of existence here, and the whole affair was most successful.

* * *

In this connection it may be of interest to note that President Robert C. Harlow, of the Monatiquot Rubber Works Co., has been appointed the first Fire Commissioner of the historic old town of Plymouth in this State, the town having voted to change from the old system of a board of fire engineers and give one man, as fire commissioner, full charge of the department. Mr. Harlow had been a member of the water board of that town and was one of the town committee named to report on a more efficient fire department. His extensive business experience should prove valuable in the work which he has undertaken for his home town and Plymouth is to be congratulated upon acquiring his services in this important department.

* * *

In the Boston letter last December mention was made of the purchase of land by parties who proposed building a rubber factory near Maplewood Station. This has materialized in the incorporation of the Fellsway Rubber Co., with an authorized capital of \$95,000, of which \$30,000 is paid in cash, for the manufacture of mechanicals and molded goods, including rubber soles and heels for the shoe factory trade. F. P. Gowing, of the shoe supplies firm of H. H. Kelley & Co., Boston, is the treasurer, whose office is at 230 Purchase street, Boston. Louis H. Williams, who has had a wide experience in the manufacture of molded goods in Scotland and Canada and this country, is president, and will have charge of the manufacturing end of the business. His office will be at the factory, which is situated at 30 Locust street, Medford, Massachusetts.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE rubber factories continue to be among the busiest manufacturing plants in Rhode Island, and additional orders are being constantly received, notwithstanding that practically all of the concerns have more demands on their books than can be filled for some months to come. Many of the departments are, and have been for many weeks, working on overtime schedules and there would be even more machines operating in double shifts if there were men and women in sufficient numbers to work on them. There is not a single plant in the State that has enough help, it is said, and while improvements are being made in machinery and methods, it is not known where the extra help that will be needed is to come from, as repeated advertising in the newspapers fails to bring any material response. This shortage of help, together with the freight embargoes which are still in force to a greater or less extent, and some slight labor controversies, have somewhat handicapped the manufacturers, but these, in a measure, are adjusting themselves, and it is believed

that the year 1916 will be written into the history of the rubber industry of the State as one of the most prosperous ever experienced.

* * *

With all the hustle and bustle incident to rush orders under far from favorable conditions and circumstances, however, the welfare of the operatives has not been overlooked or neglected. Rubber manufacturers as a rule have been prompt in taking advantage of every opportunity to better the working environment in their plants. The Woonsocket Rubber Co. maintains a fully equipped hospital for all emergency purposes, and a rest room that was established at the Alice Mill, at Woonsocket, early in 1915, and later similar accommodations were provided at the Millville plant. Miss Essie McDonald, a trained nurse, is on duty at the Alice Mill in the morning and at the Millville plant of the company each afternoon. She has full supervision as regards the health of the employes in both of these mills.

* * *

The most extensive welfare work done in Rhode Island in any industry, is that carried on at the National India Rubber Co.'s plant at Bristol, involving the expenditure of \$10,000 on one item alone, with a good many more thousands of dollars in the aggregate, and yet the plans are not fully developed. For a number of years there has been a steady effort made on the part of the National company to improve working conditions and to bring the operating force up to a high standard. Owing to the serious lack of housing accommodations, many of the employes reside elsewhere, not a few as far away as Providence and Fall River. For other reasons, it has often been necessary to hire persons almost as they stepped off the ocean liners in New York, few of whom had the remotest conception of hygiene.

The first problem in welfare work, therefore, was cleanliness, essential because of the character of the output. To obtain this there was a vigorous campaign waged, to the extent that in every department where white goods are handled personal neatness is now apparent.

The second step was to obtain satisfactory sanitary conditions, and for these it became necessary to give notice that spitting on the floor would be followed by instant dismissal—this was to pre-

DISPENSARY AND REST ROOM AT THE NATIONAL INDIA RUBBER CO.

vent tuberculosis infection. Inspectors were employed who could speak the various languages, and personal notice was served upon every employe that this rule would be enforced to the letter, and now the rule is rarely broken.

New, up-to-date toilet accommodations were provided in a

modern three-story building erected contiguous to the workrooms, connections made by means of winding iron stairways, and additional fire escapes thus provided.

The next feature taken in hand was that of the hospital. This was located off the calendering room, where the liability of accidents is the greatest. It is finished in white, with tiled walls

SURGEON'S OPERATING ROOM AT THE NATIONAL INDIA RUBBER CO.

and floor, and equipped as an operating and emergency service room. On the second floor of the upper building, midway between the shoe and stitching room departments, where most of the girls are employed, is a cheerful rest room, in which there are two beds and a medicine cabinet. It is here that Miss Ruth Graham, a graduate nurse, who has general supervision of the health of the employes, has her headquarters.

Inability to provide suitable homes for expert sewers, has handicapped the company in obtaining the services of a sufficient working force. To overcome this trouble in part, the company took over the D'Wolf Inn, expending more than \$10,000 on repairs and for suitable heating and toilet arrangements, and opened this as a boarding house in April, 1915. As nominal board only is charged, the Inn is run at a loss. At present there are about 60 boarding at the Inn. The company has contributed a phonograph, but the girls pay for the hire of a piano. There are nights of reading and dancing and a competent instructor is training a class in gymnastics that the girls themselves have formed.

Following suggestions of those interested in welfare work, the company has installed a very expensive ventilating system for the workrooms and widened the passageways in, and those connecting the buildings, to a uniform width of 25 feet, thus providing for easy exit should there be occasion for hurried leaving of the shops.

The work of fitting up one of the rooms as a restaurant and lunch room for the employes has recently been finished, and good food is now being served at moderate prices. It is also proposed to fit up a room for recreation purposes, where the female operatives may enjoy themselves during the noon hour. This will be done as soon as accommodations can be obtained, and this may result in the construction of a special building for this purpose, as every foot of space now available at the plant is needed for manufacturing purposes.

In common with all the plants of the United States Rubber Co., the Revere Rubber Co. maintains a safety committee, composed of manager, master mechanic, superintendent and two others, which safeguards the employes from injury by applying protective devices to all machinery. It also looks after sanitary conditions and everything else that will conduce to the comfort

and advancement of the help. Special welfare work is done among the girl employes, individual drinking cups are provided, and a rest room is maintained. There is also a hospital, in which first aid is given minor injuries antiseptically treated. It is intended to place this work in charge of a trained nurse in the near future, and to establish a recreation room. No lunchroom is provided, for the reason that it is required that all shall leave the premises at noon, that the rooms may be thoroughly ventilated and conditions for the afternoon work made better. Tennis courts are maintained for the free use of the employes during the noon hour.

* * *

I. Victor Stone, chief chemist at the Revere Rubber Works, Valley street, has taken possession during the past few days of the new laboratory that the company has recently finished in addition to its plant on Eagle street. This addition is said to be one of the most complete and up-to-date of its kind in the country.

* * *

The Washburn Wire Co., of Phillipsdale, has begun dredging operations in the Seekonk river, preparatory to the building of a dock at the plant. In the past the company has received its water shipments from a dock owned by the American Electrical Works. This method has entailed much handling, which will be eliminated when the proposed wharf is completed. Other improvements are being made or are in contemplation at the plant of the Washburn Co., and will be commenced at an early date.

* * *

Julian A. Read, of this city, has been appointed executive secretary and accountant of the Kansas City Tire and Rubber Co., at Kansas City, Mo., and will make his headquarters there with P. A. Werner, organizer of the concern. The concern has also recently taken over a plant at Chester, West Virginia, which is to be a subsidiary.

* * *

Edward L. Viets, of Detroit, State agent for Michigan for The B. F. Goodrich Co., was a recent visitor in this city in the interests of his concern.

RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

THE demand for automobile tires is reported as unprecedented in the local factories. It is estimated that more than eight hundred thousand tires will be turned out before the coming season has closed. The total payroll of the tire manufacturers is now \$3,000,000 a year. This sum will be considerably increased, according to plans under way for next season. One factory will fall 10,000 tires short of filling the orders it has already booked.

It is possible that some of this business is due to users anticipating their tire wants in view of the expected increase in prices in the near future, but, in the main, it is but the reflection of a normal healthy growth. One Trenton firm by working every department to capacity on day and night shifts has been able to get ahead of orders, and it is said this company has made up several carloads of tires which have been placed in storage. These will be held for the better prices which will undoubtedly be obtained within the next few months.

Zinc oxide, it is said, will be at a much higher figure within a few weeks and at the present rate of increase the price will be almost prohibitive in mid-season if the present war conditions continue. Red oxide of iron is being substituted for antimony as a coloring agent for red tubes and tires, but even this is becoming steadily more scarce and it looks as though the gray product will have the call almost exclusively.

* * *

Among the concerns filing charters with the Secretary of State in April is the Dayton Tire Co., of New Jersey. Head-

quarters, Newark. The concern, as the name indicates, is to manufacture automobile tires. Accessories will also be turned out. The capital stock is \$10,000. The incorporators are: Nathan Schwartz, Belleville; Fred D. Rausler and I. G. Farmer, Newark.

* * *

The Trenton Chamber of Commerce is negotiating with a company of New York capitalists who are considering the advisability of locating a factory here for the manufacturing of a popular-priced car, not yet on the market. The names of the promoters are being kept secret pending the negotiations.

* * *

Finishing touches are being put upon the \$20,000 addition to the plant of the Thermoid Rubber Co.

* * *

Samuel McDonald, who resigned his position as salesman for the Acme Rubber Manufacturing Co. some time ago to open a tire salesroom in Trenton, has again taken a position with the Acme.

* * *

The Zee Zee Rubber Co., which has begun the making of "Brazilian" tubes in its new plant at Yardville, a few miles south of Trenton, has already seen the necessity of practically tripling the present capacity of the plant by additional buildings, although the mortar has scarcely had time to dry in the plant now occupied. The new addition will be erected at once.

NEW FACTORY OF THE ZEE ZEE RUBBER CO., YARDVILLE, NEW JERSEY.

The story of the Zee Zee Rubber Co. is interesting. About eleven years ago Irvin Zimmerman, the president of the company, was a banker and broker in Philadelphia. He determined to go into the automobile tire business and formed a selling company with his brother as a partner. Their original stock of tires, made under their brand in a Trenton factory, was worth about \$3,000. Such was the beginning. When it is stated that last year this company sold \$1,500,000 worth of tires and didn't even have its own factory, the statement will probably be rated as remarkable. But it isn't so remarkable when one knows Irvin Zimmerman, a man who fairly radiates "pep" and who gives the impression that he could start a garage in Venice and get rich at it. He is a born salesman, and under his business methods the Zee Zee output is sold far into the future. There are now 400 branch salesrooms for the Zee Zee tires and tubes. About 60,000 autoists are regular users.

The company expects to be making tires in its own plant by July. According to the plans of the concern, 3,000 tubes and 800 tires a day will be turned out when the new building is completed and all the machinery installed, and 180,000 feet of floor space will be occupied.

The Detroit, Michigan, office of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, formerly at 1201 Woodward avenue, has removed to 1109 Kresge building.

WESTERN TRADE NOTES.

THE Southwestern Tire Manufacturing Co., whose incorporation was noted in the April issue of THE INDIA RUBBER WORLD, has secured a factory site in Oklahoma City, Oklahoma, and will begin the construction of its plant this month. The officers of this company are as follows: John L. McClelland, president; Charles W. Gunter, vice-president; W. E. McClelland, secretary, and C. H. Everist, treasurer.

* * *

The Denver, Colorado, branch of the Fisk Rubber Co., Chicopee Falls, Massachusetts, has been removed from 1635 Broadway to a new building at 1168 Broadway, constructed with large space for service use.

* * *

A. L. Devault, formerly manager of the Detroit, Michigan, branch of the Federal Rubber Manufacturing Co., of Illinois, has been transferred to Chicago as manager of the central district, with headquarters at the Chicago Warehouse, 1434 Michigan avenue. Mr. Devault entered the rubber business in 1905, with the G. & G. Tire Co., Detroit, finally being given charge of that branch, and still later becoming special representative for the United States Tire Co.

* * *

J. G. Smith has been appointed manager of the Dallas, Texas, branch of the Pennsylvania Rubber Co. of New York. Mr. Smith has been connected with the Pennsylvania company for the

last eight years, being, for the past three years, with the selling organization at the Atlanta, Georgia, branch.

* * *

J. W. Wildman, formerly with the New York branch of the Portage Rubber Co., Akron, Ohio, has been made manager of the branch at Des Moines, Iowa.

* * *

The United States Rubber Co., Detroit branch, is the name now given to the consolidation of two branch stores of this company which were previously known as the Detroit Rubber Co. and the Hub Mark Rubber Co. This concern will continue at 81 and 83 Jefferson avenue, carrying the lines formerly carried by both branches. There will be no change in the management, both A. H. Crum and J. C. Huff being connected with the agency.

* * *

O. S. Johnson has been placed in charge of sales and service in Detroit, Michigan, as branch manager for the Glibey Tire & Rubber Co., Conshohocken, Pennsylvania; H. L. Winter, formerly Detroit branch manager, having resigned. Mr. Johnson was formerly with the United States Tire Co. as district manager.

* * *

The Banigan Rubber Co. and the Standard Rubber Shoe Co., Chicago, Illinois, have consolidated, operating under the latter name, with J. J. Hawkins as president and E. C. Yarnell as treasurer.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

BUSINESS at the works continues brisk, both for government account and private orders, but the all-absorbing topic is how to get the work done with the continual withdrawal of men for military service. Comparatively few of the applications to the tribunal for the total exemption of men have been granted and works managements have been compelled to fall back more and more upon the services of women. With regard to this change, the managing director of a large works tells me that the effectiveness of the substitution has been an eye-opener to him, more particularly with regard to the volume of work turned out. In fact, it seems to be the general result that women have proved efficient in the various forms of manual labor to which they have been introduced for the first time, while the results have been by no means so satisfactory where they have replaced men in office and other clean-hand work, this being probably accounted for by the fact that the recruits come from somewhat different social strata.

THE NEW BUDGET DISAPPOINTING.

The new budget is mainly of home interest and, much to the disgust of fervent tariff reformers, there are no new import duties, which are naturally the main interest for foreigners. The considerably increased duties on motor cars, coupled with the market rise in the price of petrol, will probably have some effect, but not much on the demand for tires, pleasure motoring having fallen off already to a great extent. The value of tires, tubes and accessories for motor cars imported from America from October 1 last to February 29 is stated officially to be £912,397 plus £4,365 for motorcycle tires. It will be remembered that the import duty proposed in the last budget on these goods was abandoned, though it was retained on motor cars. Ford motor cars, which formerly paid a license of £6, will now have to pay £18 under the new budget.

BELTING QUALITIES CRITICISED.

The old controversy as to the respective merits, as regards strength and longevity of Brazilian Para and plantation Para, was renewed in the discussion of Mr. Tinto's paper on rubber and balata belting before the Manchester Association of Engineers. Mr. Bentham expressed the opinion that the rubber belting of 30 or 40 years ago, made from wild rubber, could not be obtained today, because plantation rubber was being used in place of the Brazilian rubber, which was now practically exhausted. Quite probably the speaker was correct in saying that the average rubber belt, as indeed the average compounded rubber article, is not today equal to what was obtainable in earlier days of the manufacture before competition among makers became keen, but this matter of belting is not one in which the relative lasting values of the two rubbers can be summarily determined without careful consideration of many details of the manufacture, and I have reason to suppose that this view is supported by the author of the paper. Mr. Bentham, I may say, is an engineer of wide experience and holds an important position, but he is not a rubber manufacturer. With regard to the statement that the wild rubber of which belts were formerly made is now practically exhausted, if this is meant, as is presumably the case, to refer to Fine Hard Para, I fancy that our friends in Brazil would be inclined to disagree.

GARMENT WORKERS' WAGES INCREASED.

An agitation among waterproof garment workers in the Manchester district for an increase of pay has led to the increase being granted in practically all cases. This branch of the trade remains fully employed, and it would be a serious matter if any stoppage occurred. At the same time, although the manufac-

turers have perforce all come into line, it must not be assumed that they all see, eye-to-eye, the necessity for, or advisability of, this concession.

A QUESTION OF HONESTY—OR ETHICS.

Some time ago I referred to the sale in one shop of "The Kleenquick" eraser, made entirely of substitute and mineral matter. I must say that it answers its purpose very well and does not get soiled on the rubbing surface as does ordinary india rubber when left lying about. A question of ethics, however, arises in the sale of it as india rubber, as it has come to my knowledge that compositions of the sort are supplied to buyers at shops who ask for a piece of rubber without any explanation as to the fact that it is not india rubber. The problem is a knotty one because it would doubtless be easy to show that various goods supplied as made of rubber, have frequently contained that substance in but infinitesimal quantities. It might be argued successfully that as it rubs out pencil marks with ease and completeness, the buyers' expressed wants are filled, despite the fact that the composition is different from what has been supplied in the past.

SHORT TRADE NOTES.

It is one thing to get out plans for the extension of works and another to get the work done in these days of labor shortage. Thus it is not surprising that delay has been experienced at the large new works of the Dunlop Rubber Co. at Bromford, near Birmingham. Another firm whose large extensions are making but slow progress is the Premier Waterproof & Rubber Co., Limited, of Danzig street, Manchester.

J. V. Worthington, general manager of the Dunlop Rubber Co., has been appointed a director both of this company and the parent tire company in place of Sir W. G. D. Goff, Baronet, one of the original Irish directors, who has retired from business. The new director is a qualified medical man who took the somewhat unusual step of leaving the profession to go into commerce, where he has been a recognized success and proved popular with the large numbers under his control.

Among the alien enemy companies recently wound up by government order is the Continental Tyre & Rubber Co. (Great Britain) Limited, South Kensington, London, and the Polack Tyre & Rubber Co., Limited, Shepherd's Bush, London.

The vulcanite manufacture has been taken up, as regards various articles, by several rubber manufacturers, and an extension of the home manufacture is to be seen in the case of certain firms using vulcanite in their businesses. For instance, a large firm of tobacco pipe manufacturers, who, when former supplies of vulcanite from Germany were cut off by the war, got its requirements filled by home manufacturers, though at a considerably higher price, has installed machinery made by one of our leading rubber machinists and is now turning out its own vulcanite.

A novel contract has been made between the Bradford Tramways Committee, Bradford, and the Dunlop Rubber Co., Limited, Birmingham. The latter agrees to furnish rubber tires for railless street cars for two years from February, 1916, at 75d (134 cents) per mile run per vehicle.

Your correspondent has been informed that an item in the February issue of THE INDIA RUBBER WORLD regarding a position of commercial manager at the works of the Leyland & Birmingham Rubber Co., Limited, Leyland, England, was incorrect. The position, which was made vacant by the death in active service of Lieutenant Colonel Fallows, has been filled by the

appointment of George Anderson, a departmental director of the company and formerly joint manager of its Glasgow business.

The British Board of Trade is in receipt, through the Foreign Office, of information to the effect that exportation from Norway of all manufactures of rubber, gutta percha and balata is prohibited, with the exception of driving and transmission belts of balata and gutta percha.

ANTI-RUST INNER TUBE.

The Stepney Spare Motor Wheel, Limited, London, has introduced on the British market a new type of inner tube for automobile pneumatic tires consisting of an ordinary air tube having around its inner circumference, where it is slightly thicker than the tread, a band of rubber which it is claimed prevents the rust from the rim injuring the rubber tube. It is also well suited for use on wire wheels owing to the fact that its shape before inflation protects it from damage by the spoke heads when being fitted in the casing.

Another feature of this tube provides what is termed a "tropical" joint, which, before curing, is treated with special solution and is claimed to be thus rendered immune from overheating when in use.

RUBBER EAR PLUG.

Though very similar in some respects to the ordinary ear protector, this recent invention has several novel features to command attention and interest. In the illustration on the right the protector is to be seen by itself, while on the left it is shown as it appears when fitted to the ear.

The plug or protector consists of a ball *A* made of flannel, silk or rubber, slightly tapered to fit the outer ear passage. This plug is attached to the end of the small screw *C* that is set at an angle of 45 degrees and threaded through the anchor piece *B*.

When the plug is in place the screw is turned by the milled head, which causes the plug to move both forward and sideways to suit the size and shape of the ear. Thus it can be adjusted to fit any ear, whereas other ear plugs must be made to fit each different size of ear. A cap of vulcanite, celluloid or rubber is used to cover the plug. A ball made of vulcanite, celluloid or rubber may be used in place of the flannel, silk or soft rubber. [T. N. Atkinson, 26 Hart street, Holborn, London, W. C., England. British patent No. 4,579 (1915).]

BRITAIN PROHIBITS AUTOMOBILE IMPORTS.

At a meeting of the privy council of Great Britain, King George signed a proclamation prohibiting the importation of automobiles, motorcycles and various other articles. This prohibition has been expected for some time, and is understood to be for the purpose that shipping may be free to carry necessities for which the need is urgent. It is pronounced in logical sequence to the imposition of the 33½ per cent duty placed upon automobiles by the British government last October. It is understood that the prohibition does not apply to motor trucks or vehicles to be used solely for commercial purposes.

NEUTRAL EUROPE NEEDS TIRES.

Diplomatic representatives of the United States in Holland and Scandinavian countries have brought to the attention of the state department the difficulties encountered by automobile dealers and users in those countries, through shortage of tires. The agreement between the British Government and American manufacturers of rubber goods has resulted in forcing the automobile and tire dealers to buy all their tires through British dealers, and this has caused greatly increased prices, and in some cases inability to purchase tires at any cost.

THE SITUATION IN FRANCE.

By Our Regular Correspondent.

THERE is little to report from this country that would be of real interest to readers of THE INDIA RUBBER WORLD. We are all heart and soul in the war, our thoughts are on Verdun which is successfully resisting the most formidable, the most terribly scientific and powerful onslaught that ever was waged in war. A gigantic struggle like this is consuming tremendous quantities of rubber goods, tires especially. Practically all ammunition en route to the battle front and all the men traveling to and from the fighting lines are transported over great distances by vehicles equipped with rubber tires. The motor car has revolutionized warfare. Railways no longer have the importance they had in the great wars of the past. Motor trucks on our roads can do all that the railroads can and much more. We have solved the tire problem and are now obtaining very good mileages from the solid kinds which gave much concern at the beginning of the war. Our greatest motor-truck troubles of late have been with anti-skid devices on which there is much room for improvement. All our military trucks are provided with non-skid devices but they unfortunately are often lost just when they are required. The work of fitting non-skid chains is not easy when the man has but little experience and the thermometer is a dozen degrees below zero. Then, frequently, when the chauffeur endeavors to apply his non-skid chains he finds them perhaps a foot too short or too long. Drivers are reluctant to use non-skid chains but many have learned by experience that it is costly to do without them.

THE TIRE INDUSTRY.

Our rubber manufacturers are still able to supply our civil and military demands in the way of tires, as well as a fair portion of the requirements of our Allies. Only recently the Société des Etablissements, Bergougnan, Clermont-Ferrand, secured a contract for 25,000 solid rubber truck tires for the Italian Government and is now working on this important order having increased its manufacturing capacity to more than 900 solid tires per day.

SPORTING GOODS.

Business in rubber balls and sporting goods continues to be fairly good, thanks to the efforts of our athletic associations and publications. The army has been kept well supplied with these healthy means of recreation. Football matches are organized weekly and a large portion of the gate receipts are devoted to purchasing balls for the troops. The Paris representative of the American firm of A. G. Spalding & Bros. has been conspicuous in donating footballs, each to be used for one match and then turned over to the army. At a recent match in Paris a rugby football team of the American Ambulance, in Neuilly, was opposed to a team made up of available first-class players of Parisian clubs, and a goodly sum was raised for purchasing sporting goods for the soldiers.

SYNTHETIC RUBBER.

Our rubber men have followed with interest the writings of the German press on the subject of synthetic rubber and the progress alleged to have been made towards the solution of the problem. Of course we are skeptical when we read that the problem has been solved, and we have good reasons to be so. Writing on this subject your Paris contemporary "Le Caoutchouc & la Gutta-Percha" makes a few pertinent remarks, saying in substance: "They claim that a factory in Frankfurt is making pneumatic tires from this new material which is sufficiently durable to be used for the same purpose as natural rubber. The process is secret, but Professor Memmler, of Berlin, says that the product is the result of several years experimenting and that it is satisfactory."

"In the course of the past seven or eight years, we have been asked on an average twice each year, to publish a statement

similar to this. In the present instance, we have no information other than that contained in a general article prepared for the press, giving no details of the process. Usually in such announcements, particular stress is laid on the low cost of production of the synthetic product, and it is worth while to note in this connection, the omission of all reference to the cost of production.

"Synthetic rubber is not a new discovery; it can perfectly well be made in a laboratory, but its production on a commercial scale has not yet been attained.

"It is evidently quite possible for a process to be economical in war time when one has to pay 21s. per pound for natural rubber, while the same process could not be countenanced in time of peace. The allusion to several years experimenting may merely indicate the development of one of the well-known patented processes.

"Another point worth noting is the indication concerning the lasting quality of this rubber; it is 'sufficiently durable,' etc. If all difficulties had been overcome a more energetic term would certainly have been used."

PERSONALS.

Baron de Wiscoeq, head of the Etablissements Hutchinson, serving as captain in the army, has been promoted to the rank of major and made Knight of the Legion of Honor.

Count R. de Fleury, a well-known rubber authority and contributor of your contemporary "Le Caoutchouc & la Guttapercha" is serving as a lieutenant of artillery.

Captain Rouxville, the noted rubber chemist, recently returned to the front after a rest necessitated by wounds suffered in battle.

André Dubosc, chemical engineer and authority on rubber manufacturing, has returned from an extensive American trip.

TRADE NOTE.

Rousselot & Cie, Paris, manufacturers of chemicals, are installing a plant that will produce 220 pounds of golden sulphurett of antimony per day.

ACCUSED OF TREASON.

The barbarities in the Putumayo district are again brought to mind by the arrest and incarceration of Sir Roger Casement, who is now in military custody, having been captured when a German auxiliary was sunk, which was attempting to land arms and ammunition in Ireland for use against the British Government.

It was in 1910 that the stories were published of horrible atrocities perpetrated on the rubber gatherers in the Putumayo district in South America. Sir Roger Casement was then Consul-General at Rio Janeiro, and the British Government sent him to investigate the truth or falsity of the story. After spending several months in the interior, he reported that the accounts of the barbarities were not exaggerated.

After years of service in the British Government, holding offices of honor and responsibility, and having been knighted and having bestowed upon him medals and decorations, it is alleged that he has endeavored to arouse the hatred of the Irish, and that he has conspired with Germans against Great Britain.

HOLLAND.

The offices of the Amerikaanse Handelsmaatschappij, conducted by J. Polak Grödel, in Amsterdam, representatives of the United States Rubber Co., Everlastik Inc., and several other well-known firms, have been removed from their old location—Prinsengracht 544—to new quarters at Marnixstraat 402A, in the same city.

Owing to the shortage of rubber in Germany, it is stated, on the authority of the managing director of a large rubber company who returned recently from Berlin to Stockholm, that nearly all the taxicabs in Berlin have steel tires, and that steel tires are also in use on cars at the front.

EUROPEAN TRADE NOTES.

SWEDEN.

The Swedish Government is taxing all exceptional profits that are deemed to be due to extraordinary conditions developed by the war. The War Profit Tax Administration in Stockholm, which has the task of estimating these war profits for taxation, recently published a general list from which were obtained the following names of dealers in rubber goods, together with the amounts upon which each will be obliged to pay as war profit taxes: Wahlen & Block, wholesale dealers in rubber mechanical goods, 23,700 crowns [\$6,352]; Aktiebolaget Axel Christiersson, wholesale dealers in rubber mechanical goods and general factory supplies, 256,400 crowns [\$68,715], and Aktiebolaget Andersson & Pohl, wholesale dealers in scrap rubber, 18,000 crowns [\$4,842].

The Aktiebolag J. R. Broman & Co., wholesale dealers in mechanical rubber goods, packings, beltings, etc., 17 Lilla Nygatan, Stockholm, has declared a dividend amounting to 10 per cent.

DENMARK.

Statistics recently published show that the number of automobiles in Denmark on September 1, 1915, was 4,331, as against 3,430 machines at the corresponding date in 1914, and 682 in 1909, when the first statistical information regarding automobiles was published by the Kingdom. Of the total number of machines on September 1, 1915, 3,773 were for passenger use; this number included 1,291 used for cabs or omnibus service. Motor trucks numbered 558. At the same date there were also 6,347 motorcycles in use.

EXTENSION OF EUROPEAN EMBARGO ON EXPORTS OF RUBBER GOODS.

SWEDEN.

The Swedish Government has extended its export embargo to include sales for shoes made of rubber and fabric, and belting made in whole or in part of rubber, gutta percha or balata.

NORWAY.

A recent circular of the Norwegian Foreign Office places an embargo on all exports of rubber goods; also all goods made whole or in part of balata and gutta-percha, with the exception of belting.

ITALY.

The Italian Government has prohibited all commercial intercourse with the German Empire both for Italy and its colonies. Further, an export embargo has been placed on all rubber, balata and gutta percha goods, all waste materials and scrap from which rubber may be reclaimed. Benzine is also on this list.

NORTHERN FREIGHT ROUTE TO OPEN.

American exporters will shortly have an opportunity to land goods in Russia without delay from pressure of government shipments. The American-Russian Chamber of Commerce, 60 Broadway, New York City, has received a cablegram from the Russian-American Chamber of Commerce of Moscow announcing that the Pacific port of Nikolaevsk, at the mouth of the Amur River, Siberia, will be opened for navigation June 14. American exporters wishing to avoid the congestion and delays in sending freight by way of Vladivostok should direct shipments to Nikolaevsk. Goods received there will be transported up the Amur River to Stretynsk, where connection is made with the railroad system.

RUBBER IMPORTS INTO AUSTRALIA.

The British Trade Commissioner for Australia has prepared interesting tables illustrating the share of the United Kingdom, the United States and British Dominions and possessions in the importation of "competitive merchandise" into the Commonwealth of Australia during the year ended June 30, 1916.

Under the heading "India Rubber, and manufactures of," out of total imports from all countries amounting to £481,811 [\$2,344,733] Great Britain's share was £214,929 [\$1,045,925], the United States ranked second with £118,669 [\$577,503], while the share of the British Dominions and possessions was £36,703 [\$178,615].

THE RUBBER TRADE IN GERMANY

By Our Regular Correspondent.

PERHAPS the most interesting development here since my last communication is the revival of interest in preparations for the commercial and industrial struggle that is sure to follow this terrible war. The Berlin Chamber of Commerce recently held a general meeting, at which this important subject was discussed at length. The representative business men who attended were unanimous in their belief that measures of preparation should be taken immediately and that adequate quantities of raw material should be purchased—without haste, but as soon as practical—to be held in neutral countries for shipment to Germany as soon as the war ends. All were of opinion that if peace comes before German interests have been able to secure such supplies of raw materials as this country will need, the prices that will be demanded for these materials will be prohibitive, even though our enemies may not attempt to place obstacles in the way of our industries, a course they may decide to adopt.

RUBBER TRADE.

Uncertainty is the characteristic of our rubber trade at the present time. No one knows how high prices will be tomorrow nor is anyone sure of being able to get goods at all. Prices are constantly advancing and further articles are being added daily to the list of those no longer obtainable. Dealers have to take practically what they can get, and are often obliged to sell with little or no profit. When prices are communicated to the dealer he finds them excessive, and sets about to see if others are not offering better prices and conditions than those of his regular supplier. By the time he discovers that the prices quoted were right and sends in his order, prices have again advanced and he has no remedy because all quotations are made subject to change without notice.

Both dealer and manufacturer have much to contend with in the way of complaints about the quality of merchandise. Consumers appear to be unable to grasp the fact that war qualities cannot bear the same guarantees as standard peacetime goods, and their distrust and discontent are often increased by the acts of competitors who are able to include standard quality goods in their deliveries. These peacetime manufactures give much better service than the war qualities and, of course, this starts real trouble. The dealer cannot get any redress from the manufacturer, so he is left to adjust matters with consumers, who rarely are disposed to understand and accept his explanations.

Manufacturers also have their troubles. They do their very best to satisfy all needs and then have no small difficulty in inducing dealers to recommend the fruit of their efforts.

RUBBER NIPPLES.

It is practically impossible to comply with health laws and supply rubber nipples under the present conditions. Substitute qualities contain prohibited substances and cannot be used. Recently the Government released a certain amount of crude rubber to be used exclusively for making nipples, but the quantity was inadequate to supply the demand and prices are becoming prohibitory on an article that is essential and is used by the poor in greater quantities than by those who could better afford to pay.

NATIVE RUBBER-YIELDING PLANTS.

Certain people bidding for notoriety have created considerable excitement by stating to the press that a plant indigenous to Central Europe yields a higher percentage of pure rubber than any other plant, and that its cultivation would render Germany independent for her supplies of crude rubber. All this is but a revival of the attempt to exploit the "*Lactuca viminea*" a few years ago. It is interesting from a botanical

point of view but of no commercial value. Our chemical factories are producing better rubber than any weeds of the Danube or Elbe valley can supply, and there are good reasons for the hope that they will soon be able to produce it in quantities that can never be expected from our native "rubber vegetables."

EXPORTS TO NEUTRAL COUNTRIES.

Our manufacturers have been facing many difficulties in exporting to such neutral countries as are still accessible to us. The chief cause of complaint is the delay experienced in obtaining export permits. The matter has been taken up with the Government by the "Permanent Committee of German Export Associations," and it is hoped that some relief will soon be secured. These difficulties do not directly affect our rubber industry, which is not generally in a position to export, but they do so indirectly because rubber manufacturing is concerned, to a greater or less extent, in the prosperity of almost all branches of industry.

LEIPSIK FAIR.

The Leipzig Easter Sample Fair was held as usual and the rubber industry was well represented. This was the fourth sample fair held at Leipzig since the outbreak of the war, and was pronounced the most successful.

STATE MONOPOLY OF MECHANICAL POWER.

It is now clear to everyone that the tremendous cost of this war can never be paid for by ordinary or even extraordinary taxation, and many believe that the creation of government monopolies will best solve the problem. It has been suggested that the government be given the monopoly of mechanical power. This would certainly lead to the high development of water power and electricity and would thus result in great benefit to our own as well as all other industries.

CONFISCATION OF TEXTILES.

The law requiring the confiscation of certain supplies of textiles includes duck, or canvas, and drills, also burlaps, all of which are extensively used in our rubber industry. These measures were not taken because the country's supplies are coming to an end. Quantities on hand are sufficient to last for a long time yet. The confiscation is but another instance of the government guarding against any emergencies that may occur, especially as the duration of the war is uncertain.

TRADE NOTES.

Fire broke out recently in the works of Dr. Traun & Söhne (formerly Harburg Rubber Comb Co.) in Hamburg. Prompt action on the part of the employees and the city fire brigade limited the damages to one department in which, however, the loss amounted to over 100,000 marks [\$23,800]. The stock of rubber, fortunately, was not damaged.

Otto Werner, of Canstatt-Stuttgart, one of the owners of the great Werner & Pfleiderer organization, on the occasion of the birth of his first son and heir, donated 50,000 marks [\$11,900] to needy employees in Stuttgart and 20,000 crowns [\$4,060] to such employees in Vienna.

The Excelsior Rubber Works, Hanover, report that 1,000 of their employees and workmen are at the front. Fifty-five have received the Iron Cross for conspicuous bravery and 66 have died on the field of honor.

RUBBER COMPANY DIVIDENDS.

The Asbest und Gummiwerke, Alfred Calmon, A.G., Hamburg, has declared 6 per cent dividend.

A 30 per cent dividend was declared by the Continental Caoutchouc und Gutta Percha Compagnie, Hanover.

The Hanoversche Actien Gummiwaren Fabrik, Hanover-Linden, declared a dividend amounting to 10 per cent.

The Middledeutsche Gummiwarenfabrik Louis Peter, A.G., Frankfurt-on-the-Main, and the Norddeutsche Gummi und Gutta-Perchawarenfabrik (formerly Fanrobert & Reinmann, A.G.), Berlin, each declared a 4 per cent dividend.

A dividend amounting to 6 per cent and one amounting to 11 per cent were declared by the Gummiwerke Elbe, A.G., Klein-Wittenberg, and by the Mannheimer Gummi, Gutta Percha und Asbest Fabrik, A.G., Mannheim, respectively.

The Norddeutsche Jutespinnerei und Weberei, Hamburg, spinners and weavers of jute for the rubber and other industries, have declared 8 per cent dividend.

RUBBER COMPANIES SUBSCRIBE TO FOURTH WAR LOAN.

The Continental Caoutchouc und Gutta-Percha Compagnie, Hanover, together with its employees, have subscribed over 5,000,000 marks [\$1,190,000] to the fourth war loan, making the total contributions of this organization to war loans more than 15,000,000 marks [\$3,570,000].

Felten & Guillaume Carlswerk, A.G., Cologne-Mülheim, have subscribed 3,000,000 marks [\$714,000] to the fourth war loan. The Guillaume family, privately, has subscribed 5,000,000 marks [\$1,190,000] to this same loan.

The Excelsior Rubber Works, Hanover-Linden, has subscribed 1,000,000 marks [\$238,000] to the new war loan.

Gebrüder Feisenberger, wholesale dealers in rubber footwear, Frankfurt-on-the-Main, and the Liga Gummiwerke, Frankfurt-on-the-Main-Hausen, subscribed 300,000 [\$71,400] and 100,000 marks [\$23,800], respectively.

AUSTRIA-HUNGARY.

Austrian and Hungarian rubber manufacturers have added 150 per cent to their prices for mechanical rubber goods and placed another 50 per cent advance on their last prices of asbestos goods.

The Hungarian Government has suspended its order requiring the registration of all supplies of crude rubber and automobile tires.

SIAM'S IMPORTS OF AMERICAN AUTOMOBILES.

Siam imported 76 American automobiles in the fiscal year 1913-1914, and only 25 during the fiscal year 1914-1915. These imports formed 40 per cent of the total number of automobiles imported in 1913-1914, and 33 per cent in 1914-1915. In value, imports of British and German automobiles exceeded those of American cars. The total value of the 101 American machines imported during the two fiscal years referred to amounted to \$73,945, the average value per car being \$728. During 1913-1914 and 1914-1915 Siam imported, from all sources, of automobile parts to the value of \$53,526.

PERUVIAN IMPORT DUTY ON TRANSMISSION BELTS.

The Peruvian Government has placed an import duty of 10 per cent ad valorem on transmission belts of cotton or hemp, of leather or of rubber. Hitherto such belts have been exempt from import duty.

RUBBER ON THE EAST COAST OF SUMATRA.

The growth of the rubber plantation industry on the East Coast of Sumatra in the past 10 years has been remarkably rapid. From 3,305 acres in 1905, rubber plantations grew to cover 73,826 acres in 1910, and 245,000 acres in 1914, when the last census was taken.

In the Tamiang district of Sumatra rubber plantations only date back to the boom in 1909, when a start was made with 2,250 acres. Today the plantations cover more than 14,000 acres.

The crude rubber exported from the East Coast and from

the Tamiang district of Sumatra includes plantation sorts (*Hevea* and *Ficus*), and also wild rubber of the *Ficus elastica* genus.

DIAGRAM SHOWING THE WEEKLY RISE AND FALL IN THE PRICES AND QUANTITIES OF RUBBER (ALL GRADES) OFFERED AT LOCAL AUCTIONS, HELD IN CEYLON DURING 1915.

Compiled by the Ceylon Chamber of Commerce.

THE LIGHT LINE DENOTES THE QUANTITY OFFERED FOR SALE. THE HEAVY LINE DENOTES THE AVERAGE PRICE PER POUND REALIZED.

SINGAPORE RUBBER AUCTIONS.

At the annual general meeting of the Singapore Chamber of Commerce, which was held in February, it was stated that 51 rubber auctions had been held during the year 1915, and, of a total of 27,010 tons of rubber exported from Singapore in that year, 7,322 tons were sold at these weekly auctions. The amount of rubber disposed of at private sale was still considerable, but the proportion of the total business embraced by the auction sales showed steady increase. Prices obtained at the auctions were reported most satisfactory, and in the great majority of cases compared favorably with London values ruling at the same dates. The highest prices realized were: 204 Straits Settlements dollars per picul (about 87 cents per pound) for ribbed smoked sheet, and 209 Straits Settlements dollars per picul (about 90 cents per pound) for fine crepe, as compared with 141 and 146 Straits Settlements dollars per picul (about 58 and 61 cents per pound) respectively, in 1914.

The Chairman confidently anticipates that in the future Singapore would steadily increase its influence in the crude rubber market.

Rubber Planting Notes.

CRUDE RUBBER EXPORTS FROM FRENCH INDO-CHINA.

THE latest available official statistics regarding crude rubber exports from French Indo-China are for the calendar year 1914, and show that the total of these exports for the period covered amounted to 180,092 kilograms [397,522 pounds], and were distributed as follows:

France:—

Plantation rubber	Pounds 297,161
Wild Forest rubber	" 79
Singapore:	

Plantation rubber	Pounds 100,283
-------------------------	----------------

Compared with 1913 these figures show a decrease of 66,000 pounds in the exports of plantation rubber to France and a decrease of 8,800 pounds for the same exports to Singapore. The year 1913 was, however, exceptional, for the plantation rubber exports to Singapore amounted to 99,000 pounds against 13,200 pounds in 1912. The decrease in the plantation rubber exports to Singapore during 1914 was due to the fact that the great Michelin company of France bought up the whole output of one of the largest plantations of Indo-China.

However, the fact remains that the war has injuriously affected the plantation rubber industry in French Indo-China. The measures of financial conservation which the Allies took from the very beginning of the war prevented the sale of plantation shares on European markets and, as reported in THE INDIA RUBBER WORLD for February, 1916, many plantations would have been obliged to abandon operations had the local government not been able to negotiate loans through the Banque de l'Indo-Chine for the benefit of those *Hevea* planters most seriously affected. These loans accomplished great good, because they were timely and were allowed only after careful investigation of both the planting and the financial condition of the plantations.

DIFFERENCE IN QUALITY OF HEVEA LATEX.

A rubber expert writing in the "Monthly Bulletin of Agricultural Intelligence and Plant Diseases" is of opinion that the properties of *Hevea* latex vary according to the tree from which it is obtained, and he bases his opinion on determinations of viscosity of rubber in solution in benzene. He made up an index of viscosity, and discovered large differences among the individual trees yielding the rubber. This expert also believes that there is a correlation between the color of the latex and the quality of the rubber obtained from it. It would appear that these observations are of use in the selection of seed-bearing trees.

EXPERIMENTS FOR PREVENTING THE BARK ROT DISEASE OF RUBBER TREES.

The Progress Report of the Peradeniya Experiment Station, Peradeniya, Ceylon, contains interesting reference to experiments conducted at that station for preventing the development of the bark rot disease of rubber trees.

The newly tapped surfaces of the trees are covered with a thin coating of a mixture made by boiling 1 ounce of sulphur in half a kerosene tin [2½ gallons] of water and adding equal parts of animal compost and clay till a thick paste is obtained. A pinch of salt is added to keep the paste moist and prevent cracking and peeling off from the tree. The object of this treatment is to protect the exposed delicate, cambium layer from sun and drying winds, as a precaution against the bark rot, and to encourage good bark renewal. The experiments proved it to be advisable to apply this treatment monthly during the dry weather to within a quarter of an inch of the tapping area.

RUBBER IN BURMA.

For years past the government of British Burma has been undecided as to the revenue which the rubber industry there ought to yield to the Provincial Exchequer and the long-standing discussion as to the extent of the government's share has materially retarded the industry.

Most of the plantations are on leased lands, paying a rent to the government; and all along there appears to have existed a feeling that, in addition to the rent, the rubber planters, whether private individuals or limited companies, should pay something additional either in the form of a royalty or as an export duty, as is done in Ceylon and elsewhere.

Recently a deputation representing the Upper and Lower Burma Planters' Association called upon the Lieutenant-Governor and views of the situation were interchanged.

Among the suggestions made, one, that is most likely to be acceptable to both the local government and the planters, proposes that the latter pay an equitable rent for the land under rubber and a further contribution based on the selling price of rubber in London. This payment would rise and fall as the selling price fluctuates.

The matter is now in the hands of the government, which has decided to refer the proposals for fuller discussion and to evolve some definite proposition, to a sub-committee in which both sides are represented.

The climate of Burma is considered a good one for rubber growing, and the proposed arrangement, if definitely adopted, should encourage people in going into the rubber planting business in the colony.

INDENTURED LABOR FOR RUBBER ESTATES.

India and Java have, for many years, been the source of labor supply for all parts of the tropical world, India furnishing labor chiefly to Ceylon and Malaya, while Java was the supplier of hands for Sumatra and other countries. This labor received "coast advances" and similar money and was indentured for three or more years.

Recently the government of the Netherlands and East Indies put a stop to the three-year indenture of Javanese coolies for Sumatra, and now it is said that the Government of British India will follow suit by deciding to abolish the system of Indian indentured labor.

Such a policy would affect the labor of the whole of the tropical world, including Jamaica, Trinidad, British and Dutch Guiana, Fiji, etc., but it would be particularly felt on Ceylon and Malayan rubber plantations where labor is of vital importance and, as before said, comes chiefly from India.

ELEPHANTS UPROOTING RUBBER TREES.

It is reported from the Middle East that several large rubber estates in the Kalutara district of Ceylon are using elephants for thinning out work. This scheme for uprooting rubber trees was first resorted to in Kalutara, it is said, by a contractor, who, having entered into a felling agreement, made a profitable business of it by this method.

PROPOSED JAPANESE CUSTOMS TARIFF REVISION.

A Government Bill recently introduced in the Japanese Diet (Parliament) proposes to modify the customs duties on various articles imported into Japan. Among these articles are seeds of rubber and gutta percha trees which are proposed for the free list. These seeds are not specified in the tariff rates now in force.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED MARCH 21, 1916.

- N**O. 1,175,940. Suction roll, the metal shell portion of which is covered with rubber. H. R. Farnsworth and T. H. Savery, Jr.—both of Sandusky, Ohio.
- 1,176,065. Tire armor. W. K. Knight, Dexter, Mo.
- 1,176,073. Pneumatic tire. L. McKinnon, Salt Lake City, Utah.
- 1,176,141. Erasing pencil. C. L. Heider, Schenectady, N. Y.
- 1,176,145. Tire-carrying rim. F. Hopkinson, East Orange, N. J., assignor to United States Tire Co., New York City.
- 1,176,146. Instrument for administering anesthetics comprising rubber tubing. F. R. Jones, Cleveland, Ohio.
- 1,176,158. Pneumatic tire. J. V. Markle, assignor of one-half to C. F. Nast, both of Seattle, Wash.
- 1,176,159. Cushion tire. T. Midgley, Worthington, Ohio, assignor to Morgan & Wright, Detroit, Mich.
- 1,176,161. Tire tread. A. P. Nirdlinger, Chicago, Ill.
- 1,176,165. Resilient tire. M. Rasmussen, Racine, Wis.
- 1,176,209. Joint for elastic dolls and other figures. G. R. Dice, Asbland, Ohio.
- 1,176,220. Automatic chair blower, comprising air hose. A. Kaczmaszky, Piper, Ala.
- 1,176,230. Tool for contracting detachable wheel rims. V. McLain, East Moline, Ill.
- 1,176,286. Heelless rubber over-shoe. C. S. Goodyear, Nantucket, assignor to L. Candee & Co., New Haven—both in Connecticut.
- 1,176,288. Rubber insulating splice cover. J. B. Hamilton, Hoboken, N. J.
- 1,176,295. Tread for tires. F. S. Ingoldby, Pine Lake, Mich.
- 1,176,305. Rubber soled boot or shoe. C. Lee, assignor to The Goodyear's Metallic Rubber Shoe Co.—both of Nantucket, Conn.
- 1,176,338. Combined tire valve and pressure gauge. O. F. R. Bromberg, San Diego, Calif.
- 1,176,424. Puncture-proof tire lining. A. F. Brady, assignor of one-half to E. C. Maillard—both of San Francisco, Calif.
- 1,176,511. Cushioning body for tire casings. F. Zuber, Reading, Pa.
- 1,176,518. Self-propelling hose nozzle. J. T. Burns, New York City.
- 1,176,529. Self-lifting fountain pen. W. I. Ferris, Westfield, N. J., assignor to L. E. Waterman Co., New York City.
- 1,176,552. Puncture-proof tube for pneumatic tires. A. E. Henderson, Toronto, Ontario, Canada, assignor to Superior Tubes & Accessories, Limited, a corporation of Canada.
- 1,176,553. Tube for pneumatic tires. A. E. Henderson, Toronto, Ontario, Canada, assignor to Superior Tubes & Accessories, Limited, a corporation of Canada.
- 1,176,560. Non-skidding band for tires. A. T. Hughes, Kew Green, England.
- 1,176,647. Shoe sole having elastic tread members. A. Bucolo, Washington, D. C.
- 1,176,671. Vehicle wheel for demountable tires. E. W. Fothergill, assignor to Hartford Rubber Works—both of Hartford, Conn.
- 1,176,674. Rubber nursing nipple. A. G. Gardiner, Providence, R. I.

ISSUED MARCH 28, 1916.

- 1,176,760. Resilient tire. F. G. Koehler, St. Louis, Mo.
- 1,176,783. Brush attachment for cracker. J. L. Sommerkamp, Glen Ridge, assignor to Consolidated Safety Pen Co., Bloomfield—both in New Jersey.
- 1,176,839. Support for timepieces. S. G. Lewis, Greensburg, Pa.
- 1,176,840. Watch holding and attaching device. S. G. Lewis, Greensburg, Pa.
- 1,176,886. Inhaler. C. Ermoled, New York City.
- 1,176,907. Pressure indicator. H. P. Kraft, New York City, and M. C. Schweinert, West Hoboken, N. J.
- 1,176,909. Eraser and pencil holder. W. E. Lane, Kansas City, Mo.
- 1,176,910. Elastic bandage. A. G. Lee, Colorado Springs, Colo.
- 1,177,048. Pneumatic tire. M. C. Overman, New York City.
- 1,177,060. Cover for dress shields. F. Seovel, New York City.
- 1,177,063. Valve for pneumatic tires. B. E. Taylor, Oak Park, Ill.
- 1,177,099. Elastic horseshoe calf. F. J. Glanville, Morristown, N. J.
- 1,177,128. Hydrometer comprising a rubber bulb. M. E. Moeller, Brooklyn, N. Y.
- 1,177,136. Rubber boot or shoe. R. B. Price, New York City, assignor to Rubber Regenerating Co., Mishawaka, Ind.
- 1,177,203. Pulmotor. J. H. Pierpont, Pensacola, Fla.
- 1,177,206. Hose reel. F. Nemeo, Chicago, Ill.
- 1,177,263. Inflatable pneumatic rubber for vehicle sleds. J. E. Ollivier, St. Gervais, France.
- 1,177,299. Tire valve. T. P. Borden, assignor to R. B. Low both of New York City.
- 1,177,316. Hose rack. H. Gibbs, assignor to W. D. Allen Manufacturing Co.—both of Chicago, Ill.
- 1,177,350. Rubber vehicle tire. J. Monson, New York City.
- 1,177,383. Mouth connection for portable breathing apparatus. F. I. Claren, assignor to Firm of Drägerwerk, Heintz & Bernh. Dräger—both of Lübeck, Germany.

- 1,177,388. Massage apparatus. H. L. Crane, New York City.
- 1,177,412. Rubber glove. J. Hopkins, North Attleboro, Mass.
- 1,177,438. Smoke helmet comprising air tube. B. Newman, New York City.
- 1,177,456. Vehicle wheel rim. J. H. Wagenhorst, Akron, Ohio, assignor of two-fifths to The B. F. Goodrich Co., New York City; one-fifth to the Goodyear Tire & Rubber Co., Akron, Ohio, and one-fifth to the United States Tire Co., New York City.
- 1,177,457. Vehicle wheel rim. J. H. Wagenhorst, Akron, Ohio, assignor of two-fifths to The B. F. Goodrich Co., New York City; one-fifth to the Goodyear Tire & Rubber Co., Akron, Ohio, and one-fifth to the United States Tire Co., New York City.
- 1,177,458. Vehicle wheel rim. J. H. Wagenhorst, Akron, Ohio, assignor of two-fifths to The B. F. Goodrich Co., New York City; one-fifth to the Goodyear Tire & Rubber Co., Akron, Ohio, and one-fifth to the United States Tire Co., New York City.
- 1,177,459. Vehicle wheel rim. J. H. Wagenhorst, Akron, Ohio, assignor of two-fifths to The B. F. Goodrich Co., New York City; one-fifth to the Goodyear Tire & Rubber Co., Akron, Ohio, and one-fifth to the United States Tire Co., New York City.
- 1,177,460. Vehicle wheel rim. J. H. Wagenhorst, Akron, Ohio, assignor of two-fifths to The B. F. Goodrich Co., New York City; one-fifth to the Goodyear Tire & Rubber Co., Akron, Ohio, and one-fifth to the United States Tire Co., New York City.
- 1,177,461. Vehicle wheel rim. J. H. Wagenhorst, Akron, Ohio, assignor of two-fifths to The B. F. Goodrich Co., New York City; one-fifth to the Goodyear Tire & Rubber Co., Akron, Ohio, and one-fifth to the United States Tire Co., New York City.
- 1,177,462. Vehicle wheel rim. J. H. Wagenhorst, Akron, Ohio, assignor of two-fifths to The B. F. Goodrich Co., New York City; one-fifth to the Goodyear Tire & Rubber Co., Akron, Ohio, and one-fifth to the United States Tire Co., New York City.
- 1,177,474. Friction and metal plug for rubber heels. F. Berenstein, Chelsea—both in Massachusetts.
- 1,177,500. Hose patch. M. O. Dolson, Los Angeles, Calif.
- 1,177,549. Pneumatic tire. E. M. Stewart, Montpelier, Idaho.
- 1,177,582. Two wheel rubber-tired apparatus to aid blind to walking. F. Murphy, New York City.

ISSUED APRIL 4, 1916.

- 1,177,593. Vehicle tire. S. Ch. Beloit, Brockton, Mass.
- 1,177,601. Rim clamp. R. S. Bryant, assignor to The Standard Welding Co.—both of Cleveland, Ohio.
- 1,177,627. Inner tube for vehicle tires. J. M. Hunt, Atlanta, Ga.
- 1,177,630. Automatic tire alarm. A. T. Johnson, East Las Vegas, N. Mex.
- 1,177,636. Reel for elastic tape. C. P. Kuehn, assignor to A. Stein & Co.—both of Chicago, Ill.
- 1,177,650. Demountable rim. G. H. Parks, Grand Rapids, Mich.
- 1,177,669. Tire protector. W. E. Wilson and S. S. Wilson—both of Des Moines, Iowa.
- 1,177,684. Suspender buckle and webbing combination. H. E. Crandall, New Britain, Conn.
- 1,177,759. Water bag and syringe. W. J. Butler, Springfield, Ill.
- 1,177,795. Automobile horn. C. Nagle, assignor to Lee Tire & Rubber Co.—both of Chesholm, Pa.
- 1,177,808. Pedal pad. G. H. Rives, New York City.
- 1,177,902. Method of applying rubber washers to valves or the like. M. C. Schweinert, West Hoboken, and H. P. Kraft, Ridgewood—both in New Jersey.
- 1,177,930. Tire protector for use within the shoe of a pneumatic tire. H. J. Johns, West New York, N. J.
- 1,177,979. Section holding means for dental plates. F. W. Wilson, Willets, Calif.
- 1,178,008. Spring wheel with solid rubber tire. M. E. Hanson and J. B. Key—both of St. Louis, Mo.
- 1,178,074. Tire tread. W. J. Howard, Seattle, Wash.
- 1,178,145. Pipe testing plug having an annular rubber gasket. J. Florence and C. Frauer—both of Indianapolis, Ind.
- 1,178,202. Demountable cushion tire. W. H. Allen, Akron, Ohio, assignor to The B. F. Goodrich Co., New York City.
- 1,178,327. Resilient vehicle wheel comprising two outer rims having interposed rubber blocks. G. H. McKinnis and L. E. Neale—both of Wardner, Idaho.
- 1,178,361. Ornamented rubber ball. C. Van Seiver, assignor to Lambertville Rubber Co.—both of Lambertville, Pa.
- 1,178,414. Fountain pen. H. Sawamura, New York City.
- 1,178,421. Combined air mattress and life preserver. C. T. Smith, Malton, Wash.
- 1,178,481. Tire-removing clamp. A. M. Roland, assignor to A. Newhouse—both of San Francisco, Calif.

ISSUED APRIL 11, 1916.

- 1,178,484. Hose. G. C. Ansell, assignor to Dunlop Tire & Rubber Goods Co.—both of Toronto, Canada.
- 1,178,517. Car closure comprising an inelastic rubber ring. H. Hartmann, assignor to Firm Globus, Gummi & Asbestwerke G. M. B. H.—both of Ahrensbeck, Germany.
- 1,178,541. Vehicle wheel rim. E. C. Shaw, Akron, Ohio, assignor to The B. F. Goodrich Co., New York City.
- 1,178,559. Flexible gas tubing. J. J. Vautier, New York City.
- 1,178,741. Piston packing strip formed of alternate parallel layers of fabric and rubber. C. L. E. Mastin, Midland Park, N. J.
- 1,178,754. Sectional wheel rim. R. R. Royal, San Francisco, Calif.

- 1,178,809. Tire valve. H. P. Kraft, New York City, and M. C. Schweinert, West Hoboken, N. J., assignors to A. Schrader's Son, Inc., New York City.
- 1,178,821. Elastic apparel belt. M. Scheuer, assignor to American Belt Corporation—both of New York City.
- 1,178,833. Shaving brush embodying a disc of rubber sponge and an embracing elastic band. F. W. Bacon, Sewickley, Pa.
- 1,178,839. Hose coupling. R. Carlson, Greenwich, Conn.
- 1,178,869. Overlay for half-tone printing having a cushioning surface of rubber. J. B. Neale, assignor of one-half to F. W. Gage—both of Battle Creek, Mich.
- 1,178,870. Half-tone overlay formed of rubber. J. B. Neale, assignor of one-half to F. W. Gage—both of Battle Creek, Mich.
- 1,178,874. Life preserver including a bag of flexible waterproof material. N. K. Ramos, Lansing, Mich.
- 1,178,944. Rubber typewriter eraser. N. Ransom, Jersey City, N. J.
- 1,178,968. Resilient tire. J. M. Taylor, Ohio, Va.
- 1,179,018. Life-saving appliance. H. McFarlane and N. E. Rogers, assignors to Boddy Lifesaving Appliances, Limited—all of London, Eng.
- 1,179,086. Fountain pen. J. O. Foster, Seattle, Wash.
- 1,179,123. Vehicle wheel. S. R. McKay, East Cleveland, Ohio.
- 1,179,159. Rubber banding in knickerbockers for women, etc. O. E. Buley, London, Eng.
- 1,179,272. Life-saving appliance. G. M. Boddy, assignor to Boddy Life-saving Appliances, Limited—both of London, Eng.
- 14,110. Life preserver. O. A. Younghan, assignor to National Life Preserver Co.—both of Sheridan, Wyo.

THE DOMINION OF CANADA.

ISSUED JANUARY 31, 1916.

- 167,006. Sleeping bag having incorporated therein a waterproof sheet. W. H. Simpson, Montreal, Quebec, Canada.
- 167,033. Garter. The I. B. Kleintner Rubber Co., assignee of R. K. Guinzberg—both of New York City.
- 167,066. Hose nozzle. A. E. Eljertsen, Stamford, Conn.
- 167,295. Rim for vehicle tires. J. G. Rolf, Covington, Kentucky.
- 167,302. Waterproof cover for automobiles and collapsible water part. F. B. Sullivan, Carson City, Nevada.

THE UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent upon the filing of the application.

*Denotes Patents for American Inventions.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, MARCH 15, 1916.]

- 22,498 (1914). Nail polisher comprising an inflatable bladder. J. H. Devlin, 20 Rue Cambon, Paris.
- 22,569 (1914). India rubber pads in a machine for forming hat covers. F. A. Dunkley, 128 Marlborough street, Rye, Kent, Ash-ton-under-Lyne.
- 22,638 (1914). Sheet rubber linings for neckties. W. Hey, 6 Grimstone Terrace, Hull Road, York.
- 22,667 (1914). Corset mainly of elastic webbing. A. Soum, 138 Brompton Road, London.
- 22,734 (1914). Flooring for ships' decks, in which rubber filling is used between sections. Wailes, Dove & Co., 5 St. Nicolas Buildings, St. Nicholas street, Newcastle-on-Tyne, and C. MacDonald, 21 Julian avenue, South Shields.
- 22,774 (1914). Rubber covered canvas receiving screen for cinematograph projection. British Patent Subritte Co., and E. G. Meadway—both of 31 Lombard street, London.
- 22,781 (1914). Rubber rims for lamp shades. F. A. Andrews and T. G. Allen—both of 106 Victoria street, Westminster.
- 100,026 (1916). Rubber tube for pharmaceutical preparations. M. de Jong, 16 J. D. M. Pluin, Amsterdam.
- 100,038 (1916). Rubber in the manufacture of artificial leather. N. G. Scheuer, 6 Gyldenlovegade, Copenhagen.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, MARCH 22, 1916.]

- 22,829 (1914). Cushion tire. T. Thibault, 4 Rue du Commandant Riviere, Paris.
- 22,850 (1914). Waterproof sleeping bag. H. M. Knight, 9 Lilypot Lane, London.
- 22,855 (1914). Toy boats, etc., propelled by twisted rubber bands. G. Thomas, 46 Gutter Grove, Chelsea, London.
- 22,890 (1914). Toy gun with rubber disc projectiles. G. W. Kingsland, Tunnel Hill, Worcester.
- 22,938 (1914). Billiard table cushion. W. J. Mellersh-Jackson, 38 Southampton Buildings, London.
- *22,975 (1914). Gramophone sound box formed of hard and soft rubber parts. A. D. Jones, 46 Sibley Building, 1214 Fifth street, Philadelphia, Pa.
- 23,065 (1914). Rubber soles with reinforcing plate of sheet metal. F. W. Foulden, 115A Trafalgar Road, Greenwich, London.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, MARCH 29, 1916.]
- 23,077 (1914). Rubber ring in apparatus for delivering measured quantities of liquid. R. Pownley & Sons, and M. Pownley, 3 Handel street, Sunderland.
- 23,132 (1914). Flexible breathing bag. R. H. Davis, 187 Westminster Bridge Road, London.

- 23,170 (1914). Surgical probe having rubber encased conductor tubes. D. Findlay, 74 Woodside, Wimbledon, London.
- 23,177 (1914). Spring wheel with continuous outer rigid ring and pneumatic cushion. W. Morgan, Halford Azeal, Abertillery, Monmouthshire.
- *23,241 (1914). Tire protector for insertion between the air tube and cover. A. Dow, 1733 Broadway, New York City.
- 23,283 (1914). Telephone receiver with vulcanite cap. L. Brown and C. Malsiosh & Co., Cambridge street, Manchester.
- 23,309 (1914). Non-skid device for wheel tire. W. Cross, 10 New Court, Lincoln's Inn, London. (J. R. Peck, Boston, Massachusetts.)
- *23,310 (1914). Elastic self-adjusting waistband for women's garments. A. Malsiosh & Co., Cambridge street, Manchester.
- 23,313 (1914). Sheet armor for body wear, or for protection of aeroplanes, ships and cars of dirigible balloons enclosed in cotton and india rubber cloth. N. Lacrotte, 136 Avenue Parmentier, Paris.
- 23,320 (1914). Rubberized leather protectors for pneumatic tires. A. M. Kobielle, 18 Gordon avenue, New near Melbourne, Australia.
- 23,326 (1914). An attachment for watering cans, hose pipes, etc., comprising a rubber ring. T. H. Webster, Stock, Ingelstone, Essex.
- 23,356 (1914). Wheel tire. A. Rosa, 46 Corso Casale, Turin, Italy.
- 23,358 (1914). Wheel tire. A. Rosa, 46 Corso Casale, Turin, Italy.
- 23,439 (1914). Marine life-saving apparatus, inflatable and buoyant. J. Davis, The Cottage, Turley, Bradford-on-Avon, Wiltshire.
- 23,462 (1914). Toy operated by elastic cords. T. Crawford, Wilton House, Stapleton Place, Dundalk, Ireland.
- 23,439 (1914). Metal and rubber disc bottle closures. H. Birbeck, 329 High Holborn, London. (L. M. Rosenthal, 1105 Park avenue, Mount Vernon, New York.)
- 23,510 (1914). Tread band comprising solid square headed studs secured by riveting to a rubber and canvas band. H. Agha, Eagle Lodge, Hale, Cheshire.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, APRIL 5, 1916.]

- 23,545 (1914). Truss pad comprising an india rubber envelope. H. C. Stephens, Cheltenham, Wiltshire.
- 23,550 (1914). Mine signaling device employing a rubber block. J. J. C. Allison, London, and J. Waller, Woodlands Colliery—both in Durham.
- *23,562 (1914). Rubber rings in paper cutting and winding machine. C. H. Thorndarson, 501 South Jefferson street, Chicago, Ill.
- 23,585 (1914). Rubber buffers in machine for polishing or scouring needles, etc. C. E. Baylis, 34 Millsboro' Road, Redditch, Worcestershire.
- 23,610 (1914). Reinforced rubber sole pads for boots and shoes. W. W. Phillips, 142 Old street, London.
- 23,737 (1914). Non-skid device for twin tires. F. H. Shepper, 7 Thomas street, and S. G. Jowitt, 104 Lawrence street—both in York.
- 23,779 (1914). Combined leg rests and walking sticks with rubber and caps. G. E. Marshall, 28 Chisworth street, Paddington, London.
- 23,870 (1914). Inhaler preferably made of india rubber or gutta percha. A. P. Stokes, 36 Wei Hai Wei Road, Shanghai, China.
- 23,895 (1914). Protection for breach action and magazine of a rifle of waterproof fabric. W. C. Hammond, St. Augustine, East Moseley, Surrey.

NEW ZEALAND.

ISSUED FEBRUARY 17, 1916.

- 36,987. Milking machine test cup. N. J. Daysh, Carterton, New Zealand.
- 36,989. Tire tube valve connection. A. E. Hendersson, Kent Building, Toronto, Canada.
- 37,084. Hose nozzle and the like attachment. C. Dobbie, 4 Warwick street, Hobart, Tas.

ISSUED MARCH 2, 1916.

- 36,790. Brush and brush manufacture. The Rubber Set Brush Co., Limited, 21 Bucklersbury, London, England.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

- 478,238 (April 1, 1915). Plugs for stopping perforations in pneumatic tires. B. W. Spittler.
- 478,294 (April 6). Splash guard for automobile wheels and others. E. D. Self.
- 478,295 (April 6). Tire with a mud guard. E. D. Self.
- 478,303 (April 7). Improved pneumatic tire pump. J. Heeley.
- 478,416 (April 16). Pneumatic tire. The American Tire Co.
- 478,424 (April 17). Improved reinforced armor for pneumatic tires. M. Patrick.
- 478,454 (April 20). Improved valves for pneumatic tire inner tubes. C. E.
- 478,470 (April 22). Elastic wheel. E. Basjanoff.

THE GERMAN EMPIRE.

PATENT ISSUED (With Date of Validity).

- 641,270. Elastic solid tire for vehicle wheels. National Antriebs, G. m. b. H.

TRADE-MARKS.

THE UNITED STATES.

- 90,618. Stauntag and Hilder Bros., New York City. A coat of arms with the word *Colonial*. For bathing caps made of rubber, etc.
- 91,432. The Miller Rubber Co., Akron, Ohio. The words *Glee Bub-Lets*. For rubber balloons.
- 92,313. Woonsocket Rubber Co., Woonsocket, R. I. The word *Pulcan*. For rubber boots and shoes.
- 92,574. A. B. Mann, New York City. Illustration of the world with the words *Mann's Universal Elastic Bandage*. For elastic bandages.
- 92,746. The De Press Chemical Co., Holland, Mich., and Chicago, Ill. The word *San-Tox*. For hot water bottles, fountain syringes and combination syringes.
- 81,939. The Gordon Rubber Co. (now by change of name The Gordon Tire & Rubber Co.), Canton, Ohio. Representation of a cone on each side of the word *Gordon*. For rubber tires and tubes.
- 91,518. The B. F. Goodrich Co., New York City. Representation of an automobile tire. For automobile tire casings composed of rubber and fabric.
- 92,170. J. L. Schnell, New York City. The words *The Master Pen*. For fountain pens.
- 92,378. The William A. Welty Co., Waterloo, Iowa. The word *Watuco*. For fountain pens.
- 92,720. American Rubber Co., Boston, Mass. The words *Oil King*. For raincoats.
- 89,403. Franklin Toro Co., Richmond, Va. Illustration of a mint leaf with the words *Richmont Gum*. For chewing gum.
- 91,921. Joseph A. Vogel Co., Wilmington, Del. Illustration of a seal with the word *durite* and the representation of a pneumatic tire. For a sealing liquid for pneumatic tires.
- 92,338. The Goodyear Tire & Rubber Co., Akron, Ohio. The word *Imperator*. For hose and rubber surface fabric belting.
- 92,356. Craddock-Terry Co., Lynchburg, Va. The word *Pollyanna*. For shoes made of leather, rubber and canvas.
- 92,416. L. J. Levy, New York City. The words *Ultra Magnetie*. For rubber massage brushes.
- 92,528. Kokomo Rubber Co., Kokomo, Ind. Representation of a tire divided into red, white and blue sections. For pneumatic tires composed of rubber.
- 91,457. Simmons Sales Co., Springfield, Mo. The word *Simmons*. For suspenders, garters, etc.
- 91,458. Simmons Sales Co., Springfield, Mo. The word *Daziti*. For suspenders, garters, etc.
- 91,459. Simmons Sales Co., Springfield, Mo. Representation of the initials *S S Co.* and the words *Simco Mills*. For suspenders, garters, etc.
- 91,834. The Gordon Tire & Rubber Co., Canton, Ohio. The word *Everrite*. For rubber druggists' sundries.
- 92,354. Brownell Auto Co., Inc., Birmingham, Ala. The word *B-A-C-O*. For automobile inner tubes, rubber hose, etc.
- 93,340. The Mechanical Rubber Co., New York City. The word *Nobby*. For golf balls.
- 93,347. A. Stein & Co., Chicago, Ill. Representation of a rabbit with the word *Bunny*. For garters.

NEW ZEALAND.

- 12,319. Adolph Frankau and Co., Limited, 119 Queen Victoria street, London, E. C., England. The word *Diana*. For pouches manufactured of india rubber or gutta percha.

THE DOMINION OF CANADA.

- 21,402. Hyslop Brothers, Limited, Toronto, Ontario. The words *Skid-Grip*. For tires.
- 21,427. The Goodyear Tire & Rubber Co., Akron, Ohio. The word *Neolu*. For soles and heels for boots and shoes made from an artificial composition.

DESIGNS.

THE UNITED STATES.

- 48,789. Tire. W. A. S. Mauk, Baltimore, Md.
- 48,854. Automobile tire. W. P. Braender, Passaic, N. J.

THE GOODYEAR TIRE MILEAGE COST CHART.

Motorists that give close attention to tire mileage and who figure on the cost of the tire per mile instead of considering the original cost, will be interested in the accompanying chart compiled by the Goodyear Tire & Rubber Co., Akron, Ohio, reproduced in the next column.

To find the tire cost per mile, the initial cost of the tire and the tire mileage received must be known. Then by stretching a thread or rubber band from a point in the first column representing the initial tire cost, to a point in the third column representing the tire mileage received, the tire cost per mile may be read at the point of intersection in the second column. Moreover, the chart is valuable in showing the economy of oversized tires. Through the use of these tires, the tire cost per mile is invariably reduced, and at the same time easier riding qualities and freedom from tire trouble gained.

STATEMENT OF THE INDIA RUBBER WORLD.

Statement of the ownership, management, etc., required by the Act of Congress of August 4, 1912, of Title 1810, RUBBER WORLD, published monthly at New York, N. Y., for April 1, 1916.

Before me, a notary public in and for the State and county aforesaid, personally appeared E. M. MacPhee, who, having been duly sworn according to law, deposes and says that she is the Business Manager of The India Rubber World, and that the following is, to the best of her knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher, The India Rubber Publishing Co., 25 West Forty-fifth street, New York City.

Editor, Henry C. Pearson, 83 Agawam Road, Waban, Massachusetts.

Managing Editor, None.

Business Managers, William M. Morse, 99 North Broadway, Tarrytown, New York; E. M. MacPhee, 244 West Forty-eighth street, New York City.

2. That the owners are (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock):

Henry C. Pearson, 83 Agawam Road, Waban, Massachusetts.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.) None.

4. That the two paragraphs next above, giving the names of the owners, stockholders and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

Sworn to and subscribed before me this 31st day of March, 1916.

(SEAL) E. M. MacPhee.

Notary Public, Westchester County.

Certificate filed in New York County.

New York County Clerk No. 138. Register's No. 8226.

(My commission expires March 30, 1918.)

Review of the Crude Rubber Market.

NEW YORK.

THE crude rubber market has been decidedly quiet in all quarters during the month of April. True, there have been a few large orders placed, but, in general, trading has been quietly done in small lots, and prices have steadily declined. The big buying interests seem to have deserted the April market.

The direct shipments to America from the East by way of the Pacific coast still continue in large volume. From January 31 to February 14, inclusive, there were 779,715 pounds shipped from Penang. From Singapore 5,030,412 pounds were shipped between February 7-27, making a total of 5,810,127 pounds now arriving at the Pacific ports. Pacific shipments are not entirely satisfactory, as more time is required than by the Cape route, averaging about a month longer. Akron shipments, however, are favored, as they are not affected by the eastern freight congestion.

The arrivals at New York, compared to 6,000 tons for the first three weeks of March, are falling off as indicated by the figures for April 1 to 18, inclusive, which total 3,700 tons and are divided as follows: Plantations from London and Liverpool, 600 tons; Singapore and Colombo, 1,715 tons; Batavia, Java, 595 tons; Para and Manaus, 335 tons; Africans, 260 tons; Centrals, 125 tons; Manicoba, 70 tons.

The steamship "Suldanh da Gama," overdue in New York with 120 tons of rubber, was captured off the Orkney Islands last month by a British cruiser.

Early in the month first latex spot, was selling at 85½¢/86½ cents, and Smoked sheet, ribbed spot, was 84½¢/85½ cents. May-June deliveries of these grades were quoted from ½ to 1 cent less than spot prices. Upriver fine spot, and May deliveries were quoted at 73½ cents.

The downward trend of prices continued with minor fluctuations during the month, and on April 25 first latex spot, was quoted at 80 cents, smoked sheet ribbed spot, at 79 cents, and Upriver fine, 71 cents.

LONDON.

The inquiry was fair during the early part of April, with small lots of Standard crepe spot, going at 3s. 4¼d. [82.6 cents], and Smoked sheet spot, at 3s. 4¼d. [81.5 cents]. May-June deliveries were at a ¼d. premium for both grades. Sellers of Hard fine Para were asking 3s. 1d. [75 cents]. On April 25 Standard crepe spot sold for 37¼d. [75 cents] and Smoked sheet for 37d. [74 cents], an average decline of 7 cents the pound since April 1.

The absence of large buyers was marked during the entire month, and consequently the market lacked the support necessary to hold up prices. The diversion of shipments to America via Pacific routes, the increase of ocean rates and the advance in war risks, have had a disquieting effect on London.

The consumption of crude rubber in the United Kingdom for the past three years has steadily declined, according to figures furnished by the London Board of Trade. In 1915 the quantity of crude rubber retained in England for home consumption was 17,982 tons, as compared to 18,850 tons in 1914 and 25,275 tons in 1913.

SINGAPORE.

At the auction held March 1-2, 1,274,000 pounds were offered and 619,733 pounds sold. Fine pale crepe brought 79½ cents, and Smoked sheet ribbed sold for 79 cents. On March 8-9, of 1,137,600 pounds offered, 845,333 pounds were sold. Fine pale crepe went readily at 79 cents, and Smoked sheet ribbed sold up to 80 cents. The market closed firm and active. The auction, March 15-16, brought out 972,666 pounds, 778,800 pounds being sold. Fine pale crepe sold at 80 cents, and Smoked sheet ribbed at 79 cents. The market was steady at the close.

SINGAPORE-NEW YORK FREIGHT RATES.

The following are the new freight rates from Singapore to Boston and New York via the Suez or Panama Canal:

Rubber scrap (cases).....	\$48.60 per 50 cubic feet
Gutta jelutong (cases) (Pontianak).....	\$2.24 per 50 cwt.
Rubber shavings, not exceeding \$300 per ton (cases)	53.46 per 50 cubic feet
Gutta re-boiled or mixed, not exceeding 24 cents per pound (c. i. f. in cases)....	55.89 per 50 cubic feet
Borneo rubber (baskets).....	65.61 per 12 cwt.
Borneo, Para, and rubber, genuine (cases).....	65.61 per 50 cubic feet
Gutta percha (cases).....	68.04 per 50 cubic feet
Rubber, genuine (bags or bundles).....	97.20 per 20 cwt.

The new through rate on rubber in cases from Port Swettenham, Malacca, Teluk Anson, Port Dickson, is \$79.25 per 50 cubic feet. In cases by steamers calling at Port Swettenham is \$65.61 per 50 cubic feet. [The equivalent of a ton (2,240 pounds) is figured at 40 cubic feet, a hundred weight (cwt.) 112 pounds.]

In addition to the above the following items were exported during the same period: To England—Balata, \$26,996; to Panama—Balata, \$90; to China—Vulcanized rubber, \$1,600; to Cuba—Gutta percha, \$297.

Plantation Rubber from the Far East

TOTAL EXPORTS FROM MALAYA.

(From January 1, 1916, to dates named. Reported by Barlow & Co, Singapore. These figures include the production of the Federated Malay States, but not of Ceylon.)

To—	From Singapore.	From Malacca.	From Penang.	From Port Swettenham.	Total.
United Kingdom, pounds	31,191.6	31,191.6	2,057.067	5,270.234	9,890.634
The Continent	375.200	375.200
Japan	311.067	311.067
Ceylon	14,400	64,933	396,846	476,179	912,000
United States	8,600.267	591,733	9,192.000
Australia	39.200	39.200
Totals	11,494.667	408.800	2,713.733	5,667.080	20,284.280
For the same period, 1915	4,408,928	537,281	2,513,598	5,810,062	13,269,869
For the same period, 1914	2,771,704	1,746,266	5,084,254	9,602,224
For the same period, 1913	2,020,289	1,027,733	4,218,179	7,266,201

EXPORTS OF CEYLON GROWN RUBBER.

(From January 1 to March 20, 1915 and 1916. Compiled by the Ceylon Chamber of Commerce.)

To—	1915.	1916.
United States, pounds	1,745,084	6,514,304
Canada and Newfoundland	340,140	2,540
France	35,840	398,050
Russia	137,259	18,695
United Kingdom	7,404,194	4,498,779
Australia	4,486	198,280
Japan	119,582	45,396
Straits Settlements	78,990
Totals	9,905,075	11,676,294

(Same period 1914, 8,123,655 pounds; same period 1913, 5,692,636.) The export figures of rubber, given in the above table for 1914, include the imports re-exported. (These amount to 928,613 pounds from the Straits Settlements and 246,546 pounds from India.) To arrive at the total quantity of Ceylon rubber exported for that year deduct these imports from the total exports. The figures for 1915 and 1916 are for Ceylon rubber only.

RUBBER AND GUTTA EXPORTS FROM JAVA AND MADURA.

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram from Kuala Lumpur states that 4,429 tons of plantation rubber were exported in the month of March as against 5,207 tons in February and 5,418 tons in the corresponding month last year. Exports for the first quarter amounted to 14,107 tons, compared with 10,302 tons in 1915 and 7,324 tons in 1914. Appended are the comparative statistics:

	1914.	1915.	1916.
January	2,542	3,473
February	2,364	3,411
March	2,418	3,418
Totals	7,324	10,302

THE RUBBER SCRAP MARKET.

NEW YORK.

THE break in the shoe market that had been confidently predicted, occurred during the first week in April, and boots and shoes declined to 9@9½ cents. Auto tires, while not so badly affected as boots and shoes, were influenced by the downward movement, and mixed tires sold to the mills for 6½ cents delivered. G. & G. tires brought 8¼ to 8½ cents. The other tire sorts failed to be of interest even at easier prices, while No. 1 inner tubes at 29 cents were neglected through anticipation of lower prices. The mechanical grades all exhibited easy tendencies due to the small demand occasioned by general tone of the market. This general weakness and subsequent decline of prices in all grades is due to the similar condition of crude rubber that is always a prime factor in scrap conditions.

Spring collections are very much heavier this year, a circumstance to be expected when the enormous consumption of rubber is considered. These large accumulations of scrap naturally have a depressing influence on price values.

On April 22 sales of shoes were made at 8½ cents delivered, although some mills frankly held out for 8¼ cents. The actual amount of business doing was not large, according to reliable reports, and this view is substantiated by the prevailing quietness. The tire situation is still weaker as the month draws to a close, and mixed auto tires were quoted at 6¼ cents delivered, though actual sales could not be consummated at more than 6½ cents. Some G. & G. tires were going at 8¼ cents, but a shade better was offered by the mills. Inner tubes were easier with No. 1 grades, selling at 28 cents delivered. Mechanical grades were weak, particularly hose, the garden variety bringing \$1.40 delivered to the mill. Air brake hose appeared to be in good demand, but prices were lower than a fortnight ago.

MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

EGYPTIAN COTTON.

THE Alexandria market developed weakness about the middle of March and prices steadily declined, showing a loss of about ½ cent on the old crop cotton. This reaction is apparently of local origin, as the American markets were generally well sustained. Prices for new crop futures have been averaging about 2 cents less than those for the old crop for some time. The statistical local position continues to grow stronger daily, stocks are decreasing, and the interior is now practically cleared of cotton. It must not be forgotten that before getting new cotton, five months' requirements are to be filled, and the present stocks at Alexandria are insignificant.

SEA ISLAND COTTON.

The southern markets have been quiet for the past month, and prices show very little change as compared to the figures of a month ago. The entire crop has been disposed of, and is now in second hands, consequently the southern markets are closed until the next crop comes in. On April 21 there were 67,903 bales in sight at all ports, compared to 63,754 at the same date last year.

FABRICS.

Great Britain's cotton fabric embargo, that went into effect last month, was the result of England's desire to facilitate the shipment of war orders. Permits must be obtained from the British Consul for all shipments of cotton fabrics, and those classed as necessities are given preference over all others. This new order went into effect without disturbing the market.

Tire fabrics are still high, and deliveries on contracts are usually delayed. Supplies are used up so rapidly that the rubber mills are unable to maintain any stocks of tire fabric, whatever. There has been no change in the market during the month, and prices are firm.

COTTON DUCK.

Trade conditions are prosperous and the demand is good for hose and mechanical duck, in fact, deliveries are only restricted by the question of securing raw materials promptly. Goods are going into consumption as soon as they are shipped. Auto top manufacturers are buying for 1917 deliveries.

Most of the ducks, drills, sheeting, etc., used by the rubber trade are sold up to the end of the year. Indeed, many contracts have already been written, covering the first six months of 1917 and options are called for on deliveries, during the last half of the coming year. The demand seems to be increasing, and prices have advanced in a firm market. There is little doubt that the recent advance in wages paid the textile workers in New England will become general throughout the East. American textile workers will then enjoy the distinction of being the highest paid labor in the textile world. That the direct cause of this increase is entirely due to the high wages paid by manufacturers of munitions, there is no doubt, and it is equally true that when normal conditions once more prevail, wages will be revised.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

PRICE changes during the month have not been important and most materials have been held at previously quoted levels. This is true of litharge, white lead, orange mineral, zinc oxide, lampblack, china clay, lithopone and whiting. High prices and scarcity of some materials have contributed to retard jobbing activity.

Barytes has sold at advanced prices and the market is strengthened not only by good consuming demand, but also by increased cost of production.

The movement of prices for spirits of turpentine was downward during the last week of the month. There has been no apparent realization of the expected spring inquiry so far, and primary values are said to have settled to a lower than cost basis.

In the case of caustic soda the undertone of the spot market continues heavy, on account of the amount of resale stock held by second hands. The inability to secure ocean tonnage has resulted in moderate accumulations, and sellers are experiencing some difficulty in moving goods into consuming channels.

Clarence A. Evans, of Worcester, and Charles S. Burgess, of North Brookfield, have been appointed receivers for the B. & R. Rubber Co., of North Brookfield, Mass., under a bond of \$50,000. The company has liabilities of \$265,000, assets, \$80,000. It is understood that the receivers will operate the factory on present orders, for a month, for the purpose of determining what advantage the creditors may expect by a continuation of this policy.

TABLE OF CONTENTS ON LAST PAGE OF READING.**PROCESSIONAL EFFICIENCY.**

PIECE work and team work, so long the acme of production effectiveness in great manufacturing establishments, are beginning to look antiquated when compared with processional work. At bottom its basis is simplicity itself and is of this sort. Say that in days past a blacksmith struck a piece of iron twenty blows to secure a certain result. Processionally there would be twenty blacksmiths ranged before twenty anvils. The iron brought before each pauses only long enough to be smitten once and passes to the next. The first blacksmith has just time enough to raise his hammer when another piece of iron is in place to receive its blow. A man who misses a blow promptly loses his job. Each worker must do his part at just the right moment or it gets by him. Active and alert men are required and the pay, by the day, is exceedingly high—and the amount of work accomplished is tremendous. Of course, the iron hammering description is only by way of explanation. Such work would be done by machinery. But processional

work has already been adopted in automobile manufacture, and wherever it is adaptable to rubber work it is sure to be tried out.

THE UNIVERSALITY OF THE RUBBER STAMP.

IT is not contended that the rubber stamp is quite on the same plane of importance as the rubber tire, for instance. In value of annual product these two commodities stand in about the ratio of fifty to one. The car owner's annual contribution to the rubber industry aggregates approximately \$200,000,000. That of the stamp user is about \$4,000,000.

But in one particular the stamp far surpasses the tire—in its universality. Bankers, merchants, office boys, farmers' wives, young girls with a dozen handkerchiefs, all use them. There are 12,000,000 tires in use in the United States today, while of rubber stamps there are 100,000,000. Someone may say "That's a rubber stamp for every person—man, woman and child—not to mention infants in arms." Quite true. There are not 100,000,000 stamp-owners, but over against the ten men who use none is the man who uses a four-story rack full of them.

The rubber stamp does its work faithfully and cheerfully until it is worn out in service, and dies in the harness. It has the supreme virtue of unfailing reliability—it tells the same story day after day and never deviates a hair's breadth.

In fact it has become so generally recognized as a symbol of docile, unquestioning obedience that when one statesman wants to charge another with too unfaltering loyalty to somebody else he invariably calls him a "rubber stamp."

A PESSIMISTIC PROPHECY.

A NEW YORK financial sheet recently sent to its subscribers a confidential communication, which it claimed originated with a leading bank interest in New England, that should surprise the rubber trade. The advice, which was in the nature of a warning, claimed:

First—That the production of plantation rubber had reached its maximum, due to overtapping of the trees.

Second—That a white ant pest was retarding rubber production.

Third—That reclaimed rubber could not be relied upon to take the place of crude.

Fourth—That higher prices for tires were to be expected.

An expert who does not know a tapping test from a tuning fork, a white ant from a whipparee, or reclaimed rubber from honeycomb tripe is perhaps not to be taken seriously when he talks rubber. Nevertheless, with the hope that this catches his eye, we submit the following

facts: Plantation production has not begun to approach its maximum. Not only will existing plantations show an increase next year, but hundreds of thousands of trees just coming into bearing will add to the aggregate in rubber production. In addition, thousands of small plantings by natives all through the Far East will add their product. As for white ants, they have been fought from the beginning and are not a menace, as they are well under control. Further, few trees have been overtapped, and no danger is to be feared from this source. As to reclaimed rubber, it is not "dead," but by modern processes just as live as new rubber.

One statement is perhaps correct. Tire prices, because of higher labor, more costly cotton and compounding ingredients, may advance.

We congratulate the New England banker-prophet upon scoring one point out of four—75 per cent wrong is better than the usual 100 per cent.

ASBESTOS AND ITS EMBARGO.

AN order in council by the government at Ottawa, Canada, in March of this year, placed an embargo on the shipment of asbestos from Canada to other than British ports, but permitted shipments to the allied countries, France, Russia, Italy, Japan, and Portugal, on special licenses granted by the British consul. The announcement of this order was received with alarm by users of asbestos in the United States, and a vigorous protest was at once filed. It was shown that practically 90 per cent of all the asbestos used in this country comes from Canada, and this shutting off of supplies would cripple several important industries. It was demonstrated to the government at Ottawa that a great hardship would be entailed, and the embargo has been modified to the extent of permitting shipments of crude asbestos to enter the United States if guarantees are given by the manufacturers and their customers that none of the crude or manufactured material will be re-exported, except as provided for in the original order.

For the last few years we have been importing annually from 60,000 to 76,000 tons, of a value of from \$1,378,000 to \$1,678,000, and practically all of this came from Canada, about 200 tons being imported from Europe. In no year previous to 1914, has the total domestic output amounted to 8,000 tons, while the average is less than 4,000 tons per year, and in 1913 and 1914 it was less than 1,300 tons.

Rubber manufacturers are using steadily increasing

quantities of asbestos, chiefly in packings and automobile brake lining. The latter is a narrow asbestos fabric impregnated with rubber and vulcanized. That it is an important product may be inferred from the fact that the 3,000,000 or more automobiles in this country, and the 200,000 trucks, have certainly two, usually four brake linings. The total length of such lining needed for a single car is about ten feet. This of itself would make about 37,000,000 feet—a tremendous production. And when it is considered that such linings wear out in use, and must be renewed, it will be seen how important is this one branch of the asbestos-rubber industry.

The raw material is also used for clutch lining. About 35 per cent of 1916 models of automobiles have dry disk clutches, and while the amount used for this purpose is small, compared with that used for brakes, still in the aggregate, this is, in itself, an important addition to the business.

There are, of course, other uses for asbestos in the rubber trade. All manufacturers of mechanical rubber goods use this material, chiefly in packings.

The action of the Canadian Government has brought vividly to the minds of American manufacturers their dependence upon imports of asbestos. Investigation as to the resources of our own country as reported by the United States Geological survey shows that in 1915 there was a great increase in the production of high-grade asbestos in Arizona. The lower grade asbestos produced in this country comes mainly from Georgia. Both Arizona and Georgia are capable of increasing their output. Virginia, ten years ago, produced a small quantity of low-grade asbestos and in 1911 Vermont had a productive mine, largely of the chrysotile variety, in the same belt of rocks that contain the rich deposits in Canada. For the last few years the mine has not been in operation. Asbestos has also been reported in the Casper Mountains and other regions in Wyoming and there are deposits in Idaho of about the same quality of material as that in Georgia. California has produced some low grade asbestos.

However, as far as rubber manufacturers are concerned, it is probable that they will continue to use the Canadian product, submitting to the conditions required by the Dominion Government, which are practically the same as these manufacturers have agreed to with the British Government with regard to the importation of crude rubber and the exportation of rubber manufactures.

Rubber in the Construction of Aeroplanes.

THE balloon has not received as much attention in America as in Europe. Americans have never believed that it would become really practical, and heavier-than-air machines have possessed more attraction for our inventors. The problem of mechanical flight has given birth to many chimerical plans and projects, but the fact remains that, although most of the earlier theoretical literature on the subject came from France, practical results with machines heavier than air were first obtained by Americans.

As far back as 1894, Hiram Maxim, an American residing in England, constructed a flying machine, provided with a steam engine, which showed flying capability but lacked stability. Professor Langley, secretary of the Smithsonian Institution at Washington, built several working models of flying machines propelled by steam engines, of which two, in 1890, made aerial flights of about a mile. Then followed, also in America, the remarkable "gliding" experiments of Lilienthal, Chanute, Herring and finally of the Wright brothers who, as far back as 1902, had completed gliders

possessing most of the refinements of modern aeroplanes, minus the motor. Since Wilbur Wright made his historical flight in 1908—the first mechanical flight worthy of the name—gigantic strides have been made towards perfection in navigating the atmosphere with machines heavier than air, and thousands of successful aeroplanes of many types have been produced.

The flying machine has proved its value both as a vehicle of sport and as an instrument of war. The new industry has been growing rapidly all over the world. Forty American aeroplane factories are now working full force on foreign government orders for flying machines, and consequently it seems quite worth while to go somewhat into details concerning this industry and the extent to which rubber is used in the construction of aeroplanes.

AEROPLANE CONSTRUCTION.

There are four important ways in which rubber is used in the construction and use of aeroplanes: First, in the pneumatic tires with which the wheels are equipped; second, in the rubberized fabric for covering the wings and other surfaces; third, in the construction of shock absorbers, and fourth, in the equipment of the aviator and passengers.

All aeroplanes—some water-aeroplanes excepted—are equipped with wire wheels similar to motorcycle wheels and provided with pneumatic tires which are either cemented, glued or attached with lugs to the rims of the wheels. The Dunlop type of tire is most favored for aeroplane service on account of the facilities it offers for light construction. The size of wheels and tires varies with the type of machine. Aeroplane tires must be attached very tightly to their rims, for the slipping off of a tire is even more dangerous to an aviator bringing his machine to earth

than it is to an automobilist taking a corner on the road. Aeroplane tires must have great resiliency and strength of fabric to withstand the terrific shock when an aeroplane alights on rough, uneven ground. A blow-out at such a moment might prove fatal. The plain tread is perhaps most used, although aeroplane tires are also made on the non-skid plan. The tire and the rims of the wheels of aeroplanes should be constructed so as to make rim-cuts impossible even when the landing shock flattens out the tires.

AEROPLANE FABRICS.

Fabrics play an important role in aeroplane construction. As long as the cloth covering the sustaining planes of a flying machine stays taut in all kinds of weather, little attention is paid to it, but when it alternately shrinks and stretches, when it shows itself as sensitive as a hygrometer to the presence or absence of atmospheric moisture, aviators and aeroplane constructors soon realize the importance of aeroplane cloth. The quality of the cloth affects the efficiency and even the safety of

a flying machine. Aeroplane cloth must be moisture-proof, heat-proof and cold-proof, and it must not oxidize in the sun or become affected by gasoline or engine oil.

The following fabrics are used in the construction of aeroplanes: Cotton canvas, either unbleached or colored in yellow, and weighing from 145 to 150

AEROPLANE FLOWN DURING THE NEW YORK PREPAREDNESS PARADE, MAY 13, 1916.

grams (4.90 to 5.07 ounces) per square meter (10.764 square feet), is used single-fold for covering the sustaining surfaces of flying machines. The tensile strength of this canvas is from 2,200 to 2,800 pounds per running yard and its thickness about 0.18 millimeter (0.007 inch). Some constructors use cotton canvas weighing from 180 to 200 grams (6.34 ounces to 7.05 ounces) per square meter (10.764 square feet), having a tensile strength of about 2,600 pounds to the running yard and a thickness of about 0.18 millimeter (0.007 inch). Flax fabrics or linen are most used. Linen fabrics weigh about 145 grams (4.90 ounces) to the square meter (10.764 square feet) and their tensile strength is in the neighborhood of 3,600 pounds to the running yard or 18.80 pounds to the square millimeter (0.00155 square inch), while their thickness is around 0.20 millimeter (0.0078 inch). Silk fabrics, though stronger than others for their weight, are not used in the construction of aeroplanes on account of their excessive cost.

French constructors use quantities of ramie fabric. This weighs 120 grams (4 ounces) per square meter (10.764 square feet), its tensile strength is 2,120 pounds per running yard, or 13.64 pounds per square millimeter (0.00155 square inch), and its thickness 0.17 millimeter (0.0066 inch). Ramie fabrics are very tough and hard to tear.

MAKING THE FABRIC MOISTURE PROOF.

Rubberized fabrics were used almost exclusively for covering

the sustaining surfaces of the first aeroplanes, but the rubber industry had been taken unawares and the rubberized fabrics then obtainable were not well suited for the requirements of aeroplane construction and they soon fell in disfavor because the best of them absorbed a certain amount of humidity, stretched, and thus lost their rigidity. Canvas, coated with acetate of cellu-

Photograph from Underwood & Underwood.

SHIPPING U. S. ARMY AEROPLANES INTO MEXICO

lose, took the place of rubberized fabrics in the construction of aeroplanes because such canvas is supple and at the same time little affected by the weather. The plain canvas was first stretched and fastened tightly to the frame of the machine and then coated with acetate of cellulose varnish. Acetate of cellulose applied in the form of a collodion tightens cloth that is stretched on a frame; it makes the cloth waterproof without making it stiff and brittle as nitrocellulose does; it does not crack and it is not inflammable. Acetate of cellulose varnishes used in the early days of aviation were diluted with chloroform, but this solvent was soon dropped on account of its high cost and the danger in its use. At the present time two sorts of acetate of cellulose varnishes are used—varnishes that give a rigid coating and those that give supple coatings.

RUBBERIZED FABRICS.

The use of rubberized fabrics in the construction of aeroplanes is not so extensive as it is generally believed to be. Aeroplane manufacturers and aeroplane users are still under the influence of the prejudice developed in the early days of aviation when proper rubberized fabrics for this purpose were not to be obtained. The fabrics available in the pioneer days of aviation were rubber-coated and not impregnated with rubber as they are now. The result was that the rubber coating cracked and peeled off, allowing moisture to penetrate the fibre of the fabrics, causing them to alternately shrink and stretch. Modern rubberized aeroplane fabrics present no such difficulties, and aeroplane builders are now beginning to give them the consideration they deserve.

Rubberized balloon fabrics are made either of linen or of cotton and they are thoroughly impregnated and saturated with rubber applied gradually by a series of operations. Manufacturers have learned to make them absolutely weather-proof and lasting. Besides being thoroughly saturated with rubber, modern rubberized aeroplane fabrics are generally coated with rubber solution on both of their surfaces. These coatings are so light that rubberized aeroplane fabrics are no longer open to objections on the score of weight, as was formerly the case. The process of preparing these fabrics is quite similar to that used in the preparation of balloon fabrics already described in a preceding article on the subject. Aeroplane fabrics are made in all colors or, like some of the balloon fabrics, are metallized with aluminum.

SHOCK ABSORBERS

All aeroplanes are provided with a running gear which invariably includes a system of shock absorbers built to protect

the machine as well as the aviator from too violent shocks when leaving and when returning to earth.

The Blériot type of rubber springs or shock absorbers was at first built up of fine rubber strands bunched together, covered with a cotton fabric, the ends of the strands being firmly held in metallic clamps constructed in such a manner as to facilitate the fastening of the spring to the landing gear of the aeroplane. It was, however, discovered that the fine rubber strands soon decayed from oxidation and their place was taken by molded rubber vulcanized to give proper tensile strength and elasticity.

The Farman type of aeroplane spring is used in attaching the axle on which the wheels are mounted, to the skids of the flying machine. Two or more rubber rings are hooked to one side of the skid, then brought over the axle and fastened to the other side of the skid. These rings are made of either red or of bluish-gray stock compounded so as to be strong enough to withstand heavy strain and with the exact degree of elasticity to allow proper elongation and no more. These types of rubber shock absorbers vary widely with the type of machine and of landing gear used. For aeroplane shock absorbers rubber is unrivalled on account of its light weight and extraordinary elasticity. Metal springs, hydro-pneumatic shock absorbers and the like are used but not nearly to the extent that rubber is.

EQUIPMENT OF THE AVIATOR.

Aviators, when flying, use rubber and rubberized fabric clothes almost exclusively. These are made in all colors and afford perfect protection against weather. Aerial waves make riding in an aeroplane comparable to riding a bucking bronco and aviators are obliged to fasten themselves to their seats lest they be thrown out by the violent bounding of their machine.

Here again rubber is used in the shape of a rubber belt which the aviator passes around his waist and fastens to the machine with leather straps. Such a belt not only prevents the aviator

Copyright Underwood & Underwood, N. Y.

UNITED STATES MILITARY AEROPLANE IN MEXICO.

from being thrown out of his machine but, in case of accident the elasticity of the rubber acts as a fall-breaker. This type of rubber belt is generally composed of two pieces held together by a miniature coupling pin. By pulling out the coupling pin the flyer can immediately free himself from his machine.

Many aviators use hard rubber helmets to guard their heads in case of accident and rubberized gloves to protect their hands and forearms from cold and rain. As in dirigibles, the navigating instruments used in aeroplanes are generally held in place by soft, elastic rubber attachments which prevent excessive vibration and violent shocks reaching the delicate mechanism of these instruments. The upholstering of aeroplane seats is often made of rubberized fabric inflated with air. Aviation, like aërostation, presents numerous and extensive applications of rubber and offers an interesting field to the rubber manufacturer, and one that may in the future grow into much larger proportions and become of still greater importance.

The European Rubber Trade After the War.

Written by a German, well posted on general conditions of the European rubber industry, this article gives the writer's forecast of the manner in which the European rubber trade will be resumed after the war.

A VERY conservative estimate made according to the actual business done during the year 1913 shows that the total international turnover in rubber goods represented by the sum of the imports and exports from one to the other of the countries now at war was about \$40,000,000, or five-sixths of the total interstate rubber trade of Europe.

Of the rubber goods imported into Germany, amounting to approximately \$6,500,000, about \$600,000 came from France. England supplied \$2,300,000 worth, Russia \$1,000,000, Austria \$450,000 and Belgium \$250,000. Germany in return sent about \$3,500,000 worth to France; England bought for her own use and for her colonial trade, shipped via London, about \$6,500,000; Russia received somewhat less than \$2,000,000; Belgium about \$750,000; Austria \$2,500,000; Italy \$5,000,000, and Turkey \$150,000.

Taking the case of England, it appears that apart from the business done with Germany, she bought from Belgium about \$350,000 worth of rubber goods; France supplied her with \$700,000 worth and she received about \$200,000 worth from Austria. Italy is also well represented in the British market. The English figures are far from complete, giving only tires, footwear and general goods, while many others are hidden under different class headings, as, for instance, electrical goods.

Looking at the export side of the British trade exchange, it appears that Belgium received goods to a value of \$850,000; France \$2,000,000; Russia \$250,000, and Turkey about \$100,000. The trade to Italy consisted very largely of tires and raw materials.

Belgium bought from Austria goods to the value of \$50,000 and sold her three times that amount. France sold Austria \$250,000 worth of rubber goods and in return bought half that quantity, while honors were practically even between Austria and Russia, each exchanging goods worth slightly over \$120,000.

From European letters, as well as from opinions of travelers, the feeling seems to be that the war will be followed by marked changes in the character and channels of European business. It is pointed out that the relations between the two largest competitors, England and Germany, may be restrained for a considerable time. This would doubtless necessitate a complete reorganization of the whole European market, if not that of the world.

Until the beginning of the war, the German rubber industry regarded London as a large clearing house for trade passing between Germany and the British colonies. The London shippers had acted as intermediaries, and regret is expressed that the continuance of this profitable trade relationship may be endangered by the war.

There were in London many firms representing the interests of the German rubber industry, including some of the largest concerns handling rubber goods in the British market, such as the Continental, Metzler, Calmon, and Harburg-Wien. The management of the latter house in England was completely in the hands of English interests and the same condition has existed with British firms in Germany, such as the Dunlop Rubber Co., Limited, which has a large German plant. In many of the less prominent houses, there were employed in both countries a large number of agents doing business for England in Germany and for Germany in England.

The relations between the representatives of the rubber industries of both countries and the buyers of such goods were most cordial. They found their expression repeatedly in the participation of the German manufacturers in the International

Rubber Exhibitions, the last of which closed shortly before the outbreak of the war. It is claimed by some that the interests of these firms are so clearly interwoven that after the war a re-establishment of relations may be possible and that the feeling of distrust which undoubtedly will be left may speedily be overcome. This applies equally well to the relations between the Austrian and British merchants.

Before the war Italy not only bought from Germany a fairly large quantity of tires, but the German exports to Italy of mechanical rubber, hard rubber goods, etc., had been large. This trade has entirely ceased since the outbreak of the war. What the commercial relations between these countries will be after the war, is problematical.

It is difficult to predict how the war will affect the relations between Italy and Austria. These countries after previous wars have soon returned to peaceful trading again. Hence, one may anticipate a fairly early resumption of their commercial intercourse when the political difficulties have been removed.

As an exporter of rubber goods, Italy has never exerted a strong influence upon European trade, although Italian manufacturers had built up a satisfactory export business and the London market was well supplied with Italian goods. Those made by Pirelli & Co. are especially well known. This firm and other Italian manufacturers may benefit after the war by any decrease in German exports to England.

The situation between Germany and France presents greater difficulties, for between their rubber industries considerable competition has existed for some time past which, as an industrial conflict, has been shown by boycotts and in other ways. It is said that the French market was fast becoming of less value to the German manufacturers. Opinions seem to indicate that after the war this trade will cease altogether.

France is not producing all the rubber goods she needs and the lack of German imports, having a value of about \$3,500,000, should have a decided effect on the French rubber trade. If, after the war, cordial commercial relations are not resumed with Germany, France will either be compelled to expand the producing power of her rubber industry immensely or she will have to look about for some other source of supplies.

It should be remembered that France has built up an export trade, especially in tires. The French tire industry has gained a large export demand, mostly through the fame of her motor industry. French motor cars winning races all over the world have helped to introduce the tire products of the French rubber manufacturers, who have taken good care of the openings thus made. French tires were sold in large quantities in the British and other European markets, and French manufacturers are of the opinion that they will be able to replace German tires in England after the war. How far this will be possible will depend upon conditions existing at the conclusion of peace.

The German rubber goods sold in France consisted largely of mechanical goods and tires. The former may not be easily replaced by French makers, as the demand for this class of goods promises to become enormous. Tires are a French specialty which the domestic manufacturers are able to furnish in sufficient supply for home consumption.

The English rubber industry naturally is in a more favorable position than that of the other countries at war, for England has been able to keep her export business open. The strength of London is in its capability to distribute goods. In the past it has acted mostly as a receiver or intermediary for the continental rubber industries. Whether it will retain this position

will depend largely on the settlement of the British dispute with Germany.

The increasing influence of Antwerp must not be forgotten. This city has made great progress in former years and it is predicted that its position after the war will be still more influential, endangering not only London as a distributing center but Hamburg as well. The realization of the immense possibilities of Antwerp dates back to the middle of the last century. Only the great financial influence exerted by London has kept it from becoming the most important port of Europe.

Conditions in Russia are not clear. It is said that in Russia the sentiment has been very favorable to Germany and consequently it is thought that no great difficulty will be encountered in returning to normal trading conditions. Some merchants feel that the war will have but little influence on the turnover of German and Austrian rubber goods in Russia.

The markets affected by the war are producing about half of the rubber goods made in the world, and these markets are consuming a large part of that which is made. The important question for manufacturers to ask is: Will the volume of trade in rubber goods increase or decrease after the war?

At present the general opinion seems to be that for the first few years after the war the production in the rubber industry of Europe will increase by leaps and bounds, provided there is sufficient raw material available. Rubber goods of great value have already been destroyed, and more will be wasted before the war comes to an end. These goods must needs be replaced.

At this time, one cannot predict with any degree of certainty whether a decrease of the general rubber trade may be expected after the readjustment of European economic conditions. The increasing use of automobiles and possible new uses for rubber may bring added business to the industry of Europe and prevent a serious falling off of manufacturing when the rush of after-war orders have been filled.

NEW FORM OF RUBBER GUARANTEE.

THE British Consul-General at New York has informed the secretary of The Rubber Club of America, Inc., of a change in the rubber guarantees required by that government. These read the same as the previous forms, with the exception of one paragraph, which now reads:

We will not sell the rubber now delivered by you [nor any raw rubber, reclaimed rubber or waste rubber, whether the same has been imported from British Dominions or not] to any dealer or other person or persons in the United States, but will use it for our own manufacturing purposes.

The addition to the former forms is enclosed in brackets. Other than this, the entire guarantee remains as before.

In addition, a new form, No. 3, is presented, which is required to be signed by reclaimers, in respect to scrap or waste rubber imported from Great Britain or British possessions. This reads:

In consideration of your consenting to the delivery to me of the rubber specified in the margin, I undertake that I will not, directly or indirectly, at any time so long as Great Britain is at war with any European country, export any raw rubber, reclaimed rubber, waste or scrap rubber from the United States, except to the British Dominions, and that I will not sell any raw rubber, reclaimed rubber, waste or scrap rubber for exportation without satisfying myself that it is not intended for exportation from the United States except to the British Dominions.

I further undertake that I will not sell any raw rubber, reclaimed rubber, waste or scrap rubber to any person, firm or corporation in the United States without satisfying myself, so far as possible, that the purchaser has signed the British Rubber Guarantee.

RECENT BRITISH RULING ON INSULATED WIRE.

The British Government has recently decided that on account of their military importance, insulated electric wire, cables and wire of all descriptions, even though containing 5 per cent and less of rubber, must be shipped by way of the United Kingdom.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless, they are of interest, not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[168.] A correspondent desires the names of manufacturers of rubber tissue.

[169.] An inquiry has been received for the address of a reliable maker of rubber enemas, manufactured in one piece without any connection part.

[170.] A special type of jelutong is desired in quantity by a rubber cement firm.

[171.] Names of tire fabric makers have been requested.

[172.] A rubber factory promoter seeks information regarding a continuous process tire building machine.

[173.] A Canadian concern desires to be placed in touch with manufacturers of rubber valve cutting machines.

[174.] Names of dealers in rubber scrap have been requested.

[175.] A correspondent seeks information regarding a thorough test for cured rubber.

[176.] A rubber manufacturer seeks information to aid in the cure of a poison rash affecting a workman who handles compounds and several grades of rubber.

[177.] Inquiry has been received for names of manufacturers of grinding mills ordinarily used for grinding or pulverizing junk or scrap rubber for reclaiming purposes.

[178.] Information is desired by a correspondent on the dipping process in the rubber industry.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A Spanish agent desires to represent American manufacturers of rubber tires for carriages and automobiles. Report No. 20,856.

Full information from American manufacturers of insulating materials is desired by an applicant in an insular possession. Report No. 20,905.

A firm in the Far East requests catalogs, quotations, etc., from American manufacturers of rubber supplies, such as gloves and hot water bags. Report No. 20,908.

Commercial relations are sought by a Brazilian firm with American importers of rubber. Report No. 20,969.

An applicant in Australia would like to communicate with American manufacturers of rubber goods for druggists. Report No. 20,993.

Catalogs and price lists are solicited by a firm in Italy from American manufacturers of toys, rubber balls, etc. Report No. 21,059.

There is a growing demand for chewing gum among the Chinese. Names of firms and others interested may be obtained. Report No. 21,092.

Commission agents in Greece would like to be placed in touch with American exporters of dress shields. Report No. 21,100.

A merchant in Spain desires to import rubber, gutta percha and celluloid articles. Report No. 21,129.

An agent in Norway wishes to represent American manufacturers of electrical insulated wires, tubing, etc. Report No. 21,232.

An applicant in Denmark is in the market for American rubber combs. Report No. 21,243.

* * *

Sealed proposals for 200,000 yards of waterproof fabric will be received until June 12 at the office of the Depot Quartermaster, Boston, Massachusetts, for furnishing at either the Boston, New York or Philadelphia depots of the Quartermaster Corps, United States Army.

What the Rubber Chemists Are Doing.

SYNTHESIS AND STRUCTURE OF CAOUTCHOUCS.

THE researches of I. I. Ostromyslenski and F. F. Koschelev on the chemistry of caoutchouc are here condensed from the abstracts published in the *Journal of the Society of Chemical Industry* (March 31, 1916). The authors find that much of the work published since 1911 on the polymerization of the diolefines is inaccurate and many of the patents are useless. These papers describe peculiar processes of isomerization of two different forms of isoprene-caoutchouc and methods for the catalytic polymerization of diolefines, both to normal and abnormal caoutchoucs. These methods give practically quantitative results.

Caoprene bromide is identical with the symmetrical bromide of erythrene-caoutchouc. Removal of hydrogen bromide from either yields dehydrocaoprene and a homologous compound is similarly obtained from the bromide of natural Para caoutchouc.

Reduction of caoprene bromide by zinc dust yields erythrene-caoutchouc and more or less isomeric caoprene. Caoprene is transparent and forms either a viscous liquid or an amorphous, elastic mass. Benzoyl peroxide at 140 to 158 degrees F. converts caoprene into normal erythrene-caoutchouc.

SYNTHESIS OF NATURAL CAOUTCHOUC BY WAY OF B-MYRCENE.

Isoprene heated cautiously at 176 to 194 degrees F. yields B-myrcene. This hydrocarbon is a colorless, mobile liquid, soluble in all the organic solvents. When heated with sodium and barium peroxide at 140 to 158 degrees F. it is converted quantitatively into normal isoprene caoutchouc, whereas under similar conditions isoprene gives an abnormal caoutchouc.

STRUCTURE OF CAOUTCHOUCS.

The bromide of natural caoutchouc is homologous with caoprene bromide and possesses unicyclic structure. Under the action of zinc dust it is converted readily and quantitatively into free caoutchouc; therefore the latter possesses a unicyclic structure. Willstätter has shown that multi-membered unicyclic groupings of unsaturated hydrocarbons are readily transformed into polycyclic groupings, and Harries has proposed for natural caoutchouc a structure in which such isomerism is assumed. That free caoutchouc and its halogen compounds possess unicyclic structures has been demonstrated experimentally.

The conversion of unsaturated compounds into cyclic compounds may be regarded as a process of intramolecular polymerization. For example, in the polymerization of vinyl bromide, at the moment when the trimeride appears, the action proceeds in two directions: (1) A small part of the trimeride undergoes intramolecular polymerization with formation of the stable six-membered ring compound, 1,3,5-tribromocyclohexane; (2) The remainder of the trimeride unites with unchanged monomeride until a 32-membered chain of carbon atoms is formed. This then undergoes ring formation to form the symmetrical bromide of erythrene-caoutchouc.

CONVERSION OF ISOPRENE AND B-MYRCENE INTO CAOUTCHOUC.

The discovery of the formation of B-myrcene in the process of conversion of isoprene into caoutchouc throws light on the mechanism of this process. In the first phase, the hydrogen atom and the residual radicle from a molecule of isoprene combine at the ethylenic linking of a second

molecule, giving the dimeride, B-myrcene. The latter is then converted into the trimeride, and so on, until the octameride is formed. This then undergoes "intramolecular polymerization" to isoprene-caoutchouc. This polymerization of chemically pure B-myrcene may possibly represent the only synthesis of natural caoutchouc, that is, of a substance perfectly identical with natural Para caoutchouc, both in the general structure of its nucleus and also in the positions of the methyl groups and double linkings of the molecule. There is reason to believe that tropical plants synthesize natural caoutchouc by way of B-myrcene or myrcene-like hydrocarbons or their dimerides and not by the polymerization of isoprene. The sap of plants frequently contains compounds with an atom grouping like that of myrcene, such as geraniol, linalool, nerol, etc., and dehydration of these unsaturated alcohols would lead immediately to the corresponding myrcenes.

COMPARISON OF BRAZILIAN AND PLANTATION METHODS OF PREPARING PARA RUBBER.

G. Stafford Whitby recently reported the results of his researches on this topic before the London Section of the Society of Chemical Industry.

In order to obtain strictly comparable results, the two methods mentioned were applied to separate portions of the same lot of freshly tapped latex. The Brazilian method employed for the preparation of the fine hard Para rubber was followed as closely as possible, the latex being coagulated on a paddle in smoke from burning wood and palm nuts. The plantation method adopted as typical was the preparation of smoked sheet by diluting the latex, coagulating it with acetic acid (0.5 per cent of the weight of dry rubber), holding out the coagulum, drying the sheets, and finally, hanging them in a smoke house for 22 days. The products obtained by these two methods were subjected to precisely similar vulcanization tests, the results of which were expressed in accordance with a scheme worked out by P. Schidrowitz to indicate the duration of heating required for a "perfect" cure and the mechanical properties of the vulcanized product.

The results indicate that the Brazilian method is not superior to the plantation method, and the rubber coagulated by the Brazilian method required longer curing in the vulcanization tests. Such differences as were observed the author attributed in part to a specific and deleterious action of phenolic substances derived from the smoke, and the presence of formaldehyde may also be responsible to some extent.

From vulcanization tests on a very large number of samples, the author concluded that oxidation and the discoloration which it produces have no effect on the vulcanizing properties of the rubber. The outer and more discolored portions of balls of fine hard Para rubber were found to be equal in quality to the inner portions.

Separate investigation of rubber from young and from old trees gave no support to the widely accepted opinion that the latex from young trees is inferior.

In further experiments it was ascertained that air-dried plantation sheet rubber is quite equal, if not superior, in quality to smoked sheet rubber.

In the discussion following the paper Professor Henry E. Armstrong said that the impression he had formed when recently in Ceylon was that they understood very little of what they were doing, and that more research work was

necessary in regard to rubber than was being practiced at the present time.

Dr. Stevens said that for some years there had been research stations in Ceylon and Malaya. Rubber stations have been carrying out work for six or seven years past, and researches have also been carried out at the Imperial Institute and in private laboratories.

OXIDATION OF HEVEA RUBBER.

The experiments of M. Kerbosch on the oxidizability of rubber of *Hevea Brasiliensis* (Bulletin of Agricultural Intelligence, 1915, Vol. 6, page 1703) show that rubber under the influence of sunlight and of diffused daylight gave the following results: Rubber prepared by evaporation of the latex resists oxidation better than that prepared by coagulation. The difference is due to the presence in the former of certain unidentified soluble constituents of the latex. The oxidizability of the rubber is not affected by the presence of quebrachite. The superiority of the Brazilian method of coagulation is probably due chiefly to the retention of the soluble constituents mentioned, and not to the smoking operation.

NEW COAGULANTS FOR RUBBER LATEX.

HEVEA latex is readily coagulated when acidified. It is not desirable to accomplish this by permitting the latex to become rancid because of the important loss of uncoagulated rubber in the waste serum of the latex. In consequence, acetic acid has been generally adopted as the preferred coagulant in the preparation of plantation rubber.

Since the beginning of the war the price of acetic acid has risen from about ten cents to 60 cents per pound, and is almost unobtainable owing to lack of transportation facilities.

The serious shortage thus caused has resulted in a thorough search for a substitute for the very large quantity of acetic acid required on the rubber plantations throughout the Far East. Among the substitute reagents suggested but not generally adopted are sulphuric, hydrochloric, nitric, oxalic, tannic, carbolic, tartaric and citric acids, corrosive sublimate and acid potassium tartrate. Aside from the merits of these chemicals as coagulants, they are in scarcely better position than acetic acid as regards price and transportation to the plantations. Acetic acid can be made cheaply and in ample quantity from cocoanut shells. The crude product is not sufficiently clear in color for the coagulation of rubber that is to be made into first latex crepe, but good, clear, smoked sheet can be and is being made in large quantities with it.

For the production of first latex crepe a better substitute for glacial acetic acid is necessary. This has apparently been found. It is well known that in all parts of the tropics there are many strongly acid fruits, water extracts of the juices of which readily coagulate rubber latex. Shortly after the beginning of the war cocoanut water, and cocoanut vinegar were found to be suitable coagulants; especially cocoanut water, which is now being regularly used on some rubber estates. The process consists in allowing the cocoanut water to ferment for four or five days, after which it can be used immediately for coagulating latex. It is said to produce better rubber than that procured by using crude acetic acid, especially as regards color.

Ceylon is said to produce enough cocoanut shells to provide sufficient acetic acid for all the smoked sheet rubber made in Ceylon and perhaps in the whole East. At the same time the available supply of cocoanut water would doubtless practically supply the requirements for the production of first latex rubber, and the entire rearrangement become a profitable one both to growers of cocoanuts and of rubber.

PROPERTIES OF VULCANIZED RUBBER.

THE relationship of mechanical to chemical properties of vulcanized rubber has been studied by Philip Schidrowitz and H. D. Goldsborough, who have published in the "India Rubber Journal" (April 8) notes on the preliminary results obtained. The experimental methods employed were as follows:

MIXING.—Standard mixing of 100 parts rubber and 8 parts sulphur.

CURING.—Standard cure, in screw molds, in live steam at 286 degrees F.

CORRECT CURE (Rate of cure).—This was determined by the optimum curve method ("Rubber Industry," 1914, page 212).

The examination of many hundreds of samples demonstrates that the optimum curve method of estimating the correct cure gives in practice concordant results, and actually represents the best product obtainable under the conditions of mixing, curing and testing.

SLOPE OF CURVE (Type).—As a matter of convenience the slope of curve is represented by the figure corresponding to the expression

$$T = \frac{E_1 - E_2}{2.5}$$

E_1 = elongation at a load of 600 grams per square millimeter and E_2 = that at a load of 1,040 grams per square millimeter. For any given load the extension will be greater for the flatter curve. This fact is of fundamental importance.

INSOLUBLE MATTER.—This was determined by difference [Schidrowitz, "Rubber" (Methuen, 1911), p. 252].

SOLUBLE MATTER.—Caspari's method, and his distinction between "soluble" and "pectous" rubber was observed.

COMBINED SULPHUR.—This was estimated in the rubber after exhaustive extraction with acetone.

Number.	Nature.	Correct Cure. (Hrs.)	Slope of Curve. (Type.)	Lbs. per Square Inch.	Elongation at Break at Original (= 1).	Insoluble Matter.	Soluble Matter.	Combined Sulphur. (Per Cent.)
1—Smoked sheet...		38	2,118 ×	10.39	10.80	81.9	4.37	
2—Smoked sheet...		33	2,250 ×	10.74	8.88	81.3	4.86	
3—Plain sheet...		33	2,100 ×	10.66	7.52	28.8	2.88	
4—Plain sheet...		31	2,450 ×	11.00	6.64	80.55	2.03	
5—Smoked sheet...		134	2,100 ×	10.43	11.52	81.1	4.30	
6—Smoked sheet...		37	2,110 ×	10.35	10.16	76.4	4.70	
7—Film sheet...		37	2,528 ×	10.56	7.52	94.85	4.21	
8—Film sheet...		134	2,289 ×	10.78	17.20	81.75	4.70	
9—Para...		38	2,093 ×	10.43	3.62	

As far as they go, these results do not support the suggestion made by B. J. Eaton that the amount of combined sulphur at the correct rate of cure may be more or less a constant, like the mechanical properties. It should be noted that the two plain sheet samples, while not differing greatly as regards mechanical properties from the smoked sheet samples, both show a very much lower "combined" sulphur content.

LAYING OF THE CORNER STONE OF THE CHEMISTRY BUILDING OF THE BUREAU OF STANDARDS, WASHINGTON.

On March 23, the corner stone of the new chemistry building of the Bureau of Standards, at Washington, D. C., was laid by the Hon. William C. Redfield, Secretary of Commerce. The building is about 60 × 200 feet, constructed of brick and stone, and is to be four stories in height, in addition to attic and basement. It will provide adequate laboratory space for about 120 chemists, besides rooms for offices, supplies, etc. It will probably be ready for occupancy early in the spring of 1917.

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

CHEMICAL TREATMENT OF RUBBER.

THE UNITED STATES.

COATING COMPOSITION. A new product, the oil of Pontianak rubber resin. [Carlton Ellis and Alfred A. Wells, Montclair, New Jersey. United States patent No. 1,179,413.]

THE UNITED KINGDOM.

SYNTHETIC CAOUTCHOUC. Isoprene and synthetic caoutchouc substances are prepared by the following processes: (1) Treating with fuming sulphuric acid a mixture of an aliphatic ketone with an aliphatic alcohol or ether. Example, a mixture of acetone and ethyl alcohol or ether is treated, the reaction mixture is cooled and volatile products distilled off. (2) Passing ethylene or its homologues through a heated mixture of acetone or its homologues with fuming sulphuric acid, giving isoprene and caoutchouc. Propylene, butylene, or amylene and methyl-ethylketone, diethylketone, dipropylketone, are also specified as parent materials. (3) Passing ethylene or its homologues, or the corresponding alcohol vapors, together with vaporized acetone or its homologues, through a red-hot tube, with or without a dehydrating agent, and collecting the reaction products in fuming sulphuric acid. [H. Stern, 42 Karlstrasse, Munich, Germany. British patent No. 297 (1915).]

THE GERMAN EMPIRE.

RUBBER SUBSTITUTE. Sulphurized oils fluid at the ordinary temperature are treated with dilute nitric acid to obtain a product which can be vulcanized like rubber. It is not completely soluble in any known solvent, but swells up with carbon bisulphide, benzol, etc., to a gelatinous mass, which on evaporation of the solvent leaves a tough elastic residue which can be used for many purposes as a rubber substitute. [H. Bayer, Vienna, German patent No. 288,968 (1914).]

THE FRENCH REPUBLIC.

VULCANIZING RUBBER CEMENT BY ULTRA VIOLET RAYS. The process consists in exposing thin layers of pure rubber, a fraction of a millimeter thick, to the action of ultra-violet rays from a mercury quartz lamp using 220 volts, 3 amperes of current. The surfaces to be united are held by mechanical means at a distance of 5 centimeters from the lamp. The exposure required is about 40 seconds. The vulcanizing agent may be free sulphur, metallic sulphides or metallic sulphides in the presence of bisulphide of carbon. Extremely dilute solutions of rubber are successfully used for cementing surfaces by this method because the surfaces freely absorb the solution and the vulcanizing effect of the ultra-violet rays converts the cementing medium into a strong elastic binder. [H. Olivier. French patent No. 477,204.]

POROSITY IN RUBBER GOODS.

The porosity of rubber as it occurs in the manufacture of goods is due to one or more of several factors. Surface porosity is usually caused by condensation of steam on the goods during vulcanization. In the case of goods cured embedded in talc in open steam, drops of water sometimes percolate through the talc to the rubber and cause uneven vulcanization, by locally reducing the temperature. This danger may be practically eliminated by protecting the receptacle for the goods with a sheet metal covering to shed the water. In the case of wrapped goods, moistening the wrapper will prevent blowing. Internal porosity is caused by moisture in the rubber or compound, by the use of a low-grade, weak rubber in whole or in part, or by over-milling the stock in

breaking down the gum or compounding. Porosity in molded goods may be due to imperfect closure of the mold or to insufficient stock to fill the mold.

LABORATORY APPARATUS.

VISCOSITY INSTRUMENT.

In a paper presented by H. C. Hayes, professor of physics, and G. W. Lewis, assistant professor of engineering, both at Swarthmore College, at the spring meeting of the American Society of Mechanical Engineers held at New Orleans, Louisiana, last April a new form of viscosimeter was described. It operates in accordance with the principle that a solid body having a surface of

revolution when suspended in a rotating liquid experiences a torque which is proportional to the viscosity of the liquid under test, such as a lubricating oil.

The specimen, *S*, is contained within a cylindrical chamber that is rotated uniformly by a motor, *M*, through a worm drive, *R*. A cylinder, *C*, is suspended within the specimen by a thin steel wire, *W*, so that the axes of the rotating liquid and the cylinder coincide.

THE VISCOSITY OF AN OIL IS HERE MEASURED BY THE TWIST GIVEN TO A BODY WHEN OIL CHAMBER IS REVOLVED.

A cap, *V*, shaped so that the excess liquid can overflow when the cap is seated and thus give constant conditions within the specimen chamber, is provided. The specimen chamber is surrounded by an oil jacket, *J*, in which a thermometer, *T*, is suspended. The jacket oil may be brought to any desired temperature by a heating coil. The cover of the jacket chamber, *D*, has a scale graduated in degrees or may be calibrated to read the viscosity in terms of a standard liquid directly through the deflection of the pointer, *P*. The specimen chamber and the suspended cylinder are both made of copper to insure a constant temperature throughout the specimen, and the outside of the specimen chamber is provided with blades which keep the jacket oil thoroughly mixed as the chamber revolves and thus expose the latter to a uniform temperature. This is an important factor toward insuring constant temperature throughout the specimen.

Experimental work conducted with the machine has shown that the temperature of the specimen is uniform to within a small fraction of a degree and follows that of the jacket oil so closely that the temperature viscosity curve can be taken while the temperature is slowly raised or lowered. This has proved to be a great saving of time and labor, as it is not necessary for the operator to stand by the instrument continually. The deflection of the pointer is at any instant a measure of the viscosity, so that all that is required is to take simultaneous readings of temperature and deflection at intervals in the heating or cooling process.

RESISTANCE GLASS.

The war has stimulated the production in America of resistance glass for chemical and other purposes. There are now on the market several excellent brands of this material, capable of filling the severest requirements. Among these may be mentioned the "Pyrex" laboratory glassware of the Corning Glass Works, Corning, New York; Fry resistance glass, H. C. Fry Glass Co., Rochester, Pennsylvania; "Vitreosil," Henry Heil Chemical Co., St. Louis, Missouri; Transparent quartz glass, Hanovia Chemical Manufacturing Co., Newark, New Jersey; "Nonsol" glass, Whittall-Tatum Co., New York City; "Insol" glass, Lenz & Naumann, Inc., New York City.

The Commercial Production of Benzol.

Now that prices of solvents used in the rubber industry have greatly advanced, the following account of the manufacture of benzol is particularly timely and interesting. It is summarized from a comprehensive article by J. Albert Robinson, in the "Quarterly of the Natural Fire Protective Association." The illustrations are from plants erected by the H. Koppers Co., Pittsburgh, Pennsylvania.

BENZOL recovery, from coal gas residuals of gas works and the by-product coke ovens, has become a great industry new to this country, on a scale of real commercial importance. The recovery of the valuable by-products, such as tar and other residuals, and the extraction from the gas itself of ammonia and benzol has proved a source of great revenue to the coal

the amount distilling at 212 degrees F. The lower boiling benzols have the following approximate composition:

BENZOLS.	100%	90%	50%
Benzene	94-97%	80-88%	40-50%
Toluene	2-6%	10-25%	30-60%
Nylene	0-1%	0-5%	0-25%

In general, the use of all grades of benzol has been for solvents. They are excellent solvents for gums, resins, greases, rubber, etc., and it is mainly upon the wide and varied solvent power of benzol that their commercial utilization has rested.

The present impetus has been given the industry for the production of explosives. Aniline oil and synthetic carboic acid have been manufactured in this country in a small way for technical purposes.

It is thought that benzol will find a ready market as an automobile fuel after the war. Experiments for automobile purposes show that benzol has a motive power about 25 per cent better than gasoline; consequently it would have that advantage at the same price. With the present immense production of benzol, the cost has been reduced so that it could actually be produced

BATTERY OF 56 KOPPERS BY-PRODUCT COKE OVENS.

gas producer, and this business has become a very important agent for the conservation of a great natural resource.

Owing to the custom of candle power standard, instead of the scientific method of heat value standard, most of the benzol recovered at the present time is from by-product coke-oven gas.

COAL TAR.

Coal tar is the oily mixture which separates from the gases formed in the destructive distillation of coal. The raw tar is composed of light oils, pyridine bases, phenols, naphthalene, anthracene, heavy oils, pitch; also materials insoluble in benzene, such as free carbon, water, ammonia and dissolved constituents of the gas. It varies greatly in composition, and may be divided into retort gas tar and oven gas tar.

RETORT GAS TAR.—The retort gas tar is obtained as a condensation product in the hydraulic mains, scrubbers or condensers in the manufacture of coal gas for illuminating purposes.

OVEN GAS TAR.—This material is obtained in the distillation of coal in retort or by-product coke ovens. It is similar to gas tar, but is more fluid. It contains more of the hydrocarbons, and considerably less free carbon.

One ton of good gas coal yields about 10,000 cubic feet of gas, 1,400 pounds of coke, and 120 pounds, or 20 gallons, of tar. Not over 2 per cent of this tar consists of benzol, while 2 gallons of benzol may be recovered from the gas given off from the same amount of coal. It is estimated that benzol is now being produced at the rate of 15,000,000 gallons a year in the large steel works alone, an amount five times greater than before the war.

Pure benzol, or benzene, has the formula C_6H_6 . A similar product of the same formula is found in crude petroleum, and is known as benzine. The distinction in spelling should be noted.

Commercially, benzol is known as 50 per cent, 90 per cent and 100 per cent benzol, these consisting mainly of benzene and toluene, with small amounts of xylene. This percentage does not indicate the comparative purity of the materials, but merely

GAS SCRUBBERS FOR BENZOL EXTRACTION, KOPPERS' SYSTEM.

now, and sold at the same price as gasoline if it were necessary to do so. The use of gasoline for automobile fuel is so large (100,000,000 gallons per year) that it is with difficulty that the oil companies are able to produce enough to meet the demand.

METHODS OF RECOVERY OF BENZOL.

The recovery of benzol, etc., from gas is carried out in two principal steps: Scrubbing or washing, and extracting or covering.

After the gas has been cooled to the required temperature, it is admitted into the benzol washers, where it is brought into intimate contact with wash oils which at low temperatures are capable of dissolving out of the gas all the constituents, which go to make up what is commercially known as crude or 50 per cent benzol. The wash oil containing the benzol will again release these constituents after being heated to about 266 degrees F., and further separation takes place by distillation.

SCRUBBING OR WASHING.—The wash oil, called "straw oil" at the works, is a petroleum product which is virtually a light machine oil, free from water, having a low naphthalene content, and a flash point of 300 degrees F., or more. The gas is passed

BENZOL STILL.

through one or more water tanks, then through several scrubbers, consisting of tall iron towers, through which the gas passes upward and encounters a downflow of straw oil. The oil may be sprayed, or spread out over the hurdles or trays contained in the towers. By thorough scrubbing it is possible to remove practically all of the benzol, etc., from the gas.

The scrubbed gas is passed through a drip tank, and then sent to the gas manufacturing division of the works to be burned under the ovens, sent to gas enriching plant or direct to gas holders. The saturated wash oil, or "charged oil," is delivered to near-by storage tanks, from which it is pumped to a storage tank on the roof of still house at the recovery plant.

EXTRACTING OR RECOVERY.—The processes in this plant are essentially the heating of the wash oil to drive off the absorbed benzol constituents, the recovery and cooling of the wash oil, and the separation by distillation of these benzol constituents to a greater or less degree. There may or may not be present an elaborate rectification plant for recovering benzol of 90 per cent or more purity. In the ordinary separation of a light oil, or primary oil, 80 per cent benzol may be attained, and the secondary or heavy oil will contain toluol, xylol, etc. These oils may be shipped away for further refining at the plant where they are to be used.

The detailed methods of recovery vary, and an exact account of any one plant would not apply to all. The process is rather involved, but the fundamental features are about as follows:

In order to use as small an amount of steam as possible for heating the charged oil, methods of preheating are used. The cold wash oil enters a preheater, where it is heated to about 175 degrees F., by benzol and steam vapors issuing from the still. This oil now passes through a second preheater in which it is preheated to a temperature of about 212 degrees F., by means of the hot debenzolized wash oil issuing from the still. The lighter products of benzol begin to vaporize and leave the oil. It is then heated to about 266 degrees F., by means of live steam in one of the superheaters, for the purpose of driving off the water contained in it and thus rendering it possible to separate the naphthalene. The naphthalene is washed from the gas

and absorbed by the oil in a manner similar to washing out benzol in the scrubbers.

At the temperature of 266 degrees F., in the superheater, all benzol, toluol and water is expelled, and the oil with its remaining burden, xylol, solvent naphtha and naphthalene, now enters the still. The oil flows through the lower portion of this apparatus, the steam being blown directly into the lowest part of the still, thence traveling in a direction counter to that of the oil, thus driving off all xylol, solvent naphtha, and most of the naphthalene from the wash oil.

The resultant mixture of benzol and water vapors passes through the upper portion of the still, where crude rectification is performed and where all entrained wash oil particles are separated from the vapors. The benzol and water vapors issuing from the superheater enter the upper portion of the still, where they are rectified in conjunction with the other vapors.

These vapors now issue from the top of the still at a temperature of about 220 degrees F., and enter the first superheater, previously mentioned, where they are nearly all condensed and the wash oil receives a preliminary heating. The remaining vapors and the condensates formed in the superheater then enter a water cooler, where the vapors are completely condensed and all condensates, water and light oils, enter a separator or decanter, where they are separated due to their difference in specific gravity.

The wash oil, which has been freed from benzol, etc., leaves the still at a temperature of about 257 degrees F., and enters the superheater previously referred to, where it transfers a portion of its heat to the charged wash oil, after which it enters the oil cooler, where it is cooled by water to a temperature below 77 degrees F. It may pass over a series of circulation coils through which cold water is passing, arranged one above the other ver-

GAS WASHERS, TAR EXTRACTORS AND GAS EXHAUSTERS.

The rectangular stacks on the left are bell washers for removing ammonia from the gas. The elevated tanks are for liquor storage and feed.

tically; the oil flows down over the whole coil, being caught in a trough at the bottom.

A further distillation may take place and the various benzol products be separated and sent to their respective storage tanks. Purification of benzol, etc., is accomplished by washing with sulphuric acid, caustic soda, and washing and then distilling, for a final separation of the products, in their desired state of purity. This is generally done, where necessary, at the plant using these materials. From the usual by-product coke oven gases, about the following proportions of hydrocarbons are recovered: Benzol 67 per cent, toluol 16 per cent, xylol 8 per cent, and solvent naphtha 9 per cent.

The United States Geological Survey reports 14,000,000 gallons benzol and other light oils produced in the United States in 1915. In connection with these oils 761,256 pounds

of naphthalene were recovered. Several of the plants are not equipped to separate the different oils found in the crude. Over one-half the output, 7,322,670 gallons crude benzol and light oils, were shipped in tank cars to refineries connected with powder works and other chemical industries; 6,620,090 gallons of crude oils refined at the place of recovery yielded 483,393 gallons of 100 per cent benzol; 1,315,727 gallons of toluol, and 470,425 gallons of solvent naphtha.

Thirty-one coke making establishments with 4,933 by-product ovens contributed to this total, and it is estimated that between eight and nine million tons of coal were carbonized. The annual capacity of the benzol recovery plants

BENZOL PURIFYING APPARATUS.

now in operation is estimated at over 20,000,000 gallons and with the completion of the plants now building will probably exceed 22,000,000 gallons.

DEMOUNTABLE RIM HISTORY.

TO the Editor of THE INDIA RUBBER WORLD:

You have recorded some very interesting history in your May issue, in your story of "Perlman Wins the Demountable Rim Suit." Notwithstanding my present close connection with rim circles, I am not ruffled when I write to register a slight correction in the interest of history. History, it has been well said, is a systematic record of past events, especially the record of events in which man has taken part.

In your opening paragraph you say, that "the first public use of this invention (demountable rim) was in June, 1905, when Thery substituted a new tire for a damaged one in 80 seconds, an unprecedented feat." Conceding for the moment, for the purpose of argument only, that this is true, let us seek its origin and source, for this statement was evidently taken from "La France Automobile" of the issue of June 29, 1905, concerning the Richard-Brasier cars driven in the James Gordon Bennett Cup Race in France, by Thery and Calois, on July 5, 1905, six days later, so that the French motoring magazine actually published this feat before it really occurred.

Looking over the files of all of the foreign and American publications of June and July, 1905, at which time I was editor of "Motor," handling all its technical and editorial matter, I failed to find a single mention paralleling this statement made in "La France Automobile," but I did find mention of the fact everywhere, that clincher tires of Michelin make with a leather band and metal studs were used, and all the photographs of the Richard-Brasier cars used in that race show these tires and plain clincher rims, and Michelin himself advertised this fact in the English and French motoring journals. So, if I am correct in this chronological statement, then I may well say "that youth

longs, and manhood strives, but age remembers," and "La France Automobile" was wrong.

Now, except for the fact that you might think that as a press agent I might be guilty of that charming faculty that members of the Fourth Estate have, *i. e.*, unconscious exaggeration, let me quote from Judge Hunt's decision, who heard the testimony in open court and was, therefore, best able to judge of the truth of the matter as to when a demountable rim of the Perlman type was first publicly used. Judge Hunt says, "invention which was completed by Perlman in the summer of 1903, and which under the evidence must be found, was first publicly used by Perlman on a Royal car in August, 1904." Again, Judge Hunt says, "The French patent to Vinet, November 4, 1904, was considered by the patent office examiner. Perlman made a showing sufficient to overcome the Vinet reference, and thereafter the examiner in the patent office abandoned Vinet. Perlman showed prior invention." Further on, Judge Hunt says that, as he "understood it, Vinet showed a complete ring, not crosscut or split, and failed to show a ring capable of radial movement." Finally, Judge Hunt said that, "in October, 1904, he (Perlman) put his wheels on a Welch car and used it. A number of witnesses say that they went riding in the summer and the fall of 1904 with Mr. Perlman. One witness particularly recorded that he went with Perlman in the Welch car to attend the first Vanderbilt Cup Race, the date of which was 1904."

In the United States Circuit Court of Appeals, the element of time was the only point considered. Judge Lacombe, who wrote the decision of the Court of Appeals, said, "The crucial question here is the date when Perlman reduced to practice the invention which he describes in his patent. The trial court found that the evidence showed beyond a reasonable doubt that the invention was conceived in 1903, and actually put to use on a car in 1904.

"Judge Hunt heard the witnesses for the case, which was tried in the above court. Under these circumstances, if we were in doubt, . . . we should hesitate to disturb the findings of the district court; but from an examination of the testimony, as it is here presented in cold type, we are convinced as Judge Hunt was, . . . but when we have the demountable wheel used in 1904 before us, . . . all doubts as to what Perlman's original invention was are resolved." Finally, Judge Lacombe said, that "we fully concur in Judge Hunt's reasoning and conclusions."

The Court of Appeals has the last say on this matter, and so we must accept their conclusions, and not the mere unsupported statement of a foreign motoring publication as to the first public use of a demountable rim of the Perlman type.

During the past 35 years, it has been my very good fortune, indeed, to be closely associated with many very famous patent cases, notably so, the Lallemand bicycle crank; the Fauber one-piece bicycle hanger crank; the Conrad ball bearing, and the Perlman demountable rim, but none of these have exceeded in public utility, in value and general use the Perlman demountable rim, and if I may paraphrase Dr. Mayo,—Perlman displayed that type of originality which we call genius, to which discoveries marking epochs are due, but which is given to but few men. The type of which Perlman was a distinguished example, while, perhaps, not arising to a height to be called genius, has been given to many men. The latter phase of originality may best be characterized as scientific imagination, carrying with it a talent for work,—scientific imagination, reasoning from things known to unknown, clarifying and solving problems by what may appear at first to be merely an hypothesis, a leap in the dark, but which is soon to have sound footing in fact.

Everybody knows that a wheel is old, a rim is old and may be moved off and on a wheel, and a wedge is old, but Perlman's idea of connecting these three essential elements together and adding to them the necessary operating parts, made a new combination previously unknown to engineers, and produced a valuable result, *i. e.*, the demountable rim of today.

Yours very truly, ALEX. SCHWALBACH.

Welding Rims by Electricity.

By C. D. Ryder.*

IN the older days of rim manufacture the processes used were more or less crude as compared to present day methods. This is a general statement that may be applied equally well to many industries, and the manufacture of automobile rims is no exception to the rule. Inasmuch as this article is supposed to deal chiefly with the process of welding rims rather than to convey a great deal of information regarding the whole process of manufacture, the writer will try to give a clear idea of this work, the result of observations made in a number of the larger plants, and of experience covering several years' intimate connection with the electrical welding process.

The old original, time-honored method of welding iron or steel involved taking the articles to be welded to the blacksmith shop,

Just here it may be of interest to explain, briefly, what an electric welder is, how it operates and the kind of welds it produces.

Fundamentally, the electric welder depends for its operation upon a well-known law which states that if an electric current is caused to pass through a substance (such as iron or steel) a certain amount of heat will be developed in the substance traversed by the current which will be proportional to the square of the current, the resistance the substance offers to the flow of current, and to the time the current is applied. The final temperature attained by the substance will depend upon the readiness with which this heat is dissipated by radiation and conduction. An electric welder, then, is a machine for securely clamping the parts to be welded in proper alignment, with means for passing a heavy electric current through the abutting ends of metal and with provision for forcing these two ends together to complete the welding operation. The commercial machine is one which not only embodies these three essential features but, in addition, is equipped with means for adjusting the current through a given range of values, to suit the stock to be welded, switching mechanism for applying and turning off the current, and numerous adjustments which are obviously necessary.

Little or no preparation of the stock is required for performing an electric weld. All that is necessary is to have the surfaces fairly clean, to insure good electrical contact of the material in the copper dies or electrodes. No scarring of the ends is done. The heat is developed at the junction of the abutting ends only. When the correct welding temperature is reached, the current is turned off and the ends are forced together by the action of a lever or an hydraulic ram. In the process of forcing the ends together the burnt and oxidized metal is extruded from the weld in the form of a fin, which is quite thin and is easily removed. As all

FIG. 1.—17A ELECTRIC WELDER.

which was a distinct and important department in every well regulated factory. The pieces to be welded having been delivered to his "sanctum," the blacksmith proceeded to heat the ends and scarf them down by hammering. He then placed the ends again in the fire, sprinkling a little borax and sand over them to reduce oxidation, and brought them up to the welding heat. Upon attaining the correct temperature, the pieces were withdrawn, the ends overlapped, as provided by the scarf, and the joint hammered to force the two ends of metal together forming a weld. The hammering was continued until the metal at the joint was reduced to about the same dimensions as the original stock. Obviously this method was slow and productive of uncertain results. The strength of a weld made in this way depended altogether on the skill of the blacksmith. It may be said that no matter how skilful the blacksmith or how carefully the joint was made, it could not by any possibility approach very closely the strength of the original stock. The chief reason for this lay in the fact that more or less oxidation takes place in spite of the flux used, which was retained in the weld at the junction of the pieces.

However crude and unsatisfactory the old method may have been, it was the only one which could be used until the advent of the electric welding machine. As a matter of fact, it may be conservatively stated that the electric welding machine has made possible the successful production of automobile wheel rims on a commercial scale. Electric welding is now done, exclusively, in every rim plant in the United States, so far as the writer knows.

FIG. 2.—15A ELECTRIC WELDER.

the burnt or oxidized metal is thus extruded, leaving only clean metal which has not been touched by the air in final contact, no flux is required and the joint is of maximum strength. Tests made to determine the strength of a weld made in this manner indicate that usually, barring carelessness, the welded portion will show the same strength as any other portion of the stock of like sectional area.

Various methods are employed in the different large plants in the manufacture of automobile rims, but the following

*Electrical Engineer, The Toledo Electric Welder Co., Cincinnati, Ohio.

brief outline is typical of them all. The stock (either rectangular in cross section or of some special shape) is first cut to the proper length corresponding to the circumference of the rim. It is then formed up into a circle by rolling. The surfaces near the ends are slightly ground or sand blasted to remove the rust and scale to assure good contact in the welding dies. The rim is then placed in the welder for a period of from a few seconds to a minute and a half, depending upon the size of rim, which is the time required for making the weld. After welding, the rim is removed from the welder and the fin removed while red hot, by means of an air chisel, or it is sheared off in a special machine. Next, the welded portion is smoothed down by grinding and the rim brought to exact size by a special hydraulic shrinking machine or if under size, the rim is expanded upon a bulldozer. The subsequent operations necessary to finish the rim for mounting are not of interest in connection with this subject.

It is estimated that approximately 75 per cent of the power taken from the lines is converted into heat and used directly in making the weld. The efficiency of the charcoal, coke, gas or oil fire in no way is comparable to this. Further, the use of the electric method vastly increases the output obtainable over the old method when employing a given number of men. And, moreover, the ends are held in absolute alignment and uniform results always assured.

The following table will give an idea of the current consumed and time taken in making welds by the electric process. In this table the time taken can be reduced by increasing the power, or *vice versa*.

Area Square Inches	Power Kilowatts	Time Seconds	Power Horse-power
1.00	18.75	40	25.0
1.50	29.5	44	39.5
2.00	33.0	57	44.0
3.00	43.5	70	58.5
4.00	56.3	80	76.0
5.00	61.7	90	83.0
6.00	69.0	98	92.5

While there are several machines used for electrical rim welding that are designed to perform a great variety of work, the illustrations and descriptions are of typical rim machines.

The welder shown in Figure 1, welds flat stock up to 6 x ¼ inches, or 1 x ¼ inches, or 1½ inch round stock. This machine is designed for welding automobile rims, which are rolled to size and welded flat. The flat bands are then shaped in special rolls to fit the rubber tires. An exceedingly fine adjustment is obtained in the clamping dies by four eccentrics mounted in the heads and operated by worm gears. After the stock is clamped in the jaws, two levers mounted on cams give the final pressure to avoid the possibility of the stock slipping in the dies. On ordinary stock, 4 inches wide by 9/64 inch thick, a man will weld from 450 to 600 rims per day; 6 x ¼ inches, 350 to 400 per day, and 3¼ x ¼ inches, 600 to 700 per day.

The machine shown in Figure 2 welds rims up to 12 inches wide by ½ inch thick. It requires a heavy and well constructed machine, both mechanically and electrically, to heat and compress a piece of steel 6 square inches in cross section. This type is designed for welding this heavy stock and all parts are necessarily massive and substantially made. It is especially constructed for welding heavy flat band stock.

The Society of Automobile Engineers has issued a sheet showing to what extent the various automobile manufacturing companies are using S. A. E. standards in their manufacture. An examination of this sheet shows that 27 manufacturers of solid tires and 24 manufacturers of pneumatic tires have adopted these standards, while in insulated requirements 12 are using these standards, and 9 have adopted the standard tests of insulating materials.

BRITISH SOLID TIRE RIM STANDARDS AND AMERICAN SIZES.

OUR British contemporary, "Motor Traction," has of late devoted space to a controversy relating to the advisability of prohibiting or, at least, placing a heavy duty upon, the importation of American commercial motor vehicles not conforming to British tire standards.

The British Finance Act, 1915, placed 3¾ per cent duty upon imports of motor cars, chassis, motorcycles and parts and accessories of motor cars and motorcycles, except tires. Commercial cars were, however, excepted from the operation of the tax and were also left without mention in a recent royal proclamation prohibiting the importation into Great Britain of pleasure cars and accessories (except tires).

The controversy above referred to was started by an open letter to our contemporary in which it was argued that the importation of American motor trucks, not conforming with British standard tire sizes, would introduce an element of disorganization into the British trade, as there would necessarily be a demand for various American tire sizes for at least 5 or 6 years after they had been placed in service. It was pointed out that after the mutual agreement that had been made between British automobile manufacturers and tire manufacturers, it would be regrettable that American importations should upset all calculations and necessitate different molds, and consequent disorganization, not to mention increased expense in the production of solid tires. It was further stated that for American sizes, British tire manufacturers would be at a disadvantage when competing with American manufacturers. It was, therefore, proposed that a duty of 3¾ per cent be levied upon American motor trucks (the same as was levied on pleasure cars before their importation was prohibited altogether), unless they conform to the British standards in construction and equipment.

The matter was taken up by other readers of "Motor Traction," one of whom went so far as to propose that combined pressure be brought to bear to induce the government to absolutely prohibit the importation into Great Britain, her dominions and colonies, of trucks which do not, so far as their wheels are concerned, comply with British standard sizes. British tire manufacturers had been put to great trouble in competing for the business in furnishing odd size tires for trucks which were already in use in England. It could not be expected that users would go to the expense of altering wheels to accommodate British standard tires, and, either the tire manufacturer would have to stand this expense, or continue to produce tires from molds of suitable American sizes.

A correspondent presenting the other side of the case—there are always two sides—pointed out the advantage to the commercial community which had resulted from the free importation of American trucks at a time when British manufacturers were unable to guarantee deliveries and the fact that an examination of American wheel and tire sizes showed that there were only six of these, three of which had been adopted by the American Society of Automobile Engineers as standards. The manufacture of the three or six American sizes was quite a different matter from the manufacture of the multiplicity of millimeter sizes which was taking place in Great Britain prior to the adoption of the British standards. All these old millimeter sizes promise to be wiped out in the course of the next five or six years, as soon as the vehicles become obsolete. The matter is receiving the earnest consideration of British, American, French, Italian and Belgian manufacturers of both tires and automobiles, and there is promise of an international agreement on the subject. Such an agreement would be made difficult should ill feeling be raised by premature action.

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

New Machines and Appliances.

THE THROPP REDUCTION GEAR DRIVE.

MOTOR drives are becoming an indispensable aid to the operation of modern rubber mills where efficiency is recognized as one of the main factors of increased production.

Thropp has designed a new 100-horse power drive that is shown equipped with a special General Electric motor of the ventilating type. This is entirely enclosed and provided with an outside air suction vent and discharge pipe. Both motor and drive are bolted to a heavy continuous bed plate, the motor being connected to the jack shaft of the drive by a flexible coupling that allows the motor shaft to oscillate and the double helical gears to float. The jack shaft pinion is machine cut from a solid forging and drives the large cast iron main gear, both of which are the "Maag," double helical cut type of gearing. They are enclosed in oil-tight guards and run in a bath of oil, the bearings being of the newest

ring oiling type. The main driving shaft runs 100 revolutions and the jack shaft at 575 revolutions per minute. The drive is shown connected to a 2-roll rubber mill. [William R. Thropp & Sons Co., Trenton, New Jersey.]

A NEW APRON FEED FOR MIXERS.

The value of a practical mixing apron is instantly recognized by progressive rubber men, particularly those who have had experience with the ordinary apronless mill. Two illustrations are given here of a device of this character that has recently attracted favorable comment. The first is a front view of the mechanism, ready to be attached to a mixer, while a rear view of the apron is given in the second illustration.

This device consists of a cast iron pan upon which are

fastened bearings and brackets supporting two rolls and also a sliding mechanism carrying a third roll. The apron, in the form of an endless belt, travels over these rolls and is driven by the top roll through direct contact with the front roll of

the mill. The batch is fed to the mill in the usual manner; the apron, however, catches the particles that have not massed and automatically returns them to the rolls.

The sliding mechanism makes it possible to drop the top roll so that the finished batch is easily removed, after which

the roll is again placed in the original position and the mill is ready for another batch.

Among the advantages claimed for this mixing apron, safety comes first, for it reduces the possibility of injury to the workman. It eliminates the dust, so troublesome and expensive in ordinary mixing operations, and, moreover, delivers a finished batch of the same weight as the original amount placed in the mill. The saving of 30 to 35 per cent of the time consumed in mixing is another important feature and at the same time the material is delivered in a thoroughly massed condition. [Morgan & Wright, Detroit Rubber Works, Detroit, Michigan.]

THE ALLEN TUBE SKIVING MACHINE WITH MOTOR DRIVE.

An extremely well designed, self contained, inner tube skiving machine is herewith illustrated, showing the consistent progress that is being made in labor saving tube building machinery.

The slide is operated by a lever which carries a hollow brass mandrel of the correct diameter for a given size tube. This mandrel is clamped in alignment with the tubular knife that revolves from 2,000 to 2,500 revolutions per minute. The end of the brass mandrel is tapered for a given length of skive. The tube is then thrust through the center of the mandrel and folded back over the tapered end. The slide is then forced forward by the lever until it comes in contact with the revolving knife

and a sufficient flow of water is automatically released at the time of contact which is also automatically shut off when the slide is brought back to its original position. This feature prevents undue waste of water besides being cleaner, as the excess of water would become sloppy and objectionable. Also the little shutter device over the knife, which operates automatically, prevents the hands of the operator from coming in contact with the knife when placing the end of the tube in position. The

pedestal of the machine also acts as a reservoir for the water which the pump forces to the knife and back again through the splash pan into the pedestal.

The machine is equipped with six knives and mandrels for skiving all sizes of tubes up to and including $3\frac{1}{2}$ inch. It is also furnished with drive with countershaft or direct connection to any motor that the customer may desire. [Allen Machine Co., Erie, Pennsylvania.]

ROLLS FOR REMOVING WRINKLES FROM FABRICS.

The twin screw rolls illustrated herewith are designed as an attachment for calenders, spreaders, bias cutters, brushing, rolling and measuring machines, for the purpose of

removing wrinkles, puckers and turned edges from the goods. This device is particularly useful in connection with a rolling machine for taking out wrinkles from the liners and wrappers

used in tire and footwear manufacture.

The rolls are cut with right and left-hand threads running from the center towards each end, and are mounted in stands so that they may be turned in any desired position and give as much contact of the cloth as desired on each of the screw rolls. The screw rolls may be adjusted to act on goods running horizontally, vertically, or at any angle. One screw roll acts on one side of the goods and the other screw roll on the opposite side to straighten out the selvages, no matter whether they are inclined to turn over toward the face or the back of the goods. Only one belt is necessary for driving both rolls. The rolls are regularly made of iron, though on special work where there is liability of rust they may be made of brass or other material. [Curtis & Marble Machine Co., Worcester, Massachusetts.]

MILLER'S BIAS FABRIC CUTTER FOR REPAIRMEN.

This is a very useful little machine for repair shops where a considerable volume of work is done. It is operated by a hand crank, or a power attachment can be applied if so desired. As the fabric is taken from the roll, the liner is automatically wound

up on a roller. The machine being set for the required width, the fabric is fed between the knives and by pressing down the foot lever a strip is accurately cut off on the bias.

The machine is useful in the manufacture of tires, reliners, flaps, boots and air-bags and will cut from 20 to 30 strips of fabric per minute. [Charles E. Miller, Anderson, Indiana.]

GAS BURNERS FOR VULCANIZING AND HEATING.

The use of illuminating gas as a heating medium for hard rubber vulcanizing presses is apparently being accepted as good practice by manufacturers of certain kinds of hard rubber goods.

A type of burner that is specially designed for this purpose would therefore be of interest to show the development of gas heat as a vulcanizing agent.

The burner shown in the illustration is of the three-burner type, arranged to be inserted in the chambered press platen through holes drilled in the side for that purpose. A flexible rubber hose that allows for the platen movement connects the header with the gas and air pipes that are fitted with lever valves by which the supply of gas and air is regulated. The number of these burner units usually corresponds to the number of platens in the press and the degrees of heat required. Single burners are furnished for direct mold heating, in fact all sizes are made to suit the quality of gas used and the special purpose for which the burner is intended.

The other illustration shows a powerful burner specially designed for industrial and laboratory purposes. This particular type of burner is used for heating metal furnaces such as are used in melting type metal, for casting soft metal molds. It is easily

adapted as an atmospheric burner if so desired, or it can be arranged to work under air and gas pressure. The burner is made to deliver the required number of heat units in accordance with the work to be performed, and the correct adjustment for the varying quality of gas is also insured. [Tirrill Gas

Machine Lighting Co., New York City.]

THE ADVANCE WASHER CUTTER.

A hand-operated machine that will accurately and quickly cut washers from sheet rubber, leather or asbestos would apparently fill a long-felt want in the repair shop or garage.

A press of the description shown here is made of cast iron and the crankshaft and plunger head are of cold rolled steel. The dies are made of tempered tool steel and turned down at the cutting end to a sharp uniform edge. There are 23 dies in the combination, which will cut 529 different sizes of washers ranging from $\frac{3}{8}$ inch to $3\frac{1}{4}$ inch outside diameter and any size inside diameter within this range. A maple wood cutting block also constitutes a part of the outfit. [Advance Felt Specialty & Cutting Co., Chicago, Illinois.]

VANADIUM STEEL RUBBER SHEARS.

For heavy work in cutting rubber, special shears have been designed, shaped to the hand of the operator, to allow continual use without tiring the wrist. A special feature is the automatic tension, which consists of a coiled spring made of piano wire, sunk in a hollow thimble between the blades. It is entirely out of sight, but with its upward tension it takes up the wear of the screw, keeps the blades in perfect adjustment and doubles the life of the shears. These shears are made of vanadium steel of extra hard temper, specially adapted to the heavy work required of them. [Perfection Shear Co., North Woodbury, Connecticut.]

New Tire Machines.

MOLDING PNEUMATIC TIRES.

THE object of this machine is to compress the tread mold against the tire core and draw the adjacent sides of the casing toward the beads. The side molds compress the casing

adjacent to the beads against the tire core and the edges are stretched from the tread and inwardly toward each other. Thus the fabric plies are stretched, smoothing down all wrinkles and uneven surfaces.

The illustration on the left shows a vertical section of this machine in operative position. Base *A* supports the upper cross head by heavy upright rods. The table supports the core *D* and sectional tread mold *E* and normally rests on brackets *F*.

The tire core is placed in the machine and pressure applied to the ram *G* which acts on the levers, forcing the tread mold against the tire. Then pressure is applied to the inner ram *H*, bringing the table *I* in contact with the lower mold, when both tables *C* and *I* are simultaneously raised, forcing the tire against the upper mold by contact with the cross head as seen in the figure on the right. The pressure from both cylinders is then released and tire and core are removed for final curing. [Joseph H. Coffey, Jr., and Joseph H. Coffey, Toronto, Canada, assignors of one-half to Gutta Percha & Rubber, Limited, Toronto, Canada. United States patent No. 1,179,898.]

THROPP'S TIRE BUILDING MACHINE.

This apparatus is particularly adapted for use in connection with the tire making machine covered in United States patent No. 1,119,326, granted to the same inventors, illustrated and described in the January, 1915, issue of THE INDIA RUBBER WORLD.

In the illustration, frame *A* supports the revolving tire core *B* upon which the fabric strips are applied. Frame *D* is attached to the cylinder *C* that is adjusted vertically by screw and bevel gearing. Two stock rolls *E*, *E*, that are journaled in this frame, carry the friction fabric of different widths used in constructing the casing. The wooden rollers *F*, guide the fabric to the revolving core, and tension is applied by weight levers *G*, *G*. The liner strips are wound up on the weighted rollers *H*, *H*, which are driven by contact with the stock rolls.

In operation the plies of narrow fabric are first laid on the core and then the bead cores are applied, after which the wider fabric is laid on while the core is revolved in the reverse direction. Thus the threads of the fabric plies under the bead cores are laid at the same angles and those of the superposed plies are laid the same, but at a different angle to the plies under the head

cores. [Peter D. Thropp, John W. Thropp, Trenton, New Jersey, and Albert de Laski, Weehawken, New Jersey, assignors to The De Laski & Thropp Circular Woven Tire Co., Trenton, New Jersey. United States patent No. 1,178,874.]

INNER TUBE ROLLING MACHINE.

In the manufacture of inner tubes, and for that matter hose generally, sheets of vulcanized rubber are rolled around a hollow mandrel, an operation requiring careful and experienced hand labor. A machine for doing this work is the subject of the following illustrated description.

Referring to the drawing, which is an elevation of one side of the machine *A*, parallel housings *B* are provided with vertically sliding heads *C* connected to the mandrel rolling plate *D*. The vertical movement of this pressure plate is controlled by rollers *E*, sliding over upper and lower tread flanges *F*, *F*.

The mandrel *G* and sheet of rubber stock are placed on the table *H* and the screw threaded shafts *I* set in motion by the belt driven gearing *J*, moving the pressure plate over the table in contact with the mandrel, thereby rolling the sheet of stock around it. The mandrel and tube are then placed in a similar machine which performs the operation of cross wrapping in a like manner. [Elmer S. Current, Beach City, Ohio. United States patent No. 1,179,077.]

TIRE BEAD TRIMMING MACHINE.

Molded beads are substantially triangular in cross section and the excess material on two of the edges known as "flash" must be trimmed off to make them serviceable. This is usually performed by hand, an operation that is comparatively slow and one that is not always productive of uniform results.

B, adjustable to and from each other by set screws *C*, and supporting two shafts *D*, *D*, each of which carries four curved cutter blades *E*, *E*. The head guide block *F*, adjustable longitudinally, is triangular in cross-section and supports the trough-like bead support *G*. Stationary cutters *H*, *H*, vertically adjustable, are attached to the inclined sides of the guide block and a bar *I* restricts the bead to longitudinal movement.

In operation the cutter blades rotate toward each other with a downward cut and exert a shearing action, in connection with the stationary blades, on the bead as it passes through the machine, removing the "flash" in an effective manner. [Thomas Midgley, Detroit, Michigan, assignor to Morgan & Wright, Detroit, Michigan. United States patent No. 1,180,309.]

METHOD AND APPLIANCES FOR BUILDING TIRE CASINGS.

The principal feature in this invention consists in subjecting the outer casing to an internal fluid pressure during vulcanization. Another is an improved form of collapsible core, is illustrated herewith, that does not require sealing at the joints.

Referring to the drawing, *A* is the collapsible core, *B* the valve stems and *C* the fluid-tight tubular casing of rubberized fabric that is placed over the core and provided with openings for the valve stems. At the outer end of each valve stem the tubular casing is held between two circular washers *D* and *E*. The sectional retaining ring *F* is provided with openings for the valves, and when the two mold halves *H* and *G* are bolted together a space *I* is left between the casing and the inner surface of the mold.

When the fluid pressure is applied through the valve stems the steam or hot water is discharged between the inner surface of the tire and the fluid-tight tubular casing surrounding the core. Thus the continued pressure forces the tire against the inner mold surfaces during the period of vulcanization. [W. R. Denman, assignor to Miller Rubber Co., both of Akron, Ohio. United States patent No. 1,176,885.]

REINFORCING INNER TUBES. A tube is placed in a flattened condition around an endless circular form and a strip consisting of fabric on the outside and a layer of rubber on the inside is cemented to the tube. [John H. Poole, Brockton, Massachusetts, assignor to Reinforced Inner Tube Co., Brockton, Massachusetts. United States patent No. 1,179,033.]

MANDRELS FOR SPLICING TUBES. Both inner and outer mandrels are slotted their entire length, the latter being provided with an annular passage through which air is forced, blowing the end of the inner tube that is on the larger mandrel over the end of the tube on the smaller mandrel, thereby forming the splice. [Dempsey Lowe, East Akron, Ohio. United States patent No. 1,179,200.]

A NEW TIRE BUILDING TOOL. This novel tool consists of a round helical spring that revolves on a suitable support and is used as a hand stitcher in tire building. [Wilhelm Kaufmann, New York City, assignor to Hartford Rubber Works, Hartford, Connecticut. United States patent No. 1,179,528.]

TIRE FLAP VULCANIZER. Flaps are made of straight fabric instead of bias strip, formed and vulcanized on a circular-shaped vulcanizer provided with clamps accommodating a plurality of flaps. [Thomas C. Marshall, Akron, Ohio, assignor to Kelly-Springfield Tire Co., Jersey City, New Jersey. United States patent No. 1,179,738.]

BEAD WIRE WRAPPING MACHINE. An endless wire hoop is expanded to nearly the contour of a circle by a series of concentric pulleys which carry it in a circular path through a rotary shuttle that applies the tape helically on the hoop. [Thomas Midgley, Worthington, Ohio, assignor to Morgan & Wright, Detroit, Michigan. United States patent No. 1,179,545.]

BEAD CLEANING MACHINE. Beads are repeatedly passed through guides having helical grooves which present the different faces of the beads to the buffing wheels that remove the dust and bloom. [Thomas Midgley, Worthington, Ohio, assignor to Morgan & Wright, Detroit, Michigan. United States patent No. 1,180,310.]

BUTT-ENDED INNER TUBES. The two ends to be joined are considerably smaller in diameter than the main tube and a locking ring on the extremity of the male end abuts against an annular thickened extremity on the female end. [Dunlop Rubber Co., Limited, 14 Regent street, London, S. W., and Colin Macbeth, Aston, Birmingham, England. British patent No. 4693 (1915).]

PNEUMATIC TIRE MOLD AND CORE. In this type of mold the inner part is closed at the last part of the operation so that the

beads can be inspected before the final closing. [F. A. Byrne, 2 Ludgate Hill, Birmingham, England. British patent No. 9454 (1915).]

MACHINERY PATENTS.

DIPPING AND DRYING MACHINE.

RUBBER articles are made on this machine by successively dipping a form in rubber solution, and drying each coating separately in the presence of heat and a reduced air pressure of a vacuum.

This apparatus is shown in side elevation and plan, the enclosed chamber *A* containing the solution at *B*. The four sprocket wheels *C*, revolved by a hand crank, drive the two endless chain belts *D*, that support a series of cross bars *E* on which the forms *F* are mounted. Paddle wheel *G* acts as an agitator for stirring the solution.

Heat is applied to the upper part of the chamber by steam coils, and in order to maintain the solution at constant, low temperature cooling coils are provided at the bottom of the solution chamber. Should it be desirable to separate the solution from the upper chamber to prevent overheating and evaporation during the drying operation, a two-part sliding partition is fitted in the tank above the solution. Pipes for solution inlet and outlet and vacuum connections are provided. [Carl S. Williams, New York City, assignor to Revere Rubber Co., a corporation of Rhode Island. United States patent No. 1,180,358.]

AIR PRESSURE ROLLING MACHINE FOR FOOTWEAR.

In the manufacture of rubber shoes, it is necessary to assemble the various parts on a last, each component part being hand rolled or "stitched" as it is called, to compact the various layers into a homogeneous article.

This hand work requires considerable skill and strength on the part of the operator, all of which is eliminated by this novel machine.

Referring to the illustration, base *A* supports the bed plate that has a depression *B* to accommodate the last to be operated upon. An arm *C* pivoted at *D* is raised and lowered by toggles *E, E* controlled by the air piston *F*. The outer part of this arm constitutes a dome-shaped cover *G* with a bottom flange that cooperates with rings for clamping the rubber diaphragms *H* and *I*. The former approximates the upper shape of the last and the latter conforms to the lower part.

When the cover is raised, the shoe—previously built up on the last without hand rolling—is placed on the lower diaphragm. The cover is then lowered and air or water pressure applied by automatically controlled valves *J*. Thus the air contained within the mold will be forcibly excluded and the diaphragms pressed evenly around the last, firmly compacting the materials of the shoe, which is now ready for vulcanization. [Joseph W. Moore, Newton Highlands, Massachusetts, assignor to Boston Rubber Shoe Co., Boston, Massachusetts. United States patent No. 1,181,083.]

THE KEARNS MULTIPLE FRICTION CALENDER.

In this invention a series of pressure rolls are geared in vertical alignment, driven at different speeds relative to the adjacent roll, and arranged to friction with rubber a plurality of fabric webs.

Referring to the illustration, which is a vertical section of the calendar, *A* designates one of the side frames that support the rolls *B*, *C*, and *D*.

A web of fabric *E*, led by guide rollers, passes under the bank of rubber stock *F*, and between the rolls *B* and *C*, where it is frictioned, and then wound up at *G*. At the same time another web of fabric *H* is fed past the bank of rubber stock *I* and passes between the rolls *C* and *D*, where it is frictioned and finally wound up at *J*. [John Kearns, Chicopee Falls, Massachusetts, assignor to Fisk Rubber Co., Chicopee Falls, Massachusetts. United States patent No. 1,179,634.]

TUBING MACHINE FEED. A roll located in the feed hopper, forces the material between the convolutions of the stock worm. [George F. Fisher, Plainfield, New Jersey, assignor to Morgan & Wright, Detroit, Michigan. United States patent No. 1,178,908.]

IMPROVED TUBING MACHINE HEAD FOR INSULATED WIRE. A tubing machine head is provided with a by-pass for the material so that the machine can be quickly put in running condition without disturbing the setting of the die. [Otto P. Houben, Akron, Ohio, assignor to The B. F. Goodrich Co., a corporation of New York. United States patent No. 1,180,399.]

VULCANIZING CONTINUOUS SHEETS. The sheets of unvulcanized rubber are passed between an upper and lower series of relatively staggered heating drums, and at the same time are dusted with talc to prevent adherence to the drums. [E. T. Fenwick, attorney, 600 F street, N. W., Washington, D. C. British patent No. 4,139 (1915).]

MACHINE FOR INLAID TILING OR SHEETING. The different sheets of rubber stock are passed around rollers equipped with dies, that cut out the pattern mosaics, which are then deposited on a suitable backing and the whole pressed and vulcanized. [E. T. Fenwick, attorney, 600 F street, N. W., Washington, D. C. British patent No. 4,140 (1915).] A similar machine was illustrated and described in THE INDIA RUBBER WORLD, June, 1915, and May, 1916.

DOUBLE SPREADING MACHINE. The fabric is proofed on one side and passed under the steam-heated table where the solvent is removed. It is then reversed, proofed on the other side and passed over the steam-heated table, which assists evaporation of the solvent. [A. Olier & Co., Clermont-Ferrand, France. British patent No. 8757 (1915).]

INDUSTRIAL TRUCK WHEELS. A solid tire construction adapted for use with small wheels, consisting of side plates bolted together, and an annular band of metal embedded in the rubber tire. [A. B. Williams & Co., Weaman street, Birmingham, England. British patent No. 11,165 (1915).]

COAGULATING LATEX WITHOUT CHEMICAL OR MECHANICAL AGENTS. This invention consists in pouring the undiluted latex into horizontally arranged shallow pans, forming a thin layer of uniform thickness by exposing the latex to sun and air. [Julius Schadt Medan, Sumatra. British patent No. 12,002 (1915).]

BEARING FOR WASHERS AND MILLS. These are mounted on the frames, without side pieces or brackets, and connected by bolts of such tensile strength as to give way under an unusual strain. [Deventer Ijgerietij en Machinefabrik and Reinout van

Volten, both of Deventer, The Netherlands. British patent No. 13,776 (1915).]

New Goods and Specialties

WILLIAMS' PATENT VIOLIN CHIN REST.

VIOLINISTS frequently suffer from chafed and irritated skin on the chin, owing to the position in which they are obliged to hold their instruments. The advantage of a chin rest that will obviate this difficulty is self-evident, and this claim is made for the Williams' patent. This chin rest is made of soft rubber of good quality, not likely to harden with use. Its flexible quality allows freedom of motion without the friction that is the fundamental cause of sore chins. In use it requires but slight pressure to hold the violin in position. It is light in weight and the metal bars are unusually far apart, distributing the pressure on the ribs of the violin, thus avoiding the danger of cracking or otherwise injuring the instrument. It sets up well from the violin, rendering the use of a pad unnecessary in most cases. The top of the chin rest is easily detached and can be replaced at small cost. [Carl Fischer, New York City.]

THE "UNIKA FUTUIT" BATHING SHOE.

At many beaches it is necessary to protect the bather's feet against pebbles and rocks. Many bathing shoes used for this purpose are heavy and stiff-soled, and are not only inconvenient but make swimming the harder. A new style of bathing shoe is here shown which, having no laces, can be put on and off quickly the same as a stocking and will always stay on the feet.

These shoes are very light weight, do not absorb water, and dry out quickly. The soles are of rubber and it

is claimed will positively keep the wearer from slipping on a wet diving board, a heaving float, or slippery rocks. What will commend itself to the ladies is that this line of shoes is made in a number of handsome colors and combinations, to match or harmonize with the bathing suits and caps. They are supplied in low shoe and ankle heights. [United States Rubber Co., New York City.]

SCALLOPED FRUIT JAR RING.

The thin rubber ring that fits so snugly between the cover and the jar holding canned fruit, though a small affair, is an important feature in the preservation of the contents. As an article chosen solely for its utility little attempt has hitherto been made to beautify it. However, one has appeared upon the market having scalloped edges which add to its utility an attractiveness which may appeal to the feminine mind. When this ring is applied to the fruit jar and the cover is fastened down, the scallops form a frill beneath it, but, more important than this, the wider surface is claimed to afford additional security and protection. [Mechanical Rubber Co., Cleveland, Ohio.]

PIVOT SLEEVE GOLF COAT.

In the popular game of golf, absolutely free muscle and shoulder play is essential for an effective stroke. The ordinary coat sleeve cuts short the free swing of the arm by binding at the shoulder, and the special feature of the golf coat shown herewith is designed to eliminate this difficulty. Self-expanding plaits at the top of the sleeve allow unrestricted motion of the arm, adapting themselves to the various movements required, while in normal position the plaits are invisible. These coats are made of various sporting fabrics, including waterproofed cloths and rubberized textures. While specially designed for golf, they are excellently suited for use in trap shooting, motoring and general sporting wear. [Ph. Weinberg & Sons, New York City.]

IMPROVED DENTAL APPLIANCE.

An improvement in the invention [mentioned in THE INDIA RUBBER WORLD, September, 1914] for cleansing the mouth by vacuum drainage and for massaging the gums is illustrated here. Its use, by stimulating a full flow of blood to the tissues, it is claimed, is exceedingly beneficial in pyorrhea. It consists of an appliance of flexible rubber which fits comfortably over the jaw, with connections for inducing a partial vacuum when attached

to a water faucet. This is the invention of Dr. M. H. Cazier, who claims that its use will check the progress of the disease and with proper professional aid will result in complete recovery. The cylinder is attached to a water faucet by means of a rubber disk and screw cap, the force of the water regulating the amount of suction. There is a flask which receives the discharges during the treatment, this latter being provided with an alternating lever to regulate the action. The various parts are connected by rubber tubing. [The Sanitor Co., Chicago, Illinois.]

THE "NOWAY" RUBBER SHEETING.

Rubber sheeting manufactured under the name of "Noway" is claimed to be a perfect substitute and can be used for each and every purpose where oiled silk is now employed. It is a fine texture white fabric, of light weight, with a light coating of pure Para rubber and it is claimed to be thoroughly waterproof and antiseptic, and having superior tensile strength. It is well

adapted for hospital uses, for bed sheets, pillow cases, surgeons' aprons, etc., and is also especially recommended for first aid treatment to glove a cut member and as a cover for a bandage. [American Rubber Fabric Co., Pittsburgh, Pennsylvania.]

"CLEAR-O-SCOPE" AUTO WIND-SHIELD CLEANER.

The annoyance and danger in driving an automobile in bad weather and not being able to see the road clearly is familiar to every motorist. A device to prevent clouding of the windshield from rain, fog or snow is here shown. It consists of two steel rods covered with rubber which are simply slipped over the top of the windshield, being provided with a handle which the driver grasps, sliding the rods back and forth and over the glass. One operation, it is claimed, cleans and dries the glass, presenting the absolutely clear surface necessary for safe driving. [The Zinke Co., Chicago, Illinois.]

ELASTIC HEAD BANDS.

The "Bike" elastic band here shown is intended to be worn by athletic sport enthusiasts of either sex, when indulging in their favorite exercise, for the purpose of keeping the hair in place and absorbing perspiration, that dims the vision of those players who wear glasses.

An elaboration of this band intended especially for the football player is also shown. It has straps going over the head and is worn low, covering the ears.

These bands are made of cotton thread interwoven with rubber-covered thread, which, in the case of the football headgear, affords protection for the ears without interfering with the hearing. They are supplied in three sizes—small, medium and large. [Sharp & Smith, Chicago, Illinois.]

"REALFLEX" ARMORED CONDUCTOR.

In electrical wiring in old buildings an armored wire is a practical necessity. It is difficult to secure the maximum of strength and at the same time the degree of flexibility needed. Again, the armor must be sufficiently smooth to be drawn between partitions and through small openings with a minimum of friction. It must be so finished that it will not injure the hands of the workmen while handling it. A piece of "Realflex" armored conductor is shown here, tied

in a double knot, thus practically illustrating its flexibility. The rubber-covered wire is completely protected by a heavily hot galvanized flexible steel wire, both rat proof and dust proof. This is wound about the conductor in a new and ingenious manner which gives this flexibility combined with maximum strength. A complete line of sizes is made, suiting all individual requirements. [The Western Conduit Co., Youngstown, Ohio.]

AN ARMY SANDAL.

The Canadian troops going into active service in the field in Europe will certainly be well shod.

The army sandal shown here is the one officially adopted by the government. It is of tan colored rubber, specially designed to fit the heavy type of ankle leather boot which has been issued to the troops. The sole is of a coarse type, with extension heel lined with zero net, and a strong cotton reinforcement is placed inside the rubber at the heel and toe. Many thousand pairs of this special sandal have been ordered and duplicate orders have recently been received, thus showing their special adaptation for this heavy service. [Canadian Consolidated Rubber Co., Limited, Montreal, Canada.]

THE "FRUIN-TOBIN" RUBBER BAR HORSESHOE.

Every winter storm brings its quota of injured horses, owing to their inability to keep from slipping and falling on wet or icy pavements. There is no better preventive than rubber, and this also serves as a cushion and relieves the jar caused by the hoof striking the pavement. The horse shoe here shown is made of forged steel containing large channels at the heels and at the toe, into which rubber is vulcanized, extending across the heel and forming a bar. The sharp flange running from each side of the toe back to the quarters is an exclusive feature, and the width of the frame at the heel prevents pressure, therefore eliminating heel trouble. The shoe can be concaved to fit a drop sole foot and is said to be a positive cure for corns. Owing to the drop forged frame, it can be shaped to fit the hoof without heating. It will spread one-quarter of an inch, and is punched so that it can be nailed on securely and easily. [Fruin Drop Forge Co., Chicago, Illinois.]

TYPEWRITER CUSHION FEET WITH DOUBLE CAVITY.

The device here shown was adopted as most satisfactory by its inventor and manufacturer after detailed experimentation with other forms of support for the typewriter, such as built-up felt pads, a flat metal spring, sponge rubber, and other devices. These cushions are made of solid rubber so shaped as to be easily slipped over the feet of the machine. An exclusive feature is the double cavity. The upper cavity receives the foot of the machine, while the lower tends to create a vacuum under the typewriter and prevents it from creeping. The upper illustration shows the cushion in proper position. The lower gives a view of the bottom, showing the vacuum cavity, also a slight depression of the rim, which further serves the purpose. The use of these rubber feet is claimed to reduce the noise of operating about one-half, also giving a spring to the key action and softening the touch on account of their resiliency. By absorbing the shock, the nerves and strength of the operator are conserved, also wear and tear on the machine. [H. C. Nielson, Chicago, Illinois.]

METAL AND RUBBER HOSE FOR GASOLENE.

Rubber hose has its disadvantages when used to convey gasoline, for that volatile liquid is a solvent of rubber and causes rapid deterioration. A metal hose is better adapted for such purpose, but such a hose is hard to handle, and much trouble is apt to appear because of the difficulty in preventing leakage at the joints. A hose which is claimed to combine the advantages of both metal and rubber is here shown. The basis is a very flexible, smooth-bore metal tubing made tight by means of an

asbestos cord packing. This lining keeps the gasoline from coming in contact with the rubber tube which is vulcanized over it. The rubber tube is of special gasoline-resisting composition specified by the Underwriters' Laboratories. Outside of this is a heavy, woven cotton jacket to protect it from external wear. Couplings furnished with this are attached in such a manner that they will not leak nor pull off. Four sizes are carried, $\frac{1}{8}$, $\frac{3}{8}$, $\frac{1}{2}$, and $1\frac{1}{4}$ inch, and these are made in any desired lengths up to 50 feet. [American Metal Hose Co., Waterbury, Conn.]

CLEAN-O-PORE VACUUM MASSAGE OUTFIT.

This massaging device has many apparent advantages. It costs nothing to operate. No electricity is needed, and there are no wires or motor to get out of order. The outfit consists of rubber washer connections for round or oval faucets, three rubber

suction cups of varying sizes for body and face massage, seven feet of rubber tubing, a nickel-plated vacuum chamber, and a book of instructions, all arranged in a compact leather-covered box. To operate, attach to a wash basin faucet and turn on the water. A gentle suction is created, which increases in strength as the pressure of the water is increased. The massage cup can then be moved over the face or any part of the body desired, stimulating the blood vessels, opening the pores and drawing out waste matter. It is recommended for use after shaving, for the relief of muscular soreness, for bust development and scalp invigoration. Also, when applied to the spinal column, it is claimed to relieve nervousness. [The White Swan Manufacturing Co., New York City.]

SPORTSMEN'S ENGRAVED GARTER.

The customary clasp for men's garters is apt to slip or become unfastened if the wearer is indulging in active exercise, causing embarrassment and annoyance. A new form of fastening has been devised which is claimed to eliminate this possibility. The lower end of a narrow metal plate or strip is equipped with small beveled teeth which grip the hose securely and are claimed not to injure the finest hose. The elastic band fitting about the leg can be readily disengaged from the metal clasp for renewal, and the garter may

be put on or taken off in considerably less time than is usually required for that operation. These garters are also being produced with gold and silver bands, in place of other metal, to be engraved with the wearer's name, this valuable and distinctive style offering a good field for gift sets. [Whitely Exerciser Co., New York City.]

VACUUM BREATHING APPARATUS.

The purpose of the apparatus here shown is to increase the breathing capacity of the user and it is especially recommended for bronchial affections such as asthma, hay fever and similar disorders. The patient places a rubber hood over his nose and mouth so that all air reaching him must be drawn through the rubber tubing. This tubing is connected with a glass containing

water, which is permeated by air obtained through another independent opening. The patient is forced to draw the air he breathes through the water, or against an approximate pressure of six pounds, causing him to breathe deeply and vigorously. The pull of the vacuum apparatus operated by motor, connected through a second tubing with the breathing hood, facilitates exhalation. A mercurial register shows the lung energy expended. [Sanitarium Equipment Co., Battle Creek, Michigan.]

SOMETHING NEW IN GOLF TEES.

Every golfer recognizes the inconvenience and annoyance of building up tees with sand which may have lain in the boxes for weeks exposed to the weather. Such players will appreciate

the Soluble Golf Tee, for which is claimed several special advantages. It affords a constant height for the ball from the ground, eliminates the guesswork, always present when teeing with wet sand. It is so light that it offers a minimum resistance to

the sweep of the club in a "follow through," thus improving playing. This tee is made of gelatin, and if left upon the ground does not litter up as would a paper tee, but dissolves from the action of the weather and disappears. It is more durable than a paper tee and can be used over and over again. It cannot injure the club and if lost it costs so little no time need be wasted in hunting for it. These tees are made up in $\frac{3}{8}$, $\frac{1}{2}$ and $\frac{5}{8}$ inch heights, packed in neat boxes containing 100, or in boxes of 18, as may be desired. It is claimed that a box of 100 will last the average golfer an entire season. [The Pittsburg Golf Tee Co., Wilkinsburg, Pennsylvania.]

The Editor's Book Table.

PHYSIOLOGICAL PRINCIPLES FOR DETERMINING THE VALUE of the Various Rubber Tapping Methods. By Professor Dr. Hans Fitting (translated by J. H. Renton). Capper & Sons, or "Times of Ceylon, office 27 Mincing Lane, both London, E. C., England. [Paper, 8vo, 51 pages.]

THE rubber planter is interested in bringing his plantation quickly into a profitable condition as a commercial enterprise and maintaining it in that state as long as possible. Doctor Hans Fitting has made a very careful study of the many questions involved and has indicated the way to be followed in investigating practical methods of tapping.

After explaining the functions of the root, stem and crown, the circulation of water, and showing that the ascending movement of water and the inorganic salts takes place in the wood, and the descending movement of the organic substances, chiefly in the bast, he reports the result of his experiments. Believing with Kneip that in all probability latex is not a nutrient juice, and, consequently, is of no importance as regards the circulation of the sap, he assumes that the latex is produced almost entirely, in the stem, however, it is also found to a small extent in the leaves, and therefore the nutritive substances required for this purpose must exist in the stem in sufficient quantities. If there is a deficiency of them, the renewal of latex must necessarily suffer and the supplementary latex may possibly deteriorate in quality.

It may be concluded that in rubber trees cuts made very deep in the cortex and in the bast disturb some very important vital functions of the tree. As the lactiferous vessels are situated chiefly in the bast, tapping should penetrate to the inner parts of the bast in order to secure a sufficient flow of sap, but must neither reach nor cut through the cambium.

Dr. Fitting's first tapping experiment was a spiral incision one and one-half times around the tree. This had the same effect as girdling because the circulation of organic nutrients in an oblique direction proceeds too slowly to provide the food supply required by the base of the tree. The tree is, therefore, obliged to draw on the reserve material from its reservoirs in the bark and wood.

In the second experiment the tapping cuts extended only over a quarter of the stem's circumference. There were six tapping areas, with bridges of bark between each. On three of these areas, the Bowman parer alone was used, and on the alternate three, the Bowman parer and Bowman pricker. The tapping period extended from November 8 to April 11. The tree was then cut down and examination showed that tapping cuts of this description can at most have only a local influence on the descent of organic food substances toward the base.

In the case of young trees, planters are warned against the use of all those tapping cuts by which the rectilinear connection of the vertical channels for the circulation of organic substances in the cortex and bast suffer a complete, or almost complete, interruption at any spot between the crown and the base of the tree.

Therefore, the spiral cut should be rejected, not because a great quantity of bark is in course of time removed from the tree, but because it completely destroys the food channels. Also, all those tapping methods are unsuitable, by means of which straight strips of bark are at first left between incisions and are removed in the second tapping period. Lastly, it is advisable to avoid all tapping methods, where the incisions are of such length that the nutrient and constructive substances within the tapping system must

travel too great a distance in an oblique or even horizontal direction.

In reviewing the value of tapping methods, the demands of practice must be considered, namely, that the latex should run easily and be easily collected, and the incisions be easily made. The herringbone incision must be given preference, here, as long as it embraces only a small part of the tree's circumference. The tapping system should extend only over a quarter of the tree's circumference. Successive tapping periods are to be confined respectively to the second, third and fourth quarters. Preference should be given to the half herringbone incision because of the short channels for flow of the latex.

The use of the pricker, as a tapping tool, cannot be recommended. Wherever the teeth of the pricker penetrate to the neighborhood of the cambium, the latter forms a new bark with many stone cells, but practically without lactiferous vessels. Where the pricker teeth did not penetrate through the inner cortex, new bark formed containing lactiferous vessels arranged irregularly. Bark on the tapping spots is renewed much more evenly if the knife is used exclusively, and is sooner ready for re-tapping.

The author's conclusions are summed up thus: "Do not begin to tap the trees till they are six or eight years old and are twenty inches in circumference, at three feet from the ground. Adopt the half, or the full herringbone V-shaped incision. Angle of sixty degrees is best. The tapping system must cover only a vertical strip of bark not exceeding a quarter of the tree's circumference. Tap daily, or on alternate days, with knife only. Prolong the tapping to five or six months. Avoid mixing latex of different quality, that from young and old trees, or from trees at different stages of tapping.

"It will be found advantageous to tap for two or three months, removing at most half the strips of bark between two incisions; after that pause for one or two months and then finish tapping the remainder of the bark in two or three months."

GREEN BOOK FOR BUYERS. PUBLISHED BY THE OIL, PAINT & Drug Reporter, New York City. [16mo, 206 pages. Paper bound. Price, \$1.00.]

This is a semi-annual publication, a guide for buyers of all sorts of oils, paints and drugs, being really a directory of manufacturers and dealers in these lines, arranged under the headings of the materials manufactured and sold. The book is a very small one, can be conveniently carried in the breast pocket, and seems very full and complete in every particular that would make it of use to heads of purchasing departments in all factories using oils and chemicals.

THE MEDICAL WHO'S WHO, 1916. THE FULTON-MANDERS PUBLISHING Co., London, England. [16mo, 1,140 pages. Price, 10s. 6d.]

The many members of the rubber trade who know A. Staines Manders and his able secretary, Miss D. Fulton, may be aware of the fact that the Fulton-Manders Publishing Co., of London, is publishing a number of important works concerning the medical profession and other lines, including several in the rubber field. The latest publication of this company is the one named above, a compact volume containing an immense amount of information regarding the medical profession of the United Kingdom. Brief biographies are given of the many thousand physicians. There are

also lists of those who have died in the preceding year; a general index of the towns with the names of the practitioners who live in each, and a brief mention of the medical periodicals published in the Kingdom. In all it is a book which must be of great value to those in or interested in the medical profession. We congratulate Mr. Manders on bringing out so complete a book, one showing care in compilation and excellent judgment in arrangement and publication.

NEW TRADE PUBLICATIONS.

GUTTA PERCHA & RUBBER, LIMITED, Toronto, Canada, is sending out a neat little pamphlet describing the "Maltese Cross" tires. The book is handsomely printed, the illustrations being especially clean, clear and distinct, and giving a very realistic idea of the tires, inner tubes, patches, rubber mats and other automobile accessories manufactured by this company. Each page is printed with a tinted background, which adds particular brightness to the illustrations, and the whole mechanical arrangement is most commendable.

* * *

The Link-Belt Co., Chicago, Illinois, in a compact little booklet describes and pictures the various forms of belt conveyors for handling separate pieces or packages from floor to floor or from one part of a factory to another. These various forms are pictured and described in such a manner as to give a very clear idea of their arrangement and appearance. The pictures show conveyors carrying such things as loaves of bread, or even ink bottles, while others are shown moving raw material, printed matter, trays of bottles, boxed and other goods, as well as barrels, loose packages, bales of various substances and similar articles. There is hardly a manufacturing establishment of any large extent in the United States which could not find use for one or another of such conveyors, and managers of industrial establishments might well read this little book with profit.

* * *

The B. F. Goodrich Co., Akron, Ohio, has published a wall calendar for the 12 months following April 1, 1916, which is likely to find space in many offices. Like all the Goodrich advertising, it is attractive, and this particularly so, being mainly a large lithograph of a crossing policeman escorting a daintily dressed little miss of perhaps ten years across the street while holding up traffic for the purpose. The aristocratic step of the little girl and the appreciative smile upon the face of the policeman make the picture especially noticeable. It is the work of Peter Newell, the well-known artist. A series of monthly leaflets forms the calendar portion, with bold, strong figures easily read from a distance.

* * *

The Racine Rubber Co., Racine, Wisconsin, has published a very attractive booklet entitled "The How and Why of Racine Tires," which gives a well written story of the factory, the method of manufacture and the kinds of tires manufactured by this concern, together with hints of value to users of these tires. The pamphlet is printed in two colors, has a bird's-eye view of the factory and many illustrations of the various departments, as well as of the tires, patches, reliners, casing boots, etc., manufactured by this enterprising company.

* * *

We have recently received a copy of the India-Rubber, Gutta-Percha & Electrical Trades Diary and Year Book for 1916, published by McLaren & Sons, Limited, London, England. This is the regular edition of the convenient desk book which has been published by this firm for a number of years and which contains a large amount of statistical

matter and useful information of the British rubber trade besides the regular diary pages, which are so arranged as to give a liberal amount of room for accounts of daily transactions of the busy rubber man. In former editions these pages have been interleaved with blotting paper, the absence of which is in part made up this year by the insertion of several loose sheets of this material. The trade index comprises a long list of importers, brokers and rubber manufacturers throughout Great Britain and also information regarding export duties from rubber producing countries and other useful facts in convenient form for quick reference.

* * *

The National Fire Protection Association, Boston, Massachusetts, has printed a special pamphlet fully describing the sweeping fire in the residential section of Nashville, Tennessee, on March 22, at which there was an estimated property loss of \$1,500,000. It gives a panoramic reproduction of a photograph of the burned district nearly four feet long and shows what havoc the fire wrought. It also gives a map of the burned section showing area and extent of the fire. A similar booklet describes a \$10,000,000 fire in Paris, Texas, last March which resulted in a destruction of 1,440 buildings. In each case the conclusion is that, if sweeping fires in American cities are to be avoided, light frame construction and especially shingle roofs must be eliminated, and the recommendation is that there should be a legal abolition of the shingle roof and encouragement of that type of building construction which resists fire. This is a point well worth the consideration of those manufacturers who are erecting buildings for their plants or for their employees.

* * *

The board of directors of the Underwriters' Laboratories, Chicago, Illinois, under date of March 16, sent out their annual report, which shows the assets and liabilities, recommendation for the annual appropriation, and by-laws adopted. These items are followed by a statement descriptive of the organization, its purposes and methods, which portion of the book is illustrated with fine half-tone engravings of the building and various departments, thus giving a good idea of the thoroughness of the equipment for the purposes designed. In the latter portion of the book is shown in fac simile, printed in several colors, the many labels which are furnished by this corporation as guarantees of efficiency of the many machines, accessories, etc., which are examined and recommended by this establishment.

BALLOON FABRIC PATENTS.

German patent, No. 283,760, of September 9, 1913, was granted to Walter Seyd and Paul Benrath, both of Barmen, Germany, for a new balloon fabric made of a knitted textile having a rough surface instead of the ordinary smooth surface of woven balloon materials. This new fabric is said to be very strong, flexible and not easily torn. It is further stated that it can be used for covering the sustaining surfaces of aeroplanes as well as for making up balloon bags. It can be made of silk, cotton or any other textile, in any color, and it can be produced in large quantities at a low cost. It is especially easy to impregnate the new fabric with balata, which gives it great strength and makes it perfectly gas-proof.

German patent, No. 283,437, of January 11, 1913, to Metzeler & Co., of Munich, Bavaria, is for a process for building the hulls of airships from a material composed of several layers of fabric assembled in such a manner that the diagonally running warp threads of one layer cross the corresponding threads of the next layer of fabric, the strips of fabric being composed of a consecutive series of panels whose warp and weft threads cross one another.

The Obituary Record.

A THOROUGH RUBBER MAN.

L E BARON C. COLT, vice-president and general manager of the National India Rubber Co., Bristol, Rhode Island, died at his home in that town May 25, the result of a motor accident described in the Rhode Island letter, printed on another page in this issue.

He was born February 27, 1877, at Bristol, the only son of United States Senator Le Baron B. Colt and Mary Louise (Ledyard) Colt.

LE BARON C. COLT.

After attending the public schools he entered Brown University, and on his graduation from that institution, entered the employ of the National India Rubber Co. as an apprentice, learning the business thoroughly by practical experience, working successively in the cloth room, the mill room, the cutting room, the making room, the heater room. In each he began at the bottom, and learned the work as did any apprentice. He was appointed assistant superintendent, which gave him time for laboratory and experimental work,

for which line he developed unusual fitness. Then he became traveling salesman, and in 1904 he was selected as resident manager.

At that time the Bristol plant was a somewhat heterogeneous aggregation of buildings with considerable antiquated machinery. Rearrangement, consolidation, new buildings and equipment characterized his management, and the business developed from a maximum number of people on the pay roll of 1,700 to 3,300, and the output of shoes from 18,000 pairs to 44,000 pairs per day, and the insulated wire business from 60,000 to over 200,000 feet per day.

He was particularly careful about the health and welfare of his employees, and devoted considerable of his energy to bettering hygienic conditions in his plant. About three years ago he built a hospital for the better care of the workers, and personally organized it. As a result of his efforts on behalf of his operatives and his ability to cooperate understandingly with them he was held in high regard.

In 1904 he married Miss Joujou Edith Converse, daughter of the late Admiral George A. Converse, who, with three children survives him.

Mr. Colt possessed to a remarkable degree qualities of successful leadership. The son of a judge of the United States Court, and a nephew of Colonel Samuel B. Colt, president of the United States Rubber Co., he combined in a remarkable manner the judicial instinct of the one and the far-sighted business acumen of the other. He had the thorough loyalty of those who worked under him, the warm personal friendship of his business associates and the unbounded confidence of all with whom he came in close business contact. He will be mourned by a wide circle of friends.

CHEMIST, ORGANIZER AND EXECUTIVE.

In the death of E. H. Pound of the Holland American Plantation Company, the United States Rubber Co. has lost one of its most valuable workers.

Edward Harold Pound was born at Pontiac, Michigan, April 12, 1886. Shortly after graduating from the high school, he went to Mexico on the railway survey for the Mazatlan Extension

E. H. POUND.

from Durango to the Pacific Coast. Returning in 1907, he entered the University of Michigan School of Forestry. During part of his time there, he acted as assistant in forest botany, and the summer of 1909 he spent in the U. S. Forest Service in Montana. In 1910 he left the University of Michigan to enter the employ of The Rubber Exploration Co., taking charge of the forestry and botanical ends of two extended exploration trips in South

America. In 1912 he entered McGill University, Montreal, to take up work in organic chemistry, specializing in biological chemistry, with particular reference to rubber, and graduated with the degree of B. Sc. in 1913.

Mr. Pound entered the service of the United States Rubber Co. on June 17, 1913, and after a year in charge of the crude rubber division of its general laboratories in New York, was selected by this company for the important post of director of the technical department of the Holland American Plantation Co., which operates its eastern plantations. In April, 1914, he left for his new position in Sumatra to undertake the task of organizing and conducting experimental work on a large scale on the important problems involved in the production of plantation rubber.

Mr. Pound's thorough training, an unusual experience, together with his good business sense and unbounded energy and enthusiasm, made his work a success from the beginning. His ability as a judge of men, and as an organizer and executive is shown by the excellence of the technical staff which he gathered around him, and by the smoothness with which this organization was able to carry on its work when Mr. Pound was forced to be absent on business, and later on account of ill health. In December, 1915, he was obliged to leave his work at Sumatra for a rest trip in China and the Philippine Islands. His health, however, failed to improve and he died on January 21, 1916, in Hong Kong.

Mr. Pound's breadth of vision and keen technical judgment have left a mark on the rubber industry of the East, and have resulted in a degree of achievement which most men would be proud of reaching at the end of a long business career. His death is a distinct loss to the rubber industry, to the company which employed him, and to the associates whose love and loyalty he won by his rare personal charm and uncommon breadth of nobility and character.

A PIONEER ELASTIC WEB MAKER.

William Rapp, one of the best known men in the field of elastic web manufacturing in this country died, at his home in Brockton, Massachusetts, May 19, aged 82 years.

Mr. Rapp was born in Staffordshire, England, in 1833. His father died two years later. There were no free schools there, and the boy received but scant education. At an early age he went to work in a webbing factory and by diligence and industry rose to the position of foreman and later established himself in the business in Leicester. In 1881, his factory was burned down, and he decided to come to America. Locating in Chelsea, Massachusetts, he joined forces with William and Thomas Martin, and formed the Elastic Gusset Co. Two years later, he formed a partnership with Albert Herbert, and built a webbing factory at Brockton, Massachusetts. This concern later became the Hub Gore Makers, with factories in Brockton, Rockland and Chelsea, Massachusetts, Bridgeport, Connecticut, and Camden, New Jersey, and is now a part of the more recently formed concern "Everlastik, Inc."

Mr. Rapp made his home in Brockton, and for many years supervised the work at the factory in that city. He served as a councilman in 1890, 1895 and 1896. He was a member of the Commercial Club, and a prominent member of the Porter Congregational church.

His wife died a few years ago. He is survived by a son, eight grand-children and four great-grand-children.

AN ABLE EXECUTIVE.

Aaron D. Weber, vice-president and general manager of the Canadian Consolidated Felt Co., Limited, died at his residence in Berlin, Ontario, Canada, May 7, at the age of 43 years. He was born on a farm near Berlin in 1873. In 1900 he started work as a shoemaker in the Berlin rubber factory. The following year he became a traveling salesman. When the Merchants Rubber Co. was founded in 1903 he joined that organization, and after the company passed under the control of the Canadian Consolidated Rubber Co., Limited, he served successively as assistant manager of the Merchants factory, manager of the footwear department at the Toronto branch, manager of rubber footwear production and sales at Montreal, general manager of the Canadian Consolidated Felt Co. at Berlin, and vice-president of the company.

Mr. Weber's career is a splendid example of what ambition and will-power can accomplish for a young man. Sixteen years ago he started as shoemaker in a rubber factory and at his death was vice-president and general manager of one of Canada's great industries.

His death is a distinct loss to the city of which he was a worthy citizen, and to the industry of which he was general manager. He is survived by his widow, father, sister, and two brothers.

ORPHAN BRANDS NOT REGISTREABLE IN AUSTRALIA.

A trade-mark decision of interest to those who are dealing with Australia is that recently announced in the matter of the National India Rubber Co., Bristol, Rhode Island, which made application to register the words "Empire Rubber Co." as a trade-mark for boots and shoes. There were several reasons why the application was not allowed, one being that it was printed in ordinary script and not displayed in a distinctive manner, another because the word "Empire," which is the principal feature of the trade-mark, was anticipated by prior registrations for the same kind of goods. But the added reason, and the one most important as coming within the provisions of the Australian trade-marks act, was that it was not the name of a company, individual or firm actually in existence and the law officer held that the use of the words "Empire Rubber Co." would amount to a representation that the goods were manufactured, packed

or marketed by a company of that name when, as a matter of fact, they were not. It was also contended that the word "Empire" when used in a British possession would *prima facie* convey a reference to the British Empire and lead British subjects to believe that the goods were the product of a British company. Consequently, the use of the mark on the goods of the applicant would amount to a false trade description.

STANDARDIZATION OF HOSE COUPLINGS.

The Hose Coupling Committee of the National Fire Protective Association, in its report to that body at Chicago, states that there is an encouraging growth in the movement toward the general adoption of national standard hose couplings in order to secure reliable and efficient service in cooperation between fire departments of neighboring communities. It particularly praised the activities of the Ohio State Fire Prevention Association in its work of standardizing of hose couplings and fire department equipment in cities within 55 miles of Columbus, while similar work is in progress in and adjacent to other large cities in that State. New editions of "Hose Coupling Specifications" and "Couplings Record" have been printed. The latter shows a list of 2,222 towns, the equipments of which 894 are standard, and 1,328 adaptable. The committee, which consists of Howard L. Stanton, Norwich, Connecticut; H. C. Henley, St. Louis, Missouri; George E. Bruen and F. M. Griswold, New York City, suggests that the committee be enlarged by the creation of sub-committees selected from the membership of each State Fire Association, whose duty shall be to collate hose couplings and hydrant data for record, to urge the adoption of the standard and to foster cooperation between communities, and that the N. F. P. A. select one or more of its members to attend the conventions of the State Fire Marshals' Association to urge such cooperation and standardization.

ANOTHER SCHOLARSHIP IN CHEMICAL ENGINEERING.

In our May issue a brief announcement was made of the establishment of a scholarship fund endowed by Dr. Victor G. Bloede, of Baltimore, Maryland, the income of which, approximately \$500 a year, is to be devoted to financially assisting deserving young men to obtain an education in the field of industrial chemistry or chemical engineering, at any institution in the United States which may be designated or approved by the Chemists' Club of New York City. This club has since announced the establishment of another scholarship fund, the income of which, approximately \$400 a year, is to be devoted to the same purpose. This scholarship has been endowed by William F. Hoffmann, president of the American Oil & Supply Co., Newark, New Jersey, and one of the founders of the Chemists' Club of New York. The benefits of both these funds will be open to properly qualified applicants without restriction as to residence, and may be effective at any institutions in the United States which may be designated or approved by the Chemists' Club. The qualifications and full particulars regarding these scholarships can be obtained by addressing the Bloede Scholarship Committee and the Hoffmann Scholarship Committee of the Chemists' Club, 50 East 41st street, New York City.

THE STORAGE OF RUBBER GOODS.

An anonymous writer in "Gummi-Zeitung" states that light, high and low temperature, and moisture tend to shorten the life of rubber goods. Blue and violet light rays are particularly harmful. Red light is practically without effect. He claims that the color of goods seems to have some influence, bright colors acting in some degree as preservatives, and that sulphur bloom may have a certain protective effect.

The New York Preparedness Parade.

THE parade in New York City on May 13, of over 125,000 citizens was a wonderful demonstration of the stand taken by representatives of leading trades and professions on the question of preparedness for national defense. The rubber trade, as has been the case on similar occasions, was amply represented, there being by actual count, 2,415 rubber men in the procession.

Great credit must be given the committee in charge, H. G. Cleveland, W. G. Ryckman and H. S. Vorhis, upon whom fell most of the details and arrangements, and the result proved the thoroughness with which these duties were performed.

The military direction was under the command of Amedee Spadone, who had as his aids, H. H. Barnard, H. G. Cleveland, S. T. Hodgman, W. G.

Ryckman, T. A. Aspell and H. S. Vorhis. Captain Spadone was chosen as marshal of this division because of his training in the New York National Guard. His insignia of office was a handsome blue sash, the aids being distinguished by yellow silk sashes. The 2,400 marchers wore straw hats and each carried an American flag. On the coat of each was a medal of oxidized

silver and celluloid, showing two American flags, attached by a blue ribbon which read: "Rubber Division. Citizens' Preparedness Parade. May 13, 1916." A gorgeous banner of purple silk, with cloth of gold border, fringes and tassels, read: "The Rubber Industry of America," and was adorned with the seal of The Rubber Club of America, Inc.

The Rubber Division consisted of five regiments, each wearing a distinguishing color; the first regiment, under Colonel R. C. Fisher, red; the second, under Colonel Jackson, blue; the third, under Colonel M. Charles Schweinert, green; the fourth, under Colonel J. R. Parker, brown; and the fifth, under Colonel William E. Bruin, yellow.

Various rubber houses were represented by large delegations, the United States Rubber Co. heading the list with 884 men, all of whom wore straw hats, the bands of blue and white ribbon he emblazoned with the circular monogram trade-mark of the company. A. Schraders' Sons, Inc., were represented by 472 men; The B. F. Goodrich Co. by 104; Ajax Rubber Co., 109; New Jersey Car Spring & Rubber Co., 70; American Hard Rubber Co., 60; Kelly-Springfield Tire Co., 49; Hodgman Rubber Co., 46; Firestone Tire & Rubber Co., 40; while those which furnished one or two files of representatives included:

Parker, Stearns & Co., Goodyear Tire & Rubber Co., L. Littlejohn & Co., Core & Herbert, Obalski & Sweeney, Inc., Henderson & Korn, Consolidated Stamp Co., Republic Rubber Co., Okonite Co., H. Muehlstein & Co., Arnold & Zeiss, F. H. Cone, Vulcanized Rubber Co., Gutta Percha & Rubber Manufacturing Co., New York Mackintosh Co.

It would seem that every rubber house having its headquarters or branch offices in New York City was anxious to be repre-

AMEDEE SPADONE, MARSHAL.

RUBBER DIVISION OF THE PREPAREDNESS PARADE PASSING THE NEW YORK PUBLIC LIBRARY.

sented, and besides those mentioned above, the following were represented among the marchers:

Mohawk Rubber Co., Tyer Rubber Co., New York Insulated Wire Co., Oxford Tripoli Co., Gibney Tire & Rubber Co., Falls Rubber Co., Knight Tire & Rubber Co., R. J. Caldwell & Co., Continental Rubber Works, Thomas Malone, C. W. Niles, Rolfe Rubber Co., U-Glu Supply Co., Edward Maurer & Co., Charles Rubber Co. of New York, W. H. Stiles, W. G. Ryckman, Aldens' Rubber Co., Elkhart Bros., Pennsylvania Rubber Co., Combination Rubber Co., Empire Rubber & Tire Co., Rex Rubber & Novelty Co., Davol Rubber Co., Seamless Rubber Co., Canton Rubber Co., Miller Rubber Co., Miller Tire Corporation, Boston Woven Hose & Rubber Co., Meyer & Brown, Boston Belting Co., F. B. Ross & Co., A. Beers, Condensite Co., R. J. Pierce, Ritchie Ryan Rubber Works, Gould Commercial Co., Continental Rubber Co. of New York, W. H. Stiles, W. G. Ryckman, Aldens' Successors, Limited, Earle Bros., W. Hammesfahr & Co., Robert Badenhop Co., Inc., Chas. E. Wood, Richard Wohlberg, Rubber Trading Co., Pell & Dumont, Fred Stern & Co., A. V. W. Tallman, A. B. McNamara, Robinson & Co., Paul Bertuch, Eastmond & Co., Alcock Manufacturing Co., Jacob Blyn, U. S. Rubber Reclaiming Co., Inc., Converse Rubber Shoe Co., Raw Products Co., New York Rubber Co. and THE INDIA RUBBER WORLD.

The Rubber Division had the place of honor at the head of the trade section of the procession, immediately following the Municipal Departments. The trade was further honored in that George B. Hodgman, Van Henry Cartmel and H. Stuart Hotchkiss were chosen to escort the Mayor to the grand reviewing stand. The music for the Rubber Division was furnished by the First Regiment Band of New Jersey, 36 pieces; the band of the Mission of Immaculate Virgin, Staten Island and Manhattan, 70 pieces, and the Oriental Fife and Drum Corps of Stamford, Connecticut, 21 pieces.

It must be acknowledged that the fine marching of the rubber men aroused the plaudits of the half million onlookers who lined the entire route of the procession. All the marchers reached Fifty-seventh street at the end of the parade in fine condition, well satisfied that the rubber trade had done its full duty in showing its stand upon this important national question.

Captain Spadone has received from Colonel Sherrill, the grand marshal of the parade, a letter of thanks and appreciation for the splendid showing made by the Rubber Club. The letter closes as follows:

The pleasantest memory of my life will always be my service with you in this work, and I shall always remember you with affectionate regard.

You will please convey to your command my warmest thanks and heartiest congratulations for their splendid cooperation in our patriotic crusade.

The premises of the Gutta Percha & Rubber Manufacturing Co., on Duane street, were used as the headquarters and rendezvous for the Rubber Division, and in appreciation of this there has been presented to the company a beautiful silver loving cup bearing this inscription:

The Gutta Percha & Rubber Manufacturing Co., from the rubber trade of New York and vicinity in appreciation of courtesies extended in connection with the Citizens' Preparedness Parade, May 13, 1916.

This cup, we understand, will grace Mr. Spadone's office, as a reminder, for all time, of this occasion.

SILVER CUP PRESENTED GUTTA PERCHA & RUBBER CO.

BOSTON'S PREPAREDNESS PARADE.

NEW YORK CITY'S great popular demonstration for preparedness set Boston an example worthy of emulation, and the latter city held a similar parade on Saturday, May 27, when between 50,000 and 75,000 citizens marched to show their sentiments on this question of the hour.

MAJOR H. P. BALLARD, MARSHAL, RUBBER TRADE DIVISION, BOSTON PREPAREDNESS PARADE.

This was in many respects similar to the Sound Money parade of 1896, but far exceeded it in the number of marchers.

The rubber trade was well represented. Major H. P. Ballard of the Boston Rubber Shoe Co., was chosen marshal of this division. His appointments to act as honorary staff were: Col. Harry E. Converse and Capt. Lester Leland of the United States Rubber Co.; Capt. Francis H. Appleton of F. H. Appleton & Son, Inc.; George E. Hall of the Boston

Woven Hose & Rubber Co.; Fred C. Hood, of Hood Rubber Co.; Ira A. Burnham, of American Rubber Co.; M. M. Converse, of Converse Rubber Shoe Co.; W. E. Piper, of Boston Rubber Shoe Co., and H. L. Williamson.

Assistant marshals of the division were P. R. Browne and H. H. Nance, of American Rubber Co.; E. H. Kidder, of United States Tire Co.; J. H. Learned, of Revere Rubber Co.; E. L. Phipps, of Boston Rubber Shoe Co.; J. W. Fellows, of Boston Woven Hose and Rubber Co.; Hugh Bullock, of Converse Rubber Shoe Co., and C. H. Peckham, of Boston Belting Co.

The rubber men rallied well, there being a total of 1,570 enrolled. Unfortunately, this division was given a position so far back in the line of march that it did not start in the parade until after 4 o'clock, a fact which undoubtedly prevented a much larger number of marchers. The houses represented included Boston Woven Hose & Rubber Co., Boston Belting Co., Converse Rubber Shoe Co., Hood Rubber Co., American Rubber Co., United States Rubber Co. of New England, Revere Rubber Co., Boston Rubber Shoe Co., Peerless Rubber Manufacturing Co., New York Belting & Packing Co., United States Tire Co., The B. F. Goodrich Co., Goodyear Tire & Rubber Co., Firestone Tire & Rubber Co., Kelly-Springfield Tire Co., Fisk Rubber Co., C. J. Bailey & Co., Republic Rubber Co., and Empire Tire & Rubber Co.

If numerically this division did not equal some of the others, it was no whit secondary to any other trade in soldierly bearing, fine marching and in enthusiasm. Major Ballard may well be proud as well as all who participated, of the representation of the rubber trade in this greatest popular parade Boston has seen in twenty years.

CHICAGO'S PARADE.

Chicago, following New York and Boston's example, will have a parade on Saturday, June 3. We are informed that the rubber trade will be well represented.

News of the American Rubber Trade.

JOHN ACKEN.

ONE of the pioneer concerns in the rubber business is the New York Rubber Co., which had its beginning back in 1858. At that time William H. Acken and John P. Rider came together and built up the company that has, for half a century, been acknowledged as one of the most stable, conservative and reliable of all of those which make rubber goods.

The senior Acken was president for many years and was succeeded, in time, by his son, John Acken. The present head of the company, like his father, is averse to publicity and is quite content to go his way unheralded as long as his business prospers and he lives up to the family traditions.

JOHN ACKEN.

Mr. Acken is a resident of Nyack, New York, where as an evidence of public spirit he is a member of the Nyack Business Men's Association and the Nyack Country Club. Fond of out-door sports, he was formerly an enthusiastic tennis player, but today confesses to being less keen for such strenuous exercise.

The object of this brief note is to add our congratulations to those of his employees, tendered May 2, upon the occasion of his fiftieth birthday.

BUSINESS CONSOLIDATION.

H. A. Astlett & Co., crude rubber importers and dealers, 117 Pearl street, New York City, have admitted to partnership F. H. Peaty and F. H. Sanford. Mr. Peaty has for many years been prominently identified with rubber interests in New York, and in 1906 with Samuel Kubie formed the Raw Products Co., with which house he was connected until 1913, when he sold his interest on account of poor health. Late in 1914 Mr. Peaty opened an office at 38 Vesey street, New York City, which he discontinued to form his present connection. Mr. Sanford was with the South American house of George A. Alden for 20 years.

H. A. Astlett & Co. took over the business of Shipton Green and have extensive foreign connections. In addition to its large rubber interests, this house is the export agent for the sale of Waltham watches and several other well known and standard American products.

One hundred and fifty cases of rubber which formed part of the cargo of the "Sandefjord" when that ship was seized by a British cruiser and brought into Halifax in November, 1914, were last month condemned for seizure by Justice Drysdale of the admiralty court. The "Sandefjord" was on her way from New York to Copenhagen and was allowed to proceed after this shipment of rubber was removed. Justice Drysdale held that whereas the rubber was shipped by one neutral to another, an enemy designation was intended. He also held that a description of the article as "gum" was deceptive, further justifying the seizure.

RUBBER CLUB 1916 OUTING.

The annual outing of The Rubber Club of America, Inc., will be held July 18, at the Vesper Country Club, near Lowell, Massachusetts, the same place as last year's outing. The committees are making extensive plans for the occasion. Probably the same arrangements will be made for special trains from Boston to the Club grounds and return. Special parties are being made up in Akron, Trenton and New York, and if a sufficient number can be secured from each of these points a special train will be run landing the members directly at the Vesper Country Club on the morning of the outing. The committee having the details in charge is as follows: P. E. Young (chairman), Acushnet Process Co., New Bedford, Massachusetts; Robert L. Rice, Hood Rubber Co., Boston, Massachusetts; F. H. Appleton, Jr., F. H. Appleton & Son, Inc., Boston, Massachusetts.

THE PREPAREDNESS PLAN.

Five hundred and twenty-one men connected with the rubber trade in different parts of the country have been nominated as members of the District Preparedness Committees planned by The Rubber Club of America, Inc., to secure the cooperation of the entire industry in this nation-wide movement for defense. Few of our important industries depend so completely upon imported raw material as does the rubber trade, and therefore this matter of national preparedness is a vital one to all connected with this trade. The plan of the Rubber Club is to so interest the rubber people in each city, town or district that local clubs or committees may be formed for the purpose of exerting a broad influence on public opinion in regard to national defense.

The Rubber Club, at its annual meeting last February, appropriated \$1,000 for the purpose of forming such local bodies, and supplying them with appropriate literature, posters and information. This fund is almost exhausted, and contributions are now being solicited by a circular letter sent, not only to members of the club, but to the trade generally.

RUBBER COMPANY DIVIDENDS.

At a meeting of directors of the Lee Rubber & Tire Corporation held on April 27, a quarterly dividend of 50 cents per share and an extra dividend of 25 cents per share was declared, payable June 1 to stockholders of record May 15.

On May 9 the directors of the Ajax Rubber Co., Inc., declared a dividend of 2½ per cent, payable June 15 to stockholders of record May 31.

The Hood Rubber Co. paid a regular quarterly dividend of 1¼ per cent on the preferred stock on May 1, to stockholders of record on that date.

RUBBER COMPANY SHARE QUOTATIONS

The following market quotations of shares of rubber manufacturing companies on May 25 are furnished by John Burnham & Co., 115 Broadway, New York City, and 45 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new).....	66½	68
Firestone Tire & Rubber Co., common.....	840	860
Firestone Tire & Rubber Co., preferred.....	113	114
The B. F. Goodrich Co., common.....	75	77
The B. F. Goodrich Co., preferred.....	114½	116
Goodyear Tire & Rubber Co., common.....	392	396
Goodyear Tire & Rubber Co., preferred.....	85	106
Kelly-Springfield Tire Co., common.....	71	73
Kelly-Springfield Tire Co., first preferred.....	95	99
Kelly-Springfield Tire Co., second preferred.....	300	300
Miller Rubber Co., common.....	115	115
Miller Rubber Co., preferred.....	88	88
Portage Rubber Co., common.....	107½	108½
Portage Rubber Co., preferred.....	83	84
Swinehart Tire & Rubber Co., common.....	54	55
United States Rubber Co., common.....	108	109
United States Rubber Co., preferred.....		

PERSONAL MENTION.

William S. Gordon, general representative of the General Rubber Co., New York City, returned last April from the Far East, and after a short visit to the home office, sailed on the 26th of that month for Manaus, Brazil, where he will relieve D. S. W. Aimers, the general representative there. The latter will leave for England on Mr. Gordon's arrival to join a British regiment and proceed to the front.

William A. Eden, secretary of the Canadian Consolidated Rubber Co., Limited, Montreal, married on April 20 Miss Mabel Spencer Henderson of that city. His friends and office associates presented to him a purse of gold on this occasion. The wedding trip was to southern cities.

R. C. Ritchie has been transferred to the main office of the Westinghouse Electric & Manufacturing Co., Pittsburgh, Pennsylvania. He was formerly in charge of the office of the automobile equipment sales service station of this company at Chicago, Illinois.

Henry G. White, formerly with the Panhard Oil Co., is now representing the Pennsylvania Rubber Co., covering the territory of New Hampshire and Vermont, with headquarters at the Boston, Massachusetts, branch, 735 Boylston street.

Russell Ward Earle, whose retirement from the firm of Earle Brothers, crude rubber dealers, was mentioned in the April issue of THE INDIA RUBBER WORLD, was married May 9, the bride being Evelyn, daughter of Mr. and Mrs. George W. Beavers, of New York City. The marriage ceremony was at the Church of the Heavenly Rest, and the wedding reception at the Ritz-Carlton Hotel, New York City.

Theodore Hofeller, president of Theodore Hofeller & Co., Buffalo, New York, has recently returned from California, where he and Mrs. Hofeller have spent over three months.

Warren MacPherson, proprietor of the Cambridge Rubber Co., Cambridge, Massachusetts, had a curious experience on the Fall River Line boat between Fall River and New York one day last month, having been attacked by a negro who broke into his state-room. Mr. MacPherson was obliged to pass several days at the Stillman Infirmary, Cambridge, nursing cuts and bruises received from the negro's blackjack. It is thought that no very serious results will follow.

Arthur C. Kingston has been appointed general sales manager of the Peerless Rubber Manufacturing Co., New York City. Mr. Kingston was formerly connected with the Revere Rubber Co. for 23 years, the greater portion of that time in the sales department, at Boston, Chicago, and the home office, Chelsea, Massachusetts.

The Barrett Co., New York City, is notifying its customers that owing to the greatly increased cost of drums, charges on 100 to 110 gallon drums have been advanced to \$15 each and on 50 to 55 gallon drums to \$8 each, and calls attention to the necessity that the drums be emptied and returned promptly.

Harrison Bros. & Co., Inc., Philadelphia, Pennsylvania, manufacturers of chemicals, acids and pigments, have removed their New York office to 80 Maiden Lane, to better serve the chemical trade.

In a recent decision upholding the decision of the commissioner of patents refusing registration to the word "Ford" as a trade-mark for rubber tires, the District of Columbia Court of Appeals held that a word which forms a part of a corporate name, even though written or printed in a peculiar and distinctive manner, is unregistrable as a trade-mark.

The Lancaster Tire & Rubber Co., Lancaster, Ohio, is adding additional tire building equipment and will manufacture an impression tread tire as well as its present "Wiregrip" tire.

MR. STEDMAN IN NEW YORK.

ALTHOUGH by birth, training and residence a Boston man, after the first of the present month, Arthur W. Stedman becomes a New Yorker. As manager of the crude rubber department of the Hagemeyer Trading Co., he will be found at 17 Battery place. For a right-hand man he has selected Lewis C. Duffy,

who was with him for 14 years, a part of the time at the Manaus branch. The whole trade know Mr. Stedman, as he has been an active factor in rubber for more than 25 years. At various times he has visited South America and Europe and has thus gained knowledge, friends, and established connections that are of great value. It will be recalled that at the great rubber exhibition in New York Mr. Stedman not only handled the crude rubber from Brazil, for which he was made

A. W. STEDMAN.

an honorary member of the Commercial Association of Manaus, he also took over all the plantation rubber that was sent in by the British Rubber Growers' Association and by many Far Eastern planters. His wise and businesslike handling of this brought him in intimate touch with the most important plantation interests, a connection that he has since kept up.

The Boston business Mr. Stedman has sold to the Rubber Importers' Selling Co., which will continue it at his aforesaid offices on Atlantic avenue.

BATAVIA RUBBER CO.

At the annual meeting of the Batavia Rubber Co., Batavia, New York, May 9, the following directors were elected: George W. Hodges, William H. Remick, W. P. Berrien, C. M. Marvin and S. J. Bailey. The directors then elected the following officers: George W. Hodges, chairman of the board; W. P. Berrien, vice-president; C. M. Marvin, treasurer; S. J. Bailey, secretary; William S. Whitman, assistant treasurer.

Plans are under way for the erection of a new office building, the present office space of the Batavia company being needed for factory purposes owing to increased business.

HALIFAX RUBBER CO. TAKES OVER PRENZEL COMPANY.

The Halifax Rubber Co., Halifax, Pennsylvania, has taken over the business of the A. H. Prenzel Rubber Co., of Halifax, with the intention of continuing the manufacture of surgeons' gloves and finger cots carried on by the latter company, and possibly branching out in other lines later on. The personnel of the Halifax Rubber Co. is as follows: John H. Klingman (president Halifax Chair Seat Co., Millersburg, Pennsylvania), president; A. M. Smith (Grain & Coal merchant, Halifax, Pennsylvania, and vice-president Halifax National Bank), vice-president; P. S. Hill (cashier Halifax National Bank), secretary and treasurer; James E. Neitz, manager. A. G. Bashoar, president Alvord Reamer Works, Millersburg, Pennsylvania, and controlling factor in the Millersburg Fifth Wheel Co., is also interested.

NEW INCORPORATIONS.

Federal Rubber Co., The, April 26 (Massachusetts), \$10,000,000. John E. Searle, Francis C. Gray, Branton H. Kellogg—all of 60 State street, Boston, Massachusetts. Principal address, Chicopee Falls, Massachusetts. To manufacture and deal in rubber, gums, rubber substitutes, etc. This company has been incorporated by the Fisk Rubber Co., Chicopee Falls, Massachusetts, to take over the Federal Rubber Manufacturing Co., Cudahy, Wisconsin, which the Fisk company recently acquired.

Acushnet Process Co., Inc., April 27 (New York), \$500. Samuel Wright, Vanderbilt avenue and Forty-fifth street, New York City; Theodore F. Furness, Cunwyd, and E. K. Monnington, Land Title Building, Philadelphia—both in Pennsylvania. A corporation formed to handle New York City business of the Acushnet Process Co., of New Bedford, Massachusetts.

Acme Tire & Rubber Co., Limited, March 3 (Ontario), \$400,000. Joseph Max Bullen, of McMaster, Montgomery, Fleury & Co., 44 King street, West; Francis H. Hurley, 32 Aberdeen avenue; Harold Learoyd Steele, 437 Broadview avenue, and others—all of Toronto, Canada. To manufacture and deal in tires and rubber goods and rubber substitutes of all kinds.

Beaver Mills Co., April 22 (Massachusetts), \$500,000. President, G. Ellsworth Huggins, 299 Broadway; James F. Bacon, George A. Butman, Arthur W. Clapp, F. Chester Everett—all of 77 Franklin street, Boston; Ernest S. McLean, Framingham. To manufacture tire fabrics. Principal address, North Adams, Massachusetts.

Boone Tire and Rubber Co., The, April 17 (Delaware), \$500,000. I. V. Maclean, F. A. Maclean, C. H. Isbell—all of Des Moines, Iowa. Principal address, Des Moines. To manufacture and sell all kinds of automobile tires, etc.

Borderland Tire Manufacturing Co., The, April 6 (New Mexico), \$150,000. J. Thomas Ward, H. M. Mandeville, Gerald H. Totten, Gus Manasse, John L. Burnside, J. C. Miller and F. W. Campbell—all of Las Cruces, New Mexico. Principal address, Las Cruces, New Mexico. To manufacture and deal in automobile tires and tubes, rubber hose and all other kinds and classes of rubber goods, etc.

Brookside Rubber Works, Inc., May 4 (New York), \$25,000. John McLaren, F. B. Knowlton, and E. M. Beyhl—all of 154 Nassau street, New York City. To manufacture rubber goods.

Cut Price Raincoat Co., Inc., May 8 (New York), \$2,000. Charles Henschke and Esther Henschke—both of 214 Rutledge street, and Max Baron, 34 Sumner avenue—all of Brooklyn, New York.

Carolina Tire Co., The, April 18 (South Carolina), \$1,000. J. M. Chapman, president and general manager; D. A. Childs, secretary and treasurer. Principal address, Columbia, South Carolina.

Central Tire Co., The, March 16 (Texas), \$12,000. Grover C. Shaw, Robert S. Yantis, W. S. Magee, and Charles K. Biggs—all of San Antonio, Texas. Principal address, San Antonio, Texas. To deal in automobiles, automobile tires, and accessories.

Delion Tire & Rubber Co., Inc., April 27 (New York), \$50,000. Henry A. Ludeke and Alma Ludeke, 170 Broadway, and Ira A. Worthington, 1791 Broadway—all of New York City.

Dayton Tire Co. of New Jersey, Inc., April 19 (New Jersey), \$10,000. Nathan Schwartz, 468 Washington avenue, Belleville; Frederick D. Ransley, 532 Central avenue, and Irving G. Farmer, Walnut street—both in Newark—all in New Jersey. Principal address, 445 Central avenue, Newark, New Jersey. To manufacture automobile tires and accessories.

Ferry Tire & Rubber Co., April 24 (Delaware), \$50,000. Olive C. Ferry and Mary H. Ferry, Middleberry Center, and Leon H. Klock, Wellsboro—all in Pennsylvania. Principal address, Cap-

ital Trust Co. of Delaware, Dover, Delaware. To manufacture and deal in all kinds of rubber tires and rubber goods.

Globe Tire Service Co., April 21 (Maine), \$10,000. Horace Mitchell (president), H. A. Paul (treasurer), M. G. Mitchell and Benjamin F. Bunker (directors)—all of Kittery, Maine. Principal address, Kittery, Maine. To acquire, repair, sell, and otherwise deal in automobile tires, etc.

Hawkeye Tire Co., July 19 (Iowa), \$500,000. John T. Christie, I. V. McLean, C. B. Hextell, T. H. Dexter, and E. G. Raffensberger. Principal address, Des Moines, Iowa. To manufacture automobile tires, casings and tubes.

Louisville Tire Co., April 4 (Kentucky), \$5,000. Aaron Kern, Ruby B. Kern, A. A. Ericson—all of Louisville, Kentucky. Principal address, Louisville, Kentucky. To deal in automobiles, automobile tires, etc.

Newsom Auto Tire Vulcanizing Co., April 27 (Tennessee), \$75,000. Thornton Newsom, Louis LeRoy, L. R. Forsick, Joseph L. McLean, Jr., and R. P. Cary—all of Memphis. To deal in automobiles, etc.

Oak Rubber Co., The, April 22 (Ohio), \$5,000. John C. Goodman, Paul E. Collette, Lem H. Oberlin, John Shira, and G. W. Auten. Principal address, Akron, Ohio. To manufacture and deal in toy balloons.

Palmer Tire & Rubber Co., May 5 (Delaware), \$500,000. Herbert E. Latter and Norman P. Coffin, Wilmington, Delaware; Clement M. Egner, Elkton, Maryland. Principal address, 394 duPont Building, Wilmington, Delaware. To manufacture and deal in gutta percha and all goods made therefrom.

Pharis-Packard Tire Sales Co., The, April 15 (Ohio), \$10,000. Glen Geddis, Lillian Chope, W. H. Hill, Howard W. White, H. R. Sproul. Principal address, Cleveland, Ohio.

Plantation Rubber Importers, Inc., April 29 (New York), \$50,000. John French, Robert N. Chambers and Henry H. Graff—all of 59 Wall street, New York City.

Quick Tire Service Co., April 3 (Illinois), \$5,000. Kirk S. Miller, Earl F. Miller, Anthon Miller and Thomas H. Edwards. Principal address, 1559 Michigan avenue, Chicago.

R. and O. Tire Co., Inc., April 25 (New York), \$2,000. Charles W. Rehmann and Thomas O'Mara, 240 West Forty-eighth street, and Irene V. Rehmann, 4250 Disney avenue—all of New York City. To manufacture and repair tires, etc.

Richmond Waterproof Products Co., Inc., May 2 (New York), \$25,000. Irving Johnson, Van Duzer street; George T. Simonson, 218 Richmond Turnpike—both of Tomkinsville, New York; and Alfred Falstraalt, 12 Archer Place, Jamaica, Long Island, New York. Principal address, Richmond Co., New York City. To manufacture cement, waterproof products, etc.

Savage Tire Corporation, March 8 (California), \$10,000. J. D. Spreckels (president); Arthur W. Savage (first vice-president); H. L. Titus (second vice-president); Claus Spreckels (secretary), Coronado, California; A. J. Savage (treasurer). Principal address, San Diego, California.

Southwestern Tire Manufacturing Co., March 2 (Oklahoma), \$250,000. W. A. McClelland, J. T. Wheatley, John L. McClelland, Charles W. Gunter and W. F. Westcott. To manufacture and deal in automobile tires, tubes, etc. Address, Colcord Building, Oklahoma City, Oklahoma.

Vargyas Safety Tire Co., The, May 2 (Delaware), \$100,000. Eugene Von Vargyas, Lawrence A. O'Dea, John P. Appleman—all of Washington, D. C. Principal address, Colonial Charter Co., 927 Market street, Wilmington, Delaware. To manufacture automobile tires and accoutrements.

White Tire Co., April 19 (Kentucky), \$10,000. Charles Dobbs, B. H. Plaskett, Emil Von Allen—all of Louisville, Kentucky. Principal address, Louisville, Kentucky. To manufacture and deal in automobile tires, etc.

Young Co., A. M., March 10 (Michigan), \$40,000. Arthur M. Young, Emanuel R. Kuhn and John J. Knight. To deal in the manufacture of metal and rubber specialties. Principal address, Kalamazoo, Michigan.

TRADE NOTES.

Pedro Rafecas is representing Rosenwald & Weil, the well-known manufacturers of raincoats and allied products, Chicago, Illinois, in Central and South America and Porto Rico.

The Dryden Rubber Co., Chicago, Illinois, has added a general line of typewriter accessories to its output.

The Walpole Shoe Supply Co., a subsidiary of the Revere Rubber Co., has been transferred to the new building at 60 High street, Boston, Massachusetts, and now operates as a department, under the name of the Revere Rubber Co. The supply department will continue under the direction of B. F. Chamberlain, formerly manager of the Walpole Shoe Supply Co.

The Ravenna Rubber Co., Ravenna, Ohio, notice of whose incorporation appeared in the April issue of THE INDIA RUBBER WORLD, has purchased a four-story building containing about 45,000 feet of floor space and land covering $3\frac{1}{2}$ acres to allow for future additions. The building is being equipped as a factory for the manufacture of rubber sundries. The company expects to be producing several lines by the middle of the month and to be equipped for full operation before the end of the year.

The Eureka Rubber Manufacturing Co., Inc., rubberizer of textiles for the rubber raincoat manufacturing trade, formerly of 89 Hope street, Brooklyn, New York, has moved to larger and better quarters at Fourth avenue and Eighth street, College Point, New York. Arthur C. Squires, rubber expert, has laid out the plant, to which have been added washers, mills, and a battery of five dry heat vulcanizers. The company will wash and dry crude rubber for the trade; will compound, mill and vulcanize stocks by the vapor, dry heat or open steam processes. Single and double surfaced white sheetings, auto top fabrics and transparent babing cap fabrics will also be added to the output of the factory.

Richter & Co., Hartford, Connecticut, have obtained control of 4,200 of the 5,000 shares of the Omo Manufacturing Co., maker of dress shields, hospital sheeting and general sanitary goods at Middletown, Connecticut. The annual meeting of the Omo company was held May 17, at which the following board of directors was elected: W. C. Fisher, Russell Manufacturing Co., Middletown; Edward M. Day, Hartford; James W. DeGraff, selling agent of Omo Manufacturing Co., Plainfield, New Jersey; Ferdinand Richter, Hartford; G. Lloyd Jones, Middletown; Arthur G. Woolley, Hartford; H. M. Burr, Middletown. Later the following officers were elected by the directors: Edward M. Day, president; G. Lloyd Jones, vice-president; H. M. Burr, treasurer; T. H. Barbour, secretary.

The entire business, patents, registered trade-marks and good will of the National Cement & Rubber Co. and the New Process Vulcanizer Co., both of Toledo, Ohio, have been purchased and the entire plants removed to Cincinnati, Ohio, where in future the business will be carried on under the name of the National Rubber Specialties Co., manufacturing a large variety of cements, oils, enamels, vulcanizers, and similar goods for cycle and automobile supplies. The company's address is 4433-49 Chickering avenue, Cincinnati, Ohio.

The Columbus Rubber Co. of Montreal, Limited, is now controlled by the Canadian Consolidated Rubber Co., Limited, Montreal, Canada. A meeting of the directors of both companies held in New York City during Easter week to discuss the terms of sale of stock resulted in the purchase of 2,250 shares of the Columbus Rubber Co.'s stock by the Canadian Consolidated company, thus securing a controlling interest.

SUPERINTENDENT GRANBY RUBBER FACTORY.

CHARLES K. HUTCHINSON, superintendent of the Granby rubber factory of the Canadian Consolidated Rubber Co., Limited, started his business life after graduating from the high school at New Haven, Connecticut, his native city, as an apprentice in a merchant tailoring establishment, but after duly qualifying as a "knight of the needle and shears," he deserted

CHARLES K. HUTCHINSON.

that business in 1892 to become shipper in the L. Candee & Co. factory. Later he became cost clerk, which position he held for ten years, and in September, 1907, he went to Canada to become superintendent of the Granby rubber factory. When that factory was shut down three years later, Mr. Hutchinson was transferred to the head office of the Canadian Consolidated Rubber Co., Limited, at Montreal, as factory cost accountant. In 1915 he was appointed superintendent of labor and efficiency for the company, a position which he filled with thoroughness and ability, and when the Granby factory was again opened, because of the great increase of orders for footwear, partly caused by the demands of the Canadian government for its troops sent to the European war, Mr. Hutchinson was again appointed superintendent, thus returning to the scene of his earlier success. Mr. Hutchinson in his youthful days was an active member and officer in the Connecticut National Guard, later joining the State Naval Militia, and during the Spanish-American war enlisted for active service in the United States Navy. He maintains that his military and naval experience in handling men has greatly helped him in the positions which he has held. He is receiving many expressions of congratulation on his recent transfer to Granby.

THE RUBBER HEEL CLUB OF AMERICA.

At the recent convention of the National Leather and Shoe Finders' Association at Richmond, Virginia, representatives of several rubber companies, which are members of that body were present and formed another association under the name of the Rubber Heel Club of America. The members of this club are: Elastic Tip Co., Boston, Mass.; Essex Rubber Co., Trenton, N. J.; Federal Rubber Co., Milwaukee, Wis.; Foster Rubber Co., Boston, Mass.; O'Sullivan Rubber Co., New York City; Panther Rubber Manufacturing Co., Stoughton, Mass., and Plymouth Rubber Co., Canton Junction, Mass. George A. Stetson, of the Elastic Tip Co., was elected president, secretary and treasurer. The full details of the organization have not yet been perfected, but its objects cover the correction of trade evils and abuses, the education of the general public in the use of rubber heels, and the general improvement of the rubber heel industry. The secretary's address is, Care of Elastic Tip Co., 370 Atlantic avenue, Boston, Massachusetts.

TRADE NOTES.

The U. S. Rubber Reclaiming Co., Inc., New York City, is adding to its factory at Buffalo, New York, a storehouse, 150 x 150 feet, equipped with electric cranes for handling scrap, with a capacity of about 3,000 tons. Ground has also been broken for a new mill at Buffalo, which will be three stories and basement, 150 x 100 feet. The storehouse will be completed within two months, and the mill in the early fall.

We understand that W. M. Mackintosh, inventor of "Galbulose," and who has recently been connected with the Columbus Rubber Co., Montreal, Canada, contemplates starting a factory in the neighborhood of that city for the purpose of treating fabrics with his process, which renders cloth substances so treated waterproof, rot and mildew-proof, and is guaranteed an absolute repellent, and of special value at the present time for treating fabrics for army blankets, tents, ponchos, etc. Mr. Mackintosh is a thorough rubber man. He started with the North British Rubber Co. in 1880 and was with them ten years, after which he was with several Continental and European rubber factories, returning to England and later coming to this country and to Canada.

Joosten & Janssen, rubber brokers, Amsterdam, Holland, have established a branch office at 15 William street, New York City, which will be in charge of Ernest Janssen, one of the partners, and A. F. Baarslag.

The Charles Harley Co., of San Francisco, among the largest operators on the Western coast in scrap rubber and other materials, has opened a New York office in the Woolworth building. H. Greene, well known in waste rubber circles, is the New York representative.

The Berkshire Rubber Co., of Akron, Ohio, has changed its name to the Scioto Rubber Co. and is now located at Columbus, Ohio, at Fifth avenue and the Big Four Railroad. Installation of machinery is completed and the company will manufacture rubber heels, toy balloons, rubber fabric and novelties of all kinds. It is the first rubber factory to locate in Columbus.

The Republic Rubber Co., Youngstown, Ohio, has placed on the market a new black tread tire of remarkable strength and toughness. It is made of their exclusive Prodim Process Rubber or "Prodim." The characteristics of this new triumph in compounding are wonderful tensile strength; practical freedom from cutting or chipping on rough stony roads; remarkable resiliency; smooth wearing; heat resisting quality and light weight.

Rosenwald & Weil, Chicago, Illinois, report having sold 250,000 yards of rubber sheeting and considerably more than 1,000,000 yards of other goods within a year. This concern has recently organized a new department in the plant for calendaring cloths. This is in addition to its regular business of proofing cloth for the trade and the manufacture of a regular line of men's raincoats and similar garments. This firm is rapidly establishing agencies throughout the United States for the products turned out in its establishment.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has sent to the trade an announcement, effective May 15, of a reduction of prices on its Vacuum Cup and Ebony Tread tires, claiming that although the tendency of the market in many raw materials is, in a general way, distinctly upward, the saving effected, through improvements in its new plant, resulting in a largely increased production, has enabled the company to make this change in prices. Prices on their Paruco Gray and Puregum tubes are unchanged.

A drawback allowance was granted on May 24 on dress shields manufactured by the I. B. Kleinert Rubber Co., New York City, with the use of imported silk piece goods after the same have been dyed for its account by the United Piece Dye Works, Lodi, New Jersey.

FIRESTONE TRUCK TIRES ADAPTED TO RAILWAY TRACKS.

THE adaptation of the automobile to run on standard gage railroad tracks is an accomplished fact. A Riker truck, made by the Locomobile Co. of America recently ran from Columbus, New Mexico, to El Paso, Texas, 93 miles, at an average speed of 18 miles an hour actual running time, carrying 20 soldiers and

MOUNTING SPECIAL TIRE FLANGES.

a machine gun. On its arrival, the steel rims were removed and the truck proceeded on its pneumatic tires to the hotel in El Paso, where Generals Scott and Funston made a careful inspection of the vehicle. General Scott and his engineers pronounced the test to be most satisfactory. The truck left El Paso the same evening for the return trip to Columbus, which was accomplished without incident.

A number of these trucks, equipped with Firestone tires, are to be used by the United States Army in Mexico, below Cases Grandes, where Gen. Pershing controls the railroad. They are equipped with flanged steel rims, fitted over the wheels, which take the rails the same as a locomotive wheel. These rims can be carried on the truck while on regular road service, and when desirable to run the truck over the railway lines, the flanges can be fitted over the tires of the truck wheels, in 15 minutes, and the truck is ready to take the rails under its own power. The

MOTOR TRUCK MOUNTED ON RAILS.

device was invented and developed by A. L. Riker, vice-president and chief engineer of The Locomobile Co. of America. His achievement opens up a new and important field of endeavor for the gas motor truck. Mr. Riker is chairman of the Committee on Internal Combustion Motors of the United States Naval Advisory Board.

TRADE NOTES.

Taylor, Armitage & Co., Inc., well-known dealers in tire fabrics of every description, and selling agents for the American Tire Fabric Co. and the Passaic Cotton Mills, have removed their offices from 346 Broadway to the Equitable Building, 120 Broadway, New York City.

The Newark, New Jersey, branch of the McGraw Tire & Rubber Co., East Palestine, Ohio, is being newly equipped with a 200-ton tire press and other machinery. A full stock of all sizes of McGraw tires will be carried, in both the European and new S. A. E. American types. F. B. Geary, formerly with the Kelly-Springfield Tire Co., has been made manager of this branch, succeeding W. P. Fraley. P. E. Hulick has been advanced to the position of office and service station manager.

The Fisk Rubber Co. of New York has opened offices at 11 Broadway, Bowling Green Building, for the handling of its export trade.

At the first meeting of the directors of the Hartford Rubber Works Co., Hartford, Connecticut, following the annual meeting on April 26, Charles B. Whittlesey was elected president, succeeding E. S. Williams. Mr. Whittlesey became connected with the Hartford company 15 years ago as clerk and has risen through successive stages to his present prominence. The other officers are as follows: Ernest Hopkinson, vice-president, New York City; James P. Krogh, treasurer, Hartford, Connecticut; John D. Carberry, secretary, New York City.

At a meeting of the board of directors of the Motor & Accessory Manufacturers held in New York City May 5, H. E. Raymond and C. E. Whitney resigned as members of the board. W. O. Rutherford, general sales manager of The B. F. Goodrich Co., Akron, Ohio, was elected to fill Mr. Raymond's unexpired term as a board member, as well as an executive committee member. The president also appointed him a member of the finance committee. The election of Mr. Whitney's successor was postponed. Christian Girl was made a member of the show and allotment committee.

At a recent meeting of The Motor Tire Reconstruction Co., Norwalk, Connecticut, the following officers and directors were elected: Richard Tjader, retired banker and African explorer, president and director; M. D. Randall, vice-president Mianus Manufacturing Co., Greenwich, Connecticut, vice-president and director; W. E. Goldsborough, consulting engineer, New York City, treasurer and director; R. S. B. Perry, physical director, Montclair, New Jersey, secretary and director; F. C. Goodyear, manager Royal James Inn, Norwalk, assistant secretary and director; Charles D. Burns, Secretary of State of Connecticut, and Joseph J. Ryan, son of Thomas Fortune Ryan, financier, directors.

Joseph Woodwell & Co., Pittsburgh, Pennsylvania, have arranged with the Federal Rubber Manufacturing Co., Cudahy, Wisconsin, to act as distributor of Federal tires in that territory. The Woodwell company will take care of all adjustments, thereby doing away with any possible delay. Harry Webb is manager of the automobile department.

At a recent meeting of the board of directors of the Alliance Rubber Co., Alliance, Ohio, W. H. Christensen, superintendent of the company, was elected to the board to fill the vacancy caused by the death of G. C. Russell, late president. J. C. Shiveley was elected president and treasurer, Milton Bejach, vice-president and general manager, W. H. Christensen, secretary, and John B. Pow, assistant treasurer. The Alliance company's statement to the board and stockholders of April 1 shows a 1500 per cent increase in business over the corresponding period of 1915, the chief lines of manufacture now being

automobile tires and inner tubes, although some mechanical goods are also manufactured.

The Giant Rubber Co., Carlstadt, New Jersey, notice of whose incorporation appeared in last month's issue of THE INDIA RUBBER WORLD, has begun operations in a plant consisting of a two-story building with extension covering an entire block. The factory is being fully equipped for the manufacture of various soft rubber goods, such as gloves, tubing, nipples, bags, etc., and a specialty will be made of the manufacture of inner tubes for automobile tires. For the present, the selling office of the company will be maintained at 217 Mercer street, New York City.

The Perfection Tire & Rubber Co., with factories at Fort Madison, Iowa, and offices in the Marquette Building, Chicago, Illinois, has leased the premises at 1002 Michigan avenue, in the latter city, for the distribution of its product in Chicago and northern Illinois.

The Connecticut Mills Co., Danielson, Connecticut, maker of tire fabrics, has acquired the Nemasket Spinning Mill at Taunton, Massachusetts, which will be promptly equipped for a maximum production of 6,000,000 pounds per annum, which will give that company its own spinning capacity for about one-half of its weaving production at Danielson. The strike at the latter mill, although not entirely overcome, is in process of adjustment.

The new owners of the Beaver Mills, North Adams, Massachusetts, will make a line of tire fabrics which will require much new machinery. Carding and twisting machinery from the Saco-Loell Shops is being installed and Whittin combers. The mill will be operated in future by leased hydro-electric power from the Connecticut Power Transmission Company. The New York office of the Beaver Mills is at 299 Broadway.

THE MICHELIN AMERICAN PLANT.

A good year's work is shown in the Michelin Tire Co.'s plant at Miltown, New Jersey, ground for which was broken on June 3 of last year, and seven of the buildings being now completed and the eighth probably finished within the present month. The plant, when completed, will have about 8½ acres of floor space and it is claimed to be the largest tire plant in America. The property consists of about 80 acres of ground on which were four large buildings which had been used by the International A. & V. Tire Co. It was decided to use these only for storehouses and offices, and the eight new buildings mentioned have therefore been built for the factory. It is stated that when this manufacturing plant is completed no visits of inspection will be allowed, this being the Michelin inflexible policy and the rule in all of his plants in France, England and Italy. Indeed it is said that at one time the Queen of Italy desired to inspect the processes of manufacture at the Turin factory but permission was refused.

CANNOT REGISTER "NOBBY" IN AUSTRALIA.

The United States Rubber Co. was especially fortunate in its choice of the word "Nobby" as a trade-mark for one brand of its tires, inasmuch as there is a double meaning attached to the word, one meaning aristocratic or elegant and the other really descriptive of the tread, which is covered with knobs. When this company applied for registration of this word as a trade-mark in Australia the examiner objected on the ground that the word was descriptive of the character and quality of the goods, since it was commonly accepted as meaning, having an aristocratic appearance, showy, elegant, fashionable, smart. An appeal was taken to the registrar, but he sustained the decision of his subordinate, basing his opinion on the definition of the word in the Century dictionary.

PERSONAL MENTION.

Lloyd L. Seaman has been made district representative for The Knight Tire & Rubber Co., Canton, Ohio. Mr. Seaman's territory will cover the western and northern parts of New York State, with headquarters at Syracuse.

George W. Larkin, formerly with The B. F. Goodrich Co. at its Milwaukee, Wisconsin, branch, has been placed in charge of the tire department of the Woodward Tire & Repair Co., Detroit, Michigan. The Woodward company acts as distributor of the Miller tire, and although the tire end of the business is the principal feature, a completely equipped accessory stock is also carried by this company.

J. D. Hess, Jr., is now manager of the Cleveland, Ohio, branch of the Firestone Tire & Rubber Co., Akron, Ohio, having been for three years a salesman in the Detroit, Michigan, branch.

E. D. Hensley has been appointed resident manager of the Dayton, Ohio, branch of the United States Tire Co., New York City, having been a traveling salesman for the company since 1913.

George L. Sullivan, formerly associated with a prominent advertising agency in New York City, assumes the office of advertising manager of the Fisk Rubber Co., Chicopee Falls, Massachusetts, on June 1. Mr. Sullivan's experience as advertising man for the Boston Woven Hose & Rubber Co. and later in advertising and in the establishment of agencies with the American Locomotive Co., as supervisor of branches and manager of the Chicago, Illinois, branch of the latter company, renders him peculiarly fitted for his new position. Miss M. G. Webber, who has supervised the Fisk company's advertising in the past and who has been responsible for many of its unique ideas, and George B. Hendricks, who has been in charge of the publicity department, will act as assistants to Mr. Sullivan.

E. T. Battin has been elected a member of the board of directors of the Midcontinent Tire Manufacturing Co., Wichita, Kansas.

A. S. Hetzell, formerly connected with The Knight Tire & Rubber Co., Canton, Ohio, has been appointed sales manager of The Mason Tire & Rubber Co., Kent, Ohio.

J. W. Alexander has been appointed superintendent of the auto tire duck department for the new mill which is being built at Lawrence, Massachusetts, by the Arlington Mills.

MARATHON TIRE COMPANY CHANGES.

H. H. Replogle, formerly manager for The Marathon Tire & Rubber Co., Inc. of New York, at Omaha, Nebraska, has been made manager of sales, with headquarters at the home office of the company at Cuyahoga Falls, Ohio.

G. R. Howell, who has been representing the Marathon company in Iowa, has been promoted to the division managership at Omaha.

C. M. Folger, Southern representative for Marathon tires, has been made division manager at San Francisco.

NEW BALTIMORE BRANCH FOR FIRESTONE.

A thoroughly complete and up-to-date branch has been established by the Firestone Tire & Rubber Co., Akron, Ohio, at Baltimore, Maryland, in the new Walter Scott building on St. Paul street at Mount Royal avenue. This branch is well equipped to care for the demands from the territory it covers, including Maryland, Virginia, parts of West Virginia and half of North Carolina. It occupies 16,000 square feet of space, 4,000 square feet being used for the offices, which are furnished in quartered oak, with quartered oak wainscoting and terraza floor. A garage occupies 3,000 square feet on the first floor. This is to be used for motor trucks and contains a hydraulic press of 200 tons' capacity for solid tires. E. R. Leisure, the manager, came to Baltimore from Salt Lake City, Utah, where he formerly managed the Firestone branch in that city.

RIGHTS OF TIRE DEALERS IN NEW ZEALAND.

A litigation affecting tire importers and exporters and of interest to the tire trade generally was recently decided in New Zealand.

The Dunlop Rubber Co. of Australasia, Limited, has the sole right of manufacturing and selling Dunlop tires in Australasia and New Zealand. Certain concerns, however, imported English-made Dunlop tires into New Zealand without the consent of the Australasian company. The latter, after repeated warnings, brought suit against the importers. The Supreme Court of New Zealand held that the trading rights of the Dunlop Rubber Co. of Australasia, Limited, should be protected and issued a permanent injunction against the defendants, restraining them from selling, offering or advertising for sale any goods under the name "Dunlop" other than those made by the Australasian company. Further, the defendants were ordered to pay the costs of the litigation in addition to a substantial sum for damages.

THE J. & D. TIRE & RUBBER CO.

The directors not named in the incorporation notice of the J. & D. Tire & Rubber Co., Charlotte, North Carolina, appearing in the May issue of THE INDIA RUBBER WORLD, are as follows: H. S. Leyman, Thomas J. Northway, L. A. Folger, J. D. McCullough and E. Thomason. H. O. Smith, president of the company, first entered the rubber business in 1893. He was one of the organizers of the Indianapolis Rubber Co., remaining with that company about 13 years. The Indianapolis company and one other concern were the only manufacturers of the Gormully and Jeffery tires until the G & J patents were sold and the G & J Tire Co. was organized, with Mr. Smith at the head. The other officers of the J. & D. Tire & Rubber Co. are: Thomas J. Northway, vice-president; C. C. Coddington, treasurer, and L. A. Folger, secretary.

The J. & D. company is erecting a new plant consisting of three buildings, all of concrete construction. A one-story vulcanizing room will be located between the two main manufacturing buildings. Electric drive will be employed throughout and automobile tires of the conventional types will be manufactured.

SOME TIRE DON'TS.

The touring season being almost here, The B. F. Goodrich Co., Akron, Ohio, urges motorists to give the proper care to their tires by heeding the following:

- "Don't overload your tires.
- "Don't underinflate.
- "Don't neglect small cuts.
- "Don't run in ruts, car tracks or against curbing.
- "Don't start or stop suddenly or skid around corners.
- "Don't let oil, grease or gasoline remain on your tires. Wash only with pure, cold water and a little soap.
- "Don't keep a spare tire out of use too long. Change over occasionally.
- "Don't let your rims get rusty. Common stove polish will keep them in good condition.
- "Don't let the weight rest on a deflated tire. Jack up the wheel or remove the tire.
- "Don't pinch the inner tube, when applying or removing an outer casing. Pass the hand around inside before re-applying the outer bead. Don't try to force a tire onto the wheel. If it goes unusually hard, look for some trouble."

The Trainer Spinning Co., Trainer, Pennsylvania, is now producing tire fabrics, additional equipment consisting of twistlers and looms having been added, and a warehouse built.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Machinery; Rubber Trade Directory.

GOODRICH NEW QUARTERS AT BUFFALO.

The Buffalo, New York, branch of The B. F. Goodrich Co., Akron, Ohio, has been removed from 731 Main street, to 1050 Main street, in the building formerly occupied by the Ford Motor Co. This change of location brings the Goodrich company more nearly in the center of the automobile district and adds materially to the office space, the general arrangement of offices being such that trade can be handled to better advantage. The building is particularly well heated, ventilated and lighted, thus benefiting the comfort and efficiency of the employees, and a 2-ton elevator is a material aid in rendering prompt service. The truck tire department is exceptionally well equipped and the company is able to handle a great many more trucks per day than was possible in the old location.

RUBBER ARMOR FOR AUTOMOBILE TIRES.

An armor or cushion intended to be inserted between the inner tube and the shoe of an automobile tire is shown in the accompanying illustration. It is claimed that this makes the tire puncture proof, non-collapsible, and that it cannot blow out, and the resilience is greater than in tires not thus provided. Besides this, being self-ventilating, the tire is prevented from heating. This device consists of a rubber cushion having a T-shaped head which presses upon the inner surface of the tire; flanks or sides of the armor which prevent the tire from collapsing, and serve as a protection for the tire and tube; and air channels which it is claimed prevent the tube and tire from heating. It is claimed that the T head prevents the tire from flattening and that it will stay at the same radius, making the running and steering of the car easier; that the tire and tube will flatten less from the weight, and that the inner tube need not be pumped up as hard as under the present system without the "Armor." [C. C. Wais, Oakley, Ohio.]

THE LUCK PNEUMATIC TIRE AND RIM.

This is called the botherless tire, because the casing and inner tube are protected against puncture by an extra heavy rubber tread and metal side flanges. The tire itself is built very much

like an ordinary pneumatic tire, with several plies of frictioned fabric, heads of the usual clincher sort and an inner tube. But the actual difference is apparent in the accompanying illustration, and the following explanation:

The sides of the tire are protected by curved flanges, one of which is shown at *A*, that prevent blow-outs, punctures and side strain. The body of the tire *B* is made up of five plies of frictioned fabric and the space *C* provides for the expansion of the side walls under compression. The inner tube *D* is very similar to those used in the ordinary casing, but of a special construction adapted to the peculiarities of the casing.

The steel flanges are bolted to the felloe *E* by eight bolts *F* that likewise hold the two flanges in place, the heavy, extra thick tread *G* acting as a protector to the casing, preventing blowouts, rim cuts, blisters and punctures. [Luck Tire Manufacturing Co., Jonesville, Michigan.]

SEIBERLING, STEVENS AND STATE PATENTS VALID.

An opinion in favor of Frank A. Seiberling, president of the Goodyear Tire & Rubber Co., has been handed down by Judge J. M. Killits late in April, in the suit against the Firestone Tire & Rubber Co., charging infringement of the Seiberling, Stevens and State tire-making machine patents Nos. 725,135, 726,561 and 941,962. The court held the Seiberling-Stevens patents valid and that they were infringed by the Firestone company. The suit was in the United States District Court for the Northern District of Ohio, Eastern Division, at Cleveland, Ohio.

In reviewing the patents, Judge Killits found that their outstanding and unique feature was the provision of methods for taking straight fabric and so stretching and forming it that it would take a cylindrical shape.

Says the judge: None of the alleged anticipations was either intended to produce nor had the capacity to produce one important result which is one of the *desiderata* aimed at both by the patentees of the grants in suit and the defendant, namely, to lay down the fabric so that a structural rearrangement thereof would be brought about to meet most efficiently the changing direction of strain to which a tire is subjected in use, circumferential, transverse, and, to some extent at least, torsional.

That these inventions so operate to stretch the fabric circumferentially of the tire and also on the wings of the fabric, as it is being laid down, in the direction of the radius of the circumference, and that these results are highly desirable in an efficient product, no one has very effectively disputed.

In view of the working of plaintiff's Exhibit "32" in the presence of the Court, and of the testimony of Hall that this exhibit was made exactly after the detail of drawings in the Seiberling and Stevens' patent in suit, and of the product of this exhibit in practical use shown in evidence, and further, in view of the state of the art at the time the Seiberling and Stevens' application was made, we feel justified in concluding that their invention was not only the first practical invention to produce mechanically automobile tires having the qualities of service demanded in the use thereof, which qualities were peculiarly the fruit of mechanism effecting the rearrangement of cords to meet the various directions of stress, above alluded to, but that it employed therefor novel and patentable combinations of mechanical elements; that it was decidedly an advance step in the art and so far occupying the field that it anticipated in a large measure both the State and Stevens' inventions.

In fact, we regard the Seiberling and Stevens' mechanism so nearly pioneer invention that the claims of the patent grant therefor should receive liberal interpretation, and we are forced to hold that the three sued upon, Nos. "1," "2" and "14," are valid.

BRITAIN WILL CONTINUE TIRE IMPORTATIONS.

On May 4 a further extension of British embargo lists against importation of various articles was received by the State Department at Washington, to the effect that the British Board of Trade would restrict the importation of many lines of manufactured goods, among them rubber tires and tubes for motor cars and motorcycles. The reason given for this was because of the shortage of tonnage and the necessity of restricting imports to necessities, mainly coal, grain, fuel, timber, munitions, etc. The effect of this decree, which was to go into effect May 12, upon British industry would have been serious for numerous dealers who have existed during the past year or two almost entirely by the sale of American automobiles and tires, and it was stated that if the prohibition was maintained for a year or more, several of the big London agencies would be forced to close down, causing an almost complete stagnation of highly developed British branches maintained by several American tire manufacturers. However, a later despatch states that Walter Runciman, president of the Board of Trade, has announced that motor car tires would not be included in the lists of articles whose importation is prohibited. Arrangements made with manufacturers of rubber goods in the United States led to the decision that the proposal to include tires in the embargo should be abandoned.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

ACCORDING to estimates of the city building department, nearly \$5,000,000 worth of building is under way in Akron, and it is estimated that factory additions alone will total over \$2,500,000 before they are completed. Even at this rate, houses are not being built fast enough to accommodate the hundreds of workers and their families who are pouring into the city every week in response to manufacturers' calls for help.

The rate of tire output at the plant of The B. F. Goodrich Co. is now 17,000 tires daily, last year's record output being 14,000 daily.

An application for a trade-mark consisting of a tire with a black tread with red side walls has been opposed by the Goodrich company, which claims rights to a mark consisting of a black tread, intermediate to circumferential bands of contrasting color or colors, these colors being especially light gray or white. The Goodrich company also claims to have been the first to use red side walls with a black tread, and this contention has been sustained by the Examiner of Interferences.

People in various parts of the United States are familiar with the guide posts which have been erected by the Goodrich company. It is stated that this company has erected nearly 85,000 such guide posts, each individually labeled. Most of these, of course, are in the United States on principal highways, but the northern and southern national boundaries have been passed in some cases in the erection of these valuable guide posts, each of which is also a good advertisement for the company.

W. H. Yule, formerly manager of the New York branch of the Goodrich company, has been made sales manager of the mechanical department at the home office, in which capacity he will be an immediate assistant to W. O. Rutherford, general sales manager, handling the general mechanical specialties of the company in hard rubber, wire and clothing, his work paralleling that of H. C. Miller, who is sales manager of the tire department. Mr. Yule was graduated from Harvard in 1906 and has been directly and indirectly connected with the automobile industry ever since. He is succeeded in New York by H. J. Morehead, who was formerly in charge of the Detroit branch of the Goodrich company.

F. A. Seiberling, president of the Goodyear Tire & Rubber Co., and A. B. Jones, of The B. F. Goodrich Co., were delegates to the National Conservation Congress held in Washington last month.

A new \$30,000 library building recently opened to the students of Akron University was a gift from F. H. Mahon, of The B. F. Goodrich Co., and F. A. Seiberling, of the Goodyear Tire & Rubber Co.

M. A. Flynn, superintendent of The B. F. Goodrich Co., and W. M. Metzler, superintendent of the mechanical goods department of the Goodyear Tire & Rubber Co., represented their respective factories at the State Convention of the Knights of Columbus held in Akron the early part of last month.

The Goodyear Tire & Rubber Co. has dedicated to "The Old Guard," an organization of their old employees who were with the company when P. W. Litchfield, present factory manager, assumed charge 16 years ago, an eight-story tower carrying a huge clock, which will inform all the residents of the city of the time of day. These old employees will hold their annual dinner hereafter in the Old Guard Tower.

The annual relief association picnic of the Goodyear company will be held at Cedar Point on June 24. Eight trains with a

total of 80 coaches will be used to transport the 5,000 employees who will attend the outing.

M. E. Morris, formerly Pacific Coast manager for the Good-year company, has been made manager of the salesmen's department of the Akron factory.

On June 2 a meeting of the stockholders of the Miller Rubber Co. is to be held to approve the action of the board of directors to increase its present capital stock of \$2,000,000 to such amount as may be determined upon at that meeting. It is understood that if this action is taken, a stock dividend of 66 2/3 per cent will be declared to the common stockholders, provided they will waive their right to subscribe to a proposed new issue of preferred stock to the amount of \$2,500,000, and to consent that the same may be sold by the directors at par, or better. The board of directors has also decided to retire all the present outstanding preferred stock at the price at which it is redeemable, namely, \$120 per share. It is stated that the proposed increase of capital is for the purpose of taking care of rapidly enlarging business, sales for the past six months having increased more than 100 per cent over the same period the previous year.

The American Rubber & Tire Co. is erecting a two-story addition to its plant.

In a spacious laboratory connected with the factory of the Firestone Tire & Rubber Co. and equipped with every modern device to aid in rubber research, H. W. Kugler, head chemist of the company, produces, studies and selects the ingredients and compounds that are used in the manufacture of Firestone tires and tubes. Mr. Kugler's early training especially fits him for this important work. He was born at Barnesville, Ohio, and at an early age went to England. Some years later he entered the Manchester Technical School, remaining there for four years. Immediately thereafter he spent three years as chemist with Dr. Liebman, of Manchester, and in June, 1909, became head of the chemistry and experimental department of the Firestone factory.

H. W. KUGLER.

Charles E. Wood, crude rubber operator, of 24 Stone street, New York City, has opened an Akron office at room 504 Hamilton Building and will be represented there by Walter H. Bass. Mr. Bass, who is a graduate of Princeton College, has been in the employ of Mr. Wood for some time, having been connected with the home office.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

WE do not find people in any branch of the rubber business complaining of lack of trade. Of course, the boot and shoe industry will now have a little lull, for the retail merchants who proposed to take advantage of the extra discount have already sent in their orders, and the jobbers have now a month during which to forward their orders previous to the expiration of the time limit. There seems to be some let-up as regards tennis orders, but all factories are still at work on goods previously ordered, and are rushing them out as fast as possible. In the clothing business trade has been unusually good, and the demand for goods for fall delivery continues to such an extent that some of the manufacturers are practically swamped with orders. Tire manufacturers are busy with more than seasonal demands. In fact, while there are some reports that the higher

price of gasoline has deterred people from buying new automobiles, it is evident that cars already in use are being run and new tires are in demand. In mechanicals, business is quite active in some departments. There is not a seasonable demand for hose, especially of the garden variety, as distributors' stocks are pretty large, last summer being a poor season for retail sales. Drugg sundries are more than normally active. Belting is having a boom because of the high cost of leather, and many manufacturing establishments are adopting rubber belting experimentally, which, it is believed, will result in its far wider use, later.

The Boston Woven Hose & Rubber Co. has recently completed two fine examples of factory structures of reinforced concrete. One which will be used for additional manufacturing facilities, has four stories and basement and is 204 feet long by 60 feet wide. It has a floor area of nearly 55,000 square feet. In the center a bay extends the full length of the building in which there is a traveling crane. The other building, which is a storage warehouse for manufactured goods, has also four stories and basement and is 155 x 60 feet, the floor area being nearly 45,000 square feet. These new buildings are connected with other buildings of the factory by tunnels.

The moving picture demonstration of the workings at the Boston Woven Hose company's plant, together with the lecture delivered by Ralph E. Conder, of its advertising department, is giving this company some effective publicity. Mr. Conder has been invited to deliver this lecture before a number of clubs and educational institutions, with the result that the manufacture of rubber goods is being more widely understood and the company gains valuable advertising for the many specialties it manufactures.

* * *

The plant and machinery of the Eastern branch of the St. Louis Rubber Cement Co., at West Lynn, Massachusetts, has been purchased by the National Adhesive Co., a Massachusetts concern capitalized for \$15,000, which is to manufacture rubber cements, stams, inks and adhesives for the shoe trade. This company will have branches in Haverhill and Brockton, Massachusetts, and in Auburn, Maine. E. F. Olson is president, E. J. Looke, treasurer, and W. O. Hadley, general manager.

* * *

The Monaquiot Rubber Works Co., South Braintree, recently gave its employees a voluntary increase in wages, amounting to ten per cent. This is in line with the company's policy of sharing with its organization in the advantage resulting from general business conditions. Plans are under way for the erection, on the company's property, of model homes which will be for the exclusive use of its employees. The allotment which is being thus developed is a very attractive plot of about 12 acres lying across Monaquiot Pond from the factory buildings and its situation makes it ideal for the purposes contemplated by the company.

* * *

One of the most serious labor disputes in this State this year was the strike of 2,600 employees of the Fisk Rubber Co., at Chicopee Falls, which has been happily settled. The strikers returned to work on May 22, after having been out, or at least a portion of them, since the middle of March. For some time, in spite of negotiations, a deadlock had existed and it was not until about the 20th of May that an agreement could be secured. The settlement of the strike is due in a large measure to the efforts of Frank M. Bump, commissioner of the state board of conciliation and arbitration, who secured some concessions on the part of both the striking employees and the company. The main points demanded by the workmen were an eight-hour day without a diminution of wages, time and a half for over-time, double for Sunday and holiday work, and a recognition of the labor unions. The company has granted all except the last condition. The factory is to

run on eight-hour shifts, two or three shifts, as ability or necessity demands, shift No. 1 working from 7 A. M. to 3 P. M., No. 2 from 3 P. M. to 11 P. M., No. 3 from 11 P. M. to 7 A. M., the shifts to advance their positions every fourth week. As regards recognizing the unions, the company, while not conceding this, agrees to handle questions of dispute through a committee selected from its employees. This is considered fairly satisfactory to the workmen because, all the departments being unionized, this arrangement is tantamount to recognition of the union.

* * *

Ira A. Burnham, vice-president of the American Rubber Co., who was quite ill with pneumonia early in the spring, has returned to his office fully recovered. Mr. Burnham is a veteran in the business, having been associated with the Mystic Rubber Co. and the Hall Rubber Co. previous to the establishment of the Stoughton Rubber Co. in 1889, and his business experience in the rubber line dates back nearly 40 years. He was one of the first to discard foot power sewing machines for steam power in factory work and the first to discard the then prevalent solarizing process and introduce vulcanization in dry heaters for proofed fabrics. When the gossamer garment was displaced by the mackintosh the Stoughton Rubber Co. came to the front at once as a

I. A. BURNHAM.

large and profitable manufacturer of raincoat clothing and much of its success from then up to the time of its consolidation with the American Rubber Co. this year is due to Mr. Burnham's knowledge of the business, his executive ability and his enterprise.

* * *

The Revere Rubber Co. is now well established at its new office, 60 High street, in this city, where it occupies the second and third floors of what has been named the Revere Building. Here the company has most comfortable and convenient headquarters, both for its office and sales departments and to carry a stock of goods for quick delivery. The windows in the second story, which are of plate glass, have been emblazoned with the trade-marks of the company, one window showing the handsome shield trade-mark which the company uses, depicting Paul Revere on horseback, making his famous ride, the other front windows advertising in colors and gold the "Spring Step" heel, the "Four-Ace" belt and the "Grant Stitched" belt. The rooms are well arranged, there being special private offices for W. D. Rigdon, manager of the New England sales department in the mechanical line, and J. H. Learned, manager of the rubber thread department. Here also are the accounting department, sales rooms and desk rooms for the accommodation of salesmen and customers. Above, on the third floor, are the offices of B. F. Chamberlain, manager of the shoe supply department, and Fred T. Ryder, manager of the sole and heel business of the company. These offices are very convenient for customers, being not far from the shoe center and in the immediate vicinity of the machinery and plumbing supply trades.

* * *

At a hearing on May 15 the receivers of the B. & R. Rubber Co., North Brookfield, Massachusetts, were authorized by the court to sell the plant of the company if they deem such a course necessary.

* * *

The Revere Rubber Co. will erect a one-story brick building for the manufacture of rubber cement at its factory at Chelsea.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE month of May opened with several of the rubber factories of Rhode Island struggling with labor troubles, some with strikes on their hands and others threatening. Fortunately, however, these were settled in the majority of instances by increasing the wages to meet the demands of the operatives. Few, if any, of the plants have sufficient help to get out the large orders on hand, and to allow any of the operatives to go would be a serious handicap at this time.

The rubber mills throughout the State have had more than a year of unusual and in some cases unprecedented prosperity, and despite the high price that has had to be paid for crude rubber, as well as nearly all of the supplies needed in the industry, it is believed that the profits have kept up with the times, and have been large enough to warrant sharing them with the employees. All of the plants are working full time, or better at present and the heavy demand for goods, especially shoes, that has been noticed for many months past, continues.

* * *

The declaration of strikes among the rubber workers was rather unique in labor matters from the fact that they followed the voluntary and unexpected announcements on the part of the concerns of a general increase in wages that affected upwards of 7,500 rubber workers in Woonsocket, Bristol and this city. The first announcement of any increase came from the United States Rubber Co., affecting its mills and subsidiaries, and was quickly followed by other concerns.

On April 27 LeBaron C. Colt, vice-president and general manager of the National India Rubber Co., Bristol, caused notices of the increase to be posted to take effect on May 1. In the notice Mr. Colt said that the company had voluntarily decided to make the advance in wages, but that the exact amount of the increase would not be known until the new schedule had been figured out.

Notices were also posted in the Woonsocket and Millville mills of the Woonsocket Rubber Co. These stated that, as in the past few months, there had been certain increases in day and piece-work prices, commencing May 1 there would be an adjustment and increase of certain other piece-work prices.

As soon as the announcement had been made public of the advance in the Woonsocket and National plants, the Bourn Rubber Co. in this city announced that it would follow the lead of the larger concern and would give an increase to the men, making the same kind of goods that are made in the factories of the United States Co.

The wages of the employees of the Narragansett Rubber Co. at Bristol were also advanced. Terrence McCarthy, the owner and manager, announcing that the new schedule was made to meet the increase in other rubber mills of the State, either on day work or piece-work.

* * *

LeBaron C. Colt, vice-president and general manager of the National India Rubber Co. at Bristol, died last week, the result of an automobile accident, on the night of May 18. With Mr. Colt were Albert S. Chesbrough, a yacht designer of international note, and nephew of the famous yacht builder Nathaniel G. Herreshoff, and Col. Luke H. Callan, Superintendent of Highways of the town of Bristol. The machine skidded and plunged down an eight-foot embankment into Narragansett Bay. Mr. Chesbrough was instantly killed. Col. Callan escaped severe injury, and rescued Mr. Colt who had been pinned beneath the machine. It was believed that while Mr. Colt's injuries were severe he would certainly recover, but pneumonia set in and he succumbed one week after the accident.

* * *

The Manhasset Manufacturing Co., Putnam, Connecticut, of which Roland H. Ballou of Woonsocket is treasurer, is soon to

open the addition to its plant which has been under construction for two months, and which will nearly double the output of the plant. The company makes automobile tire duck and is running night and day, and according to Superintendent A. D. Lown, will continue for some time to do so.

The company intends starting work soon on six new dwelling houses for operatives. These will hold three families each and will probably be located on land just south of the recent addition.

* * *

The Tire Shop, Romeo A. Bonin, proprietor, has removed from 127 Court street to its new and larger quarters at 143 Court street, Woonsocket, where a tire repairing shop fitted up with the most modern appurtenances has been installed.

* * *

The Narragansett Rubber Co. at Bristol is having a new elevator for handling freight set up in the mill. Several of the departments in the plant are being operated nights.

* * *

Rapid progress is being made in the erection of additions to the north part of the mill of the National India Rubber Co. at Bristol.

* * *

Dr. Edward B. Knight, secretary of the New England Butt Co., Providence, died at his home, 366 Broadway, that city on May 8, of heart trouble. He had been in ill health for several years and about three weeks previous to his death his condition became very grave. He retired from medical work about 14 years ago, but prior to that time he had established an extensive practice. He graduated from Harvard Medical School in 1867. He had been secretary of the New England Butt Co. for several years and his son, Russell W. Knight, is treasurer of that concern.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

THE John E. Thropp's Sons Co. is steadily increasing its rubber machinery export business. A tire making machine was recently shipped to the Paris Rubber Co., Paris, France. Another shipment of molding and wrapping machines was sent to a concern in Lyons, France. A plant in Argentine Republic for the manufacture of tires was recently completely equipped by this company. Among orders in the Thropp shop now in process of completion is one for the new tire making plant of the Brunswick-Balke-Collender Co. They are also completing the equipment for the new Zee Zee Rubber Co.'s plant in Yardville, New Jersey.

* * *

Fire which started in the drying room did \$20,000 worth of damage to the plant of the Delton Tire and Rubber Co. A watchman who discovered the blaze made ineffectual efforts to extinguish it. A nearby volunteer fire company responded but the blaze gained rapid headway and it was necessary to call on the Trenton department for aid. The factory is in Hamilton Township, just outside of Trenton. When the engines arrived from that city the building had been practically gutted. The work of reconstruction was at once taken up and the plant, equipped with new machinery, will be in operation shortly.

* * *

The rubber sundries plant of Gropp & Gedney was damaged to the extent of \$1,000 by a fire of unknown origin. Most of the damage sustained was to equipment and supplies.

* * *

Plans are under way for a great industrial show in the Trenton armory in October. A big rubber show will be part of the affair if the plans are carried out. Among those on the general committee to arrange for the show are J. Cornell Murray, of the

Empire Rubber & Tire Co., and Alfred Whitehead, of the Whitehead Brothers Rubber Co.

WESTERN NOTES.

THE Macandaruba Elastic Tire Filler Co., Inc., a \$25,000 corporation manufacturing a patent tire filling composition, is building a factory at Oakland, California, 40 x 111 feet in dimensions. With the present equipment tires can be filled for 20 cars per day. This company has its main factory at 1722 Fairmount avenue, Philadelphia, Pennsylvania, is now operating in the Central Western States, Illinois and Indiana, and intends entering Oregon and Washington also. J. H. Copeland is the inventor and patentee of this tire filler, which is claimed to be a panacea for tire evils such as punctures, blow-outs and rim cuts.

* * *

The Peters-Tucker-Hay Rubber Co., Denver, Colorado, whose incorporation was noted in the May issue of THE INDIA RUBBER WORLD, has the exclusive agency for the Knight and Blackstone tires manufactured by the Knight Tire & Rubber Co., Canton, Ohio. H. G. Peters, president, was formerly treasurer of the Boss Rubber Co., Mr. Hay and Mr. Tucker also being connected with that company.

* * *

The St. Louis Rubber Manufacturing Co., St. Louis, Missouri, has changed its name and location and will hereafter be known as the Bunker Hill Rubber Works, Bunker Hill, Illinois.

* * *

The Portage Rubber Co., Bartholomew, Ohio, has established a new branch on the Sheridan Road, corner of Broadway, Chicago, Illinois, a point passed by practically every automobile going out of Chicago to the north, and therefore a convenient location for many users of its tires.

* * *

The B. F. Goodrich Co., Akron, Ohio, has established a wholesale stock depot at 406 Myrtle avenue, El Paso, Texas, which will be a dealers' service station, designed to facilitate delivery of supplies and to work for the dealers' interests. C. K. Chapin will be in charge.

* * *

The United States Rubber Co. of California, Los Angeles, has recently moved into a new building at 923 South Los Angeles street, which allows space for carrying and handling a much larger stock than in the old location. The new building is three stories high, with 90 feet frontage and 175 feet depth. In addition, the company has a separate building, approximately 40 x 75 feet, devoted exclusively to solid tires.

* * *

Richard Leigh, a well-known Eastern rubber man and tire expert, has been made general manager of the Dry Climate Tire Manufacturing Co., Denver, Colorado.

SAVAGE TIRE CO. EXPANSION.

The Savage Tire Co., San Diego, California, has been growing very rapidly during the last year, and is now manufacturing about 250 tires per day, as compared with 75 a year ago. The capitalization has recently been increased to \$5,000,000, and it is predicted that within a short time the output will be 700 to 1,000 tires daily.

The Savage company is also planning for distribution of its tires all over the United States. Branch stores have been opened in Chicago and New York, the former branch controlling the middle West, distributors having already been appointed at Kansas City and St. Paul, while the New York branch will look after the distribution in the Western and New England states. A number of additional distribution points will also be arranged for through the South.

AN INTERESTING EXHIBIT OF BRAZILIAN PRODUCTS.

DR. EUGENIO DAHNE is a man of action. He generally accomplishes what he plans to do or knows the reason why. His remarkable work in exploiting Brazil and its products at world's fairs and rubber exhibitions is well known to our readers, as is also the exhibit he has arranged at the Panama-California Exposition at San Diego. Mention was made in our April issue of the departure of Dr. Dahne for Brazil to secure more exhibits, and the prediction made that he will come back with much rubber, coffee and a great variety of interesting Brazilian products.

It must not be inferred, however, that the Brazilian exhibit at San Diego is not already a well-arranged and important

PART OF THE BRAZILIAN EXHIBIT AT SAN DIEGO EXPOSITION.

one. Some pictures of the exhibit, as arranged at the opening, were shown by us in September, 1915, and certainly these gave a good idea of its size, scope and seeming completeness. Dr. Dahne, however, was not satisfied, and plans even more comprehensive exhibits. The picture on this page gives an excellent idea of the products of Northern Brazil, exhibiting rubber, forestry and game. The approach to this department is through a long aisle, on one side of which are shown the products of Central and on the other those of Southern Brazil. The main attraction of this department is a representation of a rubber gatherer's house. This is decked with trophies of the hunt, skins, clubs, bows and arrows, while behind and above is a large map of the Republic of Brazil and the columns are festooned with national flags of the Republic. At the other end, but not showing up well enough to reproduce in this picture, is a representation of a South American jungle with growing plants brought from the tropics, this natural verdure being backed by a huge painting of a Brazilian forest. Here also is a rubber gatherer's hut, with the usual tools and implements used in the gathering and smoking of rubber. There are specimens of every kind of rubber produced in the country, cases of rubber seed, and small rubber trees growing in pots, and the walls are covered with large photographs illustrating the various steps from gathering the latex to shipping the crude rubber.

It will thus be seen that this department and the exhibition of some five tons of different varieties of rubber which are arranged at the approach to this special department well represent the rubber industry of Brazil, and that if Dr. Dahne brings with him on his return still further additions, it would seem as though this exhibit would be the most complete of any ever shown of Brazilian rubber.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

IMPORTED RUBBER TIRES.

IN the April issue of *THE INDIA RUBBER WORLD* it is stated that the British duty on rubber tires is 33½ per cent ad valorem; it should be noted, however, that although this duty was proposed it was subsequently abandoned. There is a general feeling among manufacturers and among workmen engaged in tire making works that a heavy import duty should be levied or even total prohibition ordered. No tires, of course, are coming from enemy countries, and the only imports which really count are those from the United States. Business is still being done in well-known French makes and this introduces complications, which those who are clamoring for legislation on the matter do not perhaps sufficiently take into account. It is not unnatural that the very great increase in the business done with America should be somewhat resented by home manufacturers who, owing to being engaged at present on special government work, are handicapped in competing with those American firms who are continually extending their activities in Great Britain. From the tone of the most recent parliamentary Board of Trade reply to a query on the subject, I think it is not at all improbable that the present American imports will be affected in the near future, not by the imposition of a heavy duty, but by an extension of the restricted imports order, to include motor and cycle tires. It must not be overlooked, however, by those advocates for protection, who are now so prominent in numerous branches of trade, that not all the imported tires are used for pleasure motoring, and that it might prove to our disadvantage at the present time, with the increasing labor shortage and other trials, to have to depend practically entirely on the home output.

THE PROOFING BRANCH.

Beyond the work on existing government contracts there is no great activity in the trade, home trade being decidedly slow, as is also new foreign business. Large government orders for certain goods which have been on the tapis for some time, have not yet matured, owing, it is said, to differences of opinion as to the quality and price which, in the case of straightforward manufacturers, always synchronize. A discussion as to what constitutes a weatherproof or a waterproof, which has been going on in some trade papers, is not without importance, and although I am not aware of any legal decision on the point, I may say that it is the opinion of leading men in the rubber trade, that a waterproof garment means one proofed with rubber, while a showerproof or weatherproof indicates cloth which has been chemically treated so as to repel rain, but has no impermeable layer of rubber. If the term "mackintosh" was universally used for a rubberized garment—to use an Americanism not favored in this country—it would simplify matters; but outside of one large firm, there is no very general disposition among manufacturers to limit themselves to this term. It is contended that "weatherproof" applies to both rubbered and non-rubbered goods, while showerproof does not, but in the present unsettled state of definition, purchasers had better ask for rubber or non-rubber goods and see that they get what they want.

THE GARMENT WORKERS' STRIKE.

The strike of members of the United Garment Workers Society still continues at the works of the Premier Waterproof and Rubber Co., Limited, Manchester, the firm having declined to offer more than 10 per cent advance in wages. The advance of 40 per cent and more demanded has been conceded by other local manufacturers. Advances, it may be said, have been pretty continuous at various works since the war began, a good deal depending on the exact class of work, and thus it happened

in more than one case that when the secretary of the Workers' Society put his demand before a firm, it was discovered that the firm was already paying practically the whole advance requested and was naturally disinclined to quarrel over the trifle that remained to be either granted or refused. The strike at the particular works mentioned has, it should be stated, by no means paralyzed the business, because only the makers-up, and not the proofers, are affected; and, further, there has been no strike among the hands employed on government work, as these come under the supervision of the Ministry of Munitions, which has the emergency power of proceeding severely against absentees from work. Other branches of the work's business also continue in full swing. This increase in garment workers' wages must fall eventually upon the purchasers of waterproofs, though the question of a rise in price is complicated, because the present agitation is confined to the Lancashire district, and does not include the Scottish and London districts.

DISABLED SOLDIERS EMPLOYED.

H. L. Rothband, of J. Mandelberg & Co., Limited, has been prominent in a scheme for finding regular employment for disabled soldiers, several of whom are now employed in these works. Although the firm, of course, is well known as rubber proofers, it has always done a large business in rain and showerproof goods. One of the latest developments at the works is the dyeing and rainproofing of worsted dress serges by the "Silco" process whereby the goods, it is claimed, will not shrink, cockle nor spot.

AMERICAN RUBBER BOOTS PREFERRED.

Officers who have experienced the discomforts of waterlogged trenches during the past winter, speak highly of the rubber thigh boots known as "Bullseye" made by the Hood Rubber Co. These are retailed to them at 35 shillings a pair. They have very thick soles, and are rather clumsy, but they are said not to slip and for this reason are preferred to others of British make of more presentable appearance but having thinner soles.

RECLAIMED RUBBER.

An article on "Regenerated Rubbers," which appeared recently in the "Gummi Zeitung," is especially interesting at the moment, as evidence that a country considered preëminent in chemical knowledge has not yet learned the way to treat waste rubber to the best advantage. Her source of supply from Great Britain and America having been cut off, she has had to fall back upon Continental products, made in either Germany or Austria, and perhaps the Scandinavian countries. Analyses and comparative prices of various Continental regenerated rubbers, or reclaims as we call them in England, are given by the author to show how far away the price is from indicating actual value. The writer goes on to say that it is amply evident that the market is sorely in need of adjustment. He has little to say in favor of Continental makes of reclaimed rubber. It is a well-known fact that in pre-war times considerable quantities were imported into Germany from Great Britain and America. It was thought that the loss of this business would be severely felt, but both countries have found that it has been quite made up by new home business. This transference of trade from foreign to home account is a considerable help to the reclaimer, through the saving of freights and credits. It seems hardly possible that the article was written by a practical man, otherwise the products of this country would have been bracketed with those of the United States, as our manufacturers here can and do produce reclaimed rubbers in no way inferior to the best

American makes, this statement being borne out by the fact that the production here for many years past has been advancing by leaps and bounds, exports prior to August, 1914, going to all countries having rubber works. Great Britain, of course, is indebted to the United States reclaimers for having been shown how to produce reclaims at a competitive price and quality, and also to United States manufacturers for showing how it can be used in quantities. Now the pupils claim to be equal to their teachers and the trade here looks forward to the future with confidence, as, however low the price of their rubber may be, the cost of waste must be in proportion, and so enable the reclaimer to put his products on the market at corresponding prices.

TRADE MEMORANDA.

Since the death of Mr. Openshaw, the proprietor of the Holt Town Rubber Co., Limited, Holt Town, Ancoats, Manchester, manufacturer of reclaimed rubber and rubber substitutes, this works has passed into the hands of Laughton & Son, who carry on a similar business near Manchester.

The Alpertown Rubber Works at Wembley, near London, which has now been closed down, was a reorganization of that ill-fated rubber boom concern, the Crude Rubber Washing Co., Limited. On the failure of the original enterprise, whose factory was in London, the Alpertown concern started to manufacture tires and other mechanical rubber goods, with the above-mentioned result.

Thomas Lilley, whose death was recently announced, was a partner in a large wholesale boot and shoe business in London, but became prominently connected with the rubber trade some years ago as chairman of directors of the Premier Waterproof and Rubber Co., Limited, of Manchester, when the works were taken over from a former private company.

The annual meeting of the Society of Chemical Industry is to be held in Edinburgh, where a new section was formed last year. I may mention that the local secretary of the section is B. D. Porritt, chief chemist of the North British Rubber Co., and as he will be responsible for the organization of the proceedings, it is probable that members who are ignorant of the rubber manufacture may have an opportunity of seeing something which will interest them.

Sir F. H. Smith, Baronet, chairman of Charles Macintosh & Co., Limited, has been appointed on the Board of Trade Committee appointed to consider the position of the British textile industry after the war. This is owing to the fact that he is now and has been for many years actively associated with the staple Lancashire industry.

Among the most recent enemy firms to be wound up is the New York-Hamburg India Rubber Co., Limited, presumably because the Hamburg element predominates over the New York.

Lindsay and Williams, Limited, at whose works an explosion of naphtha was mentioned a few months back, are now moving their business to larger premises at Bennett street, Ardwick, Manchester.

OTHER BRITISH NOTES.

THE conclusion of Justice Peterson in the Chancery Division, Manchester, in the action of Cohen and another v. Fidler & Co., in which both parties claimed the use of the word "Regent" as a trade-mark for waterproof clothing, was to the effect that the plaintiffs had established a reputation for their goods under that name prior to the time when the defendants commenced to use the word, and that its use by the defendants was calculated to mislead. He therefore granted injunctions and dismissed the defendants' motion, with costs.

THE NEXT LONDON RUBBER EXHIBITION.

The announcement has been made that the Fifth International Rubber and Allied Industries Exhibition and the Second International Cotton, Fibres and other Tropical Products Exhibition

will be held in London in May or June, 1919, under the same direction as the previous exhibitions, A. Staines Manders, organizing manager and Miss D. Fulton, organizing secretary.

DR. WILLIS NOW IN ENGLAND.

Dr. J. C. Willis, having resigned the directorship of the Botanical Gardens at Rio Janeiro, has returned to England, and is now living at Beechcroft, Clarendon Road, Cambridge, where he is devoting his time to botanical work. It will be remembered that Dr. Willis when in the Far East was director of the Royal Botanical Gardens at Peradeniya and editor of the "Tropical Agriculturist," published at Colombo. Dr. Willis writes that he does not expect ever again to have much to do with rubber, though he will always be interested in the progress of the rubber planting industry.

CHANGE STYLE OF FIRM NAME.

The firm of Ritter & Hankin, 27 Mincing Lane, London, E.C., England, have sent out notices to the trade that they have decided to alter the name of the firm to Geo. Hankin & Co., the change to date from the first of May. There is no alteration in the general conduct or constitution of the firm, which will be continued as heretofore.

A ROYAL DOCUMENT.

The North British Rubber Co., Limited, Castle Mills, Edinburgh, Scotland, has been made by special appointment supplier of pneumatic and other tires and general rubber goods to His Majesty, King Alphonso XIII of Spain. A reproduction in

miniature of the diploma or certificate of appointment is shown upon this page and will be examined with some interest and curiosity. We understand that this company has equipped a royal automobile with clincher tires.

SEIZED RUBBER CONDEMNED.

The British Price Court has condemned both the ship "Sul-danba Da Gama" and her cargo of rubber, which was seized just off the south-east corner of Iceland and taken to Kirkwall, March 6. The testimony was that this ship sailed from Para on February 6 and all the documents and papers, bills of lading, invoices, etc., were for New York. No tidings were received from her

prior to the seizure, off the coast of Iceland, as absolute contraband. The captain, who was the owner of the ship, explained his being in that location by claiming that his ship needed repairs which could be done cheaper in Norway than in New York. Afterwards he claimed that the price of rubber in New York had fallen, and therefore he decided to take the cargo to Norway in hopes of better returns. The president, in giving judgment, said there was no question that the real destination of the cargo was Germany, and that the ship was carrying contraband, and also was sailing under false colors, and therefore both ship and cargo were condemned as a lawful prize.

On May 23, the Prize Court condemned 1,400 parcels of rubber which were taken from the first-class mails on the Dutch steamer "Gelria," while she was on her way from South America to Holland. It was claimed that these parcels were destined for Germany. This is one of the instances where mails from neutral countries and on neutral vessels have been examined and seized by the British, a practice which is the subject of a note of protest sent to London by the United States Government last month. The British Attorney-General, in presenting this case, pointed out the fact that such seizures had led the government open to criticism by neutrals on the ground that it was a violation of the Hague Convention, but he declared that it should be realized by neutral governments that there had been in this case an attempt, on a very large scale, to use the shelter of the Hague Convention to smuggle contraband goods into Germany.

The decision of the Court was that the parcels in question had been dishonestly sent by post as though they were postal correspondence, and that under the Hague Convention it was expressly laid down that postal correspondence should not cover and include parcels.

THE RUBBER TRADE IN GERMANY.

By Our Regular Correspondent.

THE situation here has not improved since I last communicated with you and, generally speaking, it cannot be said that either trade or industrial conditions are brilliant. Concerns that have government orders are fairly busy but those who have not this good luck find time for meditation. The domestic trade in rubber and rubber substitute articles is very slack as is also the trade we have been doing with adjacent neutral countries. The building trade is practically dead and shipping, limited to the Baltic since the outbreak of the war, is becoming more and more restricted.

The economic relations between Germany, the Balkans and the Near East which have been widely discussed in commercial and industrial circles here, are not measuring up to expectations. In spite of our enemies' blockade we have been able to continue to do business with all parts of the neutral world, but of late this trade has become so restricted that it hardly is worth mention. Our fiscal year comes to an end March 31, and this date is always preceded and followed by a slack period in business activities. This year, however, this state of trade industry cannot be attributed in any wise to the inventory period but to conditions created by the war.

RUBBER TRADE WITH THE ORIENT.

Prior to the war we did a good business in rubber goods with the Balkan States, Turkey and Persia. After the government placed an embargo on rubber exports the demands of these markets continued to be supplied to some extent from stocks of goods manufactured before the outbreak of the war and with substitute qualities. Of course this business was small, but it was very welcome under the circumstances, in spite of the difficulties of exchange that always mark Oriental trading. This small business is now practically dead, notwithstanding the opening up of direct communications which was accomplished last year.

RUBBER INDUSTRY.

Our rubber industry is in no better condition than other branches of trade or production. Manufacturers who are making tires and other supplies for the army and navy are fairly busy, but not working under as high pressure as they were last year. Crude rubber grows scarcer and more expensive, and is now available for use only on government contracts. By mixing what crude rubber we can obtain, with synthetic rubber and rubber substitute our mills are managing to meet the demands of the military administrations. Goods for private use containing crude rubber are distributed only by special permit which is allowed only in exceptional cases.

For compounding ingredients we are not so badly off, but prices are exceedingly high. Solvents are plentiful and their prices continue to be regulated by the Government.

LEATHER SUBSTITUTES.

Many of our rubber manufacturers are finding a profitable occupation in the manufacturing of leather substitutes. Leather has become so scarce, and its price so high, that it cannot be used extensively for other than military purposes. Further its use is restricted by government decrees. The state of affairs has created a considerable demand for substitutes made from various compounds which our rubber industry has created.

MECHANICAL GOODS.

Outside of the demands of the military, and of the industries working under government contracts, little or nothing is being done in mechanical rubber goods, if these, as now manufactured, can still be called rubber goods.

The shortage of necessities of life, especially grain, has led to further restriction of the brewing industry, which was one of the best customers of our manufacturers of mechanical rubber goods. We are importing important quantities of beer from adjacent neutral countries, especially from Denmark, but have sold but little mechanical rubber goods to these neutral countries. The fact is that it is better so, for the qualities we are now producing would surely hurt the good name of German rubber goods.

The "Gummi Zeitung" in a recent issue published two clever cartoons reproduced from an English paper. One represents John Bull joyfully welcoming a ship loaded almost to its topmasts with American automobile tires. The companion picture depicts his gloom as he shows his empty pockets, while the ship is sailing homeward to the United States, stacked high with British gold. Commenting on this, our leading trade publication

says that we are better off than the British, in spite of our lack of raw materials. We are manufacturing our own tires, and doing what the cartoon advises, keeping our gold at home.

Rubber Planting Notes.

RUBBER PLANTATION COMPANIES' REPORTS.

RUBBER plantation companies' reports recently published, show that successful results are general. A notable feature is the reduction in all-in costs. Among other instances of excellent financial results are the following: The Sungai Way (Selangor) Rubber Co., Limited, 52½ per cent dividend; the Udalage Tea & Rubber Co., Limited, 35 per cent; the Peacock and Nilambe Tea & Rubber Co., Limited, 12 per cent; Dimbula Valley (Ceylon) Tea Co., Limited, 35 per cent; Pantiya Tea & Rubber Co., Limited, 30 per cent; Hingurugama Tea & Rubber Estates, Limited, 24 per cent; Kepong (Malay) Rubber Estates, Limited, 75 per cent. The Anglo Malay Rubber Co., Limited, is raising its dividend from 32 to 60 per cent for the year, the Cheronese Estates Co., Limited, from 15 per cent to 20 per cent, and the Mahawale Rubber & Tea Co., Limited, from 27½ to 60 per cent. The Seafeld Rubber Co., Limited, paid a final dividend of 65 per cent, compared with 45 per cent for 1914. The Pataling Rubber Estates, Limited, report 225 per cent dividend for 1915 against 175 for 1914 and the Selangor Rubber Estates, Limited, have declared a 165½ per cent dividend.

Generally speaking, shareholders in rubber plantation companies have good reason to be satisfied with the present results, and the prospects for the future are certainly promising.

ACETIC ACID VERSUS OTHER RUBBER COAGULENTS.

Kelway Bamber, chemist, Ceylon Department of Agriculture, has recently visited Java, Sumatra, and the Federated Malay States. In the course of an interview granted to our contemporary, the "Ceylon Observer," he said that he was pleased with the growth of trees on rubber plantations in the Malay States. He was, however, of the opinion that thinning out was not done early enough, especially in the case of the older trees. Where thinning out had reduced the number to 80 or 90 trees per acre, at a reasonably early stage, he noticed that the yield had improved. He was much interested in the vulcanizing experiments being carried out by Mr. Eaton at the Experimental Station at Kuala Lumpur, and considered as especially valuable those relating to the time of vulcanization. The cost of acetic acid has risen enormously, both in Java and in the Federated Malay States, with the result that other coagulents are being recommended. He believed estate superintendents should be warned against using various coagulents, as many of them have been shown to considerably affect the time of vulcanization. In Mr. Bamber's opinion the fact that rubber manufacturers were accustomed to rubber coagulated with acetic acid made it a mistake for plantations to ship rubber, even of a better appearance, which might upset compounds and possibly cause the spoiling of manufactured goods, in which case there would result a feeling of distrust among the manufacturers which might influence prices of all plantation rubber.

RUBBER PLANTATIONS IN FRENCH COCHIN CHINA.

The following table showing the extent of rubber plantations in French Cochin China, has been compiled from data recently published in the "Annales des Planteurs de Caoutchouc de l'Indo-Chine," the official quarterly bulletin of the Rubber Planters' Association of Indo-China:

A NEW BULLETIN ON RUBBER TAPPING.

The Federated Malay States Department of Agriculture has published a bulletin on "The Tapping of the Para Rubber Tree," by E. Bateson, which contains much of interest to those who study the technical problems connected with rubber tapping.

The investigations covered in this publication are divided into six main sections, dealing with the effect of tapping on the starch reserves, lateral transport of food in bark, tapping systems, theory of tapping and, finally, a section on "some practical considerations as regards the effect of tapping on the starch reserves." The conclusion reached by Mr. Bateson is that "if any depletion of the starch reserves is caused by tapping, it is small in amount and temporary in duration." He rejects Fitting's suggestion that an examination of the starch reserves would be a useful method of determining when trees are ready to be retapped after the whole of the original bark has been removed, believing that "such examinations are unnecessary and that the thickness of the renewed bark forms a perfectly safe criterion."

Regarding the effects of leaf change upon starch reserves, Mr. Bateson considers the facts elicited by his research somewhat too meager, on account of the small number of trees examined, to enable precise conclusions to be drawn on the points of theoretical interest. He believes, however, that in the Federated Malay States the effects of wintering are spread over such a long period that they merely form part of the general problem of devising a method of tapping, which, over a period of years, will not be so exhaustive to the tree as to check its full and natural development.

In his tapping experiments Mr. Bateson describes only three methods; the single-quarter system with two cuts on one quarter, the adjacent quarter system with one cut on each of two quarters; and the opposite quarter system with one cut on each of two quarters. He found that the bark of trees tapped by the adjacent quarter system contained more starch than the bark of the trees tapped differently, and that the thickness of renewing bark was greater. As to rubber yield, the single quarter system was 16 per cent better and the adjacent quarter system 31 per cent better than the opposite quarter system, while the adjacent quarter system yielded 13 per cent more than the single-quarter system of tapping.

Mr. Bateson is of the opinion that if trees growing in a soil of average fertility are allowed sufficient space, four years will be found quite adequate for bark renewal.

AREA UNDER RUBBER IN COORG, BRITISH INDIA.

According to the official "Report on the Administration of Coorg, 1914-1915," the total area under rubber in that province of British India is 3,367 acres.

TIRES IN SOUTH AFRICA.

It is reported that the Dunlop Rubber Co. (South Africa), Limited, has received a repeat order from the South African Union Government for 350 pairs of motorcycle tire casings, for use with the machine-gun section for further operations in German East Africa.

Name of Province	Acreage Under Rubber	Number of Trees Planted	Number of Trees in Bearing in—				
			1915	1916	1917	1918	1919
Gadinh	7,806	1,137,656	78,300	196,700	430,300	683,066	859,442
Bienhoa	13,206	1,442,200	134,000	343,000	745,000	928,000	1,117,500

THE WIDE PLANTING OF RUBBER.

THE Department of Agriculture of the Federated Malay States is doing good work in inducing the native planters to adopt modern ideas in growing rubber. It has recently caused to be translated and printed in Romanized Malay a paper on the thinning out of rubber plantations, which is being circulated for the benefit of native holders of small plantations. The subject treated in this paper is one of the most important affecting small holdings in the Malay Peninsula where rubber trees were first planted very close together, generally 10, 12 or 14 feet apart. Experience has proved that such plantings were much too close. Most of the large estates with closely planted areas are beginning to thin them out, to reduce the total number of trees to about 100 per acre.

The paper above referred to advises that in planting new areas, distances apart should not be less than 20 feet, which would total but 108 trees to the acre. It is further stated that time will probably show that 25 feet by 25 feet, or 70 trees per acre, is a better plotting for planting rubber trees.

It is explained that trees that are closely planted have too small a leaf area, and are much more liable to attacks of disease. When tapping commences they are still further weakened, and, therefore, the renewal of bark is not vigorous, this renewed bark being so thin that it is impossible to tap the trees without wounding after the original bark has been consumed.

Citing benefits obtained by thinning out, the paper says that the trees are much healthier, yield more rubber, and renew their bark quicker. It has been found that after thinning out, many trees will yield double the amount of rubber, and not only that, but the quality is improved, for it is argued that labor is reduced and it follows that if the yield per tree is doubled, a less proportion of scrap will be obtained when only half the number of trees is being tapped. Again, if the number of trees is reduced, there will be a large saving on tapping equipment, as a less number of cups and spouts will be required to bring in the same amount of latex.

All this is clearly explained and illustrated in plain, simple language which native holders can easily understand.

Advising as to the best method of thinning out, the paper says that, first, all small, weakly trees, which are very backward in appearance, should be removed because their stunted growth is sure to make of them very poor yielders of rubber. The process of selection and elimination should next concern trees which have a very irregular growth, such as bad trunks and forked branches, which are liable to be split by winds. After these have been exhausted it may be found necessary to cut out a number of good trees in order to improve the spacing of those which remain.

If trees in the area to be thinned out have not reached the tapping stage, they should be reduced to 100 trees per acre immediately, but if they are producing it should be carried out gradually at intervals of, say, six months, so that any drop in yield will not be apparent. Trees should be cut out completely and roots extracted and burned in order that no disease may attack the dead stumps. To tap stumps to death is unprofitable because of the small margin left by the present price of rubber.

The drop in the yield of an area in process of thinning out is only temporary and after a period of six to twelve months the yield per tree increases and makes up for the trees which have been removed.

When trees are very closely planted the yields fall rapidly when tapping renewed bark is commenced, and while close planting may have shown good profits with rubber selling at high prices, today the margin of profit is very small, and

the maximum yield per tree must be obtained to keep down the expense of collecting.

The longer thinning out is delayed the more difficult is the work, and the longer will the remaining trees take to increase their yields, and the lower will be the ultimate profits per acre.

COMPOSITION OF AN OLD RUBBER TREE.

AN ANALYSIS has been made, by M. Kelway Bamber, of a rubber tree 11 years old, measuring 34 inches in circumference at 3 feet from the ground. It was cut before leaf fall began. The trunk weighed 820 pounds and the branches and leaves 305 pounds; total 1,125 pounds. The trunk and branches were burned separately and yielded 0.445 per cent and 2.54 per cent of pure ash respectively. The total ash was 11.4 pounds, equivalent to 1.01 per cent on the whole tree. The total ash in 100 trees per acre would be 1,140 pounds, all of which has been taken up from the soil, and partly from the annual leaf-fall during 11 years' growth. The ash consists chiefly of carbonates and phosphates of lime, potash and soda. The phosphoric acid is about one-third of the lime, and one-half the potash content. The average percentage of soda is higher than the potash, which is unusual, and would indicate a deficiency of available potash in the soil in which the tree was grown. The table shows the composition of the ash as to its chief constituents:

Ash Constituents.	Wood, Per Cent.	Branches and Leaves, Per Cent.	Average, Per Cent.	Total Ash per acre, 100 Trees, Pounds.	Average Absorbed Annually, Pounds.
Lime	21.30	30.00	20.60	235	21.3
Magnesia	6.04	6.77	6.40	73	6.6
Potash	14.96	10.34	12.65	144	13.1
Soda	14.79	15.69	15.24	174	15.8
Phosphoric Acid	7.80	6.53	7.16	81	7.3
Sulphuric Acid	2.88	2.54	2.71	31	2.8

Dry rubber contains only about 0.32 per cent ash, and 400 pounds per acre would only remove about 13½ pounds of mineral matter, a quantity that is negligible.

PREPARATION OF RUBBER IN FRENCH AFRICA.

THE following translation from a circular addressed by the Lieutenant-governor of the French Ivory Coast Colony to subordinate administrative officers is of interest:

Auctions recently held at railway terminals clearly demonstrated the fact that prices obtained for lots of rubber depended solely on the methods by which the rubber was prepared. Thus, fine quality vine rubber sold at 4.94 francs per kilogram [about \$0.43 per pound] and *Funtumia* rubber that was well prepared brought as high as 4.70 francs per kilogram [about \$0.40 per pound], whereas, poorly dried rubber brought only 3.80 francs per kilogram [about 33 cents per pound].

Therefore, you must oblige the natives to prepare their rubber properly and handle it carefully right up to the market day.

In this connection I wish to recall to your attention that the object of having rubber prepared in slabs is not merely to prevent fraud, i. e., by mixing foreign matter with the rubber. The slab form makes it possible: first, to thoroughly wash the rubber and eliminate all soluble impurities; second, to dry it easily and rapidly.

The latter operation should be pushed as far as possible. The increase in value is always worth the additional trouble.

Drying should be performed in the shade, in a well ventilated place. Slight smoking will help to preserve the dry slabs.

The principal deterioration of rubber is a decomposition or oxidation, which is favored by high temperatures. Well prepared rubbers, and especially vine rubber, are rarely subject to this form of decomposition; however, climatic conditions here are not favorable to the preservation of crude rubber, which should be delivered to the export houses as soon as possible after its preparation.

When, for any reason, the natives are obliged to hold their rubber, they should be instructed to store it in dark, cool, dry

places, where they should pile it up to reduce to a minimum the surfaces exposed to the air.

To recapitulate, you should constantly see to it that rubber be carefully prepared. Careful preparation is essential to maintaining quality and prices, which under the present circumstances, are of an importance you can readily realize.

ANNUAL MEETING OF MALACCA PLANTERS' ASSOCIATION.

THE annual general meeting of the members of the Malacca Planters' Association was held in Malacca, Malaya, on February 22.

LABOR DIFFICULTIES.

Reviewing the past year, the chairman stated that 1915 had been a particularly trying year for the planters on account of the shortage of labor, which threatened to become serious and was acutely felt towards the middle of the year. This shortage was due to the repatriation of a large number of coolies to China when the war broke out and to the total cessation of immigration from both India and China for several months. The government did not grasp the situation until it was assuming a serious aspect, not only for the planting, but also other industries in Malacca and, when matters were remedied, considerable time had elapsed before any appreciable improvement in the flow of immigration took place, with the result that matters became very serious for many estates.

RUBBER PROSPERITY.

The year 1915 had been one of great prosperity in Malacca. The increase in the price of rubber during the year, although perhaps anticipated to a certain extent by a few, came as a pleasant surprise to the majority, and resulted in a small land boom in Malacca. Rubber was being planted throughout the length and breadth of Malacca by small native holders.

The area under rubber in 1915 showed an increase of 17,262 acres as compared with the area in 1914, the figures being, 1914, 114,845 acres; 1915, 132,110 acres. Other forms of cultivation had remained more or less stationary.

NATIVE RUBBER.

The chairman's opinion was that a large proportion of the 17,000 odd acres of rubber planted in 1915 had been planted by natives, and he believed that the extensive planting of rubber by small holders should be viewed with concern by those interested in the future of rubber in the country. Apart from the question of rubber thefts, which were serious enough in their own way and many of which were probably traceable to small holders, the industry was facing the possibility of an outbreak of disease which, if it started in small holdings, might go on unchecked until it would become well established, and prove serious.

Upon investigation, it had been found that there were many small holdings on which trees had been tapped too young, and were therefore weakened and likely to be ready subjects for any form of disease that might appear. This matter should engage the serious consideration of the government, because the prosperity of Malacca depends mainly upon agriculture and particularly on the rubber industry. A conception of the importance of the latter could be formed by examining the export figures for 1915, which showed that the exports of plantation rubber from Malacca amounted to 202,901 piculs [27,052,790 pounds], valued at 24,506,929 Straits Settlements dollars [\$13,723,880]. Of these, 17,737 piculs [2,364,874 pounds], valued at 1,960,876 Straits Settlements dollars [\$1,098,091], were imported, making the net production of Malacca, 185,164 piculs [24,687,916 pounds],

equal to approximately 10,994 tons, an increase of 4,228 tons over the 1914 figures.

RUBBER THEFTS AND DEALERS' ORDINANCE.

A matter of much importance, which had engaged the attention of the association during the year and was still billed for further discussion, was the question of rubber thefts. The evil was widespread and had reached proportions which were not realized by the government.

The rubber dealers' ordinance came into force in 1910 and was made to deal with the serious evil of rubber stealing. The original proposal of the association was that licenses for rubber dealers should be given out on certain specified days, appointed just as the liquor licenses now are granted, to give planters who so desire an opportunity to oppose the application. This proposal had already been passed. Then it was suggested that every cultivator of rubber should have a license to trade. In the chairman's opinion, the present ordinance did not go far enough. It should be in book form and every transaction made should be endorsed on the license. The association also desired that on this license should be noted the acreage under cultivation, the acreage which was being tapped, and the probable amount of rubber which was to be produced in that area, the latter to be estimated by a competent authority. There were difficulties to be met in the estimates of production. There were cases proved in Malacca in which men disposed of rubber in amounts that were absolutely ridiculous when the acreage under their cultivation was considered. The association desires to assist the magistrate, and it is for the government to so amend the law that certain rubber may be considered as stolen until it has been proved by the defendant to the contrary. The license should have a photograph of the dealer, and also the license of the seller should be produced. The majority of the sales of rubber by their tappers were made to small holders adjoining the larger estates. Rubber stealing has been worse since the ordinance came into force, and it is necessary to devise more efficient means for controlling the dealers who purchased stolen rubber up country. The association feels that the rubber industry, which pays a large and increasing revenue to the government, is worth being protected by the latter.

Replying to the chairman, the local representative of the government, who was present at the meeting, said that since the rubber dealers' ordinance had come into operation in 1910, the production of rubber had probably increased 200 per cent, but "the total volume of theft might not be greater." European managers did not attempt to give annual returns, as called for by the ordinance. Rubber is one of those commodities difficult to identify, and under the system of laws which obtain in the colonies and throughout the British Empire proof is needed before any man could be convicted. The chairman was a potential receiver in many of these cases. The local representative suggested that efforts be made to seize the thief on the estate, so that identification of the goods might be easier. To this the chairman rejoined that the police have pronounced it disheartening to take any cases under the rubber ordinance, 50 per cent of such cases being discharged. It was voted that suggestions be forwarded to the governor.

DAMAGE TO RUBBER TREES BY PORCUPINES.

Rubber planters in India complain of damage done to their *Hevea* trees by porcupines. Several remedies have been tried, with indifferent success. It has recently been found that whitewashing the trees up to a height of two feet from the ground protects them from attack by these animals. During the rainy season the whitewash is liable to be washed off, but it is said that this inconvenience can be overcome by mixing gum with the lime.

THE RUBBER SITUATION IN BRAZIL.

By Our Regular Correspondent.

CONDITIONS here continue to be most favorable. The prevailing rubber prices, though substantially lower than in the first days of the year, are still remunerative, even for those collecting their rubber in the most remote districts of the upper Amazon and, as little of this season's crop has been sold ahead, the people here have good prospects of reaping the full benefit of the present heavy demand. There will be real prosperity, both in Para and Manaus, if the entire crop can be sold while prices hold at their present level, and this crop will probably be a large one on account of the thousands of men that have been driven from their homes by the drought and famine in the State of Ceara and who are now employed in gathering rubber in the states of Para and Amazonas. These new rubber gatherers are, of course, unskilled and, though they certainly will increase our rubber production, they may also do great harm to the trees.

The once rich rubber districts on the Rivers Solimoes and

Purus are said to be now abandoned, having been completely exhausted. In the islands around Para the trees are being literally tapped to death.

There are millions of rubber trees untapped in our vast forests. The difficulty and travel necessary to opening new *estradas* have led our native gatherers to visit the same *seringaes* year in and year out with the result that the exploited trees have been tapped to their limit. Once the lower bark has been tapped until it is useless, crude ladders are used to reach higher parts of the trees to practice "overhead" tapping, which is pushed as high as 30 and more feet above the ground. The relative abundance of labor we are now enjoying is leading to the opening of new *estradas* and exploitation of new *seringaes*. Fresh trees yield greater quantities of latex than trees that have been visited for years, and this exploitation of new sources may well account for the low prices at which our rubber can now be produced.

OVERHEAD TAPPING.

GERMAN PURCHASES.

Reports are current here that German interests have purchased about 5,000 tons of crude rubber in this country for delivery after the war. These purchases are said to have been paid for in gold, and their object is believed to be to make sure of a supply for a time when Germany might still find difficulty in purchasing through British concerns as she was doing before the war.

RUBBER DEALERS AFFECTED BY BRITISH "BLACK LIST."

Among the names of German and Austrian concerns established in Brazil which have been placed on the "black list" by the British Government are those of the following rubber dealers and exporters: Ohliger & Co., Para and Manaus; Pralow & Co., Manaus; and Semper & Co., Manaus. The effect of being black-listed is that these concerns are barred from shipping in British bottoms and from trading with British concerns. They can continue to do business with neutral countries and to ship their goods in neutral bottoms. As British steamship lines alone make

regular calls at Para and Manaus under present conditions, this blacklisting is a very serious matter for the firms concerned and it is said that attempts are being made by them to avoid these difficulties. An attempt was made to have the Brazilian Government interpose in the matter, but it has been intimated that in case of too great agitation the British Government would go so far as to withdraw British steamers altogether and Manaus would be reduced to dependence on the irregular service neutral shipping now offers.

IMPORT AND EXPORT DUTIES.

Our budget law for 1916 went into effect on January 1. It included no changes in the import or export duties on manufactured rubber. In fact, there are no duties at all on exports of manufactured rubber. As to the duties levied by our several rubber-producing states on exports of crude rubber, the only recent change in such duties is that prescribed by the government of the State of Manaus, in a decree dated June 12, 1915, which provided for an export tax of 7 per cent ad valorem on rubber produced in the territory of the Javary river and its Brazilian tributaries.

DISCRIMINATING DUTY REPEALED.

The Budget law for 1916 definitely repealed the provision in the budget law for 1915 for reduced rates on articles made of Brazilian rubber. It will be recalled in this connection that the 1915 law called for discriminatory duties on articles made of rubber of foreign origin, but neither the higher nor the lower rates applicable to rubber goods have actually been imposed since the early part of 1915, owing to the impossibility of distinguishing, in the manufactured goods, between Brazilian rubber and other sorts.

A change that will affect all dutiable imports, rubber goods included, is the increase in the proportion of import duties payable on a gold basis from 35 to 40 per cent, which will result in some increase of duty.

AMERICAN MANUFACTURERS FAVORED.

On January 14, 1916, the President of the Republic signed a decree that will continue the preferential treatment which has heretofore been allowed to products and manufactures of the United States, including manufactures of rubber on which the preferential reduction is 20 per cent. This is an important advantage to American tire manufacturers, many of whom are sending large quantities of their goods to this country.

PLANTATION PROPAGANDA.

We Brazilians continue to witness with indifference the efforts London rubber plantation interests are constantly making to lead manufacturers to believe that their best plantation sorts are superior to our Upriver fine Para. The indolence of our people in this connection is without excuse. It is not sufficient that we know our rubber to be the best of all. It is high time for taking measures to protect our interests and, at the same time, those of manufacturers. We should not allow these manufacturers to be misled by the incessant and well-planned propaganda of our chief competitors. We, too, should spend some money in exploiting the superiority of our native rubber for many manufactures. When will our authorities awake to this necessity, and when will they reduce our excessive export duties and thus help to place our rubber producers in a better position to meet plantation competition? I am sorry not to be able to answer.

CHANGE IN A BRAZILIAN RUBBER EXPORTING CONCERN.

A new rubber trading company has been chartered in this country to take over the export business heretofore carried on by Schnack, Nueller & Koehn, at Coromaba, in Matto Grosso, at Puerto Suarez, Bolivia, and at other important points. The legal headquarters of this company are at Hamburg, Germany.

Hevea in British Guiana.

NEWS from the biggest and potentially the best *Hevea* plantation in British Guiana is sure to be interesting, not alone to the American projectors but to all users of crude rubber.

For various reasons it has been felt that the Far East was alone adaptable for *Hevea* planting. Indeed, when some six years ago a great tract of land up the Mazaruni River was acquired and clearing begun, many experts were honestly doubtful about the ultimate success of the project. It, however, was not abandoned. On the contrary, under the intelligent management of a man well versed in tropical planting, land was cleared, seed brought in from the Malay states, and more than a thousand acres successfully installed.

THREE-YEAR-OLD HEVEAS, WINTERING.

The illustrations herewith give glimpses of most satisfactory accomplishment. The growth of the trees has been fully equal to that in any part of the world. There are no more diseases, leaf or root, the rainfall is ideal, and the land is so situated that high winds are unknown. Last, and most important, labor is cheap and abundant. Incidentally, very comfortable administration buildings have been erected. So comfortable are they and so delightful is the climate on the Mazaruni River that Colonel

As you know, I bought some glass cups for tapping purposes last December, and expected them here just after I returned in January, and I waited and waited, but they did not come, so I started to tap 312 trees, as that was all the cups I had, and for ten weeks I have been tapping that number, we have had the

FIVE-YEAR-OLD HEVEAS.

usual dry weather, but they have been running well all the time. Then, as I heard last week of somebody who had some of the latest earthenware cups for sale I bought 1,000, which arrived here two days ago, and by the very same boat that brought these up to me, I had a letter from town saying the glass cups had arrived there at last; however, they will all come in handy soon.

The results of the tapping as far as I have been able to weigh so far, are as follows: Each 14 days' product is kept separately

TAPPING FIVE-YEAR-OLD HEVEAS.

and weighed as soon as dry, and as the weather has been very dry, we have now got weighed up the first four fortnights.

The following is the result from 312 five-year-old trees:

	Biscuits			Scrap, etc.			Total			Wet Rain.
	Lbs.	Ozs.	Drs.	Lbs.	Ozs.	Drs.	Lbs.	Ozs.	Drs.	Days. Ins.
First 14 days.....	16	10	8	4	15	12	21	10	4	8 79
Second 14 days.....	33	5	12	5	9	3	38	14	15	10 2.52
Third 14 days.....	34	0	8	6	5	12	40	5	4	9 2.59
Fourth 14 days.....	28	14	12	6	15	14	35	14	10	5 2.57
	112	15	8	23	14	9	136	14	1	32 8.47

At the above rate this would give an average of 3 pounds, 4 ounces, 4 drams per tree for the year, which we certainly ought to improve on considerably, and the above tapping in the first fortnight includes all the very first cuts, from which, as you know, much is not given in the way of latex. Also this tapping has been done during the very worst time of the year that we have in regard to rainfall so that I hope, and expect that we shall average for the year a good deal more than the above would average, and this for five-year-old trees, I think you will agree is very good indeed.

MOTOR ROAD ON THE PLANTATION.

and Mrs. Roosevelt, who visited British Guiana this winter, made their whole stay at "The Hills," which is the headquarters of the Bartica Agricultural States plantation.

Regarding the plantation's progress, an extract from a letter written by George B. Withers, the manager, is of interest.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED APRIL 18, 1916.

- N**O. 1,179,417. Ammunition box with rubber buffers. W. Feller, assignor to E. Krupp Aktiengesellschaft—both of Essen-on-the-Ruhr, Germany.
- 1,179,598. A combination rim and casing with cork filler. E. M. Deal, assignor to J. J. Brooks—both of Philadelphia, Pa.
- 1,179,552. Hose coupling and mender. L. R. Nelson, Peoria, Ill.
- 1,179,622. Safety heel with rubber parts. A. C. Rightor, Pittsburgh, Pa.
- 1,179,654. Rubber vehicle wheel tire. R. M. Roberts, assignor to F. T. Butler—both of Anderson, Ind.
- 1,179,668. Safety valve for tires. E. W. Shewmaker, assignor of twenty one-hundredths to M. D. Lawler and twenty one-hundredths to W. B. Schlottman—all of San Francisco, Calif.
- 1,179,692. Fluid hose. W. F. Bowers, San Francisco, Calif.
- 1,179,733. Emergency chain attachment for automobile wheels. L. E. McKinnin, Buffalo, N. Y.
- 1,179,742. Solid tire with coil spring. W. Murry and J. Conway, Shrewsbury, Mass.
- 1,179,771. Resilient tire. C. A. Smith, Wellsville, N. Y.
- 1,179,774. Spring wheel with rubber tire. F. D. Stuart, Douglaston, N. Y.
- 1,179,857. Resilient tire with rubber abutments. S. F. Millard, Norwalk, Conn.
- 1,179,871. Textile fabric glove having the palm surface and finger portions impregnated with a rubber composition. J. P. St. John, New Haven, Conn.
- 1,179,884. Cushion tire for vehicles. J. F. White, Pittsburgh, Pa.
- 1,179,996. Hydrometer having a rubber bulb. J. and G. Berg—both of Brooklyn, N. Y.
- 1,180,012. Vehicle wheel comprising a plurality of annular pneumatic cushions. H. B. Coates, Sellersburg, Ind.
- 1,180,035. Hose supporter. C. J. Hansen, New York City.
- 1,180,115. Tense post for violins comprising a rubber part. H. Edwards, Downsview, N. Y.
- 1,180,182. Means for clearing waste pipes. G. Petersen, Spokane, Wash.

ISSUED APRIL 25, 1916.

- 1,180,543. Force cup. C. F. Schuh, Newark, N. J.
- 1,180,581. Tire fastener for wheels. H. T. Dunbar, Buffalo, N. Y.
- 1,180,590. Bead for tires. J. R. Gammeter, Akron, Ohio, assignor to The B. F. Goodrich Co., New York City.
- 1,180,591. Device for lathering preparatory to shaving. W. A. Gatzert, Gronwald, near Munich, Germany.
- 1,180,624. Self-filling fountain pen. E. G. Peck, Seymour, Conn.
- 1,180,637. Means for vulcanizing punctures in rubber tires. S. I. Rose, assignor to the Marvel Accessories Manufacturing Co.—both of Cleveland, Ohio.
- 1,180,652. Rubber boot. A. H. Steen and H. McNulty, Berlin, assignors to Canadian Consolidated Rubber Co., Limited, Montreal—both in Canada.
- 1,180,695. Gear. F. A. Headson, assignor to H. W. Johns-Manville Co.—both of Milwaukee, Wis.
- 1,180,702. Locking ring for tires. H. Kappan, assignor to Long Manufacturing Co.—both of San Francisco, Calif.
- 1,180,723. Filler for vehicle tires. C. M. Nevins, Frontier, Mich.
- 1,180,733. Retainer for rubber footwear. J. H. Brackin, Newark, Del.
- 1,180,681. Toy ballroom. R. B. Whelan, Los Angeles, Calif., assignor to Albert Behrend and Joseph Rothschild, composing the firm of Behrend & Rothschild, New York City.
- 1,180,704. Method of producing waterproof coatings of balata on objects which are influenced by humidity. M. Diekert, Werne, Germany.
- 1,180,714. Method of patching hose and tool therefor. R. C. Hall, Lexington, Ky.; N. C. Hall administratrix of said R. C. Hall.
- 1,180,733. Rubber hose bulb for spraying of flushing devices. J. A. Mulherin, St. Louis, Mo.
- 1,180,549. Waterproof life-saving appliance. I. Gilbert, Chicago, Ill.
- 1,180,887. Fountain pen. T. Tanimura, Rock Springs, Wyo.
- 1,180,911. Device for repairing punctures. G. B. Drake, Norfolk, Va.
- 1,180,946. Self-filling fountain pen. E. G. Peck, Seymour, assignor to E. W. Waterman Co.—both of New York City.
- 1,181,001. Waterproof sheet attachment for bed pan. J. C. Griesel, assignor of one-half to W. F. Doyle—both of Pottsville, Pa.
- 1,181,049. A wheel for cars comprising a removable tire of solid rubber. D. Wieseler and F. Cremer, Fultz, Germany.
- 1,181,060. Hose coupling. R. Bennett, Beacon, N. Y.
- 1,181,063. Elastic rubber inner liner for pneumatic tires. P. T. Coffield, Dayton, Ohio.
- 1,181,069. Puncture proof tire. J. C. Fair and T. A. Anderson, Chicago, Ill., assignors to Premium Punctureproof Tire Co., a corporation of Maine.
- 1,181,088. Demonstrable rim for wheels. I. D. Walter, assignor of fifty-three one-hundredths and fifty-fifths to J. Brinkerhoff, one-tenth to H. P. Cole, one-tenth to T. Flannery, one-fiftieth to J. W. Gant, one-twentieth to I. G. Gant, and one-fiftieth to S. A. Latimer—all of Harrisburg, Ark., and one-tenth to C. B. Bolley, Wynne, Ark.
- 1,181,100. Wheel rim for pneumatic tires. J. H. Fawkes, Portland, Oreg.
- 1,181,101. Fountain pen. E. Winne, New York City.

REMARKS.

- 14,117. Friction and metal plug for rubber heels and other tread surfaces. P. Berenstein, Chelsea, Mass., assignor to Panther Rubber Manufacturing Co., Stoughton, Mass.

ISSUED MAY 9, 1916.

- 1,182,162. Tool for use in the manufacture of shoes comprising a pad of laminated, spongy rubber. F. M. Farber, Revere, Mass., assignor to United Shoe Machinery Co., Paterson, N. J.
- 1,182,168. Pad garter. C. A. Hamlin; F. E. Lipscombe—both of Auckland, and H. Spencer, Hamlin, Wellington—all of New Zealand, administrators of said G. A. Hamlin, deceased.
- 1,182,227. Bridge having an electric strip between the brow band and blinders. M. J. Stephan, Nortonville, Kans.
- 1,182,246. Penholder having an expandible and elastic rubber sleeve. W. S. Bridges, Chicago, Ill.
- 1,182,257. Storage battery. F. Engel, Buffalo, assignor to U. S. Light & Heat Corporation, Niagara Falls—both in New York.
- 1,182,262. Sanitary skirt shield. N. H. Fosse, Appleton, Wis.
- 1,182,297. Tire. A. D. Morris, Philadelphia, Pa.
- 1,182,341. Truss, comprising an elastic strap. W. T. Ebo, assignor to The Easy Truss Co.—both of Battle Creek, Mich.
- 1,182,357. Method of constructing pneumatic tires. F. S. Dickinson, New York City.
- 1,182,433. Resilient pneumatic wheel, which comprises an inflatable element surrounding the hub. D. D. Stoner, Cincinnati, Ohio.
- 1,182,459. Pedal pad. F. J. Mason, assignor of one-half to S. E. Allen—both of Los Angeles, and one-half to J. C. Rice, San Diego—both in California.
- 1,182,600. Tire. W. E. Superson, Elgin, Ill.
- 1,182,604. Golf ball. F. L. O. Wadsworth, Sewickley, Pa.
- 1,182,605. Golf ball. F. L. O. Wadsworth, Sewickley, Pa.
- 1,182,634. Pneumatic tire. W. B. Buckley, Washington, D. C.
- 1,182,647. Combined non-skid and traction device for dual tire wheels. M. H. Cleaver, assignor to Neverskid Manufacturing Co., Inc.—both of New York City.
- 1,182,669. Outside layer of rubber compound for conservation in the wear of rubber vehicle tires. J. T. Flaherty, Springfield, Mass.
- 1,182,698. Tire patch. J. G. Mooney, Erie, Pa.
- 1,182,699. Tire liner. J. G. Mooney, Erie, Pa.
- 1,182,756. Life saving suit. M. A. Czerkas, Philadelphia, Pa.
- 1,182,764. Anti-slip underlay for rugs, comprising a sheet of duck having one face treated with rubber. E. W. Harral, Bridgeport, Conn.
- 1,182,810. Bath appliance. C. E. Stalter, Detroit, Mich.
- 1,182,820. Non-slipping rubber attachment for the soles and heels of boots and shoes. J. H. Turner, Abingdon, England.
- 1,182,871. Inflatable tire. H. C. Boggs, Decatur, Ala.
- 1,182,882. Bowling pin, the body of which consists of a composition of hard vulcanized rubber. M. Whelan, Muskegon, Mich., assignor to The Brunswick-Balke Collender Co., Chicago, Ill.

[NOTE.—Printed copies of specifications of United States patents may be obtained from THE INDIA RUBBER WORLD office at 10 cents each, postpaid.]

THE DOMINION OF CANADA.

ISSUED FEBRUARY 29, 1916.

- 167,359. Tire tread. D. B. McKenzie and A. Fowler—both of Winnipeg, Manitoba, Canada.
- 167,366. Dust cap for valve stems of tires. G. F. Fisher and A. Bailey—both of Plainfield, New Jersey.
- 167,367. Dust cap for valve stems of tires. E. L. Aiken, Springfield, Mass.
- 167,368. Massage appliance. C. H. Archibald, East Las Vegas, New Mexico.
- 167,406. Fish bait box with elastic front section. P. Lamb, Denver, Colo.
- 167,410. Tire forming strip. J. T. Lister, Cleveland, Ohio.
- 167,441. Cord for tire casings. J. D. Tew, Akron, Ohio.
- 167,425. Shoulder rest for violin secured to the instrument by elastic bands. B. Poehland, Brooklyn, N. Y.
- 167,428. Safety valve for tires. J. Riehl, Winnipeg, Manitoba, Canada.
- 167,439. Laminated fabric. L. A. Subers, Cleveland, Ohio.
- 167,441. Cord for tire casings. J. D. Tew, Akron, Ohio.
- 167,449. Composite sole having a tread portion of rubber. The Williams-Kneeland Co., South Braintree, Mass., assignor of W. F. Bostock, Providence, R. I.
- 167,520. Tire chain. M. Bodenstein, Rochester, N. Y.
- 167,524. Tire valve and pressure gauge. O. F. R. Bromberg, San Diego, Calif.
- 167,707. Triangular-shaped rubber cushion for game tables. The Brunswick-Balke Collender Co., assignor of M. J. Whelan, Muskegon, Michigan.
- 167,799. Valve for tires. M. J. Payne, Staunton, Va.
- 167,906. Pneumatic tire. H. Jancolovich, Pittsburgh, Pa.
- 167,910. Tire. H. M. Lambert, Portland, Oregon.
- 167,953. Club consisting of a piece of wire rope with ferules at both ends and a covering of rubber. E. E. Wellen, Christiania, Norway.

THE UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent upon the filing of the application.

*Denotes Patents for American Inventions.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, APRIL 12, 1916.]
- 24,022 (1915). Razor stop having a rubber end piece. G. H. De Naveene, 28 Avenue Bosquet, Paris.
- 24,105 (1915). Waterproof sleeping bag and marine life preserver. M. A. Campart and R. A. J. Amy, 10 Clifford street, and F. C. Bacon, 29 Portland street—all of London.
- 24,124 (1915). Spring wheel with pneumatic tire. J. Gonzalo Y Garrido, 44 Gran Via, Barcelona, and F. R. De Dampierre, 8, Hermsilla, Madrid.
- 24,128 (1915). Crutch with arm-pit cushion. F. A. Pennington, 10, Halesden Road, Halesden Chapel, Stockport, Cheshire.
- 24,164 (1915). Rubber mats, stair nosing, and treads. A. L. Neeson, 52, Old Bailey, London.
- 24,208 (1915). Overshoe. A. Johnston, and North British Rubber Co., Castle Mills, Edinburgh.
- 24,261 (1915). Figure having rubber base for use in table games. H. P. Robbie, 154, Perth Road, Dundee.
- 24,270 (1915). Life belt comprising rubber chambers containing gas forming chemicals. A. P. Row, and F. E. Ardrey, 9 Grand Parade, Muswell Hill, London.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, APRIL 19, 1916.]
- 24,441 (1915). Rubber grips for electric cords. R. J. Quainton, 53, Clarendon Road, Putney, London.
- *24,448 (1915). Stutch with elastic cuffs in the neck band. A. Bernstein, 31, North State street, Chicago, Ill.
- 24,499 (1915). Demountable rim. A. G. De Grey and Auto Sundries, Ltd., 10a, Lower Grosvenor Place, London.
- *24,559 (1915). Rubber faced metal shields for camera and like supports. W. H. Klenck, Warren, Pa.
- 24,569 (1915). Vehicle wheel with interior pneumatic cushions. G. R. Taylor, 373, Bath street, and R. Whyte, Reid street, Bridgeton—both in Glasgow.
- 24,570 (1915). Means for opening and closing the sliding lights of windows comprising a rubber lined bar. J. S. Bedford, 61, Park street, Blakenhall, and J. A. Cooper, 103, Owen Road—both in Wolverhampton.
- 24,586 (1915). Rubber tube for use in spinning apparatus for yarn winding. W. J. Lister, 68, Castle street, Nelson, Lancashire.
- 24,624 (1915). Apparatus for restoring respiration. R. H. Davis, 187, Westminster Bridge Road, London.
- 24,680 (1915). Treatment of rubber latex. S. Milne, 11a, Grange Road, Edinburgh. [See THE INDIA RUBBER WORLD, November 1, 1915, page 64.]
- 24,683 (1915). Spring wheel with continuous outer ring and rubber ring and like cushions. P. F. Dundon, San Francisco, California.
- 24,752 (1915). Hard rubber tires provided with a number of concentric rows of transverse cells filled with softer rubber. R. K. Hearn, Northerton, The Downs, Wimbledon, London.
- 24,815 (1915). Filter for attachment to a suction pipe for field service comprising a nozzle of rubber. W. Brooks, 28, Addison Road North, London.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, APRIL 27, 1916.]
- 46 (1915). Metal and rubber tread bands for tires. R. von Krenski, 25, Lessingstrasse, Berlin.
- 56 (1915). Combination tent, ground sheet and cape. G. H. Dale, 3 Weltmarkt, Cape of Good Hope.
- 126 (1915). Combination sole of rubber and cork. E. C. R. Marks, 57 Lincoln's Inn Fields, London.
- 146 (1915). Tread band for twin tires. A. J. Law, 29 Southampton Buildings, London.
- 147 (1915). Exercising apparatus, the links of which are composed of elastic cords. E. Sandow, 329 St. James street, London.
- 157 (1915). Non-inflatable rubber tire. W. E. Kerslake, 8 Mill Lane, West Derby, Liverpool.
- 173 (1915). Rubber tired spring wheel. R. Greenwell, Huntly, Auckland, New Zealand.
- 206 (1915). Puncture repair hand for tires. W. Allen, 22 Broad street, Seaford, Sussex.
- 222 (1915). Inflating valve for use with pneumatic life saving apparatus, sponge substitutes, and polishing pads. J. H. Devlin, 11 Johnson street, Notting Hill, London.
- 240 (1915). Renewable non-slip rubber treads for horsehoes. F. Shephard, 43 Works, Temple street, Swindon, Wiltshire.
- 285 (1915). Rubber cap for reservoir gun bottle. H. J. Visek, 5 Rangoon street, Fenchurch street, London.
- *288 (1915). Attaching artificial teeth to vulcanize plates. F. H. Nies, 859 Bay Ridge avenue, Brooklyn, and J. F. Carretto, Baldwin—both in New York.
- 100,088 (1914). Single tube pneumatic tire. C. A. G. Deterding, The Hague.
- *100,101 (1914). Method of forming cord tire casings. F. S. Dickinson, 233 Broadway, New York City.
- *100,102 (1914). Hesse pipe comprising an outer covering and a removable rubber lining. R. Many, 127 Duane street, New York City.
- *100,108 (1914). Rubber packing washer for dust caps of pneumatic tire valves. H. P. Kraft, 219 Godwin avenue, Ridgewood, N. Y.

- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, MAY 3, 1916.]
- 323 (1915). An appliance for treating foot rot in sheep, comprising a rubber boot molded to the shape of the hoof. C. Liddiard, 27 Somerset Road, Frome, Somersetshire.
- 365 (1915). Rubber faced target practice apparatus. W. J. Mellersh—Jackson, 28 Southampton Buildings, London.
- 392 (1915). Rubber impeller vanes and other rubber parts for centrifugal and turbine pumps, etc. R. C. Parsons, 39 Victoria street, London.
- 434 (1915). Wheel tires. F. Lieemann, Bremen-Horn, Bremen, Germany.
- 418 (1915). Hair curling appliances comprising rubber bands. H. E. Marcel, 534 Oxford street, London.
- 603 (1915). Brushes, having their bristles set in vulcanizable material. Rubber Set Brush Co., 21 Bucklersbury, London, and A. H. Tiramis, Fairmount, Harrow View, Harrow, Middlesex.
- 664 (1915). Air escape valves for discharging vitiated air from divers' helmets. R. H. Davis, 187 Westminster Bridge Road, London.
- 665 (1915). Rubber faced portable track wheels. R. H. Fowler, H. Livsey, and H. Walker, Steam Plough Works, Leeds.
- *100,141 (1914). Rubber heel with metal insert. J. M. van Heusen, 101 Robinwood avenue, Jamaica Plain, Boston, Mass.

NEW ZEALAND.

ISSUED MARCH 16, 1916.

- 35,937. Postmarking machine with rubber hand. R. M. Simpson, Wellington, N. Z.
- 35,914. Hose reel. L. J. Bennington, of Geraldine, N. Z.
- 35,924. Milking machine test cup of rubber. H. Eoden, of "Euroma," Sydney street, Willoughby, Sydney, N. S. W.
- 36,178. Milking machine test cup. H. R. Jenkins, of Eltham, N. Z.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

- 478,488 (April 23, 1915). Elastic tire for motor vehicles. A. Dreyer.
- 478,552 (April 29). Detachable wheel. Firm of Adolph Saurer.
- 478,579 (May 3). Improvements in the manufacture of tire casings. The Dunlop Rubber Co., Limited.
- 478,584 (May 4). Pneumatic tire. The rim is built so that its sides enclose the casing and the corresponding part of the inner tube in such a manner that the edges of the rim are above the average horizontal diameter of the inner tube, the unprotected part of the elastic casing is thus reduced to an arch considerably less than 180 degrees. The casing thus protected by the rim is now provided with beads and has on either side a heavy tube forming a puncture-proof tread. There are two flaps covering the part of the arch inside the inner tube. Hall, Behrens and Godel.
- 478,642 (May 8). Puncture-proof pneumatic tire. This tire consists of an air tube, a flexible casing, an intervening rigid sleeve, a certain number of plungers that are attached to the sleeve and the intervening sleeve and thus transmit to the air chamber the displacements of the casing. Parts like annular plates and bolts hold the whole together on the rim of the wheel. J. A. Shearer.
- 478,648 (May 10). Elastic tire for vehicles. E. W. Price.
- 478,719 (December 21, 1914). Pneumatic tire for vehicle wheels. G. W. Beldam and A. V. B. Ryall.
- 478,791 (May 22, 1915). Improvements in vehicle wheels and tires. L. Linde.
- 478,806 (May 26). Improved nipple with one or more non-elastic ribs embedded in the rubber at certain distances from the edges, preventing the nipple from collapsing. W. A. Kokke.
- 478,819 (May 27). Improved anti-slip devices for pneumatic tires. V. Gorecki.
- 478,826 (December 1, 1914). Improvements in elastic tires. Deal and Brooks.
- 478,892 (June 2, 1915). Elastic wheel. Orrills and Artigas.
- 478,901 (June 3). Splash guard for vehicles. H. Flad.

TRADE-MARKS.

THE UNITED STATES.

- 89,692. C. A. Rodriguez, New York City. A circle within a circle, the word "Ardur" between, and in the center three legs 120 degrees apart wearing garters. For zartars.
- 91,501. Cumings Brothers, Flint, Mich. A triangle, surrounding the letter B within the letter C. For tire plasters or pads for use inside of rubber tires, etc.
- 92,458. Williams-Kneeland Co., South Braintree, Mass. Representation of a doll with the word "Wible" in the center. For toy sales having a composite structure of rubber and leather, etc.
- 92,728. Gaul, Derr & Shearer Co., Philadelphia, Pa. A boy in Dutch costume holding a tire and standing on a square with the words "Gadsh Goods in center."
- 93,211. Hart, Schaffner & Marx, Chicago, Ill. The word "Trumpeter." For use on raincoats, etc.

- 21,501. The B. F. Goodrich Co., New York City. The word *Hiprest*. For rubber footwear.

DESIGNS.

- 48,885. Rubber tire. O. P. Downing, Dallas, Tex.
- 48,892. Pneumatic tire. A. Hargraves, assignor to the Firestone Tire & Rubber Co.—both of Akron, Ohio.
- 48,904. Elastic fabric. C. A. Lapworth, West Bridgewater, assignor to The Lapworth Webbing Co., Brockton—both in Massachusetts.
- 48,905. Elastic fabric. C. A. Lapworth, West Bridgewater, assignor to The Lapworth Webbing Co., Brockton—both in Massachusetts.
- 48,906. Rubber tire. C. O. C. Lindroth, Redfield, S. D., assignor to The Pharis Tire & Rubber Co., Newark, Ohio.
- 48,926. Elastic vehicle tire. A. L. Breitenstein, Akron, Ohio, assignor to The Rubber Products Co., Earlinton, Ohio.
- 48,932. Rubber pad for boots and shoes. H. P. Fouquet, New York City.

CUSTOMS RULINGS.

Mention was made last month of the customs' decision that small rubber balloons with advertisements printed upon them were decided to be toys and duty appraised as such. A similar case has since been decided when Florent Bauwens of St. Louis imported a large number of these balloons upon which the names of various city parks were stamped. He contended that the entry should be allowed as india rubber manufactures calling for a duty of 10 per cent, but the board of general appraisers decided that they were subject to a duty of 35 per cent as toys or their parts.

As is well known, the audiophone is an instrument used by partially deaf persons to aid their hearing. It consists of a fan-shaped sheet of hard rubber attached to a suitable handle and with a cord so placed as to draw the fan into the shape of a sounding board. The collector claimed that these were fans and dutiable at 50 per cent, but the board of appraisers has reversed this ruling, being convinced that the article was not a fan in the generally accepted sense of the word and should not be classified as such. An entry was given at 25 per cent as manufactures of rubber.

At the Boston Custom House a protest was filed by Ashworth Bros., Inc., when the government claimed that the chief value in rubber-faced card cloth was the cotton in the fabric, and assessed duty at 30 per cent. It was shown that rubber was the component material of value, and the board accordingly admitted the cloth at a duty of 10 per cent.

A decision regarding raincoats is interesting. W. B. Hutchinson & Co., Seattle, Washington, claimed that as cotton wearing apparel the duties should be 30 per cent, but the collector claimed that they should be classified as wearing apparel composed wholly or partly of wool and dutiable at 44 cents per pound and 60 per cent ad valorem, and this decision of the collector has been affirmed.

JUDICIAL DECISIONS.

FEDERAL RUBBER MFG. CO. V. HAVOLIC—AND OTHERS.

Havolic worked for the plaintiff; his duties were to feed stock into a tubing machine. In this department there was a compressed air system with hose and nozzle. Employees were forbidden to use the hose for cleaning their clothes. Havolic knew of the prohibition, but one day disobeyed it. A fellow workman took the hose from his hand and playfully prodded Havolic with the nozzle, thereby injuring him so that he was totally disabled for 17 weeks. He sued under the Workmen's Compensation Act, and the case came before the Industrial Commission of Wisconsin, which made an award in favor of the claimant. The employer appealed to the Circuit Court. The award was confirmed and appeal was taken before the Supreme Court of Wisconsin, where the decisions were reversed, it being held that the Workmen's Compensation Act of Wisconsin was enacted to provide compensation for injuries sustained when the causative danger is peculiar to the work, and that the workman is not entitled to compensation for injuries that do not result from a causative danger of his employment. (156 Northwestern Reporter, 143).

AJAN-GRIEB RUBBER CO., v. HUBBARD.—The former brought suit against the latter on a verified account of \$586.04. Answering, the defendant pleaded in set-off a sum of \$267.50, the value of certain goods alleged to have been returned by him to the plaintiff and, by cross-action, sought to recover other amounts aggregating \$750. He agreed that \$376.12 of the plaintiff's claim was just and asked for judgment in the sum \$364.48, over and above the amount due by him to the plaintiff.

The trial court found for the plaintiff in the sum of \$115.54, which was less than the amount claimed, and the plaintiff appealed.

There being no statement of facts or finding of facts in the record of the case, the court of appeals held that it could not determine that the judgment on the contested issues was erroneous, nor could it review errors in overruling special exceptions to the pleadings.

The decision of the trial court must therefore be affirmed. (Court of Appeals of Texas, 181 Southwestern Reporter, 568).

IN RE DUNEY. IN RE REVERE RUBBER CO. IN RE AMERICAN MUTUAL LIABILITY INSURANCE CO.—Durney, an employee of the Revere Rubber Co., was injured on September 28, 1912. His average weekly wages were \$22. He was paid a maximum compensation under the statute, until September 7, 1914. On September 8, 1914, he returned to work, but was then partially incapacitated, his weekly wages only amounting to \$13.20. Had there at the time been no business depression, these wages would have amounted to \$15 per week. Durney was awarded partial compensation based on one-half the difference between his average weekly wages before the injury (\$22), and his average weekly wages since the injury (\$13.20). The insurer, the American Mutual Liability Insurance Co., appealed, and the Supreme Court of Massachusetts affirmed the award, holding, that under the Workmen's Compensation Act, providing that in case of partial incapacity the employee should be paid one-half the difference between his average weekly wages before his injury and the average weekly wages he is able to earn thereafter, no deduction from wages earned before the injury should be made because of business depression. The award should be based on difference between the wages the employee was actually earning before the injury and the wages he is able to earn thereafter, although if his wages are reduced because of a depression in the business conditions, the amount of such reduction should be ascertained and added to the wages the employee actually receives. (111 Northwestern Reporter 166).

Review of the Crude Rubber Market.

NEW YORK.

MAY has been a very dull, uninteresting period for the local importers and dealers in crude rubber. Early in the month the market developed an unsettled condition that reflected the dull tone of the London market. There was an absence of trading, due to the holders' reluctance to accept orders at prices that were under the market. Both buyers and sellers appeared to be awaiting some decisive development that would definitely change the monotonous tone of the market. Predictions that the bottom had been reached and a reaction was imminent were daily confuted by prices that continued to seek lower levels. This condition of general apathy on the part of traders and the steady decline of prices were the dominant features of the month. The factors that are controlling the market are not so well hidden that the fundamental causes cannot be, at least, surmised. For instance, there is a lot of rubber in sight; the manufacturers accumulated large stocks prior to April 1; the anticipated heavy spring business in tires has not materialized, due to the backward spring weather; and machinery for new equipment is being delivered very slowly. Everyone is confident that the bottom in prices has been reached and is waiting for the reaction that will follow.

New York arrivals for the first three weeks of May are 6,756 tons compared to 4,000 tons for the same period last month, and are as follows: Plantations from London and Liverpool, 2,720 tons; Singapore and Colombia, 1,117 tons; Batavia, Java, 575 tons; Para and Manaos, 1,875 tons; Africams, 205 tons; Centrals, 84 tons; Manicoba, 180 tons.

May 1, first latex, spot and nearby, were quoted 77 cents; July-December, 76 cents. Smoked sheet ribbed, spot and nearby, were 76½ cents; July-December, 75½ cents. Upriver fine, spot and nearby, were quoted 69 cents and May-June 70 cents. On May 29, First latex, spot and nearby, were quoted 67 cents, July-December 67 cents. Smoked sheet ribbed, spot and nearby, were quoted 66 cents, July-December 66 cents. Upriver fine, spot and nearby, were quoted 66 cents, and June-July 67 cents. There was a decline during this period of 10 cents in the spot plantation grades, 9 cents in the futures, while Para sorts were 3 cents less than four weeks ago. The fact that futures have recently been higher than spot rubber in New York, while the reverse is the case on the London market, is a strange anomaly.

LONDON.

The market was heavy early in the month due to the quantities of rubber in sight, and fair business was being done, principally by the exporters. Shipments to the United States had gone forward in much greater volume than last month, with the result that permits were withheld for a time. On May 1, Standard crepe, spot was quoted 3s. ¾d. [74.5 cents]. October-December was 3s. 1¼d. [75.5 cents]. Smoked sheets, spot, were 3s. ¼d. [73.99 cents]. Hard fine sold at 2s. 10½d. [69.93 cents]. Values continued to fall during the month and on May 24, Standard crepe, spot, was selling at 2s. 9d. [66.89 cents]. July-December was quoted 2s. 9d. [67.91 cents]. Smoked sheets, spot, were 2s. 8d. [64.87 cents] and July-December sold for 2s. 9½d. [67.91 cents]. Standard crepe having declined, ¾d. [7½ cents] and Smoked sheet, 4½d. [8½ cents] during the first three weeks of May. The peculiar position of spot rubber selling from ½d. to 1d. [1 to 2 cents] below futures continues to be a surprising feature of the London market.

SINGAPORE.

The 5 auctions held between April 27 and May 23, inclusive, realized a total sale of 1,350 tons of all grades. First latex crepe

averaged 67.5 cents and Smoked sheet averaged 65.3 cents. The market has shown a steady decline of 13.2 cents a pound for First latex and 11.9 cents for Smoked sheet. On May 23 the difference between Singapore and New York spot prices was 7 cents for First latex and 7.8 cents for Smoked sheet rubber, with the demand active.

SINGAPORE.

GUTHRIE & CO., LIMITED, report [April 13, 1916]:

For the second week in succession prices ruling at the auction held yesterday and continued today were above London parity. Demand throughout was good and prices of most grades were higher on the week.

Fine sale crepe fetched the top price of the sale, one very fine lot selling for \$183, an increase of 53. Fine ribbed smoked sheet sold up to \$182, this being 53 higher than last week's best. Unsmoked sheet met with a good inquiry, ribbed and plain, selling up to \$168 and \$165, respectively. Brown and dark crepes sold readily at an average increase of \$2 per picul. Scraps shared in the general improvement.

About 400 tons were offered for sale and of this quantity about 280 tons changed hands.

The following was the course of values:

	In Singapore per picul.*	Sterling equivalent per pound in London.	Equivalent per pound in cents.†
Sheet, fine ribbed smoked.....	\$175 @ 182	3/ 4 1/2 @ 3/ 5 3/4	81.59 @ 84.63

STRAITS SETTLEMENTS RUBBER EXPORTS.

A cablegram from the Colonial Secretary, Singapore, notifies that the export of plantation rubber from Straits Settlements ports in the month of March amounted to 4,481 tons compared with 3,759 tons in February and 2,477 tons in the corresponding month last year. The total export for the first quarter amounted to 12,283 tons against 12,411 tons in 1915 and 4,169 tons in 1914. Appended are the comparative statistics:

February.....	1,203	2,741	3,350
March.....	1,285	2,477	4,481
Totals.....	4,169	7,794	12,283

These figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements such as Borneo, Java, Sumatra and the non-Federated Malay States as well as rubber actually exported from the Colony, but do not include rubber exports from the Federated Malay States.

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram from Kuala Lumpur reports that the export of plantation rubber from the Federated Malay States for the month of April amounted to 3,004 tons, compared with 4,420 tons in March and 2,877 tons in the corresponding month last year. The total export for the first four months of the current year amounts to 13,079 tons against 13,079 tons for the corresponding period of 1915 and 9,475 tons in 1914.

India rubber	289,219	\$147,569
Balata	147,510	51,199
Totals	437,129	\$198,768

PORT OF NEW YORK—MARCH, 1916.

IMPORTS:		
India rubber	23,859,096	\$15,743,731
Balata	265,240	107,084
Gutta percha	210,325	26,606
Gutta jelutong (Pontianak).	1,090,140	73,016
Rubber scrap	1,171,484	93,253
Totals	26,596,285	\$16,043,690
EXPORTS:		
India rubber	20,000	\$10,080
Balata	55,484	26,996
Totals	75,484	\$37,076

PORT OF BOSTON—MARCH, 1916.

EXPORTS:		
Rubber scrap	11,423	\$1,003
Manufactures of india rubber		101,518
Totals	11,423	\$102,521

PORT OF BOSTON—APRIL, 1916.		
IMPORTS:	POUNDS.	VALUE.
India rubber	145,600	\$120,002
Gutta percha	22,421	1,941
Gutta jelutong (Pontianak).	237,220	9,404
Manufactures of india rubber		4,250
Totals	425,241	\$135,597

PORT OF CLEVELAND—APRIL, 1916.		
IMPORTS:		
India rubber	690,608	\$486,112
EXPORTS:		
Rubber scrap	380	\$11
Rubber scrap	30,004	\$900
Reclaimed rubber	14,242	2,453
Totals	44,426	\$3,353

PORT OF HUCON—APRIL, 1916.		
EXPORTS:		
Rubber scrap	30,004	\$900
India rubber boots... (pairs)	1,740	4,180
Automobile tires		119
Other rubber tires		99
Belted hose, etc.		96
Other manufactures of india rubber		2,193
Totals	31,744	\$8,474

PORT OF NEW ORLEANS—APRIL, 1916.		
IMPORTS:		
India rubber	79,199	\$34,224
EXPORTS:		
Automobile tires		\$1,185
Other rubber tires		106
Belted hose, etc.		1,357
All other manufactures of india rubber		804
Totals		\$3,452

PORT OF PHILADELPHIA—APRIL, 1916.		
IMPORTS:	POUNDS.	VALUE.
Manufactures of india rubber.		\$448
EXPORT:		
Manufactures of india rubber.		\$7

PORT OF SAN FRANCISCO—APRIL, 1916.		
IMPORTS:		
India rubber	692,495	\$561,370
Gutta percha		670
Manufactures of india rubber		270
Totals	692,495	\$562,310
EXPORTS:		
Reclaimed rubber	23,437	\$2,385
India rubber boots... (pairs)	1,665	898
India rubber shoes	9,915	5,764

THE RUBBER SCRAP MARKET.

NEW YORK.

It would appear that the rubber scrap market has maintained a fairly steady position during the entire month despite the unfavorable influence reflected by the declining rubber market. Early in the month boots and shoes were firm at 8½ cents and dealers refused offers around 8½ cents from the reclaimers, and in some cases as high as 9 cents was asked. Steady buying was noticed the first week of the month on the part of several large dealers who evidently believed the present market has reached the bottom, and it was freely predicted that the reclaimers and rubber mills would be in the market before the end of the month. It is believed that there has been considerable tentative buying on the part of these interests which would substantiate this forecast.

The tire situation has been limited to small transactions controlled through price concessions by those who were anxious to sell, however, the dealers, for the most part, have asked 8½ cents for white G. & G. tires, delivered. Other grades of tires were unchanged, and No. 1 inner tubes were nominally 29 cents. The mechanical grades developed a tendency early in the month to lower prices, as buyers were not so keen for supplies as they were a week ago.

By the 20th of the month certain grades exhibited strength, particularly boots, shoes and arctics, due to the recent curtailment of arrivals. Boots and shoes were going in good volume at 9 cents delivered, though some dealers held out for 9½ cents. Arctics developed a firm tone in sympathy, the leading trimmed grades being delivered to the mills for 7 cents.

In white G. & G. tires the situation had not changed materially, though sales at 8½ cents delivered were reported. Mixed tires presented the anomaly of dealers buying at 6 cents and selling at 6½ cents delivered. Bicycle tires moved freely at prices ruling between 4½ and 4½ cents. Inner tubes were dull and easier in price, the No. 1 grade being quoted nominally at 27½ cents. White mechanical scrap appeared to move freely at prices ranging between 14½ and 15½ cents delivered, while the other grades failed to attract any interest whatsoever. There is no demand for garden hose, and the other grades were exceedingly dull.

A special form of rubber guarantee has been issued by the British consul at New York for use by the reclaimers. The rubber scrap dealers will continue to sign the same form.

MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

THE bullish sentiment of the past month is doubtless due to the belief that the war will be over within a year, and restoration of peace will result in a sharp advance in the cotton market. The other side of the question, however, is supported by the fact that the estimated 3,000,000 bales now consumed annually abroad for war purposes will stop short and that our own mills also will face curtailment, with a depressing effect on values. As for the crop, every effort is being made to make it a large one. The estimated production for 1915 in the United States, India and Egypt is 15,950,000 bales.

EGYPTIAN COTTON.

Sakellaries, Mit Afifi and Nubari are the grades used for tire fabrics and are set down in the order of their importance. Last year England cut the total production 40 per cent by limiting acreage. This year it is a different story, as conclusively shown in the following table of comparative figures:

PERCENTAGE PLANTED.

Year.	Total Acreage	Sakellaries	Mit Afifi	Nubari	Others.	Total Crop Yields.
1913...	1,723,094	14.3	36.2	11.7	37.8	768,417,200
1914...	1,755,270	22.5	26.6	14.9	36	634,676,800
1915...	1,186,004	46.2	17.7	17.1	(?)	400,000,000
1916...	1,910,000		17	8	25	(?) 700,000,000

The normal yearly consumption of Egyptian cotton in tire fabrics is under 100,000 bales; however, this year 200,000 bales are confidently predicted.

SEA ISLAND COTTON.

The average increase in acreage is reported to be 21 per cent for Georgia, with 10 per cent requiring planting, and 8 per cent for Florida, with 33 per cent requiring replanting. Crop conditions in the entire district are poor to fair, due to dry weather and a late spring.

Last year's crop was 78,000 bales, of which 62,000 bales went into tire fabrics. Efforts are being made to bring the total production for this year up to 100,000 bales. The crop in sight at all ports on May 19 is 68,516 bales against 65,116 a year ago.

TIRE FABRICS.

The activity in tire fabrics has continued during the month and the mills are reported as sold up to the first of the coming year. It still continues to be a seller's market with delivery the prime factor and price and quality of secondary consideration. Toward the end of the month the pressure for building fabric lessened somewhat, though the accessory fabrics continued scarce. The dull season for tire making is at hand and labor curtailment has already occurred in some quarters which should predict easier conditions in fabrics for the immediate future, at least.

COTTON DUCK.

In general the story is practically a repetition of last month, with a greater demand, however, for home deliveries of hose and belting duck. Foreign business has consumed all available stocks and is now affected adversely by the embargo, while domestic orders are appearing in good volume at higher prices. Orders are taken only for December 1916 delivery.

DRILLS AND SHEETINGS.

These continue to be scarce; particularly the drills and twills in widths of 55 and 65 inches. These are in great demand and some mills are putting on double shift to meet contract deliveries. Business is now being written for July 1917 deliveries.

RUBBER TIRE IMPORTS INTO THE STRAITS SETTLEMENTS.

The Registrar of Imports and Exports at Singapore, Straits Settlements, recently furnished to the British Board of Trade interesting statistics which show the share of Great Britain, Continental Europe, Japan and the United States in the importation of "competitive merchandise" into the Straits Settlements during the year 1915.

Under the heading "Rubber Tires," these statistics show that out of total imports from the four sources above mentioned, amounting to 2,199,000 Straits Settlements dollars [\$1,231,440], Japan's share was 1,037,000 Straits Settlements dollars [\$580,720], Great Britain's share was second in importance, amounting to 574,000 Straits Settlements dollars [\$321,440], Continental Europe ranked third with 572,000 Straits Settlements dollars [\$320,000], while the share of the United States was only 16,000 Straits Settlements dollars [\$8,960].

THE CENSUS OF INDUSTRY.

THE best fighting force in the world is useless without arms, ammunition, food, clothing, medicines and transport. It is with these facts in view that the Committee on Industrial Preparedness of the Naval Consulting Board of the United States is taking an inventory of the resources of manufacturers of such lines as would be needed in war. It is also planning for the development of increased efficiency in lines that are not up to the requirements.

Many factories whose products cannot be considered war necessities, have machinery easily adaptable for the production of war materials. A part of the comprehensive plans of the commission is to make these potential forces practical. It is proposed that the normal requirements of our army and navy be so divided and distributed that every plant capable of such manufacture be given a share at cost, plus a reasonable profit. If these requirements are not sufficient for this purpose, such goods as would not deteriorate might be made and stored

for later, or emergency, use. In order to encourage those factories which are not now making war materials, they may be given sufficient orders to justify adapting enough of their present equipment, and training a portion of their help, to such manufacture, so that they will have a practical knowledge of such work, and can quickly turn over more of their machinery, and instruct a larger proportion of their help, to greatly increase their output of these lines should occasion demand.

Every rubber mill is now, or could be quickly equipped with the machinery needed to furnish necessary material for use in time of war. The proofing of fabrics for tents, ponchos, ground sheets, etc., and of textiles for balloons and aeroplanes; the preparation of hospital sheetings; the manufacture of druggists' and surgical sundries; the making of automobile truck tires, and the production of footwear and insulated wire are all regular lines of the rubber industry which would be called for in case of war.

As a preliminary move, rubber manufacturers are being requested to supply answers to a series of questions regarding their business for the industrial inventory. This information is to be held strictly confidential, and the work is non-partisan, non-political, and wholly patriotic.

Among the questions to be answered are the names of officers, principal stockholders, and directors, and whether each of these is an American citizen, and if not, what is his native country. Much detailed information is requested as to the value of land, buildings, machinery, tools, equipment and merchandise; a full description of the plant, with its ground plan and total floor areas; with a list of apparently non-pertinent questions as to feeding, housing, and caring for employees, the number of the latter and their nationality; whether they are union or non-union, whether the work now done by men could be done by women; kind and amount of material used, and from whom purchased; principal products manufactured, and amounts; where and how marketed, details of shipping, etc.

The form supplied for recording all this information is rather formidable. Were each manufacturer able to answer the questions offhand it would be a task of considerable size. This, however, will be attended to by volunteer workers, trained men of technical education.

No doubt the rubber trade will respond freely and fully, and—this for a guess—it will be found already equipped with men and machinery capable of furnishing supplies faster than men could be recruited to use them.

JUL 1 1916

A PROTEST FROM LONDON.

THE increase in purchases of crude rubber in the Far East by representatives of American manufacturers for direct shipment to this country is viewed with some alarm by English rubber interests.

A recent issue of the "Financier" thus sums up the situation: "America uses about 90,000 to 100,000 tons of rubber a year. With the increase of mechanical traction, this quantity within the next few years, will probably be trebled. Towards this consumption of 100,000 tons, London exported to the States—according to the official statistics—no less than 40,000 tons. The whole of this business is directly affected if the Rubber and Tin Exports Committee continues its present policy. Let there be no illusion upon the subject. If this great trade is, during this time of stress, allowed to pass from our hands, it will never be regained."

The writer contends that no national purpose is being served by the policy adopted by the exports committee, and its efforts to prevent rubber reaching enemy hands are resulting in a very maximum of damage to British trade interests, with no corresponding advantage. He quotes from "a well-known authority" as saying "To help the Americans to obtain control of an essentially English industry is not to beat the Germans, and, as a matter of fact, it will suit German-Americans far better to buy in the East than to have to come to London for their supplies."

The "Financier" claims that there are 10,000 tons of rubber in England, besides cargoes unloading from the Far East, so there is no question of shortage; and furthermore, that this condition has brought about the recent decline in the price of rubber, and the consequent effect upon Eastern exchange; and that the whole rubber trade is demoralized by the existing uncertainty. The article suggests that "the sooner the Rubber Growers' Association and the Rubber Trade Association bring pressure to bear upon the committee to secure a more enlightened policy, the better for the present and future prospects of the rubber industry. It may be that these august bodies have already moved in the matter. If this be so, and a redress of grievances is not speedily obtained, it is to be hoped that they will jointly put forward an official remonstrance on the subject."

At first blush it would seem as if London had no reason for this protest—that she stood in the place of an expensive middleman who could and should be eliminated with speed and despatch; that if rubber sold in Singapore and bought in New York were held up by London, it might as justly be held up also by other English ports as Penang, Colombo, Aden and Port Said. Such reasoning

would, however, fail to take into account the important service rendered in making the present plantation industry possible. Through the most generous financing, and broad gage handling, the great producing plantations in the Far East were created and brought to their present productiveness. London was more than a partner; it was a wealthy elder brother with wide open purse.

Then, too, the work of the Rubber Growers' Association, of the greatest value to the planters, always centered in London. The London crude rubber men in the past have been singularly fair and impartial, but with the great growth of the Singapore market there is bound to be a readjustment in selling and shipping. London might hinder direct shipments for a time, but would it be best for all concerned? The better the producers of plantation rubber treat their biggest and best customer, the tighter that customer will stick. The cheaper the rubber, the greater the market.

THE STRIKE EPIDEMIC.

THIS is a time of unrest in the industrial world. It is a rare day when the morning news does not include the institution of a strike in some large factory. This is a result of present productive prosperity. The European war requires tremendous amounts of munitions, arms and supplies, while the call to arms of millions of artisans in Europe causes an increased demand for American goods to fill the scarcity of foreign manufacture. There is an almost unprecedented demand for labor, skilled and unskilled. The industries in greatest need of workers naturally offer high wages, and thus draw to their establishments employees from other factories. To hold their help these latter must increase the pay, and then workers in other plants, not thus affected, become dissatisfied, and demand equally high compensation.

No line of manufacture is free from this disaffection of employees. The rubber trade is no exception. Generally speaking, rubber workers are paid as liberally as are most others for labor requiring equal intelligence, strength and skill. Some of the leading rubber manufacturing concerns have voluntarily increased the wages of their workmen. Others have granted full wages for a shorter working day. Some strikes have been settled by granting the full demands of the workmen. Others have been compromised.

But the present industrial prosperity cannot last indefinitely. When this war is over—and it must end some time—reaction must inevitably follow. Then, with a total cessation of demand for labor in many of these great munition factories, and a lessened call for products of other establishments, many thousands of workers, skilled and unskilled, will be thrown out of employment. And, as is the case with merchandise, so it is with labor, less demand and oversupply must result in a readjustment downward of the wage scale of today.

Cord Tires and Cord Tire Fabrics.

MODERN cord tires owe their origin to the thread fabric invented by John T. Palmer and first used in racing tires on bicycles in 1893. That Thomas J. Jeffery was first in the field with a thread fabric tire as claimed by some, cannot be verified, but it is true that fabric bicycle tires were made at Indianapolis by the G. & J. Tire Co. in the early nineties.

The name "cord" tire originated in England, where the principle was first applied to the manufacture of automobile tires in 1900. It was known as the Palmer cord to distinguish it from the lighter Palmer cord bicycle tire. The Silvertown cord tire

PALMER THREAD FABRIC.

was invented and patented by Christian H. Gray and Thomas Sloper of England, and manufactured at Silvertown, England, by the Palmer Cord Tire Co., and in the United States, under license, by The B. F. Goodrich Co.

THE SILVERTOWN CORD TIRE.

In this tire, the cords are built up from units of 24 threads that are separately impregnated with rubber and subjected to uniform tension. They are then cabled and the foregoing operation repeated until cords of the required sizes are produced, which are flattened in a machine specially constructed for the purpose. The two layers of these flattened cords are applied in the following manner: First, a layer of rubber is applied to the core—set in the tire building machine. A series of metal staples, 300 in number, are then placed at spaced distances around the inner edge of the bead ring. The cord is fed from a supply spool to a tension governor which regulates the de-

SILVERTOWN CORD.

livery and maintains a reserve supply under uniform tension. A folding device measures off an exact length of cord and folds it into double loops which are seized by automatic fingers and placed diagonally on the core and, at the same time, on the bead staples. At the anchorage or smaller circumference of the tire the cords are arranged on edge, and as they approach the tread or larger circumference of the tire each cord is given a quarter twist so that it lies flat on that part of the core corresponding to the tread. When one complete layer is placed around the core, a layer of rubber follows, over which a second layer of cord is applied in the same manner as the first but at the reverse angle. Then another layer of rubber follows which completes the carcass.

THE DICKINSON CORD TIRE.

The principles embodied in this tire and the machine for con-

structing the carcass show effort on the part of the inventor to improve the art and practice of cord tire making. The separate strands of which the cords are composed are thoroughly impregnated with rubber which penetrates to the finest fiber. Thus a bond is created, not only between the cords but between the individual fibers of which the cord is composed, thereby preventing friction within the cord itself or between the separate cords. These are formed originally in flat section, the initial strength being retained; and the possibility of breaking the yarn fibers by application of pressure is obviated.

The cords are laid to a true helix under uniform tension on the tire core by a new automatic machine, in such a manner that the full area represented by the variable circumference be-

DICKINSON'S CORD.

ween the bead and tread is covered without packing, twisting, or distorting the cords. The cord loops are firmly anchored around the annular bead rings which are subsequently built into the carcass, thereby retaining the relative positions of the cords throughout the process of building and vulcanizing the tire. This method of construction permits curing the tire on the core, and therefore no distortion in the carcass occurs through the necessity of removing the core before a permanent bond is created between all the cords by vulcanization.

DEES CORD TIRE.

The Dees cord tire is built up on another new type of cord laying machine. The tire core is revolved and the rubberized threads are wound around it by a rotary winder in the form of a reel that carries the four thread bobbins and also the rubber solution cylinders. The threads are first impregnated with

DEES CORD.

rubber solution and then passed through rubber dough under pressure. They are then wound under tension around the core from one set of bobbins diagonally in one direction while the other ply from the other set of bobbins is wrapped diagonally

in the other direction, thus the threads of the two plies cross each other.

When the core has turned one complete revolution it is covered with a double ply of oppositely placed diagonal threads. Separator rings are applied to certain parts of the carcass and the thread winding operation continued. The separators prevent the different plies from sticking to each other so that the bead rings can be inserted and the carcass structure severed on the inner circumference in forming the beads and completing the casing.

WOVEN CORD FABRIC.

It can be safely said that with few exceptions, notably the Goodrich Silvertown cord tire, all cord tires now in use are made from a modification of the well-known thread fabric used in making hose pipe bicycle tires. It is composed entirely of cabled, parallel warp cords laid close together and without the usual filler other than small threads of soft, light yarn, spaced about one-half inch apart, that act as fillers but are only a temporary support to the web. In fact, the usual practice is to inflate an air bag within the unvulcanized casing that results in each cross thread being broken before the casing is finally cured.

Thirteen and one-half-ounce Sea Island fabric is generally used for the average cord tire, although 16½-ounce is recommended when size and excessive strain are factors to be considered. The fabric is coated on a spreader which applies several coatings of rubber to both sides of the web, the thickness of the solution and the number of coatings depending on the size and service required of the tire carcass. The spreading process not only impregnates the separated cords but preserves their alignment, which would be impossible in calendering. The fabric thus frictioned is skim-coated on the calender and then cut on the bias into strips of the required width and length. Thus it will be seen that all air is expelled from the fabric and the individual warp cords are imbedded in rubber, thereby reducing to a great extent the friction and consequent heating when the tire is subjected to air pressure and unusual strain due to fast driving.

There is apparently a limit to the size of the cord that can be successfully rubberized in cord fabric form. When the attempt was made to use a heavy warp cord in order to make up for the several plies made necessary by the use of lighter cord, the result was a failure, as the rubber could not be satisfactorily driven into the heavy 28½-ounce cord fabric.

PALMER'S FLAT CORD.

A development that grew out of the recognized imperfections in round cord, is a new type of ribbon or flat cord approximately one-half inch wide. According to John F. Palmer, these inextensible flat strips can be placed on the tire core at a true tangent to the rim, that is, at right angles to the spokes of the wheel.

PALMER'S IDEAL TIRE.

This position gives the most efficient power transmission from the rim to the tread for the reason that force is best transmitted in straight lines. The illustration shows how the cords are tangent to the rim in the ideal flat cord tire. A represents the axle; B the spokes; C the felly and D the rim. The cords E, form a bridge construction supporting the tire at F.

SUBERS' CORD FABRIC.

The inventions of Lawrence A. Subers follow closely along the lines of the cord principle in the development of a new laminated fabric that depends on a flat tubular fabric building strip. Moreover, the mechanical method of constructing the fabric is novel in principle. The fabric is made up of tubular bands, impregnated with rubber, that have alternating wide and narrow portions so that when it is made up in the form of a casing the wide portions will correspond to the tread and the narrow portions to the sides of the tire adjacent to the

SUBERS' CORD FABRIC.

beads. The fabric is laid, not braided nor woven, around an endless tubular mandrel corresponding in cross section to the general shape of a tire, by a machine that lays the strip around the moving mandrel at an angle of 45 degrees, while another layer of strip is simultaneously laid at opposite angles, forming a laminated tubular fabric. This fabric is slit on the inner circumference and removed from the mandrel in continuous lengths. These strips are of the correct width and shape to form the various plies of the tire carcass, which is built up on a separate machine.

13½ OUNCES.

16½ OUNCES.

28½ OUNCES.

THREE TYPES OF CORD FABRICS.

LISTER'S CORD FABRIC.

Lister's tire fabric strip is made up of two layers of spirally wound rubber cords, with the cords of one layer laid at an angle to the cords of the other layer and an intermediate layer of rubber formed by a spirally wound strip of rubber. The fabric strip is formed on a machine having a traveling core composed of an endless chain of segments of the same

LISTER'S CORD FABRIC.

cross section as the finished tire. The tubular strip thus formed is cut on its inner periphery, forming an open tube which is ready to be applied to the core of a tire building machine.

THE UNITED STATES "ROYAL CORD" TIRE.

The fabric used in the United States "Royal Cord" tire is woven with very strong warp and light, soft filler threads, the latter spaced about half an inch apart and serving only to hold the web in position during the preparation of the carcass. The rubber that is applied to the fabric and between each ply, forms a covering about each thread in such a way, that when the tire is completed, no thread touches nor chafes against another, and each thread bears its full amount of the inflation and strain.

In the manufacture of the "Royal Cord" tires, the fabric is first impregnated, so that all of the individual threads are thoroughly covered with rubber. By a special frictioning process, the spaces between the threads are then rubber filled, and, lastly, the surface is skim-coated with rubber. The tires are then built up on a core in the usual manner.

THE GOODYEAR CORD TIRE.

In the Goodyear cord tires a series of hard cabled parallel cords, without any cross weave other than the web-supporting threads, are imbedded in rubber in the usual way. The resultant fabric is then cut into bias strips and laid up on the tire core by the Seiberling-Stevens-State tire building machine.

GOODYEAR CORD FABRIC.

FUTURE OF THE CORD TIRE.

At present the cord tire is used only on large cars, the high cost of Sea Island and Egyptian cotton limiting its

field. It is said, however, that cheap and satisfactory tires made from Pécier cotton are a possibility, which would give the small car owner an opportunity to use them.

An indication of the present importance of the cord tire in the American trade is the prediction that 2,000,000 will be made during the coming year.

TIRE WEAR AND THE DIFFERENTIAL.

Whether the differential is necessary or only advisable on motor trucks is a subject of discussion in manufacturing circles. Some claim that though the present differential is far from satisfactory, it is a necessary evil, and it would not be wise to discard it. It is pronounced a heavy and expensive mechanism, which increases the cost of manufacture, of operation and of maintenance. But as regards wear of tires, there is not the slightest doubt that any vehicle not provided with a differential

must give unequal wear on the tires, so much so, in fact, that even with all its objections, the differential is still an economizer in maintenance.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless, they are of interest, not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[179.] Names of concerns handling guayule shrub are desired.

[180.] A correspondent wishes to secure one or more rubber trees of No. 1 quality for green-house novelty.

[181.] Names of manufacturers of "rubber foam" have been requested.

[182.] A foreign rubber manufacturer contemplates making tires and desires complete information on the subject.

[183.] An inquiry has been received for inner tube testing machines.

[184.] The name and address of a firm making and selling hard rubber beads is solicited.

[185.] Information regarding a solvent for balata is requested.

[186.] A correspondent desires the names of manufacturers of sponge rubber.

[187.] Makers of machines for covering metallic wire with rubber are sought.

[188.] A correspondent asks where wool and cotton flock can be obtained.

[189.] The name of a manufacturer of a machine for cutting designs in tread molds is requested.

[190.] Names of companies making aniline dyes suitable for rubber compounds are requested.

[191.] An inquiry has been received for a firm manufacturing rubber tile and interlocking rubber tile.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

An applicant in Spain desires to represent American manufacturers of india rubber goods. Report No. 21,273.

An inquirer in Norway would like to be placed in touch with American exporters of india rubber for dental purposes. Report No. 21,322.

A firm in Argentina wishes to receive quotations, descriptive catalogs, etc., from American manufacturers of rubber tubes for oxygen and acetylene gas under pressure, asbestos gloves, etc. Report No. 21,390.

Commercial relations with American manufacturers and exporters of rubber articles are desired by a firm in the Far East. Report No. 21,406.

An agent in the United Kingdom desires to communicate with an American manufacturer who can supply a loom or machine for weaving elastic hosiery, elastic abdominal supporters, etc. Report No. 21,409.

A commercial organization in Russia requests the names of American manufacturers of rubber crasers. Report No. 21,418.

Representation of American manufacturers and exporters of hospital supplies in rubber goods is sought by a firm in Italy. Report No. 21,419.

A firm of commission agents in Brazil seeks commercial relations with American manufacturers and exporters of rubber tires and other rubber goods. Report No. 21,471.

Representation of American manufacturers of surgical rubber goods is desired by an applicant in France. Report No. 21,590.

Automatic Control of Time, Temperature and Exhaust in Tire Vulcanizers.

PERFECT vulcanization is the final achievement in the many important steps that are necessary in making automobile tires. A uniform curing temperature is vitally essential in the production of a guaranteed product. Dependence on the carefulness and experience of an operator invariably challenges the well-known fallibility of human skill, and an automatic control that neither forgets nor becomes tired and careless is incomparable.

Such devices are doubtless well known in general to the trade; however, the following description of the principle and methods

of operating that are characteristic of the Tagliabue system will be of undoubted interest. The operating principle of these controllers is embodied in the primary parts that are described in the following text and illustrated in Figure 1: A capsular spring which expands and contracts in direct ratio with the temperature tendency within apparatus to which controller is attached; a transmitting lever for multiplying and transmitting this movement; a ball valve which is operated by the transmitting lever and which allows more or less air pressure to open or close the steam valve to a greater or lesser extent; air inlet and outlet connections for the air pressure which does the actual work of regulating the steam valve.

The capsular spring *A* is a phosphor bronze shell with a flexible top that when a temperature controller is involved is connected by flexible tubing with a thermostatic bulb, partly filled with ether. When the bulb temperature varies, the pressure of the vapor above the ether varies in accordance and moves the top of *A* in response to the merest tendency toward a change at the bulb. In the case of a pressure controller the capsular spring is directly connected to the controlled steam pressure.

The transmitting lever *B* is provided with an adjusting screw at the point where it contacts with the capsular spring. Advancing or withdrawing this screw, in connection with a dial and pointer arrangement, provides an ideal adjustment for higher or lower temperature maintenance.

The ball valve is extremely simple; it is sensitive and positive because frictionless and self-cleansing. When the temperature tends to go too high the consequent slight expansion of the capsular spring *A* and the resulting movement of the transmitting lever *B* allow the valve stem *D* to move upward. This increases the opening for the incoming air, which enters through *G*, and restricts the opening for the air which escapes past the pin *D*. Thus the air pressure on the diaphragm-motor steam

valve, through passage *F*, is increased, and the consequent closing movement of the steam valve checks the excess steam. The opposite effect occurs, of course, when the temperature tends to diminish and more steam is needed.

The compressed air affords an instant, flexible and powerful means for doing any amount of work required, especially when the steam temperature shows a mere tendency to change and when, therefore, the capsular spring moves only an infinitesimal extent.

The actual operation of the Tagliabue control system applied to a tire press is briefly as follows, with reference, however, to Figure 2:

Figure 2 shows a tire vulcanizing press to which the following Tagliabue units are applied. The first is a compound controller which consists of two controllers housed in one case. One of these controllers maintains a uniform steam temperature within the press, while the other portion of the controller takes care of the exhausting or venting at the bottom of the press by periodically relieving the heater, not only of the water condensation, but of the supersaturated steam also. Another controlling unit is the automatic time controller which, after the vulcanizing period is at an end, automatically shuts off the steam supply and opens the exhaust wide. This can also be arranged to turn on cold water for flooding and cooling the contents of the press when

FIGURE 1. THE PRINCIPLE OF THE TAGLIABUE SYSTEM.

desired. At the same time this controller rings a bell, or otherwise signals the operator, that he may know the heater is blowing off and be ready to open and re-charge it with the least waste of time. Another unit is the recording thermometer, which gives a graphic record of just what the controllers have accomplished in the way of uniform temperature maintenance, the final units being the mercurial thermometers, which serve as a check on the recorder.

Assuming now that the operator has charged the heater and is ready to start the cure, he first steps up to his time controller and by means of the setting key turns the hand clockwise from the starting point to the exact time period required for the cure. Then he opens the hand valve which is between the steam supply source and diaphragm motor valve *B*, shown in the "Side View Showing Arrangement of By-pass." Steam now enters the heater and the hand of the time controller *K* will commence to travel backward, or counter-clockwise. At the start diaphragm-motor valve *B* will be wide open, but will gradually close as the temperature builds up within the heater until finally it will assume the exact throttling position required to maintain

the temperature for which the controller is set. When the steam first enters, it has little effect on the thermostatic bulb of the temperature controller *E* because of the rapid condensation, but as the molds heat up, the condensation becomes less and the thermostatic bulb transmits the temperature effect to the capsular springs of the temperature controller. This gradually expands and moves the transmitting lever within the controller, causing more and more compressed air to flow to the diaphragm-motor valve *B*, which assumes the throttling position mentioned. Should the steam pressure in the header *A* increase, causing the temperature within the heater to go higher, this effect is instantly transmitted to the controller, and more compressed air is allowed to enter the top of diaphragm motor valve *B*, which will close, thus checking the rise in temperature. If, on the other hand, the steam pressure within header *A* falls, the reverse will occur and the diaphragm motor valve will open wider.

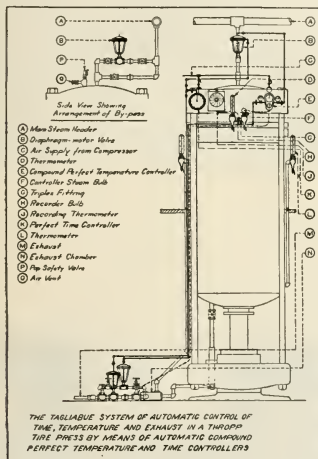

FIGURE 2. AUTOMATIC CONTROL APPLIED TO VERTICAL HEATER.

In the meantime the exhaust control portion of the controller *E* is intermittently draining the heater, because, as the condensation or the supersaturated steam, which is at a lower temperature, comes in contact with the thermostatic bulb of the latter it causes the diaphragm motor valve on the exhaust line to open, and the steam within the heater will eject the water and supersaturated steam. But when dry steam contacts with the thermostatic bulb it will cause the diaphragm-motor valve to again close. This occurs periodically during the vulcanizing period. During this time the hand of the time controller *K* has been slowly returning to the starting point. When the time is finally up this hand trips the time controller mechanism and compressed air, flowing through the time controller, with shut off diaphragm-motor valve *B*, the steam inlet valve. At the same time compressed air flowing to the "reverse acting" diaphragm-motor valve on the exhaust line will cause the latter to open wide, allowing all of the steam left within the heater to be vented out. In addition, as already mentioned, the operator is signaled so that he can unload the press and get ready for another cure.

The time controller can also be arranged, although it is not thus shown in Figure 2, so that it will cause a third diaphragm-

motor valve to open wide when the vulcanizing period is up, and cold water will flood the heater until the operator shuts off the water supply.

The water of condensation settles in the exhaust chamber *N* in Figure 2. This chamber has two outlets, as shown, each of which is provided with a diaphragm-motor valve, one of said valves being a direct acting and the other a reverse acting valve. The direct acting valve opens when the compressed air pressure is relieved and closes when the air pressure enters the top. This valve is in connection with the exhaust control part of the compound controller shown at *E* in Figure 2. When the temperature gets low this valve opens, thus venting the heater until dry steam comes in contact with the thermostatic bulb. The reverse acting valve mentioned is connected to the time controller, and, being reverse acting, remains closed while there is no air pressure on the diaphragm top. When, however, the time controller functions, and allows air to pass and flow to the top of this reverse acting diaphragm-motor valve, it opens wide and thus blows off the apparatus when the time period is up.

The same arrangement of units can be applied to a horizontal vulcanizer, used for curing treads, inner tubes or the open cure process. The functioning of the different units is exactly the same as already described.

THE CONCENTRIC WIRING SYSTEM.

There are in almost every city numbers of small houses which the owners will not have wired because the standard forms of wiring are more or less expensive, and with present methods of wiring it is necessary to disturb the wall decorations to obtain neat installations.

Rubber insulated wire of special construction, intended to be installed on the surface of the wall and to be covered with paint or paper, has been devised for wiring inexpensive houses.

Bare concentric wire, so-called, has a single, rubber-insulated, solid wire for its inner conductor.

CONCENTRIC WIRE.

The outer conductor, or sheath, is composed of tinned sheet copper, folded longitudinally around the wire with a full lap, giving uniform, double thickness. The laps of the sheath are then soldered, forming a continuous water and gas tight jacket.

The special fittings are so arranged that joints can be quickly made by expert wiremen, and they are designed so that the grounded sheath is continuous throughout the system. Because of the possibility of injuring the rubber insulation on the wire, the use of solder is considered inadvisable. It is, of course, necessary that the outer sheath be carefully grounded at the service switch so that the whole system will be thoroughly grounded. The concentric wiring system can be installed only with a special permit from the local insurance bureaus or municipal inspection bureaus. [General Electric Co., Schenectady, New York.]

METHOD OF INSTALLING AND SPECIAL FITTINGS.

A College Course in Caoutchouc.

THE growth and development of the city of Akron has been due almost entirely to the strides made by the rubber industry. The great demand made by the factories of the city for college men, and the evident superiority of young men with theoretical knowledge and practical experience with rubber, were the incentives which caused the introduction of a course in the chemistry of rubber by the Municipal University of Akron.

The chemistry of rubber is still in its infancy, due to the nature of the hydrocarbon to be dealt with, and also to the comparative youth of the industry. Owing to the rapid development of the manufacture of all kinds of rubber articles, the

experimental washing mill and, after drying, calculates the loss due to washing and, from that, the cost of the rubber to the manufacturers.

Besides taking up the general nature of the pigments, fillers, diluents and the well-known accelerators, a study of their chemical properties and methods of manufacture is gone into. If they are obtained as by-products in some other industry, these industries are reviewed as far as the time allows. The general methods of analysis for factory control are discussed, and carried out in the laboratory with samples which will later be used in actual compounding. Emphasis is placed upon the great value of the relation between the specific gravity of a substance and its cost per pound.

The methods of analysis of vulcanized rubber as used today are fully discussed and carried out in the laboratory. Thus the student becomes acquainted with the various forms of apparatus used in the analysis, and also gets a working knowledge of such methods as give comparatively good results.

The theories on compounding and vulcanizing of rubber are taken up in lecture and conference work. In the laboratory the student carries out these processes from a practical factory point of view. The rubber laboratory is equipped with modern standard mixing mills, a vulcanizing press, a steam vulcanizer heated by a smaller boiler, which can be regulated to any practical vulcanizing temperature desired, and a tensile testing machine. As the cost of a compound, together with its specific gravity, is a most essential factor in rubber manufacture, the method of calculation from the cost and specific gravity of the raw materials is gone into and the importance discussed.

The student first makes up simple standard compounds, vulcanizes them, and, after getting the tensile strength, calculates

MINIATURE WASHERS AND MIXERS.

ingenuity of chemists has been taxed to develop processes, and to find adequate methods of control, both of the raw material and the finished products. The varied nature of the raw materials used in the manufacture of rubber broadens the scope of a chemist employed in this work to such an extent that there is hardly a branch of his profession which is not touched at one time or another.

This course at Akron is an advanced one, and to be taken only by men who have already had training in chemistry. The requirements for entrance are one year of general inorganic chemistry, one year of qualitative analysis, one year of quantitative analysis, and one year of organic chemistry. Men with such preliminary training should be in a position to fully comprehend the theories and understand the methods used in the analysis and manufacture of rubber.

The curriculum consists of lectures, conferences and laboratory work. The results of experiments which have been made to advance the theoretical knowledge in connection with the chemistry of rubber, from the latex to the vulcanized product, have been collected from different sources and are given to the student in the lectures. Their value and application are discussed fully, and, as far as possible, the development of the individual theories traced and applied to other branches of chemistry. The conferences consist in recitation work on subjects for which the student has been required to prepare himself by consulting various books and journals.

In the study of raw rubber, the botanical origin, the nature of the latex, its method of collection and coagulation, are taken up in the lectures. The different grades of raw rubber on the market are studied with the aid of samples. These are used for lecture work, and also for practical chemical analysis in the laboratory, where the student carries out the methods as used in the technical laboratories. To get acquainted with the practical factory side of the manipulation of crude rubber, the student is given a sample to prepare for use in compounding. Besides going through the general analysis, he washes the rubber on the

MINIATURE PRESS AND VULCANIZER.

the volume cost from the raw products used. A check is obtained by determining the specific gravity of the finished product. After he is familiar with the manipulation of the rubber compounding he is given problems in making up formulae having given properties and given volume costs. By actual compounding and vulcanizing, the practicability of the formulae is determined. In this way he becomes familiar with practical factory problems.

During the year, by courtesy of the Akron rubber manufacturers, the students inspect all of the larger factories in the city where the processes, which cannot be carried out in a small

laboratory, are explained. Many of the students also spend their summer vacations working in different departments of the various factories in the city.

It is not the aim of the Municipal University of Akron to graduate experts on the chemistry of rubber. The limit of time

TESTING MACHINE.

allowed for the course permits only the teaching of the fundamentals. But with this preparation the student should be able to develop into a valuable rubber man, whether he be of the laboratory, factory or sales force.

The success of the course is shown by the fact that calls for graduates are received from all parts of the United States, and that these graduates have been uniformly successful in holding the positions thus obtained.

The course is in the direct charge of Professor William F. Zimmerli.

SCHOOLS FOR TIRE REPAIRERS.

THE business of repairing automobile tires, as many a car owner knows, is not one to be entrusted to any chance mechanic who happens to own an obsolete vulcanizing apparatus. In order that those to whom this work is entrusted shall know their business more thoroughly, special schools of instruction have been instituted and courses prescribed which will fit these men to do such work in a proper and efficient manner.

The Goodyear Tire & Rubber Co., Akron, Ohio, has instituted such a school where they teach men, free of charge, the art of repairing tires under practically the same conditions that are apt to obtain in their own workshops. A complete practical course is furnished. Beginning with fundamentals, every step in scientific tire repairing is demonstrated by expert teachers, and actual practice is given in the latest approved methods, so that when these students have completed their course it is stated they will be qualified to undertake any kind of repair job, from a puncture to a re-tread.

A picture of this tire repair school is shown herewith. At the left in the picture a buffing wheel is in operation. Next is shown the instructor demonstrating the use of a vulcanizer to an attentive student. In the center of the picture is shown a student placing the tire on the rim and, further to the right, another measuring fabric for repairing the carcass; while in the rear are to be seen other operations in tire repairing.

A similar institution is that of the Haywood Tire & Equipment Co., Indianapolis, Indiana, manufacturer of tire repair apparatus. In this school a ten days' course is given, covering personal, practical instruction in the making of every kind of tire repair, the rational use of the machinery, tools, etc. For those desirous of securing this practical education, but who live at too great a distance from the school, a correspondence course has been provided. A recent class included people from nine different states, from Vermont on the north to North Carolina at the south, who came to Indianapolis to secure instruction in what has been for many of their predecessors a profitable, useful and steadily increasing business.

A more ambitious plan, perhaps, than either of the above, is that of the Akron Tire Repair School which was incorporated May 15 of this year, with a capitalization of \$10,000. It occupies a building 29 by 125 feet, two floors and a basement. The second floor is used as a lecture room, the first floor for offices and equipment and teaching of actual repairs, and the basement for stock and storage.

The plan of this school is to obtain students through advertising who will come to Akron and for two weeks be instructed in the lecture room, where they will be shown by actual building the construction of the tire. This will be accompanied by general instruction regarding rubber, from its gathering and handling to the processes it goes through to reach the completed tire. Then will come instructions regarding the different troubles that come to a tire which will be shown by actual samples. The student is shown how to tear down and build up a tire for repair. After this course in the lecture room, the students will be taken into the shop where they will do actual work under trained teachers.

The repair shop is equipped with the Akron-Williams outfits made by the Williams Foundry & Machine Co., and will carry a complete line of these outfits for repairing tires. This shop will do the repair work on tires for a part of the 9,000 machines which are operated in and around Akron.

After the mechanical instruction has been completed, the business end will be taken up and instruction given in the merchandizing and financing ends of the business, the bookkeeping and routine of records, etc., being fully taught.

These schools are fitly situated in tire manufacturing centers. Their progress will be watched, and if they prove profitable to

A TIRE REPAIR CLASS AT THE GOODYEAR WORKS.

scholars and managers, it is more than likely that their example will be followed, and similar schools instituted in other sections, to provide for those who would find it inconvenient to travel so far in order to get the principles and rudiments of this comparatively new but very important industry.

What the Rubber Chemists Are Doing.

VULCANIZATION OF CAOUTCHOUC BY MOLECULAR OXYGEN.

THE researches of I. I. Ostromyslenski have shown that the action of ozone in vulcanizing caoutchouc depends on the preliminary formation of the caoutchouc ozonide. The ready-formed ozonide has an effect similar to that of ozone, both soft and hard resins being formed. The course of the process is chiefly determined by the concentration of the vulcanizing compound. When caoutchouc is exposed in an atmosphere of dry air to the ultra-violet rays of a quartz mercury lamp, it undergoes gradual vulcanization, increasing in weight at the expense of the oxygen. At 104 to 176 degrees F. this process takes place with fair rapidity, but at 248 degrees F. no vulcanization occurs.

Vulcanization of caoutchouc by means of its ozonide takes place under the same conditions as vulcanization by benzoyl peroxide.

In the presence of moisture, chemically pure caoutchouc activates molecular oxygen and thus behaves like most of the terpenes. Thus, moist isoprene—or erythrene, caoutchouc of the normal series, when left in the air at ordinary temperature, gradually becomes covered with a layer of new, less elastic substance, this process being analogous to the drying of vegetable oils. If normal erythrene-caoutchouc, thus coated, is milled on cold rolls to render it homogeneous, and then heated in the ordinary way in the absence of air, the unchanged caoutchouc undergoes vulcanization. If, however, this surface is first removed, vulcanization does not take place. Evidently this layer, consisting of a product of the action of atmospheric oxygen on the caoutchouc, constitutes the vulcanizing substance.

The vulcanization of caoutchouc by its halogenides or ozonides is purely a physical process and is comparable with the formation of celluloid. The latter process may be regarded as vulcanization of cellulose esters by camphor, etc.

The large number of known vulcanizing agents indicates that the chemical nature of these plays no determining part. All these agents form colloids with the caoutchouc, and it is by these colloids that vulcanization is effected.

VULCANIZATION BY NITROBENZENES.

Dr. H. P. Stevens has endeavored, without success, to repeat the results of Ostromyslenski in the vulcanization of rubber by the use of nitrobenzenes (see THE INDIA RUBBER WORLD, May, 1916).

His method was as follows:

A mixture was made, in the ordinary way, of 100 parts raw rubber and 2 parts of powdered dinitrobenzene. A control sample of rubber alone was prepared. Both samples were vulcanized, under cover, in steam for 3 hours at 275 degrees F. Comparison after this treatment showed no apparent difference between the samples, neither being vulcanized in the slightest degree. The rubber was simply lifeless and without nerve, same as when overmasticated and heated. The result seems to indicate, contrary to the announcement of Ostromyslenski, that dinitrobenzene has no vulcanizing property and is unable to replace sulphur in vulcanization.

ORGANIC PIGMENTS IN VULCANIZED RUBBER.

Most organic pigments are practically unavailable for coloring hot vulcanized rubber, because at high temperature, in the presence of sulphur, they readily decompose with loss of color. A method of special value in the manufacture of rubber articles, colored with such pigments, has been devised by I. I. Ostromyslenski, which permits vulcanization at the ordinary temperatures in the presence of sulphur, an amine, and an oxide. Certain organic pigments are not decomposed when heated either at a compara-

tively low temperature, or even at that of ordinary vulcanization, provided that the heat is maintained for only a short time. In such cases the process permits acceleration of the vulcanization or lowering the temperature employed. Experiments were made with eosin, erythrosin alkali blue and cinnamylidene-fluorene. In the case of erythrosin, a mixture of 3 parts of the dyestuff, 10 of caoutchouc, 2 of magnesium oxide, 0.8 of sulphur and 0.2 of piperidine-piperidylidithiocarbamate, after cool mixing, was completely vulcanized in iron molds in ten minutes at 284 degrees F. Similar results were obtained with the other dyestuffs mentioned.

THE STRUCTURE OF CAOUTCHOUC.

Doctor Samuel S. Pickles in the "India Rubber Journal" (May 6, 1916) has briefly stated his views on the structure of caoutchouc, a summary of which is that the molecule consists of a large number of C_8H_8 complexes. Natural rubber contains at least eight of these units and the ring is a 32-carbon ring. The simplest form to express this formula is

The chemical reasons why the ring, rather than the open chain form of molecule is preferred are (1) Caoutchouc combines with only two bromine atoms for every C_8H_8 complex which it contains (Weber); (2) Caoutchouc can be so oxidized that the whole of its carbon atoms appear as derivatives of levulinic-aldehyde and levulinic acid (Harris). Assuming the correctness of these two observations, the closed ring follows as a corollary. The bulk of the evidence and the weight of opinion are at present strongly in favor of the large ring formula for caoutchouc.

ANALYTIC REACTIONS OF ISOPRENE.

THE presence of isoprene formed in a reaction of a diolefine with conjugated linkings is detected by I. I. Ostromyslenski by shaking 5 to 10 drops of the products of the reaction for a short time with 50 cc. of concentrated aqueous sulphur dioxide solution, the mixture being then left at the ordinary temperature in a hermetically sealed vessel. In the course of 2 to 30 hours an abundant, colorless, amorphous precipitate is formed. This consists of a compound of the diolefine with sulphur dioxide possessing characteristic properties.

Isoprene may be determined quantitatively by converting it into 1,3-dichloroisopentane. If a grams of the dichloroisopentane compound be obtained from S grams of the crude isoprene, the latter contains $3403 a \times 70.49 S$ per cent isoprene. The procedure is as follows: 200 grams of the crude isoprene, containing butylenes, amylenes, benzene, etc., with boiling point 86 to 104 degrees F., is energetically shaken with 1500 cc. of fuming hydrochloric acid for 6 hours in a mechanical shaker. The black, opaque upper layer of chloro-compounds is separated, washed with aqueous sodium chloride solution saturated in the cold, again separated after the emulsion formed has separated into two layers, dried over calcium chloride and distilled. At 104 to 122 degrees F. only two or three drops of hydrocarbons generally distil over, and the fraction 122 to 194 degrees F. contains butylene and amylene chlorides. The fraction 194 to 266 degrees F. is collected separately. From 266 degrees F. the temperature usually jumps immediately to 288 degrees F., the boiling point of the 1,3-dichloroisopentane. When the crude isoprene has been obtained, for example, from turpentine, the 1,3-dichloroisopentane cannot be distilled, but it is found that the residue distilling with boiling point beyond 291 degrees F. consists, in spite of its black color, of almost chemically pure 1,3-di-

chloroisopentane. This residue may be filtered through glass wool and the filtrate weighed. The fraction boiling at 194 to 266 F. is subjected to careful fractional distillation, as it contains 1,3-dichloroisopentane, sometimes in considerable quantity. The fractionation is carried out three times in each case up to 288 degrees F.

ANALYSIS OF LITHOPONE.

THE tentative methods of the American Society for Testing Materials for the analysis of lithopone are as follows:

INSOLUBLE MATTER. Take 1 gram of the sample in a 200 cc. beaker, add 10 cc. of concentrated hydrochloric acid and mix. Add in small portions about 1 gram of potassium chlorate; then heat on steam bath until about half of the liquid is evaporated. Dilute with water, add 5 cc. of dilute sulphuric acid (1 part of acid to 10 of water); boil, settle, filter, wash, ignite, cool and weigh the insoluble matter, which should be only barium sulphate.

TOTAL ZINC. The filtrate from the insoluble matter is made alkaline with caustic soda, acid with hydrochloric acid, add 3 cc. of concentrated hydrochloric acid, dilute to about 250 cc. with water, heat nearly to boiling, and titrate with potassium ferrocyanide solution and calculate to zinc.

ZINC OXIDE. Treat a 4 gram sample of lithopone for 4 hours with 200 cc. of 1 per cent acetic acid at ordinary temperature, stirring occasionally. Filter by suction on a double filter paper and wash with cold water; add to the clear filtrate 13 cc. of concentrated ammonia water, neutralize with hydrochloric acid, and then add 3 cc. of concentrated hydrochloric acid in excess; heat to boiling and titrate with potassium ferrocyanide, using uranium acetate solution as an outside indicator. Calculate to zinc oxide. Calculate this result to zinc, deduct from total zinc, and calculate difference to zinc sulphide. Zinc carbonate or zinc sulphate is included in the zinc oxide.

ZINC SULPHIDE. Place 0.5 gram of pigment in evolution flask with about 10 grams of mossy zinc, add 5 cc. of water; insert the stopper carrying a separatory funnel and an exit tube. Run in 50 cc. of concentrated hydrochloric acid from the funnel, having previously connected the exit tube to two absorption flasks in series; first flask contains 100 cc. of alkaline lead nitrate solution, second flask 50 cc. of same as a safety device. After all of the acid has run into the evolution flask heat slowly, finally boiling until the first appearance of steam in the first absorption flask; disconnect, let the lead sulphide settle, filter, wash with cold water, then with hot water till neutral to litmus paper and washings give no test for lead. The lead sulphide precipitate is dissolved in hot, dilute nitric acid, evaporated to fumes with sulphuric acid, and finally weighed as lead sulphate. Calculate to zinc sulphide.

The alkaline lead solution is made as follows: Into 100 cc. of potassium hydrate solution (56 grams in 140 cc. of water) pour a saturated solution of lead nitrate (250 grams in 500 cc. of water) until the precipitate ceases to redissolve, stirring constantly while mixing. About 3 volumes of the lead solution will be required for one of the alkali.

Instead of absorbing the evolved sulphuretted hydrogen in alkaline lead nitrate solution, a solution of 8 grams of cadmium chloride in 250 cc. of water and 150 cc. of ammonia water (sp. gr. 0.90) may be used. The cadmium sulphide precipitated, may be filtered on a weighed Gooch, washed with water containing a little ammonia, dried at 212 degrees F., and weighed. Calculate to zinc sulphide. It is better to filter the cadmium sulphide on a small filter and wash as above, then place filter and precipitate in a beaker and dissolve in hydrochloric acid and potassium chlorate (keeping at room temperature at first); filter out any paper pulp or insoluble matter; make filtrate alkaline with ammonia water, then just acid with hydrochloric acid, heat to boiling, and precipitate with barium chloride in the

usual manner. Filter, wash, ignite and weigh as barium sulphate. Calculate to zinc sulphide.

For very rapid work the contents of the absorption flask, after all sulphuretted hydrogen has been absorbed, may be washed into a vessel with cold water, and diluted to about one liter, acidified with concentrated hydrochloric acid, and titrated with standard iodine solution, using starch indicator. (The precipitate should be completely dissolved.) The iodine solution is prepared by dissolving about 127 grams of pure resublimed iodine and 18 grams of potassium iodide in a little water, and then diluting to one liter.

TESTS ON LITHOPONE.*

COLOR. The color of the dry pigment should be compared with a standard sample of pure dry zinc oxide and a standard sample of lithopone that has been kept in a colored glass jar protected from light. Portions of these samples should then be ground in light colored linseed oil and again compared for whiteness.

OPACITY. The relative opacity or "dense" character of the samples may be determined by making small batches of paste paint with mortar and pestle. To 25 grams of lithopone add 2 grams of 98 per cent red oxide of iron. Use about 10 grams of raw linseed oil (pale) for grinding. Brush out a sample of the paint upon a strip of glass in comparison with others prepared in the same manner. The most "dense" grade of lithopone will give the lightest effect.

TESTING RUBBER INSULATION.

In testing rubber insulation according to the "Underwriters' Specifications, Aaron Arthur Ladon, Chicago, Illinois, has found that samples taken from the same coil showed marked variation in strength and elongation. The wire had been in stock some time and the tests were carried out with the idea of putting it in with the new stock, provided the insulation had not deteriorated.

Samples 5 inches long were taken from each coil. They were rolled between two blocks of wood to loosen the insulation. The rubber could then be slipped off the wire. The insulating material was then tested for elongation, stretch and tensile strength.

The results varied as much as 100 per cent, and in only six coils out of 52 did the samples check.

The trouble did not lie in non-uniformity or deterioration of the rubber compound, as was first supposed. The method of separating the wire from the insulation was at fault. No matter how carefully the samples were rolled between the two blocks, the insulation could not be removed intact. In places it would stick to the wire.

A new method was therefore devised for removing the insulation. The wire was tinned copper. Tin amalgamates with mercury very easily and forms a very slippery surface on the copper. The mercury has no effect on the rubber compound. About 1/4 inch of insulation was cut off of each end of the samples and the stripped wire scraped to remove dirt and grease. The ends of the samples were then immersed in mercury. After a period of time, varying from 4 to 24 hours, the insulation could be slipped off the wire with almost no effort.

This method is being used by one of the largest electrical manufacturers in the country. Besides the accuracy and uniformity of results accompanying the application of this property of mercury, the cost of the testing has been reduced by over one-third.

A NEW SOURCE OF ANTIMONY.

Alaska, during 1915, shipped to San Francisco about 800 tons of antimony, chiefly from the region about Fairbanks. Four deposits are being worked on a small scale. The mineral is found in pockets and contains 50 to 58 per cent of metallic antimony. This discovery is not remarkable, since antimony is frequently found in abundance in gold bearing strata.

*A circular issued by Henry A. Gardner, Director, Scientific Section, Educational Bureau, Paint Manufacturers' Association.

CHEMICAL TREATMENT OF RUBBER.

UNITED STATES PATENT.

ADHERING RUBBER TO FABRIC. The process of uniting fabric or fibrous material and a rubber compound containing a vulcanizing medium consists in treating the fabric with a non-vulcanizing medium, non-detachably associated with the fabric and which has greater adhesion for rubber than the fabric, and finally vulcanizing the rubber to the fabric. [United States patent No. 1,184,015. Raymond B. Price, assignor to Rubber Regenerating Co., Mishawaka, Indiana.]

SYNTHETIC CAOUTCHOUC. By this process there is heated in a closed vessel, with an acid reagent, a distillate, obtainable by cracking pinene into various hydrocarbons by passing it, in the form of vapor, through a tube heated to a temperature of between 572 degrees and 662 degrees F., and then cooling quickly, and distilling the hydrocarbons. The resultant mixture is heated in a closed vessel, thereby creating pressure and maintaining the temperature constant while the pressure drops, and until the pressure reaches a point where it remains substantially constant, distilling off the volatile matter, and oxidizing the residue. [Eva Gottschalk, Newark, New Jersey. United States patent No. 1,185,654.]

THE UNITED KINGDOM.

SUBSTITUTE FOR CELLULOSE OR LEATHER. India rubber is converted into a chlorine derivative by dissolving it in carbon tetrachloride or other solvent, which does not react with chlorine, but is a solvent of the product to be obtained, hydrocarbons being excluded; and treating with chlorine, or a gaseous mixture containing chlorine. A filling agent, such as camphor, may be incorporated with the material. The solvent is removed by evaporation or distillation, or the new derivative may be precipitated by alcohol or other miscible solvent which has no solvent action on the substance. [S. J. Peachey, Stockport, England. British patent No. 1,894 (1915).]

ALBINITE.

A new compounding ingredient known as Albinite white is being introduced in the French rubber industry. It is described as kaolinite, obtained chemically as a double decomposition product of extreme purity, whiteness, and of impalpable fineness. It is said to act as a vulcanization accelerator and is an inexpensive and satisfactory substitute for zinc oxide.

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

LABORATORY APPARATUS.

A CHECK VALVE FOR SUCTION FLASKS.

AN effective ball valve easily made and attached to the usual types of suction flasks has been devised by G. P. Walton, of the Bureau of Chemistry, U. S. Department of Agriculture. It consists of a glass tube *A* having an indentation or other check for the ball valve; a glass ball valve with guide *D* blown from a capillary tube; an inner glass tube *B*, and the valve seat *C*, a short piece of smooth, heavy rubber tubing with square cut ends. The parts are shown assembled and fitted to the usual form of suction flask. A rubber drain tube, not shown,

completes the apparatus. A comparatively slight suction is sufficient to close the valve perfectly, and upon releasing, the suction a column of liquid in the flask a fraction of an inch above the valve is sufficient to start the outflow.

In the form of suction-flask not provided with an outlet at the bottom, a suitable vent may be drilled, by using a short section of copper tube in a drill press with carborundum and water for abrasive. To adjust the valve, force the rubber *C* through the vent, moisten the inner tube *B*, and push it through the rubber, making a tight joint between the latter and the wall of the flask; place the ball *D* in position, and force the outer tube *A* over the rubber. The rubber should project about 1/16 inch beyond the end of the inner glass tube, which serves merely as a siphon and space for the valve-seat.

SPECIAL BINOCULAR MICROSCOPE.

A binocular microscope is particularly applicable to the work of an industrial laboratory, both for inspection and research. Through its double optical system the object is viewed with both eyes so that it is seen in relief, as with the unaided vision, and a distinct stereoscopic effect obtained. The image is also shown in its true form, and not transposed or inverted as with the regular microscope.

The binocular microscope is thus of special advantage in examining surfaces and materials of all sorts, as wood, metal, leather, rubber, fabrics, etc., and for noting the results of tool work on surfaces. A real perception of depth is obtained when viewing furrows, cracks, or like depressions.

The model illustrated has an extremely wide range of adjustments, permitting it to be conveniently used for every kind of work to which it may be put. For the examination of transparent or translucent materials, for counting threads in cloth or the like, the specimen is placed upon the stage and light directed through it by the mirror. When examining large surfaces, such as pieces of leather, rubber or paper, which are too large to be placed upon the stage, the upper part of the instrument may be detached and used with the stage as a base. This is the arrangement shown in the illustration.

The magnification obtainable with the outfits supplied with this instrument varies from 10 to 74 diameters. [Bausch & Lomb Optical Co., Rochester, New York.]

New Machines and Appliances.

AUTOMATIC TIRE FABRIC LOOM.

THE prominence that pneumatic tires have given to certain fabrics has resulted in many improvements in the looms on which building fabric is woven. The question of increased production has been fully considered in the design and construction of the loom shown in the illustration, which embodies the latest improvements in machines of this type.

These looms are generally equipped with automatic shuttle changers so that changing by hand is eliminated. The magazine carries six or seven shuttles filled with weft, and when the yarn on a bobbin is exhausted the shuttle is automatically thrown out and a new one substituted so that the loom continues to run without stopping as is necessary with the older types of looms.

There are various claims as to the percentage of production, but, broadly speaking, the average on each loom is from 80 to 90 per cent of a theoretical production of 100 per cent; moreover, the automatic loom is said to give better production and the cloth is woven more perfectly. This loom, therefore, is a decided improvement over the older type, where the filling or weft is changed by hand. Ordinarily, with the automatic loom, the amount of waste is less, referring particularly to the amount

of yarn left on the bobbins, because the automatic feeder can be set so that a very small amount is left. As the yarn used in tire fabrics is very expensive, the question of waste is a very essential matter to guard against.

The looms are made in various widths from 48 to 90 inches. As there has been some demand for long lengths of fabric during the past year, the looms are equipped with an attachment so that a roll of cloth 125, 250 and even 500 yards can be rolled up in the loom as woven. Most of the tire fabric is made from combed Sea Island or Egyptian yarn of the very best quality and weighs $17\frac{1}{4}$ to $17\frac{3}{4}$ ounces per square yard. The number of picks per inch is usually $23\frac{1}{4}$ to $23\frac{3}{4}$, and the fabric must be woven very carefully and free from knots.

The looms are particularly heavy and in a way similar to the duck loom, the widest weighing approximately three tons. The speed is usually from 128 to 100 picks a minute, according to the width; the wider the loom the slower the speed. They are driven by belt or by motor, and a great many of the newer mills are equipping with individual motor drive, which is a

desirable advantage. [Crompton & Knowles Loom Works, Worcester, Massachusetts.]

A NEW 15-TON DUPLEX VULCANIZING PRESS.

Increased production and economy in floor space are the special advantages claimed for the Duplex vulcanizing press shown in the accompanying illustration.

It is specially designed for tire manufacturers, to be used in patching slight defects in non-skid casing treads; however, it is readily adaptable to the manufacture of a variety of small mechanical rubber goods.

This press is built for 1,500 pounds accumulator pressure and develops 15 tons on each side. The rams are 5 inches in diameter with a $4\frac{1}{2}$ -inch stroke, and spring returns or "pull backs." The platens are 12 by 14 inches, with $4\frac{1}{2}$ -inch mold space and are connected by swing joints and chambered for steam. Plain flat platens can be furnished if desired. Each side of the press is operated independently and controlled by patented single pressure quick operating valves.

The weight of the machine is 1,450 pounds and it occupies a floor space of 36 by 34 inches. Height over all is 6 feet 7 inches and height of the platen from the floor is 3 feet. [Metalwood Manufacturing Co., Detroit, Michigan.]

PREMIER ELECTRIC VULCANIZER.

Tire repairing on the road, or, for that matter, in the garage, is exceedingly simple, safe and sure, according to the claims made for the Premier electric car repair vulcanizer. This handy little device can be used in making repairs on casings and inner tubes with ease and facility. Attach the wires to the storage batteries or a 110-volt lighting circuit and after preparing the tube or casing, clamp on the device and press the red button shown in the illustration on the side of the vulcanizer. When the vulcanizer develops sufficient heat to cure the repair, an automatic temperature control instantly shuts off the current.

The apparatus weighs but two pounds, and the standard equipment includes a tool for holding open the cut when preparing a casing, scissors for cutting the Para rubber gum, a tube of quick curing cement, a piece of emery cloth for cleaning and roughening the rubber, and wax papers to place over the repair to prevent the vulcanizer from sticking. The vulcanizer is fitted with a connecting cord and a durable chain for clamping to the work, the whole outfit being packed in a neat container. [Premier Electric Co., Chicago, Illinois.]

MACHINE FOR ENGRAVING NON-SKID TIRE MOLDS.

The universal engraving machine illustrated and briefly described here, was designed for the purpose of engraving non-skid molds used in the manufacture of pneumatic tires of all descriptions.

It works on the familiar pantograph principle, where a tracing pin at one end of the pantograph is guided over a carefully

prepared copy of the design which it is desired to reproduce, and the engraving tool at the opposite end of the pantograph accurately cuts this design in the tire mold.

A is the tracing pin and B the engraving tool. The copy to

be followed is fastened to the holder plate C, while the mold to be engraved is clamped to the index plate D, which can be adjusted to any angle by the hand wheel F. The handle E provides

for adjusting the position of the work holder. The drum G is provided for moving the work through fractional parts of a revolution. The "copy" guides the engraving tool in a horizontal plane, but owing to the fact that the mold is concave, a template H is provided to control the vertical movement of the engraving tool.

The vertical cutter spindle is mounted in the frame I, to which the motor spindle drive is also attached. The motor and spindle mechanism are supported on the link K, which in turn is carried by the pivot L, and a similar pivot on the column slide. These pantograph pivots are fitted with radial and thrust ball bearings, so that the movement is very sensitive.

All types of molds, for all sizes of tires up to 48 inches in diameter, can be engraved on this machine. Concerning the rate of production, a letter S, 1½ inches high, was engraved in a forged steel ring to a depth of 5/16 inches in four minutes. The same letter was engraved in cast iron in 1½ minutes. The dimensions of the machine are as follows: Height 12 feet, floor space 5 by 9 feet, net weight 18,000 pounds. [George Gorton Machine Co., Racine, Wisconsin.]

THE "GIANT" RUBBER SCRAP CUTTER.

The increased use of motor trucks within the last few years has naturally thrown a great many old tires on the rubber scrap market, which has brought up new problems as to the

best way of getting them into shape for reclaiming. A very heavy, strong machine is of necessity required for cutting these large solid

tires. A cutter built to meet these conditions is the Taylor-Stiles No. 11 "Giant" rubber scrap cutter, illustrated here.

The frame is made of one solid casting weighing over 2,800 pounds.

The head, or revolving knife cylinder, is steel, 20 inches in diameter, weighing about 1,100 pounds, and is practically unbreakable. The main shaft is 6-inch hammered steel, with bearings 11 3/16 by 5 3/8 inches. It is equipped with two 24 by 8½-inch special balance shearing pulleys, one on each side, which gives a nearly perfect balance and enables the cutter to be driven either right or left hand. The shearing feature of these pulleys prevents the possibility of any serious damage due to running iron or any foreign matter into the machine.

After the tire has been cut once, it is fed endways into the feed box and passing under the spiked feed roll, it is cut off into slices from ¼-inch to ½-inch thick by the three 17-inch revolving knives cutting against the bed knife, leaving the material in good shape for further treatment. This machine will handle equally well pneumatic tires, hose or any other rubber scrap. [Taylor, Stiles & Co., Riegelsville, New Jersey.]

MACHINERY PATENTS.
PRICE'S VACUUM MASTICATOR.

WHEN rubber stock is prepared previous to vulcanization it is very important that the material should be free from entrapped gases or liquids. This object is accomplished by the novel application of a vacuum in connection with a machine commonly known as a masticator.

In the illustration, which shows a side elevation in section, A is the cylindrical casing jacketed for heating

and cooling, provided with a hinged cover B. The corrugated

roll *C* is hollow and connected to pipes *E* and *F* through which the heating or cooling medium is conducted. It revolves in bearings supported in the ends of the casing and is driven by a spur gear *D*. A multiplicity of hollow pins *G* extend within the casing and are connected to the vacuum pipes *H*.

As the roll rotates, the rubber stock will be kneaded between the corrugated roll and the inner sides of the casing; meanwhile the hollow pins will penetrate the mass and the gases and fluids withdrawn from the material by action of the vacuum. [Raymond B. Price, New York City, assignor to Rubber Regenerating Co., a corporation of Indiana. United States patent No. 1,184,016.]

ROYLE'S TUBING MACHINE HEAD.

Tubing machines are at times subjected to excessive strain due to overcrowding the capacity for which the machine is designed. Royle's invention precludes this danger, whether the machine is used for multiple tube forming or straining reclaimed rubber, by providing a plurality of discharge openings in the head.

Referring to the drawings, *A* represents the tubing machine cylinder, and *B* the stock worm. *C* is the strainer head and *D*, *E*, and *F* the hollow nuts that screw into the discharge openings and hold in place the strainer plate, or die and core bridge, as the case may be. The opposite sides of the head between the discharge openings are covered by plates *G* and *H*, forming chambers *I* and *J*, in which circulates either a heating or cooling medium. The annular chamber *K* surrounds the front discharge opening for the same purpose.

The construction of the head permits the stock worm to be used at full capacity without danger of overcrowding, since the material will find an outlet through the lateral passages when the forward discharge passage is overloaded. [Vernon Royle, Paterson, New Jersey. United States patent No. 1,182,711.]

HOPEWELL'S ENCLOSED SPREADER.

This machine proofs and dries the fabric within an enclosed chamber from which the volatile vapors are conveyed to a separate apparatus where the solvent is recovered. The plates designated by *A* in the illustration enclose the revolving steam-heated cylinders *B* and *C*. Supplemental heat is furnished by the sectional steam plates *D*, *E* and *K*.

The spreading mechanism is bolted to the frame at *F* and comprises a transverse chamber in which a scraper travels back and forth automatically, cleaning the back of the hinged spreading knife *G* that is raised by hand levers *H*. The chamber *I* is provided with a fabric slot opening into the dryer and extending the entire width of the machine.

A metal fabric supporting strip closes the bottom of this chamber and passes around a transverse roller that is raised or lowered to adjust the distance between the fabric and spreading knife.

The dough is spread on the fabric *J* in front of the knife and seals the opening through which the web passes into the vaporiz-

ing chamber. Revolving knives remove foreign particles and imperfections and the coated and cleaned fabric passes around heated drum *C*, over water-cooled roller *L* and around drum *B*, passing out through opening *M*, sealed by felt-covered rollers. The volatile vapors are conveyed to a brine-cooled solvent condenser of the usual coil type where the solvent is recovered. [Charles F. Hopewell, Newton, Massachusetts. United States patent No. 1,184,452.]

A NEW OPEN CURE TIRE MOLD.

The principal object of this invention is to avoid the wrapping process customary in open cure tire vulcanizing. In place of the usual strips of cotton cloth that are wound around the mold and tire, a fabric diaphragm is clamped securely on both sides of the tire, forming a flexible support, covering the casing and tread.

APPLYING HARD COMPOUND TO SOLID TIRE RIMS.

This machine receives the hard rubber compound from a strip forming calender and lays it evenly on the metal base or rim, forcing it into the grooves provided for anchoring purposes.

In the illustration, *A* is a calender and *B* the rim chuck that revolves on a stud attached to an arm *C* provided with a counterweight *D*. This arm is pivoted to a shaft that is journaled in bearings attached to the calender frames.

Below the rim, drums *E* and *F* are mounted and carry a wire belt or a series of wire belts *G*, driven by sprocket gearing and chain *H* from the calender.

The rim is then placed upon the machine feeding the compound to be used for the base of the tire and put in operation. The strip of compound passes between the rolls and upon the traveling belt which rolls it upon the rim while still warm and tacky, causing the latter to revolve through frictional contact. When the rubber on the rim is of sufficient thickness, it is removed and placed upon the second machine, which applies the compound for forming the outer part of the tire. In making tires according to this invention, a number of calendaring machines are provided, having attached thereto the apparatus described, one complete machine being provided for each of the different compounds to be incorporated in the tire. After enough of this has been rolled upon the rim, the rim and tire are placed in a mold and vulcanized by heat and pressure. [John J. Gammer and Walter H. Allen, Akron, Ohio, assignors to The B. F. Goodrich Co., New York City. United States patent No. 1,183,552.]

A CORD TIRE. Endless loops of rubber-impregnated strands are twisted, forming cords with loops at each end which are laid over the core and held by the head wires which pass through the loops of the cords. [George F. Fisher, Plainfield, New Jersey, assignor to Morgan & Wright, Detroit, Michigan; United States patent No. 1,183,965.]

BEAD WIRE FORMING MACHINE. A number of wire strands can be wound on a form wheel by setting a stop bracket at a point indicated on the scale. When the indicated number of revolutions has been wound on the form wheel the machine stops automatically. [F. C. Brucker, Akron, Ohio, assignor to Miller Rubber Co., Akron, Ohio; United States patent No. 1,184,619.]

CALIFER GAGES FOR RUBBERIZED FABRICS. Two ordinary gages are mounted above a tension roller over which the rubberized fabric passes, the thickness being continuously indicated by the gages. [Thomas Midgley, Worthington, Ohio, assignor to Morgan & Wright, Detroit, Michigan; United States patent No. 1,184,002.]

TIRE BUILDING MACHINE. A plurality of stock rolls for frictioned fabric of different widths are mounted on a reel. The fabric is fed to the core by feed rollers that stretch the fabric. The feed rollers are driven by a friction wheel that contacts with the core and regulates the stretch of the different fabric plies as they are applied to the core. [William W. McMahan, assignor to Morgan & Wright, both of Detroit, Michigan; United States patent No. 1,183,996.]

British Patents.

SEIBERLING'S FRICTION CALENDERS.

This patent relates to continuously-working apparatus for coating both sides of the fabric with rubber and for applying a skim coating to one of the sides. The fabric to be coated is placed in two stacks *A, B*, with a railway sewing-machine *C* interposed for joining the end of *B* to the beginning of *A*. The fabric *D* is drawn from the top of *B* and passes through a tensioning device *E* over idler rolls 35, 36, 41 to a calender

F, where the under side receives a coating of rubber. The fabric then passes through a tensioning device *G* to a second calender *H*, which coats the upper surface, and thence to a tensioning device *I* having cooling rollers 53, 56. The fabric next passes to a device *J* wherein the selvage edges are trimmed off and a third calender *K* applies a skim coating to the upper surface of the fabric, which finally is wound up by a device *L*. [F. A. Seiberling, Akron, Ohio. British patent No. 1,289 (1915).]

A NEW DIPPING MACHINE.

The cylindrical casing *A* is shown in end elevation and contains a central shaft *B* having radial arms supporting at their outer ends four carriers *C* for the dipping forms *D*. The lower part of the casing forms a chamber *E* located over a hydraulic ram, upon which is wheeled a solution tank *F* through the doors *G*. The forms are introduced through a door *H*.

The shaft being locked, with one set of forms arranged vertically over the tank, pressure is applied to the ram and the tank is raised until the forms are immersed in the solution, then a trip lever shuts off the pressure and opens the exhaust which lowers the tank.

When this is clear of the forms, the shaft is unlocked and turned by means of the hand wheel to bring down the next set of forms, and the operation is repeated. The tank has hinged lids that open and close as it is raised or lowered. The vapors escape through the pipe *I* and a steam coil *J* is provided for drying the dipped forms. [J. W. Reeves, 25 Great Poultry street, London, England. British patent No. 1,344 (1915).]

DRIVING BELT FOR MOTOR CYCLES. Two ridges extend continuously around the outer surface of the belt. In another type transverse ridges forming troughs are used, the idea in both instances being to carry off any water that would cause the belt to slip. [Dunlop Rubber Co., Limited, London; British patent No. 4,692 (1915).]

GAS HEATED VULCANIZING PRESS. The platens are heated by gas burners in combination with means for automatically maintaining the platens at a predetermined temperature. [I. Hall, Whitehouse street, Aston, Birmingham, England; British patent No. 1,063 (1915).]

PROCESS PATENTS.

MAKING SOLID TIRES. A process for making solid tires having bases of harder vulcanizing compound than the tread, consists in forming strips of compound of uniform thickness and applying them to the rim. [John R. Gammeter and Walter H. Allen, Akron, Ohio, assignors to The B. F. Goodrich Co., New York City; United States patent No. 1,183,551.]

METHOD OF MAKING TIRE CASINGS. The middle portion of the fabric is stretched to a greater degree than the edges and then shaped by cupping and applied while curved to the core. [John R. Gammeter, Akron, Ohio, assignor to The B. F. Goodrich Co., New York City; United States patent No. 1,183,553.]

REMOVING FLUIDS FROM RECLAIMED RUBBER. The rubber stock is penetrated by a multiplicity of hollow points through which gases or liquids are extracted and the mass subjected to pressure. [Raymond B. Price, New York City, assignor to Rubber Regenerating Co., Mishawaka, Indiana; United States patent No. 1,184,259.]

INSULATING TELEPHONE CABLES. In a telephone cable with

artificially increased induction load and wherein the conductor is insulated with gutta percha or similar material, the dielectric losses are minimized by eliminating or reducing the resinous substances. "Green" gutta percha which contains a small amount of resin may be used alone or may be mixed with gutta percha or balata to reduce the proportion of resin. Artificial gutta percha or *Gutta Gentsch*, prepared according to Specification 15,255 (1899), may also be mixed with gutta percha or used alone. The insulating material may be arranged in several layers, and one or more of the substances, such as resin-free balata, green gutta percha, *Gutta Gentsch*, and gutta percha mixtures, may be used in some or all of the layers.

[K. W. Wagner, 1 Luisenstrasse, Lankwitz, Berlin, Germany. British patent No. 1,346 (1915).]

RUBBER CALENDER CONTROLLERS.

THE application of electrical apparatus to rubber calender drives, in practically all cases, requires motors with 4 to 1 speed variation and suitable controllers. The speed limit of the motors should be approximately 1,000 revolutions per minute. To meet these requirements the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, has developed a line of motors and controllers for rubber calender drives, designed for operation on two voltages—115 and 230 volts direct current. This method has been adopted, due to the fact that electrical equipment for calenders can be made somewhat cheaper if used on a two-voltage circuit rather than a single-voltage circuit, and there is very little difference between the cost of providing either a two-wire or a three-wire circuit. As a matter of fact, in practically all large rubber plants two-voltage, direct-current circuits are used to secure power for the calenders.

As a rubber calender represents a constant torque application, a motor of sufficient capacity to provide the required torque at high speed will take care of the power requirements throughout the whole speed range. The motors furnished for calender drives have a two to one speed range by field control.

The controllers furnished provide approximately a 6 to 1 speed variation by means of armature and shunt field control on the two-voltage circuit. They also have a "threading in"

point which gives a speed of approximately 50 per cent of normal low running speed by means of armature control. This threading in point is used when starting up the calender after it has been stopped. Acceleration is automatic up to the setting of the master switch handle, and is controlled by shunt contactors with mechanically interlocked accelerating relays, and by field accelerating relays. Emergency stop with dynamic braking is obtained by a slack cable switch, which can be operated by rope, or by another suitable means, and must be reset by hand. The design of these controllers is such that there is no slump in speed when decelerating from 230 to 115 volts. The operation and features of the controllers in brief are as follows:

Starting and speed acceleration is obtained by a drum type master switch. A starting push button is also furnished, by means of which the calender can be started and automatically

accelerated to speed corresponding to the setting of the master switch. One of the line contactors is provided with a back contact, which gives dynamic braking on the motor when the calender is shut down, either by means of the slack cable switch or the master controller. This assures stopping of the calender quickly. A two-pole, double-throw knife switch is also provided to permit quick reversing of the calender. The controllers, however, are not designed, nor are they required to operate in the reverse direction. Overload and no-voltage protection is provided.

The controller shown on the left in the illustration is one for use with motors varying from 75 to 150 horse-power in capacity. The line and transfer contactors shown on the bottom panel are of 500-ampere capacity. The accelerating contactors shown on the upper portion of the panel have a capacity of 250 amperes. The panel on the right is for use with motors having a capacity of 125 horse-power and upwards. The main line contactors and transfer contactors have a capacity of 1,250 amperes, and the accelerating contactors are of 500-ampere capacity.

ARTIFICIAL DAYLIGHT LAMP FOR COLOR WORK.

Rubber chemists engaged in preparing and matching colored rubber stocks will appreciate the Scimatco lamp.

The annoyance and loss frequently sustained by insufficient or improper illumination, or by delays spent in waiting for sunlight, have been looked upon as necessary evils. The Scimatco artificial daylight lamp has removed completely the risk of these losses and made it possible to ignore the weather and the hour in making color comparisons because the light produced is spectroscopically identical with daylight. [Scientific Materials Co., Pittsburgh, Pennsylvania.]

*Denotes patents for American inventions.

The Editor's Book Table.

THE FINANCIER RUBBER SHARE HANDBOOK. Thirteenth Edition. April, 1916. The Financier & Bullionist, Limited, London, England. [Cloth, 8vo, 860 pages. Price, 3s. net.]

THIS convenient handbook has a wealth of information regarding the many stock companies owning rubber plantations in the Far East, South America, Africa, and other rubber producing countries. It gives the authorized share capital of each of these companies, the amount issued, the balance sheet, the list of directors, acreage and similar information, well arranged and quickly available. Besides this an alphabetical list of directors in all these companies is given, including a list of secretarial groups in London, with the addresses and telephone numbers. In the preface is given the world's production of rubber in 1915, and it may be well to print in this connection, for comparison, the production of previous years, as given in the 12th edition of this handbook. The figures are as follows:

	Plantation.	Brazil.	Rest.	Total.	Increase, Per Cent.
1915.....	106,989	37,220	12,615	157,824	31.0
1914.....	71,380	37,000	12,000	120,380	11.0
1913.....	47,618	39,370	21,452	108,440	9.6

In the thirteenth edition Mr. Killick, rubber expert of the "Financier," gives as the probable total output for the year 1916, about 200,000 tons. He says that a low price for the commodity tends to restrict production, more especially of wild rubber, which is far more expensive to collect than plantation. However, he considers that the present price standard leaves a sufficient margin of profit for the Brazilian industry to continue as before.

Speaking of the maturity yield of rubber per acre, it is considered that 400 pounds an acre is about the proper figure on which to base calculations, though estates are mentioned whose yield was far higher, in one case, the Seafeld Estate in Selangor, yielding 682 pounds per acre from 124 acres planted in 1904, and from the entire area in tapping (1,940 acres) an average of 439 pounds.

Regarding investments, Mr. Killick believes that the share market value of estates of the Pataling type may be quite common in years to come, from the fact that an acre of *Hevea* yielding 400 pounds of rubber at 1s. a pound profit per year is worth £200 capital.

INDIA RUBBER AND BALATA BELTING AS CONVEYOR AND Power Transmission Belts. An address by James Tinto before the Manchester Association of Engineers. [Pamphlet, 16 pages.]

Mr. Tinto, of the Irwell & Eastern Rubber Co., Limited, Manchester, England, in this address gives some account of the introduction and history of rubber belting. He describes minutely the manufacture and tests for transmission and conveyor belts. Of the latter, he mentions some of the largest or longest in use, going into details and figures. He quotes from a friend in America, that the rubber belting trade totalled \$18,000,000 in 1914 and \$26,000,000 in 1915. He mentions the many industries where conveyor belts are used, and gives particulars of such use in the New York Post Office Station at the Grand Central Station, described in THE INDIA RUBBER WORLD, September 1, 1915.

For the introduction of balata belting, he credits R. & J. Dick, of Glasgow, who made this in 1884, and in 1885 secured a patent. For balata belting he claims the following qualities: Freedom from shrinkage, resistance to stretch, great tractive power, solidity of texture, great durability, absolute uniformity throughout, unequalled transmitting ability, perfect balance and flexibility, steam and water proof.

A weakness of balata belting, he states, is its inability to

stand heat. It should not be exposed to a temperature of more than 100 degrees F. Neither should it be used where it is liable to come in contact with oils, particularly mineral oils. He states that balata belts have been proven superior to any other for electric lighting of trains, the power being driven from the axle under the body of the coach. Such belts are exposed to varying speeds, and all kinds of weather and subjected to unusual abrasive wear.

The pamphlet is illustrated with half-tones of a number of unusually large belts made by the corporation with which Mr. Tinto is connected.

LARGE SINGLE VERSUS DUAL SOLID TIRES FOR REAR TRUCK Wheels. By W. H. Allen, manager Truck Tire Department, The B. F. Goodrich Co., Akron, Ohio.

In a paper presented at the semi-annual meeting of the Society of Automobile Engineers, Mr. Allen announces his opinion in favor of the use of large single wheel rear truck tires instead of smaller dual tires. He maintains that dual tires are overrated and that the statement that dual equipment is capable of carrying loads double that of one of the singles of the pair, is open to discussion. His reasons for advocating large single in place of small dual equipment are that the contact area of the former exceeds that of the dual it replaces. The load per square inch is distributed over a reduced contact area. Small dual equipment does not give satisfactory performance, for the reason that neither single tire is sturdy enough under certain conditions. Also, with the single tire equipment, costs are reduced from 8 to 15 per cent. Wheel cost is less because of the narrower felly and wheel rim, saving in wheel, tire and rim weight. Other advantages are, easier fitting of non-skid chains, better tracage with front wheels, greater height of rubber tread, providing better cushioning properties and increasing tire life, and less strain on the axle and wheel bearings. Mr. Allen states, however, that the large single tire has its limitations, and pending results of further investigation, he deems it advisable to consider 7-inch tires as the limit of practical single equipment.

PREPARING PLANTATION RUBBER FOR THE MARKET. Annales des Planteurs de Caoutchouc de l'Indo-Chine No. 49. Saigon, Cochinchina.

The report of a recent meeting of the Rubber Planters' Association of French Indo-China gives in detail the discussion on methods of preparing crude rubber for the market. Naturally, opinions differed. A member who had just returned from inspection of plantations in Java claimed that crêpe offered advantages of rapid preparation and enabled planters to ship the crude rubber within a week of collecting the latex.

Honorary President Le Croispeiller is of the opinion that crêping destroys the "nerve" of the rubber. Manufacturers prefer sheets to crêpe, but it is immaterial whether the sheet be smoked or not. As practiced, the smoke is not incorporated with the rubber, but is merely a surface deposit, and gives no added value, unless as an outside protection against mold. Smoked sheet must be washed more than crêpe. The premium on smoked sheet has rapidly dwindled.

Attention was called to Perrot's book on the London Rubber Show of 1914, in which the block process was described. President Croispeiller stated that he considered Perrot a theorist, having little practical knowledge on the subject. Regarding block rubber, however, it was said that Michelin, the tire manufacturer, gave minute directions for preparing the rubber as he

preferred it. These were: First, no coagulation by acid, and no machinery. There should be a pure and simple desiccation of fresh latex, poured into pans to a depth of $1\frac{1}{2}$ to 3 inches, placed in a well-ventilated place, protected from sun and dust, for several days. The film of rubber should be removed and, if necessary, dried between blotting paper, and it is then ready to ship.

Dr. Versin, who sells large amounts of rubber to Michelin at highest quoted prices for first latex crepe on the day of delivery, was said to have written that his method was simply preparation by natural coagulation, moderate washing between fluted rolls, drying eight days and compressing into blocks for packing. It was stated by M. Cremazy that Michelin had said he did not know how to vulcanize all the kinds of rubber he received, and that he had experienced so much trouble from this source, that he contemplated going into the planting business to raise and prepare all he required.

The conclusion was, that manufacturers' ideas were so divergent, and their manipulations so different, that it would be impolitic for all planters to unite upon any one process for preparing rubber for the market.

NEW TRADE PUBLICATIONS.

A NEAT little booklet entitled "The Mill by Stony Brook" gives a brief outline of the history of india rubber, and the establishment and growth of the Boston Belting Co. Pictures are shown of the original factory, and of the seven principal buildings of the present plant, and also miniature reproductions are printed of various diplomas and awards received by the company for its belting.

The bicycle is coming back into popularity, perhaps not to the extent of pre-automobile days, but manufacturers are finding a good sale for the modern up-to-date bicycle. The Fisk Rubber Co., Chicopee Falls, Massachusetts, has published a neat booklet entitled "How to Form a Fisk Club," which is intended to interest boys and girls in bicycling and, indirectly, to help the sale of Fisk bicycle tires. The book, which is pocket size, gives information on how to organize a club, a list of officers to be chosen, signals for the road, by-laws and parliamentary rules for procedure of business meetings; also instructions in signal flag drills and suggestions for club runs. The company is careful to note that it is not intended that boys who are not using Fisk tires should be barred from membership in Fisk clubs, but that any boys should be allowed to join who wish to do so. The company has made an offer of a free set of fancy colored non-skid bicycle tires to the secretary of each of 100 best Fisk clubs. A full description and a price list of the Fisk tires is given at the end of the pamphlet, and a bird's-eye view of the company's plant is shown on the back cover.

Harrison Brothers & Co., Inc., Philadelphia, Pennsylvania, are sending out a little publication entitled "Our Battle with the Iron-Eaters," which is made up principally of fac-similes of testimonials from many leading manufacturing concerns praising "Antoxide" which, as its name indicates, is a preparation for the prevention of rust on metals. Very little is printed except these letters, which are sufficiently strong in themselves to form a good advertisement for the preparation. The first page has a fac-simile of a rust-eaten iron plate which is oxidized to the extent that a portion has been entirely consumed. The whole is bound with a red silk cord.

The B. F. Goodrich Co., Akron, Ohio, is sending out to the trade a handsome lithographed hanger, a reproduction of a painting begun by the late A. B. Frost, one of the last works of the famous artist, left unfinished, and later taken up and finished by

his son, John Frost. It represents the main street in a country town, where the constable has held up a dapper feminine motorcyclist for speeding. The expressions on the faces tell the entire story, in Mr. Frost's best style. The hanger is entirely without advertisements, with the exception of the Goodrich sign in the village store in the background. Undoubtedly this hanger will find a prominent place in many offices and rubber stores.

W. T. Henley's Telegraph Works Co., Limited, London, England, is sending out some attractive and informative booklets, descriptive of the tires of its manufacture. Two booklets are of the catalog class, picturing, pricing and describing, one the solid band tires, and the other the pneumatic tires, which are denominated "All-British," with a parenthetical clause "made in England by British Labour." A third pamphlet treats of the "Cause and Prevention of Abnormal Wear of Solid Tyres," and the fourth, "Science and Tyres," gives a description of the processes of manufacture, illustrated by a number of small but clear half-tones of the various machines, mills, presses, vulcanizers, etc. This latter booklet also gives some directions for the care of tires, and descriptions of tubes and treads of the Henley make.

The Ericson Manufacturing Co., Brookings, South Dakota, sends out a very finely printed pamphlet describing its tire and giving facts regarding the same. The cover of the book has a fine half-tone engraving of an automobile wheel with a steel-studded, leather-covered tire, each stud being printed in gold and embossed in high relief. The catalog is one which would receive more than a passing glance because of its attractiveness.

POSTERS ADVOCATING PREPAREDNESS.

The Rubber Club of America, Inc., is certainly doing its share in the national preparedness campaign. About the middle of last month the committee on preparedness sent out to every rubber manufacturer a set of seven posters which had been prepared by the Patriotic Education Society and the National Security League. Most of these posters are nearly two feet by three feet. Two of a smaller size, however, are fully as noticeable, because they are printed in the national colors. All of these preach preparedness and are intended to be posted in offices and factories to promulgate the views of this society and league. Each poster takes up some one vital phase of the issue and points out the urgency with which Congress should adopt the recommendations of military and naval experts. The Rubber Club is also distributing a convincing and readable book on "Peace Insurance" by Richard Stockton, Jr., the purpose of which is sufficiently indicated by its name. The preparedness committee of the Rubber Club is to be commended for the energy with which it is entering upon the duties assigned it.

MILL-PANTS AND RUBBER BOOTS.

A thoroughly efficient clothes protector for work in mills, rubber factories and garages is afforded by the mill-pants and rubber boots here illustrated. The pants are made of heavy cotton material, rubberized. They are supported by shoulder straps and fit closely over stout rubber boots, which are made according to the specifications of the individual customer. This outfit is also well adapted for fishing and wading, or any occupation which necessitates protective covering from water or greasy substances. A similar garment is made entirely of rubberized material, to be worn over the wearer's trousers and shoes. [Alfred Hale Rubber Co., Boston, Massachusetts.]

New Goods and Specialties

THE "NATURAL NURSER" NIPPLE.

THIS "Natural Nurser" outfit consists of a wide-mouthed glass cell and a rubber nipple and is claimed to afford the closest duplicate of natural nursing in existence. One of the greatest troubles in artificial

nipples to cave in, or collapse, so that the infant cannot obtain its food properly. As the food comes out, air must enter, and when it does not, owing to the fact that the only outlet is inside the baby's mouth, a vacuum is formed inside the bottle and the nipple, being of flexible construction, collapses.

The special valve in the rubber nipple here illustrated is designed to elim-

inate this difficulty. Its action is automatic. On the inside of the nipple is a circular raised part across which a slit is cut, a pin hole on the outside running through into this slit. In use, as soon as a vacuum begins to form inside the bottle, the air pressure will cause the nipple to give at the part where there is least resistance, but as the valve is surrounded by a circle of thinner rubber than the rest of the nipple, it gives at the valve, opening the slit enough to admit air. This ends the vacuum inside the nipple, which immediately returns to its proper shape. It is claimed that owing to its ingenious patented construction, the valve will not leak.

Two horizontal and three vertical ribs are molded on the inside of the nipple, giving strength and resistance against distortion and acting as springs to keep the nipple in shape. The heavy flange at its base fits over the raised edge or beading on the bottle, holding the nipple tightly in position. [The Faultless Rubber Co., Ashland, Ohio.]

THE AETNA ELECTRICIAN'S GLOVE.

The hazard of the live wire renders a lineman's life one of constant danger, and the greatest precaution is necessary for safety. An improvement in the protective hand covering worn by electricians is offered in the rubber glove here illustrated. These gloves possess high dielectric qualities. The Electrical Testing Laboratories of New York City show in their report

that 10,000 volt Aetna gloves withstood 32,000 volts before breaking down, and the 5,000 volt gloves withstood 19,200 volts. They are made of tough rubber that will withstand hard usage on poles, wire, etc., and it is claimed that leakage, the common trouble in linemen's gloves, is practically eliminated. A special feature is the wide wrist, which allows the glove to be drawn over a heavy coat sleeve in winter. They are made in maroon and black rubber, in 12, 14 and 18 inch lengths and in the usual hand sizes. [The Aetna Rubber Co., Cleveland, Ohio.]

FASHIONS IN BATHING COSTUMES.

The entire costume shown in the first illustration, with the exception of the pure rubber cap, is made of rubberized mummy silk. The wistaria-colored bathing suit is cut in Mandarin style and trimmed with contrasting bands in exquisite shades of American beauty, blue and green. The cap worn with this costume is plaited and built over wire. The bag carried on the arm is intended to hold the bathing suit when not in use. It has a stiffened bottom and fastens at the top with a cord, two wooden strips securely clamping the edges together when closed. The pointed oval cushion has the same design as the bag,

and an Oriental parasol completes a seashore costume of marked originality and beauty.

The rubber coat shown on the second figure, is of pale blue, with revers and frogged fastenings. It has no sleeves, the front being slashed all the way across for the arms, the two lower pieces fastening by means of loops on a button underneath the center of the top part. This lower section may be left unfastened, if desired, swinging free at the sides and giving the effect of a cape. The wired,

fringed edges of the rubber hat worn with this coat, give a saucy, wing-like effect that is wholly captivating. [L. C. Studios, New York City.]

THE "TEXTAN" SOLE.

"Textan" is the name given to a new material to be used in place of leather for the soles of shoes. While this is a secret composition, it is evidently one of that class composed of fibrous substance with a binder of vulcanized material. Long wear is claimed for this new sole, and other advantages claimed are that it gives a handsome finish to the shoe; that it can be sewn through by machine without cracking; that the sole will not

crack across the ball, and that it is light in weight and waterproof. [The B. F. Goodrich Co., Akron, Ohio.]

NEW USES FOR THE VACUUM CUP.

Automobile driving is hard on the eyes, the watchful gaze of the driver being affected by snow-blinding in winter, the dazzling heat of summer, and the reflecting light cast from wet roads. At night, also, the glare of headlights on approaching cars impairs the vision. By means of the device here illustrated, the optic nerve which contracts the eye under strong light is protected from all glare and allowed to relax, thus eliminating a prevalent and serious difficulty. A flexible circular disk of deep orange color is attached to the inside of the wind-shield by a suction cup of fine surgical rubber. This vacuum cup is eccentrically pivoted, grips the glass firmly, and will not work loose from vibration, although it allows the shield to be swung to one side at will.

A stout metal hook attached to a rubber suction cup forms a most convenient accessory called the "Cantilever Flyfoot Vacuum Hanger," which can be attached to a mirror, glass, or any wall space or article of furniture in which it is not desired to drive a nail. A special feature of this hanger is the rubber sleeve which covers that portion of the metal hook coming in contact with the surface to which the hanger is fastened. By means of this sleeve, all danger of injuring the above-mentioned surface is obviated. [Fitzgerald-Noble Co., Richmond, California.]

"FEATHERWAITE" RAINCOAT.

This garment, although its length is 50 inches, weighs only 15 ounces, and is therefore well named "Featherwaite." It is of Oriental silk, proofed with the best grade of plantation rubber. It is entirely hand made except the buttonholes, and the garment is not cured until it is entirely finished, being then hung in the curing room on a padded hanger. It is made in a variety of shades, the most popular of which are taupe and navy. The proofing is so transparent that it in nowise affects the color of the fabrics. It is claimed that the garment will give the most satisfactory service if it is not subjected to abuse. For convenience in traveling, it is folded and enclosed in a compact envelope made of the same material as the garment. [Rosenwald & Weil, Chicago, Illinois.]

HANDY AUTO-TENT.

Camping arrangements for auto touring are fast eliminating all the discomforts while retaining the joys of gypsy life. The auto-tent here illustrated is a model of convenience and utility.

There are no poles—simply a roll of light, waterproofed khaki with eyelets which button on the side of the auto top, tent stakes, ropes and a three-foot wall. It can be adjusted in a few minutes and, furnished with a cot, forms a comfortable sleeping place, the body of the car being used as a dressing room. Two such tents can be carried, each wound around a folded cot, and stowed on the running boards, one on each side of the car. To complete the comfort of the touring camper, a small box is furnished to fit the running board which, when open, rests on folding brackets, making a table. This handy device is called the "Auto-Eat." [Strong Bungalow Co., Hartford, Connecticut.]

THE "SATIN" GOLF GRIP.

In golf playing, control over the second and third fingers while gripping the club is highly important, and also difficult of attainment, lack of such control inducing the faults known as the "hook" and "slice." The soft rubber grip here illustrated enables even the novice to properly hold his club when making a stroke, to the consequent benefit of his score. Less effort is needed, and the permanent strain on the fingers, that frequently produces muscle-wens, is thus avoided. This grip fits all hands, large or small; can be adjusted to suit all styles of grip, whether interlocking-checked or open, and insures the club being gripped at the same place all the time. Its use obviates the necessity of wearing gloves to protect the hands from callousing, and it does not become slippery when damp, as do the leather grips. It is also claimed that the "Satin" grip gives added elasticity to the stroke, adding distance to the drive. [The Satin Golf Grip Co., Chicago, Illinois.]

THE "UTILITY" HAT COVER.

For the feminine automobilist a veil is a necessity, but the ordinary chiffon veil is difficult to adjust becomingly over all kinds of hats and, moreover, affords no real protection against rain. The "Utility" hat cover here shown is of mercerized tissue, rubberized, or silk tissue, rubberized, and is ingeniously arranged for instantaneous adjustment over a hat of any size or shape. The edge furnished with an

elastic cord is drawn across the forehead directly under the hat brim, and the cover is placed over the crown of the hat. Then

the loops shown in the illustration are attached to that one of a series of buttons, that accommodates the size of the hat. These convenient and highly presentable hat covers are supplied in black, navy, tan, pearl gray, brown, etc., in a small case which can be carried in a hand bag. [Stern Specialty Co., New York City.]

THE "UNIVERSAL" REINFORCED TUBE CONNECTOR.

The tube end, or connector, here illustrated, is designed for joining to fittings, gas tubing of all kinds—rubber, metallic, canvas-covered or insertion—without the aid of cement, wires, bands, etc. It is made of rubber, with an inner brass ferrule and tempered brass prongs. The latter are embedded and vulcanized in the rubber, gripping it tightly, thus affording a thoroughly stable joint which is fixed instantaneously. The brass ferrule supports the tubing from the inside. These connectors may be readily fitted to any kind of gas tube by simply pushing them into position. They are claimed to be unexcelled for acetylene gas, motor car and cycle lighting, joints for electric conduit insulating tubes, etc. [Reliance Rubber & Hardwood Co., London, England.]

"UTILITY ADAPTO" TRAVELING CASE.

The traveling case of waterproofed double texture fabric here illustrated is made to suit individual fittings, thus eliminating the

necessity for ready-fitted cases, which are generally very expensive and do not always suit the customer's ideas or requirements in every particular. All articles are held securely in place by adjustable, self-holding straps. The slots in the slip strap are less than an inch apart, one or as many as necessary being used to accommodate the various pieces. Large pockets hold the wash cloth, towel, night-dress, etc. When closed, the case lies perfectly flat, as shown in the second illustration, and can easily be tucked away in a suitcase, trunk or automobile. These traveling cases are furnished in leather, cretonne, linen, silk and other novelty fabrics with a foundation of waterproofed double-lined material. [The Stern Specialty Co., New York City.]

THE "RADIO" DATER.

This is a new dating stamp of the dial variety. Its indicator dial is arranged, as will be noted, around a nicked rim on a vertical cylinder revolved by turning the handle of the dater.

A novel feature of this stamp is the molding of the printing die containing the day dates in one piece with the cushion; others are the molding of the cushion piece in two close-fitting parts, and the insertion of brass linings in the mortises carrying the date blocks. The stamp represents the latest improvement—especially as regards its rubber features—in dial daters, an extensive line of which has been included in the company's productions for many years. [The R. H. Smith Manufacturing Co., Springfield, Massachusetts.]

**STANDARD ENVELOPE SEALER.**

An ingenious use of rubber is shown in the Standard Envelope Sealer where a canvas belt, with pointed rubber projections,

is used to convey and propel the envelopes, while two rubber stripping fingers combine to regulate the feed and to prevent more than one envelope at a time from passing through the machine.

The envelopes are placed in the feed hopper. The endless belt pulls the under envelope out, carrying it along to the moistening tank; a blade opens the flap and passes it over a moist felt, then it is delivered under a sealing plate and into the receiving hopper. The machine is mounted on six rubber feet and has a rubber plug for the tank. [Orrin S. Lyon Co., Metropolitan building, New York City].

BALLOON NOVELTIES.

The new design in balloons, shown herewith, is appropriately named "Old Glory," having an American flag printed upon it in the red, white and blue of the stars and stripes.

A life-like representation of a watermelon, also shown, is a unique novelty now offered in balloons. It is large size, of an attractive green color and is furnished in plain green or decorated with a two-color design, simulating a piece of watermelon, along one side. This attractive toy is made to please the youngsters' desire for noise, a squawker being used as an inflater, giving forth a more or less musical sound in the deflation. A silent style, likely to be more popular among adults, has a special closing

valve which holds the melon in shape until deflation is desired. [The Faultless Rubber Co., Ashland, Ohio.]

WORKMEN'S PROTECTIVE GLOVES.

Analyses of industrial accidents show that the hands and fingers are more frequently injured than any other members, and this is probably as true of rubber mills as of any other line of manufacturing plants. Handling the molds and machinery is always more or less dangerous and the use of knives and hand tools requires protection to prevent blisters. A strong and serviceable pliable glove for rubber workers who need forefinger and thumb protection is shown here. This leaves parts of the hand free while affording such protection where it is needed. It is made of a heavy textile material reinforced with leather patches.

Another glove, used mostly in foundry and shop work but also useful in handling hot molds, shows a leather patch on the thumb sewed in with steel ribbons so that it cannot pull out, while additional strips of tough leather sewed in with steel thread reinforce the palm and fingers and insure the worker protection against heat and abrasions. [W. H. Salisbury & Co., Inc., Chicago, Illinois.]

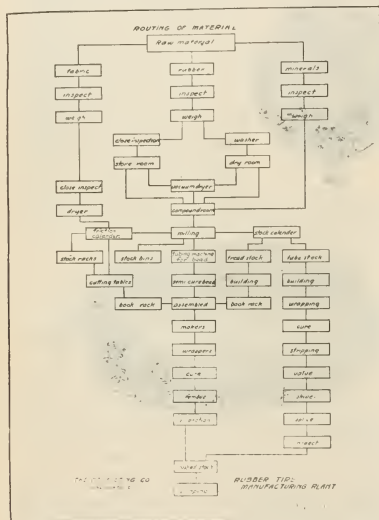

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Polyglot Rubber Trade Directory, 1916.

THE ROUTING OF MATERIALS IN A MODERN TIRE PLANT.

IN planning a manufacturing plant the first requisite is that the materials and the articles manufactured shall be advanced from one process to the next by the most direct route, with no duplication of handling. The layout of the entire plant should be planned to this end. The diagram shows the routing of crude rubber, compounding ingredients and fabric, step by step to the finished tire casing and inner tube, in an up-to-date tire plant.

This diagram is the key to the location of the store rooms, dry rooms, working departments, machinery, tools and equipment,

ROUTING OF MATERIALS IN A MODERN TIRE PLANT.

which should be placed and arranged to permit progress of materials through the necessary processes to the finished product with the least possible deviation from a straight line. The planning should also allow possible enlargement of departments with but a minimum of disturbance of the existing plant.

Low cost, known exact cost, decreased damaged stocks and finished goods, full time and consistent production from the worker, a maximum output from equipment,—all these are necessary for success, and a well-arranged and thoroughly organized plant makes this success far better assured than one built and run under the old "rule-of-thumb" method.

TIRE AND RIM STANDARDS COMMITTEE.

The Society of Automobile Engineers has a new division of the Standards Committee to be known as the Tire and Rim Division, of which H. L. Barton is chairman. The other members of the committee are as follows: W. H. Allen, C. C. Carlton, J. E. Hale, Russell Hoopes, C. B. Whittelsey, C. E. Bonnett, John Kelsey, J. V. Mow, J. C. Manternach, C. B. Williams, E. K. Baker, J. C. Cole and Christiana Girl. Most of these men were formerly on the Truck Standards Division, or the Pleasure Car Wheels Division, which latter was discontinued last year. The new

division will have charge of standardization work in regard to solid and pneumatic tires, rims, felly bands, etc. It will therefore take up some of the incomplete work upon which the Truck Standards Division has been working, including the following subjects: Carrying capacities of solid tires; carrying capacities and inflation pressures of pneumatic tires; depth of solid metal rims for demountable solid tires.

EUROPEAN TIRE DIMENSION ANOMALIES.

THOSE who have had occasion to measure European pneumatic automobile tires, for fitting speedometers, or for other purposes, have noted that the metric measurements indicated on these tires very seldom correspond with their actual dimensions. For instance, a tire marked 760 x 90 millimeters [29.92 x 3.54 inches] does not actually measure 760 millimeters in diameter; nor does an 880 x 120 millimeters [34.65 x 4.72 inches] tire actually measure 880 millimeters. Here is the reason:

In the early days of the automobile tire industry, when Michelin, the pioneer, began to make "large tires"—large when compared with the 65 millimeter [2.56 inches] section tire which was the first type of automobile tire produced—he made them according to his own judgment, and in sizes demanded by automobile manufacturers, without any idea of the dimensions corresponding with even numbers of centimeters. He made inner tubes of 105; 120; 135 millimeters [4.13; 4.72; 5.32 inches], all of which could be fitted to rims of approximately the same size, and he adopted the method, still in vogue today in Europe, of designating automobile tire sizes by two numbers, the first referring to the diameter of the wheel with the inflated tire upon it, and the second relating to the sectional diameter of the tire.

It was soon found that chauffeurs experienced difficulty with the fractions of centimeters in ordering tires and, to make it an easy matter for them to remember tire sizes, Michelin decided to have the two numbers designating the tire terminate with the same figure or figures having a similar consonance when named in the French language. For instance, 810 x 90, stated in French is *huit cent dix, quatre-vingt-dix*. This was the origin of the automobile tire size designations that today are still current in Europe, and of which the principal ones are as follows:

Millimeters.	Equivalents in Inches.
810 x 90	31.89 x 3.54
815 x 105	32.9 x 4.13
820 x 120	32.28 x 4.72
870 x 90	34.25 x 3.54
875 x 105	34.45 x 4.13
880 x 120	34.65 x 4.72
895 x 135	35.24 x 5.32
910 x 90	35.83 x 3.54
915 x 105	36.02 x 4.13
920 x 120	36.2 x 4.72
935 x 135	36.81 x 5.32

Michelin adopted these designations arbitrarily, without making any changes in the actual sizes of the tires, the numbers marked upon them being changed to suit euphony and to make them easy to remember. Hence the anomalies and confusion.

In a number of these confused designations, however, the figures referring to the sectional diameter of the tires represent approximately the correct measurements of the casings, not when they are new, but after they have covered several hundred miles. New tire casings swell during the first few hundred miles of their wear and an 820 x 120 millimeters [32.28 x 4.72 inches] casing, that measures when new a little more than 110 millimeters [4.33 inches] in sectional diameter, will measure its full 120 millimeters [4.72 inches] after running from 200 to 300 miles.

As far as the exterior diameter of the tire is concerned, the designating numbers marked on European millimeter tires are never more than approximate.

MOISTURE CONTENT OF AUTOMOBILE TIRE FABRIC AND ITS INFLUENCE UPON THE WEIGHT AND TENSILE STRENGTH.

By Walter S. Lewis and C. J. Cleary.*

IT is well known that cotton fiber is hygroscopic. The extent to which it will absorb or give up its moisture content depends upon the condition of the material and the relative humidity and temperature of the air by which it is surrounded. Under changing atmospheric conditions, tire fabric may sometimes vary in moisture content from 3.5 to 8.5 per cent.

Automobile tire fabric is usually sold in rolls of from 100 to 500 yards each. In some instances moisture is intentionally added to the cloth when it is rolled for shipment. This moisture is sometimes added to increase the weight and strength of the fabric and sometimes to improve its appearance. Cotton tire fabric under such conditions may contain from 3.5 to 10.5 per cent of moisture per 100 parts of dry material.

The quantity of uncombined water present in the fiber has a marked influence upon the weight and strength of the fabric; to a less degree, the width and elongation and the crimp of the yarn.

From preliminary tests upon combed Sea Island tire fabric the results have shown that for each 1 per cent of moisture content, upon the basis of 100 parts dry material, there is an increase in tensile strength of approximately 7 per cent. This ratio of strength to moisture content was based upon results obtained from tests upon fabrics which contained from 0 to 10 per cent of moisture.

If dry fabric, therefore, has a tensile strength of 200 pounds per inch of width, it would test 249 pounds with 3.5 per cent moisture, 319 pounds with 8.5 per cent, and more than 325 pounds with 10.5 per cent moisture content. There is thus a difference of 70 pounds in tensile strength of the same fabric caused by a 5 per cent difference in its moisture content, *i. e.*, between 3.5 per cent and 8.5 per cent.

A consideration of the variation in weight of fabric is also important, especially when it is bought upon the pound basis. What is known as a 17¼-ounce tire fabric, under so-called normal atmospheric conditions, will weigh approximately 16½ ounces under bone-dry conditions. Therefore, with 3.5 per cent moisture it would weigh 17.08 ounces and with 8.5 per cent moisture 17.90 ounces per square yard, a difference of about 5 per cent in weight. On a roll of 500 yards a difference of 5 per cent in weight would mean 25 pounds.

Many tests for the determination of moisture have been made during the past year upon 17¼-ounce tire fabric. The particular fabrics employed in this preliminary investigation were produced and tested by four prominent cotton mills, three located in the North and one in the South, and all tests were made upon cloth which did not have moisture added artificially when being wound into a roll. In other words, the rolls were shipped in box cars to the purchaser as wound under the normal conditions of the mill. The rolls were sometimes exposed for a few days only, while in other instances they were exposed for weeks to the different air conditions that obtain in the winter months in unheated cars and during the summer months in ordinary box cars.

The tests included altogether more than 200 rolls and more than 400 samples were tested. The results were as follows:

Mill No.	1	2	3	4	Average	Percent.
	1	2	3	4		4.6
						4.8
						5.4
						4.6
						4.85

The extreme variation of moisture was between 3.5 and 6.5 per cent, no single sample reaching as high as 7 per cent.

EMPIRE RED TIRES AND TUBES.

A bright red color is the distinguishing feature of Empire tires and tubes that are said to deliver the maximum mileage with a minimum cost per mile. The casing and tread of the non-skid tire are made of a durable red rubber compound which, combined with dependable fabric base, has shown, according to the manufacturer, superior strength and wearing qualities on the road. The red tubes are thick, tough and elastic and can be repeatedly repaired.

The best quality of rubber and effective curing are the basic factors that are carefully considered by the makers of Empire tires and tubes. All sizes and types of oversizes are furnished; only in red, however, including Clincher, Q. D. Clincher and Straight Edge tires with tubes to correspond. [Empire Rubber & Tire Co., Trenton, New Jersey.]

THE KOKOMO "KORD" BICYCLE TIRE.

A bicycle tire that, according to its manufacturers, is immune from the effects of stone bruises and is much harder to puncture than the ordinary kind, is of special interest to bicycle riders and dealers. As the illustration shows, it is made up with an inner air tube of heavy black rubber; a layer of strong, specially treated cords, laid diagonally; a layer of black rubber, another layer of cords laid transversely to the first, and over all the outer

covering of best quality black rubber and a non-skid tread ribbed longitudinally. It is claimed that the "Kord" tire loses nothing in resiliency and is easy to repair. [The Kokomo Rubber Co., Kokomo, Indiana.]

THE LANCASTER WIRE GRIP TIRE.

"A wire grip tire with a thousand claws" is the pointed statement that is intended to attract public attention to the non-skid puncture resisting qualities of the Lancaster tire.

The non-skid and the resistance - to - puncture effects are obtained by four spiral coils of steel wire that completely encircle the tire and are vulcanized in the tread, near the surface. After the tire has been used for a few miles, the wires wear through, forming thousands of steel points that grip the road. Moreover, the closely

intermeshed wires shield the tread, thus protecting it against glass and tin. Reinforced by the wire coils and strengthened

*From Technologic Paper No. 68 of the Bureau of Standards.

by extra heavy fabric, the side walls of the casing are claimed to be practically proof against blow-outs. [The Lancaster Tire and Rubber Co., Lancaster, Ohio.]

AN ENGLISH COMBINATION NON-SKID TIRE.

It is a well-known fact that rubber non-skid treads hold better on dry than on wet pavements. It is equally true that steel-studded treads hold better on wet than on dry pavements. Therefore, the Henley combination non-skid tread with steel studs and V-shaped rubber projections should hold well in all conditions of weather.

This tire is built up on an extra stout casing, with a generous thickness of rubber on the walls and a non-skid tread composed of thick V-shaped blocks of solid rubber and toughened steel studs. The rubber blocks act as a protection to the steel studs, and also permit of the power being transmitted to the road without the sudden spinning of the rear wheels and loss of studs which so often occurs when steel studs only are used. [W. T. Henley's Telegraph Works Co., Limited, 18 New Union street, Moorfields, London, E. C., England.]

PUNCTUREPROOF TIRES.

It is claimed that the problem of eliminating air and still retaining the resilient qualities of a pneumatic tire has been solved by the King tubeless tire. This universal desideratum is based on the unusual mechanical construction of the tire which is shown

in the illustration.

The inside web and casing are molded in one piece, and are really a part of the tire. The web is a composition of rubber which takes the place of the inner tube in a pneumatic tire.

TOURING CAR TYPE.

It carries the load and is provided with two angular braces which rest directly over the bead when locked in the rim. These braces form a support to the web and also prevent any lateral motion of the tire, under severe loads or high speed. This web from the rim up to the dark line shown in the cut is figured as equivalent to 70 pounds of air in the inflated tire. Between this and the tread is placed a cushion, having a resiliency equal to only 40 pounds of air, which produces an easy effect upon the car. They are made in different types for touring cars, electric and light commercial vehicles and trucks; can be placed on any clincher or straight side rim and are guaranteed for 8,000 to 10,000 miles. [The Punctureless Auto Tire Co., Akron, Ohio.]

THE TWELVE-INCH TIRE.

The 12-inch tire is scarcely likely soon to become a formidable rival of the automobile tire of standard size, in public popularity, but some very interesting "stunts" may be accomplished on tires of this size—by those skilled in their performance. We re-

produce a photograph of Ed. Mayer in a vaudeville act in which, under the name of Francis Le Maire, he has gained popularity through his performance on monocycle skates, equipped with 12 x 1-inch tires. As will be noticed, the position of the foot in skating is on top of, or directly over, the wheel, a particularly difficult one to maintain.

Mr. Le Maire—or Mayer—has also attained distinction in amateur bicycle racing in the West, and in all of these events,

as well as in his stage equipment, he uses Palmer tires, made by The B. F. Goodrich Co., Akron, Ohio.

A NEW TIRE ACCESSORY.

Here is a device that stands for preparedness when the motorist encounters deep, sandy roads or faces the possibility of being stuck in the mud.

It will be seen by referring to the illustration that it is an exceedingly simple contrivance made of metal, fitting snugly

around the curve of the tire and held in place by a leather-covered chain passing around the felly. It is comparatively light in weight yet amply strong enough for the purpose for which it is designed. A pair of these trouble savers occupies only a small space in the tool box, and doubtless the day would come when they would be used to good advantage.

When power is applied, the "Dig-U-Out," as it is called, prevents the wheel from slipping by acting as a lever, and practically lifts

the car out of the deep mud or sand. It is made in 5 sizes, for pleasure cars and trucks, fitting both pneumatic and solid tires. It is confidently expected that this invention will be used on United States Army trucks in Mexico. [The Protex Co., 1790 Broadway, New York City.]

The Obituary Record.

INVENTOR OF IMPORTANT RUBBER MACHINERY.

JOHAN H. PEARCE, at one time superintendent of The L. Candee & Co.'s plant at New Haven, Connecticut, and an inventor of note in rubber machinery, died at his home in New Haven, Connecticut, June 12, aged 61 years. Mr. Pearce

J. H. PEARCE.

was a native of Montreal, Canada, where he spent the early part of his life, starting in business with the Canadian Rubber Co. Eight years later he entered the employ of the Boston Rubber Shoe Co. at Malden, Massachusetts, and from there went to the Looming Rubber Co., Williamsport, Pennsylvania, and in 1884 was transferred to The L. Candee Co.'s plant, where he rose to the position of superintendent. Some years ago he went back to Montreal to occupy a prominent position with the Canadian Consolidated Rubber Co. Two years ago he returned to New Haven and arranged for the formation of a new company, in connection with E. E. Carll, to manufacture footwear, soles and heels, as well as tennis and sporting goods, and he had made considerable progress towards securing the capital for this purpose at the time of his death. Early in the present year he submitted to a surgical operation which was supposed to have resulted successfully, although he had not been in the best of health since that time. On the date mentioned he was seized with hemorrhages and, in spite of prompt measures taken for his relief, his death occurred the same evening. He was well known in the rubber business through his connection with these prominent rubber companies and for the inventions of the automatic mixer and feeder bearing his name, and several styles of calendars, used mainly in the manufacture of shoes and sheeted goods, while several minor inventions of value in the manipulation of rubber are recorded to his credit. Mr. Pearce was a thirty-second degree Mason. He is survived by a wife and three sons, all of New Haven, and by one brother, Richard N. Pearce, of Boston.

AN ELECTRICAL EXPERT.

James T. Phelps, for many years associated with the National India Rubber Co.'s plant at Bristol, Rhode Island, died at his home, 100 Franklin street, that town, on the night of Friday, June 16, from a complication of diseases, including a hurt he received three weeks previously, in a fall at his home. He was born in Bristol in 1840 and served with distinction in the Civil War in the Seventh Rhode Island Volunteer Infantry, enlisting as a private and rising to First Lieutenant, after being severely wounded at Petersburg, Virginia, on September 20, 1864. He removed to Bristol from New York City in 1870 and took charge of the electric de-

partment of the National India Rubber Co., where he remained many years. He introduced the first electric street lights in Bristol at the time of the town's bicentennial in 1880 and also installed the first telephone system in that town. He is survived by his wife and one son.

A FAITHFUL AND EFFICIENT AUDITOR.

James T. Halland, of the auditors' office of the United States Rubber Co., New York City, died recently at his residence on Staten Island, New York. He was born in St. James' Parish, London, England, December 8, 1851. Upon completing his education at St. Marks' College in that city, he trained for an accountant, and at the age of 25 went to New Zealand, where he followed that vocation, and after ten years returned to England. Later he decided to come to America, and he entered the employ of George Watkinson, at Colchester, Connecticut, in November, 1892. Two years later he went to Providence, and in 1895 was transferred to the New York offices of the United States Rubber Co., to take charge of the work in the auditing division, remaining there with steadily increasing responsibilities up to the time of his death.

J. T. HALLAND.

Mr. Halland married Fanny Lavarat, of London, in 1872, who survives him. He was a member of the Episcopal Church and occupied the office of vestryman in All Saints' Church, Orange, and later in Grace Church, Nutley, New Jersey. He was a solo singer for nine years in the first mentioned church and was also president of the Mendelssohn Union of East Orange. He was a Master Mason and a member of the Royal Arcanum. Mr. Halland possessed a genial disposition, was popular among his business associates, and leaves a wide circle of friends to mourn his loss.

HEAD OF AN IMPORTANT DEPARTMENT.

Otto P. Huebner, head of the wire department of The B. F. Goodrich Co., Akron, Ohio, died suddenly in East Orange, New Jersey, on May 13, at the age of 45 years. Mr. Huebner contemplated undergoing an operation within a few days after returning to Akron. He was born in Germany. His wife died last December and he was buried in the same plot with her in Yonkers, New York.

EXPLORED IN RUBBER PRODUCING COUNTRIES.

Frank Vincent, author of "Through and Through the Tropics," "Around and About South America," "Actual Africa," and "The Land of the White Elephant," died June 19 at Woodstock, New York. He was 69 years old. Mr. Vincent was a noted explorer and traveler, particularly in India, but other explorations were in Brazil, Congo Free State, Lapland and Indo-China.

A PROMISING YOUNG MAN.

Eugene Clifton Squires died June 7, at Grand Rapids, Michigan, aged 19 years. He was the youngest son of Arthur C. Squires, the veteran rubber man, and at the time of his death

E. C. SQUIRES.

was associated in the retail rubber business with his brother, Arthur R. Squires, in the Squires Rubber Co., of the above mentioned city.

Born in Brooklyn, New York, June 5, 1897, where his boyhood days were passed, he later moved to Akron, Ohio, with his parents and attended the High School in that city, finishing his education at Keyport, New Jersey, where he also learned the rudiments of the rubber business under the direction of his father.

He soon developed an aptitude for drawing and mechanical design, that was applied in his study of rubber

manufacture and its devices, in which he was particularly interested.

He will long be remembered by his many friends and business associates for his frank, genial manner and lovable disposition.

Henry S. Jones, formerly with the Converse Rubber Co. and later a valued employee of The B. F. Goodrich Co. at its Boston, Massachusetts, office, died at his home in Stoughton, Massachusetts, June 4, aged 65 years.

The many friends of A. R. Duryee, the veteran rubber superintendent, will share with him his sorrow over the loss of his son Robert, who died recently at Saranac Lake, New York, at the age of 18.

JUDICIAL DECISIONS.

I. J. COOPER RUBBER CO. VS. JOHNSON. A suit was instituted by the I. J. Cooper Rubber Co., an Ohio corporation, to recover from Johnson and others, as sureties on a bond executed by the Standard Vulcanizing & Tire Co., a Tennessee corporation, as principal.

Following the terms of a contract, the rubber company consigned tires to the Tennessee corporation which had executed a bond to secure the rubber company against breach of contract by the Standard Vulcanizing & Tire Co.

The defense of the sureties was that the complainant rubber company had not complied with the Tennessee foreign corporation acts, and was doing business in that State through the agency of the tire company; that it could not, therefore, maintain the suit. The Chancery Court sustained this defense. The plaintiffs appealed and the Supreme Court of Tennessee reversed the decision of the court below. Held, that a foreign corporation which consigned tires for sale to a company in the State, was not doing business within the State to render necessary compliance with the foreign corporation act as a condition precedent to its right to recover from the sureties, since the business of a factor or commission merchant, one whose business is to receive and sell goods for commission, is not the conduct of an agency or business for the consignor of the goods. The factor sells to customers at his own risk and the consignor does not exclusively own the proceeds (182 Southwestern Reporter, 593).

BLACKWOOD TIRE & VULCANIZING CO. VS. AUTO STORAGE CO. The defendant sold an automobile to one Cooper, retaining title. Thereafter Cooper bought from the plaintiff, and fitted to the machine, certain tire casings; plaintiffs not retaining title. The machine was not fully paid for and the defendant took possession, and sold it. Cooper made no claim to the tires when defendant acquired the machine and made no objection to its sale. After the sale, however, at the instance of the plaintiffs, Cooper sold,

or purported to sell the tire casings to the plaintiff, their value at that time to be credited on Cooper's account. Suit was brought on this alleged title and the tire casings were replevied. The trial court dismissed the suit and an appeal was taken before the Court of Civil Appeals, which affirmed this judgment. Appeal was then taken before the Supreme Court of Tennessee. Held, that both courts were correct, that, where the purchaser of an automobile (title to which is retained by the seller) fits the machine with tires, and the seller on non-payment recovers the machine, title to the tires passes to the seller, the seller of the casings not having retained title to them, such being the rule of "accession" which supports the right of the owner of corporeal property, real or personal, to any increase thereof from any cause, either actual or artificial (182 Southwestern Reporter, 576).

IN THE MATTER OF AN APPLICATION FOR THE REVOCATION OF WILLIAM TAYLOR'S PATENT. In 1905 a patent was granted for "An application in golf balls." The specification stated that the principal object of the invention was to obtain better results in the flight of the ball than had been possible with balls of known types. One of the claims was "A golf ball having a spherical surface pitted with isolated cavities, forming the cavities substantially circular in plan, with steep sides and flat or concave bottoms and of a depth not exceeding one-eighth of their diameter." In other claims it was stated that the cavities were to be semi-elliptical in section, the minor axes being radial to the ball, and, also, the cavities were to be of a diameter not less than 9 hundredths, nor greater than 15 hundredths of an inch, and of a depth not exceeding 14 thousandths of an inch. The specification stated that preferably the cavities should occupy not less than a quarter, nor more than three quarters of the surface of the ball. On a petition for the revocation of the patent, the petitioners alleged anticipation by certain specifications, prior public use, want of subject matter, and want of utility. At the hearing the holders of patent contended that their experiments, made with a driving machine, showed that the patented golf balls had a better flight than certain balls having a different marking. It was proved that it had long been customary to make indentations in the surface of golf balls to improve the flight, and that at the date of the patent there were golf balls with projections in the form of a segment of a sphere and balls with corresponding depressions, also balls with circular depressions produced by a punch, and balls with raised lines or ridges on their surface. Held at the trial, that the patentee had not shown what particular depth of the depressions or steepness of their sides was the best; that he had not exactly specified the improvement claimed; and that the patent was invalid for want of subject-matter. An order for revocation was made. The respondents to the petition appealed to the Court of Appeal, and this court held, that the patent was invalid for want of novelty and of subject-matter.

The appeal was dismissed with costs (Central Court of Appeal, London, February 1, 1916).

WINS FIGHT OVER TRADE NAME.

The Newark, New Jersey, District Federal Court, on June 8, 1916, filed a decision enjoining the F. W. Devoe-C. T. Reynolds Co. from the use of the word "rubberet" or any other name resembling it. This means that the Rubberet Co., of Newark, has won its second suit in defense of its trade name. To establish the name, the company has spent thousands of dollars annually. The first suit was brought against the Rubber Bound Brush Co., Belleville, New Jersey.

It was decided in favor of the plaintiffs and the decision was later upheld in the Court of Errors.

JAR RINGS IN GERMANY.

Owing to the scarcity of rubber in Germany, and the necessary use of reclaimed rubber, it is now permissible to use compounds containing not over 1 per cent of lead for the manufacture of jar rings for canned fruits, etc. Rubber nipples for nursing children must, however, be lead free.

News of the American Rubber Trade.

OUTING OF THE RUBBER CLUB OF AMERICA, INC.

EXTENSIVE preparations are being made by the committee having in charge the seventeenth annual outing of this club at the Vesper County Club, near Lowell, Massachusetts, on Tuesday, July 18. It is planned to run a special train of sleeping cars, club car and diner from New York, leaving Grand Central Station at 11:30 P. M. on the 17th. Western members will assemble at Cleveland, Ohio, and will travel by special sleeping cars to Springfield, Massachusetts, where they will be joined to the special train from New York. The entire party from New York, Trenton and Akron will thus arrive at the Vesper County Club by about 8:30 on the morning of the outing. Breakfast will be served on the dining-car on the train. There will also be special cars from Boston to the Vesper County Club. Similar accommodations will be made for the return of the members to their respective destinations and round-trip tickets will be issued at a special price.

For reservations on these trains, members are requested to make immediate application to P. E. Young, Acushnet Process Co., New Bedford, Massachusetts.

WESTINGHOUSE ELECTRIC & MANUFACTURING CO. ANNUAL MEETING.

The annual meeting of the Westinghouse Electric & Manufacturing Co. was held at East Pittsburgh, Pennsylvania, on June 14. In addition to transaction of purely routine business, the following directors whose terms expired on June 14 were re-elected: J. W. Marsh, G. E. Tripp, H. H. Westinghouse, and A. H. Wiggin. Samuel M. Vaulcan, vice-president of the Baldwin Locomotive Works, of Philadelphia, was also elected a director, of the class whose term will expire at the annual meeting to be held in 1919.

The consolidated statement of income gives the gross earnings of the company as \$50,269,239.84, and the net manufacturing profit as \$9,429,895.76. Other income, with interest deductions, makes the net profit available for dividends and other purposes, \$9,666,788.68. The sales billed and net income for the year are in excess of any previous year in the history of the company. These results were attained in part from orders for war munitions, the shipments on account of which amounted to \$8,578,266.

WESTERN DIVISION OF THE NATIONAL ASSOCIATION OF WASTE MATERIAL DEALERS MEETS IN CHICAGO.

The western division of the National Association of Waste Material Dealers met at the Sherman House, Chicago, Illinois, on June 13. In his address President Birkenstein urged the members to advance the work of the association by increasing the membership of the western division. The attendance was good and that considerable progress had been made since the last meeting was evident from the favorable reports of the various committees. Among those present were the following: Louis Birkenstein, president of the National association; Harry Birkenstein, Victor Loewenthal and Charles Muehlstein.

SCRAP RUBBER DIVISION MEETING.

The Scrap Rubber Division of the National Association of Waste Material Dealers met at the Hotel Astor, June 21. Chairman Paul Loewenthal presided over the very successful meeting and marked progress was reported since the last meeting. There were about 20 representative members of the trade present who took part in the business of the meeting and the general discussions with enthusiasm. It was decided that the

scrap circular B will be revised and issued on July 1 of each year. A committee will be appointed to make recommendations for the necessary changes in the circular. Copies can be obtained from the secretary of the National association.

RUBBER COMPANY DIVIDENDS.

The Apsley Rubber Co. has declared the usual semi-annual dividend of $3\frac{1}{2}$ per cent, payable July 1 to stockholders of record June 16.

The Exello Tire & Rubber Co. has declared a semi-annual dividend of $3\frac{1}{2}$ per cent on preferred stock, payable July 1.

The Kelly-Springfield Tire Co. has declared a quarterly dividend of $1\frac{1}{4}$ per cent on preferred stock, payable July 1 to stockholders of record June 17.

The New Jersey Zinc Co., New York City, has declared an extra dividend of 5 per cent, making six dividends declared so far this year, in all 38 per cent, on the \$35,000,000 capital stock. Besides two quarterly dividends of 4 per cent each, the company has paid two extra dividends of 10 per cent and two of 5 per cent each. The six dividends declared this year require payment of \$13,300,000 in cash to stockholders. The dividends paid in January and February, however, amounting to 14 per cent, or \$4,900,000, were out of profits accumulated prior to January 1, and not out of those of the current year.

The Rubber Goods Manufacturing Co. paid a regular quarterly dividend of $1\frac{3}{4}$ per cent on the preferred stock on June 15, to stockholders of record June 10.

The Westinghouse Electric & Manufacturing Co. has declared a quarterly dividend of $1\frac{3}{4}$ per cent on the preferred stock, to be paid July 15, and a dividend of $1\frac{1}{2}$ per cent on the common stock for the quarter ending June 30, to be paid July 31, both dividends payable to stockholders of record June 30.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on June 24 are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new).....	64	66
Firestone Tire & Rubber Co., common.....	870	
Firestone Tire & Rubber Co., preferred.....	112	114
The B. F. Goodrich Co., common.....	74 $\frac{1}{2}$	74 $\frac{3}{4}$
The B. F. Goodrich Co., preferred.....	113 $\frac{1}{2}$	114
Goodyear Tire & Rubber Co., common.....	233	237
Goodyear Tire & Rubber Co., preferred.....	106 $\frac{1}{2}$	107 $\frac{1}{4}$
Kelly-Springfield Tire Co., common.....	71	73
Kelly-Springfield Tire Co., 1st preferred.....	96	96 $\frac{3}{4}$
Kelly-Springfield Tire Co., 2nd preferred.....	96	
Miller Rubber Co., common.....	350	357

United States Rubber Co., preferred.....	108 $\frac{1}{2}$	110

OLDTOWN COMPANY SUCCEEDS XENIA.

The Oldtown Rubber Co., Xenia, Ohio, notice of whose incorporation appears elsewhere in this issue, has taken over the rubber mills, water power, and 23 acres of land of the Xenia Rubber Manufacturing Co., the latter company having ceased operations. The new owners are making extensive alterations of the premises, with the object of greater development of the water power, and modernizing the equipment. The Oldtown company has acquired the patents covering the "Springfield Rubber-Abrasive Polishing Wheels," and will develop this line in conjunction with its extensive manufacture of rubber heels and soles, both for the factory and shoe repairing trade, baby carriage tires, and molded work for mechanical purposes.

MR. SCHLOSSER VICE-PRESIDENT OF THE NATIONAL INDIA RUBBER CO.

At a meeting of the directors of the National India Rubber Co., Bristol, Rhode Island, last month, George Schlosser was elected vice-president, to fill the vacancy caused by the death of LeBaron C. Colt.

Mr. Schlosser has been connected with the rubber industry more than a third of a century. He entered the employ of the New Jersey Rubber Co. as office boy in 1882. Advanced from one position to another, he was assistant superintendent in 1895, when he was made superintendent of the National India Rubber Co. Six years later he was chosen superintendent of the Alice Mill of the Woonsocket Rubber Co., and still later he was made general superintendent of the Woonsocket Rubber Co. mills at Woonsocket, Rhode Island, and Millville, Massachusetts; the L. Candee & Co. plant at New Haven, Connecticut, and the Lawrence Felting Co. at Millville, Massachusetts.

Mr. Schlosser has had a wide experience in the manufacture, not only of rubber footwear, but also of mechanical rubber goods, and is eminently fitted for the still broader responsibilities which are likely to be added through his recent election.

ARTHUR F. TOWNSEND VOLUNTEERS.

Arthur F. Townsend, president of the Manhattan Rubber Manufacturing Co., has been appointed assistant to Colonel Sternberger, Chief of the Quartermaster's Corps, N. G. N. Y., with the rank of lieutenant-colonel. Colonel Townsend resigned from the position of Chief Quartermaster last January and was placed on the reserve list. His long and varied experience in the National Guard made his services invaluable to the state and he promptly responded to the call.

THE GUNN RUBBER INTERESTS.

The Gunn Rubber Co., whose incorporation is noted elsewhere in this issue, is located at 61 East Main street, New Britain, Connecticut. The officers are as follows: A. P. Gunn, president and treasurer; Edward F. Gunn, vice-president; Albert E. Kilby, secretary.

The president, A. P. Gunn, was also interested in the Todd Rubber Co., of Waterbury, New London, and Pittsfield, Massachusetts, and also the E. J. Todd Rubber Co., Hartford, Connecticut, but has relinquished his holdings in the various companies with the exception of the E. J. Todd Rubber Co., at Hartford, of which he has purchased the entire stock. The new officers of this latter concern are as follows: A. P. Gunn, president and treasurer; M. E. Gunn, vice-president; Edward F. Gunn, secretary. Edward F. Gunn formerly held a one-quarter interest in the Todd Rubber Co., of Pittsfield, and was secretary of that company up to August 31, 1915.

PERSONAL MENTION.

Arthur W. Stedman, whose recent association with the Hagemeyer Trading Co., New York City, as manager of its crude rubber department, was mentioned in *THE INDIA RUBBER WORLD* last month, sailed for Europe on the "Finland," on June 14. He expects to be away about six or eight weeks.

C. Berlage, rubber and tobacco broker of Amsterdam, Holland, has opened offices at Medan, on the East Coast of Sumatra, and at Soerabaya, Java. With a view of extending his brokerage business and purchasing for American houses, he has arranged with the Hammesfahr Co., 68 Broad street, New York City, to represent him in this country.

W. J. Proctor, general manager of the Dunlop Rubber Co. of Australasia, Limited, Melbourne, Australia, was in this country last month and called on the machinery and supply houses and also visited several tire plants.

W. L. Wadleigh, for many years prominent in the rubber trade in Boston, Massachusetts, and now the head of Wadleigh Co., Limited, Singapore, Straits Settlements, returned from that city early in June, after an absence of nearly seven months, during which he accomplished a most satisfactory amount of business. One of the first things he did upon his return to this country was to go trout fishing in New Hampshire.

H. J. Morehead has been promoted to managership of the New York City branch of The B. F. Goodrich Co., Akron, Ohio. Mr. Morehead has been manager of the Detroit, Michigan, branch since 1908. Paul T. Oppen, formerly assistant manager of the Detroit branch, succeeds Mr. Morehead as manager.

The Denver depot of The B. F. Goodrich Co., Akron, Ohio, at 1422-1424 Court place, Denver, Colorado, is now in charge of C. A. Cotter, formerly chief adjuster at the St. Louis, Missouri, branch. H. E. White, whom Mr. Cotter succeeds as manager, has been transferred to a factory position. J. K. Laird, formerly Kansas City adjuster, is the new assistant to the local manager of the Denver depot, and C. L. Harding is new chief clerk.

I. L. Miller, secretary and manager of the foreign department of the Faultless Rubber Co., Ashland, Ohio, has recently returned from a fishing trip in Michigan.

Collier W. Baird, assistant treasurer, Rubber Trading Co., 9-15 Murray street, New York City, is a member of Essex Troop, N. J. N. G., that was ordered to the Mexican border June 26.

M. F. Hall has been placed in charge of the Louisville, Kentucky, depot of The B. F. Goodrich Co., Akron, Ohio, relieving W. H. Sheehy, who will be assigned to other duties.

Wilmer Dunbar will sever his connection with the Greensburg Tire & Rubber Co., Greensburg, Pennsylvania, July 1.

E. E. Fay, sales manager of the Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, is at present on a six weeks' trip to the Pacific Coast, visiting the Company's branch offices and distributors in the principal western centers.

M. H. Whipple, formerly branch manager of the Fisk Rubber Co., Chicopee Falls, Massachusetts, at Fresno, California, is now manager of the San Francisco branch, succeeding E. N. Merguire. R. W. Carter, in charge of the Sacramento branch, goes to Fresno and C. H. Francee assumes charge in Sacramento.

Rubber bands have been put to a new use by the proprietor of a barber shop in a western city, who suspends Japanese fans from the ceiling, over his chairs, by rubber bands. The fans are all kept constantly in motion by the draft from one electric fan at the end of the room. The rubber band gives sufficiently to enable the barber, when he has finished a shave, to use the suspended fan to dry the customer's face.

GEORGE SCHLOSSER.

PRESIDENT ROBINSON OF CANADIAN CONSOLIDATED.

WILLIAM HEZEKIAH ROBINSON, the new president of the Canadian Consolidated Rubber Co., Limited, Montreal, was born in Waterloo, Quebec, Canada, April 17, 1848, and educated at Shefford Academy in that town, Bishops College, Lennoxville, and military schools at Montreal, receiving a first-class certificate in infantry in 1865, and in school gunnery in 1869.

He began business life in a general store in Waterloo in 1867, and in 1870 bought out the business and became head of the firm known as Robinson Brothers & Stevens. He withdrew from that firm in 1874 on account of ill health and two years later entered the service of the Eastern Townships Bank as accountant. Three years later he instituted the branch at Granby of which he became manager, and ten years afterward established the Huntingdon, Quebec, branch which he managed until 1896, when he returned to Granby,

W. H. ROBINSON.

where he remained as manager until his retirement from banking in 1908. In the meantime, he went to British Columbia and opened a branch of the bank at Grand Forks. Since 1908 he has devoted his time chiefly to the interests of the Granby Consolidated Mining, Smelting & Power Co., Limited, of which he is vice-president; to the Crow's Nest Pass Coal Co. and the Granby Printing & Publishing Co., Limited, in which companies he has been a director.

He was a director of the Granby Rubber Co., Limited, up to the time of its amalgamation with the Canadian Consolidated Rubber Co., Limited. In 1915 he became a director of the Dominion Rubber System, and on the death of President J. H. McKechnie, was elected to that office.

His military record includes active service during the Fenian raid, when he served as ensign. On the formation of the 79th Battalion, Shefford Highlanders, he was appointed captain and paymaster and later received a commission as major, retiring in 1879.

Mr. Robinson is past master of Shefford Lodge, No. 52, A. F. and A. M. He has three sons, two of whom recently left for the defense of the British nation, one being lieutenant of the 73rd Royal Highlanders, and the other a captain in the C. O. T. C.

TO INVESTIGATE ANTIPODEAN TRADE.

J. A. McKenzie, manager of the Victoria, British Columbia, branch of the Canadian Consolidated Rubber Co., Limited, sailed last month for Australia and New Zealand where he will spend several months in investigating the footwear needs of those islands, with the idea of establishing a district agency there. He expects to spend about seven weeks in Sydney, a month in Melbourne, and a week or two each in Adelaide, Brisbane and New Zealand. While he will devote most of this time in studying the

rubber footwear trade, he will look up the tire business to some extent. He will appoint local agents in all important cities in this territory.

TRADE NOTES.

Arthur Jackson Wills, manufacturer of special rubber machinery, North Brookfield, Massachusetts, has applied for a patent on what he terms a "bath cap edging" plaiter which, he claims, produces an absolutely correct plaited edging on either cured or uncured rubber sheet. He has also evolved another machine of the same class which will plait around the edges of disks of pure gum stock.

The Adamson Manufacturing Co., East Palestine, Ohio, is erecting an addition, to be used for the increased production of vulcanizers and new, patented devices of interest to the automobile industry. The building, which will be of brick and glass construction, 50 by 150 feet and three stories high, with a total of 22,500 square feet of floor space, is expected to be ready for occupation some time in July.

The I. T. S. Rubber Co., Elyria, Ohio, manufacturer of cushion heels, is building a brick warehouse to accommodate increased business.

The National Rubber Co., Pottstown, Pennsylvania, is erecting a five-story building, 170 by 134 feet, of reinforced cement and glass construction. This company recently donated a set of tires for the new auto ambulance of the Goodwill Fire Co. at Pottstown.

The Standard Asphalt & Rubber Co., Jersey City, New Jersey, recently qualified to transact business within the State of Oklahoma.

The toy makers of the United States met at the Hotel McAlpin, New York City, June 9, and formed The National Association of Toy Manufacturers. Permanent offices will be opened in this city and a competent secretary engaged to attend to the association's affairs. It is expected the rubber toy manufacturers will become identified with this movement, that will undoubtedly result in benefit to the industry.

The American Hard Rubber Co., New York City, is about to erect at its plant at College Point, Long Island, New York, a three-story building 200 by 50 feet, to be used as a paper box factory and carpenter shop.

The Dayton Rubber Manufacturing Co., Dayton, Ohio, is installing hydraulic vulcanizers and adding to its machinery and mold equipment. The work will be completed within two or three weeks, and will practically double the present capacity of those departments.

The Cameron Machine Co., Brooklyn, New York, was recently favored with an order for ten slitting and rewinding machines from the Russian government. It is understood that these machines will be employed in general commercial work in Russia for converting fabrics, paper and other material into strip for a variety of uses in Russian textile and paper trades, also for medical and surgical purposes.

Following a reorganization of the company, the name of the Dings Electro-Magnetic Separator Co., Milwaukee, Wisconsin, has been changed to the Dings Magnetic Separator Co. The capital stock has been increased from \$10,000 to \$100,000 and the new officers of the company are: Robert A. Manegold, president and treasurer; Frank W. Manegold, vice-president, and William E. Wehr, secretary. These officers also constitute the board of directors.

The De Vilbiss Manufacturing Co., Toledo, Ohio, has purchased from the Davidson Rubber Co., Boston, Massachusetts, a portion of its hard rubber equipment, which will be transferred to Toledo and will be used in the manufacture of hard rubber parts in connection with the De Vilbiss company's extensive line of atomizers.

TRADE NOTES.

The Rubber Club of America, Inc., was represented in the Cincinnati, Ohio, Preparedness Parade on June 24. Fifty thousand people participated in the parade, and while the rubber interest, from a manufacturing standpoint, is not extremely heavy in that city, nevertheless, from the various branches of the trade, 100 men formed a company, and marched, headed by a banner bearing the legend: "Rubber Club of America."

The American Hard Rubber Co., 11 Mercer street, New York City, has built several model four-family apartment houses at College Point, Long Island, New York, for the use of their employees.

Heidman & Haynes, Cuyahoga Falls, Ohio, is a relatively new machinery concern specializing in experimental work for rubber mills.

The United States Rubber Co. of California has opened a factory branch at 906 Sixth street, Sacramento, which will handle all territory to the Oregon line. R. J. Jones, who has been covering this territory for the past five years, will be manager. This store will carry a full line of the United States Rubber Co.'s products.

F. Bierman & Sons Metal & Rubber Co., St. Louis, Missouri, has increased its capital stock from \$16,000 to \$32,000. This company was formed to deal in all grades of rubber and metals, succeeding the firm of F. Bierman & Son in the same line, and was incorporated under the laws of the State of Missouri in October, 1912. The incorporators are: F. Bierman and two sons, Samuel L. Bierman and Isaac Bierman.

Developments along the Mexican border recently have tested the attitude of employers toward employees who have answered the call to arms. The United States Rubber Co., New York City, of which the United States Tire Co. is an associate, offers full salary and protection of position during absence, the announcement affecting the employees of 37 factories distributed throughout the country and over one hundred branches and stores.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, will hold positions open for employees belonging to the National Guard while they are in service, both at camp and away, for the period of one year. They will pay the married men or single men with dependents three-quarters of their average salary and single men without dependents one-half, and no deductions will be made for the amount received by employees from the government. Should any men now employed desire to enlist, this same rule will apply, with the exception that such employees must have been in the employ of the company for six months prior to this date, this proviso being intended to prevent the employment of men who have in mind enlisting.

BEACON FALLS PLANT AT COLLEGE POINT.

The Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut, has leased 60,000 square feet of factory space at College Point, Long Island, New York, in the one and two-story modern factory buildings at Tenth street, running from Third to Fourth avenues. The College Point plant will be used by the Beacon Falls company as a branch for the manufacture of tennis shoes. Three hundred men and girls will be employed at the start.

LEAD COMPANIES CONSOLIDATE.

The Eagle White Lead Co., Cincinnati, Ohio, and the Picher Lead Co., Joplin, Missouri, have united, and the new company is to be known as the Eagle-Picher Lead Co., with general offices at 208 South La Salle street, Chicago, Illinois.

John B. Swift, who has been president of the Eagle White Lead Co., was elected chairman of the board and chairman of the executive committee. O. S. Picher was elected president and general manager; R. W. Evans, vice-president and general sales manager; S. M. Evans, vice-president; Thomas S. Brown,

Jr., treasurer; Joseph Hummel, Jr., secretary. These, with F. L. Perrin, Frederick Hertenstein and J. Edward Webb, comprise the board of directors.

It is announced that the capital stock of the new company has been authorized at \$10,000,000, of which \$1,000,000 is preferred, \$7,000,000 common, outstanding, and \$2,000,000 common in the treasury. It is not planned to offer the stock to the public, but employees of the company will be given an opportunity to subscribe to \$500,000 worth of the common stock at par, upon easy payment terms.

It is stated that the combined business of the two companies amounts to more than \$15,000,000 per year. The new company will engage in the mining and manufacture of pig lead and spelter, all lead products and pigments, plumbers' goods, etc. The company has plants at Henryetta, Oklahoma; Galena, Kansas; Joplin and Webb City, Missouri; Collinsville, Illinois; Cincinnati, Ohio, and Newark, New Jersey. All present branches will be maintained and a number of other district offices opened in the near future.

LOWER PRICES IN ZINC OXIDE.

The New Jersey Zinc Co., New York City, announces the following prices per pound on Florence brand, French process, oxide of zinc, for shipment on contract, during the third three months of 1916:

	Carloads.	Less Carloads.
White Seal	17 cents	17½ cents
Green Seal	16½ cents	16¾ cents
Red Seal	16 cents	16½ cents

The above prices are based upon shipments in barrels f. o. b. shipping point, with freight allowance as heretofore on carload lots only.

The above prices are effective July 1, 1916, and are subject to change without notice.

SOME NEW KETONE SOLVENTS.

One of the interesting developments of industrial chemistry in the past few months is the production of Ketone solvents. These materials are obtained as by-products in the manufacture of a new series of dyes, and are characterized by their exceptional solvent properties. The research department of the Rubber Trade Laboratory, which has succeeded in separating this material into three distinct fractions, thus describes them:

Ketone Solvent No. 1 has a specific gravity of 0.880 to 0.900—and is entirely volatile below 100 degrees C. This solvent will probably be used to a large extent to replace acetone. It has also been tested out in the preparation of cements in the rubber and celluloid industries, and the preliminary experiments indicate that it can be used successfully for this purpose.

Ketone Solvent No. 2 has a specific gravity of 0.900 to 0.950—and has a boiling point of 100 to 150 degrees C. As a solvent, it has been recommended as a substitute for toluol and xylol. These latter materials have a boiling point of 111 and 138 degrees C., respectively.

Ketone Solvent No. 3 has a specific gravity of 0.940 to 0.970—and boils at a temperature between 150 and 180 degrees C. This is a high boiling product, and is likely to find extensive use as an auxiliary material in the manufacture of reclaimed rubber.

A material designated as "Yocarbon" has also been isolated from the melt. This is a pitch-like substance having a melting point of 250 degrees C. and a specific gravity of 1.100.

A means to prevent accidents due to the slipping of belts on pulleys and sudden starting of machines has been devised in the form of a small wooden wedge, covered at its tapered end with sheet rubber. To one side of the wooden strip—which is about a foot long, four inches wide and an inch and a half thick—two clips are attached, and when in use the rubber-covered wedge is inserted between the belt and the pulley, these clips fastening over the edge of the belt and holding it firmly in place.

NEW INCORPORATIONS.

Abdominal Supporter Co., Inc., The, May 29 (New York), \$12,000. H. L. Brown, L. A. Hammersley, and Alex H. Sands, Jr.—all of 200 Fifth avenue, New York City. To manufacture elastic appliances, etc.

Acme Rubber Co., March 3 (Ontario), \$400,000. F. D. Law, 471 Yonge street, Toronto, Ontario. Principal office, Brampton, Ontario. To manufacture rubber tires, rubber goods, etc.

Aero-Cushion Tire Agency, Inc., April 15 (California), \$20,000. W. B. Denhart, J. O'Shannessy, and George A. Ledoux—all of San Jose, California. Principal address, San Jose, California. To deal in auto and vehicle tires.

Akron Tire Repair School, May 15 (Ohio), \$10,000. A. G. Zeller (president), W. S. Hunter (general manager), C. B. Keener (secretary-treasurer). Principal address, 46-48 North Main street, Akron, Ohio. To teach men the tire repair business.

American Tire Sales Corporation, May 18 (Delaware), \$100,000. William F. O'Keefe, George G. Stiegler, E. E. Wright—all of Wilmington, Delaware. Principal address, 901 Market street, Wilmington, Delaware. To manufacture and deal in automobile tires, tubes, etc.

Bolivia-Brazil Rubber & Timber Corporation, February 7 (Arizona), \$1,000,000. Hon. Adolfo Ballivian, 2 Stone street, New York City; William L. Glorieux, Jr., Hon. Daniel S. Voorhees, F. B. McMillan, Dr. Britton D. Evans, Samuel T. Busey. To develop rubber plantations, etc.

Chicago Tire Pump Co., May 4 (Illinois), \$7,200. George Mahler, Arthur E. Stenzel and Anna Mahler. Principal address, 20 East Jackson Boulevard, Chicago.

City Rubber Corporation, June 10 (Delaware), \$550,000. George G. Stiegler, N. T. Parsons, E. E. Wright—all of Wilmington, Delaware. To manufacture and deal in automobile tires, etc.

Crude Rubber Importing Corporation, June 27 (New York), \$105,000. S. C. T. Dodd, 37 Wall street, George F. Jebbitt, 3161 Broadway—both of New York City, and Tracy S. Buckingham, 204 Livingston street, Brooklyn, N. Y.

Denver Tire Service, Inc., June 9 (New York), \$1,000. A. Foshay, 120 Broadway; Russell Goldman, 1190 Madison avenue—both of New York City, and A. G. Thaarum, 1331 Herschell street, Westchester, New York.

Detroit Tire Co., June 9 (New Jersey), \$10,000. Robert S. Mantell, 3033 W. Grand Boulevard; Ray Wirtz, 1419 Dime Bank Building; J. E. Welch, 944 Woodward avenue—all of Detroit, Michigan. To manufacture, deal in and repair automobile tires, etc.

Druggists Rubber Co., June 17 (Ohio), \$10,000. O. D. Eshelman, L. C. Shaver.

Miami Rubber Co., June 17 (Ohio), \$40,000. E. H. Botsford, G. C. Congdon.

Gunn Rubber Co., May 21 (Connecticut), \$2,500. A. P. Gunn (president and treasurer), Edward F. Gunn (vice-president), and Albert E. Kilby (secretary). Principal address, 61 East Main street, New Britain, Connecticut.

Halifax Rubber Co., May 11 (Pennsylvania), \$5,000. John H. Klingman, A. G. Bashoar, of Millersburg, and A. M. Smith, Halifax, Pennsylvania. Principal office at Halifax, Pennsylvania. To manufacture and deal in rubber goods and novelties.

Newmann Rank Tire Co., Inc., May 23 (New York), \$25,000. Samuel A. Newman, 316 West 113th street, Ernest Rank, 410 Lenox avenue, and V. C. Bogardus, 140 Nassau street—all of New York City. To manufacture rubber tires, etc.

North American Rubber Co., June 8 (Delaware), \$250,000. S. S. Adams, Jr., H. M. Kennedy, M. B. F. Hawkins—all of Wilmington, Delaware. Principal office, Delaware Corporation Co.,

Tenth and Market streets, Wilmington, Delaware. To manufacture and deal in automobile tires, etc.

Oldtown Rubber Co., The, May 8 (Ohio), \$30,000. David Shearman (president), D. A. Bickett (secretary), L. M. Bickett (treasurer). Principal address, Xenia, Ohio. To manufacture rubber heels and soles, and baby carriage tires, etc.

Overtire Service Co., Inc., June 16 (New York), \$1,000. Philip Rosenberg, 121 Hopkins street, Isaac Slutsky, 344 Jay street, and Abraham Kempner, 2021 Croysey avenue—all of Brooklyn, N. Y. To manufacture tires, rubber goods, etc.

Passaic Tire Co., May 31 (New Jersey), \$25,000. Hyman Morris and Gussie Morris, 279 Madison street, Yetta Evansky, 56 Lexington avenue—all of Passaic, and Harris Evansky, 799 Paterson avenue, Wallington—both in New Jersey. Principal address, 39 Lexington avenue, Passaic. To manufacture and deal in tires, etc.

Schultz Tire & Supply Co., May 4 (Illinois), \$5,000. Frederick C. Schultz, S. H. Schultz, and Emil A. Schultz. Principal address, 6737 Sheridan Road, Chicago. To deal in tires and supplies, also have a complete vulcanizing plant and service station.

Reliable Tire & Rubber Co., of New England, June 6 (Massachusetts), \$25,000. Joseph T. Gilman, 9 Lawson road, Winchester; G. S. Van Voorhis, 440 Newbury street, Boston; Hermon Holt, Jr., 45 Pleasant street, Newton Center—all in Massachusetts. Principal address, Boston, Mass. To deal in tires, etc.

Sanitary Rubber Tooth Brush Co., June 10 (Delaware), \$100,000. Frank L. Mettler, Charles F. Bowers, Moses Weil—all of Wilmington, Delaware. To manufacture tooth brushes of all kinds.

Supreme Rubber Co., June 17 (Ohio), \$25,000. Chester A. Teits, Dan Zeisloft and others.

Wright Tire & Rubber Co., May 20 (Ohio), \$100,000. Richard Ryan, Robert Wright, C. R. Wagner, C. F. Hiller and A. C. Foose. Principal office, 2041 E. 105th street, Cleveland, Ohio. To manufacture rubber goods in general and the Wright Anti-Skid Puncture Proof Pneumatic tires in particular, together with a demountable rim.

Westgard Tire & Rubber Co., June 20 (Delaware), \$1,500,000. A. L. Westgard, 18 Old Slip; J. E. Levi, 50 Broad street and R. S. Ireland, Fifty-first street and Broadway—all of New York City. Principal address, 202 Equitable Building, Wilmington, Delaware. To manufacture rubber, rubber tires, rubber goods, etc.

Western Tire & Garage Co., January 27 (New Mexico), \$100,000. J. D. Hamlin (president), C. A. Roberson (vice-president), M. M. Craig (secretary), C. L. McClellan (second vice-president), J. A. Oden (treasurer). Principal office, Texico, New Mexico. To manufacture and deal in automobile tires.

Wakefield Motor Reconstruction Co., June 1 (Massachusetts), \$25,000. Thomas E. Dwyer, 12 Gould street; John D. Dwyer and Dennis F. Dwyer, 228 Spring street—all of Medford, Massachusetts. Principal office, Wakefield, Massachusetts. To manufacture and deal in automobile tires, etc.

LATE CUSTOMS RULING.

It seems that rubber bulbs are not druggists' sundries if they are made to be used on pyrographic outfits. This was the decision of Judge McClelland, reversing the action of the collector in assessing a 15 per cent duty as "rubber manufactures commonly known as druggists' sundries," and sustaining the claim of the importers for entry at 10 per cent as "manufactures of rubber not specially provided for."

AMERICAN INVESTMENTS IN MEXICO.

Marion Letcher, United States consul at Chihuahua, states that up to 1912, American investments in Mexico aggregated \$1,057,770,000. He credits \$15,000,000 of that amount to American capital invested in the rubber industry.

A MODEL TIRE PLANT OFFICE.

The Colorado Tire & Rubber Co., Denver, Colorado, has just completed plans, and will soon start building an addition to its present plant, at a cost of about \$12,000. This addition will be two stories high, of brick, as is the present factory. The enlargement is necessitated because of the heavy increase in demand for the company's "Durable" treads. The accompanying

picture shows the business office of the company, which, for systematic arrangement, and for the comfort and convenience of the workers, is worthy of study of details by every concern having a large office force. Such an office must naturally facilitate routine work and make for increased efficiency.

NEW PLANT FOR GOODYEAR IN TORONTO.

The new plant of the Goodyear Tire & Rubber Co., Limited, in New Toronto, Canada, mentioned in a former issue, will comprise a building for the manufacture of pneumatic tires, 100 by 500 feet, four stories and basement; a power plant, and a building for the manufacture of cement. C. H. Carlisle is treasurer and general manager. The present factory of this company is located at Bowmanville, Ontario, and when the new plant is completed the Bowmanville factory will be used exclusively for the manufacture of mechanical goods, carriage tires, motor truck tires and Neolin.

A NEW TIRE FACTORY AT SOUTH BEND.

The International India Rubber Corporation, incorporated under the laws of Delaware, October 29, 1915, with a capital stock of \$1,000,000, is to build a factory at South Bend, Indiana, for the manufacture of automobile tires and tubes and other rubber products.

The officers and directors are: Peter E. Studebaker, president; Edward H. Schwab, vice-president; Thomas W. Slick, treasurer; George W. Odell, secretary and general manager; William S. Moore, director.

Mr. Studebaker is the son of Henry Studebaker, who founded the Studebaker Brothers Wagon Co. in 1852. As soon as the plant is in operation, he will devote his entire time to the interests of the company.

Mr. Schwab is a manufacturer of spark plugs at Bethlehem, Pennsylvania, and is a brother of Charles M. Schwab, former president of the United States Steel Co.

Mr. Slick is a lawyer and was formerly president of the Chapin State Bank and director of the American Trust Co. and the Union Trust Co., and is interested heavily in real estate in South Bend, Elkhart and Gary.

Distributing branches are being established in various parts of the country by selling garage men and tire handlers small blocks of 7 per cent cumulative preferred stock.

NEW FIRESTONE BRANCHES.

A three-story building in Los Angeles, California, is soon to be erected by the Firestone Tire & Rubber Co., Akron, Ohio, to be used as a tire branch. An unusually attractive establishment is planned for this branch, the construction to be of the characteristic California mission style.

A new two-story structure is about to be started at Syracuse, New York, which will be used as a tire building for the Firestone company.

A branch has also been opened at Harrisburg, Pennsylvania, in a temporary location, and it is expected that a permanent location will soon be secured. L. L. McClintock is in charge of this branch.

A new direct factory branch at Springfield, Massachusetts, covers a space of 48 feet frontage and 32 feet depth, containing two private offices, one for use by the adjusters, and the other being the office of the branch manager, G. I. Engle. Equipped with a Syracuse press, and facilities to take care of all trucks, this branch will also carry a good supply of motor truck tires, pneumatic tires, bicycle tires, accessories, repair stock, rims and carriage tires. The territory embraces the State of Vermont; Cheshire and Sullivan counties in New Hampshire; and Berkshire, Hampden, Hampshire and Franklin counties in Massachusetts.

THE BRUNSWICK-BALKE-COLLENDER CO.

The Brunswick-Balke-Collender Co., Chicago, Illinois, maker of billiard tables, bowling alleys, etc., has entered the tire manufacturing field, and will manufacture automobile tires and inner tubes as side lines at its factory at Muskegon, Michigan. This company has also begun the manufacture of electric storage battery cells and other specialties in both hard and soft rubber.

HELPING THE CAUSE OF PREPAREDNESS.

The Norwalk Tire & Rubber Co., Norwalk, Connecticut, has offered to pay every factory employee who joins the training camp at Plattsburg this summer the difference between the wage he earns at camp and his regular wages, thus allowing every employee who goes to the Plattsburg camp to receive full pay. This is an especially generous concession in view of the fact that the rush of orders at the Norwalk company's factory is necessitating night and day work.

WILL BE RUNNING NEXT MONTH.

The plant of the Hawkeye Tire Co., Des Moines, Iowa, whose incorporation was noted in the June issue of THE INDIA RUBBER WORLD, embraces about 40,000 square feet of floor space. The

company expects to be turning out 100 tires per day by August 1, the maximum capacity being 400 tires per day. E. E. Harding, formerly of the Swinehart Tire & Rubber Co., and of the Knight Tire & Rubber Co., will be assistant general manager.

COMFORT AND BUSINESS.

Down in the busy business district of New York City one hardly expects to find such a home-like office as that occupied by R. J. Caldwell, of the company which bears his name, situated at 15 Park Row, corner of Broadway. Mr. Caldwell con-

trols the output of two large tire and mechanical fabric mills and is an important distributor of this product to the rubber trade. His office looks more like a library in a private residence, and shows evidence of the best of taste in furnishings. Mr. Caldwell believes that in these surroundings he is able to do more and better work than in the old-fashioned business office, and it certainly gives the visitor, whether calling on business or socially, a most home-like feeling which, in itself, is a welcome second only to Mr. Caldwell's own cordial greetings.

GOODRICH SERVICE STATIONS.

Recognizing the importance of Bangor, as a distributing center to the automobile tire and accessory trade, The B. F. Goodrich Co., Akron, Ohio, has opened a wholesale stock depot and dealers' service station at 7 Franklin street, Bangor, Maine. H. H. Baker will be in charge.

During the past month the Goodrich company has also established a similar station at 137 St. Paul street, Burlington, Vermont, under the management of L. E. Stone, and one at 243 North Sante Fe avenue, Salina, Kansas, in charge of L. K. Graham.

INSTALLS A RESEARCH DEPARTMENT.

The Polack Tyre & Rubber Co. is operating its factory at Bridgeport, Connecticut, on a 24-hour schedule. This company has recently added to its organization a scientific development department including a laboratory for routine testing and research work. This department is in charge of Webster Norris, one of the best known American rubber chemists.

BE SAW TIRE & RUBBER CO. SUCCEEDS QUALITY.

The Quality Tire & Rubber Co., Hartville, Ohio, has changed its name to the BeSaw Tire & Rubber Co. Charles BeSaw, the president and general manager, was formerly general superintendent of the Knight Tire & Rubber Co., of Canton, Ohio, and P. P. Parker, the sales manager, was formerly assistant sales manager for the latter concern. The BeSaw company is working its plant both day and night and turning out about 150 tires daily, one a high grade known as the "BeSaw Quality," and a low-priced tire in small sizes which has been named the "Blackford."

TRADE NOTES.

The following new agencies are reported by the Braender Rubber & Tire Co., Rutherford, New Jersey, manufacturer of Braender tires and tubes: American Motor & Equipment Co., 181 Massachusetts avenue, Boston, Massachusetts; The Kassler Motor Co., 5th and White streets, Dubuque, Iowa, and H. B. Herr, 30 West King street, Lancaster, Pennsylvania.

The capital stock of the Fisk Rubber Co., Chicopee Falls, Massachusetts, has been increased from \$14,400,000 to \$19,400,000.

The Kansas City Tire & Rubber Corporation, manufacturer of pneumatic and solid tires and tubes, was incorporated under the laws of New York, May 21, 1915, with a capital stock of \$575,000. The principal office of the company and one of its factories are in Kansas City, Kansas, another factory being located at Chester, West Virginia.

The Quaker City Rubber Co., Philadelphia, Pennsylvania, is building a one-story addition, 50 by 150 feet, to afford better facilities for handling its output of tires.

The Ajax Rubber Co., Inc., New York City, which distributed prizes for high mileage of its tires for the year ending March 31, 1916, is now offering \$5,000 in cash prizes in a similar contest now begun, and to continue until March 31, 1917. Two hundred and eight cash prizes are offered to chauffeurs. The judges of the contest are as follows: Alfred Reeves, general manager, National Automobile Chamber of Commerce; R. A. Patteson, president, Tarrytown (New York) National Bank; L. W. Scudder, certified public accountant, New York City.

The Keystone Tire & Rubber Co., New York City, has increased its capital from \$5,000 to \$500,000.

F. A. Skipworth, of Dallas, Texas, will handle the products of the Wilson Tire & Rubber Co., Springfield, Illinois, in the State of Texas. This is not a factory branch, as Mr. Skipworth is using his own capital.

The Boss Rubber Co., a tire distributing concern with headquarters in Denver, Colorado, has very recently opened a new store at Butte, Montana, which will be the distributing point for the state. The company is said to specialize in Kelly-Springfield tires.

The plant of the Beaver Tire & Rubber Co., Ashtabula, Ohio, is rapidly being pushed to completion. The company hopes to be on an operating basis shortly after August 1.

With a view to organizing the rubber industry of Los Angeles, California, as a unit in the chain of similar organizations throughout the United States to be affiliated with The Rubber Club of America, Inc., 15 leading members of the tire trade of that city recently met at luncheon for discussion of the plan.

Contracts for three new buildings will be given out by the Federal Rubber Co. of Cudahy, Wisconsin. When these are completed the company will have approximately 12 acres of floor space, and will allow facilities for a 50 per cent increase in the output of Federal products. The company is putting out a new line of black tread tires under the name "Trafik," made in non-skid and plain types.

The Valley Rubber Co., North Yakima, Washington, has recently installed a new 6-bar tube press, which greatly facilitates the treatment of inner tubes and saves delay on repair work.

Aeroplane cord tires, made with large cross sections to afford adequate cushioning properties, will probably be extensively used on American air craft in the future.

THE GOODWEAR TIRE CO. BUILDS.

The Goodwear Tire Co., Minneapolis, Minnesota, incorporated January 6, 1916, with a capital stock of \$300,000, is building a factory at Red Wing, Minnesota, 120 by 150 feet, two-story and basement, and a power plant, 60 by 50 feet. The plant will be equipped with the most up-to-date machinery obtainable and the company expects to begin operations by November with a production of 200 tires and tubes daily and a full mechanical line. The officers and directors are as follows: H. Scott Ewers, president; G. W. Franson, vice-president; Frank E. Oberg, secretary; C. W. Oberg, treasurer; Harry J. Smith, purchasing agent and factory manager.

ARMORED CAR FOR THE MARYLAND NATIONAL GUARD.

Rubber men all over the country are interesting themselves in the present Preparedness movement. The Maryland National Guard will have a first class armored car of the latest approved type if the plans of four Baltimore men prove successful. They are at this time endeavoring to raise the necessary funds through subscription, and a good start had already been made the latter part of June. At the head of the committee is George P. Thomas, 3d., of the Goodyear's Rubber House, Baltimore, of which his father, George P. Thomas, Jr., is principal. The other members of the committee are Addison de Goll, E. L. Bartlett, 3d., and Gordon T. Parks, the latter being treasurer.

THE NEW DREADNAUGHT COMPANY.

The Dreadnaught Tire and Rubber Co. of Maryland, incorporated under the laws of Maryland, has purchased the entire plant and assets of the old Dreadnaught Tire and Rubber Co. of Delaware, the new organization being completed and the plant at Orangeville, Maryland, ready to commence operations July 1. The general offices of the company are also located at the Orangeville plant.

The new company is capitalized at \$700,000, of which \$300,000 is preferred and \$400,000 common; nearly one-half has already been subscribed to. The officers are as follows: John Hiltz, president; John P. Lauber, vice-president; Wm. C. Schmeisser, treasurer; H. James Lepper, secretary, and W. V. Sleek, general manager. All of these men, with the exception of Mr. Sleek, are well-known Baltimore business men. Mr. Sleek has for the past four years been connected with the Mansfield Tire & Rubber Co., Mansfield, Ohio, as purchasing agent and efficiency engineer and for ten years previous, in executive capacities, with some of the largest motor car manufacturers.

CRUSADE AGAINST FRAUDULENT TIRE AND SUPPLY SCHEMES.

The American Automobile Association is conducting through its legislative committee a campaign against fraudulent schemes in the accessories field. Richard H. Lee, of Cleveland, Ohio, the chairman of this committee, is president of the Cleveland Automobile Association and the Ohio State Automobile Association. This crusade is directed against leagues and associations which promise standard automobile supplies and accessories at cut rates. Through the efforts of this committee two men pleaded guilty to fraud in St. Johns, New Brunswick, Canada: one man was arrested in Uniontown, Pennsylvania, and pleaded guilty to fraud; and a fourth was arrested in Valdosta, Georgia; and in Washington on June 24, the president of the International Automobile League was arrested at the close of his testimony before the solicitor-general of the Post Office Department, on an action brought to prevent the use of the mails by the league, which purports to supply its members with tires and auto accessories at greatly reduced prices to those who pay an annual fee of \$10 to join the organization. But it is claimed that members, who wrote for standard accessories and tires listed in the catalog, have been informed that they were "just out," and have been offered unnamed tires "manufactured by the concern exclusively" instead of those cataloged. When

complaints were made, it was pointed out that the contract with members provided that they would furnish the goods listed in the catalog, "when such goods are in stock." The legislative committee is to be congratulated on this outcome of its activities.

TIRES AT THE INDIANAPOLIS AUTOMOBILE SWEEPSTAKES.

The first three cars in the 300-mile automobile sweepstakes race at Indianapolis, May 30, were equipped with Goodrich Silvertown cord tires. The fourth and fifth cars used Firestone tires.

The leaders using the Silvertown tires covered the 300 miles with but one change each, while the Firestone tires completed the distance with four changes. Left front tires were unchanged, but several right front tires were blown, this tire being most dangerous of all and requiring most careful attention. Generally speaking, the tire changes were made often to insure safety. Tires were inflated to about 60 pounds, although some drivers inflated to 100 pounds, and then, before starting, let the pressure down to the required amount.

Many drivers used smaller tires in front than in rear on account of the strength required in steering with 5-inch tires.

One driver used a novel attachment for cooling his tires. Water was conducted from a special tank by pipes to each wheel, ending in spray nozzles. The apparatus worked by air pressure, the control-valve being operated by the mechanic.

T. G. RICHARDS BUYS THE B. & R. RUBBER CO. PLANT.

The plant of the B. & R. Rubber Co., North Brookfield, Massachusetts, which has been in the hands of the receivers, was advertised to be sold at public auction as a going concern in one lot, at a price of not less than \$265,000. The sale was to be on June 28, at the office on the premises, but was, on that date, postponed till June 29, when it was sold to Thomas G. Richards, who was president and treasurer of the B. & R. Rubber Co. According to the terms of the sale, the property is to be delivered within 15 days from the confirmation of the sale by the court.

A FIREMAN IN HIS YELLOW SLICKER.

A fire chief in one of the Southern cities recently took a newspaper man into his confidence relative to the yellow oil coats known as "slickers." When he joined the fire department his first act was to possess himself of one of these coats. Shortly after an alarm was sent in. The rest of the story can very properly be told in his own words:

"My, that was a hot fire! But when we got there it, was supposed to be my job to be on the business end of the steamer line. I had on my pretty little yellow slicker and was a fit subject for a swell drawing room, and started with the captain of the company for the fire. By the time I got half way across the street that coat began to melt from the heat of the fire, and the liquid rubber began to run down my neck, raising a blister wherever it touched my then tender hide. I began to try to squirm out of it, and one of the boys pulling slack behind me thought I was trying to pull it further up on me, and he came to help. Great Caesar, the very thing I didn't want done was being done. I suppose we have all formed an idea of the inferno. I had mine before that, but let me tell you one thing, and you can take my word for it—my idea of the inferno before that man pulled that coat up on my neck and back would make the warm place an ice palace beside the new idea I formed from that experience.

"Yes, sir; I am 'agin' rubber coats to fight fire in and have been from that night."

This is an interesting story, and nobody can blame the chief for looking with marked disfavor on the yellow "slicker," but his description of it as a "rubber" coat is quite inaccurate, because there is no rubber in these yellow coats—they are waterproofed with boiled linseed oil, and, are they ever worn by firemen?

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

THE rubber companies of this city are responding generously to the call of patriotism in encouraging their employees to join the militia for Mexican service, by the practical expedient of insuring them against financial loss.

The B. F. Goodrich Co. has announced that to all employees who will serve in the militia who contribute to the support of dependents, two-thirds of their average wage, based on their previous average wage during the last three months, will be paid.

To all men not contributing regularly to dependents, one-half of their average wage will be paid.

Payment will be made direct to dependents designated or will be held in trust for the employee. Insurance issued by the company will remain in effect. The company also announces no discrimination will be made against the employee upon his return and he will return to his position if possible.

The Goodyear Tire & Rubber Co. encourages its employees to enlist in the national guard, allowing them the necessary time for summer military camp duty, without prejudicing their salaries or positions with the company. Many Goodyearites are affected by the President's mobilization order, among whom are executives and engineering experts whose services to the company are invaluable.

The Firestone Tire & Rubber Co. will give all employees enlisted on or prior to June 20, who have been in continuous service of the company three or more years, full wages less all money received from the State or National Government. Employees in continuous service of the company between one and three years, will receive two-thirds of wages less all money received from the State or National Government; and employees in continuous service of the company less than one year, one-half of wages less all money received from the State or National Government.

Employees who enlist after June 20, will be allowed wages as follows, less all money received from the State or National Government:

Those in continuous service of the company three or more years, full wages; those in continuous service between one and three years, two-thirds of wages; those in continuous service between six months and one year, one-half of wages. Those in continuous service less than six months will receive no allowance. The average wages earned per month for three months prior to enlistment will be the amount allowed piece workers, also employees on salary.

The Firestone Tire & Rubber Co. has just installed a turbine engine, capable of generating 12,000 horsepower. The new turbine replaces one of 3,000 horsepower.

That there is a growing interest in the popular mind as regards the rubber business is shown by the inquiries made to every rubber company for samples and particulars of manufacture by school principals and teachers. To meet this demand, the Firestone company has prepared an exhibit of the chief commercial rubbers and has sent out several hundred such exhibits to the various schools and colleges, together with a booklet which explains processes of manufacturing the various articles.

On June 17, the power house of the Firestone company was partially destroyed by fire, caused by defective insulation. While the fire was confined to the power plant, the damage done was of a character to affect general operation, though all departments are now restored to normal operating condition.

A. H. Harris has sold to the Firestone company his patents on the machine and method used in making cord tires. This machine was illustrated and described in THE INDIA RUBBER WORLD, January 1, 1916.

Mention was made in the June letter of the appointment of a meeting of stockholders to increase the capital stock of the Miller

Rubber Co. and to distribute shares to the common stockholders. The meeting was duly held on June 2 and the capital stock of the company was increased from \$2,000,000 to \$20,000,000, divided into 200,000 shares of \$100 each, of which amount of stock \$10,500,000 par value, consisting of 105,000 shares of \$100 each, shall be preferred stock, and \$9,500,000, consisting of 95,000 shares of \$100 each, shall be common stock.

The Miller company is to be congratulated on the present condition of its business. It is stated that for the past six months of the present fiscal year the sales were 100 per cent in excess of the same period last year. The gross sales from October 2, 1915, to April 1, 1916, were about \$2,000,000, compared with \$800,000 for the same period the previous year. A portion of the proceeds of the sale of \$2,500,000 worth of preferred stock is to provide for factory additions now in process of erection and for the retirement of old preferred stock. The company is erecting two six-story buildings and two eight-story buildings which, when completed, will make the total floor area over 21 acres.

The advertising department of the Miller company is sending to dealers handling its tires electrotype advertisements for inserting in the local papers which are distinctly novel. Each one is adorned with a figure named "Mr. Quick Service," the word "Quick" being used to form the principal features of this supposititious person. He is crowned by a cap made from a Miller tire and he is represented as being on the spot to do every sort of tire and tube repairing. The ingenious artist has evolved a figure which is decidedly noticeable, though it can hardly be called handsome, but that it will be quickly recognized if given sufficient publicity goes without saying.

* * *

At a director's meeting of the Portage Rubber Co., at Barberton, held on May 29, the regular quarterly dividend of 1 3/4 cent upon its issued and outstanding preferred capital stock was declared, payable July 1 to stockholders of record June 20; also a quarterly dividend of 2 per cent on its issued and outstanding common stock, payable August 15 to common stockholders of record August 5.

The Portage company will hold a stockholders' meeting on July 11 to vote on a plan to increase the capital stock of the company from \$1,250,000 to \$3,000,000. Half the new stock is to be common, and shareholders will be offered the right to buy new stock at 105. The issue has already been underwritten.

* * *

The Punctureless Auto Tire Co., manufacturer of the King tubeless truck tire, has recently purchased a 20-acre tract of land just south of the Barberton pumping station, with a frontage of 1,864 feet on the Pennsylvania, Erie and B. & O. tracks on the north; Mud Run on the east; the Ohio canal on the south, and 364 feet of public highway. A factory will be built at once, comprising four main buildings, 80 by 400 feet, four stories high, with a power and rim plant. A temporary building will be erected for immediate production.

* * *

The Double Service Tire & Rubber Co. has purchased the plant of the Lily Rubber Co. at Barberton, comprising 4 1/2 acres of ground. For the present, the buildings now on the property will be used, but a new, modern tire factory will be erected in the near future on this site.

* * *

The Goodyear Tire & Rubber Co. recently presented to the Ohio National Guard, through Battery B, largely composed of Goodyear employees, a fully equipped military "kite" balloon, made under the direction of Sergeant R. H. Upson, the Goodyear aeronautical expert.

The kite balloon is a type of balloon developed by foreign governments for use in making military observations. It takes its name from the manner of rigging, which is similar to a

boy's kite, being held at an angle from horizontal so that the wind helps to hold it steadily in suspension. Experiments at the Goodyear Tire & Rubber Co. factory have developed a balloon which it is claimed can be operated in any weather conditions, and will not pitch, roll nor yaw even in a stiff gale. The new balloon is 81 feet long and 22 feet in its largest diameter. Hydrogen gas is used for inflating. The method of rigging is readily shown in the picture, taken during the test

last month which was conducted under the observation of representatives from two foreign governments, and one each from the United States Army and Navy, and pronounced satisfactory.

The use of an automobile for holding the balloon was a novel proceeding. The "kite string" was a wire cable. This was passed over a drum, and power was transmitted to the drum from the driving wheel of the automobile, thus allowing the balloon to be raised or lowered as desired, an experiment found to be fully successful.

It is claimed that in 1907 the Goodyear Tire & Rubber Co. made 28,685 tires; that this year it will make more than 3,000,000, and that in 1917 the output of Goodyear tires will exceed 5,000,000.

To make a larger area available as a site for the Goodyear company's new mechanical goods and chemical plants, a new channel is being excavated for the Little Cuyahoga River, incidentally shortening its course.

The third smoke-stack of the Goodyear company, which was recently completed, is the highest in the State, and required 1,585 tons of brick in its construction. It is 21 feet 6 inches in diameter at the top, which is 250 feet above floor level. On June 22, the Goodyear company set a new record in tire production by turning out in 24 hours 28,499 tires.

A delegation of the American Association of Chemical Engineers recently were shown through the factory of The B. F. Goodrich Co., and subsequently entertained at luncheon at the Portage Country Club, Akron, Ohio.

Garth A. Dodge, one of the well-known rubber engineers of Akron, and a member of the American Society of Automobile Engineers, has recently accepted the position of factory manager and mechanical engineer with The Dayton Rubber Manufacturing Co., Dayton, Ohio.

A. J. Bethea, a chemist of experience schooled in the Akron plants, has also joined the staff of the Dayton company.

* * *

Among the recent visitors to Akron well known in rubber and allied lines were: William D. Anderson, Bibb Manufacturing Co., Macon, Georgia; R. P. M. Eagles, Taylor Armitage & Co., New York City; F. H. Peaty, H. A. Astlett & Co., New York City; Merton A. Turner, Monaquot Rubber Works Co., South Braintree, Massachusetts, and Thomas Midgley, The Interlock Core Co., Columbus, Ohio.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

REGARDING the rubber trade generally, I find no one complaining very greatly of dull times. To be sure, some lines are in more demand than others, but all are having a pretty fair call. Manufacturers of automobile tires report a better call than last month, and this is but natural, for as the season proceeds more machines are going into use, and those already in use are wearing out tires, thus there is both a manufacturer's and a consumer's demand. This has been a record season in rubber footwear and the demand for tennis goods has been wonderfully expanded. Just now jobbers are sending in additional and duplicate orders for rubber footwear, the time limit for the extra discount allowed by some companies expiring July 1. In mechanicals the call continues to increase for belting, this because of the continued high price of leather. But this is to some extent balanced by the small demand on the manufacturers for garden hose, owing in great measure to the backward spring and the large amount of rain which has fallen during the last two months. The rubber clothing business, in the retail trade, at least, has been exceptionally good, owing to the aforesaid rainy weather. Manufacturers have more orders for waterproofed garments than they have ever had at this time, and some are making preparations to increase their output. Taken altogether, the rubber trade in this section is in a most satisfactory condition.

* * *

Like all other sections of the country, the Massachusetts militia responded quickly to the call of the President and at this writing are already on their way to the Texas border. And here, in the emergency, the Forsyth Dental Infirmary for Children offered its services to treat free the dental needs of those who were going into military service. The infirmary, which was intended for free service for children only, was enabled in the short time between the call to arms and the departure of the troops, to give several hundred treatments, the 65 chairs being continuously occupied during Saturday and Sunday, June 24 and 25, and even a portion of Monday, the day when the companies departed for the South. Here is another example of the public benefaction of the president of the Boston Belting Co., and as a side thought, a tribute to his ingenuity, for it was through his insistence, and his own suggestions and designs, that the chairs in the infirmary, though made primarily to accommodate children, were so adjustable that they could be used, while being treated, by the troopers of all dimensions and weights. Adjutant-General Cole and Mayor Curley have both sent their thanks to Thomas A. Forsyth and Superintendent Dr. W. H. D. Cross for this timely assistance. And it might be added that Dr. George A. Sullivan, of the Carney Hospital Clinic, and 20 dental assistants went immediately to Camp Whitney to do similar work for other soldiers there.

* * *

The Pennsylvania Rubber Co.'s Boston store has been moved from Boylston street to the new Lewis building at 683 Beacon street. This move is an important one, as it brings the company's headquarters right into the heart of Boston's automobile district, which will undoubtedly redound to the material benefit of the sale of the Pennsylvania company's well-known tires.

The Davidson Rubber Co. has recently sold to the De Vilbiss Manufacturing Co., Toledo, Ohio, a portion of its hard rubber equipment, and it was reported that the Davidson company was about to retire from hard rubber manufacture and use the space formerly devoted to this branch for the development of soft rubber specialties. I am in a position to contradict this story. The only equipment which the Davidson company has sold is that pertaining to the manufacture of hard rubber parts for atomizers. Aside from that, the Davidson company's hard rubber department will continue as usual.

* * *

Mention was made in my letter last month of the completion of new buildings of the Boston Woven Hose & Rubber Co., and I am sending you a photograph of one of the new buildings in order to show their character and stability. This is the smaller of the recently added buildings, measuring 155 by 60 feet. Like

the others, it is of reinforced concrete construction. This structure will be used mainly for storage purposes, although one floor will be devoted to the comfort and convenience of the employees during their noon hour, tables being provided for those who bring their lunch, while a lunch counter will be established where food will be furnished practically at cost. There will be facilities also for entertainment, thus adding to the welfare work already established by the company. A similar building just completed is used for a machine shop, the manufacture of garden hose, and for storage. This is also 60 feet wide and more than 200 feet long, and is provided with a traveling crane in the center bay which extends the full length of the building. The company has just broken ground for another building, 165 by 60 feet, four stories, also of this same solid concrete construction, which building will be used to extend the manufacture of friction tape, rubberized fabrics, etc.

* * *

The strike at the Revere Rubber Co. factory at Chelsea has now lasted a month, with prospects of a long continuance. The strikers demand a nine-hour day and 50 hours a week for men, and a 48-hour week for women, as well as an increase on piece-work basis. At a conference between the strike committee and Superintendent Scribner on the 19th of June no agreement was reached. In an interview, Mr. Scribner said he has only the kindest feeling for the men, that he regrets the continuance of the strike, but sees no prospect of an early settlement.

* * *

The Standard Woven Fabric Co., manufacturer of "Multi-bestos" products and rubber specialties, is installing new equipment and making important changes in the plant at Walpole which it recently purchased. This will give the company a much needed addition to its present facilities for the manufacture of clutch linings which is now being carried on at the plant at Framingham. The business of this company has been so important and so pressing as to necessitate working upon a day and night schedule, but it is hoped that as soon as enough

machinery is installed at Walpole, it will be possible to discontinue production at Framingham, and to move the whole equipment from there to the newly acquired property at Walpole. In this connection the company will develop a business in friction and insulating tapes for the electrical trade, the Walpole property being particularly adapted for this line of manufacture. The company has closed a contract to manufacture rubber heels for the Panther Rubber Co., Stoughton. It is reported that the contract calls for a maximum output of 100 gross per day, and the company has already started on this work.

* * *

Everett Morss, president of the Simplex Wire & Cable Co., of this city, which has had a successful profit-sharing plan in operation for 15 years, is scheduled to speak at the Third Annual Babson Conference on Cooperation at Wellesley Hills, Massachusetts, in September. Vice-Chairman Edward N. Hurley, of the Federal Trade Commission, has also accepted an invitation to speak, and others who are interested in profit-sharing are expected. Mr. Morss's address last year excited keen interest on account of the simplicity and directness of his ideas on profit-sharing.

* * *

The F. S. Carr Co., of this city, has removed its Canadian factory from Tilbury, Ontario, to Granby, Quebec, where it has bought the premises formerly occupied by the Walpole Rubber Co. This is a five-story brick main factory and a brick cement mixing building, and is in every respect an up-to-date establishment. The Carr company will manufacture a line of rubber heels and shoe factory supplies, automobile fabrics, rubber sheetings and hospital supplies. This, of course, is an auxiliary factory for supplying Canadian trade. No change will be made in the Framingham, Massachusetts, plant. The Canadian factory is in charge of P. G. Dunham, who went to Granby seven years ago, and organized and managed the Walpole company's factory there, and later assumed the supervision of the Walpole, Massachusetts, plant, resigning two years ago to take charge of the Carr company's Canadian business.

* * *

The new mill of the American Tire Fabric Co.'s plant in Newburyport is now nearly completed and equipment is soon to be installed. It is a brick structure, 186 feet long and from 20 to 64 feet wide. This concern is a successor to the American Textile Co. It is expected to give employment to about 80 hands at the start.

* * *

At the National Shoe and Leather Market-Fair, which is to be held in this city the week of July 12 to 19, the following manufacturers will exhibit: Panther Rubber Co., Essex Rubber Co., Federal Rubber Co., The B. F. Goodrich Co., Avon Sole Co., Revere Rubber Co., Goodyear Tire & Rubber Co. All of these are manufacturers of rubber soles and heels, but only one manufactures boots and shoes. This might seem strange at first thought, but practically the season's business in rubber footwear has already been placed and this may be the reason why none of the other rubber boot and shoe manufacturers have thought it expedient to make exhibits.

* * *

Hudson, Massachusetts, holds its fiftieth anniversary of incorporation as a town the second, third and fourth of this month and there will be a general celebration appropriate to the Fourth of July, and also an industrial exhibit at the Armory, of goods manufactured in Hudson. The Apsley Rubber Co. will show a full line of all its different styles of goods, and will have in operation machinery for manufacturing. Operatives will show the making of boots and shoes and rubber clothing. Hudson was named for the only member of Congress elected from that place previous to its date of incorporation and the only other member of Congress from that town is the Hon L. D. Apsley, who will deliver an address on this occasion.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE several rubber manufacturing plants throughout Rhode Island continue to be rushed with work, practically all lines being pushed to capacity. Notwithstanding the long period of unprecedented activity every indication, according to those in close touch with affairs in general, is that this condition may be expected to continue for many months, at least. One of the gravest problems confronting the various plants is the shortage of help, although all of the concerns are paying a higher wage scale than ever before in order to secure workers. Orders for immediate delivery are plentiful, with additional requisitions for future shipment being received daily.

The wire-insulating department of the National India Rubber Co., Bristol, resumed operations May 31 after a shutdown from the 27th for the purpose of taking an inventory.

The work of enlarging the vulcanizing department at the plant of the National company is rapidly nearing completion. With the completion of the new buildings at the west end of the company's plant, the National will have one of the largest and most thoroughly equipped vulcanizing departments in the country.

The election of George Schlosser as vice-president of the National India Rubber Co., and his taking charge of the Woonsocket and Millville plants, has necessitated numerous changes and promotions in the executive staffs of these plants, in order that Mr. Schlosser may have more time for his managerial responsibilities. Among these changes is the promotion of Superintendent Henry C. Wagner to the position of factory manager of the plants at Woonsocket and Millville. Herman Fahrenholz, who has had general oversight of the manufacturing end of the Alice mill at Woonsocket, has been made superintendent and William H. Schlosser, who has been in charge of the Alice mill calendaring room, has been made assistant superintendent. Waldo E. Kelly, who has been chief clerk and purchasing agent at the Alice mill, has been appointed secretary to the manager.

James W. Franklin has been appointed superintendent of the footwear department, and Frederick L. Dunbar, superintendent of the wire insulating department. Both were assistant superintendents. Edward L. Cooper, who has been connected with the plant for several years, has been appointed overseer of the packing division of the shoe department.

A gold watch and chain were presented to Cornelius J. Gallagher on June 17 by the employes of the packing department of the National India Rubber Co., of which he had been in charge for several years. The presentation was made by Superintendent James W. Franklin. Mr. Gallagher severed his connection with the company that afternoon to take up another line of business.

Colonel Samuel P. Colt, president of the United States Rubber Co., with nearly a score of guests, left on the morning of June 3 for his camp in Maine, where they remained for a fortnight. This camp is located on a chain of lakes at the base of Mount Katahdin, about 35 miles up the Penobscot river from Norcross, Maine, and the trip from Norcross is made in canoes. Trout, bass and other fish abound in these lakes and furnished the party excellent sport during their stay.

The Colonel's guests were Nathaniel Myers, Walter S. Ballou, Mrs. Imogene S. Waldron, Colonel and Mrs. Harold J. Gross, Mrs. Florence Beresford, Rev. George L. Locke, D. D., Countess Eleanor Moroni, E. A. Barrows, Mr. and Mrs. Wallis E. Howe, United States Senator LeBaron B.

Colt, Dr. Calvin S. May, S. X. Constantinidi and Ernest Hopkinson.

The joint standing committee of the fire department of the Woonsocket city council has awarded a contract for 1,000 feet of hose to the Gutta Percha & Rubber Manufacturing Co., of Boston. There were eleven firms that submitted bids.

The Board of Aldermen of Newport has awarded contracts for 2½-inch fire hose to J. T. O'Connell (Bay State Rubber Co.) and K. Postel (The B. F. Goodrich Co.) for 500 feet each, at 80 cents.

The Phillips Insulated Wire Co., of Pawtucket, has been authorized to increase its capital stock from time to time by vote of the directors to an amount not exceeding \$2,500,000. All shares are to be common of \$100 par value.

Large shipments by both freight and express have been made almost daily during the past few weeks from the Millville plant of the Woonsocket Rubber Co. Extensive improvements are in course of construction, a new concrete driveway of considerable proportions having recently been completed.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

THE Trenton Chamber of Commerce is planning for a permanent exhibit of goods made in Trenton factories. If the plan is carried out there will be considerable space devoted to the products of rubber mills. The plan of the organization is to acquire a building in a central part of the city for meeting quarters, with space for the exhibit on the ground floor.

The Empire Rubber Manufacturing Co. is erecting a \$2,000 addition to its plant.

General C. Edward Murray, of the Empire company, has been publicly complimented by Governor Fielder for his prompt and efficient work as Quartermaster General when the recent call was received for the mobilization of the New Jersey National Guard. General Murray had planned to leave Trenton shortly with his family for an extended cruise on his yacht, to various places of interest on the great lakes.

The Thermoid Rubber Co. has given out a contract for an addition to the plant to cost \$18,000. It is to be two stories high and absolutely fire proof and will be used as a vulcanizing department.

The Three Star Tire Co. is to have spacious salesrooms in a new garage to be erected on North Montgomery street.

Richard Barlow, proprietor of Barlow's Hotel, in this city and a member of the De Lion Tire and Rubber Co., died recently at the home of his daughter in Ohio. Mr. Barlow, who lived in Ohio before settling in Trenton, was buried in that state.

According to printed reports the American Tire Sales Co. of Washington, D. C., planned to take over the plant of the Mecca Tire Co. on June 15. This report could not be verified in Trenton as none of the interested parties live here. THE INDIA RUBBER WORLD correspondent visited the plant after the date mentioned, but there was no sign of activity about the place. It is said the office furniture of the Mecca company has been removed, as well as some of the stock.

KEEPING EMPLOYEES CONTENTED.

By Ernest A. Dench.

IT is difficult to keep employees who work in outlying districts thoroughly contented, for the call of the city is strong. It is possible, however, to curb this desire somewhat by entertaining the workers with motion pictures, a method that the Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut, has found highly satisfactory. The theater is the only one in the village, has seating accommodation for 400, and standing room for an additional hundred. Only the men and women employed at the plant and their families are admitted. The building, constructed of stucco, is equipped with two projection machines, in order to present feature productions without an intermission at the end of every reel.

Photoplays are the same, whether shown at the most pretentious theater in New York or at the smallest hamlet. There is no such thing as a Number One Company, the only difference being that some of those presented may not be in perfect condition, though still capable of giving satisfaction.

The first thing needed for a moving-picture show is an adaptable building. In the early days of the film industry the exhibitor usually did business in a converted store. Since that time the authorities have become far more strict and the public much more fastidious, consequently the modern exhibitor has had to erect a pretentious building in its stead. As a result makeshifts are not so general.

But the position of an operator in a manufacturing plant is entirely different from that of a proprietor of a picture house in the city. The employees will not protest, because they do not view photoplays under such perfect conditions as prevail in the towns and cities.

In selecting an existing building on the plant which can be remodeled into a passable photoplay theater, the following points should be borne in mind: The room should be lofty, well-ventilated and large enough to accommodate all the employees and their families. It should also be free of obstructions in the way of pillars and other supports, and should, moreover, be situated on the ground floor.

If the building is constructed of wood, this does not make it wholly unsuitable; but to make it safe, plastered metal laths or wire mesh should cover the walls and ceilings.

There should be at least four exits, which must open outward. It is advisable to divide the rows of seats into sections so as to provide for an aisle on each side, not less than three feet wide.

Chairs or benches should be fastened to the floor because if a fire occurs the seats will be overturned and will interfere with the orderly egress of the crowd. It is customary in the design of such buildings to allow each spectator four and a half square feet of floor space.

The projection machine will cost from \$250 to \$300, according to make selected. The best standard makes include: The Simplex, which has many pleasing features in its construction, simplicity and safety being its outstanding points. The price is \$300. The Motiograph is also popular, owing to its durability and guarantee given by its manufacturers. The Edison Kinetoscope may be recommended because it is easy to manipulate with little experience and stands hard wear. There are two models, one priced at \$155 and the other at \$250. The Edengraph excels in that it produces perfect projection when operated by an experienced operator, and possesses several improvements not contained in other machines. The selling price is \$250. The distinguishing feature about the Cameragraph No. 6a is that a special device lessens the danger from fire. This costs \$250.

The authorities insist that the projection machine be enclosed in a fireproof booth, so that if there is an outbreak of fire, it cannot spread beyond. Here an expense of \$65 is involved, but it is worth it in the interests of safety. The booth, made of galvanized iron, is shipped in sections which are easily put

together by means of bolts and nuts provided for that purpose.

In the days gone by a bed sheet or a table cloth has been used as a screen, but science has come to the rescue, and now there are screens and screens. To obtain the best results it will be necessary to pay about \$1.50 per square foot for the materials used for that purpose.

The light by which to throw the pictures on the screen is usually obtained from an electric power plant. Failing this, a calcium gas-making outfit can be secured for \$35; the gas can be manufactured at five minutes' notice and gives a 700-candle-power light.

In selecting suitable lens for the projection machine, the size of room, make of projection machine, the length and height of screen and distance from the booth must be taken into consideration. It is false economy to purchase a cheap lens, and the

MOTION PICTURE THEATER BUILT BY THE BEACON FALLS RUBBER SHOE CO.

foregoing particulars should be furnished to the supply firm at the time of ordering.

Carbons are needed to run the projector. A case containing 1,000 costs from \$17 to \$45, according to market conditions.

A reliable operator will also be required. To obtain the services of one on full time will cost from \$20 to \$30 per week, but as he will only be on the job in the evenings, and then perhaps not every night in the week, it might be possible to arrange with someone on the staff, who has a practical knowledge of electricity, to undertake the work, and who would be paid, of course, for the additional time occupied by the work.

The operator will need a tool outfit, which should include cement for mending broken films, a file for sharpening carbons, lugs, reels and machine oil.

The average feature, at first, commands from \$50 to \$100 per day, but the price eventually drops to \$10. But this type of production provides a whole evening's entertainment. As four single reels may be rented for \$1.50 and upward, one is apt to decide in favor of the latter. It will be best to give both forms of entertainment a fair trial in order to determine which gives the most satisfaction.

The reels are rented from the nearest film exchange. It is customary to contract for a service and pay a week in advance. After this, the weekly requirements can be mailed, telephoned or telegraphed to the branch house and the films are despatched as required.

This plan of providing modern entertainment for employees is being considered by other prominent rubber manufacturing concerns in connection with their welfare work already under way.

METHODS OF TESTING COTTON FABRICS AND RUBBER PRODUCTS.

COMMITTEE D-13 of the American Society for Testing Materials presented tentative methods of tests for consideration at the annual meeting held at Atlantic City, New Jersey, June 27-30.

TESTING COTTON FABRICS.

The tentative tests for automobile tire fabrics submitted last year by the committee have been amended and continued as "Tentative General Methods for Testing Cotton Fabrics."

The new features included are:

1. Definition of "Dry Condition" and "Standard Condition" with respect to moisture.
2. Method of determining the thickness of the fabric.
3. Two alternate methods, designated as "grip" and "grab," for determination of tensile strength.

DEFINITION OF MOISTURE.

DRY CONDITION. The dry condition of cotton material shall be understood to be absolute dryness obtained by material placed in a ventilated drying oven maintained at a temperature of 221 to 230 degrees F., and dried to constant weight as determined by two consecutive weighings not less than ten minutes apart, and showing a further loss of not more than 0.1 per cent of the previous weighing.

STANDARD CONDITION. The standard condition of cotton material shall be understood to be the condition in which it contains 8.5 per cent of its dry weight of moisture.

THICKNESS OF FABRIC.

The thickness shall be measured by an automatic spring micrometer which presses upon at least 0.5 square inch of the fabric with a uniform constant pressure, and which is so mounted as to make measurements 6 inches from the selvage.

At least 10 measurements at different portions of the roll or piece shall be made, and the average shall be the thickness of the fabric.

TENSILE STRENGTH TESTS.

STRIP METHOD OF TEST. The test pieces of fabric are taken as shown in THE INDIA RUBBER WORLD (August, 1915, page 612), and are ravelled to the specified threads per inch.

GRIP METHOD OF TEST. The test specimens shall be taken as follows: Starting at a line in the center, warpside, lay off

adjacent to this line five specimens on one side, parallel to the line (warp) and five specimens on the other side perpendicular to the line (filling). The test specimens shall be cut 5 inches long by 2 inches wide. The specimens are not reduced in width by raveling, but are broken in a clamp that grips 1 inch width.

Where material requires special treatment, the committee intends to prescribe specific methods and tests which will be given precedence over the general methods. Two such tests have been prepared, one for automobile tire fabrics and the other for hose and belting duck.

AUTOMOBILE TIRE FABRICS.

The count per inch is determined by aid of the count scale

shown in THE INDIA RUBBER WORLD (August, 1915, page 612), and the strength determined by the "Strip Method" in the "Dry Condition" mentioned above.

FABRICS FOR HOSE AND BELTING.

The use of the "General Tentative Methods" is required, with the special requirement that the strength shall be determined by the "Grab Method," and the specimens, when tested, shall be at standard condition as defined above.

RUBBER EXPANSION MOLD IN METAL SHAPING.

The elasticity of rubber is utilized in shaping sheet metal objects in the die press. The operation of drawing or forming is a simple matter where the shape of the piece is such that it will clear the dies, and may be readily removed after

forming. Many styles of brass bed ornaments, alarm clock and cheap watch cases, parts of gas and electric fixtures, however, are of such shape that the opening is smaller than the main diameter of the piece. Such articles are first drawn in the form of a shell, and then shaped by an expanding portion, made of rubber. Such an operation is here illustrated. Figure 1 shows a shell of metal. Figure 2 shows the same shell, after being expanded in the dies shown in Figure 3.

The shell is placed in the die surrounding the upper plunger a, the rubber washer b, and the upper part of the lower plunger c. The punch, or upper die d is then brought down by the action of the press. The lower plunger c descends against the pressure of the two coiled springs until it strikes the bed plate and can go no further. As the descent of the punch d continues beyond this point, the plunger a is forced down against the rubber cushion b. This action causes the cushion to expand laterally, thus forcing the shell to fill the annular space formed when the punch d has descended to e.

Upon the rising of the punch the coiled springs and rubber washer resume their original form, and the finished piece, Figure 2, is removed.

The rubber for this work must be of a quality which will stand a very considerable distortion without breaking, but sufficiently tough so as not to wear out too rapidly.

BRAKE LINING CUTTER.

This is a small, compact, hand-operated machine of great strength, constructed to accurately cut brake linings with ease and despatch. The eccentric device that operates the shear blade requires very little effort to cut $\frac{3}{4}$ x 3 inch lining with one stroke of the lever.

The machine is compact, weighing only 17 pounds. The measurements are: Length of blades, $3\frac{1}{2}$ inches; length of bed, $10\frac{1}{2}$ inches; height of bed, $6\frac{1}{2}$ inches; length over all, including lever, 18 inches. It is intended to be attached to a bench or convenient table. [The Peck Stow & Wilcox Co., Cleveland, Ohio.]

THE UNIVERSALITY OF THE RUBBER HEEL.

THE nerve-relieving quality of the jarless rubber heel has received world-wide recognition; and in frugal countries, where economy is a prime consideration, the demand for rubber heels on that score has constantly increased. It is safe to say that rubber heels of one variety or another are worn today in practically every civilized country, one style being particularly popular in one quarter of the globe and another, perhaps totally different, being preferred somewhere else. For instance, in the United States there are comparatively few revolving rubber heels worn. While the rubber heel in this country has long enjoyed a considerable vogue, it is almost invariably the solid rubber heel having practically the same shape as the leather heel it displaces and being quite as immovable. But in many other countries the revolving heel that permits the wearer, by changing the position of the heel from time to time, to get the maximum amount of service, is held in high esteem. The following brief review of the trade and varying tastes in rubber heels, in certain selected districts, may be of interest.

In England, according to reports, the solid heel is very little worn, and the revolving heel has also lost favor. But quarter tips, which are applied to that part of the heel that first strikes the ground in walking, are very generally affected.

In France, high-quality heels are most in demand, the circular heel, turning freely, being the only kind used. In Havre there is an extensive trade in these heels. A practical two-part heel has been put on the market, having a section attached immovably to the heel of the shoe, and a circle of rubber fitting into it and turning freely, both being of the same material.

In the principal cities of Bohemia—Prague, Pilsen and Budweis—the use of rubber heels has become general, and it is reported that in other towns and villages in Austria the demand for them is growing. Low-quality heels of reclaimed rubber, although stiffer and less elastic than those made of new rubber, are in greater demand because of the difference in price. Almost all the rubber heels used in this country are manufactured in Vienna. Of course, the continuance of war and the increasing scarcity of rubber greatly lessens the present use of rubber heels of any variety throughout Austria and Germany.

The two styles of rubber heels most popular in Spain are of German and American make. The American heels—bought from a leather house in Madrid—are the best wearing on the market, yet it is said that before the outbreak of the war their sale was exceeded twice over by those of the Germans. In Almeria round rubber heels are worn extensively. They are fastened with a single screw and may be revolved when one point is worn. The stock is drawn mainly from Barcelona through agents in that city of German and British manufacturers, and the selling price is nearly double the purchase price.

In Basel, Switzerland, the rubber heel is popular, especially with the middle classes, who conserve the life of the shoes by heavy leather soles, and heels reinforced with rubber. The heel-shaped rubbers with leather inlay are the most used, the heel being fastened on by wooden pegs driven through the leather inlay. They also use the rubber-edge, covering only the portion of the heel most exposed to wear, and the round, metal-cross-center rubber heel.

In the larger cities of the Union of South Africa rubber heels are worn by a majority of the population, the round and square heels having the greatest sale in the district of Johannesburg. Buying through local agencies is preferred, and the establishment of American agencies in this district is recommended by the local consul.

In the island of Jamaica it is estimated that about one-tenth of the population wear rubber heels. The round heels and those shaped to fit the latest style shoes are most in demand. Buying is done direct from the manufacturers or through New York commission houses.

An importer in Rosario, Argentina, who has handled a variety of heels, now imports almost exclusively a high-grade American make which he sells to retailers at \$3.82 per dozen pairs.

A SPANISH RUBBER-SOLED SHOE.

The fame of THE INDIA RUBBER WORLD is exemplified when a shoe manufacturer in Spain, and 30 miles from a railroad, sends here a sample of his work for examination. Armando Fernandez has had excellent results with a rubber sole, claimed to be made entirely from reclaimed rubber from automobile tires, and this sole is so firmly attached to the leather upper that even on the cobblestone pavements of Cordova it has shown no signs of separation until worn out. The maker claims it will wear three times as long as a leather sole. His method of fastening to the welt is by the usual machine or hand sewing, the first layer of rubber being less than one-eighth of an inch in thickness, and to this is cemented a second layer which covers the stitches. The heel is built up of lifts, the outer layer of the sole continuing along the shank, down the breast of the heel and folding over to form the top lift. The sole and heel are deeply scored by diagonal lines forming diamond studs. It is said that the French Government has found these so durable that after a trial, an order was given for 700,000 pairs through the Parisian agent, Ricardo Vazquez. Certainly this Spanish inventor has produced a wonderfully fine piece of rubber if, as he claims, it is made from automobile casings, though from its red color it may have been made entirely from inner tubes; and his method of attaching seems to have some points which might be worthy of emulation by American manufacturers.

AN INTERVAL TIMER.

Small rubber articles, such as rubber heels—usually called mechanical rubber goods—are made in metal molds, and subsequently cured in a steam-heated press vulcanizer for a certain period of time. The old way was to chalk down on some post or convenient surface of the press, the time to take the molds out of the vulcanizer. The inevitable results were the loss of considerable time through the necessity of constantly watching the clock and the production of overcured goods caused by negligence on the part of the forgetful operator.

The Acme Interval Timer is a specially constructed clock, operated by electricity, and would appear to be almost infallible. It is extremely easy to operate as the following directions indicate: Note the position of the dial hand when the mold is put in the press, or if more convenient turn the hand forward to the zero position shown in the illustration. Press the button opposite the numerals representing the number of minutes desired for the cure. When the time has expired the bell will ring—then pull the button out as far as it will go. Thus any number of cures, up to thirty, can be taken care of at the same time. [Acme Supply Co., Ionia, Michigan.]

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

WITH the passing of the Compulsory Service Bill for married men the question of labor in rubber works has now reached an acute stage and many small manufacturers are at their wits' end how to carry on. Unlike banks and business houses, generally, rubber works have long been accustomed to employ female labor for tasks for which it has been found adequate and suitable, and the managers know better to what extent it is possible or advisable to replace men to a greater extent by women, than do the official compilers of a detailed list of occupations in which further substitution is recommended. For instance, it is difficult to find any approval in the trade for the proposal that women might be substituted for men on heavy machinery such as washers, mixers and calenders, and it will more likely result, in the case of small works, where the mixers have gone, that their work will be abandoned for the time being. Certain relaxations of the Factory Acts, especially with regard to the employment of women, have been officially granted and, in fact, every encouragement is being given to manufacturers to get along as best they can under the altered conditions. Of course there is no shortage of materials, and consequently no need to turn out special war qualities of goods such as are pathetically referred to by the correspondent of THE INDIA RUBBER WORLD in another country. At the same time one often hears of goods, especially certain lines of proofings, being accepted by buyers, though they have imperfections which would have caused their rejection in other days. Nowadays, the buyer has often to eat humble pie to get the goods he wants and he cannot afford to be too particular or to stand too much on his dignity.

THE TIRE IMPORT DECISION.

The decision of the government not to stop the import of foreign tires has led to a good deal of feeling in quarters where a ban on the import of American tires had been confidently anticipated. The difficulties in the way of interfering with the American business under certain agreements now in operation between the two countries had not been appreciated, and though the position is accepted philosophically, there is a strong disposition to grumble, and further endeavors, it is understood, will be made by some of those directly interested, to see if the government decision cannot be altered. The latest restrictions regarding the use of petrol for motoring, whereby the pleasure car is to be penalized, will, of course, have an adverse effect upon the tire trade and should automatically lead to a reduction in imports.

WOOLWORTH BUYING ENGLISH RUBBER GOODS.

Some of the smaller rubber works which are not engaged on government work are busy turning out goods which larger firms have no time to attend to. For instance, large orders for rubber sundries have been received from America, which I understand went to Germany in pre-war times. In this connection the name of the large American firm, F. W. Woolworth & Co., is mentioned. This firm, which deals in a large variety of goods sold at low prices, has, I understand, 300 shops in America and possesses a building 50 stories in height.

WILL CONSIDER THE GARMENT WORKERS' STRIKE.

The recent formation of a waterproof section of the India Rubber Manufacturers' Association is interesting and is another instance of the advance in activity of the association since the present chairman, Mr. Goudie, took office. The new section has an important matter in hand in the dispute as to wages in the waterproof garment trade in Lancashire, no settlement having yet been reached.

RAW RUBBER.

The position remains more satisfactory to the manufacturer than the producer, the demand for spot rubber being quiet, showing a tendency to await future developments. At the same time, holders of stocks are in no hurry to sell, believing that the big consumers cannot hold off the market much longer. The expected depletion of British stocks has not come about, mainly on account of the smaller exports to the United States, due to greater difficulties in obtaining export licenses.

THE SYNTHETIC BOGEY.

From authentic accounts to hand, it seems to be a fact that the German shortage of raw rubber for tires has been overcome by the use of synthetic rubber, which has given satisfaction in the war zone. This, though interesting, does not, of course, affect the view generally held that there is extremely little likelihood of synthetic rubber competing with natural rubber in normal times. Nowadays, when certain materials are wanted for war purposes, the price is a very secondary consideration and it is quite probable that at the present price of raw rubber in Germany the synthetic product can compete successfully. Famine prices for certain goods, especially chemicals, are being paid in most of the belligerent countries at the present time and no outcry comes from the sellers thereof, whatever the buyers may have to say on the matter.

NORTH BRITISH RUBBER CO., LIMITED.

The May meeting of the Edinburgh and East of Scotland Section of the Society of Chemical Industry was held in the new laboratory of the North British Rubber Co., Limited, Castle Mills, Professor Walker presiding.

W. A. Williams extended to the society and the visitors a hearty welcome on behalf of the management of the company and expressed the hope that the meeting would be the forerunner of many others in the district and that manufacturers would come forward and show the society what they were doing in scientific and, particularly, chemical work. He apologized for the absence of the company's general manager, Mr. Johnstone, and for the fact that on account of the depletion of the laboratory staff by about 50 per cent through the war, there was not so much to show them as if the times were normal. Professor Walker, in reply, said it was excessively kind of the North British Rubber Co. to let them have this opportunity of seeing its laboratories. It was just at a time like this when the war had made their minds more open than usual that these privileges were most useful and most appreciated. He had always felt from the academical point of view that those who taught in universities had far too little experience in seeing how matters were conducted on a technical and commercial scale, and it was quite certain that if we were to hold our own in the industrial competition which was sure to follow the war, not only with Germany but with other nations, we must more and more have the combination of technical with academic chemistry. The academic chemists must have their minds directed towards the technical openings of the theories and researches which they put before the students and, on the other side, the technical students must be ready to welcome the latest results of research. A paper on the "Raw Material Used by the Rubber Manufacturer" was read by B. D. Porritt and one on "Some Aspects of Synthetic Rubber" by B. D. W. Luff.

EXPORTATION OF TALC PROHIBITED.

The government has added talc to the list of articles the exportation of which is prohibited to all foreign countries in

Europe and on the Mediterranean and Black Seas other than France, Italy, Russia, Spain, and Portugal.

PERSONAL MENTION.

Arthur Mallaby, who, in conjunction with Mr. Bentley, started the Bradford Rubber Co., Shearbridge, Bradford, Yorks, two years ago, reports business as brisk in articles such as rubber tea pot spouts, door stops, gas tubing and molded and cut push-on gas connections.

The Enfield Cable Manufacturing Co., at Brimsdown, Enfield, Middlesex, is now in full swing under the management of Mr. Cowup.

The Birthday Honor list contains the name of Arthur Philip Du Cros, who has been made a baronet. Sir Arthur Du Cros, M. P., for Hastings, is the managing director of the Dunlop Rubber Co. Besides holding a post at the Ministry of Munitions, he has taken an active part in the provision of motor ambulances for the war.

Another name on the list is F. W. Whitby-Thomson, who has received a knighthood. He is connected with the English Card-clothing Manufacturers' Association.

Dr. W. A. Caspari, Ph.D., has received the degree of Doctor of Science from the Victoria University, Manchester.

In case any confusion should arise, I may mention that the Premier Waterproof & Rubber Co., of Bromley street, Manchester, is quite distinct from the Premier Rubber Works, of Bent street, Chatham, Manchester. This works is owned by W. S. Rothband & Co., patentees and manufacturers of india rubber and vulcanite surgical appliances.

The waterproofing works of both Ferguson, Shiers & Co., Limited, and A. O. Ferguson & Co., near Manchester, have had outbreaks of fire, but without seriously interfering with the businesses.

The will of the late J. E. Baxter was proved for £10,379 and that of the late W. M. Henderson for £27,257.

OTHER BRITISH NOTES.

A TIMELY AND INGENIOUS ADVERTISEMENT.

A clever advertisement, especially timely, was that of the Republic Rubber Co., Limited, London, which appeared in the "Observer" and "Sunday Times," the day when the daylight saving bill went into effect. It read: "As clear as DAY-LIGHT is the SAVING you effect by fitting Republic Tires." A clock face was shown, as here reproduced, and subheads in the advertisement read:

"On the one hand you have service," "On the other hand you have durability." These, of course, have direct connection with the illustration of the clock, which is a splendid example of connective advertising, that everyone is striving to attain.

The idea and its working out was by Ernest A. Gleich, managing director of the London "Republic" organization, who believes in striking while the iron is hot, especially in getting out novel automobile advertising.

LETTERS OF THANKS TO THE RUBBER GROWERS' ASSOCIATION.

Our friends of the Rubber Growers' Association, London, have been kind enough to forward us a copy of a circular which Secretary Frank G. Smith recently sent to the members, calling attention to the great value of the 4,500 pairs of rubber boots, donated by them, to the men in the trenches. A perusal of this circular gives an idea of the appreciation of the wearers; containing, as it does, extracts from a score of letters chosen from the many received from officers and men of the various units of

the British army in the fighting lines, telling how the men have been made comfortable and saved from cold and pneumonia, and possible death, by these boots, so generously donated. This circular, which is sent only to the members of the Rubber Growers' Association, states that if the war should extend through another winter, there is no doubt that further supplies, in greater number, will be despatched.

TYPKE & KING'S NEW ADDRESS.

Typke & King, Limited, chemical manufacturers, London, England, with a view of centralizing their business, have removed their offices to their manufacturing plant, and their address is now "Crown Chemical Works, Mitcham Common, Surrey, England." Thus all their business is consolidated, though they still retain a buying office at the old 16 Mincing Lane address. It is their desire that all communications shall be directed to Mitcham. Their cable address is now "Valerianic, Mitcham."

THE GOODRICH COMPANY'S LONDON TIRE DEPOT.

The B. F. Goodrich Co., Limited, London, England, is now maintaining a tire-fitting depot, furnished with a thorough equipment for dealing efficiently with all kinds of truck tire repairs and renewals. It is stated that nearly 14,000 tires are carried in

stock, in both millimeter and inch sizes. The latter are of increasing importance in view of their general use on American chassis. A corner of the new tire depot shown in the illustration gives a good idea of its spaciousness, and of the abundance of stock carried.

THE SITUATION IN FRANCE.

By Our Regular Correspondent.

IT occurs to me that your American readers would be interested in a few details regarding general industrial conditions here in France today, and the conditions that are likely to prevail after the conclusion of hostilities. Much speculation on this subject has been evidenced in foreign newspapers, and I have noted that the real situation is not well understood by American writers.

VALUE OF THE FRANC IN FRANCE.

The value of a franc in France is the same as it always was. Its exchange value is much less, due to the fact that the balance of trade is against France. As a consequence of this, the purchasing value has fallen. In France a franc purchases less now than in normal times because everything is more costly. It is not the franc that has changed in value, but it is the things that one purchases in France that have become dearer because of lesser supply or greater demand.

PRODUCTION COST OF RUBBER GOODS.

As a consequence of prevailing conditions here, the rubber industry is burdened with additional costs that can be classed as follows:

First: costs affecting the raw material, caused by higher rates of exchange in the Far East and other regions producing crude rubber; increased ocean freight charges, in many instances as much as 250 per cent; increased cost of marine insurance, in some cases amounting to 1,425 per cent and small increases in the costs of transporting merchandise, stevedoring, etc., due to labor shortage.

A second cause for high costs is the increase in maintenance expenses, that is to say, the upkeep of machinery, appliances and equipment, due to higher cost of such materials as iron, steel, copper, wood, leather, etc.,—in general, all factory supplies. This increase amounts on an average to 100 per cent.

Third, general overhead expenses are extremely high; coal, mineral oils, greases, chemical products, cardboard, paper, stationery, etc., have all advanced 100 per cent.

GENERAL EFFECT ON MANUFACTURING INDUSTRIES.

Taking into account the universal military service throughout France, it can easily be understood that the effect of the war upon manufacturing industries has been very pronounced. The help is taken away, no one is left behind to do the work except those physically unable to serve in the army. Raw material is hard to obtain, and it is costly. Coal is three times as high as in normal times. To all of this is to be added the difficulty of running a plant under such a disorganized condition of affairs as necessarily prevails. Few plants can reach normal efficiency.

Industries dependent upon enemy countries for certain articles such as dyestuffs, or which are dependent upon such countries for the sale of their products, are naturally great sufferers.

Industries are going ahead, but in a much crippled manner. Business is good. The only difficulty is to fill orders.

CONDITIONS AFTER THE WAR.

After-war conditions are being freely discussed throughout France, and there will be no lack of initiative in going ahead as soon as peace is reestablished. The great industries of the invaded territories will be rapidly reconstructed and reorganized. In those districts machinery has suffered as much as buildings. The latter can be easily and rapidly reconstructed, but the machinery problem will present greater difficulties. The market which war-stricken districts will offer is enormous. Everything there appears to have been either stolen or destroyed. When the men come back from the trenches, they too will have to pass through a period of reconstruction, as they have been away so long from civilian life.

Wages after the war will be higher than they were previous to the great struggle, so will raw materials, and, consequently, the cost of production will be greater than before the war. Freights also will be on a high level.

TREATIES.

The allied nations will arrange treaties and tariffs to favor themselves and their colonies. Increased and discriminating export duties will be placed on colonial products and arranged so as to favor the Allies. In this respect the Central Powers are sure to be placed at a great disadvantage for the supplies of such colonial products as rubber. The great demand for labor, if nothing else, is sure to make labor high, and it is certainly easier to increase wages than it is to reduce them.

DUMPING.

I understand that in America, you fear the dumping of stocks of merchandise accumulated in Europe during the war. I do not believe this fear well-founded. The Central Powers have acquired much material as a result of conquest, but with the prolongation of the war and the Allies' blockade, these powers will have been obliged to use up much of their spoils. This opinion is supported by the following instance: The invaders took enormous quantities of cloths and fabrics from the Lille-

Tourcoing-Roubaix district, but they are obliged to use these goods; we have captured prisoners wearing uniforms made of Roubaix cloths, and have brought down aeroplanes, in the make-up of which we found much Lille-made linen. Of course, these are but instances, but they indicate conditions and speak louder than words.

No doubt there will be some dumping in certain lines of merchandise, but I believe little is to be feared on this score. It will be found that the Central Powers, like France and her Allies, will have been more engaged in making shells and other war munitions than in making great stores of manufactured goods.

RECAPITULATION.

After peace is reestablished, and after the period necessary for reorganization and the return to normal conditions, the cost of manufacturing in France will approach the same level as before the war, but will be rather above than below ante-bellum levels.

Raw materials will continue at high prices for a year or so, due to the exhaustion of supplies throughout Europe.

TIRES FOR MILITARY PURPOSES.

The situation here is practically the same as it was when I mailed my last letter. The Verdun struggle is still on, and, besides men and ammunition of all kinds, it continues to consume enormous quantities of rubber tires, both solid and pneumatic. However, there is no more shortage of

AN ARMY TIRE DEPOT IN PARIS.

tires here than there is a shortage of other elements of modern warfare. Worn tires are readily replaced by new ones and the constant travel of rubber-tired vehicles, to and from the front, continues without interruption. To fill the demand has been a heavy task, but we were ready for all emergencies and everything has been moving like clock-work in the industries as well as in the army.

IMPORTS PROHIBITED.

Recent presidential decrees prohibit the importation into France and Algeria of various articles, among which are automobiles, automobile rims, bicycles and parts thereof.

OBITUARY.

It is my sad duty to inform you of the death of Lieutenant C. L. Gatin, one of our leading tropical agricultural scientists, who was a representative of France at the last (1914) Rubber Exhibition in London and a member of the expert staff of our leading tropical agricultural paper, the "Journal d'Agriculture Tropicale." Lieutenant Gatin was killed while leading his company of Zouaves in the defense of Verdun. His premature death is mourned by his wife, his mother and hosts of admiring friends.

PERSONAL.

Lieutenant Alan, of the firm of Alcan & Cie., successors to Hecht Frères, Paris, dealers in rubber goods, has been made Knight of the Legion of Honor, a deserved recognition of his special valor in the present war.

Rubber Planting Notes.

COSTS OF PRODUCTION OF PLANTATION RUBBER.

THE advisability of publishing or not publishing costs of production of plantation rubber is a subject that is troubling the minds of the directors of Far Eastern rubber plantation companies.

With the constant growth of the consumption and the increase in production of plantation rubber, the cost of production has been decreasing. Each year the cost is lower than the preceding, a tendency that is in evidence in the following table, compiled from figures disclosed in company reports recently published. This shows the production cost per pound of dry crude rubber for the past three years.

Cost per Pound in U. S. Currency.

	1913.	1914.	1915.
Banteng (Selangor)	48.74	33.33	28.33
Bekoh	44.00	38.33	29.00
Batak Rabbh	32.50	32.33	29.00
Broome (Selangor)	56.00	37.33	31.00
Pukit Lintang	39.33	30.33	24.60
Ipoh Kenneth	39.40	31.33	26.00
Kamuning	44.33	29.33	28.00
Seaport	46.33	34.33	28.33
Selangor	50.33	38.33	26.00
Sangkai Chumor	43.33	32.00	26.00
Tanjong Malin	53.66	41.00	31.00
Average cost	45.30	34.36	28.20

TAPPING SYSTEMS.

In his annual report on agriculture for 1915, in North Borneo, E. Bateson, director of agriculture, made some remarks on tapping systems. He wrote:

It will probably be some years before the relative merits of the different systems are definitely established to the satisfaction of everyone; in the meantime it is desirable to adopt the system which has the balance of experimental evidence in its favor. The system which appears likely to become most general in North Borneo is that of placing two cuts one above the other on a single quarter of the tree. On anatomical and physiological grounds, however, there is good reason for believing that it is better to place the two cuts on adjacent quarters. This has been confirmed by tapping experiments in the Federated Malay States, which, so far as they have gone, all indicate the superiority of the adjacent-quarters system in point of yield. A further advantage of this system is that it favors the nourishment of the renewing bark, and gives quicker renewal than the single-quarter system. When trees are tapped on adjacent quarters the cuts are commonly made in the form of a V, but it has been proved that a tapping cut sloping up to the left yields about 14 per cent more rubber than a cut of the same length sloping up to the right. A left-handed half-spiral, therefore, will yield about 7 per cent more than the basal V.

EXPORT DUTIES ON CAMEROONS CRUDE RUBBER.

The British Board of Trade announces that the German imports and exports tariff remains in operation in the Cameroons, which is now under British military occupation.

The export duty on rubber, except plantation rubber, which is exempt from duty under special provisions, amounts to four cents per pound in United States currency.

RUBBER PROSPERITY OF THE FEDERATED MALAY STATES.

E. Burnside, Commissioner of Trade and Customs, Federated Malay States, in a speech at the general meeting of the Selangor Chamber of Commerce, reviewing the prosperity of the Federated Malay States in the last 25 years, said that in 1890 the total value of the trade of the four States amounted to only \$5,714,187 [\$27,808,091], whereas in 1915 it was valued at \$26,106,773 [\$127,048,611]. The total exports of plantation rubber in 1915 amounted to 44,523 tons, with a value for revenue purposes of £10,897,365 [\$53,032,047], more than 40 per cent of the total value of exports.

RUBBER IN NYASALAND.

The British Colonial Report on Nyasaland for the fiscal year 1914-1915, recently published, would lead to the belief that rubber cultivation is not a success in the Protectorate. With the low prices prevailing during the year covered by the report, little interest centered in rubber, and most of the estates in the Nyasaland Shire Highlands have ceased tapping or abandoned cultivation.

The harvesting of wild rubber has practically ceased, and at the prevailing prices there is little likelihood of any quantity of Ceara and wild rubber being exported. The *Hevea* rubber planted in the West Nyasa district is giving indications of satisfactory development. The value of the exported crop amounted to only £3,423 [\$16,658], as compared with £9,598 [\$46,709], showing a decrease of £6,175 [\$30,050]. The area under cultivation dropped from 10,562 acres to 5,936.

RUBBER FROM GERMAN WEEDS.

MENTION has been made of the efforts of German scientists to obtain rubber from plants indigenous to Central Europe. The following letter, from a chemist in Leipzig, who has been drafted into government work, will be read with interest.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

In your excellent journal, dated May 1, 1916, your German correspondent speaks somewhat sceptically of the value of some plants as a source of caoutchouc. I write to inform you that German scientists have apparently found a really valuable plant for this purpose in *Lactuca viminialis* (in German called *Ruten-lattich*). Exhaustive tests have shown that the milk exuding from cuts in stem and root of this plant, after the latter has reached the age of 18 months, consists of a dark yellow liquid which on exposure to the air turns brown and becomes exceedingly tough and sticky. As the plant reaches a height of six feet, and the milk is fairly abundant, the yield of a field of *Ruten-lattich* in this "rubber substitute" is not by any means to be despised.

According to the announcement of government chemists who have made the tests, the milk contains about .49 of caoutchouc, representing a very high percentage, as there are only a few rubber plants which exceed it (*Hevea Brasiliensis*—only .30; other *Hevea* species even less!).* Plans are said to be under way now to cultivate this *Lactuca* species throughout Germany, it being found wild only in the southeastern sections, south of the Warthe and east of the Elbe rivers, as well as in Austria-Hungary.

In the course of the investigations covering the various types of "rubber weeds" it was found that the *Günsdistel* (goose thistle) yields a fair quality of caoutchouc to the extent of .16; *Wolfsmilch* (wolf's milk) contains .27 of caoutchouc, and many other plants of these families yield caoutchouc in quantities ranging from .12 to .25 per cent.

**Hevea Brasiliensis* latex yields from .30 to .45 of caoutchouc.

NEW JAPANESE RUBBER COMPANY.

The American Consul-General, Yokohama, Japan, reports that several business men in Tokyo and Osaka, Japan, are planning to promote a rubber company, with a capital of 2,000,000 yen [\$997,000], in the Federated Malay States.

Constantinople, in normal times, annually exports waste rubber to the amount of 900,000 pounds valued at about \$50,000. Rubber shoes are imported to the value of approximately \$400,000, and the extent to which the United States participates in this trade is shown by the figures for 1913 and 1914. In the former year we sent to Constantinople 121,988 pairs, valued at \$59,155. In 1914 the figures were 64,278 pairs, valued at \$33,097.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED MAY 16, 1916.

- N**O. 1,182,925. Detachable rim for vehicle wheels. G. H. S. Moyes, Pittsburgh, Pa.
 1,183,032. Elastic tire block for vehicle wheels. H. Raflovich, New York City.
 1,183,033. Wheel rim and tire construction. H. Raflovich, New York City.
 1,183,036. Artificial foot having a rubber heel. J. F. Rowley, Chicago, Ill.
 1,183,037. Elastic leather, composed of elastic webbing and impregnated leather. M. Scheuer, assignor to American Belt Corporation—both of New York City.
 1,183,060. Garment supporter comprising adjustable elastic strips. M. D. Brown, Baltimore, Md.
 1,183,108. Hair class comprising an elastic band. E. Noyes, West Kensington, London, England.
 1,183,180. Rim comprising an automatic tire remover. J. G. Faria, Wilfords, Calif.
 1,183,212. Suction cup bracket support. W. Lenzikow and D. Bühler, New York City.
 1,183,365. Safety tread. J. O. Fowler, New York City.
 1,183,440. Pneumatic tire. B. W. Davis, Chicago, Ill.
 1,183,481. Self filling fountain pen. O. A. Morrow, Pittsburgh, Pa.
 1,183,518. Demountable rim construction. E. K. Baker, assignor to Universal Rim Co.—both of Chicago, Ill.
 1,183,533. Demountable rim. E. P. Calvin, Sardinia, Ohio, assignor of one-tenth to W. W. Masters, Indianapolis, Ind.
 1,183,545. Interchangeable rubber heel for shoes. T. Doody, Duluth, Minn.
 1,183,595. Cushion tire. S. A. Rouse, Chicago, Ill.
 1,183,727. Pneumatic wheel. J. Greppi and A. Romanach, Buenos Aires, Argentina.
 1,183,728. Rubber nursing nipple. R. Griffith, assignor to The Miller Rubber Co.—both of Akron, Ohio.
 1,183,796. Parachuting attachment for balloons. G. B. Lambaugh, assignor of one-half to A. L. Watters—both of Indianapolis, Ind.
 1,183,874. Dress shield stiffener. H. D. Hardecastle, Atlantic City, N. J.
 1,183,914. Armored diving device. H. Usener, assignor to the firm of Neufeldt & Kuhrie—both of Kiel, Germany.
 1,183,965. W. G. F. Fisher, Plainfield, N. J., assignor to Morgan & Wright, Detroit, Mich.
 1,184,032. Bathing cap. O. Schron, Milwaukee, Wis., assignor to M. Neumann, Berlin, Germany.
 1,184,118. Hoof pad. F. W. Oman, Spokane, Wash.
 1,184,136. Tire plug embodying an elastic cushion. R. W. Sampson, Westmont—Quebec, Canada, assignor of one-half to L. Schwab, East Orange, N. J.
 1,184,175. Non-skid tire protector. A. Goodall, Portland, Oreg.
 1,184,220. Tire alarm. C. V. Amburgh, Tacoma, Wash.
 1,184,225. Resilient shoe heel. J. H. Brown, Marseilles, Ill., assignor of one-half to J. H. Brown, Cleveland, Ohio.
 1,184,229. Resilient wheel. D. L. Crosbie, Sacramento, Calif.
 1,184,257. Construction of the covers of pneumatic tires. W. E. Muntz, London, England.
 1,184,258. Tire shoe for vehicle wheels. C. F. Nickerson, Reading, Mass.
 1,184,317. Water-excluding device for bathing caps. E. S. Bullard, Wheeling, W. Va.
 1,184,325. Inflatable rescue float. J. S. Coxley, Massillon, Ohio.
 1,184,371. Compression bulb. H. A. Myers, assignor of one-half to A. S. Hickok—both of Toledo, Ohio.
 1,184,469. Method of making rubber and fabric piston rod packings. C. J. E. Maston, Midland Park, N. J.
 1,184,484. Hose coupling. F. N. Muller, assignor to Republic Hose Coupler Corporation—both of Buffalo, N. Y.
 1,184,632. Test cup for milking machines. C. de Leon, Dayton, Ohio, assignor to N. D. Rutherford.
 1,184,691. Bead for pneumatic tires. H. K. Raymond, assignor to the B. F. Goodrich Co.—both of Akron, Ohio.
 1,184,717. Antiskid device. V. L. Bowman, Alameda, Calif.
 1,184,820. Tire stem cover. R. A. Campbell, Minneapolis, Minn.
 1,184,838. Implement for washing clothes. A. Edwards, New York City.
 1,184,970. Syringe. W. W. Larssen, San Francisco, Calif.
 1,185,044. Wheel rim. G. B. Austin, Junco, Nev.
 1,185,082. Rubber tire. A. G. Fitz Gerald, Boston, Mass., assignor to Reliance A. Co., Inc., New York City.
 1,185,084. Tire protector. W. H. Gahan, Victoria, British Columbia, Canada.
 1,185,119. Lineman's rubber shoe. H. E. Marshall, Highland Park, Mich.
 1,185,215. Hose coupling. J. Lezzani, Fairfax, Calif.
 1,185,281. Resilient tire for vehicles. J. Beynon, Youngstown, Ohio.
 1,185,365. Tire with tubular sections and filling of wool waste. F. D.

- Brown and Rose Seals Brown, Josephine County, near Grants Pass, Oreg.
 1,185,386. Life-saving apparatus. J. L. Edlund, Claresholm, Alberta, Canada.
 1,185,388. Extension fountain pen. H. P. Fairchild, assignor to F. G. Fairchild—both of New York City.
 1,185,403. Vehicle wheel tire. F. A. Howarth, Philadelphia, Pa.
 1,185,411. Rubber swimming glove. C. D. B. Kennard, Winnipeg, Manitoba, Canada.
 1,185,432. Glove made from overwound strips of rubber and balata. L. T. Petersen, Youngstown, Ohio.
 1,185,444. Non-slipping tread. F. H. Stanwood, Arlington, Mass., assignor to Stanwood Equipment Co., Maine.
 1,185,445. Non-slipping tread. F. H. Stanwood, Arlington, Mass., assignor to Stanwood Equipment Co., Maine.
 1,185,451. Rubber tire. J. Thomson and E. L. Pratt, Syracuse, Nebr.
 1,185,583. Suction cup massage instrument. J. W. Bond, Providence, R. I.
 1,185,606. Rubber heel. S. D. Smith, East Dedham, assignor of one-half to J. C. Kennedy, Boston—both in Massachusetts.

ISSUED JUNE 6, 1916.

- 1,185,660. Pneumatic tire and inflation means therefor. R. Harris and N. Harris, Newark, N. J.
 1,185,684. Valve for pneumatic pillows and other articles. H. F. Kraft, New York City, and M. C. Schweinert, West Hoboken, N. J., assignors to A. Schrader's Son, Inc., New York City.
 1,185,714. Non-skid vehicle tire. A. Rich, Stamford, Conn.
 1,185,769. Emergency rim and tire. R. E. Cloud and F. C. Taylor, Ensley, Ala.
 1,185,986. Pneumatic tire. P. J. Collins, New York City.
 1,186,029. Demountable rim. P. Overman, assignor of one-half to H. V. Turner—both of San Francisco, Calif.
 1,186,153. Vehicle tire-filler comprising a rubber-covered felt core. R. S. Wicks, Mount Vernon, Wash.
 1,186,160. Inner casing for automobile tires. C. L. Archer, Council Bluffs, Iowa.
 1,186,225. Nipple. L. R. Neiswender, Phoenixville, Pa.
 1,186,311. Tire for motor vehicles. J. H. Hamlin and J. C. Burford, Winston-Salem, N. C.
 1,186,316. Rubber friction elements for hat bands. R. H. Holmes, Woodmere, N. Y.
 1,186,437. Pneumatic tire. D. C. Roberts, Trenton, N. J.
 1,186,453. Resilient non-collapsible tire. D. E. Tillman, Selma, Ala.
 1,186,460. Automobile tire. E. D. Wassell, Wilkinsburg, assignor of six-tenths to H. B. Wassell, Pittsburgh—both in Pennsylvania.
 1,186,467. Flexible metallic protector for rubber tires. F. H. Brueggemann, Norwood, assignor of one-fourth to J. W. Heintzman, Cincinnati, and one-fourth to H. P. Rohmann, Norwood—all in Ohio.
 1,186,472. Rubber tire. W. B. Estes, assignor of one-half to M. F. Amontett, E. L. Amontett, and J. M. Amontett—all of West Orange, N. J.
 1,186,492. Noise reducing platen for typewriters. W. R. Mulock, Winnipeg, Manitoba, Canada.

ISSUED JUNE 13, 1916.

- 1,186,550. Hand rail for escalators comprising a channelled member of rubber. H. Z. Cobb, Winchester, Mass., assignor to Revere Rubber Co., Providence, R. I.
 1,186,551. Flexible hand rail for escalators comprising a circular rubber impregnated braided strip. H. Z. Cobb, Winchester, Mass., assignor to Revere Rubber Co., Providence, R. I.
 1,186,613. Stretchable leather belting which comprises a sheet of elastic. M. Scheuer, assignor to American Belt Corporation—both of New York City.
 1,186,722. Hose coupling. G. E. Young, Waterbury, Conn.
 1,187,006. Packing. N. B. Miller, Haddon Heights, N. J.
 1,187,330. Basket ball and similar playing ball. J. L. Beebout, Canton, Ohio.
 1,187,065. Toy water pistol having a rubber bulb. C. W. Kallenbaugh, Duquesne, Pa.
 1,187,106. Automobile wheel rim. W. B. Schaeffer, Portland, Oreg.
 1,187,131. Teat cup. L. Bull, Libertyville, Ill.
 1,187,132. Hose supporter. M. C. Calkins, Brooklyn, N. Y.
 1,187,139. Method of repairing ruptured pneumatic tubes. J. C. Irvin, Jersey Shore, Pa.
 1,187,150. Alarm for pneumatic tires. C. E. Johnson, Grand Rapids, Mich.
 1,187,154. Hose and air valve. H. P. Kraft, New York City, and M. C. Schweinert, West Hoboken, N. J., assignors to A. Schrader's Son, Inc., New York City.
 1,187,173. Tire chain and armor. W. J. Putnam, Deposit, N. Y.
 1,187,260. Shock absorber for firearms. R. S. Cross, Westport, N. Y.
 1,187,330. Device for locking electric lamp bulbs in receptacles having an elastic washer. E. Jordan, San Francisco, Calif.
 1,187,386. Cable insulation stripper. A. A. Fehrsen, New York City.
 1,187,418. Blow out patch for pneumatic tires. J. N. Davis, Denver, Colo.
 1,187,430. Hose clamp. W. F. Kenly, assignor of one-half to L. C. Grove—both of York, Pa.

THE DOMINION OF CANADA.

ISSUED MARCH 31, 1916.

- *167,989. Cover for a sink drain. D. J. Connell, Butte, Mont.
 168,002. Infant's grooved feeding bottle with a rubber ring in each groove. O. H. Shultz and E. Benson, assignee of a half interest—both of Edmonton, Alberta, Canada.
 *168,018. Teat cup for milking machines. C. O. Anderson, Lancaster, Pa.
 168,031. Valve for tires. R. S. Burr, Hull, York, England.
 168,055. Typewriter platen having an inner layer of elastic. W. R. Mulock, Winnipeg, Manitoba, Canada.
 *168,088. Fountain pen. R. L. Warnock, Warnock, Ohio.
 168,096. Rubber eraser for fountain pens. F. C. Graham, Aylmer, Quebec, Canada.
 168,097. Pneumatic tire for vehicles. C. F. A. Gray, Montreal, Quebec, Canada.
 *168,133. Fountain pen mechanism. The L. E. Waterman Co., Limited, St. Lambert, Quebec, Canada, assignee of E. F. Britten, Jr., Jersey City, N. J.
 168,144. Spring tire. T. Comeau and A. E. Ouellet, assignee of a half interest—both of Lawrence, Mass.
 *168,181. Non-skid attachment for tires. J. L. Duff, Cambridge, Ohio.
 *168,213. Life preserver. J. E. Lomas, Smuggler, Colo.
 168,225. Tire arbor. M. J. O'Connell, Corpucine, Ontario, Canada.
 168,227. Tire cushion. J. E. Parrish, Richmond, Va.
 *168,263. Life-saving device. B. Zopf, Santa Rosa, Calif.
 168,273. Hose coupling. The Universal Coupler Co., Philadelphia, Pa.
 168,381. Life preserver. O. A. Youngren, Sheridan, Wyo.
 *168,420. Fountain pen. The L. E. Waterman Co., Limited, Montreal, Quebec, Canada, assignee of W. I. Ferris, Westfield, and E. F. Britten, Jr., Jersey City—both in New Jersey.
 168,465. Fastener for overshoes. R. P. Dobson, Ravenna, Ontario, Canada.
 168,479. Pneumatic tire tube. R. I. Henderson, Toronto, Ontario, Canada.
 *168,523. Tire tool. M. H. Stewart, Detroit, Mich.

THE UNITED KINGDOM.

SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent upon the filing of the application.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, MAY 17, 1916.]

- 1,059 (1915). Taps for cycle and like saddles made of canvas and rubber. J. J. Jolley, 41 Spoon street, Coventry.
 1,128 (1915). Confectionery molds of rubber. R. C. Burger, 92 Yonge street, Toronto, Canada.
 *1,175 (1915). Corset comprising strips of elastic webbing. D. Kops, 525 West End avenue, Manhattan, N. Y.
 *1,176 (1915). Corset comprising strips of elastic webbing. D. Kops, 525 West End avenue, Manhattan, N. Y.
 1,194 (1915). Method of inserting studs in the treads. F. E. Blaisdell, 61 St. James' street, London.
 1,236 (1915). Rubber pads for the ends of ladders. W. Thomson, 774 St. Helen's street, Bolton, Lancashire.
 1,296 (1915). Solid or cushion tire. A. H. Greenfield, 92 Earl's Court Road, London.
 1,447 (1915). Inflatable life saving garment. C. E. Hartley, 61 West Dock avenue, Kingston-upon-Hull.
 *100,183 (1916). Safety valve for tires. S. Kahn, 83 Court street, Newark, N. J.
 100,186 (1916). Double chambered teat cups for milking machines. O. V. E. Gosling, 4 Fridhemsgratan, Stockholm.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, MAY 24, 1916.]

- 1,500 (1915). Electric lamp provided with a rubber washer. B. J. Grigsby, 14 Roschere avenue, London.
 *1,576 (1915). Life-saving suit having an air bag with inflating tube. O. A. Youngren and R. H. Stalup, Sheridan, Wyo.
 *1,591 (1915). Toy ship and torpedo propelled by elastic cord. W. H. Huth, 6136 Sheridan Road, Chicago, Ill.
 *1,595 (1915). Tire valves. M. C. Schweinert, 226 Palisade avenue, West Hoboken, and H. P. Kraft, 219 Godwin avenue, Ridge wood—both in New Jersey.
 1,631 (1915). Means for securing rubber heels to shoes. P. Lace, 19 Parkfield Drive, Liscard, Cheshire.
 1,651 (1915). Doors for storage chambers and safes made air tight by the use of rubber sheets. A. J. Roach-Cumming, 68 Cowcross street, London.
 1,715 (1915). Lamp reflector and globe carrier, comprising a rubber washer. W. Sanders & Co., and W. Sanders, 7 Oxford street, Birmingham.
 *1,767 (1915). Electrically equipped diving chamber with air hose attached. W. D. Sison and J. L. Buchanan, 543 Title Insurance Building, Los Angeles, Calif.
 1,817 (1915). Air tube for wheel tires. M. S. Stevenson, 41 Cheapside, London.
 1,889 (1915). Military overboot having a legging continuation and a hard rubber insole. Soc. Anon. Etablissements Hutchinson, 60 Rue St. Lazare, Paris.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, MAY 31, 1916.]

- 2,019 (1915). Engine and machine packing. G. W. Beldam, Boston Lodge, Ealing, London.
 2,021 (1915). Elastic reinforced hat lining. V. L. Grosjean, 10 Rue de Paris, Compiegne, Oise, France.

*Denotes Patents for American Inventions.

- 2,041 (1915). Inflatable life preservers and chest and lung protectors. L. Nixon, 33 Overgate, Dundee.
 2,100 (1915). Rubber cap for the mouthpiece of a pipe or holder. H. P. Simpson, 39 Victoria street, Westminster.
 2,104 (1915). Inflatable life belt. T. D. MacFarlane, 515 Metropolitan Building, Vancouver, B. C.
 2,155 (1915). Sponge rubber pad in machine for labeling bottles, packages, etc. P. J. Purdy, 10 Euston Buildings, George street, London.
 2,156 (1915). Sponge rubber pad in machine for labeling bottles, packages, etc. P. J. Purdy, 10 Euston Buildings, George street, London.
 *2,166 (1915). Rubber tires. W. H. Dane and C. de Lukasevics, 26 Oak Crest Place, West Nutley, N. J.
 2,235 (1915). Golf ball. W. Taylor, Southles, Elms Road, Knighton, Leicestershire.
 2,256 (1915). Rubber overshoes for use on bowling greens, etc. C. Woollett, 11a Oxtan Road, Poulton, Seacombe, Cheshire.
 100,212 (1916). Printing blankets. H. Hartmann, Globus, Gummi und Asbestwerke Ges., Ahrensburg, Germany.

NEW ZEALAND.

ISSUED APRIL 13, 1916.

- 36,368. Rubber sound-absorbing pipe for milking machines. The Kidd Milking Machine Co., Limited, Queen street, New Plymouth, N. Z.
 36,891. Teat cup for milking machine. H. W. Bartram, 586-588 Bourke street, Melbourne, and A. Gillies, "Glencairn," Templestone Road, Heidelberg—both in Victoria.
 37,195. Milking machine teat can. R. N. Pilkington, Hamilton, N. Z.
 37,278. Teat cup. G. E. Walker, Hamilton, N. Z.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

- 478,987 (June 10, 1915). Elastic wheel. Habbe Technical Tyre Co., Limited, 478,995 (June 11). Vehicle wheel. E. P. Calvin.
 479,023 (June 14). Improvements in elastic tires for motor vehicles. R. J. Wickham.
 479,045 (June 16). Protector and anti-skid device for pneumatic tires. A. E. Hughes.
 479,087 (June 25). Pneumatic wheel. F. Personé.
 479,117 (June 26). Improvements in lateral mud-guards and splash-guards for automobile wheels and the wheels of other vehicles. H. V. N. Gravelley.
 479,157 (November 28, 1914). Improvements in pneumatic tires. The Helix Tyre Co.
 479,198 (July 6, 1915). Automobile tire. E. J. Mitchell.
 479,219 (July 13). Elastic tire. J. B. Bernard.
 479,223 (July 7). Elastic wheel for vehicles. C. Multhmann.
 479,227 (July 6). Improvements in insulated cables for the transmission of high-tension electric currents. Beaver and Claremont.
 479,256 (July 10). Device for protecting pneumatic tires, cycles and similar vehicles. J. C. Jørgensen.
 479,259 (July 12). Improvements in pneumatic tires. James & Milford.

TRADE-MARKS.

THE UNITED STATES.

- 88,299. The B. & F. Goodrich Co., New York City. Two red diamond-shaped figures located and used circumferentially of a tire on the side of the latter. For pneumatic tires.
 89,097. Gumbo Co., Asheville, N. C. Words Gum-Bo-Chew. For chewing gum.
 92,332. The Goodyear Tire & Rubber Co., Akron, Ohio. The word Elm. For rubber hose.
 92,333. The Goodyear Tire & Rubber Co., Akron, Ohio. The word Elect. For rubber hose.
 92,334. The Goodyear Tire & Rubber Co., Akron, Ohio. The word Ext-terminator. For rubber hose.
 92,335. The Goodyear Tire & Rubber Co., Akron, Ohio. The word Glide. For rubber hose.
 92,336. The Goodyear Tire & Rubber Co., Akron, Ohio. The word Ash. For rubber hose.
 92,337. The Goodyear Tire & Rubber Co., Akron, Ohio. The word Drill-well. For rubber surfaced fabric belt.
 93,315. A. & A. Rubber Co., Framingham, Mass. A combination of A & A, R. Co., and Dufrut Co. inside a circle. For heels, etc., made of rubber and fiber.
 93,604. Lund-Mauldin Co., St. Louis, Mo. The word Lundin. For rubber boots, etc.
 94,215. The Vanola Co., Winston-Salem, N. C. The word Vanola. For chewing gum.
 94,299. H. C. Willison, Los Angeles, Calif. The word Reco. For ball chewing gum.
 93,217. United States Rubber Co., New Brunswick, N. J. A white bar between two blue bars of equal width. For overshoes of rubber and tennis shoes of rubber and fabric.
 93,717. The Miller Rubber Co., Akron, Ohio. The words "Confectioners Special." For toy balloons.
 94,057. Aspley Rubber Co., Hudson, Mass. The word Rock-Hill. For rubber boots, overshoes, shoes and rubbers.
 94,778. Jose de Jose Martinez S. en C., San Juan, Porto Rico. The words Our Regard. For rubber shoes, etc.

- 91,022. The Scholl Manufacturing Co., Chicago, Ill. A heavy line ellipse broken away at one portion. For dental, medical and surgical appliances.
- 92,749. The Goodyear Tire & Rubber Co., Akron, Ohio. A blue streak is displayed upon the outer face of the hose and extending longitudinally thereof, and the words *Blue Streak* printed in block letters on the outer face of the hose. For rubber hose.
- 93,396. Panama Rubber & Equipment Co., St. Louis, Mo. The word *Parco*. For automobile tire.
- 94,294. S. A. & H. Myers, Boston, Mass. The *S. A. & H. M. Rain Check* illustrated within a square. For raincoats.
- 94,300. Wright & Ditson, Jersey City, N. J., and Boston, Mass. The word *Birdie*. For golf balls.
- 94,301. Wright & Ditson, Jersey City, N. J., and Boston, Mass. The word *Bisk*. For golf balls.
- 94,344. John Wanamaker, New York City. The words *Blue Flash*. For golf balls.
- 94,516. Schmelzer Arms Co., Kansas City, Mo. The word *Kilty*. For golf balls.
- 86,499. George Benton Wood, Duluth, Minn. The representation of a pneumatic tire with the word *Woods* illustrated on the half of center and the words *Lockite* and *Patch* on tire. For inner tube and casing patches for vehicle tires.
- 90,126. The Miller Rubber Co., Akron, Ohio. The word *C-Kure-Nek*. For hot water bottles, etc.
- 90,942. Seneca G. Lewis, Greensburg, Pa. The words *Lewis* and *No Jar*. For rubber supports for time pieces.
- 93,467. New Jersey Car Spring & Rubber Co., Jersey City, N. J. The word *Car Spring*. For rubber hose, packing and tires.
- 93,875. Michigan Waterproofing Co., Grand Rapids, Mich. The word *Ishture*. For rubber dressing and preservative, etc.
- 94,175. Reid Bros., Seattle, Wash., and San Francisco, Calif. An illustration of a walrus head and the words *Walrus Sheeting* within a circle. For waterproofed hospital sheeting.
- 90,911. The Standard Tire & Rubber Manufacturing Co., Cleveland, Ohio. A design of a wreath with an eagle standing on top of the letter *S* in the center. For rubber and fabric tires and tubes.
- 92,291. Geo. E. Keith Stores Co., Brockton, Mass. The word *Gekco*. For boots and shoes of rubber and other fabric construction.
- 94,386. The Mechanical Rubber Co., Jersey City, N. J. The word *Hyd-Rex*. For machinery packing composed of rubber or rubber and fabric.
- 94,405. The Worthington Ball Co., Elyria, Ohio. The word *Arrow*. For golf balls.
- 94,406. The Worthington Ball Co., Elyria, Ohio. The word *Four*. For golf balls.

METAL SPRAY PISTOL.

For many purposes it has been found desirable to deposit a thin plating or coating of non-corrosive metal upon other more vulnerable metals, or on objects made of non-metallic substances.

and is handled in a similar manner. It is, to all intents and purposes, an atomizer of melted metal.

The metal, in the form of a thin wire, is fed into a reducing flame zone where the end is melted, a drop at a time, and each drop is struck a blow at the instant of formation, thus causing it to be ejected in the form of a molten spray. In order that this pistol may be aimed at any angle, a flexible connection is necessary between the supply of oxygen, hydrogen and air, and the pistol. This is accomplished by lines of rubber hose, made to withstand 40 pounds pressure. The device is the invention of M. C. Schoop, an engineer of Zurich, Switzerland.

Review of the Crude Rubber Market.

NEW YORK.

THE crude rubber market for the past month has been extremely quiet, with very little business other than occasional small orders for the purpose of trying out the market, and desultory trading among the local dealers. This is the quiet season when the mills usually commence to slow down for taking inventory or making necessary repairs and additions to equipment, therefore, unless something unusual happens, the large buyers have no reason to be interested in the present market.

Early in the month the reported heavy buying of futures, running into 1917, and the activity of London had a strengthening effect on the local market, resulting in firm prices. On June 1, First latex, spot and nearby, were selling for 66¢@66½ cents, with July-December at the same figures, and future positions during 1917 were quoted 62½ cents. Smoked sheet ribbed, spot and nearby were 65 cents; July-December 65¢@65½ cents, and futures for 1917 were quoted 61½ cents. Upriver fine was steady at 65 cents, and July-August deliveries were quoted at the same figures.

Extreme dullness continued to rule the local market as the month progressed and prices continued to decline to such an extent that on June 15, Upriver fine was selling at 2 cents premium over First latex. Toward the end of the month these unusual conditions, accompanied by steadily declining prices, had developed a most unsettled tone to the local market. On June 28, however, Upriver fine, spot and nearby developed considerable activity due to speculative interests coming into the market, and running the price of Upriver fine up to 67 cents. July-December was firm at 64 cents. The other Para sorts, however, are normal. On the same day First latex, spot and nearby were selling at 61 cents, with July-December at the same figures. Smoke sheet ribbed, spot and nearby, were 59¢@60 cents, and July-December at the same figures. All future positions for 1917 were selling at spot quotations.

New York arrivals for the first three weeks of June are approximately 5,635 tons, as compared to 6,756 tons for the same period last month, and are as follows: Plantations from London, 2,535 tons; Singapore, 1,855 tons; Para rubber from Brazil, 645 tons; from Europe, 60 tons; Centrals, 80 tons; Guayule, 180 tons; Africans, 185 tons; Manicoba, 95 tons.

LONDON.

June opened with declining values, that continued to fall with few unimportant rallies throughout the month. June 1, Standard crepe was 62.3 cents; Smoked sheet, 60.8 cents, and Hard fine, 64.8 cents. The sensitiveness that has featured the June market has continued up to the present writing and both buyers and sellers are apparently unwilling to try the strength of the position.

The supply of crude rubber is undoubtedly unwieldy. America's demands have evidently quieted down for a time and the situation is very much like a ship in the doldrums,—something may happen at any time. On June 28, Standard crepe was 57 cents, Smoked sheet 56½ cents and Hard fine 64 cents.

SINGAPORE.

There were 1,302 tons sold at the four auctions held between May 31 and June 21 inclusive. The average price being 57.2 cents for crepe and 55.9 cents for Smoked sheet.

The following are the new freight rates from Singapore to Boston and New York via the Suez or Panama Canal:

Rubber scrap (cases).....\$36.00 per 50 cubic feet
Gutta jelutong (cases) (Pontianak)..... 39.60 per 50 cwt.
Rubber shavings, not exceeding \$300 per ton (cases) 39.60 per 50 cubic feet

Gutta re-boiled or mixed, not exceeding 24 cents per pound (c. i. f. in cases)..... 40.80 per 50 cubic feet
Borneo rubber (baskets)..... 48.00 per 12 cwt.
Borneo, Para, and rubber, genuine (cases)..... 48.00 per 50 cubic feet
Gutta percha (cases)..... 50.40 per 50 cubic feet
Rubber, genuine (bags or bundles)..... 72.00 per 20 cwt.

The new through rate on rubber in cases from Port Swettenham, Malacca, Teluk Anson, Port Dickson, is \$51.00 per 50 cubic feet. In cases by steamers calling at Port Swettenham is \$48 per 50 cubic feet. [The equivalent of a ton (2,240 pounds) is figured at 40 cubic feet, a hundred weight (cwt.) 112 pounds.]

NEW YORK QUOTATIONS.

SINGAPORE.

GUTHRIE & CO., LIMITED, report (May 10, 1916):

Prices realized at the auction held today show a further decline, but are satisfactory when compared with London values. Standard sheet is \$13 lower at \$149, but standard crépe is only \$2 lower than last week's best. Demand was good for the latter grade, and most parcels found buyers. Out of a total of 454 tons cataloged 168 tons were sold.

The following was the course of values:

In Singapore per picul,*	Sterling equivalent per pound in London.	Equivalent in cents†
Sheet, fine ribbed smoked.....	\$140 @ 149	2 8½ @ 2 10½
Sheet, good ribbed smoked.....	135 @ 140	2 7½ @ 2 8½
Sheet, plain smoked.....	135 @ 138	2 7½ @ 2 8½
Sheet, ribbed unsmoked.....	137 @ —	2 8½ @ —
Sheet, plain unsmoked.....	117 @ 135	2 4 @ 2 7½
Crépe, fine pale.....	150 @ 159	2 11 @ 3 0½
Crépe, good pale.....	139 @ 150	2 8½ @ 2 11
Crépe, fine brown.....	125 @ 133	2 7½ @ 2 7½
Crépe, good brown.....	115 @ 129	2 3½ @ 2 6½
Crépe, dark.....	107 @ 125	2 2 @ 2 5½
Crépe, bark.....	75 @ 110	1 7½ @ 2 2½
Scrap, virgin.....	83 @ 90	1 9 @ 1 10½
Scrap, pressed.....	83 @ —	1 9 @ —
Scrap, loose.....	80 @ 82	1 4½ @ 1 8½

*Picul = 133½ pounds.

†Figured at standard rate of exchange, 1s. = 24.3 cents.

Quoted in S. S. dollars = 2/4 [56.7 cents].

Straits Settlements.....	116,036
Japan.....	164,479	72,276
Totals.....	15,515,812	18,994,806

(Same period 1914, 12,406,917 pounds; same period 1913, 8,083,692.) The export figures of rubber, given in the above table for 1914, include the imports re-exported. (These amount to 1,286,100 pounds from the Straits Settlements and 263,444 pounds from India.) To arrive at the total quantity of Ceylon rubber exported for that year deduct these imports from the total exports. The figures for 1915 and 1916 are for Ceylon rubber only.

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram from Kuala Lumpur states that 3,956 tons of plantation rubber were exported from the Federated Malay States in the month of May as against 3,504 tons in April and 2,708 tons in the corresponding month last year. The total exports for five months of the current year amounted to 21,967 tons, compared with 15,787 tons in 1915 and 11,544 tons in 1914.

Append-d are the comparative statistics:

In addition to the above, 5,300 pounds of Gum Cicale was imported from British Honduras valued at \$1,823 for the week ending May 19, 1916, also 33,492 pounds valued at \$20,710 from Canada and 1,162 pounds valued at \$299 for the week of May 26, 1916.

STRAITS SETTLEMENTS RUBBER EXPORTS.

A cablegram from the Colonial Secretary, Singapore, notifies that the export of plantation rubber from Straits Settlements ports in the month of April amounted to 4,319 tons compared with 4,481 tons in March and 1,978 tons in the corresponding month last year. The total export for the first four months of the current year amounted to 16,502 tons against 9,772 tons in 1915 and 5,717 tons in 1914. Appended are the comparative statistics:

	1914.	1915.	1916.
January.....	1,181	2,576	4,443
February.....	1,703	2,241	3,960
March.....	1,285	2,477	4,481
April.....	1,348	1,978	4,219
Totals.....	5,717	9,772	16,502

These figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements such as Java, Sumatra, Borneo and the non-Federated Malay States as well as rubber actually exported from the Colony, but do not include rubber exports from the Federated Malay States.

THE RUBBER SCRAP MARKET.

NEW YORK.

THE adverse conditions surrounding the local market caused a break in the price of boots and shoes early in the month of June that resulted in lower values being quoted on the other grades in the list, with some exceptions, however. The weakness in the crude rubber market, together with the fact that rubber manufacturers and reclaimers alike were anticipating a quiet summer season, and the usual period of inventories, would naturally indicate easier conditions and lower prices. Moreover, the increasing volume of scrap arrivals released by the recent freight congestion is another potent reason for the unsettled tone of the market early in June. On Saturday of the first week, boots and shoes varied from 8½ to 8¾ cents, the former price being more representative of the actual business transacted with the mills. The other grades remained practically unchanged; G. & G. tires being quoted 8¾ to 8½ cents, and mixed auto tires, 6½ cents, with little business resulting. Inner tubes were weak, the best quality was nominally quoted 27 to 28 cents delivered to the mills.

Toward the end of the month the belief was current among the large dealers that prices had reached the lowest level—a theory that was supported by a noticeable diminution in the arrivals of supplies—and therefore they were not anxious to sell. On June 28, boots and shoes were very sluggish at practically the same prices that have prevailed since the first of the month, 8½ cents delivered being the best price obtainable. Transactions in mixed auto tires were small in volume at 6¼ cents delivered, while the other grades remained unchanged. The balance of the list offered no unusual features worthy of recording, and the prevailing opinion is that for the next few weeks there will be no improvement in the rubber scrap business.

MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

ACCORDING to the official government figures recently published, the cotton production in the United States for 1915, exclusive of linters, was 11,068,173 bales, the smallest grown since 1909, when the number of equivalent 500-pound bales was only 10,040,949. The crop for 1914, exclusive of linters, was 15,905,840 bales.

EGYPTIAN COTTON.

The Egyptian Government has taken steps to prevent the importation of dangerous cotton pests by prohibiting imports of cotton plants, cotton lint, cottonseed, seed cotton and cotton stalks. This law is much more drastic than the regulations provided by the United States Department of Agriculture to protect our cotton crop from imported disease.

SEA ISLAND COTTON.

The official figures for Sea Island cotton production in 1915, show that Florida produced 28,094 bales, Georgia, 57,572 bales, and South Carolina, 6,178 bales, a total of 91,844 bales. There was an increase of 10,000 bales compared to the 1914 crop, when 81,654 bales were produced, the crop being divided as follows: Florida, 33,662 bales; Georgia, 47,395 bales; South Carolina, 5,597. The estimated production of Sea Island cotton for 1916 is 100,000 bales.

TIRE FABRICS.

The demand for tire fabrics during the greater part of June, has continued to engage the utmost activities of the producers. Towards the end of the month, however, the smaller consuming trade was less important in its demands, which led to the belief in some quarters that tire fabrics were getting easier. This is not altogether verified, as the prices are ruling strong and show an increase over quotations made a month ago. This is the commencement of the usually quiet season, of shut-downs and inventory taking; moreover, the backward season and war rumors all conspire to make unusual market conditions that cannot be definitely explained. There has been no large source of production developed recently; raw material is high and labor still continues to be high and scarce. Therefore, it would seem that fundamentally the tire fabric situation is practically the same as it was a month ago.

COTTON DUCK.

Cotton duck still continues to be active, with a large demand for hose and belting duck. Prices have stiffened considerably, and an advance was expected during the last week of the past

month. Price seems to be of secondary consideration, as the question of delivery takes precedence over all terms now being written in the contracts.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK

THE market weakness shown during the past month by many chemicals and compounding ingredients and the decline in prices since April 1, is a strange anomaly. The sources of production have not materially changed and basic metals in general are still high, yet prices of many important chemicals used by the rubber trade have declined. This has been in a measure due to holders becoming uneasy and unloading. Many shipments long overdue, arrived and were sold in a quiet market, resulting in lower prices. Certain colors were weakened by the rumored

import of 15,000 tons of dyestuffs, but recovered and are now advancing. There is little doubt that price levels must be readjusted before the mills can be expected to support the market. This is their quiet season and surplus stocks will be drawn upon to tide them over the summer season.

ANILINE OIL. The market for this month has been fairly firm since the decline in May, but weakness developed later in the month, due to delay in granting export shipping permits.

ANTIMONY SULPHURETS. Antimony metal has decreased in price and the best grades of sulphurets have been affected by an inferior quality being offered at lower prices. The demand is good and sales plentiful.

BARITES. Supplies are scarce and present prices have been maintained by heavy demand. A new, large mine is being opened in the South for the production of prime white grade.

CAUSTIC SODA. The inquiry has been moderate. The large amount of resale stock has caused the market to settle.

LITHARGE. Prices have remained firm and unchanged.

LITHOPONE. The shortage of stocks has been marked by firm prices.

SULPHURIC ACID. The production of sulphuric acid, expressed in terms of 50 degree acid, in the United States in 1915, was 3,868,152 short tons, valued at \$29,869,080, together with 189,795 short tons of oleum or fuming acid of different strengths, valued at \$2,787,971, making a total of 4,057,947 short tons, valued at \$32,657,051.

TALC. Shortage of imported talc has directed attention to the American product. Large quantities are being substituted for the French and Italian goods.

ZINC OXIDE. The New Jersey Zinc Co. has reduced the prices of three high grade brands of zinc 8 cents a pound, white seal to 17 cents, green seal to 16½ cents and red seal to 16 cents. This is due to the fact that spelter from which these grades are made, has declined. The lower grades made from lead ore have advanced on account of the high price of the ore.

WIRING ASSEMBLY FOR FORD CARS.

There are many users of Ford cars, and a wiring assembly has been prepared expressly for any model car of this make, comprising timer wires and four spark plug wires. These timer wires are supplied in four individual colors fitted into the very best insulating loom. The timer terminals are finished with pure rubber insulated ferules, thus eliminating any chance of short circuit. All the other ends have proper terminals with soldered connections, making an absolutely tight electrical joint. The loom ends are finished off with pure rubber insulating collars. The set is attractively packed in an individual carton. [Humboldt Machine & Stamping Co., Long Island City, New York.]

PREPAREDNESS—LOOKING BACKWARD.

Extract from a letter written by _____ to a friend
in _____, August 1, 1920.

DEAR M———:

Since my last, things have moved rapidly if not pleasantly for our country and for the rubber trade. The war, our first with a really first class power, has now been on for six months—a half year of disaster. Such preparedness as we had indulged, rendered ineffective by graft, incompetence and politics, availed us hardly at all. Our navy defeated, our soldiers on the defensive, we are in sore straits—yet the whole country is rallying for real defense in a manner that promises a final triumph no matter how long delayed.

Aside from the scarcity and consequent high price of crude rubber, the trade is doing well. The factories on the Atlantic Coast have established headquarters either in Cleveland or Chicago. Manufacturers in the Middle West have taken over the work of some Eastern mills, while others have simply closed their doors.

The arrival of a merchant submarine at New Orleans with a thousand tons of rubber cheered the manufacturers exceedingly. They gladly paid the price, \$5, a pound, and made the intrepid captain a substantial present besides. It is believed, by the way, that the present price is high water mark and that within a few months three-dollar rubber is a possibility. This belief is founded upon the supplies of guayule that are beginning to arrive. Several plants have also been erected in Colorado and are able to extract rubber profitably from the *Picradenia*, which is very abundant. Central rubbers have begun to come in, as Mexico, and the countries south of her, rising to the bait of high prices, are tapping everything that contains latex, and the aggregate is considerable. With the completion of the motor truck railway from Guatemala to Panama, and the linking up with the road from Colombia to Bolivia, South American rubber will come overland, provided, of course, we continue as in the past, to hold the Panama Canal.

It is splendid to note the cheerfulness with which all respond to the general call for economy in the use of rubber goods. The motor cars of the millionaires run on tires that long since failed to hold air and are filled with "tire fillers" and often covered with leather to hold core and carcass together. Rubber clothing has disappeared and slickers of a new, odorless type have taken its place. City buildings stripped of their rubber tiling and matting have added much to the vast quantity of scrap needed when the crude rubber supply was first shut off. Trench boots are the only goods turned out by the great footwear factories. Indeed, all of the rubber in the country is practically at the service of the government. It is most interesting to note the anger expressed toward our former agricultural department because they allowed us to be so long dependent upon foreign sources for our crude rubber. Experiments begun in the last few months show conclusively that there are several rubber producers that could be grown within our own borders. Not the kind that produce latex, but those of the guayule and grass rubber sort, that contain rubber itself.

It is said, also, that certain scientists are experimenting with the *Ekanda* root to see if by a process of selection a variety cannot be obtained that contains a larger amount of rubber milk. Could this percentage be increased enough, it might result in a great industry not unlike that of the sugar beet—but with rubber, not sugar, the extracted product.

The only important compounding ingredient that the war has cut off is whiting, but there are so many earthy

fillers available that no especial hardship has been felt by its absence.

Of course, our export trade has been entirely destroyed. The few airships that venture forth cannot afford to carry freight, the mails alone taking all available room.

In the meantime the non-resistants are holding meetings and advocating the offer of a huge indemnity to the enemy to call the fight off. As if it were not disgrace enough for us to have been forced to pay the huge sums for the safety of New York, Philadelphia, and Washington, followed by the destruction of the latter city because a civilian wounded a soldier. No, the rubber trade are not for peace at present, but after this war is over, they and hosts of others are going to be strong for PREPAREDNESS. It is a bitter, costly lesson, but we had it coming, and believe me, it is one that will be thoroughly learned and long remembered. Sincerely,

X—

RUBBER PRICES WHEN PEACE IS RESTORED.

THE question of rubber prices, after the European war, is of interest, not only in producing, but more emphatically in consuming countries. Our British contemporary, the "India Rubber Journal," is of the opinion that there is a definite danger of violent price fluctuations once peace is declared. The war period has brought new influences to contend with, but there will be still another factor to be reckoned with, when peace is really in sight. Then speculators are likely to come forward under the unusual and almost certain demand. Austria and Germany will want 40,000 tons of raw rubber, or its equivalent in manufactured rubber goods, within a year of peace being declared, while the allied countries will be large buyers at the same time.

The Journal believes that therefore the demand on account of the enemy and other countries is likely to be formidable, and so insistent that prices may run wild; the rise in price may be checked by London and New York agents holding their hands for a little time until stocks have accumulated. If either side becomes too powerful we shall see prices which will be unreasonable, and which may affect not only spot sales, but forwards, for many years to come.

Further, our contemporary states that;

While commercial groups convene to discuss trade developments after the war it has heard of no steps being taken to check any irrational development during the peace phase referred to. Growers alone would never do anything which would in any way affect the law of supply and demand, and any action, to be successful, would have to secure cooperation of buyers' and sellers' agents, an almost impossible arrangement. This will be the most

vulnerable period and the possibilities are so great as to demand timely consideration. No one wishes Germany and Austria to get their rubber cheap, especially since the major part of the plantation supplies comes from British possessions. But, on the other hand, no one wishes home trade to be penalized by the activities of agents who will be out for produce so long denied by our navy.

While there is much theorizing regarding prices at that time, and later, it seems well worth considering that the Eastern plantations will raise this year, or next, that 40,000 tons extra needed by Germany and Austria, thus in no way interfering with the normal demands of the rest of the world, while, if this amount is not sufficient for the period under consideration, England can throw into the market some of the raw rubber she is now storing for the very purpose of preventing it from getting in the possession of nations fighting against her. It looks as if the whole question of preventing unwise speculation is quite largely in the hands of the British themselves, either in London or in the Far East.

THE EMPLOYERS' PATRIOTIC DUTY.

WHEN the orders came for the militia to proceed to the frontier, many thousand men answered the call of duty, leaving their stores, offices or workshops to serve their country. What is more, they left their homes and families, and probably, in many cases, they left their families but meagerly provided for, or totally without means of support during their absence.

These patriots are doing their duty to the country at a tremendous sacrifice. Are those who stay at home doing their duty? Are they also sacrificing? Many employers, in fact a large proportion of them, are carrying the absent soldiers on their payrolls. Thus they are enabling the soldiers to continue to support their families. Such a course cannot be universal, but the more general it becomes, the nearer will employers come to bearing their just burden, and doing their full share of sacrifice for the nation.

THE MOST SIGNIFICANT FEATURE OF THE RUBBER CLUB outing this year was not the attendance, the sports, nor the dinner. They were all of the biggest, the most enthusiastic, and the best. It was the special train that bore the guests from distant centers, and returned them speedily and comfortably when the day was done. It showed that the club was no longer local even as far as New York is concerned.

IT HAS LONG BEEN PREDICTED THAT MOTOR TRUCKS would in time outnumber pleasure cars. The new detachable flanges that adapt motor truck wheels to railroad tracks will be a potent factor in increasing the use of trucks. Possibly the flanged wheels for the rails will be rubber shod, in time giving rail speed equal or greater than road speed. At all events every truck, whether fitted for railroad use or not, is equipped with the regulation rubber tires and ever will be.

The Electric Storage Battery in the Motor Car.

IT is estimated that there are 28,000 electric vehicles in the United States, of which 20,000 are pleasure and 8,000 are commercial cars. The cost of the average battery to the manufacturer, for a pleasure car, is about \$300, and \$500 for a commercial car; so that \$4,000,000 is the sum expended for automobile batteries and \$6,000,000 for commercial car batteries. The average number of hard rubber jars in a pleasure car is

FIG. 1. WILLARD VEHICLE BATTERY.

32, and 44 for the commercial, or a total of 1,000,000 jars. The average cost is \$1.50 per jar to the manufacturer; which figures a total of \$1,500,000 for hard rubber jars.

There are about 1,500,000 starting and lighting batteries being used in the United States, costing the manufacturer an average of \$15 each or a total of \$22,500,000. There are three cells to the average battery, or 4,500,000 jars in use, which cost the manufacturer about \$1.00 each or a total of \$4,500,000 for hard rubber jars.

The above estimates do not include hard rubber covers, separators and vent plugs, which would materially increase the grand total of figures for hard rubber used in electric storage batteries.

This article will cover the storage battery only as applied to automobiles and commercial cars for driving, starting, lighting and ignition purposes. Such batteries are also used for house and railway car lighting, for lighting, power and ignition in motor boats. In radio apparatus they are indispensable, and recently the submarine has emphasized the importance of the storage battery and its hard rubber insulation in modern warfare.

The fundamental principle of the electric storage battery is best illustrated by the voltmeter, a well-known instrument in which water is decomposed by an electric current. The voltmeter consists of a glass jar containing two platinum plates covered with acidulated water and connected by wires to an electric battery. When an electric current is established, small bubbles of oxygen collect on the positive plate, or electrode, and of hydrogen on the negative electrode. If the battery current is cut off and the two electrodes connected to a galvanometer, a reverse current is registered. For storage battery purposes, however, the electrolysis of water was impractical, as the hydrogen and oxygen quickly escape.

Planté invented a cell in which two lead plates insulated by hard rubber strips were placed against each other and covered with sulphuric acid diluted with water. When electric current is passed through the electrodes the water or electrolyte is decomposed, the oxygen separating at the positive plate and the hydrogen at the negative. The positive plate becomes oxidized and covered with a coating of lead peroxide. When the battery current is cut off and the plates connected, a reverse current is established and the peroxide is reduced to lead, while the other plate becomes oxidized.

Fauré's improvements consisted in coating both plates with red oxide of lead paste, which contains a smaller proportion of

oxygen; thus the current only has to form peroxide on one plate and reduce the oxide on the other.

Many improvements have been made by modern inventors toward correcting the inherent defects of the original types. The most successful modern storage batteries depend on the same chemical reaction as in the original Planté cell, but with one notable exception—the Edison—which uses nickel-steel plates in an alkaline solution, with the advantage that the battery is much lighter, and also that the absence of the sulphuric electrolyte makes possible the use of a metallic jar.

Hard rubber has been found to be practically the only flexible insulator impervious to the action of sulphuric acid, which is the basic electrolyte in the lead storage battery. For that reason, hard rubber jars, separators, vent-plugs, hold-downs, and insulation tubes are used; also soft rubber gaskets, plugs and rubber-insulated battery terminals. Descriptions of a few of the well-known types of vehicle storage batteries will in a general way cover the entire field.

THE WILLARD BATTERY CELL.

One of the best-known is the "Elba." A 6-volt cell type "M-11" is shown in Fig. 2.

FIG. 2. ELBA CELL—TYPE "M-11."

A—Hard Rubber Jar, B—Hard Rubber Perforated Separator, C—Hard Rubber Cover, D—Hard Rubber Hold-downs, E—Hard Rubber Vent-Plug, G—Soft Rubber Gasket, H—Positive Plate, I—Negative Plate, J—Wood Separator.

The individual cell principle is employed in all types; any one cell can be inspected or repaired without disturbing the others. The plates are the pasted type and the grid is made of an alloy consisting of lead and antimony. The jar, cover, hold-downs, vent and perforated separator are of hard rubber; the vent-plug and sealing gasket are of soft rubber. The separator might be compared to a piece of lace. It is honey-combed with holes and, therefore, allows the electrolyte to seep through evenly so that the battery gives maximum service at all times. The separator is ridged with rubber strips which protect it against wear by the abrasion caused by the vibration of the car.

The plates measure $5\frac{3}{4}$ by $8\frac{5}{8}$; there are 11 to each cell and the discharge is $27\frac{1}{2}$ amperes for 5 hours. The complete cell measures $3\frac{3}{8}$ by $6\frac{1}{8}$, by $13\frac{1}{2}$ inches high and weighs $30\frac{1}{2}$ pounds.

THE E. S. B. CELL.

The "Ironclad-Exide" cell, type "7-MV," is shown in Fig. 3. The positive plate is of novel construction. It has a grid composed of a number of parallel, vertical metal rods united integrally with the horizontal top and bottom frames. Each rod forms a core which is surrounded by a cylindrical pencil of peroxide of lead, the active material. This, in turn, is enclosed by a hard rubber tube having a large number of horizontal slits. These serve to provide access for the electrolyte or solution to the active material, and yet are so fine as to practically eliminate the washing out of the material. The outside tubes are reinforced by leaving the exposed edge solid, that is, without slits.

Each tube has two parallel, vertical ribs projecting on oppo-

site sides at right angles to the face of the plate and these not only serve to stiffen the tubes, but also act as insulating spacers. The rubber tubes have a certain amount of elasticity, allowing them to compensate for changes in volume of the active material, due to expansion and contraction during charge and discharge. The negative plate consists of gray spongy lead and the top and bottom edges are encased in rubber vulcanized in place. This eliminates the possibility of short circuits from

FIG. 3, "IRONCLAD-EXIDE" CELL—TYPE "7-MV."

A—Positive Plate, B—Hard Rubber Tubes, C—Hard Rubber Jar, D—Hard Rubber Vent, E—Soft Rubber Plug, F—Hard Rubber Cover, G—Wood Separator, H—Positive Plate, I—Hard Rubber Insulator.

material bridging across from the positive frames. The negative frames are undercut so that the rubber sheathing is flush and does not project beyond the surface of the plate. There are 7 plates, which measure $5\frac{3}{4}$ by $8\frac{5}{8}$ inches, and the discharge in amperes for $4\frac{1}{2}$ hours is 21. The rubber jars are $2\frac{3}{4}$ by $6\frac{1}{8}$ by 12 $\frac{3}{8}$ inches high and weigh 22 $\frac{3}{4}$ pounds.

THE U. S. H. & L. BATTERY CELL.

The positive plate of the U. S. H. & L. type "WB," shown in Fig. 5, is made up of antimonious lead grids of the staggered bar type. A paste mixture of oxides forming the active material is forced into the cells of the grid under pressure, giving the finished plate a dark brown color.

The grid of the negative plate is made up of an antimonious center web with thickened edges to give it strength and rigidity.

FIG. 4, THE U. S. H. & L. VEHICLE BATTERY.

The active material is applied under pressure, resulting in a finished plate of a slate gray color.

The bridges in the hard rubber jar have soft rubber tops on which the plates rest. These act as shock-absorbing cushions. The size of the plates is $5\frac{3}{4}$ by $8\frac{5}{8}$ inches, and the 7-plate cell will discharge 21 amperes in 4 hours. The jars measure $2\frac{3}{4}$ by $6\frac{1}{8}$ by 13 $\frac{3}{8}$ inches high, and the cell complete weighs 22 $\frac{3}{4}$ pounds.

THE EDISON BATTERY CELL.

The Edison type "A-4" cell consists of four positive, and four negative plates. (See Fig. 6.) The former are made of per-

FIG. 5, U. S. H. & L. CELL—TYPE "WB-7."

forated nickel-plated steel tubes, filled with alternate layers of nickel hydrate and metallic nickel flake. The negative plate contains pockets of perforated steel, holding iron oxide, the negative active material. The four positives are supported on a horizontal rod, forming part of the pole or terminal. They are spaced apart by nicked steel washers, and clamped firmly by a nut on each end of the rod. The five negatives are similarly mounted on their pole. The two groups are then assembled. In order to support rigidly the edges of the plates, there are placed thereon two hard-rubber "ladders," each of which has grooves into which the plates fit. The compact mass is then ready for the can.

The hard-rubber "stool," or plate support, is then placed in the can bottom, and the grouped elements pushed in. Two

FIG. 6, EDISON CELL—TYPE "A-4."

thin sheets of hard rubber are next placed between the outside negatives and the can ends, and after a hard-rubber washer is slipped over each pole, the top is placed in position and welded on.

A hard rubber bushing is next placed over the poles to insulate them from the can top. Into the little well around each pole is placed a pure gum gasket, followed by a metal ring. The hard-rubber threaded glands are forced home, resulting in the compression and expansion of the gasket, with consequent sealing around the poles. Mounted on the top between the two terminals is the gas vent and filling aperture combined.

The electrolyte is then put into the cell. This is composed

of 21 per cent solution of chemically pure potassium hydrate and distilled water, to which is added a small amount of lithium hydrate.

FIG. 7. THE EDISON VEHICLE BATTERY.

STARTING, LIGHTING AND IGNITION BATTERIES.

The batteries used in connection with electric starting systems are selected for their ability to crank the engine at sufficient speed, and for a sufficient length of time, to insure positive starting, especially when the engine and mechanism is stiff, due to cold weather or mal-adjustment.

The rates of discharge are high, yet the starting battery must occupy little space and be of minimum weight. It must withstand shocks, jolts, short circuits, charges at 16 times above normal rates, and discharges at 25 times above the normal or ideal rate.

FIG. 8. THE WILLARD STARTING BATTERY.

FIG. 9. THE "EXIDE" STARTING BATTERY, HORTS.

The cells are assembled in batteries, charged and discharged three times, and finally inspected, when they are ready for use. The "A" type cell with 4 positive plates discharges at the rate of 30 amperes for 5 hours. The dimensions of the cells are 2 11/16 by 5 1/8 by 13 7/16 inches high and weigh, complete, 135 pounds.

For lighting purposes a high capacity battery is necessary, owing to the greater amount of current needed. Ampere discharge rate plus capacity in hours is the only true indication of battery value. The lower the discharge rate in amperes the greater the capacity in hours obtained. Lighting batteries may also be used for ignition and operating electric

AUTOGRAPHIC FRICTION TEST OF HOSE AND BELTING.

THE methods and resultant autographic charts of hose and belting friction tests made on the autographic testing machine that was illustrated and described in THE

INDIA RUBBER WORLD, May 1, 1916, are shown in the accompanying illustrations through courtesy of the Bureau of Standards, Washington, D. C.

The views show only the upper details of the machine as it appears when making the tests. The one on the left is seen with the hose sample in place and the autographic pen recording the friction or adhesion between the plies at all points of the strip being tested. The sample consists of a round section of hose one inch wide, and is fitted over a mandrel that revolves in a fork suspended from the top of the machine, the detached end of the fabric being secured to the lower grip.

On the right the machine is shown while making a rubber belting test and recording the variations of the friction curves at the same time. The test piece consists of a one-inch strip containing two plies that are separated for a short distance to afford space for attaching the grips. One end is attached to the upper and the other to the lower grip, and as the plies are pulled apart by the machine the autographic attachment records the adhesiveness at all points of the sample strip.

RECORD OF BELTING TEST.

RECORD OF HOSE TEST.

The charts shown above are exact reproductions of the records made of the above tests at the Bureau of Standards. The figures on the left margin of the charts represent the tension in pounds.

The variation at any point on the strip being tested is readily seen by referring to figures at the bottom of the charts. These figures represent the length of the strip tested, in inches.

A tire filler that has been recently exploited in Chicago by mysteriously withholding the name and sponsors of the compound is now announced as "Tireoid." It is manufactured by the Tireoid Co., 1200 Michigan avenue, Chicago, Illinois. W. L. Rohrer, of Chicago, is president, and among other prominent men connected with the company are A. Watson Armour, Martin J. Insull, Lafayette Markle and James Levy. The compound was invented and patented by R. T. Garvin.

The National Rubber Co., Elgin, Illinois, has recently increased its capital stock from \$10,000 to \$60,000.

Rubber Club of America Outing.

MEMBERS of the Rubber Club of America, Inc., were in a state of preparedness for at least 60 days prior to July 18—preparedness for the outing of the club scheduled for that date. Reports were rife that every wielder of a golf club was working every Saturday as well as every spare evening as long as it was light enough to see a golf ball, and it is intimated that some of them painted these balls with phosphorescent material in order to prolong their practice. It was the same way with tennis players, swimmers and quoit pitchers. All were practicing in order to capture some of the handsome prizes the club was sure to offer in the contests.

The time, as stated above, was July 18, all day and part of the night. The place, Vesper Country Club, Tyng's Island, on the Merrimac River, near Lowell, Massachusetts. It is doubtful if a more suitable place could be found in any one of a dozen states. Those who attended the outing there last year knew

eral sales manager of the B. F. Goodrich Co., and Secretary C. B. Raymond of the same company.

The Firestone Tire & Rubber Co. was also represented by R. J. Firestone, S. G. Carkhuff, J. W. Thomas, R. E. Glass, H. W. Kugler, C. A. Myers, H. J. Adams, E. C. Knox, H. W. Smith, and last, but by no means least, E. S. Babcox, the advertising manager.

Besides Messrs. Rutherford and Raymond, the Goodrich

this, and those who came this year for the first time agree unanimously with the others.

company's force was represented by E. C. Tibbetts, the advertising manager, W. H. Yule, W. C. Geer, H. E. Kelly and H. M. Bacon.

The Goodyear Tire & Rubber Co. had as its quota, Vice-president P. W. Litchfield, W. D. Shits, M. E. Morris, E. S. Stevens and R. H. Daniels.

Others of the party included President Thomas F. Walsh, of the Swinehart Rubber Co.; President H. W. Dupuy, of the Pennsylvania Rubber Co.; E. C. McGraw, of the McGraw Tire & Rubber Co.; Treasurer C. W. McLaughlin, of the Mohawk Rubber Co.; Vice-president J. H. Kelly, of the Republic Rub-

MEMBERS AND GUESTS OF THE RUBBER CLUB OF AMERICA, INC., AT THE

And there were many new-comers this time. For instance, two special Pullman cars started from Akron, Ohio, on Sunday night with nearly 40 rubber men, in charge of H. S. Firestone, president of the Rubber Club; W. O. Rutherford, gen-

ber Co.; Frank Lahey, Harold French, William McArthur, Jack Handy, Sydney D. Gridley, Leroy Wood, W. H. Bass, A. R. White and Harry Henderson. This big delegation arrived in Boston, Monday noon, where they were met by representatives

of the Eastern manufacturers, and after a lunch at the Copley Plaza, were taken in automobiles to various points of interest on the North Shore, and to dinner at the Masconomo House at Manchester, Massachusetts, returning late in the evening.

Monday night a train of five sleepers and a buffet car left New York City with about 80 rubber men from that city and nearby manufacturing centers, which ran direct to Lowell and debarked the passengers at the land end of the famous vibrating suspension bridge leading to the grounds.

The Boston contingent, between 100 and 200 strong, and the Lynn Cadet Band came in another special train to the same spot. Besides those who arrived by rail, there were automobiles a-plenty. Massachusetts cars, of course, were in the majority,

TEAM WORK DRIVE. YOUNG, A LONG DRIVE, AND JONES, A STRAIGHT DRIVE, IN COMBINATION DRIVE. RESULT, A LONG STRAIGHT BALL.

but there were Mr. Darrach's and another car from Connecticut, Mr. Milligan's from New Hampshire, Mr. Murray's from New Jersey, Mr. Firestone's from Ohio, and Mr. Berkenstein's from Illinois.

The new-comers, or perhaps we should say, those who attended for the first time, certainly had no cause for complaint at their cordial reception. Old acquaintances or new, it was a hearty welcome of good fellowship. No one stood on ceremony. There was the usual sorting out into bunches of congenial members, and those who did not care to enter into the strenuousness

players. There were so many entering some of the contests that it took the main part of the day to choose the winners by the process of elimination. As a guess, there were probably 50 entrants in the quoit contest, which finally narrowed down to two, F. Feinburg securing the first prize, a fine chafing

THE WATER SPORTS INTERESTED MANY PARTICIPANTS, AND A HOST OF SPECTATORS.

disk, and A. R. White capturing the second prize, an electric lamp.

The clock golf contest was to start at noon, but as lunch was announced at the same hour, the game was postponed until after this feature of the program. Seated around tables under the shadow of great trees, the members were served edibles and drinkables to their heart's—or their stomach's—content. Meanwhile the band played—in fact the band played pretty continuously all day and evening, sometimes with a volunteer leader to whom, in his good nature, Leader Lurvey temporarily surrendered his baton.

The clock golf interested 37 contestants and as many spectators as could be accommodated around the rim of the field. H. S. Firestone started off. His score was 21. There were four whose score was 23 and who were therefore pronounced the "Skidoo Club." The contest finally narrowed down to P. E. Young and R. L. Chipman, who tied at 18. Chipman said Young was taking too many prizes, so he beat him 21 to 22, and won a pair of beautiful silver mounted hair brushes.

In the golf tournament, W. S. Carleton held the best gross

SEVENTEENTH ANNUAL OUTING AT LOWELL, MASSACHUSETTS, JULY 18, 1916.

of the sports, found enjoyment in quieter ways on the clubhouse veranda.

The elaborate series of tennis courts were occupied practically all day. The golf course, a splendid one, was never free from

score, 83. E. C. Clark and F. H. Jones were tied for best net, Clark's score being 84, handicap 8, net 76, and Jones scoring 91, handicap 15, net 76.

Harry Tyer had charge of the ball game. In order to get it

started, and to secure a fairly large "bleacher" crowd, he induced the band to march at the head of the players to a spot on the main land, either in New Hampshire or Massachusetts, this point being disputed by those who walked in the hot sun and those who rode comfortably in automobiles. Arrived at the ball field, they found it newly mowed, while a twentieth century Maud Muller and her father cleared the diamond for the game. As the thermometer registered 90 degrees in the sun, and there was no shade, the game was certainly a hotly contested one, the Giants against the Red Sox, and both against the umpire. F. H. Appleton, Sr., was the umpire, and his decisions were the cause of much good-natured raillery. The heat, the strenuousness of the work, the anxiety of each captain to win, resulted in so many changes that the score sheet looked like a plan of battle in Europe. The score was 5 to 1 in favor of the Giants.

CLARENCE H. LOW, WHO DONATED THE MAGNIFICENT CUP FOR THE INTER-FIRM DOUBLES COMPETITION.

From the sizzling hot baseball field to the water sports was a grateful change. Bathing suits were provided, and some who didn't enter the tilting or swimming matches, took a plunge in the cooling river. The swimmers shot through the water as if New Jersey sharks were pursuing them, but C. E. Murray led all the rest at the end of the 100-yard race, and was awarded a silver pocket-knife of the most approved Maine State prohibition pattern.

There was rare fun in the canoe-tilting contest, which was won by A. R. White, who flourished the pole, and H. N. Grieh, who presided at the paddle. The prize was a "library" set.

There were many pillow fight duels in the cock fight contest. W. L. Pitcher downed every antagonist, and won a pair of gold sleeve-links. A handsome cut glass silver-mounted bottle went to P. E. Young for the longest drive in the driving contest.

Eighteen couples entered the three-legged race, and some very curious and furious hustling resulted. Haldane and White were the final winners, and each carried home a fine thermos bottle as a prize.

Clarence H. Low, of the United States Rubber Reclaiming Co., Inc., generously donated a beautiful silver and copper cup to be contested for in the Inter-Firm Doubles Competition, this trophy to become the permanent possession of the firm member of the club whose team wins it three times. Teams will consist of two representatives of each firm member, but need not necessarily be the same players each year. Teams from seven firms participated in the initial contest. They represented Gove & French, Inc., J. T. Johnstone & Co., United States Rubber Reclaiming Co., Firestone Tire & Rubber Co., Hood Rubber Co., United States Rubber Co. and Plymouth Rubber Co. The contest narrowed down to the Gove & French and the J. T. Johnstone teams, the latter winning by a score of 6-3, 6-3 and 6-2. This firm will hold the cup until next summer's outing, when it is believed that even a larger number of teams will enter the contest. The singles tennis matches had 21 entrants. Many of these were also in the doubles, and the day was not long enough nor the players' strength sufficient to decide the contest. The

winners of the semi-finals were John L. Handy and Clarence H. Low. The final playoff was at the New York Athletic Club, Travers Island, Mr. Handy showing the true sporting spirit in coming from Akron on July 26 for the purpose. Mr. Low won, the score being 6-2, 6-2, 4-6 and 6-2. Mr. Handy did not go back empty-handed, but carried a handsome silver cup as second prize.

The call for dinner was answered with alacrity. All appe-

THE CANOE TILTING CONTEST WAS EXCITING AND AMUSING.

tites were sharpened; if not sufficiently so, at each plate was found either a hatchet or a dagger, murderous in appearance, but found to be of rubber, and harmless. Each man was furnished a handsome fez and a necktie, both of red rubber, which he was directed to wear, and the assembly presented the appearance of a lodge of Shriners.

The menu was ornamented with a drawing of a rubber plant, with several human heads "rubbering." The substantial were:

Cocktails	Strained Mushrooms	Clams
Olive	Chau Bonbon	Radishes
Poached Live Lobster	Julienne Potatoes	Cheese
Cigars	Champagne	Cigarettes
One Half Stuffed Native Chicken	Delmonico Potatoes	Green Corn
New Peas	Canterbury and Ice Cream	Roast Beef
Roast Beef	Toasted Crackers	Cafe Noir

THE OUTING COMMITTEE: F. H. APPLETON, JR., ROBERT L. RICE and PHILIP E. YOUNG.

As is the invariable rule, no speeches were delivered at or after the dinner. At its conclusion, the Boston contingent boarded the special train in waiting, and an hour later the New York train took its quota and some of the Westerners back to New York, and thus ended an occasion which will long be remembered by all who participated.

Much credit for the smooth running of the whole affair must be given the committee: Philip E. Young, Robert L. Rice and F. H. Appleton, Jr., as well as those having special charge of the contests: M. G. Hopkins, Clarence H. Low, W. L. Pitcher, Wallace G. Page, Henry G. Tyler, Raymond Drake, Lloyd E. Appleton and Thomas F. Kimball, all of whom added to the enjoyment of the occasion.

Rubber Cements in Leather Goods Manufacture.

ONE of the most valuable uses of rubber, and also a most wide spread one, is as an adhesive. As such, it is a necessity in many trades. Rubber cements are many and varied, differing in properties and qualities according to the requirements of the various uses.

In manufactures of leather, good rubber cements are especially valuable. While many leather articles are made by stitching the different parts together, others, particularly those of lighter leather, are fastened wholly by cementing, or by cementing and then reinforcing by stitching. Rubber cements figure in many trades. Bag and pocket-book makers, hatters, box makers and shoe manufacturers use large quantities. These cements are used today for purposes which years ago were undreamed of. Some of them have a tenacity sufficient to be used in processes where formerly tacks were employed. This is the case with sole-laying cement, used in shoemaking, to hold the sole in place to the lasted upper, preliminary to stitching.

And in many other processes of shoe manufacture cements are used, their composition varying to adapt them to the special work they are required to perform.

In trade parlance, cements made of gutta percha are included under the generic name of rubber cements, though the purist might pronounce such a misnomer. As a rule, cements are mainly solutions of gums in naphtha. There are other solvents: chloroform, ether, bisulphide of carbon are efficient for this purpose, but are too expensive for general use. For some degrees of tenacity gum mastic, gundac, or ordinary rosin is added. Such cements require heating and softening to apply, but these ingredients add brittleness, a quality which unites cements containing them for joining where suppleness is required.

SOLE-LAYING CEMENT.

To make a cement for sole laying, the following formula is recommended: Lagos buttons or strips, 10 pounds; Pontianak, 5 pounds; naphtha, 20 gallons. This is also used as an oil proof.

CHANNEL CEMENTS.

Channel cements are used to close the lip of leather which has been raised to allow the sole to be stitched to the welt, the object being to cover the stitches and give a smooth, unbroken finish. For such cement various formulas are presented. For these, the rubber used is washed but not sheeted. Three of these are similar, but the quantity of rubber varies. Each contains 5 pounds of rosin and 40 gallons of naphtha, but one calls for 10 pounds, the second for 20 pounds and the third for 30 pounds of Para rubber.

A fourth channel cement calls for 10 pounds of Madagascar pinky, 40 ounces of rosin and 20 gallons of naphtha.

Number 5 requires 12 pounds of Madagascar rubber, 12 pounds of Madagascar niggers, 8 pounds of rosin, 2 pounds of common pitch and 50 gallons of naphtha.

Another channel cement receipt is 6 pounds of fine Para rubber, 4 pounds of hard African rubber, 16 gallons of naphtha, and of rosin, 3 pounds in the summer or 2 pounds in winter.

COLORED CEMENTS.

If colored cements are desired, most formulas are practically the same as the first three channel cements mentioned above, with aniline dyes in proper proportions. For instance, a batch of 40 gallons, to be colored black would require $\frac{1}{2}$ ounce of black aniline. For red cement, $\frac{1}{2}$ ounce of red aniline is needed to each 40 gallons. Blue cement would require 2 ounces of blue aniline. Green cement should have 2 ounces of green aniline. Yellow cement needs 3 ounces of yellow aniline to acquire the proper color. Another black cement is made of Para rubber,

20 pounds; rosin, 5 pounds; bone black, 5 ounces; and naphtha, 40 gallons.

WELTING CEMENT.

For wetting cement 10 pounds fine Para rubber (sheeted) and 5 ounces of sulphur, are mixed and dissolved in 10 gallons of naphtha. A somewhat similar paste cement is 10 pounds of Majunga rubber (sheeted) and 20 gallons of naphtha. Where it is necessary that the cement shall not stain, as in cementing shoes of white leather to canvas, a paste cement is made of East Indian pale crepe, 20 pounds, to 50 gallons of naphtha.

FOR SHOE REPAIR.

Shoe repairers use cements to patch leather shoes. By skiving the patch down to a thin edge, and cementing, a much neater job is done than in the now almost obsolete way of stitching the patch on. For such purpose either one of the channel cements or wetting cements mentioned above are suitable.

RUBBER HEEL CEMENTING.

For attaching rubber heels and soles a special cement is recommended, which is made as follows: gutta percha (finely cut), 20 parts; ammonium sulphide, 18 parts; benzol, 3 parts; and turpentine, 24 parts. This combination is dissolved by shaking in a container at a slightly warm temperature, after which 35 parts of finely powdered asphalt are added, and the closed container thoroughly shaken for several days. This cement, which has a syrupy consistency, is warmed by immersion of the container in boiling water, and applied to the leather surface, properly prepared for it; then the sole or heel is laid on and subjected to a heavy pressure. A second cement for this purpose, which dries more quickly than the above, is made in two solutions, equal parts of each being mixed together at the time of applying. One solution contains 20 parts of finely cut gutta percha and 80 parts of ammonium sulphide. The second solution is 20 parts of shellac, 2 parts of crude turpentine, and 70 parts of alcohol.

PRECAUTIONS NECESSARY.

Leather and rubber surfaces, to which rubber cements are to be applied, need special preparation to secure successful adhesion. Both should be roughened,—the leather, to produce a fibrous surface for the penetration of the cement; and the rubber, for the removal of any incrustation of sulphur or talc. If the leather is at all oily a washing of the buffed surface with benzol is recommended.

For use on leather which contains oil, a cement is manufactured which contains a percentage of talc, powdered soap-stone, whiting, or some similar substance. This absorbs the oil, and allows the cement to perform its function. These substances do not dissolve, but are held in suspension in the cement, which must be thoroughly agitated before applying. Such cement is particularly useful in turning in the skived edges of shoe uppers, to produce a smooth finish.

PATCHING RUBBER SHOES.

Shoe repairers are often called upon to patch rubber footwear. A cement made for this purpose is made of Para rubber, 20 pounds; rosin, 8 pounds, and turpentine, 80 pounds.

RUBBER BLACKINGS.

Two receipts for rubber blacking may be appropriately given in this connection. A rubber blacking formula recommended is: caoutchouc oil, 12 pounds; acetic acid, 12 pounds; vinegar, 12 pounds; molasses, 20 pounds; and lamp black, 44 pounds.

A liquid blacking contains caoutchouc oil, $\frac{4}{5}$ pounds; sulphuric acid, 12 $\frac{1}{2}$ pounds; vinegar, 27 pounds; gum arabic solution, $\frac{1}{2}$ pound; molasses, 23 $\frac{1}{2}$ pounds; bone black, 32 pounds.

What the Rubber Chemists Are Doing.

VULCANIZING BY ULTRA-VIOLET RAYS.

A FRENCH chemist, H. Olivier, has perfected the following method for vulcanizing rubber solutions by ultra-violet rays. The rubber solution, containing free sulphur, with or without certain organic or inorganic sulphides which are decomposed by ultra-violet rays, such as carbon bisulphide, allyl sulphide, or antimony sulphide, passes from a hopper on to an endless steel band, which is carried by guide rollers round the greater part of the periphery of a mercury vapor lamp. The lamp is surrounded by a double, hemicylindrical water-jacket of quartz, in order to cut off heat rays. The time of exposure is quite short, in order to avoid the deleterious effect of prolonged exposure to ultra-violet radiation on the rubber. As an example, a layer of solution a fraction of a millimeter thick, at a distance of 5 centimeters from the lamp, which is operated at 220 volts and 5 amperes, requires an exposure of about 40 seconds. After passing the lamp the solution is removed from the endless band to a receiving vessel by means of a scraper.

AGING TESTS.

C. Beadle and H. P. Stevens have tested the keeping quality of vulcanized material, from rubber prepared after the manner proposed by B. J. Eaton of the Department of Agriculture of the Federated Malay States, who suggested the treatment of rubber coagulum with caustic soda, sodium carbonate, or lime, to obtain a product having a very rapid rate of cure. The result of the test made by Beadle and Stevens shows that such rubber when vulcanized deteriorates on keeping, and sooner or later "perishes."

A series of experiments, conducted by C. D. Kratz, on accelerating vulcanization by increasing the temperature, leads to the conclusion that if a compound is correctly vulcanized the temperature at which it is vulcanized in no way affects its aging properties, and the author decides that it is therefore safe to increase the temperature of vulcanization (within reasonable limits) for the purpose of increasing output, provided that the highest temperature which may be employed corresponds with the shortest time capable of definite measurement under the conditions of vulcanization.

PLASTIC SUBSTANCES.

The war has necessitated the economy of such volatile solvents as ethyl alcohol and ether for use in the manufacture of explosives. In 1914 Henri Barthelemy, of Paris, published a study of this subject (See *THE INDIA RUBBER WORLD*, March, 1915, page 324). In a recent issue of "Le Caoutchouc & la Gutta Percha" he reverts to the subject from a mathematical point of view. He finds it practicable to recover at least 50 per cent of these solvents from the air containing them. Two systems are available for the purpose. One of these is the Claude process, which depends on heat absorption by expansion of the air in molecular contact with the solvents. The other is the ordinary system of refrigeration by machines using ammonia or carbonic and sulphuric anhydrides.

Each method has advantages and disadvantages. The Claude is simple and economical of space, with low freezing efficiency, while the other system is more complicated, occupies more space, but is more effective.

The well-known French rubber chemist, André Dubosc, has recently discovered a new process for separating pure rubber from combined sulphur in reclaimings. He is said to be now perfecting the industrial application of this discovery.

METHODS OF ANALYSIS.

BARIUM CARBONATE IN VULCANIZED RUBBER.

THE method of J. B. Tuttle for the determination of barium carbonate in vulcanized rubber is as follows: One gram of the rubber is placed in a porcelain boat and ignited in a current of carbon dioxide in a glass tube. The residue is finely ground, treated with 5 to 10 grams of ammonium carbonate, 15 to 20 cc. of strong ammonia, and 50 cc. of water, and boiled for 15 to 20 minutes, to convert lead sulphate into carbonate. The insoluble matter (barium sulphate and carbonates of lead, barium, calcium and zinc) is filtered off, washed to remove soluble sulphates, and treated with 10 cc. of glacial acetic acid and sufficient water to make the total volume 100 cc. The solution is heated to boiling and filtered. Lead is removed from the solution by precipitation as sulphide, and the barium then determined as sulphate. This gives the barium present as carbonate, and the barium present in the rubber as sulphate is obtained by the difference.

CHEMICAL TREATMENT OF RUBBER.

THE UNITED STATES.

PRODUCING SUBSTANCES RESEMBLING CAOUTCHOUC. The process consists in polymerizing isoprene in the presence of from 2 to 5 per cent of isoprene ozonide. [Henry S. A. Holt and Gerhard Steinig, assignors to Badische Anilin & Soda Fabrik, Ludwigshafen, Germany. United States patent No. 1,189,110.]

PROCESS OF RECLAIMING RUBBER. The waste rubber is heat-treated with protein in the form of an albumin. [Harold B. Murdock, Assignor to Rubber Regenerating Co., both of Naugatuck, Connecticut. United States patent No. 1,189,282.]

RECLAIMING RUBBER WASTE. The process of reclaiming rubber waste containing lead and sulphur by adding a reactive substance such as zinc sulphate, to form, with the sulphur and lead respectively, a light colored water-insoluble sulphide and a light colored water-insoluble lead salt, and converting the lead sulphide into the said light colored sulphide, and lead salt, through the action of the reactive substance (zinc sulphate). [Harold E. Murdock, assignor to Rubber Regenerating Co.—both of Naugatuck, Connecticut. United States patent No. 1,189,721.]

THE UNITED KINGDOM.

PROCESS AND APPARATUS FOR COAGULATING LATEX. Latex is supplied to tubes provided with longitudinal slots, arranged at top of a chamber into which a coagulating vapor or gas, such as carbon dioxide or smoke, is admitted. The latex flows from the slots on to a series of inclined glass or other plates, arranged vertically one below the other, in such a way that the uncoagulated latex from the top plate is received by the second plate of the series, and so on. The plates are in parallel pairs, pivoted about a horizontal shaft, so that when a layer of sufficient thickness has been formed on the upper plate of a pair, the pair can be rotated through 180 degrees to enable the under plate to receive the latex. By this method it is possible to separate the rubber from a given latex into different grades or qualities. [W. G. ten Honte de Lange, Jr., Bandoery, Java, and C. Bosman, Haarlem, Holland. British Patent No. 10,382 (1915).]

THE FRENCH REPUBLIC.

PROCESS AND APPARATUS FOR TREATMENT OF LATEX. Latex is placed in shallow aluminum trays (about 50 by 20 centimeters) to a depth not exceeding 2 centimeters, and the trays are packed on shelves in a chamber. A charge consists of

350 trays. Smoke, previously cooled, is passed through the chamber from a smoke generator for about 20 minutes, after which communication between the chamber and the chimney is closed, and the passage of the smoke into the chamber continued for about an hour and a half. The progress of the coagulation is observed through a glass window; and the chamber is kept closed for half an hour after the coagulum has shrunk away from the sides of the trays. The smoke is then allowed to escape, the chamber opened, the trays are allowed to stand for two hours, and the serum is poured off. The coagulum is transferred to a large tank of water, in which it is left over night, the sheets of rubber are washed with changes of water, and each sheet is then exposed to sunlight for one to two hours, after which it is lightly pressed in an iron or wooden mold and allowed to dry in the air for five or six days. [F. Ripeau. French patent No. 477,238, June 5 (1914).]

APPARATUS FOR VULCANIZATION BY ULTRA-VIOLET RAYS. See note preceding. [H. Olivier. French patent No. 477,204 (June 3, 1914).]

LABORATORY APPARATUS.

HYDROGEN SULPHIDE GENERATOR FOR INDIVIDUAL USE.

WHEN small amounts of hydrogen sulphide are desired the generator shown in the illustration will be found very convenient. As described by H. A. Noyes, the apparatus is essentially two ordinary test tubes, one of which just slips inside the other. Blow a small hole in the bottom of the smaller tube, insert a stick of ferrous sulphide, close the open end with a one-holed rubber stopper that has been fitted with a delivery tube.

To use: Fill the larger tube about one-third full of dilute acid and slip the smaller tube down into the acid. Gas is generated and conducted directly to the solution to be tested. When through using, the inner tube is quickly raised, stopper removed and the delivery tube and test tube washed out under the tap. This serves as a very satisfactory apparatus for individual use for the generation of small amounts of hydrogen sulphide. It is extremely simple and can be kept "ever ready" in the test tube rack.

A CRUCIBLE "FORK."

This little device, credited to H. G. Parker, of William Jewell College, Liberty, Missouri, has proved very practical and convenient. It was designed for the use of students, but may appeal to chemists in general. The fork is made of stout aluminum wire. The prongs of the fork enclose slightly more than a semi-circle and should be bent to fit the crucible used. The space between the ends of the prongs should be large enough to pass around the crucible when supported on a tripod, but small enough to prevent the crucible from slipping out when the fork is lifted. When

properly adjusted the crucible is held very securely.

A HIGH TEMPERATURE BURNER.

The Scimatco laboratory burner illustrated below produces a short, wide flame that is uniformly hot, and the coolest part of it is hotter than the hottest part of a Bunsen flame. The extremely high temperature of the flame of this burner is due to perfect mixture, maximum speed and the preventing of back-firing by the special design of the burner. The latter feature consists in the use of a grid of pure nickel $\frac{3}{8}$ inch thick, placed at the top of the tube.

For many purposes the burner replaces the blast lamp, with a saving of 98 per cent in gas and the elimination of expense, and noise of the blast. The non-reducing flame of the Scimatco burner is particularly suited for heating platinum ware, as it prolongs the life of the metal tenfold over that possible with the ordinary blast burner. [Scientific Materials Co., Pittsburgh, Pennsylvania.]

SPECIFIC GRAVITY BALANCE.

The illustration shows a very conveniently arranged triple-beam balance for general chemical use, and for taking specific gravities. Weighings are obtained by movement of the riders along the beams. These riders are easily handled and quickly placed in notches, but cannot be removed from the beams. An adjustable support is provided for holding a vessel of water in the case of specific gravity weighings. The three beams are placed in the same horizontal plane. Capacity of the middle beam is 100 grams by 10 gram divisions; back beam, 10 grams by 1 gram divisions; front beam, 100 centigrams by 1 centigram divisions. Total capacity, 111 grams; sensibility, 1 centigram. [Voland & Sons, New Rochelle, New York.]

VACUUM DESICCATOR.

The "home-made" vacuum desiccator devised by Dr. Percy A. Houseman, shown in the illustration, has proved very practical in drying materials *in vacuo* above room temperature. The apparatus is made from a percolator fitted with a desiccator lid.

The temperature at which the sample is dried may be regulated by varying the height above the electric bulb of the glass triangles attached to the tripod.

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

LABORATORY APPARATUS PATENT.

UNITED STATES.

- 1,190,085. Viscosity testing apparatus. Hans F. Bauer, Cedar Rapids, Iowa.

SELECT METHODS OF ANALYSIS OF GOLDEN SULPHIDE OF ANTIMONY.

GOLDEN sulphide of antimony, or antimony pentasulphide, is a product of prime importance for the vulcanization of many rubber articles, notably for automobile inner tubes and surgical sundries.

The preparation of antimony pentasulphide is very delicate and if the different phases are not conducted with every required precaution, there is risk that a product will be obtained which will possess none of the qualities required in rubber manufacture. Pure pentasulphide of antimony is both an orange red pigment and a vulcanizing agent. It is capable, at the ordinary temperatures of vulcanization, of partially decomposing, with the liberation of 2 molecules of sulphur, becoming reduced to the red or trisulphide of antimony.

According to the method of its preparation, it is capable of carrying more or less free sulphur, besides antimonious acid, antimonates, red trisulphide, oxysulphides of antimony and of sulphate of lime.

Besides these substances, which are legitimate impurities of manufacture, there may be found flowers of sulphur, added mechanically, vermilion or red sulphide of mercury and oxide of iron added to produce a tone.

Before using it one should submit it to a thorough analysis to determine its exact contents of free sulphur and actual pentasulphide.

True golden sulphide should contain only antimony and sulphur. It should be neutral or slightly alkaline. If it is acid, its color deepens, loses its clearness and becomes maroon. This defect of acidity is one by which one is able to detect hurried manufacture and insufficient or hasty washing.

It should be very nearly impalpable and perfectly dry, a condition difficult to attain, except by vacuum drying process, because the drying temperature must not exceed 70 degrees C.

Various methods have been proposed for the analysis of golden sulphide, and some of them readily furnish knowledge of the commercial products on the market.

They are summarized below:

FREE SULPHUR

To use intelligently a golden sulphide, it is always necessary to know its free sulphur.

Herbst's Method.—A known weight of pentasulphide is extracted in a Soxhlet by freshly distilled sulphide of carbon for 8 or 10 hours. The sulphur solution is transferred to a tared beaker, evaporated on a water-bath and sulphur weighed after drying in an oven at 100 degrees C.

Weber's Method.—Ammonia dissolves the pentasulphide of antimony at a moderate temperature. Antimony oxide and free sulphur are insoluble.

A quantity of golden sulphide is dissolved in concentrated ammonia, gently heated on a water-bath, thrown on a tared filter and the residue washed with ammonia until the filtrate will no longer precipitate pentasulphide by acidifying.

The insoluble residue is dried at 60 degrees C., and extracted for 6 hours with freshly distilled sulphide of carbon.

The residue on the filter is practically antimonious acid which can be dried and weighed.

The bisulphide of carbon used for the extraction is evaporated on a water-bath, the residue is dried at 60 degrees C., and the sulphur weighed.

This method is long, but if the pentasulphide dissolved in ammonia is reprecipitated by acid, filtered and dried, one is able to determine by the same analysis the free sulphur, pentasulphide and antimonious acid.

COMBINED SULPHUR

Caspari's Method.—The analysis is made on a half gram sample from which the free sulphur has been removed by carbon

bisulphide. The extracted antimony sulphide is added gradually into 5 cc. pure nitric acid in an Erlenmeyer flask and the mixture cooled by immersion in water. The antimony is thus completely oxidized, but a certain quantity of the sulphur remains in the form of yellow masses. The flask is then slowly heated by immersion in boiling water, care being taken to guard against the fusion of sulphur. From time to time a pinch of potassium chlorate is added, until all the sulphur has disappeared.

The mixture is then transferred to a dish and evaporated to dryness.

The residue is taken up in 400 cc. of boiling water, with addition of a little tartaric acid, to keep the antimony in solution. The sulphuric acid formed is determined, in the usual way, as barium sulphate.

ANTIMONY.

Caspari's Method.—The determination of antimony should be conducted on a sample from which the free sulphur has been extracted, because it otherwise prevents the solution of the antimony sulphide in the acids. One-half gram of sulphur-free pentasulphide is dissolved in 10 cc. of hydrochloric acid and the sulphureted hydrogen expelled by boiling; 2.25 grams of tartaric acid and 200 cc. of water are added and the whole boiled. Any residue of silica should be filtered from the solution on a tared filter, dried and weighed. The antimony tartrate in the filtrate is precipitated as antimony sulphide by a current of hydrogen sulphide. The antimony sulphide is transferred to a large porcelain crucible and 3 cc. nitric acid is added to it. The crucible must be covered to prevent loss.

When the action is over, the mass is evaporated until dry, by immersion of the crucible in boiling water; then a few drops of nitric acid are added to the residue and the crucible is heated, first, slowly, over a small flame, then more powerfully, to expel the sulphur and the acid, and, lastly, calcination is effected. The antimony present is weighed as SbO_2 and calculated as pentasulphide.

WATER.

Moisture is determined by drying 10 grams of pentasulphide either in a vacuum oven or in an ordinary oven in a current of nitrogen at a temperature not exceeding 60 degrees C. The percentage of moisture present should not exceed one per cent.

VERMILION.

The pentasulphide is totally soluble in ammonium sulphide without the application of heat, while vermilion is not soluble. In this manner these two substances can be separated.

After washing, the vermilion precipitate is dried and weighed.

If a commercial golden sulphureted contains pentasulphide, red trisulphide and vermilion, an aliquot part is first treated by cold ammonium carbonate which dissolves the trisulphide and leaves the pentasulphide and the vermilion. Then the residue is treated with cold ammonium sulphide which dissolves the pentasulphide and leaves the vermilion.

RUBBER COMPOUND TO REPLACE SEALING WAX.

A patent has been recently granted for a material that is flexible, adhesive and an excellent substitute for common sealing wax. It is composed of the following ingredients:

	Grams.
Resin (colophony)	350
Pure rubber	300
Naphtha	100
Sulphur	100
White lead (dry)	200

For coloring, 40 grams of vermilion are added. The resin is first dissolved in a copper vessel and the other ingredients then added and the whole well stirred over a hot fire. The melted mixture is then poured into molds and when cool, the cakes are removed and allowed to cool for 24 hours on a marble slab. [Ramon Castello, Provenza 240, Barcelona, Spain. British Patent No. 7,703 (1915).]

New Machines and Appliances.

THE M. & W. HEAVY DUTY REFINING MILL.

THE mill embodies a number of improvements that are unquestionably of great advantage in mills of this type.

The illustration here shown represents a 14 by 20 by 30-inch, heavy duty double geared refining mill. It is of massive construction, the weight being distributed to adequately resist the heavy strains to which refiners are subjected. The housings are of the end cap type, made of semi-steel iron and provided with broad feet, which insure rigid attachment to the foundation plates. The end caps are cast steel and the cap bolts are made from chromium vanadium steel, making the completed housing capable of withstanding the heaviest strains.

The rolls are made of the best chilled iron, cored and fitted with stuffing boxes, water and steam connections for controlling the temperature of each roll. The roll bearing boxes are cast steel and lushed with phosphor-bronze, a pocket being provided to accommodate a quantity of grease, and sight feed oil cups are also provided for stimulating the grease, thereby insuring proper lubrication. The roll guides are cast iron with telescoping tee irons that fit the radius of the roll to the lowest possible point.

Another feature is the telescope gap guard fastened to the boxes and frame, completely covering the openings at the inside of the housings and preventing particles of rubber and other ma-

terials from getting into the bearings and gearing, resulting in considerable saving of materials as well as affording a protection to the lubrication.

The roll adjusting screw has a coarse, heavy pitch and is made of chromium vanadium steel. The bronze adjusting screw nut interlocks with housing so that it can be removed or inserted from the outside. The adjusting screw wrench is a special double-acting ratchet wrench and has a number of advantages, such as a time saver in adjusting the rolls (it being always in position for use), as well as the convenience with which adjustment can be made, as the operator can locate the lever to suit his convenience. [Morgan & Wright, Detroit, Michigan.]

DYKES' RELINER MOLD AND VULCANIZER.

A machine that dispenses with all cores and wrapping and cementing operations necessary in the old method of making reliners, patches and inner shoes, is illustrated herewith. It combines in one machine both shaping and curing, the former by hydraulic pressure and the latter by heat directly applied.

The frame and bed are solidly built of I-beams to withstand deflection common to hydraulic presses of this type. The lower

platen carries the male reliner mold and is raised and lowered by three hydraulic rams. The upper platen is rigid and carries the female mold.

To make a complete reliner, the material is placed longitudinally on the lower mold and pressure applied to the rams which raise the lower platen and force the molds together. Heat is then admitted to the molds and in ten or twelve minutes the cure is complete and the reliner is ready for the stock room.

One man can operate two machines and easily turn out 200 reliners a day. By doubling up—that is, molding "two on" for each heat—the capacity can be increased to 400 reliners; depending on the length of cure. In making patches, material for 18 is placed on the mold of each machine. Allowing one hour for 5

heats, the result will be 50 heats a day and the product, 1,800 complete patches. The machines are made in five sizes for 3-inch to 5-inch reliners and special size for patches, double hock shoes, lace and clinch boots. [The Dykes Tire Shoe Machinery Co., Chicago, Illinois.]

THE WILLS RUBBER EDGING PLAITER.

This machine was designed with the object of producing plaited edgings from strips of rubber sheet. That it is practical in construction and efficient in operation is evidenced by the accompanying illustration showing the machine in operation.

It is compactly built and mounted on a substantial base that may be fastened to any convenient bench or table. The strips of rubber are delivered from the feed table to the horizontal

plaiting head, on which the folds are made, and the plaits permanently cemented together. The machine is belt driven and will finish 30 inches of plaiting per minute. [Arthur Jackson Wills, North Brookfield, Massachusetts.]

TOY BALLOON INFLATING MACHINE.

The popularity of toy balloons as an advertising medium continues to grow remarkably, and manufacturers experience difficulty, not in securing orders, but in filling them. As these balloons are invariably supplied in a deflated state, the question of inflating several thousand of these little toys is rather perplexing unless one is familiar with the usual procedure. The accompanying illustration is the answer. It is, in fact, a small

electric motor attached directly to a small rotary blower, and can be placed on a table or desk and operated from an alternating or direct current service.

The neck of the balloon is slipped over the nipple that is seen in the picture, extending from the opposite side of the blower, and the motor started. When the balloon is inflated, the air is shut off by means of the hand valve and thread is tied around the neck to prevent the air from escaping. Thus it will be seen that balloons can be easily and cheaply inflated. The motor consumes current at the rate of an ordinary 16-candle-power lamp, revolving the blower at 1,500 revolutions per minute. [Dependable Manufacturing Co., Chicago, Illinois.]

MACHINERY PATENTS.

PERRAULT'S SOLE LAYING MACHINE.

ACCORDING to this method, the layers of sole stock are superimposed and simultaneously subjected to a rolling pressure and a vibratory movement imparted by vertically reciprocating rollers. At the same time, the shoe is moved at right angles to the plane of reciprocation of the rollers.

In the accompanying illustration, *A* is the bed of the machine and *B* the last and shoe to which the rubber sole is to be applied. The last is mounted on a carriage *C* that travels back and forth under the vertical rollers, and is driven by a reversible lead screw.

The first roller *D* is a straight-faced pressure roller operating on the central part of the sole. Following this, a pair of rollers *E*, arranged at an angle of 15 degrees, contact with the edges of the sole. These rolls are journaled in yokes, the upper ends of which are carried by eccentric shafts *F* and *G*, that impart a vibratory motion to the rollers. The two yoke heads are fastened to slides that have a limited vertical movement within a frame that is raised by a cable which passes over the top sheave *H*, then down and around sheaves *I* and *J* journaled in the bed of the machine. Here it is connected to a bell crank lever that is tripped by the forward

movement of the carriage, and lifts the reciprocating rollers from the sole on the return movement of the carriage.

The eccentric shafts *F* and *G* are driven by belts *K* and *L* from the countershaft *M*, that is in turn driven from the motor shaft *N* which also drives the carriage operating screw *O* by means of gearing shown at *P*. The return movement of the carriage is effected by a clutch operated by a pivoted fork and rod that cooperates with a lug attached to the carriage. A hand lever holds the clutch in neutral position and stops the carriage to permit the removal of the last and the replacement of a new one to be operated on. [J. E. Perrault, Belmont, assignor to Hood Rubber Co., Watertown—both in Massachusetts. United States patent No. 1,184,990.]

VULCANIZING BRUSH BRISTLES SET IN RUBBER.

This machine is designed to heat and vulcanize the rubber cement used to secure together the butt-ends of brush bristles. It accommodates a number of brushes of different sizes, and supplies pressure and heat at the particular point desired. The machine is constructed with six platens, arranged in pairs, one above the other, the upper platen of each pair being raised or lowered by separate vertical screws operated by hand wheels. The platens are all chambered for steam and the connections provided with swing joints to allow for vertical movement.

In the drawing, which illustrates a vertical section through a pair of platens, *A* is the upper and *B* the lower platen, both being heated by steam and covered with asbestos insulation. Two rows of brushes *C* and *D*, with the ferrule ends rubber cemented, are placed on the lower platen, when pressure and heat are applied until vulcanization is complete. [M. P. Tottle, Glyndow, assignor to William A. Tottle & Co., Inc., Baltimore—both in Maryland. United States patent No. 1,189,212.]

COLLAPSIBLE CORE FOR HOT WATER BOTTLES.

A core that can easily be removed through the neck of molded hot water bottles or similar goods, without injury to the article, is shown in the illustration. It is composed of ten

sections, *A* being the top and *B* the bottom section, all held in place by a rod *C*. The neck of the bottle is provided with a round plug *D*, through which the rod *C* passes, and fits within the threaded stopple ring *E* that is molded in the bottle neck. A recess at the lower part of the mold forms a nipple *F* for attaching a syringe tube, and *G* is a recess for centering the end of rod *C* in the mold. The operation is as follows: The sections of the core are assembled, being held in position by the rod, and the two mold halves are lined with calendered stock, the core inserted and the mold parts clamped together in the usual manner. After being cured, and when the mold is sufficiently cooled, the bottle is removed from the mold, and the rod and plug are withdrawn. This frees the top

held in position by the rod, and the two mold halves are lined with calendered stock, the core inserted and the mold parts clamped together in the usual manner. After being cured, and when the mold is sufficiently cooled, the bottle is removed from the mold, and the rod and plug are withdrawn. This frees the top

core section *A*, which is removed by slightly stretching the neck of the bottle. The other sections are removed in a similar manner, after which the bottle is trimmed and finished. [E. Stahl and W. Klein, assignors to Goodyear's India Rubber Glove Manufacturing Co.—both of Naugatuck, Connecticut. United States patent No. 1,188,693.]

SUBERS' FABRIC STRIP MACHINE.

Cotton yarn is interwound and laminated upon a mandrel by this machine, forming a tube that is afterward impregnated with rubber, collapsed in band form, and then dried and wound up on a reel. These strips are used for building tire fabric, making rubber hose, belting and other rubber products.

The drawing is a side elevation of the machine. The four reels, *A*, *B*, *C* and *D*, rotate one within the other, the alternate reels revolving in opposite directions, and are supported by the standard *E*. Upon each reel is mounted a number of spools *F*, containing the yarn elements which are interwound around a centrally located hollow mandrel by the rotation of the reels.

The band passes over the mandrel through the solution chamber, and is shown at *G*, being fed to the drying roller *H*, and drums *I*, *J*, *K* and *L*. After passing over the drying rolls the band is carried through the chamber *M*, in which the solvents are recovered and then led through stretching rollers *N*, *O*, and finally wound up on the reel *P*. [L. A. Subers, Cleveland, Ohio. United States patent No. 1,188,571.]

In a more recent patent Subers provides a machine that impregnates the strands of yarn separately, prior to forming them on a mandrel, into a hollow band, and at a relatively larger angle than heretofore employed. [L. A. Subers, Cleveland, Ohio. United States patent No. 1,189,751.]

DAVIDSON LATEX COAGULATING CHURN.

According to this invention, the latex is churned to and fro in an oscillating cradle, the coagulant being added to the latex at the same time.

The illustration shows a side elevation of the machine, which is constructed of angle iron and strongly braced to support the working parts. The cradle *A* has upwardly curving ends, giving it a somewhat kidney shape in longitudinal section. The central part is open to receive the latex and coagulant, and a screen *B* is provided on the side from which the mother liquid is poured. The cradle is attached to four links, two of which, *C*, *C*, are shown, pivoted to the frame at *DD*. The oscillating motion is obtained by the pitman rod *E*, connected to the belt-driven crank disk *F*.

The coagulant tank *G* is connected to the auxiliary tank *H* that holds a quantity of coagulant, bearing a definite relation to the quantity of latex to be coagulated in the cradle. The

two valves *I* and *J* are connected so that when one is open the other is closed; thus when the bottom valve is closed and the upper one opened, the auxiliary tank is filled. When the top valve is closed the lower one opens, and the coagulant drips into the cradle and mixes with the latex.

In operation the latex is poured into the cradle to about one-third its capacity, the machine set in motion and the coagulant allowed to gently flow into the rocking cradle. When coagulation is complete the machine is stopped and the mother liquid poured out through a screen by tipping the cradle to one side, and the rubber is emptied from the other side into a deflecting chute that leads into a suitable receptacle. [S. C. Davidson, Belfast, Ireland. United States patent No. 1,189,351.]

BATHING CAP PLAITING MACHINE.—A circular disk of sheet rubber is plaited and the plaits permanently cemented on this machine, which also operates on half and quarter disks and those with the center cut away. [F. F. Brucker, assignor to Miller Rubber Co.—both of Akron, Ohio. United States patent No. 1,186,374.]

HALE'S AIRON FEED FOR MILLS.—The apron is maintained in a taut condition when moved out of contact with its driving roll and in the inoperative position it is supported so that it will not fall into the pan or obstruct the front roll. [B. O. Hale, assignor to Farrel Foundry & Machine Co.—both of Ansonia, Connecticut. United States patent No. 1,189,444.]

NEW TIRE MACHINES.

A RAMLESS PRESS VULCANIZER.

THE steam chamber *A* of a hydraulic press vulcanizer serves also as the ram cylinder, and the upper cover *B* is raised by rams *C*, *C*. Water is admitted to the lower side of the piston *D* through a pipe *E*, and in its lowest position the piston is supported by a flange *F*. To reduce condensation, the upper part of the piston is covered with metal and asbestos sheets *G*. [J. H. Nuttall and D. Bridge and Co., Castleton, Manchester, England. British patent No. 978 (1915). This patent was briefly described in THE INDIA RUBBER WORLD, July 1, 1915.]

KUENTZEL'S BEAD FORMING MACHINE.

Endless straight side and clincher tire beads are made of threads or cords impregnated with rubber by a continuous winding process, on the machine here described and illustrated. In

the drawing, *A* is the vacuum chamber, *B* the condenser that produces the vacuum and *C* the rubber solution tank. The thread or cord is arranged on a reel *D*, journaled on bearings within the vacuum tank. When the valve *E* is opened, the partial vacuum causes the solution to flow from the tank into the vacuum chamber, submerging

all or part of the reel of thread.

The impregnated cord then passes out of the chamber, through a drying apparatus *F*, to the bead-forming machine *G*. This consists of a short belt-driven shaft journaled in a suitable frame with an annular bead mold *H* keyed to the outer end. A lining of frictioned fabric is placed in the groove of the bead mold, the end of the impregnated cord is adhered to the lining, and the mold revolved until sufficient cord has been coiled to

form the bead. During the winding operation the hand-operated pressure roller *I* is introduced into the groove of the bead mold, firmly compacting the threads. The finished bead is released from the mold by detaching the outer ring. [C. Kuentzel, assignor to The Republic Rubber Co.—both of Youngstown, Ohio. United States patent No. 1,187,339.]

COLE'S COLLAPSIBLE CORE

The rapidity with which tire casings are made depends to a great extent on the core, with relation to easy manipulation, and facility in removal from the vulcanized casing.

The drawing on the left is a front elevation, and on the right is an enlarged cross section, of a new collapsible core. The four core segments indicated by *A* are provided with the usual web *B*, terminating on the inner circumference with a projection *C*, that fits the groove in the outer annular clamping ring *D*.

When the core segments are assembled on the ring, they are held in alignment by the four plates *E*, that are clamped by eight bolts *F*.

When the casing is removed from the mold, after curing, the bolts are simply loosened and the plates withdrawn inwardly, which permits the removal of the core segments from the interior of the shaft in the usual manner. [J. C. Cole, assignor to Fisk Rubber Co.—both of Chicopee Falls, Massachusetts. United States patent No. 1,189,192.]

A FRENCH PRESS VULCANIZER FOR TIRE CASINGS.

This press is characterized by the arrangement of its controlling parts and the method of extension and retraction of the divided core.

The illustration shows on the right a perspective view of the press and on the left a vertical section.

The upper mold *A* is carried by a heating table *B*, which is attached to the platen *C*, that is operated by the hydraulic ram *D*. The lower half of the mold *E* rests on a heating table *F*, supported by the stationary bed-plate *G*. The core *H*, divided in segments, is supported by a plate *I* that is fixed to the ram *J*. This is hollow and acts as a cylinder for piston rod *K*, which is provided, at its upper end, with connecting links that control the extension and the retraction of the core segments.

The operation of the apparatus is as follows: To bring the upper platen *C* into the position it occupies in the illustration, pressure is introduced under the ram *D*.

To release the core *H* from the lower part of the mold, pressure is introduced under ram *J*. Finally, to bring about the retraction of the core segments, the piston rod *I* is raised and the segments converge towards the center.

When the press is in this position, the casing is placed on the

core and the segments extended. It is then lowered in contact with mold *E* and pressure applied by the upper part of the mold *A*. Thus the casing is molded and vulcanized. It is then removed and the operation repeated. [A. Wolber. French patent No. 477,474 (June 17, 1914).]

MACHINES FOR REELING BIAS FABRIC STRIPS FOR TIRES.

The old method of placing bias fabric strips used for tire building between the muslin leaves of a "book" is apparently obviated by this new invention. Referring to the illustration, *A* is an elevation of the delivery end of a bias shear, and *B* indicates the delivery belts. *C* is the side elevation of one of six reeling machines that are placed alongside the shear, with sufficient space between them

for the six operators. As the cut strips are advanced by the traveling delivery belts of the shear, they are removed by the operators to the reeling tables, where the ends are spliced together and the continuous strip *D* is wound up on the reel *E* by the hand wheel *F*. At the same time the liner strip *G* is wound between the strips of fabric.

Besides the saving of labor and the avoidance of the troublesome "books," it is claimed that a better splice is obtained by this method, due to the superior adhesiveness of the rubber fresh from the calender. [De Courcy Neal, Detroit, Michigan, assignor to Morgan & Wright, Detroit, Michigan. United States patent No. 1,189,724.]

TIRE BUILDING MACHINE. This automatic machine stretches and applies the fabric to the core smoothly, imparting an eccentric movement to the smoothing rollers that are mounted on a vertically swinging arm. [A. Mather, Zollikon near Zurich, Switzerland. United States patent No. 1,186,591.]

TUBULAR TIRE FABRIC LOOM. A tubular endless fabric, composed of single or multiple interwoven plies, is woven on this loom without stretching, pulling, packing or otherwise distorting the weave. [F. S. Dickinson, New York City. United States patent No. 1,188,418.]

CORD OR STRIP WRAPPING MACHINE. The core is rotated and the spools of material, mounted on the ends of two arms that revolve in opposite directions, apply the strip or cord circumferentially, beginning at the sides and continuing toward the middle of the core, where the two series of convolutions meet. [J. H. Coesir, Joplin, Missouri. United States patent No. 1,189,666.]

TIRE FLAP TRIMMING MACHINE.—The ragged excess material known as "flash" is trimmed from the tire flaps by two endless band cutters that operate in a manner similar to double band saws, severing the "flash" from the flap as it passes through the machine. [Thomas Midgley, Worthington, Ohio. Assignor to Morgan & Wright, Detroit, Michigan. United States patent No. 1,193,315.]

THE UNITED KINGDOM.

INNER TUBE MANDREL. This is tapered and made of a series of transverse cardboard or papier-mâché disks, surrounded by and supporting a tapering tube of similar material. When the tube has been spliced, the mandrel is dissolved, or reduced to pulp, by water or steam. [F. H. Hall, 6 Livery street, Birmingham, England. British patent No. 16,890 (1915).]

WIRE CORE FOR SOLID TIRES. A straight or wavy wire is inserted within the coils of the wire core before the rubber is forced or molded around the core. [Thomas Gare, Wembley, Middlesex, England. British patent No. 8,228 (1915).]

AIR-FILLED STUDS FOR SOLID TIRES. The hollow rubber studs are stiffened at the base by notched metal rings that are incorporated in the tire and vulcanized with it. [E. B. Killen and the Commercial Tire Co. British patent No. 11,070 (1915).]

British Standard Solid Tire Rims.

THE pioneer work in connection with the standardization of solid tire rims in Great Britain was undertaken by a select committee of the Society of Motor Manufacturers and Traders, Limited. From data obtained from the wheel and tire manufacturers it was found that there were 173 wheel diameters in use, all more or less closely approaching one another. The data were analyzed, and by a careful process of elimination it was found possible to reduce the number to 6 standard sizes, and at the same time cover practically all the requirements of the commercial motor industry, and these were finally adopted as British standards by the Engineering Standards Committee, the body which fixes and regulates British mechanical standards.

The task was a heavy one. It was found, for example, that where the suitable size of tire might be 900 by 120 millimeters [35.43 by 4.72 inches], the correct size of rim, as quoted by five of the principal manufacturers, was 719.8 millimeters [28.32 inches], 721 millimeters [28.39 inches], 740 millimeters [29.13 inches] and 742 millimeters [29.21 inches].

Further simplicity was afforded by dropping all reference to the outside diameter of the tire; every standard size being designated by the diameter of the rim on which it fits, together with the dimension for the width of the base.

The official report of the Engineering Standards Committee reads, in part, as follows:

1.—SIZES OF RIMS.

British Standard Solid Tire Rims for Automobiles shall be made to the outside diameters given in column 1 of the table, and shall measure at a temperature of 60 degrees F. not less than the minimum circumferences given in column 2 and not more than the maximum circumferences given in column 3.

1. Standard Outside Diameter.		2. Minimum Circumference.		3. Maximum Circumference.	
Millimeters.	Inches.	Millimeters.	Inches.	Millimeters.	Inches.
*670	26.38	2,144.9	82.83	2,107.9	82.95
720	28.35	2,262.0	89.06	2,265.0	89.17
*741	29.17	2,327.9	91.65	2,330.9	91.73

*The Committee recommends that for general use these sizes be dispensed with.

2.—MINIMUM WIDTH OF STEEL RIMS.

Where no raised flange is used the width of the rim shall be such as to provide not less than 10 millimeters [.3937 inch] overhang on each side of the wheel base (see Fig. 1).

3.—LEAD TO FACILITATE FITTING OF TIRES.

A lead of 10 mm. [0.3937 inch] wide and 3 mm. [0.1181 inch] deep (see Figs. 1 and 2) shall be provided on one edge of the rim to facilitate the fitting of the tires.

4.—SLOTS TO FACILITATE REMOVAL OF TIRES.

In case of steel rims having fixed raised flanges the Committee recommends that the slots to facilitate the removal of tires (see Fig. 3) be spaced at equal intervals, round the rim and be not

less than 100 millimeters [3.937 inches] in width. For rims up to and including 771 millimeters [30.35 inches] in diameter the

FIG. 3. SIDE ELEVATION OF FIG. 2 SHOWING SLOT.

slots shall be four in number, and for rims above 771 millimeters [30.31 inches] in diameter the slots shall not be less than four in number and have a combined length of not less than 600 millimeters [23.62 inches].

5.—TURNED FLANGE, OR PAD SUPPORTS FOR STEEL BLOCKS USED FOR REMOVAL OF TIRES.

The Committee recommended that either an turned flange (A, Figs. 2 and 3), or suitable pads or rests, spaced at equal intervals around the rim, be provided for the support of the steel blocks used in removing the tires.

6.—MARKING OF RIMS.

The rims of all wheels for solid tires which purport to comply with the British standard outside diameters and limits for circumference laid down in Clause 1 of this report, shall be marked on the external surface of the rim (as shown in Fig. 4)

FIG. 4. EXAMPLE OF STANDARD MARKING FOR RIM.

with the standard outside diameter (Column 1), and also with the letters B, S and the Committee's brand as *prima facie* evidence adduced by the manufacturer that the rims are in accordance with the diameters and limits laid down in Clause 1. The letters shall be not less than 10 millimeters [0.393 inch] high and the arrangement of the marking shall be as shown in Fig. 4.

7.—MARKING OF SOLID TIRES.

The Committee recommends that every solid tire be marked on both sides, in such a manner as to indicate clearly the width of the tire base and the diameter of the standard rim it is intended to fit; for instance, "120 for 850" [4.72 for 33.46 inches] would indicate a tire 120 millimeters [4.72 inches] wide to fit an 850-millimeter [33.46 inches] diameter rim. The figures are to be molded

on the tires, immediately following the marker's name, in the position shown in Fig. 5 and to be not less than 10 millimeters [0.393 inch] high.

A study of the table of standard rim sizes, given in the above report, shows that the limit of accuracy to which the wheels must be turned, and the tires bored, is fairly fine, taking into consideration the class of work. Such accuracy is justified, however, under the circumstances. It should be remembered that

FIG. 1. STEEL RIM ON WOOD FELLY.

FIG. 2. RIM OF STEEL WHEEL IN SECTION.

these tires must be pressed on so tightly as to remain in place under severe side thrusts delivered while the vehicle, and consequently the wheels also, are subject to considerable vibration, which naturally tends to loosen the band from the felly.

It will further be noted that in deciding upon the widths of wheel rims, care was taken to arrange for ample safeguard against damage being done to the tire, whenever the wheels run against the curb. In case of flangeless rims, a minimum of 10 millimeters [.3937 inch] is to be left projecting at each side of the tire. Where a flange is provided at one side, this allowance is demanded on the opposite edge of the rim. The edge of the rim is tapered to allow easy entry of the wheel into the tire.

In order that support may be offered for the steel blocks used when removing the tires, it is recommended that an intumed flange be provided; failing that, suitable pads or rests, spaced at equal intervals round the rim, would suffice.

AEROPLANE TIRES.*

NOW that increased attention is being given to the employment of aeroplanes as aids in national defense, it is interesting to note the part that tires play in their use. Aeroplane motors, like automobile motors, must be protected from jolts by pneumatic tires. In the earlier days all sorts of makeshifts were used; even bicycle tires were pressed into service on some of the pioneer machines. Some builders went so far as to use full size automobile tires. These were equal to the occasion as far as reducing the shock of landing was concerned, but were far too heavy and offered too much wind resistance.

The old type of aeroplane tire was costly and uncertain. Present day necessity has compelled tire dependability, as machines are now larger and heavier and must carry more passengers and heavier loads.

The development of tires to fit the peculiar requirements of the aeroplane began about five years ago. It was early discovered that resiliency was an important factor—that a live, springy tire actually aided the machine to get off the ground and helped to absorb the shock of landing. Experiments were made with cord construction, with the result that cord tires for aeroplanes have been refined to a point of efficiency equal to that of its successful big brother for electric and gasoline cars.

On aeroplanes, tires of large cross section are used to provide maximum cushioning ability to resist the lateral thrusts that occur when the machine side-swipes the earth in landing. On machines used for scouting in war, the cross section size is reduced one inch to reduce weight, thereby permitting the carriage of an additional amount of gasoline.

*By E. R. Preston, Aeronautic Dept., The Goodyear Tire & Rubber Co.

THE COMPRESSION INNER TUBE.

This type of inner tube is designed along new lines of construction with the object of avoiding pinching, rim cuts and puncture troubles.

MONTHLY TIRE EXPENSE.

That tire expense is one of the large items in the cost of operating a motor car is generally conceded. But accurate average figures are difficult to obtain, due to the great variety of cars and the varying conditions under which they are operated. Exact figures, therefore, are interesting.

	COST PER MONTH OF OPERATING LARGE TOWN CARS.						Per Cent of Total Cost.
	A	B	C	D	E	Average	
Miles traveled	51 HP	38 HP	38 HP	32 HP	25 HP	848	
Fuel consumed, gallons	883	903	862	1,005	590	848	
Cost of fuel at 30 cents a gallon	175	141	147	121.5	119	140.7	
Cost of lubricants	\$52.50	\$42.30	\$44.10	\$36.45	\$35.70	\$42.21	27.6
Tire expense	2.17	1.59	.87	2.73	1.45	.9
Insurance	54.95	50.91	39.31	48.78	33.89	45.57	29.9
Tire expense	17.14	29.13	10.35	13.80	7.47	15.58	10.2
Storage	40.00	40.00	40.00	40.00	40.00	40.00	26.2
Supplies, license fees	13.66	4.14	3.54	15.36	2.76	7.91	5.2
Total	\$180.42	\$168.07	\$138.17	\$157.12	\$119.82	\$152.72	100.0

It is extra thick and molded from Upriver fine stock, the diameter being larger in its normal cross section than that of the casing. The first illustration shows the tube in its normal position in the casing, before inflation. When inflated, as shown in the second illustration, the excess diameter and molded construction of the tube, it is claimed, produces radial compression that effectively

closes an ordinary puncture when the object is withdrawn. When fully deflated, the tube occupies a folded position apparent in the illustration that permits a car of ordinary weight to run a limited distance on the rim without injury to the casing or tube. It is said that the heavy walls of the tube require less air pressure and prevent the majority of blow-outs. While these tubes are more expensive than the ordinary inner tube, the extra service and immunity from tire troubles are said, by those who have used them, to be worth the difference in price. [Compression Inner Tube Co., Louisville, Kentucky.]

THE PARKER DEMOUNTABLE RIM AND WHEEL.

Two patents of interest to the rubber tire industry were granted recently to Orrel A. Parker, manager of the Hydraulic Pressed Wheel Co., Cleveland, Ohio. The most important in

relation to tires covers a rim that apparently avoids the Perlman claims by providing four simple bolts and two clamps, the former exerting a radial and the latter a lateral pressure in attaching the rim to the felly of the wheel. Dowel pins are provided on the rim opposite the locking devices to take the thrust of the drive.

The second patent provides means for attaching the rim directly to the spokes of an all-metal wheel. In this, the alternate spokes are provided with radial locking screws and lateral clips of substantially the same construction as those set forth in the principal patent.

The illustration shows the application of the Parker demountable rim to a wooden wheel of the ordinary type.

The Automobile Club of America has recently accumulated data on the cost of operating large town cars, shown in the following table, in which the monthly tire expense is given:

It would seem that these figures are excessive; however, the weight of the cars and the fact that they were driven by chauffeurs must be considered.

Demountable Motor Trucks.

THE idea of huge wheels and steel flanges fitted over regular wheels, permitting a motor truck to travel on railroad tracks, is not new.

There have, however, only two such devices worthy of attention and then only is limited, owing to the time and trouble necessary to change a truck over from solid tires to flanges.

One of the devices is a flange wheel, made similar to a regular railroad steel wheel, which replaces the regular truck wheel. A truck so equipped must change wheels every time it leaves the rails or leaves the road for the rails.

The other is an endless flange rim, made to fit over the S. A. E. band, and is applied by hydraulic pressure the same as the pressed-on type tire. To use this flange it is necessary to remove the tires, and it is also necessary to employ hydraulic pressure of not less than 25 tons.

Neither of the above mentioned devices are practical for military purposes, and consequently are of no value to the army.

In May of this year Mr. Wales of the Riker Motor Truck Co. conceived the idea of making a flange in two pieces. He submitted his idea to Captain J. R. Lee, who is in charge of motor transportation for the punitive expedition at Columbus, New Mexico, and as Captain Lee encouraged the idea, Mr. Wales referred the matter to A. L. Riker, vice-president and general manager of the Locomobile Co. of America, who designed a sufficient number of flanges for the truck and sent them to the army base at Columbus.

Upon the arrival of the flanges Captain Lee equipped a three-ton Packard truck with them, and ran the truck over the tracks of the El Paso & Southern Railway from Columbus to El Paso, a distance of 120 miles, without any trouble whatever. The truck carried a crew of 20 men, each man being equipped with complete field equipment, and then, on regular railroad schedule, with a railroad conductor, an engine, an air compressor, an air pump, a portable electric light, and a portable generator for the entire train. The fact that the truck was able to travel on the tracks at a speed of 19 miles this vibration was harmless but of such force as to prohibit a greater speed.

Another noticeable feature was the fact that the truck ran

better loaded than empty, on account of traction, for with an empty truck there was considerable slippage.

Of the illustrations, Fig. 1 shows one-half of the flange. Fig. 2 shows the flange complete, while Fig. 3 shows a truck equipped and ready for service on a railroad. The flange is so constructed as to fit over the tire with the inside edge resting on the steel base or steel fastenings of the tire. In case of a dual wheel the inside edge of this flange rests on the center wedge ring. It does not come in contact with the tire or wheel at any other point. Two bolts are then fitted at each joint and drawn up tightly, which causes the edge of the flange resting on the center or inside flange of the wheel, to be drawn up with sufficient pressure to eliminate all danger of creeping.

In starting the experiment at Columbus, the truck was driven up to the railroad track, the flanges were applied on all four wheels in 20 minutes' time, requiring four men. The truck was then driven on the track, and on arrival in El Paso, the truck was stopped at a street intersection and the flanges removed in 16 minutes, thrown on the truck and the truck driven over the streets to the hotel. In the opinion of Captain Lee, who conducted this test, these flanges are a complete success, their superiority over other devices of a like nature being the fact that it is not necessary to remove the wheels nor tires to apply them. Their value to the army cannot yet be estimated, but the fact that these trucks can be operated over bridges and road-beds where heavy locomotives would break through, and also the fact that on encountering washouts, these flanges can be removed, and the truck driven around the obstruction, all with a minimum amount of expense and time, practically assures that they will be used by the United States army more extensively than anyone realizes at this time. It is hardly possible that they will ever be used on the main lines of any railroad except for rapid transportation of troops on emergency calls. Their chief field of operation will be on branch lines, or lines constructed to facilitate the convenience of the army. A truck of three-ton capacity will carry 20 men fully equipped for field service.

Each of 20 of these flanges is about 20 pounds each. They are made of cast steel. In case they were made of pressed or rolled steel this weight would be reduced easily 50 per cent.

Should be on every rubber man's desk—Polyglot Rubber Trade Directory, 1916: Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon.

FIG. 2. THE FLANGE COMPLETE.

FIG. 3. TRUCK EQUIPPED WITH THIS DEVICE ON TRACK.

New Goods and Specialties.

RUBBER WATCH PROTECTOR.

ELECTRICAL workers, mechanics, firemen, trainmen, locomotive and steamship engineers, sportsmen, automobilists, miners, millmen and farmers will find in these rubber cases a neat and convenient protection for their watches.

For electrical workers a protective watch covering is an absolute necessity, and the one shown in the first illustration is especially designed for this purpose. Being made entirely of rubber, the case affords perfect insulation against electricity. It covers the watch completely, stem and all, and the corrugations on the back of the case, shown herewith, prevent the watch from slipping out of the pocket.

This case is attached by removing the ring from the stem of the watch and pushing the stem through the neck of the rubber case, adjusting the watch so that it fits snugly in the protector. The ring is then replaced and the watch chain snapped to the rubber.

In attaching the non-stem rubber case, also shown, the ring of the watch need not be removed. This style of case is useful for those who do not come in contact with electricity, but desire to protect their timepieces from dust, dirt, or water. [All-proof Watch Protector Co., Oakland, California.]

RUBBERIZED BATHING ACCESSORIES.

Sea-bathing today calls for many accessories, if one follows the dictates of fashion. Besides the bathing suit, the cap to cover the hair, and the shoes, the fair sojourner on the beach now

over the basic material. Three pillows of this character are shown, all of which are proving popular as novelties at the fashionable watering places. [L. C. Studios, New York City.]

HORIZONTAL SPRAY WITH RUBBER BALL.

A small opening in the rubber ball at one end of the perforated metal cap, in the bathtub spray device here illus-

trated, is forced up over the spigot, when the temperature and pressure of the water may be regulated with the hot and cold water cocks. A horizontal shower or needle bath is thus furnished, without wetting the head, although, if desired, it is also an effective shampoo spray. This

attachment, which measures scarcely two inches in length, may be easily carried by tourists and traveling men, and affords a great convenience in all homes not equipped with stationary showers. [John Howard McElroy, Chicago, Illinois.]

NOVEL VACUUM CLIP.

A novelty in vacuum hangers is the combination with it of a spiral spring, which assists in creating the vacuum to enable it to attach more firmly than would the rubber cup alone, and

also relieves direct tension upon the neck of the cup. This cup also has an inner core, which, it is claimed, adds still further to the adhesion. To this is attached a spring clip which will hold firmly anything from a sheet of paper to a curtain stick, and the main purpose for which it

is recommended is to hold a curtain so that it will not flap in the wind, if the window is open. However, this is only one of many uses for the "Put-me-on" as it is called. It can be used to suspend show cards or small articles in store windows, or brushes and toilet articles in the boudoir or bath room, or special memoranda on the office desk. It is small and inexpensive, and is efficient in many ways which suggest themselves in the household, store or office. [Knight & Christensen Co., Chicago, Illinois.]

THE McDERMOTT HYDRAULIC FORCE CUP.

In the drain pipe provided for all sinks and wash basins there is necessarily a trap, and in this, organic waste matter collects, gradually filling up the pipe. The McDermott hydraulic force cup is designed to enable the house-

holder to remove this accumulation, and thereby save both plumbers' bills and—through prompt eradication of an unsanitary condition—doctors' bills as well. This force cup is similar in appearance to those operated by air pressure, but a rubber hose is attached to the water faucet—fitting any size—and the force of the water is utilized to clean out the pipe. [John McDermott, New York City.]

requires cushions on which to recline while taking the air and sun-bath on the sands before or after the sea-bath. And the fashion is to have these cushions elaborate in material and make-up. The need of water-resisting qualities in such pillows has resulted in the use of rubberized mummy-silk of various colors, brilliant hues predominating, the figures or designs being of solid color, cut from this cloth and cemented or applied

RUBBER LIFT FOR LOUIS HEELS.

While rubber heels and half-heels are plentiful, and of various shapes and sizes, their use has been confined mainly to broad heeled shoes. It was not until recently that any endeavor was made to give to wearers of women's high heeled shoes the advantage of resiliency, soft tread and non-slip qualities, which such heels afford. Now, however, rubber heel lifts are made expressly for the Cuban and Louis heels which are so fashionable today. The cut shown is a "Maltese Cross" special size heel made expressly for this purpose, the cut being the exact size of the base of the heel lift, which is attachable to either wood, leather or fiber heels

by three screws, which, being countersunk below the surface of the lift, allow play for the resiliency of the rubber, thus affording the elastic tread so desirable in such goods. [Gutta Percha Rubber, Limited, Toronto, Ontario, Canada.]

RUBBER HOSE PROTECTOR.

A novel attachment for garters, which is claimed to prevent drop stitches even in the thinnest stockings, consists of a thin rubber disk, with a small hole in the center, which allows it to be slipped over the stud of the garter, lying directly over the base plate. In this manner the sharp edges of the metal parts of the garter are cushioned and prevented from cutting the threads of the stocking. The disk need never be removed except for cleansing, which can readily be accomplished with soap and water. [No-Tear Hose Protector Co., Portland, Maine.]

**"UNIQU" RUNNING BOARD FOR FORD CARS.**

The running board here shown is built on a sound wood base, specially treated to prevent warping or swelling. It is covered with heavy corrugated rubber, the edges being bound with heavy aluminum or brass moldings securely fastened with nickel-plated or brass screws. A full set of bolts is furnished with each pair of boards, and each bolt is covered with a shell of aluminum or brass, so that it cannot rust and spoil the appearance of the car. The "Uniqu" running boards greatly improve the looks of the car, and are claimed not to rattle, rust nor sag in the middle, as do the iron boards. [The C. Spiro Manufacturing Co., New York City.]

**RUBBER LINED TOBACCO POUCH.**

The pipe or cigarette smoker appreciates the convenience of a well-made tobacco pouch, and manufacturers produce many varieties, each having its distinct and individual merits. A new pouch is made of fine quality leather, with a snap button as fastener. The special feature of this pouch is its rubber lining, which enables it to retain the moisture of the tobacco, thus keeping it in the proper condition to give the most enjoyment to the smoker. This "Sportsman's Tobacco Pouch," as it is called, is made in tan and black leather and is an article which

should find ready sale, in those stores which carry a line of smokers' articles. [H. J. Collis Manufacturing Co., Taunton, Massachusetts.]

RUBBER CEMENTED BRUSH.

The brush for automobile painting or varnishing and similar uses, shown herewith, is guaranteed by the manufacturer to withstand the most severe usage and remain intact until entirely worn out. In its manufacture, the butts of bristles or

hair in these brushes are saturated with pure plastic rubber in a semi-liquid state and then vulcanized, thus firmly attaching them to the handle of the brush and eliminating the defects present in the ordinary brush, which cause annoyance in painting and varnishing. [John L. Whiting-J. J. Adams Co., Boston, Massachusetts.]

A RACQUET GLOVE.

The tennis player knows the value of a first class racquet, and well understands the advantage of keeping the most vulnerable part, the stringing, in proper condition. No player can do good work with a flabby, loose-stringed racquet, and unfortunately the gut strings lose their effectiveness if allowed to absorb dampness. To properly preserve the racquet, and to protect the stringing from moisture, a "racquet glove" has been placed on the market. This is shown in the illustration. It is of fine quality cloth, coated with Para rubber. It is shaped to fit the racquet and is provided with a strap, which has a snap fastener. [Nathan Novelty Manufacturing Co., New York City.]

**AUTOMATIC ELECTRIC SWITCH FOR AUTOMOBILES.**

The usual practice in automobile electric wiring is to protect the batteries against grounds or short-circuits by installing a fuse on each circuit. The blowing of a fuse invariably occasions annoyance to the motorist who is obliged to find the fuse block, often placed where it is hard to get at, locate the fuse which has blown—not always an easy matter—and put in a new fuse, providing he has one available.

The automatic lighting switch here illustrated combines the functions of a lighting switch and overload circuit breaker, and in the latter capacity acts as the usual fuse block, instantly breaking the circuit when a ground occurs, and positively indicating such a breakage by throwing out a small button which is visible underneath the lighting switch control key. To again close the circuit it is merely necessary to push the button in, and if it remains in this position, it is certain indication that normal conditions are restored.

A similar automatic switch is marketed for ignition circuits, also a combined ignition and lighting switch, working on the same principle. Both of these are designed to prevent the draining of the battery, should the driver neglect to throw the switch off when the engine is stopped.

The bases of these ingenious devices are made of molded hard rubber with the terminals embedded in the same material, thus insuring perfect insulation. [Hartman Electrical Manufacturing Co., Mansfield, Ohio.]

FORD REAR WIND-SHIELD.

Protection from cold winds, dust and dirt has long been afforded the driver of an automobile by front wind-shields. The accompanying illustration shows a rear wind-shield which gives

the same protection against the elements for the passengers that the driver enjoys. This convenient addition to the comfort and pleasure of motoring is made of heavy rubber cloth with transparent partitions, and may be readily attached to the top, and to the back of the front seat

AN INTERCHANGEABLE RUBBER HEEL.

Few people wear the heels of their shoes uniformly—some wear down the outside of the heel, others the inside, while almost everyone wears off the back of the heel rather than the level tread. Rubber heels when worn down lose their resiliency, of course, as the thickness of the rubber is reduced. Therefore it has been found desirable that the heels might be interchangeable, so that when worn off on one side they could be reversed from one shoe to the other, and thereby give longer service than would otherwise be possible.

A heel made for this purpose is shown in the illustration, both the upper and under surface being presented. When on the shoe it differs in no respect from any other makes of rubber heels. The application to the shoe, which also allows for the interchangeable feature, is explained by the pictures.

A metal fastener is attached to the shoe, over which the heel is then sprung through its resiliency. The method of application is to lay the heel, with the fastener in place, upon the prepared leather heel; then a light blow on the rubber heel will cause the "dogs" or points on the fastener to mark the exact position in which the fastener is to be nailed. This fastener is then removed from the rubber heel and nailed securely in place. The rubber heel is then sprung over the fastener, and the concave surface springs flat and seals the joint between the shoe heel and the rubber heel. Of course, it is a simple matter to remove such heels, and transfer them to the opposite shoes after they have been run down on one side. The heels cannot be pulled off accidentally and will not crowd or shift out of place. They are made in various sizes for men's and women's shoes. [The Nolan Rubber Co., St. Paul, Minnesota.]

ANTERIOR-METATARSAL ARCH SUPPORT.

Most arch supports are intended to raise the arch extending from the heel to the ball of the foot, and many and varied are their forms and composition. As is well known, there is another

arch in the human foot, that across the ball, at the bases of the toes; in anatomical language, the anterior or metatarsal arch. A disarrangement of the bones of this arch is the cause of severe suffering. To overcome and remedy this a special arch is made. It is claimed that the construction of this support is such that adjustment may readily be made to fit the form or structure of the bones of the foot, by means of the pocket placed in the upper end of the support into which the user places the specially devised pad of rubber molded to conform with scientific accuracy to the natural contour of the anterior metatarsal arch. This arrangement enables the user to adjust the pad in the exact position which affords greatest relief. The contact of the rubber pad against the upper layer of soft, flexible leather and the bottom layer of felt, holds the rubber pad in the position in which it has been placed, and its use tends to bring the bones back to their proper position. [Nathan Novelty Manufacturing Co., New York City.]

RUBBER IN THE NURSERY.

The inventor of the rubber bib, besides sharing in the sure profits of the present, is in line for the promised reward to the benefactors of the little ones. The rubber bib is not a new article of manufacture. It is not improbable that it has been a source of comfort to babies since grown up to engage in its

manufacture and sale; but it does contribute to a child's comfort, offering relief from the irritating effects of the frequent spilling of milk over the neck and chest. Neither is the nurse's rubber apron new, its practical utility having been for some time recognized. The styles shown in the illustration, however, are in new decorative materials, the effect being quite different from the bibs and aprons hitherto in vogue. [Currie, Thomson & Co., London, E. C., England.]

THE TREO ELASTIC GIRDLE.

This is a new elastic girdle. It is made entirely of a washable, porous, surgical woven elastic, boned front and back with rust-proof steels, the front ones being of the new French soft top variety. It is suitable alike for growing girls and adults, and for bathing and athletic, as well as ordinary wear. Each girdle has four hose supporter straps of firm, substantial elastic with padded loops and all-rubber buttons. This corset is made in various materials, in white and pink, and is from 7 to 16 inches in length. [M. W. Schloss Manufacturing Co., New York City.]

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

The Editor's Book Table.

RUBBER PRODUCING COMPANIES—1916. COMPILED BY THE Mining Lane Tea and Rubber Share Brokers' Association, Limited, and published by "The Financial Times," London, England. [Board covers. 8vo, 551 pages. Price 3s.]

THIS volume is a compendium of information regarding the 532 rubber-producing companies in the Middle and Near East giving, as it does, the capital authorized, the capital issued, acreage, production, dividends, profits, the secretaries, boards of directors and much miscellaneous information of interest to investors or planters. Besides these, there is a supplementary section covering companies in the Far East. There are also estimates for the current year and outputs to the beginning of May; details of new land to be opened up, the highest and lowest prices of shares for several years, a complete list of directors and secretaries of rubber companies. These facts and figures are in most cases official. The work is well printed and admirably arranged for quick reference.

TRACTION RESISTANCE TO A MOTOR DELIVERY WAGON ON Different Road and at Different Speeds. By A. E. Kennedy and O. R. Schwiege. Presented at the Annual Convention of the American Institute of Electrical Engineers, Cleveland, Ohio, June 27-30, 1916.

In this paper is given a complete report on an investigation of traction resistances of urban roads to a motor delivery wagon equipped with solid rubber tires. The "traction resistance" as used in this paper, includes still-air resistance, but does not include wind resistance and the resistances internal to the truck. The test truck is fully described, with its driving mechanism and the storage battery which supplied the motive power. The investigation involved test runs over definite lengths of road, at measured truck speeds, to determine the gross battery output during these runs; and laboratory tests to determine the overall efficiency of the truck between battery terminals and rear-wheel treads at speeds and loads corresponding to the road tests. The results included in the paper are (1) overall efficiency of truck mechanism and (2) traction resistances of a number of typical urban roads. The components of traction resistance for a typical road are also given.

RAILWAY EXPANSION IN LATIN AMERICA. BY FREDERIC M. Halsey. The Moody Magazine & Book Co., 35 Nassau street, New York. 141 pp. 8vo, 160 pages, illustrated. Price \$1.50.

While this book is avowedly written to interest capital in a line of investments which is unfamiliar, to most Americans, it is far from being a book of dry facts and statistics. Rather, it is an entertaining account of the origin and development of the principal railway systems in Central and South America, giving many facts of the mechanical and engineering difficulties as well as the climatic conditions which were overcome, and briefly outlining the history of each of these enterprises. The story of the Madeira-Mamore Railway is given in detail, though no facts are presented which have not been covered by THE INDIA RUBBER WORLD. Mr. Halsey suggests that a number of the larger South American railway enterprises, controlled abroad, be invited to make formal application to list their securities on the New York Stock Exchange, believing that when American capitalists become acquainted with the Latin-American investment field, they will doubtless be able to finance various new projects in those countries, where hitherto European capital has predominated. The book is neatly bound, has 40 half-tone engravings and four maps, showing the extent and location of the South American railways.

THE LEGACY OF THE EXPOSITION. PUBLISHED BY THE Panama Pacific International Exposition, San Francisco, California. [Large vo., 200 p., etc.]

This book is a compilation of the opinions of over 700 well-known Americans regarding the great exposition which was

held in San Francisco last year. The sentiments are many and varied; they come from commanding figures in politics, science, art, transportation, business and literature, and also include many from prominent American women, the whole forming a permanent record of the comments of leading minds as regards the exposition, in its various phases. It is a beautiful book, which will delight bibliophiles, it being very novel in its manufacture. It is printed on toned antique paper, sewed on tapes after the book-making art of four centuries ago. A ruled scheme gives separate panels for the body text, the running heads and the side heads, the type matter being black and the rules red, to match the hand-made paper of the covers, while the backbone is of unleached linen with a Japanese vellum title.

NEW TRADE PUBLICATIONS.

THE B. F. Goodrich Co., Akron, Ohio, is publishing a series of route books for the use of automobilists and we have just received copies of those for New York and New Jersey, as well as one entitled "Electric Car Tours in New England." These books are carefully compiled and give a great amount of exact information valuable to anyone touring the sections covered. Each book contains a map of the territory, and this is followed by instructions regarding the routes from one point to another. The large cities are also mapped to show the ways of approach and exit, while each tour is also shown in the same way. The routes are given concisely and clearly, showing the direction and the number of miles between every two points on the route. Where the Goodrich company has erected road marker guide posts at the corners, these are indicated by a character showing the way to turn; this, of course, being in addition to the verbal directions. The New York route in the New York book has in its central pages an outline map of the state, showing the number of miles between each important point. It is a book of 160 pages, of convenient size to carry in the pocket, as are the others mentioned. Undoubtedly, these books, which are offered free to motorists, will have a large circulation.

The Goodrich Company is sending out to the shoe trade a finely printed pamphlet exploiting the new "Textan" soles and Goodrich heels for the shoe manufacturing trade. The illustrations are printed in natural colors, and folded within is a chart showing the shapes, sizes and thicknesses of the soles and heels described in the body of the work.

The Goodyear Tire & Rubber Co., Akron, Ohio, publishes a general catalog for dealers which gives a large amount of information regarding such goods as are usually carried by automobile accessory dealers and repairers. Many of the articles listed are illustrated by clean, clear half-tones, and a considerable amount of information regarding the goods and their methods of use, guarantees, etc., is added.

The Racine Rubber Co., Racine, Wisconsin, sends out a brilliantly colored folder advertising its tires, a portion of the circular showing a bird's-eye view of the plant, while a map of the United States has 37 cities indicated, at each of which there is a distributor of the Racine company's tires, the names of these distributors being given in tabular form below.

"Shoveling Coal by Machinery" is a 16-page pamphlet crowded full of information regarding the various methods

of handling coal by means of the conveyor belts made by the Link-Belt Co., Chicago, Illinois. The text is by Henry J. Edsall, M.E., and the diagrams and illustrations give one a very full and complete idea of the efficiency of these methods. A supplementary chapter deals with a conveyor for coal and ashes, also well illustrated.

William H. Scheel, New York City, importer and dealer in chemicals and specialties for manufacturers in various trades, has just issued a buyers' list, giving the complete line of products carried by him, some 200 in number, of which about 75 are used in the manufacture of rubber goods. The list is in compact form and handy for quick reference.

JUDICIAL DECISIONS.

HOOD RUBBER CO. VS. UNITED STATES RUBBER CO., AND OTHERS. Six of the defendants were manufacturers of lasts used in making rubber footwear, and were the only makers thereof in the United States. The United States Rubber Co., with the intent of restricting and controlling the interstate sale and transportation of lasts, made separate agreements with each of the last manufacturers whereby they agreed to sell no lasts for a certain fixed period, except to persons and corporations specified by it. By means of these agreements it deprived the plaintiff of the ability to procure lasts.

The court held that, where it did not appear that any of the last manufacturers intended to restrict and control trade, or knew of the contracts between the rubber company and other last manufacturers, there was no combination or conspiracy in restraint of the trade, and the last manufacturers were within their rights in making the contracts, and were not liable. But the court held that the action of the United States Rubber Co. was a domination of the trade and control, as used in the plaintiff's declaration, and was the substantial equivalent of monopoly as used in the statute.

Therefore, the court sustained the demurrers of all the defendants except the United States Rubber Co., whose demurrer was overruled. [The Federal Reporter, Vol. 229—page 583.]

PENNSYLVANIA RUBBER CO. VS. DREADNAUGHT TIRE & RUBBER CO. The court of trial held that the defendant was guilty of unfair competition in its markings and sale of certain tires known in the trade as "seconds," and entered a perpetual injunction enjoining such markings. The Dreadnaught Co. did not appeal from this part of the trial court's decision, but from another part concerning the sale of other tires in which the court of trial held "that, unless in connection with the sale and disposition of the defendant's 'seconds,' the bill cannot be sustained" and entered a decree "that in other respects the bill of complaint be and the same is hereby dismissed."

The Federal Circuit Court of Appeals, Third Circuit, held that, where a bill alleging unfair competition made no mention of any trade-marks of complainant, or the violation thereof, and it appeared that when complainant called defendant's attention to defendant's alleged violation of its rights, no mention was made of the use of any alleged trade-mark, the case would be treated as one of alleged unfair competition, though argued as though it involved a trade-mark.

That, where it did not appear that any intending purchaser of complainant's automobile tire had been misled, or could be misled, by the markings of the defendant's tire, into buying defendant's tire under the belief that he was getting complainant's, no case of unfair competition was established. The court below having fully and satisfactorily discussed the case, the Court of Appeals affirmed its decree, with the addition that the bill be dismissed without prejudice to complainant's right to renew the same, if any confusion of goods should thereafter develop in the course of trade. [The Federal Reporter, Vol. 229—page 560.]

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered, nevertheless, they are of interest, not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[192.] Names and addresses of manufacturers of safety vulcanizers have been requested.

[193.] Inquiry has been received for the name of a maker of machines for cutting rubber sheets in small pieces, for making cement.

[194.] Concerns manufacturing machinery for the pulverizing of scrap rubber are sought.

[195.] A correspondent requests names of manufacturers of machinery used for making insulated wire.

[196.] Inquiry has been received for the addresses of tennis ball manufacturers.

[197.] The address of a dealer in M. R. hydrocarbon has been requested.

[198.] Another inquiry has been received during the month for names of manufacturers of sponge rubber.

[199.] A correspondent requests the name of the manufacturer of the "New Year" hot water bottle.

[200.] Information is sought regarding the process of manufacturing of hard rubber set shaving brushes.

[201.] A jobber of advertising novelties desires to add toy balloons to his line.

[202.] The address of a manufacturer of dipping machines is requested.

[203.] We are asked for the names of manufacturers of glass and porcelain dipping molds.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A firm in Spain desires agency for that country for a first-class line of pneumatic tires. Report No. 74,192.

An agent of a large American steel company in Chile wishes to represent an American manufacturer of fire hose. An order can be placed immediately, it is stated, for from 5,000 to 8,000 meters of canvas fire hose (from 16,404.15 feet to 26,246.64 feet), a sample of which may be inspected at the Bureau or its district offices. As the demand for this hose is urgent, quotations are desired by cable, giving the price on board at Valparaiso per meter, the conditions of payment, and the approximate date of shipment. Report No. 21,702.

LATE CUSTOMS RULINGS.

The Harshaw, Fuller & Goodwin Co., Cleveland, Ohio, protested the collector's assessment of 15 per cent on bone black as a pigment. The importers claimed that the merchandise was used as a bleaching material in the manufacture of cream of tartar and tartaric acid, and that it was never used as a pigment. The customs examiner who passed the goods testified that a mistake had been made and the board sustained the claim for free entry under the provision in the law for bone black not suitable for use as a pigment. Reliquigation was ordered.

According to a recent decision of the United States Court of Customs Appeals, gutta jelutong, commonly known as Pontianak, is classified with spruce gum, and dutiable as a non-enumerated, unmanufactured article. The Treasury Department therefore has instructed that jelutong and other similar crude gums, not drugs, shall be classified at the rate of 10 per cent ad valorem on importations made 30 days from May 12, 1916.

THE OBITUARY RECORD.

A VETERAN RUBBER MANUFACTURER.

JAMES H. SEIBERLING, president of the India Rubber & Insulated Wire Co., Jonesboro, Indiana, died at his home July 7. He was born in Summit County, Ohio, November 25, 1835, and educated in the common schools of that county. He lived with his parents on the farm and assisted in the operation of a sawmill until 1860, at which time he formed a partnership

JAMES H. SEIBERLING.

with his brother, J. F. Seiberling, for the manufacture of farm implements and a general foundry business. A year later the brother's interests were taken over by S. H. Miller, and these two men continued their association in business up to the time of the death of Mr. Seiberling. In 1890 he went to Grant County, Indiana, taking an active interest in the oil and gas business then developing at that point, and was thus instrumental in the founding of

Gas City, Indiana. In that year he also organized the Indiana Rubber & Insulated Wire Co., and became its president and general manager, retaining this office until the time of his death.

Mr. Seiberling joined the Lutheran church at Doylestown, Ohio, at an early age, and remained to the end a consistent member. During his residence there he was superintendent of the Sunday school for 27 consecutive years.

He married Elizabeth Baughman in 1860, and to this union six children were born, of which A. F. and R. W. survive, both of whom are officers in the company.

Mr. Seiberling was an inventor of considerable note of rubber machinery, tires, etc.—and as a pioneer in the branch of the rubber industry with which he was affiliated, he formed a wide circle of prominent and influential friends who mourn his loss.

HEAD OF A RECLAIMING COMPANY.

John R. Trewin, president and treasurer of the Stockton Rubber Co., Stockton, New Jersey, died at Mercer Hospital, Trenton, on July 10, subsequent to an operation. Mr. Trewin was 48 years old. He was born in Flemington, New Jersey, and educated in the public schools there. He entered the employ of a clothing concern in Flemington and later became proprietor of a retail clothing establishment in Lambertville, New Jersey.

In 1905 he became associated with E. K. Price and O. A. Blackwell, forming the Stockton Rubber Co. Mr. Blackwell retired in 1907, when his stock was purchased by D. J. Price, vice-president of the company.

For the last five years Mr. Trewin made his residence in Trenton, New Jersey, where he was a member of Masonic bodies and the Elks. He is survived by a widow.

FREDERICK C. BREAKSPEAR.

Frederick C. Breakspear, general manager of the rubber factory of A. G. Spalding & Bros., at Chicopee Falls, Massachusetts,

died recently in New York City. Mr. Breakspear was one of the veterans of the Spalding organization with a service record which began with the old Peck & Snyder firm in 1875. From his first position as errand boy, his progress was steadily forward, one promotion following another during his service with that concern, and continuing when the Peck & Snyder firm was acquired by A. G. Spalding & Bros. in 1890.

Mr. Breakspear was placed in charge of the Chicopee factory in 1894 and occupied that position to the time of his death. His life was a conspicuous example of what conscientious zeal, ability in one's line and singleness of purpose can accomplish—traits of character which, together with a pleasing personality, brought their rewards of confidence and lasting friendships.

Mr. Breakspear occupied a position of large influence in his home town. He was for many years a park commissioner of Chicopee Falls, and at his death was president of the Manufacturers' Association there.

BUILDER OF A LARGE BUSINESS.

George E. Austin, manager of the Imperial Rubber Co., New York City, died suddenly at his home in Brooklyn last Monday of heart failure.

Mr. Austin was born in London, England, 50 years ago, and received his education in that city. On graduating from the high school he entered the employ of the London Rubber Works. He came to this country in 1886, connecting himself with the Commonwealth Rubber Co., New York City, and two years later established the Imperial Rubber Co., developing an extensive foreign and domestic business in belting, hose and other mechanical goods. Later he added to his business a line of bicycles, conducting this as the Imperial Cycle Co. of New York City. In 1891, with George M. Ayres, he formed a partnership under the name of the Duplex Rubber Co., to deal in mill supplies and mechanical goods.

Mr. Austin was a man of wide acquaintance, ambitious and energetic, and the Imperial Rubber Co. is the practical result of his activity and business acumen. He leaves a widow and two married daughters.

A PIONEER IN THE BRITISH TIRE TRADE.

Charles Challiner, joint managing director of the Shrewsbury & Challiner Tire Co., Limited, died suddenly at his home, Manchester, England, on June 15. He was 67 years of age and a native of Tinsley, near Sheffield, where his early business life was devoted to the engineering trade. Later he moved to Manchester and engaged in the solid tire business in a small way, which rapidly grew under his able management. His business ability and inventive genius have made his name prominent in the development of the solid tire industry of Great Britain, among his inventions being the cup tire for carriages, and the cross-ribbed tires largely used on motor fire engines. He is survived by his brother, Walter Challiner, who is still connected with the Shrewsbury & Challiner Tire Co., Limited; his eldest son, C. S. Challiner, secretary of that company; and two other sons, J. A. Challiner and T. Challiner, also in the tire trade.

A PROMINENT JAPANESE EXPERT.

Yutaro Yoshida died on the 20th of May. He was superintendent and technical expert of the Toyo Rubber Co., Limited, which is one of the leading rubber manufacturing companies in Tokio, Japan.

The Electric Storage Battery Co., Nineteenth street and Allegheny avenue, Philadelphia, Pennsylvania, is having plans drawn by the William Steele & Sons Co., 1600 Arch street, Philadelphia, for the erection of a seven-story reinforced concrete and brick factory addition, 115 by 117 feet, at a cost reported to be about \$300,000.

News of the American Rubber Trade.

NEW OFFICE BUILDING OF FISK RUBBER CO.

THE Fisk Rubber Co., Chicopee Falls, Massachusetts, has just moved into a fine, modern six-story office building of cut stone and brick. The building contains every modern device which makes for organization and efficiency. The whole basement of the building is used for a check room. On the ground floor, at the main entrance, is a spacious reception hall, at one side of which is an information bureau. This floor contains the purchasing, traffic and engineering departments. On the second floor are the service and architectural departments, and the advertising department, which also occupies a portion of the third floor. The third floor is occupied by the correspondence department and the mailing room, and here one large and well-furnished room is set apart exclusively for the use of the office boys. On this floor, also, is the telephone exchange and a private branch of the Western Union Telegraph Co., and the general manager's office and the stenographic department. The fourth floor is given over to the accounting department. The fifth floor contains the offices of the president and vice-president, as well as the statistical department. On the sixth floor are large conference rooms, the president's private dining-room, a cafeteria which will accommodate about 300 at one time, the private dining-room of the heads of departments, and a thoroughly equipped kitchen. Elevators run the full height of the building, and from the sixth floor to the basement, at the rear, is a specially constructed brick fire-escape tower which can be entered from each floor.

RESALE OF THE B & R RUBBER CO. PLANT.

At the auction sale of the B & R Rubber Co., North Brookfield, Massachusetts, on the 25th of June, the property was bid off to Thomas G. Richards, president of the company, for \$228,000, the next highest bid being \$227,000 by his former partner, Charles L. Beebe. This sale was made subject to the approval of the United States Court. When the matter came up before the judge on July 12, it was found that a bid of \$233,000 had been offered since the auction, and the court therefore ordered that the sale be re-opened on July 19, at 11:30 A.M., at the office of the company, with the same auctioneer. This sale was advertised to be subject to an upset price of \$265,000, on which the receivers reserved the right to waive if they deemed it advisable. The sale was held at the time appointed, and T. G. Richards was again the purchaser at \$256,000 which, although \$9,000 less than the advertised upset price, was approved by the court.

DU PONT INTERESTS PURCHASE FAIRFIELD RUBBER CO.

The Fairfield Co., one of the subsidiaries of E. I. duPont de Nemours & Co., has purchased the Fairfield Rubber Co., Fairfield, Connecticut, and will operate the concern on the same lines as heretofore. The Fairfield company manufactures a rubber carriage cloth, and employs about 100 men. The home office has been transferred to Wilmington, Delaware, but it is not thought that there will be any change of importance at the plant. It is said that the Fairfield company has large contracts in this country and abroad; in fact, these contracts are rumored to be large enough to keep the plant busy for a year. If expansion is determined upon there is plenty of room at the Connecticut plant, which has several acres of vacant ground adjoining.

E. W. Harrell, president of the company, who has been associated with it since 1880, has retired, and has been succeeded by R. R. M. Carpenter, president of the Fabrikoid Co. and one of the directors of the duPont corporation.

ANNUAL CONVENTION OF THE FAULTLESS RUBBER CO.

The annual convention of the Faultless Rubber Co. was held at Ashland, Ohio, from the 20th to the 22nd of July, inclusive. There were approximately 70 representatives of the company present and the period of meeting was divided between business and pleasure. The convention was opened by Sales Manager W. H. Balch, whose initial remarks took the form of thanks to those present for their effective co-operation during the year just passed. This was followed by a discussion of the advertising and selling campaign of the company by H. S. Lett, advertising manager of the Faultless Rubber Co., and M. P. Gould, of the M. P. Gould Co. of New York, who has general charge of Wearever advertising. In the evening a dinner and musicale were given by President T. W. Miller, at his beautiful residence, and Friday, the 21st, was devoted to a tour of the factory, conducted by President Miller and Superintendent C. E. Campbell. Subsequently Mr. Miller delivered an address outlining the policy for the coming year. This was followed by interesting remarks by Messrs. Balch and Gould. Saturday, the 22nd, was devoted to concluding business and the departure of delegates to their respective homes.

RUBBER COMPANY DIVIDENDS.

The United States Rubber Co. paid a quarterly dividend of 2 per cent on the first preferred stock and a quarterly dividend of 1½ per cent on the second preferred stock of the company, on July 31, to stockholders of record July 15.

The Kelly-Springfield Tire Co. has declared a quarterly dividend of 4 per cent on common stock, payable August 1, to stockholders of record July 17.

At a meeting of directors of the B. F. Goodrich Co., held July 26, a dividend of \$1.75 per share on the preferred stock was declared, payable October 2, to stockholders of record September 21; also a quarterly dividend of \$1.00 per share on the common stock, payable November 15 to stockholders of record November 3.

The New Jersey Zinc Co. has declared an extra dividend of 10 per cent, payable August 10 to stockholders of record August 1. The regular quarterly dividend of 4 per cent has been declared, payable August 10 to stockholders of record August 1.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on July 25 are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new)	64	65
Firestone Tire & Rubber Co., common	91½	930
Firestone Tire & Rubber Co., preferred	111	115
The B. F. Goodrich Co., common	72	73½
The B. F. Goodrich Co., preferred	113½	115
Goodyear Tire & Rubber Co., common	222	226
Goodyear Tire & Rubber Co., preferred	106	106½
Kelly-Springfield Tire Co., common	72	72
Kelly-Springfield Tire Co., 1st preferred	96	97½
Miller Rubber Co., common	200	215
Miller Rubber Co., preferred	104	106
Portage Rubber Co., common	113	116
Portage Rubber Co., preferred	115	117
Swindart Tire & Rubber Co., common	85	87
United States Rubber Co., common	52½	52½
United States Rubber Co., preferred	108½	109

The National Rubber & Specialties Co., Cincinnati, Ohio, has increased its capital stock from \$20,000 to \$100,000. The officers of this company are as follows: C. L. Bonfield, president; G. M. Allen, vice-president; G. W. Drach, secretary and treasurer, and J. E. Bancroft, general manager.

THE CONNECTICUT MILLS CO.'S NEW ACQUISITION.

The Nemasket Spinning Mill at Taunton, Massachusetts, lately acquired by the Connecticut Mills Co., Inc., Danielson, Connecticut, has been reorganized under the name of the Taunton Cotton Mills Co. The mill has 30,000 spindles and will give

about 6,000,000 pounds product, somewhat less than two-thirds of the consumption of yarn at the Danielson factory. This is independent of the 3,000,000 pounds product of fabric at the company's Canadian plant at Sherbrooke, Quebec, which contains its own spinning equipment.

DOUBLES BY GEOMETRIC PROGRESSION.

The Morse Chain Co., Ithaca, New York, manufacturer of the "Morse Rocker-Joint Power Transmission," used in many rubber mills, has increased its capital from \$400,000 to \$1,500,000, for the purpose of greatly enlarging its plant. The business was established in Trumansburg, New York, in 1904, and two years later removed to a new factory at Ithaca, double the size of its former one. Six years later the plant was enlarged to more than twice its former capacity, and present plans contemplate again doubling the size of the plant. The addition of a large storage building is nearly completed, and additions to the steel and wire mills, and a new gas producer building are well under way. The main building is to be increased to more than 900 feet in length, and when these additions are all completed, the company will have a total floor space of approximately seven acres.

CONVENTION OF THE CONTINENTAL SALES STAFF.

The third annual convention of the sales staff of the Continental Rubber Works, Erie, Pennsylvania, was held in Erie last month. The attendance embraced branch managers from New York, Chicago, and San Francisco agencies and factory representatives from Middle and Atlantic States and from the South and Southwest. The convention lasted a week, combining business and pleasure, including daily conferences, dinners, luncheons, motor rides, picnics and country club diversions. This company has, under the efficient direction of Theron Palmer, become one of the important rubber manufacturing organizations of the country.

KAUFMAN RUBBER CO., LIMITED.

The representatives of the Kaufman Rubber Co., Limited, Berlin, Ontario, Canada, during the week of June 19, held an important conference at the company's headquarters in that city. The branch managers came from all parts of Canada, and the object of the convention was to discuss business topics and to plan the campaign for the coming season. The entire plant was inspected under the direction of Manager A. R. Kaufman and Superintendent J. H. Roedding. There were business sessions for the discussion and interchange of business views, and between times, various entertainments, such as automobile rides, a clam-bake, and a banquet at one

of the principal hotels, at which several interesting addresses were given. A handsome bear rug was presented to Manager A. R. Kaufman, and a set of leather-upholstered living-room furniture to Sales Manager W. E. Wing. The business of the company was reported as excellent and the output this year will be larger than ever before.

TRADE NOTES.

The Willard Storage Battery Co., 274-276 East One Hundred and Thirty-first street, Cleveland, Ohio, will erect four new buildings in addition to its present plant. These buildings will cover 150,000 square feet, and when completed will double the present floor space. The new power house and plant will be modeled along the lines of the best engineering practice and 40,000 amperes at 110 volts will be generated.

Joseph Chalfin, well-known dealer and importer of scrap rubber, has removed his offices from 36-38 Whitehall street, New York City, to 42-44 Whitehall street, where he occupies larger quarters, equipped with every convenience.

A newly organized rubber concern is the Scioto Rubber Co., located at 5th avenue and the Big Four tracks, Columbus, Ohio. The plant is well equipped for the manufacture of clothing, toy balloons, and hospital sheeting. The officers are C. M. Linthicum, managing director; Guy C. Bowman, president; C. F. Johnson, vice-president, and C. L. Lamont, secretary.

The Lycoming Rubber Co. (U. S. Rubber Co. factory), Williamsport, Pennsylvania, recently inaugurated a graduated bonus system for the encouragement of apprentices while learning the making of rubber footwear. The schedule in force shows that the first week apprentices will receive 75 cents per day. After that they will receive piece-work pay and a bonus graduated down from \$2.00 the second week to 50 cents the eighth week, after which straight piece work rate will be paid. Any girl whose entire ticket is transferred from tennis to gum shoes will receive similar graded bonuses for the first seven weeks.

T. J. Jones, for twenty years with the Mechanical Rubber Co., Cleveland, Ohio, where he was manager of the belting and hose department, and for the past three years assistant general manager of the Ohio Rubber Co., of that city, has recently incorporated the latter concern, which deals in mechanical goods, canvas belting and tires.

In THE INDIA RUBBER WORLD of June 1, 1916, a note appeared to the effect that we understood that W. M. Mackintosh contemplated starting a factory in the neighborhood of Montreal for the purpose of treating fabrics with "Galbulose," of which he is the inventor. Mr. Mackintosh writes that the information we received was somewhat premature. The use of this process and material is already established in Canada with two concerns, and is showing satisfactory results, and Mr. Mackintosh predicts a great future before it in several directions. At present the inventor is not promoting a company, his time being practically monopolized as a specialist in a munition factory.

GOODYEAR TIRE & RUBBER CO. PROMOTIONS.

M. D. Montgomery, who has been acting as manager of the Denver, Colorado, district for the Goodyear company during the illness of the late S. E. Gillard, has been appointed to the managership.

F. C. Moyer, formerly in charge of the Des Moines, Iowa, branch, is now branch manager at Minneapolis, Minnesota, succeeding G. H. Barmore, who has been made manager at the Milwaukee, Wisconsin, branch. The position of manager at Des Moines has been filled by F. W. Telford, formerly supervisor of motor truck tire sales in Chicago, Illinois.

The branch managership at El Paso, Texas, left vacant by the death of G. F. Dennis, has been placed in the hands of T. J. Fitzgerald.

VERNON ROYLE.

THIRTY-FIVE years ago the first Royle tubing machine was put into service. At that time the name Royle was unknown to rubber manufacturers. Today it is no exaggeration to say it is a household word throughout the trade.

Although not the original inventor of the process of making rubber tubing and allied forms, by forcing a plastic mass through a die, the development of the tubing machine has been so largely the personal work of Vernon Royle, the subject of this sketch, that he may be justly termed the father of this method of producing formed rubber products.

VERNON ROYLE.

Born in Paterson, New Jersey, on June 9, 1846, Vernon Royle received such education as the local schools of the time afforded, supplementing this by individual study and work, largely along mechanical lines. His first real experience of the elements of machine design and construction began with his apprenticeship to the pattern-making trade, which he mastered thoroughly in his father's shop and elsewhere, and later, through his connection with the old firm of Vanderburg, Wells & Co., makers of printers' furniture, wood type, etc., in New York, in ante-bellum days. Here young Royle's aptitude for mechanics led to his being placed in charge of the routing department, where he became familiar with the merits and defects of the routing machine, a fact that was not without a determining influence on his future career, as it was his intimate knowledge of routing machines, that in later life enabled him to develop the router that has made the name of Royle famous and which proved the foundation of the Royle success.

Illness terminated Mr. Royle's career with Vanderburg, Wells & Co., and there followed a year of battle for health; then seven years as secretary of the Board of Education of Paterson, followed by two years as Commissioner of Education. In 1880 he embarked on what proved his life work by forming a partnership with his father, John Royle, Sr., and his brother, John, Jr., for the prosecution of the machine business under the name of John Royle & Sons, under which name the concern has existed uninterruptedly to the present time.

The first Royle tubing machine was produced in 1881. This followed roughly the lines of a crude experimental machine already in existence, but was the first attempt to build a rubber machine with some pretensions to mechanical excellence. Judged by the machines of today, it was crude enough, yet it marks a distinct advance and was eagerly accepted by rubber manufacturers as the most efficient machine of its type in existence. It was, in short, the first tubing machine of real practical value.

It would extend this brief review unduly to mark the various steps by which the Royle tubing machine, as it is today, was developed. Detail after detail was made the subject of special study with a view to increasing the range of the machine and its productive capacity, all being finally brought together in the

perfected tubing machine as now made, a machine with a productive capacity at least six times as great as the earlier machines, while its range has been extended to include sizes and classes of goods formerly deemed entirely outside the range of the tubing machine. Continuous-length garden hose, for instance, is an example of the adaptation of the machine to meet a new demand, while many auxiliary devices for use in connection with tubing machines were invented, including strainer heads for reclaiming rubber, three-way heads for the same purpose; special insulating heads for making rubber packing; compound screws and dies for marbled tubing, etc.; also a very important machine, the circular loom for weaving seamless fabric coverings for steam, fire and garden hose. This machine was first placed on the market as the Royle-de Laski loom, from which has grown the present Royle circular loom, a type involving many important modifications of the original model. Two sizes are made, one for garden hose, the other for coverings up to eight inches in diameter.

Parallel with the development of the tubing machine proceeded the development of the insulating machine, a machine broadly similar to the tubing machine, but so modified as to permit of the application of seamless insulating coverings to wires and cables. Prior to the introduction of this machine, insulating compounds were commonly applied in strips by strip-covering machines, the raw edges of the strips being supposed to unite under pressure in the machine. The method answered well enough, but was essentially defective as the seam was a source of weakness. The Royle insulating machine corrected this, as it applied the covering in an absolutely seamless, homogeneous form, and hence proved a revolutionary machine in its field.

This, in brief outline, has been Vernon Royle's contribution to the rubber industry—the work of a lifetime summarized in a few words, yet so numerous have been Mr. Royle's inventions in this field, that 17 patents, embracing over 196 claims, have been granted him for his purely original work.

Nor has the rubber trade been the sole field of Mr. Royle's activities. Since 1880 he has been a dominant figure in the mechanical branches of photo-engraving, and in jacquard card cutting for silk weaving, in both of which lines, his inventions have been accepted as representing the highest achievements in efficiency. From a purely mechanical and technical standpoint, these lines are more interesting than the rubber line, involving, as they do, machinery of the most delicate and accurate construction, both in design and workmanship. In both lines, Royle machines are widely popular, the photo-engraving machinery, in particular, being used in every civilized country in the world and some rather uncivilized ones as well. In the case of tubing and insulating machines, 73 patents in all have been issued to him covering 671 claims.

At 70 years of age Mr. Royle is as active as ever in the conduct of his business and is still devising new things. His latest work includes improved motor-driven, positive-action take-offs for tubing and insulating machines, and he is now designing a tubing machine that will take dies up to 6 inches in diameter.

In addition to his activities in the field of mechanics, Mr. Royle has always taken a broad interest in the civic affairs of his native city, having served as a Commissioner of Education and as an officer of the Taxpayers' Association, serving on the committee charged with solving the difficult problem of sewage disposal in the Passaic Valley. At the present time, he is a director of the Hamilton Trust Co., a leading financial institution of Paterson, and of the Cedar Lawn Cemetery Co., to both of which he devotes considerable time. He is also a member of the American Society of Mechanical Engineers; the Masonic fraternity; the Hamilton Club and the New Jersey Historical Society. Mr. Royle is of Scotch-English descent and was married in 1872, his wife dying in 1908. He has two sons, Heber and Vernon E., both of whom are associated with him in business.

NEW INCORPORATIONS.

Alpha Rubber Manufacturing Corporation, June 30 (Delaware), \$100,000. Joseph A. Berger, L. Edward Dean, John F. Ram—all of Chicago, Ill. Principal office, 8 S. Dearborn street, Chicago, Ill. To manufacture rubber tires, tubes and all other rubber goods and material used in same.

Armored Tire Co., July 3 (Maine), \$100,000. Ernest L. McLean, Augusta, and E. M. Leavitt, Winthrop—both in Maine. To manufacture and sell automobile tires and reliners for automobile tires and pneumatic tires and reliners of any and all descriptions.

Atlantic Rubber Manufacturing Co., Inc., July 7 (New York), \$15,000. William Schrader and William Ehlers, of 337 Broadway, New York City, and Felix Schwemer, 402 First avenue, College Point, L. I.

Buckeye Tire Co., The, May 24 (Ohio), \$5,000. R. S. Graves, R. H. Woolley, C. W. Shields, John Bleska, and S. W. Lewis.

Burrill Tire Co., The, May 9 (Massachusetts), \$200,000. Frank H. Burrill, Charles Noll, Edward F. Loughlin—all of Concord Junction, Massachusetts. Principal office, Concord, Massachusetts. For the purpose of manufacturing and selling at wholesale and retail a certain patented device known as the Burrill Tire Tool for removing rims from automobile tires.

Colonial Braid Co., Inc., June 12 (New York), \$10,000. Robert F. Dreuge, 1126 Fox street; Sylvia Kaipf, 564 West 149th street—both in Bronx, and C. Agnes Berard, 541 16th street, Brooklyn—all in New York City. To manufacture elastic braid, etc.

Chicago Tire Co. of America, Inc., July 20 (New York), \$100,000. S. Bernheim, 35 Nassau street, New York City; C. A. Weldon, 591 Seventh avenue, and Harry J. Jacobson, 555 Grand street—both in Brooklyn, N. Y.

Corcoran Tire & Rubber Co., May 18 (Ohio), \$5,000. Thomas J. Corcoran, Jacob A. Hollander, Charles E. Weber, Phil W. Tozzer, and T. M. Miller.

Dorman-McClelland Tire & Supplies Co., July 5 (Iowa), \$10,000. F. E. Dorman (president); Tom McClelland (vice-president); Robert McClelland (secretary and treasurer), all of Davenport, Iowa. Principal office, Davenport, Iowa. To sell and repair tires and other auto accessories.

Duplex Tread Tire Co., June 13 (Indiana), \$10,000. Edward C. and Lucile Meisner, and Samuel G. Boyer. Principal office, Terre Haute, Indiana. To manufacture auto tires.

Eagle Rubber Co., The, June 1 (Ohio), \$50,000. H. R. Gill, Harry V. Poble, J. E. Arnold, J. W. Dash and Clyde C. Sherick. Principal office, Ashland, Ohio. To manufacture toy balloons, rubber novelties, sundries, etc.

Fibre Wel Co., April 27 (Indiana), \$15,000. W. E. and L. W. Bundy, and D. H. Snapp. Principal office at Kewanee, Indiana. To manufacture fiber board.

Kansas City Tire & Accessory Co., April 14 (Missouri). Glenn R. Donaldson (president), B. E. Weldon (vice-president), and Tom C. Schroeder (secretary and treasurer). Principal office, 1518 Grand avenue, Kansas City, Missouri. To deal in tires and automobile accessories.

Keystone Metallic Tire Co., May 18 (Delaware), \$100,000. Franklin L. Mettler, Walter R. Mull, Alfred Whartenby—all of Wilmington, Delaware. Principal office, 702 Market street, Wilmington, Delaware. To manufacture and sell insulated and non-insulated metallic ties for steel, electric and other railways.

Lee Tire Co., June 27 (Tennessee), \$5,000. G. M. Seewald, F. R. Rouse, R. F. Seewald, J. M. McKernan and Earl King. Principal office, Memphis, Tennessee.

Non-Skid Co. of America, June 7 (Massachusetts), \$200,000. Robert M. Clark, Newton Centre; Albert H. Harrington, Fall River; E. Clifford Potter, 50 Congress street, Boston—all in Massachusetts. Principal office, Boston, Massachusetts. To

manufacture and deal in motor vehicles, parts, accessories, tools and appliances, and apparatus and machinery for making the same.

Overture Service Co., Inc., June 16 (New York), \$1,000. Philip Rosenberg, 121 Hopkins street; Isaac Slutsky, 344 Jay street, and Abraham Kempner, 2021 Cropsey avenue—all in Brooklyn, N. Y. Principal office, Brooklyn, N. Y. To manufacture and deal in all kinds of tires.

Pan-American Rubber Co., June 29 (Wisconsin), \$200,000. F. J. Kamler, H. C. Clausen and N. J. Kopeimer. Principal office, Milwaukee, Wisconsin. To manufacture and deal in rubber goods.

Standard Album Corporation, March 21 (New York), \$10,000. Jennie H. Betts and Julia E. Byrce, 410 Riverside Drive, New York City. To deal in pictures, leather, rubber goods, etc.

Stein, A. S., Inc., July 10 (New York), \$500. Arthur S. Stein, Jersey City, N. J.; George J. Constable, 354 Ocean avenue, and Henri Presspich, 256 7th street—both in Brooklyn, N. Y. To deal in auto tires and tubes.

Tempest Waterproofing Corporation, June 15 (New York), \$10,000. W. Tempest, 234 Central avenue, West Hoboken, N. J. Charles C. Turner, 67 West 104th street, and Herbert Tempest, 71 East 11th street—both in New York City. Principal office, New York City. Waterproofing fabrics.

Thomas & Guzman Co., Inc., July 19 (New York), \$10,000. William W. Thomas, Octavia J. Thomas, A. M. Lazarowitz—all of 51 Leonard street, New York City. To deal in tires of all kinds.

Tire Co. of Baltimore, Inc., July 10 (New York), \$100,000. Sydney Bernheim, 305 West 72nd street, New York City; Catherine A. Weldon, 591 Seventh street, and Harry H. Jacobson, 555 Grand street—both in Brooklyn, N. Y.

Triangle Packing Co., The, March 17 (New York), \$100,000. Edward H. Letchworth, Fritz Fernow, Walter M. Wilkins, 12 Cleveland Place, Buffalo, New York. To manufacture packing.

Twin Tube & Rubber Co., June 26 (Delaware), \$1,000,000. George W. Dillman, F. D. Back, M. L. Harty—all of Wilmington, Delaware. Principal office, Delaware Charter Guarantee & Trust Co., 328 DuPont building, Wilmington, Delaware. To manufacture and deal in inner tubes, solid or pneumatic tires, rubber shoes, rubber heels, etc.

Washington Tire & Rubber Co., May 16 (Delaware), \$250,000. E. P. Altenberg, East Palestine; F. H. Grove, Columbiana; G. P. Wilson, Steubenville—all in Ohio. Principal office, United States Corporation Co., 311 South State street, Dover, Delaware. To manufacture and deal in rubber tires and tubes.

CANADIAN CONSOLIDATED PICNIC HUGE SUCCESS.

The natal day in Canada, July 1, is celebrated annually as "Dominion Day," and on this occasion the annual picnic of the employees of the factories of the Canadian Consolidated Rubber Co., Limited, and the Canadian Consolidated Felt Co. was held at West Side Park, Waterloo, Ontario.

Over 5,000 people were in attendance and the all-day program of sports was highly enjoyed. Valuable prizes were given for the different events, which included amusing features such as frog and wheelbarrow races, pie eating and watermelon contests, and a Mutt and Jeff race.

A tug-of-war inter-company contest between the Kimmel felt factory and the Berlin felt factory against the Merchants Rubber Co. and the Dominion tire factory resulted in victory for the Dominion tire team; while in the relay inter-company race the Merchants Rubber team conquered.

Refreshments were served in abundance, and two excellent bands provided music.

TRADE NOTES.

Charles E. Miller, Anderson, Indiana, has just completed a new brick addition to accommodate the increased demand of the rubber department. This structure adds about 3,500 square feet of floor space to the factory. A second addition is in early prospect.

It is said that the McGraw Tire & Rubber Co. will erect a warehouse at 135 Mt. Royal avenue, Baltimore, Maryland.

The Lee Tire & Rubber Co., Spring Hill, Pennsylvania, has resumed operation after the annual Fourth of July and stock-taking suspension.

Thomas Midgley has petitioned to enjoin the Lancaster Tire & Rubber Co. from using the word "Midgley" in connection with its products, his contention being that the Lancaster company has not lived up to an agreement made at the time he severed relations with the company, that at the expiration of three months, the use of his name in connection with its tires would be discontinued.

More than 1,000 employes of the McGraw Tire & Rubber Co., East Palestine, Ohio, have formed the McGraw Rubber Club, a social organization. To keep in touch with the activities of the club, a bright little four-page paper, entitled "The Rubber Leaf," is to be published, bi-monthly. Lewis E. Stein is the editor.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has equipped all the new Indian motorcycles of the machine gun company of the Second Regiment, M. V. M., bound for the Mexican border, with "Red Top" motorcycle tires, free of charge. The labor troubles which have kept the tire makers away for three weeks have been finally settled, and they are now back at work.

The Continental Rubber Co., Sandusky, Ohio, is erecting a two-story building, 50 by 200 feet, on West Monroe street. It is expected that the plant will be ready for operation by November 1, with a capacity of 200 tires a day. H. H. Herman, formerly with the Firestone Tire & Rubber Co., will be superintendent.

The Hester Tire & Rubber Co. has obtained a site at Lima, Ohio, upon which a main factory building, 60 by 150 feet, and a power house, 60 feet square, are to be erected. The company officials state that work on the buildings will soon be started, and machinery will be installed before early fall. The capacity of the plant will be 100 tires per day and 100 men will be employed. A second building for the manufacture of motor truck tires is also contemplated.

The B. F. Goodrich Co., Akron, Ohio, has opened a pneumatic tire service station at Yosemite National Park, Yosemite, California. This store will be under the jurisdiction of the San Francisco branch and will be in charge of S. M. Wynne.

The Blow Tire Sealer Co., at 21st and Race streets, Philadelphia, Pennsylvania, is putting a new tire sealer on the market.

The Kelly quick detachable wire wheel is now to be manufactured and aggressively marketed by the Craftsmen Motor Corporation, Chicago, Illinois.

The Bates Puncture Plugger, a plastic preparation for use in tires, is said to be a most effective resistant to punctures, and occupies but 5 per cent of air space. It is the invention of Edgar L. Bates, a western chemist, and controlled by Paul Richey of the Russell M. Seeds Co., Indianapolis, Indiana.

The Pan-American Rubber Co., Milwaukee, Wisconsin, notice of whose incorporation appears elsewhere in this issue, takes

over the business of the Sporn Tire Co., which has been manufacturing inner tubes for about ten months. Factory quarters have been leased in the Kopmeier building, and a large production is planned. F. J. Ramler is president and general manager of the new company. Mr. Ramler is half owner of the Standard Racine Rubber Co., Milwaukee, and a large stockholder in the Racine Rubber Co., Racine, Wisconsin, having been engaged in the rubber and tire business for more than 16 years.

The Chicago, Illinois, branch of the Fisk Rubber Co. has been removed from 1440 Michigan avenue to new quarters at 2508 Michigan avenue, with a service station at 53-59 East Twenty-fifth street. The new office is complete and up-to-date in every detail, the building being two stories high, with basement, and having a 40-foot frontage and 190-foot depth. Wayne Murray, for five years in charge of this company's business in Texas, is manager.

CHANGES AT GOODRICH DEPOTS.

The B. F. Goodrich Co., Akron, Ohio, has recently re-opened its depot at Sacramento, California, located at 1129 Ninth street. George M. Gay has been appointed local manager.

The temporary store of the Goodrich company at Columbus, New Mexico, which has been operated as part of the depot at El Paso, Texas, is now maintained as a separate service station, Charles R. Serfass continuing in charge. The principal activity of this depot will be caring for government business incident to the military activity on the Mexican border.

THE BRUNSWICK COMPANY WILL MAKE TIRES.

The Brunswick-Balke-Collender Co., Chicago, Illinois, has greatly increased its rubber factory capacity and will enter the automobile field with a complete line of automobile rubber parts and accessories, from tires to the smallest rubber unit found on a car.

The accompanying illustration shows the newly erected addition to this company's factory at Muskegon, Michigan, where

the Brunswick Skid-Not tire and a new puncture self-healing tube are manufactured.

J. E. Duffield, formerly Western manager for the Thermoid Rubber Co. and more recently connected with the United States Rubber Co. interests, will be sales manager for the entire rubber goods and automobile accessories division.

TRUCKS MUST BE RUBBER-TIRED IN MONTREAL.

Complaining of the deterioration in the city's streets caused by truck wheels, Montreal, Canada, has passed a law compelling truck owners to provide the wheels of their vehicles with tires made of rubber, or of some other resilient material that will not injure the surface of the streets.

PERSONAL MENTION.

Samuel Norris, secretary of the United States Rubber Co., recently underwent an operation, from which attending physicians state recovery is a practically assured fact.

Edgar B. Davis, in charge of the Sumatra plantations of the United States Rubber Co., and H. Stuart Hotchkiss, vice-president of the General Rubber Co., recently left New York for the Sumatra district on a tour of inspection of the properties which, it is estimated, will consume about six weeks. They expect to return to New York early in November.

Arthur W. Stedman, manager of the crude rubber department of the Hagemeyer Trading Co., New York City, returned from an important and successful trip to England on July 20.

Grant Lambright, formerly superintendent of the Bucyrus Rubber Co., has recently assumed the management of the Marion Rubber Co. He is succeeded by John Field, formerly assistant superintendent of the Bucyrus plant.

D. P. Harris, head of the Harwaco Rubber Works, New York City, and of the D. P. Harris Hardware Co., returned from a trip to the Pacific Coast recently, and superintending the removal of these two concerns to their new building, corner of Church and Chambers streets.

William H. Wellington, of the commission house of Wellington, Sears & Co., has been elected a director of the Hamilton Woolen Co., to fill the vacancy caused by the death of Charles B. Gookin.

Maurice Horowich, of the Double Tread Tire Co., Binghamton, New York, has secured the agency of the Northland Rubber Co., of Buffalo, and will distribute Northland tires in Binghamton and vicinity.

B. C. Swinehart, for three and a half years manager of the Philadelphia branch of the Republic Rubber Co., has been called to the factory at Youngstown, Ohio, where he will have charge of the solid tire department. He is succeeded by H. S. Worthington, who has been connected with the Philadelphia branch for the past five years as assistant manager.

R. W. Pharis recently resigned as director and manager of the Columbus branch of the Pharis Tire and Rubber Co., Newark, Ohio, to assume the management of the International Tire Co., a distributing concern handling factory seconds, located at 187 Gay street, Columbus, Ohio.

E. P. Logan, formerly district manager of the St. Louis branch of the Federal Rubber Co., has recently assumed charge of the central district, with headquarters in Chicago, Illinois.

Edward C. Strayer, who has been the office credit man for the McGraw Tire & Rubber Co., East Palestine, Ohio, for the past two years, left for St. Louis, Missouri, during the past month, to take charge of the McGraw office there.

Fred H. Ayers, formerly New England district manager and for 13 years connected with the Fisk Rubber Co., Chicopee Falls, Massachusetts, has been appointed supervisor of districts, with charge of the entire outside organization of the company.

A. J. Pennington, formerly with the Dryden Rubber Co., Chicago, has been appointed general superintendent of the tire, tube and automobile accessories plant of the Brunswick-Balke-Collender Co., at Muskegon, Michigan.

J. L. Wacksmuth has been appointed local manager of the Washington depot of The B. F. Goodrich Co., Akron, Ohio.

B. F. Hochschild has resigned the office of treasurer and general manager of the Gordon Tire & Rubber Co., Canton, Ohio, and will announce later his new connection.

G. J. Bates, for the past ten years prominently identified with the tire business, has relinquished a prominent position with the Firestone Tire & Rubber Co. to accept the newly-created office of commercial manager of the King Motor Car Co., Detroit, Michigan.

G. F. Farasey, formerly with the Boston and Cleveland branches of the Kelly-Springfield Tire Co., has been made office manager of the local branch at St. Louis, Missouri.

I. B. Rohrer has been appointed general manager of the Fisk Rubber Co. branch at Council Bluffs, Iowa.

H. B. McMaster, general manager of branches of the Berger Manufacturing Co., Canton, Ohio, has resigned to become vice-president and general manager of the Gordon Tire & Rubber Co., of the same city.

PREPAREDNESS PARADE AT MILWAUKEE.

Preparedness parades are in order all over the country, and in Milwaukee, Wisconsin, on July 15, the rubber trade was well represented in an enthusiastic gathering undaunted by the rainy weather. The Federal Rubber Co. representatives numbered 583, and each man and girl wore a white felt hat with a ribbon band on which the words, "Federal Rubber Co." were printed. The Cutler-Hammer Manufacturing Co., whose devices are so largely used in rubber factories, had 1,074 representatives in the parade. The following companies having branch stores in Milwaukee were also represented: Fisk Rubber Co., United States Rubber Co., Goodyear Tire & Rubber Co. The Wisconsin State Rubber Co. also had a file of representatives in the parade.

THE GERMAN SUBMARINE AND THE BRITISH BLACKLIST.

AN event of interest in the rubber trade, last month, was the arrival at Baltimore of the German submarine "Deutschland," and the taking on of a cargo to carry back to Germany. Great secrecy was maintained as to the character of this cargo, but that it comprises, in part, approximately 150 tons of Upriver fine rubber is a practical certainty.

It is considered quite probable that in the sale and shipment of this rubber some American rubber brokers and dealers were concerned. Soon after the arrival of the "Deutschland," and the

Copyright by Underwood & Underwood.

LOADING RUBBER ON THE "DEUTSCHLAND" AT BALTIMORE.

reports of its intention to carry to Germany contraband materials, came the announcement by the British Government that over 80 firms, corporations or individuals in the United States had been placed on the "black list" under the "trading with the enemy act" which prohibits persons domiciled in the United Kingdom from dealing with these parties. Among these 80 houses are several connected with the crude rubber business and some of these feel that their business will be severely restricted if they cannot purchase rubber in any British home or colonial market, or secure transportation of goods from any port in British vessels.

RUBBER SCRAP DEALERS' PACKING STANDARD.

ACCORDING to a request, we publish in a slightly condensed form "Circular B" of the Rubber Scrap Division of the National Association of Waste Material Dealers.

All goods bought and sold under these specifications are understood to consist only of domestic manufacture unless otherwise stipulated. All rubber scrap bought and paid for net weight, no allowance for bagging nor covering of any kind, nor shall same be returned to seller.

DELIVERY.

- A. Delivery of more or less on the specified quantity up to 2½ per cent is permissible.
- B. If the term "about" is used, it is understood that 5 per cent more or less of the quantity may be delivered.
- C. In the event that buyer should claim the goods delivered on a contract are not up to the proper standard, and the seller claims that they are a proper delivery, the dispute shall be referred to the Arbitration Committee of the National Association of Waste Material Dealers to be appointed for that purpose.
- D. A contract for a carload, unless otherwise agreed upon, shall mean the minimum quantity recognized by the official classification tariff of the district in which the seller is located.
- E. A ton shall be understood to be 2,000 pounds unless otherwise specified.

The standard of packing is given below :

1. RUBBER BOOTS AND SHOES must be packed as per Rubber Reclaimer's Circular No. 5. (Circular No. 5 is the same as No. 3 excepting that red, white, tan and fancy colored shoes must be kept out.)
2. TRIMMED ARCTICS must be closely trimmed and free of leather, tennis soles, tennis shoes and detached heels.
3. TRIMMED TENNIS SHOES must be black; closely trimmed; free of molded soles, and leather.
4. STANDARD AUTO TIRES must be free of the following: All McGraw tires such as "Imperial," "Pullman" and "Congress" and other tires of similar quality; all unguaranteed tires; heavy beaded tires; "Dayton Airless" and other filled tires, must not contain any hard, oxidized, burnt, single tube, motorcycle, stripped or badly worn tires nor tires containing leather or metal.
5. UNGUARANTEED TIRES must be free of heavy beaded tires, hard or oxidized, stripped, badly worn tires with leather and metal.
6. HEAVY BEADED TIRES must be free of hard or oxidized tires, stripped, badly worn and tires with leather and metal.
7. STRIPPED AND BADLY WORN TIRES must be free of hard or oxidized tires, heavy beaded and tires with leather and iron. A reasonable proportion of the tread must be on the tires.
8. NO. 1 AUTO TIRE PEELINGS must be free of cloth, metal and leather.
9. NO. 2 AUTO TIRE PEELINGS must consist of peelings from auto tire treads only and must be free of metal, leather and stripped auto tire fabric.

10. BICYCLE TIRES must be free of hard or oxidized tires, wire and beaded tires.
11. SOLID WAGON AND CAB TIRES must be free of metal and baby carriage tires.
12. SOLID MOTOR TRUCK TIRES must be free of metal and tires with hard bases and fiber bases.
13. AIRBRAKE HOSE must be free of metal, hard or oxidized hose and steam hose.
14. GARDEN HOSE must be free of metal, rags, rope and cotton covered hose.
15. LARGE HOSE must be free of metal, rags, rope, hard or oxidized hose and all cotton covered hose.
16. COTTON COVERED FIRE HOSE must be rubber lined, and free of hard or oxidized hose and metal.
17. NO. 1 AUTO INNER TUBES must be strictly elastic floating tubes, free of crusty tubes, cloth and metal.

18. NO. 2 AUTO INNER TUBES KNOWN AS COM-
POUNDED TUBES must be standard tubes, free of crusty tubes, cloth and metal.

19. NO. 1 BICYCLE INNER TUBES must be strictly elastic floating tubes, free of crusty tubes, cloth and metal.

20. NO. 2 BICYCLE INNER TUBES KNOWN AS COM-
POUNDED INNER TUBES must be standard tubes, free of crusty tubes, cloth and metal.

21. RED AUTO INNER TUBES must be standard tubes, not perforated, free of crusty tubes, cloth, metal and black patches.

22. NO. 1 WHITE RUBBER must consist of strictly clean white soft druggists' sundries and must be free of cloth and metal.

23. NO. 2 WHITE RUBBER must consist of white horse shoe pads, white toys, white mechanical goods, and to be free of cloth, metal, crusty, hard oxidized material.

24. NO. 3 WHITE RUBBER must consist of painted white rubber balls or toys and white jar rings, and to be free of cloth, painted wainscoting, metal and hard or oxidized rubber.

25. WHITE WRINGER RUBBER must be strictly white soft rubber, free of yellow wringer rubber, hard or oxidized wringer rubber, cloth and metal.

26. YELLOW WRINGER RUBBER must be free of cloth, metal and free of hard rubber.

27. MIXED BLACK RUBBER must be free of cloth, metal, crusty, hard or oxidized material, packing, stripped matting and tiling.

28. MATTING AND PACKING must be free of Garlock and piston packing, belting and similar material, metal and hard or oxidized stock.

29. NO. 1 RED RUBBER must consist of soft red druggists' sundries, free of maroon, chocolate, and other dark shades, also free of cloth and metal.

30. NO. 2 RED RUBBER must consist of material such as red toys, balls, mechanical red. Must be free of jar rings, soles, packing, hard or oxidized rubber cloth and metal.

31. RED PACKING must be free of hard or oxidized rubber, cloth and metal and discolored rubber.

This standard of packing was adopted by the Rubber Scrap Division and approved by the executive committee of the association on March 14, 1916, to be effective from April 1, 1916.

CHEMICAL INDUSTRIES EXHIBITION.

The second National Exposition of Chemical Industries will be held at Grand Central Palace, New York City, September 25-30, 1916. Many important manufacturing companies doing business with the industries wherein chemistry plays a part, will make exhibits. Several chemical and engineering societies will hold their annual meetings in that city during the week. The American Chemical Society, and the American Electrochemical Society are among the number.

The Bureau of Commercial Economics at Washington is co-operating with the exposition by arranging an elaborate program of motion pictures covering subjects dealing with the industries depending on chemistry. Many of these films will have their premier showing at the exposition. They will take the visitor through industrial plants, shops, manufactories, mines, etc., where visitors themselves are never admitted. They will show operations which in ordinary light would never be seen. They will demonstrate more than any other kind of motion pictures the great strides and improvement in the art of photography.

A few of the films that appear on the tentative program are: the rubber industry, the match industry, manufacture of explosives, varnish manufacture, silver mining, mining and manufacturing of iron, making of blotting paper, accident and fire prevention, manufacture and use of fertilizers and the manufacture of steel.

Some of these films are now being made, and other features are in active preparation for the exposition.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

THE Mason Tire & Rubber Co., at Kent, Ohio, is completing installation of equipment in its new factory and expects to start making tires within a few days. The plant is of steel and concrete construction, is 230 feet long and contains about 40,000 square feet of floor space, having a capacity of 500 tires and tubes per day. This structure stands in the middle of a 16-acre tract of land, thus affording ample room for expansion.

The officers of the company are: O. M. Mason, president; I. R. Davies, secretary; D. M. Mason, general manager, and A. S. Heltzel, sales manager. B. E. Prantz, superintendent, has

PLANT OF THE MASON TIRE & RUBBER CO., KENT, OHIO.

spent 12 years in practical tire making, having been connected with some of the largest Ohio plants; and H. H. Forrest, another practical tire man, is in charge of the tire and tube department.

It is stated that already plans are being made for increasing the capacity to 1,000 tires per day, these plans calling for the addition of a one-story mill and calender room of saw-tooth construction and three-story cutting, tire-building and storage rooms.

The company is capitalized for \$1,000,000, \$650,000 preferred and \$350,000 common stock, the financing of which has now been practically completed.

* * *

Since 1910-11, when the Firestone Tire & Rubber Co. moved into its new factory, the sales have grown from \$7,462,581.17 to \$25,187,884.33, making a total increase of 257 per cent for the past five years. This past year, 1915-16, the increase to June 1 was 38 per cent over the showing of 1914-15. Since the new factory was erected five years ago it has been tripled in size. This has been done, wing by wing, these additions being made without loss in production efficiency.

The annual picnic of the Firestone company was held on Saturday, July 29. In the morning special cars carried the Firestoneites and their families, numbering around 25,000, to Silver Lake Park, near Akron. A soccer football game and a baseball game between department heads were keenly enjoyed by both participants and spectators. Following bountiful midday refreshments, varied athletic events provided wholesome fun until time for the evening display of fireworks, which were shown on the island in the center of the lake.

* * *

At a meeting of directors of the Portage Rubber Co., on July 11, the capital stock of the company was increased from \$1,250,000 to \$3,000,000, \$1,500,000 of this increase to be issued and disposed of as common stock and \$250,000 as preferred stock.

* * *

The employees of the Miller Rubber Co. held their annual outing at Silver Lake Park on Saturday, July 15. The picnic was

largely attended and the day's sport proved highly enjoyable, a baseball game being the chief feature.

* * *

The books of The B. F. Goodrich Co. were closed on July 1, for the purpose of determining the result of operations for the first six months of 1916. They have not been audited by public accountants, but the company's auditor has submitted to the directors a statement of earnings for the period. After making proper provision for maintenance charges, depreciation, doubtful accounts, and all known outstanding current liabilities, the net profits for the period amounted to \$4,800,000.

The Goodrich company is the first among our rubber factories to adopt the weekly pay system for its employees. Heretofore the workers have been paid semi-monthly, and under that system new workmen had to wait three weeks before drawing any money, as the first pay was held back. This meant hardship in many cases, especially among out-of-town workers who arrived in Akron with only a small amount of money.

* * *

The Goodrich and Goodyear companies gave \$15,000 each to the recent campaign for Akron hospitals. A. H. Marks, vice-president of the Goodrich company, donated \$25,000, and C. B. Raymond, secretary of the same company, gave \$10,000. F. A. Seiberling, president of the Goodyear Tire & Rubber Co., also gave \$10,000.

* * *

The factory school of the Goodyear Tire & Rubber Co., organized originally for the benefit of the workers in several departments, has been so successful that the classes are now thrown

GOODYEAR EMPLOYEES NOW AT THE FRONT.

open to all employees of the company. Those wishing to improve upon their early education can do so, by means of these classes, in common school and high school subjects, arranged at convenient hours; while in the citizenship classes, men of alien birth are taught the fundamental principles of our government, the geography of the country, and the subjects necessary to make them intelligent citizens.

Lucian L. King, advertising manager for the Goodyear Tire & Rubber Co., Akron, Ohio, who is a member of the Hospital Corps of Battery "B," Ohio Field Artillery, has been detailed to special duty in inaugurating a publicity campaign to stimulate enlistment in the National Guard.

* * *

The capital stock of the Punctureless Auto Tire Co., at Bartenton, Ohio, has been increased from \$100,000 to \$1,000,000.

* * *

The Phoenix Rubber Co. is the name of a newly organized concern to locate in East Akron. The company will make molded specialties.

* * *

The rubber men who attended the outing of The Rubber Club

of America, Inc., on July 18, were greatly pleased at the smoothness of the arrangements whereby they were transported to and from Akron in the special cars under the direction of Messrs. H. S. Firestone, W. O. Rutherford and C. B. Raymond. Akron was represented by nearly 40 members of the trade and probably had a larger showing than any city except New York and Boston. They were handsomely entertained by members of the Boston trade during their visit to that city.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

AN event of interest in the trade was the Shoe and Leather Market-Fair which was held in the Mechanics' building the second week of last month. Taken as a whole, it was much less a shoe fair than a leather fair, for there were few shoe exhibits. There were, however, quite a number of rubber manufacturers who had exhibits, most of these showing heels and soles. The number of people manufacturing these is evidence of the increasing use of rubber or compositions containing rubber, to replace leather in footwear. This is, of course, largely due to the excessively high cost of leather, but it is also, in a measure, due to the growth of appreciation of rubber for this purpose by the public.

Among those who exhibited at the fair was the Foster Rubber Co., which for many years has manufactured the "Cat's Paw" heels and is the manufacturer of rubber soles. This exhibit was in charge of William Noll, the enterprising sales manager of the concern, who made a good showing of the many shapes and styles of heels and soles made by this concern, the samples being arranged on the hinged leaves of a huge book. An amusing animated sign, advertising the "Cat's Paw" heel, showed the black cat trade-mark of the company, which by mechanical action humped its back and lifted its paw at regular and frequent intervals. A good display was also made of the "Red Plug Spring Step" heel which this company is now handling for the jobbing trade.

The Essex Rubber Co., Trenton, New Jersey, had a fine display of its rubber fiber and fiberized soles and heels. The booth was attractively arranged. Large artistic pictures were shown at the back, labeled "Business," "Pleasure," "Safety," "Service," showing, respectively, the business man, with a city background, a yacht at full sail, a policeman at a street corner, and a girl tripping along gaily in the rain.

The exhibit of the Plymouth Rubber Co., Canton, Massachusetts, was in charge of W. H. Mott. Its advertised line of "Slipknot" rubber heels was featured by means of a big gilt sign in the shape of a heel, and properly lettered. The company showed a line of plain plug heels for manufacturers to use on their shoes; also soling and patches for cobblers' use, a line of rubber boot heels and a line of "Durable Kompo" fiber, and rubber soles and "Bantam" soles of rubber and fiber. A novelty was shown in a shoe in which not a particle of leather was used. The top was of shoe cloth, the vamp of "Plymouth Leatherette," the sole of "Durable Kompo," with "Slipknot" heel and inner sole of "Gem" duck—everything, except the counter, the product of the Plymouth Rubber Co.'s factory.

The Avon Sole Co., Avon, Massachusetts, which claims to be the pioneer in making a shoe sole of leather fiber and rubber combined, had a display of its "Du-Flex" sole and "Avon" fiber sole, both being guaranteed to outwear the best oak sole leather. This company claims to use only the best plantation rubber in its compounds, and exhibited samples of first latex and smoked sheet rubber. The exhibit was in charge of C. B. Packard.

The I. T. S. Rubber Co., Elyria, Ohio, exhibited a novel style of rubber heel, it being molded convex on the tread and concave on the part attached to the heel, this shape being adopted that the heel might lie flat and close, with a tight joint, even

without cementing, when attached. The claim for this heel is that because of this shape the nails can be placed nearer the center, and therefore the heel will stand more wear before the heads of the nails are exposed, thus giving longer wear and less liability of damage to floors. This company also showed a novel way of packing heels, the carton being so labeled that whatever side is presented to view on the shelf, the contents of the carton can be easily and quickly read, the boxes being square, the sizes marked on all four sides, right side up and up side down, and the exact pattern of the heel shown on both top and bottom. This exhibit was in charge of J. G. Tufford, the inventor of this heel.

The B & R Rubber Co., North Brookfield, Massachusetts, had an exhibit of its "Armortred" rubber soles, in white, gray and tan. The company claims these soles to be 25 to 50 per cent lighter than the average rubber sole. The "Barco" brand was also exhibited, a lower-priced rubber sole made expressly for shoe manufacturers, who, if they so desire, can have their names placed upon the sole.

The Oko Rubber Co., Campello, Massachusetts, exhibited a series of samples showing the gradual changes from the pure rubber sole to the fiber sole it is now manufacturing, and which is made of cotton felt with only 5 to 8 per cent of rubber as a binder. It is claimed that this sole is neither a rubber nor a leather sole, but that it will outwear either, will not crack or break, and is absolutely waterproof. The exhibit was one which was viewed with interest by many because of this practical demonstration.

The Fellows Rubber Co., Medford, Massachusetts, exhibited its "Walkmore" soles and heels, manufactured expressly for the findings trade. These soles are made of flax and cotton fiber combined with rubber and are claimed to outwear leather, can be stitched without breaking, and are claimed to be superior to either rubber or leather soles. The "Walkmore" heels, unlike many other heels exhibited, also contain fiber.

Perhaps the handsomest booth at the fair was that of The B. F. Goodrich Co., Akron, Ohio, which was effectively decorated so that it seemed a veritable flower garden. M. M. Davis had charge of this exhibit, in which there was a fine display of the Goodrich company's "Textan" soles, which were pronounced to

EXHIBIT OF THE B. F. GOODRICH CO. AT THE SHOE AND LEATHER MARKET-FAIR.

be of fiber and rubber, just enough rubber being used for a binder. This sole is being exploited by means of extensive advertising and is being adopted by many shoe manufacturers on certain lines of their goods. A number of handsome shoes were exhibited with "Textan" soles. This company also exhibited the O'Sullivan rubber heels which, although not marketed, are manufactured by the Goodrich company. Incidentally, it was stated to your correspondent that the company recently made one shipment of 30 tons of O'Sullivan rubber heels.

The Federal Rubber Co. of Illinois, Cudahy, Wisconsin, exhibited a line of "Pennant" fiber soles and "Pennant" fiber and rubber heels for shoe manufacturers and "Rugged" fiber soles and heels for the jobbing trade.

In the booth of the Panther Rubber Co., of Stoughton, Massachusetts, was a striking representation of its trade-mark, being an immense, stuffed panther. Among the heels which were shown were the "Triplug," "Panther Tread" and "Indian" brands. The "Indian" and "B. B." soles were also shown, the "Indian" sole being guaranteed to such an extent that if a sole goes wrong the company pays for the whole shoe, while with the "B. B." soles, if any trouble results, the company pays for the sole. The Panther company also showed a line of coated duck for making "Gem" inner soles, and exhibited a heater which it furnishes to customers for use in manufacturing these inner soles from the Panther company's mill. This concern distributed advertising fans which were very popular during the heated term which lasted all through the week of the exhibit.

The Goodyear Tire & Rubber Co., Akron, Ohio, had a very extensive exhibit of shoes made by prominent manufacturers, with the Goodyear "Neolin" soles attached; also a line of "Wing-foot" heels. This company distributed diminutive sample soles of "Neolin."

The Hood Rubber Co., Watertown, Massachusetts, was the only concern to exhibit rubber footwear on this occasion. The booth was in charge of William B. Loughton, manager of the Hood company's export department. The exhibit consisted of a large variety of rubber and tennis footwear, the regular line manufactured by the company, and there were samples of Para biscuit and plantation rubber. This booth was a center of attraction when Mr. Loughton distributed little silver-plated charms in the shape of Hood rubber boots and storm slippers.

At the United States Rubber Co.'s booth, in charge of F. T. Ryder, was a fine exhibit of this company's new "Rinex" sole, in black, white and tan. This sole is made at the Revere Rubber Co. factory at Chelsea, Massachusetts. At this exhibit a large number of diminutive pin badges in the shape of flags, containing the United States company's trade-mark, were distributed and many hundreds of these were given away, thus popularizing still further the trade-mark of the company.

In the same booth were exhibited the various specialties of the Revere Rubber Co.'s shoe supply department, which is the successor to the Walpole Shoe Supply Co., this portion of the exhibit being in charge of J. N. Moulton.

Although the concern known for years as the Hub Gore Makers is now a part of Everlastik, Inc., New York City, still, as far as the shoe trade is concerned, the old name is used, thus preserving the identity and the words on which thousands of dollars have been spent in advertising. This concern exhibited a large number of styles of footwear in which elastic goring was used, some novel forms being shown. The one most noticeable was a new automatic shoe which was worn by a lady demonstrator who exhibited its workings to all interested visitors. This shoe has a lattice of little wires on either side of the opening of the shoe. A sliding key is pulled up and the lattice is interlocked. When pulled down it is unlocked. It is evident that such a shoe would not be satisfactory unless it fitted perfectly, and to insure a proper fit, for large or small ankles, an insertion of elastic goring is used. There were shoes shown having the entire top of Everlastik cloth, and pumps in which some webbing was used; also, the "Gardiner No-Wrinkle" turned shoe, which has a piece of goring in the lining of the heel, thus enabling the shoe to be turned without breaking or wrinkling.

The Peters Manufacturing Co., of New York and Boston, which does a business in backing cloth and thin leather by means of gutta percha cement, showed various samples of its work in this line and demonstrated the advantages of its methods by means of a testing machine showing the number of pounds pres-

sure necessary in order to burst a hole in these various backed leathers and fabrics.

The American Wringer Co., Woonsocket, Rhode Island, exhibits a full line of its rubber-covered rolls and bolsters for tanning machinery.

The Dexter Manufacturing Co., of this city, exhibited a line of rubber cements for shoe manufacturers.

The Fibre Hide Filler Co. exhibited a filler of ground cork and rubber cement for sole filling; also a machine for demonstrating the manner of use of the filler.

Taken altogether, it will be seen that this was quite a rubber fair, as well as a leather fair. The attendance was large, and it is stated that a large amount of business was accomplished with visiting shoe manufacturers.

The Boston Woven Hose & Rubber Co., Cambridge, had a special exhibit at the annual convention of the National Retail Hardware Association, held at Mechanics' Hall a month or two ago. Specimens of crude Para and plantation rubbers were shown, as were also finished sections of the various lines of

EXHIBIT OF THE POSTON HOSE & RUBBER CO. AT THE HARDWARE CONVENTION.

hose this company manufactures, and samples of its fruit jar rings and spray nozzles. In connection with the convention, the company's motion picture film, "The Story of Rubber; What It Is and What It Does," was shown, thus affording dealers an opportunity to see how the products exhibited were manufactured.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE rubber factories in Rhode Island continue to be rushed with work as they never have been before, while orders continue to pile up in a manner that indicates full time schedules for months to come. Rubber goods of every description are wanted, and the factories are shipping large consignments of their products daily. Additions and improvements are being made to the factory, machinery and equipments. The prevailing scarcity of help has for many months proved a severe handicap to manufacturers.

The movement started by friends of the late LeBaron Carleton Colt to secure funds for the purchase and equipment of a memorial ambulance, is meeting with considerable success, and it is expected that the desired amount will soon be in hand. It was at first proposed to found a free bed in memory of Mr. Colt at the Rhode Island Hospital in Providence, but the committee decided that the ambulance would serve the people of the town

of Bristol to better advantage, and arrangements were accordingly made to receive contributions, especially from among the officers and employees of the National India Rubber Co.

The ambulance, which will cost about \$5,000, will be housed at the National Rubber company's plant, in readiness to respond to call, whenever needed. The executive committee having the matter in charge consists of James W. Franklin, chairman; Edward E. Bunn, secretary; Wendell R. Davis, treasurer; Arthur H. Emerson, Robert W. S. Cox and Frederick L. Dunbar.

* * *

The F. O. B. Club, composed of employees of the Revere Rubber Co., Providence, held an outing and field day at Emery Park on July 1, the affair being a great success. The program consisted of a chicken dinner and outdoor sports, including a baseball game between the married and the single men, which was won by the Benedicts, by a score of 12 to 4. There were 65 in the party.

* * *

The practical side of modern efficiency was demonstrated at the Alice mill of the Woonsocket Rubber Co., and later at the Millville plant of the same concern, during the past month, where a dozen of the traveling representatives from the branch stores of the United States Rubber Co. were engaged in learning the rudiments of the rubber business. The salesmen came from Chicago, New York City, Baltimore, Buffalo and Boston, and spent several weeks in learning how rubber shoes, arctics and boots are made.

* * *

Early in the past month the property in Bristol, originally occupied by the Byfield Rubber Co., and later by the Consumers' Rubber Co., was transferred to the Narragansett Rubber Co., of which Terrence McCarthy holds the controlling interest. The transfer was consummated through the receiver in charge of the settling of the affairs of the Consumers' company, which became involved in bankruptcy proceedings following the suspension of the Atlantic National Bank of Providence some three years ago.

Mr. McCarthy reports that the business of the Narragansett Rubber Co. is constantly on the increase, the demand, being especially large for tennis shoes. A large quantity of these are being shipped every day to customers of the concern in the West and Southwest.

* * *

The International Rubber Co. is making extensive alterations, additions and improvements at its plant at West Barrington, among the most important being the erection of new buildings for the enlargement of the carriage cloth department, the demands upon which have increased many-fold within the past year. One large new wooden building has just been completed and is being equipped, and other buildings are to be erected at an early date.

* * *

The Goodyear Tire & Rubber Co. has taken the store at Federal and Tower streets for salesrooms. There is a big rear section for a shipping and delivery room, while the cellars have storage capacity for 6,000 tires.

* * *

Notices were posted during the month at the factory of the National India Rubber Co., Bristol, for a shutdown of the plant for twelve days for the purpose of a general stock-taking, in accordance with orders from the managing director, George Schlosser. The last day of making will be Tuesday, August 22, and the factory will resume operations for the first day of making on Wednesday, September 2.

* * *

The BeSaw Tire Co., 46 Franklin street, Providence, is being conducted by Frederick L. Scott, of 316 Pawtucket avenue, Pawtucket, and Adolf W. Schaick, of 257 Broadway, Providence,

according to their statement filed at the City Clerk's office.

* * *

C. Schoos & Son have recently installed a complete vulcanizing equipment in their place of business, Quindnick street, Arctic, for all kinds of work on tires, inner tubes, etc.

* * *

William McCaw, assistant treasurer of the Lee Tire and Rubber Co., Conshohocken, Pennsylvania, formerly a resident of Bristol, spent several days the early part of the month at his old home.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

MANUFACTURERS of rubber machinery continue to be handicapped by a scarcity of workmen. The molders have been on a strike for several months, and the end of the trouble is not in sight. The machine plants are all running with reduced forces, whereas they have sufficient business to keep a much larger number of operatives busy. It is necessary to have a detail of special police escort the "open shop" workers to and from their homes. This is a particularly unfortunate condition, coming as it does at a time when orders are so plentiful.

* * *

The DeLion Tire & Rubber Co. has completely recovered from the effects of its recent fire. The plant has been rebuilt, in larger dimensions than the original structure.

* * *

The Essex Rubber Co. has awarded cash premiums to those of its employees who took advantage of the concern's educational inducement feature, by attending night schools during the last term. The attendance for October, the largest month, was 18. Of these, 13 took the English course. More than one hundred dollars was expended by the concern in making the awards. It is thought that a larger number of employees will take advantage of the plan next season. Most of last season was devoted to getting the work under way. It is figured by the company that any employee who is willing to devote his evenings to study will most likely prove a more efficient operative because of the more intelligent use of his time. The offer of the company was not made in a narrow spirit, for it rewards its employees even though they take up technical work entirely foreign to the rubber trade.

The Essex company recently gave United States flags to 350 employees for the purpose of stimulating patriotism.

* * *

The Lambertville Rubber Co. will begin operations shortly on the erection of an addition to the plant, to cost several thousand dollars. Plans have been drawn, and when the work is started it will be pushed to completion to help take care of the coming season's business. This company has had an unusually successful season. An entirely new line may be added to the company's output following the completion of the new building. The nature of the new line will shortly be announced.

* * *

The employees of the United & Globe Rubber Manufacturing Cos. have formed an organization known as the U. & G. Athletic Association; having for its object the furtherance and promotion of various sports.

A constitution and set of by-laws have been adopted and the following officers elected: John S. Broughton, honorary president; George W. Skirm, president; Daniel M. Henry, vice-president; Joseph D. Connelly, secretary and treasurer.

The association has secured a room at the Central Y. M. C. A. in which to hold their regular meetings once a month.

RUBBER TIRES LEND THEMSELVES TO A SCHEME OF DECORATION in a Little Rock, Arkansas, drug store, where the proprietor has dressed his soda fountain with tires, headlights and steering wheel. He claims that it attracts business, not only from automobilists but also from others.

The India Rubber Trade In Great Britain.

By Our Regular Correspondent.

JUDGMENT has now been delivered by the House of Lords (the unusual number of eight law lords sitting) in the action of the Daimler Co., Limited vs. the Continental Tire and Rubber Co. (Great Britain), Limited, in favor of the plaintiff company. The Continental company brought an action to recover a debt for tires supplied to the Daimler company, which refused to pay on the ground that the Continental company was an enemy firm. Both the Court of First Instance and the Court of Appeal decided in favor of the Continental company, because it was registered in England, although 24,999 of its 25,000 shares were held by subjects of the German Empire, who reside in Germany. The final Court of Appeal has now upset this decision and decided that the Continental company cannot sue the Daimler for the money due during the period of the war. This decision is of considerable importance as it has been taken as a test action with regard to numerous other companies of the status of the Continental.

CHANGED TAX REGULATIONS.

The extra tax proposed in the last budget on private motor cars has been abandoned, and an additional tax of 6d. per gallon on petrol substituted for it. Further, there are special regulations relating to the purchase of petrol by car owners, all of which have the object of still further reducing the use of motor cars for pleasure. Commercial motor vehicles and parts thereof have now been put on the list of prohibited imports.

TRADE DISPUTE SETTLED.

The long drawn-out dispute at the Premier Rubber Works, Manchester, has now been amicably settled, a standard price list having been arranged between the Waterproof Garment Manufacturers' Section of the India Rubber Manufacturers' Association and the United Garment Workers' Trade Union.

ROYAL AGRICULTURAL SOCIETY EXHIBITION.

This year's show was held at Manchester at the end of June and proved a great success, both as regards exhibits and attendance. With respect to rubber there is not much to report, as owing to the embargo put upon the exhibition of tires of any sort by the Ministry of Munitions, many rubber manufacturers who would otherwise have had a general display did not exhibit. The only manufacturer who had a stand was the North British Rubber Co., Edinburgh, which made a comprehensive exhibit of hose used for various purposes connected with agriculture, also driving belts for machinery. A few waterproof garments were also on view, but here the firms dealing with the wholesale trade only, did not attempt to rival the exhibits of the retail firms, such as the Palatine Rubber Co., of Manchester; J. H. Peck & Co., of Wigan; Davis & Co., of Oxford, who had exhibited collections of waterproofs, rainproofs and oilskins. Exhibitors of this sort are about the only people who smile when the weather breaks after a bright morning, as they make a large number of sales among those who have come unprovided. James Wilson & Co., of Manchester, had a good display of waterproof covers of every description, carriage rugs and oilskins, here as elsewhere, being much to the fore.

Some buildings were roofed with Ruberoid, which is a British invention of earlier date than its rival, the asbestos slate. The name and plasticity of Ruberoid might lead to the supposition that it contained rubber. This, however, the makers, the Ruberoid Co., Limited, Brimedown, Middlesex, expressly disavow, stating that it is a special form of bitumen and felt.

The mechanical milking apparatus, which is by no means novel, attracted a good deal of attention this year, owing to the

scarcity of farm labor. A considerable amount of white and red one-inch and half-inch rubber tubing is required for the equipment.

THE CHEMICAL OUTLOOK.

The recent break in the high prices which have ruled for some time in the case of many chemicals, and more especially metals, is welcome to those who are not contracted far ahead. This break is attributed, rightly or wrongly, in many cases, to increased production in America, where factories have been rushed up regardless of cost. Of course, the fall in the market quotations for zinc and lead is not immediately reflected on compounds like zinc oxide and litharge, but buyers who will be in the market shortly are expecting better terms than they obtained a few months ago. Solvent naphtha has slumped considerably from the contract prices of six months ago. It is noticeable that some of the chemicals which have been coming to us from across the Atlantic are now being bought at much more favorable prices than six months ago, while others, notably carbon black, maintain their inflated price level. One result of the war will be a coordination and more general working together of our chemical manufacturers than has been the case in the past, when each firm kept its doings to itself. A powerful chemical manufacturers' association has been formed, including most branches of the chemical industry, and this association will be in a position to present its views forcibly to the government of the day.

According to statistics, America has increased her output of barytes to a much greater degree than we have since German supplies fell off. Before the war we produced about 50,000 tons per annum and imported about an equal amount from Germany. The imports had developed, not only because of the finer grinding and other preparative machinery, but because the German deposits generally are of more uniform purity. Our deposits are in many cases of somewhat variable constitution, other earthy minerals being apt to intrude, and lower the grade, thus leading to increased cost of production.

FOUNDER OF THE INDIA RUBBER JOURNAL.

Mr. Herbert Standing, who has been known to the rubber trade for more years than perhaps he cares to remember, and who has, since the war broke out, been connected with the mechanical transport section of the Army Service Corps, has now returned to business life as the representative of Messrs. Laughton & Sons, of Manchester, for London and the southern counties. This firm, which deals in reclaimed rubbers and substitutes, is the one which I recently reported to have taken over the Holt Town Rubber Co., Manchester, formerly belonging to the late Mr. Openshaw.

TRANSPORTATION OF RECLAIMED RUBBER.

Although in the great bulk of cases the regulations for the carriage of various commodities by railway are very much the same in Great Britain and America, there are some notable exceptions. Reclaimed rubber, for instance, is evidently considered as more dangerous in America than it is in England. The following is the American regulation for rubber shoddy, regenerated or reclaimed rubber. It must be packed in tight metal containers or in wooden boxes, complying with shipping container specification No. 17, except when in the form of dense homogeneous non-porous sheets or rolls, the sheets of thickness of $\frac{3}{8}$ inch or greater, packed flat or in rolls.

Rubber scrap, if ground, powdered or granulated, whose rubber content exceeds 45 per cent as determined by subtracting the sum of the per cent ash and the per cent acetone extraction from

100, must be packed in tight metal containers or in wooden boxes, complying with specification No. 17.*

The British railway regulations do not put reclaimed rubber on the special list of dangerous goods, though it is stated that india rubber and india rubber substitute, shredded or finely divided, must be packed in approved tarpaulin bags or in air-tight and damp-proof casks or cases.

The difficulties put in the way of carrying reclaimed rubber by some of our shipping firms have arisen from existence of the American railway rules, as nothing seems to be known in railway and shipping circles in Britain about any latent dangers attaching to reclaimed rubber. I don't say that the American rules are needlessly stringent, or that there is no cause for alterations to be made in Britain. I merely wish to draw attention to the difference in existing regulations. As reclaimed rubbers are by no means of uniform composition, and are prepared in different ways, it would seem that as regards liability to spontaneous combustion they should be sub-classified and not all lumped together under one general heading.

EXPORT PERMITS AND RUBBER PRICES.

A Far Eastern contemporary has published an extract from a letter from a leading firm in London in which the recent fall in crude rubber prices in the London market was attributed to the great difficulty in obtaining permits to export.

It seems that a certain individual or firm put in an application for permits to export large quantities of crude rubber to America, and succeeded in obtaining them, whereas at the time they were not in possession of any rubber or orders for rubber. It appears that after having obtained these permits they placed themselves in communication with various large American buying houses, soliciting orders, pointing out that possessing these permits, they were able to make more prompt shipments than other concerns could effect after receiving orders. Other buyers for the American market learning of this, promptly brought the matter to the notice of the authorities with the result that a number of additional restrictions and further difficulties soon attended the obtaining of permits involving very considerable delays. The writer of this letter says that it would appear that the authorities had gone from one extremity to the other and that representations had been made to the authorities, which it was hoped would result in an improvement in this matter.

THE RUBBER TRADE IN HOLLAND DURING 1915.

UNITED STATES CONSUL FRANK W. MAHIN,

Amsterdam, Holland, reports that the rubber market in Amsterdam would have been at a complete standstill in 1915, had it not been for the efforts of the Netherlands Overseas Trust to induce the Entente Allies to permit the shipment of rubber into the Netherlands, for the use of the domestic industry, which required larger quantities than before the outbreak of the war, and which is steadily expanding.

The monthly public auctions at which Dutch East Indies rubber was formerly sold at Amsterdam have been discontinued since August, 1914, when the Batavia rubber market practically took their place. The exports of rubber from Amsterdam to the United States decreased from \$534,805 in 1914 to \$98,960 in 1915.

No reliable data are available regarding the actual stock of crude rubber on hand at Amsterdam at the beginning of 1915, nor is there any information that can be furnished regarding imports and prices obtained. Brokers state that

prices were higher than at the London market and were irregular. It is said that the highest price during the year for prime *Hevea* rubber, which was the quality most in demand, was about \$1.04 per half kilogram (1.1 pounds), and the lowest about 70 cents.

THE RUBBER TRADE IN GERMANY.

By Our Regular Correspondent.

CONDITIONS do not improve, but our enemies must not for a moment imagine that our position is hopeless. Our great naval victory that was a serious blow to Britain's sea power, should open their eyes.

Official statistics, reports by chambers of commerce and other commercial and industrial organizations, as well as many trade manufacturing and local publications having ceased to circulate, all information concerning trade, commerce and general conditions in the different parts of the Empire is fragmentary and you must, therefore, pardon the desultory information and the unconnected style of the letters I may be fortunate enough to get through to you.

RAW MATERIALS.

Our rubber industry continues to suffer from the lack of raw materials, especially crude rubber, but it manages nevertheless to meet practically all demands by using compounds of reclaimed and synthetic rubber with small proportions of crude rubber.

Other compounding ingredients are not lacking, but their prices are very high.

Ducks and other fabrics used in the rubber industry are also very expensive and their use greatly restricted by governmental decrees.

Chemicals used in reclaiming are scarce and very costly, and their use is strictly regulated and supervised.

SYNTHETIC RUBBER A SUCCESS.

The manufacture of synthetic rubber has been placed on a basis that is commercial under the existing conditions. Many experts go so far as to predict that, before the end of the war, we will have made such progress that we will be able to produce this material, when peace is reestablished, in competition with the natural product and at such prices as to displace crude rubber partially, if not entirely. They predict for the rubber plantation, as well as for the wild rubber industry, the same fate as that which befell the indigo industry, not many years ago, when synthetic indigo was first brought out by Germans and in a short time completely destroyed the trade in the natural East Indian product. Of course this may seem very optimistic to you, but it cannot be denied that wonders have been accomplished by our chemists and by those who have helped them in making their discoveries industrially practicable.

TIRES.

Our armies continue to use rubber tires in ever increasing quantities and these are all being made of compounds containing synthetic, reclaimed and crude rubber, the latter in much restricted proportions.

Much has been done since the outbreak of the war, and especially in the last six months, to facilitate the use of steel-tired motor road vehicles in private enterprise. New speed limits have been fixed for these steel-tired vehicles; motor trucks and trailers, not weighing more than five and a half metric tons, empty, are now allowed to travel at as high as 15 kilometers (9.3 miles) per hour in open country and 8 kilometers (4.97 miles) per hour in towns. Only one trailer may be hauled by a steel-tired motor truck, and the speed in that case must not exceed 12 kilometers (7.46 miles) and 8 kilometers (4.97 miles) per hour in country and town districts, respectively.

These rules permit the extension of the private use of motor trucks that had been practically stopped by the restrictions in

*While our correspondent is correct as regards our railroad regulations for scrap and reclaimed rubber, the fact remains that little or no reclaimed rubber is shipped except in sheets or rolls, and scrap rubber seldom in powdered form.

the use of rubber tires, but regulations cannot relieve the machinery of these vehicles of the heavy strain and vibration caused by rigid tires at such speeds, and it is not likely that there will be any permanent developments in steel-tired motor vehicles for road use. Steel tires must do the work under present conditions, but after the war, when conditions again become normal, the great majority of users will go back to resilient rubber tires which insure economic operation such as can never result from the use of rigid tires.

TRADE.

The demands of the army and navy are so large that most of our rubber manufacturers, as well as manufacturers in many other lines, do not have time to worry about the civilian, foreign and domestic, trade that has been lost through the effect of the war.

FOREIGN TRADE.

Our foreign trade with neutral countries has become more and more limited, as a result of embargo, blockade, and contraband restrictions. Our trade with nations at war with us is naturally at a standstill since the beginning of the war. The success of our submarine merchantmen in landing dyestuffs in your country, however, has given us renewed confidence in overcoming these handicaps.

SHIPBUILDING.

Shipbuilding has been very active for the last year and is consuming much mechanical rubber goods, though practically all in substitute qualities.

MANUFACTURING.

The building trade continues to be stagnant and manufacturing industries that are not working for the war departments have very little to do.

AGRICULTURE.

Agriculture was never so important to us as it is today. The fact of the matter is, we feel that our salvation is to be found in our agriculture as much as in our arms. The shortage of food is acute in many sections of our country, but the coming crops promise to be plentiful and there are no immediate reasons to be over-anxious regarding the future.

LABOR CONDITIONS.

Labor conditions have now settled down to something like the normal. Female labor is largely taking care of lines of manufacture where male labor was formerly employed. Many industries have imported foreign neutral labor, mostly from Scandinavia and the Netherlands, and more than half a million prisoners of war are being employed.

The employment of prisoners has in fact largely limited the trade our manufacturers of machinery and rubber mechanical goods expected to do with the farmers; there being no real shortage of cheap labor, our agriculturists have not taken so readily to modern machinery as one could have expected them to. To be sure, more machinery is now used in our agriculture than formerly, but this is perhaps more due to the intensive development and the phenomenal growth of this industry since the outbreak of the war than to any other causes, shortage of labor included.

ORGANIZING FOR AFTER THE WAR.

Our leading industries are all seriously preparing for the commercial and industrial struggle that is sure to follow this war of blood.

Up to date nothing definite has been developed in our rubber industry, but our chemical manufacturers have formed a gigantic syndicate. This combine, which is for a period of 50 years, has for its object the safeguarding of the world-wide pre-eminence of our chemical industry. It will also enable its members to more easily bear their losses in foreign countries, which are estimated already at much more than \$25,000,000.

The new chemical combine has a larger capital than any other of our numerous syndicates or "kartels." Sums varying between \$50,000,000 and \$100,000,000 have been mentioned as constituting this capital. The following firms constitute this chemical combine: Badische Anilin und Soda Fabrik; Leopold Casella; Chemische Fabriken Weiler-ter-Meer; Kalle & Cie; Farbwerke Höchst; Farben Fabriken Bayer; and Aktiengesellschaft für Anilin-Fabrikation.

SECRET PATENTS.

Until a few years ago the Imperial Government recognized what was known as secret patents, claims and specifications of inventions which were filed with the patent department, but not published, yet protected the inventors' rights. The growing of liberal business interests, however, in time disposed of this rather undemocratic institution. But now all are beginning to recognize the advantages of this discarded system, which will probably soon be reestablished.

The keen commercial competition that is sure to follow the war makes necessary the protection of our national industries, and secret patents are well designed for this purpose. The compositions of the products we will place on the world markets after the war can well be determined by analyses, but these will be of little value as long as processes of manufacture can be kept totally secret.

LIMITATIONS ON RUBBER WASTE TRADE.

The Imperial Government has given to the following concerns the exclusive right to deal in rubber waste: H. Herzheimer, Florsheim; Martin Jacobsen, Berlin; F. H. Mayer & Co., Lubbeck; Friedrich Walther Müller, Dresden; Eugen Perle, Breslau; Gebrüder Salomon, Hanover, and S. Salomon, Minden.

THE RUBBER TRADE IN JAPAN.

By Our Regular Correspondent.

ON account of greatly advanced cost of many compounding ingredients, 24 Japanese rubber manufacturers in Osaka, Kobe and other towns consulted together and advanced the prices of their manufactures 20 per cent, this advance to take effect the 1st of February. Tokyo manufacturers did not confer as an association, but each manufacturer raised his prices from 10 to 30 per cent because of these same reasons.

EXPORTS TO GREAT BRITAIN SMALLER.

Japanese manufacturers have received orders from Australia, British India, Straits Settlements, China, England, Russia and the United States. Among the goods which have been exported are tires, air pillows, rubber toys, shoe-heels, clothing, etc. Because of the British prohibition regarding rubber toys, Japanese exports of this line declined some 20 per cent from the previous year. In the matter of tires Japan sent to Great Britain last year, tires to the value of 513,518 yen [\$256,759], and the first four months of this year 310,000 yen [\$155,000], since which time none have been sent to Great Britain. These rubber tires were mostly manufactured for the military service, by the Dunlop Rubber Co., Limited, Kobe, Far East, which is a branch of the Dunlop Rubber Co., London. At the same time exports of valves for bicycles, motor cars and air bags which had been largely exported to England were also discontinued, and to further complicate matters, Great Britain placed export duties for export of iron and its manufactures, so that rubber machinery cost so much as to prohibit Japanese manufacturers from purchasing.

CHANGES AND ENLARGEMENTS.

Notwithstanding these untoward conditions, considerable enlargements have been made in Japanese rubber factories. The Azuma Rubber Works (Tokyo), burned last winter, was rebuilt on a new and larger scale in March. It manufactures rubber toy balls, rubber soles and heels. The Teikoku Rubber Co., Limited

(Tokyo), which was in financial difficulties last year, has been reestablished by new members, to manufacture "tabi" or "zori" soles.

The Taiheiyō Rubber Co. (Tokyo) increased its capital to 30,000 yen [\$15,000] in January. The Eastern Rubber Works (Tokyo) changed its capital to 15,000 yen [\$7,500] in March, and the Fujikura Rubber Cloth Works (Tokyo) increased its capital to 200,000 yen [\$100,000] in May, this amount being invested by Kenzo Okada and T. Matsumoto, leading members of the Fujikura Electric Wire & Rubber Co., Limited (Tokyo). The Cotton Belting Co., Limited, was established at Suma, Hyogo-Ken with a capital of 25,000 yen [\$12,500] to manufacture cotton beltings and rubber goods, and the Nitto Rubber Co. was established in Nagoya for manufacturing rubber tires for bicycles, and is to commence manufacturing in a few days. The Komo Rubber Cloth Works (Tokyo), which was burned on the 20th of May, is to rebuild on a large scale. The Nihon Cristall Rubber Works (Tokyo), changed its title to the Shibuya Rubber Works on the 15th of June.

CRUDE RUBBER IMPORTS.

The imports of crude rubber from January to April, 1916, amounted to 2,319,084 yen [\$1,179,542], increased 1,627,522 yen [\$813,761], comparing it with the amount imported in the same period in 1915.

JAPANESE PLANTATIONS IN MALAY AND BORNEO.

Japanese rubber plantations in Malay aggregate 85,850 acres, on the 147 plantations, at the end of 1915, in which acreage 27,880 acres are already planted and some yielding their products. The Nanyo Rubber Co., Limited, which was established for rubber plantation in Johore with capital of 200,000 yen [\$100,000] in December, 1910, doubled its capital in January of this year and purchased the Nanyo Oita Rubber Plantation Co., Limited, which was established for the same purpose in April, 1911, and planted 600 acres of total acreage, 1,301 acres. Thus the Nanyo Rubber Co., Limited, became possessors of a total acreage of 3,343 acres, 1,600 acres having been planted. On May 10 the Nanyo Rubber Cultivation Co., Limited, was established with 2,000,000 yen [\$1,000,000]. One-fourth of the sum was paid in, and a Chinese rubber plantation was purchased next to the Fujita-gumi Rubber Plantation (Japanese) in Johore, the Fujitagumi Rubber Plantation (established October, 1911), having 6,970 acres and having planted 3,797 acres. The total acreage of the newly purchased plantation is 6,630 acres, of which 1,790 acres are planted; that is, 150 acres of 6 and 7-year trees, 500 acres of 5-year trees, 700 acres of 3 and 4-year trees, etc. The plantation is yielding 50 piculs [660 pounds] a month, having 50,000 trees to be tapped and having 80 coolies and 50 workers.

In British Borneo there were no Japanese rubber plantations, but Mokutaro Yoneda had 1,000 acres and has now added to this. Fusanosuke Kuhara, one of the richest men in Osaka, purchased a plantation of 2,000 acres under the name of B. Tanabe, Mr. Kuhara's manager, paying therefor 180,000 yen [\$90,000], in which acreage 500 acres are planted, 70 per cent with *Hevea* trees and 30 per cent cocoa. The rubber trees will yield next year.

RUBBER PLANTING IN FORMOSA.

Rubber planting in Formosa has been of questionable profit, for hurricanes visit the island once or twice a year, and the climate is not as good or beneficial for rubber growing as the Malay peninsula. However, as the trees seem to stand these handicaps, a few planters have interested themselves in producing rubber, more as a curiosity than as a business proposition. According to the reports from The Fujikura Afforestation Department and The Murai Afforestation Department, the plantations produced a fair quality of *Manihot*.

THE FUJIKURA AFFORESTATION DEPARTMENT.

The Fujikura Afforestation Department was established as an attribute of The Fujikura Electric Wire & Rubber Co., Lim-

ited (Tokyo), in the south part of Formosa, in 1912, and its acreage is about 2,400 acres, in which was planted teak, *Manihot*, *Hevea*, camphor-trees, red sandalwood trees, and some other tropical plants. Among these, *Manihot* and teak have proved best fitted for plantation growth. The results in June, 1915, are as follows:

Manihot, planted in May, 1913, is 30 feet high and one foot in diameter, two feet from the earth, and has shown better results than in plantations in Java. In two years and a half after planting, the *Manihot* in Formosa can be tapped.

Hevea, planted in May, 1913, in one year and a half attains a height of 15 feet, the growth being about as rapid as in Malaya for the first two or three years, but it seems to grow more slowly from three years on in Formosa.

In Formosa, *Manihot* is the most successful rubber tree. By the hurricane of 1913, buds, leaves, branches and even trunks of *Manihot* were broken off, and the authorities and planters thought that the rubber plantation in Formosa would be hopeless. But, on the contrary, the injured trees grew their trunks larger than before, making the tapping period earlier than was previously expected.

Formosa, situated within the Torrid Zone, is able to grow *Hevea* trees and will, undoubtedly, yield as beneficial a product as the plantations in Malaya, although the growth is slower compared with that of Malaya. Crude rubber exhibited at the Formosa Exposition of May, 1915, the product of *Hevea* trees in the official garden in Kagi, Formosa, was recognized as of good quality.

Though the percentage of loss in washing for Para rubber is less than that of *Manihot*, the latter is more beneficial in Formosa for the reason that it can be tapped at from two and a half to four years, while *Hevea* trees need from seven to ten years. So rubber planting in Formosa is promising, if confined to *Manihot* planted on the slopes of hills protected from hurricanes.

THE MURAI AFFORESTATION DEPARTMENT.

The Murai Afforestation Department, established in 1910 by Kichibe Murai, a wealthy resident of Tokyo, planted *Manihot* and camphor trees, the latter to protect the former from the hurricanes. The total acreage is 2,773 Ko [6,018 acres], a Ko (Formosan measure) being 217 acres, in which 452 Ko [981 acres] are planted, and 1,300 Ko [2,821 acres] will be taken to cultivate tropical plants, except the acreage for roads, bamboo forests, refreshed forests and necessary uses. The results of the afforestation to June, 1915, are as follows:

	First (1912) —	<i>Manihot</i>	Camphor Trees.
Planted trees	42,162	192,036	
Complemental planted trees	41,325	183,371	
Trees in June, 1915,	42,162	192,036	
Second (1913) —			
Planted trees	36,220	189,100	
Complemental planted trees	17,597	141,205	
Trees in June, 1915,	36,220	189,100	
Third (1914) —			
Planted trees	52,769	2,248	
Complemental planted trees	5,761	450	
Trees in June, 1915,	34,915	2,248	

When finishing the supplemental plantation, camphor-trees will aggregate 383,384 and *Manihot* and *Hevea* 131,152, besides a few tropical trees, such as coffee, orange, teak and others.

Planting on the remaining 1,300 Ko [2,821 acres] has been postponed until results from present plantings prove financially successful.

NEW TARIFF FOR MOTORCYCLES AND RUBBER TREES.

The Diet of Japan in the spring passed two new customs tariffs, one for motor cycles and the other for rubber trees, as follows:

	New Tariff.	Old Tariff.
	United States.	United States.
	Yen.	Yen.
	Currency.	Currency.
Motorcycle (combined with engine)	\$46.80	\$36.00
Motorcycle (without engine)	\$38.80	\$16.60
Rubber trees	Free	15% ad val.

PATENT REGISTRY.

The Diet also decided that the terms of "New Idea Registry" of the Japanese Government shall be extended from six to ten years, but the duration of patents will continue to be 20 years.

THE ILCKEN-DOWN COAGULATION PROCESS.

IN the March, 1916, issue of THE INDIA RUBBER WORLD, a brief description was given of the Ilcken-Down method of coagulation. Since this process was introduced last October, several improvements have been made. One factory has been working this process for some months, and others are now beginning to use it. Some of the leading estates on the Peninsula have ordered tanks, to test the process on a large scale.

Briefly described, the improved process is as follows:

PRESSURE COAGULATING TANK.

form the latex depends on the nature of the latex. The purer and the richer the latex, the quicker will it be transformed into a soft clot by the action of the glycerine, in which will be developed a certain bacterium called "Sorbosc" bacterium, transforming the glycerine into dioxycetone and the dioxycetone fermenting the enzyme action into ethylalcohol and carbon dioxide. On a large scale it is recommended that engine power be used for stirring for about five minutes. When stirring is completed, the stirring apparatus is removed from the tank, which is then covered.

When this clot is formed, the mixture of methylated spirit and benzene is gradually added to the latex, until a quantity of not less than 2 ounces per gallon of latex has been injected round the clot, thoroughly enveloping it.

Complete precipitation of the coagulum will have taken place and the serum is sufficiently clear in about 12 hours. The serum is run off and the hard coagulum may then be removed from the tank and made into slabs or creped.

After removing the rubber from the tank a certain amount of pure rubber in the form of fine flour (less than one per mil of the dry rubber weight) will be found in the tank. This should be poured into a clean cylindrical receptacle with tap at bottom and treated by separation in the ordinary way. The flour floats on top, and the serum is run off.

The fresh latex is strained into a tank, whence it runs into a second tank fitted with a stirrer and a cover, where it receives one-tenth of an ounce of glycerine to every gallon of latex, and is thoroughly stirred. As soon as the latex has coagulated, which will occur in from six to eight hours, and is visible by a soft, spongy clot having formed containing nearly all the serum, a mixture composed of any of the following agents: A—alcohol and B—petroleum-benzene, or A—alcohol and B—gasoline, is forced into the tank by means of an injector fitted at the base, and envelops the soft coagulum. It is found that good qualities of denaturated or methylated spirit and benzene give most satisfactory results.

PURIFYING TANK.

It should be borne in mind that all delay that may arise from time of taping to collecting and treating the latex with glycerine affects its coagulation. Therefore, to insure the best results the collection and treatment with glycerine should be done expeditiously, the spongy clot frequently forming in 6 hours.

For small estates zinc or earthenware column-shaped tanks about 6 inches diameter and 18 inches high, to treat 1 to 1½ gallons of latex, each, can be used. For these small tanks an injector is not necessary. The mixture is merely poured on the coagulum, and the tank is turned round by the hands in a circular direction from left to right and from right to left, thus insuring complete envelopment of the coagulum by the mixture.

NITRE CAKE IN RUBBER RECLAIMING.

ALMOST every type of rubber scrap is today treated for recovery. These types are generally divided into three general classes, fabric free, fabric bearing and ebomite.

Fabric bearing material includes such scrap as belting, hose, overshoes and auto tires. Preliminary to depolymerization and softening all fabric must be destroyed and removed. The fabric is usually cotton and is by various reagents changed into such a form that it may be removed by washing with water. The three principal methods of accomplishing this are the mechanical, the alkali and the acid. In the first method, which is now little used, the scrap is very finely ground and the fluffy fibre blown away. The second, the alkali method, consists in heating ground scrap with alkaline solution to destroy the fibre. The third is the acid process. In this the ground scrap is treated with a hot solution of sulphuric acid varying in strength from 15 per cent to 30 per cent, according to the character of the scrap and the fineness to which it has been ground.

As a result the cellulose of the fabric is charred and can be removed by the thorough washing. This washed scrap, free from fabric, is then ready for the depolymerization and softening.

Sulphuric acid is no inconsiderable cost factor in rubber reclaiming and the increase in prices following the outbreak of the war has been keenly felt by the rubber reclaimer. Naturally, an acid substitute has been eagerly sought. In the manufacture of nitric acid by the treatment of sodium nitrate with sulphuric acid, there is produced a secondary product termed nitre cake, and this has proved in many industries the solution of the acid problem.

Nitre cake is a fused salt made up chiefly of sodium acid sulphate. It is readily soluble in hot water and has an average acidity of 32 per cent in terms of sulphuric acid. That is, three pounds of nitre cake approximately equal one pound of 66° acid. The chemical action of a nitre cake solution is practically the same as that of sulphuric acid solution, though it does not have the tendency of acid to char or burn organic matter. Nitre cake is shipped in lump form, either in bulk or barrels. Being a solid, its handling does not present the difficulties of handling acid, especially in carboys.

The substitution of nitre cake for acid in defiberizing rubber scrap is dependent upon the character of the scrap and the degree of fineness to which the scrap is ground or cracked, the strength of the acid solution being governed chiefly by this factor. A hot saturated solution of nitre cake is approximately equal in strength to an 18 per cent acid solution and a cold solution to a 15 per cent solution. Where a stronger solution is necessary it is prepared by dissolving nitre cake in dilute acid. This effects a partial substitution of nitre cake for acid. The method of treatment with a nitre cake solution is the same as with acid and the results the same, except as to the lack of the charring tendency where the nitre cake solution is used.

The grades of scrap treated and the variation in the method of treatment are so wide that it is really necessary for the reclaimer to make an actual trial to determine the applicability of this material to his needs. Certainly, it has merit for it is already being successfully used on a large scale.

Rubber Planting Notes.

COST OF PRODUCING PLANTATION RUBBER IN MALAYA.

FROM a survey of the annual reports of the various rubber companies in the Federated Malay States, it would appear that the average cost of production, f. o. b. steamer, including all expenses except interest charges on investment, was during 1915, approximately 25 cents per pound on well managed plantations in full bearing. Some companies were able to produce their rubber at somewhat lower cost, but quite a number of others reported higher costs which were in many cases due to charging the expense of operating the entire estate, including portions not in bearing, against the output of their productive areas. One company figures its proportionate charges as follows:

	Cents Per Pound.
Collecting and manufacturing.....	12.00
General administration charges, including superintendence and Singapore offices.....	5.60
Depreciation.....	3.40
Miscellaneous.....	4.00
Total.....	25.00

With the best grades of rubber ranging, during 1915, from 50 cents to \$1 per pound, it is easy to compute the substantial profits of rubber planting in Malaya.

EASTERN PLANTATION PRODUCTION.

A report from United States Consul Harry Campbell, detailed as vice-consul at Singapore, Straits Settlements, states that the production of plantation rubber in the East has increased during the last ten years from practically nothing to 70 per cent of the world's production. He gives the following figures in tons of 2,240 pounds as a verification of his statement, which in some respects differs from some statisticians' figures and estimates:

Year.	East.	Brazil.	Other countries.	Total.
1906.....	531	36,000	29,500	66,031
1907.....	1,133	38,000	30,000	69,133
1908.....	2,610	39,000	24,500	66,510
1909.....	3,997	42,000	34,000	79,997
1910.....	7,521	40,800	21,500	69,821
1911.....	13,973	37,200	23,000	74,173
1912.....	29,518	42,410	28,000	99,928
1913.....	47,302	39,370	21,500	108,172
1914.....	71,959	37,000	12,000	120,959
1915.....	102,600	36,750	6,000	144,750

Estimating the output for 1915 at an average of 67 cents per pound, which the consul believes is slightly below the actual figure, he places the selling value at \$215,000,000, of which \$155,000,000 is attributable to the Middle East plantations. As these have a total capitalization of about \$282,000,000, his estimate suggests an average profit of about 50 per cent, covering all plantations, both producing and non-producing. He believes this is a fair estimate, because many of the producing companies are reported to be reaping profits of 100 to 200 per cent.

RUBBER CULTIVATION IN HAINAN.

The first exportation of rubber produced in the island of Hainan, China, was shipped in 1915.

Rubber trees were introduced in Hainan in 1910 by two Chinese companies. There are 4,000 in the Lo Hui district, 2,000 of which began to be tapped in April, 1915.

About 400 pounds of rubber was sent to Singapore between June and the end of 1915, which realized about 37 cents per pound. The rubber is said to have been of first quality, but faultily prepared and was therefore sold as second quality. The introduction of machinery will doubtless improve the product.

Since 1910, Chinese interests have planted \$2,000 *Hevea* rubber trees in the vicinity of Modoa, Hainan, but these are still young and are not expected to produce for another two years.

SMOKING RUBBER.

Replying to an inquiry in regard to the best wood for producing dense smoke for curing rubber, our South India contemporary "The Planters' Chronicle," says:

Any kind of Indian jungle wood may be used, but it should not be too green as the smoke would then contain too much moisture, with the result that the rubber would dry slowly and be apt to be over-smoked. The best results are obtained with a judicious mixture of dead, dry timber with green wood. *Hevea* logs obtained from thinning out may be used, but they should be first stacked in the sun to dry.

It is not so much the kind of wood which is used, as the type of furnace which produces the best smoke. A comparatively slow rate of combustion should be aimed at. This produces a dense smoke, with a low proportion of fine ash to contaminate the rubber in the smoke-house. The draught should be kept low and the combustion regulated so that the wood glows and smoulders, leaving a high proportion of charcoal at the end instead of white ash.

VALUATION OF RUBBER TREES.

The "Straits Budget," Singapore, Straits Settlements, published the following interesting information regarding the valuation of rubber trees:

"In response to an inquiry from a government department as to the value planters placed upon rubber trees at varying ages, a sub-committee was appointed which drew up a standard valuation as follows:

Age of Tree.	Value in United States Currency.		Number of Trees per Acre.
	Tapped.	Untapped.	
3 months.....	\$0.28	130
6 months.....	34	150
9 months.....	40	150
1 year.....	45	150
2 years.....	75	150
3 years.....	\$0.85	1.13	150
4 years.....	1.32	1.51	150
5 years.....	2.72	125
6 years.....	3.47	110
7 years.....	4.25	100
8 years.....	6.97	90
9 years.....	6.02	80
10 years.....	6.37	80

The standard valuation presumes: (a) that the tree is well grown on good soil; (b) that the tree is healthy; (c) that the tapping has been careful and moderate; (d) that the planting has not been too close, or if originally too close that it has been thinned out; (e) that the expenditure on the estate has been normal; (f) that no pest has attacked the tree; (g) that the price of best rubber is 2s. 4d. a pound [56 cents].

THINNING OUT RUBBER.

Much has been written on the subject of thinning out rubber, but it appears that no fixed rules have yet been determined.

At a recent meeting of the Committee of Agricultural Experiments at the Peradeniya School of Agriculture, Ceylon, J. S. Patterson submitted some figures showing the result of thinning out on a plantation 20 years old. These figures showed that profitable results appeared to follow the thinning out of a plantation even at this age. The original number of trees was 161 per acre and thinning out during three years brought the number down to 105 trees per acre. The yield had at first dropped from 439 pounds to 400 pounds of dry rubber per acre but had risen to 439 pounds again and appeared to be continuing upon the upward trend.

Questioned as to whether it would be more profitable to begin thinning out at an early date or leave it until the plantation was, say, 20 years old and then thin out, several members of the committee offered remarks, generally agreeing that there were no data upon which to base definite conclusions on this subject. It depended upon so many factors—the original spacing, climate and price of rubber. Nevertheless, the consensus of opinion

was that thinning out should not be delayed too long but should be done early enough to allow the trees ample opportunity to branch.

RUBBER IN SOUTHERN INDIA.

According to a recently issued report, the Pudukud Rubber Co., Limited, has already paid a 5 per cent *interim* dividend and will probably pay a further dividend of 10 per cent for 1915. Last year's rubber crop was 123,481 pounds, which came from 653¼ acres, the total number of trees tapped being 88,155 and the yield per tree 1.56 pounds against 0.81 pounds in 1914. The total area under rubber was 822 acres.

The Kinalur Rubber Co., Limited, which held its first general meeting in Madras May 17, harvested 22,493 pounds of dry rubber last season, as compared with 1,814 pounds in the previous year, and it was stated that the company was likely soon to pay its first dividend. These are remarkable results for plantations that, for the most part, are six years old or less.

BOLIVIAN RUBBER INDUSTRY.

The Bolivian rubber industry has been enjoying some improvement; 1915 exports are estimated to have been over 5,000 tons, as against 4,485 tons in 1914. This improvement was mainly due to higher prices obtained in 1915 for the product, and it is believed that after the war Germany will be a large purchaser of Amazonian rubber, as practically all other rubber comes from lands controlled by the Entente Allies, who, it is believed, will subject the Germans to disadvantages of various kinds.

NEW BOLIVIAN RUBBER CORPORATION.

The Bolivia-Brazil Rubber & Timber Corporation is the name of a company recently incorporated under the laws of the State of Arizona, capitalized with 1,000,000 shares of a par value of \$1.00 per share. The announcement of incorporation says that the company has acquired 82,000 acres of rich land along the Madeira and Negro rivers, the latter an affluent of the Abuna, in the Republic of Bolivia. It is stated that this land abounds in rich forests of rubber trees, hard cabinet woods, Tagua nuts (used extensively in making buttons), and other tropical products.

The corporation expects to begin active work on the properties this month with a view to begin tapping the rubber trees early in the coming year. The gathering and preparation of the crude rubber will be carried on under the modern methods. It is planned to supplement gathering wild rubber by establishing large plantations of rubber trees.

CHICLE CONCESSIONS IN VENEZUELA.

The Venezuelan Government has recently granted José Patrocínio Cuellar the exclusive right to export chicle from Venezuela. This concession will be effective during the life of a contract made by the Government in 1912, giving the sole privilege of extracting chicle in Venezuela.

According to United States "Commerce Reports," exports of chicle from Venezuela to the United States have been rapidly increasing, the amount shipped in 1915 being 952,358 pounds, or four times the total shipments of Venezuelan chicle to this country from 1912 to 1914, inclusive.

EXPORTS OF CHICLE FROM BRITISH HONDURAS.

Exports of chicle, or *sapodilla* gum, from British Honduras in 1914 (last statistics published) amount to 3,461,809 pounds, valued at \$1,125,519, as compared with 3,163,129 pounds in 1913. Only one-third of this export was the produce of the colony. The United States received almost all of this chicle.

THE SITUATION IN BRAZIL.

By Our Special Correspondent.

GENERAL conditions in the crude rubber trade here in Brazil are better to-day than they have ever been since the development of plantation competition. The situation has been gradually improving and we are now looking forward to real prosperity.

The decline of exchange has had its effect on the currency prices of our crude rubber and, as a result, those engaged in gathering, preparing and dealing in rubber are prospering, and the position of the Para and Manaos markets is stronger than it ever was before. The depreciation of the pound sterling in this country has, therefore, been of incalculable benefit to our rubber industry.

We are approaching the close of the Amazon 1915-1916 rubber season. The crop shows a considerable increase over that of 1914-1915 and it is expected that the 1916-1917 crop will be larger still, very likely the largest ever harvested in Brazil. Provided exchange does not advance, continued and increased prosperity may be very reasonably expected, and, at the close of the war, we are sure to do wonderful business with Germany.

MANAOS ATHLETIC CLUB INAUGURATED.

The Manaos Athletic Club has recently completed a comfortable club house on its grounds in that city. Naturally, a large number of men connected with the rubber trade are

members, and several may possibly be recognized by a close examination of the picture, which was taken at the inauguration of the club.

GERMAN REQUIREMENTS.

The Germans will need large quantities of crude rubber which they will hardly be disposed or possibly will be unable to obtain from lands under the control of the Entente Allies. It is therefore probable that they will look almost exclusively to South America for their supplies of this commodity.

BRITISH BLACK LISTS.

Many of our large rubber dealers, who have contributed in the past to the greatness of our crude rubber industry, are Germans or at least have German affiliations, and for this reason they have been blacklisted by the British Government, with the result that they are unable to ship their goods in British bottoms

—practically the only ones now available. Further, a number of national concerns have also been "blacklisted" for having assisted the Germans, by allowing them to ship under their names.

At first much resentment resulted from these British measures, but now we are beginning to understand that Great Britain's shipping and commerce are world-wide and interference is therefore world-wide in its effects. At the beginning there was a belief that the British blacklists were aimed against Brazil, for the purpose of favoring British plantation rubber, but this feeling is rapidly vanishing.

RUBBER VALORIZATION.

The press here is again talking of rubber valorization and of the law for the protection of articles made of Brazilian rubber, which it was found impossible to apply.

To revive this question—which has always been fruitless—is really childish. One need only recall the disastrous attempt at valorization which occurred in 1909 when the production of plantations was insignificant as compared with that of Brazil. What would valorization lead to now that the positions have been more than reversed? Last year the plantations of the Orient produced close to 100,000 tons of crude rubber against Brazil's 35,000 tons, and even under the present favorable conditions, and the trade prospects after the war, there is nothing to encourage the belief that our production of crude rubber under the present system will ever approach that of the plantations. Before valorization could prove any measure of success we should create and develop a rubber plantation industry on Eastern lines. We must have vast, easily accessible plantations, in full production and equipped with the most modern machinery, before we can hope to regain our lost leadership.

If we will get to work and profit by the lessons the East has demonstrated, if we will organize real plantations and take proper care of our trees instead of tapping them to death, as is now the practice, then we may be able to get as good, possibly better prices than the East. Such a course would be far more advantageous to the nation than any valorization chimera.

RUBBER PLANTATIONS IN BRITISH GUIANA.

THE official report of the British Guiana Department of Science and Agriculture for the year 1914-15, recently published, states that the total area under rubber cultivation in the colony was 4,962 acres, an increase of 743 acres over the previous year. It consists almost entirely of *Hevea Brasiliensis* and by far the greater proportion of the trees have not yet reached maturity. It is anticipated, however, that tapping operations will be commenced on a fairly extensive scale during 1916.

The rate of growth of the trees in the colony, generally, was more rapid than it was in 1913-14 and considerably greater than in the year 1912-13. During the year 1911-12 the trees were badly afflicted by a prolonged drought.

EXPERIMENTAL TAPPING.

Experimental tapping was continued at Issorora and On-denreeming during the year; tapping was also commenced at Christianburg towards the end of the year.

At Issorora the tapping of 379 trees in one experiment was commenced in November, 1913, a basal V being employed as the tapping system and the trees being tapped every day. In January, 1915, the tapping of the surface of bark (18 inches high and $\frac{1}{2}$ circumference of the tree) marked out for the experiment was completed. Altogether, 714 pounds of dry rubber were collected at an average cost of 16 cents per pound. The trees in this experiment were not adjacent to each other, but were scattered through the older part of the rubber cultivation of the station, and the total number, 379, was found to be rather more than a fair task for one man to tap in a morning. These two factors resulted in the

cost of tapping being higher than it would have been had the conditions been more favorable for the experiment. However, this cost of collection for an initial experiment was considered to be quite reasonable.

In February, 1915, another experiment was inaugurated; 300 trees, the number regarded as a fair task for one man to tap in a morning, being tapped each day with a basal V on the opposite half of the tree to that tapped in the previous experiment. Up to the end of the financial year (March 31), 260 pounds of wet rubber had been collected, the equivalent of 130 pounds dry, at a cost of 7 cents a pound.

The results of these experiments lead the Department of Science and Agriculture to believe that rubber can be collected at a low cost in British Guiana, if the trees are grown under proper estate conditions.

Tapping experiments at other experimental stations were less extensive than at the Issorora station and had not been sufficiently long in progress to enable any accurate conclusion to be drawn as to the probable cost of collection per pound.

The results obtained at the Issorora experimental station, both in regard to cultivation and tapping of cultivated *Hevea Brasiliensis*, caused much interest among farmers. Towards the close of the year 9,000 *Hevea* seedlings were planted on various grants and general progress was made on the grants of the Consolidated Rubber and Balata Co., during the year, in connection with planting and tapping operations.

BARTICA RUBBER.

Some news and views of the Bartica Agricultural States Plantation in British Guiana were published in the June 1, 1916, issue of THE INDIA RUBBER WORLD. Since that date the first shipment of crude rubber from that plantation has been re-

ceived in this country. It has been valued at fully equal to first latex crêpe. Now that the 600 acres are coming into bearing, the Bartica brand is likely to be well known. The accompanying view is of one end of the dry-house on this plantation, and shows the first product from five-year-old *Hevea*.

RUBBER EXPORTS FROM TRINIDAD.

According to a recent report of the Agricultural Society of Trinidad, B. W. I., rubber is showing up somewhat better on that island, but is still a disappointing item in the exports of the colony. Very few planters have realized expectations.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED MAY 2, 1916.

- N**O. 1,181,133. Tire pressure gauge. W. P. Hammond and T. A. Hammond, Passaic, N. J., assignors to A. Schrader's Son, Inc., New York City.
- 1,181,134. Carling iron having a liquid fuel reservoir and air bulb. G. H. Harper, Oklahoma, Okla.
- 1,181,243. Tire protector. W. A. Otto, Milwaukee, Wis.
- 1,181,263. Wheel tire. C. Schragin, Berlin, Germany.
- 1,181,277. Grip tread for vehicle tires. H. D. Weed, Syracuse, N. Y., assignor to American Chain Co., Inc., Bridgeport, Conn.
- 1,181,280. Hose coupling. G. J. Winter, assignor to The Republic Hose Coupler Corporation—both of Buffalo, N. Y.
- 1,181,430. Fountain pen. W. K. Buckles, Rifle, Colo.
- 1,181,441. Boot or shoe. J. W. Franklin, assignor to National India Rubber Co.—both of Bristol, R. I.
- 1,181,540. Pneumatic tire. H. D. Peaslee, Fresno, Calif.
- 1,181,574. Fountain pen comprising a barrel containing a self-expandable rubber sack. S. S. Crocker, Wollaston, Mass.
- 1,181,646. Waterproof toilet bag. V. E. Davis, New York City.
- 1,181,670. Rim holding device. J. Kelsey, Detroit, Mich.
- 1,181,676. Hose coupling. C. H. Lambkin, New York City.
- 1,181,744. Fountain pen filter control. J. W. Crozier, New York City.
- 1,181,841. Tire armor. A. J. Chubb, Marlboro, Mass.
- 1,181,891. Raincoat. H. H. Hulbert, Excelsior, Minn.
- 1,181,937. Bias lining fabric package. W. S. Stevens, assignor to Firestone Tire & Rubber Co.—both of Akron, Ohio.

ISSUED JUNE 20, 1916.

- 1,187,489. Heel protector for rubber shoes. C. Besse, Watertown, Mass.
- 1,187,539. Tire valve tightener. C. D. Miller, St. Joseph, Mo.
- 1,187,553. Hose connection. J. A. Riordan, Rochester, assignor of thirty-five one-hundredths to N. G. Riordan, Salamanca—both in New York.
- 1,187,624. Auto tire. E. A. Illig, assignor to E. F. Shugart—both of Erie, Pa.
- 1,187,637. Pneumatic tire. A. Malsin, New York City.
- 1,187,654. Safety tire valve. E. J. Ryan, assignor of one-half to F. M. Welsh and one-twentieth to M. H. Darby—all of Long Beach, Calif.
- 1,187,666. Antiskid horsehoe call. V. Slaninka, Swanton, assignor of one-half to H. Dietz, Rosford—both in Ohio.
- 1,187,820. Mountable rim. I. B. Dace, Kishville, Ill.
- 1,187,838. Musical rubber ball. R. D. Hughes, assignor to W. J. Almond, F. H. Almond and C. H. Almond, Jr.—all of Lynchburg, Va.
- 1,188,034. Antiskid tread. E. H. Bingham, San Francisco, Calif.
- 1,188,062. Flat section pneumatic tire. J. R. Gammeter, Akron, Ohio, assignor to The Goodyear Tire & Rubber Co., New York City.
- 1,188,180. Surgical tip. C. E. Kells, New Orleans, La.
- 1,188,195. Tire and reliner. E. F. Morse, assignor of fifteen thirty-seconds to W. F. Knap—both of Des Moines, Iowa, and nine thirty-seconds to W. G. Park, Galveston, Texas.
- 1,188,200. Demountable rim. O. A. Parker, Cleveland, Ohio.
- 1,188,233. Pneumatic automobile tire body with a plurality of spaced closed cells containing air. J. C. Anderson, Washington, D. C.
- 1,188,271. Self-filling fountain pen. J. Harris, New York City.
- 1,188,276. Inflation device for multiple chambered tires. W. L. Ireland, Grand Lodge, Mich.
- 1,188,311. Electrically illuminated fountain pen. H. Pendleton, assignor of one-half to M. A. Spaulding—both of Kokomo, Ind.
- 1,188,347. Friction plug rubber heel. F. J. Gleason, Walpole, assignor to Standard Woven Fabric Co., Framingham—both in Massachusetts.
- 1,188,348. Rubber heel. F. J. Gleason, Walpole, assignor to Standard Woven Fabric Co., Framingham—both in Massachusetts.
- ISSUED JUNE 27, 1916.
- 1,188,394. Fountain pen. M. Bernstein, New York City.
- 1,188,478. Apparatus for enteric lavage. L. C. Pair, Dallas, Texas.
- 1,188,588. Brake lining and similar material. E. E. Waite, assignor to Standard Woven Fabric Co.—both of Framingham, Mass.
- 1,188,598. Vehicle wheel with pneumatic cushions. A. J. Wolff, Hartford, Conn.
- 1,188,668. Soap carrier and massage device. G. A. Madison, St. Paul, Minn.
- 1,188,694. Inner tube for pneumatic tires. A. L. Stanford, Chicago, Ill., assignor of one-half to R. B. Gillette, Eau Claire, Wis.
- 1,188,701. Automobile tire. W. H. Strouse, Oskaloosa, Iowa.
- 1,188,739. Pneumatic tire. O. C. Dyer, Brockton, Mass.
- 1,188,823. Tooth-brush attachment. T. B. Plank, Los Angeles, Calif.
- 1,188,904. Bottle protector of rubber. J. E. Gosgriff, New York City.
- 1,188,998. Tire plug. L. V. Road, Marietta, Ohio.
- 1,189,091. Cushion tip for the keys of typewriters and like machines. E. H. Gemmill, Akron, Ohio, assignor to Thorp & Martin Typewriter Co., Boston, Mass.

ISSUED JULY 4, 1916.

- 1,189,223. Vehicle wheel including a pneumatic tire. L. Albrecht, New York City.
- 1,189,404. Clamp for hose and the like. F. J. Stulp, Muskegon, Mich.
- 1,189,408. Rubberized cloth for billiard tables. J. Turner, Dorchester, Mass.
- 1,189,421. Means for locking demountable tire rims. G. G. Bayne and A. W. Knutsen, Quincy, Ill.; Knutsen assignor to Bayne.
- 1,189,424. Tire tool. F. H. Burrill, assignor to The Burrill Tire Tool Co.—both of Concord Junction, Mass.
- 1,189,446. Demountable rim. C. C. Harbridge, assignor to Detroit Demountable Rim Co.—both of Detroit, Mich.
- 1,189,472. Rubber heel with metal wear plate. J. Opperud, Madison, S. D.
- 1,189,485. Automobile tire. J. C. Reifsmider, Seattle, Wash.
- 1,189,505. Tooth brush with liquid containing bulb. L. C. Stockton, Denver, Colo.
- 1,189,511. Pneumatic tire. C. E. Vawter, Blacksburg, Va.
- 1,189,569. Automobile tire tread. W. H. Henderson, Omaha, Nebr.
- 1,189,586. Nursing syringe. J. B. A. LaFenestre, Alameda, Calif.
- 1,189,589. Fasting brasserie. L. Lawrence, Vancouver, British Columbia, Canada.
- 1,189,654. Pneumatic tire. B. Barrow, Barrows Store, Va.
- 1,189,730. Tire. M. C. Overman, New York City.
- 1,189,788. Resilient tire. T. L. Carbone, Charlottenburg, Germany.
- 1,189,789. Resilient tire. T. L. Carbone, Charlottenburg, Germany.
- 1,189,845. Tire. S. Lioilis, Charleston, Mo.
- 1,189,857. Puncture proof automobile tire supporter. C. O. Myers and H. T. Maring, Gettysburg, Pa.
- 1,189,859. Rubber heel. F. Neger, Chicago, Ill.
- 1,189,923. Tire tool. R. W. Damaron, Jackson, Mich.
- 1,189,937. Eraser. R. B. Goldsmith, New York City.
- 1,189,989. Full-on attachment for overshoes. L. R. Moore, San Rafael, Calif.
- 1,190,017. Hair-drying device comprising a bulb of rubber. G. L. Scheel, Chicago, Ill.
- 1,190,065. Pneumatic tire sleeve or patch. R. Yost, Tyrone, N. Y.
- 1,190,068. Hose coupling. R. J. Abbott, Washington, D. C.
- 1,190,118. Wheel rim. W. E. Copithorn, Natick, Mass.
- 1,190,144. Pneumatic tire. M. A. Gibbons, Des Moines, Iowa.
- 1,190,179. Bath mat. F. L. Livingston, West Orange, N. J.
- 1,190,228. Fountain brush. J. Barlow Fesler, assignor to Fesler Sales Co.—both of New York City.
- ISSUED JULY 11, 1916.
- 1,190,266. Bath mat. E. R. Crocker, Los Angeles, Calif.
- 1,190,474. Pneumatic tire and process of making. J. H. Seiberling, Jönköping, Sweden.
- 1,190,497. Rubber stamp type holder. M. L. Willard, assignor to Superior Type Co.—both of Chicago, Ill.
- 1,190,602. Brasserie. S. Sorkin, New York City.
- 1,190,744. Inner tubes for pneumatic tires. F. Fenton, Akron, Ohio.
- 1,190,781. Sponge rubber hand grip for steering wheels. D. F. Maher, Watonsville, Calif.
- 1,190,790. Well packer having a rubber body. F. J. Moser, Kane, Pa.
- 1,190,866. Tire valve attachment. H. F. Crawford, Brockton, Mass.
- 1,190,867. Fountain pen provided with reservoirs for different colored inks. H. C. Crosby, New York City.
- 1,191,065. Demountable rim. W. E. Copithorn, Natick, Mass.
- 1,191,081. Demountable rim. J. S. Johnston, Utica, N. Y.
- 1,191,101. Detachable rim. D. E. Agnew, assignor of one-half to H. F. Sullivan—both of Portland, Oreg.

THE UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

In order to give the public the advantage of having abridgments of specifications up to date while retaining their numerical sequence, applications for patents made subsequent to 1915 are given new numbers when their complete specifications are accepted, or become open to public inspection before acceptance. The new numbers start with No. 100,001 (without any indication of date), and supersede the original application numbers in all proceedings after acceptance of the complete specifications.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, June 7, 1916.]

- 2,449 (1915). Hose pipe and like clamps. F. Nepack, 63 Karlstrasse, Cannstatt, Stuttgart, Germany.
- 2,451 (1915). Rubber hose coupling. R. Barnfather, 55 Margravine Gardens, Hammersmith, London, W.
- 2,489 (1915). Section grip for portable electric lamps. H. J. C. Forrester, 75 New Street, Birmingham.
- 2,510 (1915). Corsets comprising elastic sections. R. Charnley, 8 Chatham Street, Piccadilly, Manchester.
- 2,512 (1915). Gramophone with rubber bulb and tubing. G. T. Waite, 172 High Street, West Bromwich, near Birmingham.

- 2,606 (1915). Rubber covered roller. J. Muskett, 42 Delamere avenue, Swanton Park Road, Fenchurch, Manchester.
- 2,638 (1915). Collapsible hinged segment tire rim for aeroplanes, etc. Dunlop Rubber Co., 14 Regent street, Westminster, and C. MacFeth. Manor Mills, Salford street, Aston Cross, Birmingham.

2,675 (1915). Detachable rim for vehicle wheels. A. H. Greenfield, 92 Earl's Court Road, London.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JUNE 14, 1916.]

2,739 (1915). Rubber cement in hat manufacture. C. Clermont, 66 Hyde Road, Denton, near Manchester.

2,753 (1915). Stoppers for hot-water bottles and method of insertion. T. T. Brown, 2 Carson Road, Levenshulme, Manchester.

2,778 (1915). Cushion wheel tire. J. F. Vander Velde, 12d Bezuidenhout street, Trojeville, Johannesburg, and J. Hosking, 154 Harpur Terrace, Transvaal.

2,776 (1915). Sock suspender. C. A. Hamlin, 16 Hobson Buildings, Shortland street, Auckland, New Zealand.

2,946 (1915). Vulcanite reflectors. M. Wiskott, 3 Flurstrasse, Breslau, Germany.

2,952 (1915). Rubber wheel tire. J. Cairns, 27 Payne avenue, Hove, Brighton.

2,959 (1915). Reservoir pens. E. M. Wade, 65 Cavendish Drive, Rock Ferry, Cheshire, Manchester.

3,015 (1915). Tent pole comprising a rubber spring. F. Schultz, 12d Voorhout street, Trojeville, Johannesburg, and S. Africa.

3,029 (1915). Inflatable life saving jacket. J. C. Steer, 9 Evans Terrace, Swansea.

3,103 (1915). Finger-stall of chamois with an attached elastic band for holding it in position. I. L. Williamson, 145 Addycombe Terrace, Heaton, Newcastle-on-Tyne.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JUNE 21, 1916.]

3,138 (1915). Toy operated by rubber bands. C. T. Eaton, 84 Eaton Terrace, London.

3,171 (1915). Cushion tire. T. Whitehead, Bela Grove, Blackpool, Lancashire.

3,213 (1915). Device for anchoring or attaching electric cables having an external rubber sheath. A. E. Foster, 86 Mayron Road, Charlton, Kent.

3,235 (1915). Non-skid pad for wheel tires. A. E. Walkden, 46 Trafalgar Road, Egremont, Cheshire.

3,251 (1915). Rubber packing in siphon heads. J. R. Trigwell, "Rayleigh," Bishop's Park Road, Norbury, Surrey.

3,326 (1915). Galvanic battery comprising a rubber strip. W. S. Naylor, 1850n Junction, Manchester.

*3,441 (1915). Inflatable life buoy the shape of a sailor's collar and adapted to be secured and concealed by the collar of a garment. W. G. Browne, Highpoint, North Carolina.

*100,335 (1916). Device intended to prevent the heel of an overshoe from slipping. F. W. Ostrom, 78 Court street, Newark, New Jersey.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JUNE 28, 1916.]

3,568 (1915). Rehabilitating old tires, employing layers of rubber and rubber proofed asbestos. E. C. Langton, 238 Schert Road, Forrest Gate, Essex.

3,623 (1915). Jackets and covers for tires. D. R. Shewan, 1541 22nd Avenue East, Vancouver, British Columbia, Canada.

3,625 (1915). Kithaps and sleeping valises. A. M. Bellingham, 11th (Service) Battalion, Middlesex Regiment, Aldershot.

3,754 (1915). Tire attachments to rims. R. S. Stephen, 4 Gillespie Crescent, Edinburgh.

3,788 (1915). Raising sunken bodies by means of inflatable air bags. C. Daghetto, 74 Corso Vittorio Emanuele, Turin, Italy.

100,360. Rubber glove for use in teaching writing. A. Usterud, Belevien, Skien, Norway.

100,362. Pneumatic tire cover. E. L. De Bayo, 16 Alameda Mazarredo, Bilbao, Spain.

100,371. Tire tool. D. R. Lewis, Trehanos, near Pontardawe, Swansea Valley; F. J. Monaghan, 30 Vind street, Swansea, and D. H. Thomas, 56 Waun Road, Morristown—all in Glamorganshire, and A. D. Berk, 1 Fenchurch avenue, London.

*100,381. Cushion tire. J. Milne, 30 Church street, New York City.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

479,299 (July 17, 1915). Improved suspenders. Société de Caoutchouc Manufacturé.

479,300 (July 17, 1915). Improvements in making suspenders. Société de Caoutchouc Manufacturé.

*49,208 (July 19, 1915). Improved wheel for automobiles. A. C. Dunham, 479,340 (March 26, 1915). Improvements in elastic wheels. B. J. Mattingly, 479,407 (July 28, 1915). Detachable rim. E. Dubouef.

497,502 (August 13, 1915). New rubber glove and method for its manufacture. Société de Caoutchouc Manufacturé.

479,504 (August 13, 1915). Pneumatic tire. E. V. Roberts.

479,535 (August 14, 1915). Elastic tire for wheels. J. P. Murray and C. F. Wood.

479,543 (August 15, 1915). Process for manufacturing rubber agglomerates. J. Daura Mundi.

*Denotes Patents for American Inventions.

479,550 (August 18, 1915). Rubber overshoe. A. Johnston and The North British Rubber Co., Limited, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000.

479,604 (August 27, 1915). Detachable, interchangeable wheel for automobiles and similar vehicles. W. Baker, J. S. Foley, and Baker Rim Co.

NEW ZEALAND.

ISSUED MAY 11, 1916.

*35,790. Talking machine sound box of rubber. A. D. Jones, 46 Sibley Building, 1214 Filbert street, Philadelphia, Pa.

36,664. Tire filler. J. Flint and G. Bolton, Main street, Katoomba, N. S. W., and W. A. McLauchlan, 44 Victoria Road, Marrickville.

37,099. Tire clasp. G. H. Broughton, 7 Spruce Court, Toronto, Canada.

37,233. Stayette. M. J. Taylor, Rickard avenue, Bondi, Sydney, N. S. W.

36,293. Milking machine test cup. G. W. Gane, Normanby, and J. Hopkirk, Hawera—both in New Zealand.

37,085. Tire repair out-box and press. A. J. Bert, Elizabeth Bay Road, Sydney, assignee of W. M. Holliday, St. Thomas Rectory, Mulgoa Road, Penrith—both in New South Wales.

*37,344. Wheel pressed metal. Simmens Wheel Co., Room 718 State Bank and Trust Building, assignees of O. G. Simmens, 3120 N. Flores street—both of San Antonio, Texas.

TRADE MARKS.

THE UNITED STATES.

92,483. An illustration of a section of a tire with the word **IMPERATOR** across the center—rubber automobile tires. Sporn Tire Co., Chicago, Ill.

93,311. The word **SWAGO**—Asbestos, rubber, and composition packing. Neptune Packing and Rubber Co., New York City.

90,566. The word **OWARD**—combined rubber and fabric hose. Oxwell Acetylene Co., Chicago, Ill.

93,365. The words **PUSSEY FOOT**—boots and shoes of leather, rubber, etc. The Hurlbut Co., Limited, Preston, Ontario, Canada.

95,423. The word **SILVERGATE**—raincoats and capes. C. Kenyon Co., Brooklyn, N. Y.

84,585. An illustration with the words **PHARIS PUCKARD**—pneumatic tires and inner tubes. The Pharis Tire & Rubber Co., Newark, Ohio.

85,465. The words **NON LEAKABLE, NO LOST TIME, NO LUGGING, NO LIES**, written one above the other and on top an illustration of a tire with the letters **F & B** in the center—cement for stopping leaks in punctured pneumatic tires. F. A. Buono, Hackensack, N. J.

92,606. Illustration of a tire with blue bands or stripes positioned circumferentially and on opposite sides of the center-line of the tread portion—elastic vehicle tires. The Goodyear Tire & Rubber Co., Akron, Ohio.

94,411. The word **VICTOR**—belt dressing and balata cement. Victor Balata & Textile Belting Co., Easton, Pa., and Brooklyn, N. Y.

94,432. The word **RUMCO**—rubber tubes and rubber tires. Rubber Insulated Metals Corporation, Richmond, Va., and Plainfield, N. J.

94,695. The word **NAUCHAYDE**—carriage cloth. American Rubber Co., Boston, Mass.

94,696. The word **DYBAK**—carriage cloth. American Rubber Co., Boston, Mass.

94,857. The word **MULTICO**—friction tape. Standard Woven Fabric Co., Framingham, Mass.

94,858. The word **STANWAVE**—friction tape. Standard Woven Fabric Co., Framingham, Mass.

94,737. The word **WALWORTH**—heels and soles of boots and shoes. Fells-way Rubber Co., Medford, Mass.

88,634. The words **RUB-STEP**—rubber valves. Voorhes Rubber Manufacturing Co., Jersey City, N. J.

94,185. The word **LILY**—rubber gloves for general use, brassieres, rubber bathing caps, and infants' bibs. Brooklyn Shield & Rubber Co., Brooklyn, N. Y.

94,567. Two concentric circles with the word **ENDUROID**—a substitute for leather. Endurance Tire & Rubber Co., New Brunswick, N. J.

94,789. The word **NUSS**—rubber hose reinforced with fabric. Eureka Fire Hose Manufacturing Co., New York City.

95,673. The word **NEMO**—abdominal belts made of rubber, cloth, and combinations of rubber and cloth. Kops Bros., New York City.

95,845. Pictorial representations, in the center the words **HAPPY HIKER**—boots and shoes made of leather or canvas with leather, felt, or rubber soles. George R. Jones Co., Manchester, N. H.

THE FRENCH REPUBLIC.

9,901. The name **LE 75**—rubber goods, shoe heels, etc. Michel Deguerre, Bron.

9,902. The name **LE 105**—Same.

*23,869. The word **GARLOCK**—using a lozenge—packings. Garlock Packing Co., Palmyra, N. Y.

*23,931. The word **WALWORTH**—dry goods and corset stays covered with vulcanized rubber. Walwyn Manufacturing Co., New York, N. Y.

24,350. A rhinoceros with the word **DERMATITE**—rubber goods. Dermatite Co., Limited, Camberwell, London, S.E., England.

160,665. The word **ASBESTOID**—substitute for wood. Camille Tiebaut, Paris,

- 160,666. The word **PAPEROID**—Same.
 160,667. The word **CARTEROID**—Same.
 160,668. The word **CARTER**—Same.
 160,671. The name **L'ARY**—liquid and paste containing rubber for cold proofing fabrics and leather. Gustave Pary, Paris.
 160,695. The name **L. E. POILU**—pneumatic tire casings and tubes, and other bicycle accessories. Ernest Veluard, Paris.
 160,918. The name **LA VICTORIEUX**—garters, suspenders, braces, belts, tobacco pouches, bibs, bed cloths, dress shields, crasers, toys, waterproof garments, cushions, elastic fabrics, finger cots, proofed fabrics, all of rubber or containing rubber. Société de Caoutchouc Manufacture, Paris.
 160,919. The name **LA VICTORIEUX**—Same.
 160,920. The name **LE COQ GLORIEUX**—Same.
 160,921. The name **TOMMY**—Same.
 160,922. The name **MARNE**—Same.
 160,923. The name **JOFFRE**—Same.
 160,924. The name **JOFFRINE**—Same.
 160,925. The name **JOFFRETTE**—Same.
 160,926. The name **JOFFRINETTE**—Same.
 160,927. The name **FLEU DE GLOIRE**—Same.
 160,928. The name **MARCHEL JOFFRE**—Same.
 160,929. The name **SOUVENIR D'ALSACE**—Same.
 17,059. The word **ZENITH**—erasers. Jules Vru, Marseille.
 161,130. The word **ERIN**—erasers. G. Michand, Quentin & Cie., Paris.
 161,131. The word **ECRILOIR**—erasers. Desvernay & Cie., Paris.
 161,133. The name **No. 300**—erasers. Fargard & Leuba, Paris.

DESIGNS.

THE UNITED STATES.

- 48,959. Garter. L. S. Agerton, Nashville, Tenn.
 48,965. Clock-casting. F. Boyle, assignor to United States Rubber Co.—both of New York City.
 48,972. Comb. G. D. Harper, Minneapolis, Minn.
 48,981. Tire tread. W. D. McNaull, assignor to The McNaull Auto Tire Co.—both of Toledo, Ohio.
 48,991. Automobile tire. W. A. Robbins, Glen Ridge, N. J.
 49,211. Resilient tire. H. H. Hewitt, Buffalo, N. Y.
 49,213. Rubber tire. V. P. Jackson, assignor to Globe Rubber Tire Manufacturing Co., Inc.—both of Trenton, N. J.
 49,283. Rubber tire. M. W. Roe, assignor to The McGraw Tire & Rubber Co.—both of East Palestine, Ohio.
 49,296. Tire tread. O. Braunwarth, New York City.

HOW SHOULD RUBBER BE SOLD?

UNDER this title our English contemporary, "The India Rubber Journal," publishes a very interesting and timely article by W. F. de Bois Maclaren, the well-known rubber plantation agent.

After reviewing the situation of the crude rubber market in England and on the continent of Europe before the war, and comparing it with present conditions, Mr. Maclaren proposes forward sales contracts, on a sliding scale plan, as a means of protecting producers from too low returns for their rubber.

Prior to the war most of the crude rubber marketed in England was sold at public auctions, where, according to Mr. Maclaren, it was recklessly sacrificed at the rate of as many lots per minute as possible, for whatever bids rubber dealers chose to offer. Rarely was there any strong competition to secure lots.

On the Continent, sales were chiefly made by sealed tenders, the highest bidder always being declared the purchaser. This means of sale was always strongly opposed by rubber brokers in England, who maintained that the public auction was best in the interests of the owners as well as most convenient for buyers. To this system Mr. Maclaren lays the fact that last latex rubber was sold as low as 1s. 10d. [44 cents] per pound in London in 1913.

When the war came, public auctions had to be abandoned and sales by negotiation through brokers took their place. These sales have been recognized to be so much more satisfactory in their results that it is not likely that the auctions will ever again be revived.

Mr. Maclaren holds that the rubber plantation industry is, however, still too largely at the mercy of dealers and speculators in rubber, which fact, he claims, is to a large extent concealed by the extraordinary demand for rubber in the United States and the increased consumption in England. Given a period of

temporarily restricted trade, together with large and increasing arrivals of crude rubber, the same conditions would be repeated, unfavorable to the rubber planters.

SALES BY FORWARD CONTRACT.

As a remedy against this, Mr. Maclaren proposes the development and popularizing of the system of selling forward. He argues that:

Sales by forward contract are not new in the crude rubber trade, and they have done much for the rubber plantation industry. The chief benefit derived from such forward sales is that the amount of unsold rubber arriving on the market at any one time is restricted, and thus the demand for what is left is stronger than it otherwise would be. The larger the unsold tonnage on the market at any time, the greater the opportunity of the dealers and speculators to make large profits at the expense of the producers by breaking down the price.

RISKS OF FORWARD SALES.

Directors and commercial agents of rubber companies are not always ready sellers. Quite a large number of rubber companies sell no rubber forward and many others sell only the most meager portions of their total output. Yet these companies derive benefits from the sales made by the more public-spirited companies, and on occasion are able to boast that they have obtained a higher average price for their crops. The rubber market is so speculative that no one, however intelligent or well informed, can forecast its course with certainty. A forward sale, while insuring a certain profit on the portion of the crop sold, may be the means of depriving the company of a further considerable profit which it would otherwise have obtained.

Another aspect of the case is that it is sometimes the buyer forward who suffers severely.

PROPOSES SLIDING SCALE.

To the end that neither the seller nor the buyer be heavily penalized as the result of having entered into a forward sale contract, Mr. Maclaren proposes the adoption of a sliding scale in all such contracts. He takes a supposititious case as example:

A enters into a contract to sell forward to B three tons of crude rubber per month during a period extending from January to December, 1917, at 3s. 2d. per pound. In this supposed case one of two things is likely to happen. The market price may rise considerably and the seller regret the sale or, on the other hand, it might fall considerably and the purchaser suffer heavily financially on account of his purchase. In either case the result is more or less bad from the point of view of those interested in maintaining sound market conditions. With a sliding scale clause, such as is frequently inserted in forward sale contracts for very large amounts in the base metal trade, this would not have happened.

The working out of this supposititious contract the writer explains as follows:

Let it be imagined that during 1917 an average price of 4s. 2d. instead of 3s. 2d. ruled for first grade latex rubber. In this case, instead of suffering an apparent loss of one shilling per pound on 36 tons sold forward, of which amount the market was relieved, half of the rise would be paid to the seller who had assisted in bringing about the improved market condition. The seller would thus get an average price of 3s. 8d. per pound. Or, on the other hand, if there was a heavy fall in the price of rubber and the average for the year was 2s. 2d. instead of 3s. 2d.—the rate at which the forward contract was made—the loss would be shared. Instead of 3s. 2d., the seller would receive an average price of 2s. 8d., which would be 6d. more per pound than the average price for the year.

Mr. Maclaren argues that both the buyers and the sellers would run far smaller risks under such contracts than they do under present conditions, and consequently would be disposed to transact the bulk of their business on these safe, conservative lines. Further, the reduced quantities of spot rubber that would be on sale at any period would prevent dealers and speculators from making profits that are detrimental to the crude rubber producer. The result would be more stable market conditions and probably generally higher prices.

Review of the Crude Rubber Market.

Copyright, 1916.

NEW YORK.

It Can be said in general that the market conditions which have prevailed during July were decidedly quiet. There has been, however, a fair demand and considerable inquiry with the principal interest centered in plantation futures for delivery during the coming year. Spot plantations have been scarce with prices ruling higher than quotations on forward positions for next year. The arrival of about 800 tons at San Francisco, last month, is the record for that port; however, Seattle is still the principal port of entry for eastern shipments via the Pacific coast.

Upriver fine was still high as compared to First latex and has maintained a generally firm position throughout the month, but an easier tendency was noticed during the closing week. Supplies of this particular grade are scarce, but it is too early for the market to feel the effects of the new crop that is not due to arrive until November. The other Para grades were fairly plentiful at normal prices.

During the last week of the month the cables from London announced a sharp advance and the New York Market responded accordingly by promptly advancing. This was primarily due to the reports of heavy buying in the eastern markets and rumors of large orders being placed in London for Russian account. This movement has the appearance of only a temporary flurry, and that it will subside as soon as the dealers have covered their requirements, is freely predicted.

The market was fairly steady with firm prices early in the month, but the heavy arrivals in London reported later caused prices to break sharply. On July 5, First latex spot and July-December were quoted 58 cents. Ribbed was 57 cents for both spot and futures while Upriver fine sold for 68 cents for spot and July-December deliveries. Prices for plantations continued unchanged, with minor fluctuations. Smoked sheet ribbed holding about a cent lower than First latex until the middle of the month when only a difference of one half cent was noted. The advance occurred on July 26, when First latex spot was quoted 59½ cents, buyers 58½ to 59 cents and Smoked sheet ribbed spot was 59½ cents. Upriver fine spot was scarce at 67 cents, and forward positions were held at 65 cents. The medium grades were normal, with the exception of Islands fine spot that was quoted 56½ cents and Islands coarse spot at 26½ cents. An easier tendency was noticed in all Para grades during the last week of the month.

The arrivals at New York, July 1-19, were approximately 3,530 tons compared to 5,635 tons for about the same period in June. They were as follows: Plantations from London and Liverpool, 1,300 tons; Colombo, 300 tons; Singapore, 80 tons; Seattle 760 tons; Para rubber from Brazil, 800 tons; from Europe, 80 tons; Centrals, 50 tons; Guayule, 58 tons; African, 17 tons and Manicoba, 85 tons.

LONDON.

The London market has been generally quiet and uneventful, with little to record other than the possible causes of the sharp advance that occurred late in the month, which has been already mentioned. On July 1, First latex spot was 56 cents and Smoked sheet ribbed spot, 55.5 cents. These prices continued during the month with slight variations until July 28, when First latex spot was quoted 55 cents and ribbed spot 54.5 cents. London crude rubber arrivals during June were approximately 4,000 tons. Liverpool arrivals for the same period were 1,000 tons.

SINGAPORE.

There were 967 tons sold at the four auctions held on July

7, 13, 20 and 27. Crêpe brought an average of 53.2 cents and Smoked sheet, 52.1 cents. Good demand and an active market were reported at the last auction.

NEW YORK QUOTATIONS.

Following are the quotations at New York one year ago, one month ago, and July 29, the current date:

PARA.	August 1, 1915.	July 1, 1916.	July 29, 1916.

MARKET CABLE SERVICE FROM SINGAPORE.

The following reports of the weekly auctions held at Singapore have been cabled by The Waterhouse Co., Limited:

Date.	Crêpe.	Smoked Sheet.	Pounds Sold.	Market.
July 7.....	52.2	51.8	739,200	Active, same prices.
July 13.....	54.8	53.1	560,000	Duller.
July 20.....	53.4	51.0	636,160	Firmer, more inquiry.
July 27.....	52.7	52.7	846,720	Active, good demand.

COMPARATIVE NEW YORK PRICES FOR JULY.

The demand for Commercial paper still continues quite good, though not as large this month as previously, and the best rubber names are now quoted about 4½@4¾ per cent, and those not so well known 5½@5¾ per cent.

	1916.*	1915.	1914.

SINGAPORE.

GUTHRIE & CO., LIMITED, report [June 16, 1916]:

At the continuation of the auction today demand was slow and values suffered a further decline. The top price paid was \$128, one parcel of standard crepe fetching this figure. Standard sheet sold up to \$126.

All other grades were from \$2 to \$5 lower than yesterday's levels. Of the quantity cataloged some 300 tons changed hands.

The following was the course of values:

	In Singapore per picul.*	Sterling equivalent per pound in London.	Equivalent per pound in cents.†
Sheet, fine ribbed smoked...	\$122@129	2/ 5½ @ 2/ 6½	59.04 @ 62.08
Sheet, good ribbed smoked...	117 @ 123	2/ 17 @ 2/ 5½	57.01 @ 59.54
Sheet, plain smoked...	118 @ 123	2/ 4½ @ 2/ 5½	57.21 @ 59.54
Sheet, ribbed unsmoked...	117 @ 124	2/ 4½ @ 2/ 5½	57.01 @ 59.80
Sheet, plain unsmoked...	115 @ 127	2/ 3½ @ 2/ 6½	56.00 @ 61.06

For same period, 1913	8,614,698		4,589,733	10,530,769	13,735,200

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram from Kuala Lumpur gives the figures of the export of plantation rubber from the Federated Malay States during the month of June as 5,114 tons against 3,956 tons in May last and 3,402 tons in the corresponding month last year. The total export for the six months of the current year amounted to 27,091 tons against 19,190 tons in 1915 and 13,850 tons in 1914. Appended are the comparative figures:

	1914.	1915.	1916.
January	2,542	3,473	4,471
February	2,364	3,411	5,207
March	2,418	4,418	4,429
April	2,151	2,777	3,914
May	2,069	2,708	3,956
June	2,306	3,403	5,114
Totals	13,850	19,190	27,091

STRAITS SETTLEMENTS RUBBER EXPORTS.

A cablegram from the Colonial Secretary, Singapore, notifies that the export of plantation rubber from Straits Settlements ports in the month of May amounted to 3,274 tons, compared with 4,219 tons in April and 3,588 tons in the corresponding month last year. The total export for the first five months of the current year amounted to 19,776 tons against 13,660 tons in 1915 and 7,026 tons in 1914. Appended are the comparative statistics:

	1914.	1915.	1916.
January	1,281	2,576	4,443
February	1,703	2,741	3,359
March	1,285	2,481	4,481
April	1,548	1,978	4,219
May	1,309	3,588	3,274
Totals	7,026	13,360	19,776

These figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements such as Java, Sumatra, Borneo and the non-Federated Malay States as well as rubber actually exported from the Colony, but do not include rubber exports from the Federated Malay States.

EXPORTS OF CEYLON GROWN RUBBER.

(From January 1 to June 12, 1915 and 1916. Compiled by the Ceylon Chamber of Commerce.)

To—	1915.	1916.
United States	5,084,644	12,172,076
Canada and Newfoundland	208,140	
Russia	309,376	691,092
United Kingdom	327,720	179,010
Australia	11,672,418	8,336,026
India	168,081	407,451
Straits Settlements	500	628
Japan	119,933	183,739
Totals	18,106,752	21,919,039

(Same period 1914, 14,454,752 pounds; same period 1913, 9,675,521.) The

export figures of rubber, given in the above table for 1914, include the imports re-exported. (These amount to 1,478,849 pounds from the Straits Settlements and 265,660 pounds from India.) To arrive at the total quantity of Ceylon rubber exported for that year deduct these imports from the total exports. The figures for 1915 and 1916 are for Ceylon rubber only.

THE RUBBER SCRAP MARKET.

Copyright, 1916.

NEW YORK.

THERE was very little prospect early in July of much activity in the rubber scrap market during the month. And so it was proven, as week after week passed without important changes in market conditions or price levels. It is true that values were slightly lower at the close of the month, which is only a natural result of weakness, due to a dull market.

The mills are undoubtedly well supplied with stocks that will carry them over the quiet period between now and the time for speeding up for fall business. As crude rubber responds to the dictation of London, in a similar way rubber scrap is influenced by the conditions controlling the crude rubber market, which has been quiet.

Boots and shoes, early in the month, developed an easier tendency and some dealers were making offers of 8½ cents delivered. It was reported that buyers were secured at these figures. Tires were quiet, with the exception of a little movement in mixed auto tires at 6½ cents. White goods were nominally quoted to mills at 8¼ to 8½ cents, and bicycle tires were steady at 4½ to 4¾ cents. There was no change in No. 1, inner tubes, being nominally held at 26 to 27 cents delivered. The balance of the list was devoid of new features and prices were nominally unchanged.

The month closed without improvement in the generally dull condition that has characterized the rubber scrap market for the past month. There is belief in some quarters that a general buying movement is due early in August. By referring to the following market quotations of July 28, it will be seen that there has been a slight downward revision of prices since a month ago, and practically no change during the last three weeks of July.

Exports of waste and reclaimed rubber from London and Liverpool for June, 1916, were 600 tons, divided as follows: United States, 313 tons; Italy, 197 tons; France, 49 tons; Spain, 35 tons; Java and Straits Settlements, 6 tons.

MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

It was generally expected that the official figures for June would indicate a falling off in the condition of the present cotton crop. The actual report, however, revealed a condition of 81.1 compared with 80.2, the ten-year average. Favorable crop progress during June is not, as a rule, accepted as conclusive evidence of future yield. More apprehension is felt of the uncertainty between now and the maturing period, particularly on account of the restriction in the use of fertilizer and the evidence that boll weevil are more numerous than ever before within a restricted area.

EGYPTIAN COTTON.

Cabled reports from Alexandria indicate a rather sensitive market, due, no doubt, to the approaching finish of the old crop stock. There is apparently a good demand from abroad, which is rapidly exhausting present stocks, resulting in a very narrow market that is extremely liable to fluctuate. Sakelaries qualities are practically exhausted. Crop growth is reported to be very satisfactory.

SEA ISLAND COTTON.

The weather during the month of June has been generally favorable, and the crop has made satisfactory progress. The entire section has had beneficial rains, which have improved the outlook very much. Although in some instances the young plant is reported small and backward, the general condition is quite up to a good average, and with continuance of favorable weather the new crop may begin to come to market the latter part of August and early September. Estimates still are about 100,000 bales and upwards.

TIRE FABRICS.

The July market for tire fabrics has generally maintained a strong position, although the situation during the last week of the month appeared to be somewhat easier. This was due to the usual quiet that prevails at this time of the year, when full deliveries are not strictly held to contract.

Producers have therefore been able to meet their obligations that have been otherwise burdensome. Deliveries of new loom equipment are slow and overtime and double shift operations are seriously interfered with through a scarcity of textile workers.

Sea Island building fabric has advanced, but Egyptian and Peellers have recorded no change during the month.

COTTON DUCK.

The demand for duck has been accelerated by orders for

government requirements and the market is firm with prices of hose and belting duck at the same levels as a month ago.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

Copyright, 1916.

NEW YORK.

THE summer dullness usually experienced at this time of the year has had a depressing effect on the market for the past month. The mills are busy with stock taking, making repairs and additions to plant equipment in anticipation of a record fall business, and are paying little attention to present market con-

THE SLIPKNOT RUBBER HEEL.

A new rubber heel has recently come on the market. This is the "Slipknot," and the appropriateness of the name will be seen from the accompanying illustration in which it will be noticed that a slipknot forms a part of the design. Not all commodity names involving a pun are to be commended, but this one is a happy selection, as it describes the character of the heel and enables the name to be easily remembered. Another point brought out by the accompanying cut is the raised crescent-shaped section around the back of the heel, which adds to its durability and its non-slipping qualities. [Plymouth Rubber Co., Canton, Massachusetts.]

TABLE OF CONTENTS ON LAST PAGE OF READING.**PURE RUBBER AND THE BARKLEY BILL.**

A BILL introduced by Congressman Barkley "to prohibit the manufacture, sale or transportation in interstate commerce of misbranded articles; to regulate the traffic therein, and for other purposes," has passed the House of Representatives recently and now awaits action by the United States Senate. It differs from previous pure goods acts in that it seeks, not to compel manufacturers to list the ingredients upon their products or packages containing them, but to impose penalties upon those who misbrand their goods. By this is meant placing upon a product "any word, statement, symbol, design, device or indication which is false, fraudulent, deceptive or misleading . . . as to the materials or substances of which it is composed." A further provision makes it unlawful to publish, issue or circulate "in any newspaper, magazine, book, pamphlet, circular or other publication or advertisement any false, fraudulent, misleading or deceptive word, statement, representation, symbol or device as to the matters or things stipulated" in the act.

While this appears to be fair legislation, it can hardly be hailed as advantageous to rubber manufacturers, some of whom use the words "pure gum," "pure rubber" or "pure Para" in describing their products, while others claim that their goods are "all rubber," or "contain nothing but pure rubber," when every rubber manufacturer knows that substances other than pure gum are necessary to the manufacture of all rubber articles. Should this bill become law it would make amenable anyone using phrases of the character quoted in publicity work of any kind, and despite the fact that the rubber trade understands the technical meaning of such terms as "pure gum" or "pure rubber" the manufacturers using them could be indicted under the provisions of this act and subjected to the expense of defending themselves, were dissatisfied purchasers or competing firms disposed to enter complaint against them.

The rubber business is not exceptional in that some of its nomenclature may be misleading. "Solid gold" jewelry contains a smaller or larger proportion of alloy; also "all wool" fabrics frequently contain shoddy and are not less satisfactory in wearing quality than others similarly designated but which contain a certain proportion of cotton. It is admittedly difficult to frame any law incapable of imposing hardship upon someone, and while the Barkley bill is right in principle, it may hamper manufacturers who use perfectly well understood terms in describing, labeling and advertising their products.

We do not fear the effects of this bill as far as the rubber trade goes, for its nomenclature is elastic and easily adjusted to new conditions. But to the class of men to whom the framer of the bill belongs, is it not a menace? A Congressman is, of course, a "product." If, therefore, any word such as "statesman" be placed upon him, and it be "false, fraudulent, or misleading" may he not be indicted and suffer the very penalty intended for the merchant?

RUBBER STRATAGEMS OF THE BLOCKADE.

IN all times blockade running has developed superlative ingenuity, and the present world conflict is no exception. England was quick to appreciate the value of her great navy and to realize that the most effective way to counter Germany's military preparedness was to use it to suspend German shipping, close German ports to the world and thus cut off all outside sources of important raw materials, such as rubber, copper, cotton and similar commodities not found or not produced in sufficient quantity within the borders of the Central Powers.

During the early months of the war considerable quantities of these materials were purchased by German agents in America and elsewhere and consigned to similar agents in the neutral countries of Europe, whence they subsequently found their way into Germany. But this subterfuge was not long permitted to continue after these neutral countries had exceeded their normal yearly importation. The contraband list was extended to embrace all these commodities, and cargoes including them were seized and in due course confiscated to Allied use by prize court proceedings. Meanwhile a constantly increasing shortage rendered the demand more urgent, and finally German agents found it necessary to resort to stratagem with all the ingenuity and resourcefulness characteristic of their race. That they so rarely succeeded, however, indicates no lack of initiative on their part; indeed, their adroitness was of an order to elicit admiration, but the examining officers of the British navy quickly developed a correspondingly keener intuition and an unyielding incredulity that brought many strange things to light in their thorough search of all vessels bound for European ports.

Obviously rubber lends itself very readily to clever faking and so has become the chief masquerader among contraband goods. It has been found in the guise of rusty iron hoops, toys, sponges and the inside filling of various articles, from tinned meats to broom handles. On one ship 4,000 packages, supposedly bread for British prisoners in Germany, were found to contain a pound of rubber each. Another vessel carried 17 tons of coffee beans in 250 sacks in which large quantities of crude rubber were concealed. One item of a miscellaneous cargo consigned to a neutral port consisted of many sacks of onions of excellent appearance, but when the examining officer selected one at random and dropped it on the deck it bounded back into his hand. Only a few, carefully spread over the top of each sack were genuine; the others had been made of rubber, and remarkably realistic imitations they were, too. Far more ingenious, though, were many cases labeled "pure honey." These were filled with the familiar little square boxes of comb with what appeared to be honey oozing out of it. An inquisitive sailor tasted of it, made a grimace and threw the box to the deck where it bounded about in the most surprising manner. The combs had been fashioned out of rubber and filled with some convenient smeary substance resembling honey yet not tasting like it.

Bulkheads and decks of somewhat more than normal thickness were several times found to contain contra-

band. In two instances, at least, it was discovered clamped to the bottom of a ship along her keel. Hollow steel masts were a subtle feature of one tramp steamer and her double bottoms were also stuffed with contraband, but these proved to be much less secure hiding places than the hollow furniture and bunks like conjurer's trick boxes which were afterward detected on an innocent looking trader. These are only a few of the many artful ruses that failed; of those that succeeded, and there were some—perhaps many, there is no record.

THE A. L. A. (THE AUTOMOBILE LEGAL ASSOCIATION) is a valuable organization; is strong, alert, and uniformly sane, but is the following, which is an official utterance, up to its usual standard?

The automobile journals and magazines are beginning as usual at this time of the year to carry a great deal of advertising space relating to tire treads or other devices intended to protect the tire, but we now feel that we can safely say that they are not satisfactory, and that the alluring advertisements referred to should not be considered.

Our experience is that rubber anti-skids prevent slipping except in deep mud or sand. While a few years ago they wore smooth after about 500 miles on the road, today they last from three to six thousand miles, when the tires become smooth.

MAKERS OF LEATHER FOOTWEAR COMPLAIN THAT DAMP weather, that for example which July and August of this year afforded in great abundance, spoils their work, as the rubber cement fails to stick. Their troubles are light, however, when compared with those of rubber manufacturers. Their work is full of building up by cementing, and prisoned dampness not only prevents proper adhesion, but results in blisters. The ideal making up room of the future will undoubtedly be supplied with air always of certain temperature and always free from moisture. This indeed is already done in dipped goods plants.

TWENTY YEARS AGO THE RUBBER CHEMIST WAS A *novus avis*. To-day he is an important, often the most important, member of the staff of experts attached to every successful rubber factory. In the last five years chemists have practically revolutionized compounding and reclaiming, and have but touched the edges of the great field of accomplishment. That they should meet and exchange views at the approaching National Exposition of Chemical Industries to be held in New York, the week of September 25, is eminently fitting, and a large attendance is assured.

THE NUMBER OF RUBBER WORKERS IN NEW YORK STATE increased 23.75 per cent in four months of 1916, as against a corresponding period in 1915. For the same term the wage increase over that of 1915 was 36 per cent.

Plantation Rubber in Cochin China.

By Lawrence P. Briggs, United States Consul at Saigon, French Indo-China.

THE production of plantation rubber is a comparatively new industry in Cochin China. Several years after Ceylon, Java, Sumatra and the Federated Malay States were producing rubber in considerable quantities, it was thought that Cochin China lacked the requisite soil and climate for the successful cultivation of the rubber tree. The first real plantation was established in 1900. In 1908 the first plantation rubber was exported from Saigon. About this time several large plantations were established. In 1915 the port of Saigon exported over 350,000 kilos of plantation rubber, with a customs valuation of over \$300,000 (United States currency), but with a market price nearly twice that figure. On the first of January, 1916, there were in Cochin China about 100 plantations, with a total of nearly 70,000 hectares and over five million trees, of which only about 400,000 have yet been tapped. It needs only the normal exploitation of the trees already planted to make plantation rubber in 1920 second in value to rice among the exports from Saigon.

WILD RUBBER.

For many years Saigon has exported native rubber—years ago in much greater quantities than now. This rubber was brought from the forests of Cambodia and Laos by natives, who obtained it from several varieties of wild trees and tropical lianes, especially the *Ecdysanthera glandulifera*. These lianes are tapped by making, with a knife or other sharp instrument, longitudinal slits in their vine-like trunks, in which the latex or sap is coagulated. After coagulation these strips of rubber are smoked on the tree, then rolled into a ball. This trade has declined greatly during the past few years, partly because the easily available trees were nearly ruined during the years of high price and partly because from 1912 until recently the price has not been sufficiently great to make it worth while to transport this product the necessary distance. The exportation of native rubber during the years 1899-1915, inclusive, has been as follows:

Year.	Kilos.	United States Currency.	Year.	Kilos.	United States Currency.
1899.....	1,513	\$722	1908.....	10,414	\$13,057
1900.....	39,491	37,688	1909.....	3,085	2,679
1901.....	76,356	97,688	1910.....	9,125	7,925
1902.....	14,767	18,525	1911.....	67,995	59,053
1903.....	7,692	9,649	1912.....	70,052	60,841

1907.....	34,137	42,825			

Kilogram = 2.2 pounds. Hectare = 2.47 acres. Franc = 23.8 cents. Piastre = about 50 cents.

BEGINNINGS OF PLANTATION RUBBER, 1880-1900.

There is some dispute about the exact time and place of the introduction of plantation rubber (*Hevea Brasiliensis*) into Cochin China. Old pioneers recall that a few rubber trees were planted in the Botanical Gardens at Saigon in 1880 or 1881, but these trees seem to have disappeared within four or five years from that date. According to the best authorities the rubber tree was permanently introduced into Cochin China in 1897 by M. Raoul, chief pharmacist for the Colonies. During a visit to Ceylon this official sent to the Saigon Botanical Gardens several thousand

seeds. From these seeds about 1,800 plants appeared in 1898. In October of that year, 1,000 plants were sent to the government experimental station at Ong-Yem in Cochin China, 200 were sent to Dr. Yersin, director of the Pasteur Institute at Nha Trang in southern Annam, and a few hundred were distributed among various planters of Cochin China.

The rubber plantation at the Ong-Yem experimental station still continues. Less than 400 of the original trees survive, but new plantings on this and the adjoining plantation of the House of Correction raise the present number of trees to 16,500. The joint production of these two plantations for 1914 and 1915 is said to be about 3,700 and 6,000 kilos, respectively. Dr. Yersin's plantation at Suoi Giao near Nha Trang is more extensive. This plantation now consists of about 60,000 trees. Its production during the various years since tapping began is shown in later pages of this report.

The next year (1899) several thousand seeds were imported from Ceylon and the plants were distributed among various planters. The first successful plantation was established by M. Francois Belland, at that time chief of the Saigon police. In 1900, this colonist

planted 600 trees on his plantation at Phu Nhuan, about three miles from Saigon. The next year he planted 4,500 more, and in 1902 another 9,000. This plantation, with that of Hanh-thong-tay a few miles away, purchased later by M. Belland, contains about 25,000 trees. The first tapping, in 1908, yielded about 1,500 kilos of rubber. This amount has been gradually increased, especially during the past two or three years. Nearly all the plantation rubber exported from Saigon before 1913 came from the Belland plantations.

DEVELOPMENT OF RUBBER PLANTATIONS, 1907-1916.

The plantations at Phu Nhuan and Ong-Yem were located on

MAP OF FRENCH INDO-CHINA.

the narrow strip of gray soil which marks the first elevation from the delta-lands and flood-plains of which lower Cochín China is composed. Above this gray strip lies a wider strip of red soil of volcanic origin and of remarkable fertility and depth, reaching in some places 20 or 30 feet. This strip, about 35 miles wide, begins in the upper end of the province of Baria and extends 60 or 70 miles north-northwest across the provinces of Bien Hoa and Thudamot and into the protectorate of Cambodia.

In 1907 and 1908 two companies were organized to make more ambitious attempts to cultivate *Hevea Brasiliensis* on plantations located within the red soil area. In the former year the Société Agricole de Suzannah was organized with a capital stock of 2,500,000 francs, divided into 10,000 shares of 250 francs each. The same year this company planted 700 trees on their plantation near the station of Dau Giay on the Saigon-Nha Trang railway in the province of Bien Hoa, about 45 miles east of Saigon. The number of trees was increased to 45,000 in 1907, 140,000 in 1909 to 300,000 in 1910. The first tapping took place in 1912, when the production amounted to 4,480 kilos. In 1913 this plantation produced over 24,000 kilos of rubber. Since that time it has been, next to Xa Trach, the most productive rubber plantation in Cochín China.

In 1908 the Société Anonyme des Plantations d'Héveas de Xa Trach was formed with a capital stock of 2,300,000 francs and purchased a plantation at Xa Trach, about 65 miles north of Saigon, in the province of Thudamot. The first year 100,000 trees were planted. This number was increased to 200,000 in 1909 and 250,000 by 1915. In 1911, 540 trees were tapped; in 1912, 15,300, and in 1913, 54,000. The production of this plantation during the latter year was 25,170 kilos. It has since remained the most productive of the Cochín China rubber estates.

The years 1908 and 1909 witnessed the creation of two large plantations on the gray soil strip near Saigon. In the former year the Société des Héveas de Tay Ninh planted about 8,500 trees in the province of the same name, about 40 miles west of Saigon. In the latter year the Société des Héveas de Tan-thanh-dong planted about 55,000 trees on their plantation in the province of Giadinh, a few miles distant from the capital. Although the development of these plantations has been slower than that of those in the red-clay strip, the figures given in later pages of this report show them to be among the most important plantations of the colony.

The four following years (1909-1913, inclusive) saw the formation of many companies and the rapid absorption of the best available lands for rubber cultivation. The most important of the companies formed at this time is the Société des Caoutchoucs de l'Indochine. This company, controlled by the Banque de l'Indochine, has a capital of 4,500,000 francs and its headquarters at Paris. Its plantation is located at Loc Ninh in the red-soil district, a few miles beyond Xa Trach. Besides being considerably the most ambitious attempt at rubber cultivation in Cochín China, this plantation is notable as being the first successful attempt to interest, on a large scale, the capital of the mother-country, the earlier plantations being controlled almost entirely by local capital.

By the year 1913 the rubber industry can be said to have become firmly established in Cochín China. By this time the total surface planted to rubber trees amounted to about 14,000 hectares, the number of trees planted was over 4,000,000 and the capital invested not less than \$5,000,000. In this year the older estates were beginning to yield and the exportation rose to about 85,000 kilograms.

The next three years, 1913-1915, inclusive, saw the development of old plantations rather than the creation of new ones. This was partly due at first to the decline in the price of rubber, partly to the fact that the most available lands had been taken up and partly, later, to the war. But the productivity of the later large estates is just beginning to assert itself. On January 1, 1916, there were in Cochín China and adjacent territory in Annam and

Cambodia over 70,000 hectares in rubber plantations, of which over 17,000 hectares were planted to over 5,000,000 trees. Over 400,000 trees had been tapped, about 440,000 more were to be tapped during 1916 and the production for 1916 was estimated at over 700,000 kilos. The amount of capital invested is placed at more than \$6,000,000.

CHOOSING A RUBBER PLANTATION IN COCHIN CHINA: CLIMATE, SOIL.

In beginning a rubber plantation the first step is to choose a location, the second to get possession of the land. In choosing a location the primary questions are those of climate and soil. Transportation, difficulty of clearing the land and the labor problem are questions to be solved later.

The question of the right amount of water is an important one in Cochín China. The plantation must have sufficient elevation to avoid the annual floods of the delta region and to afford quick drainage after the annual rains. Many of the trees first planted at Ong-Yem were drowned out during the wet season. On the other hand, the extreme dryness of the years 1911 and 1912 wrought serious handicap to those plantations where irrigation was impossible or insufficient. Then, temperature seems to count for something. There is a point along the coast of Indo-China above which the rubber tree cannot be successfully cultivated. This point seems to be about the 13th parallel north latitude, just north of Nha Trang. The only plantations above this line are those of Delignon Freres near Qui Nhon, in Annam, about 14 degrees north, and still in the experimental stage. Another peril along the coast of Annam is the typhoon. The typhoons of 1909 and 1912 seriously damaged and plantation of Suoi Giao near Nha Trang.

Experiments show the soil of Cochín China to be well adapted to the growth of the rubber tree. A physical analysis made in the laboratory of the Saigon Botanical Gardens of the red lands of Bien Hoa at 100 degrees shows the following compositions:

Sand	478.40
Clay	438.19
Organic matter	67.72
Perigrinous gravel	7.15
Carbonate of lime	6.16
Vegetable mould	4.38
	1,000.00

Chemical analysis of this soil made at the same time and under the same conditions shows the chemical composition indicated in the first column of the following table. The other columns show the composition of red soil taken from plantations in the province of Thudamot (Xa Trach) and Baria (Arcillon) and an average of seven analyses taken from various parts of Cochín China:

	Bien Hoa.	Thudamot.	Baria.	Average of 7 Analyses.
Azote	1.81	1.33	.92	1.01
Phosphoric acid	6.70	1.65	5.21	7.22
Potash	1.02	1.10	.59	.62
Lime	3.44	.50	.25	.25
Magnesia	2.49	.35	.59	.39

An analysis under the same conditions of the gray sandy soil of the older plantations shows the following composition:

	Province of Giadinh.— Plantation Toussaint.	Thudac.	Thudamot. Ong-Yem.
Azote57	9.310	.404
Phosphoric acid154	.107	.347
Potash510	.796	.510
Lime420	.644	.196
Magnesia550	.350	.100

These analyses show the red soil to be very rich in phosphoric acid, above the average in azote, but sometimes slightly deficient in potash, lime and magnesia. These deficiencies may be supplied by the occasional use of a small amount of artificial fertilizers. The gray solids, on the other hand, have an abundance of potash, lime and magnesia, but are wanting in azote and phosphoric acid. The lacking substances have been supplied by the application of stable manure and oil cakes.

In practice the red soil has proven richer in the elements necessary for the development of the rubber tree, and colonists who are able to choose are locating their plantations in the red soil strip.

(To be continued.)

Captain Landolphe, Pioneer and Privateer.

The great French botanist Palisot de Beauvois, gave the name *Landolphia* to the African vines that have, in the past, produced a great proportion of the African rubber. That the name was given in honor of a brilliant pioneer, privateer and adventurer, Captain Landolphe, has perhaps been forgotten. This sketch, therefore, from the "Annuaire de l'Institut Colonial de Marseille" will be read with interest.

LANDOLPHE, the youngest of 23 children of an archer of the royal army, was born at Auxonne, in Burgundy, February 5, 1747. At the age of 18 he went to Paris to study to become a surgeon. But he soon tired of this and fled to Nantes and later shipped as secretary on the "Royal Louis," bound for St. Domingo, March 7, 1767.

On a second voyage, the ship was wrecked, and of 120 on board only 20 escaped, and Landolphe was rescued after clinging to the mainmast for 16 hours.

After other ups and downs, Landolphe found himself on the slave-ship "l'Africaine," sailing on March 5, 1769, for the Slave Coast. With his comrades he bought 360 negroes, which he sold at Cape François, St. Domingo, returning to Nantes with a heavier purse and probably a harder heart.

On another trip, Landolphe made a longer stay in Africa, learned the language and the manners of the natives, got into the good graces of the little inland kings, especially with a certain Danican, who proposed he establish a business, to deal in and export the products of the country, which plan, however, he did not adopt till later.

Between voyages Landolphe followed hydrographical courses given by two noted professors and mathematicians of Nantes, Leveque and Guirand, and graduated as sea captain in March, 1775.

From that time, Landolphe led two lives: the one, that of the founder of a colony that could have become the basis of a French Africa, and the other, the life of a privateer.

After many attempts, and as many setbacks, Landolphe secured the command of the "Negresse," a ship carrying 90 seamen and armed with 20 cannon. War had just broken out in America, and France was talking of extending help to the revolutionists. At the port of Belem, near Lisbon, Portugal, Landolphe rescued 17 American prisoners who had jumped overboard from a British man-of-war and, seeing the *flour-de-lis* floating from her mast, swam to the "Negresse." The British claimed their prisoners. Landolphe refused on the ground that he was exercising his neutral rights. Being in Portuguese waters, and not too numerous, the English did not insist, but set about to make things uncomfortable. One day as Landolphe was going ashore, he found the landing stage crowded with boats from the British fleet. He ordered his men to row with all possible speed, and ran his boat, head on, into a British launch, sank it, and was ashore with his armed men in time to meet the onrushing, infuriated sailors. The affair ended with an exchange of words instead of blows. Following this a British frigate waited for Landolphe outside of the Portuguese territorial waters, but he escaped.

After many trips, sea battles and storms, after visiting New York and other American ports, Landolphe obtained the indorsement and the aid of the King, sailed back to Benin with three ships, hoisted the white flag of France on a fort constructed by his engineers, and set about to organize a French colony.

In the meantime, the naturalist of his expedition Palisot de Beauvois, was collecting samples for the great work he was to publish later under the title of "Flora of Oware and of Benin." This was published in 1804-1811, in 20 volumes and with 120 colored illustrations. Illustration XXXIV showed the *Landolphia ovariensis*, a plant justly named after the organizer of the expedition.

At Oware on the Benin coast, Landolphe established a trading post, and was doing a business of more than \$6,000 per day when the English by an unexpected attack utterly destroyed the post. Landolphe later equipped a ship and sailed to Guadeloupe, arriving there at the outbreak of the French Revolution. He took part with the republicans, organized an army, and subdued the revolt. England, taking advantage of the internal trouble of France, started to appropriate her West Indian colonies. Landolphe armed a powerful ship, and started privateering. Pursued by a British fleet he took refuge in the port of Baltimore. The British blockaded the Chesapeake, but Landolphe eluded the blockade, returned to Guadeloupe, drove the British out of the island, recaptured St. Martin and St. Eustache, and re-provisioned St. Domingo. Surrounded by the British fleet off St. Thomas, he and his men captured two British frigates by boarding, but were later overcome by the superiority of the British artillery. Landolphe was captured, and after many months in prison, he was taken to England and finally released unconditionally, having refused to accept a parole.

Returning to France, Landolphe was acquitted by court-martial for the loss of his ships, and obtained from Napoleon, then first consul, the command of a cruising expedition to the coast of Africa. He fought several successful battles with British fleets, destroyed the Portuguese African trade also, crossed the Atlantic to Buenos Aires and took part in the defense of that city. He destroyed many British ships in South American ports from the Plata river to Bahia

Blanca. Taken prisoner, he was confined to an island in the bay of Rio de Janeiro, but, thanks to his being a Free Mason, as were the British admiral who captured him, and the Portuguese commander at Rio, he was allowed to go to Lisbon and to Madrid, where he was exchanged. Returning penniless to France, he retired to his home town, where he wrote his memoirs, which were published in Paris in 1823.

Landolphe died in Paris July 13, 1825.

Palisot de Beauvois was certainly well inspired in choosing this vine to perpetuate the name of Captain Landolphe. The *Landolphia ovariensis* is the principal source of the rubber collected on the west coast of Africa from Sierra-Leone to Angola.

On the other hand, in French Guinea, in the Soudan and in the Senegal, the plant that takes its place is of a neighboring species, the *Landolphia Hendolii*, while in the French Congo and the Congo Free State (Belgian Congo) the blacks tap the *Landolphia ovariensis* and the *Landolphia Forestii*.

CAPTAIN J. E. LANDOLPHE.

In the sandy districts of the Congo Free State and of Angola, the so-called "grass" and "prairie" rubber is obtained from the rhizomes of plants which, though not vines, are also called *Landolphia orariensis*, especially the *Landolphia Henriquesiana*.

On the east coast, in German East Africa and Mozambique, there is also a species of this kind, the *Landolphia Kirkii*, which

is the most common and most important of all rubber vines.

Finally, in Madagascar, the red rubber of the east coast, from Vohémar to Farafangana, is produced by the *Landolphia Madagascariensis*, and the pink rubber from the Boina and the Menabe districts, on the west coast, is from the *Landolphia spirocarpa* and the *Landolphia Perrierii*.

The Largest Rubber Tree.

A CORRESPONDENT in Los Angeles, California, sends us a picture of what he confidently affirms is the largest of all rubber trees. According to his description, the branches cover a space about 112 feet in diameter. The body of the tree at its thickest point measures about 14 feet in circumference, while each lower limb is about 8 feet in circumference. The tree is not a tall growing variety, but is probably 60 feet in

height. The roots spread over the ground for quite a space around the body, giving it an odd appearance. The leaves are about 6 inches long by 3 inches wide and are rather thick. They contain a milk-like juice, that soon condenses and a gummy web is formed.

It has been estimated by a prominent expert on rubber that this tree would make over 100 standard size tire casings.

Speaking of rubber trees, as far back as 1852, Daniel Webster in the great India Rubber Suit committed himself thus:

It (india rubber) is a gum procured from an equatorial tree found in greater or less quantities in Brazil, and called by botanists *Ficus Elastica*. . . . It is said to be, in some of its specimens, the largest tree growing on the face of the earth. There are instances in which it is described as being nearly a hundred feet in circumference.

He was in error, of course, in several errors; but the *Ficus Elastica* is the world's big rubber tree. Not in Los Angeles, nor in Brazil, but in Sumatra.

There on the West coast in the town of Siboga is a really big tree. It is 196 feet high, and 180 feet in circumference, 5 feet

GIANT *FICUS ELASTICA* IN SUMATRA.

BIG *FICUS ELASTICA* IN LOS ANGELES, CALIFORNIA.

from the ground, or 60 feet in diameter—nearly thirteen times as big as its California cousin. It has given as much as 100 pounds of rubber in a year. In the accompanying illustration three natives may be seen high up on the trunk of the tree, showing graphically its enormous size.

USES OF PERFORATED RUBBER SHEET.

Perforated hard rubber sheet is used in storage batteries and also for screening certain substances. Perforated sheet rubber packing is used quite extensively in canning factories for grading green peas after they have been shelled. The soft rubber screen does not injure the peas. Perforated rubber sleeves are sometimes used on driving pulleys to prevent belt slipping.

The Rubber Trade Preparedness Committee.

THAT the rubber trade is fully alive to the importance of an active campaign for "Preparedness," is manifested by the interest taken by the large number of leading firms and corporations, in the rubber and allied trades, to cooperate with the Committee on Preparedness of The Rubber Club of America, Inc., and to disseminate its literature, primarily among rubber men, but also to the public generally.

The Executive Committee on Preparedness of the club consists of Raymond B. Price, chairman, United States Rubber Co. System, New York City; Harvey S. Firestone, Firestone Tire & Rubber Co., Akron, Ohio; George B. Hodgman, Hodgman Rubber Co., Tuckahoe, New York; and Harry S. Vorhis, secretary, New York City.

More than 125 rubber concerns have appointed representatives in nearly 150 cities in the United States as members of local committees, to promote the movement and to arouse public opinion to the importance of bringing the nation to a state of preparedness. In addition to these, representatives have been appointed in many factories to act as sponsors for this movement among the employees, their special efforts being to urge the naturalization of foreign born employees. Such cooperation of wideawake, earnest, enthusiastic men must prove an effective force in furthering this important movement.

The following list gives the concerns which have thus far signified their assurance of cooperation, and the names of their appointees in various cities on this committee:

ACME RUBBER MFG. CO., Trenton, N. J.—R. J. White, Chicago, Ill.; R. B. Smith, New Orleans, La.; S. V. B. Brewster, New York City; E. H. Thiemeyer, St. Louis, Mo.; W. L. Pugh, San Francisco, Calif.
 ALCO RUBBER CO., Inc., New York City—L. D. Mason, Atlanta, Ga.; S. L. Blood, Boston, Mass.; A. M. DeLisser, Brooklyn, N. Y.; S. H. Pierce, Chicago, Ill.; F. C. Burnett, Dallas, Tex.; F. C. Thompson, Denver, Colo.; W. J. Ward, Los Angeles, La.; E. J. Traylor, Detroit, Mich.; J. B. Haggerty, Indianapolis, Ind.; W. J. Baylis, Kansas City, Mo.; M. B. Johnson, Minneapolis, Minn.; E. J. Quinn, New York City; D. W. Boyer, Philadelphia, Pa.; H. A. Ward, Cleveland, Ohio.
 ALKON PIGMENT CO., Akron, O.—Factory Representative J. A. Houser.

ALLIANCE RUBBER CO., Alliance, O.—Factory Representative Milton Dejak.

AMERICAN WEINGUT CO., New York City—Factory Representative J. P. Walsh, Woonsocket, R. I.

ANSONIA O. & C. CO., Ansonia, Conn.—Factory Representative R. W. Eastop.

ROBERT BADENHOP CO., New York City—J. E. Odell, Boston, Mass.; W. G. Brown, Cincinnati, Ohio.

BATAVIA RUBBER CO., Batavia, N. Y.—Franklin Kesser, New York City; Factory Representative C. M. Marvin, Batavia, N. Y.

BEACON FALLS RUBBER SHOE CO., Beacon Falls, Conn.; D. E. Gray, Boston, Mass.; J. J. Adams, Chicago, Ill.; H. M. Gasaway, Kansas City, Mo.; A. C. Wylie, Minneapolis, Minn.; E. E. Beard, New York City; Factory Representative J. T. Crowley, Beacon Falls, Conn.
 BIRMINGHAM IRON FOUNDRY, Derby, Conn.—F. B. Wanning, New Haven, Conn.

BLOOMINGDALE RUBBER CO., New York City—J. A. Talbot, Butler, N. J.; George Brown, Chester, Pa.; C. W. Harrison, New York City.

BOSTON BELTING CO., Boston, Mass.—O. P. Arnold, Buffalo, N. Y.; H. H. Whitesell, San Francisco, Calif.; W. E. Greene, New York City.

BOSTON INSULATED WIRE & CABLE CO., Boston, Mass.—Factory Representative H. B. Burley.

BOSTON RUBBER HOSE & RUBBER CO., Cambridge, Mass.—P. D. Luce, Albany, N. Y.; F. E. Walker, Atlanta, Ga.; M. F. Smith, Buffalo, N. Y.; R. T. Davis, Chicago, Ill.; C. Y. Dempsey, Cleveland, Ohio; J. L. Gillman, Corpus Christi, Tex.; H. S. Wims, Denver, Colo.; L. H. Weyant, Denver, Colo.; Chas. Campbell, Erie, Pa.; R. J. Owens, New York City; F. E. Stockwell, Philadelphia, Pa.; A. C. Barlow, Pittsburgh, Pa.; H. C. Foster, Richmond, Va.; E. A. Wood, St. Louis, Mo.; F. J. Ryker, San Francisco, Calif.; S. R. Ruge, Seattle, Wash.; Factory Representative J. W. Fellows, Cambridge, Mass.

BOSTON YARN CO., New York City—P. C. Ware, Boston, Mass.; Cyrus Woodman, Lowell, Mass.

BROWN RUBBER CO., Providence, R. I.—Factory Representative Harry F. Lincoln.

L. S. BOWERS CO., New York City—E. M. Stimson, Philadelphia, Pa.

BRITISH-AMERICAN MFG. CO., Inc., Springfield, Conn.—Factory Representative L. C. Himebaugh.

BROWN RUBBER & TIRE CO., Rutherford, N. J.—W. J. Heathcock, Chicago, Ill.; Harry Brander, New York City; W. L. Porter, Philadelphia, Pa.

BUFFALO WEAVING AND BELTING CO., Buffalo, N. Y.—Factory Representative W. S. Wacker, Buffalo, N. Y.

II. O. CANFIELD CO., Bridgeport, Conn.—J. G. F. Squires, New York City; Factory Representative M. B. Waldo, Bridgeport, Conn.

CHICAGO RUBBER CLOTHING CO., Racine, Wis.—Philip Loewe, Chicago, Ill.; E. T. Smith, Chicago, Ill.; R. G. Bryant, Racine, Wis.

CLIFFTON MILLS CO., Boston, Mass.—Factory Representative C. G. Atwood.

CLYDE INSULATED WIRE CO., Pawtucket, R. I.—Factory Representative E. C. Bowen.

COMBINATION RUBBER MFG. CO., Bloomfield, N. J.—E. F. McArdle, New York City.

CONTINENTAL RUBBER WORKS, Erie, Pa.—H. J. Elwood, Buffalo, N. Y.; E. W. Peet, Chicago, Ill.; Griswold Wilson, Cleveland, Ohio; E. J. Berwick, Detroit, Mich.; G. H. Carnahan, New York City; W. A. Darling, New York City; B. W. Snowman, New York City; G. E. Crawford, Pittsburgh, Pa.; W. S. Talbot, San Francisco, Calif.; Factory Representative C. C. Strickland, Erie, Pa.

CONVERSE RUBBER SHOE CO., Malden, Mass.—W. H. Jones, Chicago, Ill.; F. R. Goddell, New York City; Factory Representative M. M. Converse, Malden, Mass.

SAM'S CUPPLES WOODEN WARE CO., St. Louis, Mo.—Factory Representative H. B. Wallace.

DAVAL RUBBER CO., Providence, R. I.—Lewis G. Abbott, Boston, Mass.; E. G. Hartwell, Detroit, Mich.; Raymond J. Fries, New York City; Oscar C. Nidekstein, New York City; Edward J. George, Pawtucket, Wis.; P. Raymon Wesley, Providence, R. I.; George A. Sheehan, San Francisco, Calif.; John A. Burgess, Charleston, S. C.; Factory Representative Fred J. Riley, Providence, R. I.

DEANE PLASTER CO., Yonkers, N. Y.—Factory Representative William F. Holland.

DETROIT INSULATED WIRE CO., Detroit, Mich.—L. A. Wooley, Buffalo, N. Y.; also local representatives in Birmingham, Ala.; Pittsburgh, Pa., and San Francisco, Calif.

DOUBLE FABRIC TIRE CO., Auburn, Ind.—Factory Representative C. C. Marston.

DREADNAUGHT TIRE & RUBBER CO., Baltimore, Md.—Factory Representative H. Jones Loper.

DRY CLIMATE TIRE MFG. CO., Denver, Colo.—Factory Representative Richard A. Leigh.

DAYTON RUBBER MFG. CO., Dayton, Ohio—W. C. Miner, Albany, N. Y.; W. C. Floyd, Baltimore, Md.; Herbert W. Vinton, Baltimore, Md.; C. Newcomb, Boston, Mass.; R. L. DeLoe, Chicago, Ill.; E. G. Hartlieb, Cincinnati, Ohio; L. F. Mau, Cleveland, Ohio; W. E. Trenchard, Columbia, S. C.; M. V. Thompson, Indianapolis, Ind.; B. F. Wade, Los Angeles, Calif.; W. J. Weisenberger, Louisville, Ky.; J. N. Simpson, Milwaukee, Wis.; D. E. Ford, Minneapolis, Minn.; E. R. DeTamble, New York City; B. D. Foster, Pittsburgh, Pa.; B. A. Blenner, Richmond, Va.; Arie Dykstra, Sioux Center, Ia.; Factory Representative Barney Holzf, Dayton, Ohio.

DAYTON RUBBER CO., Chicago, Ill.—C. F. Quinn, Boston, Mass.; H. J. Gordon, Detroit, Mich.

EARLE BROS., New York City.—E. W. Laird.

ELECTRIC HOSE & RUBBER CO., Wilmington, Del.—J. D. W. Archer, Chicago, Ill.; J. D. Archer, New Orleans, La.; A. W. Archer, New York City; Wm. M. Sibley, Philadelphia, Pa.

EMPIRE RUBBER & TIRE CO., Trenton, N. J.—W. H. Chadwick, Boston, Mass.; W. H. Paddock, Buffalo, N. Y.; E. B. McKay, Chicago, Ill.; J. B. Fry, Detroit, Mich.; D. E. Wills, Newark, N. J.; T. O'Sullivan, New York City; J. B. Richardson, Philadelphia, Pa.; R. L. Logan, Pittsburgh, Pa.; H. C. Camp, New York City.

ESSEX RUBBER CO., INC., Trenton, N. J.—R. W. Philbrook, Boston, Mass.; E. Le DeVere, Chicago, Ill.; C. C. Tucker, Trenton, N. J.; R. C. Hunter, Detroit, Mich.; A. M. Mallory, New York City.

FALLS RUBBER CO., Cuyahoga Falls, Ohio—Factory Representative Mr. Beyer.

FAULTLESS RUBBER CO., Ashland, Ohio—Factory Representative Percy McDowell.

FEDERAL RUBBER MFG. CO., Milwaukee, Wis.—H. D. Benner, New York City; Factory Representative J. M. Tait, Cudahy, Wis.

FIRESTONE TIRE & RUBBER CO., Akron, Ohio—W. West, Atlanta, Ga.; B. B. Leisire, Baltimore, Md.; J. E. Weldon, Birmingham, Ala.; Glenn, Boston, Mass.; E. L. Birby, Brooklyn, N. Y.; H. W. McFadden, Buffalo, N. Y.; A. Moore, Chicago, Ill.; J. P. Patterson, Cincinnati, Ohio; D. H. Leavelle, Cleveland, Ohio; C. J. Collins, Columbus, Ohio; G. A. Grubb, Corpus Christi, Tex.; W. G. Kroff, Davenport, Ia.; G. A. Spahr, Des Moines, Ia.; H. A. Coffin, Detroit, Mich.; W. R. McCarty, Fargo, N. D.; H. C. Brown, Grand Rapids, Mich.; F. C. Hebert, Houston, Tex.; W. L. Esterly, Indianapolis, Ind.; F. M. Salley, Jacksonville, Fla.; P. B. Talbot, Kansas City, Mo.; J. V. Johnston, Los Angeles, Calif.; A. Smith, Los Angeles, Calif.; J. E. Martin, Minneapolis, Minn.; A. L. Manley, Newark, N. J.; C. L. Miller, New Orleans, La.; C. D. Studebaker, New York City, Okla.; C. L. Miller, New Orleans, La.; C. D. Studebaker, New York City; W. R. Walton, Philadelphia, Pa.; G. A. Richards, Pittsburgh, Pa.; P. W. Thatcher, Portland, Ore.; F. T. Bailey, Rochester, N. Y.; E. M. Taylor, St. Louis, Mo.; W. L. Sewell, C. F. DeLoe, St. Antonio, Tex.; F. S. Firestone, San Francisco, Calif.; E. R. Wood, Seattle, Wash.; S. L. Clark, Spokane, Wash.; G. L. Engle, Springfield, Mass.; S. E. Douglas, Syracuse, N. Y.; J. J. Mass, Washington, D. C.

FOSTER RUBBER CO., Boston, Mass.—Blake A. Pitcher, Chicago, Ill.; F. C. Bernhardt, San Francisco, Calif.

GENERAL TIRE & RUBBER CO., Akron, Ohio—Factory Representative J. G. Stoller.

TIE B. P. GORDICH CO., Akron, Ohio—R. J. Murphy, Atlanta, Ga.; J. T. Kemp, Birmingham, Ala.; E. J. Moore, Boston, Mass.; J. T. Buffalo, N. Y.; F. P. Rowen, Chicago, Ill.; E. M. Lee, Cincinnati, Ohio; C. A. Dunham, Cleveland, Ohio; P. T. Opper, Detroit, Mich.; H. A. Little, Indianapolis, Ind.; F. Oberlin, Kansas City, Mo.; F. R. Carroll, Los Angeles, Calif.; E. W. McCreery, Minneapolis, Minn.; H. J. Morehead, New York City; G. O. Simson, Philadelphia, Pa.; A. M. Jack, Pittsburgh, Pa.; J. B. Bond, Portland, Ore.; W. S. Doherty, St. Antonio, Tex.; C. E. Cook, San Francisco, Calif.; W. D. Albright, Seattle, Wash.

GUNDEY TIRE & RUBBER CO., Mt. Airy, Ohio—R. W. Ross, Ahvay, N. Y.

STANDARD FOUR TIRE CO., Keokuk, Ia.—*Factory Representative* W. J. Farnham.

CHEMICAL EXPOSITION AND SOCIETY MEETINGS.

THE Second National Exposition of Chemical Industries, to be held at the Grand Central Palace, New York City, during the week of September 25-30 will call together chemists and those engaged in many allied industries from all sections of the country. A number of chemical societies have chosen this city and the above date for their regular or special meetings.

The section of Rubber Chemistry will gather at the same time, and a general conference on the progress of chemistry of india rubber will be held. This section will be under the chairmanship of Dr. Lothar E. Weber, of Boston, Massachusetts. J. B. Tuttle, Bureau of Standards, Washington, District of Columbia, is the secretary. It is expected that some interesting papers will be presented at this meeting.

The Chemists' Club, who will also have headquarters at the exposition, have offered the lobby of the clubhouse for the registration of the members of the society. The Chemists' Club, which is a few squares from the Grand Central Palace, has been selected as the headquarters of the American Chemical Society, and on Monday afternoon the council of the American Chemical Society will hold a business meeting there, followed by a dinner tendered to the council by the New York Section. This society will also conduct a symposium on occupational diseases presided over by Professor Charles Baskerville, head of the department of chemistry of the College of the City of New York. Among the subjects treated will be the avoidance of contamination of the air in rubber factories by the fumes of bisulphide of carbon; the avoidance of and remedy for lead poisoning, and diseases or troubles incidental to work in rubber factories. A general discussion will be held by leading authorities of the country, including Drs. W. Gilman Thompson, F. L. Hofman, J. W. Schereschewsky, G. P. Adamson, H. K. Benson, W. A. Lynott, Alice Hamilton, and J. B. Andrews.

MEETING OF THE NATIONAL ASSOCIATION OF COTTON MANUFACTURERS.

The semi-annual meeting of the National Association of Cotton Manufacturers will be held September 14-16 at The Griswold, New London, Connecticut. Besides the usual business of the association there will be many interesting papers read, a golf tournament and a banquet at which questions of national importance to the cotton industry will be discussed by eminent speakers.

TOY MANUFACTURERS FORM ASSOCIATION.

Toy Manufacturers of the U. S. A., Inc., is the name of an association recently incorporated, the objects, as explained in its constitution, being to cooperate with and help toy merchants in every conceivable way; to exchange ideas on matters pertaining to manufacturing problems; to protect the members in the matter of credits by exchange of information; to take an interest in all legislation affecting the toy industry, and to carry on a national campaign of advertising to acquaint the public with American-made toys. The manufacture of rubber toys is an important branch of the rubber industry and it is likely that manufacturers of such goods will consider it to their interest to join the association, which has an office at 200 Fifth avenue, New York City. The officers are as follows: A. C. Gilbert, president; Harry C. Ives, A. D. Converse, vice-presidents; Leo Schlesinger, treasurer, and Fletcher D. Dodge, secretary.

What the Rubber Chemists Are Doing.

VARIABILITY IN VULCANIZATION OF PLANTATION PARA

AN important study of the cause of variability in respect to the rate of cure of plantation Para is being conducted by B. J. Eaton and J. Grantham in the chemical laboratory and experimental vulcanizing factory, Department of Agriculture, Federated Malay States.

THE INDIA RUBBER WORLD, October, 1915, page 11, and December, 1915, page 114, presented abstracts of the first communication on this research. The second communication, published in "The Journal of the Society of Chemical Industry" (June 15, 1916) is abstracted below.

In their previous paper, the authors indicated that the primary cause of variability in rate of cure was attributable to the accelerating action of a small quantity of some substance existing in the latex or produced subsequently in the raw rubber from some constituent present in the latex.

Subsequent experiments have been directed to ascertaining the nature of this substance and its behavior under different treatments, to determine its probable constitution. These efforts have resulted in the isolation or preparation of a substance or substances from the latex serum to which acceleration in rate of cure can be attributed, and evidence has been obtained of the presence of a second substance which also has a similar effect.

The experimental results of the present paper confirm the theory that the rate of cure is influenced by the amount of an accelerating agent formed by the decomposition of some constituent of the latex, and that this substance is a decomposition product of the protein or nitrogenous constituents of the latex, produced usually in the freshly coagulated raw rubber by the action of micro-organisms, which gain access to the latex after it leaves the tree, or possibly in some cases decomposition by chemical action. The retarding effect of smoking, on the rate of cure, has proved to be a more complicated problem than at first appeared. The retarding effect, though invariably shown by slab, has been found not to be constant in sheet, especially in thin sheet. This is due to the fact that, in smoking rubber, more than one variable factor, influencing the rate of cure, is present.

In most of their experiments the authors used raw rubber in the form of slab slightly pressed, or unpressed coagulum containing a large percentage of serum. The latex was coagulated one day about noon, left in the serum till about 10 A. M. the following day and then rolled under a wooden rolling pin on a sloping table. All samples were eventually converted to thin cripe before vulcanizing. In order to demonstrate that the differences obtained by the authors in their experimental samples were not a special feature of the latex or rubber prepared in their factory, their methods of preparation were repeated for them on different estates, with identical results.

The authors present their investigation in three divisions:

PART I.—EXPERIMENTAL.

Part I embraces a group of experiments for determining—The time necessary to develop the change in slab rubber, causing an increase in rapidity of cure.

The effect of antiseptics, heat and cold.

The effect of formalin.

The effect of soaking in running water.

CONCLUSIONS UNDER PART I

1. That the rate of vulcanization of rubber from any given latex is determined by the extent to which a certain change takes place subsequent to coagulation.

2. This change is normally limited to the first few days after coagulation. The change is progressive and reaches a maximum

in "slab" rubber (i. e., coagulum containing a large proportion of the serum) in approximately six days after coagulation.

3. The change can be arrested either partially or completely by the action of formalin, heat, and cold. It is also arrested by creeping shortly after coagulation, which may be due either to the larger surface exposed or to the more rapid drying, or both, combined with the removal of most of the serum in machining to cripe form.

4. The complete arrest or inhibition of the change by formalin (similar effects have been obtained with other antiseptics) and by the action of both heat and cold, indicates the formation by biological action of a substance which increases the rate of cure of raw rubber, the decomposition being probably of an anaerobic nature. There is no evidence that the change is due to chemical agencies.

In this connection experiments carried out on latex frozen for several days at 12 to 15 degrees F., are of considerable interest, since by freezing for this period, the rubber no longer cures rapidly, even if left for a considerable period afterwards at 84 degrees F.

[The method of freezing latex to produce rubber has been patented in the Federated Malay States. Latex after freezing for 4 to 5 hours is coagulated and, on thawing the solid block thus formed, a solid coagulum is formed, whereas latex can be frozen for a short period and on thawing is reconverted into latex.]

PART II.—EXPERIMENTAL.

Part II deals with the probable nature of the constituent of the latex involved in the changes in raw rubber, and the nature of the constituents which are responsible for the variations in rate of cure of different rubbers.

The experiments of Part II included the addition of proteins to rubber and the effect was determined of the following additions:

Casein and peptone.

Decomposed casein.

Protein from the latex.

Evaporated serum minus protein.

Decomposed protein from serum.

CONCLUSIONS UNDER PART II.

It is apparent from these experiments that there exist in the serum two substances: (1) a substance of the nature of protein, precipitated or coagulated by heat, which is ineffective in accelerating the rate of vulcanization unless decomposed; (2) a soluble substance, only obtained by evaporation and not easily decomposed, which has itself an accelerating action or vulcanization.

Decomposed precipitated protein is effective in much smaller quantity than serum residue obtained by evaporation, after the heat coagulated protein has been removed.

In the ordinary preparation of sheet and cripe rubbers the greater part of the serum is removed in machining the coagulum, and the whole of the soluble products may be washed out in creeping, so that normally the accelerating effect of the soluble serum is nothing. All of the experiments of the first part show the gradual development of the accelerating substance during the first few days after coagulation. This is attributed to the decomposition of protein (similar in nature to that precipitated from the serum by heat) which is precipitated with the rubber during coagulation.

PART III. ANALYTICAL. NITROGEN CONTENT OF RUBBER AND THE RATE OF VULCANIZATION.

The contrast between the high nitrogen content of a slow-

curing crepe, compared with the low nitrogen content of fast-curing crepe from a slab rubber, can only be explained on the theory that, in the slab rubber, decomposition of the protein or nitrogenous substance takes place. A soluble portion is washed out during crepeing, and the insoluble residue, or part of it, is presumably the substance causing acceleration in rate of cure in the case of slab rubbers.

In view of the vulcanizing results obtained in Parts I and II, the authors have analyzed a large number of their samples which are tabulated below, together with the rate of cure determined by the load-stretch curve method.

Per Cent of Nitrogen in Dry Sample.	Optimum Time of Cure in Hours.	Per Cent of Nitrogen in Dry Sample.	Optimum Time of Cure in Hours.	Per Cent of Nitrogen in Dry Sample.	Optimum Time of Cure in Hours.
0.31	234	0.42	234	0.28	2
0.26	135	0.19	114	0.22	115
0.19	114	0.37	234	0.31	24
0.17	114	0.36	234	0.19	134
0.16	114	0.36	319	0.24	114
0.14	114	0.36	319	0.24	134
0.18	114	0.38	319	0.24	134
0.18	114	0.20	114	0.38	3
0.33	216	0.20	114	0.20	319
0.30	134	0.40	234	0.39	314
0.16	114	0.19	1	0.26	1
0.11	114	0.40	314	0.36	214
0.13	114	0.33	3	0.27	314
0.12	114	0.23	214	0.38	21
0.12	114	0.27	214	0.40	214
0.18	114	0.36	214	0.19	214
0.17	114	0.27	214		

In every case, the amount of nitrogen in a slow-curing rubber, is about 50 to 100 per cent greater than the amount of nitrogen contained in a fast-curing slab rubber, the amount of nitrogen being determined on all samples after conversion to crepe and drying.

On the other hand, the amount of nitrogen in samples of rubber prepared by the evaporation of thin layers of latex, or by pouring out the latex into thin layers, after addition of acid coagulant, and allowing the thin sheets thus obtained to dry rapidly, is high, and amounts in some cases to 0.5 per cent. Such samples are rapid curing, although the percentage of nitrogen indicates that no decomposition of the protein or nitrogenous constituents of the rubber has taken place, the factor deciding rapidity of cure being apparently, in this case, the unknown substance present in the evaporated serum after removal of the major portion of the protein.

SUMMARY.

1. The experiments and results of Part I show that one factor which causes variability in respect of rate of cure in plantation Para rubber is produced during the first six days after coagulation and that the change which takes place in the coagulum is progressive during this period, while after this period, no further change, under ordinary conditions, takes place.

2. The action of antiseptics, such as formalin, as well as heat and cold, are also shown to inhibit this change, while soaking of the fresh coagulum in running water considerably retards the rate of cure.

3. The action of formalin is also shown to be partly, though not to any great extent, an action on the accelerating agent after its formation.

4. Experiments on the cold storage of freshly coagulated rubber show that while the change which produces rapidity of cure is inhibited as long as the coagulum remains in cold storage, if the rubber is removed again and allowed to remain, without machining, for a further period (13 days or possibly less) at ordinary atmospheric temperatures (about 85 degrees F. in the Federated Malay States), rapidity of cure is again brought about.

5. All the experiments of Part I suggest that the change which produces rapidity of cure in the rubber is caused by biological agencies, that is to say, micro-organisms entering the latex after collection and remaining in the coagulum, and that the change is probably a decomposition of the protein or nitrogenous sub-

stances present in the coagulum, producing an accelerating agent which is a decomposition product of the proteins.

6. The experiments of Part II, on the slow-curing rubbers of various proteins and nitrogenous substances, and their decomposition products, including the proteins from the latex serum, decomposed by suitable methods after separation from the serum, confirm the conclusions from the experimental evidence contained in Part I, and show that the original proteins have little or no effect under the conditions employed, while the decomposed proteins have a marked effect.

7. Experiments with undecomposed evaporated serum, after separation of the proteins coagulated by heat, suggest the presence of a second factor which accelerates the rate of cure, and is due to some substance originally present in the latex.

8. In the case of the authors' so-called "slab" rubbers, possibly both factors are responsible for the acceleration of the rate of cure, and it would appear that the second factor may be responsible for the actual superior tensile properties of the rubber. Some evidence to this effect is contained in the comparatively poor quality of the rubbers to which the protein decomposition product has been added, in which the second factor has been removed, and also in the good quality in the case of the evaporated latex samples and the rubber to which the evaporated serum has been added. Further experiments are, however, necessary to confirm this.

9. Experiments with evaporated latex, which contains all the serum constituents and is dried with sufficient rapidity to prevent decomposition of the proteins, also confirm the presence of this second factor.

10. The nitrogen figures given in Part III still further confirm the decomposition theory, that is to say, the production of some substance from the protein which accelerates the rate of cure, the nitrogenous portion which becomes soluble in water and is removed on crepeing being non-essential. The high nitrogen content, on the other hand, in rapidly curing rubbers produced by evaporation of the latex, without decomposition of the protein, again confirms the evidence obtained as to a second factor which is probably of a non-nitrogenous nature.

11. These experiments and results also show why it has not been possible hitherto to connect the nitrogen content of a rubber with its rate of cure, since a rapidly curing rubber may have either a low or high nitrogen content, and indicate how previous workers have gone astray, or not gone sufficiently far in their investigations, in connection with the protein or nitrogenous constituents of latex and rubber.

12. Many other experiments on nearly 1,000 samples of rubber all confirm the above results and conclusions.

13. A further investigation is now being made as to the exact nature of the protein decomposition product, which accelerates the rate of cure, and as to the nature of the second factor responsible for acceleration, together with the numerous subsidiary factors which influence the rate of cure, a number of which have already been investigated.

The authors have since found that the protein left in sheet of average thickness can be decomposed and so produce a more rapidly curing sheet rubber by simply rolling up the sheets after machining in order to retain sufficient moisture content for the bacterial decomposition. This demonstrates that the rapidity of cure of the so-called slab rubber is largely due to the decomposition of protein nominally retained by the rubber, even after rolling to sheet form. These results also show the importance of the rate of drying during early stages, as a factor in the preparation of sheet rubber, in order to have a uniform rate of cure.

It is reported from France that the incendiary lozenges and asphyxiating gases the German army has been using so freely are due to the work of Dr. Wolfgang Ostwald, the well-known German chemist and editor of the "Kolloid-Zeitschrift."

VULCANIZATION OF CAOUTCHOUC AND ITS REGENERATION.

THE chemical investigation of the vulcanization of caoutchouc and the possibility of its regeneration from the vulcanized product is the subject of a paper by I. C. Harries in "Berichter," 1916 [Vol. 49, pages 1196-1201]. In the ordinary hot vulcanization process with about 10 per cent of sulphur, two distinct stages must be differentiated. The primary action is an absorption phenomenon, since the sulphur can be extracted practically quantitatively with a solvent such as acetone, and, moreover, does not pass into the derivatives, such as the hydrochloride, which contains only a trace of sulphur, although, unlike the hydrochloride of natural caoutchouc, it is quite soluble in chloroform. On the other hand, a vulcanized caoutchouc which has been kept for a long time in a warm place, contains from 2 to 4 per cent of sulphur, which resists the action of solvents, and it also gives a sulphur-containing hydrochloride. The vulcanization of caoutchouc is accompanied by a change from the metastable form of the natural caoutchouc to a stable form, a change which is accompanied by the above mentioned difference in solubility between the hydrochlorides of the natural caoutchouc and of the caoutchouc obtained by desulphurizing the vulcanized product. In chemical structure both forms are apparently identical, although the stable form is more slowly attacked by ozone, and in their solubility relationships they behave very differently. The desulphurized vulcanization product cannot again be satisfactorily vulcanized. This is not due to the extraction by the acetone of a substance which favors the vulcanization, as Harries had previously supposed, but rather to the fact that a regeneration of the caoutchouc or reversion to the metastable form is an essential preliminary to revulcanization. Theoretically, the devulcanization is but a secondary consideration.

LABORATORY APPARATUS.

AUTOMATIC PIPETTE.

AN automatic pipette for which Alexander Ljwy, of the Commercial High School, Brooklyn, New York, has applied for a patent, is shown in the illustration, as relates to the stop-cock, which is the improved patentable feature. The valve or stop-cock is placed in the tube.

With suction applied at end of the tube *G* the liquid is drawn upward through tube *H* until it just passes the graduation level *A*. The opening *D* is then closed air tight by the thumb and the cock rotated 90 degrees, clockwise, establishing connection between *H* and *D* through passage *F* *C*. The thumb is then released and air pressure forces the exact measured volume of liquid from the pipette.

The advantages are summarized as follows:

1. Automatic control of exact measured volume of liquid in the pipette.
2. Obviates manipulating the exact volume of liquid once it has passed the graduation mark, placed where the stop-cock meets the lower end of the valve of the pipette.
3. Permits discharge of exact measured volume.
4. Ease of manipulation.

An instrument of the hydrometer type has been patented by T. Cockerill, Government Technical Schools, Colombo, Ceylon, for use in testing rubber latex. The graduations are marked in addition to or in place of the specific gravity numbers with the quantity of acid per gallon required to coagulate the latex, and also in some cases the number of ounces of rubber per gallon of the latex [British patent No. 100,591.]

CHEMICAL TREATMENT OF RUBBER.

THE UNITED STATES.

PROCESS OF MAKING CAOUTCHOUC-LIKE SUBSTANCES.—The process consists in producing substances resembling or related to caoutchouc by shaking a butadiene hydrocarbon with an alkali metal and zinc balls in the presence of carbon dioxide and then, when a dark-colored mass has been obtained, adding a further quantity of butadiene hydrocarbon, and allowing polymerization to proceed, also in the presence of carbon dioxide. [Henry S. A. Holt, Ludwigshafen, Germany, assignor to Badische Anilin & Soda Fabrik, Ludwigshafen, Germany. United States patent No. 1,192,310.]

TIRE FILLER. A composition comprising raw rubber, 34 pounds; infusorial earth, 14 pounds; rosin oil, one pint; flour of sulphur, four pounds; air slaked lime, four ounces; carbonate of ammonia, two pounds; baking soda, one pound. [Edward L. Sherbondy, Los Angeles, California, assignor to Aero-Cushion Tire Co., San Jose, California. United States patent No. 1,193,196.]

CANADA.

RECOVERING RUBBER. A process for recovering rubber contained in rubbered fabrics, consisting in treating the fabrics with ethane tetrachloride, heating the fabrics during this treatment, filtering the resulting mass to remove the fabric, adding water to the filtrate and heating it to drive off the water and solvent. [La Compagnie Générale des Caoutchoucs de Térébenthine, Paris, France. Canadian patent No. 168,727.]

VULCANIZATION ACCELERATOR. Accelerating the vulcanization of natural or artificial caoutchouc or caoutchouc-like substances by vulcanizing them in the presence of paranitrosodimethylaniline or its homologues. [S. J. Peachey, Manchester, England. Canadian patent No. 168,806.]

PLASTIC CHLORINE DERIVATIVE OF CAOUTCHOUC. Same subject matter as British patent No. 1,894 (1915). (See below). [S. J. Peachey, Manchester, England. Canadian patent No. 168,807.]

THE UNITED KINGDOM.

PLASTIC MATERIALS. Caoutchouc is treated with chlorine to form a plastic or solid material resembling celluloid or leather. The caoutchouc is first dissolved in carbon tetrachloride, or other solvent which does not react with chlorine, and which is a solvent for the product to be obtained, hydrocarbons being excluded. This solution, after treatment with chlorine or with a gaseous mixture containing chlorine, is evaporated or distilled. During chlorination the solution is jacketed with circulating cold water. In an example, 50 grams caoutchouc in 1250 cc. carbon tetrachloride are allowed to absorb 100 grams of chlorine. Camphor, mineral fillers, or pigments may be added. [S. J. Peachey. British patent No. 1,894 (1915).]

CEMENT FOR APPLYING SHOES SOLES AND REPAIRING.—The cement is made by melting together 1 pound gutta percha, ½ pound caoutchouc, 2 ounces pitch or bitumen, 1 ounce shellac, and 2 ounces mineral oil. [R. M. Dobbie, Ayr. British patent No. 4,771 (1915).]

SWEDEN.

RUBBER SUBSTITUTE. Ordinary isoprene is polymerized by suitable substances at a temperature not above 374 degrees F. [Chemical Fabrik Co. Swedish patent No. 40,471.]

OTHER CHEMICAL PATENTS.

THE UNITED STATES.

- 1,191,390 Process for making condensation products from phenols and formaldehyde. Ludwig Berst, Amönburg-on-the-Rhine, Germany.
- 1,191,439 Process for preparing cellulose acetates. Joseph Koetschet and Alex. Theumann, Lyon, France, assignors to Société Chimique des Usines du Rhône, France.
- 1,191,801 Process of manufacturing plastic substances from derivatives of cellulose. Feodor Lehmann and Johannes Stocker, Berlin, Germany.
- 1,194,261 Resinous products and method of producing same. J. F. A. McCoy, Wilkesbarre, assignor to Westinghouse Electric & Manufacturing Co., East Pittsburgh—Allegheny in Pennsylvania.

New Machines and Appliances.

A MODERN GRINDER AND MIXER.

LARGER and better machines are now being designed and constructed by rubber machinery manufacturers to keep pace with the steadily increasing requirements of the rubber industry. The accompanying illustration shows a modern type of mill now being manufactured for the grinding and mixing of rubber and is particularly adapted to handling tire stocks. The bed-plate is heavy and substantial, having twelve foundation bolts with the necessary plates, and is provided with two solid pedestals that are lined with babbit metal and arranged for grease lubrication.

The housings and caps are made of semi-steel, of a rugged design for heavy duty, and the journal boxes which are also of heavy construction are provided with wide seats on the housings. Full bronze liners of special bearing bronze are fitted in the boxes, and arranged for direct water cooling circulation.

The rolls are not equal in diameter, one being 22 inches and the other 26 inches, while the length of both is 84 inches. They are made of chilled iron, the journals ground true, and bronze stuffing boxes with distributing pipes are furnished for controlling the temperature. The adjusting screws and nuts are of steel, easily removable at all times and provided with a locking device. Breaking cups for overloads are placed between the screws and boxes, and automatic cast-iron guides, compensating for the opening of the rolls, are mounted on the journal boxes. A bronze sight feed oiler and an accessible grease pocket are provided for each journal for the purpose of lubrication.

The shafting is of hammered steel turned true and smooth. Both drive gear and pinion have cut spur teeth, the gear being made of semi-steel in one piece; the steel pinion is made in halves with machined joint, and heavy holding bolts.

The connecting gears are of steel, and have cast spur teeth with staggered face. The connecting gears operate in a deep

sired. Many efforts have been made to remedy the trouble, which has always been an objection to the use of herringbone gears.

The use of any fixed end thrust causes too much constraint, and the lack of it allows the lateral motion due to the drift of the motor armature or any other external forces acting on the shaft to be transmitted directly to the pinion, with the disagreeable results before mentioned. Flexible couplings have been,

and are being, widely used with the idea of relieving the gears from these end thrusts and some form of connection between the motor and herringbone pinion was desired which would (1) transmit the necessary power; (2) leave the pinion free to align itself with the gear, and (3) leave the pinion unaffected by any end thrust, caused by lateral motion of the shaft.

Such a coupling has been recently designed, and is here shown, in connection with the well-known magnetic safety clutch which has been in use on calender rolls for some time.

The mechanical construction of the coupling is very simple, the principal object being to make the disks *D* strong enough to transmit the torque, and at the same time secure the utmost flexibility. It may easily be seen that the amount of torque transmitted is only dependent on the thickness of the disks, and the size of the bolts. The extensibility is only dependent on the flexibility of the disks, and is absolutely independent of the amount of torque transmitted, in that it is the same when no load is being transmitted as when the load is maximum.

In order to secure the utmost extensibility the disks are laminated, each disk consisting of several thin disks bolted together. The deflection of a thin circular plate under a given load varies inversely as the cube of the thickness. Three $\frac{1}{8}$ -inch disks will transmit the same torque as one $\frac{3}{8}$ -inch disk, but the three thin disks will deflect nine times as easily as the one thick disk. Practice has demonstrated the correctness of this theory, and in the case of a 32-inch coupling recently built, the force necessary to cause a deflection of a large part of an inch, was much less than the end sliding friction in the bearings.

While this coupling has only been applied to rubber calender work, where it has met instant approval, it is not limited to this field, and may be applied in any case where a truly extensible coupling is desired. [The Cutler-Hammer Clutch Co., Milwaukee, Wisconsin.]

EXTENSIBLE COUPLING FOR MILL DRIVES

All users of herringbone gears are familiar with the bad effect of end thrust, or any constraint which does not leave the gears perfectly free to align themselves. The resulting noise, vibration and wear are very objectionable, especially in the case of rubber calender rolls where a very smooth action is de-

PORTABLE MOTOR DRIVEN ALLIGATOR SHEARS.

Alligator shears are indispensable to the rubber scrap and reclaiming industries; moreover, the great variety of refractory material to be cut generally requires a heavily constructed and powerful shear. The illustration and description of the lighter portable type that follows are offered as a suggestion for doubt-

less so convenient a machine could be made useful in many rubber plants that do not reclaim rubber scrap. In fact it is now used in a large tire factory for cutting scrap tires to facilitate packing, prior to shipping to the reclaimer.

In the No. 1 machine the axles at both front and rear are so arranged that the tongue may be attached to either axle. Thus the machine is drawn to the scrap pile and when the cutting is over the tongue is attached to the rear axle and the shear drawn away. A special crank shaft and pitman permit a $7\frac{1}{2}$ inch opening at the widest point of the jaws.

This machine is made in both stationary and motor-driven types and requires only one man to operate it, making 50 cuts per minute with the expenditure of three horse-power. Thus it will be seen that considerable scrap can be cut in a day at very small cost. [The Canton Foundry & Machine Co., Canton, Ohio.]

NEW DRY COMPOUNDING MACHINE.

A new type of masticator for dry compounding has been recently designed as the result of experiments tending to prove the theoretical superiority of a masticating blade over the ordinary compounding roll. Sufficient power, the chief requisite, especially for the higher grade compounds, has been considered in the construction, resulting in a much larger and stronger built machine. Another factor that makes for an enclosed machine is the increasing use of various forms of lamp black and other light substances for compounding, which have a strong tendency to fly about and cause considerable dirt and annoyance.

The following advantages are claimed by the manufacturers.

AUTOMATIC. The proper time for breaking down various gums can be determined by experiment and also the proper sequence for adding the ingredients and the time required to incorporate them completely into the compound.

LABOR SAVING. Owing to the fact that personal attention is not necessary to each machine between the various loadings, it is estimated that one man of ordinary intelligence can handle four machines.

MORE UNIFORM COMPOUND. As the compounding of the material is automatic in the machine, which not only has a compressing action but a kneading and mixing action, the ingredients are

thoroughly and uniformly incorporated into the compound, eliminating the personal equation in manipulation, a most important cause for lack of uniformity in the compound.

BETTER TEMPERATURE CONTROL. The outer shell or trough is jacketed, and the blades made hollow, if desired, so that the effect of steam, cold water or even brine can be applied to a very large surface of the material.

FLYING DUST CONTROLLED. The inconvenience of flying dust, so troublesome in the lighter compounds, can be controlled to a large extent, as the active blades are inclosed in a chamber or trough.

The size of the machine is considerably larger than the ordinary type, but it is claimed that it takes up considerably less space than mills of corresponding capacity.

The working capacity of this machine is figured at approximately 10 cubic feet per charge against $5\frac{1}{2}$ cubic feet, the charge of the regular masticator.

The power required will, of course, vary with the compound. The machine is designed to carry 125 horse-power without overloading, although it is estimated that the average demand will be from 65 to 80 horse-power.

The time of masticating must naturally be determined by experiment for each compound, but in experiments held up to the present time it has varied from half an hour to an hour.

A small machine having a capacity of about one cubic foot, on which this company has been conducting experiments at their Saginaw factory, will be exhibited at the Second International Exposition of Chemical Industries to be held at the Grand Central Palace the week of September 25. [Werner & Pfleiderer Co., Saginaw, Michigan.]

THE FREEMAN IMPROVED BLOCK PLANER.

All manufacturers of rubber goods, using power cutting machines and wood cutting boards or die blocks, will find a planer or resurfacer a valuable and needed addition to their factory equipment.

The operation of the machine is simple. The board or block to be planed is clamped on a platen and fed automatically. The cutter head is covered with a guard, making it perfectly safe, and also acts

as a part of dust collector and can be connected with the dust collecting system if that is available; if not, almost all the chips are collected and dropped at the side of the machine into a receptacle placed there for that purpose. By using this machine, blocks can be kept in good condition, effecting a

saving in blocks and practically eliminating sprung or broken dies.

The machine is self contained, having its own counter shaft with friction pulley. It has a locking lever to start and stop, automatic feed in either direction and a knife grinding attachment.

It is built in the following sizes for the rubber trade: No. 0 will plane boards or blocks 4 feet long, 24 inches wide and 24 inches high, while Nos. 1 and 2 will plane boards or blocks 6

feet and 9½ feet long respectively, and 24 inches in width and height. A four-foot block can be planed in two minutes so that the labor is a small item. [The Louis G. Freeman Co., Cincinnati, Ohio.]

THE UTILITY AIR HOIST.

Progressive methods in modern rubber mills require progressive equipment to successfully carry out in practice the principles of progressive manufacture. Labor saving is the constant watch-

word of the executive, superintendent and department foreman, who know the value of time and energy-saving equipment.

Air hoists are not new, but the application of this efficient and economical power to various uses in rubber mills is of comparatively recent date. The hoist illustrated here is specially designed for removing covers and lifting tire molds in and out of the heaters. Solid tire and hose molds are handled quickly and safely with this device and in removing calender and mill rolls its adaptability is instantly apparent to all practical men. The hoist is shown suspended from a trolley and travels on a track constructed from I beams that are hung from the ceiling over the machines the hoist is intended to serve. Air is supplied from the main line and the operator controls the movement of the piston by a conveniently placed handle that operates the valve lever. [Utility Manufacturing Co., Cudahy, Wisconsin.]

MACHINERY PATENTS.

VULCANIZING TUBING OR HOSE IN FIVE HUNDRED FEET LENGTHS.

IN the manufacture of rubber tubing or jacketed hose the usual procedure consists in first forming the interior of rubber stock which is then semi-cured and the jacket braided or woven about the tube. The hose is then vulcanized by admitting steam to the interior without application of heat to the exterior which sometimes resulted in poor adhesion between the plies of fabric.

The method illustrated here apparently eliminates the disadvantages of the old process by subjecting both the interior and exterior of the hose to the same vulcanizing heat. In the drawing, which is a vertical section, *A* is the vulcanizer shell that is heated by steam pipes *B*. The pan *C*, supports the coils of hose *D*, the ends of which are connected to pipes *E* and *F*, through which the vulcanizing medium is introduced to the interior of the hose. This fluid medium is controlled by two valves and a gage *G* which registers the pressure within the hose. Dry air is admitted to the vulcanizer which is maintained at the required temperature by the steam coils. Thus the tubing or hose is cured in an even

manner, the interior and the exterior portions being subjected to the same vulcanizing temperature. [H. S. Blanchard, New York City, and F. Duesler, Cleveland, Ohio, assignors to the Mechanical Rubber Co., Cleveland, Ohio. United States patent No. 1,190,261.]

ROLLING BEADS ON NECKS OF TOY BALLOONS.

This machine is designed for forming beads on the ends of the tubular necks of toy balloons, with rapidity and without injury to the rubber stock. It consists of an annular plate or disk that revolves in a horizontal plane, supporting on its outer edge a plurality of forms over which the necks of the balloon are placed.

The drawing is a vertical section showing only one of these form carriers, the method of attaching to the revolving plate and the cone-shaped roller that forms the bead. The plate *A*, positively rotated by worm gearing, is supported by rollers *B*. The spools *C* are supported by a series of swinging arms *D*, pivoted to the under side of the plate *A*. The forms *E* support the balloons *F* and are rotated at the proper time by sprocket wheels *G* when brought in contact with the cone-shaped roller *H* that rolls up the bead on the neck of the balloons as they pass by. Means are provided for properly seating and holding down the forms on the carriers during the action of the bead roller which exerts an upward pressure on the balloon neck. [W. A. Brubaker and F. F. Brucker, Akron, Ohio. United States patent No. 1,192,383.]

GAMMETER'S VERTICAL PRESS VULCANIZER.

Hydraulic press vulcanizers of this type usually comprise a shell in which the tire molds are placed, a removable head with some sort of quick opening and tight closing device and a hydraulic ram or rams for raising or lowering the molds, and clamping them against the head.

Gammeter employs a single ram that simultaneously raises and lowers the molds and the head, against which the former are clamped by action of the ram while a specially designed packing ring effectively seals the joint between the shell and head.

The drawing on the left is a partly vertical section and side elevation of the press in position for charging and discharging. On the right is a similar view showing the head locked in position and the molds

being forced against the head by the ram during vulcanization.

The base *A* supports the hydraulic cylinder *B* in which reciprocates the ram *C* provided at its upper end with a platen *D*. The vulcanizing casing *E* is supported by a base ring that is attached to the upper flange of the ram cylinder, and *F* is a ring secured to the top of the casing, provided with alternating lugs and spaces, corresponding to those of the head *G*. Depending

from the head is a mold frame consisting of four bolts *H*, the upper ends of which are fixed to the head and the lower ends to a ring *I* that slides freely on the ram piston. A pair of racks *J* are arranged one between each pair of rods, the upper ends being bolted to the head and the lower to the ring. These have shoulders that engage the mold carrying trays *K* that are each provided with holes through which the bolts pass.

When the molds have been placed on the trays the ram is lowered and the head rotated by a segment rack and pinion which locks it in place, and at the same time disengaging the frame from the ram head which is then free. Pressure is admitted to the cylinder and the ram forces the nest of molds upwards against the head. A rubber packing ring mounted in the ring at the top of the shell automatically seals the joint when steam is admitted to the vulcanizer. [J. R. Gammeter, Akron, Ohio, assignor to The B. F. Goodrich Co., New York City, United States patent No. 1,191,296.]

GUM CHICLE CUTTING MACHINE.

When in the raw state gum chicle is in the form of irregularly shaped blocks which must be cut into small pieces prior to the washing process. Usually this work is done by hand,

with the ordinary hatchet as the only tool, and is therefore a laborious and expensive process. On account of the low melting point of the gum a machine of special construction has been designed and is here shown in side elevation in the plane of a line through the center of the machine.

A is the housing in which revolves the shaft *B* carrying the revolving cutter head to which are bolted the knives *C* and *D*. The block or blocks of chicle *E* are fed by gravity to the knives which chop off a piece of gum at each revolution. The size of the chips and the quantity produced depends on the speed at which the knives are rotated and the weight of the blocks. The contour of the central part of the housing and the revolving cutter head produces a blast of air that is effective in cooling the gum and preventing it from melting and clogging the machine. [B. W. Brown, Roselle Park, New Jersey, United States patent No. 1,190,372.]

GOLF BALL.

The principal idea disclosed in this invention is embodied in the construction of a golf ball with a liquid center in which a ball having a greater specific gravity than the liquid, is free to move about, with the object of aiding flight and insuring better control of the ball.

The golf ball comprises a container *A* made of double texture fabric and filled with liquid *B*. Rubber tape *C* is wound under high tension around the container *A*, and rubber threads are then wound around the tape windings as indicated at *D*. Finally, then, the cover *E* is applied, which may be of any wear resisting material such as gutta percha. The ball *F*, as previously stated, is of a specific gravity greater than the liquid, and is made of hard composition or hardened steel with a smooth surface to prevent puncturing the container. While there is only one inner ball shown, more than one can be used if desired. [W. R. Knight, Bellville, New Jersey, assignor to St. Mungo Manufacturing Co. of America, Newark, New Jersey, United States patent No. 1,192,831.]

INNER TUBE ROLLING TABLE.

This radical departure from the old time flat top rolling table presents several points of novel interest, particularly the pneumatic feature. The drawing is a cross section of the new table.

The strip of stock *E* is laid on

the table and the edges of the strip are moistened with rubber solution. The two operators place the mandrel *F* on the lower edge of the stock to which it adheres, and roll it up around the mandrel forming a tube. The mandrel and tube thereon is then rolled over the crown of the table and down to the rack *G* ready to be cured. [C. L. Witsaman, assignor to Firestone Tire & Rubber Co., Akron, Ohio, United States patent No. 1,194,803.]

SUBERS CORD COVERING MACHINE. A tubular flattened fabric band is made by inter-winding the individual strands previously impregnated with rubber on a mandrel at the same time that bands of unvulcanized rubber are interposed between the series. The fabric band is finally removed from the mandrel and flattened to form a band with selvage edges. [L. A. Subers, East Cleveland, Ohio, United States patent No. 1,192,017.]

CUSHION TIRE. Two rigid annular rings of sheet metal are placed on the inside of the rubber casing, one conforming to the inner circumference adjacent to the rim and the other to that of the tread. [T. L. Carbone, Charlottenburg, Germany, United States patent No. 1,192,036.]

TIRE BUILDING MACHINE. Four or more collapsible cores are carried by a revolvable frame that presents each core to different reels of frictioned fabric, so that while the inner fabric plies are laid on one core, the outer plies are laid on another, thus a plurality of casings are progressively constructed. [John T. Lister, Cleveland, Ohio, United States patent No. 1,190,432.]

A later patent relating to the same machine provides improvements in supporting and driving the cores and compressing rollers, also means for shaping the material to each core. [John T. Lister, Cleveland, Ohio, United States patent No. 1,190,433.]

MOLD AND PROCESS FOR SEMI-SOLID TIRES. The mold comprises separate annular side, top and bottom sections that are arranged to be clamped together. The annular body of rubber forming the tire is laid around the inner base that is built up of frictioned fabric forming an inner tube provided with an ordinary air valve. The tube is inflated, forcing the rubber against the walls of the mold, and the tire is then vulcanized. [M. A. Dees, assignor to American Tire Co., both of St. Louis, Missouri, United States Patent No. 1,192,994.]

TIRE CASING INSPECTING MACHINE. The finished casing is passed between rollers so shaped that the tread is bulged inward, whereby the tire material is stretched and any imperfections disclosed. [H. J. Hoyt, assignor to Morgan & Wright—both of Detroit, Michigan, United States patent No. 1,193,691.]

THE UNITED KINGDOM.

CORD FABRIC SPREADER. The weftless fabric consisting of parallel cords, is fed between liquid solution rollers and then under a spreading knife whence it passes through a dryer and is then spooled with a liner between the rubberized fabric. [E. Burdin, 71 Rue Ney, Lyons, France, British patent No. 2,568 (1915).]

VULCANIZING TIRE CASINGS. The inner circumferential edges of a finished casing are brought together and held by a strip of unvulcanized tape forming a tube. This is placed in a two-part mold provided with an inner expanding ring that holds the tire in place. Steam is admitted to the interior of the casing which is then cured in a press vulcanizer of the Doughty type. [F. A. Byrne, 2 Ludgate Hill, Birmingham, England. British patent No. 8,075 (1915).]

MAKING TENNIS BALLS. Inflated playing balls are made by first forming with beveled edges, hemispherical shells of semicured stock. The edges are cemented and the parts placed in two-part molds that are brought together in an atmosphere of compressed air, a portion of which is entrapped within the ball. The pressure of the surrounding atmosphere on the exterior of the balls being relieved, heat is applied to the molds and the balls are vulcanized. [R. H. Rosenfeld, Cleveland, Ohio, and F. T. Roberts, Trenton, New Jersey. British patent No. 8,756 (1915).]

COMPOSITE RUBBER SOLE. This invention consists of a sole with a tread portion of rubber or rubber composition and a shank or rear portion of a different material having greater strength and toughness than the rubber portion and also being less expensive. [Williams-Kneeland Co., South Braintree, Massachusetts. British patent No. 12,818 (1915).]

A COMBINATION SOLID AND PNEUMATIC TIRE. Two pneumatic tubes are embedded in annular openings that are molded within a solid tire near the central circumference, allowing sufficient rubber between the tubes and the tread. The tubes are inserted through narrow openings in the side of the tire and provided with suitable air valves, while the entire tire is enclosed in an outer cover. [R. Blakoe, 69 A. Queens Road, Bayswater, London, England. British patent No. 16,579 (1915).]

PROCESS PATENTS.

PROCESS OF MAKING HOSE. The inner tube or lining is made on a tubing machine and semi-cured, after which a fabric cover is woven on a circular loom and placed over the tube when it is in a collapsed condition. The tube is then inflated, and another cover put on by passing it through a tubing machine, and finally the hose is vulcanized in any suitable way. [A. T. Hopkins, Cleveland, Ohio, assignor to The Mechanical Rubber Co., Cleveland, Ohio. United States patent No. 1,190,292.]

PROCESS OF FORMING ARTICLES FROM PLASTIC MATERIALS. The materials are reduced to a powder and a light coating sifted upon the mold which is then heated to expel the gases and render the material plastic. Another thin coating is sifted upon the previous layer and the mold again heated. This operation is repeated until the required amount of material is in the mold, which is then closed and subjected to pressure, heat and finally cooled. [W. J. Burns, assignor to The Peerless Vulcanite Co.—both of Bridgeport, Connecticut. United States patent No. 1,190,510.]

MOLDING HOT WATER BOTTLES. The parts are semi-cured in a mold and then removed, stripped from the core and again assembled with a T-shaped binder strip of quick curing stock between the edges. The bottle is then placed in the mold, partly inflated and fully cured with heat and pressure, producing a seamless article. [N. D. Crawford, Elizabeth, New Jersey, assignor to The Mechanical Rubber Co., Cleveland, Ohio. United States patent No. 1,190,731.]

SOLID TIRES AND TREADS OF PNEUMATIC TIRES. These are made by laying unwoven fibers side by side, forming strips, one fiber thick, that are then impregnated and enveloped in rubber. These strips are superimposed, forming a block from which sections are stamped, built up and vulcanized in the form of a solid tire or shoe, with the ends of the fibers presented to the wearing surfaces. [J. W. H. Dew, London, England. United States patent No. 1,191,876.]

MAKING ELASTIC LEATHER. Soft leather is stretched, coated with rubber cement and united to a piece of elastic fabric under tension. After the cement has dried, the tension is released and the elastic fabric is stripped from the leather, leaving the dried film of rubber on the leather. This is again stretched, coated with cement and united to the elastic fabric a second time. After drying, the tension is released and the leather and double film are again stripped from the elastic fabric. These operations are repeated until the leather has sufficient elastic material in and on it for the intended purpose. [M. Scheuer, assignor to Carrie Scheuer—both of New York City. United States patent No. 1,192,691.]

PROCESS OF TREATING TEXTILE MATERIALS. The fibers are carded or combed into substantially parallel lines and subjected to a vacuum to expel the gases, at the same time the material is impregnated with rubber solution. In the manufacture of tires, hose and other products from this material the fibers may be laid radially, diagonally or in a combination of ways. [R. B. Price, New York City, assignor to Rubber Regenerating Co., Mishawaka, Indiana. United States patent No. 1,192,794.]

PROCESS PATENTS.

The Editor's Book Table.

FUNDAMENTALS OF A COST SYSTEM FOR MANUFACTURERS.
A System of Accounts for Retail Merchants. By Robert E. Belt and R. W. Gardiner, Federal Trade Commission, Washington, D. C. [Paper, 8vo, 32 and 19 pages, respectively.]

TWO small but comprehensive pamphlets have been published under the direction of Edward M. Hurley, Chairman of the Federal Trade Commission, Washington, for distribution to manufacturers and merchants throughout the United States. These books not only show the importance of a thorough system of costs for manufacturers and a complete system of accounting for retail merchants, but give the various details for installing these systems, with a thoroughness and simplicity which should enable anyone to install such a system in his business, whether it be large or small. Every item which enters into costs is explained, and methods are shown for securing the facts, and arranging the forms for recording them. These books, we understand, are distributed free, and can be obtained by addressing the Federal Trade Commission at Washington, D. C.

ACCEPTANCES: CIRCULARS, REGULATIONS AND INFORMAL Rulings of the Federal Reserve Board, including Opinions of Counsel. National City Bank of New York. [Paper, 32 pages.]

This little book gives an explanation of the use of acceptances by banks in the way of business; explains the manner of their use; shows forms and specimens of bills drawn in foreign countries or locally; gives circulars and regulations of the Federal Reserve Board on acceptances, together with legal rulings and explanations. The book is a concise and valuable guide for those who have dealings with the banks, and may well find place in the offices of many business establishments.

PERSONAL REMINISCENCES OF JAMES MAPES DODGE. BY Charles Piez. [Paper, 24 pages, with portrait.]

Mr. Piez was for many years intimately connected with the late Mr. Dodge, and his tribute to the memory of the latter is a graceful one, showing not only Mr. Dodge's broad grasp of mechanical and business problems, but telling of the various vicissitudes of the development of the Link-Belt Co., of which he was the executive as well as the engineering head. The booklet is an interesting one, has a fine portrait of Mr. Dodge, and has also several other interesting illustrations showing in detail some of the problems which he solved. It will undoubtedly be read with interest by all who had the honor of his acquaintance.

TARIFF SYSTEMS OF SOUTH AMERICAN COUNTRIES. BY Frank R. Rutter, Department of Commerce, Washington, D. C. [8vo, 308 pages. Price, 25 cents.]

This book was prepared primarily for the use of exporters and gives full information regarding South American tariffs and customs methods, describing, under each country, the system in force. Those who know how intricate are the tariffs, with the various surtaxes and the heavy fines imposed for non-compliance with details, will appreciate the exactness and thoroughness of detail of this report, written after personal investigation and years of study, by Dr. Rutter, who is assistant chief of the Bureau of Foreign and Domestic Commerce and was formerly chief of the Division of Foreign Tariffs of that bureau. This report also gives export duties, in which it is noted the export duties exacted on rubber, in Brazil, Bolivia and Peru.

PRACTICAL SAFETY METHODS AND DEVICES. BY GEORGE ALVIN COWEE. D. Van Nostrand Co., New York City. [8vo, 434 pages. Price \$3 net.]

It is claimed that industrial accidents cost this country 35,000 human lives and more than \$500,000,000 annually, and in addition to this, other serious injuries and minor accidents bring the number well up to 2,500,000 each year. It is to arouse interest in the prevention of such accidents and to explain how this can

be brought about, that this book is published. It gives descriptions of tried and proven methods and devices, rules for manufacturing establishments, and the general principles for securing a larger degree of safety for all classes of industrial workers. The book is divided into 37 chapters, and is illustrated by more than 125 pictures and diagrams of safety devices. It has chapters on welfare work and on first aid to the injured; a brief classification of occupational diseases; rules for fire drills and special chapters devoted to accidents from fires, boilers, engines, elevators, electric transmission, tools and various lines of machinery, and in construction work. In the preface it is stated that no attempt has been made to cover the subject in all its branches and that an exhaustive treatment is altogether impossible within the limits of a single book, but that the general principles suggested will be useful in special and exceptional applications not specifically described in its pages.

THE SEVENTEENTH YEAR BOOK AND ANNUAL REPORT OF THE Rubber Club of America, Inc., Prepared by the Secretary.

The year book of The Rubber Club of America, Inc., just issued, is an ambitious publication of nearly 100 pages, containing a large amount of information regarding the club, its membership, its constitution, and its various committees, with the report of President George B. Hodgman and that of Secretary Harry S. Vorhis. The reports of the directors' and committee meetings give details as to the doings of those bodies. The report of the sixteenth annual banquet gives the speeches in full and, last but not least important, are the membership lists of firm, associate and honorary members. On the last two pages are given the names of members who died during the past year. Fine half-tone double page pictures are shown of the sixteenth annual outing at Lowell, Massachusetts, and the sixteenth annual banquet at the Waldorf-Astoria, New York City.

NEW TRADE PUBLICATIONS.

THE Link-Belt Co., Chicago, Illinois, is sending out No. 275, giving the revised price list, effective July 15, of the many different lines of goods manufactured by this company. The pamphlet is essentially a business one, full of facts and figures, and is intended to supersede all previous catalogs and price lists of the company.

* * *

The Racine Rubber Co., Racine, Wisconsin, is sending out a very attractive little booklet entitled "The How and Why of Racine Tires," giving descriptions and pictures of the various processes in the making of these tires, from the securing of the rubber to the wrapping and shipping of the finished product. The various styles of treads are shown and figures for the tire user are given, showing the proper pressure of inflation in the different sectional sizes; the table of weights to be used with tires of different dimensions; some directions for repairing; adjustment of brakes and other instructions which are likely to insure good service from these tires. The center of the book contains a bird's-eye view of the factory printed in two colors, as are several of the other illustrations in the book.

* * *

The B. F. Goodrich Co., Akron, Ohio, is distributing a "Goodrich News Service" which is in the nature of posters or cards for use in the windows of the various agencies of this company. Two recent ones are, respectively, an outline map of the United States, over which are shown a large number of automobiles and motor trucks, and the other, a picture of a prairie schooner

as compared with an automobile with similar furnishings, one showing the first trip, and another the present trip, of a pioneer over the old Oregon trail. The pictures are interesting, and are likely to attract the attention of automobile users and others to the goods of this company.

The Hardware & Supply Co., Akron, Ohio, sends a very neat cloth-bound book giving a list, with prices, of the many tools which it makes for rubber workers. The book is well illustrated, showing in detail the many styles of tools made and in some cases explaining their use. There are several blank pages arranged for such additions as may be sent from the firm, or memoranda to be made by the holder of the catalog.

IMPROVEMENTS IN DEEP SEA DIVING.

In the July number, Spanish edition, of the Bulletin of the Pan American Union is an interesting article on deep sea diving. It states that companies are being organized to recover sunken ships and the valuable treasures which have gone down with them, by means of great improvements in deep sea diving resulting from experiments conducted under the auspices of the United States Navy. This article states that not until the elasticity and imperviousness to water of vulcanized rubber became known did the modern diving apparatus become possible. This apparatus is fully described, and is similar in details to what has already appeared in *THE INDIA RUBBER WORLD* (January, 1915, page 189). It is now stated that as a diver can descend to depths of 250 to 300 feet, it seems feasible to salvage ships and treasures that

have lain at the bottom of the sea for many years. Examples are given of many such which are within that distance of the surface, also a list of cargoes of gold, silver, bullion, securities and jewelry, all of which it might be possible to recover because of the improvements in diving apparatus which are due to the experiments under the direction of the United States Navy.

COMBINED TIRE RACK AND WINDOW CARD.

Tire manufacturers appreciate the value of window advertising and many novel cut-outs and cards are made for such display. The Pennsylvania Rubber Co., Jeannette, Pennsylvania, is sending to its agencies racks of heavy, warp-proof, 15-ply cardboard. Each rack contains a slot in which a tire can be inserted in such manner that each supports the other, thus eliminating brackets or easels. These racks are handsomely printed, each calling attention to the special type of tire exhibited, and, altogether, form a most attractive way of showing the tires to advantage.

Interesting Letters from Our Readers.

BUYING RUBBER DIRECT IN THE EAST.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR: The article in your July number entitled "A Protest From London," on the relative merits of shipping rubber direct from the East to America, and shipping via London, has been read with interest, and it certainly would be against the traditional English policy for the government to adopt any such policy as the "Financier" apparently desires them to adopt. The chief argument, however, which should influence the British public against the plan of shipping all the rubber via London is that this will diminish the profits of the British investor. A few of the investors indeed may profit by it, namely the London agents to whom the rubber would be consigned. These people are usually large shareholders, and in addition to their dividends they would get commissions. But what about all the other shareholders? Rubber will not become more valuable by having passed through the port of London. The value of one pound of rubber to an American manufacturer will be exactly the same, and all the extra cost of freight, handling, London commissions, etc., will have to be debited, directly or indirectly, to the producing company, and from all the conversations which I have had with planters in the East I am convinced that they are thoroughly alive to this fact. A country does not grow wealthy through opposing the ordinary economic laws.

It is also particularly interesting to note that it is the "Financier" which is saying that rubber should come by way of London, and that your contemporary, "The India Rubber Journal" of London, which is the principal trade paper there, takes quite the opposite view in its issue of July 15 under the heading of "Eastern Rubber Sales." The whole of this article is well worth reading, and the suggestion which they make is a good one, that the London firms who wish to continue handling this rubber should open branches in the Eastern ports. This would

be a good plan. They would earn the same commissions which they are earning now, and yet they would do useful work for their living, instead of simply duplicating other people's work in a useless manner.

Yours truly,
A BUYER IN EASTERN MARKETS.

FROM A WELL KNOWN EDITOR AND ESSAYIST.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR: Your leading editorial in the August issue, entitled "Preparedness—Looking Backward," and taking the unique form of an imaginative letter, will set many men, old as well as young in the trade, to thinking. There is ever a tendency to become so thoroughly engrossed with one's own problems of the day as to fail to give due thought to the morrow or to see things from other than one's own, often narrow viewpoint, and there is no better way for the prophetic thinker to enlighten those who look to him for inspiration than to picture as lucidly as may be a possible outcome of present conditions, their consequences and avoidance in years to come. In doing this so logically, you have sounded a much needed warning at a time when an object lesson is being enacted across the seas which emphasizes its significance most emphatically.

We have heard much recently about industrial preparedness in the abstract. For the most part it has been mere exhortation without concrete particulars, but you seem to have brought the entire rubber industry into true perspective in its relation to military expediency, to have appreciated its weaknesses and to have pointed out likely means of remedy. Rubber has come to occupy so important a place in the processes of war, as well as of peace, that there is great need of constructive suggestions such as yours emanating from an authority untrammelled by entangling alliances of the trade, and possessed of a broader

vision than that of many who are so closely confined to their own particular departments of it as to have lost their sense of proportion. You have penned a vivid picture of what might reasonably be expected to ensue should this country under present conditions find itself besieged as Germany now is. The facts are not overstated; every word rings true, while the graphic manner of portrayal you adopted, more certainly than commonplace direct statement, will attract the attention and stimulate the thought of those conservative men whose first line of defense in the face of proposed innovations invariably is that they "must be shown."

German industrial preparedness holds much to inspire admiration and to teach us many wholesome lessons, particularly in the field of chemistry. Not always have the fundamental ideas been of native origin; England and America have provided untold inspiration. Indeed, German scientists in many lines have borrowed generously from all available sources, but by the application of that phlegmatic perseverance and painstaking thoroughness characteristic of the race, they have almost without exception developed a state of higher efficiency. The light of scientific research has been turned upon even the commonplace of life, and under pressure of war necessity the resourcefulness with which almost every by-product has been utilized and the ingenuity with which many available, and in certain instances previously neglected, materials have been made to serve new purposes, is little short of marvelous.

Germany has developed her natural resources and economic opportunities to the very limit, and by intelligent conservation and clever scientific use has done the utmost with all imported commodities, yet she now finds herself greatly in need of a few vital things, notably such metals as copper and nickel and also crude rubber. This serious shortage of raw materials indicates indisputably the importance to every nation of becoming, or paying the way to become, virtually independent in anticipation of a state of war covering a period of years. For many small nations and because of geographical and attendant conditions this is physically impossible, but their hazard is correspondingly less. The United States, however, the richest and most envied in the family of nations, may well take heed lest at some future time jealous members of that family attempt to crush her. While it would be difficult and probably impossible for an enemy to maintain an effectual blockade of our entire seacoast, our imports could be seriously interrupted and a large percentage of cargoes seized or destroyed.

Preparedness constitutes the best insurance against war, and that infers industrial, quite as much as military, preparedness, for it is through the former that the latter is possible. We must place ourselves in a position to be independent of imports if necessary. We must look to our raw materials and develop a source and supply of each and every one of them within our borders, at least sufficient to meet military needs. With raw materials in ample quantity, the various processes of refinement and manufacture will practically take care of themselves. Our chemists, electricians, and machinists are as intelligent and ingenious as any in the world. Their weakness has been a natural reluctance to enter certain fields which had become highly developed abroad. Not until the outbreak of the present war in Europe did we realize fully our dependence upon Germany in several branches of chemistry, notably the many ramifications of the coal-tar industry. But in this particular instance we have the raw material, our chemists are grappling with the intricate niceties which had become so highly specialized along the Rhine, substantial progress is being made, and while it will take time, the day will come when we shall be able to manufacture any and all coal-tar derivatives if necessary.

Our country is so vast in extent, so varied in soil and climate, so rich in natural resources, especially minerals and metals, that preparedness is not so much a problem as a matter of application, a matter of setting to work with the knowledge we have

and accomplishing the desired end. A bountiful Providence has blessed us with most of the essentials of peaceful life and of defense. Most of the few we lack, among which crude rubber stands first, are of an agricultural character and, thanks to the variety of our soil and climate, may be grown at home. Steps ought to be taken to supply these materials at once; it is our patriotic duty, and in times of peace as in times of war untold fortunes await the successful pioneers. Intensive methods should be resorted to if necessary. They have been applied to the production of table delicacies that we may have fruits and vegetables out of season and in unfavorable latitudes, also that staple crops may be grown on arid lands, so why not deal similarly with these great problems of exigency?

When you suggest the possibilities of the *Pieradenia*, the *Ekanda* root and rubber producers of the guayule and grass rubber sort, you point out the foundation of a great American industry of the future. Here is constructive work of superlative importance for our botanists and rubber experts, offering a financial reward in proportion to the task. In the manufacturing end of the rubber industry America takes first place, and what we need to make it secure should war ever become inevitable, is an increasingly productive source of crude rubber grown at home. The project is feasible, laudable and should and would receive the hearty support of the trade.

Let me suggest that marked copies of this editorial be sent to the leading agricultural periodicals in the hope that the editors will reprint it and thereby give their more enterprising readers a valuable suggestion for investigation and experiment. Both the feasibility and the opportunity to grow rubber producing plants in the United States deserves the widest publicity.

Very truly yours,

PHIL. M. RILEY.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless, they are of interest, not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[204.] A correspondent has inquired for the address of manufacturers of the "Jolly Spiral Balance" and "Nicholson Hydrometer."

[205.] Inquiry has been received for builders of machines for turning and crimping the edge of rubber bathing caps.

[206.] The name of a manufacturer of machinery for making balata packing is requested.

[207.] We have been asked for information concerning the makers of a motor-driven mold cleaning device.

[208.] The name of a manufacturer of carbon bisulphide is requested.

[209.] Information is sought regarding the process of making a rubber cement which will retain its elasticity after application.

[210.] We are requested to supply the names of manufacturers of inner tube mandrels.

[211.] A correspondent desires names of manufacturers of a Black Kraft or black pattern wrapping paper suitable for use as wrapping for automobile tires.

[212.] Inquiry has been received for names of manufacturers of machinery for making rubber tiling.

[213.] We are asked who can supply tools for tapping *Castilloa* rubber trees.

[214.] Names of manufacturers of transparent nipples are requested.

[215.] An exporter of automobile tires and automobile outfits has requested names of manufacturers of these articles.

[216.] Names and addresses of rubber tire machinery manufacturers have been requested.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A firm in France wishes to be placed in communication with American manufacturers of washing machines and wringers with rubber rollers. Report No. 21,933.

Agencies are desired for Chile and Argentina from American manufacturers of rubber goods. Report No. 21,941.

Commercial relations are desired in Denmark with American manufacturers of rubber tires. Report No. 21,953.

A physical culture instructor in Brazil wishes to receive catalogs, price lists, etc., of footballs and other athletic and sporting goods. Report No. 22,090.

A manufacturer in Spain is desirous of importing tires for bicycles. Report No. 22,092.

A newspaper in the Far East with stationery and job printing departments desires to obtain connections in the United States with dealers in rubber stamps. Report No. 22,131.

A dealer in France desires to purchase gold nibs and barrels with necessary parts for the manufacture of fountain pens. Report No. 22,139.

A firm in Spain is in the market for rubber erasers. Report No. 22,150.

A firm in the United States wishes to secure for transmittal to correspondents in Japan, quotations and literature covering cotton and silk elastic for garters and braces. Report No. 22,158.

Additional agencies are sought in Argentina for the sale of rubber heels and soles and other American products. Report No. 22,173.

A firm in the Netherlands desires to get in touch with American manufacturers and exporters of rubber nipples and tubes for nursing bottles. Report No. 22,190.

A Norwegian import firm wishes to communicate with American manufacturers of automobile tires and accessories. Report No. 22,195.

JUDICIAL DECISIONS.

BUFFALO SPECIALTY CO. V. VAN CLEEVE. In an action for the wrongful use of the plaintiff's trade-mark name "Never-leak," in connection with the manufacture and sale of "tire fluids," it appeared that the plaintiff manufactured the tire fluid according to a secret formula. Another party obtained a patent for a vehicle tire, which consisted of a combination of a pneumatic tire and a free-flowing sealing agent within the air chamber. The plaintiff purchased this patent, and thereafter used, in connection with its tire fluid, a label on which appeared a circle presenting a pneumatic tire within which were the words: "Patented U. S. A. Foundation patent No. 578,551." Below the circle were statements that this was the foundation patent, and covered the use of any liquid, semi-liquid, paste, powder, or compound, capable of being converted into or used in connection with any liquid in any pneumatic tire for closing punctures; that the plaintiff's tire fluid was manufactured and sold under and by the owner of such patent, and that persons making, selling, or using any other such fluid were infringers. The Circuit Court of Appeals held that the plaintiff was justified in laying the patent to avoid infringing it, and the label in question was not such an abuse of its patent rights as deprived it of its pre-existing property right in its trade-name. If, as the court assumed, the patented tire had no generic name, and all pneumatic tires, whether containing a free flowing sealing agent or not, were made and sold under the marks and names of their manufacturers, the expiration of the patent could not authorize the public to use the trade-name of the unpatented element, under the rule that the expiration of the patent authorizes the use of the name of the patented article, where it has become a generic name.

All that could be said from the face of the label was that the

plaintiff needlessly gave true information of the fact that prior to March 9, 1914, the patent was in force, and inferentially that it had been owned by the plaintiff and used in some way not disclosed by the label. This, it was held, did not deprive the plaintiff of its right to equitable relief against piracy of its trade-name and unfair competition. [The Federal Reporter, Vol. 227—page 391.]

PERLMAN V. STANDARD WELDING CO. The Perlman patent No. 1,052,270 for a wheel for automobiles, the special feature of which is a demountable rim. Held not anticipated, valid, and infringed. [The Federal Reporter, Vol. 231—page 734.]

This case was reported at length in the May 1916 issue of THE INDIA RUBBER WORLD.

MACDONNELL V. VORHIES RUBBER MANUFACTURING CO. The Federal District Court D. New Jersey, holds that the MacDonnell patent, No. 981,208, for an improvement in pneumatic tires, which consists in rendering the inner tube self-healing in case of puncture, by means of a wrapping or stay strip of canvas, which is incapable of stretching transversely, but capable of stretching in a direction longitudinally of the tire, was not anticipated, and discloses invention; and also that it was infringed by the tubes made in accordance with Brown's application for patent, serial No. 704,637. [The Federal Reporter, Vol. 227—page 898.]

SPALDING V. GAMAGE. The case in which A. G. Spalding & Bros., the well-known American sporting goods concern, claimed damages against A. W. Gamage, Limited, the large London sporting goods firm, in respect to passing off condemned footballs which had been sold by the plaintiffs as waste rubber, as "Spalding's Improved Sewn Orb Balls," which was reported in the May 1915 issue of THE INDIA RUBBER WORLD, came recently before one of the official referees of the High Courts of Justice, in London, for assessment of damages.

After hearing evidence which lasted many days, the official referee made his report to the judge, who found on the whole of the evidence that the plaintiffs were injured by the acts of the defendants, and that they were entitled to recover the sum of £2,000 [\$9,733] for injury to their reputation.

LOVELL-MCCONNELL MANUFACTURING CO. V. ORIENTAL RUBBER SUPPLY CO. This suit was brought under the patent laws of the United States for infringement of the United States letters patent No. 1,120,057, for a diaphragm horn for automobiles.

The United States Circuit Court of Appeals, Second Circuit, held that the taking of two steps in changing a prior device, both obvious and not involving invention, and unpatentable when taken separately, does not involve invention and become patentable when taken in unison. A combination of old elements, to be patentable, must produce a new result or effect in the combined forces or processes from that given by their separate parts.

Patent No. 1,120,057 was therefore void for lack of invention, in view of the prior art.

Though a rubber company was involved in this case, the disputed patent contained no rubber. [The Federal Reporter, Vol. 231—page 391.]

MICHELIN TIRE CO. V. ROBBINS AND OTHERS. This case was an appeal by the defendant party from a judgment for plaintiff. Judgment as against the defendant was reversed, and complaint dismissed as to him, the court of appeal holding that where a tire company knew that a garage business was transferred to new proprietors, and accepted them as the persons with whom it would fulfill its contract, intending to release the old proprietor from further performance of the contract, and accept the new in his place as parties, there was a "novation." [New York Supplement, Vol. 159—page 256.]

[*Novation (in law), the substitution of a new obligation for an old one, in this case the substitution of a new contracting party for Robbins, the original one.*]

New Goods and Specialties.

THE NEW NAUGAHYDE RAZOR STROP.

NOVELTIES in rubber designed to supplement, if not replace leather, are constantly developing these days when the price of leather is high and still advancing.

The difficulty of making a complete replacement of leather is a handicap seldom overcome, but in the case of the Naugahyde Razor Strop, developed during the past year, this problem seems to have been successfully met.

It has been developed and tested by the latest scientific methods, with most excellent results.

Its composition is such it will put a keen edge on the finest quality of razor with very limited stropping, only a few strokes being necessary to obtain the desired edge.

The abrasive material in the strop is so combined that it sharpens the razor quickly, and at the same time prevents the edge from wearing down and becoming round. It is seldom necessary to hone a razor sharpened on this strop.

The strops are made in two styles and sizes, with either nickel or gun metal swivels. They may be had in double strops with the sharpening and finish sides separated, or in single strops with the two sides combined. [Goodyear's Metallic Rubber Shoe Co., Nangatuck, Connecticut.]

RINGMETER GARDEN HOSE.

The continuous-length hose shown in the accompanying illustration is self-measuring, owing to the flat rings of rubber which are placed upon it exactly one foot apart. This is a great convenience, as it is only necessary to count one foot for every ring as the hose is unwound. This hose is of the molded type and consists of a seamless tube covered with plies of braided

fabric and a durable, corrugated cover. It is made in three sizes— $\frac{1}{2}$ -inch, $\frac{3}{4}$ -inch and $\frac{1}{2}$ -inch. [Quaker City Rubber Co., Philadelphia, Pennsylvania.]

VULCULOSE SANITARY RUBBER TOILET SEAT.

The advantages of a one-piece toilet seat over the old style wooden seat are self-evident. Disease germs can find no lodging place; there are no seams or joints to open up, and it will not warp, crack nor split.

The varnish on wooden seats is soon eaten off by acids used for cleaning, as well as by uric acid, but this rubber seat has an ebony-black finish, polished surface which will not wear off nor sustain injury through the use of sulphuric acid, carbolic acid or any cleanser or disinfectant. The fittings are nickel-plate throughout, and claimed to be unbreakable under any ordinary use. The three soft rubber bumpers are of peculiar design, and are placed at

three bearing points. They are vulcanized into the hard rubber seat, and therefore cannot become loose. [The Vulcalose Co., Chicago, Illinois.]

"UNIKA" FINGER COT.

These rubber finger cots are designed as convenient and useful aids in the work of mail and office clerks, cashiers and bank

tellers, their non-slipping qualities being of decided advantage in sorting mail, counting money and in general office work. They are also in demand by fruit packers. They are intended to be worn on the thumb, as well as on the forefinger, and are supplied in assorted sizes. A feature

of value is the arrangement of round openings for ventilation, making long continued wear of these protective coverings possible with a greater degree of comfort than unventilated ones. [United States Rubber Co., New York City.]

CHIN MASK AND FROWN BAND.

The purpose of rubber chin masks is well known: When worn during the hours of sleep, they hold the relaxed muscles in place and prevent the sagging which forms the unsightly

double chin. A special advantage of the mask here illustrated lies in the fact that it extends further up on the face than is customary, covering the upper lip and acting as a remover of the nose-to-mouth lines. It also extends down lower than some other chin masks, tending to whiten the skin of the throat and remove the discolorations caused by high collars. This mask is fastened by means of tapes, which can be adjusted, if closer tension is desired, by slipping the hook and eye down on the tapes, thus shortening the lower tapes.

A rubber frown band is also shown, the use of which prevents the frown and lines in the forehead. [Miss Lillian Bender, Stockton, California.]

THE "NEW PARAMOUNT" TENNIS BALL.

The "Paramount" tennis ball, although successfully marketed for some time, has been the subject of continued experimentation to still further improve its resiliency. The results are claimed to be a greatly added resiliency, with no impairment of the many other sterling qualities of the ball. Tennis balls are ordinarily made in four sections and inflated with a hollow needle that penetrates a self-closing rubber plug inside the ball, but the "New Paramount" through its special patented construction, is made in two pieces, without a plug, thereby insuring a more perfect bounding article. [A. J. Reach Co., Philadelphia, Pennsylvania.]

WATERPROOF FABRIC AND GARMENTS.

A new waterproof fabric has been perfected for the manufacture of women's coats, which is radically different from any previously placed upon the market. It is named "Silvareign,"

because of its shimmer of silver or gold, and is made in a number of beautiful tints. It combines the lightest weight of silk with rubber, and is made up in a number of attractive lines of garments having that style which commends them for sport and motor coats for fair weather wear, sunlight imparting to them a strikingly beautiful iridescence, while their water-resisting quality makes them ideal for rainy weather. The fabric was invented, its manufacturing problems solved and the lines of garment designed by the manufacturer, who has patented the material and trademarked the name, and who will enter upon a national advertising campaign early this fall. [E. Kenyon Co., Brooklyn, New York.]

BOWLING MAT AND FOOT-GRIP.

Bowling on the green is more general in England than here, although evidence that it once was popular in this country is shown by the name of an open square in the southern part of New York City called "Bowling Green." To protect the lawns from excessive wear during this game a rubber mat with a corrugated surface, such as is shown here-with, is used for the players to stand upon. The standard size for this mat is 22 by 14 inches, but other sizes are furnished as desired.

The side view of a rubber overshoe also used for bowling and for curling shows the high back section and the toe cap which hold the rubber sole on the foot. The back section is overlaid with an extra thickness of tough rubber so molded as to grasp and hold firmly to the shoe. The sole is made perfectly flat, in order not to damage the surface of bowling greens, and it provides a non-slipping foothold on the keenest green or ice. This style of rubber overshoe would also prove convenient and useful in any other game played on lawns, or as a substitute for tennis shoes or "sneakers" in an indoor bowling alley. [The Waverley Rubber Co., Limited, Edinburgh, Scotland.]

"IMPERIAL" RUBBER SHEETING.

There is an ever increasing demand for high quality rubber sheeting, and it is claimed that in the "Imperial" sheeting an article has been evolved, by laboratory experimentation covering two years, which combines all the essentials for a sheeting that will withstand without injury the most severe tests of sterilization, resistance to steam under pressure, dry heat, boiling water,

acid, alkali and saline solutions, chloroform, ether, lysol, urine oxidation and gasoline. Moreover, the manufacturers of the "Imperial" line claim to have discovered a secret process which prevents maroon, black or tan colored sheeting from fading [Rosenwald & Weil, Chicago, Illinois.]

JONES "NEVER-LOOSEN" RUBBER HEELS.

In the rubber heel here illustrated a specially prepared strip of leather is vulcanized to the outer edge of the rubber heel when made, forming a leather rand which can be nailed close to the

edge on any shoe heel, even one with composition or fiber lifts. There are no washers in this heel the leather rand acting as a substitute, holding the nails as does the "lift" of a leather heel. This not only obviates the labor of cementing the edges of the rubber heel to the shoe but prevents the loosening and spreading to which cemented rubber heels are claimed to be liable. A chamber or air space gives a pneumatic cushion, adding to its resiliency. These heels are closely trimmed, fitted to any shape heel, and can be applied correctly by even the

most inexperienced workman. [Jones "Never-Loosen" Rubber Heel Co., New York City.]

HYDROMETER MADE OF RUBBER.

Testers of non-freezing solutions, used for cooling gasoline engines, are usually made of glass, and are easily broken. An unusually durable device for this purpose consists of a specially made rubber ball attached to a tag bearing the necessary directions for using it as a tester. To secure correct proportions, these balls are constructed in halves, each half being tested individually as to its specific gravity and then assembled with another half of such gravity that the two together have the same specific gravity as the correct anti-freeze solution for which the ball is to be used. Different balls are made for solutions of as many different sorts and they indicate, by floating or sinking, whether the solutions are too weak or too strong. This tester, or hydrometer, can be used to test the solution directly in the radiator by dropping the ball through the filling cap, or by drawing the mixture into a receptacle and dropping the ball in it. If it floats, more alcohol and glycerine should be added to the mixture, while if it sinks there is perfect safety. When heated, the rubber ball expands at practically the same rate as the solution being tested, making it unnecessary to correct for any temperature differences other than allowing the ball to remain in the solution about one minute before observing whether it floats or sinks. [The Liquid Tester Co., Lancaster, Ohio.]

A SINGLE TEXTURE RAINCOAT FABRIC.

Scintella is a dress goods fabric that has recently claimed attention in the rubber clothing trade as an excellent material for single texture raincoats for women. It is made of imported artificial silk and worsted and, as its name indicates, it scintillates a silken, silvery glow over a surface of a darker tone or color. Being of light weight, yet having sufficient body, it

lends itself readily to straight effects or to the soft folds and fulness now popular in the newest styles. Supple and pliable, with enough resistance to prevent wrinkles, it makes a desirable material for week-end garments, as it packs snugly without crushing. It can be obtained in a variety of colors, though the black and white combination is most popular for single texture women's raincoats, auto coats, travel coats and golf capes. [B. Priestly & Co., New York City.]

THE "ALL-TOGETHER POUCH"

A new idea in rubber-lined tobacco pouches admits of carrying the pipe in the same receptacle. It is more convenient than using two cases and keeps the pipe cleaner than if carried loose in the pocket. Separate compartments contain the tobacco and pipe and the whole is claimed to be no less compact and easy to handle than the ordinary tobacco pouch. The "All-Together Pouch" is made of doeskin and lined with high grade rubber of English manufacture. [M M Importing Co., New York City.]

AMPHIBIAN SANDALS.

A British manufacturer of tennis, gymnasium and other sporting shoes has put on the market a sandal intended for children which he calls the "Amphibian." It has an open upper, being fastened over the instep by straps, as shown in the illustration. Its distinctive feature lies in its rubber sole, which makes it a comfortable and springy shoe under all circumstances and enables the wearer to walk over wet grass or moist beaches and still keep dry-shod. [The Victoria Rubber Co., Limited, Edinburgh, Scotland.]

"F. & S. COLONEL" GOLF BALL.

In the eyes of every player a golf ball that is long on the tee, but slow on the putting green; that flies fast and far from the drive, but stops dead on the pitch, would be the acme of perfection as an aid to high scoring. The "F. & S. Colonel" ball, evolved after several years' experimentation, is credited with these exceptional qualities. It is claimed that the movable center in the ball adds accuracy to its flight when driven from the tee; and on the approach, when given a back-spin, this center revolving against the momentum of the ball, causes it to drop dead, and in putting makes it as slow as a gutta percha ball. The recent patent covering its construction is described elsewhere in this issue. [St. Mungo Manufacturing Co. of America, Newark, New Jersey.]

TOY BALLOON VALVES.

THE manufacture of toy balloons is a highly specialized branch of the rubber business, requiring technical knowledge and special equipment, the successful development of which is due almost wholly to practical experience. There are innumerable types of these attractive toys made in variegated colors and all sorts of shapes, including effigies of various animals, imitations of footballs, watermelons and dirigibles. They are not all equipped with self-closing valves, which feature is a decided advantage as it permits inflation and deflation at will.

The original type of air valve was a simple disk of wood,

around which the balloon neck was stretched. A round piece of thin sheet rubber was attached at one point to the inner part of the disk, covering the hole through which the balloon is inflated and acting as an air retaining valve.

These valves have been almost entirely superseded by the types shown in the illustration, that are interesting developments of the idea to make a cheap and satisfactory valve.

In the upper row are shown in side elevation three rubber types. Those on the right and left are molded, the one on the right being reinforced by a metal ring that is vulcanized in the lower part of the valve body. In both cases the air hole does not extend entirely through the body, sufficient stock being retained at the upper end which is afterwards slit, forming a flap that lifts when the balloon is inflated and closes by pressure from the enclosed air. A pin or match is inserted in the hole in the valve body and the valve raised, when it is desired to deflate the balloon.

A novel departure from the usual procedure is shown in the upper center view in which a small section of rubber tubing is employed as a closing auxiliary. This is slipped over the neck of the balloon which is then stretched over a round wooden

disk, provided with a hole in the center. When the balloon is inflated by the simple process of applying the lips to the wooden disk and blowing, the air is retained by giving the balloon a few turns to the right or left which closes the neck within the tube section. The air pressure against the end of the rubber tube prevents the neck from untwisting and the air is retained within the balloon. A few turns in the opposite direction will untwist the neck and the air then escapes.

In the lower row, inside views of the metal valves now in use are shown. These are stamped out of sheet tin and are all very similar in shape, size and design although there are some characteristics peculiar to each one which are of sufficient interest to describe in detail.

The one on the extreme left has a larger air opening than the others and the sides of the disk are straight, and formed with a projecting ear. This is bent down against the round disk of rubber sheet, holding a small section of it against the metal disk while the remaining portion of the rubber disk is free to act as an air valve.

The next valve is provided with an air opening of about $\frac{3}{8}$ inch and the edges are beaded, forming a groove to retain the neck of the balloon. A piece of spring wire is given the peculiar form necessary to retain its position within the metal body and at the same time hold the rubber disk in place.

The third valve shows about the same construction as the previous ones, with the exception, however, that instead of a spring retainer a cover is provided and the rubber disk allowed to move freely within the valve body.

The metal valve on the extreme right retains the same size, shape and general construction of its predecessors but discards all previous methods of holding the thin rubber disk in place. This disk is made very similar to an ordinary pump valve and is held in place by an annular groove on the inside of the valve body.

It is estimated that there are 20,000,000 toy balloon valves made in the United States each year.

THE DOUBLE SERVICE NON-INFLATABLE TUBE.

A substitute for air in pneumatic tires which will retain all the resiliency displacement and easy riding qualities of compressed air is offered by the makers of the "airless" tube.

This is made in an arch shape similar to a tire design and fits the inside of the tire perfectly—being inserted exactly like an ordinary tube. It is built of specially compounded springy rubber and fabric of a thickness that will retain the weight of a car and its load and permits of deflation or displacement whenever an object is struck or passed over. Its action is therefore the same as the ordinary pneumatic tire when in use. This tube requires no inflation, and as it only contains ordinary atmospheric pressure of 18 degrees, there cannot be punctures or blow-outs.

The illustration shows the tube action when passing over an

object. There is a displacement of air and rubber exactly the same as a pneumatic tire which prevents vibration or bouncing and results in easy riding qualities. [The Double Service Tire & Rubber Co., Akron, Ohio.]

THE KAHN VALVE.

This new departure in tire valves combines a pressure gage and valve that in outward appearance is similar in size and shape to the ordinary inner tube valve. A novel feature is, that it can be set to the desired pressure and when that point is reached the unnecessary air is diverted through an outside port producing a whistling noise that serves as a warning. Referring to the illustration, the collar *C* is turned until a projection slips into one of the five slots marked 50, 60, 70, 80 and 90 pounds. The air is then turned on and when the point at which the valve has been set is reached, a check valve closes, due to the opening of the blow-off valve *E*, thus relieving the air pressure from the outside and allowing the pressure in the tire to close the inner check valve. All air now coming from the pump passes outside through the port *G*, with a whistling sound.

It is impossible to put more air into the tire than the pressure to which the valve has been set, as the area of the port *G* is greater than that of the inlet valve. The reason air does not escape through these ports before the desired pressure is reached is due to the pressure of a spring that acts on the blow-off valve and closes the ports until the pressure becomes greater than that of the spring.

Should it be desired to verify the tire pressure, the collar *C* is set at 80 and the top of the valve is pressed down. If the valve does not whistle it indicates that there is less than 80 pounds pressure. With the collar *C* set back to 70 pounds and the operation repeated, if the valve whistles it will indicate that the pressure is over 70 pounds. If it does not whistle at 70 the collar *C* is set back to 60 pounds and the operation repeated until the pressure in the tire is indicated. [Armstrong Rubber Co., New York City.]

A DEPENDABLE AIR BAG.

The tire repair air bag is a very useful accessory that usually receives scant attention until the time comes for the accomplishment of its important part in repair operations. Then it

is resurrected from underneath the bench in a more or less neglected condition and expected to faithfully fulfil

its duty. All air bags should be well made and well taken care of, that good service and reliable repairs shall be the result. The illustration shows one that is specially constructed in a manner to fulfil the peculiar duties of an air bag.

According to the maker, the lining and frictioned fabric are made with a special non-blooming rubber compound that will withstand several hundred vulcanizations without losing its usefulness. Strength has been considered by using sufficient plies of the best cotton duck in the body and the entire bag is constructed with the idea that first cost is considered subordinate to satisfactory service. [The American Rubber & Tire Co., Akron, Ohio.]

HOOD AND PURITAN TIRES.

The "Hood" and "Puritan" tires are claiming serious attention from motorists who are interested in obtaining results in mileage and freedom from tire troubles. The claim of the makers is that they are manufactured primarily to excel in quality and length of service, as a marked distinction from cheap and unguaranteed tires.

Among the points of superiority claimed for "Hood" tires may be mentioned that they are made with an extra ply of fabric, having on the small sizes one more, and on the larger, two more plies than the standard priced tire; the best quality of Egyptian fabric is used, every roll being tested before it is frictioned; the rubber is carefully selected from first quality Plantation and Para, and claimed to be compounded only with sulphur; the beads are locked in, and constructed to prevent rim cutting, while the cushion and breaker strips are made unusually wide, giving the tire extra strength.

ARROW TREAD.

The depressed type tread is extra wide, and made of tough stock, and the arrow-shaped non-skid depressions have very sharp edges that hold the road by suction.

The unusually long mileage obtained from these tires makes the cost per mile of the tire very low, although the first cost is higher than that of the standard tire because of the extra construction. This may be seen from the fact that, during 1915, the loss on the tires which came back to the factory for adjustment, on the basis of 5,000 miles, was less than one-half of one per cent.

They are made for every size and style of rim, in clincher, quick detachable and straight side types. [Hood Rubber Co., Watertown, Massachusetts.]

GRIPPER NON-SKID TREAD.

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

News of the American Rubber Trade.

SEAMLESS RUBBER CO. SALESMEN CONVENE.

THE selling force of the Seamless Rubber Co., New Haven, Connecticut, recently held a convention in that city which, for enthusiasm and real business planning was most successful. The meetings lasted several days and were presided over by President James A. Murray, who informed the salesmen of the policy of broadening the field of operations by extended advertising in the national magazines and urged their co-operation. Each day was devoted to some special subject, the first being the plans for an aggressive campaign, the second for the discussion of methods of improving sales, a sample of every article made by the company being mounted on large screen frames for the salesmen's inspection, while sales arguments were formulated and discussed. One day was devoted to a demonstration and lecture on window trimming by Charles C. Stewart, of the Lee Advertising Service of New Haven, a temporary show window having been erected in which to illustrate the points of the lecture. The advertising campaign was explained by Frank L. Little, of the George Batten Advertising Agency of New York City. Various points regarding the coordination of the advertising and selling plans were given. The salesmen made their headquarters at the Hotel Taft, and the convention was fittingly rounded out by a banquet on the final evening.

WASTE MATERIAL DEALERS MEET.

A regular meeting of the National Association of Waste Material Dealers will be held September 19 and 20 at the Bellevue-Stratford hotel, Philadelphia, Pennsylvania. Besides the regular business of the association, it is expected that a considerable amount of time will be devoted to recreation, including automobile trips to places of interest in Philadelphia, excursions to Atlantic City, and a cabaret dinner. The committee having charge of the arrangements are Messrs. Murphy, Weil, White and McGarrity.

NEW CORPORATION WITH INCREASED CAPITAL.

The Vulcanized Rubber Co., Morrisville, Pennsylvania, which was incorporated under the laws of New Jersey in 1901, has sold and transferred all its property, assets, etc., to a new company bearing the same name, incorporated June 20, 1916, under the laws of Maine with a capital stock of \$1,500,000 (\$500,000—8 per cent cumulative preferred and \$1,000,000 common) and a meeting of the stockholders has been called to dissolve the former company. The stockholders are to receive one share of preferred stock and one share of common stock in the new company for each share held in the older company.

THE S. & W. RUBBER MANUFACTURING CO., INC.

The S. & W. Rubber Manufacturing Co., Inc. (See list of incorporations in this issue) is erecting a modern brick factory at Nineteenth street and Sixth avenue, College Point, New York. The officers are: Arthur C. Squires, president; George Jench, secretary; John E. Wainwright, treasurer. Inner tubes, dental rubber, dental dam, toilet and bath sponges, bathing caps, rubber heels and other molded goods will be made. An experimental laboratory completely equipped with miniature rubber machinery will be installed for the purpose of instructing and demonstrating the art of manufacturing all kinds of rubber goods. Experimental work will be done and inventors of rubber articles assisted in perfecting their ideas. This department will be under the personal direction of Arthur C. Squires, who is amply qualified for the position by long and varied experience.

WILSON RUBBER CO. PROMISES WELL.

The Wilson Rubber Co., Canton, Ohio, notice of whose incorporation appears elsewhere in this issue, has leased the plant formerly occupied by the Canton Rubber Co. and will make a specialty at the outset of electricians' and household gloves, and transparent nipples and pacifiers. It is stated that Fred Wilson, general manager of the new company, has secured from a man prominent in the rubber business in Germany a process for making a perfectly clear and transparent rubber, which will be used in future products of the company. Mr. Wilson has had nearly 25 years' experience in the rubber business and for the past ten years has been superintendent and factory manager of the Canton Rubber Co. In the management of the factory he will be assisted by John C. Moore and George W. Kocher, both of whom have had wide experience in the manufacturing of dipped goods.

PERFECTION RUBBER COMPANY PLANS LARGE OUTPUT.

The Perfection Rubber Co., Cleveland, Ohio, notice of whose incorporation appears elsewhere in this issue, is installing machinery and equipment for an output of 4,000 gross toy balloons and 200 gross household gloves per month, and expects to add considerably to that capacity within a short time. L. J. Johnson, formerly with the Faultless Rubber Co. and the Miller Rubber Co., is head of the manufacturing department. A. D. Wismar, of Cleveland, will have charge of the business end, as secretary of the company. Messrs. Johnson and Wismar, together with S. Korach, R. W. Korach and H. J. Barham, of the S. Korach Co., of Cleveland, form the directorate of the Perfection company.

RUBBER COMPANY DIVIDENDS.

The Hood Rubber Co. paid a regular quarterly dividend of 1 1/4 per cent. on the preferred stock on August 1 to stockholders of record July 28.

The Lee Rubber & Tire Corporation has declared a regular quarterly dividend of 50 cents and an extra dividend of 25 cents, both payable September 1 to stockholders of record August 15.

The directors of the Ajax Rubber Co. have declared the usual quarterly dividend of \$1.25 per share, payable September 15 to stockholders of record August 31.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on August 25 are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new)	63	66
Firestone Tire & Rubber Co., common	930	940
Firestone Tire & Rubber Co., preferred	112	114
The B. F. Goodrich Co., common	71 1/2	72 1/2
The B. F. Goodrich Co., preferred	113 1/2	114 1/2
Goodyear Tire & Rubber Co., common	235	239 1/2
Goodyear Tire & Rubber Co., preferred	106 1/2	107 1/2
Kelly-Springfield Tire Co., common	73 1/2	74 1/2
Kelly-Springfield Tire Co., 1st preferred	95	97
Kelly-Springfield Tire Co., 2nd preferred		
Miller Rubber Co., common	220	226
Miller Rubber Co., preferred	105	106
Portage Rubber Co., common	130	135
Portage Rubber Co., preferred	130	135
Swinehart Tire & Rubber Co., common	95	100
United States Rubber Co., common	56 1/2	57 1/2
United States Rubber Co., preferred	111 1/2	112

JOSEPH P. DEVINE, INVENTOR AND EXPERT.

FIFTEEN or twenty years ago a French scientist and an American mechanical expert at Niagara Falls were conversing in the subject of the production, on a commercial scale, of carboide of calcium. The Frenchman finally said, "Sir, it cannot be done." The American said, "Come and see," and he took the scientist into an adjoining building and showed him eleven tons

of this product. The astonished scientist could only say, "Oh! That makes a difference!"

The American was Joseph P. Devine, whose name is well known in manufacturing circles, especially in rubber, in connection with the wide application of the vacuum dryer.

Mr. Devine was born in Philadelphia, January 4, 1867. His father, now 94 years of age, is still in perfect health. His mother,

Sallie Paul, was a Quakeress, born in Philadelphia, and living her entire life in the house where she was born. The son was educated in the schools of his native city and lived there until about 20 years ago, when he moved to Buffalo. Previous to this, he had traveled extensively throughout Europe, and in one of his trips abroad began investigations on the use of the vacuum as applied to a wide range of materials. This resulted in the creation of a great plant for the manufacture of vacuum drying apparatus at Buffalo.

His special success lay in the application of vacuum drying, under reduced pressure, and by it he revolutionized many lines of industry. Of the products which have been made commercially possible through his studies, and carried out by the creation of special machines for the purpose, the list is a long one. It embraces the recovery of solvents; the application of oil heating to various chemical processes where exact regulation of temperatures is essential; the production of benzol, aniline oil, phenol, beta naphthol, trinitrotoluol, picric acid; all these are made commercially practicable or more economically produced through the study and inventive genius of the subject of this sketch.

It was Mr. Devine who installed the first vacuum dryers for crude rubber when every manufacturer in the United States firmly believed that air-dried rubber was the only good product. To-day practically all of the rubber is vacuum dried, and fabrics for rubberizing, as well. Mr. Devine has recently installed over 20 plants for the vulcanization of rubber boots and shoes under pressure, or in vacuo, which sounds the death knell of the old-time "dry heat" method. Mr. Devine was also one of the pioneers in the desirability of gums and of low grade rubber, and his work in this line has been of great value to the rubber industry. To sum up for rubber, he has equipped establishments all over the world with dryers, impregnators, condensers, pressure vulcanizers, and apparatus designed by him and perfected in the works of the company of which he is the head.

Mr. Devine inherits the thorough-going traits of his Quaker

ancestry and the wit and brilliancy of his Irish forbears. He is versatile, resourceful and of indomitable energy, popular with those in his business establishment and possessing the confidence of the hosts of manufacturers whose problems he has solved and whose business he has revolutionized.

PERSONAL MENTION.

F. H. Gerrans has been appointed manager of the London branch of A. Schrader's Son, Inc., Brooklyn, New York, W. H. Cole, formerly in charge, no longer being connected with the company.

Seneca G. Lewis, general manager of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, was married on July 3 to Mrs. Elizabeth McFall-McAfee in Sandusky, Ohio. Mr. Lewis and his bride are now settled in their home at Jack's Hill, Greensburg, Pennsylvania, the latter city being located about four miles from the company's plant at Jeannette.

Edwin N. Ohl was recently elected president of the New Castle Rubber Co., Pittsburgh, Pennsylvania, following upon the resignation of J. S. Wilson. W. H. Schoen and C. H. Bolton were made vice-presidents and E. H. Brainard, secretary. Mr. Ohl is also treasurer of the company.

E. M. Perdriau, managing director of the Perdriau Rubber Co., Limited, Sidney, Australia, was in New York City on business last month.

Frank G. Bolles, former manager of the export publication, "International Trade," Chicago, Illinois, has been chosen vice-president of the Russia Trade Corporation of America, a subsidiary corporation of R. Martens & Co., Inc. The former named company has opened an office in New York City and offices in several commercial centers in Russia, for the purpose of extending trade of American manufacturers in that country.

Harold R. Murdock has resigned his position as chief research chemist of the Rubber Regenerating Co., Naugatuck, Connecticut, to accept a position on the research staff of Charles Pfizer & Co., manufacturing chemists, Brooklyn, New York. Mr. Murdock has recently been granted several interesting patents on rubber reclamation.

G. H. Carnahan, formerly vice-president of the Intercontinental Rubber Co., with offices at 120 Broadway, New York City, has been elected president of the company.

T. K. Smetts, for two years representative of the service and advertising departments of the Firestone Tire & Rubber Co. at Des Moines, Iowa, has been transferred to the managership of the Spokane, Washington, branch of the company.

A. N. Rust, formerly salesman of the Minneapolis branch of The Fisk Rubber Co., Chicopee Falls, Massachusetts, has been made manager of the Fisk branch at St. Paul, Minnesota.

GOODRICH COMPANY APPOINTMENTS.

W. J. Sheehy has been appointed local manager of a new depot opened last month by The B. F. Goodrich Co., Akron, Ohio, at Estes Park, near Denver, Colorado.

John W. McCall has been succeeded as local manager at San Diego, California, by Warren F. Sanford.

C. L. Kelsey, Jr., formerly assistant manager at the Buffalo, New York, branch, has been appointed manager in charge at Cincinnati, Ohio, H. M. Spencer acting as assistant manager.

C. W. Simpson, formerly in charge at Cincinnati, will now devote his entire time to the district operating department and stock regulation department at Akron.

E. M. Lee, formerly assistant manager at the Cincinnati branch, has been given charge of the Denver, Colorado, depot.

JOSEPH P. DEVINE.

ARTHUR JACKSON WILLS.

It is gratifying to introduce to the readers of THE INDIA RUBBER WORLD, and to the rubber trade in general, men who are active in promoting efficiency in the manufacturing processes of the industry.

The career of Arthur Jackson Wills as an inventor of special machinery began with his connection, about ten years ago, with the B & R Rubber Co., North Brookfield, Massachusetts. Mr. Wills is a New Yorker and a graduate of the Stevens Institute of Technology, in mechanical engineering. His first invention of special rubber making machinery was an automatic jar ring cutting lathe.

ARTHUR JACKSON WILLS.

Supplementary to this machine, Mr. Wills invented a carton erecting and filling machine for counting and boxing jar rings.

Probably his most widely known invention is a trimmer for removing the

overflow from the edges of rubber heels or similar molded articles. These machines are installed in large groups in some of the most important rubber factories in America and Europe.

His latest development is a machine designed to produce the plaited edging for bathing caps made from thin, pure rubber sheet or strip stock.

All of Mr. Wills' machines are most efficient and have been adopted by manufacturers of the lines to which they are adapted. He certainly is to be congratulated on the showing he has made as a designer of special rubber machinery, during the comparatively few years he has devoted to the needs of the rubber industry.

PEARCE-ARROW TIRE & RUBBER MANUFACTURING CO.

The Pearce-Arrow Tire & Rubber Manufacturing Co., Philadelphia, Pennsylvania, has purchased the assets and equipment of the Germantown Almegum Manufacturing Co., assigned, operating the plant leased under a purchase proposal, which has since been confirmed by the United States District Court.

The Pearce-Arrow company is making three grades of tires, a "Jit," "Standard" and "Puncture Proof," and turns out about 400 tires per day. A new building is being planned, to care for increasing demand, and the company hopes to have equipment installed allowing for a daily output of 800 tires in time for 1918 business. H. H. Allyn, formerly with the Canadian Consolidated Rubber Co. and later with the Lee Tire & Rubber Co., is the superintendent.

RAPID PROGRESS OF THE NORWALK COMPANY.

The output of the Norwalk Tire & Rubber Co., Norwalk, Connecticut, has been more than doubled during the past year, and is now operating at full capacity day and night and turning out in the neighborhood of 2,000 tubes and 200 cases daily. Dr. David Spence, the well-known technologist, has been vice-president and general superintendent of the company since its inception in the spring of March, 1914.

TRADE NOTES.

Dr. H. R. McCurdy has been appointed receiver of the McCurg Tire & Rubber Co., of Coshocton, Ohio. A suit for \$15,000 and inability of the company to market its product is given as the reason for the receivership. It is thought that this will be of short duration and that business will be resumed on the old basis, as there is said to be sufficient stock on hand to make this probable.

Important changes in the official force of the Perfection Tire & Rubber Co., Chicago, Illinois, resulted from a series of elections and appointments recently made. The officers and directors representing three companies which have been merged, including the Perfection Tire & Rubber Co., the Champion Automobile Co., and the Perfection Tire & Rubber Co. of Canada, Limited, will control all of the concerns. The present officers of the newly effected combination are C. R. Cole, president; R. J. Evans, vice-president; Charles W. Harris, secretary; E. A. Stickelman treasurer, and T. J. Mell, general manager. Mr. Mell was formerly assistant general manager of the Republic Rubber Co. Other executives who have been prominently identified with standard tire manufacturing companies are, Charles W. Harris, the secretary, formerly connected with the Kelly-Springfield Tire Co., and C. D. Whitston, the general sales manager, well known in connection with the old Diamond Rubber Co.

The American Auto Tire Co., 154 North Broad street, Philadelphia, Pennsylvania, has purchased the old Patterson Textile mills in Chester, Pennsylvania. The mills will be enlarged and converted into an automobile tire manufacturing plant. George G. Meeley is president, and Hugh B. Turner, secretary and treasurer. The Patterson mills are on a tract of six acres on Chester River and the line of the Philadelphia, Baltimore & Washington Railroad. The structures consist of the main building, of stone, 76 by 316 feet, three stories; a two-story brick building, 80 by 188 feet, a brick and frame building, 64 by 123 feet, a brick building, 33 by 74 feet; a brick boiler and engine house, and a two-story brick and stone office building.

The Braender Rubber & Tire Co., Rutherford, New Jersey, has moved its Philadelphia branch to 675 North Broad street.

At a recently held annual meeting of the shareholders of the Kansas City Tire & Rubber Co., Kansas City, Missouri, the following directors were elected for the ensuing year: P. E. Werner, Frank A. Werner, W. W. Wuchter, L. J. Smith, Harry Goodman, William R. Swissler and William Gould.

The Ohio Tire Service Co. has removed to 70 North Fourth street, Columbus, Ohio, where a greatly increased stock of Ohio tires and tubes will be carried. J. C. Henne, manager of the company, recently ordered five carloads of these tires for the Columbus store.

Suit was recently filed in the United States District Court to compel a number of alleged subscribers to the stock of the Dreadnaught Tire & Rubber Co., Baltimore, Maryland, to pay their subscriptions.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has opened a service, repair and selling agency at Bismarck, North Dakota. This business was formerly handled through the Fargo branch.

The McGraw Tire and Rubber Co., East Palestine, Ohio, is increasing its capital stock to \$4,000,000; \$2,000,000 of which will be common capital stock; and \$2,000,000 of which will be 7 per cent cumulative preferred capital stock, redeemable at 110 and accrued dividends. \$1,000,000 of the new preferred stock has been underwritten by The Maynard H. Murch Co., Cleveland, Ohio, and will be utilized to retire the present outstanding issue and to furnish additional working capital to care for increased business; the remaining \$1,000,000 of preferred stock will be placed in the treasury to care for future growth and expansion.

TRADE NOTES.

At a recent meeting of the board of directors of the Victor Rubber Co., Springfield, Ohio, it was voted to increase the capital stock of the company from \$300,000 to \$750,000, and to declare a 100 per cent stock dividend on common stock, made possible by the last year's earnings.

The United States Rubber Co. takes advantage of conventions of retail shoe dealers to advertise its footwear by demonstrators. At the recent convention of the Illinois Shoe Dealers' Association, J. J. Hawkins showed practically the operation of making a rubber boot, giving a description of all the different processes, from the crude rubber to the finished product, and building up a boot upon a last while explaining the same in detail.

The three-story plant addition of the Anderson Rubber Works, Anderson, Indiana, which is nearing completion, will bring the total floor space of the company in actual use up to 50,000 square feet. The new addition, which is 86 by 60 feet, and adjoins the factory at 14th and Meridian streets, is being erected to care for the fast growing demand for the Miller vulcanizer, which is one of the company's important lines.

The Eagle Rubber Co., Ashland, Ohio, notice of whose incorporation appeared in the August issue of THE INDIA RUBBER WORLD, has purchased an acre of ground centrally located along the Erie right of way opposite the Erie station and will erect a brick building of about 150 feet in length and 60 feet in width, three stories, including basement. The company expects to materially increase its output of toy balloons and will also undertake the manufacture of various rubber sundries. H. R. Gill is president and treasurer, and H. V. Pohle, general manager.

The annual outing of the employees of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, was recently held at Idlewild and attended by more than 2,000 persons.

John W. Maguire, Chicago branch manager of the Republic Rubber Co., and chairman of the house committee of the Chicago Automobile Club, is trying a novel experiment with all automobile clubs in the United States and Canada, acting in cooperation with President W. O. Duntley, of the Chicago Automobile Club and the board of managers. Briefly, the plan is to extend the privileges of the club to all members showing credentials indicating good standing in their clubs. It is an exchange of courtesy which has resulted very satisfactorily in connection with ordinary social clubs.

The Hunter Dry Kiln Co., Indianapolis, Indiana, is building a drying laboratory adapted for the working out of drying problems. Any one having a drying proposition that they desire to have solved may refer it to the laboratory of the Hunter Dry Kiln Co. This process is as well adapted to the drying of compounds as it is to crude rubber.

The employees of the executive offices of the United States Rubber Co. in New York City have, on their own initiative, formed a company of infantry and are drilling twice a week at the armory of the Twelfth Infantry, N. G. N. Y., the use of this armory having been donated for the purpose. The services of a former officer of the National Guard have been secured as instructor. This is another example of the preparedness campaign now in progress.

The plant formerly operated by the Blodgett Rubber Co. at St. Joseph, Michigan, has been taken over by the recently organized Palmer Rubber Co. It is estimated that the new company will commence operation on September 1.

The Mattson Rubber Co., Lodi, New Jersey, has filed notice with the county clerk at Bergen indicating a change in the issuance and classifications of its capital stock, the purpose being to divide it into 100 shares preferred and an equal amount of common stock.

The Allen Machine Co., Erie, Pennsylvania, has increased its capital stock to \$200,000 and is building an addition to its present plant which will enable the company to handle the heaviest class of work. This addition will be 60 by 180 feet with a 20-ton electrical crane serving the entire floor space.

The malleable iron foundry of the Link-Belt Co., Indianapolis, Indiana, is being enlarged by a one-story extension, 70 by 275 feet, with a wing 106 by 140 feet in dimensions. This addition will house the fifth melting furnace of the company and provide space for 60 molders.

In order to increase its factory facilities to allow for a future output of 500 automobile tires per day, the capital stock of the Vail Rubber Co., Chicago, Illinois, has been increased to \$100,000 all of which has been paid in. At present the Vail company has a capacity of 265 tires but is only making 200 per day. The officers of this company are as follows: Adolph C. Ehman, president and treasurer; W. A. Vail, vice-president, and Francis Lackner, secretary.

The Board of Trade of Girard, Ohio, have in contemplation the establishment of a plant for the manufacture of rubber specialties. According to plans discussed the proposed company will be capitalized for \$200,000.

The Hamilton Rubber Co., Trenton, New Jersey, has opened offices at Atlanta, Georgia, which will be the headquarters for the States of Georgia, Atlanta, South Carolina and Florida. H. B. Schesinger will manage the southern branch and will be assisted by F. L. Martinez. This company makes tires, tubes and mechanical goods.

A. B. McVay has resigned as secretary of the Bucyrus Rubber Co., Bucyrus, Ohio, and has been succeeded by G. P. Mader.

Interesting statistics concerning the United States Rubber Co. and subsidiaries show that the company owns plantation property in Sumatra covering 90,000 acres representing an investment of nearly \$9,000,000. In its 47 factories the company employs 35,000 people and its yearly production fills 15,000 freight cars, a train 112 miles long. It is said to consume in the manufacture of its various products more than 55,000,000 yards of cotton fabric yearly.

The Iowa Rubber Co. has been recently organized and expects to locate at Davenport or Bettendorf, Iowa. This section of Iowa is said to be an eligible location, both from a labor and distribution viewpoint. Chief among those interested are: J. W. Bettendorf, J. R. Lane and Judge J. W. Bollinger.

The Republic Rubber Co., Youngstown, Ohio, is working double shift in every department. The company has made shipments to 22 foreign countries this year.

Creditors of the New York Commercial Co., 290 Broadway, New York City, have received a final dividend of 15¢ per cent, making a total dividend of 39½ per cent. The company went into bankruptcy on April 12, 1913, with liabilities of nearly \$2,000,000.

The Standard Woven Fabric Co., Walpole, Massachusetts, has sold its Framingham factory. This company recently acquired the old plant of the Walpole Rubber Co., and is making a variety of rubber specialties.

The death of P. Carter Bell, of the Carter Bell Manufacturing Co., New York City, manufacturer of rubber substitutes, will in no way interfere with the business of the company. All of Mr. Bell's formulae will be continued in use and no interruption will be caused by his demise.

Gustave Kusch, well-known manufacturer of printers' blankets, 3 Park Row, New York City, has succeeded in developing a certain type of specially cured tubing in active request in hospitals and laboratories. As this tubing was formerly an exclusively European product, Mr. Kusch's invention will materially promote the convenience of consumers in this country.

NEW INCORPORATIONS.

American Banana Products Co., August 7 (Delaware), \$1,000,000. Henry T. Farrow, Norman P. Coffin, Wilmington, Delaware, and Clement M. Egner, Elkton, Maryland. Principal office, Corporation Trust Co. of America, 394 duPont Building, Wilmington, Delaware. To acquire plantations for the cultivation of bananas, rubber, etc.

American Puncture Seal Co., Inc., August 7 (New York), \$1,000. William E. Hendry and Hulda G. Hendry, 1461 St. Peters avenue, and Alice M. Waters, 2466 Frisby avenue—all of New York City. To manufacture puncture healing liquid.

Anderson Tire Manufacturing Co., July 22 (Delaware), \$100,000. James C. Anderson, William W. Anderson, George A. Rock—all of Washington, D. C. To manufacture tires, etc.

Beacon Tire Co., Inc., July 31 (New York), \$100,000. Edward C. Griffith and K. G. Johnston, 1625 Broadway, New York City, and H. A. Demarest, Los Angeles, California. To manufacture auto and motor tires, etc.

Bradshaw Tire & Rubber Co., Inc., June 24 (Illinois), \$10,000. C. E. Bradshaw, William M. Gentleman, Jr., and George S. Atwater. Principal office, 1337 S. Michigan avenue, Chicago.

Carnegie Tire & Rubber Co., Inc., August 23 (New York), \$25,000. Roland J. Reynolds; Victor W. Fink, and William H. Dodd—all of 69 Wall street, New York City.

Central & South American Chicle Co., The, July 7 (Delaware), \$2,000,000. José P. Cuellar, Caracas, Venezuela; B. L. Atwater, Garden City, New York; Julian A. Arroyo and Miguel Gonzalez Rincones, New York City; C. L. Rimlinger, Herbert E. Latter and Norman P. Coffin, Wilmington, Delaware. Principal office, Corporation Trust Co. of America, 394 duPont Building, Wilmington, Delaware. To manufacture and deal in raw chicle or any other kind of chicle or gum.

Col. Brown Tire Co., July 24 (California), \$500,000. Henry D. Boddington, C. H. Braden, A. D. Denison, James Edmunds, Bert C. Smith—all of Los Angeles—and Mattison B. Jones and O. A. Lane—both of Glendale, Los Angeles County, California. Principal office, Los Angeles, California.

Cut Price Auto Tire Co., July 27 (New Jersey), \$100,000. Herman Fineberg, Isaac Fineberg and John L. Heher—all of Trenton, New Jersey. Principal office, 12 East Hanover street, Trenton, New Jersey. To deal in tire and automobile accessories, etc.

Eckrode Rubber Co., C. E., Inc., August 2 (New York), \$50,000. C. E. Eckrode and Otto Wuest—both of Highland Park, and Andrew Perkins, 17 Water street—both in New Brunswick, New Jersey. To manufacture rubber goods and novelties.

Falcon Chicle & Lumber Exploitation Corporation, August 24 (New York), \$100,000. Francisco Garcia, John O. Perez and Alexander Lamont—all of 68 William street, New York City. To produce chicle, etc.

Federal Tire & Repair Co., The, June 26 (Tennessee), \$3,000. L. A. Wallace, B. J. Hughes and Will R. Manier, Jr.—all of Nashville, Tennessee. Principal office, Eleventh avenue and Broad street, Nashville, Tennessee.

Fibre Rubber Manufacturing Co., Inc., July 20 (Delaware), \$500,000. A. J. Sherman, Ferris Giles, L. S. Dorsey—all of Wilmington, Delaware. Principal office, Colonial Charter Co., 927 Market street, Wilmington, Delaware. To acquire letters patent for the manufacture of rubber goods of all kinds.

G. A. Aeronautic Co., Inc., The, August 4 (New York), \$105,000. Charles H. Bassford, 38 North 12th street, Newark, New Jersey; Samuel W. Mower, 66 West 85th street, and Joseph E. Rogers, 203 West 108th street—both in New York City.

Goodyear Tire Co., The, January 4 (Minnesota), \$300,000. Harry A. Trenholm, Minneapolis; Gust W. Franson and Charles W. Oberg, Deerwood—both in Minnesota. Principal office, Minneapolis, Minnesota. To manufacture auto tires and automobile accessories and supplies.

Hipwood International Pneumatic Crutch Co., Inc., August 8 (New York), \$250,000. George Hipwood, Hotel McAlpin, New York City; John W. Barrett, 62 Temple street, Somerville, Massachusetts, and Carmac F. Egan, 382 East 168th street, New York City.

Indian Tire & Rubber Co., July 19 (New Jersey), \$100,000. Elmer W. Van Ness, Mountain View; Adelbert Hantsch, 29 Morris street, New Brunswick, and Willard P. Fraley, 127 Benner street, Highland Park—all in New Jersey. Principal office, 320-6 Commercial avenue, New Brunswick, New Jersey. To manufacture and deal in all kinds of rubber goods.

J. T. Johnstone & Co., Inc., August 19 (New York), \$200,000. Albert F. Jaekel, Adele M. Ferre, 32 Liberty street, and Douglas Haldane, 22 William street—both in New York City. To manufacture rubber goods, operate rubber plantations, etc.

Kelsey Wheel Co., Inc., August 23 (New York), \$13,000,000. Elmer F. Holmes, 37 Wall street; Allen E. Moore, 20 Arden street—both in New York City, and Donald Havens, 55 Hansen Place, Brooklyn, New York. To manufacture wheels, rims, auto parts, etc.

Maple Leaf Tires, Ltd., June 3 (Canada), \$500,000. Rupert K. Grimshaw, Edward J. Swift and Harry C. Long. To manufacture automobile tires, tubes, truck tires, belting and all rubber sundries.

McNall Tire Corporation, August 4 (New York), \$500,000. Edward H. Power, 108 West 57th street; Farron S. Betts, 410 Riverside Drive—both of New York City, and Joseph W. Murphy, 189 Eighth avenue, Brooklyn, New York. To manufacture tires and rubber goods.

Mee-Tu Tire & Rubber Co., July 31 (Pennsylvania), \$5,000. Thomas G. Meeley, George G. Meeley, 5,000 Fine street; Lester U. Weaver, 5447 Lansdowne avenue—all of Philadelphia, Pennsylvania. Principal office, Chester, Pennsylvania. To manufacture and deal in automobile tires, tubes, accessories, junk, etc.

Muller Tire & Rubber Co., July 7 (Oklahoma), \$15,000. Alfred Muller, San Antonio, Texas; A. L. West and R. J. Uehlinger, Tulsa, Oklahoma. Principal office, Tulsa, Oklahoma. To buy and sell all parts and appliances used in connection with motor vehicles, etc.

Nashua Rubber Co. of Nashua, August 4 (New Hampshire), \$5,000. Fred A. Jewell, Lawrence; George I. Crocker, Fitchburg—both in Massachusetts; Guy W. Swallow, Nashua, New Hampshire. Principal office, Nashua, New Hampshire. To manufacture and deal in rubber goods, etc.

Newark Auto Supply Co., June 30 (New Jersey), \$25,000. Nathan J. Berkowitz, Newark; Abraham G. Weinberg, Harrison; Samuel G. Salls, Plainfield, and Harry Roth, Irvington—all in New Jersey. Principal office, 304 West Front street, Plainfield, New Jersey. To deal in automobile accessories, etc.

New Tread Tire Co., The, June 17 (Kentucky), \$5,000. David H. Smith, T. W. Price, A. L. Smith. Principal office, Louisville, Kentucky. To deal in automobile accessories, etc.

North American Rubber Co., July 24 (New Jersey), \$250,000. S. S. Adams, Jr., H. M. Kennedy and M. B. F. Hawkins—all of Wilmington, Delaware. Principal office, 143 East State street, Room 210, Trenton, New Jersey. To manufacture and sell the Mercer Non-Blowout Inner Tube, to make rubber covered poles and to go into the rubber business in general.

Pennsylvania Rubber Co., Inc., August 21 (New York), \$6,000,000. Seneca G. Lewis and H. W. Duppy, Jeannette, Pennsylvania, and G. A. McLaughlin, 61 Broadway, New York City. To manufacture tires and rubber goods.

Perfection Rubber Co., The, July 7 (Ohio), \$40,000. L. J. Johnson, A. D. Wismar, S. Korach, B. W. Korach and H. J. Barham. Principal office, 2097-2107 Columbus Road, S. W., Cleveland, Ohio. To manufacture and deal in dipped goods, druggists' sundries and rubber specialties.

Post Tire & Rubber Corporation, August 1 (Delaware), \$1,500,000. William F. O'Keefe, George G. Steigler and E. E. Wright—all of Wilmington, Delaware. Principal office, Corporation Co. of Delaware, Equitable Building, Wilmington, Delaware. To manufacture and deal in automobile tires, tubes, casings, etc.

Rubber-Aid Co., The, August 9 (Ohio), \$10,000. David Rubin, Max Schwab, Sam Rubel, Abe Efron, and Abe Israsky—all of Cincinnati, Ohio. To manufacture surgical goods.

Rubber Co. of America, July 7 (New Jersey), \$25,000. Judson G. Campbell, Rutherford; Julius Greenfield, West Newark—both in New Jersey, and Charles Heimlich, 362 Bleeker street.

New York City. Principal office, Broadway, corner St. Louis avenue, West Newark, New Jersey. To manufacture and deal in rubber goods, etc.

Quabaug Rubber Co., August 3 (Massachusetts), \$125,000.

Thomas G. Richards, North Brookfield; Frank C. Smith, Jr., and J. Otis Sibley, Worcester—both in Massachusetts. Principal office, North Brookfield, Massachusetts. To manufacture rubber heels, soles and all other rubber goods and goods made of rubber compounds or other substance, etc.

Shaw Tire Co., July 10 (Massachusetts), \$300,000. A. B. Shaw, 23 Bowers street, Medford; Edgar E. Fay, 34 Beacon street, Newton, and William V. Burton, 7 Irving street, West Medford—all in Massachusetts. Principal office, Boston, Massachusetts. To manufacture and deal in tires, tubes, etc.

Stungo Radium Rubber Co., August 10 (Delaware), \$1,000,000. Harry T. Farrow, M. V. Haywood—both of Wilmington, Delaware, and Clement M. Egner, Elkton, Maryland. Principal office, Corporation Trust Co. of America, 394 duPont Building, Wilmington, Delaware. To manufacture and deal in chemicals, rubber and any goods of which rubber is a part.

Superior Tire & Rubber Co., July 18 (Maine), \$500,000. E. M. Leavitt (president), Winthrop, and Ernest L. McLean, Augusta—both in Maine. Principal office, 242 Water street, Augusta, Maine. To manufacture and deal in tires.

S. & W. Rubber Manufacturing Corporation, The, August 10 (New York), \$10,000. Arthur C. Squires (president); Thomas J. Smith, 637 10th street; John Wainwright and Edward Jockers, 13th street—all in College Point, Long Island. Principal office, 19th street and Sixth avenue, College Point, Long Island. To manufacture inner tubes, rubber heels, dental rubber, etc.

United Securities, August 5 (Maine), \$50,000. Fred F. Phillips (president and treasurer) and George H. Hinckley (clerk)—both of Portland, Maine. To manufacture rubber, etc.

Wilson Rubber Co., The, July 18 (Ohio), \$40,000. Fred Wilson, John S. Willis and Wendell Herbruck. Principal office, 1320 Fifth street, N. E., Canton, Ohio. To manufacture dipped rubber goods.

PROGRESS OF THE McFALL RUBBER COMPANY.

The McFall Rubber & Manufacturing Co., Kansas City, Missouri, which began manufacturing tire accessories, blow-out patches, reinforcers, fan belts, etc., in March, last, is now working full blast, with 60 employees. A complete line of tire accessories is being made and the company expects to

manufacture inner tubes next season. A. J. Stephens, who has been in the tire jobbing business for the past six years, as owner of the Stephens Motor Tire Co., of Kansas City, is general manager of the McFall company. L. E. McFall is superintendent. Mr. McFall formerly held a similar position with the Western Tire & Rubber Co., of Kansas City, and has been in the manufacturing business for the past seven years.

FEDERAL RUBBER CO.'S OUTING.

The office force and factory heads of the Federal Rubber Co., Cudahy, Wisconsin, held an outing at Keippner's Park one day last month, and the camera proves that they thoroughly enjoyed

themselves on that occasion. An interesting program of athletic sports was successfully carried through. A leading feature of the day was a ball game between the office force and the factory representatives, which was won by the latter. The penalty to

be paid by the losers of the game is a banquet for both nines, to be held later. The outing was concluded by a banquet in the evening.

FRENCH ARMY FOOTWEAR.

The Canadian Consolidated Rubber Co., Limited, Montreal, Canada, has contributed many men to the Dominion troops which have gone to the front in the great European war. The business and the mechanical departments are represented in both rank and file, and much valor has been shown in regimental and individual cases.

This company has furnished the British government many thousand pairs of trench boots, showing wonderful despatch in filling orders for this necessary footwear. On this page is shown a company of Canadian infantry "somewhere in France," each man wearing a pair of the trench boots, made in Canada.

THE OBITUARY RECORD.

PROMINENT IN RUBBER CHEMISTRY.

PERCY CARTER BELL, president of the Carter Bell Manufacturing Co., New York City, died at his residence at East Orange, New Jersey, August 23, aged 49 years. Mr. Bell was born at Manchester, England, August 28, 1867. He was the son of J. Carter Bell, an eminent chemist, and chose his father's profession, graduating with honors from Victoria University.

Choosing the manufacture of rubber for a special field he secured employment with prominent concerns in that line in England. He came to America about 25 years ago, and after a year in the chemical department of the New York Belting & Packing Co., he opened a technical laboratory in New York City in 1893, devoting himself as analytical and consulting chemist for the rubber trade.

In 1894 he formed

a partnership with Curtis P. Smith to manufacture chemically pure chloride of sulphur, and also a rubber substitute of his invention. This concern was incorporated three years later as the P. Carter Bell Co. and in 1903 the present concern, the Carter Bell Manufacturing Co., was incorporated.

Mr. Bell some years ago contributed to the columns of THE INDIA RUBBER WORLD, his articles on the effect of various chemicals and materials on caoutchouc being specially instructive. He was a most companionable man and had a host of friends in the rubber and chemical industries.

Mr. Bell was prominent in the Masonic fraternity, being a past master of the lodge at East Orange. He leaves a widow.

QUEBEC'S RUBBER SCRAP EXPORTS AND GOODS IMPORTS.

According to the Annual Report for 1915 by the American Consul at Quebec, Canada, \$122,356 of rubber scrap was exported to the United States, as against \$117,017 in 1914; showing an increase of \$5,339.

During 1915 the Province of Quebec imported \$27,623 of manufactures of rubber and gutta percha, of which \$17,667 was from the United States. The previous year these imports amounted to \$32,348, of which \$11,448 was from the United States; showing that, while the total imports of rubber and gutta percha goods increased by \$4,725, the imports of the same merchandise from the United States decreased to the extent of \$6,219.

The crude rubber sausage has always held its place in the world of raw rubber, but the rubber sausage as a more or less dainty edible is an innovation, again reflecting German ingenuity. Word comes from Berlin to the effect that a certain Hamburg merchant has been fined 2,000 marks for a unique violation of the pure food laws. The offense committed by this enterprising purveyor of delicatessen consisted in the selling of a commodity purporting to be liver sausage for 2 marks and 20 pfennigs a pound, which proved on analysis to contain macerated rubber, finely ground hair and gelatine. It was absolutely guiltless of liver, other flesh or fats.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

TRUE sportmanship is shown by The B. F. Goodrich Co. in the conditions governing its award of the hammered silver trophy cup shown in the accompanying illustration. Although

the Goodrich company is a maker of bicycle tires, among which is the famous Palmer tire used by many racers, it is expressly stated that riders contesting for this trophy may use any make of tire they wish. The bicycle club team scoring the highest number of points in open road competition during 1916 will win the cup. It is valued at over \$400, and, as will be seen, is of graceful, chaste design, with clear-cut explanatory lettering under the space left for the winner's name. Bicyclists and cycle fans are all

anxious to see this unusually handsome trophy, and the company is therefore sending it on tour to the larger cities, while in other cities full size reproductions are being displayed as hangers. In order to have the points count, all races must be sanctioned by the National Cycling Association and conducted under its rules.

The Goodrich company is also making things interesting in the driving competitions for 1916, by announcing \$10,000 in awards to racing champions during the year, the rules governing the competition to be determined by the American Automobile Association, based on the length of each contest, the field of starters and the character of the race. Although the Goodrich Silvertown cord tire is deservedly popular in speed contests, no stipulation is made as to the make of tire to be used by the contestants. The money will be awarded as follows: \$5,000 for the champion; \$3,000 for second in number of points, and \$2,000 for third.

On Goodrich outing day, held during the past month, \$15,000 was distributed to employees, each employee being given one dollar to spend as he desired. Many of them attended the great Akron factory picnic at Cedar Point, arranged by the Whitman-Barnes relief association and the Brotherhood of Railway Trainmen.

C. O. Littlefield, who has been in the employ of the Goodrich company less than two years, has recently been promoted to a responsible position in the Trade Record department at the Akron office.

The Goodrich Athletic Association has sent a challenge to the Goodyear and Firestone athletic associations for a triangular track and field meet on the new Goodrich athletic field in October. The field will be opened on Labor Day by the employees of the Goodrich company by a big field and track meet for which 300 entries have been received from the Goodrich forces. The athletic contest between the three rival tire companies of Akron will take place in October.

The Firestone Tire & Rubber Co. is conducting an extensive plan of window displays in all its branch agencies. Appreciating the value of attractive exhibits, F. S. Balcox, manager of the advertising department, has had made various cut-outs, show cards, etc., for such use, and these are arranged in a window at the factory and photographed. Then these various accessories are shipped to the agencies, together with the photograph, by which means the display can be duplicated in all the principal cities. The illustration shown is one of these displays.

A folded cardboard background is handsomely lithographed in colors, while the signal posts are cut out and arranged to stand upright in the window, the rest of the display being taken from the stock of goods in the store. Another has a large picture of a cyclist and a motorcyclist being photographed by a "movie" camera man, whose cut-out, electrically-propelled arm, turning the crank, is an eye-catcher. This campaign has now gained such prominence, that the agency windows in various cities are regularly observed by many for the changes.

On August 26 the foremen, superintendents and officials of the Firestone company, to the number of 225, held their annual outing. Early in the morning 50 automobiles carried them to the large farm of Amos C. Miller, vice-president of the company, at Castalia, where a sumptuous midday dinner was heartily enjoyed. The early afternoon was spent in ball games, quoits, etc., after which the entire party journeyed to Cedar Point, Sandusky, where they were the guests of President Firestone. Bathing in Lake Erie was followed by supper at the Hotel Breakers and the following morning, after breakfast at the hotel, they returned to Akron.

Harvey S. Firestone, Thomas Edison, Henry Ford and John Burroughs, the naturalist, are "roughing it" together in the Adirondacks.

* * *

Mention has been made of the remarkable department in the factory of the Goodyear Tire & Rubber Co. composed entirely of deaf mutes, whose affliction only serves to heighten their efficiency in factory work. For some time a fraternity has existed among this band of workers, and a club has now been formed to promote good fellowship among them. The Goodyear officials cooperate in every way to conserve the safety and add to the pleasure of this department, and many of the deaf mutes are very good athletes, contending for Goodyear honors on the football, baseball and basketball teams.

The name of the safety department of the Goodyear company has been changed to that of "police department," with P. J. Hutchison as police chief. Goodyear police patrol the factory and have authority to stop all dangerous work, and censure or discharge careless workmen.

A "Suggestion System," in use by the Goodyear company, encourages employees to offer ideas for improving machinery, methods, conditions and product in the factory, hundreds of dollars being paid annually to the employees for suggestions accepted by the company.

Shelby A. Falor, manager of the motorcycle tire department of the Goodyear company, has been elected president of the Federation of American Motorcyclists.

* * *

The General Tire & Rubber Co. has applied for an increase of capital from \$200,000 to \$500,000, to care for the growing demands of its business. A 60 by 200-foot addition is soon to be erected, which will be used for an additional tire building room.

M. O'Neil, president of The General Tire & Rubber Co., has leased to F. A. Seiberling, president of the Goodyear company, the eight-story Ohio Building and a large plot of land adjoining. This office building has been completed less than a year and contains the quarters of The Akron City Club, a new organization of Akron business men, the club occupying the three upper stories of the building.

* * *

The Portage Rubber Co. has just completed a three-story building, 60 by 80 feet in dimensions, that is being used for manufacturing automobile tires, and has begun the erection of a two-story building, 50 by 150 feet, the lower floor of which will be used for a shipping room and the upper floor as a stock room for tires and tubes. All the buildings of this company are of structural steel construction surrounded with concrete and brick.

The \$250,000 worth of new preferred stock of the company, mentioned last month, has all been taken by the stockholders at 105 per share and paid for on August 1.

* * *

A two-story building of the Miller Rubber Co., in which chemicals were stored, was recently burned to the ground.

* * *

P. H. Goodall has been made assistant sales manager of the Mohawk Tire & Rubber Co. Mr. Goodall was formerly branch manager in Cleveland for the United States Tire Co.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

THE vacation season is about over. Many of the mills shut down during the excessively hot spells of the past month and took this opportunity for making such alterations and improvements as will put them in proper shape for the large amount of business which they have on hand for the coming season. Most lines of the rubber business are in pretty good condition, with enough orders on their books or business in prospect to keep them going well along into the season, and the outlook for orders during the early fall is most encouraging. There is a diversity of opinion as regards the tire business, some producers reporting orders ahead of production, and others admitting that they could do more business than they have on hand. In rubber boots and shoes, the manufacturers have had a busy season and have not caught up, so the summer shutdowns have been shorter than in some former years. It is evident that retail stocks in rubber footwear were practically sold out last winter and, as a consequence, large orders were taken by every producer—in fact, the capacity of every factory has been strained in order to be able to deliver the early fall orders. Mechanicals have felt the effect of the spring and early summer weather as regards the garden hose business, and it is evident that a considerable amount of last year's goods are still in retail stocks. The demand for rubber belting in part makes up for the loss of the hose trade, the

present position of the leather belting industry being such that the demand for rubber belting has very largely increased. Druggists' sundries manufacturers report a good seasonal business.

* * *

The Hood Rubber Co. will remove its Boston office from Bedford street, where it has been ever since it started in business, to the new 11-story building at the junction of Summer and High streets, which is now nearing completion. The Hood company will occupy a portion of the eighth floor, which is now being fitted up for a sales room and sample room. The accounting, business and executive offices will remain at the factory in East Watertown. The Boston headquarters will be presided over by W. W. Richardson, who for some years has welcomed all visitors to the factory and guided them to the several departments. With him will be Proctor Caldwell, city salesman for the Hood Tire Co., Inc.

This new building, which is one of the most noticeable in the vicinity of the South Terminal Station, stands upon historic ground. For years Daniel Webster made his home in the granite residence which had to give way to the onward course of business. He was living there when he took part in the historical India Rubber case. The new building represents a monument to the indomitable energy of William B. Rice, who began life as a shoemaker and who, before his death, had made his name and his shoes known in five continents, and who, for several years, placed upon the market a line of rubber footwear branded with the name of Rice & Hutchins.

* * *

The 700 men and women employed by the Revere Rubber Co. who went on a strike about the first of June are now back at work, the company having agreed to raise wages \$1 per week, to make the working week for men 54 hours and for women 53 hours, and to settle departmental grievances by conferences with shop committees.

* * *

Mention was made in THE INDIA RUBBER WORLD of the formation of the Rubber Heel Club of America for the purpose of securing closer relations between manufacturers and jobbers; correcting trade abuses; educating the general public in the use of rubber heels, and improving conditions relating to the rubber heel industry. Since that time the organization has been perfected at a meeting held in this city, resulting in the election of the following officers: Robert H. Cory, O'Sullivan Rubber Co., president; George A. Stetson, Elastic Tip Co., secretary and treasurer, whose office is at 370 Atlantic avenue, Boston. Mr. Cory is also on the board of directors, of which the other members are C. H. Oakley, Essex Rubber Co., and Charles Measure, Federal Rubber Co. The present membership includes the following firms:

Elastic Tip Co., Boston, Massachusetts.
Essex Rubber Co., Trenton, New Jersey.
Federal Rubber Co., Cudahy, Wisconsin.
Foster Rubber Co., Boston, Massachusetts.
Goodyear Tire & Rubber Co., Akron, Ohio.
O'Sullivan Rubber Co., New York City.
Panther Rubber Manufacturing Co., Stoughton, Massachusetts.
Plymouth Rubber Co., Canton, Massachusetts.
Revere Rubber Co., New York City.

* * *

Mention was made in THE INDIA RUBBER WORLD last month that the business of the B & R Rubber Co. had been purchased by Thomas G. Richards. Since that time a Massachusetts corporation has been organized, with a capital stock of \$125,000, under the name of the Quabaug Rubber Co., which has purchased from Mr. Richards all the assets and

business of the B & R Rubber Co. Mr. Richards is president and treasurer of the new company, and the board of directors consists of Mr. Richards, of North Brookfield; J. Otis Sibley and Frank C. Smith, Jr., of Worcester. There has been no interruption of the work since the B & R company went into the hands of the receiver and the plant is now running to nearly full capacity in the same lines of goods which were manufactured by the old company, prominent among which are tubings, baby carriage tires, mats and the Armored and Barco soles, the former for shoe repairers and the latter for shoe manufacturers.

* * *

Several hundred employees of The B. F. Goodrich Co. from all over New England participated in the annual outing held at Riverside recreation grounds on August 8. It was one of the hottest days of the season, but the water in the Charles River was found to be most comfortable for bathing purposes and there was no lack of canoeing up and down the river. There were a variety of field and river contests, the latter including a 20-yard dash under water and a diving contest, and some of these events afforded great amusement for the onlookers. A prize was given the handsomest baby attending the outing. The committee having charge of the outing is to be congratulated on the perfect success of the whole affair. This committee consisted of Fred T. Moore, the New England manager; W. H. Moore, F. W. Tucker and C. F. Conner. The committee on sports was "Tom" Donnellan, E. S. Clark and H. J. Slaman.

* * *

The second annual field day of the employees of the Boston Woven Hose & Rubber Co. was held at Riverside recreation grounds on July 29, more than 1,000 persons attending. Special trains carried the party to and from the grounds. There were track and field events and a baseball game. A band concert and dancing were also features of the occasion. The tennis team of this company was defeated 4-3 by one from the Edison Illuminating Co., which carried off the prize, a handsome loving cup. The outing was under the auspices of the Mutual Benefit Association of the company and the arrangements were in charge of a committee of which James H. O'Brien was chairman.

* * *

The clothing factory of the American Rubber Co. at Stoughton, formerly the Stoughton Rubber Co., is now adding a story to one of its big wooden buildings, the object of which is to still further systematize the progress of materials, from the arrival of the raw materials of the factory to the finished product ready for shipment.

* * *

Guy D. Niles has been appointed manager of the Boston branch of the Portage Rubber Co. at 683 Boylston street, succeeding Judson C. Eubank. I am informed that the company has taken a ten-year lease on a new building that is being erected for its use at 700 Beacon street, but does not expect to be able to move from the present location for some months.

* * *

Charles A. Coe, Eastern selling agent of the United States Rubber Co., who has been ill at his residence at Essex Junction for a protracted period, has sufficiently recovered to be at his office in this city a portion of the week. He has hosts of friends in the trade who will be glad to hear of his recovery.

* * *

E. T. Foote, formerly of the New York office of The Cutler-Hammer Manufacturing Co., whose clutch brakes and calendar controllers are used in many rubber mills, has re-

cently been put in charge of the Boston office of that company, located in the Columbian Life Building at 77 Franklin street. Mr. Foote's experience in the engineering department at the Milwaukee factory, and in sales engineering work in New York, fits him admirably for his new position.

* * *

Merton A. Turner, sales manager of the Monatiquot Rubber Works Co., South Braintree, has just returned from a most enjoyable cruise along the Maine coast in the good yacht "Hypatia." The company is laying another line of machines to take care of the increased demand for its "naturalized" rubber, and is building a garage to accommodate 12 or 15 cars.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

ANENT the filing of a certificate at Wilmington, Delaware, the other day, increasing the capital stock of the Globe Rubber Tire Manufacturing Co., there is unfolded a story of a marked growth in the demand for Globe tires. The stock is increased from \$400,000 to \$1,500,000 for the sole purpose of increasing the tire output of the company. The personnel of the concern will remain the same as at present.

It is the intention of the company to double their present capacity. Building operations may be begun late in the coming fall. In spite of the fact that not long ago the capacity of the

over and above its present capitalization of \$125,000 common stock, and \$50,000 preferred stock. A recently completed addition enables the company to take care of the growing business for the present, but it has been necessary to double the office room.

* * *

Contracts for a \$20,000 addition to the plant of the Luzerne Rubber Co. have been given out. This concern, which confines its operations to hard rubber specialties, has been uniformly successful since starting in business. It has been necessary each year since its organization to add somewhat to the capacity of the plant.

* * *

The North American Rubber Co., Inc., hopes to begin the manufacturing of fabric-lined tubes for automobiles next month in its newly leased quarters. Unprecedented claims are made for this tube and it is said that practical road tests have proven that it will do all that is claimed for it. By a patented process the company is enabled to line the tube with a fabric having an exceptionally high percentage of elasticity. The lining fabric is guaranteed not to crease or buckle in a tube which is only partly inflated. One of the tests to which the tube was subjected was carried out by placing it in a shoe picked from a junk heap. After the worn out shoe had been further mutilated by having a number of holes cut into it sufficiently large to cause

UNITED PLANT.

GLOBE PLANT.

PLANTS OF THE UNITED & GLOBE RUBBER MANUFACTURING COS., TRENTON, NEW JERSEY.

plant was materially increased, it has been a physical impossibility to keep up with orders. Both the United and the Globe plants of the companies are now working to capacity. The new plant will be erected adjacent to the present structures.

E. S. Goodloe has been added to the staff of representatives of the United and Globe companies. He will look after the mechanical rubber goods line, with headquarters at Washington, D. C. His territory will extend as far south as Atlanta, Georgia.

* * *

It was expected that the recently organized Rubber Manufacturers' Association would be located in permanent quarters by this time, but a location has not as yet been decided upon. John A. Lambert, of the Acme Rubber Manufacturing Co., president of the association, has left Trenton on a vacation of one month. After his return, action on permanent quarters may be taken.

* * *

Because of a heavy increase in its business the Essex Rubber Co. has found it necessary to increase its capital stock \$325,000

the tube to touch the ground through the tread, it was placed on a car weighing 2,800 pounds and four men entered the car. The car was driven at the rate of 45 miles an hour for nine miles without any sign of a blow-out. There were other tests equally severe. The tube is to be marketed under the name of the "Mercer."

In addition to making the tubes, the North American company will market a patented hard rubber composition for coating mandrel poles. It is claimed by the company that a mandrel covered with this composition permits the thorough and uniform curing of a tube with no possibility of burns or uneven curing, as may be the case where the metal pole touches the rubber. Mandrel poles of all descriptions can be treated with the composition and then returned to the sender for use. Another advantage claimed for the composition-covered mandrel is that it strips clean.

* * *

Representatives of the Kelly-Springfield Tire Co. have looked over factory sites in and around Trenton with a view to possibly

locating one of their plants here. Several sites have been considered and the Trenton Water Commissioner was visited by the representatives to learn whether sufficient water would be piped to certain sites in the event of their selection. They were assured that the required water would be furnished. There is no positive assurance that the company will decide to open a Trenton plant.

The Globe Tire Co. is encouraging its men in the field of athletics. A large ball park on the company's land adjoining the mill has been fenced in and bleachers erected. A grand stand is contemplated and next season the outfield is to be improved and sodded. Nearly all the rubber mills have been represented on the diamond this year, but the Globe boys have the most pretentious grounds. It is said the heads of the rubber concerns find that it pays in dollars and cents to encourage their men in activities of this sort and that there has been a corresponding falling off in saloon patronage.

William L. Doyle, who served as sales manager of the Insulated Wire Department of the John A. Roebling's Sons Co. for many years, has resigned his position with the intention of opening a wire plant at Easton, Pennsylvania, in the near future. Robert C. DaCosta, for several years manager of the enameled wire department of the Roebling mills, has resigned his position to become associated with Mr. Doyle in the new venture.

A permit has been issued to the John A. Roebling's Sons Co. for the erection of an addition to their Hancock street shop, to cost \$35,000.

T. T. Tams and W. A. Bagby have arranged to handle Fisk tires in Trenton. They will also carry Delion, Eureka and Mohawk tires in their recently opened shop.

All rubber goods, in common with other commodities, used by the State of New Jersey, will after November 1 be bought by the State Purchasing Agent, Edward E. Grosscup. This is in conformity with a law passed at the last session of the Legislature.

General C. Edward Murray of the Empire Rubber Co. has been made a member of the general committee to arrange for the local reception of the delegates to the Atlantic Deeper Waterways convention on the occasion of their visit to Trenton this month.

Walter P. Austin, one of the managers at the Delion Tire and Rubber Co.'s plant, has moved his family from Washington, D. C., to Trenton.

John S. Broughton, president of the United and Globe Rubber Manufacturing Cos., recently returned from a vacation spent at Cape Cod, Massachusetts.

C. H. Oakley, president of the Essex Rubber Co., is recovering at St. Francis Hospital from an operation for appendicitis. Mr. Oakley was suddenly stricken with the trouble and an operation was at once performed. His condition was at no time serious.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

ALL of the rubber factories are running to full capacity and in many cases double shifts would be utilized if sufficient numbers of workers could be obtained. Large orders continue to be received for all kinds of rubber goods and carload lots are being shipped daily for both domestic and foreign consignment.

Several of the plants are considering the erection of additions and plans are now being drawn to provide for these improvements.

The Alice Mill of the Woonsocket Rubber Co. closed down on Friday night, August 4, for repairs and improvements and resumed on the 16th. One new boiler of the Dillon type, 18 feet by 72 inches, was installed, the other three boilers were reset and a new elevator pump was also installed.

The Millville plant of the same company was shut down for the same period. One of the most important additions to the equipment of this plant is the installation of three new electrically operated freight elevators, by the Otis Elevator Co., of Boston, Massachusetts. This is but one of a number of improvements that have been contemplated and which are now being made as rapidly as possible without interfering with the operation of the plant.

At the factory of the National India Rubber Co. at Bristol the constantly increasing business calls for large additions to the buildings and equipment and new work is being planned or carried out. The building formerly used as an auxiliary for the curing heats has recently been torn down and a new building, the same height as that of the building adjoining to the eastward, is to be erected adjoining the older structure.

The Universal Winding Co. has filed intentions, at the office of the city clerk of Cranston, to erect two new buildings at its plant. One of the buildings is to be used for foundry work in connection with the plant and is to be 220 by 161 feet. This is to be located 150 feet north of the No. 1 building and is to be constructed of brick and steel. The cost is given as \$40,000. The second building is to be 96 by 17 feet, one story in height and will cost about \$5,000.

E. C. Southwick, secretary of the foreign trade committee of the Providence Chamber of Commerce, has received a communication from a company located in Jaffa, Palestine, that desires to receive catalogs, quotations, etc., from manufacturers of certain goods including rubber goods, for early shipment at the expiration of the European war.

Officials of the Hope Webbing Co., Pawtucket, on Monday morning, August 21, unfurled two large flags over their office buildings in that city, one a national flag and the other a state flag. In speaking of the occasion, General Manager Charles S. Sis-on said that it was an innovation among industrial plants and that the object was to indicate the company's loyalty to both the country and the State.

The Phillips Insulated Wire Works, at Pawtucket, closed down on August 10 for an indefinite period. Numerous strikes have been called at the plant during the past few months.

Walter Norton, assistant superintendent of the United States Rubber Co.'s plant at Lycoming, Pennsylvania, who has been making a trip through New England visiting the various plants of the United States Co., was an interested visitor at the factories of the Woonsocket Rubber Co. at Woonsocket and Millville and of the National Rubber Co. at Bristol.

John Conrick, for several years in the office of the National India Rubber Co., Bristol, has resigned to accept a similar position with the Lee Rubber Tire Co., of Conshohocken, Pennsylvania.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

As far as government orders are concerned business remains brisk in mechanical, but has fallen off in proofed goods, with the result that solvent naphtha is obtainable at much more reasonable prices than prevailed a year ago. Side lights on the importance of various processes and departments are reflected from time to time in the application made to the tribunals for exemptions. A successful application was made the other day for the manager of a new rubber reclaiming factory on the ground that he was engaged in urgent work for the government. This sounds rather odd to those of us who have long been familiar with the clause in government specifications for rubber goods, notifying that no crumb rubber, reclaimed rubber, or rubber substitute may be used. Possibly this restriction may not be enforced at the present time, for some classes of goods at least. If this surmise is correct, it will be a source of gratification to manufacturers of high-grade alkali reclaim, who have long held that the clause should be deleted. In mentioning government orders, it must be noted that such do not refer to the British Government only, but to the Allies as well, and it may be that the specifications of different countries show variations. I may mention that the analytical tests which government rubber has to stand preclude the use of organic matter such as oils, and, therefore, it may be considered redundant to mention that they are ruled out. Thus the usual stipulation at the present time is "the rubber of the mixture must not yield more than 10 per cent of organic acetone extract, and not more than 10 per cent of organic alcoholic potash extract after removal of acetone extract." I may amplify this reference to reclaimed rubber by mentioning that two new works have recently been started, thus testifying to the good condition of the trade. Later on I hope to say more about these ventures.

SOME PENDING LEGISLATION.

One or two matters concerning politics are not without interest to rubber manufacturers at present. One is the bill which has already passed the House of Lords, which is to compel companies and firms or individuals trading under assumed names, to register the correct names of the partners. Thus the X. Y. Z. Rubber Co., makers of certain rubber goods, will have to register the names of the proprietors for public inspection. A bill to this end was brought in some years ago, but failed to pass. The favorable reception given to the present bill is due to the desire of traders to know whether firms with British titles are owned or not by those who at the moment are enemy aliens.

Turning to another matter, it is common knowledge that many British tire manufacturers have been keen on the stoppage of the imports of American tires, but for certain reasons the government has taken no action in the matter. The importation of other classes of goods, for instance, soap, has, however, been stopped, but there is by no means unanimous opinion among manufacturers that if such war time measures are perpetuated it would be to their ultimate advantage. A manufacturer said to me recently: "I would rather have American competition from over the water than have the Americans coming over here and putting up works next door to mine, which they probably would do."

With regard to pneumatic tires, it was reported that the Ford company was making preparations to produce its own tires and had taken extra land in Trafford Park, Manchester, for the purpose. This was when, in a previous budget, it was proposed to put an import tax on tires. As this proposal did not mature, the idea seems to have been abandoned; at any rate, for the present.

CRUDE RUBBER PRICES.

The price continues to favor buyer rather than seller, though the general opinion seems to be that if the commodity goes any lower it will only be to a trifling extent. Cautious but steady buying for future needs has been the rule lately, though I do not think that much credence may be attached to the somewhat sensational story that one of our largest works has bought very largely at 1s. 7d. per pound for future delivery. Fine hard keeps up its premium over plantation, the supply being somewhat less than a year ago, and there are the usual buyers who want this quality and will not look at anything else. It was noticeable at a recent auction that fine hard rose $\frac{1}{4}$ penny per pound while at the same time plantation fell $\frac{1}{2}$ penny. I understand that the slow American demand is to be attributed in part at any rate to the election. On this side we don't let elections interfere with business, but there is probably a difference in the election.

As to the future the opinion is widely held that there will be no more 3 shilling plantation, until peace comes and with it the German demand, which will, of course, be a large one.

CHEMICAL SOCIETY MEETING.

Among the large number of papers which were read and discussions which took place at the annual meeting of the Society of Chemical Industry, held this year in July, at Edinburgh, rubber was not mentioned at all, nor were any of the rubber manufacturers who are members present. In connection with the meeting there was an exhibition of dyes, various fine chemicals, and glass and porcelain laboratory apparatus produced for the first time in Britain and previously obtained from enemy countries. The North British Rubber Co. showed a large variety of erasing rubber goods, which though of course by no means new to British trade, have been imported largely, in the past, from Central Europe. An interesting exhibit was the blue oxide of cobalt made for the first time in Britain by the Beaverhall Colour Co., of Edinburgh, the source being Canadian cobalt ore. The exhibit of the Broxburn Oil Co., Limited, D. R. Stewart's paper on the Shale Oil Industry and the visit of the members to the works of the Pumpherton Oil Co. at Midcalder had associated interests with the rubber trade. This industry, like many others, has benefited by the war. For one thing, since the rise in the price of coal tar naphtha, the shale spirit, which has always been used to a limited extent, has been in greatly increased demand by Scotch proofers, and has probably gone over the border. In the course of a paper on recent developments in coke oven practice it was stated that at one place the waste gases were being burned under iron plates for the production of lamp black. The process was kept a secret and the reader of the paper knew nothing of the quality of the black. This development is of importance because of the scarcity and high price of American carbon black at the present time. One of the speakers said with regard to the utilization of the present glut of coal tar pitch, that the efforts which had been made to convert it into natural asphalt, or at any rate, to a body with the physical characteristics of the latter, had not been crowned with success.

Papers which were read in reference to the manufacture of fine chemicals and medicinal chemicals testified to the great progress which has been made in these branches in the last two years, a branch of manufacture in which Britain has always been backward. This should mean an increased demand for vulcanite and gutta percha, which are used to a much larger extent than in the heavy chemical manufactures. At the close of the meet-

ing a large party of the members visited the works of the North British Rubber Co. and were shown over a considerable portion of this hive of industry, including the new chemical laboratories, where the special apparatus for testing balloon fabrics for permeability to hydrogen was an interesting feature. The new buildings for the solid tire department are nearly finished, the machinery having been delivered. The party was under the efficient leadership of Mr. Porritt, chief chemist, and Mr. Luff, assistant.

PETROL RESTRICTIONS AND THE TIRE DEMAND.

The large and increasing demand of the service for petrol has resulted in civil consumers being limited to certain quantities, which has naturally had the effect of reducing motor traffic, especially long distance pleasure motoring. A resultant effect must be a reduction of business for the tire manufacture, though to what extent it is difficult to say. At this stage, at any rate, it is difficult to find anyone who cares to make a prediction. Already, however, in the West End of London, the discarded victoria and other horse-drawn vehicles have reappeared, and I have been told in the country that horse carriages would be brought out again generally, if there were not a shortage of horses. The push cycle is also being seen in increased numbers, so we may expect a run on carriage, cab and cycle tires this autumn. A wealthy owner of a Ford car with Goodrich tires told me that he had now got level with the owners of heavy expensive cars who used to chaff him, as he could cover a much larger mileage on his allowance of petrol than they could, and nowadays this is the main thing that counts.

COMING TO ENGLAND.

Hugh Fraser Macmillan, who recently left Ceylon on a well-earned leave of absence, completed last June, 21 years in the Ceylon Government service.

During that time he filled the post of curator of the Royal Botanic Gardens, Peradeniya, and has acted periodically as superintendent of the Hakgala Gardens during the absence of William Nock, now retired.

With the reorganization of the Peradeniya staff under the scheme for an Agricultural Department formulated by R. N. Lyne, the Director of Agriculture, Mr. Macmillan was appointed superintendent of Botanic Gardens in Ceylon with a curator to assist him at Peradeniya.

During his 21 years' service in the East Mr. Macmillan has made a thorough study of the flora of the Eastern tropics, in which he was aided by his knowl-

edge of the vernacular languages acquired soon after his arrival in the Island; and as the fruits of his experience he has produced his "Handbook of Tropical Gardening and Planting," which has become a standard work of reference.

A photographer of no mean order, Mr. Macmillan's studies of plant life are in great request both for local and foreign publications.

In addition to his regular duties Mr. Macmillan is lecturer

on Economic Products at the School of Tropical Agriculture. He is the author of an excellent illustrated guide to the Peradeniya Gardens, and has written numerous bulletins for the Department of Agriculture, papers for the Agricultural Society and articles for the "Tropical Agriculturist."

The Peradeniya Gardens of to-day owe much of their beauty and attraction to his trained and artistic eye which has also brought him into prominence at the agricultural shows. He was Secretary of the All Ceylon Exhibition of 1912 and in recognition of his services in this capacity he was presented with a special gold medal. He has a host of friends who will welcome him on his arrival in England.

INVENTOR OF MURAC INSOLVENT.

A meeting of the creditors of Morland Micholl Dessau, inventor of "Murac," was held last month at the offices of the official receiver for the Brentford district. Mr. Dessau at this hearing stated that he is an American subject and came to this country in 1893 with a free capital of about £5,000. In 1906 he invented a process for the manufacture of "Murac," to improve low-grade rubber. This invention was assigned to the Murac Syndicate, Limited, which was succeeded by the British Murac Syndicate, Limited, the inventor receiving shares in the company and being appointed technical adviser at a salary of £700 a year, and commissions which amounted to £200 a year. He also invented a machine for washing rubber on which he received one-half the profits, but the business and patents were afterwards sold to the Crude Rubber Washing Co., Limited. The business of this latter company was not successful and the inventor found himself indebted to the London Venture Corporation which had promoted the Crude Rubber Washing company. Although since then he has invented a rubber-capped wooden block intended for use in paving highways, an expanding joint for guttering highways, and a rubber skate, the exploiting of these has been unsuccessful on account of the present war conditions. For the last year he has been employed as a buyer for the Associated Rubber Manufacturers. He has lost on the Stock Exchange and in the raw rubber market, to an estimated amount of £30,000, but it was not until this action was taken by his creditors that he discovered himself insolvent. The official receiver postponed the meeting, intimating that a proposal of composition for the benefit of his creditors should be made, which must not be less than 5s. on the pound.

RECLAIMED RUBBER

I have found a trade circular over thirty years old in my rubber archives, which emanates from Loewenthal & Morgenstein of New York and is headed "Rubber Shoddy for galoshes, clothing, hose buffers, insulated wire, and all other kinds of rubber work. Works: Cresskill Rubber Works, Cresskill, N. J." The circular explains that the shoddy is made of old rubber boots and shoes by a mechanical process by which they are finely pulverized and the fibre and other deleterious matter removed, leaving a fine vulcanized rubber powder. Two grades of this powder were made, and it was offered to the rubber trade in this state, with instructions for devulcanization. The process is summarized as follows:

"The powder is put into iron pans about 2 feet deep which are placed in a steam vulcan pan with live steam and covered to prevent condensation of water on the rubber. The heat is kept at 300 F. for 25 hours, after which the rubber is ground on mixing rolls until it will produce even sheets, which occupies twenty to thirty minutes, the rolls being kept at the temperature required for working low grade crude rubber." It is stated that "some manufacturers use 50 per cent of this shoddy for galoshes and from 10 to 75 per cent for belting, packing and mats, but practical experiments are advised in order to determine the quantity which is suitable."

In addition to selling the original shoddy powder to manufacturers the Cresskill Rubber Works also devulcanized it them-

selves and sold the powder in the devulcanized form. This circular evidently relates to the beginning of the now large and important reclaimed rubber industry, and it would be interesting to know whether a satisfactory sheet was really obtained without the addition of mineral oil or other binding matter, as is customary in the mechanical process of today. Perhaps some of our manufacturers who received this circular between 30 and 35 years ago and responded to it might be disposed to relate their experiences. The reference to the extensive use of the substance for rubber belting synchronizes rather ominously with the date given in a preceding paragraph for the deterioration of rubber belting.

BRIEF NOTES OF INTEREST.

The authorities here have discovered that hundreds of rubber covered typewriter cylinders have been shipped by small London firms to neutral countries. Believing that Germany was probably their ultimate destination, many parcels have been seized, and it is anticipated that prosecutions will be instituted under the Customs Exportation Prohibition Acts and the Orders in Council.

The Trading with the Enemy Amendment Act, 1916, has been applied to the property of the Bakelite Co., Limited, Orb Works, Cowley, Middlesex, for which a controller has been appointed.

Owing to extended increase in its solid tire business in Scotland, the W. T. Henley's Telegraph Works Co., Limited, London, has opened a depot adjacent to its Glasgow branch where a hydraulic press is maintained for fitting and removing solid rubber truck tires.

Announcement has been received from Richard Julius Hoffmann, 139 Cannon street, London, E. C., to the effect that he has changed his name by legal process to Richard Julius Arnold.

RUSSIAN RUBBER COMPANY PROFITS.

A general annual meeting of shareholders of the Russian-American India-Rubber Co., "Treugolnik" was held in Petrograd on March 31 (April 13) last. Accounts for the year 1915 were submitted and approved.

The net profits amounted to 12,845,212 rubles [\$6,615,284] and the dividend to be paid was fixed at 35 rubles [\$18] per share.

The board of directors was authorized to add 9,000,000 rubles [\$4,635,000] to the capital of the company for the purpose of extending its business and handling large orders obtained from the Russian Government.

Aside from its nominal value of 100 rubles [\$51.50], each new share will include a premium equal to the part of each old share in the company's reserve fund. To facilitate the realization of this new issue of shares, the directors were authorized to draw from the special reserve fund—which is at the disposal of the shareholders—a sum of 5,670,000 rubles [\$2,920,050] to pay up, at the rate of 63 rubles [\$32.44] per share, a portion of the premium on the new shares, so that the shareholders would have to pay cash only for the balance of the premium due, plus the nominal value of the shares.

Another annual meeting of shareholders of a rubber manufacturing company recently held in Petrograd, was that of the "Bogatyr" Mechanical Rubber Co. The capital of this company is 9,380,000 rubles [\$4,830,700] and the profits for the year 1915 amounted to 2,674,261 rubles [\$1,377,244]. A 9 per cent dividend was declared.

AUTOMOBILE TIRES IN SWEDEN.

A large demand is reported to exist in Sweden for American automobile tires; there being practically no others on the local market.

As the Entente Allies are allowing to pass their blockade, only the same number of tires as were imported by Sweden in the 12

months preceding the war, very few American tires are getting into that country. Most American cars imported come in without tires and the stocks of tires that are in the country are mostly held by speculators.

It is stated that recently a dealer in a low-priced American car was obliged to pay as high as \$300 a set for tires for a car selling in the United States at slightly more than \$400 fully equipped.

THE SITUATION IN FRANCE.

By Our Regular Correspondent.

FIGHTING here has increased a hundredfold since I last wrote you. To the vigorous defensive of the Verdun sector our armies, together with those of our Allies, have added a gigantic offensive movement on the Somme front, where rubber-tired automobiles and motor trucks are, like at Verdun, playing a leading part. Probably a hundred thousand are engaged in transport and staff work, and these are consuming about four times as many solid and pneumatic tires as an equal number of machines would wear out under normal conditions in private use.

In spite of this tremendous demand our rubber manufacturers are giving full satisfaction.

DISTRIBUTION OF TIRES.

In the early days of the war there was great lack of organization in the distribution and the repairing of tires, with the result that the wastage was terrific. The suddenness and the extent of the effort necessary to stem the tide of invasion was such that tire economy was considered a matter of no importance. Drivers of cars using pneumatic tires, having neither time nor means of effecting repairs, abandoned damaged tubes and casings by the roadside, and their claims for new ones were never questioned. All this has been corrected. Now each and every car and driver works from a base or depot, into which every worn

RUBBER TIRES RECEIVED FROM THE FRONT.

or damaged tire casing or tube has to be returned before new ones are allowed. From the depot the damaged tires are sent to central repair stations, where they enter a well-equipped shop and are, when possible, made almost as good as new. Repaired tubes are tested, dried, talced and packed in cardboard boxes marked with their dimensions, makes and other necessary indications. Repaired casings are wrapped and marked just as for new ones. These repaired tires are stored in special warehouses and distributed, several hundred a day, to the army machines as needed.

SOLID TIRES.

Similar methods are employed for solid rubber tires. Travelling hydraulic presses, like the one I described and of which I sent you a photograph in a previous letter, are carried on trailers hitched to motor repair trucks. The solid tire depots are also provided with large hydraulic presses. All current solid rubber

tires are returned to the depots of the respective army sectors, special machines pare off the rubber remaining on the steel bases, and the latter, together with the scrap rubber, are sold from time to time, as quantities accumulate, to tire manufacturers and rubber reclaimers, so that, all in all, waste is reduced to a minimum.

TWIN TIRES.

I note that the subject of twin or dual pneumatic tires—which is by no means new here—is attracting much attention in American automobile circles.

Dually mounted pneumatic tires have been used here in France for more than four years, and their use has greatly increased since the outbreak of the war.

Prior to the war twin tires were never recommended for light weight automobiles, being only of advantage on cars in which the weight to be borne by each of the rear wheels was in excess of 1,500 pounds per wheel, practically the limit weight that can be borne, without excessive strain, by current sized pneumatic tires. On such cars it was found that the use of these dual tires was of decided advantage. They required less air pressure per tire than single tires carrying an equal weight and they gave better mileage results.

Under war conditions the use of twin pneumatic tires has greatly increased, especially for ambulance work, and more because of the increased security they afford—one tire can be punctured without necessitating a stop for changing. Further, twin fittings allow the use of repaired casings and tubes that would never stand the strain were they mounted singly.

The objection to dual tires is that they increase the traction effort necessary to move the cars, therefore require more gasoline, and have the bad habit of picking up rocks and throwing them with no small force.

TIRES IN PRIVATE USE.

We are so much absorbed by the war that I have, up to date, failed to mention the fact that very large numbers of private cars have been kept in commission in spite of the war and that these consume considerable quantities of tires. This private demand for tires has also been largely taken care of by our domestic rubber manufacturers.

LEATHER TREADS.

Our tire manufacturers have largely, not to say completely, discarded the leather tread metal-studded anti-skid tires which have so long been in almost universal use in Continental Europe. They have continued to make metal-studded casings, but the studs are now embedded in the rubber tread and in the fabric of the tire, instead of being anchored in a leather cover.

It will be remembered that leather treads were made of chrome-tanned cowhide and required leather taken from the middle of the back of the animal. Chrome tanning made the leather impervious to water and prevented it from softening when wet.

Many attempts had previously been made to launch metal-studded rubber tread tires on the market but these had always failed, chiefly on account of lack of durability, which was due to faulty methods of tire building. The scarcity and consequent high cost of leather has led to great improvements in the making of these rubber tread, metal-studded casings, but it has not as yet been proven that this type will show itself to be equal, let alone superior, to the time-honored leather non-skids.

RUBBER IMPORTS AND EXPORTS DURING 1915.

Statistics for the year 1915 have been recently published. Although the individual items of these statistics are not as well defined as in normal times it is probable that those for rubber represent more imports of rubber and rubberized clothing, footwear, etc., than tires. It is, of course, true that in the first year of the war large quantities of rubber tires were imported, especially solid tires for American motor trucks, which came into this country in great numbers.

The imports of manufactured rubber in 1915 amounted to \$4,928,000, as against \$4,970,000 the previous year.

Exports of rubber goods, largely tires, amounted to \$13,958,725 in 1915, as compared with \$16,395,350 during 1914.

SALES OF AMERICAN CHEWING GUM.

An interesting development of the war times, though not exactly a rubber item, is worthy of mention.

American chewing gum has long been sold in Paris and other centers, but almost exclusively to American visitors, for whose convenience it was stocked by druggists patronized by them. Since the outbreak of the war chewing gum has become popular with native consumers, and it is now being sold in many parts of the country, not only by druggists, but also by tobaccoists and other retail dealers. The gum is presented in American style, but with French labels, and it is retailed at relatively the same prices as in the United States.

THE CHEMICAL INDUSTRY.

I have repeatedly mentioned to you the scarcity of chemicals for the rubber industry and the necessity of importing much of these from abroad.

Conditions in our chemical industry have greatly improved. War orders and the absence of German competition have made this a really profitable industry, and it has developed to a remarkable degree. The manufacture of chemicals, materials for explosives, medicines, antiseptic preparations or the treatment of wounds, etc., has been developed along with the manufacture of benzene, benzol, toluene and the like, and acids and coal tar products, which were formerly imported from Germany, are now being produced in excellent quality in France.

Our rubber manufacturers are still importing many chemicals and compounding ingredients, but the energy and skill of our chemical manufacturers is achieving success and it will not be long before almost all our requirements will be produced by domestic manufacturers.

SECOND SAMPLE FAIR AT LYON.

Beginning March 1, 1917, and continuing for 15 days, the Second Annual Lyon Sample Fair will occupy the attention of the commercial world. The first fair was opened on March 1, 1916, and although there was scarce time to work out the details of such a great undertaking, it proved, nevertheless, to be an immediate success and gave promise of accomplishing its original purpose of establishing a sample fair in France similar to the great Leipzig Fair held in Germany.

At the last Lyon Sample Fair, it will be remembered, rubber companies of France, England, Spain and Italy were well represented and all reported unexpectedly large sales.

American rubber concerns should take advantage of this opportunity to present their products to French buyers. The total sales made in all merchandise from samples at the last fair exceeded \$30,000,000.

TRADE NOTES.

A severe fire resulting from a short circuit recently caused damages estimated at more than \$60,000 to the rubber factory operated at Billancourt, near Paris, by Arthur Gobert, manufacturer of friction tape, rubber solutions, and reclaimed rubber.

The Société Générale des Établissements Bergougnan, Clermont-Ferrand, well-known manufacturer of rubber tires and general rubber goods, has issued 16,250 new shares of 500 francs [\$96.50] each, completely paid up by the reserve fund of the company. This reserve fund amounts to 10,000,000 francs [\$1,193,000] and is wholly made up of funds derived from premiums paid by subscribers on shares previously issued to increase the company's capital. These new shares are to be distributed

among shareholders at the rate of one new share for two old shares, taking part in the profits earned from October 1, 1915, on. The Bergougnan company's profits for the fiscal year 1913-1914 amounted to 6,746,445 francs [\$1,303,064].

At a meeting recently held by the shareholders of the Société des Établissements Hutchinson, tire and rubber manufacturers, a dividend of 30 francs [\$5.79] per share was declared for the year 1915 on preferred shares, while a 40-franc dividend [\$7.72] will be paid on common shares. In 1914 the common shares only received 25 francs [\$4.82] per share. The total profits of the company in 1915 amounted to 2,531,525 francs [\$488,525] of which a large amount was written off to the reserve fund.

Rubber Planting Notes.

FUNGUS OF RUBBER IN MALAYA.

IN the last two years the fungus *Ustilina Zenata* has attained prominence in the Federated Malay States as the cause of a root disease affecting rubber trees over ten years old.

This root disease was first noted early in 1913 by E. Sharples, mycologist of the Agricultural Department of the Federated Malay States, but it was 12 months later that the fungus was isolated in pure culture and the fruit bodies found. Evidence obtained during the last year indicates that the fungus has been causing damage for several years. A manager of a rubber estate in Johore reports that he has been losing trees, owing to its attacks, since 1907.

This same fungus is the cause of a common root disease of tea in Ceylon, though it is not yet certain that it attacks *Hevea* in that country.

In Malaya, the fungus is found on old plantations in every part of the peninsula. It attacks old rubber trees, especially in the region of the Collar; only in advanced cases does the fungus spread up the stem and it seldom reaches two feet above the soil level. The diseased wood, on exposure, is found to be dry and tindery, and, running through the diseased tissues, conspicuous black lines are to be seen.

Fungus appears to be one of the chief agents causing the rotting of rubber stumps and logs left in plantations after thinning out operations. It enters the stumps and grows down them into the lateral roots. The roots of growing trees in contact with these infected laterals are quickly attacked.

Remedial measures against this root disease consist of thorough cleaning of timber and jungle stumps when clearing, and of rubber stumps and logs at the time of thinning-out. Strict sanitation methods, thorough clearing, attention to wounds, etc., should be strongly advocated lest fungoid diseases impair the future of the rubber planting industry.

CRUDE RUBBER INDUSTRY IN PERAK.

According to the annual report for 1915 by the British Resident in Perak, Federated Malay States, the quantity of crude rubber exported during the year was 16,663 tons as against 11,041 tons in 1914, an increase of 5,622 tons.

The acreage in rubber alone of estates exceeding 100 acres in area was 164,022 acres, with 2,226 acres in addition interplanted with catchcrops; of this area 2,195 acres was planted in the year under review. The crop for this total area was given as 12,112 tons.

RUBBER IN SELANGOR.

The annual report for 1915 by the British Resident at Selangor, Federated Malay States, recently published, contains some interesting details concerning the rubber planting industry in that state.

The approximate area under rubber was 255,326 acres. In some estates in the Klang district where rubber was interplanted

FRENCH GOVERNMENT SPECIFICATIONS FOR RUBBER MASKS.

The French Government specifies the following composition and tests for the rubber employed in the manufacture of army masks:

New rubber, not less than 50 per cent. Sulphur of vulcanization, not to exceed 5 per cent of the rubber present. Free sulphur, not over 1 per cent. Mineral residue (ash), not over 35 per cent. Moisture, not over 3 per cent. Reclaimed rubber and substitutes, none. Minimum thickness, 1 millimeter [.03937 inch.]

The rubber must withstand a tensile strain of 250 grams per square millimeter without breaking, and be able to stretch at least 25 per cent.

with cocoanut trees, the latter were cut out in order to allow the rubber trees to develop. In many small holdings, also, cocoanut trees in good bearing have been cut out in order that rubber may be planted. This practice on the part of small owners is condemned by the Director of Agriculture, Federated Malay States, who advises that it be discouraged as far as possible.

About the middle of the year a demand suddenly sprang up among small cultivators for the seed of what was known as "getah chat," a species of rubber which was said to grow faster and give better return than *Hevea*. The origin of the report had not been discovered, but inquiry proved that the tree in question was identical with the *Ceara* rubber tree, and steps were taken to warn cultivators of its low economic value as a rubber producer.

CRUDE RUBBER EXPORTS FROM THE GOLD COAST COLONY.

According to a report of the Comptroller of Customs at Accra, British Gold Coast Colony, the value of the total exports of crude rubber from that colony during the year 1915 amounted to £25,167 [\$122,475], as compared with £21,631 [\$105,267] in 1914; showing an increase of \$17,208.

RUBBER TRADE OF JAVA AND SUMATRA.

According to a recent report of the American Consul at Batavia, Java, the United States bought 7,486,080 pounds of plantation rubber from Java in 1915 and maintained for the whole year its rank as the island's best customer, which it had won in the January-June half of the same year. Great Britain was second with purchases of 4,818,240 pounds, and the Netherlands third with 2,885,120 pounds. The total for the year was 96 per cent larger than for 1914, amounting to a total of 16,705,920 pounds, as compared with 8,581,440 pounds in 1914.

The Dominion of New Zealand has placed an export embargo on crude and manufactured rubber.

RUBBER SAMPLES FROM NORTHERN NIGERIA.

The Imperial Institute, London, England, has recently published the results of tests made on a sample of rubber produced in Northern Nigeria.

The sample lost 26 per cent. of its weight in washing (due to the large amount of impurities). The analysis of the residue showed:

Caoutchouc	49.2 per cent.
Resin	47.7 per cent.
Proteins	2.4 per cent.
Ash	0.7 per cent.

The caoutchouc that was separated was almost black and its physical properties were poor. From the analysis the investigators concluded that the sample probably came from the *Ficus vogelii*. Samples of rubber produced from the latex of *Ficus vogelii* growing in Gambia and on the Gold Coast had previously been tested at the Imperial Institute.

THE RUBBER TRADE IN MALAYA.

By Our Regular Correspondent.

THE annual meetings of many of the rubber estate companies of the Malay Peninsula have been coming thick and fast in the last two months, and to those connected with the industry a comparison of the reports for 1915 is of interest. Though companies may differ widely in degree, some owning new estates which are just beginning to feel their feet, and others being old established concerns—as old established goes in the Eastern rubber trade—one dominant fact stands out in all the reports; that is, 1915 was a good year. Among most of the companies which have reached the paying stage, a dividend of less than 10 per cent for the year is exceptional. In the gilt-edged varieties we find figures calculated to take away the breath of those who are not acquainted with rubber's paying properties. There are companies which have paid 160 per cent and more for the year, and cent per cent is not by any means uncommon. Those outside the magic circle can only vaguely imagine what it feels like to get one's investment, and more, returned annually.

As perhaps the majority of the companies are registered in England, and the bulk of the shareholders reside there, a matter of immediate concern to directors at the present time is that of excess profits taxation. Just now, no one seems to have any definite idea as to what rubber companies will be called upon to pay in this direction, and all that can be done is to carry forward substantial sums to cover any possible demands. Naturally a Chancellor of the Exchequer, with war expenditure to provide for, is likely to keep a sharp eye on companies which pay big dividends. While the most prosperous companies feel that they cannot reasonably object to whatever calls are made, many of the newer ones feel that they have a legitimate grievance in one respect. Estates may have reached a paying basis only since the war began, and shareholders feel that not only is it impossible to attribute their profits to the fact that war is being waged, but that profits would probably have been a great deal bigger if there had been no war. But these are questions which have still to be decided, and, as I have said, all that companies can do at present is to retain an ample reserve.

The matter of forward contracts is also prominent in most reports. As is generally known, forward contracts have become a feature of the rubber business of late years, for when the last echoes of the boom of 1910 had died away, and the price began on a steady downward course, many companies became anxious regarding the policy of selling from month to month, and would agree to sell so much of the monthly output at a fixed price for, say, one year. The days when a price of four shillings a pound was not at all unlikely seemed gone forever. A two-shilling period appeared to have set in, so it was thought better to sell at, say, a fixed 2s. 4d. for the year than to fluctuate from 1s. 10d. to 2s. 8d. These figures are, of course, merely approximate. Naturally a forward contract policy cuts both ways, and in 1915 the cut happened to be against the seller. In the last six months of the year there was a sharp rise in prices, and companies which had contracted to sell so much of their output at 2s. 5d. a pound bemoaned the fact that in the absence of forward contracts they could have got an easy 2s. 11d. However, directors console themselves with the reflection that the forward contract policy seemed best when the year began, and they could not be expected to foresee what the last few months would bring to light.

A point in reports which those concerned with the manufacturing side of the business will note with pleasure, is that it is now quite the rule for companies to earmark a certain portion of their output, to be used in the scheme for investigating new uses of rubber. It is generally admitted nowadays that the methods of employing rubber are only beginning to be discovered, and with the export from Malaya increasing practically

month by month, it is easy to see that this is a point which concerns the producer as much as the manufacturer. That companies owning estates realize this is now quite evident, and with the money and produce which is being set aside for the purpose, one hopes to hear of a big step forward in the development of the product's usefulness.

As regards the increasing output from Malaya, a passage from the last report of the Colonial Secretary of the Straits Settlements is of interest. Here it is said that rice cultivation, formerly the staple industry of the Straits Settlements and the Federated Malay States, is fast disappearing. The Malay who owns a few rubber trees can live in comfort, have silks for himself and his family, and buy all the imported rice he wants—a decided contrast to the lot of the rice cultivator, who has to cultivate with all his might, in order to support a bare existence. Demands for rubber plantations are increasing enormously, and where possible, as regards small native holders, the government lets them out with the proviso that trees are grown in conjunction with the cultivation of more homely products. Meanwhile, rice fields are allowed to lie fallow so that cultivation can be taken up again at once if necessity arises.

The following figures, which are those for the first quarter of the present year, show the increase in the export of rubber from Malaya down to the present time.

	1914.	1915.	1916.
January	2,542	3,473	4,471
February	2,364	3,411	5,207
March	2,418	3,418	4,429
Totals	7,324	10,302	14,107

PECULIAR METHOD OF GATHERING RUBBER IN SIERRA LEONE.

A CURIOUS and interesting method of collecting *Funtumia elastica* rubber in Sierra Leone is described in a book recently written by O. H. Newland, director of the Peneiro Rubber Estates, Limited.

The natives fell the tree and cover it with dry grass, which is set on fire. The heat generated is just sufficient to cause a practical coagulation of the latex in the lactiferous vessels. The bark is then bruised off by pounding with stones, and the debris taken down to the river and washed thoroughly to separate the bark from the rubber. The separation is seldom complete, and the result is a dirty rubber, fetching 2s. [48 cents] per pound.

This primitive method, however, is not universal in Sierra Leone. The more intelligent natives ascend the trunk of the standing tree by means of a sling passed around the trunk. One end of the sling is provided with a loop which fits over the right thigh. The worker keeps his left foot on the sling and thus, by moving the rope up the tree the ascent is rapidly accomplished and when the desired point is reached, both hands are free to make the tapping.

The climber carries a chisel with which he cuts vertical as well as transverse oblique grooves, forming a rough "herring bone" pattern, which may be continued the whole length of the trunk, and even extend up to the main branches. The flow of latex commences at once, and follows the vertical channel into a calabash placed at the base of the tree, being guided by means of a lip of clay or a chip of wood. The quantity of latex procured at one tapping varies from a pint to two quarts per tree. After each tapping the tree is allowed to rest several months, during which the wounds heal. On the second tapping the same form of cut is made upon the opposite side of the tree, and the transverse channels often intersect those made previously.

In gathering the vine rubber of the *Landolphia ovariensis*, the natives add lime juice to hasten coagulation when it is necessary to do so. Usually, however, the *Landolphia* latex coagulates in the tapping wound almost immediately upon exposure

to the air. Ofttimes the collector merely smears the fresh latex upon his naked body, until enough has been coagulated to be stripped off and formed into a small ball, which serves as a nucleus for winding on the strips of fresh latex, as the new cuts are made.

THE RUBBER TRADE IN DUTCH GUIANA.

By Our Regular Correspondent.

THE report on the leaf disease prevailing in the colony made by the Agricultural Department has not yet been published, although it is said to be completed. The matter has been treated at length and should furnish interesting reading.

In the neighboring colony of British Guiana Mr. Bancroft mentions in his report on the South American Leaf Disease the following improved methods of treating the disorder:

"Six pounds of copper sulphate are dissolved in five gallons of water in a wooden vessel. Then four pounds of lime are slaked in a little water and put in a tub with 45 gallons of water; it is stirred well and allowed to settle. After it has settled the clear supernatant lime water is poured off and mixed with the copper solution, the whole being thoroughly stirred for at least five minutes. Care must be taken to determine that all the copper has been precipitated and this can be done in the usual way by testing the mixture with a clean, bright blade of a knife. If copper is found deposited on the knife blade, then there is copper in the solution and more lime water is to be added." It is claimed that this method insures a mixture which will act more quickly than the old method, and also that the fungicide is more effective.

The quickness of action is of great importance in dealing with many fungoid attacks, especially so in the case of the present leaf fungus attacking rubber plantations. What treatment will be recommended here in Dutch Guiana is hard to tell, but as far as can be gathered, a treatment of spraying will be instituted.

On the government rubber plantation "Slooywijk" the disease is rampant, and measures have been taken to cut down the trees and plant in their stead coffee, which, in the government's opinion will be more remunerative in the near future.

On other plantations in the colony, the disease does not appear to have such disastrous results, and hopes are entertained for an eventual speedy recovery.

RUBBER TAPPING UNREMUNERATIVE AT PRESENT.

Tapping operations have been carried out on only a few estates during the past six months, owing especially to the want of lucrative markets, but, it is said, as soon as the war is over, a general tapping campaign will be commenced, when it is anticipated an increase in the price will follow.

BALATA PRODUCTION LARGE.

The balata industry is showing signs of vigorous health, and several thousand bleeders are engaged in gathering this season's harvest, which is expected to be large. Several parcels are arriving daily from the interior and if weather conditions remain as satisfactory as at present, the production will be a large one. Government figures show the production from January to June, 1916, 234,840 kilos [517,728 pounds]; January to June, 1915, 74,222 kilos [163,630 pounds]. The bulk of the product is yet to arrive, August and September being the greatest productive periods.

BLEEDERS EMIGRATING TO FRENCH GUIANA.

One of the principal collectors has transferred his office to French Guiana, where he has joined company with a wealthy French combination and is said to be reaping a big harvest. Many of the bleeders employed at Cayenne are old seasoned Surinam men who left the colony when the new regulations were instituted here. They find French conditions much better and can earn more money.

French Guiana promises to become a most important balata center, and already reports are going the rounds that in 1917

most of the best bleeders from this colony will join their friends in the new fields at Cayenne.

DRAINAGE AND IRRIGATION NEEDED.

The recent heavy rains which have caused flooding in many districts where agricultural pursuits are carried on, again brings forward a question which has been raised more than once in the local press, viz., the possibility of a new Department of Irrigation and Drainage being formed.

It is well known that on drainage and irrigation hang most of the agricultural problems of this colony. It is certainly worth while getting to the root of the matter, for with good drainage and irrigation, even the most backward farmer is fairly certain to earn a competency.

When one considers the enormous advantage to be gained by the colony if the best and highest returns are obtained to the acre of cultivated land, it seems lamentable that no more effort has been made than has actually been the case.

OTHER AGRICULTURAL REFORMS NEEDED.

It would be far wiser for us to face, not only this question of drainage and irrigation, but also the question of building up a solid, thriving peasantry, the establishment of agricultural schools not confined to one district, the creation of a more elaborate system of school gardens, and a carefully devised and extensive scheme of field instruction. In other words we must face our agricultural problems and be prepared to spend more money on schemes which are bound, if properly conducted, to prove sound investments. One has but to look at the money voted for the Agricultural Department to be assured that it is impossible for those responsible for the agricultural progress of the colony to accomplish very much. No, we have to face the position. If we are to do work of a permanent nature we must find the money to do it with. Other problems of even less importance have, in the past, received sufficient money to carry them through. Why not agricultural problems?

RUBBER AND BALATA INDUSTRY IN NORTHWEST BRITISH GUIANA.

According to an official report on the industrial conditions in the Northwest District of British Guiana and covering a period of nine months ended December, 1915, very little work has been done in the balata industry in that district during the period covered and no large yields are expected for the present year.

The Consolidated Rubber & Balata Estates, Limited, surrendered 73 of their licenses. The following table shows the shipments of balata for the nine months:

Barima District	385 pounds
Barama District	1,461 "
Total	1,846 pounds

The imports of balata from Venezuela into British Guiana during the period covered amounted to 29,945 pounds valued at \$7,761.78.

The area under rubber was increased 50 acres and the Consolidated Rubber & Balata Estates, Limited, was engaged in extending the cultivation on the land held by them under lease on the Aruka river; 80 acres were cleared and 47 acres empoldered and planted up with Para rubber—100 plants to the acre—and interplanted with catch crops of ground provisions.

This company was engaged in tapping the trees of the David Young Estates, Aruka, now the property of the company. They shipped from this plantation more than 5,000 pounds of rubber of very good quality.

The tapping at the experimental station was continued with satisfactory results, and a further block of trees was prepared for tapping in the present year.

During the period covered by the report the rubber cultivation of the district was rather severely attacked by the

Hevea leaf disease. Active measures consisting in spraying with Bordeaux mixture were undertaken to cope with the disease. It was, however, impossible to say whether the steps taken would eradicate it. The Assistant Director of Science and Agriculture, Mr. Bancroft, visited the district during November in connection with the outbreak of the disease.

There was no increase in the area under rubber cultivation at the Experimental Station. The existing cultivation was, however, well maintained.

RUBBER TIRES IN GUATEMALA.

THE American Consul at Guatemala City, Guatemala, has made a very interesting and timely report on the use of rubber tires in that country.

In Guatemala City rubber tires are used on approximately 307 carriages of all sorts, 113 automobiles, 573 bicycles and 17 motorcycles; a total of 1,110 vehicles, and it is safe to say that in the rest of the country there are not more than 15 or 20 automobiles and rubber-tired carriages, while bicycles and motorcycles are practically unknown outside of that city.

CUSTOMS TARIFF.

There is no specific provision in the Guatemalan customs tariff for rubber tires, but, upon request from the Consul, the Director General of Customs stated that such tires were classed with carriages and their accessories, and paid duties ranging from \$4.09 to \$7.21 per 100 pounds.

When shipped alone rubber tires are taxed \$7.21 per 100 pounds, but when shipped with vehicles are subject to the same duty as the vehicle to which they appertain.

All of the duties are payable one-half in United States currency and one-half in the money of the country.

IMPORTS OF TIRES.

Tires are not listed as separate items in Guatemalan import returns, but are included under several headings, "Accessories for vehicles," "Automobiles and accessories," "Vehicules, bicycles and accessories," which include so many things besides rubber tires that it is hardly possible to form an idea of the amount and source of the tire imports.

RUBBER IMPORTS OF THE DOMINICAN REPUBLIC.

The American Vice-Consul at Santo Domingo reports that during the year 1915 the Dominican Republic imported rubber and manufactures of rubber from the United States amounting to \$31,965. Porto Rico ranked second with \$1,800; \$365 was imported from France; \$215 from Spain; \$118 from Germany, and only \$79 worth of rubber goods were imported from Great Britain. During the year covered by the report, \$66 of waste rubber was shipped from Santo Domingo to the United States.

RUBBER GOODS IMPORTED BY ARGENTINA.

In a report for the year 1915 just published, the American Vice-Consul at Buenos Aires states that during the year Argentina imported \$103,153 of rubber tubing, weighing 363,196 pounds, and other rubber goods valued at \$193,175, of which the weight and nature are not given.

THE FIRST RUBBER FACTORY IN JAVA.

The Nederl. Indische Caoutchouc Fabriek (Netherlands India Rubber Works), Bandoeng, Java, is the name of the rubber company that will soon start manufacturing mechanical rubber goods in the island of Java. According to L. A. van Rijn, director of the company, who passed through New York on his way to the Far East, the machinery is being installed as rapidly as possible and later on the company will undertake the manufacture of solid tires. Mr. van Rijn was formerly manager of the Netherlands Gutta Percha Co., Singapore, Straits Settlements, mention of which was made in THE INDIA RUBBER WORLD, July, 1907.

PROPOSAL TO REDUCE TARIFF ON MANUFACTURES OF BRAZILIAN RUBBER.

A bill has been introduced into the Brazilian Congress proposing to encourage the consumption abroad of Brazilian rubber by means of reduced import duties on products manufactured of such rubber. The new bill provides for a reduction of 95 per cent of the ordinary duties on such articles, if they are accompanied by a declaration from the manufacturer, duly authenticated by a Brazilian consul, attesting that the goods are made of "Fine Para" rubber. The words "Para Rubber, Brazil" or their equivalent in the language of the country of origin must be stamped on such articles. On certain grades of insulated wires and cables, in the manufacture of which Para rubber has been used, the regular duty is to be reduced 90 per cent. It is proposed to make pneumatic automobile tires not made of Brazilian rubber (present rate 5 per cent ad valorem) dutiable at 15 per cent ad valorem.

This measure differs from the Budget Law passed by the Brazilian Congress in 1915 in that no discriminatory surtaxes are imposed on articles made of other than Brazilian rubber. The 1915 law fell into disuse because there were no means for distinguishing between the contents of pure Para and other rubbers. With a view of remedying this difficulty, the new bill prescribes a number of tests for determining whether articles are made of Brazilian rubber. Thus goods admitted at the reduced rates must stretch six times their size without breaking and must stand all the elasticity and compression tests required by certain French organizations such as the French State Railways, the Arsenal at Châtelleraul, and the Forges et Fondueries de Pont-à-Mousson, and may also be subjected to other tests.

Commenting upon this proposed modification of the Brazilian customs laws, our contemporary, "Wileman's Brazilian Review," says that the Brazilian import trade in rubber goods is not very big and that it doubts if many will be induced to certify that the constituents of goods that consist "for the great part of chemicals" contain purely Para rubber, but some no doubt will be found, and among them probably the parties that the bill promoted by Dr. Passos Miranda will favor. If it is left to the discrimination of the Custom House, it is pretty certain that few manufactures will pass the test and that those which do will get a practical monopoly. Our contemporary further suggests that this probably is the real object of the promotion of the bill.

A rubber manufacturing industry is being gradually developed in Brazil, thanks to the protective customs tariff, and it is thought a reduction of the tariff such as proposed in this bill would mean its extinction.

PARCEL-POST CONVENTION WITH CHINA.

A development of interest to all exporters, including rubber concerns, is the parcel-post convention recently concluded between the United States and China and which took effect August 1, 1916.

Parcel-post packages exchanged between these two countries must not weigh more than 11 pounds nor measure more than 3 feet 6 inches in length, and 6 feet in length and girth combined, and, in the case of parcels for or from non-stream-served places in China, must not exceed 25 cubic decimeters [1 cubic foot] in volume.

Postage on parcels sent from the United States to China is at the rate of 12 cents per pound or fraction of a pound; and from China to the United States at the rate of 35 cents (Chinese currency) per pound or fraction of a pound, except that on parcels for or from non-stream-served places in China an additional Chinese domestic parcel-postage may be levied and collected by the Chinese service. Parcel-post packages for China may be registered.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED JULY 18, 1916.

- N. O. 1,191,200. Clothing protector comprising a protective apron of moisture proof material. M. J. Lichenstein and L. H. Emsheimer, assignors to A. Stein & Co.—all of Chicago, Ill.
- 1,191,219. Hose clamp. C. Pelter, assignor of one-half to J. L. Eggers—both of Walla Walla, Wash.
- 1,191,318. Automatic tire alarm. F. N. Kelsey, assignor to A. H. Bowditch—both of New Haven, Conn.
- 1,191,320. Hose support. C. P. Kuehr, assignor to A. Stein & Co.—both of Chicago, Ill.
- 1,191,402. Demountable rim. A. J. Glau, San Ardo, Calif.
- 1,191,444. Gelf practicing device comprising an elastic hollow loop. A. G. Lott, Washington, D. C.
- 1,191,498. Combination leather sole and rubber heel. O. C. Davis, Brockton, Mass.
- 1,191,500. Rubber sole with imitation welt strip. O. C. Davis, Brockton, Mass.
- 1,191,516. Nipple protector. R. Keil, New York City.
- 1,191,543. Smith, assignor of one-half to W. N. Dorsett—both of Washington, D. C.
- 1,191,577. Demountable rim. R. A. Eckberg, Des Moines, Iowa.
- 1,191,578. Massage brush. O. Englund, Chicago, Ill.
- 1,191,604. Shaving brush. O. S. McCurdy, Wilkesburg, Pa.
- 1,191,785. Corset. R. Heindrich, New York City.
- 1,191,788. Water shoe. A. F. Horn, Fort Thomas, Ky.
- 1,191,820. Rubber stamp. W. J. Pannier, Jr., assignor to Pannier Bros. Stamp Co.—both of Pittsburgh, Pa.
- 1,191,836. Life-preserving jacket. S. Sarosiek, Nutley, N. J.
- 1,191,866. Rubber tired vehicle wheel. E. Amodeo-Salvator, Brooklyn, N. Y.
- 1,191,894. Spring tire with rubber cushions. J. E. Hart and A. Benzing, Columbus, Ohio.

ISSUED JULY 25, 1916.

- 1,192,036. Resilient tire. T. L. Carbone, Charlottenburg, Germany.
- 1,192,038. Dust cap for tire valves. C. W. Cleveland, Louisiana, Mo.
- 1,192,039. Toy construction block comprising two rubber disks. A. D. Converse, Winchendon, Mass.
- 1,192,090. Automobile tire. R. M. Merriman, Akron, Ohio.
- 1,192,147. Demountable rim tool. O. A. Wood, Blissfield, Mich.

- 1,192,238. Inner tube for pneumatic tires. R. C. Sprathing, assignor to Opelika Pneumatic Tube Co.—both of Opelika, Ala.
- 1,192,259. Water-marking wheel embodying an annular pneumatic tire-like tube. J. N. Anderson, Lincoln, N. H.
- 1,192,291. Protector for pneumatic tires. R. G. Falconer, Litchfield, Ohio.
- 1,192,352. Tire valve cap. O. A. Smith, assignor of one-half to E. C. Henn—both of Cleveland, Ohio.
- 1,192,357. Inhaler. W. R. Thatcher, Oskaloosa, Iowa, and H. Dixon, Dayton, Ohio.
- 1,192,495. Resilient tire. J. F. Carlson, Attica, Ind.
- 1,192,496. Resilient tire. J. F. Carlson, Attica, Ind.
- 1,192,554. Internal armor for pneumatic tires. A. Nielsen, Brigham, Utah.
- 1,192,622. Tann connection for connecting a suction hose with a fire hydrant. W. H. B. Halahan, Rye, N. Y.
- 1,192,648. Tire protector. J. T. Landis, Remy, La.
- 1,192,683. Catametal appliance. S. B. Potter, Washington, D. C.
- 1,192,831. Playing ball. W. R. Knight, Belleville, assignor to St. Mungo Manufacturing Co. of America, Newark—both in New Jersey.

ISSUED AUGUST 1, 1916.

- 1,192,853. Tire rim. P. W. Burford, East Rochester, N. Y.
- 1,192,860. Coupling for gas hose. J. J. Carey, Brooklyn, N. Y.
- 1,192,924. Tire protector. R. S. Miller, Red Sulphur Springs, W. Va.
- 1,192,969. Massage appliance. E. Winton-Charteris, London, England.
- 1,193,011. Hose nozzle. H. Gibbs, assignor to W. D. Allen Manufacturing Co.—both of Chicago, Ill.
- 1,193,086. Faucet spray attachment. M. Thomsen, Chicago, Ill.
- 1,193,088. Demountable rim. H. J. Trares, Edwardsville, Ill.
- 1,193,108. Rubber tire. A. K. Allen and C. A. Allen, Seattle, Wash.
- 1,193,198. Resilient heel. J. Solomon, Oberlin, Ohio.
- 1,193,250. Automobile floor mat. G. F. Foss, Montreal, Quebec, Canada.
- 1,193,287. Beard softener of rubber. T. G. Morgan, Shamokin, Pa.
- 1,193,392. Anti-skid tire chain. R. T. Hughes, Kansas City, Mo.
- 1,193,476. Force pump. M. Block, assignor to Illinois Force Cup & Specialty Co.—both of Chicago, Ill.

ISSUED AUGUST 8, 1916.

- 1,193,500. Auxiliary tread. O. Basten, assignor to Rutherford Rubber Co.—both of Rutherford, N. J.
- 1,193,524. Atomizer. T. A. De Vilbiss, assignor to The De Vilbiss Manufacturing Co.—both of Toledo, Ohio.
- 1,193,529. Bath mitten, comprising a mitten of rubber sponge and a tough rubber coat lining the inner side. J. Ellis, Chicago, Ill.
- 1,193,608. Insole forming an inflatable arch support. F. O. Poulson, Roswell, N. Mex.
- 1,193,715. Fabric for tires and the like. R. B. Price, assignor to Rubber Regenerating Co.—both of Mishawaka, Ind.
- 1,193,781. Demountable rim for vehicle wheels. C. F. Heinig, assignor of one-fourth to M. L. Baugham—both of Indianapolis, Ind.
- 1,193,810. Demountable rim. G. S. Maxwell, assignor of one-half to M. A. Bayles—both of Washington, D. C., and W. F. Hale, Nokesville, Va.
- 1,193,865. Dust cap for valve-stems. R. M. Brown, Wilmington, Ohio.
- 1,193,991. Rubber top. F. A. Cigol, Little Falls, N. J.
- 1,193,922. Musical rubber ball. F. A. Cigol, Little Falls, N. J.
- 1,194,020. Demountable resilient tire seating rim for automobile wheels. J. G. Hodgson, Maywood, Ill.
- 1,194,081. Resilient tire. E. L. Seranton, Rising Sun, Ind.
- 1,194,120. Cushion tire. J. S. Bahen, Rock Island, Ill.
- 1,194,136. Demountable rim. B. A. Bryon, Ridgefield, Conn.
- 1,194,152. Cushion insole for boots and shoes. F. F. Douglas, Minnedosa, Manitoba, Canada.
- 1,194,161. Antiskidding device for tires. G. B. M. Foust, assignor to C. H. Keith—both of Cleveland, Ohio.
- 1,194,177. Cushion tired wheel. A. H. Henderson, assignor to The Henderson Rubber Co.—both of Baltimore, Md.
- 1,194,193. Adjustable sweat band, comprising elastic sections, for headwear. L. Kronthal, New York City.
- 1,194,215. Medicine applicator and moistener. J. O. Morrison, Anderson, Ind.
- 1,194,233. Armored tire. R. E. Stamp, Fresno, Calif.
- 1,194,279. Blow-out patch for pneumatic tires. J. N. Davis, Denver, Colo.
- 1,194,285. Guard rim for pneumatic tires. J. R. Gammeter, Akron, Ohio, assignor to The B. F. Goodrich Co., New York City.
- 1,194,322. Vehicle tire construction. W. S. Temple, Mount Vernon, Ohio.

THE DOMINION OF CANADA.

ISSUED APRIL 30, 1916.

- 168,564. Fly swatter composed of a perforated web of rubber. The Standard Vending Machine Co., Hazelton, assignee of G. W. Gombor, Conyngham—both in Pennsylvania.
- 168,583. Life preserver. G. E. Fell and G. A. Fell, Buffalo, N. Y.
- 168,639. Protector and non-skidding band for tires. A. T. Hughes, Kew Green, Surrey, England.
- 168,719. Life preserver. The American Life Buoy Co., assignee of B. Franklin—both of Chicago, Ill.
- 168,811. India rubber shoe pad. W. W. Phillips, 142, 144 and 146 Old street, London, England.
- 168,813. Syringe. J. H. Pruitt, Fort Myers, Florida.
- 168,919. Test cup for milking machines. T. N. Fletcher, Hamilton, Auckland, New Zealand.
- 168,980. Ear drum. G. J. Wagar, Detroit, Mich.
- 169,020. Tire calipers. The B. F. Goodrich Co., New York City, assignee of J. R. Gammeter, Akron, Ohio.
- 169,021. Tire calipers. B. F. Goodrich Co., New York City, assignee of H. E. Curtis, Dayton, Ohio.
- 169,058. Pneumatic tire. A. Baigne, Montreal, Quebec, Canada.
- 169,068. Method of marking rubber. M. H. Clark, Hastings-on-Hudson, N. Y.
- 169,105. Nasal irrigator. C. H. W. Moellering, Newark, N. J.

THE UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

In order to give the public the advantage of having abridgments of specifications up to date, those retaining their numerical sequence, applications for patents made subsequent to 1915 are given new numbers when their complete specifications are accepted, or become open to public inspection before acceptance. The new numbers start with No. 100,001 (without any indication of date) and supersede the original application numbers in all proceedings after acceptance of the complete specifications.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JULY 5, 1916.]

4,073 (1915). Waterproof waiccoat lined with a film of rubber. W. T. Bowles, 55 Beaver Hall Hill, Montreal, Canada.

*4,076 (1915). Galvanic battery separator made by cutting slices from a block built up from layers of rubberized cloth, of cloth and rubber, compressed, and vulcanized. T. A. Willard, 817 Carnegie Centre, Cleveland, Ohio.

4,084 (1915). Stocking-suspenders. J. H. B. Dawson, Foster Road, Parkstone, Essex.

*Denotes Patents for American Inventions.

- *4,094 (1915). Spring wheel with outer rigid ring and rubber cushions. W. M. Hlrich, 1733 Broadway, Manhattan, N. Y.
- 4,146 (1915). Flexible fabric for deckchairs, seats, hammock beds, mats, etc., built up from rings of reinforced rubber sheeting folded at d interlaced. A. A. Scott, 6 Spring Gardens Road, Bradford.
- 4,148 (1915). Rubber rostril dilator and medicament holder. E. S. Johnson, 115 Fleet street, London.
- 4,151 (1915). Splash guard for automobiles, etc., comprising an india-rubber strip. P. Christensen, Vesterbrogade, Copenhagen.
- 4,212 (1915). Capsule for liquid comprising a rubber disk. F. A. Bouty, 3bis Rue de Dunkerque, Paris.
- 4,297 (1915). Locking nut for tire valves. E. Bellan, 139 Avenue de Villiers, Paris.
- 4,315 (1915). Combined eye-shielding device and megaphone having a covering of rubber round the rim. J. A. MacLellan, Newton Club, Newton Abbot, Devonshire.
- *100,395. Wheel tire. E. H. Herrick, 35 East 30th street, New York City.
- *100,397. Pneumatic tire. A. H. Harris, 342 6th street, Barberton, Ohio.
- 100,405. Conveyor belts formed of transverse corrugated sheet iron or aluminum laths laid on longitudinal straps of balata. C. T. Glum, Denmark.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JULY 12, 1916.]
- 4,363 (1915). Armored hose. G. Mitchell, 32 Queen Victoria street, London.
- 4,494 (1915). Textile driving belts impregnated with rubber and balata. W. Kohlshütter; G. Rothmund and G. Rothmund & Co., 65 Bartels Strasse, Hamburg, Germany.
- 4,531 (1915). Twin tires and rings of rubber. S. H. Cope and Warland Dual Rim Co., Alma street, Aston, Birmingham.
- 4,579 (1915). Ear plug. T. N. Atkinson, 26 Hart street, Holborn, London.
- 4,623 (1915). Wheel tires. J. E. Howard, La Maisonette, St. Peters, Jersey, Channel Islands.
- 4,626 (1915). Vehicle wheels. P. H. Benjamin, 31 St. Fransquin street, Malvern, Johannesburg, South Africa.
- 4,693 (1915). Double-ended air tubes for tires. Danlop Rubber Co., 14 Regent street, Westminster, and C. MacBeth, Manor Mills, Salford street, Aston, Birmingham.
- 4,739 (1915). Funnel for liquids made of waterproof canvas. Asiatic Petroleum Co., St. Helens Court, St. Helens, London, and H. Avery-Jones, Stone House, Fownhope, Herefordshire.
- 4,745 (1915). Respirators. M. Stern & Co., and S. Goldreich, 18 Ropemaker street, London.
- 4,761 (1915). Rubber-sheathed electric cables. British Insulated & Helsby Cables, Ltd., Lancashire, and J. Brotherton, Cable Works, Helsby, Cheshire.
- 4,765 (1915). Hose couplings. Electric Hose & Rubber Co., Caxton House, Westminster, and R. H. Carr, Standard Buildings, City Square, Leeds.
- 100,451. Rubber layers in boot heels. T. H. Robinson, 2 Grosvenor place, Carlton, Victoria, Australia.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JULY 19, 1916.]
- *4,863 (1915). Puncture repair plug. M. W. Spitzer, 52 Claybourne street, Dorchester, Mass.
- 4,921 (1915). Spring wheel with continuous outer rigid ring and pneumatic cushions. B. O. Bergersen, 38 Rangitikei street, Palmerston North, New Zealand.
- 5,023 (1915). Tire tube. T. H. B. Gayner, 113 Neville street, Middle Park, Victoria, Australia, and Western Canadian Enterprises, 512 Dominion Building, Vancouver, British Columbia.
- *100,500. Resilient heel, comprising a rubber lift and one or more leather lifts. A. K. Pomeroy, Williamstown, N. J.
- 100,518. Hose couplings. H. T. Stephens, Tahoonia, Ferryside, South Wales, and C. E. Baker, 34 Blue street, Carmarthen.
- 11,425 (1914). Signaling buoys in which rubber-faded gripping jaws are used. M. J. L. P. Bonard, 1654 Esplanade, Montreal, Quebec, Canada.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JULY 26, 1916.]
- 5,179 (1915). Rubber chin rest for violins. R. S. Williams, 145 Yonge street, Toronto, Canada.
- *5,208 (1915). Containers for tobacco, tea, coffee, spices, etc., made from a blank, the edges of which are treated with rubber. J. Peterson, 30 Union Square North, New York City.
- 100,544. Means for securing a tread band to a tire cover. T. Doyens, 21 rue de la Paix, and R. Hustins, 10 Spoorweglaan—both in Maastricht, Holland.
- 100,554. Rubber bands in banking wallets. A. Masser, 10 St. James Road, Watford.
- 100,571. Tire gages. H. Fairbrother, 30 Ludgate Hill, London.
- [ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, AUGUST 2, 1916.]
- 5,463 (1915). Pneumatic tire cover. R. L. Gould, 5 Corporation street, Birmingham.

NEW ZEALAND.

ISSUED JUNE 22, 1916.

- 36,351. Detachable rim for solid or pneumatic tires. C. A. James, Prescott Terrace, Rose Park, and F. F. Milford, Portrush Road, Toorak—both in South Australia.
- 36,632. Teat cup inflator tube. G. W. Gane, Normanby, and J. Hopkirk, Hawera—both in New Zealand.
- 37,457. Milking machine test cups. J. Treloar, Hamilton, N. Z.

THE FRENCH REPUBLIC.

PATENTS ISSUED (WITH DATES OF APPLICATION).

- 479,637 (September 2, 1915). Elastic tire for vehicle wheels. J. Guerrero.
- 479,685 (September 7, 1915). Improvements in elastic-tired wheels. A. Toncera.
- 479,728 (September 13, 1915). Improved air tubes for pneumatic tires. A. E. Henderson.
- 479,735 (September 14, 1915). Pneumatic hose collar. O. F. Hurley.
- 479,788 (September 21, 1915). Puncture-proof elastic tire. H. E. Wolken.
- 479,790 (September 21, 1915). Improved wheel rims. Dadey and Sellberg.
- 479,804 (September 22, 1915). Improvements in detachable shoe heels. J. Drew and H. Drew.
- 479,821 (September 24, 1915). Pneumatic tire valves. R. Walmsley.
- 479,829 (September 25, 1915). Improved vehicle wheels with detachable rims. The Standard Welding Co.

TRADE-MARKS.

THE UNITED STATES.

- 91,726. The word VESPA—lightweight rubber shoes. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind.
- 91,742. The word MAGIC—rubber goods. Eastern Rubber Co., Philadelphia, Pa.
- 94,331. The word HOU-TEX—raincoats, etc. Leopold & Price, Inc., Houston, Tex.
- 94,340. An illustration of a hub—rubber hose reinforced with fabric. United States Rubber Co., New York City.
- 94,341. The word HUBMARK—rubber hose reinforced with fabric. United States Rubber Co., New York City.
- 94,342. The word HUB—rubber hose reinforced with fabric. United States Rubber Co., New York City.
- 95,224. An illustration of the words THE GRANGER SHOE, and figure of a man sharpening a scythe—leather, canvas and rubber shoes. J. P. Masen, Boston, Mass.
- 95,248. The word UTULUS—rubber hose reinforced with fabric. United States Rubber Co., New Brunswick, N. J.
- 95,260. The words OLD COLONY—rubber belting, rubber hose, and rubber packing. G. B. Carpenter & Co., Chicago, Ill.
- 95,630. An illustration of a square with the word NO-TEX over a circle—shoes and slippers having fiber-rubber soles, etc. Morton Samuels, Baltimore, Md.
- 93,204. The words NEW ERA inclosed in an annular frame or band—rubber heels for shoes. The Goodyear Tire & Rubber Co., Akron, Ohio.
- 94,190. An illustration of a triangle and circle, in the center the letters C T & S and bordering the triangle the words THE CLEVELAND TOOL & SUPPLY COMPANY—balata, rubber belting, packing, hose, etc. The Cleveland Tool & Supply Co., Cleveland, Ohio.
- 95,240. The word GRANITE—piston and sheet-packing consisting of rubber and fibrous material. Revue Rubber Co., Providence, R. I.
- 95,644. The figures 40—hot-water bottles. The Faultless Rubber Co., Ashland, Ohio.
- 96,168. An illustration comprising a wreath and circle and within the circle the letter S P F—shoes made of combinations of leather and rubber, etc. Sutherland Pedigo Farwell Shoe Co., St. Louis, Mo.
- 73,360. The word PARA-TEX—rubber aprons, rubber gloves, and rubberized raincoats. W. MacPherson, Cambridge, Mass.
- 88,713. A design below the word KEYSTONE—garters, armbands, and trousseau-belts. C. L. Meyer, Pittsburgh, Pa.
- 11,690. The word ASHES—light-weight rubber shoes. Mishawaka Woolen Manufacturing Co., Mishawaka, Ind.
- 93,831. The letters CC—machinery packing composed of rubber. Crane Co., Chicago, Ill.
- 94,859. The word MULTISTRET—tire-tape. Standard Woven Fabric Co., Framingham, Mass.
- 95,626. The word "EVEY"—inner tubes. Lee Tire & Rubber Co., White-marsh township, Montgomery county, Pa.
- 95,671. The word COMMANDER—pneumatic tires. The B. F. Goodrich Co., New York City.
- *5,783. The word BELLE OF BROADWAY—shoes made of canvas and rubber, etc. The Elfinger Shoe Manufacturing Co., Lebanon, Ohio.
- 93,327. The words PARA OKE, A. & A. R. Co., and 100% LIVE within a circle—shoe soles and heels made of a composite material containing animal and vegetable matter. A. & A. Rubber Co., Framingham, Mass.
- 93,393. The word PIONEER—rubber tires, inner tubes, patches, etc. Powell Supply Co., Omaha, Neb.
- 95,921. Representation of two valve-tire valves for pneumatic tires. Double Seal Tire Valve Co., New York City.
- 96,233. The words THE LITTLE GIANT—syringes and parts thereof. G. W. Jessup, Boston, Mass.

* Denotes patents for American inventions.

- 96,311. The word MULTIBEST—friction tape. Standard Woven Fabric Co., Walpole, Mass.
- 96,506. The word PIONEER—belts, armbands and garters. Pioneer Suspender Co., Philadelphia, Pa.
- 96,545. The words DRAFO NOT—rubber heels. Kilian Rubber Co., Boston, Mass.
- 96,608. The word RINEX—soles for boots and shoes. United States Rubber Co., New York City.

CANADA.

- 1,649. Representation of a sailing vessel across which the word "BRITANNIA" appears on a panel; above the words MADE IN CANADA and below WARRANTED FOR ALL CLIMATES—waterproof clothing. Canadian Consolidated Rubber Co., Ltd., Montreal, Quebec.
- 21,661. Black tread band used with sides of contrasting color, particularly light gray or white—pneumatic tires. The B. F. Goodrich Co., New York City.
- 1,166. Black tread band used with sides of red or reddish color—pneumatic tires. The B. F. Goodrich Co., New York City.

THE FRENCH REPUBLIC.

- 23,738. The word ACCLERENE—chemical product for use in the rubber industry. Hooley Hill Rubber & Chemical Co., Limited, Stamford Road Works, Hooley Hill, near Manchester, England.
- 23,780. The words TALON ACHILLE—rubber heels. Hooley Hill Rubber & Chemical Co., Limited, Stamford Road Works, Hooley Hill, near Manchester, England.
- 23,781. The word EROSEE—rubber heels, soles, tips and other rubber findings for footwear. Hooley Hill Rubber & Chemical Co., Limited, Stamford Road Works, Hooley Hill, near Manchester, England.
- 23,782. The word BUFFALO—Same.
- 23,783. The word STANDARD—Same.
- 23,784. The words DAL PAD—Same.
- 159,250. The word PARANEIGE—proofed garments. Société Potier Frères, Paris.
- 159,208. The words AMERICAN COMPANY, A. V., on a turnable rubber heel—rubber heels. Alfred Verlesson, Paris.
- 159,250. The word VAINQUEUR—hard rubber hair combs. Société Veuve Moulard & H. Georgeau, Paris.
- 159,251. The words L'ANTI-BOCHE—Same.
- 159,281. The word THERMOCOPOC—rubberized and elastic fabrics and other goods. Société Industrielle et Commerciale du Kapok, Paris.
- 159,290. The word RADIOCAPOC—Same.
- 159,291. The word CALORCAPOC—Same.
- 159,292. The word RADIA—Same.
- 159,293. The word FORSHO—Same.
- 159,294. The word CALOR—Same.
- 159,295. The word THERMOS—Same.
- 159,362. The word MI-KA-BO—proofed wearing apparel. Arthur Dufour, Paris.
- 159,458. The words PLUS-QUE-PARFAIT—rubber goods for medical, surgical, hygienic and toilet purposes. Albert Eugène Fromont, Paris.
- 159,459. The words MATHEUS DE PARIS—Same.
- 159,460. The words MATHEUS PARISIEN—Same.
- 159,461. The words MATHEUS DE FRANCE—Same.
- 159,462. The words MATHEUS FRANCAIS—Same.
- 159,463. The words MATHEUS NATIONAL—Same.
- 159,464. The word GRUWING with a drawing of a goat—Same.
- 159,465. The word YABOS—Same.
- 159,466. The word ANANA—Same.
- 159,467. The word ARIAI—Same.
- 159,507. A label with crossed French, Belgian and English flags and the words ALLIANCE NOUVELLE DE REPRESENTATION COMMERCIAL, ANGO-FRANCO-BELGE—miscellaneous articles of merchandise including rubber goods. Girard, Paris.
- 159,616. The words SEMELLE DE SANTÉ—proofed soles for footwear. Leopold Lévy, Paris.
- 159,639. The words L'AUTO-INTERMÉDIATEUR—composition for cleaning, disinfecting and waterproofing fabrics and all kinds of garments. G. Lakovsky, Paris.

DESIGNS.

THE UNITED STATES.

- 49,391. Garter. M. J. Liebenstein, assignor to A. Stein & Co.—both of Chicago, Ill.
- 49,403. Vehicle tire. R. J. Stokes, assignor to Thermoid Rubber Co.—both of Trenton, N. J.
- 49,404. Vehicle tire. R. J. Stokes, assignor to Thermoid Rubber Co.—both of Trenton, N. J.
- 49,407. Elastic vehicle wheel. W. E. Wilson, assignor to The American Tire & Rubber Co.—both of Akron, Ohio.
- 49,433. Rubber tire. C. E. Jenkins, Chicago, Ill.
- 49,485. Vehicle tire. M. J. Gillen, assignor to Standard Tire & Rubber Manufacturing Co.—both of Cleveland, Ohio.

PREVENTING SPREADER-ROOM FIRES.

THE spreader and churn rooms of modern rubber mills are equipped with machinery that absorbs much static electricity. When the natural humidity falls below 40 per cent, the naphtha vapors are extremely liable to become ignited by a static spark and cause a disastrous fire. An artificial humidifying instrument that will raise the moisture content of the air to the point of safety is therefore interesting, and is here illustrated. This instrument is adjustable to any desired relative humidity and is extremely sensitive.

In operation the humidifier induces an air current which

enters the base of the casing and passes successively over the dry and wet bulbs, up through the aspirator intake, to the condensation chamber.

The humidifier supersaturates this continuous sample of air, which then passes through the aspirator outlet, leaving behind it an excess of unevaporated water at the hygrometric wet bulb temperature. This water trickles down through the drip outlet upon the upper end of the wet bulb, which is surrounded by a linen mantle. The slight evaporation from this mantle due to the air current, insures the continuance of the hygrometric temperature.

The lower ends of both thermostatic members are secured to brackets, and internal rods of non-expandable metal connect their upper ends with the outer ends of the operating lever. Therefore, any change in the relative length of the two thermostatic members will slightly rock the lever, thus bringing it in or out of contact with the pilot valve lever. This pressure raises the upper end of the lever from a small pilot valve seat, permitting the escape of air from the relay valve diaphragm, which operates the humidifier valves that are attached to the overhead air and water pipes.

Air for operation is taken from any convenient main, through a special filter, and then to the frame of the instrument, whence a portion is diverted through a stop valve for the humidifier. [G. M. Parks Co. Fitchburg, Massachusetts.]

Review of the Crude Rubber Market.

Copyright, 1916.

NEW YORK.

AUGUST has been a very quiet month for crude rubber, a condition that was generally anticipated in the trade at this time. Extreme dullness has characterized the market, with only routine business to occupy the attention of importers and dealers. Inquiries were few and lacked the real buying tone that has apparently been absent from the New York market for some time. Plantation prices are practically the same as they were a month ago, at figures about one cent lower than the London market. The fluctuations noted in the foreign primary markets during the month have been reflected locally, but without resulting in any business to warrant further price activity.

A peculiar condition of the New York market is noticed in the fact that sales have been made at less than ruling prices, while attempts to buy on the London market at ruling prices are invariably met with one-half to one cent advance.

The feature of the month has been the continued firmness of Upriver fine and there was a noticeable scarcity of this grade toward the end of the month. The natural result of this condition has been the stiffening of prices on the other grades. Plantation rubber appears to be well supported during the period of waiting that exists in the belief that First latex at 55 cents is a near possibility. Until buying orders are placed for large quantities or some unusual disturbance occurs in the primary markets, there is small prospect of a change in the local situation.

During the first three weeks in August, 4,600 tons of crude rubber arrived in New York, compared to 3,530 tons for the same period in July. There were as follows: Plantations from London and Liverpool, 700 tons; Singapore, 950 tons; Colombo, 400 tons; Batavia, 500 tons; Para rubber from Brazil, 615 tons; Europe, 95 tons; Centrals, 380 tons; Africans, 436 tons; Manicoba, 20 tons; Guayule, 4 tons. From August 8 to 18, 500 tons of Plantation were received at Seattle, compared to 335 tons for the same period in July.

LONDON.

The unsettled condition of this market during August has been evidenced by irregular buying that has caused minor price fluctuations which have not really affected the general situation. While the American demand, Plantations best customer, remains apathetic there is not much hope for improvement. On August 1, Standard crepe spot, was done at 2s. 2½d. [57.27 cents] and Smoked sheet for 2s. 13½d. [52.20 cents]. Hard fine Para spot, sold at 2s. 10d. [68.92 cents]. On August 29, Standard crepe spot, sold for 2s. 3¼d. [55.24 cents] and Smoked sheet was done at 2s. 3d. [54.73 cents].

During July London imports were 4,553 tons, re-exports 2,800 tons. Liverpool imported in the same period 906 tons and re-exported 771 tons. Total imports for both ports were 5,459 tons, against 4,288 for July.

SINGAPORE.

At the auctions held August 4, 11, 16 and 24, about 1,350 tons were sold. First latex crepe and smoked sheet brought an average of 50 cents a pound.

NEW YORK QUOTATIONS.

Following are the quotations at New York one year ago, one month ago, and August 30, the current date:

Para.	Sept. 1, 1915.	Aug. 1, 1916.	Aug. 30, 1916.

MARKET CABLE SERVICE FROM SINGAPORE.

The following reports of the weekly auctions held at Singapore have been cabled by The Waterhouse Co., Limited:

Date.	Crêpe.	Smoked Sheet.	Pounds Sold.	Market.
Aug. 4.....	50.1	50.1	582,400	Slightly weaker—less demand.
Aug. 11.....	51.4	51.8	938,560	A general and active demand.
Aug. 16.....	48.8	48.8	443,520	Very dull.
Aug. 24.....	49.7	49.7	748,160	Steady—holders are firm.

SINGAPORE.

GUTHRIE & CO., LIMITED, report [July 6, 1916]:

The weekly auction finished to-day with a good demand but a declining tendency. Fine pale crepe and ribbed smoked sheet sold at \$120 and \$119 per picul respectively. Brown crepe and the lower grades were on the average about \$4 lower than last week. There was a fair demand for scrap rubber. Of the 383 tons catalogued 325 tons found buyers.

The following was the course of values:

	In Singapore per picul.	Sterling equivalent per pound in London.	Equivalent per pound in cents.
Sheet, fine ribbed smoked.....	\$118@122	2/ 4 1/2 @ 2/ 5 1/4	57.27 @ 59.04
Sheet, good ribbed smoked.....	110@116	2/ 2 3/4 @ 2/ 4 1/2	53.97 @ 57.01
Sheet, plain smoked.....	104@115	2/ 2 1/4 @ 2/ 3 1/4	52.95 @ 56.00
Sheet, ribbed, unsmoked.....	100@106	2/ 0 1/2 @ 2/ 1 3/4	49.66 @ 52.20
Sheet, plain unsmoked.....	104@108	2/ 1 3/4 @ 2/ 2 1/4	51.43 @ 52.95
Crepe, fine pale.....	117@123	2/ 4 1/2 @ 2/ 5 1/4	59.04 @ 60.00
Crepe, good pale.....	109@120	2/ 2 1/4 @ 2/ 3 1/4	53.46 @ 58.28

EXPORTS OF CEYLON GROWN RUBBER.

(From January 1 to July 17, 1915 and 1916. Compiled by the Ceylon Chamber of Commerce.)

To—	1915.	1916.
United States...../pounds	7,033,921	14,276,005
Canada and Newfoundland.....	240,140	420,240
France.....	223,072	854,320
Russia.....	332,290	248,874
United Kingdom.....	12,992,554	10,038,573
Australia.....	346,457	489,231
India.....	500	678
Straits Settlements.....	119,933	159,666
Japan.....	308,089
Totals.....	21,596,866	26,069,590

(Same period 1914, 17,368,591 pounds; same period 1913, 11,741,234.) The export figures of rubber, given in the above table for 1914, include the imports re-exported. (These amount to 1,784,515 pounds from the Straits Settlements and 367,511 pounds from India.) To arrive at the total quantity of Ceylon export rubber, the above must be deducted these imports from the total exports. The figures for 1915 and 1916 are for Ceylon rubber only.

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram from Kuala Lumpur gives the figures of the export of plantation rubber from the Federated Malay States during the month of July as 5,053 tons against 5,114 tons in June last and 3,687 tons in the corresponding month last year. The total export for seven months of the current year amounted to 32,144 tons against 22,877 tons in 1915 and 16,821 tons in 1914. Appended are the comparative statistics:

	1914.	1915.	1916.
January...../tons	2,542	3,473	4,240
February.....	2,364	3,441	5,207
March.....	2,418	3,418	4,429
April.....	2,151	2,727	3,919
May.....	2,069	2,778	3,956
June.....	2,306	3,403	5,114
July.....	2,971	3,687	5,053
Totals.....	16,821	22,877	32,144

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official cablegram from Singapore gives the figures of the export of plantation rubber from Straits Settlements ports for the month of June as 3,376 tons against 3,274 tons in May and 2,249 tons in the corresponding month last year. The total export for the six months of the current year amounted to 23,612 tons against 15,609 tons in 1915 and 8,506 tons in 1914. Appended are the comparative figures:

	1914.	1915.	1916.
January...../tons	1,181	2,576	4,443
February.....	793	2,741	3,359
March.....	1,285	2,477	4,481

April.....	1,548	1,978	4,219
May.....	1,308	3,588	3,274
June.....	1,480	2,249	3,836

Totals..... 8,506 15,609 23,612

These figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements such as Borneo, Java, Sumatra and the non-Federated Malay States as well as rubber actually exported from the Colony, but do not include rubber exports from the Federated Malay States.

THE RUBBER SCRAP MARKET.

Copyright 1916.

NEW YORK.

AUGUST is usually a dull month in the rubber scrap market and with the exception of deliveries on contracts there has been but little business to claim attention from the trade. The easy tendency noted a month ago has continued without change for the better, resulting in a heavy market with downward tendencies. Crude rubber continues to be weak and, in fact, the rubber trade in general has been apathetic towards all markets at this time. Price changes have been unimportant and at the close of the month the market was decidedly weak.

BOOTS AND SHOES. It is reported that supplies are not abundant and that spring collections have been absorbed. During the month, sales are said to have been made to the mills for 8½ cents, but 8½ cents is generally considered the outside price.

AUTO TIRES. Tires have continued weak and some concessions in price have been noticed during the month. G. & G. white tires were offered at prices ranging from 8 to 8½ cents delivered, but the mills have not appeared interested. The other grades are unchanged in price and easy in tone.

INNER TUBES. There has been no interest shown in inner tubes, as the manufacturers are apparently well supplied. For No. 1 tubes the delivered price is held nominally at 24½ to 25 cents with buying confined to small lots. Compounds are slow and weak.

MECHANICALS. In mechanical scrap some grades are stagnant and prices generally weak.

LONDON AND LIVERPOOL STATISTICS.

During July 74 tons of waste and reclaimed rubber were imported into London and 252 tons exported during the same period. Liverpool's imports were 26 tons and 65 tons exported.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright 1916.

NEW YORK.

COTTON has had the most sensational price advance during the latter part of August that has occurred at any time for the past 30 years, with the exception of the Sully boom of 1903 and the bull movement led by Patten six years ago, when prices went to 16 cents.

In this recent movement prices advanced 150 points within a week, and on August 25, September contracts, representing the beginning of the new crop movement, went to 15.66, October 15.75, December 15.89, January 15.95, March 16.09, May 16.20 and July deliveries 16.20.

The principal cause of this spectacular advance was the fear of crop shortage that has gradually developed during the past month, due to drouth conditions and low crop reports recently issued by the Agricultural Bureau at Washington. The apprehension is that this season's crop will be cut down to 12,000,000 bales against 14,000,000 bales that represented the world's spinners' consumption for last year.

SEA ISLAND COTTON. According to the U. S. Census Bureau the Sea Island crop for the year 1915-16 amounted to 91,920 bales distributed as follows: Georgia, 57,572; Florida, 28,170; South Carolina, 6,178. The commercial crop report figures for 1915-16 are 85,278 bales distributed as follows: South Carolina, 6,211; Georgia and Florida, 79,067. A difference of 6,642 bales is noted in these reports which cannot be definitely accounted for; however, it is known that this year's crop is some 6,000 bales in excess of last year.

EGYPTIAN COTTON. The Alexandria market has been characterized by weakness with scarcely a change in the new or old crop positions. Advances dated July 27 indicate entire absence of buying orders from abroad and a consequent stagnant market. The weather has favored new crop conditions, with the result that the plant has developed too rapidly at this time; however, the coming months of August and September are looked forward to with more anxiety as the plant development at that time is most important.

The recent rise in American cotton has resulted in prices advancing rapidly and the closing of the Egyptian Cotton Exchange.

COTTON FABRICS. The fundamentals that have controlled the cotton fabric situation for the past month are the same, and, moreover, the same market deductions are applied in tire fabrics, hose and belting duck, and textiles generally used in the rubber

trade. The general demand both at home and abroad for all sorts of rubber textiles continues unabated. The textile mills have made extensive plant additions, ordered new equipment, increased the running time and arranged night shifts to take care of the business. Theoretically, production should now equal the demand, but practically it does not, for the labor is not obtainable. For that reason looms are idle, night shifts incomplete and machinery builders unable to make delivery of new equipment.

Following the sensational advance of cotton, prices of cotton fabrics advanced rapidly, and the mills withdrew all old quotations and refused to quote prices at the present time. Under the prevailing circumstances the fabric market is most unfavorable for both seller and buyer, the former threatened by labor and a short crop, and the latter by higher prices.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

Copyright 1916.

NEW YORK.

It was generally known that the mills had anticipated their summer requirements to the extent of laying in sufficient stocks or arranging for contract deliveries covering August and September so that the extreme dullness in rubber chemicals for the past month was expected. Very little change has been noted in local market conditions and prices, and unless something new unforeseen should occur there is not much movement expected for the next six weeks.

The Department of Commerce, Bureau of Census, has issued the following figures on the production for 1914 of various compounding ingredients, most of which show an increase in value during the period between 1909-1914.

Ingredients.	1914.		Per Cent. of Value Increase (+) or Decrease (-) 1909-1914.
	Pounds.	Value.	
Bone black	44,509,000	\$1,532,000	+43.1
Carbon black	22,623,000	900,000	+44
Lampblack	517,167	+17.6
Barytes	46,920,380	325,922	+6.5
Lithopone	48,972,062	1,875,510	+12.5
Chrome yellow	5,747,317	641,534
Prussian blue	1,239,382	387,077
Ultramarine	2,698,639	222,769
Vermilion (true)	322,759	200,134	+86.2

ANTIMONY SULPHURETS. There has been no change in prices or market conditions controlling this commodity. The domestic producers of both crimson and golden antimony are apparently meeting the requirements of the trade.

BARYTES. The foreign demand has continued and domestic consumption appears to be larger than normal. Prices have undergone no change, but are firm despite the fact that production of barytes has increased materially in this country during the past year.

LITHARGE. There has been no change in the fundamentals controlling this commodity which has been generally firm, and sellers are inclined to predict higher prices for that reason; however, values remain the same and the mills appear to be uninterested.

LITHOPONE. Foreign grades have been freely quoted during the month and domestic business has been confined principally to contract deliveries. In some cases forward sales have been reported covering the balance of the year, yet some producers are said to be in a position to make spot deliveries.

SULPHURIC ACID. The call has been steady and prices unchanged. Liberal offerings for spot and futures reflect the activity of the producers who are striving to meet the increasing demand at home and abroad.

WHITING. The market is still dominated by the high price of chalk and is routine in character. The demand is good and contract deliveries are regularly made, although a few producers are having difficulty in obtaining supplies of the raw material.

Vol. 54 SEPTEMBER 1, 1916

No. 6

TABLE OF CONTENTS.

Editorials:	Pages.
Pure Rubber and the Barkley Bill.....	647
Rubber Stratagems of the Blockade.....	647
Minor Editorials.....	648
Planting Rubber in Cochin, China.....	Map 649-650
Captain Landolphe, Pioneer and Privater.....	Portrait 651
Largest Rubber Tree, The.....	Illustrated 652
Rubber Trade Preparedness Committee, The.....	653-655
Chemical Exposition and Society Meetings.....	655
Chemistry:	
What the Rubber Chemists Are Doing.....	656-657
Vulcanization of Caoutchouc and Its Regeneration.....	658
Chemical Treatment of Rubber.....	658
Laboratory Apparatus.....	Illustrated 658
Other Chemical Patents.....	658
Machines and Appliances, New.....	Illustrated 659-663
A Modern Grinder and Mixer. Extensible Coupling for Mill Drives. Portable Motor Driven Alligator Shears. New Dry Compounding Machine. Freeman Improved Block Planer. Utility Air Hoist.	
Machinery Patents: Vulcanizing Tubing or Hose in Five Hundred Feet Lengths. Rolling Beads on Necks of Toy Balloons. Gammeter's Vertical Press Vulcanizer. Gum Chicle Cutting Machine. Golf Ball. Inner Tube Rolling Table. Other Machinery Patents.	
Process Patents.....	663
Editor's Book Table.....	664
Fundamentals of a Cost System for Manufacturers. Acceptances: Circulars, Regulations and Informal Rulings of the Federal Reserve Board. Personal Reminiscences of James Mapes Dodge. Tariff Systems of South American Countries. Practical Safety Methods and Devices. The Seventeenth Year Book and Annual Report of The Rubber Club of America, Inc.	
New Trade Publications.....	664-665
Interesting Letters from Our Readers.....	665-666
Inquiries and Trade Opportunities.....	666
Judicial Decisions.....	667
New Goods and Specialties.....	Illustrated 668-670
New Naugahyde Razor Strop. Ringmeter Garden Hose. Chin Mask and Frown Band. "Unika" Finger Cot. Waterproof Fabric and Garments. "New Paramount" Tennis Ball. Jones "Never-Loosen" Rubber Heels. Bowling Mat and Foot-Grip. "Imperial" Rubber Sheet-ting. Vulcalose Sanitary Rubber Toilet Seat. A Single Texture Raincoat Fabric. Rubber Hydrometer. "All-Together Pouch." Amphibian Sandals. "P. & S. Colonel" Golf Ball.	
Toy Balloon Valves.....	Illustrated 670
Tires:	
Double Service Non-Inflatable Tube.....	Illustrated 671
Kahn Valve.....	Illustrated 671
Dependable Air Bag.....	Illustrated 671
Hood and Puritan Tires.....	Illustrated 671
American Rubber Trade—News Notes and Personals.....	672-677
Rubber Company Share Quotations.....	672
Rubber Company Dividends.....	672
Joseph P. Devine—Portrait and Sketch.....	673
Arthur Jackson Wills—Portrait and Sketch.....	674
New Incorporations.....	676-677
Obituary Record.....	678
P. Carter Bell (Portrait)	

Domestic Correspondence:	Pages.
Akron.....	By Our Correspondent—Illustrated 679-680
Boston.....	By Our Correspondent 680-681
Trenton.....	By Our Correspondent—Illustrated 681-682
Rhode Island.....	By Our Correspondent 682

Foreign Rubber News:	
Great Britain.....	By Our Correspondent 683-685
European Trade Notes.....	685
France.....	By Our Correspondent—Illustrated 685-687

Planting Notes, Rubber.....	687
Rubber Trade in Malaya.....	By Our Correspondent 688
Peculiar Method of Gathering Rubber in Sierra Leone.....	688
Rubber Trade in Dutch Guiana.....	By Our Correspondent 689
Rubber and Balata in British Guiana.....	689-690
Rubber Tires in Guatemala.....	690
Proposal to Reduce Tariff on Manufactures of Brazilian Rubber.....	690
Patents Relating to Rubber.....	691-692
United States, Canada, United Kingdom, New Zealand, French Republic.	

Trade Marks.....	692-693
United States, Canada, France.	

Designs.....	693
Preventing Spreader-Room Fires.....	Illustrated 693

Markets:	
Crude Rubber.....	694
Market Cubes.....	694
Singapore Rubber Auction.....	695
Rubber Scrap.....	702-703
Cotton and Other Fabrics.....	703
Chemical and Ingredients.....	704-705
Comparative New York Prices 1910-1916.....	705

Statistics:	
Brazil, Rubber Exports from Manaus During June, 1916, and from January to June, 1916.....	699
Canada, Rubber Statistics for Two Months Ending May, 1916.....	700-701
Ceylon, Rubber Exports.....	695
Federated Malay States, Rubber Exports.....	695
Italy, Rubber Statistics for Four Months, Including April, 1916.....	702
Malaya, Rubber Exports.....	695
Straits Settlements, Rubber Exports.....	695
United Kingdom Rubber Statistics for Seven Months Ending July, 1916.....	701
London and Liverpool Rubber Imports and Exports for July, 1916.....	701
United States, Custom House Statistics.....	697
New York Arrivals of Crude Rubber.....	696-697
Imports and Exports of Crude and Manufactured Rubber.....	698
Rubber Statistics for Eleven Months Ending May, 1916.....	699-700
Quarter Ending March, 1916.....	700
Seattle, Arrivals of Crude Rubber.....	697

REMARKABLE TIRE RECORD.

The record run, 5 days 18 hours and 22 minutes, recently made from New York to San Francisco by S. B. Stevens, under the auspices of the American Defence Society, to try out the possibilities of the automobile in time of war, was accomplished on Silvertown tires. The distance between New York and Omaha, 1,485 miles, was made in 48 hours without tire trouble. The same set of tires were used as far as Cheyenne, about 450 miles farther, where they were changed as a matter of precaution. According to Mr. Stevens, they exhibited but little signs of wear on his arrival at San Francisco.

In the manufacture of garters in Great Britain, the webbings and threads are made there, but practically all of the metal clip ends are imported from the United States. Previous to the war many French garters were imported into England, but that trade has now almost entirely ceased.
