### Pure Seed Investigation.

Through the courtesy of Gilbert H. Hicks, Esq., of the Pure Seed Investigation Division of the Department of Agriculture, we present herewith this article before the American Seed Testing Association's meeting held in Washington recently.

At the outset of my remarks, which will be more or less informal and brief, I wish to correct an error which seems to be prevalent in the minds of many seedsmen in the country, and that is that the Department of Agriculture, or the speaker as its representative in this kind of work, is desirous of securing any unjust legislation affecting the interests of seedsmen or of taking any antagonistic stand whatever to the honorable members of the trade.

About three years ago, as probably most of you are aware, the Division of Botany of the Department of Agriculture inaugurated a new line of work in the Department, known under the general head of pure seed investigations. Good seed, as we all know, is one of the main essentials of successful agriculture, for no matter how energetic the farmer, his efforts are frustrated unless the seed he sows is of the best. If the seed is of poor seed, the farmer depends for his bread and butter entirely upon the seed he plants, whether it be for the pasture, the garden or the farm. Even with the best seed, the weather, the insect, the fungus diseases, may utterly ruin some of his crops. The successful farmer plants his seed in the best soil, and he plants it at a less favorable time and with the disadvantage of a serious delay.

It is an old adage that a farmer that has an immense amount of trashy seed placed upon the market every year is only making a poor investment of his seed. Inferior stock and low germination, but also to seeds of clovers, grasses, and other forage plants.

### Scope of the Department's Work.

The difficulties under which the American farmer often labors can better be appreciated by any one who has had the experience of growing his own food for a livelihood. It is the province of the Department of Agriculture to see that the farmer has the best place within the farmer's reach every possible help and all obtainable means which will enable him to overcome his difficulties and attain success in his calling. It is the duty of the Department to bring to the notice of better knowledge of the difference between good and bad seeds of the various plants, and the work above referred to was inaugurated. It follows as a matter of course that our investigations proceed from the standpoint of the farmer, and are aimed principally at furthering his interests, and that our chief employment is to insist that we have no grievance whatever against the seed trade in general, and only in so far as it is probably engaged in this business. It is our earnest desire to become acquainted with the men with whom the convention represents, and help them in every way in our power both as to the methods of their work and to give them freely the benefit of any of our experiments or investigations which may be of value to them. Although you, gentlemen, are engaged in the growing and sowing of seeds, you are largely from the financial standpoint, and undoubtedly many of you are contented with the seed which you require patient and careful scientific investigation. It is my duty to instruct you in the best methods of your own so far as he is able, but in the press of business and for lack of time and suit-

ably equipped laboratories probably few of you are able to do your own seed as much time to such investigations as you would like. It is right here where the Department of Agriculture hopes to be of some service to you. Already we have had numerous requests from our countrymen for information concerning the vitality of seeds, the best methods of keeping seeds, methods of sowing seeds, and the like. We really benefit the seed trade will benefit the American agriculturist.

Under the present conditions of trade that cannot afford to guarantee their seed, and that they really get the very best seed obtainable, for the reason that the farmers do not appreciate that seed, and will generally purchase inferior seed if it is sold at a cheaper price. Unfortunately, in many sections of the country, the farmer has learned that a difference of a dollar a bushel, for example, between first-class clover seed and a poor quality is a trifling matter, compared with the immense difference in the real value of the seed. The farmer is naturally prone to eradicate such false ideas and to impress upon the people who plant seed that the difference between the seed which is first class in every particular, even at an increased price, the farmer will get the best seed, and that the farmer will do so. Also when a farmer writes to us, as many have, asking about the seed, we are often asked to guarantee which the seedsmen asks him fifteen cents for a small packet, we are ready to give the information that he can probably buy the same thing from the same seedsmen under the name of Soja Bean.

Although a large portion of our time in the seed laboratory is taken up with the testing of the vitality of agricultural seeds, this is by no means our only line of work, nor is it the most important. The most important part of our work we can obtain data which can be used in the broader field of seed investigations, and this is the part upon which we are engaged. I might mention the following: Seed testing, for the purpose of purity, etc. To aid us in this work we have been carrying on experiments in a way not repeated in the field. An article on this subject, to be published in the near future, will be of interest to seed-growers. Other subjects under investigation are: the effect of various fertilizers on various commercial seeds and the extent to which this is an index of the vitality of the seed. The effect of various salts upon germination, principally those found in commercial fertilizers in the soil. The effect of different kinds of chemical treatment: Do any of them hasten germination or help to overcome the effects of insect and fungus diseases and their effect upon vitality. The best time to harvest the seed, the depth of covering, climate, and the selection of the best methods of planting seeds, considering the nature of the soil, depth of covering, climate, and the selection of the best methods of planting seeds, and how to secure a greater market to the farmer for sale. The effects of climate and soil upon seed variation.

### Purity and Germination Tests.

A very important line of work, for which we are constantly obtaining data in our seed testing, is the subject of equitable standards of purity and germination of different agricultural seeds. Another subject which is frequently brought to our attention is the effect of insect and seed dealers in various parts of the country, is the best methods for the control of insects and careless seedsmen, and the best methods for the control of adulteration with inferior or dead seed, or which contain a large amount of water, and which are not properly filled out and sent with the seed which is to be tested to the Seed Testing Division of Botany, Department of Agriculture, Washington, D. C. Additional blanks will be furnished upon application. Respectfully,

JAMES WILSON, Secretary of Agriculture.

In addition I may say that already we have tested free of charge quite a number of samples of seed and garden seed received from seedsmen, and in

many cases, perhaps, the reports of these tests have been the means of putting those seedsmen on their guard against the possibility of their not handling a large amount of samples of this kind from the same source. Every farmer who is anxious and willing to help the trade in this matter all we can do is to attend to our duties, and attend as occasion demands.

I am also greatly pleased to call your attention to the fact that the United States Bureau of Plant Industry, Department of Agriculture, issued by the Office of Experimentation, a circular on the subject of "Seed Testing," the result of a recent meeting of a committee on seed-testing appointed by the Secretary of Agriculture, and the Agricultural Colleges and Experiment Stations. For several years some of the American experiment stations have been testing seeds for their constituents and an increasing interest is now being manifested in this work throughout the country. In view of this interest and the importance of the subject, the Association of Experiment Stations at its last meeting instructed its committee to formulate uniform methods of seed testing, and to issue a circular for making seed tests in order that such tests may be as reliable as possible. The circular referred to contains the results, together with a description and illustration of the germinating apparatus, and is of sufficient detail to be of great value to the farmer. The circular referred to. The present outlook for the inauguration of adequate and uniform seed testing in the various agricultural seeds is quite encouraging, and very soon there will be no excuse for the farmer who does not have his seed guaranteed the vitality and purity of their seeds for lack of places where such a guarantee may be competently secured.

**to Guarantee.**

At this point allow me to correct an impression concerning the guarantees of seedsmen, and (what must be pointed out to all of you) nobody dreams of requiring a guarantee that the seed which is planted by the farmer in the soil, under what may frequently be the most unfavorable conditions, will guarantee that seedsmen should come up to the standard of vitality. The ends desired to be secured are: First, that the seller of any seed should standardize his seed by himself, provided the buyer is willing to pay what such seed is worth. Second, that the opportunities may be furnished for giving such a fair test, which will be of benefit to the buyer, and which the matter ends.

**Seed Testing Laboratory Established.**

I hold in my hand a circular recently issued by the Department of Agriculture, which will, I trust, be welcome news to every seedsmen present.

Office of the Secretary, Washington, D. C. May 29, 1927.

Dear Sir:—Numerous requests have been received from seedsmen, growers and farmers for information concerning the purity (freedom from insect and fungus diseases) and germination of samples of agricultural seeds. The fact that there is a poor prospect of the availability of seed sold in this country, and a lack of information and facilities for testing the seeds, has led to the establishment of a very desirable that such persons may have the seed they intend to purchase tested for purity and germination.

In order to secure and diffuse information concerning the various farm and garden seeds, and the value of which depends to such a large extent the success of agricultural operations, the Seed Testing Division of Botany established a Seed Testing Laboratory in connection with the Division of Botany. This laboratory is thoroughly equipped for testing seeds, the work being furthered by the use of a greenhouse and a test bed.

At present, so far as the force and means at our disposal will admit, the tests will be confined to samples of farm and garden seeds which are sent in by their correspondents. The most common causes of adulteration with inferior or dead seed, or which contain a large amount of water, and which are not properly filled out and sent with the seed which is to be tested to the Seed Testing Division of Botany, Department of Agriculture, Washington, D. C. Additional blanks will be furnished upon application. Respectfully,

JAMES WILSON, Secretary of Agriculture.

In addition I may say that already we have tested free of charge quite a number of samples of seed and garden seed received from seedsmen, and in

many cases, perhaps, the reports of these tests have been the means of putting those seedsmen on their guard against the possibility of their not handling a large amount of samples of this kind from the same source. Every farmer who is anxious and willing to help the trade in this matter all we can do is to attend to our duties, and attend as occasion demands.

I am also greatly pleased to call your attention to the fact that the United States Bureau of Plant Industry, Department of Agriculture, issued by the Office of Experimentation, a circular on the subject of "Seed Testing," the result of a recent meeting of a committee on seed-testing appointed by the Secretary of Agriculture, and the Agricultural Colleges and Experiment Stations. For several years some of the American experiment stations have been testing seeds for their constituents and an increasing interest is now being manifested in this work throughout the country. In view of this interest and the importance of the subject, the Association of Experiment Stations at its last meeting instructed its committee to formulate uniform methods of seed testing, and to issue a circular for making seed tests in order that such tests may be as reliable as possible. The circular referred to contains the results, together with a description and illustration of the germinating apparatus, and is of sufficient detail to be of great value to the farmer. The circular referred to. The present outlook for the inauguration of adequate and uniform seed testing in the various agricultural seeds is quite encouraging, and very soon there will be no excuse for the farmer who does not have his seed guaranteed the vitality and purity of their seeds for lack of places where such a guarantee may be competently secured.

**to Guarantee.**

At this point allow me to correct an impression concerning the guarantees of seedsmen, and (what must be pointed out to all of you) nobody dreams of requiring a guarantee that the seed which is planted by the farmer in the soil, under what may frequently be the most unfavorable conditions, will guarantee that seedsmen should come up to the standard of vitality. The ends desired to be secured are: First, that the seller of any seed should standardize his seed by himself, provided the buyer is willing to pay what such seed is worth. Second, that the opportunities may be furnished for giving such a fair test, which will be of benefit to the buyer, and which the matter ends.

### The Department's Relation to the Cook Bill.

In those of these remarks Mr. Hicks explained briefly, in accordance with a previous request, the relation of the Department of Agriculture to the Cook bill (which was reintroduced in the 65th Congress, by the name of the Davidson bill). He said, in effect, that the Department did not intend to make any radical modifications.

Acting upon the instructions of the Secretary of Agriculture, Hon. J. Sterling Morton, the speaker had given the Congressman who introduced the bill in his possession concerning seed legislation, suggesting at the same time that the seedsmen of the country should be consulted.

After the bill had been presented to the Congress, the Department of Agriculture had been asked by its author to endorse it, but, unfortunately, did not do so, and in fact, has it done so at any time, although desirable regulations which will secure to the farmers and honorable seedsmen of the country the best of the inferior seeds which are introduced and sold in the United States.

\* Circular No. 34, Office of Experiment Stations, Cooperation Department of Agriculture.

### The Senate's Discussion of the Tariff on Plants and Seeds.

The amendment to insert the new clause, 24 1/2, imposing a tariff on orchids, palms, etc., as given in last week's issue, is now before the Senate. Under the proposition from Senator Vest, of Missouri, whose solicitation for the welfare of the poor man has been the chief object to criticize the proposed duty as an outrage. "Now," said he, "the flower that is sold to the husband of a poor man, brightens the sick chamber, or goes upon the coffin of our dead is to be taxed up by the Government to enable the nurserymen in the United States to rob and plunder, for that is the real meaning of the tariff, to flourish. I hope the Senate will vote the amendment down, but it is a faint hope."

To this Senator Allison replied, a vein of sarcasm evidently running through his remarks. "Under the Act of 1894, the existing law, the great necessity of life known as orchids, which are found in every poor man's home in great quantities, and lilies of the valley are already taxed 10 per cent. The Senator for Missouri has introduced four years ago did not observe the absolute importance of these things to the poor man."

Further on in the discussion the same speaker remarked, "If people go to the States that import the flowers, they are in his character for purposes of adornment and luxury, why should they not pay a little revenue?"

Senator Jones, of Arkansas, evidently also solicits for the poor, objected to the tariff on bulbs. He said, "I have asked, 'that the people of the United States desire to have something that is beautiful for their children, something that will make their homes attractive—something that will add to the beauty of the country and something which the children of the poor raise in this country?' Asked as to whether it would be a duty on the flowers of the poor people enjoying these flowers, the Senator replied that the high-grade bulb tulips, lilies, hyacinths, etc., raised abroad, and it seemed to him there was no justification—no apology—in the sale of the same. He cited some articles, which were in almost universal use all over this country. He moved forward the names of the flowers, and used the words "lilies, hyacinths, narcissi, jonquils, tulips, lilies of the valley, and other bulbs raised in the 'poor man's corners.' The motion was lost."

The discussion on the section relating to the cherry stock was equally interesting.

Mr. Vest said he should like to know why the stock of the Mahaleb or Mazzoni cherry, three years old or less, are put in with a specific tax upon them. I never heard of that cherry before, and I do not know what it is.

Mr. Allison answered—We are told that it is a very fine variety of cherry, and that they are imported by the thousand, and that the duty ought to be a specific value, and not a specific quantity.

Mr. Vest—To keep it out? Mr. Allison—No; with a view to collecting the duty on the cherry, and not the duty. So we have provided for a compound duty here instead of a wholly ad valorem duty on the cherry.

Mr. Vest—I should like to ask whether this rate of duty was not suggested in a specific article in the Mahaleb cherry nurseryman who did not want this Canadian cherry tree to come in here and compete with the Mahaleb cherry which is selling. It never has appeared in any tariff bill before.

Mr. Allison—I have no doubt it was suggested by nurserymen and others. We have suggestions coming all the time from the people who are familiar with the subjects, and nurserymen are familiar with this subject.

Mr. Vest—The last word in this paragraph that is new to me. I am not very well versed in such matters. What do you mean by "manetti" in this connection?

Mr. Allison—Manetti vine? Mr. Vest—Yes—Manetti vine. "Manetti." Then follows "multiflora."

Mr. Allison—I suppose it is an Italian plant, but I do not know. I will say to my friend from Missouri I think there is no trouble about this rate. The rate is the same as the rate on the low-priced seedlings of ad valorem. If properly collected, will be more than 30 per cent. and on the cherry stock it will be less. Therefore, we make a compound duty so as to equalize matters

between the high-priced and the low-priced article.

Mr. Platt (of Connecticut)—I think I can answer the inquiry of the Senator from California. As I understand, it is the wild-root cherry imported for the purpose of grafting old ones upon.

Mr. Vest—Under the Wilson bill as it came from the House there was added a duty upon "plants, trees, shrubs and vines of all kinds commonly known as nursery stock, not specially provided for in this act," 20 per cent. ad valorem. I think it was upon my motion in 1894 that all nursery stock, not specially provided for of the dutiable list and put in the free list, paragraph 515, has taken its way, and the Senator from California, who, I presume, boasted of his favor for agriculture and his interest in sending to this country European plants of every description that might help the people of the United States, both in articles of necessity and even of decoration. Here the whole system is reversed. A lot of goods before the controlling influence of the Finance Committee and shut out by an enormous taxation superior trees, shrubs and flowers that come from Canada and from abroad. They were absolutely now, for the first time (and I have been some what familiar with the tariff bills in the last two or eight years), singled out specifically competing products like the cherry, and they have had such a duty put upon it as they know will exclude it from competition with them, and the people of this country are to be made to use the

stock. I do not recollect the cherry called the Mahaleb, but it is the stock on which cherries are grafted.

Mr. Vest—I do not know, but I am as certain as I am that I am speaking in the Senate of the United States that some nurseryman had a job when he had that put in. It was not done by accident, and it was no rhetorical exhibition. "There is money at the bottom of it," they never would have picked out this particular cherry tree and put this enormous duty on it except to answer their own purposes. The Senator from Iowa very frankly tells us that he presumes that it was done by some nurseryman. And it is for the benefit of the people of this entire country.

The paragraph relating to seeds, as amended by the Finance Committee, was discussed by Senator Hawley from Connecticut and others. Mr. Hawley said:

There are among my constituents a large number of men who have been for many years in the seed business. The names upon their packages is worth a dividend to them. Nothing ever went from their gardens that was not what it purported to be. They are distressed very much by the abundant importation of seeds from abroad bearing the same names and fairly well respected here, which seeds are dumped upon us, are not pure and true, but are often of a different nature, and injury to the legitimate trade. As to the duty, when a man brings in worthless seeds, he is often fined, but I cannot tell a lie about their value when you

obliged to him for his information. To use the language of Dick Swiveller, "who would trade with you, and whose games of that sort." Of course seed imported under the circumstances referred to by the Senator, is to be stricken from the free list, and ought to go in with the others and pay at least 40 per cent.

Mr. Jones (of Arkansas)—Before that paragraph is left I should like to say, I believe I have seen the name in the Senate from Connecticut (Mr. Hawley) has just said, that I believe with him that it is not fair to send the name in the hands of more value than in any other business, except perhaps the jewelry business. I believe a good name in the seed business is equal to a dividend as a rule. I do not believe that seeds brought here from abroad and dumped on the market are likely to do harm, coming even in the way suggested by reason of the fact that ordinarily I believe nine men out of ten, if not ninety-nine out of one hundred, will buy seeds of seed growers whose names are established and have been well known for years.

For instance, Landreth & Sons, of Philadelphia, have been seed growers for more than a century. I confess I have not seen the name in the Senate, but that concern saying that they had been connected with the seed business from the time of the Revolution to the year 1861 there had been no tariff on seeds, and that the tariff on seeds was first 10 per cent. and now, for the first time in the history of this infant, which is the subject of the bill that is now under concern, the House proposes a tax of 40 per cent. ad valorem, and the Senator from Connecticut has proposed to impose. I believe that the character of these men is sufficient to guarantee the sale of their seeds everywhere, and that no unknown and untried seedsmen can sell seed in competition with these firms, and that the tariff is imposed to protect infant industries, and what we have an establishment of this sort, and that the excuse for this tariff seems to me that the tax is not sufficient.

Mr. Hawley—The infant industry in this case is the fraud. The old industry is honest, and fair, and has the honor of having known Mr. Landreth very well for twenty-five years, and he asks you to protect him from the frauds of that kind may be obstructed.

Mr. Jones (of Arkansas)—But the objection is that protection is needed to protect infant industries, and what we have an establishment of this sort, and that the excuse for this tariff seems to me that the tax is not sufficient. Mr. Vest—The thief that came in last night that is the infant industry, and not the honest man, and I believe the thief we desire reasonable protection.

The portion of paragraph 251 indicated by the Senator from Connecticut (Mr. Hawley) was passed over.

### Thomas Cartledge.

The subject of our sketch, in whose honor the Florists of Philadelphia recently gave a banquet on Friday evening last, in celebration of the fiftieth anniversary of his professional career, started in to work as a boy on the private establishment of the late Caleb Cove, Esq., at Holmesburg, which was one of the best of the old seedling places around this vicinity. He afterward became identified with the florists' business and for several years regularly attended the markets of Philadelphia. In April, 1864, he went to England, and returned to Philadelphia and opened a store on Twelfth Street, and in 1870 he became a partner of the firm, consisting of himself, and his brother, to Penneck Bros., and still does business under that name. The store now being on Arch Street. For several years past Thomas Cartledge has been the managing partner, the firm name being that of himself and Abram L. Penneck.

Mr. Cartledge is now 63 years old and has been in the florists' business all his life. His esteem in which it is held by his fellow craftsmen was well expressed at the banquet on Friday night, when 100 people took part in doing him honor. From 1861 to 1897 he has been a member of the American Horticultural Society, in which society he has always taken a great interest. The success of the last banquet has been given next week. DAVID RUST.

Mr. Platt (of Connecticut)—I think I can answer the inquiry of the Senator from California. As I understand, it is the wild-root cherry imported for the purpose of grafting old ones upon.

Mr. Vest—Under the Wilson bill as it came from the House there was added a duty upon "plants, trees, shrubs and vines of all kinds commonly known as nursery stock, not specially provided for in this act," 20 per cent. ad valorem. I think it was upon my motion in 1894 that all nursery stock, not specially provided for of the dutiable list and put in the free list, paragraph 515, has taken its way, and the Senator from California, who, I presume, boasted of his favor for agriculture and his interest in sending to this country European plants of every description that might help the people of the United States, both in articles of necessity and even of decoration. Here the whole system is reversed. A lot of goods before the controlling influence of the Finance Committee and shut out by an enormous taxation superior trees, shrubs and flowers that come from Canada and from abroad. They were absolutely now, for the first time (and I have been some what familiar with the tariff bills in the last two or eight years), singled out specifically competing products like the cherry, and they have had such a duty put upon it as they know will exclude it from competition with them, and the people of this country are to be made to use the

cherries and plant the cherry trees that these gentlemen have sent to the market. I do not know what a financial and economic lunatic asylum it is. They have absolutely selected a particular cherry tree and put an enormous duty upon it. If that is in a class legislation, I should like to hear some gentleman on the other side tell me what it is.

I do not know what this cherry is. I have been under the impression, from observation and experience, that the finest cherries in the world are raised in the United States. I have never tasted any such cherries elsewhere. It is said that they have cherries never to them in France, but I have never seen them. The cherry in Washington and Oregon is the finest fruit, in my opinion, that was ever put in the mouth of a mortal man. After eating them, which you can do in any quantity without any injury to your health, I have always thought if it had been a cherry in the Garden of Eden, instead of an apple, I would have gone very far to get very much of it, and made a bite. But it seems the gentleman has discovered that there is a cherry which is not raised in the United States, and instead of importing these improved fruit trees cultivated in the United States, and in the Northern States particularly, they are to be excluded by an enormous tax and sent to the States where they are now upon the free list.

Mr. Gear—The Mahaleb cherry is the

Thomas Cartledge.

come to put 25 per cent. ad valorem upon them. I want that returned to 40 per cent. as the House put it, say the least. I concur with several Senators, who wish this to go over for the present for further consideration.

Mr. Lindsay—In connection with what has been said by the Senator from Connecticut (Mr. Hawley), I call the attention of the committee to the fact, evidenced by certain papers now here in the hands of the committee on Agriculture and Forestry, that there is a certain Canadian seed, called the Canadian blue-grass seed, which is imported into this country for use in New England, and nowhere else, and that portion not used in New England is used for the purpose of being mixed with the true American blue-grass seed, it being worth about one-fourth as much, and American blue-grass seed has been put under the ban of suspicion everywhere by reason of the admixture. This seed, which is grown in Canada—and we object to everything that comes from Connecticut (Mr. Hawley), is used only for the purpose of being mixed with an American product in order to render the American product more saleable, as put by this bill on the free list.

I ask the Senator when he is considering the bill, to please to consider the fact that seed which is not common to England goes on the free list, and that the same is done in order to satisfy him in regard to New England seed.

Mr. Hawley—Though not comprehending the Senator's advice, I am

**GHRYSANTHEMUMS.**

As soon as the planting of the cut flower varieties is finished, the remaining stock must be sorted over, and all intended to be new on the market, plants that, at a good condition, ought to be potted up according to size in 3, 4, and 5 inch pots. They will all make nice market plants. Those strong enough for 5-inch pots, can be easily brought up to 5-inch pots by fall, if such size can be handled. I find it profitable always to have a lot in that size pot; they make fine specimens, though not large enough for show purposes where the sizes of pots are 12 and 14 inches. But for home ornament the smaller specimens are very much admired, and there is some money in them provided you can sell them at from \$2 to \$3 each. Rooted at the present time can be potted up and used later for single-stem plants, and such classes are in every premium list. Most any florist can handle a few hundred of them and be able to come to the market with plants from \$1.00 to \$1.50 per 100. Mutual Friend, Ivory, Golden Wedding, Helen Floodgood, Geo. W. Childs, Vivid-Morel, Major Bonnard, and a good many more, make nice single-stem stock, and if a grower having but limited room will select three or four varieties, and grow only fifty of each, he will be able to choose about twenty-five well balanced plants upon which to rely to show. But if you want to go for a premium of twenty-five single stems, and only grow twenty-five plants, you will find that the man who selects from a lot, will have the longest poles, and the most uniform. A good class grower with a little foresight will be able to come to the wire with the best of the plants, and the remainder for one needed, and the remainder can be used as cut flowers, and so forth.

As soon as the plants ought to get, from now on, all the room, air, and attention possible; at the same time, do not neglect the plants, as they are in the ground, no water; don't let the foliage drop, rather give an extra syringing during hot days. Good water would well cultivated, not too deep, but it will be always open so that the air can work it. Don't let a hard shell cover your roots, and well cut weeds grow to them, and the soil will keep in a very condition, just what your plants like.

THOS. HICK,

**CORRESPONDENCE.**

**Fire Insurance.**

Mr. W. J. Veezy:

Dear Sir:—I would like to enquire whether the fire insurance charter you speak of in your letter is the tract. I suppose would permit mutual insurance upon a plan that does not require the payment of premiums.

Also, I would like to ask what the plan upon which the company that facilities the insurance. Also what are the main features of the Indiana law upon mutual fire insurance?

Am I correct in assuming that under the plan you propose your company would commence business with \$10,000, and raise \$100,000 paid in capital? Respectfully yours,

JOHN G. ESLER, Saddle River, N. J.

**Nomenclature.**

The Nomenclature Committee of the Society of American Florists is charged with the general duty of bringing before the society, at its annual meetings, cases of misnaming, recommending nomenclature, and arrangements relating to decorative plants handled by the American trade. It will facilitate the work of this committee if any of your readers who may have noted cases which should properly come under its notice would kindly report them to the undersigned, not later than the 1st of August, so that they may be reported to the report to the committee, which is to be submitted at the annual meeting of the society in the latter part of that month. It is particularly requested that full details be given concerning any cases reported.

WILLIAM TRELLESE, Chairman, Missouri Botanical Garden, St. Louis.

## CARRIAGES.

### Successes and Failures.

It is as interesting as it is profitable to look back over the past season's record, and note the successes and failures, or partial ones, which have attended our efforts. Doubtless all of us have made many mistakes, and reaped many successes than we desired. This, however, is only a reminder that perfection is still in the distance, and the real leading cause of our many failures and disappointments—so many, in fact, that it is quite impossible to escape a good portion of them.

The season just closing has been profitable to us both in experience and in the production of good stock. We have turned out more of the latter than we had expected. Owing to very unfavorable weather last summer, our plants were in poor condition when housed; so poor were they that we had little hopes of accomplishing as much as we had done in past seasons.

The fact is that necessity stood us in the face and if we would pull victory out of defeat, it would require unceasing vigilance on our part. If we were heretofore careful with watering, ventilation, feeding, etc., we must be more careful and also more diligent in our people require more attention than do healthy ones, so it was with our house of sick plants, which they appreciate and the attention shown them became more evident as the season advanced. For some time past we have been cutting our best flowers than we were a year ago. In this respect we have made an advance over last season, but if we take an average of last season's stock and compare it with the average of this season's, the latter does not come up to it. To make the matter more serious, the rate and unsalable flowers being considerably in excess of last season's record.

We hope for a better and thrifter lot of plants this fall than we had last. The reason we had so many failures is due to those of a year ago, while the soil is not only better, but is more favorably situated and is better drained. In the event of a wet season the plants will fare better than did those of a year ago.

There are other causes for success and failure, prominent among which is the proper selection of position for the defective varieties. Any grower who is alert will notice the peculiarity of a carnation as regards growth and the amount of heat and light it requires, as well as the proportion of food it demands.

Our constant aim is not only to produce fine flowers when there is an abundance of light, but doubly so when the days are shortest and when we have more of darkness than light, when the demand is usually greater than the supply of first-class flowers.

While carnations do not require as much light as some other plants, yet during the winter months they will need as much as the most modern and expensive house can afford to give, especially true of McGowan, which is rather backward in growth; possibly have a few dainty succession which are something to do with its slow growth when placed in a position where light is lacking. Since light and air are the principal factors which assist the plant to draw the nourishment from the soil, and since the action of these on the foliage accomplishes this, the importance of planting such varieties in a house as light as possible is at once manifest.

But varieties like McGowan are not the ones that will be especially benefited when planted in a very light house. In Uncle John we have a variety to McGowan, whose foliage is abundant; it is also a rapid, luxuriant grower, but it must be kept somewhat in shade in most other varieties, and to keep its naturally rapid growth firm and healthy plenty of light and air is necessary.

There are others which are more partial to light than the above, but which need not be particularly mentioned here, as any grower who is always alert will be able to take care of them. A majority of varieties do very well in a house which is not more than ordinarily light, and in a stable, in an even-span house running north and south. They may do so well as to satisfy almost any one, yet these

same varieties, if given a lighter house, will exhibit a marked improvement, and enough to cause those who are contemplating the building of any new house to pause and consider which style of house he will build.

Varieties like Daybreak and Meteor, which are rather partial to a cool temperature, do not require as much light

partial to a cool temperature and mild light.

Next week I will describe a house which I have recently built, and which I believe is an improvement over the average house as built to-day, in that it is rather light during the dark days of winter is concerned.

H. WEBER.

most brilliant color and are thus much welcomed by all interested in the class to which they belong. As a cut flower they need care in shipping, and although they do not keep well, nevertheless, where they can be used, especially in light glasses or vases, with feathery grass or light foliage, they produce the best of decorative effects.

### Roses of the Victorian Era.

The "Gardener's Chronicle," London, in its issue of June 1891, gives an interesting account of the progress made to the rose world during the reign of Queen Victoria. The writer of the article says: "During the period of the last sixty years, it is very difficult to say how many roses have been sent out into the world, but we take the average of forty each year, there cannot have been fewer than 2,000 and 3,000 roses sent forth by raisers abroad and at home."

"The three classes of roses whose improvement has been so remarkable during the past sixty years are hybrid perennials, tea-scented, and Noisettes. The origin of the former is a matter of considerable doubt; but I believe that the hybrid China, crossed with Damask, hybrid Bourbon, and other roses, have produced some of the magnificent flowers which we now possess. Two of the most celebrated raisers in the older days were Laffay and Viret; but I do not think any of their productions have survived to the present day, except in a few garden roses such as *Gloire des Rosomanes* and *Almeida Viret*. The origin of the teas and Noisettes is somewhat better known; they are the product of the China rose crossed with the yellow China or Teal rose; and I believe that all the fine varieties that we possess are traceable to this combination. The Noisette rose was raised in America by M. Philippe Noisette; it was produced from Old Musk fertilized with Chinese China. Noisette's rose has since been a great favorite with the French rose growers; but its earlier adaption to the present day is due to a few ingenious results which have followed during recent years."

"The three perpetual class there are no roses that go back to the period of Her Majesty's accession, and by far the greater part of the roses which were raised and seventies: How prolific the sixties were in good roses may be seen by the following list of the most successful in this position as exhibition roses:—*Alfred Colomb*, *Annie Wood*, *Baroness Rothschild*, *Charles de Meillon*, *Chloé*, *Comte de Rainhaud*, *Comtesse d'Oxford*, *Jevienne Lamy*, *Dr. Andry*, *Duchesse de Moray*, *Jacques d'Angoulême*, *Empire Eugénie*, *Eugénie Verdier*, *Fisher Holmes*, *Horace Verneil*, *Louis Van Houtte*, *Madame Victor Verdier*, *Marguerite de St. André*, *Marie Lambert*, *Marie Zady*, *Marquise de Castellani*, *Maurice Barraud*, *Mons. Normand*, *Pierre Notting*, *Princesse Camille de Roban*, and *Xavier Dillie*.

The varieties produced much fewer, the most noticeable among them being A. K. Williams and *Madame Gabrielle Luizet*. "In Tea roses nearly all of the most valued varieties came from France. All the grand Teas from Niphetos sent out in 1830, down to *Marian Chloé* in 1850, have come from abroad; some from America, but they have been mainly sports."

"In garden roses also there have been charming additions in the class of Noisettes; Other classes of roses have, during the latter portion of this period, come into much notice; one is the class of hybrid teas, and to which some good additions have latterly been made, although quite later than that the fewer the divisions, and the more simple the classification of the latter; still they serve the purpose of keeping the most decided tea and Noisette roses in a class by themselves. It is somewhat remarkable that no attempt has been made in what are called summer roses, hybrid Chinas, hybrid Bourbons, Gallias, etc."

"There is yet another class which has received some remarkable additions during the past few years, that of ordinary cut and polyantha; the Japanese rose multiflora or simplex has been crossed with some of our teas, and has produced a delightful class of dwarf double polyanthas, and such flowers as *Cecile Brunner*, *Ma Piquetette*, *Gloire de Polyantha*, *Polyantha*, and others, form a class which we cannot now afford to neglect, blooming, as they do, in large clusters, of a bright and pleasing color. To these must be added that remarkable rose, *Edison Rambler*.

"To the Japanese we also owe those roses of the ferax or rugosa character, which have been produced in a very useful, and which may probably yet give us, under the hands of the hybridizer, a new class of roses, the double-flowering one, *Madame Georges Brant*, may be the *avant courier* of many others."

Papaver nudicaule.

### Flowering Shrubs, Etc.

as most others. These two varieties are always among the first to go to pieces with the advent of summer. Daybreak's principal fault is losing its color, for which strong light is mainly responsible. Heat also contributes its share in causing Daybreak to fade, but in a lesser degree than light. The color in Daybreak may be materially preserved during summer by careful feeding; but, at best, they can hardly be made to equal their color as we have it in winter.

With Meteor I believe that heat plays as important a part as does light in causing this variety to give out in summer. It blooms freely enough, but the

Magnolias and their usefulness as lawn decorative trees are so well known that no description of them is necessary, and as a change from *M. sanguinea* and others so generally grown, the subjects illustrated are well worthy of consideration. *M. stoliata* is of Japanese origin and is slightly dwarfier in habit than many others. M. Lehmanni makes an enormous bloom and thus is a desirable variety. *M. purpurea* is not so much grown as its delightful color and general good qualities demand.

Double flowering peach trees are now

Apple Blossoms.

flowers lack substance, and are often spotted. Good feeding does not seem to remedy this very much. I have always noticed, however, that when we have a few dainty succession which are cloudy and cool or raining, that the quality of the flowers improves greatly, which is abundant evidence that it is

being planted very abundantly and in a position where they are placed well in among, or at the back of, other shrubs. In addition to that their long and narrow branches of considerable value in a cut state.

Iceland poppies—These early visitors in the hardy flower garden are of the

Double Peach.

**Individual Credits.**

*Extracts from address delivered before the National Association of Credit Men of America, City, Mo., by James G. Ginnin, Vice-president, Fourth National Bank, New York.*

In discussing credit, we too frequently view it in its abstract form, and fail to consider it in its bearing upon the individual. It would, therefore, seem that a study of this phase of the subject would be productive of much interest and profit; not only to credit men, but to merchants generally, as I have yet to find that there has ever been raised a single question as to the methods to be employed in the extension of this form of credit.

All enduring structures must rest upon substantial foundations; and if upon individual credits are not upon a secure and conservative basis, the ill effects will be felt by the retail merchant, the jobber and the manufacturer.

The evils from which the mercantile community suffers seem to me to be due, not so much to a lack of money or capital, as to the lack of an intelligent and proper use of credit. If we can inspire a healthy public sentiment in regard to all forms of credit, it will receive greatly to facilitate needed reforms.

Credit is created by the desire to do business, and thereby secure a profit. For example: A is well and favorably known to B as a man of strict honor and integrity. He may be a producer, but without ready money. He may be engaged in producing goods. B has the commodities and wishes to sell them; therefore B finds it agreeable to supply A's wants for a consideration of profit, upon his promise of future payment. In this way credit is brought into play, and its continuance is justified by the prompt fulfillment and faithful performance of all the duties and obligations imposed by the contract, but if too easily obtained it promotes extravagance.

**The Basis of Credit.**  
The question naturally arises, Upon what basis should individual credit be granted? No inflexible rule can be laid down, but the underlying principles of this form of credit that suggest themselves to me are, character, ability, capital and previous conduct.

Individual credits properly dispensed call for the exercise of diplomacy, mature judgment and eternal vigilance, and one should be especially conservative in extending liberal credits on the luxuries of life. For instance, where a customer might, without criticism, buy

ion as to the basis of their credits, could give a specific or intelligent answer.

The average retailer throughout the country needs education in this and kindred lines, and he should be brought to realize that to his interest to follow some well defined system of granting credits. He will often "size up" a man on the spot and sell him a bill of goods without even knowing the party's full name, or relying, perhaps, on his supposed ability to give some thing of his means or affairs because he is an acquaintance, he will trust him without investigation as to his financial worth.

Some retailers I find have not taken stock for years, believing it to be unnecessary, because, as they say, all they have on their shelves belongs to them. They do not even keep books. Careful attention to details, and a thorough system of bookkeeping, are prime factors in determining a merchant's success. If he is careless in his methods he is likely to find his customer tardy in meeting their bills.

If the retail merchant would only change his method, ascertain the cost of conducting his business and the profit on his sales, keep his books in such shape as to enable him to know at all times whether he was making headway or losing ground, he would be in a position to adopt corrective measures when necessary and avoid the shoals and rocks that would otherwise bring disaster upon him.

Some good wholesome educational work seems to be in order, and where the jobber or wholesaler finds that a retailer to whom he is selling his goods has extended credit beyond prudent limits, compared with his own resources, although it is to persons of large means, he should confine him to the shortest possible terms, and force him into a system of making quick collections. For the nearer a retailer reaches a cash basis the better will be his position. If he pays cash for his goods he is not likely to sell them on any other terms, and when he does give credit, he will exercise more care in its extension.

If the wholesaler houses will give their retail customers the benefit of their wide experience, knowledge and counsel, as the best business methods to be adopted, it will be of mutual profit and advantage. So long as retailers pay their bills with ordinary promptness the wholesaler has no occasion to interfere, but when they become slow he is compelled to look over the situation, and in nine cases out of ten retailers will plead in extension of their tardiness that some of their own customers owe them large bills which they are unable to collect. How useful it is, therefore, that all unknown quantities should be eliminated, and that a painstaking investigation should determine the character, financial strength and integrity of every credit risk.

*(To be continued.)*

**Montreal.**

The celebration of the Queen's Jubilee called forth extraordinary efforts in the decorative art, the craft coming in for a share of the good things. This was very acceptable, as, owing to the backward season, but little bedding out had been done. It came somewhat hard upon those who depend upon outside growers for cut stock, as in one instance prices were advanced considerably, which hurt sales, but few caring to pay more than the usual price at this season.

A. Martin is putting up a new place in addition to rebuilding part of the old.

Wishire Bros. expect shortly to secure a suitable spot to erect a range of houses, the old ones being situated on valuable land in the heart of the city.

J. McKenna & Son will increase their stock, having had a first-rate spring business.

Joseph Bennett intends lowering all his benches for the purpose of carrying carnations through the summer upon the solid-bench principle, which he is convinced is the most satisfactory.

J. S. Murray says he was never rushed so much with funeral orders as he is at the present time, particularly at this season of the year, when flowers are scarce.

Miss Murray has been the recipient of many encomiums for the steamer pieces supplied Canada's representatives to the Jubilee.

S. S. Bain fills in his spare moments at his lovely seat on the St. Lawrence River and manages to contribute a weekly article upon "Cottage Gardening" to a local paper. It is highly interesting reading and has made him famous. This is superfluous, as he is well known otherwise, being president of the Caledonian Society, which were strongly represented in the parade of Monday, and at whose head Mr. Bain marched. But he bears his honors modestly.

B. T. Greaves expects a big demand for flowering shrubs next fall, as owing to the extreme cold spell at one time plants which have stood the siege of many winters succumbed, scarcely a bush remaining. Phlox and the like was completely killed.

Walt Wishire has been very unfortunate of late. To add to his troubles his whole family has been down with scarlet fever, which at one time threatened serious results. W. M.

**Dover, N. H.**

C. L. Howe reports a good spring business. The season is late, especially at the beach towns, where he has considerable custom, but the rush now is clearing everything out in the shape of a flowering plant. A good business is done in shrubbery. Five acres of excellent land are devoted to this branch. W. M.

### For the Busy Man.

The lawn party given by Mrs. Macme, of Providence, for the benefit of the S. A. F. entomological fund, was a grand success.

Frosts have been experienced in several localities the past week. The cabbage outdoors in St. Paul has suffered considerably.

The "Florists' Exchange" as far as its origin in the near future, will publish the most authentic history of the sweet pea ever written, illustrated by the best representations of the flower taken from the oldest gardening literature.

The New York Gardener's Society, on Saturday last, held its own annual exhibition of flower shows ever held in New York City. It was a highly successful one and will be an annual. The flowers were given away to the hospital.

### The History of the Sweet Pea.

In an issue in the near future "The Exchange" will publish a complete and authentic history of the sweet pea that has ever been written. The object will be to give the origin of the earliest representations of the flower, obtained from the oldest works on gardening.

The text is from the pen of an eminent specialist who has had a vast amount of experience in the cultivation of what he writes, and will prove a most valuable addition to the literature on this favorite flower.

### New York Botanical Garden.

The modified plans of the New York Botanical Society for its garden in Bronx Park were adopted by the Park Board Monday last. The principal changes have been in the locations of the director's house and the large greenhouse. The only member of the board who voted against the adoption of the plans was Commissioner Stiles, who gave as his reasons for so doing the following:

"I voted against the adoption of these plans primarily because the advice of our horticultural committee is heeded. We invited the advice of counsel in the person of these experts. They have been fully consulted and their advice not approved of the modifications. Therefore, my vote was cast in the negative. Furthermore, I don't believe that an adequate study of the landscape has been made in connection with the preparation of these plans, although they are somewhat better than the original design presented to the Park Commission. On the original plan the power house was put in a magnificent grove of trees. That has been removed to the open space, which is a distinct gain. In the original plan a big greenhouse was put in a beautiful old park which is a priceless piece of scenery. This dell has, at least, been temporarily preserved from the plans and it may hereafter be studied at all. One road goes within forty feet of the railway tracks, and another crosses a portion of a meadow. I also disapprove of the location of the museum.

At the meeting of the Park Board, during the discussion of the subject, Mr. Stiles is reported to have said: "The whole plan is a bad one and I propose to vote for it. The plan ought to have been made by men who know something about parks. When such a design is made it cannot be altered afterward."

The experts chosen by the Park Board to examine the plans and on whose advice the plans in their original form were prepared, are Prof. J. N. Rose, Olmsted, the famous landscape architect, and Mr. Hastings is said to be "an architect of high repute." In addition, previous professional association with the New York park system." Professor Rose is superintendent of the Botanical world, among his other relations thereto, as the conductor of Garden and Forest, a horticultural paper, and a managing editor; and S. B. Parsons, Jr., is superintendent of the New York City Parks.

#### Trade Show.

The past two weeks were none of the best for the florists' trade, and it looks as if the dull season was already setting in for planting and sowing in price. Bedding plant stock is still rather heavy and the market generally remains until July.

#### A Frost.

A June frost is of rare occurrence, but last week we experienced a white frost, which was very unusual. It did not damage crops to any extent. The temperature remained low for several days. However, we have had no summer weather yet.

#### Johns.

J. F. Cowell, of Buffalo, was in the city last week. John Bader returned from his trip east and brought a nice lot of plants

from the Dean sale. He is now thinking of going to Europe for several months.

#### Cleo Sales.

No quorum was present at the last meeting of the Florists' Club, but at the next one a better result is looked for. Cleo sales will be discussed and arrangements for the trip talked over. It is likely that Pittsburgh will be the next stop, as many have expressed their desire of visiting the fair East. A bowling team will be selected and will be headed by

E. C. REINEMAN.

### New York.

#### Wholesale Markets.

Business shows but little alteration from the conditions which prevailed a week ago, and from all appearances there will be no change for the better over for the balance of the summer. With June, goes all prospect of weddings. It can be said that fully half of the couples, as far as weddings and their attendant decorations are concerned, has been a failure, and that is about a point of view, the poorest on record.

Roses are getting very light in supply, especially dark stock. Next week will practically wind up the rose supply for the season. Carnations are selling even cheaper than they did last week. Great peas are very abundant, and are being very extensively used, making it possible to furnish large quantities for parties. The new, high class peas with long stems and good foliage being obtainable at \$2 per 100, less seed, is nearly a proportionately figure.

Fire broke out at the establishment of Ernest Assan, West Hoboken, Friday. The barn was practically destroyed, but little or no damage was caused to the greenhouse property of the establishment.

W. G. Marshall, with J. M. Thorburn & Co., was married Friday, June 18, at St. John's Protestant Episcopal Church, Hoboken, by the Rev. A. Bently, to Miss Lucie M. Voyer. The bride and bridegroom left on the steamer of the Hamburg, South, per steamship Furness, Saturday.

W. Resecker, Livonia, N. C., was a visitor this week. He reports the trade in garden goods very brisk. Miss Emma Jacobs, a sister of the western star of the EXCHANGE, called for Europe, leaving for London Saturday. She will visit England, France and Italy, during her two months' trip abroad.

J. W. E. Ebbing, manager of the Horticultural Company, of New York, returned to Europe on June 19, on steamer Spardam, after a brief trip to the United Kingdom.

L. C. Bobbink, American manager of the Horticultural Company, of Hoosick, Holland, was married on Wednesday, June 23, to Miss Gertrude C. Schmidt, of Hoboken, N. J., at the residence of the bride's parents, on Palisade avenue.

H. B. BERGER & Co. are now located at rooms N and O, 131 floor, 320 Broadway.

#### Auction Sales.

M. M. GARDNER & Co., 199 Fulton

st., will hold an auction sale on Tuesday, June 23, of palms, dracaenas, etc.

### Cincinnati.

#### Blossoms Blite.

It is the only thing that seems to do the most mischief in the business of the florist in the field. We have had plenty of rain and you can fairly see the plants in the fields. The damage ranged from 90 to 95 degrees for several days. Business is rapidly on the decline. One of the largest growers, McClelland, of Lexington, Ky., a noted turfman, used up many flowers. Never did the business ever get so low as in Lexington, Ky., was there such an array of powers at a funeral. Costly designs of the florists, especially New York, and the home florists had many deaths to mourn.

The Newport schools, as well as those in Covington and Ludlow, held their commencement exercises during the week, and this helped business with the wholesale houses, as well as some of the retailers. Exports to New York had many orders; in fact, had the greater bulk of the work for that town and country. Geo. Meek had it for Covington, Ky.

#### Johns.

George S. Bartlett has returned from his bicycle tour among the florists. He says he met with fair success and is

going out again when old Sol sets up a little.

J. E. Killen, with C. H. Joosten, New York, was a caller on Thursday. He had been attending the horticulturist's convention at St. Louis and could talk spinless gooseberry to perfection.

Harry Hainline, Detroit, was in the city a couple of days selling flower pots.

The bowling teams are being considered for a better time and it's nothing so much an individual score of 50 to 75; once in a while, by mistake, 100 to 200 is scored. C. GILLET.

### Boston.

#### Rose Show.

The annual rose and strawberry show of the Massachusetts Horticultural Society was held Tuesday and Wednesday, June 22 and 23. The exceedingly cold and wet spring has not been conducive to the production of the best quality of either flowers or fruits, and that is the complaint of the large and possibly the quality not quite as good as in former years. The exhibitors were the following: Geo. W. Fay (M. H. Walsh, gardener) and Miss E. J. Clark, of Pomfret, Conn. (John J. Walsh, a fine show) with his seedling roses, receiving a silver medal for the best. Also a certificate of merit for Joseph S. Fay.

Beautiful collections of orchids were shown by several exhibitors, as follows: Rothwell, W. P., Winsor and E. V. R. Thayer. A very handsome bog-orchid, traded to the exhibitor, was exhibited by Nathaniel T. Kidder, attracted a great deal of attention. Jas. Coombs showed a large collection of rhododendrons arranged with handsome colored foliage, and T. C. Thurlow an excellent set of seventy-two varieties of peonias.

Following is the list of the prizes awarded:

Orchids—Six plants of six named varieties, in bloom, E. V. R. Thayer, second, W. P. Winsor. Three plants of named varieties, in bud, E. V. R. Thayer, second, W. P. Winsor. Single specimen named, Kenneth Finlayson; second, J. H. Craig. Three plants of named varieties, Edward J. Mitton. The society's silver medal was awarded to W. A. Mackintosh, for a very fine Cattlee Arnoldiana var. superba.

Harry Hoses—Twenty-four distinct named varieties, in bloom, Kenneth Finlayson; second, the same, third, Mrs. E. J. Clark. Sixteen distinct named varieties, in bloom, Kenneth Finlayson; second, Joseph S. Fay. Twelve distinct named varieties, in bloom, the second prize to Joseph S. Fay. Six distinct named varieties, three of each, the second prize to Joseph S. Fay. Third, Miss E. J. Clark. Twenty-four distinct named varieties, one of each, the second prize to Mrs. E. J. Clark; third, Joseph S. Fay. One of each, the second prize to Joseph E. Craig; third, Miss E. J. Clark. Thirty-six distinct named varieties, one of each, Kenneth Finlayson. Twenty-four blooms of Mme. Gabrielle Lunet, Mrs. E. J. Clark; second, Joseph S. Fay. Third, Kenneth Finlayson. Six blooms of John Hopper, the second prize to Kenneth Finlayson. Six blooms of Charles H. Thomas, the second prize to Patrick Kane. Sixteen blooms of any other variety, Kenneth Finlayson, second, W. N. Craig. Best single bloom of any variety introduced since 1885, Mrs. E. J. Fay. Twenty-four blooms of named varieties, three clusters of each, John L. Gardner, second, Joseph S. Fay. Twenty-four blooms of named varieties, two clusters of each, John L. Gardner, second, Joseph S. Fay; sixth, E. J. Clark; fifth, Joseph S. Fay; sixth, William H. Spooner. Seven Williams' varieties, the Bussey Institution; second, W. N. Craig; third, Miss W. E. Craig. Sixteen Spanish Roses—Collection, named, the second prize to the Bussey Institution.

#### Salem, Mass.

H. H. Funchard's greenhouse is being torn down and a new building improvements being carried out.

New York Gardeners' Society.

Exhibitors and Meeting. The Gardeners' Society held an exhibition of flowers, fruits and vegetables...

Mayor Strong opened the exhibition and expressed the desire that it be permanent...

The rose display was a magnificent one and included all the leading varieties...

Among exhibitors of herbaceous flowering plants were those who had over fifty species, Lilium Kramerii...

A new white carnation named Greater New York was exhibited by H. A. Molatsch, Bay Ridge...

The exhibits of fruits and vegetables were of a particularly interesting lot, including several Scotch pinks...

CHANGES IN BUSINESS.

AURORA, ILL.—The De Heener Bros. have opened a florist store at 104 Fox st.

PORTSMOUTH, N. H.—Richard E. Haenaford will embark in the business here, and is having a large greenhouse erected.

SEANTON, PA.—Mrs. M. Muir will open a florist store in the Handley Building, on July 1.

LOUISVILLE, KY.—John M. Samuels is reported to have purchased the Mississippi Valley Nurseries, at Clifton, which his father, the late W. M. Samuels, established many years ago, for \$25,000.

JERSEY CITY, N. J.—The co-partnership of Garrett & Rose, 200 West Side ave., was dissolved by mental consent, Monday, June 21. The good will and interest, together with all outstanding debts and bills are undertaken by A. D. Rose, who will continue the business under his own name, at the above address.

THE MARYLAND GREENHOUSE

NOW IN PREPARATION AND TO BE SHORTLY ISSUED.

This will be a handsomely printed and bound volume, and contains a digest of the history of aquatics down to the present day, and imparting the knowledge necessary to its successful propagation and cultivation. It will be a book of highest value to the trade as also to the amateur, and in its pages will be found the best mode to grow and care for this valuable group of plants to the greatest advantage, from a sunken tub in the city garden, or the grand ponds in park lands. The book will be copiously illustrated with many excellent full-page plates and numerous half-tones of notable plants and water gardens.

The author, Mr. Wm. Tricker, has had many excellent advantages and a long education in the cultivation of aquatics, and what he has to say on the subject will be looked forward to with interest.

Price \$1.00. Orders booked now.

A. T. DE LA MARE PTG. & PUB. CO., Ltd. P. O. BOX 1697, NEW YORK.

...THE COMPLETE...

THE BOOK OF THE ROSE.

We have just issued the most Select and Complete Catalogue of Books on Horticultural and Allied Subjects, ever published. The catalogues of the various book publishers of this country, as well as of those who have been carefully gone through, and such works taken therefrom as were considered best for our purpose.

This catalogue contains 96 pages, and embraces

- ...BOOKS for The Florist, The Market Gardener, The Nurseryman, The Fruit Grower, The Seedsman, The Student of Botany, Entomology and Orthology, The Pottery Keeper, The Farmer, The Lover of Plants and Flowers, and the Student of Nature in general, in fact

BOOKS FOR EVERYBODY

interested in the science and practice of rural economy. No set of clubbing list of periodicals, home and foreign, is also furnished, through which a considerable saving may be effected in such purchases.

This handy catalogue will be sent on application, accompanied by a two-cent stamp.

A. T. DE LA MARE PTG. AND PUB. CO., Ltd. P. O. Box 1697, New York.

Burlington, Vt.

John Wilson reports that first-class success has been achieved in growing and spring bushes, and in growing holly to get things into shape to get away to the convention, where he hopes to meet many of his friends.

Manchester, N. H.

A. G. Hood has the new additions to his houses well under way, and will be completed in time for the summer planting. The sudden change in the weather has caused a very satisfactory call for plants.

Ottawa, Ont.

Graham Florist is the new name of the "House of Flowers" in Ottawa, the addition being an elder brother, who, for twenty years, was with W. Ewing, of Montreal. Mr. Graham manages the store here, and in addition to which has been added a seed branch, well equipped in every way. John continues the greenhouse end and no doubt the combination will be a strong one. Spring trade is reported as being highly satisfactory.

C. Scrim is ahead of former seasons with a fine stock of both flowering and foliage plants. The decorative and foliage department is under the care of J. I. Hagedorn, who will be remembered by many, especially his beautiful ferns, as being many years with W. Scott, of Buffalo. The change in climate has benefited both himself and his wife, which all will be pleased to hear.

Fall River, Mass.

Business has been very good, especially when the long-promised boom in the mills is set on foot. H. B. Buffinton reports an increase in bedding plants. He is the proud owner of a fine stock of evergreens, deciduous trees, among which is the soldan beauty, but rarely seen in its boldness here. The change in climate is highly effective and forms a rich contrast to the copper beech. The Charlotte and George Smith are both rebuilding and adding to their several plants. After the day is over, with the coming of the saw, their arms are in excellent condition for bowling and something starting will be seen at Providence, W. M.

Knoxville, Tenn.

The florists are all well satisfied with the commercial season, which has been remarkably good. There are several colleges near here and the call for plants has been very large. Numerous orders also have kept stock well used up.

Miss Rose Baum, sister of Florist C. Baum, was married last week. Magnificent blooms of the magnolia grandiflora were extensively used in the church decoration.

C. W. Crouch has completed his three rose rooms, which are first-class in every way. They are planted with Bride, Bridemaid and Beauty. Each beauty is a fine specimen of the plant. The weather has been very warm lately, 92 degrees in the shade being common here. Even though thunder showers have helped winter stock wonderfully, and everything is making a good growth, H. Y.

Parcellville, Va.

W. S. Davis, of the firm of A. B. Davis & Son, has been very ill with appendicitis for three weeks past. He had a close call; but is now convalesc. ut.

Madison, N. J.

L. A. Noe is erecting three new rose houses. L. M. Noe has been operating the W. P. Noe establishment since June 1. Mr. Noe now has his own extensive plants on the Slaughter pt. at, together with this last addition, thus making his combined plants the largest establishment of any grower sending to New York.

Orange, N. J.

The land has been prepared and supplies are now being delivered for the erection of a greenhouse, which will be on the Orange Mountain. Hitchings & Co. are the builders. The house is in Spain, and will be completed by the 1st of August. It is prepared for a large addition to the roses, and will be a valuable establishment to be grown suitable for commercial trade. George Atkinson, who for ten years managed the Slaughter establishment, will have charge of Mr. Herman's new venture

**FUCHSIA BLACK PRINCE.** The best win-  
dard of all, enormous heads of bloom, \$2.00 per 100; \$3.00 per 1000, by express, purchaser's

**SEED TRADE REPORT.**

Points and information from seedmen, and all interested in this column, solicited. Address Editor Seed Trade, care of Florists' Exchange, P. O. Box 167, New York.

**Seed Trade in Chicago.**—As a whole, we do not find any material complaint regarding the seed trade this year. J. C. Vaughan still writes the other day that so far as the mall trade is concerned it suffered more in the early months of this year than in the past three months having made up, in part, and brought the whole trade at least to the level of 1896, which, however, was not equal to the trade of years gone by. As regards the home counter trade generally, it averages up well.

In the plant trade the demand for cannabis is ahead of last year and these plants are still selling. In the way of newer cannas, an even better assortment of colors and foliage is noticeable. (But making them attractive for general bedding effects. Mr. Vaughan summed up in this manner: While a great amount is being sold by stores in which it may be classed as a side line, still the best buyers and those who are at all thoughtful and know what they are getting are willing and disposed to pay full prices for known high qualities of seed and pedigree stock.

As regards nursery or hardy stock, the season has been an ideal one, so far as the general seed market is concerned, commencing early and lasting, in this part of the country, till well into the middle of the month. The season has lasted eight weeks' shipping period, as against only ten days last year.

**European Notes.**—So far the outlook for Long Island has been very good. There has been, as a whole, no serious damage and the early growth has been very satisfactory, as it always is in cool weather, and plenty of rain. There has been no sign of the show is good for more than an average crop, as the plants are heavily loaded with buds. If a week of dry weather will give us a fine yield; but a week of hot and wet weather would ruin us and work. We dare not anticipate it.

Kale, which was backward at the start is making good progress, but there will be considerable difficulty in the harvest, as the plants are so close together. There is every prospect of a full average crop.

Spinach is looking remarkably well, some pieces will be very heavy—much above the average—but there is an occasional one that is badly troubled with leaf maggot.

Rutabaga is still looking well; in fact, we never saw it look better, if as well. We will have a heavy yield.

Turnips are looking fairly well, but the acreage is too small to make the crop worth doing up to now. Celery is in a very promising condition, and the acreage of the common variety is being planted, and onion is in many places badly attacked by mildew. lettuce, which it was at one time

feared would be lost, has now improved wonderfully. Endive and chicory are also immensely improved.

Carrot can be left for a few days longer before a final word can be said.

**Free Crop.**

In looking over the beets that have survived a considerable shortage is apparent. This is particularly the case with the beets of Crosby, Dango and Edman's type.

**Flower Seeds.**

As regards flower seeds, pansies and phlox are now beginning to produce a little seed. Verbenas, Zinnias and Balsams are just showing flower. Asters are fairly safe and stocks and wallflowers are good.

**A Good Centaurea.**

Those seedsmen who have wisely given the Centaurea Margarita a place in their catalogues are strongly recommended to give a trial to the parent variety C. odorata. During a recent visit to the south the writer measured many flowers of this variety more than three inches in diameter. The color is similar to the C. moschata purpurea. The appropriately named C. chameleone is also worthy of culture, for while the individual flowers are not quite so large as those of the former, and persons, and, in a mass, produce a very charming effect. When the flower first opens it is a sulphur yellow, afterwards becoming paler and tinted, with purple at the edge. Some in the autumn, they produce a most splendid display of bloom early in June.

EUROPEAN SEEDS.

**ORCHIDS and GREENHOUSE PLANTS**

FOR SALE.

Address P. O. Box 665, ALBANY, N. Y.

Having disposed of several of my Greenhouses and the remainder being over crowded, I have decided to offer for sale the excess, consisting of the greater portion and the choicest specimens of my collection for the past 20 years, either singly or in quantities. They are all well cultivated, in fine condition, and many cannot be obtained in any other collection in America. A printed list sent on application. Sales made at reasonable prices.

Flowering and Nursery stocks grown in quantities.

**ROYAL NURSERIES, LOUIS VAN HOUTTE PERE, Ghent, Belgium.**  
When Writing Mention Florists' Exchange.

Some Stocks in the electric disturbances which have prevailed late here, so far, done very little harm to our growing crops, while the rains which accompanied them have had a most beneficial effect. The irregularity of the weather is apparent every day, and "part shipments" are likely to be in demand if the tariff bill remains in force.

Some recent shipments have run the stocks remaining on hand very low.

Winter radishes are ripening up in fairly good shape and the crop may to some extent compensate for the loss of the early crops, which had begun to suffer, is regaining strength and promises now to be a considerable yield. Turnips are also at a standstill, has now begun to run, and should be a fair yield. Peas and corn are well up to now. Celery is in a very promising condition, and the acreage of the common variety is being planted, and onion is in many places badly attacked by mildew. lettuce, which it was at one time

**QUESTION BOX**  
OPEN TO ALL . . . FREE TO ALL  
Answers Solicited from Those Who Know.

**(105) Piping Greenhouses.**—Please give me your idea of the amount of pipe necessary to heat one 20x75-foot rose house to 60 degrees in one hour; carnation house to 45 to 50 degrees; rose house, three-quarter span; carnation house, even span, running east and west both houses, built together, with wood shed on east end. I think I would prefer overhead flows. I do not detest returns. There are no side lights in either house.—H. C. DAVIDSON.

If well-built and with the usual slope to the roof the rose house can be heated with three two-inch flows and nine returns of the same size. This can be modified according as more or less overhead heat is desired, so as to use either four 2½-inch flows and eight 2-inch returns, or two 2½-inch flows and ten 2-inch returns. If a temperature a trifle above 60 degrees is desired it would be well to use three 2½-inch flows and nine 2-inch returns. For the carnation house use one 2-inch flow and either four 1½-inch or three 2-inch returns.—T. TAYLOR.

**(116) Heating a Greenhouse.**—What would be the cheapest and most satisfactory way to heat a house 25x18 feet with having an expensive piping system put in?—B.

As with everything else, it will be found that in heating a greenhouse the cheapest method is seldom the most satisfactory. If to be used as a cool house for growing violets or lettuce, or for starting plants, and the spring fair results can be obtained if two large box stoves are placed at one end under the benches on opposite sides, and a six-inch pipe is carried with as much of a rise as is possible from each stove to the other end of the house, where they can enter a chimney. Another way would be to build a brick arch at one end of the house and from this carry a flue to the other end and then turn it to the arch, where it can connect with the chimney. Blue-iron pipe or pipe may be used for the last half of the flue. Care should be taken to have the work put in several inches of the pipes of flues. While it may cost a little more at first it will be more satisfactory, especially if a higher temperature is desired, if a small hot-water boiler or car heater is used. For a house 25x18 feet from 200 to 400 linear feet of ½-inch pipe, according to the temperature desired, will be necessary.

**(107) Bisulphide of Carbon for Ferns.**—The trips are ruining our rose buds in two large houses. Would liquid bisulphide of carbon create the pest? We have tried several remedies and can find nothing that is of any good. We saw something like this in a paper about bisulphide of carbon being a good insect exterminator. What proportion do you use? Would it also kill snails?—J.

**Obituary.**

**John H. Hutchinson.**

John H. Hutchinson, Portsmouth, N. H., died June 7. He was 77 years of age and was a native of the State. He served through the war and after he had been mustered out of the army returned to St. Johnsbury, where he started in the jewelry business, subsequently with his wife establishing a florist's business in Portsmouth, which was conducted under the firm name of M. E. Hutchinson & Co.

**James F. Webster.**

James F. Webster, of the firm of Webster Bros., of Hamilton, Ont., died June 5, aged 66 years. He was born in London, England, and came to Canada in 1852. He had been suffering from bronchitis and pneumonia some time, but his death was hastened by a hemorrhage. A widow and two grown-up children survive him.

**Marquette, Mich.**

William Ludy is building greenhouses here and will be among the florist business.

**The Right Cypress for Greenhouse Material.**

Have you heard of Cypress Greenhouse Material that has not been satisfactory? If you have it does not follow that Cypress is not the best lumber to use. There is high grade Cypress that grows in the swamps.

All of these different kinds are not suitable for greenhouse purposes. Do you know which kind is best and do you know that kind when you see it? If not you would better buy from those that do know and will deliver exactly what they sell. We introduced Cypress for greenhouse construction and pushed it to the front. We know all about it. For fifteen years we have made a specialty of furnishing it, and during this time we have built up a reputation that we cannot afford to jeopardize. We send out the best only.

**Brookline, Mass.**

James Quinn hopes to be with the crowd at the convention. He is rushing in a fine lot of Nephrolepis bostoniensis for his retail business, anticipating a larger demand than ever. He reports a good season's business and expects to build shortly.

Miss Vass is preparing for next season by sowing in seed. She has an excellent success with roses in solid beds. I believe she is the only one in the section who uses this method.

Fred E. Palmer met with an accident which at one time threatened to end his useful career in this line. It happened quite recently. While driving across the tracks a trolley car, without warning, struck the team of Mr. Palmer directly beneath the car, which rolled him along a distance of twenty feet. Fortunately, he fell between the wheels. He does not think he could repeat the feat again did he desire to do so. It was a narrow escape—a bad smash-up; the first he ever had, and a good prospect of hearing from him on further experiments with budded roses.

**Cambridge, Mass.**

F. C. Becker is busy planting out a great stock of the Boston fern. He will have more this year than usual, and is pushing the wholesale branch of his business extensively. Mr. Becker, Sr., is pleased with the increase in business since he took a well-earned rest and a trip to Europe, which he pretty well covered in the lengthy period of absence from home. He missed but little, making a general tour of commercial places more particularly, and while most favorably disposed towards the old country for commendable reasons, he is of decided opinion the stocks are now very busy with sea-shore orders, which promise to clean out everything in the shape of a pot plant. Orders for decorations have also been heavy of late. Mr. Murphy, the able foreman, intends taking a trip to New York and Philadelphia so soon as business slackens. He may take in the convention on his way home. W. M.

# THE FLORISTS' EXCHANGE

We are a straight shoot and aim to grow into a vigorous plant.

A WEEKLY MEDIUM OF INTERCHANGE FOR FLORISTS, NURSERYMEN, SEEDSMEN AND THE TRADE IN GENERAL.

VOL. IX. No. 27.

NEW YORK, JULY 3, 1897.

One Dollar Per Year

## ..PALMS..

Owing to our stock being grown with plenty of air the plants are all strong and sturdy, and will bear transportation for long distances. Florists intending to purchase this class of stock for their fall trade will do well to place their orders immediately, so that they can have them shipped by freight, thus avoiding the excessive cartage charges which they would have to pay, if shipped during the cold winter. The prices will also be very much higher in the fall than at the present time, owing to the high duty which will probably then be in force.

- ARECA LUTESCENS.**

## SEED IMPROVEMENT.

Points and information from seedmen, and all articles of this kind, are invited. Address: Editor SEED TRADE, care of Florists' Exchange, P. O. Box 1897, New York.

**New York.**—Louis Gieppinger, representing Polignaux & Co., has succeeded to Andre, Leroy & Co., arrived in the city this week, on his annual trip to the States.

**San Francisco.**—The Sunset Seed & Planting Co. will move business to the four-story warehouse, 33 Market Street, near the Overland Ferry Depot. As it is said, will give the finest seed warehouse west of the Rockies.

### European Notes.

**A Weed Plague.**  
One of the most striking features of the present season is the singular uniformity in the weather which has prevailed in all the seed-growing districts of Europe. A very damp autumn and mild winter have been followed by a cold and dry May. This succeeded a great heat, followed by heavy thunderstorms, which moistened the soil, rendering it very fertile. As far as possible, but not thoroughly moistening the soil.

The heat and rain combined have brought forth an abundant crop of weeds, which in many cases fairly smother the young plants, and it is doubtful if the seed grounds of Northern Europe have presented such an unpropitious appearance during the past ten years. Everybody is working at full strength and high pressure, but in spite of this the weeds still hold the field.

### Biscual Crop.

To the superficial observer the appearance of the biscual crop has been vastly improved by the recent rains. So far as this relates to beet, many of the earlier radishes and the spinach there is reason to hope that the improvement will be of a permanent character. In the case of the drought does not set in. Carrot is in many places badly attacked by the blight, but in many others it has been fully one-half of the plants have been killed. But it is when we examine the nature of the improved appearance becomes apparent.

**A Destructive Pest.**  
That destructive pest known as the black flea always accompanies a continuous spell of northeast wind and feeds upon the ovary of the flower. Where the work of fertilization has already taken place it deposits its eggs in the dry pod, and as soon as the eggs get to work a numerous brood of tiny worms is hatched out. These feed upon the seeds, and in the process they cause the pods to blister and drop. Only the very early pieces of turnip escape the ravages of this pest, as they are simply smothered with it. The last-named article may possibly yet produce a crop, but it is not so late for the numerous side shoots, which are now springing out to produce a moderate crop of medium-sized seed, but until the seed is thoroughly formed the crop is entirely at the mercy of the black flea.

**Flower Seeds.**  
In flower seeds nasturtium look much more promising, but growers do not to be content by them, however good the crop may be. The expense is too heavy.

**The Seed Crop.**  
Sweet peas are also improving daily and if the gloomy anticipations of the past are not entirely justified by results our growers may be disposed to take up their culture once more. This year the crop is more than expected and fully justified our expectations, although the color is different to what we have become accustomed to. The Blanché variety with the Cupid habit reproduced in every particular, and unfortunately has been so much retarded in its starting mature in store for us it will probably be the novelty for next season. The subject of novelties it is yet too early to speak.

EUROPEAN SEEDS.

**The Vitality of Seed Treated with Carbon Bisulphide.**—Circular No. 11 of the Division of Botany, Department of Agriculture, deals with some experiments that have been made for the purpose of testing the vitality of seed treated with carbon bisulphide, looking to the use of this material for the extermination of weevils and other insects that infest grain.

The common remedy advised by entomologists for destroying seed-infesting insects is to treat the seed for twenty-four hours with the fumes of carbon bisulphide at the rate of one pound to the hundred. This chemical when pure is a colorless liquid with a pleasant odor. Upon exposure to the air the carbon and sulphur composing the liquid are separated, each uniting with oxygen, for which they have a very strong affinity for each other. Thus are formed carbon oxide and sulphur dioxide, the latter being a very poisonous gas with a disagreeable odor. The statement is made that seed grain may be exposed to these fumes for thirty-six hours without injuring its germinating capacity.

The length of time seeds must be treated with carbon bisulphide depends not only upon the resistant power of the insect, but also upon its method of attack. In the case of the pea weevil the larva is embedded within the immature seed, becoming more and more firmly attached to it during its development, hence a treatment prolonged over twenty-four hours may be necessary to destroy the weevils.

Seedmen treat peas and other large-seed scale by placing the bags containing the seeds in a fire-proof, practically airtight building, and after being thus subjected to the fumes for about twenty-four, sometimes as long as forty-eight hours, the room is opened and thoroughly aired.

Some writers have advocated pouring the liquid through a pipe inserted into the bottom of the seed, while others suggest the use of a ball of cotton, soaked with the chemical and placed in the middle of the pile of seeds. Both of these methods are open to objection owing to the fact that the cotton is opened and thoroughly dried. Some writers have advocated pouring the liquid through a pipe inserted into the top of the pile of seeds, while others suggest the use of a ball of cotton, soaked with the chemical and placed in the middle of the pile of seeds. Both of these methods are open to objection owing to the fact that the cotton is opened and thoroughly dried.

The department's experiments were made in thirty-three different varieties of grains and vegetables, five of cotton, two of peas, three of Indian corn, two of buckwheat, two of kidney beans, two of Kaffir corn, two of barley, two of wheat, one of oats, etc. The results of the experiments were taken, being, so far as possible, from a single stock in each case. Two hundred seeds of each variety were used, 200 seeds of the larger species and 100 of the smaller kinds, were used. Similar quantities of untreated seeds were employed as checks.

In the first series of experiments the seeds were placed in glass vessels, resting on a plate of ground glass covered with a bell jar containing a saturated atmosphere of carbon bisulphide. At the end of forty-eight hours the seeds were transferred to the germinating trays, and the results were placed also the check lots of untreated seed.

The following seeds were uninjured by this severe test, the germinating percentages of both treated and untreated atmospheres of carbon bisulphide. Peas, cotton, beans, Kaffir corn, buckwheat, turnip, cabbage, cauliflower, and radish. It is concluded that, therefore, to conclude that none of the ordinary methods of treating these seeds with carbon bisulphide will impair their vitality.

On the other hand, the germinative power was impaired in the case of wheat, corn, crimson clover, millet and rice, the difference between the treated and untreated being from 85 per cent. in the case of rye to 9 per cent. in the chalky rice. With the exception of the wheat, the loss of vitality was more tender than that of other clovers, all of the injured kinds belong to the

## PETER BROWN, LANCASTER, PA.

When Writing Mention Florists' Exchange

grass family, oats alone of this group showing no injury. This resistant character of the oats is easily explained from the nature of its covering. This method was an extreme one and represents conditions which would probably never be attained in any practice. Here each seed, being exposed to a thoroughly saturated atmosphere of the chemical, had ample opportunity to imbibe as much of the vapor as it was capable of retaining. It is reasonable to suppose that seeds whose vitality was not affected by a forty-eight-hour test of this kind would be in no danger of deterioration in this respect from any treatment given them in ordinary practice.

The varieties which were damaged by the forty-eight hours' treatment were then subjected to another test of twenty-four hours' duration. Some of the varieties suffered no deterioration whatever in vitality with the twenty-four-hours' treatment, while there was a marked decrease in the amount of injury in all of them.

Ery proved the most susceptible to injury, with a difference of 41 per cent. between treated and untreated seed. Millet showed 17.5 per cent., barley 5 per cent. and crimson clover 6.5 per cent. difference. All differences in germinating tests amounting to 10 per cent. or less may be attributed to variation in the quality of each lot of seed used.

In order to ascertain whether similar injury to the seeds named in the foregoing table would result from treatment in bulk, one bushel each of wheat, rye, barley and field corn were subjected to a second series of experiments. The bulk of each kind of grain was placed in an airtight bin for twenty-four hours. Upon the surface of the grain were shallow glass vessels containing carbon bisulphide in the proportion of one pound to one hundred bushels, and as recommended by the Division of Entomology of this department. At the close of the twenty-four hours lots of each variety of seed, both treated and untreated, were germinated in duplicate.

**HULSEBOSCH BROS., Englewood, N. J.** When Writing Mention Florists' Exchange

As a result of these experiments the following conclusions are arrived at:

No appreciable difference in the vitality occurred in corn, barley or flax. Results from treating the seed in bulk with carbon bisulphide for twenty-four hours, and in the other cases, of a chemical to one hundred bushels of the grain.

In general, seeds of cotton, peas, beans, buckwheat, oats, the cabbage family and cow-peas will endure the forty-eight hours' treatment. The fumes of carbon bisulphide without their germination being injured to any appreciable extent. In the other cases, of corn, wheat, rye and other crops belonging to the grass family (except Kaffir corn and oats) should be treated with caution, as serious deterioration in vitality is likely to result from excessive exposure to the gas.

The Florist Millionaire.

Air: "The Man That Broke the Bank at Monte Carlo." When Thomas was a little kid away back...

CHORUS.

And ye wonder if he'd like to be a little boy again: To work around the potting shed...

He chose to be a florist, now he couldn't do it, he done much worse. For while it's awfully artistic, there is little for the purse...

They had no "setting snags" to make, no "clocks" nor "gates ajar." No "flowers" to build, nor the awful "railroad car."

Now here's a health, our trusty friend, May you live to be hundred, may we live as long as you.

The following poem was composed for the occasion by William K. Harris and read by TOM AND BILL.

More than fifty years ago, Tom, you be honest man. Your ambition was high, in your humble sphere.

Fifty years ago, Bill, my dealings were fair. I had what I required and nothing to spare. But the wisdom of sage was in early youth.

Fifty years ago, TOM, youth was our dearest friend; While I tried to get on humble sports he did me good and kind.

This life, Bill, is but a shadow at its best. When compared with our future eternal rest. Then spend your life in actions fair to the best of your power.

Life is here like the autumn gem, Sparkling a little while, then no longer is seen. Or like the April snowflake in beauty that melts away.

Several letters were read from prominent persons regretting their inability to be present at the banquet. Among them were James Dean and Joel Cooke.

long time and can guarantee him, single or double. He will work anywhere and we are sure to have him in years.

All the speeches were followed by songs, piano and vocal solos. In every way the night was an enjoyable one...

ROSES.

Ventilation.

When we have finished planting it is then that rose growing commences in real earnest. To be on time and watch the proper requirements of our plants constantly will not only repay us now, but likewise in the future.

When visiting florists who have had rather poor success in growing roses, I am under the impression one of the chief causes of their trouble is improper ventilation. I believe that I am right in saying that ventilation is as thoroughly understood as it should be by many and that more err on the side of not giving enough than too much. It should be borne in mind that because a rose grown under glass needs the most careful and painstaking treatment, still that should not be construed into meaning coddling. Knowledge, experience and courage are three things that we must possess in order to succeed. In visiting different establishments I notice quite a number of growers close up their houses at quitting time, no matter what the state of the weather is, while others, if it warms up, will open their houses at quitting time, will either close ventilators up tight or have such a small particle of the window open that the wind never comes too humid. I have asked quite a number why they don't use more air, and they have said they are afraid to. What there is to be feared from the warm, summer air is a condensation of moisture.

It may be well for me to mention here that it is very possible (in fact, I think it is done) to have a very pretty-looking house of roses during summer by keeping the plants rather cool and shady, likewise by using a mulching of manure; but they most generally cut a very sorry figure when the sun begins to lose its power in the fall. The leaves fall and the plants become so sickly that they are an easy prey to rust, blight, etc., consequently what few flowers are cut are very inferior in size, texture and color. If we do not have them brought up with an iron-clad (if I may term it) constitution as soon as more artificial means are used, they will fall in the fall, instead of going backward, quickly respond to these means, and an improvement in nature will be the result. Every successful grower fully realizes the vast importance at this time of the year of closing up his plants and trying to tie them over the bad days of early winter.

I am a great advocate of lots of fresh air and a circulation through the plants at all times. As stated before, there are still some who do not seem to grasp the importance of doing warm summer time I keep all the air on possible, night and day, reducing only when permitted by the thermometer, and according to the severity of these; also in sudden cooler changes in the atmosphere. I do not know of any other plant that is more susceptible to sudden changes of temperature, or, in fact, of any other plant that requires so much the necessity of constant attention. Sometimes happens a storm comes up in the night during our worst weather, then the sooner we close up for the time being the better. As such air will blow directly on the plants is dangerous, I don't like it, if the current is direct, I like it. I have recently washed the bushes to and fro. Nothing would you suppose there plants have been kept clean and properly shaded, to give them the treatment I advocate right away; but, gradually, I am accustomed to give them a little

more air each day and partly removing the shading, until in about three weeks' time clear glass is reached. It is a mistake for us to go by date or season as regards heating, ventilating and watering. To go by outside conditions day by day, as they are, is proper; at least, I have always found it so.

This season has been a very remarkable one in this section—almost continual northwest winds, accompanied by cold nights, the thermometer often going down as low as 45 degrees. This has not only necessitated reducing our heat to about two-thirds, but string also has had to be done.

It is no uncommon thing to hear some say that they are afraid to open their houses, it is too expensive to give a little gentle heat to roses during summer when the ground is so warm. I believe that the great benefit derived therefrom, my conclusion is that people with no larger reasonings than this may get a very poor showing as rose-growers.

Surely, this season has taught many a lesson about mildew. H. H.

CHRYSANTHEMUMS

Preparing for Tying.

Before the plants on the benches begin to grow much it is a good plan to tie the stems up in such a manner as to make the plants. I run my wire lengthwise, about four to six inches above the ground, and tie the stems up in four pieces. For these I use two uprights, well braced, about five feet in height, between the uprights I run a wire four inches above the ground and one piece about three and one-half feet from the ground, two by three inches will answer for a seventy-five-foot house; but where the houses are longer the pieces can be two four foot inches, to make them stiff enough to stretch the wire in straight. After these are put in place, the stems are stretched in place. The upper wires can be left out yet, to be put in whenever the stems are high enough to be stretched. I will be a little later. Of course, this framework is only put in place for center benches. The side benches do not need two wires to hold the upright stakes.

I use a 16-gauge wire, No. 14 galvan-ized, it has only to hold the upright stakes in place. The upper wires can be left out yet, to be put in whenever the stems are high enough to be stretched. I will be a little later. Of course, this framework is only put in place for center benches. The side benches do not need two wires to hold the upright stakes.

I see that our old pest, the black aphid, is showing itself and ought to be combated at once. I put a liberal quantity of strong warm water on the benches and sprinkle them every few days. That will cause the fumes to permeate the atmosphere of the house and be quite sufficient to make that pest leave in short order.

It is a good plan to tie the stems up through the benches, to be stretched down on the walk, but that is not always best. In a retail place customers go through the benches, and besides the dirt during the season is left with the stems in the walks, and for cleanliness' sake it is better to tie the stems up.

If the plants on the benches begin to show that they have well taken hold, and are strong enough to be stretched, you can break the tops out, so that you get two or three leaders. When growing roses in houses, it is better to advise this, but to grow to a single stem and flower, which will give the best results. However, it is better to be used for cut flowers, the growing of two to three flowers to a plant will be more serviceable. THEO. F. BECKER

Washington.

A Government Comptroller. The florists of this city have met with considerable competition from the Industrial Home School greenhouses on Tennyson road, the managers of which rent a stall in the market for the sale of flowers. The latest report of the Comptroller is that the greenhouse venture is a losing one. The receipts for a year are given as \$1,159.26 and the total expenditures \$1,161.26, without taking into account heating, repairs to houses, etc. A local paper figures up what all things considered, the institution is "a flat expense to the Government of \$1,000," and comments on the competition in the following manner: "The regular florists as a rule are tax-payers, law-abiding citizens, and business men of integrity, but they are unable to enter into open competition with the Government, which takes their tax money to build greenhouses and pay the expenses of florists and growers, who stand on the public money and cry the wares at any figure, an anxious public is willing to pay."

"If it is found necessary to raise flowers at the Industrial Home School or other reformatory institutions, let them be raised for free distribution among the hospitals and other charitable institutions which now tax the regular dealers by frequent requests that cannot consistently be denied them."

"In a recent interview Mr. N. Studer said he was not opposed to instructing the boys in horticulture, but was opposed to their open competition with regular dealers, who frequently find it difficult to make both ends meet with our ruinous competition from men or boys supported at government expense."

ABOVE ALL, have your advertisements susceptible. To be reasonable they must be changed often.

## Convention Souvenir Program.

The Florists and Gardeners' Club of Rhode Island is having prepared a Souvenir Program, which will contain the official programme of the convention, together with lists "of all the officers, the florists and gardeners, national and local associations, with names of officers and prominent florists of the United States, which is intended to include in this souvenir a number of illustrations of points of interest in Providence, which will go together with reading matter descriptive of same. The book will, it is said, comprise 125 pages, and will be handsome bound; at least one copy is to be mailed to each member of the society; the balance will be sold to members and seedsmen throughout the country, with a request to retain the book as a memento of the convention.

The promoters are soliciting advertisements for this souvenir programme. The interested should write to S. Aylesworth, 31 Dyer Street, Providence, R. I., for information as to rates, etc.

## Tariff Changes.

This week the Senate endorsed the Finance Committee's recommendation to change the duty on seeds of all kinds not otherwise provided for, which is to be placed on the list of dutiable articles at the rate of 25 per cent. ad valorem; also to make duty on beans 40c. instead of 60c. per bushel; on clover seed, alfalfa and spinach seeds, and sugar beet seed to be returned to the free list.

Paragraph 626, covering seeds on the free list, was modified so that clover, alfalfa and spinach seeds, and sugar beet seed were restored to the free list.

## Registered Letter Law.

The law with regard to registered letters, which was passed by Congress a year ago, when the office of Registered Letters was established, is being enforced by the law the government assumed to register letters for letters that were lost, but under the new law it is responsible for registered letters up to \$10.

## Chrysanthemum Tests at Cornell.

Bulletin 136, May, 1917, of the Cornell University Agricultural Experiment Station, Ithaca, N. Y., is devoted to the subject of chrysanthemum. It contains the results of the variety tests of 1916. The following kinds are classified as good varieties:

**WHITES**—Leawee, Lady Esther Smith, Mammoth, and White. **ORANGE**—Robert F. Hibson, Mrs. W. P. Raynor, Antuna Bride, and Mrs. H. Crawford. **PINKS**—Mrs. M. A. Perrin (in regard to this variety, the Bulletin states "color and form were not distinguishable from the Mme. Feltz Perrin; a few days later the only difference with it was: Wm. Simpson, Roy Empers, General Hoyt Kaye).

**YELLOWS**—Duchess of York and Modesto.

**SPUR COLORES**—Pluto, red, reverse yellow; Buff Gloré; Helen Owen, youngest rays tightly whorled and showing the soft inner ray; Jeanette, white, outer flesh and yellow; Violent; Oriental Glory, white, the whorled inner rays suffused with delicate pink; White Lady, as the flower becomes older, and Western Pride, cardinal, reverse greenish yellow.

**HAIRY**—Midnight; noted because it is the only hairy class, and Mrs. C. B. Freeman, yellow.

From the foregoing, the writers of the bulletin selected the following varieties: Wilhelm Miller) select the following for special purposes: General Chryso, of ten for commercial purposes—Leawee, Lady Esther Smith, Infatuation, Mme. Perrin, Pluto, Modesto, Duchess of York, White, Violent, Gretchen Buetterer.

Special varieties exhibition—Leawee, Lady Esther Smith, White, Modesto. To complete the set Mr. Hunn had better select in a practical routine, would choose Violent, Mrs. Miller would choose Oriental Glory.

Special varieties exhibition—Leawee, Mrs. Perrin, Pluto, Modesto, Duchess of York, Yanoam. Special varieties exhibition—Leawee, Duchess of York, Mrs. C. B. Freeman, Buff Gloré, Gretchen Buetterer. To complete the set, and to give the exhibitor a variety would choose Helen Owen; Mr. Miller would choose Western Pride. It contains a list of all degrees of merit, and especially those which by reason of interest

of arrival (e.g. the English, or poor quality) are to be avoided. The following are listed: Alps, F. Ashmead, Admiral Avellan, Bonnie Dundee, Emil Buetterer, dancing Queen, Mrs. J. G. Siga, Mrs. J. G. Siga, Emerald Gem, Mrs. J. W. Gouffey, Green Emerald, Inevitable, Admiral Itz, Kahm, Mrs. J. G. Siga, Mrs. J. G. Siga, Mrs. J. G. Siga, McHattie, Walter Owen, Lady Ridgeview, Gen. Roberts, Talvan, Triomphe de St. Louis, Mrs. J. G. Siga, Mrs. J. G. Siga, Mrs. J. G. Siga, Wright.

The following list is termed "unpopular (the Chinese type)," and the bulletin states the varieties, Charles H. Curtis and Signal, are not in this new popular class. These varieties are good of their type, but the bulletin states that the exhibitor should give a little favor that it seems almost necessary to put these varieties in the unpromising class. The bulletin states that the average of the year were much below the average of what we have formerly seen. Betty Hook, Washington, Chas. H. Curtis, George Waugh, Mrs. T. D. Hatfield, Mrs. E. C. Kingston, Mongolian Prince, and Signal Light.

Under the heading of "less promising varieties" are given "those novelties in which we seem to detect essentials that are likely to be disapproved by the general judgments are formed," says the Bulletin, "solely upon the behavior of the plants at Cornell." The bulletin states that the number of sorts that are no improvement on the old-established kind, but apparently not speaking of those that are identical, but of those that are not. It is to be noted that the Bulletin states that the exhibitor should not offer them as equivalents or substitutes for the old-established varieties. The Bulletin states that the exhibitor should not card the rest. Fine flowers do not make fine varieties. We know how the old plants are adapted to cultural conditions, but what of the new?

Varieties and fashions are proverbially ephemeral, and the exhibitor should be as ruthless as those of Time himself—the Prince of novelty testers. Probably the exhibitor should not offer new things which will be alive in another decade. The amateur who loves every thing that grows, and fails to fail, the florist, the appointment means dollars. What does the lover of plants care for shipping quality? The exhibitor should not offer flowers which do not meet the standards of the exhibitor's touch of trade.

The amateur who loves every thing that grows, and fails to fail, the florist, the appointment means dollars. What does the lover of plants care for shipping quality? The exhibitor should not offer flowers which do not meet the standards of the exhibitor's touch of trade. The Bulletin further states Hellem was the best of the group. Advised this was promise-yellow: "Ruth Ellis. Not true. Advertised as bluish white, was a faint yellow, fading more as the plant grew, and has obtained a high price." Mrs. Harry Toler. Advertised as flesh pink, slightly hairy, full and double. With the true blue, and the blue, the white, white, but Robert F. Hibson was more completely double. "Pink with a star." Regarding Chinese varieties, we were not hitherto aware that they should be classed as the one class. During the past year, year, was that these kinds were returning to popular favor, and trade growers were being introduced to them.

"As to those varieties that are classified as 'less promising,' there are some that, to the exhibitor, are of value. For example, Glory of the Pacific and Pink Glory, when well grown, are very desirable and profitable, and have obtained the highest price in their color. Henry Hurst is considered by experienced growers to be one of the best chrysanthemums in existence; its excellent build characterizes it as a superb specimen, and is very popular with chrysanthemum specialists and amateurs. Mrs. J. Liberty is also an excellent late yellow.

In the bulletin is pictured two separate blooms of one variety—Miss Magee—to show "the best that can be done with poor stock" and "what can be done with good stock," for the writer of the bulletin adds, "The name is nothing; the quality of the stock is everything."

Such a comparison, however, is a little misleading. The science in chrysanthemum culture is not in growing when asked what but to take. It is a well-known fact that many varieties from the crown bud and the stem bud, when properly cared for, and petaling, in fact, such kinds become stubborn, and are apt to properly develop flowers without artificial assistance. The variety in question being ranked among the best of the crown buds, it is to be shown one of these early Summer buds without an explanation, and to state that the exhibitor should not offer such stock having but little to do with the matter, as imperfect and badly formed flowers are not only more so, but the plants when taken from the crown or early Summer buds, as they are when the stock is kept, develop more so. The pictures in question clearly convey this, for on page 84 we see a terminal bud, evidently taken from a weak plant, making a well-formed and perfect bloom; and it is pictured against an imperfect flower formed from a crown bud.

## New York.

Most kinds of stock have been more abundant during the week, and prices offered for the week were generally lower than express charges. Sweet peas have dropped considerably in value, and at times, this has been due to the fact that the bundles, even for the highest grade, the supply of peas is simply enormous, and the quality generally speaking, has never before been equalled.

Carnations still remain in fine condition, but the market is somewhat soft, and prices are falling lower and lower, 50c per 100 has become a prevailing top figure. 75c being the highest price offered. The market for Lilium Harrisii, from frames and the open ground, is now very plentiful, and prices are falling lower and lower, 75c being taken. L. auratum is also in limited supply, and prices are falling lower. Iris (Japanese) is now abundant, as also is the market for Iris (Japanese).

Blauvelt received on Thursday a fine lot of Jacq. roses from Newport, R. I.

## Hill Trade.

This branch of the business is now practically at a standstill, as far as the Hill trade is concerned. The exhibitor is doing but little trade, and making window display. Many smaller stores up town are doing a good business, and some have gone into the soda water fountain business. G. M. Stump had the J. O'Donoghue floral department, which has a large number of flowers were used (more than have been seen at a funeral in a long time), in the house and in St. Patrick's Cathedral. Tree ferns and other large plants were freely utilized in the latter place, a fine lot of orchids, and a large number of plants being backed around by lilies. The floral pieces made by Mr. Stump and other firms, were used in the funeral. The exhibitor posed of sweet peas—mauve, lilac, and white. There were three colors mostly used. One variety of white was used in the funeral.

The floral and plant department at Bloomingdale's, Mr. Burnham is making about 1000 preparations for the plant trade in the Fall.

Mrs. Edith Purdy, sister of J. Purdy, was the one to be married at Sing Sing, the home of her brother, Wednesday, June 23. Thomas Garrett, late of the firm of Garrett and Sons, died at his home in England, on Wednesday, on the S. S. Paris. The trip is taken in order to gain rest and health.

John McQuaid, Englewood, N. Y., calls to-day on S. S. City of Rome, for Scotland. The exhibitor is representing John A. Scollay and the Chadborn Kennedy Mfg. Co., and has on exhibition a large number of plants. Scollay's manufactures, also a Chadborn automatic ventilator connected with wash water.

## Portchester, N. Y.

A society was properly organized here on Saturday last, and will be known as the Portchester District Horticultural Society. The officers are: W. W. Smith, Portchester, president; W. H. Harvey, Rye, secretary; J. W. Harvey, Rye, treasurer; A. Grierson, Rye, N. Y., secretary. It was decided to hold a convention at Portchester, N. Y., on the 10th of this end about \$500 has been promised by prominent people in the district.

A New Orchard Establishment.

Dr. J. M. W. Kitchen has recently built and stocked seven greenhouses in the meadow below his residence in Prospect Street, East Orange, N. J., making a most unique and complete greenhouse plant business. The company and are all detached in order to allow of free bottom, as well as top ventilation, each house being supplied with ventilators the entire length of the houses, opening direct on the pipes. Considerable attention has been given to the water and heating system, and labor has been reduced to a minimum. Liquid manure water gravitates around the houses in service pipes from a tank over the stake-hole. A cylinder holding 300 gallons of hot water will be used to temper the water in winter for watering purposes. The heating is done by two Hitcheys boilers, using four-inch pipes and hot water without pumps. All the plants in the houses, etc., was supplied by Hitcheys & Co., New York City, but the work was done by the owner.

One point worth mentioning is in connection with the stands supporting the benches. In order to prevent snails climbing up to do damage, each support stands in a saucer, which is kept filled with common salt. The houses are well adapted for the purpose to which they are now being put, viz: orchard growing.

Dr. Kitchen recently purchased half of the entire collection from Short & N. J., and together with a quantity purchased from other sources, give him a big start commencing to bring his orchard into operation to open his establishment in September through out-and-out orchard men. The name of his place will be named "The Willow Mead Gardens." The present stock in the houses consists of a large number of different orchids, together with twenty-eight kinds of Cattleyas in 2,000 established plants; 2,000 orchids in 2,000 pots, 2,000 plants, and a number of unloved seedlings. New importations will be added in season.

Paterson, N. J.

A representative gathering of the florists of Paterson and vicinity was held in the Isonian Building last week for the purpose of organizing a florists' club. Ed. Seecy was chosen temporary chairman and John G. Esler temporary secretary. R. C. Nash, of Clifton; John Bingham, of Ridgewood; William T. Keestelo, of Passaic; Mrs. J. Kirberg and Harry Powell, of Paterson, were named as Committee on By-Laws, and T. C. Goble, of Verona; William Zeigler, of Little Falls, and Martin Zeigler, of Paterson, were named as a committee to select a name for the future club. John W. Hays, of Hackensack, son of the late William Walter Phelps, Minister to Germany, is prominently mentioned with names of thirty-three names were enrolled and on the 21st of July a meeting will be held to form a permanent organization.

Indian, Ind.

Stuart & Haugh will combine their greenhouse establishment on Third Street with the one they own on South Jackson. The change will take place next fall. The Third Street houses will be torn down. Several new buildings have been erected on Jackson Street. Stuart will erect a residence at the corner of Meridian and Twenty-third Streets, a very convenient location from his greenhouses.

Rochester, N. Y.

Wallace S. Wing, of Henrietta, the assistant of the late Fred E. Young, has filed a statement with County Clerk Shedd. The assets of Mr. Young are shown to be worth approximately \$6,983.87; actually, \$3,573.77. His debts foot up to \$6,160.88.

Madison, N. J.

Enos H. Daly has just placed one of Scollay's Invincible Boilers, No. 9, to heat his entire plant.

Montgomery, Ala.

Joseph Fingstall sailed for Europe Saturday, June 12, for a three-week trip to Europe. During his trip he will visit the Hamburg Exposition.

When Writing Mention Florists' Exchange

**Toronto.**

**Business Has Already Got Down** to the regular summer dullness. Bedding out is about finished and the stock is not nearly used up. Prices for the season have generally been fairly good, but the mainstay colors, etc., have been sold for about what was offered. There has not been, as yet, so good a demand for nice table plants this season, but cut flowers, although very plentiful, have sold very well. Last week the Jubilee entertainments were not so successful as they had. Prices generally were but little higher than usual. Outside flowers were very good and abundant. There was a very fine stock of Spanish Iris, and they sold very well. We find them very useful and they are quite hardy and easily grown. Paeonias are very plentiful and are mostly sold without much trouble. Gladioli, stand poppies and clematis also find a fair market.

**A Lucky Jubilee.**

At the Jubilee games on the 23d inst., F. Brown, manager of G. H. Dunlop's King Street store, won the first prize for the best floral decorated bicycle.

**Death of Mrs. Steve Lawrence.**

I am sorry to announce the death of the wife of Steve Lawrence, who has charge of the conservatory in the Horticultural Gardens. Steve and his sons have been favorably known to all the profession here and have the sincere sympathy of all in their sad loss. **THOS. MAYTON.**

**Chicago.**

**Wooded Island Rose Garden.**

This is the sixth year of the existence of the rose garden, the plants having been obtained from many sources, and set in the rose garden of the famed Wooded Island, the latter part of April 1921, and the report can be made, the wood having come to a favorable winter and early spring, the roses were at their very best, coming into flower on good, stout bushes, two to four feet high, the first week in June—early for this part of the country. This year, not so favorable a report can be made, the wood having come to rest in a rather soft condition, followed by a very hard winter, the thermometer went to 20 degrees below zero. All the best hybrids got severely frozen and many of the best of the season, the Lady Washington climber, for the first time, got ruthlessly slaughtered. The only ones standing in the garden are the growth of and flowering finely, although the flowers are rather small, are the June and Moss roses, and they seem all but iron-clad. The White Moss, Blanche Moran, the old red, Salet, Adelaide and the Perpetual are among the best. The rugosa bed stood well and looks fine. General Jacquemont is also doing very well and certainly a good outdoor rose here. Anne de Diesbach, Alfred Colomb, Marie Morrison, Pisonia, Mrs. John Manning, Mrs. Chertis, Martha W. Wilder (one of the best), were the most striking, in fine blossoms, although some of the plants are over eight feet in height, and all from new growth from the bottom. For the reason, plants are given. There are, however, indications that the flowering season will be more extended as each week rises from the bed, comes loaded with its buds.

The border of hardy perennial plants surrounding the garden is a very fine feature. The Wooded Island, as a whole, is also a very pleasing spot, and will continue to be a fine one as long as it is now—substantially as it was at the World's Fair, and with as pretty, and the only remnants of that once noted fair in Jackson Park.

**Trade Notes.**

Taken as a whole, trade the past week has been very quiet, as times, and the retailers seem satisfied. Counter trade has been poor and this seems now to be a prevalent complaint, partly explainable, no doubt, by the many places where flowers can now be purchased in a few, well-chosen and parties have helped things along, but commencements have been the big feature, this custom showing no signs of decrease as time rolls by.

The wholesale houses also seem satisfied with the week's sales, the only complaint being the poor quality of roses. New Beauty are beginning to come in, which, although somewhat stomped as yet, furnish a better grade of flowers. Carnations are still good and over-abundant. Paeonias remain plentiful and sell readily at slightly reduced prices. The carnation market is also in.

Summer prices on all stock, from this on, are generally looked for. **The News.** Mr. Washburn, of Bassett & Washburn, with his family have left for Denver, Col., for a three weeks' outing. A game of baseball will be played on the Fourth at Summerdale by a wholesale of teams made up of the men located north of Randolph Street, versus those south of it. The Executive Committee of the Chicago Horticultural Society met last Saturday and have taken under advisement the proposition to hold the fall show at the Coliseum in conjunction with the Illinois State Fair Board. **EDGAR SANDERS.**  
*Newburgh, N. Y.*

George Cravshaw is going into business himself and his family have left for St. Paul, where he is building six houses—two for carnations, two for violets and two for chrysanthemums.

When Writing Mention Florists' Exchange

Pittsburg.  
Dull Times.  
Dull times are here and very little is going on, existing funeral work. Stock is cheap and very abundant, particularly carnations, the retail price of which averages about 25 cents per dozen. Sweet peas are still held at 50 cents per hundred, but will soon drop. There is a dearth of cuttings on stock now. Candidum lilies are more plentiful than they have been for many years, but in little demand.  
Club Diseases Convention Matters.

The last regular Florists' Club meeting was quite an interesting one, and fairly well attended. Convention matters took up most of the time. A committee on transportation, consisting of E. C. Reineman, T. P. Leungans, E. C. Ludwig, was appointed to try to secure a better rate to Providence than the one and one-third certificate plan granted to the Society of American Florists. From present indications a very reasonable rate may be secured, and it might benefit those located west of Pittsburg, intending to go to Providence, to secure rate direct from Pittsburg. About twenty-five, so far, have intentions of going.  
A committee was also appointed to make arrangements for the first smoker to be given by the club at the first regular meeting in July, which promises to be very well attended. C. Blind was proposed for membership. Bowling with a like object and a team will certainly be on deck, as usual, with J. V. Ludwig in it, one of our heaviest bowlers to recently won several valuable trophies in contests.  
The News.  
J. E. Black, of Grove City, Mercer County, Pa., was in the city Wednesday. Alen Murdock, of A. M. & J. B. Murdock, has left for California, to be absent some time.

One of our wealthiest citizens, Mr. H. C. Frick, has broken ground for the erection of an iron, steel and stone conservatory on his place in the East End. The structure will be about 400 x 100 feet and will occupy a ground space of 150 x 200 feet. Messrs. Alden & Harlow prepared the plans.  
C. Hinkle is erecting more glass this season.  
E. C. REINEMAN.

Cut Sprigs, 10 to 12 feet long,  
50 cts. each.  
Shipped to any part of the country.  
W. H. BELLITT, - Brighton, Mass.  
When Writing Mention Florists' Exchange

Floral Park, N. Y.  
By the invitation of E. S. Miller, superintendent of John Lewis Childs' establishment, upwards of twenty horticulturists visited Floral Park on Wednesday, June 30, especially to see the four acres of Iris Kamfferi, which are now in flower. For magnificence and picturesque beauty, few gardens or bouffes describe. Individual blooms measured ten inches in diameter and fully one and a half pound, in many instances, twenty to twenty-five spikes. Fully one acre is covered with a white variety named Grand Bound, an excellent sort. Exquisite is, as its name implies, a charming variety pale mauve in color. Mahogany ranked as a grand late, dark purple. Blue Jay provides a fine change and variety. Two excellent whites for florists' use are Mrs. Saxon and Eclipse.  
The party, after carefully examining the collection of Iris, spent a pleasant time wandering through the 200 acres of hardy and other flowers, shrubs, etc., and the conclusion arrived at was that there need be no fear of the stock of hardy flowers running out while Mr. Childs has a large and fine collection and in such excellent condition. The visitors were entertained to lunch by the firm at the Floral Park Hotel.

SITUATIONS WANTED.

SITUATION wanted by a single man (German), to work in greenhouses, understands the care of boiler and can do odd jobs. Address P. O. Box No. 1969, Canada, Conn.

When Writing Mention Florists' Exchange

Market Good.  
**Providence.**

Owing to the annual closing of the various educational institutions in this vicinity and the number of fashionable weddings there has been a considerable briskness in the florist business and all have had a generous share of the work. This practically closes the business for the season which taken as a whole, has been a highly satisfactory one. Prices have ranged well, but the demand has been steady and the supply ample and of good quality.

**Preparing for the Convention.**  
The monthly meeting of the Florists and Gardeners' Club was held Friday evening, with the object of the annual convention in the Society of American Florists in this city during the third week in August.

William B. Hazard reported that the recent dance at the grounds of the Wescott-Hazard Dairy Farm netted the club about \$45, and President Macrae reported the club with \$93.25, on behalf of Mrs. Macrae and lady friends, as the proceeds of the lawn party held upon his grounds. The club adopted a seal, consisting of the coat of arms of Rhode Island surrounded by the name of the organization and the date of incorporation.

A letter was read from J. J. Butler, secretary of the Florists and Gardeners' Club of New York City, in which he stated that the latter club were making active preparations for the entertainment of the Florists' Club and the convention in Newport for one day, and asked that a conference be held between the two clubs in order that a suitable programme might be arranged. President Farquhar Macrae was appointed to represent the Providence Club at the proposed conference.

When the Executive Committee of the members of the Providence Club met here in March it was voted that the local club be invited to appoint one of its members to prepare an essay to be read before the convention on the subject, "The Year's Progress in the Retail Flower Business," and last evening the club selected Thomas J. Johnson, of this city, as the essayist. It was voted that steamer Day Star be chartered for the club and guests for the trip down the bay.

It was voted that subscription blanks be passed among the friends of the club for any assistance they might feel like contributing to the cost of the convention. The Rhode Island Horticultural Society has been invited to cooperate with the Florists' Club and every effort is being put forth to make the approaching visit of the Society of American Florists to Providence one long to be remembered. A committee consisting of James B. Canning, William E. Chappell and William B. Hazard, was appointed to procure the necessary music and President Farquhar Macrae, Thomas J. Johnson and Matthew J. Leach, of Pawtucket, were appointed to select a ladies' auxiliary committee.

The convention will be held in Music Hall during the third week in August, the sessions being held in the hall, while a trade exhibit is to be held in what is the billiard room below. William E. Chappell, of this city, superintendent of this exhibition, and already the number of applications for tickets is so large that it is difficult to display is assured. The convention will be opened at 9 o'clock Tuesday, August 7, and business will continue during the forenoon and afternoon. In the evening there will be a reception to President Adam Graham, of the national body. Wednesday and Thursday will be devoted to business sessions, with trips to various points of interest, while shooting and bowling tournaments will be held between teams representing various cities throughout the country. Friday will be given up wholly to pleasure, but no details have yet been made beyond a sail down the bay and a visit at Newport. These will be decided at a meeting of the Convention Committee of the local club Friday evening next.

**Notices.**  
W. C. Farnsworth, of Brooklyn, N. Y., representing the Ormsby Ventilating System, of Melrose, Mass., was in town last week.  
Alfred McCray has gone to his summer camp at Pleasant Bluff, overlooking Narragansett Bay. W. H. M.

**Clear Cypress  
Greenhouse Material.**

This with us means the best growth of Cypress Lumber and the best grade of that growth; and from this grade all the sap—bright sap, which only experts can detect—as well as stained sap, knots and other defects cut out. Others do not equal our quality if they do beat our prices. It is not hard to see the reason: You can not buy good dollars at fifty cents each. Experienced growers know that the best is not too good and cheapest in the long run.

Write for Circulars  
or Estimates.

**MASTICA**

FOR GLAZING GREENHOUSES. SUPERIOR TO PUTTY IN EVERY WAY.  
 It not hardened by the extreme heat or cold that a greenhouse is constantly subjected to both inside and out. Mastica is adhesive and remains permanently elastic so that it is not forced out of place by expansion and contraction of the woodwork. Houses glazed with Mastica do not need re-glazing, thus saving time and expense. With Mastica can "bed-in" or use on the outside, but with a machine only.  
 Mastica and Mastica Glazing Machine were given

# THE FLORISTS' EXCHANGE

We are a straight shoot and aim to grow into a vigorous plant.

A WEEKLY MEDIUM OF INTERCHANGE FOR FLORISTS, NURSERYMEN, SEEDSMEN AND THE TRADE IN GENERAL.

VOL. IX. NO. 28.

NEW YORK, JULY 10, 1897.

One Dollar Per Year.

## ..PALMS..

Owing to one stock being grown with plenty of air the plants are all strong and sturdy, and will bear transportation for long distances. Florists intending to purchase this class of stock for their fall trade will do well to place their orders immediately, so that they can have them shipped by freight, thus avoiding the excessive express charges which they would have to pay if shipped during the cold weather. The prices will also be very much higher in the fall than at the present time, owing to the high duty which will probably then be in force.

### ARECA LUTESCENS.

4 inch pots, 15-18 inches high, 3 plants in a pot.....\$5.00 per dozen; \$25.00 per 100

SEEK THE REPORT.

Potato and information from seedmen, and all interested in this column, notified. Address EDWARD... P.O. Box 1677, New York.

The Free Seed Record Broken.—Over 2000 packages of vegetable, flower and field seed have been distributed by the Department of Agriculture...

This is the largest distribution of seed ever attempted by the Department of Agriculture, and it is said that it is the largest...

The distribution of seed in 1893 and 1894, 8,800 packages for the member of Congress, at a total cost of \$95,548, in 1894 each Congressman got kind...

Philadelphia.—Mr. W. Altie Burpee and English and English are the partners per steamship Germanic, of the White Star Line, on Wednesday, July 7.

Early Consignments of Lilies.—Bermuda lilies have been received in small parcels by several stores and dealers...

California Seeds.—The weather of late has been cool, causing everything to take on a better appearance. It certainly has a beneficial effect on everything that is in bloom...

Union Crop.—This crop is now in bloom and what heads there are are filling out. Late frosts and heavy dews at this season caused the bloom to burn and this year was very poor.

Hyacinths.—This crop is not yet dried, but under the influence of the hot tropical heat are maturing very rapidly. On the whole, they promise to be fairly good...

Spinach.—This crop is just about harvested. The crop was somewhat small. The crop was just a fair one. Lettuce is now in bloom and if the weather improves there will be no shortage.

Sweet Peas.—This crop has come very early this year; in fact, some pieces are now on the sheets ready to be thrashed and packed.

W. Altie Burpee & Co.'s new varieties show up very well. Aurora is one of the best. Triumph resembles Goldenfaint of Honor is an improvement on Butterfly and ought to replace this variety...

California growers have had no trouble in germinating Cupid this year. All small quantities of seed of this variety is remarkable how long this little imp keeps up its bright appearance.

European Notes.—Crops suffer by storms. The clerk of the weather appears to have fairly lost his head over the Diamond...

The work of digging up the tulips in Holland goes on apace and the effect of the dry, cold weather in May is very apparent, in the limited number of flowers that have been exposed.

**Japanese Floral Art.**

In a very interesting article on this subject, appearing in a recent issue of the Chicago Post, the contributor has the following to say of the present day floral art of our country:

"Americans are quick to grasp that which is in vogue, and in this we are presented with bouquets correct in composition, faultless in taste, artistically receptacled and aesthetic as any Japanese fingers can make them, will it not be surprising if afterward we gaze upon the classic and the modern, hills, meadows, fountains, flanked by masses of green, inappropriate vessels—I repeat, will it not be a bit surprising if we do not experience a keen sense of humiliation in our national ignorance of the very fundamental principles of so delicate, polite and refining an art?"

We certainly possess more real latent aestheticism than we are credited with, and once fully aroused, and our aesthetic culture can be developed as fully as is our business talent, there is no reason why American florists should not have an established school of arrangement, the style of which would be both artistic and American. It is not to be supposed that American technicalities, as any of the different schools of Japan.

Our massive bunches of flowers seem to carry their sale-ticket ever upon them, revealing the commercial valuation put upon them rather than an underlying appreciation of the aesthetic value of each and every flower, and that which will be welcomed, coming from what source it may, which will tend to the subversion of that omniscient which generally makes us forget our perfect enjoyment of the beautiful."

He then proceeds to treat of Japanese floral arrangement as follows: To appreciate their highly artistic flower arrangement we must view flowers and floriculture from the Japanese viewpoint. The term *hana* means more to the Japanese than its English equivalent, flower, and includes all shrubs, trees, evergreens, and even the redolent many leafed ones of their seven autumn flowers. They do not view a single bloom as highly as a growing plant, but derive its value from its open character to their compositions to simulate, in their arrangement of cut flowers, the growth of the plant. The development of the plant life is what particularly interests them, not a mere physical delight in the bloom. With us only masses of bloom and leaves play a part.

This conception of flower life gives rise to the fundamental principles of their floral art of arrangement; and in all their schools, each of which claims to be the only true exponent of fine art, and to possess secrets called hidden, only imparted to the very profane, this art of arrangement is based upon the representations of floral growth. The first and fundamental principle is that the lines showing the direction of branches form the basis of all floral art. This is called the "language of line," and certain fixed rules govern it in all the schools.

As floral growth and vitality are what he wishes to express, the Japanese artist will study carefully the lines of the plant as it proceeds out of the earth. In arranging flowers in receptacles he regards the water as the earth which nourishes the plant, and the different stems or branches must rise from the water by the same natural rules by which they rise from the earth.

In this respect he has mastered nature's methods, and a true artist will carefully avoid weak bends and angles in the stems, and will be slow to break, and impart the idea of strength and vigorous growth by keeping the stems or branches united to some distance above the water.

Of course to effect this natural development of the stems can be perfectly familiar with the flowers he uses, in all their stages of plant life, and in their reason plants which would with us be sought as "rare" would be immediately rejected, and we find our true idea of "choice-ness" associated with rarity directly opposed to all their rules of art.

# The Water Garden

(PROFUSELY ILLUSTRATED.)

BY WILLIAM TRICKER.

THIS volume, which has been prepared by the foremost aquaculturist of the country, and to whose efforts the present growing popularity of the Water Garden is largely due, is designed to serve as a SOUND, PRACTICAL CULTURAL HANDBOOK for amateur and professional alike.

The book will be freely illustrated with plates and illustrations in the text, and will describe all operations, from the growing of plants in tubs to construction of the large pond, planting, seed saving, propagation, wintering, and all other necessary details of cultivation.

## Individual Credits.

(Continued from page 617.)

### Obtaining Information Regarding Customers.

Considerable strategy must be used at times to secure information touching individuals supposed to be possessors of large means, and who are so reticent about their affairs that it is not deemed prudent to ask questions. You would be surprised to learn that some of the richest and most substantial houses in the larger cities will seek for data through the instrumentality of Janitors of apartments, butchers and tradespeople generally. Perhaps information thus gleaned is not always of value, but at the same time such people hear and see things of which it is important that the dispenser of individual credits should have knowledge. The question may be asked why are such methods resorted to, and the only answer that can be given is that retailers are fearful of making too many inquiries direct and driving away trade that is a source of profit to them. These practices should not be necessary, and remedial measures against giving information to the part of individuals will be overcome

edness, because of their large number and the comparative insignificance of each single account, which renders it less likely that the details will become known to the public, and this feeling of security influences the individual seeking credit and increases the probability of his account growing beyond conservative limits. Very few retail dealers have the courage to discontinue trading with a customer who does not pay promptly. They are seemingly unable to break off the habit of extending long credit to old patrons.

Something should be known regarding the financial resources and character of each debtor. Information respecting business can be secured with comparative ease, but in the case of professional men, and those living on incomes, the problem is not so simple. Therefore references should be required in all cases, and they should be looked up with great care for the reason that while the first purchase may be small, the account, once opened, may increase in importance without attracting attention. If the customer is buying goods on credit from other sources, inquiry should be made as to whether his payments are satisfactory. Where real estate is owned, some speculative data can be ascertained if gathered.

After the investigation is completed, and all the available information is at hand, a credit limit should be carefully fixed, and beyond this point the account should not be permitted to pass until it is ascertained

grown until it seems to me that a reform should be instituted, and they should be taught that the mere fact that they are possessors of wealth does not entitle them to exceptional privileges, or to a lenient attitude of those not so fortunately situated.

It has been truly said that the period of the "rich man's panic" had never been the "rich man's panic," and it is of the wealthy people who have allowed their accounts to grow beyond all bounds, that the most flagrant abuse of credit can be afforded. They are not noted for trying a trip to Europe, or out of town, leaving their accounts with their butcher, grocer and tradesmen generally, who grow more careless, and through fear to bring the least pressure upon them, as they usually take the greatest offense when asked to meet an obligation that may, perhaps, have been long past due.

Very often an account that has run for some time becomes difficult of collection merely because the debtor, under many necessities may be none too acute, feels he is asked to give something for nothing, especially when the account in question is so large as to be out of consumed, and the creditor is in sight for the money he is expected to collect.

One should insist upon the payment of all bills in strict accordance with the terms thereof, and necessary expense should be spared in order to prevent wealthy delinquent to a settlement. He may be unscrupulous, and withhold his name from the books, but in many instances that require extra effort to collect are not desirable.

### Bills should be Rendered Promptly.

I would lay special emphasis upon the importance of retailers rendering their bills promptly, as such a practice will undoubtedly increase their sales, and will also have the effect of educating their customers as to proper business methods.

Some merchants, who are disposed to be conservative, are influenced by the fact that although the precise character of a customer already has a sufficient number of accounts for the income he is receiving, and that the creditor already has credit he will feel that his honesty has been questioned and will make complaint against the retailer. On the other hand, there are people who will not permit anything to be charged on accounts, and the retailer should be sure they will allow their names to be engraved on the books. They are, indeed, quite intelligent at the suggestion.

### Whom to Trust.

Extreme care should be exercised in trusting people of narrow means, dependent upon moderate salaries, that are received with a regularity that renders continuous credit unnecessary, for the mere fact that they are seeking credit, except in rare instances, is evidence that they are living beyond their prolific source of loss. Extraordinary and, of course, should be discouraged.

Credit should always be refused to those who spend their income before it reaches the man who drinks to excess or gambles about town, or to those who spend on the promise of a future return. Outstanding factions, which often play altogether too large a part in credit.

Many houses will not properly insist upon guarantees, if the financial facts of the applicant for credit is doubtful.

Some large houses decline to enter into investigations of the accounts of those who have no substantial property in real estate investments; while others will accept accounts of customers whose who hold good titles to property. In the latter case, of course, it is well to ascertain that the customer's ability to meet obligations where retail credit is safely be predicted. A strong ability, earning capacity and honor.

It is also of comparative degree of resources, if he is possessed of those resources that inspire confidence in his ultimate ability to meet contingency in the case of that he may be afflicted with some misfortune, such as sickness or loss of property, it is a recognized fact that people in moderate circumstances are usually more punctual in meeting their obligations than the wealthy.

All honor to the man who pays his debts. He is entitled to the confidence and respect of his fellow-men.

The surety of a large number of people of practically no means, living in crowded districts of large cities, who are unable to credit to the retailer for the sake of obtaining the necessities of life, but to gratify a strange desire to surround themselves with more luxuries in these localities, the greatest killing of notes and swapping of checks dated to the retailer, is one of the most flagrant abuses of credit that exist to some extent in recognized business communities.

(To be continued.)

## A Royal Orchid Bouquet.

The "Gardeners' Chronicle," London, in its issue of June 28, editorially comments as follows on the bouquet ordered by Her Majesty the Queen for the decoration of the dining-room at Buckingham Palace on Jubilee Day. The flowers were furnished by P. Sander & Co., St. Albans, England:

"The framework of the bouquet consisted of a mass of white and pink work, heavily gilt, standing on a polished mahogany base; in shape triflingly resembling a crown. From the three corners spring the handle, its three branches forming a dome, and from the center of the crown, the letters 'V. R. L.' twelve inches in length, being arranged between the crown and the base. Several hundreds of flowers of *Odontoglossum citreum*, the letters being composed of petals of orange-colored *Epidendrum vitellinum*, Millais' favorite orchid. It is impossible to attempt to describe the many thousands of orchids used in this, the most superb bouquet ever seen, endless spikes of white and pink, raised from Her Majesty's dominions being used, together with almost priceless blossoms of the highest quality raised in our country, and our Queen's accession, many of them unique and of great value, among them being a rose from the *Empress of India*, C. Our Queen, C. Victoria Regina, which receive a award of the highest honor from the Horticultural Society on the 16th inst. The Princess of Wales *Odontoglossum* was particularly noted, the spikes of the *Dias* from *Lord Dalhousie's* Dendrobe, with its nankeen-yellow and maroon stripes, the *Stenoglossum* from *Table Mountain*; *Stenoglossum fimbriata longiflora*, also from South Africa; the month-weaver *Stenoglossum* from Australia and British New Guinea; *vandas*, from the British East Indies; cactaceas and richly-colored orchids, from British Guiana, and the lovely scarlet *Epidendrum vitellinum* and *Laelia xanthina*.

"Among the more rare species and varieties employed, mention may be made of the *Laelia* which adorned the beautiful hybrid *Phalaenopsis* *Vanada*, *Vanada* *Hookeri*, the white-rosy *Phalaenopsis* *Vanada*, the *Phalaenopsis froyes* *leucociliata* var. *Godseffiana*, an importation possessed only by Mr. R. Meade of the *Phalaenopsis* *Vanada* var. *Caudatum*, *Dendrobium* *Phalaenopsis*, the spikes of which were of the most striking character-making; *Oncidium* *Batemanianum*, with its beautiful yellow expansion; *Oncidium* *Vanada*, from *Launcehana*, a cross between C. *Sanderiana*, and C. *veratrifolia*, the flowers of which were of the most striking variety, *massevalliana*, chiefly varieties of *Harrisonia*, and a few M. *Chilmeri*.

"The flowers of the bouquet were all of a basket of orchids were fitted with flutes or sockets, and the flowers were placed with a glass in the position of the petals, and constructed for the occasion, is one central dome, forming a solid foundation for the bouquet. The flowers, blossoms, which, perfectly finished and arranged, had a height of eight feet, with a diameter of twelve feet. The number of flowers in the bouquet in 1887 was 50,000, but this huge trophy contained a great many more flowers. The bouquet is better, and rarer, greater; and by command it was delivered at Buckingham Palace on the 28th inst. The bouquet, on the termination of the court dinner, was carried into the Queen's bedroom, where it served to adorn for several days."

### View in Tourer Park, Newport, R. I.

by proper educational work, just as reluctance to give information on the part of borrowers is being removed by the requirement of signed statements.

During the past few years we have been suffering not alone from the failure of business firms and corporations, but from the straining of individual credit which, in my opinion, has been responsible in a large degree for the prevalent unsatisfactory conditions in business affairs. Many people have been living beyond their means, and since the panic of 1890 especially individual credit has been extended far beyond its normal limits; as a result the habit of credit has become disturbed, and the slow undermining of the foundation has gradually weakened and finally destroyed many of our noble institutions of trade and commerce. We have been passing through an era of extravagance that has been more pronounced than at perhaps any other period in our history. The credit structure has been upon a false and dangerous supposition, rather than upon tangible property and financial strength.

The Reverend Charles H. Spurgeon testified: "Living beyond their means is the ruin of many of my neighbors. It can hardly afford to keep a rabbit, and must needs drive a pony and chaise."

by further research that the increased line can be safely extended.

A retail creditor should know when to say No, and should have the force of character necessary to say it; moreover, he should make the refusal in a way that will give no offense.

Many people, especially those who are wealthy, are very negligent about paying their personal bills; and tradesmen and professional men are obliged to carry them longer than should be necessary, thus entailing upon them heavy losses of interest and profit.

**Laxity in Collections Cause of Failures.** It is a conceded fact that frequent salesmen, given credit, and credit contribute to better profits in all lines of trade; whereas laxity in making them pay credits and collections is the direct cause of a large proportion of the failures of retail merchants throughout the country.

A well-known writer on Political Economy says: "It is difficult or impossible to make a man pay his credit, and I find it is almost invariably their experience that the slowest customers are those who could most easily pay cash. It is almost impossible to collect from them."

The custom of allowing people of means to suit their own convenience in making payments has gradually

### Some of Newport's Gardens.

Newport, the queen of watering places, is without a driving park and for the very good reason that she needs none. The summer residence section is a park in itself of magnificent proportions and unsurpassed beauty, whether judged by American or European standards. Here one may ride or drive over many miles of the smoothest and best macadamized roads, many of them bordered by overhanging trees, and all lined by the most costly and pretentious villas to be seen in the country. Nothing that money can buy in the line of architectural or horticultural attractions is wanting for wealth and culture centre in this city by the sea as scarcely anywhere else.

It may not be generally appreciated that the Newport cliffs are the highest

park is that of Mr. Joseph Tuckerman, which is of especial interest to the horticulturist as well as the antiquarian and historian. The house was built in 1770 and stands as a fine specimen of colonial architecture, and in marked contrast with some of the new and more modern forms. Among its former occupants were General Nathaniel Greene, who was second to General George Washington in command during the War of the Revolution. In its spacious halls General Greene received and entertained such guests as Washington, Lafayette, Steuben, Kosciuszko and other distinguished men of those and former times. The present owner has largely rebuilt the eastern mansion, taking care, however, to preserve the historic features in all their perfection. The estate is a large one, and is shared with many others in the city, containing but little more than an acre of ground, but it is safe to say that in its planting it is a gem of rarest worth. In front and on the street line are several English hickories, the stately magnolias, a beautiful fern-leaved beech;

inuation that such a claim is made, but a literal statement of fact. A shrubbery can be, as this actually is, as beautiful as a bed of flowers during the entire season, and especially when colored foliage-specimens are employed to assist in making up the combination. Take for instance such shrubs not small trees as *Quercus concinna*, *Prunus pissardi*, *Sambucus aurea*, *Berberis purpurea*, *Philadelphus coronarius*, *Spirea opulifolia*, *avrea*, *Cornus sanguinea variegata*, *Ligustrum tricolor*, *Corylus purpurea*, *Weigela amabilis variegata*, *Prolea trifoliata aurea* and others that readily suggest themselves as affording variety in color leaf, and it will be seen at a glance how large are the possibilities in this direction. The opportunities for selection are so numerous when looking to a constant succession of flowers in such a plantation. Nor does it require large areas, mostly lawns, for the display of blossoms. I need not suggest the flowering peaches, apples and crabs, the flowering almonds, the beautiful magnolias, the rhododendrons and azaleas,

not sufficient room in which to grow poor ones.

I have already mentioned the fern-leaved beech on this estate, which leads me to call attention to the famous tree of that variety on the grounds of the Redwood Library in the immediate vicinity, and which has almost a national reputation. It is claimed to be the oldest and largest of its class in the country, having been brought here and planted where it now stands about the year 1835 by Mr. Samuel Johnson, a resident of the city, who had been many months abroad and had visited numerous countries, and it is not now known where he obtained it. It is not the ordinary *Fagus lacinata* as sold by the nurserymen, though much resembling that variety.

No horticulturist or florist who visits Newport should fail to see old Newport's pride, Redwood Library and its noble trees. At present almost every estate of any pretension whatever has its fern-leaved beech, however small and unpretentious. The late Miss Catherine Wolf, in fitting up Vineland, her

Shrubby in the Garden of Mr. Joseph Tuckerman, Newport, R. I.

of any on the Atlantic coast line between Florida and Maine; but such is the case. And even then they are neither lofty nor rugged. Everywhere the closely-shaven and always well-kept lawns extend to the sea, and trees, shrubs and flowers, representatives of many lands, though often maintained with great difficulty, are abundant.

And yet Newport has several small parks, of which her people are justly proud. Among them is the Ocean Park, the gift to the city of the Hon. Levi P. Morton; and Tourou Park, presented many years ago by Mr. Judah Tourou, which park is in the very centre of the city. Here it is that the "old stone mill" or "Newport round tower," the mystery of Newport mysteries, has its place. Whether the work of the ancient Northmen, who it is supposed have visited the place long before Christopher Columbus started on his famous voyage of discovery, or of the early settlers, no one knows or can well know, as there is not a scrap in ancient records relating to its origin or early history. The botanists search out many mysteries and solve numerous questions in their line, but it may be taken for granted that even the combined wisdom of the Society of American Florists, soon to visit the city, will fail in attempting to solve the problem when the members come to analyzing and classifying in this presence.

Among the estates fronting on this

*Fagus heterophylla* and one of the finest specimens of *Liquidambar styraciflua*, though by no means the largest to be seen in Newport. This, the well-known "sweet gum" of the south, is not reported entirely hardy in our northern climate, but it is here grown as easily and as surely as the oaks and maples. Its peculiarly shaped leaves and their rich coloring in autumn make it one of the most attractive trees for the lawn, or even for the street, which we have. Experience shows that it can be satisfactorily grown not only in this locality but in the vicinity of Boston and still farther north. Another of the features of the tree planting on this estate that never fails to attract attention is the three weeping beeches in the western border, which stand side by side and so hang together as to make them appear at first sight as one. Standing thus they present something of a flat surface having a rounded top, the least appearance of stiffness or undue formality. Every tree and shrub in the border is choice and grown to the most perfect form.

The shrubbery, as shown in the illustration, is partially planted on an artificial mound in the rear and farthest from the street. It contains many of the well-known hardy species and varieties, and these are so selected and arranged as to afford flowers in succession from early spring to late autumn. It is by no stretch of the imag-

ination that such a claim is made, but a literal statement of fact. A shrubbery can be, as this actually is, as beautiful as a bed of flowers during the entire season, and especially when colored foliage-specimens are employed to assist in making up the combination. Take for instance such shrubs not small trees as *Quercus concinna*, *Prunus pissardi*, *Sambucus aurea*, *Berberis purpurea*, *Philadelphus coronarius*, *Spirea opulifolia*, *avrea*, *Cornus sanguinea variegata*, *Ligustrum tricolor*, *Corylus purpurea*, *Weigela amabilis variegata*, *Prolea trifoliata aurea* and others that readily suggest themselves as affording variety in color leaf, and it will be seen at a glance how large are the possibilities in this direction. The opportunities for selection are so numerous when looking to a constant succession of flowers in such a plantation. Nor does it require large areas, mostly lawns, for the display of blossoms. I need not suggest the flowering peaches, apples and crabs, the flowering almonds, the beautiful magnolias, the rhododendrons and azaleas,

the viburnum plicatum, *Rosa rugosa*, *Cercis japonica*, *Cornus Mas*, *Clethra alnifolia*, *althica* in variety, *Hydrangea grandiflora*, *Lspedeza bicolor*, *Cydonia japonica*, *Spirea* in variety, the lilacs, roses, and a multitude of others, which furnish material always at hand. A poor or uninteresting shrubbery is all that is needed to detract from the horticultural knowledge or want of skill in making the application of that knowledge to the best uses.

In Mr. Tuckerman's border only a small part of the plants named have a place, but the end sought is practically attained. In front of the shrubs and at the base of the mounds is a bed of roses, mostly hardy perennials, but not extending the whole distance. And occasionally a showy annual is thrown in to fill a temporary vacancy, for Mr. Beatty, who is in charge of the grounds, is too good a gardener not to improve every opportunity to secure the desired effects.

In the rear of all this and separated by a series of brick arches, which are well covered with vines, is a model vegetable garden where fruit is grown to perfection and also many flowers, and last of all the conservatory, which, though not large, houses many choice plants. On calling the attention of Mr. Tuckerman on one occasion to what seemed to be a fact that every plant was a choice specimen of its kind, his reply was that it had to be, for he had

villa at Ochre Point, brought two of these trees from away at an expense of nearly a thousand dollars each, or transportation and transplanting alone. They still live, are quite large and were shipped with balls, but are not the best specimens of the class to be found in the city. That honor belongs to one on the villa of James Gordon Bennett, directly opposite the Casino, and was probably planted by the late Sidney Brooks, of Boston. It is in full view from the street and there is another planted at the same time almost equally good. This estate of Mr. Bennett attracts considerable attention, though the proprietor himself has not occupied it for several years; but whether in use or not it is always kept in perfect order. The grounds are well planted with choice trees and shrubs and the "bedding out plants" are not wanting. One of the peculiarities of the place is that the gateways in front are surmounted with bronze eyes, whose eyes at night are lighted with gas and thus mildly burned on the passers-by.

This section, the immediate vicinity of the Ocean House, marks the boundary line more nearly than any other between the old and the new city, though there are summer residences in all parts of the town. From this point southward Bellevue Avenue is almost exclusively devoted to summer villas, some of which I will describe later.

L. D. DAVIS.

Riverton, N. J.

It is several years since Mr. J. D. Bland... grand clearing up previous to the "Glorious Fourth"...

In any business it is of decided importance that a periodical cleanup and no more is this necessary than in ours, where so much remains to be straightened out after the spring rush is over...

To carry out this system is comparatively easy in a smaller establishment, but in a large one as is this considerable forethought is required...

Words fail to express admiration for the amount of ready work of addition by all who believe in a well-regulated household.

I understand that Mr. Bland is about to leave for Europe incidentally for recreation, but nothing in the way of new things, particularly in plants, will be overlooked.

2c GERANIUMS 2c

Many of the following plants, from 2 1/2 inch pots, in splendid shape, the very best varieties.

GEO. M. EMMANS, Newton, N. J. When Writing Mention Florists' Exchange

Sterling American Novelty, THE COGHET

Is a sport from Mamam Cogh, which we considered to be the best, just out-of-door rose. It has all the good qualities of its parent, its color, pure white in winter, outside petals slightly tinged in Summer, and no doubt it will prove the best white out-of-door rose up to date.

Price, per dozen, from 3 inch, \$4.00. Per 100, \$40.00. All Orders met by Accompany with Cash.

**St. Louis.**  
 Market Quiet.  
 The usual cry of demoralization of business is heard on every side now since last summer weather has set in, a little funeral work once in a while creating a slight stir in the market.  
 The best quality of cut roses is bringing about \$1 per 100 at wholesale, but supply is very limited by the hot weather, which produces large quantities of poor quality flowers, which go begging at \$1 to \$2 per 100. Good extra-ordinary bring \$1 per 100, but there are so many poor ones sold at 50 cents that many florists believe the latter figure to be the market price.  
**The Wedding Plant Trade.**  
 It is very evident from the stocks of bedding plants on the hands of the retail plant growers that the spring plant business has this year been quite a disappointment to most of the vintners, in particular, and all other bedding plants, in a greater or less degree, are found in large quantities among the greenhouse establishments throughout the city, and the plant men, as a rule, feel very blue about the future.

**The News.**  
 Fred. C. Weber is making preparations to occupy his new store in West End, which promises to outclass everything else in the city.  
 The auction sale at Michael Plant and Bulb Company's, on June 23 and 24, was, in a sense, a failure, as the attendance was too light for the amount of stock which had to be sold. In accordance with the prices bid on such of the stock as was sold, there was a total of about \$4,000 worth of plants to be offered. Not over twenty florists were in attendance.  
 Frank M. Ellis succeeds C. G. Fleckenstein as manager of the Fleckenstein Floral Company. He reports business very poor, but has bright hopes for the fall trade. Mr. Fleckenstein, it is understood, has settled permanently in Indiana.  
 A visit to Joseph Kern, at Alton, Ill., shows that the same state of affairs has made life and business a burden to the florists of that little burg this spring.  
 William Trilow, recently of Old Orchard, Mo., has assumed charge of the St. Clair Floral Co., at Belleville, where he will grow carnations and roses next winter.  
 His florist patrons will take place at Fern Glen on July 22. A special train has been chartered for the day and will make two trips to the picnic grounds. The florists are all invited. Further particulars can be had of Jules J. Benoit, 219 Olive Street.

The St. Louis Cut Flower Company has purchased seven greenhouses at Old Orchard, Mo., where it will grow palms, ferns and other decorative plants. M. H.

The Annual Exhibition.  
 The St. Louis Florists' Club will hold its seventh annual chrysanthemum exhibition November 1st, inclusive. In former years one of the halls in the Exposition Building was used, but, owing to changes, it was decided to hold the exhibition this year in the new Coliseum.

**Boston.**  
**Trade on a Summer Basis**  
 The hot weather has arrived; and though slightly behind schedule time its force is not less potent, and what little life exists in trade circles has departed and business is now run strictly on a Summer basis.  
**A Ball Game.**  
 An interesting event of the celebration of the Fourth was a closely contested game of base ball between two nines representing W. E. Doyle and Welch Brothers, respectively. The players were from Dorchester and several hundred spectators, including a great many members of the profession, witnessed the fine points which the contestants brought out. The game resulted to be in favor of the Doyle team. Another game has been arranged between the two teams to be played on Labor Day.

**Weekly Exhibition.**  
 A fine exhibition was presented at the rooms of the Massachusetts Horticultural Society on Saturday last. Wm. Thatcher carried off the honors in Iris, Kamper and Campanula media. Miss M. S. S. carried off the prizes for Iris, and the Bussey Institution one for campanulas. The Society's silver medal was awarded to J. E. Rothwell for Miltonia vexillaria, and W. E. Coburn received honor medals for the Begonia "Lion-ly." Certificate of Merit was awarded to T. C. Thurlow for Rhus colubis atopurpurea, and a similar award to W. H. Loring for Rosa lucida var. alba.

**On Pleasure Boat.**  
 Robert Farquhar left on Thursday to visit and study the Yellowstone Park and the new flow of a hot fountain. His trip will undoubtedly prove of interest to himself, and unquestionably be beneficial to the horticultural profession, information which is sure to be obtained by so careful an observer in such an available locality.  
 George A. Sutherland left on Friday for a two weeks' vacation in Digby, N. S.

F. H. Houghton, of Houghton & Clark, is front fishing at Tim Pond, near Eastis, Maine. On his return the latter part of next week he will go to Newport, where for a time he will manage the business of decorating department of Miss Fadden's business.  
 Your correspondent has had the pleasure of rustivating at Tim Pond for the past two weeks, and can heartily recommend it as a satisfactory resort for one tired of seeking trout, rest, recreation, mountain scenery, good air, and the best of treatment. W. K. W.

**SITUATIONS WANTED.**  
 Rate, 10 cents per line (9 words), each insertion. Cash on application. Apply to situation wanted advertisements and when not answered, send 10c to advertiser to cover our care and receipt to cover expense forwarding.

## Greenhouse Woodwork

Open-air-dried Cypress Lumber is more durable, and better suited to Greenhouse conditions, than kiln-dried stock. But you cannot get it from those that are engaged in the business in a small way—even though their entire business is confined to greenhouse material—for it takes a long time for the lumber to thoroughly dry and this means an investment in lumber that only those of large capital can make. The only way to have air-dried lumber is to buy green lumber and hold it until it dries. Those that order dry lumber from the producers of Cypress get kiln-dried stock. It is cheaper for them to kiln-dry than to hold the stock long enough to season it in the open air. We carry a large stock and fill all orders with open-air-dried Cypress clear of knots, sap and all other defects.

Trade Fair

Last week's trade was fairly good for the summer season and consisted mainly of funeral flowers for the market is overstocked with cut flowers of all kinds. The first asters are being cut and the carnations are beginning to show the effects of hot weather. From the pleasant weather of the past few days an excessive hot spell of the last week is quite trying to plant life, particularly the roses. On the other hand, the market in the nineties for almost a week, reaching 99 degrees several days in succession. On the 20th of the month with a severe storm passed over the two cities, heavy rain and hail doing some damage to crops, but none to glass houses.

The News.

Langhans & Co. furnished a new order of plants for the first roof garden opened in town by the new Hotel Lincoln on Penn Avenue.

John Rader and daughter sail for Europe next week to be absent for several months.

Several of our florists belong to the Elks and are attending the annual meeting in Minneapolis. Among them are C. Ludvigson and family, and Robert Faulk and wife. The latter will likely extend their trip to Yellowstone and is expected to be absent for six or eight weeks.

J. E. Killen was a visitor during the week; also J. A. Evans, of Richmond, Ind.

Invitations are out for the first meeting to be given by the Florists' Club and an enjoyable time is looked forward to. E. C. REINEMAN.

## Chicago.

Scorching Weather Creates Slow Market.

We are experiencing scorching weather, the temperature seldom being below 90 degrees at night and up as high as 95 degrees daytime. This has had its effect on trade, stock and human capacity. In only one case of froststroke among the gardening fraternity that have come under our notice were these roses planted in a semi-utility box, at Kiehm's wholesale store, who was in a bad condition for a time, but is around again, and Maxmaier, who was overcome while mowing the lawn in Humboldt Park. He also is convalescing.

A glorious rain on the night of the Fourth cooled off things somewhat, but the weather is still too much to grow in. Summer is the best time to grow in. Sweet peas are abundant and prices low, even the best of the growing above 15 cents per 100.

The seasonable rains and hot weather have at last started the cannas into good growth, as well as other tender bedding plants that were previously hard-looked subjects. Bedding out is completed. Prices have ruled low, but those parties who attended to this work have, on the whole, quite as good a report to make as those who have to depend upon cut flowers.

John Lang, of Melrose Place, finished planting his chrysanthemums, all from three-inch pots, the first week in July. The number of plants in 700 varieties being Glory of the Pacific, Lady Fitzgibbon, Yellow Queen, Mrs. H. Robinson, Mrs. George Jones, Miss Wanamaker, Ivory, Madine, Liberty and Yanoma.

Mrs. W. E. Lynch left this week for her old New England home. Mr. Lynch expects to pay his annual visit there towards the end of the month.

Bassett & Washburn have invited the

Florists' Club to visit their place in August. The big class of new houses are now nearing completion.

The framework of the new Washington Park conservatory is ready for the glass. They are imposing structures and will afford Mr. Kants much needed room for his stock.

S. Nelson, who has been noted for working up hardy herbaceous gardening in 2nd Avenue, has retained his position as head gardener there. EDGAR SANDERS.

## Cincinnati.

Results of Hot Weather.

We are still doing a little business, but it's a case of sell out every day or feed the cat every next morning. Ice does very little good. Roses will open in spite of your best efforts to prevent them.

Two of the men employed by the Hofmeister Floral Co. were overcome by the heat on the first of the week, but their condition was not serious. This firm has about finished planting and is in a new line of stage for fall business. Their chrysanthemums are looking splendid.

Among Growers.

B. P. Critchell's Sons are still busy planting. I noticed one large house planted with Mountain of Snow chrysanthemum. Mr. Critchell's prices on this variety pays well. Of course, it is not ready much before Christmas, which makes it valuable.

Huntsman & Co. are about through planting their roses. By the number of Beauty being planted at the different growers' establishments I should say that Cincinnati will be well supplied this fall. Quite a number are planting Morgan.

Notings.

A. Peterson and wife leave on the 8th for an extended Eastern tour. George F. Brehmer, of Chillicothe, O., spent several days in the city during the week of the 20th. He has been shipping the roses. John W. Holland, O., was also a caller. He tells me the firm has put up a new line of boxes, 10x6 feet in which to grow roses.

W. W. Coles, of Kokomo, Ind., was a caller on the 20th of the week. He is sending the writer some of the best Beauty and K. A. Victoria roses that I have ever seen in this line of year, the stems are 23 to 35 inches in length and he says he can cut some much longer in the future. The foliage also is perfect for the season. Mr. Coles grows his roses entirely in solid beds. Meteor did equally well in the city.

E. G. GILLETT.

Lansing, Mich.

George W. Park, a pioneer nurseryman, died here recently, aged 95 years.

Baltimore.

The establishment of Maurice A. Hantske, on Gettings Avenue, sold at auction on June 28.

**E. HIPPAID, YOUNGSTOWN, OHIO.**

When Writing Mention Florists' Exchange

**MASTICA**

FOR GLAZING GREENHOUSES. SUPERIOR TO PUTTY IN EVERY WAY.  
Is not hardened by the extreme heat or cold that a greenhouse is constantly subjected to both inside and out. Mastica is adhesive and remains permanently elastic so that it is not forced out of place by expansion and contraction of the wood-work. Houses glazed with Mastica do not need re-glazing, thus saving time and expense. With Mastica can "bed-in" or sag on the outside, but with a machine only. Mastica and Mastica Glazing Machine were given  
**HIGHEST AWARD OF SOCIETY OF AMERICAN FLORISTS AT PITTSBURGH, 1895.**  
Put up in gallons, \$1.00. Half gallons, 80 cts. Quarter gallons, 35 cts.  
Mastical Glazing Machines, \$1.00 each.  
Send for full descriptive circular and testimonials. Agents in all the principal cities.

# LIFE FLORISTS' EXCHANGE

We are a straight shoot and aim to grow into a vigorous plant.

A WEEKLY MEDIUM OF INTERCHANGE FOR FLORISTS, NURSERYMEN, SEEDSMEN AND THE TRADE IN GENERAL.

VOL. IX. No. 29.

NEW YORK, JULY 17, 1897.

One Dollar Per Year.

## ..PALMS..

Owing to our stock being grown with plenty of air the plants are all strong and sturdy, and will bear transportation for long distances. Florists intending to purchase this class of stock for their fall trade will do well to place their orders immediately, so that they can have them shipped by freight, thus avoiding the expensive express charges which they would have to pay if shipped during the cold weather. The prices will also be very much higher in the fall than at the present time, owing to the high duty which will then be in force.

### ARECA LUTESCENS.

4 inch pots, 15-18 inches high, 3 plants in a pot.....\$4.50 per dozen; \$35.00 per 100

## VAUGHAN'S INTERNATIONAL PANSY MIXTURE.

This is the Pansy mixture for every Florist who wants to grow the best and realize the highest prices for his flowers and plants. It contains the cream of the cream of every noted Pansy grower's product of the world. It embraces all the choicest colors of fancy German strains, so well known for their richness of color and perfection of shape; it contains all the separate colors of the Giant Tricolors, with their immense flowers and rich colors. It contains the Giant Cassier and Bugnot strains, the product of two celebrated Scotch strains, the Faisne and Boulogne Giants. In fact, there is no strain of any of the celebrated Pansy specialists not represented in our International Mixture. Price, per lb. \$10.00; 5 lb. \$50.00; 1/2 ct., \$1.50; trade pkt. 50c.

**VAUGHAN'S MIXTURE OF GIANT PANSIES.**  
This mixture is composed of Giant Flowering Pansies and the separate colors of Tricolors. It will produce a larger variety of colors than any other large flowering Pansy mixture and is especially suited to a trade that demands large Pansy flowers. Price, per lb. \$10.00; 5 lb. \$50.00; 1/2 ct., \$1.50; 1/4 ct., 75c; trade pkt. 50c. Send for complete list of Pansies in separate copies.

...THE COMPLETE...

**BOOK CATALOGUE.**

We have just issued the most Select and Complete Catalogue of Books on Horticultural and Allied Subjects, ever published. The catalogues of the various book publishers of this country as well as of Europe, have been carefully gone through, and such works taken therefrom as were considered suitable for our patrons.

This catalogue contains 66 pages, and embraces

- ...BOOKS for
- The Florist
  - The Market Gardener
  - The Nurseryman
  - The Fruit Grower
  - The Seedsman
  - The Student of Botany, Entomology and Ornithology
  - The Poultry Keeper
  - The Farmer
  - The Lover of Plants and Flowers

and the Student of Nature in general, in fact

**BOOKS FOR EVERYBODY**

interested in the science and practice of rural economy. A select clubbing list of periodicals, home and foreign, is also furnished, through which a considerable saving may be effected in their purchase. This handy catalogue will be sent on application, accompanied by a two-cent stamp. Address

A. T. DE LA MARE PT., AND PUB. CO. LTD. P. O. Box 1697, New York.

**Ready Sales and Quick Returns.**

Have found something new in every number of the FLORISTS' EXCHANGE during the past year and it has not only helped me to replenish my stock at reduced rates but to grow the same in such a way that it would bring ready sales and quick returns. LISA V. NEW YORK, MISS HEDBROS. Bridge Hampton, N. Y., June 15, '96.

**The Early History of Sweet Peas\***

BY S. B. DICKS.

So widespread and intelligent an interest is now felt in America in all that concerns sweet peas, that an excuse is necessary for presenting a few facts connected with their origin and early history.

Hitherto the Botanical Dictionary of Curtis has been the authority usually

having their location in the neighborhood of Panormi. In addition to the two purely botanical works referred to in this article, and which were published in his lifetime, he had prepared for the press his Pamphyrus Siculum, an illustrated natural history of plants, animals, fishes, etc. etc. to be published with the kind consent of the EDITOR, reference will be made by the writer in some future number of The Florists' Exchange. Cupani died in 1711 and the work was first published in the following year.—S. B. D.

The interest taken by Cupani in the sweet pea is evidenced by the zeal with which it was distributed by him. In 1699 some seed was sent to Dr. Uvedale at Enfield, England, where the plants were visited by many eminent botanists. Some seed was also sent by

pears on the opposite page the following passage occurs: "I am sowing seeds of this most elegant and very pleasant plant lately received from the Reverend astronomer Patru Francisco Cupani, who was pleased to communicate with me, and to send me these from Panormi, together with other somewhat rare seeds, in the beginning of 1699; which being sown, in the same year produced flowers and seeds, of which plant for the sake of the elegance and pleasantness which it possesses, I have wished to set forth a delineation and description by that name which the Reverend Pater Cupani has proposed for it in the catalogue of the most learned and excellent Catholic Prince.

"This Lathyrus, an annual, rises to a height of 6 or 7 feet; the root is thin,

to the hairy pods no illustration of the flower is given.

**LINNÆUS' DESCRIPTION.**

Before referring to the numerous botanical works published in the early part of the 18th century it may be well to refer to the first of the above mentioned plants as given by Linneus in his Systema Plantarum Europæ. Under the name of Lathyrus, the section biflorus we find Lathyrus odoratus: a. Lathyrus siculus. Rupp. linn. 210. b. Lathyrus siculus, Lathyrus siculus. Comm. hort. 2, p. 219.

b. Lathyrus Zeylanicus, odorato flore et siculis. Rivini (see above) Hort. Burm. Zeyl. 138 Knip. Cent. IV. N. 37.

Habit: (a) In Sicilia; (b) in Zeylona (Ceylon).

Of the authorities cited by Linneus, the first is of very great importance because from it we learn that the white variety is Sicilian origin.

In the Flora Jencensis (Francfort, 1718), H. B. Kupp! places in the class for plants with irregular flowers, Lathyrus siculus, Rivini (see above) and states: "In gardens they generally call it the musk-scented Lathyrus (L. moschatum). Sometimes it varies with a white flower."

The reference to the Hort. Amstel. of Commelin has already been fully dealt with.

**THE SWEET PEA OF CEYLON.**

Respecting the Lathyrus Zeylanicus, Burm. Zeyl. is the Thesaurus Zeylanicus, setting forth the plants native to the island of Ceylon, published at Amsterdam 1737 by Joannis Burmanni, Medic. Doct. et Botanices Professoris in Horto Medico Amstelodamensis.

In this work the plant appears as follows:—(a) Lathyrus Zeylanicus, var. amano ex albo et rubro vario. Nobis. (b) Lathyrus Zeyl. hirsutus flore variegato odorato Hart. This plant differs from the Lath. odorato of Cupani only in the variety of the flower, and since it has been described and figured in the Hort. Amst. part 2, we do not further describe it here, since, also, in addition to the plants as well known to all since they frequently occur in our gardens.

The reference to Nobis is not been able to verify, but regarding Hert, Hart, Burmannus says: "Hartog or Hertog is a herbarium which I possess and which is also contained very many most elegant Zeylanian plants, and was sent once to him from Ceylon to Cornelius Vossius, the gardener at Amsterdam."

In the same work also appears a variety, Lathyrus Zeylanicus, rubro pulchro. The omission of the word odorato may be accidental; if so, we have here the red variety, also ascribed to Ceylon. This is cited by Burmannus on the authority of the Prodrum Burmanni published at Gedan, 1696. If this surmise be correct these two varieties were known at the same time as the Cupani was calling attention to those of Sicilian origin.

The reference to Knip. Cent. IV. is a very important one. In 1757-1763 Johann Hieronymus Knipfoph, a celebrated Professor of Medicine, published at Magdeburg a work entitled

**"Botanico in Originali Sev. Herbarium vivum."**

The work is in several volumes of four sizes and from Dr. and V. are given colored illustrations of pressed flowers of the Painted Lady and the Yellow Fly, while in Vol. 2, two flowers are one-flowered only (see Fig. II.). I represents a cultivated plant and the second represents a dried specimen. Both illustrations are thus named.

"Lathyrus pedunculatus, albidus, ciliobiflorus, Linn. S. P. 732. Lathyrus siculus, Linn. S. P. 732. Lathyrus odoratus Zeylanicus."

It is remarkable that Knipfoph should give the barbarously descriptive name of Linnæus, and that at a later date Linneus should adopt in his "Systema" the name of the shorter one, thus placing the authority of Knipfoph. The two illustrations vary slightly in some minor details, but are evidently those of the same plant. The colors are those of the Painted

FIG. 1.—LATHYRUS DISTOPLATYPHYLLUS hirsutis mollis et odoratus. LATHYRUS odoratus Siculus et LINN.

(Reproduced from Horti Medicæ Amstelodamensis Vol. 2, Figs. 80, 169-1701.)

From a sketch made from the original engraving by Mr. G. H. Dicks (son of the writer of this article), by special permission of the Principal Librarian of the British Museum, London.

Cupani to Caspar Commelin and the result was an illustration of the plant in the Horti Medicæ Amstelodamensis, published in 1697-1701. It is a fine folio work and in Vol. II. tabula 89 is given full page drawing, very well executed, showing the foliage as we now know it; the heavy footstalks mostly carrying two flowers. (See Fig. 1.) The individual flowers are large, with the standards mostly rounded and well developed, but among them are a few monstrous forms; these, however, are very variable in character. The name given on the head line is Lathyrus distoplatyphylus, hirsutus, mollis et odoratus.

In a very elaborate article which ap-

pear on the opposite page the following passage occurs: "I am sowing seeds of this most elegant and very pleasant plant lately received from the Reverend astronomer Patru Francisco Cupani, who was pleased to communicate with me, and to send me these from Panormi, together with other somewhat rare seeds, in the beginning of 1699; which being sown, in the same year produced flowers and seeds, of which plant for the sake of the elegance and pleasantness which it possesses, I have wished to set forth a delineation and description by that name which the Reverend Pater Cupani has proposed for it in the catalogue of the most learned and excellent Catholic Prince.

"This Lathyrus, an annual, rises to a height of 6 or 7 feet; the root is thin,

MR. S. B. DICKS.

It should be borne in mind that Curtis was a trader as well as a botanist, and that the apparent object of his valuable work is to present such facts relating to the subject treated of, as would be connected with the introduction of the plant into Great Britain, and in particular that part of it which comprised Cupani's botanical Garden.

**EARLIEST MENTION OF THE PLANT.**

The earliest mention of the plant that I have been able to discover is in the Hortus Plantarum of Joannes Bauhinus, Elbroduni 1659-51 where (on the authority of J.as. Justice) it is catalogued as Lathyrus angustifolius, flore ex albo et rubro variegato, odorato. In the Hortus Blesensis of Robert Morrison, London, 1668, I find Lathyrus latifolius annuus, siliqua hirsuta. This in some respects resembles the sweet pea, but it is surmise be correct it must be the purple variety that is referred to. Conjecture gives place to certainty when we turn to the Historia Plantarum of John Ray, London, 1686-1704, where we find in Book XVII. Lathyrus major et Siciliæ, a very sweet-scented Sicilian flower, with red standard; the lip-like petals surrounding the keel are pale blue, its seed pod is hairy." In another part of the same work the plant is quoted as "Lathyrus distoplatyphyllos, hirsutus, mollis, magno et peramano flore odoratissimo purpureo," but the latter word has been added to Cupani's descriptive name on the authority of Domenico Suard.

The next and by far the most important work is the Hortus Catholicus of Pater Franciscus Cupani, Neapoli, 1696. The name of Pater was not only a very devout Italian monk, as a perusal of his book amply testifies, but a very able and authentic botanist. Picking in his Chronological History of Plants, Boston, 1873, states that Cupani was the principal cultivator of the Sweet Pea, at Panormus, in Sicily, in 1699, but of this we shall speak later. The work is merely a catalogue of names, and the sweet pea appears simply as quoted above from Ray. No color is given, neither is anything said as to the country of its origin.

**CUPANI AND HIS WORK.**

(Since the foregoing was written, I have been able to examine the first work published by Cupani, viz., Silibus Plantarum Sicilicæ super detectarum a P. F. Franciscus Cupani, Panormi, 1687.) It is a very amply work, 12 mo., and among the plants newly discovered in Sicily by Cupani, is the Lathyrus distoplatyphyllos, etc. afterwards transferred to the Hort. Cathol. published in 1696.

As the name of Cupani naturally occupies such an important place in the early history of sweet peas, the following facts in connection with his history may be of interest to the reader: Franciscus Cupani was born in 1655 and died in 1711. He was a Sicilian, his order transferred to the Hort. Cathol. published in 1696.

\*Copyrighted 1897 by the A. T. De Mare Printing and Publishing Co., Ltd., Rhineclander Building, New York.

FIG. II.—*LATHYRUS pedunculis bifloris*, cirrhii diphyllus, foliis ovato-oblongis, leguminibus hirsutis. LINN. S. P. 732. LEUW. D. G. P. 488. odoratus glaucus.

(Reproduced from *Kniphoffii* Vol. 2, 1757-1763.)

From a sketch from the original engraving, made by Mr. G. H. Dicks (son of the writer of this article), by special permission of the authorities of the Patent Office Museum Library, London, England.

Lady, as now grown, but the standards are small and of poor substance, the wings being in each case the most prominent parts of the flower.

#### AN IMPORTANT DISCOVERY.

In the summer of 1886, while inspecting for Cooper, Taber & Co., a field of the Mrs. Sankey growing on a strong, rich loam, I discovered a plant identical in every respect with Kniphoff's illustrations. I dried the plant as carefully as possible and have had much pleasure in handing it over to the editor of *The Florist's Exchange*, and he will doubtless be very pleased to show it to any caller interested in this subject.

#### FIRST COLORED ILLUSTRATION OF THE FLOWER.

Retracing our steps to the year 1730 the first colored illustration of a sweet pea that I have been able to discover is contained in a set of very fine engravings afterwards painted by hand and entitled, "Twelve Months of Flowers," designed by Peter Castels, from the collection of Robert Farber, gardener at Kensington, and engraved by H. Fletcher. The flowers of the various months are arranged in the form of bouquets and in the June month appears the purple sweet pea. The form of the flower is very loose and straggling; the standard small and reflexed and the wings very large and awkwardly arranged (see Fig. IV.). The coloring is a uniform greyish-purple, shaded with brick red, but the latter is evidently added from artistic motives.

#### FIRST TRADE OFFER OF SWEET PEAS.

The first trade offer of sweet peas is contained in the explanatory catalogue of the aforesaid Robert Farber, but only the purple variety is quoted. This had evidently come into his possession through Dr. Uvedale, to whom it had been sent by Cupani.

In the "Universal Gardener and Botanist" published a few years later under Lathyrus, we find: "Varieties of, are, purple-flowered sweet pea, white-flowered sweet pea, variegated or

Painted Lady sweet-scented pea." The careful reader will note a slight difference in the description of the latter variety, but the point to which particular attention is here directed is that at this time three quite distinct varieties were known and cultivated in ordinary gardens in England. This naturally leads us to "The Scots Gardiners' Director," by James Justice, F. R. S., Edinburgh, 1754. At that time a great effort was made by the Dutch dealers to capture the British trade in flower seeds and their catalogues were sent broadcast through the land. Referring to these catalogues, the said Justice observes that "they are neither rightly named botanically or otherwise." He then proceeds to quote from:

"Catalogus van Schone Bloem-Zaaden te vinden by Dirk en Pierre Voorhelm Bloemisten te Haarlem.

"No. 176. *Lathyrus odorate* flore albo et rubro variegato.

"No. 177. *Lathyrus odorate* flore purpureo et rubro variegato.

"The first-named," says Justice, "is the *Lathyrus angustifolius* flore ex albo et rubro variegato odorato, mentioned by J. Bauhinus, 1659. (Any person carefully examining the appended specimen now in the hands of the editor of *The Exchange* will recognize the appropriateness of the name). This is the Painted Lady pea *vulgo*, a variety seminal of the 177, but not so sweet as smelled." Respecting 177 he says: "This is the *Lathyrus distoplatyphylus* of Hort. Cathol., the sweet-scented pea *vulgo*; of this kind of pea there is both the purple and the white-flowered."

#### THE PARENT OF THE RACE.

Before resuming our consideration of the works of later writers I may remark that the opinion of Justice that the Painted Lady is the parent of the race is shared by Mr. Eckford, who, in a complete list, with which he has kindly furnished me, styles the Painted Lady "the original variety." There seems no reasonable doubt that it was known to botanists before the Sicilian purple. One singular fact in connec-

tion with it is that while Pickering states on the authority of C. C. Sprenger, whose work, "Gehinnis der Natur," was published at Berlin in 1793, that "Linnaeus received the sweet pea from Ceylon and on this account calls it the *Lathyrus odoratus* of Ceylon," the plant is not mentioned and the name by Linnaeus in his "Flora Zeylanica," published in 1747. The absence of the plant from this important work may have caused other botanists to bring it under the notice of the illustrious Swede, for very shortly after, in his "Systema Plantarum," we find him adopting the name from the work of Burmannus, published 1737.

#### THE SWEET PEA OF SICILY.

If the sweet pea is truly of Sicilian origin it is very remarkable that no mention is made of it in that very complete work by Paolo Bocconi, "Icones Plantarum Siciliæ," published 1674.

During my visit to Naples in 1886 I brought these facts to the notice of that eminent authority, Mr. G. Sprenger. He courteously undertook to investigate the matter during his approaching trip in Sicily and has, since his return, written me as follows:

"I retain that the plant is really a native of the two most important Italian islands, Sicily and Sardinia. I have just come from Sicily, where I could see the plant in the neighborhood of Corleone, a town lying in the interior on a range of hills, and in several other wild regions round about, together with other papilionacea. The plant has all the appearance of being spontaneous form and not an imported one. The above locality has been but very rarely visited and it is apparently to be excluded that *L. od.* was brought there. It is surprising that the *Lathyrus* has been found in but a few places, but this does not mean much. From what I could deduct the plant grows in three or four places in Sicily, where it could be found in Sardinia. Our most learned men retain that the *Lathyrus* is really an indigenous kind in Sicily, because it presents all the characters of being of spontaneous growth. The flowers of our kind are purple (purplea) while those of Ceylon are rose-colored. This could be a variation due to the climate, but I was unable to find

out if the *Lathyrus* varies or if the white-flowered variety is found growing spontaneously.

The statements of Mr. Sprenger are in full accord with the quotations from Cupani's *Tablæ* set above, and until further evidence is forthcoming I am compelled to question the correctness of the position taken up by Justice and Eckford. The evidence of the authorities quoted in this article leads me to the conclusion that the purple and white varieties are of Sicilian origin, while the Painted Lady and most probably the red have their origin in Ceylon.

As no history of sweet peas would be complete without a reference to "Curtis's Botanical Magazine," 1788, I copy the following from Vol. II, p. 30. After giving the Latin descriptive name, as it appears in the *Kniphoff*, he writes: "There is scarcely a plant more generally grown than the sweet pea, and no wonder, since, with the most delicate blossoms, it unites an agreeable perfume. Several varieties of this plant are enumerated by authors, but general cultivation extends to two only; the one with blossoms perfectly white, the other white and rose-colored, commonly called the Painted Lady pea."

The sweet pea is described as a native of Sicily, the Painted Lady as an inhabitant of Ceylon. The colored plate accompanying this description is a little too red in tone for the purple, as now grown. A reproduction of it with the same fault appears in the "Ladies' Manual of Botany," published 1788. It is possible that the deep purple shade is a development, for in Ray's work, before referred to (pub. 1688) the standard is described as red, which term might be used for a reddish purple.

#### THE SWEET PEA IN FRANCE.

The early French botanists do not appear to have taken very kindly to sweet peas, for the earliest reference I have been able to discover is in a work entitled "Plantes de la France. Descriptions et Plantes d'après nature par M. Jaume Saint Hilaire, Paris, 1809." The French name is given as "Gesse odorante" and the known "varieties" are described as follows:

1. *espèce standard de couleur rose, ailes et carène blanchâtres.*

FIG. III.—*LATHYRUS pedunculis bifloris*, cirrhii diphyllus, foliis ovato-oblongis, leguminibus hirsutis. LINN. S. P. 732. LEUW. D. G. P. 488. odoratus glaucus.

(Reproduced from *Kniphoffii* Vol. 5, 1757-1763.)

From a sketch from the original engraving, made by Mr. G. H. Dicks (son of the writer of this article), by special permission of the authorities of the Patent Office Museum Library, London, England.

2e. étendard de couleur pour-rose, violet ou violet-noirâtre, ailes et carène de couleur bleu foncé, et tige de Fleuret; durant les mois de Juillet et d'Aout.  
Habitant la terre, variétés est originaire de Sicile de Célian; la 2e. se trouve en Sicile.

The accompanying colored plate shows a complete branch with two blossoms on each stem. The coloring has been done entirely in the artist's fancy, as different colored flowers appear on the same stem; while the colorings of the unpicked buds, which could they be discovered in nature, drive those enthusiasts, Eckford and Hutchins, wild with joy.

AS AN ARTICLE OF COMMERCE.

With this as a final reference to literary authorities, we may leave this branch of our subject and very briefly touch upon the seedsmen's connection with the sweet pea as an article of commerce. Reference has already been made to the offer of Robert Furber, in 1730, and also that of Dirk and Voorebinder, in 1827. Next in order is the catalogue for 1733 of John Mason at the sign of the Orange Tree in Fleet Street, London, originally (under the name of the business of Cooper, Taber & Co.), wherein I find quoted: Black, purple, scarlet, white, and Painted Lady. This list shows that some intelligent work had been done during the previous thirty-nine years, but by whom I am unable to discover. The catalogues issued by this firm did not exhibit any change for many years, but in 1837 James Carter founded his business in Holborn, and in his first catalogue quoted black, Painted Lady, painted, scarlet, white, striped, and yellow. To the foregoing Noble, Cooper and Bolton, in 1850, added new large, dark purple, and mixed, showing that two selections had been made from the parent purple variety.

Shortly after this date it became customary for the wholesale seed merchant in this vegetable to be Messrs. List Nasturtiums, Mignonette and Sweet Peas, and in 1873 Robert Cooper quoted the following varieties:

Sweet Peas, mixed, do. do. named, white, and yellow.

This style continued until 1881, when they were simply offered as sweet peas mixed and named. This is of interest, as it records a peculiarity in the treatment of sweet peas at that time. For some reason, which I never clearly understood, several of the wholesale seedsmen did not include the white variety in their mixtures, unless it was specially ordered, but in the 70's the practice was generally abandoned. The indifferent permutation of the brown-seeded class varieties has always been a source of trouble to the seedsman and this may in some measure account for the custom.

Going back as far as 1860, James Carter had offered blue-edged to which the Royal Horticultural Society gave a first-class certificate many years later. On August 22, 1883, this novelty was first named Blue Hybrid, and it was understood to have been a true hybrid between the annual white sweet pea and the perennial Lord Anson's blue. It was the outcome of a series of experiments made with the object of raising a real blue-flowered variety by Colonel Trevor Clarke, of Davenport (vide Gard. Chron., Mar. 6, 1870). The latter variety offered by Sutton & Sons, in 1880, is practically identical with this variety.

On July 11, 1855, a first-class certificate was awarded to Stephen Brown for Invincible Scarlet, which, if properly grown, is one of our very best varieties to-day, and is undoubtedly the parent of the brilliant-colored class. The seeds of this variety were sold at two pence (4 cents) each, but no word of complaint came from the purchasers for its character had been thoroughly fixed before it was placed upon the market.  
About 1868 the Crown Princess of Prussia appeared in Germany, an incident of direct and valuable as any that had been offered. Who really was the raiser of this variety I have not been able to discover. It has originally been assigned to Mr. Ernst Beane, but that gentleman writes me distinctly that he has no recollection it was offered in his catalogue for 1870.  
(Since the foregoing was written I

have learned from Messrs. Haage & Schmidt, Erfurt, that Crown Princess of Prussia was sent out by them in 1868-69. The same firm also sent out Fairy Queen in 1873-74 and in the same year offered a lilac variety which they claimed to be superior to Captain Clarke; later on this variety was omitted.

FIG. IV.—THE PURPLE SWEET PEA. (No. 33)

As it appears in the set of engravings published under the title of "Twelve Months of Flowers," by Robert Furber, Gardener at Kensington, in 1730.  
Photo engraved from a set of engravings in the possession of Harry Simpson, Esq., F.R.H.S., 99 Southwark Street, London, England.

ted from their list and Captain Clarke retains possession of the field. A very pretty and distinct variety named Bronze King is the latest introduction of this well-known firm—S. B. D.)  
In 1859 Carters offered Violet Queen, an entirely new color, but a very poor flower. Adonis was offered by the same

questionable practice of naming new varieties of this lovely flower after titled and untitled nobles came into vogue.

ADVENT OF ECKFORD.

In 1852 Eckford entered the field with Bronze Prince and the history of sweet

my unstinted praise for the foresight, patience and skill he has all along displayed. Who else will be able to maintain his position as leader in the face of the great wave of Western varieties the close of another decade will show. Of the work done by that Cupani of the Rev. W. T. Hutchins, this is not the place to write; but a passing reference may be permitted to the remarkable parallel existing between the position and work of the Eastern and Western enthusiasts. I trust that the spirit of the true botanist in Hutchins will continue to animate the work of Mr. Hutchins, so that when in the distant future some student intending to write an article on the Florist's Exchange on the "Renascence of Sweet Peas" shall discover amongst the treasured archives of a grateful country the classic works bearing his name, he will find them as pleasing, instructive and helpful as those of Cupani and his co-workers have proved to yours faithfully.

S. B. DICKS.

QUESTIONS BOX.

OPEN TO ALL. . . . . FREE TO ALL.  
Answers Solicited from Those Who Know.

(115) A Flowering Vine for Brick Wall.—If the wall is cold and dark, as the query suggests, English Ivy is the best thing to cover the wall; the leaves are always useful. For a warm wall there are many flowering vines that are both pretty and useful, such as Clerodendron Balfourii, Bougainvillea glabra or B. g. Sandieriana, Stephanotis floribunda, several tecomias, aristolochias and solanums also suggest themselves.

(116) Plants for Shaded Bench.—If the bench is so shaded and cold it is difficult to suggest anything. Fannies, stevia, eupatorium, alyssum, and geranium may do well and at the same time be fairly profitable.

(117) White Greases Destroying American Beauty Plants.—The remedy is to search the soil and destroy the grubs. They are found by scratching the soil slightly with the back of a trowel.

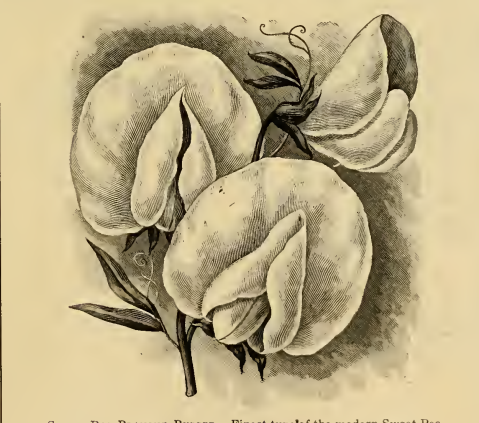

(118) Freesia and Allium Neapolitanum.—What is the proper treatment for freesia? When should they be put in the soil? Should they be treated in any way? Should Allium neapolitanum be treated the same way? What is the best temperature for same?—S. B. Dicks.

—A few freesia bulbs are already to hand from Bermuda. These are being set out at once. Freesia can be grown either in flats and pots or they may be planted out in the benches. The best results are obtained from the latter method when it is possible to spare the room. After potting in the ordinary way they should be stored in a cold frame and shaded. When the roots are working properly and head growth begins take the plants indoors in the early fall and grow on in a moderate or greenhouse temperature.

Alliums may be treated much in the same way.

(119) Plant Lice on Maples.—We send you to-day package containing some insects which were taken from a maple tree and are strangers around here. I would like to know their name and whether they are destructive to trees other than maples?—W. McBRIDE, JR., Walden, N. Y.

—The insects covered with a cottony secretion and found on the leaves of maple are a species of plant louse known as Pemphigus acerifolii. It is such a rare insect that it has never been supplied with a common name. It should not be called "the maple louse" as there are several other species of plant lice that occur on the maple. I think this is the first time that this species has been recorded for this State. The species was described by Dr. Riley, while he was State Entomologist of Missouri. Specimens have also been taken in New Jersey. Like all species of plant lice it will prove injurious wherever and whenever it occurs in large numbers. This species is known to occur on any other kinds of trees or shrubs, but it is known that most of the species of the genus Pemphigus are known to occur any other time of the year to some annual plants. What these plants are is known in only a few cases.  
F. A. S.

SWEET PEA BLANCHE BURKE.—Finest type of the modern Sweet Pea.

firm in 1882, but this was displaced in 1883 by the New Carlisle Rose of Muskett & Sons, afterwards renamed Princess Beatrice, and, to this day, one of the most popular and beautiful of the rose section. From this time onwards the purely descriptive names appear to have been discontinued and the

## EXCLUSIVELY A TRADE PAPER.

Entered as Second Class Matter, July 16, 1879, at New York, N. Y., under Post Office No. 254, Post Office of Second Class Matter.

Published Every Saturday by

A. T. DE LA MARE PTD. AND PUB. CO. LTD.,

2, 4, 6, 8 Duane St., New York.

P. O. B. 1637. Telephone 2164 Cortlandt

REGISTERED CABLE ADDRESS  
(Commercial Cable) Florist, New York.

### SUBSCRIPTIONS:

\$1.00 per year to United States, Canada and Mexico. \$2.00 per year to foreign countries in postal union. Payable in advance. New subscribers will commence with the first number after receipt unless otherwise specified. Back numbers can be supplied when wanted. The rate on address label goes when the subscription expires and in the subscriber's receipt. No other receipt is sent.

### ADVERTISEMENTS:

Copy must reach this office not later than 10 o'clock in order to secure insertion in issue of the following Saturday.  
Rate, \$1.00 per inch. Special positions extra. Discount on contracts of one month or longer.  
Orders from unknown parties must be accompanied by cash or satisfactory references.

## Exclusively a Trade Paper.

THE FLORISTS' EXCHANGE is published in the interests of those commercially identified with the Florist, Seed and Nursery business. New subscribers are requested to enclose business card or other proof of their connection with these trades.

### Subscribers

Should give notice to the publishers at the end of their time if they do not wish to continue taking paper, otherwise it is continued and payment expected.

## For the Busy Man.

Johnann Lambert, the German rose grower, is dead.

Flour by Mitchell Ash is the name of a new insecticide manufactured in Baltimore.

An article on the Bermuda Lily Disease appears on page 686.

Mr. Vasey contributes another interesting communication on Fire Insurance this week; see page 687.

Excuse hot weather prevailed throughout the entire country last week. Our florist was prostrated by the heat.

Some intending to enter into the bowling and shooting contests at the Providence convention next month are requested to notify Wm. H. Sells, chairman of the Executive Committee, Exchange Place, Providence.

## Bisulphide of Carbon.

In publishing the government report on the use of bisulphide of carbon for the destruction of weevils and other insects that weaken the vitality of seeds, we have done so with a view to simply wishing the department to state clearly its case and show plainly the benefit, if any, that may be derived to those who handle seeds—the producer, dealer or consumer.

Upon careful perusal of the report we find it far short of what it should be. It shows by the use of bisulphide of carbon an average of 10 per cent when there should be a positive gain; not that seed which tests 100 per cent, but before treatment, and is made to test more than that, which is an impossibility so long as we look at the report in detail. It says:

"Our experiments were made with thirty-two different varieties of grains and vegetables, five of cotton, two of peas, three of Indian corn, two of rice, two of common garden beans, two of Kaffir corn, two of barley, two of wheat, one of oats, etc. In all the experiments only one variety was shown to be, so far as possible, from a single stock in each case. Two lots of treated seeds and two of untreated seeds of the larger species and 100 of the smaller kinds were used. Similar lots of untreated seeds were also used." It then goes on to give the results, which, when taken as a whole, do not show a greater difference than is often in fact most generally shown when two or more tests are made from the same sample either for vitality or for the value of the strain. We infer from the report that both tests were made from the same common garden beans, two after the treatment. This report is misleading, as it does not show the slightest benefit derived or that can be derived from the use of bisulphide of carbon.

Now what does a practical test prove and how is it made? The growers and dealers in peas and beans (and the same is true with many other seeds) know that there is an egg deposited in the seed when the pod is very tender; and that the weevil in due time, and that the weevil destroys the seed's vitality by feeding upon it, and that the weevil dies by feeding upon the seed itself. Now, it naturally follows that the vitality of the bisulphide of carbon lies in its power of destroying the egg before it reaches the larval state. To that end it is used in the form of an application as soon as the crops are taken in store, and they have found that seeds treated in this way will stand as high as though the eggs had never been deposited, or the weevil had never been sown, while the seeds not treated have been so badly eaten as to become useless. This is the practical way of testing the merits of the bisulphide of carbon.

If the Department of Agriculture wishes to do this, it should state the value to the country let it imitate the seedmen's example—take samples from the various sources of supply and treat a given number of seeds, and set aside the same number for trial at some future time. The results will show the value of the treatment will become apparent. Planting time is when all seeds should be sown, and the weevil is not as the active principle of growth is then stronger than at any other time. We do not wish to minimize the work of department or underrate its usefulness, but sincerely hope it will show us a better way to fight the insect enemies than we have yet tried.

If the Department of Agriculture wishes to do this, it should state the value to the country let it imitate the seedmen's example—take samples from the various sources of supply and treat a given number of seeds, and set aside the same number for trial at some future time. ## A Leader and a Meeting Place for '98.

There are two factors connected with the well-being of the Society of American Florists, and these are the various conventions have ever taken a lively interest, but without previous notice by the majority. These are the election of a president and officer and the selection of a place of meeting. While a high regard for the important feature, however, we incline to believe, materially heighten the interest in the subject, and thus draw a larger gathering, as the friends of the opposing parties would surely be present to do better than to be absent.

Hitherto it has not been customary to parade publicly through the horri-

cal press or otherwise the names of those parties who are the choice of certain members of the Society for the presidency or other office; but the present year a breach of this unwritten law has been committed. The name presented the name of a gentleman who, it is said, would prove a very acceptable choice.

It is not our purpose at this time to discuss the merits of the gentleman in question, or to say whether or not he is a member of the S. A. F. What we desire to do is to call attention to the fact that the law is one that we wish whom the members would like to precede over them, as well as to fill the various offices of the Society. With a choice of a meeting place for another year, is necessary; more particularly having regard to the more exacting nomination and election demanded by the altered by-laws. This is all the more needful when we remember that the uncalculated and unseemly wrangle connected with the nomination of officers at the Cleveland convention last year. To prevent a recurrence of that the present time is none too early for the members to do their thinking cases and select their favorites—those whose election they consider would make for the welfare of the society—so as to be ready at the Cleveland meeting, and in the proper place. Every member of the S. A. F. should be given the right and privilege to name candidates on the informal ballot, and every member should exercise it to the full.

Two cities are making bids as the next meeting place, Milwaukee and Cleveland. Both of these places offer as inducements the fact that an exposition is to be held within their walls at the year period of the assembling of the society.

Setting aside any selfish motive which may prompt such exhibitions may have in extending an invitation to the society to hold its meeting in the cities named. Both of these places offer to decide upon a meeting place where the best interests of the society will be promoted. Both of these places offer to decide upon a meeting place where the best interests of the society will be promoted.

where its presence would exert the greatest influence and create the most favorable impression upon the membership, and the claims that certain sections of the country have upon the S. A. F. are not to be overlooked, where its presence would exert the greatest influence and create the most favorable impression upon the membership, and the claims that certain sections of the country have upon the S. A. F. are not to be overlooked.

At all events, the time is now at hand for considering these matters by intending delegates, who are to prevent haphazard selections both of men and cities.

## New York.

Wholesale Market. Business for the week has been light. Some of the goods have been considerably interfered with by the storms which prevailed; since then the supply has been better. The market has been few inquiries for high-class roses, an article which is now very scarce. The hot spell, which has prevailed since the 15th, has had the sweet peas almost out of existence; but this loss will be more than made up by the quantity of winter article quite plentiful this week.

The supply of lilies has lightened, and as the S. C. and C. are now in season, with S. C. and C. as taking figures.

Valley has been most plentiful for the drawing of some of the varieties, which prevailed—82 is the top notch.

Bound for Europe. Thom Young, Jr., sailed for England on the S. S. Euraria, Saturday, July 10. George Young sailed on the S. S. Campania, Sunday, July 11.

S. Kellor, of the firm of Reed & Kellor, who works, sails for Hamburg on July 11. He will visit the International Exposition at the above city, where his firm has an exhibit of its specialties and wire designs.

A Narrow Escape. Considerable anxiety was felt in the week, owing to the absence of James Hammond, of P. O. No. 1, near the Long Island Sound on his boat out.

On Tuesday morning, following the severe gale, a rumor got about that the boat was blown down. The rumor was a very terrible sea, wind and rain, Mr. Hammond and his little boy and a party of three gentlemen were on board. The boat was blown down, and when supposed to be lost were safely anchored at New Rochelle.

A Pleasant Fire. Mr. Siebrecht, Sr., had considerable excitement on Sunday evening last. Just as he was about to leave New Rochelle for his home in the city, a fire broke out in the sexton, in extinguishing the lights, caused the center hanging lamp to fall with what it contained upon the floor.

Mr. Siebrecht was first on the spot and attempted to extinguish the flames with his hands. He was very successful, but in the meantime some light work in the ceiling had caught fire. This he also extinguished. It was then discovered that there was fire away up in the cupola, and after that the church was doomed. Mr. Siebrecht was assisted however, being exhausted from his effort. He had his eyebrows and other parts of his face much singed, and by falling in the drenched church his knee cap was badly hurt. How well he is getting on, we do not know, which was the second oldest M. E. church in New York State and the third oldest in the United States, was entirely destroyed.

Death of G. Hallman. G. Hallman, aged 407 Third Ave., died Tuesday night at the Manhattan Beach Hotel from kidney trouble. The deceased was a well-known florist, and was highly and greatly respected. He was for seven years chief driver for Klinder, afterwards for the New York and New Jersey, and established himself as a retail florist on Third Ave., between 35th and 36th streets, where he had built up a good business, for nine years he had been engaged during the summer season as head checker at the hotel through the annual seasons of the year, and leaves a widow and three little girls, the oldest being 7 years. Solom Highmore, of 30th Street, was the funeral director, 28th street, Friday, at 10 A. M., and the interment took place later in his wife's parlors at 30th Street.

There was a very large gathering of friends, also of members of the "Bright" columns and the "Lily" columns at the funeral.

Much interest is being exhibited in the forthcoming convention at Providence, and it is expected to be held in September.

C. S. Ford, Jr., Philadelphia, was a visitor this week; he is on his eastern trip. His wife, G. of Simcoe, Ont., was also in town.

At the annual meeting of the New York Cut Flower Co., July 4, all the incumbents of the office will resign in September.

Miller & Long, 386 Columbus Avenue, have closed their store for the summer, and will reopen in September.

Samuel Henshaw, head gardener botanical gardens, Bronx Park, has returned from Europe after an extended tour through the principal gardens there.

A Business Embarrassment. Winifred and Joseph Rolker, doing business under the style of August Rolker & Sons, are the principal importers of bulbs and florist supplies at Nos. 126 and 128 West Twenty-fourth Street, New York.

Joseph Rolker, who died in 1871, was established in 1835 by his father, August Rolker, who died in 1871. Winifred was born in 1838, and died in 1886. In March, 1884, Herman, who was a partner for many years, with Winifred, died, and August Rolker, Jr., now deceased, also withdrew. The firm heretofore did a large business and was one of the oldest and most successful where most of their supplies came from. The liabilities are \$17,000; nominal assets, \$19,000; actual assets, \$19,000.

The firm of August Rolker & Sons is the oldest and most successful of the bulb and florist supply line in America. The had business of recent times, compared with the business of the late August Rolker, who died in 1871, and the subsequent thereon, and the poor collections, were the cause of the assignment. The business was sold to the creditors, who are mostly, if not exclusively, foreign houses; but it is extraordinary in its character, and something in regard to its future action shortly.

Be sure that those of our readers who have had dealings with the Rolkers will join with us in the wish that they may be able to make some arrangement may be of temporary duration.

**The Manuring of Orchids.**

Some interesting experiments, says the *Gardener's Chronicle*, have recently been made with a view to determining the gradual degeneration that takes place in some cactuses. For this purpose a number of cactuses were cultivated at the time of importation, and after some years when degeneration had set in they were set to rest. It was noted also that the production of flowers is an exhaustive process and that the plants are unable to recover if the loss of the cactuses at the time of importation, and after some years when degeneration had set in they were set to rest. It was noted also that the production of flowers is an exhaustive process and that the plants are unable to recover if the loss of the cactuses at the time of importation, and after some years when degeneration had set in they were set to rest.

"The result of these experiments shows that cactuses, when degenerate, contain less dry matter, organic substances, nitrates and ash. Among these elements, diminution is evident in the amount of potash, lime, magnesia and phosphoric acid—that is to say, in the principal fertilizing elements. The cactuses were grown in a soil almost destitute of fertilizing matter, and their weakness is attributable to the production of flowers for which they were cultivated. To verify this the experimenters proceeded to analyze the flowers and discovered what amount of loss of fertilizing elements these plants sustained as a consequence of flowering. It was said that the main matter of the flowers contains a considerable quantity of nitrogen, and that the cactus is particularly rich in potash, lime, magnesia and phosphoric acid. The dwindling of cactuses in respect to these elements, therefore, as explained very clearly in this way, the results plainly showing that degeneration is due to the exhaustion of the plants to the exhaustion caused by the production of flowers.

From the standpoint of practical horticulture we may conclude from this investigation that cactuses should receive, to counteract the degeneration, a mixture of suitable manures, containing nitrogen, phosphoric acid, potash, lime and magnesia.

The following information on the same subject, furnished to the *Orchid Compter* by the Royal Horticultural Society by Mr. A. H. Smee, is very interesting. Mr. Smee experimented with an old and a new variety of *Cattleya Trianae*. He says:

"I fed this plant once a week, during the growing season, with one or two ounces of water, which contained nitrate of potash, nitrate of ammonia, phosphate of potash, carbonate of magnesia, of the strength of half an ounce of nitrate of potash and half an ounce of nitrate of ammonia, with a small quantity of the other salts, with the result that the plant made stronger and more and produced a greater number of flowers, which were brighter in color. In 1885 I tried a larger number of plants and I was so satisfied with the result that in 1886 I added nitrate of potash and nitrate of ammonia each, during the summer to the rain water tanks of the cactusa house. The total quantity used during the summer was one pound and one ounce of ammonia and one pound of the nitrate of potash. This worked out at the rate of one grain per gallon of rain water. The flowers of the cactusa this year were larger, brighter and had more substance than at previous years.

"This year I intend to increase the amount to five grains per gallon during the summer, so that to say from May to September. I also propose to treat some of the plants with small quantities of phosphate of ammonia and carbonate of magnesia, in addition to the nitrate of ammonia and potash. I expect that I shall be able to make a favorable report on a future occasion on the results of these experiments. I am sure that further observations will prove that the assimilation of phosphates by plants sets free the phosphoric acid contained with the nitro-hydro-carbons of the tissues with tend to promote inflorescence, and will probably increase the germinating power of the seed of epiphyllal orchids."

provisions. An attempt was once made to have a walk laid out by a distinguished lawyer, who walked up the pathway, as it entered grounds, but this plan was not strong enough to stand the combined force of the winds that blow in that locality, assisted, as they were, by that of public opinion, which stood for the traditions of the fathers. There are times when almost everybody goes a-fishing. And so, by common consent, the villa owners laid out this walk in front of their "cottages" and dedicated it to the public, making it equal to any within the grounds, and trusting to the courteous instincts of humanity, that given such a path the visitors would keep off the grass and leave the plants and flowers unharmed.

In entering upon this walk it is well to begin at the bathing beach and proceed southward. In going so one first passes the Chanler estate, the early home of the husband of Amelia Rives Chanler, the novelist, who, of course, is not now a Newport resident. Then comes the New Cliffs Hotel, the only one in the city that is in sight of the ocean. In crossing Narragansett Avenue, which terminates at the "forty steps" and heading down the cliff to the sea, no one will need advice to pause and for a few moments study the situation. The rocks here make a favorite resort for the hook and line fishermen, though it is not safe to presume too much on the rocks being a favorite resort, as more than one man has been washed off at this point and drowned. From the beach above the outlook is magnificent. As Newport is situated on a neck of land extending southward, the visitor is already beyond the average line separating the land from the water, and so the view sweep takes a long coast line with its curves and clearly-defined points jutting out into the sea even to Gay Head, on Martha's Vineyard. And as the walk continues these are shown more and more clearly, making up a marine view of surpassing interest.

On leaving the "forty steps" the visitor passes at once into the grounds of some of the finest estates in the city. The first is that of Mr. Robert Goelet, of New York, where is to be found some of the best of Newport. During the past winter the walk has been cut down or depressed at this point, so that the visitor can see the sea, but as the estate is nearly square, with a street on each side, and the wall is low, the view is open to inspection. Here are to be seen shrubs and herbaceous perennials, mostly planted in the past few years, arranged by our best landscape architects. For instance, there are hundreds of *Retinospora plumosa* aurea, closely planted and sheared so as to present an unbroken surface, with perhaps a border of darker shade of foliage. The same is true of some of the varieties of the popular Japan maples, the golden junipers and many of the more common sorts. It was here the *Rosa rugosa* was first introduced and popularized in Newport, and there are hundreds of them still in use, as well as everywhere else on similar estates. One of their especial uses is as a windbreak, some of these hedges being on the very brow of the cliff, and not only holding their own but doing good service in protecting less hardy specimens behind them. A few years ago, after one of the most terrific autumnal storms I have ever known, when trees were uprooted and gardens made desolate, I went around the entire shore from Hallowell plain to the bathing beach, a distance of from six to eight miles, to study and take notes of the effect of the storm. A sufficient time having elapsed to show clearly what had occurred in this direction. The *Rosa rugosa*, though whipped and twisted out of shape and all proper proportions, everywhere was in the best condition of anything on the line. I followed up the inquiry and found that in nearly, if not quite, every instance these plants recuperated and grew the next season with their customary vigor. They should be cut in very sharply every autumn, as otherwise they become coarse and uncomely in appearance. In some instances they are cut back to three twelve to eighteen inches every year, and with the best results. The illustration shows a bed of these roses growing in a very sheltered spot, the most exposed point on all the Newport grounds, indicates how compactly the plants are packed and used as a hedge plant, for which it is in every way fitted.

One or two experiments in this direction have been tried here which proved unsatisfactory through failure to use the pruning shears vigorously in the fall or early spring before the growth had started. A *Rosa rugosa* hedge, well

in America, if not in the world. Here Mr. Cornelius Vanderbilt has his more than thirteen acres of lawn and garden spread out, including horticultural treasures gathered from all parts of the globe.

and kept as closely and carefully shaven as any in the city.

This famous Cliff Walk proper terminates at what is known as Bailey's Beach, the popular resort for bathing on the part of the summer people now

The Cliff Walk, Newport, R. I.

grown and well kept, is a thing of beauty all the summer and impenetrable to man or beast. And yet I have never seen but one good one and that was not in Newport.

Separated only by a very narrow street, which extends from Bellevue Avenue to the shores, is the millionaire villa of Mr. Ogden Golet, which is a veritable castle by the sea, a massive pile of stone and a wealth of horticultural treasures worthy of the situation. Then comes "Vineland," the name given it by its founder, Miss Catherine Wolfe, which, since that

it is not within the possibilities of an article like this to even name the villas or their owners along the line of this pathway. The course extends through the estates of such parties as J. H. Drexel, August Belmont, William C. Whitney, Jr., Mrs. William Astor, W. K. Vanderbilt, William Waldorf Astor, Dr. C. M. Bell, Ogden Mills, F. W. Vanderbilt, H. M. Brooks and many others, which would be worthy a visit either as a pleasure or a study.

The illustration shows the walk at a point across the villa grounds of Dr. C. M. Bell, of New York, where for a little

that the old and in itself better bathing place, but for the presence of the many who now go there as excursionists and townspeople. This beach is held as private property and is fitted up for the especial use of the owners, though the beach itself cannot be sequestered from the use of the general public. The villa beyond the bathing place, known as "The Rocks," is the summer home of Mr. Henry Clews, and is rightly named, as there are several acres of the solid and bare stone spread out between his house and the ocean. Here is the wonderful "spouting rock."

Hedge of *Rosa rugosa*, used as a Windbreak on Estate of Mr. Robert Goelet, Newport, R. I.

lady's death, was the property of Mr. Louis L. Lorillard, and was sold by him a year or so ago to Mr. H. McK. Twombly, the present proprietor. We have no sooner passed it than we enter "The Breakers," the largest by far and the most costly summer home

used the natural conditions permitted the passage at the base rather than on top of the cliff. The steep embankment rises some thirty or forty feet, and as seen, at a sharp decline, but the lawn in front of the mansion on its brow is extended down the declivity

with its cavern, into which at certain winds and tides the waves rush with such fury as to be forced out through an opening farther back in a column from twenty to fifty feet in the air—certainly a great natural curiosity.

L. D. DAVIS.

## Cypress

## Greenhouse Material

We are the pioneers in Clear Cypress Greenhouse Material. We discovered that Cypress is better than any other wood for greenhouses from top of posts up and we introduced it, and fought for it against many prejudices, and finally succeeded in bringing it into general use.

Others have attempted to follow where we lead, others are trying to reap what we sowed, but we have the experience and are recognized as experts in greenhouse construction.

## WHAT I KNOW

. . . of the . . .

Ormsby  
Ventilating System

BRIDGEPORT, CONN., June 16, 1897.

Mr. Ormsby,

DEAR SIR:—To express my appreciation of your ventilating system would be to say "If I had twenty more greenhouses to build besides the three I have already finished I would have them all ventilated with your system, even if a number of those in the market would put theirs in for nothing." Having had three years' experience with it, and now having 2000 feet of your ventilating apparatus, which we consider the lightest, quietest, and the best in the market, we feel in recommending it to every one that they will not be running any risk in buying it, and they will find in using it that it will prove in every respect satisfactory.

Yours respectfully,

JAMES E. BEACH.

For particulars address,

E. A. ORMSBY, Melrose, Mass.

## OBITUARY.

Johann Lambert.

Johann Lambert, partner of Lambert & Reiter and Lambert & Sons, of Trier, Germany, died on the 25 at a long illness, in the 67th year of his age. His firm is one of the largest and best known in Germany. Besides growing trees and shrubs, they raised large stock of roses. Among the latter they were the originators of Kaiserin Augusta Victoria.

James S. Reid.

James S. Reid, late foreman for Julius Wolf, Jr., whose death was reported last week, was born in Aberdeen, Scotland, in 1853. After serving his apprenticeship in his own country he went to England and spent several years on prominent places. He came to this country about 1887 and spent two years around Boston. He returned to Europe during the late Paris Exposition, having secured employment in the Horticultural Department there, and while there received a silver medal for artistic work in the exposition grounds. He returned to this country in 1892 and was employed by Julius Wolf, Jr., which position he held at the time of his death. He was an excellent plantsman and well liked by his employer.

On Sunday, July 4, deceased went for a bicycler ride to Valley Forge, Pa., along with the Diamond Wheelmen of this city. Arriving there a party went in bathing in the Schuylkill river. Mr. Reid being one of the party. For some time he had been affected with a weak heart, and being attacked while in the river he sank and was drowned before help could reach him. He has left a widow and two small children. He was a member of the Order of Rose Men and also of the Odd Fellows. These two orders have taken charge of his affairs and are now making arrangements to send the widow and children back to Scotland.

LID RUST.

## Chicago.

Market News. Another week of intensely hot weather brought roses to the lowest ebb possible. But for Kaiserin and Meteor matters would be even worse than they are. The best of these roses, too, would be little better than scrubbs at any other season of the year. "Parties fortunate enough to have these varieties in anything like fair condition commanded \$3 to \$4 per 100, while the balance had to go at very low figures—50 cents to \$2.

Carnations, especially the pink ones, are of fair quality, but 50 cents to 75 cents is about as high as the price of the blooms would go.

Sweet peas have been a drug at 15 cents to 20 cents, while the rose-gone as low as 6 cents to clear out.

We saw a wagon load of Kiehm's promise delivered from the cold storage room. From 180 to 200 dozen remain, so that the end is nearing. It is astonishing how well the flowers open after their thirty days of cold storage treatment. The price is \$2 to \$3 per 100; and with roses so poor the carnations may be said to have been a cinch for the

firm that caught on to this method of preservation.

The hot weather has affected all classes of outdoor flowers. On the afternoon of the 9th another glorious rain fell and at this writing the condition of the American gardeners livable on earth once more. A few days with prevailing weather conditions will improve the present quality downward.

There is not much trade outside of funeral work, but those who want a few extra dollars, may, perhaps, be able to obtain them. Beauty, particularly, is scarce, the best bringing about \$1 per dozen.

## Horticultural Society.

The stated meeting of this society was held on the 10th, the principal feature being a paper read by O. C. Simonds on "The Ideal Park Superintendent." Mr. Simonds is the well-known superintendent of Graceland Cemetery, but also does a good deal of landscape work around this city. All well-wishers of our park system can only pray that such persons as outlined by him should be selected and then left to carry out their own ideas without interference through the agency of political pigs, the bane of most municipal work nowadays.

## Club Notes.

The Florists' Club has been invited to give a party at Graceland at Arlington Heights, on the 18th inst., and no doubt a large crowd will accept the invitation. The guests, however, and sons, are noted for their hospitality.

Mr. Lang, of Harms & Lang, left this week for a two-weeks' outing to Manitowoc. EDGAR SANDERS.

## Toronto.

## Hot Weather Kills Business.

The weather here has been for the past nine or ten days so very hot that it has nearly killed what business there was. Excepting a little funeral work there is but little doing. The heat has made roses and carnations generally poor. Sweet peas and other summer flowers are also scarce. The North League Convention is to be held in the city this week and there will be some thousands of visitors here, so perhaps they will use up a little of the surplus stock.

## A Cricket Match.

A number of the boys met at the exhibition grounds last Wednesday for a game of cricket, and a very enjoyable time was had. After playing for nearly three hours the game was adjourned. The Park Commissioner, entertained the players in good style. It has been decided to ask Harry Dale and his boys down from Brampton for a day's amusement early next month.

## Meeting of Horticultural Society.

The July meeting of the Horticultural Society was held on Tuesday, the 6th inst., and in spite of the heat it was well attended. The subject for discussion. The meeting was an open one and many of the public were present. Mr. Dunlop, the president, read a short paper by J. H. Dunlop on the cultivation of tea roses in greenhouses. He also read a very interesting talk on hardy roses and climbers. He mentioned many varieties of roses as among the best for our country that had been in cultivation for over fifty years. While he highly praised many of the newer kinds, he said that some of these old ones had proved so good and so hardy that we could hardly do without them. It was certainly information to many of us that so many of our favorites had been in cultivation for so long. The visitors were quite interested in the talk and many questions were asked before Mr. Chambers was allowed to take his seat.

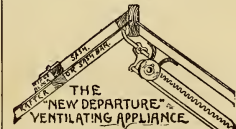

Some good seedling geraniums were on display from Messrs. Hay and Gallardias and delphiniums from Mr. Frost and Manton Bros. The next meeting will be on the 13th inst. and will be devoted mostly to the subject of sweet peas. If the weather be favorable there will be quite a show of them. Mr. Utley is an enthusiast in their culture and there are several other good growers among the members.

The members of the Gardeners and Florists' Association go to Niagara Falls on the 10th inst. for their annual picnic. THOS. MANTON.

IN THE PRESS. PRICE, \$1.00.

THIS volume, which has been prepared by the foremost aquaticulturist of the country, and to  
whose efforts the present growing popularity of the Water Garden is largely due, is designed  
to serve as a SOUND, PRACTICAL CULTURAL HANDBOOK for amateur and professional alike.  
The book will be freely illustrated with plates and illustrations in the text, and will  
describe all operations, from the growing of plants in tubs to construction of the large pond,  
planting, seed saving, propagation, wintering, and all other necessary details of cultivation.

ORDERS RECEIVED NOW.

# THE FLORISTS' EXCHANGE

We are a straight shoot and aim to grow into a vigorous

A WEEKLY MEDIUM OF INTERCHANGE FOR FLORISTS, NURSERYMEN, SEEDSMEN AND THE TRADE IN GENERAL.

VOL. IX, NO. 30.

NEW YORK, JULY 24, 1897

One Dollar Per Year.

## ..PALMS..

Owing to our stock being grown with plenty of air the plants are all strong and sturdy, and will bear transportation for long distances. Florists intending to purchase this class of stock for their fall trade will do well to place their orders immediately, so that they can have them shipped by freight, thus avoiding the excessive express charges which they would have to pay if shipped during the cold weather. The prices will also be very much higher in the fall than at the present time, owing to the high duty which will then be in force.

- ARECA LUTESCENS.**

## Sweet Pea Novelties of 1897.

The science and art of the culture and nomenclature of the sweet pea has become a well-established profession, and the many men of well-equipped faculties make a study of this popular flower, to which, however, and others in the extent of its culture, and the results of it has upon the affections of the world.

It is customary for the homes making a specialty of the flower to have on hand a half-dozen or so of novelties, so called, to the public, many of which have no real merit, some are merely changes of coloring on the old, and nearly forgotten varieties. It is the province of the sweet pea writer to test these new novelties, and give their points, good or bad, to those who depend upon them for expertness.

I give below my tests of some of the novelties of this year, as well as representative work of the specialists.

**EKKFORD'S 1897 SET.** (Eng. introduction.)

**QUEEN VICTORIA.**—This is decidedly the best of the set. It is a fine set, and is "soft yellow, subtly overlaid with faint purple," but no American specialist, so far as I know, has ever mentioned it. My "Chromometer" shows it to be a light lemon self. My test of it shows it to be a Form, hooded; size, medium; color, light lemon self; substance, fair; stem, long and slender. It has a good habit, and is the edge of the standard, which, nevertheless, apparently, from its size, it is the nearest approach that I have seen to which all standard strains strive—a real yellow sweet pea.

**THOMAS EDWARD DE VANK.**—There is nothing particularly unusual about this sweet pea, and it is surprising that Eckford should have introduced it. It proves to be a fine set. Eckford describes it as "soft yellow, subtly overlaid with faint purple," but no American specialist, so far as I know, has ever mentioned it. My "Chromometer" shows it to be a light lemon self. My test of it shows it to be a Form, hooded; size, medium; color, light lemon self; substance, fair; stem, long and slender. It has a good habit, and is the edge of the standard, which, nevertheless, apparently, from its size, it is the nearest approach that I have seen to which all standard strains strive—a real yellow sweet pea.

**LADY NINA BALFOUR.**—This sweet pea has had the poorest average of germination of any Eckford ever introduced. I have had only forty per cent, and yet neither of them is likely to bloom. Others report the same difficulty.

**PRINCE OF SALOPIN.**—This is a good sweet pea, and a new shade. Eckford describes it "as a glowing orange, suffused with purple," but I find it to be a good set. It is very attractive, and will be welcomed as an acquisition. It tests: Form, expanded; size, large; color, standard shrimp, veined salmon with salmon-pink. It has the real soft finish, substance good; stem, long and slender.

**THURMIN.**—This has the most perfect form of any of the set. It is a giant, and without a flaw as to anything but coloring, which contains nothing new except as to arrangement. This will be a good flower to cross on, as the size and color are already there. It tests: Form, expanded; perfect type; size, giant; color, dark purple, suffused with blue; stem, long and slender. It has a good habit, and is the edge of the standard, which, nevertheless, apparently, from its size, it is the nearest approach that I have seen to which all standard strains strive—a real yellow sweet pea.

**SALOPIN.**—From the advance description, we were led to believe that this would be the greatest acquisition to the list of the past year, and we were never so badly disappointed. It throws over 50 per cent. of the obsolete *Butterfly* type, and I find it to be a good set. The color is not at all what Eckford described. One of the most desired colors of the set (a deep crimson, and we were assured we had it in Salopina). It tests: Form, hooded; size, medium; deep crimson, tinged with millberry-red; suffused with rich orange-scarlet. Now, none of these are to be found in the set. It is an expanded; size, giant; color, dark cherry self; substance, good; stem, short and stout. The writer has been about Salopina, and it is generally come back to a stem, and the first to open thence before the other buds are ready to open. It may be the third is out. It is a hard matter to get a perfect spray.

**SALOPIN.**—This has the same perfection of form as the other, but the large expanded form, being hooded. It tests: Form, hooded; size, medium; color, dark purple, suffused with blue; stem, long and slender. It has a good habit, and is the edge of the standard, which, nevertheless, apparently, from its size, it is the nearest approach that I have seen to which all standard strains strive—a real yellow sweet pea.

Taken all in all, the above set is a disappointment as not being up to Eckford's standard.

**EKKFORD'S 1897 SET.** (American Trade.)

This is one of the finest Eckford ever introduced.

**COQUETTE.**—This is the same objection as to form as *Shiloh*, but comes a larger percent. True. It has a shade of true yellow in it, which, if it could be "soiled," would be what we all desire. It tests: Form, expanded, with rolled edge; size, large; color, light yellow, suffused pinkish purple; substance, fine; stem, long and stout; flowers all face one way.

**LAVELY.**—Is just what it is name indicates, a most lovely flower, its only fault being its liability to bleach whiter, if not promptly cut. None of the pinks has come so beautiful appearance on the vine. It tests: Form, finest hooded; size, giant; color, medium pink center, with wide margin of light pink; substance, fine; stem, very long.

**MARE.**—There seems to be a diversity of opinion in regard to this sweet pea. Of its form Eckford says, "a fine large, fully-expanded bold flower of the most beautiful form." Hutchins says of its form, "full size and hooded shape." I

remember the 1897 set.

While all sweet pea lovers will ever revere the name of Henry Eckford, as the pioneer in its advancement, yet justice compels one to say that the American hybridizers have caught up with, and passed him in the art of producing new and beautiful sweet peas. Of course they adopted his methods, but with the usual Yankee ingenuity they have improved upon them. Sweet peas equal to the first two named below were never put out by Eckford.

**ARROSA.**—This is the most beautiful sweet pea of the year, and a new shade. We have had many so-called medium shades in sweet peas, but *Arrosa* is the first one that has the true shade. It is of the highest grandiflora type, and is destined to have a permanent place on the list; no variety bunches as well as *Arrosa*. It tests: Form, finest expanded; size, giant; color, dark salmon, striped on white; substance, fine; stem, long and stout.

**AMERICAN SEEDLINGS.**—This is the most remarkable strain of sweet pea ever produced, both from the manner of their production and being all the results of hybridizing, and not the selection of the "sports." These seedlings run the gamut

der of the expanded form, in form presenting contrast to others of the same shade, all of which are hooded. It tests: Form, expanded; size, large; color, as above; substance, fine; stem, long and stout.

**GOLDEN GATE.**—This is noted for the peculiar shape of its wings as well as its finely coloring. The wings, when fully stand parallel, like gate-posts, suggesting the name. It is very floriferous. It tests: Form, zigzag; size, large; color, standard light cherry violet; wings, juncos; substance, good; stem, long and slender.

**Maid of Honor.**—This is a selection and improvement on the old *Batterfly*, the form of which is now considered obsolete. It comes very true to type, and will be one of the best *Batterfly* sweet peas for cut blossoms. It tests: Form, expanded; size, large; color, white ground, edged English violet, suffused rose violet; substance, good; stem, long and slender.

**UNNAMED CALIFORNIA SEEDLING.**—This is a most striking sweet pea, being the darkest of the so-called "mauve" color. It looks very much as though the originator was working for a self of this shade. The introducers offer a prize for the most appropriate name for it. It tests: Form, hooded; size, medium; co-

Plant of Pink Cupid Sweet Pea in 10-inch pot. Grown in California.

have found it to be hooded, with about 75 per cent. of the obsolete *Butterfly* form. Of its color there is equal diversity of opinion. Eckford says "bright, very crimson, depending with age." Hutchins says "intense crimson-scarlet." As there are no crimson or scarlet sweet peas I have seen, I am inclined to believe the *Chromometer* shows it to be a dark cherry self. It tests: Form, hooded; size, large; color, dark cherry self; substance, good; stem, long and slender.

**COUNTESS OF SHERWATBY.**—This sweet pea should never have been introduced by such a specialist as Eckford. It is old type, and is of color, and has not an attractive point about it, excepting its growing slender stems. It is shown as washed-out "Little Dorrit." It tests: Form, expanded old type, with notch at top; size, medium; color, standard white, suffused light rose; wings, white; stem, long and slender; fair substance.

**PRIMA DONNA.**—This is all that Eckford claims for it except that it comes of two shades, one resembling *Crown Jewel*. The typical flower throws most of its buds in the one way. It is of the highest type, and worthy of its introduction and will have a long run as a fashionable test flower. It tests: Form, size, large; color, medium pink self; substance, fine; stem, long and stout.

**ROYAL ROSE.**—This is a most beautiful and valuable addition to the list. The introduction of any lower class sweet pea from Eckford's workshop, as showing what he can do. It attracts the attention of every one, and with me was the largest sweet pea. It tests: Form, expanded; size, medium; color, standard dark violet-rose; wings, light rose, suffused with white; substance, fine; stem, long and slender.

of colors and shades, excepting those known as dark. In them we have true oranges, and light yellow, a buff with pink edge, and a white-edged white, of grandiflora size and form, being a perfected *Butterfly*. Some are of expanded and some of hooded form of the finest types. They test: size, large; substance, fine; stem, long and slender.

**BRELLANT.**—While this sweet pea is not as large as *Salopin*, yet it is far superior to that in that it does not blacken in the sun. By this is not meant that if left to do on the stand it will not turn black, but that it will keep their color equally well, and fade together. It is somewhat irregular in outline, some of the blooms showing the peculiarities of *Odity*. I have not yet been able to locate a specimen from the old *Countess of Ruth* of which I had not blacken in the sun. By this is not meant that if left to do on the stand it will not turn black, but that it will keep their color equally well, and fade together. It is somewhat irregular in outline, some of the blooms showing the peculiarities of *Odity*. I have not yet been able to locate a specimen from the old *Countess of Ruth* of which I had not blacken in the sun.

**BREED'S NEW COUNTESS.**—This is an object lesson in the art of selection. It is a selection from the old *Countess of Ruth*, and is the most beautiful specimen on account of the standard showing a new shade of light blue. It is bred with the lavender associated with it. Some years ago a typical plant was selected from the *Batterfly* and crossed with the result one of the most beautiful sweet peas grown. It tests: Form, hooded; size, large; color, standard dark lavender, edged light lavender; wings, pearl lavender; substance, fine; stem, long and stout.

**CREOLE.**—This is a decided improvement, being a soft pink floss with light lavender on the wings. Being the only lavender

of white ground "finshed," juncos; violet, "blotched" crimson; some shades deeper on reverse; standard and wings edged pansy-violet.

**WALKER'S OREGON SEEDLING.**—These novelties sent me by Mr. S. T. Walker of Forest Grove, Oregon, who is coming into prominence as a hybridizer of sweet peas, are a fine set. They contain something new in sweet peas, and when selected up to the highest standard of the appropriate name for it. It tests: Form, hooded; size, medium; color, standard shrimp, veined salmon with salmon-pink. It has the real soft finish, substance good; stem, long and slender.

**PALL MAUVE STRIP.** (a sport from Dorothy Tennant.)—These two are very fine dark stripes, but require severe selection, as they are very much variable to call them self. I think that the lighter forms of both of them should be selected. They test: size, large; form, hooded; substance, good; stem, medium.

**SPORT FROM COUNTESS OF ABERDEEN (Sport from Dorothy Tennant's packet.)**—This is the finest of Walker's novelties, being a most unique shade of soft invisible blue showing deep in the blue set. I would not be surprised to know that Eckford has this in reserve. It does not fade in the sun. It tests: Form, size, large; color, pink; it tests: Form, hooded; size, large; color, as above; substance, fine; stem, long and slender. It is most choice in large bunches.

**SPORT FROM CAPTIVATION.**—*Striped Captivity* pink.—This is a most beautiful, but is of a lighter shade, being the striped form of light self from *Captivity*, which, from Mr. Walker's collection, is a very pleasing shade, but needs selecting

for uniformity of shade, dark or light. It tests: Form, expanded; size, large; color, white, streaked light; purple-helicoid substance, fine; stem, small (needs selection).

**—STRIPED PEARLINA (similar to Aurora).**—This is the same as Burpee's Aurora, but with an extra stripe. Edith Crown Jewel shows that he has also been after an orange stripe. Edith Crown Jewel tests the same as Aurora.

**SANDED PRINCE (sport from Princess of Wales) distinct from Gray Frink.**—The coloring is not very much lighter and more evenly spread. It has a distinctly rounded appearance, and tests otherwise the same as Gray Frink.

**PURPLE STRIPE (Emily Eckford × Mrs. Joseph Chamberlain).**

As both fine sweet peas, but not yet selected to a type. All both of value when set.

**DAWK SPORT FROM CATHERINE TRACY.**—This is a hooded form of this walk-in sweet pea, but is of a darker shade than its parent. It tests: Form, hooded; color, white; substance, fine; stem, round, faintly spotted white on margin of standard.

**—PINK FLAMBEAU.**—Is a sweet pea with a future. It has attracted unlimited attention in my garden this season. It is a sport from a seedling of Gray Frink. It will set best when introduced to the public. It tests: Form, best hooded; size, large; color, white; substance, fine; stem, blood, faint on front, and dark on rear of standard and wings—the so-called "lavender" coloration; flag, blue; stem, long and slender.

**MEDIUM FLAMBEAU; LIGHT FLAMBEAU.**—This is a hooded form of this walk-in sweet pea of poorer quality. Will never be so attractive. Needs selection to a set type.

**BLANCHE BURPEE, THREE-TO-STEM FINE-LEAFED PEAS; ROYAL BLUE; CROWN AND THIRD CROP FLOWERS.**—These selections of this white sweet pea are of the very best quality. They excel in that some of the flowers of the latter are possibly slightly larger than those of the former. This is the finest strain of Blanche Burpee that I have ever seen, being certainly the best of the lot. The flowers averaged an inch and three-quarters across the standard, many being seen to be an inch larger. They are mammoth, and show the possibility of this variety in the hands of a skillful grower. It is a sport from the best of this variety two and a half inches across—if Walker keeps it at all.

**—LAVENDER (sport from losing its color).**—This is a fine selection of Venus, which comes mostly in rows, but I have not found any loss of color in the Venus furnished me.

**AURORA (four to a stem).**—Is identical with Burpee's Aurora, and brought me new.

**LIGHT GALETY.**—Is what its name indicates and tests same as Galety.

**—COLUMBIAN (white and shades, Emily Eckford × Mrs. Joseph Chamberlain) shows right fine sweet peas, of which I have seen a large number of a large range of shades. Is fine, but not need selecting to type. Being the progeny of a sport, it is not so uniform as the "break" hybridizing. Three of the best shades are: Dark Princess of Wales; dark sea, and lavender. The last is a dark red-helicoid, faintly streaked on white. All show high foliage.**

**LYONS'S 1897 NOVELTIES.**—The first of these to associate with this variety. My first two plantings failed to germinate, and the third has not yet come up. My opinion is that I have no opinion of this for another year.

**CALIFORNIA.**—Is a hooded sweet pea of variety first to be selected to a type, with Katherine Tracy, but it is not. It tests: Form, hooded; size, large; color, soft pink; substance, fine; stem, creamy pink—a very soft shade; substance, fine; stem, long and slender.

**—PINK PEARLINA (sport from ALIS, —Is a most unique flower. The foliage as well as the color and form are entirely new. It has the color of white with pink tests: Form, expanded; size, giant; color, a blue Princess of Wales; substance, good; stem, moderate.**

**STRIPED CELESTIAL.**—Is a high-grade flower, but is only a season too late, and almost identical with the latter. The color fades as the flower ripens, which I am sure does not. It tests: Form, expanded; size, large; color, striped English violet; substance, good; stem, medium stocky.

**RED RIDING HOOD.**—This variety grows upon me. Like some other good things one must acquire a taste for them. It has been universally admired in my garden this year, and it is an exponent of the highest type of the art of selection. It is a matter of judgment as to how to select a color or shade, but to select up a freak of nature, is genius, pure and simple. The Red Riding Hood is probably the typical stem, long and slender, but strong. The wings are the deepest red I have ever seen. It is a transparent crimson laced light rose. Could this be selected to a pure white standard? It is a matter of time. It should have a place in every collection.

**EMILY LYONS.**—I had an unusual experience with this variety. It came with four vines of it. While my rows were about four inches high, I noticed that these four vines were shooting up at an amazing pace. I made careful notes of their progress and they came into bloom in sixty-three days from planting the seed. There is nothing in the history of this variety to indicate extreme rapidity, and it has mystified me greatly, and opened up a new problem, whether a variety of this sport is possible. I have obtained by purchase from Mr. Hutchins, I have saved seed from these four vines, and the lowest seedling through test for earliness next season, and do not desire to be quoted as endorsing the claims of the grower. I have seen Lynch, until I have made further tests, as there is too much at stake for a misdeed. The four vines were ready earlier than E. E. B. Ferry, planted at the same time.

The following are the things in my garden, which I am not permitted to speak by the owners, but there are some fine surprises in an individual grower's sweet pea, if the ends of the hybridizers meet their expectations, as shown by their own culture. The lowest seedling was a surprise to two myself.—SAMUEL A. HAMILTON, Sweet Pea Expert, Roaring Spring.

### Burpee's Sweet Pea Tests.

There can now here be found, we think, a better indication of the increasing popularity of the sweet pea, as well as of the swelling list of varieties of the flower, than in the following list. L. H. Burpee & Co., of Fordhook Farm, Doylestown, Pa., which every variety of the sweet pea is known to the firm, is fairly tested on its merits. Some idea of the value of the low-growing form named and unnamed, may be formed, when we state that this year 373 separate varieties of the low-growing form of last year. Of the former there are 348 named varieties and 25 of mixed kinds. The system adopted by the firm is to grow samples of every grower's seed in rows of about ten feet each, along the side of the firm itself, thus a fair and complete comparison of the best source of great satisfaction to note that the plants from the Burpee-grown seed are the finest and most uniform, and in equal in most cases, and in some instances superior, to the English-grown seed. It is a fact that it takes a long time that it requires two years to get anything like good results from foreign seed. There were also observed, unfortunately, cases of mixing and some substitution from the English-grown seed, which was much deplored.

A noticeable feature observable in the trials was the tendency of Eckford to run on one type, particularly the pink type, which was the result of the seed coming from that source are evidently now secured by selection, being also in some cases, the result of the fact that those on which they were considered improvements as to be hardly distinct from the parent. It is a fact that this advance in color, as regards foreign sweet peas is probably obtained by Laxseed, and is secured at the expense of form and size.

The largest number of "breaks" has certainly fallen to the lot of the American hybridist, as seen in the distinctiveness of the color and form of the plants. We were glad to note that Messrs. Burpee were working to get a race of peas, with the pink type, and the result of the result they have obtained, and the result they bear four or more flowers on a stem, to a degree of success as to warrant its ultimate success, through further effort.

The recent hot weather has been most severe on the vines, which were showing its effects. Yet a great many of the flowers and buds were saved, and well.

It would be impossible, as well as unpractical to her comment on every variety grown by the firm; particulars regarding them will be found in the "Standard" for 1897. There were, however, some especially worthy of notice. The most attractive of the most attractive is Brilliant (Burpee), the luster of which the hot summer sun had not lessened on a stem. The color of the standard and wings is a bright crimson-scarlet, remained unchanged, while that of Igonia, Firefly and the more numerous varieties were very much affected. Present appearances would tend to justify the claim that Brilliant is "the best sweet pea yet to date."

Another very striking variety is Aurora (Burpee), a very large flower, with three to four blossoms on a stem. The color of the standard and wings is a white ground, flaked and striped with bright orange-scarlet.

—Crocus, a pretty flower, with light pinkish lavender standard, and wings of pure white ground, flaked with bright floriferous. It is a chance seedling from Lemna Queen.

—Crocus (Burpee) comes absolutely true; it is an improvement on the standard of color, being found that such a variety of this color, which is difficult to detect from the effectiveness of the color. The color is a very large and very large and very large lavender throughout.

be a failure—we fear a total one. Every precaution is being taken to save the crop. The threshers are ready, and the crop will be run through the machines as soon as it will admit of it. The crop, two weeks ago, gave promise of being the heaviest ever grown on Long Island—possibly on the whole country.

E. S. Harden, government purchasing agent for the seed division of the Department of Agriculture, has resigned his position, and at present is in his home in Ann Arbor, Mich. He has been succeeded by Captain J. H. Middleton, a former member of the department.

The many friends and customers in this country of Messrs. Vilmorin, Andreux & Co., Paris, will be glad to learn that the health of M. Jules Foch is so far improved that he is again able to join the firm. Mr. Foch has visited this country and Canada several times, and is held in kind remembrance by all who made his acquaintance both here and abroad.

M. Philippe de Vilmorin, the oldest son of M. Henri de Vilmorin, has also joined the firm as an active partner. This gentleman will be remembered from the years 1890 and 1893 when he visited this country with his distinguished father. Since that period he has been traveling extensively through various countries and has been actively engaged in horticultural literature. One well-known work of which he is the author is "Flowers in Pots."

European Notes.

Washer (Continued from beneficial to crops.

The changes which are continually taking place in our weather are, on the whole, of a beneficial character. Leaf and root diseases are more dreaded than any other crops. The average of the former is very short all over Europe, and as the plants are not doing so well as usual, there is every probability of a complete clearance of the stocks on hand at the end of the present month, so that the average quantity was transplanted, but the ground was so cold, and the plants the time that for several weeks the plants remained almost stationary. Where the plants may have been transplanted, and the growers gave the plants the necessary attention, the improvement being referred to is not remarkable, and the plants which have hardly been so full of healthy bloom for many years past. Where, however, the plants have not been so well cared for, the loss sustained by the sickly and lost heart under the very discouraging conditions, the plants are striving to escape the soil, and are being killed by the whole array of thistles and such like trash.

Dise Results of War.

It is no doubt that our growers are terribly discouraged, and it is not to be wondered at when the bad crops, low prices, and uncertain trade are taken into consideration. Even where everything has looked well hitherto we have no security from the ravages of the thistle-demons which appear to select the best crops for the display of their powers. The present week has been a terrible experience for France. At least 100 hills have been lost, and the destruction of property and crops of all kinds has been immense. The traces of the terrible storm in England will remain for several months, and it is to be feared that the individual growers that the aid of the government has been applied for to save the growers from absolute ruin.

The Olen Crop.

Turning once again to our crops, the condition of the onion is causing us some anxiety, and it is being put on every side. The young bulbs for 1898 are also badly diseased and it looks as if the crop will be a failure. A fair clearance of the heavy stocks on hand. At the same time, the disease which is being so largely appreciated at what is doubtless their true value. This of this more about the onion next week. EUROPEAN NOTES.

THE EXPERIMENT STATIONS.

FORMALIN FOR PREVENTION OF POTATO SCAB—Bulletin 66, Purdue University Agricultural Experiment Station, Lafayette, Ind. Formalin is a non-poisonous, non-corrosive liquid, and it has been found that it will free seed potatoes of scab germs by an immersion in a solution of the liquid. The strength of a 5% solution. The recipe for its use is to add "eight fluid ounces (about one quart) of formalin to each gallon of water, and soak the seed tubers in it for two or three days. The solution may be used more than once." The bulletin contains full instructions for its use. It has been made with formalin, together with a reference to the literature on its germicidal, disinfectant and preservative properties.

**ANTHEMUMS.**  
With the change in the weather has come a marked improvement in the plants, and from now on they will show quicker growth. My staking will have been finished by the time this is in the hands of my readers, and I only say a little attention to my seedlings, which stand at the present time in 4-inch staks. I find, by experience, that the best plan to handle seedlings is to keep them at present 6-inch pots, and plenty of room. I have pinched the leaders out so as to make the plants more compact, and they will soon give indications as to whether they will make bushy plants fit for pot culture, or plants only fit for cut flowers. The first mentioned are not very plentiful, the great percentage will be for cut flowers only, provided that foliage, flowers and constitution show good enough for a second year's trial.

I may here remark to those florists who are raising seedlings for the first time, that they need not expect to get 75 bouquets out of 100 plants. This fact is, some years they may get none, while in good years, probably from one to five bouquets for another year's trial may be obtained. Right here where the advantage of having them in pots is shown, the plants may be cut and dumped out at once, in the case where the plants have been cleaned up by the plants get in bloom. It will, of course, be necessary to pot a good many plants in each pot in the season, which will be enough for the first year's work.

All plants that show a poor constitution, bad foliage and weak stems are not potted beyond 4-inch pots, and then thrown out. We cannot afford to spend our time with them.

THO. ROCK.

Kingston, N. Y.

Charles P. Gulick is building two new houses, and putting in a water system.

**HILFINGER BROS. STANDARD FLOWER POTS.**  
We manufacture a full line of Standard Flower Pots, Cylinders, glass and unglazed. Lawn Pans, and Flower Vases. Wash these carefully, and keep them in a cool place. # SOCIETY OF American Florists

## THIRTEENTH ANNUAL CONVENTION

Exhibition of Requisites for and  
Products of the Greenhouse  
and Garden.

WILL BE HELD AT  
Music Hall, Providence, R. I.

August 17, 18, 19 and 20, 1897.

A notable event comprising three days of social and business intercourse, instructive lectures, papers and discussions at the capital city of Rhode Island and one day of sight-seeing and entertainment at America's most famous watering place, beautiful Newport by the sea.

### Officers of the Society of American Florists.

President, ADAM GRAHAM, Cleveland, Ohio.  
Vice-President, FARQUHAR MACRAE, Providence, R. I.  
Secretary, W. M. HASON, 67 Bromfield St., Boston, Mass.  
Treasurer, H. B. STEWART, Oil City, Pa.

### Executive Committee.

One Year.  
JACKSON DAWSON, Jamaica Plain, Mass.  
GROVE P. RAWSON, Elmira, N. Y.  
J. F. COWELL, Buffalo, N. Y.

### Two Years.

W. K. HARRIS, Philadelphia, Pa.  
J. G. ESTLER, Saddle River, N. J.  
W. N. KIDD, Mt. Greenwood, Ill.

### Three Years.

ELMER D. SMITH, Adrian, Mich.  
W. F. GUDE, Washington, D. C.  
J. CHAS. McCULLOUGH, Cincinnati, Ohio.  
Superintendent of Trade Exhibition, WM. E. COOPER, 133 Bruce ave., Providence, R. I.

### Nomenclature Committee.

Prof. WM. TALLEYS, Botanic Garden, St. Louis, Mo.; Chairman; Robert Craig, E. G. Hill, Elmer D. Smith, Robert George, Wm. K. Smith, Thos. Gunson, Fred. Dornier, A. M. Here, Edwin Lonsdale, E. A. Wood, J. F. Gault.

### Officers and Committees of the Florists and Gardeners' Club of Rhode Island.

President, FARQUHAR MACRAE.  
Vice-President, JAS. B. CANNING.  
Secretary, W. M. HASON, Providence Journal, Providence, R. I.  
Treasurer, ALEX. M. RENNIE.

### Executive Committee.

N. D. Pierce, Jr., Wm. B. Hazard, W. E. Chappell.

### General Committee on S. A. F. Convention.

Jas. B. Canning, Farquhar Macrae, Wm. E. Chappell, Thos. J. Johnston, Walter S. Nichol, J. J. Butler, Mrs. W. Appleton, Jr., M. M. Pollard, Mrs. W. L. Leland, Mrs. V. S. Nichol, Mrs. S. J. Butler, Mrs. L. L. Whitman, Miss Emily Setlow, Miss Kate Sweeney, Miss Kate Canning, Miss Agnes Devine, Miss Carter.

### Ladies' Auxiliary Committee.

Mrs. F. Macrae, Mrs. T. F. Johnston, Mrs. E. J. Johnston, Mrs. W. B. Hazard, Mrs. W. E. Chappell, Mrs. W. Appleton, Jr., M. M. Pollard, Mrs. W. L. Leland, Mrs. V. S. Nichol, Mrs. S. J. Butler, Mrs. L. L. Whitman, Miss Emily Setlow, Miss Kate Sweeney, Miss Kate Canning, Miss Agnes Devine, Miss Carter.

### Chairmen of Special Committees.

ENTERTAINMENT, MUSIC AND DECORATIONS—N. D. Pierce, Jr. & R. J. Exchange Place, Providence.  
FINANCE—A. M. Rennie, 6 Exchange Place, Providence.

HOTELS—Thos. J. Johnston, Weybosset Street, Providence.  
SPORTS AND GAMES—A. M. Rennie, 6 Exchange Place, Providence.

LECTURES—F. Macrae, Smith street, Providence.

### Officers and Convention Committee of the Florists, Gardeners and Associates' Club of Newport, R. I.

President, N. K. McMAHON.  
Treasurer, JOHN ALLAN.  
Secretary, J. J. BUTLER.

### Committee.

The Officers and the following named gentlemen:

Robert Christie, James McLeish, John Gibson, William J. Reynolds, James Hovey, Dr. Fred B. Bradley, Andrew Walkie, Robert Hunt, Herman Lippa, A. Mantoo Chase, Benj. E. Turner, Richard Gardner.

### Special Rates on All Railroads.

The low rate of one and one-third full fare for round trip has been granted by all of the transportation lines east of Chicago and St. Louis and it is expected that the railroad west of these points will also unite in this arrangement.

To obtain the benefit of the reduced rates, purchase the ticket at Providence, R. I., and at time of purchase request of the ticket agent a certificate regularly filed out.

In session. All persons joining the Society continue members and are liable for successive annual dues, unless they request a release.

### Hotels.

The following hotels in Providence are located near the Convention hall and will accommodate guests at prices indicated.

Narragansett Hotel, Weybosset street, 275 rooms, \$1.00 and upwards, American plan.

Hotel Dorrance, Westminster street, 120 rooms, \$1.00 to \$2.00, European plan, gentlemen only.

City Hotel, Weybosset street, 70 rooms, \$2.00 to \$2.50 American plan; 75 cts. and upwards, European plan.

Hotel Perrin, Washington street, 50 rooms, \$1.25 to \$2.00 American plan.

Parsons House, Weybosset street, 40 cts., \$1.00, American Plan; \$1.00, European.

Central Hotel, Canal street, 50 rooms, \$5.00 to \$10.00, European plan.

The Allen, Green street, a quiet family house \$10, American plan.

The Beckett, Pawtucket, R. I., 4 miles from Providence, Sit and electric cars every ten minutes. Will accommodate 30 to 40 guests American plan, at \$1.50 to \$2.00 per day.

A PAPER—Subject, "Root Galls of Cultivated Plants," by Prof. B. D. HALSETZ, Agricultural Experiment Station, New Brunswick, N. J.

### DISCUSSION.

A PAPER—Subject, "Trees and Shrubs which should be grown by Florists," by CHAS. J. DAWSON, Bussey Institute, Boston.

### DISCUSSION.

A PAPER—Subject, "Florists as Agricultural Chemists," by F. RANK, Agricultural College, Durham, N. C.

### DISCUSSION.

On Thursday afternoon a shooting tournament will take place at Johnston, a suburb of Providence. Intending participants should communicate with the committee for location on sports.

Next Monday the American Carnation Society (F. M.), the Chrysanthemum Society of America (F. M.), the "Proctor" Society (F. M.), the F. M. Florist's Hall Association of America (F. M.), will be held on Wednesday afternoon.

Second Day, Evening Session, 8 o'clock.  
A LECTURE—Subject, "Our Favorite Exotic Plants in their own Homes." With beautiful scientific illustrations. By PROF. GEO. L. GOODALE, of the Botanic Garden of Harvard University, Cambridge, Mass.

### THURSDAY, AUGUST 19, 1897.

Third Day—Morning Session, 10 o'clock.

### ELECTION OF OFFICERS.

DISCUSSION—Subject, "A Year's Progress in our Business."

### SECTION I.

The Carnation—Opened by WM. NICHOLSON, Framingham, Mass.

The Chrysanthemum.

The Rose—

On Thursday afternoon the Bowling Contest between teams representing various cities will take place at the alleys of the Providence Athletic Club. The contest is intended to compute with the Chairman of the local committee on sports.

Third Day, Evening Session, 8 o'clock.

DISCUSSION—Subject, "A Year's Progress in our Business."

### SECTION II.

Decorations and Greenhouse Plants—Opened by HOLT'S CARNATION, Newport, R. I.

Birding Plants—Opened by J. J. BUTLER, Newport, R. I.

The Retail Business—Opened by THOS. J. JOHNSTON, Providence, R. I.

### FRIDAY, AUGUST 20, 1897.

Friday will be devoted to recreation. The Florists and Gardeners' Club of Rhode Island, have chartered the steamship steamer, and will invite the members of the S. A. F., with their ladies, to accompany them. On invitation of the Florists, Gardeners and Associates' Club of Newport it, a landing will be made at Newport. The program will be "Six o'Clock" of the local club for the day. An evening program including a short drive in course of preparation, full details of which will be announced in due time.

### The Question Box.

The Question Box will be as heretofore an interesting feature of the meetings. Members are invited to forward inquiries to the Question Box to the Secretary previous to the meeting, which practice is that they may appear in the regular program.

### The Trade Exhibition.

This will be a grand expression of the latest improvements in all requisites for the greenhouse and other departments of the florist's business; models of greenhouses and apparatus; new and rare plants; garden implements; bulbs, seeds and soil; and many other articles in the same building and partly underneath Music Hall, where the sessions of the Convention will be held. A very large amount of space has already been rented and intending exhibitors should make applications at once to the superintendent for such accommodations as they will be required in due time.

### A Special Medal Competition.

The Society of American Florists offers six silver and six bronze medals to its members in Providence, as per the following schedule:

CANNAS display of 13 varieties in pots, not to exceed 25 cents each.

TUBEROUS HYGONIAS, 25 plants.

CALADIUMS, 12 fancy foliage varieties in pots, not to exceed 25 cents each.

AQUATIC PLANTS, display of cut blooms, to be kept in good condition throughout the exhibition.

HARDY CONIFERS, collection in pots.

The silver medals will be awarded for the best in each of the above classes, and the bronze medals for the second best. One silver and one bronze medal will be lot to the discretion of the committee to be awarded to any display of plants, showing advancement in culture or species of the trade.

No awards shall be made in any class where, in the opinion of the judges, the quality of the exhibit does not justify it. This department of the exhibition will be held in the building of the trade exhibition. No entry fee or charge for space will be required, and the arrangements should be made at once to the superintendent for such accommodations as they will be required in due time.

Entries should be made with the Secretary of the S. A. F.

## PRELIMINARY PROGRAM.

TUESDAY, AUGUST 17, 1897.

First Day—Opening Session 10.30 A. M.

Address of Welcome, by Mayor Edwin D. McGuinness, of Providence.

### RESPONSE.

President's GREETING ADDRESS.

REPORTS—Secretary, Treasurer, Standing Committee, Special Committees.

### APPOINTMENT OF EXHIBITION JUDGES.

On the afternoon of the first day the Judges will examine and prepare their reports upon the trade exhibition.

An enjoyable programme for the entertainment of the ladies will be arranged for this afternoon by the Ladies' Committee of the Florists and Gardeners' Club of Rhode Island.

### First Day, Evening.

PRESIDENT'S RECEPTION.—Tuesday evening will be devoted to the President's Reception, under the auspices of the Florists and Gardeners' Club of Rhode Island.

### WEDNESDAY, AUGUST 18, 1897.

Second Day—Morning Session 10 o'clock.

SELECTION OF PLACE OF MEETING FOR 1898.

### NOMINATION OF OFFICERS.

REPORTS OF JUDGES ON EXHIBITS.

### DISCUSSION OR RECOMMENDATIONS IN PRESIDENT'S ADDRESS.

certifying as to form, number, route and destination of ticket purchased. This certificate, duly countersigned at Providence, will entitle said purchaser to return passage at one-third fare. Certificates not to have been procured not earlier than August 15th and will be available at starting point, passengers must purchase ticket not later than August 24th.

VERY IMPORTANT. It is absolutely necessary for each passenger before starting to obtain the certificate of the ticket agent at the place and time going ticket is purchased. If without the possession of this certificate no reduction from regular fare can be obtained and respect of the Rhode Island cannot afterwards be remedied. If through ticket cannot be obtained at starting point, passengers must purchase certificate from each agent from whom a ticket is purchased. Members are advised to apply for tickets and certificates half an hour before the starting time of their train. All information required may be obtained by addressing the secretary or the chairman of the various special committees.

### Membership.

All persons in any way connected with the floral or gardening business are earnestly solicited to connect themselves with the National Society. Membership fee \$3.00 may be forwarded to the secretary at any time previous to the meeting and the Society's ledger for 1897, entitling the bearer to participate in the entertainment features of Providence and Newport, will be mailed in return, or payment may be made at Convention hall previous to the opening of the regu-

Evans Challenge Cup.

A. DE LA MARE PTC. AND PUB. CO. LTD.,

2, 4, 6, 8 Duane St. New York

F. O. No. 1697. Telephone 2154 Corland

REGISTERED CABLE ADDRESS (Commercial Cable) Florez, New York.

SUBSCRIPTIONS: \$1.00 per year in United States, Canada and Mexico. \$2.00 per year to foreign countries in postal union.

ADVERTISEMENTS: Copy rates set this office not later than Tuesday...

Contents.

Table listing various sections and their page numbers, including American Carnation Society, Fire Insurance, and The Busy Man.

For the Busy Man.

The convention program appears on page 680.

The method of distribution of free seed, to be adopted by the Government next year, will be the same as in the past two years...

The American Dahlia Society will hold its exhibition in Horticultural Hall, Philadelphia, September 21 and 22.

The recent inclement weather has had very injurious effects on the seed crops both at home and abroad.

E. S. Harnden, seed-purchasing agent for the Government has resigned.

The attention of carnationists is respectfully called to the circular issued by the American Carnation Society...

Providence, The Convention City.

With the approach of the annual convention of the F. E. which, this year, will be held with the Florists and Gardeners Club of Rhode Island at Providence...

Everybody knows the history of the foundation of Providence. Roger Williams, banished from Plymouth Colony, Mass., on account of his religious beliefs, embarked in his bark...

Providence is situated almost at the head of Narragansett Bay, and has an area of 1,063 acres, with 121,700 miles of streets.

Next to the harbor the citizens of Providence take especial pride in the improvement and beautification of the city parks.

Next week I will present a few facts concerning Roger Williams Park.

The Evans Challenge Cup.

Our illustration is reproduced from a photograph of the cup presented by the Quality Club (E. Evans), Richmond, Ind., to be competed for by the florists' growing clubs at the annual convention of the F. E. The cup is to be won twice by the same club before becoming the property of the winners.

Fire Insurance.

A topic of discussion, and one that is likely to draw the attention of our enthusiasts at the forthcoming Providence convention, will be the subject of Fire Insurance on Greenhouses.

Now, however, that the subject of fire insurance has again been ventilated, what is said to be a feasible plan presented, we would like to call the attention of every grower to the fact that the practicality or non-practicality of said plan can only be learned from a thorough study of the question, and to that end a large gathering is necessary.

The New Tariff Bill.

The following are the provisions of the new tariff bill affecting the trade as fixed by the conference committee's report.

DTABLE.

Table listing tariff rates for various goods: Beans, 45c. per bushel of 60 pounds; Onions, 40c. per bushel; Garlic, 1c. per pound; Pease, green, in bulk, barrels, sacks or similar packages, 40c. per bushel.

FREE LIST.

Moss, seaweeds, and vegetable substances, crude or unmanufactured, not dried, including seaweeds, ferns, palm nuts and palm nut kernels.

It is hardly probable that a vote will be reached before next week. Menantine imports are being secured rapidly.

The Victoria Medal of Honor.

A Victorian medal of honor in horticulture has been instituted by the Royal Horticultural Society of England.

Dr. Arthur has been elected to the position of President of the American Carnation Society.

Formalin as a Fungicide.

In view of the beneficial results which have attended the use of formalin for the prevention of the fungoid disease known as black rot, the following report was published in the Purdue University Experiment Station, Lafayette, Ind., we wrote to Dr. Arthur regarding the efficacy of formalin as a fungicide.

So far as we have tested it, spraying has no effect upon such fungi as spruce mill-canker, etc., but it has been found that much has been said, promises to be of use in this direction, and in general it is a most valuable and economical fungicide.

New York.

Wholesale Market. During the early part of the week there was a considerable improvement in business and the ground has been quiet. Losses were sought after the most, and the growers have replanted their houses, together with bad weather, the supply became very limited. The quality was not so different (quality and severely work the money asked for them. Were the better quality than the old ones, as it is, \$4 is a possible figure for good, clean, bright stock.

There is a demand for, special grades of Meteor and Bridesmaid, 6 cents each was realized. Beauty, when in shape, brought 40 cents per piece.

Sweet peas are out of the way now, and carnations are lightening up. Also, the remaining very plentiful, but flowers are only of the smaller kinds yet, consequently it is hard to get the price to be as usual with this stock. Ghaziloff is now in full swing, and the prices, as usual with his stock, are very erratic; some blooms are being sold for \$5 per 1,000 spikes, while others go at from \$1 to \$3 per 100.

Valley was good property early in the week but is moving slowly—like the week before—now mostly at between \$1.50 and \$3 per 100.

Lilium auratum and L. longifolium are doing well, and are being sold with uncertain sales; sometimes they make \$3 and \$4 per 100, but there is a heavy demand enough to use that come in.

There is a remarkable absence of demand for the small windows at Ghaziloff is all that is to be seen, and the fancy is huge stock desolate.

Grandchildren are occurring in Sullivan County.

Friends of A. W. Merritt are working hard to get him one of the "Evening Journal" prizes, which means a trip to Naples for ten popular weeks.

There is a demand for the flowers already been recorded in Mr. Merritt's favor.

There is a demand for the flowers already been recorded in Mr. Merritt's favor.

There is a demand for the flowers already been recorded in Mr. Merritt's favor.

Philadelphia.

Carnation Sales. A great amount of interest is now being manifested in the S. A. F. convention, and no doubt a good many will go west from this city and the committee on transportation is looking up the various routes and will report at the next meeting, July 23. The favorite route seems to be by rail to New York, thence by water to Providence.

There is a demand for the flowers already been recorded in Mr. Merritt's favor.

There is a demand for the flowers already been recorded in Mr. Merritt's favor.

house, and Fred Carey, Kennett Square, two carnation houses. A one-story building 19 feet from 50 feet deep, is to be erected on Melloy street, between Fifteenth and Sixteenth streets. The building will be occupied by Edward Reid, wholesale florist, who has just commenced an addition to his building to be completed by October 1. It will be of brick, and will have a large window, the room being 12 feet to ceiling.

Bowling Contest.

A great amount of interest is now being manifested in the bowling contest to date, 18 games have been played by the first and second classes. The prizes for the contest are as follows: For the first class, \$100; for the second class, \$50. The contest embraces 25 games. The third class is composed of 150 members and those whose previous average was under 110. The first and second classes are using two balls and the third class three balls.

The result, so far, up to and including Wednesday night, July 21, is as follows:

Table with columns: FIRST CLASS, No. of Games, Name, Score. Lists names like G.O. Bell, Geo. Craig, Geo. McLellan, etc.

SECOND CLASS.

Table with columns: No. of Games, Name, Score. Lists names like John Westcott, Wm. Craig, John Walker, etc.

THIRD CLASS.

Table with columns: No. of Games, Name, Score. Lists names like John McLellan, R. Keule, E. Ehret, etc.

DAVID ROOT.

David Root, a well-known florist, has recently returned from Europe with a large stock of new varieties of carnations.

Boston.

Market Notes. The Hub has little to offer in the line of an encouraging market this week, as the effect was desired, owing to the severe price of the few days preceding. The prizes for hollyhocks had been put from the show, but they were only awarded in honor of M. H. Walsh, gardener to the estate of Hon. J. S. Fay of New York, who received all the awards. Repeated before the convention meets, and will welcome their friends with the hospitality for which the East is noted.

Exhibition. The exhibition at Horticultural Hall last Saturday was rather slim so far as the prizes were concerned. The prizes for hollyhocks had been put from the show, but they were only awarded in honor of M. H. Walsh, gardener to the estate of Hon. J. S. Fay of New York, who received all the awards. Repeated before the convention meets, and will welcome their friends with the hospitality for which the East is noted.

Exhibition. The exhibition at Horticultural Hall last Saturday was rather slim so far as the prizes were concerned. Repeated before the convention meets, and will welcome their friends with the hospitality for which the East is noted.

interesting specimens, Nymphae alba rosea, a native of Sweden, which has sold for \$100 in this country, and W. Maribaea vulgaris. Added to this was a fine display of native American ferns and several complete collections of native flowers.

Change of Firm.

John T. Butterworth succeeded on the first of July to take the business of Charles J. Power of South Framingham, Mr. Power, to the old-time florist he will know of well over, and will continue to establish a fine greenhouse property in the town where he has lived for the past forty-six years. To the present generation on the street. Mr. Power is known by proxy in Mr. Butterworth, who for a number of years has taken charge of the business, not only superintending the business, but handling the outside work, as he is known to all, has achieved a well-earned reputation as one of the best bulb-growers in the East, and the trade generally will be pleased to hear of his success, and hope that he may do well for himself as he has for his employer.

A Branch Establishment.

The tendency to accommodate the Back Bay trade is further evidenced by a recent building of a new property belonging to Mr. Fayban on the corner of Boylston and Fairfax streets, which will be ready for occupancy in a few years, and on this property they will erect a store and greenhouse. Lord & Smith are probably the ones to have the construction and something especially worthy of comment is promised. Everything is expected to be ready for occupancy by October first.

Notes.

W. H. Elliott, of Asparagus phytodopsis manum form, has been spending a few days in the metropolis. F. H. Houghton returned last Friday from a two-day stay in New York, and left Monday for Newport, where he will remain until October.

For three days in town on Friday last, the first time in several months, and the florists generally were very much pleased to meet him over the glass, and to see him in person, as he had been pleased to know from other evidence that had not so far recovered from his long illness.

Although the failure of the Bolker convention did not seem to excite any one in this section, unbounded sympathy is expressed for them by the trade generally.

**Providence.** There is little or no business at the present time excepting an occasional floral order. Little business is done on sweet peas and pond lilies. The former, which had been in great abundance, are now in the hands of the growers, owing to the beating down of the vines by the heavy rains and gales of a week ago. Little business is done on regular stores. The latter do, however, handle a few pink lilies from the Cape, which retail for 15c per dozen.

**The Convention.** The coming convention of the S. A. F., so far as the arrangements of the local clubs are concerned, bids fair to be one of the best in its history. The general and sub-committees have all buckled down to hard work with an earnestness and willingness that augurs success. The committee has arranged its programme in such a way that the business sessions and discussions of the convention will not be interfered with, and there will be no no moments. An auxiliary committee of ladies has been appointed, and they will see that the ladies' business is properly and satisfactorily taken care of. With the time so broken by the hours of business, it has been found impossible for the ladies to have any other entertainment as they would have wished, but they have endeavored to make it as diversified as possible, so that all will be suited, and yet have it different from conventions in other cities. There was the customary president's reception and the bowling and shooting tournaments. Trease has an excellent list of the local club in both of these events, and the members are in constant practice. Tableaux prizes are being arranged for, and everything being done for the convenience and comfort of the participants.

The trade exhibit in Music Hall will be above the standard, and the space is about allotted, Superintendent Chappell has laid out the hall to the utmost advantage, and an excellent display is assured.

The festivities of the week will be crowded with interest. The programme of the convention and of the local club because the guests of the Newport Garden Club. The rose show has chartered one of the largest and fastest steamers on the bay for the trip to the city of flowers. The excursion will go to Newport will be unveiled by orchestral selections. At Newport the party will be received by the local club, and entertained in that hospitable manner known only to Rhode Islanders. Not the least interesting of the features of this trip will be the privilege of inspection of some of the famous grounds and conservatories of the State.

**PRICES MODERATE.** When Writing Mention Florists' Exchange

**ABOVE ALL,** have your advertisements seasonably placed, and be reasonable they must be changed often.

**Toronto.** Business last week improved somewhat, the big Ewforth League convention held in the city, making things a little more lively. There was a better demand for cut flowers, but not much change in prices. Sweet peas are very plentiful. The market for them here, they have sold on from \$1 to about \$3 per 100, and they are not generally good, the best of last week's offering being considerably. Carnations also are poor. These flowers are handled by the regular stores. The latter do, however, handle a few pink lilies from the Cape, which retail for 15c per dozen.

**Our Outline.** The Toronto Gardeners and Florists' Association had an excursion to Niagara Falls Park on Thursday, the 13th inst. About 50 members and friends took the trip. The party was guided by George Vair, and had a most enjoyable time. Mr. Vair had lately been over the grounds, and he is very anxious to see about all it was possible to see in one day. Niagara Glen was the first place visited. The park is a very nice one, nearly two hours in the glen and most of them expressed their thanks to Mr. Vair for the trip. The park is a very nice one (Canada's best known park). After leaving the glen we went to the main part of the park, where the main part of the park, the general and able gardener, who showed us over the most interesting parts. The park project is quite a revelation to several of us that had not been here for ten or twelve years. Since Mr. Cameron took the park he has been entirely changed. All its natural beauty has been preserved wherever possible, and where improvements have been found necessary they have been made in such a way as to be as unobtrusive as possible in view of the surroundings. The Dutchess Islands have been opened up for the benefit of the islands.

In conversation, Mr. Cameron stated that he had seen many of the native plants growing in the park, many of them being quite rare in this country. He has seen many varieties of native plants growing in the park, many of them being quite rare in this country. He has seen many varieties of native plants growing in the park, many of them being quite rare in this country. He has seen many varieties of native plants growing in the park, many of them being quite rare in this country.

**WILKESBARRE, Pa.**

**HEA G. MARVIN** has acquired a fine store; the ceiling and sides are lined with plate glass. It is the most stylish of its kind in this section. The fountain is being run in conjunction with cut flowers. Mr. Marvin is of the opinion that the low winter trade is a good acquisition; he has had considerable experience in this line.

**W. H. MASON & CO.** will not order their plant this season. Mr. Humphrey reports a good trade, but believes rather scarce in variety. Low winter trade supplies than having a surplus to dispose of. Undoubtedly, the season has been a very successful one for the town of this size, the surplus of stock, if any, is smaller this year than usual, which should be congratulatory.

**Elmira, N. Y.**

**HOFFMAN Bros.** are to the front with carnations in this locality; the demand for these has been better this season than ever before.

**G. F. HAWSON** is a very busy man, and he has been very successful in his place given him little leisure; the capital stock produced shows close attention. Several of the varieties are in the hands of the stocks of roses; the usual number of chrysanthemums is being grown, but the color is very good. The market is rather slenderly. Violets look as promising as ever; the system of silt houses proves most satisfactory, and a high price will be with us at convention; doubtless, something original and for the good of the order will be forthcoming from our

Washington.

Campor Growing in the South. Quite a number of years ago, while the Botanic Gardens was conducting a party of Southern nurserymen through the greenhouses, one of the company, a tree to one of them, facetiously remarking that he wanted him to plant it on the west coast of the continent of the Chinese, he might have his collar made from the wood, which is as near as it gets to being iron. The tree was planted and Mr. Smith has long since been notified that the wood is ready for his use. It is a tree over forty feet high, three of thousands of seedlings have been raised from it and distributed over the Southern States. During the recent cold winters in the South, it has been observed that the growth is harder than the orange, and the probabilities are great that campor growing will be in a short time, become quite an industry. Owing to some recent newspaper publications on the subject of campor growing, the Department of Agriculture is already flooded with requests for plants, but Secretary Wilson finds it difficult to get hold of seeds from which to raise young plants, to satisfy the demand. Those having seeds are asked to send to the idea that they will lose nothing by germinating their own seed, and selling the plants. Frank and Mrs. Brown, two former secretaries of agriculture, sent out an enormous number of young plants to the Department, but their experimental work, such as testing the hardiness of the plants and their suitability to the different soils, has not been long enough to enable the Department to give out information concerning the cultivation of the campor tree method of furnishing the plants.

The Distribution of Seeds. Some time ago it was reported that Secretary Wilson would order a return to the old method of putting up the seeds in boxes, but owing to the insufficient appropriation it is found that this cannot be done during the present fiscal year. The appropriation as it stands, gives \$110,000 for purchasing seeds and \$20,000 to pay the cost of distributing the seeds. This lack of funds, thirty demissals have been made from the force employed in testing seeds. The distribution of seeds was started in December, when the Southern States will be supplied.

Baltimore. We are having an exceptional spell of rainy weather. The rain, together with the wind, has done great damage in our public parks, flooding and uprooting trees. The crops are not suffering. If anything, up to the present time, they have been benefited by the rain. The hot weather prevented the carnations from much growing, but the rainy spell we are now experiencing is having a beneficial effect upon their growth, which no doubt will be soft and more susceptible to the rain.

Jetlags. Early shipments of Harsili bulbs have arrived, the stock is poor. Up to date the violets hereabouts show little disease, but the wet weather, which we are now having will probably bring on this disease, peas.

Sweet peas are nearly over with us. EDWIN A. SEIDEWITZ.

# CARRIATIONS.

## Cutting-Bench Sand.

The sand for the propagating bench is an important item; it becomes especially so when we consider the very best results, and have made every endeavor to have everything else in the best working order.

That the texture of the sand has a great deal to do with successful propagation is a point which has not the slightest doubt. My experience in the past has demonstrated the force of this many times over.

I believe that clean, sharp, or medium sand is universally recommended. For some years now we have been so situated that absolutely clean sand has been quite out of the question, having to depend on the banks of a rather small creek for our supply. The sand which we could get fairly clean sand, but more often the grain was from medium to fine, with a considerable quantity of silt, or other such as would more likely be deposited by high waters. Thus we were compelled to use an inferior sand, which we have thought to be incapable of the best results. Upon repeated trials, however, we not only found it to be as good as the cleaner sand, but materially better.

I have long since stultified out the whereof, which is quite simple enough when we have a knowledge of the habits and characteristics of the carriage.

When we use a sand of this nature and sharper the sand, the more readily water will pass through it. Thus making frequent irrigations necessary, which is quite out of line with the now generally accepted theory to keep the foliage dry, as being one of the essentials to successful carriage culture.

We cannot dispense with watering and syringing in the propagating house, yet with careful management, we can bring the matter so that we need not fear for the outbreak of cutting-bench fungus, or like evils, providing the sand is properly ventilated.

I feel confident that sharp sand, or, in fact, any sand which contains no traces of vegetable matter, is responsible for being more mischievous than is generally accorded it. Its only function is to hold the water, and supply the plants with moisture; beyond this it can do nothing, since it contains no plant food. It is the result of bacteria often receives its first impetus.

Bacteria is the result of a lack of nourishment, and is due to too much moisture. Too much moisture will invariably give the same effect, whether on plants in rich soil, or poor soil. Those in the latter soil will be the first to succumb, since it is more of an effort for a plant to take the nourishment where life exists than it is to take it where it does not exist. In the propagating house we have this very forcibly brought to mind. A batch of cuttings from plants which have been nourished and healthy plants can, if handled properly, be carried through the rooting stage and transferred to pots or flats without having contracted any signs of bacteria. As few waterings as possible, and a healthy atmosphere would accomplish this with almost any ordinary sand. But take a batch of cuttings from plants which are very susceptible to this disease, or from plants which are not healthy and sturdy, and it will be quite impossible to bring them out of the propagating house without contracting and showing no traces of bacteria. In the majority of cases they will be badly affected and necessitate removal to some extent, until they have time to recover.

In the first instance, the large healthy cuttings always taken from well-nourished plants, and are consequently well nourished themselves. The foliage is kept in a healthy condition to enable them to carry them through in good shape, providing the nourishment is properly attended to. In the case of the weaker ones, however, or those very susceptible to the disease, they are already half-dried, and therefore become easy prey, unless the very best of care is taken.

When a cutting is infected with bacteria will, with good treatment, recover very readily after they have been taken from the sand, yet if they are not carried through the propagating stage without contracting it, they will be almost impossible to free, they will be all the stronger and better for it.

When a cutting first seeds out its

roots, they go in search of nourishment as well as moisture. If they get all moisture and no food, bacteria is the result, and this usually takes place when the cuttings are put in earth or vegetable matter, and the sand reasonably dry. The want of supply of nourishment held by the cuttings can be said to tide them over.

They will not compare favorably, however, with material which has been given as good attention in every way, and which in addition have been rooted in sand and clean, and vegetable matter exist. In this case not only do the roots carry food at once to the cuttings, but with the addition of matter the sand will retain its moisture considerably longer than will the clean sand, thus allowing a longer interval between waterings, which is an item of no small proportion.

Clean sand is generally recommended as one of the necessary safeguards against cutting-bench fungus. Many change the sand for each batch of cuttings. That this is quite unnecessary I have determined to my own satisfaction, and as a result of my observations, I have found that the appearance of cutting-bench fungus is wholly a matter of fact, to a lack of ventilation, improper watering and excessive heat.

The fact that we use our sand for an entire season and have no trouble with this deadly pest, is all the evidence I want. The roots left in the sand from which rooted cuttings have been taken, become food for the batch which follows, and will in no way prepare the safety of the cuttings by developing cutting-bench fungus. When this pest makes its appearance, it is the result of mismanagement or carelessness. H. WEBER.

## The American Carnation Society.

There will be a meeting of the American Carnation Society called Wednesday, August 18, 1897, 2 P. M., sharp, at Providence, R. I.

Every member desiring changes in the system of judging and awards should attend the meeting, so that we may be ready there forward. If unable to attend in person, a letter addressed to the Secretary, and duly brought before the meeting for action.

Address mail to the Secretary to Albert H. Herr, Providence, R. I., (not Lancaster).

If you have not received your report it is because your report was not sent. Your remittance of the \$2 dues will be appreciated.

Under the heading of "A Year's Progress in our Business," William Nicholson of Framingham, Mass., will open up section I with a paper on the Carnation. A goodly number of our society should be present to represent us at the S. A. F. in the discussion of the paper.

Incidentally it might be well to give some thought to increasing the revenue of our society. Our treasury will be one of our twenty to give \$100 to invest in a permanent sinking fund; the interest to

be toward the running expenses of the society. This, in addition to our annual dues, would allow us to do much better work than we are able to do with the money received for dues for 1897, which amounts to give us \$154.

Try to attend this meeting in Providence to give us your views in writing. (Signed) W. R. RUD, President. (Attest) Albert M. HERR, Secretary.

# CHANGES IN BUSINESS.

COUNCIL MEMBERS.—C. G. Anderson and Charles Olsen have purchased the apartments and property of Charlotte E. Scott, Atlantic, Ill., and will take possession in the near future. Mr. Anderson was formerly foreman for J. F. Wilcox.

WILMINGTON, DEL.—De Voest & de Wilde, florists, have dissolved partnership, and the business will be continued by De Voest.—H. E.

# Water Garden

BY WILLIAM TRICKER.

THIS volume, which has been prepared by the foremost aquaculturist of the country, and to whose efforts the present growing popularity of the Water Garden is largely due, is designed to serve as a SOUND, PRACTICAL CULTURAL HANDBOOK for amateur and professional alike. The book will be freely illustrated with plates and illustrations in the text, and will describe all operations, from the growing of plants in tubs to construction of the large pond, planting, seed saving, propagation, wintering, and all other necessary details of cultivation.

Florist's Club of Chicago.

By special invitation the club, to the number of seventy-five or more, including many ladies, took the N. W. train for Arlington Heights to visit John Klehm and his three sons, who have here interesting grounds of some twenty-five acres in extent. The party strolled through the vineyard and among the other specialties for which the place is famed. These include peony plantations from which 75,000 buds were sold, strawberry an acre and a quarter of lily of the valley for forcing, 5,000 plants grafted on the Chinese julyet, cherry tree plantation of five years' planting that this year gave a good crop, hollyhocks, a miscelaneous group of rhubarb and plants. The large greenhouse had nothing specially attractive just now. This place, however, noted for growing tea roses in solid beds, the plants being often of many years' growth. They are allowed to dry off during summer, and then summaged into new growth in the fall by liberal pruning and watering; the soil being peculiarly adapted for this style of management, so that when Klehm's roses do come in, they are much prized.

After viewing the grounds, long tables were spread out on the lawn and the ladies and friends of the family joined themselves with a bonafide lunch, which was much enjoyed, even the baseball cracks on the lawn after calling "bat long enough to partake. This game was between those located south of Randolph street, versus north of that street, the players being mostly wholesale men. The northsiders, as far as the game was

Mrs. M. L. BARNES is rebuilding after the spring flush.

J. B. TRULLY is the proud possessor of a fine collection of orchids, as far as the weather is concerned. It will take a long time to overcome the effects that the hot spell had on all classes of flowers. Carnations, as well as roses, are now very small, white flowers are in best condition, a few Belgians, such as the 'Duchesse', beginning to come in; the demand, however, is very light. Even the street men are beginning to get a good price for the few flowers they purchase.

C. C. Cropp of J. C. Vaughan's has left on a visit to Europe.

EDGAR SANDERS.

**New Orleans.**

The New Orleans Horticultural Society held its annual election Thursday, July 15. The following officers were elected: Ed. Baker, president; F. B. C. Cox, Jr., Newsham, vice-president; John Ellen, treasurer; (re-elected); Paul Abbe, secretary; (re-elected).

played, seemed to have the best of it, Harry Balsey umpiring the game.

When evening came, a meeting was called to order and a vote thanks was given with a hurrah to the hosts for their generous hospitality. The President then asked Moses H. DeWitt to address the members on their success in the growth of bulbs to take the place of imported stock. He reviewed the progress that had been made here. In tulips it was found they could not be grown with profit on the hills of the valley, but in gladioli success. They are planted three inch apart in the rows, and 35 inches between the rows, so as to give plenty of horse-power. Pips were carefully graded in the first place, and it took from two to three years to get them into the final forcing. The firm claims to get much more from the imported ones, easily getting good foliage with the flowers. The actual cost of growing the pips did not exceed \$2 per 1000, which statement was verified by reference to a carefully kept record of receipts and sales. This amount, however, only covered the labor in planting and cultivation. The land rent is a heavy, clay loam. A pasture was mowed and cropped one year before the pips were set. An inching with cow manure was adapted in winter now to prevent heaving that to afford any protection to the roots.

As regards cold-storing peonies, it appears only certain varieties could be detected from the country stores. These were found out by actual trial. For example, the old double red listed only two or three keepers, the new one, white, "one of the best sellers, but a week in the lemon center, three days, what is here called the top, and W. ledigi, being the longest keepers—30 days in good condition and six weeks in fair state of preservation. The long keepers, it appears, may be sent in the hard bud, and they rip up during the process of storing, while the short keepers will not open out in hard bud, but must be near expanding when put away; hence they will not stand the cold way, dry.

The next outing is expected to take place on August 10th, at the residence of W. ledigi, on invitation of Emil Buttnier, who is one of the noted growers of this district.

**Roads Town.**

F. C. Thom, 125 Milwaukee Avenue, has just finished erecting a neat retail establishment in five houses, 100 feet each, and store. The house each is planted with roses, carnations and chrysanthemums in large tubs and pots, palms, etc., with another for mixed bedding and other plants. Mr. Thom was met by J. C. Nibson & Co., 275 North Paulina Street.

C. Longenecker and the Dunn Bros. did not finish plating their chrysanthemums till near the end of July.

John A. Evans is in the city fitting up the ventilating apparatus in Washington Park Greenhouse.

**Market Enhanced.**

There has been no change in business from last week's report, although the week has been fairly good so far as the weather is concerned. It will take a long time to overcome the effects that the hot spell had on all classes of flowers. Carnations, as well as roses, are now very small, white flowers are in best condition, a few Belgians, such as the 'Duchesse', beginning to come in; the demand, however, is very light. Even the street men are beginning to get a good price for the few flowers they purchase.

# FLORISTS' EXCHANGE

We are a straight shoot and aim to get the most vigorous plant.

A WEEKLY MEDIUM OF INTERCHANGE FOR FLORISTS, NURSERMEN, SEEDSMEN AND THE TRADE IN GENERAL.

VOL. IX. NO. 31. NEW YORK, JULY 31, 1897. One Dollar Per Year

## ..PALMS.. PALMS, FERNS, ORCHIDS,

Owing to our stock being grown with plenty of air the plants are all strong and sturdy, and will bear transportation for long distances. Florists intending to purchase this class of stock for their fall trade will do well to place their orders immediately, so that they can have them shipped by freight, thus avoiding the excessive express charges which they would have to pay if shipped during the cold weather. The prices will also be every much higher in the fall than at the present time, owing to the high duty which will then be in force.

SEEKING REPORT.

Points and information from seedmen, and all interested in this column, solicited. Address Editor, Sixty-Nine Street, Florists' Exchange, P. O. Box 107, New York.

New York, N. Y.—More than thirty cities have just received some forcing bulb importations: full assortments of White Pinks, Southerly Hyacinths, and Gladioli, etc. Paper White grandiflori arriving last Monday on the steamer La Touraine. The Massachusetts opened up in very fine order.

The steamship, Orizaba, from Bermuda, La Touraine, from Havre, and the Massachusetts from London, arrived too late to clear before the new tariff law took effect. Two other steamers brought large cargoes of bulbs, and one large shipment of mushroom spawn. The La Touraine's Captain arrived at the custom house only four minutes late. This and the failure of a large quantity of the Roman Hyacinth. Consignees were F. R. Robinson, J. O. Vaughan, W. Ellis, J. S. North, J. Henderson & Co., and R. Dowling & Co.

Weeder & Doo received a large shipment of mushroom spawn. Sioux City, Ia.—The assets of the Sioux City Nursery and Seed Company, which have been in the hands of the court for the past year, will soon be either sold at private sale or at auction. The court was disposed to think that it would be better to sell the property than to hold it for another year as it was remarked that the creditors were almost unanimously in favor of the sale and of the stock being sold. The court fixed the date for the sale at July 30. The receiver will advertise for bids for two of the property in Iowa and in Michigan and the bids will be submitted to the court. If they are not satisfactory, then the property will be sold at public auction.

European Notes.

Nature's Treatment.

Nature's treatment is evidently bent upon assisting to put business once more on a fairly solid basis by checking and preventing the superfluity of supply. Only ten days ago it appeared as if some of our annual crops, both of vegetable and flower seed, would simply disappear in proportion to the average under culture. To-day we know that this is impossible. It is caused by the drying of the seeds, and by blanching sunshine, (as much as thirteen hours per day in London) and by the reaction in the direction indicated has received a severe and apparently permanent check. All over the seed grounds of Europe, the same conditions prevail. The bloom is dropping prematurely, and in many cases the seeds are so badly checked that no crop can possibly be formed. Sweet peas and even wintergreens are suffering badly, while the latter are being completely killed. Of course, a good rain would start the two latter affords, but sweet peas are bound to go on dry land.

Cress, spinach, mustard, and radish are being considerably lightened, particularly the latter; the latter seeds only showing four or five grains.

The seeds of cress are very much lighter so to present circumstances, and that is to be found in the fact that early ripening varieties such as the cress, lettuce, cabbage, turnip, rutabaga, and rape are all being harvested in the driest portions of the country. To be sure, the seed will be small, but it will be sound and capable of retaining its vitality.

It is being managed by sowing badly, both from the white worm and the beat. Carrot and onion continue to go back.

Har for 1897 is in the balance to-day, another week will decide their fate.

EUROPEAN SEEDS.

The Tariff.

An item omitted from the free list on our last week's issue, is:

Fruit plants, tropical, and semi-tropical, not for the propagation or cultivation.

Burpee's Sw of Pea Tests.

In our last week's issue we made an error in our pea tests devoted to each trial of sweet peas at Fordhook Farm (W. Atlee Burpee & Co.). Instead of four double rows of 15 feet each, or 30 feet to a trial,

ANTHEMUMS.

The plants intended for cut flowers must be looked after frequently, and side growths taken off. The number of flowers wanted, the leaders, either one, two, or three, as the case may be, must have all the strength they can possibly get, and all surplus growth, side shoots, suckers, and summer buds must be taken off as soon as they can be reached.

Some varieties are now producing these summer buds. One of these Mrs. Henry Robinson. Where this occurs in most cases two or three breaks will come, and these must be reduced to one—the strongest leader. If long enough, this should be brought up to the stake when soft, so as not to make a bend in the stem.

There are few varieties which show at this time black spot. Where the foliage becomes affected, it ought to be taken off and destroyed. Last year E. M. Bigelow was heavily affected with it. (U. S. Consul) over also showed it, but as the lower leaves are not needed and every day makes the winter flowers many stand more robust, the plants will soon grow over the black spot.

I find it only attacks certain varieties, others may stand diseased plants and resist the disease.

The most plants must also be frequently looked over and pinched back. The long-jointed growers I generally pinch for two or three times, and repeat again and again till the end of August. For compact growers, like Fred Walz, I pinch once or twice, as they will better perform themselves in good-shaped plants, but that class ought not to be pinched much after the 15th of August, or a little more time to make nice flowering stems, so as not to look straggled, which might happen if you keep pinching later than that date.

Fig. 2.—Newport's Gardens—Vineyard.

### Newport's Gardens.

Ochre Point which is one of the finest sections of Newport, remained longer unoccupied as a residence portion than any other part of the cliff lands of similar area. For a long time it was not in the market, and when it was mentioned for the uses to which it is now put, men shrugged their shoulders and said it was too far away, though some admitted that the time might come, as Newport kept growing as it had done, when it would come into the market. All this was but a few years ago, and now the transformation has been so complete that every inch of the territory is included in the villa sites of some of the wealthiest and most aristocratic families of America. One of these is that of Mr. John J. Van Alen, which is on the westerly side of the street and so not bordering directly on the sea. It occupies a whole square and is surrounded by a high and massive granite wall as if built for defence in time of war rather than for mere ornament. An attempt was made to cover this wall with *Euonymus scandens variegata*, but, though enduring the climate, it grew so slowly, and so obstinately refused to fulfill some of the promises made in its behalf, that it proved a failure. After several years' trial, the effort has been abandoned, and other climbers substituted as the chief dependence. This plant is valuable for many purposes, but covering high walls does not appear to become of them. Tree-trivays sweep around to the residence shown in the picture which is also of massive stone and said to be in its general style and appointments a copy of a favorite English country seat of some renown. Within, on either side of the gate, there is some good planting in masses of shrubs, including many of the species and varieties of native and foreign origin.

Southerly from the house is "the sunken garden," the prominent feature of which are shown in the illustration (fig. 1). It consists in an excavation of a few feet below the level being reached by stone steps from the ends and sides, and such a preparation of the soil and bed of flowers as is called for in such a location. Here, whether the winds blow high or low, all is calm as in a May morning. The observer at this point looks down and up, and upon the tops of the beds of flowers instead of at the usual angle. It is a pretty conception and suggestive of broader opportunities in other exposed locations. The whole place has much the appearance of a park well planted and cared for.

"Across the street but not directly opposite the Van Alen gateway is the entrance to "Vineyard." As will be seen by the illustration (Fig. 2), the lodge is a choice bit of miniature architecture with surroundings befitting the situation and affording a suggestion of the horticultural treasures within. The vines shown on the cottage are what we know as the wild grape, *Vitis vulpina*, and it cannot be denied that this home production is exceedingly well fitted to the purpose to which it is put. The cottage stands a little back from the street line and the privet hedge which borders the highway curves inward to the building. This leaves a small space such as in most cases might have been left vacant. But not so here. It is occupied by a bed of choice evergreens, a portion of which only is shown. An originally arranged, there was a border of low-growing retinosporas, such as *R. graciloides* and *R. obtusiana*, behind which, steadily increasing in height, stood rows in various shades

of color to the last, which constitutes a wall of dark green including such plants as *Faxus laucata*, junipers, and others harmonizing in color as well as in proportion. Most of the darker plants at the right are silver-tipped retinosporas, while among those of a lighter shade, *R. plumosa aurea* predominates. Some, however, are what are known as Chinese golden arbor vitas, *Thuja orientalis elegantissima*, or *Biota orientalis aurea*, which name is here most in use and greatly to be preferred, and for which there is abundant authority. The silver-tipped *Biota* also appears in this group and is very effective here as well as elsewhere. These plants are not supposed to be sufficiently hardy for our northern climate, and they are not without slight protection from high winds and extreme cold. But the lover of beautiful foliage plants can well afford extra care and trouble for the sake of best results. None of the Newport gardens would be what they are, if, when planted, they

were not given more than ordinary care and attention, both in arrangement and preservation. It is safe to say that any one may get as much or more for his outlay with this choice and more costly specimens with the additional care required, than with the use of only those which need no looking after. When this group was put out, I ascertained by actual count that it contained 190 of these small conifers, though as the years have passed and they have increased in size, the thinning-out process has greatly diminished the number, and there still a further call for depletion. It is always well in planting such groups to put them so thickly that they may assist each other in their war with the elements and whatever adverse conditions that may exist, and that in a season requires, remove to other locations the surplus stock, when it will often be found that the value of the plants removed, now of larger size, will equal the first cost of the original outlay. The danger is, in such cases, that the thinning-out process may be too long delayed, and so when attended to, the plants taken away as well as those that remain are practically spoiled. There are specimens in these very grounds within which are rendered practically worthless for either the position which they now occupy or any other in which they might be placed, through having been overcrowded during the past few years. This is a failing with owners of estates, gardeners and florists everywhere, and it is safe to say that a majority of the villa grounds of Newport are suffering from this cause.

The next estate in part opposite the Van Alen grounds, and to the south of "Vineyard," is that of Cornelius Vanderbilt, the most magnificent of any in the city, of which I may speak more in detail later. Here literally, millions of dollars have been expended in building and equipping a summer home, and the three estates standing together, with that of Ogden Goeckel adjoining northerly, doubtless make this the richest field for horticultural study and inquiry, on private grounds in America. These gardens bear little resemblance to each other as a whole, though it is evident that "Vineyard" and the "Breakers" came from the same school of landscape art architecture, if not from the same hand, which is the fact.

The other estates on Ochre Point, though not embracing so many acres, are equally well planted and worthy of study. They are all enriched in their season with plants from the conservatories, though of these I have said nothing, as they constitute a theme by themselves. Newport is proud of her florists, as well as her floral decorations and their profession.

L. D. DAVIS.

CARNATION ROS.

Buttercup.

Ordinarily Buttercup is not profitable, still it is grown by a good many, and perhaps by the majority merely for the sake of variety. Its grand color alone might be said to be responsible for its existence to-day. It being in commerce now we need to locate years.

Many carnations have been disseminated since this variety first made its bow, and have passed out of cultivation and are forgotten. Many of these were of better habit and much more profitable than Buttercup, but the latter, with its perfect color, still stands and will continue to hold its present position until we find its equal or superior in color, vigor and health.

We have a number of yellow carnations, the majority of which are better grown than is Buttercup, but none are its equal in color, so if we make color the standard to judge by, Buttercup must still be regarded as the best yellow. But if we look at it from a commercial standpoint, several candidates present themselves, which, under ordinary culture, will outlast it.

It appears a little strange that in all this time we have not been able to improve upon, or equal, the color of Buttercup. Other colors have been improved to a much greater extent, and why yellow should lag behind is a subject that might prove interesting if investigated. It must be admitted, however, that in the past few years this color has received more attention at the hands of hybridists, and, as a result, we have Eldorado, Mayor Eugene and others, which may assist in producing a successor to Buttercup. In addition to those many seedlings have been produced, and also seedlings, some of them pure yellow, showing no markings at all and which, while they may not be counted as awards of this exhibition, may prove of value for further crossing.

If it appears as if the present activity among hybridists continues, we may in the near future behold Buttercup's successor, and the best specimen of growing this variety should give it the special treatment it demands, and it will probably be the one to win the many features that are constantly reported.

It used to be our practice to place the plants in a cold bed, as many perhaps still do, and as usual a large number would die before housing them in the house, or they would die during the course of the winter.

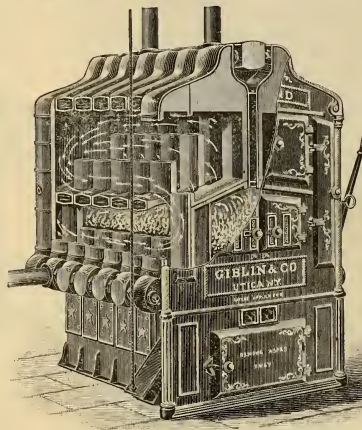

I am not prepared to state with certainty the reason for this, but believe it to be due largely to changes in temperature and excessive moisture in the soil. The latter, I believe, is quite a factor in producing the disease peculiar to Buttercup.

When planted in clay soil, which is, as a rule, stiffer, higher and drier, than lighter soils, the percentage of diseased plants is perceptibly smaller. Noting this difference, and ascribing it to the above causes, we responded to Buttercup with a possible means of growing Buttercup with profit. If sudden changes, washing rains, heavy dews, or a heavy frost without snow showing when planted outside, certainly the greenhouse was the proper place to grow it, for under these elements were quite under our control.

Our first experience with indoor culture was to produce in a cold bed, but also to improve over field-grown plants. I judged, however, that the soil had contributed to do with this, if we made entirely too light. The following year this was corrected, and instead of using a light soil, we used a heavy loam with about much manure, but with plenty of bone meal. I found it much better to allow the plants to get well established, and then give liquid manure instead of adding much manure to the soil. It seems to me better to put the soil without a great deal of humus, and continuing on these lines, Buttercup has scarcely a plant will die in an entire season, and I continue to grow it in a cold bed, and find that it is doing much better and yielding better than my yellow we have, and it is not so liable to rot. With Buttercup it seems extremely liable to stem rot, and under ordinary treatment, it is almost completely gone when the causes are removed, and under all circumstances it seems to be almost impregnable to stem rot.

H. WEBER.

NEXT WINTER...

PROFIT

Rev. W. V. NOLAN, Rector of the Pro-Cathedral, Sioux Falls, South Dakota, March 8th, 1897, says:

"The No. 65 Standard sectional hot water heating apparatus put in our parlor residence is most satisfactory. It heats the entire house even at the coldest season. We have had it 26 DEGREES BELOW ZERO, and that was sufficient to give it a fair test."

Our estimate and full information with prices can be had for the asking. Where we have no boiler, we will use the first order receives a SPECIAL ALLOWANCE.

at the end of the season. Our heaters can be erected for efficiency, economy and simplicity, and that they do good work in cold weather is shown by the following:

Hitchings &amp; Co.'s New Boiler—Sectional Cut Showing Interior.

### New Greenhouse Boilers.

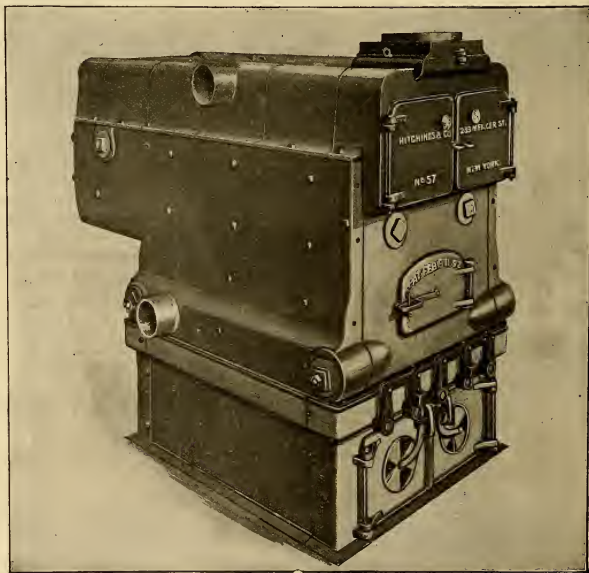

This year some of the New York boiler manufacturers are placing on the market new styles of boilers. Among these is No. 57, made by Hitchings & Co., 233 Mercer Street, of which, through the courtesy of the firm, we present the accompanying illustrations. The boiler is equally serviceable under either the open circulation or the high pressure system, each boiler being tested under a high pressure before leaving the factory. These boilers, the firm says, have been in use during the past two years under heavy service, and have proved themselves equal in efficiency and in economy of fuel to the widely known "Corrugated Firebox" boilers, and have the especial advantage of being "sectional," which admits of their being easily handled. These boilers have nine water sections, each section subjected to a hydrostatic pressure of 160 pounds to the square inch, the joints are of the same material as the boiler (best cast-iron of high tensile strength), accurately fitted and are absolutely indestructible. The grate has 8½ square feet of surface, the fire-box is deep, with adjacent chambers assuring perfect combustion. The draught is regulated by a graduated cold air damper to suit various chimneys and the work to be done.

The length of No. 57 boiler is 62 inches, width 49½ inches, length 76½ inches, weight 4,700 pounds, height to center of flow sockets is 25½ inches, to center of return sockets 23½ inches. The sizes and positions of flow and return sockets may be varied to suit special requirements. The boiler is provided with grates suitable for the consumption either of egg or pea coal as may be preferred.

The Lord & Barnham Company of Irvington, N. Y., and 160 Fifth Avenue, New York City, are bringing out some new boilers adapted for heating greenhouses and residences, which are shown on the accompanying illustrations. Their Standard boiler has been on the market for 29 years, but recent improvements to increase its efficiency have led to the construction of an entirely new set of patterns, in which an increased fire surface is provided, as well as a fire travel which is designed to extract the principal heat

from the products of combustion previous to their exit. Fig. 1 shows a vertical section of the boiler, looking towards the front, from which it will be seen that a large surface is exposed to the direct radiation from the fire. In Fig. 2 the fire travel is shown, the gases rising from the fire at the front of the boiler and passing under a thin, flat, horizontal water chamber to the back of the boiler, where they rise again and pass under the dome of the boiler to the smoke outlet at the front. This construction provides an ample combustion chamber and a sufficient depth of fire chamber to permit of a sufficient body of fuel to carry a fire through long winter nights. The flow and return connections are made by means of flange joints, so that the heater may be readily disconnected for making changes. The grate is of a construction to be readily operated and at the same time promote combustion by permitting a free entrance of air to the fire. The boiler is made in four sizes, presenting respectively 2, 2½, 3½, and 5½ square feet of grate surface, and rated to carry 450, 650, 1,050 and 1,650 feet of 4-inch pipe, which is approximately equal to the same number of square feet of surface in the form of radiators. Two larger sizes of the heaters are arranged to be set in pairs, when they are rated to heat from 2,100, 2,700, and 3,300 feet of 4-inch pipe.

Another new boiler of the sectional type is shown in Fig. 3, which is a broken view showing the construction, the fire travel and the arrangement of the heating surface. The sections are mated by means of a machine-finished surface, into which small grooves are milled, which are brought up tight against asbestos gaskets by means of a long tie rod running through the sections, as shown, which, it is said, secures a perfectly tight joint with little labor. The intermediate sections consist of a water leg forming the side of the ash pit and fire chamber, and at a sufficient distance above the fire line to permit of an ample combustion chamber, and three slanting waterways, one above the other, the bottom one being the smallest and the others increasing in size, run from the side water legs and connect with a central column which runs to the top of the boiler. This construction permits of an unrestricted upward circulation and an internal circula-

Hitchings &amp; Co.'s New Sectional Tubular Hot Water Boiler, with patent Shaking and Dumping Grates.

tion. It also permits the direct impingement of the fire on all of the slanting waterways, and has the effect of increasing the size of the combustion chamber so that the gases may be thoroughly ignited and consumed, all of which tends to increase the power of the boiler. At the back of the boiler a diving tube is formed by two solid water sections, a fire and damper being placed in the rear section

the Avenue, Brooklyn, N. Y., and 231 Water Street, New York City. In Fig. 1 we show a Y-fitting, in Fig. 2 a fitting with three outlets, and in Fig. 3 a manifold. These fittings are made adapted for 1 1/4, 1 1/2, and 2-inch wrought iron pipe, the centers being respectively 3, 3 1/2, and 4 inches for the different sizes. Fittings similar to Figs. 1 and 2 are made with a larger sweep, to reduce friction, and are

the average stock, at 2c. to 4c. some fancy Kaiserin selling as high as 8 cents. Sweet peas are getting to be of very poor quality, and drag along slowly. Snail's also is poor, brings very low prices and sells slowly.

**Jettison Here and There.**  
Mrs. Alexander Cella of East St. Louis, well known to all the florists in this vicinity, having been connected with

Rivers caused a great deal of seepage throughout the town, and most all of the gardens were too wet to permit any planting until too late. Under the circumstances, the florists have a great many bedding plants on hand. M. H.

**Sea Cliff, L. I.**  
Ferdinand Boulton has extended his vi-

Fig. 1. A Y Fitting.

Fig. 2. A Three Outlet Fitting.

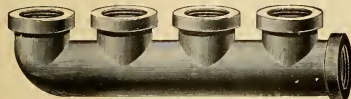

Fig. 3.—A Manifold.

SCOLLY'S SCREW JOINT GREENHOUSE FITTINGS.

so that a direct draft may be effected to facilitate starting the fire. On closing the damper the products of combustion must dive to the bottom of the boiler before they can rise and reach the smoke outlet at the rear. It is pointed out that the boiler presents a large amount of direct heating surface in proportion to grate surface provided. Large doors are provided in the boiler for removing any accumulation that may form on the surfaces of the boiler. A grate is provided of the labor-saving type. The pipe mains may be connected at either or both ends of the heater, as desired, by means of flanged elbows. It is pointed out that the boilers may be used successfully with any kind of fuel. They are made in four sizes, composed of 9, 10, 11, and 12 sections, and have respectively 10, 12, 14, and 16 square feet of grate surface, rated to carry 3,500, 4,200, 4,900, and 5,900 lbs. of coal. Where large capacities are required the boilers are adapted for double connections, when they are estimated to heat double the amount of surface given above. An eight-page circular giving full description, illustrations, dimensions and ratings can be secured on application.—Metal Worker.

made with 3-inch supply and 2-inch outlets. Fittings of this type are adapted for many special purposes in heating work, and owing to their being threaded, will be found a convenience by the trade. The Scollay pipe joint is another specialty adapted for connecting pipes. With it a tight joint can be made with wrought iron pipe without the use of threads, and in case of a defective piece of pipe it is only necessary to cut out the defective part and insert a good piece of pipe of the desired length without removing or disturbing any other parts of the pipe when this joint is used. A circular has been prepared showing the variety of fittings and this pipe joint that can be secured on application.

**St. Louis.**

**Collections are Wretched.**  
The florists are enjoying enforced vacations from work at their own expense now, and there is much complaining of the dullness of the season, but it does not seem that things are any worse this year so far as business is concerned, than in the last few seasons except in the

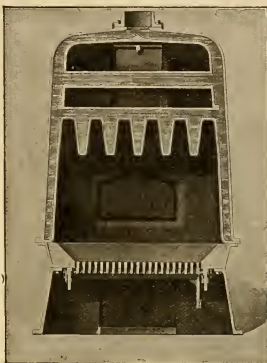

a number of flower stores in this city before her marriage to Mr. Cella, died on Tuesday, the 20th, and was buried on the 22d. She had been troubled with nervous affections since the storm of last year, and a fright from storms of recent occurrence is supposed to have been the direct cause of her death. Much sympathy is expressed among the florists at her untimely taking off.

Jordan Floral Company have a very pretty design of artificial flowers which almost fills their window and makes quite a pretty display these days when natural flowers will so quickly wither.

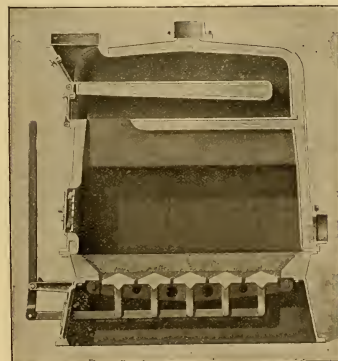

The Ostering Bros. have been busy all summer and are still hard at work getting up a stock of prepared natural palms with which they expect to supply their orders this fall. The boys have worked up a very fine business in this line during the past year and will unques-

tionably do well with them the coming season.  
A trip to Calis, recently showed that the florists of that section have had a very hard time this past spring. The high water in the Ohio and Mississippi

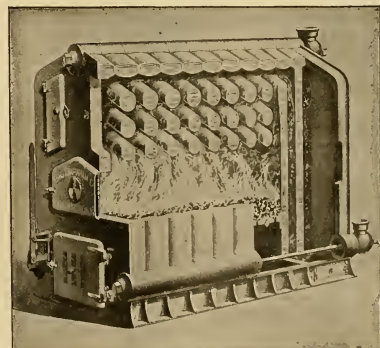

let-growing plant this season very considerably by the addition of three new houses, which are already planted with 6,000 Marie Louise. The houses are built in the most approved modern style and are very conveniently fitted in every way. They are of the following dimensions: The center house is 22x150 feet, and the two side houses 10x150 feet. The heating of these houses is being done by Hitchings & Co., who have put in one of their new pattern sectional No. 57 boilers. In addition to these new houses this boiler will, in moderate weather, heat a large proportion of the entire establishment, being connected so as to relieve other boilers. Other houses already planted with violets are: One 12x100 feet, filled with the Princess of Wales; three others, 10x140 feet, with the same variety; one house 14x150 feet, contains Lady Home Campbell; another house

Lord & Burnham's New Boilers. Fig. 2 Longitudinal Section.

Lord & Burnham's New Boilers. Fig. 3 Broken View of the Sectional.

**Scolly Joint Greenhouse Fittings.**

An extensive line of hot water-fittings of the greenhouse type threaded for use with wrought iron pipe is being put on the market by John A. Scollay, 74 Myr-

matter of collections. They are simply wretched.

Asters are coming in of fair quality now and sell at \$1.50 to \$2 per 100 for the best. Carnations run at \$1; roses

tionably do well with them the coming season.  
A trip to Calis, recently showed that the florists of that section have had a very hard time this past spring. The high water in the Ohio and Mississippi

20x80 feet, is filled with Swanley White, Equabar and Lady Campbell, while five other houses 12x60 feet, are filled with Marie Louise, and about 400 feet of cold frames with California, thus making 20,000 plants in all.

### Providence, the Convention City.

Owing, probably, to the natural beauty of the city and its suburbs, the enormous beauty placed in its immediate neighborhood on the bay, but little attention was given by the citizens of Providence to the subject of public parks till its comparatively recent growth bid fair to make the country too important to be easily reached by the busy population of the city. Until within practically a decade the parks of Providence were in an undeveloped condition, but certain elements are prominent in these breathing places that, properly developed, will form a part of the best parks in any city in the country. Already considerable advancement has been made and now considerable pride is taken by the citizens in these beauty spots of nature, for but little artificial development has been, or will be, necessary in laying out and improving them.

Fortiably appropriate is the naming of the city of Providence of its largest and principal public park after Roger Williams, P. S. F. as he has long been known to be in its naming there is a historical as well as sentimental significance that two centuries after Roger Williams had founded the city of Providence, and by the famous Indian sachems Canonicus and Miantinno in token of their good will and of the friendly relations existing between the two nations, the city of Providence in the south-western part of the city about two miles from the city hall, and at the time of its gift to the municipality, the land was a swampy and wooded land, with gentle rising, vegetation and a stream of water. Years passed and no effort was made by the city to improve this beautiful site. Finally, about ten years after its receipt, a small tract of land was set aside toward the protection of the monument that had, in 1877, been erected to the memory of Roger Williams, in accordance with the provisions of the will of the testatrix. The attention of the public was called to this most beautiful spot, and it was not long before a gradual improvement was commenced, and marvelous work has been done. The original grant has been added to by purchase and donation until there are now 430 acres of beautiful park land. The park is divided into parks that are artistically laid out with beautifully diversified walks and drives, and a series of pleasure spots, leading toward the protection of the monument that had, in 1877, been erected to the memory of Roger Williams, in accordance with the provisions of the will of the testatrix. The attention of the public was called to this most beautiful spot, and it was not long before a gradual improvement was commenced, and marvelous work has been done. The original grant has been added to by purchase and donation until there are now 430 acres of beautiful park land.

The original grant has been added to by purchase and donation until there are now 430 acres of beautiful park land.

Let us pay an imaginary visit to this park. We board an Elmwood car and ride to the first stop. The car has not yet had the distance between the first bonnet yard laid out in Providence. Just before we reach the first stop, we see the magnificent building of the Gorham Manufacturing Company.

After riding a short length of a mile alongside the park where we have an excellent view of the expansive fields surrounded with spreading oaks, maples, birches, cedars, and pines, with acres of open green sward relieved by beds of decorative shrubs and flowers, we descend at the picturesque rustic waiting room, where the architect of the handsome new building, the spacious main building, and in the distance the large barn, has been made to harmonize with the modern architecture contrast greatly with the old gambrel-roofed homestead which is the subject of the present approach. This is the house of Miss Williams on the same site that it has occupied for more than a century, and is preserved for ages to come if the elements

permit. In front of this is the handsome monument of the founder of this plantation. The base is massive in its solid construction, with a large figure of the founder of the city, the monument of the Museum of History embellishing the famous name. The whole monument is mounted by an ideal figure of Roger Williams, the founder of the city. The most existing examples of the "old oaken bucket," with its long sweep and dripping sides, are to be seen in the old adobe to the lakes, and by devious ways we wind our way among the hills and knolls until we arrive at the new best-house on the one hand or the grand museum building on the other. At the former building we arrive at the Superintendent, Joseph D. Fitts, a most practical man, under whose direction the florists and horticulturists of the city, forestry and arboretum of the park is making rapid advancement. Mr. Fitts is one of the officers of the Rhode Island Horticultural Society, and is invaluable in the responsible position which he holds in the park.

Looking from the Superintendent's office window, in the center of a fantastic park, we see a flower bed that will be strikingly familiar to the members of the S. A. F. as he has long been known to be in its center part. The rose leaf of the hedge is in the garden and in the red and green variegated arbutum. The flowers and horticulturists of the Superintendent Fitts in honor of the convention. The museum building has been built in the responsible position which he holds in the park.

Throughout the park, the larger specimens of the trees are labeled with the name of the tree and a brief description of the sections where each is found, and as Rhode Island is especially famous for its trees, the Superintendent has excellent opportunities are here afforded the student in forestry. Another feature in the park is the fact that many of the trees that have been set out here annually on Arbor Day by the pupils of the public schools, are labeled with the name of the tree and bears an appropriate inscription plainly printed upon board. These trees are labeled with the name of the tree and bears an appropriate inscription plainly printed upon board. These trees are labeled with the name of the tree and bears an appropriate inscription plainly printed upon board.

There are about 103 miles of driveway and 125 miles of walks winding in and out of the park. The park is in a state of improvement. The lakes occupy about 130 acres and there are a large fleet of row boats and steam launches whereby one can enjoy the scenery of the park without traversing the same course twice. For the maintenance of this park the city has appropriated \$130,000 in all directions. The park is in a state of improvement. The lakes occupy about 130 acres and there are a large fleet of row boats and steam launches whereby one can enjoy the scenery of the park without traversing the same course twice. For the maintenance of this park the city has appropriated \$130,000 in all directions.

Next week I will devote attention to the subject of the S. A. F. program for '97.

### S. A. F. Program for '97.

The program for the Providence convention of the S. A. F. does not differ materially from any of its predecessors. There is the usual matter of reports, says, and an innovation in the form of a discussion of "A Year's Progress in Our Business" divided into sections, the first part being devoted to the carnation, chrysanthemum and rose; the second to decorative trees and shrubs, beds and decorative plants and the retail business. It is to be hoped that the discussion will be confined strictly to the actual progress that has been made within the past year, and that the convention will not be diverted into the usual matter of reports generally known. In all kinds of ways, it is a suggestion, in order to save the time of the convention, to be on the part of those entrusted with the duty of preparing the subject matter, should suggestions be carried out to the

whole discussion can be curtailed very considerably.

The illustrated lecture by Professor Goodale, which occurs at the evening session of the second day of the convention, will be given by the author of the "Old Plants in Their Own Homes," will doubtless prove as interesting and instructive as the one given by the author at Boston, where it was thoroughly enjoyed. We hope this lecture will be a success.

The special medal competition should be the means of drawing out exhibitors and the exhibition of the same rate with the resulting honors to be awarded. Carnations, tuberoses, begonias, and other plants, and the exhibitors are the subjects to which encouragement is to be given in the manner indicated, and the results to be given to 680 of last week's issue for particulars.

The entertainment portion of the program makes provision for those sports, etc., which have heretofore been indulged in and enjoyed, and there is every evidence that they will be equally satisfactory and successful. The ladies will be well looked after, and bowling, shooting teams will, as usual, demonstrate their skill, while an excursion down the bay to the water and a shore drive will cap the climax.

The central location of the convention city, the excellent facilities for a large concourse; and those who have suggestions for the "good of the order," without any prejudicial or unfavorable features, are invited to send them. There are heard in several quarters the perennial rumblings of dissatisfaction directed against our order, as accomplished by the S. A. F. in the past. Nothing, however, is suggested whereby our order may be improved under conditions may be improved. Let the wisecracks who have, in their estimation, better ways of conducting the business of the society should tread, than have those who now manage its affairs, come to the fore. The Providence affair will all be happy yet.

### Convention Souvenir Program

Those who desire to advertise in the Souvenir Program of the 13th annual convention of the S. A. F. should send their advertisements to H. C. Ayler, Providence, R. I., who has charge of the program. The following rates are in full: Whole page \$20, half page \$15, quarter-page \$7, and all contracts will be accepted by the club.

### New York.

#### Wholesale Market.

The severe gales which prevailed during the early part of the week completely paralyzed what business might otherwise have occurred. Fortunately, the supply was light so that the loss was not large. On Thursday and Friday the market has been better. It is possible that a revival of business may be expected, especially with out-of-town trade.

Good roses are still scarce and while few are to be found recalled fair figures. Asteri are a prevalent and are selling for 75c per bunch of one dozen blooms; even then, quantities remained unsold. Gladioli are a little better, but still selling at \$3 per 1,000. A new nice bright hair \$2 per 1,000; L. auratum \$3 and \$4 per 100.

H. A. Hoffman is now doing business in New York City, 100 West 42nd street. Mr. Hoffman is very proud of its appearance, and just so, for it is one of the best of its kind in the city. The floor is 23x35 feet and carries over 100 running feet of tables, which are made of the best of the woodwork and all surroundings in white, it presents an extremely neat appearance.

J. L. Kaynor was able to come into business for a little while on Thursday, having been laid up for more than a week.

#### Retail Trade.

There is but little going on in this line; most of the help are out on vacation, while those at home have but little to do. Stamen work is not doing so well as it has been seen as by any of the outgoing lines.

Secretary Young requests that he be notified by the different clubs and individuals of any new plants or countries which intend going to Providence in New York, so that provision may be made for their care. Notice should be given to the secretary one week prior to the date of the convention.

### Exclusively a Trade Paper.

### For the Busy Man.

Over ten million feet of glass is now insured in the Florist's Hat Association.

Greenhouse building is at its peak this year as several leading firms are placing new boilers on the market this season.

Articles from our columns going to the Providence convention, by way of New York should notify Secretary Young a week before date of convention. The New York office tends to give the delegates a receipt.

Best management is to arrive too late last week to escape the working of the new tariff act.

### "The Water Garden."

Owing to the expensive character of this work, the publishers have been compelled to set the price at \$1.50. The volume is now on the press, and every effort will be made to publish it at the date specified in the advertisement. Subscribers' Orders are coming in rapidly, and all who wish to secure a copy of the first edition should apply promptly. The work is artistically, in every way of undoubted value, and the typographical appearance of the book fits it a magnificent product of the printer's art.

New Greenhouses.

Lord & Burdham are building for Henry Henthall, Madison, N. J., four rose houses 20x17 1/2 feet and one propagating house 8x17 1/2 feet; for Thos. Galvin, Boston, Massachusetts, six similar and store houses intended to be a most ornate and elaborate piece of workmanship; also for J. H. Hedges, 1111 1/2 St., four commercial houses; for L. A. Noc, Madison, N. J., three rose houses 18x32x10 and three 18x18x10. Comm. an iron rose-house 20x15 1/2 feet. This firm are also the architects for the New York Hotel, Buffalo, N. Y., and the following contracts: For J. C. Couals, Hartford, Conn., a rose house 100 feet long; for J. M. Albany, N. Y., one house; E. J. Taylor, Southampton, Conn., three 100-foot carnation houses; the material and labor for G. Herman, Orange, N. J., nine commercial 150-foot houses; W. J. Lutz & Co., Buffalo, three houses 12x25 feet and one house 19x10 1/2 feet. They also are rebuilding the conservatories at the White House, Washington, D. C.

In addition to the above, both the firms mentioned are doing a large amount of work for private individuals, specializing generally the greenhouse building this season has not suffered to a corresponding degree as in the past, they are being fully as much new glass going up this season as formerly.

Buffalo.

Mrs. D. Newlands is having her houses painted and overhauled after the season's rush. Business has been very satisfactory.

Will Milley and E. J. Buxton will probably accompany the bowlers organized for the 10th of August, who he feel confident, with these additions, to beat anything in sight at Providence. S. A. Lockport, who has been expected to escort Messrs. Long and Scott, who are just now hustling to leave everything in shape for their next excursion, says that Mr. Cowell will be there to lead dignity to the occasion, although he is engaged to be married. The new range of houses soon to be erected and placed under his supervision.

H. T. Cox of Erie, and T. Mansfield of Lockport, will accompany the boys from the Bison City. W. M.

Beneficial Effects of Weather.

Our hot spell has been succeeded by a wet one, unusual in character. It is not only a relief to the crops, but it actually retards to an extent detrimental to all outdoor matters. Some carnation plants, for instance, that suffered from drought in June, now bid fair to look in banking a desired growth on account of the humid moisture. Many expected fine effects on lawns at this time present be draughted looks.

Barren News. In flowers, sweet peas and carnations have become more plentiful in quantity and some roses from young stock, though small, betoken improved quality for the new season. Asteres are also in to add to the variety.

Noting. William Scott, as president of the Buffalo Scottish Society, in a formal manner saw the annual game played on Saturday of last week.

W. L. Milley is spending a week made a quick trip to Oil City and Bradford. For instance, that suffered from drought in June, now bid fair to look in banking a desired growth on account of the humid moisture. Many expected fine effects on lawns at this time present be draughted looks.

John Fisher has rented and taken possession of George Eckert's place on E. North street.

College vs. Pa.

The wrestling here at college crops very materially all over, but this week has been about the same as last year in which to plant some more of our own. We have had an abundance of rain during the past ten days, and it has made the celery plants grow strong and heavy.

CHRYSANTHEMUMS.

Stock mainly in 3 1/2 in. pots, will now offer succulent plants for sale. The following are for sale at reduced prices the following: From 2 1/2 inch pots: Perry, Mass., P. Perle, Germania Picher, Yellow Gown, Mrs. W. H. Hedges, 111 1/2 St., 100 for \$7.50; Modeste, Liberty, Chabazera, Mrs. E. Beattie, etc., \$3.00 per 100; 50 for \$1.50. For less than 100 plants add 10 to 100 rate quoted. Name substitute varieties if agreeable.

# MASTICA

FOR GLAZING GREENHOUSES. SUPERIOR TO PUTTY IN EVERY WAY.

Is not hardened by the extreme heat or cold that a greenhouse is constantly subjected to both inside and out. Mastic is adhesive and remains permanent. It is not forced out of place by expansion and contraction of the woodwork. It is placed in a tub Mastic. It is not need re-putting. It is saving time and expense. With Mastic only. It is used on the outside, but with a machine only.

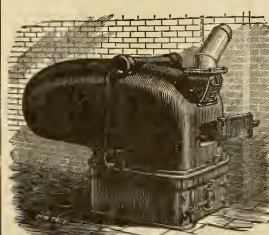

HIGHEST AWARD OF SOCIETY OF AMERICAN FLORISTS AT PITTSBURGH, 1895.  
 Put up in gallons, \$1.00. Half gallons, 60c. Quarter gallons, 35c. Mastic Glazing Machines, \$1.00 each.

Send for full descriptive circular and testimonials. Agents in all the principal cities.

# THE FLORISTS' EXCHANGE

We are a straight shoot and aim to grow a vigorous plant.

A WEEKLY MEDIUM OF INTERCHANGE FOR FLORISTS, NURSEMEN, SEEDSMEN AND THE TRADE IN GENERAL.

VOL. IX. NO. 32.

NEW YORK, AUGUST 7, 1897.

One Dollar Per Year.

## ..PALMS..

Owing to our stock being grown with plenty of air the plants are all strong and sturdy, and will bear transportation for long distances. Florists intending to purchase this class of stock for their fall trade will do well to place their orders immediately, so that they can have them shipped by freight, thus avoiding the excessive express charges which they would have to pay if shipped during the cold weather. The prices will also be very much higher in the fall than at the present time, owing to the high daily which will then be in force.

### ARECA LUTESCENS.

1000 seeds, per 100, 600 at 1000 rate.

**SEED TRADE REPORT.**

Points and information from seedmen, and all interested in the column solicited. Address Editor SEED TRADE, care of Florists' Exchange, P. O. Box 1867, New York.

New York—Samuel Cole, Ventura, Cal., sailed for Europe on Saturday (today). He has been making a tour of the Eastern states.

Long Island Seed Crop—The harvest is almost ended and the crops are being taken in. The result is about as we have stated.

California—Less than we anticipated, owing to its bad condition. There is, in some sections, much shrunken seed, owing to the blight. Some pieces will be light on account of the seed having sprouted in the field. About two-thirds of the growers have lost heavily from the seed shelling out before it could be gotten in, and only one-fourth of the growers, those in favored spots, have secured very heavy crops. It is not safe to reckon more than half a crop. But as the average planted was large, no great shortage need be feared.

What are the Prospects in the question we hear on every side, and there comes no answer; all are anxious to hear, and but few seem willing to say much. But there is evidently a much better feeling all around, and prices have, in some lines, materially advanced.

Where there was a surplus there is now a shortage. Six months ago the country seemed deluged with stamach, now the prices have materially advanced. Large sales have recently been made at a good figure, and it is safe to say that it will bring today 50 per cent more than it

could have been bought for three months ago.

The outlook for peas and beans is just as bad as it is possible to be. The large field crops will undoubtedly be disposed of at good prices, and the market cleared up so that the future transactions can be done on a paying basis.

The tariff question seems to have been settled very satisfactorily to the trade in general. Those who have large growings in Canada as well as those who import largely for retail and commission trade, are well pleased with the result.

Some of our large bulb importers are very happy, as they now find that the foreign surplus of Dutch bulbs will no longer be thrown upon our market, after our dealers have supplied, and prices ruined by auction sales of surplus stocks, which are not likely to be held here, as the growers will hesitate long before paying 25 per cent, on their catalogue prices, unless they can be placed over the auction block. But where our trade is to be benefited, very materially strengthened, is in the fact that the foreign seed trade cannot avail itself of the advantages of our retail trade. Should the seedmen wish to import, they must pass through the Custom House, no matter how small the amount, and pay duties there for every reason to rejoice over the change. There is no reason why every possessor in our country should not be able to get the foreign seedmen, without his paying a cent toward the expenses of our government.

Many of the foreign seed men boast of the privileges they have in this respect, but they are not to be envied, as retail business of our country, basing their assertions on the fact that, owing to cheap labor, they can do it more cheaply than we can. We trust they will be disappointed.

At present the trade is on the anxious seat of inquiry into the means into which the government plan to fall. As of old, every one consumes the practice, and nearly every one is anxious to secure the contract. Secretary Wilson is to continue the fare; in fact, he is powerless

to prevent it, his hands being tied by an unscrupulous Congress. That he will do as well as he can earnestly hope; and the trade is anxious to know just how we are to be helped, but it is only reasonable to expect there will be another clearing out of surplus stocks, and we should not be surprised if it were done by different hands this year. The following extract from a private letter will show how one of the most important seed houses in our country feels about the matter. We wish all in the trade left in the same way.

"We have not yet learned anything about the government bid. We understand through the papers that Secretary Wilson will follow out the Morton plan of buying seeds already purchased. If this is the case, we are not in it. We are not prepared to put up seeds at such extremely low prices as they were put up last year. We do not believe any of those fellows made a dollar; and the only advantage we can see is that it made a market for some of their surplus stock. We have heretofore refrained from putting in any bids for the packet seeds, believing we could not make anything out of it; and we will not undertake to make any bids, but will not care for business enough to go to for "Erie Seed" for nothing and then have him for competitor by giving away seeds. It is a shame on our government to be doing this kind of business and destroying the industry of the men to whom, as you know, in nearly every case is hardly making ends meet; and for this conduct of the government is largely responsible."

**European Notes.**

The weather has drifted back into an unsettled condition again, but as the rain only comes to us in the form of thunderstorms, these are, of course, very partial in their visitations, and while some of our fields are now being deluged, others are dry and hard as a mandarin road in the full glare of the sun.

Cultivators are now being harassed and a very sorry show it makes, if contrary to our expectations the trade in this article should be brisk during the coming

season, many of the late orders will be filled with difficulty.

Let us be improving except on some of the drier lands in Germany, where the drought is very persistent; throughout the large and with an early harvest time, last season's shortages should be made good.

Endive will not be a large crop, but the seed should be of the quality if present conditions are maintained. The importance of this crop may not be so fully appreciated on your side as it is in Europe, but by those who have tested it early, the health-giving properties of the plant are fully recognized.

Cress and mustard are ripening in good shape; the acreage of the latter is not so large as usual, and prices are firm with a distinctly upward tendency. The same is true of rape, which now worth 50 per cent more than in August last. During the past season the demand for this article has been simply enormous, and a complete clearance has been effected. As already pointed out some months back, the average of this valuable crop left for seed is much smaller than last year.

The drought has still further reduced the crop, and with only a moderate demand, prices will continue to rise.

Crimson clover is more abundant than we had supposed, and some extra fine samples, both English and French, have been offered during the present week at very tempting prices. Some of the English farmers mixed a little with their red clover last year and are so well satisfied with the results that the practice will be more extensively pursued this year.

Mr. W. Atlee Burpee of Philadelphia, is in London.

Sweet Pea Cupid.—The following extract from the "Gardener's Chronicle" of July 17 fully confirms the remarks of the writer respecting Cupid sweet pea, which again, as your issue of the 19th inst. says:—

A few days ago, when visiting Mrs. Price's garden at Pen-Moel, near Chesham, we were surprised to have some excellent chumps of this variety pointed out to us by Mr. Simpson, the gardener. He had planted the chumps in some positions, and each of them was a mass of blossom. Some of the chumps were almost podding freely. Four seeds were sown in

London.

Let us be improving except on some of the drier lands in Germany, where the drought is very persistent; throughout the large and with an early harvest time, last season's shortages should be made good.

Endive will not be a large crop, but the seed should be of the quality if present conditions are maintained. a 5-inch pot in early spring, and placed in a frame, and after being thoroughly hardened off were planted out, but great care was necessary to prevent slugs from devouring the dwarf neat clumps. The garden at Pen-Moel is practically a lime-

stone quarry, and before trees and shrubs could be planted, the rock had to be blasted, and fresh soil carted in. The soil is highly impregnated with lime, and to that fact I have no doubt Mr. Simpson may attribute his success.

**Newport's Ocean Avenue.**

Bellevue avenue extends from the heart of the city to what is now to be known as Spouting Rock Beach, where the famous cliff walk outlined in a previous

article also practically terminates. At present many and costly improvements are in progress at this point, as the wealthy summer residents are many of them dissatisfied with "the old beach" since it is now the resort of so many ex-

**CHRYSANTHEMUMS.**  
The plants are now growing nicely and are all the way from one to three feet in height. I find Ivory this year a quick grower being up two feet and that too with most of them grown to three flowers. Mrs. H. Robinson grows very finely and she has the more I see of the better I like it. I really think it is, today, our leader in white, for its season.  
A good many of the new ones show well in growth, but a few of them are not up to the mark. This is especially the case with Western King. I think perhaps it is a matter of over-propagation, and hope that later in the season it will do better.  
At present give your soil a good stirring, cleaning it and the plants of weeds and decayed or bad foliage. Give the beds a top dressing of one inch cow manure. This will prevent the soil getting a hard shell on top, and at the same time impart strength to the plants. This top dressing will be sufficient for the present, and later it can be renewed.  
The first set of my specimen plants I put at the present time in 10-inch pots, and give them, at the same time, a low place on the floor of a 10-foot house. I find that the cooler the pots stand the better; the plants show a benefit in their growth, and are at the same time large enough not to be too far away from the glass. In case they grow very close, stake them here and there to draw them apart.  
I have a lot of young plants potted from the cutting frame in 5-inch pots the last part of June. They are now reported in 4-inch pots, and used for single-stemmed plants, or for small market plants in 3-inch pots, later on. Copy single stems in that class, Ivory, Mutual Friend, Helen Bloodgood, Vivand-Murel, and Golden Wedding come just about right in height and size; but later in the season they have to go into 5-inch pots, excepting Ivory and Fred Wald, both of which look better in 5-inch, which size pot will be large enough to give fine healthy plants. Theo. Beck.

**CHANGES IN BUSINESS.**  
NEWARK VALLEY, N. Y.—Mrs. W. H. Wright is building a greenhouse here, and will embark in the florists' business.  
OWENSO, MICH.—Herb B. Deal has rented the Central greenhouse.  
ROME, N. Y.—H. B. Boles of Syracuse, N. Y. has leased the Clinton greenhouses of Mrs. Cora Elwood.  
GLOVESVILLE, N. Y.—E. W. Giddings has leased his greenhouses on North Main street to E. Lockard of Brockton. Mr. Giddings will continue to reside at No. 254 N. Main street, his reasons for renting his business being that his daughter House doorkeeper at Washington and also the care of his father-in-law, the father, of which he is executor require all of his attention.

**EXHIBITIONS.**  
Indianapolis.—The final premium list for the eleventh annual Chrysanthemum Show and Floral Festival, given by the State of Florida, American Horticultural Association, has been issued. The exhibition will be held at Tompkins Hall, November 2 to 6 inclusive. H. A. McKeand, Garfield Park, is secretary.

Club Picnic.

The first annual basket picnic and held given by the Florists' Club was...

From present indications there will not be a very large representation of florists at the S. F. Convention at Providence.

Recent visitors were: W. H. Hill, representing the Andrews & Sons, Philadelphia, and C. P. Lohman of Lohman Company, Detroit.

Philadelphia.

The summer outing of the Florists' Club on Saturday last was a very enjoyable one.

Recent visitors were: W. H. Hill, representing the Andrews & Sons, Philadelphia, and C. P. Lohman of Lohman Company, Detroit.

CAPTAIN TEAM. BARBUS TEAM.

- Anderson.....15 Allen.....13 Colless.....15 Bell.....13 McKarher.....7 Tappin.....7 Jones.....9 Ball.....7

Next came the baseball game of nine composed of store men and growers respectively. This game created great excitement for the spectators.

Then came the sack race which was run in two heats. George Moss won the first heat and Philip Westcott being in the final, Plush won by one foot.

The wheelbarrow contest came next. This was won by a narrow margin 30 yards away, the contestants being handicapped. The prize was won by F. Adams and Philip Westcott being a good second.

Next came the potato race, about 100 yards in length. The first heat was won by John Fitchingham was the winner. The second heat was won by Mrs. Magee who proved herself to be an expert in this line.

Club Meeting. The meeting on Tuesday last was a very enjoyable one and was well attended. Four new members were elected.

The subject for discussion at the September meeting was "What can be accomplished at the S. F. Convention," and will be opened by Edwin Lonsdale.

The unfinished discussion, "Is It Policy to Sell to Department Stores?" was taken up by Mr. Allen K. Wells on Monday upon as he was absent at the last meeting. He stated that it was his policy to sell to the retail trade, and that the department stores always did this, he was glad to sell to them.

point, he thought it the best policy to sell to the department stores.

Robert Kilt read a letter received from a florist in the suburbs stating how the department stores had hurt his business.

William Eaton said he thought the up-town florists would have to establish a club in order to have some counter attractions about the plants bought at the department stores.

Convention Notes.

John Westcott, chairman of the transportation committee, made a report on the various routes to Providence, and especially the route of the Narragansett Railroad to New York, thence by Providence boat. This route was adopted by the club.

All going should at once notify John Westcott, Ridge and Lehigh avenues, who will have stationery reserved for you.

At the club meeting, besides routine business, there was an interesting outing were entered into. The matter was placed in the hands of W. F. Kasting, John Milley, and William Gray.

At the Botanic Gardens.

Professor Cowell can be justly proud of a collection of plants which he has collected in the vicinity of this gentleman's ability is a thoroughness showing in any line undertaken.

Exhibition Notes.

Several prizes and antirium were the specialties for which prizes were offered by the Massachusetts Horticultural Society.

Merchandise.

A party of representative florists of the Hub and vicinity gave a testimonial to Fred H. Mathison of Clematis Brook.

John Barry is at Sing Sing, N. Y. He is well and writes to his friends.

Charles Jackson Dawson is rusticated on the coast of California.

E. J. Welch returned on Monday from a month's outing at Old Orchard, Me.

John Barry is at Sing Sing, N. Y. He is well and writes to his friends.

Charles W. Alden, in the employ of the New York & Albany, was married on Wednesday at St. Peter's Church in South Boston, to Miss Margaret...

E. M. Wood & Co. are making extensive alterations at the Waban Conservatory in Natick. Two houses have been taken down and the new structure is being erected.

Weather and Crops.

Agreeable weather for the season now prevailing, the extreme rain-storms having subsided. A quiet shower in the early evening of Thursday last week brought a bit of hail, but no serious damage is reported.

The early ones are, in Queen of the Market, white, bringing at wholesale, \$1 per dozen bunches, the consumer, in turn, paying 10c to 15c per bunch. Sweet peas are plentiful enough, with quality only fair at present.

Decorative Plants.

Decorative plants are for an outing were entered into. The matter was placed in the hands of W. F. Kasting, John Milley, and William Gray.

Providence, The Convention City.

Swan Point Cemetery.

This cemetery may be reached by the electric cars of the Broadway, Elmwood, Olneyville, and East Providence routes...

The car leaves Market Square and about twenty minutes ride will reach the steepest inclines in the city, over which runs the only cable tramway in Providence...

Across from the court-house is the Athenaeum, a small and handsome granite building of the Grecian temple type...

We are now riding through the arborescent enclosure of the Swan Point cemetery, which is situated on the east side of the hill...

Here we follow the handsome new driveway, the cars of the cable tramway, passing the extensive greenhouse plants of Timothy O'Connor and E. J. Johnston...

Next is the beautiful grounds of the Butler Hospital. In 1874 a former patient presented to the hospital a cemetery called the "Conservationary."

Swan Point Cemetery adjoins the grounds of the Butler Hospital to the north, and for more than half a mile follows the river's shore...

A more beautiful spot could not have been selected for its location. Lying directly upon a gentle slope on the western bank of the Seekonk River...

It seems almost strange that this beautiful park of the dead should receive more than a passing consideration on the part of the visitor...

It is a half-century ago that this cemetery was established. The main entrance is a well-kept walk leading to the main entrance...

Through a wide gate way hidden by trailing vines and covered by a circular path shaded upon two sides by immense elms...

Of first importance no doubt are the flowers and shrubs which are introduced and interest the grounds in all directions...

Within the grounds nurseries for hardy vines and shrubs have been started, and throughout the premises the use of deciduous and evergreen trees and shrubs has been largely encouraged...

Throughout the cemetery are scattered many of the flowers and shrubs which much interest is centered in. In one of these is the cascade, filling and overflowing with flowers...

Hours could be pleasantly and profitably and profitably spent in the arbors, trails, vines, flowering plants, stately trees, and choice exotics...

The principal places to be visited by the convention are the greenhouse, the fountain, the drawing attention to the extensive sheds of marble and granite...

With these monuments and the natural beauties of Roger Williams chosen city, we will bid adieu to Providence...

Syracuse, N. Y.

The farmers in Onondaga and Madison counties, N. Y., are suffering from the late rains, tons of hay have been entirely washed away...

The members of the Central New York Horticultural Society have accepted an invitation to participate in the parade on October 12...

The members of the Central New York Horticultural Society have accepted an invitation to participate in the parade on October 12, on which day the city will celebrate its centennial...

C. L. Mace's greenhouses were sold July 21st under mortgage foreclosure.

Utica, N. Y.

J. C. Spencer is enjoying a vacation leave with his brother at the Thousand Islands...

Peter Crove is the only florist we have so far heard of as expecting to go to the convention. C. F. Baker's health has not been of the best lately...

Pfeifer & Kauter have their two new greenhouses, each 20x100 feet, one for roses and the other for carnations...

Very little business now, and the florists generally are cleaning up, repairing, and painting.

Greenfield, Mass.

I am trying the plan of growing violets (M. Louise) in the house all through the season...

Building walls. The walls of the place (at the instigation of Manager Kennedy) of the Boston Flower Market is being troweled with concrete...

Carnations with me are looking fine. Carnations have not got on very well, but may be a little sorry, owing to the rains...

Pittsburg.

I should not mention business at all, for the last week very dull—nothing going on to help the florists' trade...

That competition between us is very keen is shown by the close bidding for trees and shrubs for the new building...

Superintendent Falconer of Shenley Park is expected to visit the city in the East, visiting New York, Rochester, Buffalo, Brooklyn, and Boston...

Visitors during the week were: Mr. Deans of the Dayton Paper Box Co.; J. C. Johnson of Washington, D. C.; John H. H. E. C. Ludvig's rock artist...

Hamilton, O.

John Loddor & Sons are building two new houses even span, 20x120 feet, with a 60-foot shed, 12 feet wide, attached...

Very little business now, and the florists generally are cleaning up, repairing, and painting...

RESTRICTED BOX.

OPEN TO ALL. FREE TO ALL. Answers Solicited from Those Who Know.

(118) Violets in Carnation House. Can violets be grown in carnation houses? I can give the violets more air than the carnations...

(119) Crop For a Cold House.—What crop can I get from a low house without heat to be in full bloom in January?

(120) Shipping Flowers to Market.—C. L. B.—To ship in bulk, proper boxes or cases with trays are the best. Another plan is to ship in flats...

(121) Pansies for Spring Sales.—H. L. R.—Pansies may be sown now, or in a frame and then transplanted into prepared frames and exposed to the sun...

(122) Piping.—I have 1,200 lineal feet of 4-inch pipe which I wish to pipe two chambers each 15x100 feet...

(123) Pansies for Spring Sales.—H. L. R.—Pansies may be sown now, or in a frame and then transplanted into prepared frames and exposed to the sun...

For the mushroom house it will best to have only small pipe, as that will permit of a better fit...

Catalogues Received. HULSEBROEK BROTHERS, Englewood, N. J. have just published a catalogue of choice Dutch bulbs, seeds and plants...

ALBERT M. HERR, Lancaster, Pa.—Price List of Fancy seed.

**S.**  
**The American Carnation Society.**

*Editor Florists' Exchange.*

My attention has been called to an article in the New England Florist, under the signature of Mr. Lothrop Wight. The officers of the American Carnation Society believe that such a course would be throwing mud in any direction he chooses, but as some of the erroneous statements made are so gross as to call for the object for which the August meeting is called, it seems necessary that they be called.

The calling of a meeting at Providence is neither a direct nor an indirect violation of the constitution, nor of any other article of the constitution, nor of any by-law. Article 6 provides for the calling of a meeting for "any emergency" (not one only as Mr. Wight has it), and sets forth how and how it shall be called. There is not other in this article, or any other, which prohibition either expressly or implied against the holding of other meetings.

The meeting at Providence cannot take action which will be in any way binding on the society unless ratified at the regular annual meeting. There will be many articles of the constitution, and of the by-laws, and it is desired that they meet and carefully examine into the present situation of the society, and that they be present are earnestly requested to forward to the secretary any suggestions which they may desire to see adopted or management. These suggestions can then be tabulated and published, and the society will then have the meeting fully informed, and matters can be disposed of quickly and intelligently.

To say a small florist establishment with good household, writing station, all particulars of a B. & C. care Florists' Exchange.

**WANTED**  
To purchase at a low price, within a radius of 30 miles from New York City, a small florist's plant with from one to five acres of land, and two to five greenhouses, by a young man starting in the business.

**E. T. DICKINSON, 1 Broadway, N. Y.**

**Terre Haute, Ind.**

J. G. Heintz made one of a party of 300 who recently made a tour of Mexico; trying to find the best sites for growing in comfort. Mr. Heintz speaks most enthusiastically of Mexico's glorious climate, and the soil, and the water, and the great growth; *Bougainvillea glabra* attains a height of 30 feet, the color being bright red, as never seen in this country. *Magnolia grandiflora* is clipped by huge trees of *Ficus elastica*, which produce a beautiful shade. *Tradescantia* grow on terraces and have the appearance of a beautiful waterfall; in the gulches canines abound, many being of exquisite color. The City of Mexico possesses a handsome flower market, which, like that so well known in the South of Northern markets, is well supplied with native orchids, roses, sweet peas, poppies, and numerous sizes of gladioli, double stocks, and gardenias. A large wealth exists about a dollar, and a large number of people are engaged in its proportion.

The extremes of wealth and poverty are not here as elsewhere; many of the residences and townships are princely, and the streets are clean and bright. Incidentally, Mr. Heintz witnessed a bull fight which he describes as most brutal and cruel.

Fred. Heintz is working up quite a stock of *Neprolepis elata* compta which is well known and will be in great demand this season.

**Shreema-ram, Pa.**

A visit to the well-kept greenhouses of John H. Sapping, on South second street, assures us that he is fully prepared to meet the demands of this trade. His stock of plants and cherries as well as all other varieties of flowering plants. Of these are the most beautiful and the most healthy plants. This firm enjoys the national and Canadian reputation of growing the best plants in the States and Canada. They also have a very large mail order on seed specialties of various kinds, cherries, exclaim and potatoes.

**One 3 sh. N. Y. Florist.**  
Miss Joseph Hill, Brooklyneer for J. K. Adams, care of the Florists' Exchange, in writing with Mrs. Flora T. Howell, of this place.

**Batylon, L. I.**

E. B. Sutton, Jr., has extended his violet plant this season by the erection of two additional houses, each 15x150 feet. This will make his houses in all about 20,000 plants have been planted. His carnation houses have also been supplemented by the erection of one more house, 16x150 feet.

**Baltimore.**

George G. Gill has broken the greenhouses attached to the jail which were formerly run by the Jail Board. Mr. Gill will furnish the plants necessary to keep the jail yard in view.

**Passaic, N. J.**

William P. Kesteloo's infant daughter, Anna Susan, died suddenly on July 18.

**NOTICES.**

**THE ANNUAL MEETING**  
Of the Members of the Florists' Hall Association will be held in Music Hall, Providence, R. I., on August 14, 1897, on Wednesday, August 18, 1897.

**JOHN G. ESLER, Secretary.**

**MISCELLANEOUS WANTS.**

**WANTED.**  
To buy a small florist establishment with good household. Writing station, all particulars of a B. & C. care Florists' Exchange.

**WANTED**

When Writing Mention Florists' Exchange

St. Louis. Trade Remains Quiet.

Business is still quiet and the weather very hot. Asters are coming in more plentifully, while carnations seem to be slackening up. Roses, while plentiful in supply, are very poor in quality. Kalisner and Metcalf are coming in quite open. Gladioli and tuberoses from out-doors are coming in largely.

The News. William Lingenbrink has returned from a month's vacation spent in Denver.

The Michel Plant and Bulb Company which attempted to dispose of its stock and greenhouses in order to retire from business, has found it impossible to realize on its property now, and will continue in business as heretofore. It does a general wholesale and retail plant, bulb and cut-flower business, and its shipping trade as before will continue through the St. Louis Cut Flower Company.

It is understood that Ellison and Tesson have rented the store which F. C. Weiler will vacate shortly at 3134 Olive street, and that they will run it in conjunction with their downtown place.

M. H.

Washington.

Trade in quiet. Business is about as quiet as it is possible for it to be; were it not for general orders the stores might as well be closed. With the exception of asters, which by the way are very fine, flowers are quite scarce. Grade Brothers are cutting some La France and Kalisner roses which are remarkably large. Considering the weather, the same firm has been cutting some excellent asters grown inside, field-grown flowers, even under the most favorable circumstances, cannot be compared to them.

Delegates to the Convention. Washington will send quite a respectable-sized delegation to the convention. P. Gauges, the district vice-president, has been elected to represent from members in the Southern states with a view to starting from this city in a body. W. Smith states for Boston the latter part of this week.

J. L. Loosé and family are spending the summer at Quebec.

The many friends of Robert Bowdler were much alarmed on reading in one of the newspapers last week that he had been fatally hurt by a street car running into his wagon. It turned out, however, that his injuries were of a very slight nature.

Look out for W. F. Gude at the convention; he is the best looking florist in this city, and just now he is by long odds the happiest, owing to the arrival of a ten-pound baby boy.

G. W. O.

Cincinnati.

Business Slumbers. Business is still dormant. The weather is now comfortably warm; we have had plenty of rain, in fact, an unusual quantity for July.

The News. Thomas Whidman is building a new carnation house, 10x20x3 feet. E. Ritter staeffer is building two carnation houses, 12x30x3 feet, in these Dik expects to grow seedlings that will be first-class.

Louis Pfeiffer, Jr., was married July 28 to Miss Alice Smith of Newport, Ky. It was a home wedding, and the house was beautifully decorated for the occasion. The bride and groom are now on a wedding tour through the East and will locate in a new home at the Highlands on their return.

Charles A. Bretz and wife leave Tuesday for a vacation trip to Fort Lyon, Mich.

July 29 the daily press announced that Mrs. Law, wife of W. F. Law of Shelbyville, Ind., was thrown from her buggy and fatally injured, by the horse running away. A letter received by the writer from the doctor of that place, states that his wife was thrown from her buggy, at least 15 feet into the air, falling upon her shoulder and back of her head and sustaining severe bruises. No bones were broken, and unless some unforeseen trouble arises, she will recover, although very badly hurt.

E. P. Critchell's Sons have moved their store from the corner of Fourth and Elm streets to near corner of Fourth and Walnut streets on Fourth.

E. G. GILLET.

 Club's Outing.  
 The second summer outing of The Florists' Club, by invitation, was to Grand Rapids, where the Club's headquarters greenhouse is situated.

Manager James Earl, with his lady and family, was, although still somewhat young, one of the thirty or forty florists and lady friends that formed the coterie. A few of the hour by florists drove in their own conveyances. Mrs. Bretner and family are summering on the Wisconsin Lakes. The grounds of the Club, which had been erected for the occasion, a tour was made through the grounds and finely equipped greenhouses, and much comment was heard on all sides of the bright outlook for high-grade flowers of the coming winter. Particularly noticeable were the five houses of single-stem chrysanthemums, each plant growing from a single stem, 125 per cent will easily number 10,000 to 12,000 flowers. Half dozen, a balance was only thirty, and the plants are two or three feet in height; a portion are early dwarf and stocky, all being in perfect health.

Roses here are quite a feature; the variety which is very fine, includes 6,000 American Beauty.

Plants in the old carnation houses are set perfect in health, in spite of the hot weather; but will shortly be ripped out to prepare the houses for new crops, which will be housed about the first of September.

Mrs. Bretner grows mostly those flowers which retail stores do not stock. The stock finding a market with his old partner, Mr. Weinlocher, of Oak Street. The grounds are well watered and stripped of soil each year and seeded with man in other places, so that fall crops at all times is had over the soil used. There is a peculiarity in the soil; in one spot it is a black peaty soil, rich and nearly a patch of yellow loam.

The carnation planting is in excellent condition. In fact, 12,000 to 15,000 plants to fill the houses. All here are late, including the variety, which, with others of the newer kinds, is quite healthy.

There is also one house of pot chrysanthemum for market purposes, now in 4-inch pots.

On the 10th of the grounds the party gathered under the tent where luncheon was served.

The club outing will not take place until toward the end of August, when Hinsdale and Mr. Bassett are on the tapis for a week day day to be hereafter named.

**Among Growers.**  
 A call at Singer Bros., at Washington Street the week ending 27th last year. The number of Mr. F. C. Thom's place is 1225 Milwaukee avenue, and not 1225 in printed two in the Chicago Directory. James Moore, 3731 Butler street, this city, did the past week. Mrs. Moore is a well-known buyer of plants for wholesale houses, and has the sympathy of all who know her.

**Around Town.**  
 The Chicago Directory lists 274 florists this year against 271 last year. The number of Mr. F. C. Thom's place is 1225 Milwaukee avenue, and not 1225 in printed two in the Chicago Directory. James Moore, 3731 Butler street, this city, did the past week. Mrs. Moore is a well-known buyer of plants for wholesale houses, and has the sympathy of all who know her.

Mr. Strambek of Lincoln Park, has two splendid beds of old Portia carnation in the flower ground, that are at all times a mass of bloom. They were set out from strong grown 3-inch pot plants.

**Montreal.**  
**Julius.**  
 Last Thursday was the day for the cricket match, flowers & gardeners; but owing to the rain, there were not enough present to carry out the original program. A great number, however, were enjoyed. Those who were not present amidst the excitement afterwards at Field House.

F. L. Atkins is in town and reports favorable business.  
**Trade Light.**  
 Trade here is very light. Several designs being the only ones showing that prevents stagnation. Now the weather has moderated, everyone is hustling to get through with the season stock which has been delayed through the extreme heat of the previous two weeks. The summer sales are getting more interesting as the season advances; at this week's exhibition there was a much larger display than was staged last month. Sweet peas were the largest feature. Geo. Robinson, Wilshire Bros. and F. Bennett taking most of the prizes. Canis made a good display, and the exhibitors of the various flowers were much admired by the visitors. Julius Bretner showed a perfect specimen of *Chrysanthemum* in yellow, which was highly awarded a special first. Joseph Bennett put up fine pots of *Lilium lancifolium* from the garden, and a number of other varieties of *lanifolium* roseum, album and auratum, was very attractive and was also awarded a special first.

John Doyle, James Nairn, F. L. Atkins and Walter Wilshire were judges.  
**W. W.**  
**Toronto.**  
**Summer Dallas Here.**  
 Business is down to the usual summer dullness. The roses and carnations are in the best of health, and of high quality. Outside cut flowers are good and very abundant. There is a large quantity and sold at all prices. Carnations and violets, planted outside, beginning to do very well.

**A Cricket Match.**  
 The Toronto cricket match between Harry Dale's Brampton team and a team of the Toronto Gardeners' and Florists' Association was played on Wednesday, July 28. The day was wet and unpleasant, and the ground was slippery and had to be played in the afternoon. The score at the ground game resulted. About 26 of the Brampton boys came down, and about 100 of the same number of the Toronto exhibition grounds. A nice cold lunch was served about noon, and light refreshments in the afternoon. The score at the close of the game stood: Brampton 43, Toronto 58.

**Club Meeting.**  
 The July meeting of the Gardeners and Florists' Association was a poor one; we had to wait until nearly nine o'clock before we got a quorum. Some of the members were away on a special match on the 28th, with Harry Dale's team who were invited down to our exhibition grounds. The chairman of the executive committee was asked to call a meeting as soon as possible to arrange to make our get together for the coming year.  
 THOS. MAXTON.

**Brampton, Ont.**  
 Harry Dale is not growing quite so many chrysanthemums this year; what he is growing is watered very liberally. Bergmann, Marian Henderson, Margarete de Montfort are the best exhibitors group-wise. Rosemary planted an early house containing *Verde* and *Sunset* are pretty. Asparagus plumosus is showing in beds. The weather is nice, a temperature of 70 to 80 degrees is maintained in winter. The plants do remarkably well, showing heavy hanging strings of deep green. Led spires is kept down by careful watering. This is very little known by the many who suppose it is necessary to have a cool and shady spot in which to grow them. It is surprising when one is experimenting with an improved variety, of which more will be heard hereafter.  
 W. M.

**Albany, N. Y.**  
 Louis Meunier celebrated his 90th birthday on Monday morning on Tuesday last, and bids fair to see another decade pass.

**Cut Strings, 10 to 12 feet long 60 cts. each.**  
 Shipped to any part of the country.

**Trade Still Slack.**  
 There is no material change either in the condition of stock or the demand, although a better feeling trade appears to be springing up and a fall demand for what little good stock comes in. In fact, as one of the growers says, supply and demand are high equal, and that at fair summer prices. The best Kaiserling bring \$4.00 either \$1 to \$25 carnations 40c to 75c, few go beyond, as the quality is very rather poor. Beauty, if good, which is very scarce, will bring 100c. Anemons lilies realize \$1 per dozen; all others are scarce. Asters are coming in now in better shape, although still somewhat poor in quality.  
 EDGAR SANDERS.

The idea of inviting the members of the club as a body to visit the several establishments is a happy one, and is being well responded to by the growers and retailers, as it affords an excellent opportunity to see what is being grown for next season, and who has it.  
 J. C. Vaughan's place at Western Springs was visited in the near future before the fine display of carnations, of which Mr. Wilson is justly proud, is over. At this time the display of new varieties were in bloom and justifies all that has been said in their favor. Chicago is a grand show place for the season.  
 Yellow 'Crazy' is the finest yellow, bright, not affected by the sun in the least, the color rather being intensified. The dead flowers stay on the spike, which is the only detriment observed, but the profusion of bloom, adds this defect, especially as seen even from a short distance. Burbank and Anem. bunch out, in the single and double, and several new varieties, not yet sent out, are of great promise, and will add interest to this class of plants early in the season.  
 W. M.

**Davenport, Ia.**  
 Trade is at present rather slow on account of the great heat. Such flowers as roses and carnations are in good shape, with little or no demand. Now and again trade moves up good; at such times the plants are much sought. Totted plants find no sale at all.  
 Young rose stock in benches is in excellent condition. In fact, for all trade there is much better than last year.

John T. Temple is building one house about 18x125 feet long. Henry D. DeLoe, Island, Ill., two houses, one 18x125, one 18x140 feet, for roses.  
 Cut flowers and plants have been sold at very low prices, in some instances 50 per cent. lower than in former years.  
 E. J.

**Detroit, Mich.**  
 Harry Babler will be with us with the power of the whole Park Commission behind him, and what those who have the pleasure of seeing him will testify to the attractiveness of this city for the convention of '98 will experience—we'll but we need not anticipate.  
 George Leadley has hid himself away for a week's fishing; doubtless some of our members will be glad to which, if endorsed by Robert Flowerdy, Phil. Bretmeyer, and Andrew Ferguson, will rival some of the best fishing by the boys and shooters at home.  
 W. M.

**Milwaukee.**  
 Currie Bros. are rebuilding and fixing up generally.  
 J. Freytag is rebuilding and adding to his place on the river.  
 C. B. Whitall will be delegate to the convention.  
 W. M.

**Emore, O.**  
 H. W. Rymer is building two new houses, in addition to his existing one 12x60, the other 10x160 feet and putting in a new boiler and hot-water piping for the whole plant.

**Chocoma, N. Y.**  
 Grove P. Rawson, Elmira, N. Y., will act as judge at the second annual sweet pea exhibition here, and will also deliver a lecture on "Plant Life."  
**Bay Side, N. Y.**

By the explosion of a boiler at the establishment of John H. Taylor on Tuesday last, the men, William Deuton, was severely injured.

# THE FLORISTS' EXCHANGE

We are a straight shoot and aim to grow into a vigorous plant.

A WEEKLY MEDIUM OF INTERCHANGE FOR FLORISTS, NURSERYMEN, SEEDSMEN AND THE TRADE IN GENERAL.

VOL. IX, No. 33.

NEW YORK, AUGUST 14, 1897.

One Dollar Per Year.

## FLORISTS' CONVENTION

ATTENDING THE

Should not fail to inspect our Trade Exhibit of

### DECORATIVE PLANTS,

which represents the class of goods we send out. Our representatives will cheerfully answer any questions, as they will be constantly in attendance.

In going to or coming from the Convention, we will be very pleased to receive a personal visit from all Florists to inspect our stock of PALMS, FERNS, and other plants of which we make specialties.

### PITCHER & MANDA, Short Hills, N. J.

JOHN N. MAY, Receiver.

May be reached from New York by either Christopher or Barclay Street ferries to Hoboken thence by Delaware, Lakeview and Western R. R. Trains hourly. Distance only 15 miles. When Writing Mention Florists' Exchange

WE INVITE ALL FLORISTS ATTENDING THE S. A. F. CONVENTION, AT PROVIDENCE, TO VISIT OUR NURSERIES.

Our Cannas are in full bloom at this time. We are making very extensive tests of all the

### NEWEST AND FINEST CANNAS IN CULTIVATION,

And an inspection of the recent novelties and a large number of new sorts which we are testing with a view to future introduction cannot fail to be of interest. We would call particular attention to a new *Canna* which we expect to introduce next year. This *Canna* can be seen on the grounds of Mr. Farguhar Macrae, at Providence, to whom we have sent plants for trial. We think that this will prove to be the finest dwarf red *Canna* that has been sent out up to this date. We are testing it extensively this Summer so as to be certain in regard to its value before offering it, and from what we have seen of it this season, we shall be very much disappointed if it does not prove to be the finest variety for bedding that has ever been sent out.

We should be pleased to show visitors through our extensive range of Rose Houses. It is late for

### WINTER-FLOWERING ROSES.

But we still have a good stock of fine plants for buyers, who are obliged to plant late.

We should like to call particular attention to our large stock of

### PALMS AND OTHER DECORATIVE PLANTS,

And should be pleased to have our friends examine our stock before purchasing their Fall and Winter supplies. As we are crowded for room, we will make quite a considerable concession in the matter of price where orders are placed early and shipped before we are obliged to put our plants in permanent winter quarters, the same in labor, re-handling, etc., enabling us to make quite a difference in price where plants are shipped before cold weather. There is also an additional advantage to purchasers in having plants shipped early, because they not only can buy cheaper, but the plants can be shipped by freight with perfect safety and at a large saving in expense. Where parties have room to handle the stock, they will find it very much to their advantage to have goods shipped early.

WE HAVE A LOT OF BARGAINS TO OFFER! We have a particularly fine stock of the following leaders in the very best possible shape, viz.: Large *Arca Lutescens*, *Adiantum Constans*, Small Ferns for Fern Fans, etc., etc. We handle very largely Dutch, French, Japan, Bermuda, and all other BULBS FOR WINTER FORCING AND SPRING FLOWERING.

If Visitors at the Convention will find a display of our usual high quality of Bulbs, Palms, Ferns, etc. on the exhibition tables in Music Hall, we will be glad of an opportunity of submitting prices.

# Nephrolepis Exaltata Bostoniensis.

In large and small quantities from \$40.00 to \$80.00 per 1000.

**MINE IS THE GENUINE STOCK.**

FRED. C. BECKER, - - - 1730 Cambridge Street, CAMBRIDGE, MASS.

When Writing Mention Florists' Exchange

Take off all side breaks, and whenever the leaders break with three shoots and a Summer bud, take all off, except one, to cover the plants about twice a week and refile then where necessary. Some need frequent tying, especially where the growth is weak and slender. Stiff growers, like Golden Wedding, May-flower and the like, only need tying about every nine inches to one foot.

At the present time, it is very important to shape the pot plants. Pinch out the points; strong shoots must be set back sharp; pinch weak ones moderately, so that they may catch up and make even plants. If the pinching is well and carefully done by a man with a head on him, very little tying is needed afterward. One stake to a market plant in a six, seven or eight-inch pot should be enough. Fred. Wals, if well done, will do without any stake.

And right here I may say that we ought to give the greatest credit to the grower who comes nearest to discarding stakes and wire as well as strings. If we could show our plants without artificial support like our out-floors, I think we would be decidedly nearer perfection than we are to-day. I must give Chicago credit for having enumerated in its premium list one prize for a plant without artificial support. I am strongly of the opinion that such a method of exhibiting will finally rule, but it may not be reached in 1898. Turgo, look.

## OTAHEITE ORANGES!

**Testing Seeds.**

The Maine Legislature enacted a law last Winter regarding the testing of seeds entering that State. The act comes into effect September 1, 1917. Its provisions, which we print below, are, it will be seen, based on those of the Cook (now the Davidson) bill.

**AN ACT TO REGULATE THE SALE OF AGRICULTURAL SEEDS.**

**SECTION 1.** Every lot of seeds of agricultural plants, whether in bulk or in package, containing one pound or more, and including the seeds of cereals (except sweet corn), grasses, forage crops or melons, and other plants, but not including those of trees, shrubs and ornamental plants, which is sold, offered for sale, or put on the market, by any person in Maine, shall be accompanied by a written or printed guarantee of its percentage of purity, freedom from foreign matter; provided, that said guarantee may be so issued when the percentages of the various constituents are stated.

**SECTION 2.** Dealers may base their guarantees upon tests conducted by themselves, if the same are by the Director of the Maine Agricultural Experiment Station; or, provided, that such tests shall be made under such conditions as the Director may prescribe.

**SECTION 3.** The results of all tests of seeds made by said Director shall be published by him in the bulletins or reports of the Experiment Station, together with the name of the person or persons from whom the samples of seeds were taken. The said Director shall also publish equitable standards of purity to which such other information regarding agricultural seeds may be applied as he shall best see fit.

**SECTION 4.** Any person or persons who shall offer or expose for sale or for distribution in this State any agricultural seed, without complying with the requirements of sections one and two, or who shall be convicted in any court of competent jurisdiction, be fined not to exceed one hundred dollars for the first offense and not to exceed two hundred dollars for each subsequent offense.

**SECTION 5.** Any person or persons who shall, with intention to deceive, wrongly mark or misbrand any seed, or who shall sell or expose vegetable seeds or any other agricultural seeds, including those of trees, shrubs and ornamental plants, shall be guilty of a misdemeanor and upon conviction in a court of competent jurisdiction shall be fined not to exceed one hundred dollars for the first offense and not to exceed two hundred dollars for each subsequent offense.

**SECTION 6.** The provisions of this act shall not apply to any person or persons growing or selling cereals and other seeds for seed.

**SECTION 7.** The provisions of this act of the Maine Agricultural Experiment Station before the enactment of the existing act, and the provisions of this act, shall be held in violation to the Secretary of the Board of Agriculture, and said Secretary shall prosecute the offender or parties thereto.

**SECTION 8.** All acts and parts of acts inconsistent with this act are hereby repealed.

**SECTION 9.** This act shall take effect September one, eighteen hundred-ninety-seven.

**RULES FOR TESTING PURETY OF SEEDS.**

The following rules for testing seeds are taken from those adopted by the Association of American Seed Producers, the Association of American Seed Producers, the College and Experiment Stations. The rules which have to do with germination

**STANDARDS OF THE PURITY AND GERMINATION OF AGRICULTURAL SEEDS.**

Seed.	Purity.	Germination.	Seed.	Purity.	Germination.

Kern corn	98	85-90			

\* Each beet fruit or "ball" is likely to contain from two to seven seeds. One hundred balls should yield at least 150 sprouts.

are here omitted, and the other rules are modified, when necessary, to conform to the requirements of the law in this state for the regulation of the sale of agricultural seeds.

**Directions for Sampling Seeds.**—The contents of packets should be emptied out, mixed thoroughly by stirring, and small quantities taken from different parts of the mixture to make the sample. These "take handfuls at random" from the middle and bottom, and from these, after sifting, take the sample feeding into a sample pan, seeds so under scientific guaranty of quality, must be taken in the presence of the sender and a disinterested witness, who shall certify that the sample was taken in his presence according with the above directions. The sample must be enclosed in an envelope or other suitable package, securely fastened and sealed with wax or the presence of the witness. The names of the sender and witness must be written on the outside of package with all the larger vegetable seeds except beet "balls," 2 ounces.

Grasses, except noted below, 1 ounce.  
 Clovers and all seeds of similar size, 2 ounces.

Cereals, vetches, beet "balls," and all larger seeds, 4 ounces.

Rye grasses, bromes, sorghums, and millets, 2 ounces.

All the smaller vegetable seeds, 1 ounce.  
 All the larger vegetable seeds except beet "balls," 2 ounces.

**Sending samples.**—Every sample for test sent out of the Station should be securely fastened package accompanied by a statement certifying to the fitness of the sample, its source, etc. Blank forms for this purpose will be furnished by the Station upon application. In cases of guarantee seed, the sample must be taken in accordance with directions given above.

**Quantities of samples.**—All samples should be made by weight from fair, average samples of seed. The minimum quantities to be used for testing are as follows:—See below and must be so dry as to secure a thoroughly representative sample.

Grasses, clover, sorghum, etc., 100s, yellow oat grass, tobacco.

Two grams: Bermuda grass, velvet grass, timothy, timothy, timothy, dog's tail, orchard grass, sweet vernal grass, alsike clover, white clover, Umbellifer, and all the species except meadow fescue.

Three grams: All grasses seed not enumerated above.

Five grams: Mellotts, Medicago spp., millet, lettuce, and all species of clover seed.

Ten grams: Crucifers, flax, and legumina.

Thirty grams: Buckwheat, Vicia spp., Lathyrus spp., beet "balls," sunflower, sarracella, cucurbits, and all cereals except corn.

Fifty grams: Peas, beans, corn, lupines, cotton, and cowpeas.

NEW BEAUTIES IN JARDINIERS.

As the fondness of the human family for the charming bloom of flowers is well nigh universal, it may be said with equal truth that everything which enhances their beauty or contributes to their better development is estimated in the same relative proportion.

The jardiniere and pedestal and the fern receiver, head the list of articles for the reception of plants and flowers which not only perform that graceful office but are at the same time genuine specimens of household adornment when artistically modeled and decorated.

For a number of years past the Cook Pottery Co., of Trenton, N. J., has devoted special care and attention to the manufacture and decoration of jardinières, pedestals, fern receivers, and by steady and persistent effort they have so improved their methods and processes that they are now enabled to place upon the market a class of goods, which for elegance of style and richness of decorative effects, are unequalled by anything of a similar class produced either in this country or Europe.

At a recent exhibition of their lines in New York City one of the leading caterers to the florist trade volunteered the opinion that the jardinières, pedestals and ferners

of the Cook Pottery Co., more nearly approached the ideal receptacle for flowers and plants than anything that had yet come under his observation.

The manufacturers of these goods have placed a fine exhibit of the line on view at Room 322, 1st or House, New York, where florists desiring to inspect the same will be cordially welcomed at any time—Adm.

Amounts to be taken of seeds not enumerated shall be the same as those required for seeds named which are of similar size.

STANDARDS OF PURITY.

In accordance with Section 4 of the pure seed law, the following equitable standards of purity are tentatively suggested. They are the standards adopted by the U. S. Department of Agriculture and are based upon investigations made by the Division of Botany of that Department. They are here printed without change, and include some seeds not likely to be offered in this State. For convenience of reference the percentages of vitality, as well as percentages of purity, are given. (See page 734.)

EXAMINATION OF SEEDS BY THE STATION.

The following are the rules to be observed by agents upon tests made by himself, his agent or the Maine Experiment Station, as the Station has no funds available for this purpose, a charge sufficient to cover the cost of making the tests will be made. The charge for testing seeds for purity will be one dollar per sample in the case of seeds of one kind, and two dollars in the case of mixed seeds. The seeds sold in mixtures the charge will be one dollar for the sample and twenty-five cents additional for each kind of seed to be therein. Mixtures are difficult to separate and determine, and for this reason an extra charge is necessary. Seeds to be tested for purity for any person resident of the State, whether a dealer or not, at the above rates. The Station reserves the right to publish all results which prove of general interest.

Persons desiring to send seeds to the Station for testing can obtain, on application, blanks on which to describe the sample, directions for supplying and printed on the reverse of the blank. The receipt of the sample will be acknowledged as soon as they arrive. Usually a report can be made within two or three days.

CATALOGUES RECEIVED.

R. M. WIGGINS & Co., San Antonio, Fla.—Wholesale list of Anabasis, Citrinas and Pueraria, and other plants, ferns, etc.

## OBITUARY.

## Calvin S. Goddard.

Calvin S. Goddard died very suddenly on the morning of August 4, at his home in Deering Center. It is thought that his sudden demise was probably owing to pleurisy of the heart. Mr. Goddard had been known as a successful florist in Boston for some years. He had just come from Brunswick to Morrill's (former manager of Adams' nursery, and later a partner in business) or himself at his present stand.

He was a minister in the Society of Friends and president of the church that society. He leaves a widow, daughter, and two sons, one of whom, Lewis Goddard, was associated with his business. The other son Edward H. lives in Ashland, Me. Mr. Goddard was 72 years of age.

## Nathaniel P. H. Willis.

It is with regret we are called upon to record the death of Nathaniel P. H. Willis, which occurred on Monday, August 1, in Chelsea, Mass., at the advanced age of 87 years. Mr. Willis was perhaps the oldest salesman in the country and undoubtedly the oldest in any seed store, having served in that position for over 50 years. He died in 1894, in the constant employ of Joseph Ereck & Sons and their predecessors.

Mr. Willis was a native of New York, well known among the farmers at the beginning of this century, and was descended from Charles Willis of Putnam fame. He began work as a boy in his father's shop, and in a short time went on the salesforce of Jos. B. Newell, dealer in seeds and agricultural implements, at No. 108 State street. This business was carried on for some time by Jos. B. Newell, then in the seed business and publishers of the New England Farmer, and in their employ he remained until a few years prior to his death.

## Henry A. Gane.

Henry A. Gane died at his residence in West Newton, Mass., on Monday evening, August 9. Though not identified with the trade Mr. Gane had always been an ardent and successful horticulturalist, and devoted much time to cross-fertilization of plants. He has, for example, produced the Mrs. Jerome Jones, so popular with all growers the world over. In 1891, Mr. Gane was elected president of the A. S. G. Mr. Gane was born at Frome, Somersetshire, England, in 1811, and before he was 20 years of age he was spending several years in different parts of New England. He established himself in the book-binding and book-binding supply business in Boston, in 1846. He was successful and many years ago retired from active business, and spent the remainder of his life among his plants and flowers on his beautiful suburban estate in West Newton.

## Edwin M. Buswell.

On Saturday last the remains of Edwin M. Buswell were interred in Newton Cemetery, having been accompanied by his son and daughter from Brooklyn, N. Y., where he passed away two days before last. Mr. Buswell was a noted cultivist in the vicinity of Boston. Mr. Buswell was well known, and by them the Massachusetts Horticultural Society and in this position his love and knowledge of horticulture proved of incalculable benefit to the trade. It is to him alone the credit of introducing the French reinetia alias into the United States, having received it in exchange for some tree seeds sent to the secretary of the Society of Good Gardeners and Florists Society. His interest in his life's study continued up to a few days before his death, when he was afflicted with cerebral paralysis. He was 84 years and three months of age. W. K. W.

## William Murdoch.

William Murdoch, one of the pioneer nurserymen and florists of western Pennsylvania, died at Pittsburg August 4. Mr. Murdoch was born near Belfast, Ireland, in 1801. His parents were Scotch-Irish. In 1826 his father, John Murdoch, emigrated to America with his family. There were seven children in the family, three girls and four boys, William, James, John, and Andrew. William was the last survivor. The family landed in Baltimore and came overland to Pittsburg by stage. The father bought a farm of 112 acres. The place was formerly called Hedgerow farm nursery. On the death of the father, two of the sons, William and James, took up the business. They established the well-known store on Smithfield street. About four years ago James Murdoch died, and soon afterward William Murdoch retired from business on account of his increasing years. A. M. and J. E. Murdoch, sons of the deceased member of the firm, (James) succeeded him.

William Murdoch never married. Until the death of his sister, eight years ago, he made his home with her family, and since that time he has been living with his brother's family on Wilkins avenue. His death was sudden, and occurred while he was at his home Tuesday night, August 3.

city to take it upon themselves to call a formal meeting, by circular in defiance of the constitution and the wishes of many of the members of the society is an act that cannot be too strongly condemned. Mr. Rudd says these are "erroneous statements"; members of the society can decide that question for themselves. It seems very clear that the officers have run away with the society. I hope they will reconsider their thoughtless conduct and return it in good order and condition.

It probably did not occur to Mr. Rudd that the constitution of the society was in the meeting when he wrote that "The meeting at Providence cannot take action on this matter, as the constitution of the society never ratified at the regular annual meeting."

It is to be regretted that July 22, issued by the officers of the Carnation Society, they took the fate of the society into their own hands, under the S. A. F. and all. It is not wot that such action should pass unnoticed.

## LORNON WRIGHT.

[Technically, Mr. Wright is correct. No one can construe any portion of either the constitution or by-laws of the American Carnation Society into making provision for more than "one" general meeting in a year. Article VI. of the constitution is explicit enough on this point. If, however, our correspondents, Messrs. Wright and Rudd, will refer to the records

The constitution should, however, be altered to meet the exigencies of the case, or a meeting called to amend the constitution of the executive committee only. The constitution, as it stands, including an August meeting of the Carnation Society is an attempt to "unite with the S. A. F." and to "unite with the S. A. F." without foundation. Personally, we have attended the August meetings, and have not been asked to vote on any resolution. If desired, can only be accomplished in one way, and that is by open vote. It is to be regretted that the fact officers of the Carnation Society are perfectly cognizant. E. J.

## The New Tariff and its Probable Effects.

## Editor Florists' Exchange.

"This an ill wind that blows nobody good," they say. Now let us see what good may come to the trade in view of this new 25 per cent. ad valorem duty on most garden seeds on all bulbs, bulbous roots, corms, plants, trees, shrubs, vines, etc., to be levied by florists or nurserymen. It is very hard to see how it can be made to improve on the general quality of horticultural and floricultural stock sent to the United States. It is to be regretted on an occasional 10 per cent. in the past to the 25 per cent. standard. And it is to be regretted that no forwarding agent or silk taly that "anything is good enough for America," had after they previously sent rubbish, pretended that what they sent was good and prime, because of the ignorance, indeed possibly through previous occasional staple competition there to excel rather by charge of quality.

Second: Foreign countries will likely no longer consider the United States markets as a ready dumping ground for their surplus stocks of any grade and quality, when the chances are that in many instances they will not see the on-lays for freight and duties returned. This, prices in general will be better protected, and the quality of the goods to be affected and made to suffer by a sunken market and low prices for poor and inferior goods.

Third: The higher duty should diminish the chances of seeing foreign horticultural stock, of any grade and quality, or low grade offered to the unsuspecting public through channels that cannot be traced. It is to be regretted that articles which is acquired only by artificial training or after long experience. We are not to be surprised that the new system, whose main method is to buy anything that can be bought cheap and sell it at a profit, will be the rule. It still appear cheap in selling "dry goods by the yard," "bulls by the pound," etc. The seeds of the future will be made to give satisfaction first and last, thereby to create new demands, and this increase their trade. This will be the natural outcome, when not forgetting the lessons of the past, selling prices are kept at a fair level, and no excessive profits are taken. Truly, the seedsmen and florist who follows his stock in the trade, and has his heart in his business, will help more than he is aware of to develop and improve the character of the trade in our people's character, by cultivating their taste for the truly good and beautiful.

Fourth: The duty on horticultural stock will likely have a tendency to restrict the invasion of foreign salesmen by the "free of duty system" of the Meadows and Wilson days, or even to be made in many instances without any discretion or judgment of man or locality. We are not to be surprised that they were busy; collecting accounts was left to the future. Not satisfied to sell to respond to the demand, they were content with people of little or no responsibility; thus creating, when harvest time came, a glut of stock, which the trade will blame the florist who took the chances to make some money in winter and spring, when they were hard pressed; with little or no money outlay on his part? But will this same party be any better off when he has first to procure one-fourth cash for duty on goods, and then to pay the duties on the bulbs and plants for cut flower-growing, and then to pay the duties on the goods in the future, with a good stiff duty on, than in the past without a duty. We are not to be surprised that the trade in proportion to our market's wants. We believe this will improve the character of the trade, and the duty will do us as a blessing to all importers, dealers, consumers. E. E. E. E. E.

## Exhibit of Tulips at Hamburg International Horticultural Exposition.

Made by Krelage & Son, Holland.

## CORRESPONDENCE.

*Insertion will be given in this column to all communications free from animus, and the opinions expressed will be necessarily their own.*

## The American Carnation Society.

*Editor Florists' Exchange:*  
Article VI. of the constitution of the American Carnation Society reads as follows:

"The society shall hold an annual meeting commencing on the third Tuesday [since altered to Thursday, E. J.] in February. The convention shall hold two sessions each day, uninterrupted, until the business of the society is completed, and no local committee or officers of the society shall have power to set aside this article, except as provided in Section 10 of the by-laws. (Section 9 of the by-laws refers to the order of business only.)"

An annual meeting means one annual meeting; an being in the singular number. And it is only necessary to read the article to see that the officers of the society are perpetually forbidden to make any change.

At the New York meeting some attempt to bring together the Carnation Society and the S. A. F. was made. Opposed to this was the constitution, which voted that a delegate be appointed by the president to confer with the executive committee of the S. A. F. It was voted that a delegate was not appointed, for no resolution was made at any conference. It is well known that some of the members of the Carnation Society are strongly opposed to any connection with the S. A. F. If at a lawful meeting of the society a majority of the members vote to unite with the S. A. F., that ends it, and members who don't like it can withdraw if they choose. For the officers of the so-

ciety, they will therein find (Report of 1891-92, page 69) that the first meeting of the society held at the same time as the date of the S. A. F. convention at Washington was really an adjourned meeting of the Buffalo convention of the American Carnation Society, duly convened by motion to that effect put and carried at Buffalo. This has, no doubt, served as a precedent for subsequent meetings of the Carnation Society in New York. It is to be regretted that the meeting at Washington itself was unconstitutional. Article VI. declaring that the meeting of the society at the annual meeting shall be held "uninterruptedly until the business of the society is completed."

The only meeting in the interval between the annual gatherings, for which the society passed at Cincinnati, the convention there having been "adjourned subject to the call of the president."

It will be seen, however, that for the reason before stated, the "adjourned resolution" as a violation of Article VI. inasmuch as it set at naught the said article, without conforming to Article X. However, the necessity for such a preliminary meeting is obvious, and the holding of one has heretofore made for the benefit of the society. It is to be regretted for essays chosen, and the writers selected, and the members of the society an exhibition and other important business transacted. The time was also opposed to any connection with the S. A. F. together those members attending the convention of the S. A. F., thus saving the expense of convening the executive committee at a period in the interval between the annual meetings.

ROSES.

With the advent of August we most generally get very warm days... most perceptibly shorter, thus compelling us to reverse our methods of spraying...

ranced as to suggest a Dutch bulb field, excepting that the beds were laid out in half circles instead of being straight.

Cannas, etc., at Scarboro, N. Y.

At the Scarboro branch of the F. F. Pearson Company, at the present time, the rose-houses are in exceptionally fine shape, four houses of Beauty being in such condition that they would be hard to beat...

color markings than the parent, the crimson center being more solid and much more brilliant.

Admiral Avelan is head and shoulders above all others, its foliage is darker than that of Eganade; its dark orange-scarlet flowers harmonizing well therewith.

Autria, Burbank, and Italia are also good grow-ids by side. As seen here, Burbank is certainly distinct from Austria, and in very respect proves superior to it.

Speaking of the best walks for rose houses, I have been asked lately by young beginners in such walks where cement walks they should be wetted down more frequently than those with walks of ashes or such like material.

It is no credit to the machinery mentioned the great benefits derived by syringing from different directions once or twice a week, in the narrow center walk which we see in a good many houses.

The dark-leaved varieties undergo a crucial test in squares side by side. The dark-leaved varieties undergo a crucial test in squares side by side.

Where no steam plant is used, the apparatus may be conveniently arranged on the piping system used for warming the greenhouse, whether by water or steam heat.

It is no credit to the machinery mentioned the great benefits derived by syringing from different directions once or twice a week, in the narrow center walk which we see in a good many houses.

Allegany Hollyhocks. devoted to Boston fern, and Adiantum cuneatum. Several temporary houses, made of canvas, are filled with Lantana borbonica and Arca hirsuta.

It is no credit to the machinery mentioned the great benefits derived by syringing from different directions once or twice a week, in the narrow center walk which we see in a good many houses.

Other canna worthy of mention are: Beante de Pottville, Fern, Souv. d'Antoin Crozy, F. K. Merson, Trilby and Franz Buchner, the latter being unique in color—almost salmon with a slight gold band, having a clean tress, of large size.

It is no credit to the machinery mentioned the great benefits derived by syringing from different directions once or twice a week, in the narrow center walk which we see in a good many houses.

The 15 acres of nursery stock are also in superb condition, and embrace what is most valued in the tree and shrub line.

Cannas are always a feature at this establishment, and this season, as much so as ever. The acreage is not so large as in some previous years, but the interest is being as great as ever, so that comparisons are easy, and an excellent object lesson is presented to the visitor.

The headquarters of the firm is at Fairport, and here the 10 greenhouses are replete with valuable commercial stock. One house of Pandanus Yeddoicus claims especial notice, owing to the exquisite color and general good condition of the plants.

The following notes on new and other cannas are made after a recent visit. President Cleveland.—This canna is cardinal-red, slightly darker than that of Colombia; in foliage, habit, and flower can it very much resemble that variety, but is more floriferous, growing, perhaps, six inches taller, with apparently a much better constitution, and, generally speaking, a better grower.

Miniature Field of Darwin Tulips Referring to some recent reports in your paper on the Hamburg International Horticultural Exhibition, it may be said that the illustrations which you refer to see a picture of one of the great successes of this show, viz., our Darwin tulips, which were first planted and shown "not for competition" at the head entrance of the show.

Following notes on new and other cannas are made after a recent visit. President Cleveland.—This canna is cardinal-red, slightly darker than that of Colombia; in foliage, habit, and flower can it very much resemble that variety, but is more floriferous, growing, perhaps, six inches taller, with apparently a much better constitution, and, generally speaking, a better grower.

Altogether this is a grand canna, and President Cleveland.—This is a seedling from Queen Charlie, which it undoubtedly surpasses, in size of habit and in the coloring qualities render it very desirable. The flower is bolder in its

color markings than the parent, the crimson center being more solid and much more brilliant.

Allegany Hollyhocks. devoted to Boston fern, and Adiantum cuneatum. Several temporary houses, made of canvas, are filled with Lantana borbonica and Arca hirsuta.

Other canna worthy of mention are: Beante de Pottville, Fern, Souv. d'Antoin Crozy, F. K. Merson, Trilby and Franz Buchner, the latter being unique in color—almost salmon with a slight gold band, having a clean tress, of large size.

OPEN TO ALL... FREE TO ALL... ANSWERS SOLICITED FROM THOSE WHO KNOW.

(123) Tempering Water.—I would like to learn a plan to take the chill off water used for spraying and watering plants.

(124) Wood Ashes for Carnations. W. T. Mix a portion of the wood ashes with the soil at once, about one-half or two-thirds of an inch, and mix sufficient soil to make that amount deep.

(125) Heating by Coil B-her.—I would like to ask through the EXCHANGE how to heat a greenhouse by coil pipes and the best shape, to heat three houses running north and south, fairly properly, at a reasonable cost.

(126) Heating by Coil B-her.—I would like to ask through the EXCHANGE how to heat a greenhouse by coil pipes and the best shape, to heat three houses running north and south, fairly properly, at a reasonable cost.

(127) Cheap Liquid Shading Material for Greenhouses.—J. J. G. We know of no cheaper liquid material than this paper, viz., white lead and sphalerite.

Allegany Hollyhocks.

Our illustration is reproduced from a photograph kindly sent us by Messrs. J. and W. Storer, of Fairport, Allegany, Pa. The flowers of this new type of hollyhocks are very different from the old type, and are much more numerous and in the manner in which they are disposed on the stem.

Market Remains Unchanged.  
There has been little, if any, change in condition of the market since last writing. Carnations, if anything, have grown a little nearer, while roses are more plentiful. African tulanees are becoming to come in and sell very readily. This is a beautiful single white on long stalks and quite scarce, at \$1.00. *Gladioli* are also selling readily. The majority of *Hydrangeas* are becoming to come in and sell very readily. A few extra choice selected stock are sold as high as \$2.00 and \$3.00. *Hydrangeas* to grandiflora crosses are selling readily at from \$2 to \$7 per 100. *Harris* white peonies are ready market at from \$50c. to \$1 per 100.

One kind of one from St. Louis who expects to be in Providence at the convention. M. H.

**Chicago.**  
**State of Trade and Weather.**  
So far as the weather is concerned no complaint can be made; the week has been simply perfect.

Roses continue to improve under present conditions, and may be considered fair in quality for summer growth, although beauty are not yet a very conspicuous factor. A large quantity is, however, being grown this year, more than ever before, Bassett & Washburn selling 1000 at \$4.00. Price for best is \$15 per 100. Ten roses, except *Kaiserin*, are still short stemmed, but improving weekly. Price for first quality is \$2 to \$3. Some *Arnott* are showing up, but they also are short in stem. Growers, so far, seem favorably impressed with this rose.

Carnations are poor, white being scarce; the best varieties of color are L. Gilbert, Portia, and Scott; 50c. to 75c. is the prevailing figure for best single and double kinds; 25c. to 30c. *Gladioli* are plentiful, very fine flowers are common. All do not get sold and \$2 to \$3 is the asking price.

Amarium bills are abundant and good, selling at 75c. to \$1 per dozen.  
Asters are not prime stock; it looks as though some of the green lay poor and would hardly be the plants attention enough. Price for aster is 25c. to \$1.50 per 100.  
Snailus scarce, the selling price being \$8 to \$10.

**Convention Items.**  
The Chicago Florists' Club has made arrangements with the Pennsylvania Railroad for transportation to Providence. The train leaves Union Station, Chicago, at 10:30 a. m., Sunday, August 15, arriving at New York 2:40 p. m., Monday. At New York the party will take the Providence boat, leaving at 5:30 a. m. of same day, and reaching Providence at 6 a. m., Tuesday morning. The fare from Chicago to Providence will be \$25 going, \$7.67 returning. Total of \$30.67 for the round trip. A certificate must be secured when purchasing the ticket and this must be obtained at Providence, by the secretary of the society, to entitle the holder to the special fare returning.

**Around Town.**  
Julius Schindler, 191 Blue Island avenue, died the past week, aged 32. His father was one of the early florists of this city. Deceased leaves a widow and two children.

The commissioners of Lincoln Park have advertised and are to let the park and the laying out of a 24-acre park at Chicago avenue, from lands made from accretions from the lake.  
The new walk houses at Washington Park are now glazed, the glass being ribbed inside, and the outer surface ground. Mr. Knuts believes there is now no fear of burning, nor need of whitewashing and wet abundance of ground.  
Mr. Knuts believes there is now no fear of burning, nor need of whitewashing and wet abundance of ground. All work is well advanced, covering a space of 127x140 feet, is also fast nearing completion.

Visitors the past week included Fred Trebet and this must be obtained at Providence, by the secretary of the society, to entitle the holder to the special fare returning.

# The Right Cypress for Greenhouse Material.

Have you heard of Cypress Greenhouse Material that has not been satisfactory? If you have it does not follow that Cypress is not the best lumber to use. There is White Cypress, Yellow Cypress and Red Cypress; there is Cypress that grows on the high lands and Cypress that grows in the swamps.

All of these different kinds are not suitable for greenhouse purposes. Do you know which kind is best and do you know that kind when you see it? If not you would better buy from those that do know and will deliver exactly what they sell. We introduced Cypress for greenhouse construction and pushed it to the front. We know all about it. For fifteen years we have made a specialty of furnishing it, and during this time we have built up a reputation that we cannot afford to jeopardize. We send out the best only.

Hackettstown, N. J., July 7, '97

Cincinnati. Trade Items. Business is not worth mentioning. There is a little call for white flowers for funeral work, but flowers of that color, especially roses and carnations, are very scarce. Asters are quite plentiful, also balsam, and these constitute the bulk of the supply. Among Growers. The growers are busy cleaning up and getting ready for fall business. At the Oakley rose houses, operated by George & Allen, ten houses of Beauty one house of Meteor, two houses of Brites and Bridemaid, in all 8,000 roses, are in fine shape, as also are two houses of chrysanths.

George Magrie continues the business at College Hill, and is forcing bulbs and growing a few, as well as roses and general stock. The Hoffmeister Floral Company, under the management of August Hoffmeister, has made rapid strides during the short time they have been growing cut chrysanths. Their houses of Beauty, Meteor, Bride and Bridemaid, also chrysanths—blossoms are about the best in this city. One house of the latter, consisting of Bergmann, Yellow Queen, M. M. Johnson and chrysanths of the new variety, will be in very early. A later house is in fine condition, as is also a house of Campbell violets. John Ernsterhoff & Sons, of Newport, Ky., are busy rebuilding. They are now in the building a new carnation house, 80x136 feet, for fancy kinds. Wm. Speck has one-half acre of tuberoses planted.

The News. Thieves, or a thief, broke into James Allen's residence Tuesday night and stole four suits of clothes. The well-known florist of that name, reports excellent business the past two weeks, the best he has experienced in three years.

J. Charles McCullough is able to be at his place of business again after having been laid up for five weeks from an injury caused by a spider bite on his leg. He, with his wife, children, and a party of twelve ladies, are on their way to Pittsburg on the new steamer Queen City. They will take a week to make the round trip. Mr. McCullough tells me he has done the best business of his life. He has been known for five years. Speaking of crimson clover, a great deal has been said regarding its standing our winters and whether it really would prove a success or failure in this country. He showed me a sample of the seed, and says that it averaged nine bushels per acre. If sown within the next six weeks and given chance to grow in a good firm start, crimson clover will not winter-kill, will make splendid early pasture, be a first-class fertilizer if turned under, and will give a good yield if cut for seed. It is selling now at retail for 4c per pound. The quality of the new seed is of excellent value. E. G. GILBERT.

Nashville, Tenn. One of the attractions here, in the horticultural division of the Centennial Exhibition, is the magnificent display made by the E. F. Peterson Company of Ferry-town, N. Y. On various portions of the grounds this firm exhibits 5,000 cannaes, 100,000 tuberoses, 2,000 dahlias, 500 lilies, 250 muses, besides evergreens, ornamentals, and a large collection of palms. Among a good many of Peterson's Premier, a dwarf grower, not exceeding 2 1/2 feet in height, could a rich glowing display with a very yellow border. Terry, Cabos, Queen Charlotte, Italia, Susan, Chicago, Bouvier, Souvenir d'Angleterre, Marquand, Eldorado, Florence Vaughan, and Charles Henderson. The dahlias exhibit includes Nymphs, Orange King, Golden Yellow, Dunton, Black Prince, and others. A fine collection of standard roses has been much admired, and Fremont cannot give great satisfaction out-of-doors. Dugce & Conard made a grand display of roses. Exhibits were made also by the local florists, Curry & Co., Joy & Co., and William McIntyre. The exhibition has been arranged for October 27, 28, and 29. Another stock show, which opens on Sunday, will be judged September 15. Youngstown, O. This locality was visited by a cloud-burst and very severe storm on the 23rd of July, which did many damages to field crops and trees. Many washouts are reported. G. A. G.

## SIEBRECHT & SON,

NEW YORK OFFICE: 409 5th Ave.      NEW ROCHELLE, N. Y.  
 When Writing Mention Florists' Exchange

When Writing Mention Florists' Exchange

## We invite Florists to visit Our Nurseries

Our Cannas are in full bloom at this time. We are making very extensive tests of all the

### NEWEST AND FINEST CANNAS IN CULTIVATION,

and an inspection of the recent novelties and a large number of new sorts which we are testing with a view to future introduction cannot fail to be of interest. We would call particular attention to a new *Canna* which we expect to introduce next year. This *Canna* can be seen on our catalogue of *Sp. Regularis Macrae*, at Pr. Orange, to whom we have sent plants for trial. We think that this will prove to be the finest dwarf red *Canna* that has been sent out up to this date. We are testing it extensively this summer so as to be certain in regard to its value before offering it, and from what we have seen of it this season, we shall be very much disappointed if it does not prove to be the finest variety for bedding that has ever been sent out.

We should be pleased to show visitors through our extensive range of Rose Houses. It is late for

### WINTER-FLOWERING ROSES.

But we still have a good stock of fine plants for buyers who are obliged to plant late.

We should like to call particular attention to our large stock of

### PLANTS AND OTHER DECORATIVE PLANTS,

and should be pleased to have our friends examine our stock before purchasing their Fall and Winter supplies. As we are crowded for room, we will make quite a considerable concession in the matter of prices where orders are placed early and shipped before we are obliged to put our plants in permanent winter quarters the same in labor, re-handling, etc. enabling us to make quite a difference in price where plants are shipped before cold weather. There is also an additional advantage to purchasers in having plants shipped early, because they not only can buy cheaper, but the plants can be shipped by freight with perfect safety and at a large saving in expense. Where parties have room to handle the stock, they will find it very much to their advantage to have goods shipped early.

### WE HAVE A LOT OF BARGAINS TO OFFER!

We have particularly the stock of the following leaders in the very best possible shape, viz: Large *Arecas* Lutescens, *Pandanus Veitchii*, *Ficus*, *Latanias*, *Nephrolepis Exaltata*, *Bostonides* and *Davallodes*, *Furcans*, *Araucaria*, *la Ecchia*, *Glans*, and *Meriania*, *Compaeta*, *Kenilots*, *Coccos Weddeliana*, *Adiantum*, *Plumosa*, *Variegata*, *Adiantum Cuneatum*, *Small Ferns* for Farm Plants, &c. We receive very largely Dutch, French, Japan, Bermuda, and all other BULBS FOR WINTER FORCING AND SPRING FLORICULTURE.

## CARNATIONS,

### FIELD-GROWN PLANTS.

fortune has favored beautiful as the gardens of the gods, and carried to the poor and the beauty of the city by the fragrance of the rose.

Wishing that every success may attend the meeting of the younger portion of the City, I am, very respectfully,  
CLISHA DYER,  
Governor of Rhode Island.

A selection by the orchestra was followed by singing by the Union Veteran Quartet. Solos by Florence Batchelder Sargent were enthusiastically received, and which it was announced that dancing would be enjoyed. The floor was cleared and the younger portion of the company gave themselves up to the pleasures of the dance. A light collation of ice cream and cake was served to all present.

The Bowling Contest.

The bowling contest continues as interesting as ever. It was decided that teams falling to make 600 on the first game would be unable to complete the three games, but due to one of the Providence team falling sick this rule was waived, and Buffalo and Providence, who had both failed to make the necessary 600 were allowed to roll the second time. Following are the scores by games:

Philadelphia team with a score of 2501; Boston third, with a score of 2384; Pittsburgh third, with a score of 2281.

Individual Competition.

Table listing individual scores for Philadelphia, Providence, and Buffalo.

The highest aggregate score in the three games was made by John Hornell, of the Philadelphia team, with 453 pins.

W. A. Manda having to leave, his place in the New York team in the second and third games was taken by James Logan.

The Shooting Contest.

The event of Wednesday afternoon was the clay pigeon shoot between the clubs representing Philadelphia, Buffalo and Providence. Through the courtesy of the home club or rather through the agency gave the visitors a very exciting Philadelphia match, the result being a total score of 90, Buffalo being high with 45, and the home club showing only a score of 35.

provement made in the growing of such stock as an up-to-date retail store must carry.

In concluding, I would say there has been a decided progress and improvement in all departments of our business for about a year, and now that after the S. A. F. convention we join the number of ones that have been visited with meetings, we hope the result will be a continuous increase financially, socially, etc.

THOMAS J. JOHNSON.

New York.

There is very little, if any business. The market is glutted with roses of very poor quality, which bring 4c. to 6c. per bunch. The Greeks pay 50c. for the best quality, in limited quantities. Many thousands are unsold, even at these prices.

Asters are a drug, except for a very few large varieties, which bring 4c. to 6c. per bunch. Thursday morning, at 34th Street market, the growers carried their roses home with them. The rise in wheat has had no perceptible effect upon the flower market as yet, but there is a good prospect.

Quite a large delegation from this locality left Monday night for the S. A. F. convention, at Providence.

Small Zee, N. Y., lost a little child by death, the past week.

David Y. Mellis, Flatbush, is on the sick list.

G. Oliver, Washington, D.C., on his way from Washington to Montreal missed connection and had to spend last Thursday in New York.

He improved his time by taking a trip to Connetquot Island.

CORRESPONDENCE.

Insertion will be given in this column to all correspondence from growers, but the opinions expressed do not necessarily reflect our own.

Sweet Pea Novelties, 1897.

Editor Florist's Exchange:— Re: Reply, etc. "Sweet Pea Novelties for 1897," in a recent number of the Exchange, I desire to make several points which you will find of interest in my test of Queen Victoria. I stated that it came a lemon self. I have since had a plant which has not yet come into bloom, which shows a tinting of light blue, which no doubt is what Mr. Eckford meant when he says in his description of the shading "subtly overlaid with faint purple." This shows that this variety includes two shadings, one of which has met with the greatest favor. Hutchins' notes made in Eckford's garden when he visited it in 1895, show that it was called a self.

While at Springfield, Mass., in July, I was struck by the blue color in coloring and shading of some of the well-known varieties, such as Crown Jewel, Queen Victoria, etc., which are so common. They were not at all like the shades that they come in the Middle West. It has occurred up to me the question of the "modification of soils and climates on the colors of sweet peas."

Fifteen miles from Springfield, in the high mountain country, the colors and shading were all blue. The soil was something in (or out of) the sand-hill variety, which is common in Massachusetts, which causes the variation of colors and shades. The greatest variation was noticed in the colors of the Queen Victoria. Esq., who will become a great favorite in this mystery. Some of his "coquette" colors are pink, but they have no trace of the yellow appearing in the wings of the coloring of Brilliant in a "brick red." SAM. C. HAMILTON, Sweet Pea Expert.

The Facts in the Case.

Editor Florist's Exchange:— Every now and then a new plant is brought to the notice of the craft, or it is put more exactly, an old plant, or a common one as it is called, but with a description that would make an ordinary grower go out and borrow the money to get it. It is then a matter of information that he ordinarily possesses it. He is told by the seller, and very often the result is that the grower has a great deal of experience with a small plant, and he has to pay a great deal of money. Now, what I want to get at is that there

should be some place where the intending purchaser could get the facts in the case without coloring. It seems to me that the EXCHANGE is the place to look for this information, and the writer would have had delight in furnishing a description of alleged "new" fruits and flowers.

I have moved to make these remarks by my experience with the straw-berry raspberry. I read the description of the thing, and my own eyes were not strong enough to pay for the expenditure ten times over, but there is also another side to the matter. The grower who has the body who invested his money in the plant on the basis of the description was disappointed. It is not enough to condemn the whole business.

The facts in the case, as I say them, are that the grower is the one who has the berry order, grows about a foot high, has a flower on the order of the strawberry, followed by a fruit like a strawberry, which grows to be as big as a good-sized hickory nut, turning a beautiful scarlet color about the middle of July. This fruit has all in its looks, and is not fit to eat. One can eat it, but it is not good. The grower is the one who "jazzers," dies down in the winter, and is not fit to eat. The grower is the one who "jazzes," dies down in the winter, and is not fit to eat. The grower is the one who "jazzes," dies down in the winter, and is not fit to eat.

Now this sort of talk might pinch somebody who has a very small business, but it would be a mighty help, all the same, in the division of the money that is now being made in this business. It may be that only the feeble-minded get the experience, but if the EXCHANGE is to be of any use to the grower, like the writer, who is going to do it? HOWARD MILLER.

The Scotch Thistle as a Decorative Plant.

Writing in the July number of Park and Cemetery, Fanny Cooper Seavey calls attention to the decorative possibilities of the Scotch Thistle. It is a native of Scotland, as exemplified at the Lexington (Ky.) cemetery, and by illustration shows, in a lesser degree, its adaptability for use in indoor decorations. Regarding the latter, this writer says:

Grow the Scotch Thistle in pots for indoor decoration. It is a native of Scotland, and it proved a marked success in this country. They were splendid plants and singularly attractive. It was the celebration of the Lexington Cemetery, the Scotch Thistle in honor of Queen Victoria's diamond jubilee.

The Scottish national emblem seems to be the thistle, for it may be traced to a family tradition of the national characteristics. There is, for instance, the brave brave right upright, picturesque, a certain scatty extensiveness, and a certain independence, a moderate intrusion and withal, the proverbial kindness of heart is not inaptly rendered in the motto downy under-surface of its leaves."

There are many Scottish societies scattered throughout the United States and Dominion of Canada, and the majority of them are engaged in the use of floral decorations are called in recognition. The thistle, as a part of such arrangement, would prove acceptable to the Scotch people, and it is a native to the emblem of their native country as much as to the kilt and bag-pipes. The Scotch Thistle is a native of the claus, generally occurs in January. It is very possible that the thistle could be raised into flower that year.

Imperfect Glass on Roses.

In many rose houses there are a few imperfections in the glass which, if left uncorrected, will do much harm to the plants. Probably only a plant or so may be noticed affected in a house at a time, and it is not until the plants are at their altitudes the burning ray is directed to others. To determine the location of the imperfection, the grower should turn white cardboard. When held over the plant affected the stronger ray is easily seen by the shadow it casts on the covering up to the glass it is easily found, and a little dab with the paint brush ends the mischief. H. H.

When Writing Mention Florists' Exchange

**MASTICA**  
FOR GLAZING GREENHOUSES. SUPERIOR TO PUTTY IN EVERY WAY.  
Is not deteriorated by the extreme heat or cold that a greenhouse is constantly subjected to both inside and out. Mastica is adhesive and remains permanently elastic so that it is not forced out of place by expansion and contraction of the wood work. Houses glazed with Mastica do not need re-glazing, thus saving time and expense. With Mastica can be used on the outside, but with a machine only.  
Mastica and Mastica Glazing Machine were given  
**HIGHEST AWARD OF SOCIETY OF AMERICAN FLORISTS AT PITTSBURGH, 1895.**  
Put up in gallons, \$1.00. Half gallons, 60c. Quarter gallons, 35c. etc.

### OUR NEW SECTIONAL, TUBULAR BOILER EXHIBITED IN CONVENTION HALL.

Office of HITCHINGS & CO., 233 Mercer Street.

TO THE FLORISTS AND GARDENERS OF AMERICA:

New York, August 5, 1897.

**GENTLEMEN:** We are pleased to announce that our business of Greenhouse Building is steadily growing, and we have, during the first seven months of 1897, designed and erected very much more glass than in any former year, not only for private places, but for commercial growers who now realize that high class roses, carnations and other bloom, which command the best prices, can only be grown in a greenhouse of modern construction, with large lights of glass, and a frame so designed as to cast the least shadow and at same time to be of ample strength. These requirements are fully met in our Improved Iron Frame Commercial House, and while the first cost of such construction is somewhat in excess of the old style wooden house, the saving in repairs, and the improvement in the quality of the bloom produced, will soon offset the increased cost. We will be glad to receive your inquiries for estimates for any new work or repairs you may have in view. Thanking you for past orders, and hoping for a continuance of your favors, we are,

Respectfully yours,

HITCHINGS & CO.

**VAUGHAN'S INTERNATIONAL PANSY MIXTURE.** This is the finest mixture for every Florist who would realize the highest prices for his seeds and plants. It contains the essence of the cream of every good Pansy grower's product the whole world over. It contains, besides all the choicest German, English and French strains of beautiful colorings, all the separate colors of the Giant Tricolors and their immense diverse and rich colors. It contains the finest Cester and Bazel strains, the product of celebrated Scotch strains, the Palatin and Hollande Giants. In fact there is no strain of any of the celebrated Pansy Specialties not represented in our INTERNATIONAL MIXTURE. Price, per se. \$1.00; 1/2 oz., \$1.00; 1/4 oz., \$1.50; trade price \$1.00. (Less 10 per cent. for cash).

**VAUGHAN'S GIANT PANSY MIXTURE.** All the above seeds and colors in a special strain not listed elsewhere, and which can only be had in this and our International Pansy. This mixture includes the richest reds, oranges and purples together with the most delicate rose and pink shades, all the distinct colors of Tricolors; the splendid Cester strain with its delicate veinings. We have spared no expense to secure the sweetest, richest and finest sorts. Price, per se. \$1.00; 1/2 oz., \$1.50; 1/4 oz., \$2.00.

# A FORTUNE IN STRAWBERRIES!

The Strawberry King and his Remarkably Successful Career.  
HOW A POOR BOY BECAME WEALTHY.

Through one of those strange dispensations which often mock in real life the wildest imagination of the novelist, the publishers of AMERICAN GARDENING have become possessors of the story of the life and cultural methods of Henry Jerolam, undoubtedly the

**STRAWBERRY KING OF THE UNITED STATES.**  
Mr. Jerolam has agreed to write his life history and the full description of his cultural methods, exclusively for the readers of AMERICAN GARDENING. Further than this and at our solicitation he has made a contract to supply us One hundred thousand plants of the Henry Strawberry, which we will give away as premiums to subscribers to AMERICAN GARDENING.

**THE GRANDEST BERRY OF THE AGE!**  
Four berries of the Henry, grown by Mr. Jerolam, rounded a wooden quart measure. Individual berries were three and a-half inches through each way. Specimens will be exhibited, preserved in formalin, at Waverly (N. J.) Fair next week. Mr. Jerolam's description of the value and virtues of this wonderful variety in a recent issue of AMERICAN GARDENING has brought him hundreds of inquiries from the cream of the professional growers.

**A Gold Mine at Your Own Door.**  
More than one strawberry grower in every town, village and hamlet can come into a good thing through practicing the cultural methods and getting some of the plants which have made Mr. Jerolam not only wealthy and well-known, but so wonderfully successful, by at once

**TAKING ADVANTAGE OF THIS OFFER:**  
We will send you AMERICAN GARDENING, one year, and FIVE HENRY STRAWBERRY PLANTS, BY MAIL, FOR \$1.00. Plants will be shipped now or in the Spring, as you prefer.

Mr. Jerolam's story will be found in the first issues mailed you and his cultural methods will be published in time to be of service for Fall planting. "He who hesitates is lost." It is not likely that such an offer or such an opportunity will occur again in years, therefore hand us your name to-day. Present subscribers to AMERICAN GARDENING are entitled to this offer on renewal; if their subscription has not yet expired it will be dated ahead.

N. B.—Subscribers to Florists' Exchange wishing to know full terms for procuring subscriptions to AMERICAN GARDENING under this offer, posters, with full life-sized illustrations, etc., are invited to write us without a moment's delay, for the remaining season is short. Address Publishers AMERICAN GARDENING, P. O. Box 1697, New York.

**MANURE.**  
Fresh and well rotted horse manure. Manure for market growing a specialty. Excellent for all crops. Full life-sized illustrations, etc., are invited to write us without a moment's delay, for the remaining season is short. Address Publishers AMERICAN GARDENING, P. O. Box 1697, New York.

SEEK TRADE REPORT.

Points and information from seedsmen, and all interested in the course selected. Address Editor Seed Trade, care of Florists' Exchange, P. O. Box 200, New York.

New York.—Business, generally speaking, is fairly satisfactory. Bull trade so far is good; in connection with this a strange time having the past week, viz., Dutch and French bulbs came in at the same time, owing to the Dutch stock being very light and the first arrivals to arrive. All Dutch stock is unusually good in quality; the bulbs are well ripened, good color, and a fine size.

Walter J. Knight, of Newark, N. J., was, on August 31, appointed receiver for the E. E. McAllister Co., by Judge Stone of the Supreme Court, on the application of Elie B. Walter. We understand the appointment is to be continued.

Stonx City, Ia.—A temporary injunction has been issued restraining Receiver Jonathan W. Brown from operating the Stonx City Nursery and Seed Company, a portion of which he recently purchased at receiver's sale, in order to protect the rights of the stockholders. The hearing on the permanent injunction will come up at the next term of court.

Grand Rapids, Mich.—The Allied J. Brown Seed Company has been reorganized and managed by Alfred Brown, Sully B. Brown, Henry Idean, and James H. Wyie, who have filed articles of association for the purchase, sale, and preparation of seeds, grain, fruits, and produce, and the sale of implements and tools of all kinds. The capital stock is \$10,000, of which \$8,000 has already been paid in.

European Notes.

Weather Conditions.

We are once more laboring under somewhat unfavorable conditions in western Europe so far as the work of the weather is concerned, but as it applies to our plants for 1898 crops, the rains we now share with our eastern brethren are of assistance for these are not expected at present of any long-continued rains, and as a good slice of bright dry weather has intervened since the storms, the present conditions are more troublesome than destructive.

France—A Crop.

In the south of France most of the crops have already been secured, and the safety of those still in the field is practically assured. The following report fully summarizes the situation in that district, and fully corroborates the information already conveyed in these notes.

Beet and mangel, very little planted. Vegetation field, crop only mediocre.

Celery, more planted than last year, crop mediocre.

Celery, endive, and tomato crops satisfactory.

Letuce, middling to good on the whole, where the plants have not tumbled.

Cabbage and savoy, almost nothing planted, crops very ordinary.

Leaf-letuce insignificant this season.

Onion, where the plants were not attacked by mildew there is a middling crop; in places where extra good ones have survived, in the districts outside the service of the canal, the plants were badly given up by blight and hot dry winds. When it is remembered that seed growers, the principal industry of the district, are not so very profitable to the growers, as we perceive the report of the unfortunate region.

Lucerne has done well in Provence, but in the department of Vaucluse it is feeble.

Flower seeds, about the usual quantity has been planted, and the growth of the crop has been fairly good.

Very little rain has fallen in this district during the past eighteen months, and but for the irrigation with any crops would not have survived; in the districts outside the service of the canal, the plants were badly given up by blight and hot dry winds. When it is remembered that seed growers, the principal industry of the district, are not so very profitable to the growers, as we perceive the report of the unfortunate region.

The Market.

In market seeds the principal features are a brisk demand for tares which is very welcome. Rape is still higher and the price is very firm. It is evident that the crop is a small one, for now that the

price is remunerative to the grower, and the demand brisk, any stocks on hand or available would certainly be forthcoming. Chinese clover has made an upward move at last, but the lack of orders from your article has knocked it down again.

EUROPEAN SEEDS.

California Seeds.

Now that harvesting is at its height something can be said about this season's crops. The weather in general has been good throughout the summer, and it has made the crops come slowly and unevenly.

Onion Seed.

Every grower of onion seed is being made to push the onion crop; it is nearly all on the drying sheets and thrashing has begun. However, it is not an anxious seat, while this crop is still outside, for sometimes an early shower does a good deal of damage. While the onion crop is not heavy this year, the seed will be of good quality; the prospects for a crop the first part of next season are small, yet it turned out better than expected; some pieces were again affected by the mildew, but owing to the drying season, and the consequence is that the heads are only filled on one side; one side of the onion is better than the other, and the probability is that some contracts will be filled a trifle short. The prospects for the next season are more easily affected. Yellow onion came through fairly well.

The prospects for higher prices for the growers next season are very encouraging; very few growers have any contracts for the coming season and those growers who let out contracts for the bulbs will only get half a crop. Onions are now quoted at a dollar a sack in the market and at this price it does not pay to buy and grow.

Letuce and Carrots.

Letuce has turned out well; although it ripened very unevenly, it was harvested in good shape. The reddish seed crop is now out and is only an ordinary yield. Carrot, so far, looks very good; the same can be said of leeks and cauliflower.

Tomato.

This crop is still unsettled; the weather has been so unsettled that it is difficult to think to have done. The vines are of fruitful growth and full of bloom, but the fruit is not yet set. Melons are in the same condition.

Flour-N Seeds.

As predicted, sweet peas did not turn out so well as the leading variety, the lightest in several years, and the volunteer stands which got an unusually early start, did not yield very well. Bekford's latest set will yield half a crop, and Lady Nina Balfour which germinated so poorly will not be put on the market at all, but will all be used as stock seed for next year's growing. Pink Cupid promises to be the leading variety next year; its growth is exactly like Cupid and the quality of the seed as good as that of the Bicolor variety.

Asters are now in full bloom and a fine sight they are. Some seem to be better with a reputation for aster seed as if they had a good deal of the character of the flower; they are as large as Simple's, but on the contrary, slender; the petals are very narrow and long, and the flowers look exactly like a chrysanthemum; this strain has been developed in several colors.

Nasturtiums are again short, as are the nasturtium flowers. The variety which was are now going to seed; the crop will be very good; Burpee's Mammoth Fordhook nasturtium is the best for seed, or a mixture. Japanese Morning Glory is in full bloom, but as yet there is no seed. Early cosmos is just getting into bloom.

CALIFORNIA SEEDS.

American Dahlia Society. The schedule of prizes offered by this Society for their second annual exhibition, to be held at the Fairgrounds of the Pennsylvania Horticultural Society, has just been published. The exhibition will be a double one, as the prizes to be awarded have been divided into two classes, the first—commercial—open to all amateurs only. The awards are confined to bronze medals and certificates. The prizes to be awarded, however, many, and it is hoped, will contribute special prizes. For schedules, etc., apply to the Secretary, 4827 Main street, Germantown, Philadelphia, Pa.

THE STORRS & HARRISON CO., Box 6 Painesville, O. When Writing Mention Florists' Exchange

**Work on some Problems in Violet Culture.**

BY R. T. GALLOWAY.

For several years the writer has been engaged upon a number of lines of work bearing on the cultivation of plants under glass. This work has been carried on in the principal objects in view, viz. (1) to gratify a love for plants, and (2) to obtain practical knowledge of our knowledge of some of the fundamental principles underlying their growth. The ever, were considered incidental and of other duties and has for the most part been done in a private way. This was necessary as many of the problems were of such a nature that it was not practicable to undertake them in any other manner. Since the beginning of the work the writer has been constantly aided by Mr. P. H. Dorsett, who has shared in both the expense and the labor involved. Much of the latter might have seemed unnecessary to the casual observer, but as facts were wanted and as they could not be obtained except by work, the work was done. Thus, we have constructed and reconstructed our houses to suit the needs in view; have made and re-made the heating apparatus, and have changed the arrangements for watering, spraying and feeding so many times that the original plans have in most cases entirely disappeared. Dotted glass and enameled glass and glass with putty and without putty have been used; soil boxes have been made and discarded; heating by water under pressure has been tried in competition with other systems; and there has been overheat and under-heat heating. All these matters, however, were considered incidental and formed little or no part of the serious work, but nevertheless many interesting points have been brought out and it is hoped that some time they may be fully discussed.

The present notes, which have been prepared at the request of the editor of the EXCHANGE, will deal with other problems and are intended more in the nature of a brief description of work under way than a statement of results. Results in such matters cannot be obtained in a year, in fact it may be ten years or longer before some of the questions involved can be satisfactorily answered. An account of some of the earlier work has already appeared, hence, it is not necessary to discuss it here. At this time we propose to speak of the violet, hav-

ing given it more attention than any other crop.

The work on the violet, now carried on in several years, has had for its object the elucidation of several problems, some of which are as follows: (1) to determine, if possible, the more important diseases affecting the crop, the nature of these diseases, their characteristic symptoms, and the best means of holding them in check. (2) to determine the physical and chemical characters of the soil best adapted to the crop. (3) to determine the best methods of feeding the plants. (4) to determine how far the plant might be improved in the number, size and color of the flowers; in general vigor and habit of the plant, in its flowering, by careful selection, propagation and culture.

Any one at all familiar with this crop will see and understand at once that the problems set down for investigation are not without difficulties. Perhaps no subject has been more discussed in horticultural journals during the past ten or twelve years than the so-called violet disease. The most varied opinions have been given, and up to the present time the literature, if condensed and sifted, would be found to be a chaotic mass of contradictions. However, in the light of the facts which have accumulated during the past few years in growing the crop, it does not appear strange to the writer that there have been so many conflicting statements.

The violet so behaves alike any two seasons. Some years certain methods may be followed, and the plants will be satisfactorily free from disease and again the same, or as nearly the same, conditions as possible may be furnished and nearly every plant may be set, growing the crop successfully, therefore, has come to be looked upon in many localities largely as a matter of luck. This might seem to be the case where effects only are considered, but where causes are carefully studied from year to year the true nature of many of the difficulties become apparent. It is matters of this kind that emphasize the necessity of knowing thoroughly every phase in the growth of the plant. This knowledge can be gained only in one way and that is by actually growing the plant and watching its behavior under the varying conditions which surround it and which influence its every vital function.

From the studies which have been conducted it is concluded that instead of one disease, as seems to be the general opinion, there are at least two or three; in fact, the evidence at hand is sufficient to warrant the statement that

the maximum yields of flowers considered with economy and health, is an important problem and has received considerable attention. The work in the main consisted of plant tests of various foods, singly and in combination (Fig. 1). Two general methods have been followed, (1) the incorporation of the desired food with the soil at the time of planting the crop, and (2) feeding from time to time as growth progressed, and in accordance with the sowing requirements of the crop. The first method involved a consideration of proper apparatus for applying the liquids economi-

FIG. 2.—Bed of Pedigree Plants.

The bed contained 425 plants and yielded for the season 3,470 flowers, or an average of 8.2 to the plant.

widening area, and although the changes may not be apparent to the naked eye, they are sufficient to enable the scrubland and by its comparatively rapid work, a spot of dead tissue is the result. Thus we have the apple puncture, the absorption of water, and the fungus to absorb, and in addition to this, the reaction of the plant to the constantly changing conditions which surround it.

In the work on soils many complicated questions must be considered, but after all this matter grows less complex the more skillful the grower becomes, in handling his plants and knowing just what to do and when to do it. Such practical questions, however, and the effects of different depths of soil, the value of benches and solid beds, the effects of different methods of drainage, the effects of subirrigation, the effects of continued cropping on the same soil, sterilizing the soil, etc., have been considered just as every grower would have to consider similar matters in order to find what is best for his own particular needs. The work has, of course, developed some interesting facts, but they will be applicable only in a general way other localities where conditions are different.

Subirrigation has been considered seriously, or the writer has always looked upon this process as of more value to the amateur than to the professional grower of plants. Sterilization of the soil by steam has been investigated to determine its effects on the growth of the plant as regards health and disease, and also to determine if the work could be made practicable on a large scale.

How to feed the plants in order to get

ally and expeditiously, warming the water, and other matters.

By far the most important line of work considered is that having for its object the improvement of the plants by systematic selection, careful propagation, and good culture (Fig. 2). For twenty-five years or more the Marie Louise violet has been the principal variety grown, and flowers to-day, when of good color and size, will sell in preference to all others. We are firmly convinced that much of the trouble now experienced in growing this variety is the direct result of the methods of propagation and culture practiced for many years. Like all other plants, the violet is constantly showing a tendency to vary. No two plants, in the strict sense of the word, are ever exactly alike, and while the differences themselves may be so small as to be unnoticeable, these differences eventually become markedly apparent. If a careful study be made of a hundred or a thousand plants, there will be found marked differences as regards size and general vigor of growth, resistance to disease, number of flowers produced, color of flowers, length of flowers, etc. In the case of plants, and most flowers are produced, etc. Thus, in the matter of yield, the following figures, selected at random from several hundred plants, show how strikingly the plants vary.

It will be seen that of the ten plants given, the yield varies from 62 to 126 flowers each. When we first commenced our work of selection, there were many plants that did not yield over 60 flowers, the average being about 50, taking everything in the houses. The average here is 88 flowers per plant, and there is

FIG. 1.—Plant Experiments with Fertilizers for Violets.

On the right, at the end, Albert's Horizontal Manure; on the left, at the end, no fertilizer. All the plants fertilized with Albert's Horizontal Manure, applied as recommended in the published circulars, eventually died. (Photographed July 9, 1895.)

there are no less than eight diseases, each of which is characterized by more or less distinct symptoms. The diseases in the order of their general distribution are as follows: (1) spot; (2) wilt, or stem rot; (3) blight, or stuntedness; (4) leaf falling, or withering; (5) wart disease, or Edema; (6) leaf yellowing; (7) crown rot; and (8) root galls, or nematodes. It is not our purpose, to enter upon any detailed account of the diseases here, it being sufficient at this time to simply call attention to them, in order that the gene-

Commercial lettuce forcing (American Gardener, April, 1895). and radish growing under glass (American Gardener, September 30, 1895).

**CARNATIONS.**

**Peculiarities of some Varieties.**

When hosing your carnations do not forget to hose the soil. It will be better than others in positions which are well lighted. No carnation can receive too much water, but it is better not to water it there are some that can get along with less light than others, and since in the case of most of the carnations are better lighted than others, those varieties which have shown themselves very particular to soil and light are the best situations. All varieties which have a tendency to open very slowly or poorly, during hot weather, should be watered to be easy prey to bacterial and fungous diseases. Among these may be classed the following: Facke John, Eldorado, McEwan, and Alaska, Fenchlow, Helen Keller, etc. Observation will soon point out such kinds as are not properly placed, and the wide-awake grower will have made notes of the same from past experience, which will enable him to place his plants intelligently and know just what he is doing.

The varieties enumerated above might be divided into two classes, which are: one which are very susceptible to bacterial and fungous diseases; second, those which are healthy but very early in midwinter. Of the former Facke John is probably the best illustration; its extreme susceptibility to water bacteria is very well known, but when handled properly it is by far the freest blooming of all the carnations. The latter variety, purposing even Scott in this respect; the latter, however, is more productive during summer.

Della Fox seems to have developed a carnation from a single stem (pre-proprietary or misbranding may have had something to do with this). I feel confident however, that it can be grown out of its present trouble, and that it will prove a standard variety. The fragrance is rich and when well broken, the color is a pleasing shade of salmon-pink, several shades darker than Baybreak. It is also entirely in the color common to its last winter. I believe, was entirely due to the very severe attack of the rust disease. In fact, if better cultivation, it will doubtless be more popular the coming winter.

It is very susceptible to rust, and since light and air are essentials in combating rust, it should have a light position. It is also affected to an extent by the disease peculiar to Battenberg, which is undoubtedly a form of stem rot. The disease can be kept to a considerable extent, but which indoor culture reduces to a minimum. The case of Facke John is also similar, do not differ materially, in the fact that all of them require the lightest position possible. Their worst fault lies in not opening well during midwinter. The new variety is also affected to an extent at that time, and then as the days lengthen, come all right again, as is abundantly evident. A lack of light is the cause of the trouble.

Fenchlow differs somewhat from the others in that it is liable to produce after about January 1; but during the Fall and early Winter it is remarkably free flowering, while the color is superior to any pink carnation extant.

The poor blooming qualities of Helen Keller reported by us during midwinter, and in fact, by many throughout the Winter, and it seems to differ considerably in its behavior, as the plants get well out of the calyx, and in most cases never expand. The petals seem to have been deprived of their substance, as the leaf is quite limp and wilted. This is, perhaps, partly constitutional, and undoubtedly the same trouble which affects Calcege; yet I believe the stagnation which appears to take place in the stems is largely brought about by injudicious culture.

In the case of Keller I believe that a lack of light and poor drainage are the principal causes of its going to sleep. To me it seems that I have had more experience even with this variety several years ago. We had planted a side bench in the same place as the one in which Helen Keller stands north and south and is not so well lighted as the others. The bench contained about 300 plants. The bottom was made of boards 60 wide to admit of perfect drainage, although with care taking other varieties did very well. It was not so with Keller, however. Imperfect drainage caused impaired root action, which could only result in stagg-

nation to the plant, and, as a consequence, fully 70 per cent. of the flowers went to sleep.

As I said, other varieties did very well here since careful watering would tide them over, but since Helen Keller was constitutionally weak and naturally inclined to produce shaly flowers, the effect of imperfect drainage coupled with a lack of light can readily be imagined. Such then we have grown Keller on a smaller scale, and always in a light house on well-drained, narrow benches, and with much better results.

Daybreak and Meteor are good examples of varieties which do not require so much light as most others, and which also need a cooler temperature. Daybreak will grow better in a poorly lighted house than any other variety. The grower must study these points so that he can home and group his plants intelligently and systematically. Any other method will fail to produce the most satisfactory results.

# READ THIS FIRST

The publication of the below article in a recent issue of AMERICAN GARDENING, has brought Mr. Jerolaman, hundreds of letters from every part of the country.

## Strawberries Henry and Mary.

We have grown almost all varieties of berries, but have only found two really large fruited ones. The one is Mary, originated by the late H. Alley of this village, the other is called, here on Boyden Farm, Henry. We grow tens of thousands of quarts from each variety every year, and they are without doubt the largest and best of all grown in the whole world. I have had this season thousands of quarts of thirteen inches around, and berries would make a heaping wooden quart, and I have preserved several in glass jars, with formalin, so that all who doubt can come here and see for themselves. Some of these berries in the jars measure thirteen inches around, and am the present owner of the Seth Boyden farm. Seth Boyden originated the first large strawberries, perhaps, in the world (Agriculturist and others); he died in 1870. I then bought his farm, and have continued to grow strawberries from that time to this, and will say that an honest, true plant called Henry is, beyond all doubt, not only the strongest plant, but the largest, best fruited, and sweetest strawberry ever yet produced; color dark crimson, it is perfect (Mary) is very large, round, and no combe grows on it. I have grown them for years, and they are ready for market in a small way, and this season nearly one-half of all that I grew were of the Henry; it will out-produce any strawberry plant that I have ever known, four-year-old plants giving very large, and just as fine berries as plants one year old. The plants as yet have shown no disease, while all other varieties, such as Great American, Jersey Queen, and nearly all varieties except those sold berries not good for market (Sharpless, Bach, and others), have shown disease to the plant. My Mary this season could not stand the hot sun, and nearly one-half of all the plants burst and dried up while full of berries. Mary will not bear the second season, but must be set out next year, while the Henry, but a single plant has died, either old or young; it is the first berry ripe and the first giving the large berries from the Henry to date, July 15.—HENRY JEROLAMAN, N. J.

Mr. Jerolaman will not answer any further correspondence except through the columns of AMERICAN GARDENING.

# NOW READ THE ADVERTISEMENT

ESSRS. STEVENS, SIMPSON & CO., Commission Merchants, 232 West Street, New York City, state they handle the HENRY Strawberry, and have realized for it the highest price obtainable for any outdoor stock coming into New York market. Mr. Simpson further states that in his opinion, as grown, packed and shipped by Mr. Henry Jerolaman, it is the BEST HOME MARKET BERRY in existence. For SIZE, COLOR, and SWEETNESS, and in its KEEPING QUALITIES, IT HAS NO EQUAL; these many points in its favor rendering it easy for the grower to realize considerably more per quart than the regular market value of Strawberries generally.

# THE ADVERTISEMENT. YOUR FORTUNE IN STRAWBERRIES!

The Strawberry King and his Remarkably Successful Career: How a Poor Boy Became Wealthy.

THROUGHOUT one of those strange dispensations which often mock in real life the wildest imagination of the novelist, the publishers of AMERICAN GARDENING have become possessed of the story of the life and cultural methods of Henry Jerolaman, undoubtedly the STRAWBERRY KING OF THE UNITED STATES. We have prevailed upon Mr. Jerolaman to write the history of his life and a full description of his cultural methods, exclusively for the readers of AMERICAN GARDENING. Further than this and at our urgent solicitation we have prevailed upon him to make a contract to supply us One hundred thousand plants of the HENRY STRAWBERRY, which we will distribute only as premiums to subscribers to AMERICAN GARDENING. The unrivalled HENRY STRAWBERRY has positively never been advertised until now.

## THE CONTRACT

*Publisher American Gardening, Gentlemen,*  
*I hereby agree to furnish you within the next twelve months in quantities as ordered, One Hundred Thousand plants (100,000) of any portion thereof, of the Henry Strawberry, to be used solely as premiums for subscribers to American Gardening and not to be sold.*  
Address: *Trout Pond, Ohio.* (Signed) *Henry Jerolaman*

## The Best Berry of the Age.

Four Berries of the Henry, grown by Mr. Jerolaman, rounded a wooden quart measure. Individual berries were three-and-a-half inches through each way. Mr. Jerolaman's description of the wonderful berry in a recent issue of AMERICAN GARDENING has brought him hundreds of inquiries from the cream of the professional growers.

## A GOLD MINE AT YOUR OWN DOOR.

"He who hesitates is lost." It is not likely that such an offer or such an opportunity will occur again in years. More than one Strawberry grower in every town, village, and hamlet can come into a good thing through practicing the cultural methods and getting some of the plants which have made Mr. Jerolaman not only wealthy and well-known, but so wonderfully successful, by at once

## TAKING ADVANTAGE OF OUR OFFER:

For \$1.00 (check or money order preferred) we will forward you, by mail, postpaid,

# FIVE PLANTS HENRY STRAWBERRY OF THE UNEQUALED

And AMERICAN GARDENING One Year.

Plants to be shipped this Fall or in the Spring, as you prefer.

Mr. Jerolaman's story will be found in the first issues mailed you and his cultural methods will be published in time to be of service for Fall planting.

## OFFER EXTRAORDINARY

For every new subscription you send us at \$1.00, we will forward you, postpaid, as a premium, Five Plants of HENRY STRAWBERRY; at the same time we will also send Five Plants to the party subscribing through you. Thus a club of ten new subscribers entitles you to Fifty plants of this wonderful Strawberry, as well as each individual subscriber to Five Plants. This is a BIG OFFER to all who tend to become large holders of this wonderful Berry, never before advertised. Time is short, get to work at once if you wish to accomplish anything before frost.

MASTICO FOR GLAZING GREENHOUSES. SUPERIOR TO PUTTY IN EVERY WAY.

In hot weather by the intense heat or cold that a greenhouse is constantly subjected to both inside and outside... Mastic and Mastic Glazing Machine were given HIGHEST AWARD OF SOCIETY OF AMERICAN FLORISTS AT PITTSBURGH, 1895.

F. O. PIERCE CO., Sole Manufacturers, 170 Fulton St., New York. When Writing Mention Florists' Exchange

A Pleas.

The annual picnic of the employees of H. Dale was called for August 18, and on that morning a jolly crowd of 150 of the men and their families assembled at the greenhouses lent on having a good time.

At 11 o'clock the rally-boe sounded, and a start was made in pleasure vans for Eldorado. Now as there are so many Eldorados in this little world of ours, I must admit that this particular one is a beautiful spot on the River (credit about four miles from Brampton--an ideal place for a picnic, left almost as nature made it with plenty of sunshine or shade, water or upland.

The program of sports held an event to give every one from ten to twenty rods for the wet lot of five and under, up through the different ages for misses and boys, ladies and gentils of forty and up with first, second and third prizes in each.

Say, there was more fun than a circus, a side show, roses at \$3 a dozen, and anyone might get a slice of pie. To the beautiful villa in which Dick kept his orchard, the water, lost his balance and landed in the bottom of his boat with heels in the air, or will rowed straight across the course and fouled all the other boats, or had struck out on a course of his own and landed in a clump of bushes on the shore. Then to see three boats foul each other and become jumbled together, men and oars all mixed up in a vain endeavor to get separated; altogether it was a sight to be not forgotten. The prizes, first, second and third, played cup, arm chair, and pipe in case, were awarded by the winners amid the cheers of the crowd.

After dinner the races started, beginning with the youngest, and here we found that the management had arranged so that all children under fourteen got a prize whether they won anything or not. It was worth something to see the squalls and hear the cheers "O, then kids."

A cricket match was played this afternoon, the sides being chosen on the grounds, and a prize going to the best batter of the day. A slight shower in the evening caused us to partake of the best meal under cover of a dancing hall on the grounds, and after doing to the edibles provided by the ladies, we arrived home a tired but happy crowd, about 9 P. M.

We are having a very cold spell, temperature falling to 47 degrees this week, making it necessary to put on light fires. Trade during August has been somewhat better than last year. H. DALE.

Syracuse, N. Y. State Fair.

With the exception of one day, bright cool weather favored the State Fair held at Syracuse last week. The entries in all departments were more numerous than ever before, being especially crowded in the horticultural department. The quality of the cut flowers was remarkable, all classes making a good showing, the amateurs putting up an especially fine exhibit. Considerable space heretofore used for plants was this year devoted to fruit, and this action caused some tall kicking by the plantmen. All the plants were crowded, many of them being placed on the floor, which of course detracted from the beauty of the exhibition.

Considering the early date, and the extreme dryness of the season, the work was very good. Peter Crowe of Utica and George Savage of Rochester were the judges of plants and flowers, a severe hail-storm passed over thirty two weeks ago, doing considerable damage to vegetation and to our plants, but very little glass was broken. L. B. Marquisse is enjoying a vacation camping out on the St. Lawrence. C. BARSON.

# BLOOMING PLANTS!

**FACTS.** The plants are strong, rapid growers. They are easily handled in all stages of growth. The two varieties offered are very readily propagated. They are not subject to any insect pests. They are free and continuous bloomers for four to six months in the forepart of the year. The bloom-bracts are very durable on plant or in out sprays. The color is showy and very attractive. Sold for 14 CENTS and 20 CENTS PER 100.

We offer nice stock of both varieties, from 5 inch pots. **GLABRA** (7 to 10 to 30 inches above pots, 4 to 6 shoots. **GLABRA SANDERIANA**, 15 to 25 inches above pots, 6 to 8 shoots. Price, \$50.00 per 100; 5 plants at 100 rates.

The above plants can be safely shipped by freight to points within a week's shipping distance of Pittsburgh. We mail 4 nice branched plants of either variety, from 5 in. pots, for \$1.00, or 10 for \$2.50.

# FLORISTS.

## Treatment of Uncle John.

In my notes last week I mentioned Uncle John as being particularly susceptible to fungous and bacterial diseases. It is more so than any carnation which has ever come under my notice, and as I have received inquiries as to the treatment it should receive, I will give a brief outline of the same in this column.

In many respects Uncle John is identical with any other carnation, and I believe it may be profitably grown in any community where carnations are raised, and the atmosphere is fairly dry. It is of medium height, and a very rapid grower, so that when the conditions are favorable, large bushy plants are soon formed. The natural conclusion to be drawn is to give them plenty of room, not how much depending entirely on the nature of the soil and the locality in which they are grown. This is a point for the grower to decide, who knows more about the growth of carnations in his own locality than one at a distance. It is good, to say, however, that the plants will be kept fully as much room as any of the large growing varieties, such as Triumph, Hector, and others. Its very rapid growth must be checked and held firm by keeping the plants rather on the dry side; they can get along with less moisture, and really demand less than perhaps any other carnation.

To assist in keeping the plants healthy and free from mildew, as stated in my notes last week I demand the lightest house obtainable. Ventilation also must be good; the air should be completely better.

It has long since been demonstrated that carnation is not a moisture-loving plant; on the contrary, the atmosphere around it must be dry and invigorating, and what is of the utmost importance, always moving and changing. For this reason the fans must be kept going not only because it is cool but because it is damp. Damp atmosphere hangs about the plants and circulates, and the diseases peculiar to the carnation require just such conditions in which to thrive. The plants should be kept free from watering or spraying during Winter months, or when so open apparent. My experience has fully demonstrated the folly of applying fertilizers during Fall, Winter and early Spring, and the sooner every grower realizes the fact that water on the foliage is detrimental rather than beneficial, the quicker he will be on the road to ultimate success.

As I have said, Uncle John must be kept rather on the dry side. There should, however, be no extremes; the note must be drawn intelligently. Never wait until the plants wilt for the want of water, as such waterings can only be injurious.

An examination of the calyx of Uncle John will reveal the same weakness in the weakest of all carnations, and if it grew as most other carnations do, there still would be very little to be said of flowers; but as it is, the rapid growth of the plant extends to the calyx and petals as well, so that the latter do not form long enough to cause the calyx to burst. It is only when the plants receive a sudden check either from frost, or from suddenly chilled, keeping too low a temperature, or allowing the plants to become very dry before watering, that they are any trouble with bursting. When these checks occur the plant, growth to a large extent is suspended, and when resumed the petals will have developed more than the calyx, and the inevitable result is bursting.

With proper watering and regulation of temperature, there will be no trouble from bursted flowers. A night temperature of 55 degrees suits this variety best, and the glass should not go below 50 if it can be avoided.

Another thing to be remembered with Uncle John, when the grower selects other varieties, is that they require considerably more potash than such kinds as are usually raised. It will not do, however, but in applying it, do not act under the mistaken impression that "if a little is good, so much is better."  
H. W. HERR.

## Fire Insurance on Greenhouses.

To the Florists of America.

At the Providence convention of the Society of American Florists, the undersigned committee were authorized to ascertain whether or not the trade really desires a mutual fire insurance association, and if so, to proceed with the organization of a permanent organization. We want to accomplish this work quickly, and respectfully request that you, if so interested, state what amount of insurance you would take, providing a satisfactory rate of premium can be obtained.

You will find the committee's report in the enclosed bulletin, and also in the proceedings of the convention. Should you care to make any suggestions to the committee, or to have any questions cheerfully considered. All questions will be gladly answered by any member of the committee. When you state the amount of insurance you would take, please also mention when present insurance, if you carry any, will expire.

The members of the present committee have for five years given the matter careful attention, and after weighing every objectionable feature carefully, are now convinced that the scheme of a mutual fire insurance association is practicable. There are skeptics on the subject. The Hall Association had the same trouble, and you all know how it has triumphed.

Kindly address at once the member of the committee to whom you wish to object, your name, and state how much insurance you would carry should a satisfactory organization be formed. Give us the encouragement of your support. We need you; you need the insurance. When you are satisfied, we can give you for less than 50 cents of present underwriters' rates.

Write to one of us immediately.

## A New Aster Worm.

A correspondent in Gardeners Chronicle London, this week, has called attention to a new aster worm, which he assumes is the cause of sickness in these plants. The name of the worm, as given as Euclyptus parvulus (Friend).

The worm is 3 to 5 mm. in length, or about an eighth of an inch. It is therefore the smallest species known to science. Viewed under a pocket lens, it is white and silvery, and has six feet. Under the microscope, the first six or seven segments are pellucid, while the remainder of the worm's intestinal organs are covered with dark cells.

The minute worm obtains admission to the roots and rootlets, and lodges under the epidermis, where it sucks the juices of the plant, or even (as microscopic examination has shown) enters the cell structure and swallows the vegetable tissues, thus preventing the plant from sending moisture and nutriment up through the stem to the leaves. Though the worms have no teeth, their mouths act as suckers, and they very quickly divert the nutriment from the ordinary channels to their own esophagus, to devour it of their own accord.

If it were possible, the moment sick plants showed itself, to hit the plant, excise the injured portion, and the worm might be arrested. There would, however, still be a danger, as the worm might be unable to reeve, and if it did, the eggs of the worm, which are infinitely small and are very easily diverted to other parts of the plant, would have been deposited in the tissues. This being so, young worms will soon appear and again do mischief. The only way to insure the destruction of the pest, when once in the plant, is to cut the plant off at the base, and consign it instantly to the flames.

## Why He Left His Job.

HENRY A. DREER, 714 Chestnut St., PHILA., PA.

When Writing Mention Florists' Exchange

**Combating Aphides on Violets.**

I am interested to the extent of twenty thousand plants in violet culture and no less success for five years. The hardest problem found in handling them is the control of aphides. Tobacco steams and powder, and while the aphides are not always killed, they usually suffer severely with spot after the use of tobacco in any form except smoke. The hydrocyanic gas, and the use of it, open or I would fumigate with tobacco, which, as already stated, has been the best remedy. The plants, however, do not look more promising now than ever before this season, but are beginning to show signs of recovery. The question can be done to keep them in check and do the least harm to the foliage? To use the hydrocyanic gas you recommend in the Florists' Exchange is out of the question, as the gas has all piled up and the houses shaded with kifs, mats, and brush.

I have rose-leaf tobacco extract on hand and have been thinking of mixing six ounces of it with five ounces of strong aqua ammonia, saturated with copper carbonate, and let them stand long enough to destroy any fungous spores that might be in the tobacco extract, then add to a six gallon knapsack sprayer of water and use that as a spray once a week. Would that be absolutely safe? It has been used that amount of copper carbonate solution to the knapsack of water once a week for the spot. It works well. I have also washed soap on hand. Would one-half pound of that to six gallons of water do the work?

You can understand that with a good crop in prospect, I am exceedingly anxious not to make any mistake. I am afraid of the tobacco extract unless the copper carbonate will make it safer than the former use of tobacco. Would you think that the spot on the leaves of the tobacco was the same as that affecting the tobacco plants in the market?

Aphides, especially the black ones, was once the most serious pest with violets. I have seen them, but have abandoned the hydrocyanic acid gas treatment, however, as described in a recent issue of the Exchange. It has been a serious trouble. So important do we consider the matter of being able to use tobacco in the market, that I have tried throughout the entire season in such a way that the plants may be fumigated at any time.

We abandoned tobacco extract some time ago, as we found by experience that no matter how used, it would tend to weaken the foliage and make it more subject not only to spot, but to other diseases as well. I have also washed with the tobacco leaves, stems, or extract contain the spores, or reproductive bodies of the spot fungus, and that when any of these materials are used we are sowing the seed of disease, so to speak. While the spot fungus, in its various forms may contain a few spores, there is never a time when the foliage is kept strong and vigorous, however the spores are destroyed. It is, however, experiments we can tell how many spores of the fungus will fall in a given time in any season, one by season. At night, when the air is still, it is not uncommon for twenty-five or thirty spores to fall on a square inch of the surface of a twenty-five cent piece. Every one of these spores is capable, under certain conditions, of producing a new fungus on leaf and producing a spot. It is no wonder, therefore, that we frequently find a spot on a leaf, when it has been used.

Now when tobacco is used, either as smoke, dust, stems, or extract, it seems to me to increase the vital functions of the leaf, the little cells of which temporarily lose their vitality and their ability to counteract diseases. Here is the opportunity the fungus needs, and it at once takes advantage of it by sending a hyphae into the tissue of the leaf. Once the tissue is entered the fungus confides to grow until the plant is dead. The fungus is not so fastidious. The spot then turns white, but when conditions are favorable the fungus will start anew, and the spot will be found soft, greenish, and watery. So the battlegoes

on. If the grower be wise he will try to fumigate his plants so that they can of their own accord check the fungus, for this, in the judgment of the writer, is the only way to master the disease when it once starts.

I would never use copper in any form on the foliage, nor would I use lime, for careful experiments have shown that these materials are of little or no use and sometimes may prove positively dangerous. We can produce most beautiful cases of spot with air-slacked lime alone, and can do the same with Bordeaux mixture under certain conditions.

Coming back, however, to the aphid question, the writer would recommend that the ash be put on at once if possible, and then that the plants be given one or two fumigations with cyanide gas, as already described in these columns. If it is not practicable at this time to put on the ash, then instead of using tobacco, give the plants a thorough

Cyclamen "Papilio." (A new strain).

our hose is only three-eighths of an inch in diameter and, while strong, is very light, so that it can be pulled directly over the plants without hurting them at all. Six gallons of the solution, put on as described, will cover about 500 million plants; in other words, the soap for the work will cost about ten cents per 1,000 plants for each spraying. A great many experiments have been made and many different kinds of soap have been used, but we have found nothing so good as plain Ivory soap. Strong soaps, such as white-cast, soft soaps, etc., should never be used, as they will injure the leaves in time and will certainly spot the flowers if the plants are in bloom. By actual experiments we have found that the Ivory soap will kill from 80 to 95 per cent of the aphides with which it comes in contact, and from 90 to 98 per cent of the red spiders. If not killed all the spiders' eggs, nor will it in every case destroy the young ones. The red

**Cyclamen "Papilio."**

Our illustration shows several flowers of this new and beautiful strain of cyclamen, which is very different from the Papilio or Butterfly. The originator states that it is a freak of nature, neither a cross nor a hybrid, but is the result of twelve years constant work in selection. The strain is absolutely distinct from any other known variety, and with marvelous constancy, surpassing in richness of coloring any yet observed in the class. The form of the petals of the flowers is incomparable, and its flowering qualities are surprising.

Five Dunsen Street, New York, to whom we are indebted for the illustration, writes us to the effect he has seen the strain flourish for the past three years, and the plants a superb display when in full bloom. The owner has been working up stock for the past 12 years, which has resulted in securing only the finest varieties. Some of the flowers are almost flat, and he expects to produce a variety with large, round, perfectly flat fringed blooms which will indeed be a charming novelty, especially as this one is so wonderfully reflowering.

**ROSES.**

As trade in the cut flower line is beginning to pick up considerably, many will begin to get anxious about getting the roses; at the same time the high prices and large demand at Christmas is something else to be calculated upon. I have seen roses for sale about the middle of June, from the first to the middle of June, for the reason that plants planted that date are strong enough to produce some flowers about now without injury to future crops; also by cutting early the crops will be ready to produce another week in October. To get a crop off by this time will be just about right to have to cut the roses in the winter. We get anything like reasonable weather.

I don't wish to convey the impression that it is best to get an early crop of roses, or that every bud that is formed should be left to develop. On the contrary, we must be very particular to the size and strength of each individual plant, and then only let those that are in our judgment strong enough produce a flower or two. At the same time the quantity of stem and foliage cut with each bud should have careful consideration.

It ought to be superfluous for me to mention that a person should be allowed to cut, especially just now, and the same is equally true in regard to disbudding. To allow an incompetent person to perform this work, cutting indiscriminately and letting nearly all the buds develop, will most assuredly result in financial loss during midwinter.

To get along with as few flowers as possible early, and being careful not to have any surplus that will be consigned to the rubbish heap, will require a great deal of care and attention, and over again for our foresight and trouble, during the holidays.

Greatly to be feared is to be more troublesome, and at the same time tobacco smoke will be more injurious. It is better to have the foliage and stems to work injury. My experience that the flowers will be more plentiful if we are careful with syringing, seeing to it that the foliage is well dried off before syringing, resulting in the foliage being the most susceptible to black spot; if syringing is done the next morning after finishing the work, it is better to turn the foliage over, the flowers that are only partially destroyed, the foliage that is left will be more healthy on the edges of the leaves and stems being covered with little plaques of water, which will remain visible and clean dried off by nightfall. Under such conditions we are most liable to get black spot, and also other diseases, and other kindred fungous diseases, that will come no end of trouble and loss. We are sure that the plants that are in perfect health will not have much water adhering to them after syringing. H. H.

treatment with a solution of soap. Possibly one or two applications of the three applications of this material, say at intervals of four or five days. As we have never published a description of our plan of using soap a detailed statement of the method may be of interest to the readers of the Exchange.

Take a 5-cent bar of Ivory soap, and with a knife, or preferably a small plane, shave it up, and then add about two quarts of boiling water. The soap will immediately dissolve, when three gallons more of cold water should be added. With a good, strong force pump, provided with suitable hose and a cyclone nozzle, spray the plants thoroughly with the solution of soap. The nozzle should be held down under the plant, and the spray, which is like mist, should be directed at first upwards and then into the crown. It is necessary to be quick, for a motion of the hand, if properly made, under the plant and then down in the crown will not get every leaf and limb. To give opportunity for rapid movements, about a foot of discharge hose should be used.

fellows, however, are killed by the soap almost as soon as they are touched. If any one can see by taking a leaf infested with spiders and dipping it into soap solution, that the soap, when in contact with the aphides they make a few struggles and die in from five minutes to half an hour.

The soap should be put on early in the morning and after it has been on the plants ten to thirty or more hours should be syringed off with clear water. This syringing, serves two purposes, (1) It cleans off the soap and (2) it washes the spiders and aphides down to the ground, where those not killed starve before they can again reach the plants.

Never mix tobacco with the soap, as it adds nothing to the value of the latter and makes a mess that may show on the foliage for a month. Clean, pure, mild soap will do the work; in fact, after using it for several years, we know of nothing better or cheaper for combating many kinds of insects infesting both greenhouse and house plants.

BOOKS.

Send for our catalogue of horticultural books, just off the press. It contains all the leading publications in this line.

Contents.

Table with 2 columns: Article Title and Page Number. Includes Aster Worn, Carnations, Changes in Business, etc.

For the Busy Man.

Violets reached the New York market as early as August 21... French stocks of Lilium candidum are reported as being very short.

Read what Professor Galloway has to say about the soap roses... We beg to call the attention of those interested in the circular issued by the Fire Insurance Committee, on page 816.

A clearance sale of palms and ferns at the establishment of Procter & Martin, Short Hills, N. J., will occur October 4, 5, & 7.

C. L. Watson, Des Moines, Ia., has been elected president of the American Pomological Society, and Professor T. J. B. Smith, of Purdue University, Iowa, secretary and treasurer.

At the recent meeting of the Society for the Promotion of Agricultural Science, held in Detroit, Mich., Dr. Byron D. Hall, of the New Jersey Agricultural Experiment Station, Newark, N. J., was elected president...

Reflections on Current Topics.

The receipt of a notice of the reconvening of the New York Florists' Club on Monday next after a lengthy vacation, recalls a conversation I had with one of the club members...

The point system in its relation to the exhibits before the American Ornithology Society is evidently a disappointment to some of the members who want it abolished.

It has been stated that florists' clubs can be of great service to the Carnation Society... Why cannot the Carnation Society pay to the certifying club a certain amount of the entry fee charged by the Society?

As regards judges for new seedlings at the exhibition of the Carnation Society, it occurs to me that one man drawn from each florists' club's committee should be appointed to act as judge.

To what base uses? some winners of the S. A. F. certificates of merit evidently put these flowers to very low uses... "Ornamental horticulturists." Give the private gardener and the amateur flower lover some reason to believe that the doors of the S. A. F. A. O. H. are open to them...

A notice American Gardening in a recent issue made a suggestion that, I think, will be of the greatest value to our members... "ornamental horticulturists."... A friend of mine has gone from the commercial ranks into those of the private gardener.

American Pomological Society.

At the meeting of this society, held in Columbus, Ohio, this week, the following officers were elected: President, W. Watson, Des Moines, Ia.; vice-president, G. W. Campbell, Delaware, Dc.; secretary, J. T. B. Smith, Purdue University, Indiana; treasurer, L. R. Zitt, Agricultural College, Mich. The membership fee was reduced from \$4 to \$2.

Mutual Fire Insurance Co.

The subject of fire insurance is one that has of interest several S. A. F. conventions. The complaint against the exorbitant rates of old line companies has been generally heard... The fire insurance committee of the S. A. F., consisting of E. H. Michel, John G. Esler, and H. C. Seibert, etc., has submitted a classification of greenhouse risks which was approved by the National Board of Underwriters... The Mutual Fire Insurance Co. has taken the matter from their table for action, and that board refused to recognize it.

If the usual apathy of the trade allows this opportunity to organize a fire insurance company, it will be a long time before another effort will be made.

New York.

Wholesale Market. The price of the cut flower business is going from bad to worse. With the advent of September some slight improvement was noticed, but it has not materialized for the week now ending will rank as one of the duller of the season.

Young roses are now coming into crop quite freely, and this has increased the supply of high grade flowers... The carnation demand was uncertain: at intervals they were selling fairly well for 75c and 80c but fell to figures a way below these prices.

As yet there is the talk of a very low price being taken, such as 25c, per 100 plants, etc., one finally rising to \$1 and \$2... The carnation demand was uncertain: at intervals they were selling fairly well for 75c and 80c but fell to figures a way below these prices.

Violets have made their appearance early this season, in fact, too early to be regarded as anything but a surplus... Ford Bros. received a few bunches of violets August 21, and again another small shipment Friday.

F. A. Bolker is rejoicing over the birth of a daughter which was presented to him on the 1st inst.

The stores are unusually quiet, and are carrying but very little stock, either in plants or in flowers... The floral work comprises the bulk of business, consequently wild flowers are most in demand.

An enterprising reporter speaking of a small wedding decoration which took place this week, said the body of the bouquet consisted of white chrysantheums, roses, rather airy...

Auction Sales. The season is now in full swing. Clean, well kept, on October 21, 22, and 23, the following will hold their first sale Tuesday next, Sept. 24, 25, and 26, and first in the city, R. M. Gardner & Co. also commence on the same date.

Various specimens of palm, ferns, etc., is announced to be held at Short Hills, N. J., by order of the receiver of the Fitchburg and Lowell, on October 4, 5, 6 and 7, Cleary & Co. are the auctioneers.

Horticultural Expositions.

The fourth week of exhibition at Madison Square Garden, beginning September 27 and continuing till October 23, promises to eclipse any previous attempts ever made in this city... The Dahlias Society expects to make a monster exhibit, and carries from the city to the exhibition grounds a permit William J. Ellison, Woodburn, for the construction of a new greenhouse, 11x55 feet.

The Chrysanthemum Society of America will have their annual exhibition on the best six blooms each of six standard varieties. This is likely to bring out the best of the exhibitors...

The Building Department has issued a permit William J. Ellison, Woodburn, for the construction of a new greenhouse, 11x55 feet.

After the long rest the members have enjoyed, a large attendance is expected. The Philadelphia Horticultural Providence will be the topic for discussion.

Henry A. Siebrecht, Sr., has been compensated for malaria, and is now recovering from malaria troubles. We understand he has been very ill, but are glad to state that a cure has been effected...

Philadelphia.

Business has been very dull the past week, even worse than in some weeks during the past year... The quality has had little to do outside of some funeral work. Roses are now becoming more plentiful and the quality has also improved. Prices have in greatest demand at present, beauty is being \$1.50 to \$2 per 100, while \$3 to \$4 has been the price of average quality for some time...

Valley has been selling well; first quality, 60c; second quality, 50c; and third quality, 40c. To 75c, per 100 is the price asked, but many growers are those figures...

Tuberoses are selling better this season; \$2.50 and \$3 per 100 and sell slow. Gladioli are very plentiful and sell slow.

Valters in Town. James Field, Boston; Miss Field, Baltimore; Mr. McMullin, of Galvin Bros., Boston.

The meeting on Tuesday last was well attended... The nomination of officers to serve for the next year, and owing to some many declinations... The election takes place next month. The subject for the essay for October will be "The Future of the Florist." The Florist the Coming Winter? It has been assigned to Mr. C. B. Smith on the various committees. As far as Philadelphia was concerned, the convention was a success... returned home covered with glory, and without a doubt this would be the means of a large delegation of the sporting...

Toronto.

An Exhibition.

The plant exhibit at the Toronto Industrial Exhibition both in quantity and quality was considerably ahead of last year...

The arthuriums were all foliage varieties, the first and second prize lots were all good plants...

In the class for stove and greenhouse flowering plants, there were five entries...

In fancy caladiums the most of the entries were not up to the standard...

There were very fine entries for twelve cuttings, the first lot was very good and hard to judge...

In the class for six adiantums the entries were hardly up to the standard...

In the class for 50 ferns in 3-inch pots the exhibit was not nearly so good...

For 75 foliage plants, distinct varieties, there were four entries...

The tuberoses, there was one very good exhibit, the other two were not up to the mark...

The class for flowering begonias was poorly filled, there being but one really good plant...

In the single and double geraniums were away below par...

In the class for ferns and rare plants there were some new dracaenas...

The specimen plants in bloom trained on standards included the plants for prize lot, all styles...

The classes for ferns and cypeds were all first-class...

The orchids were a rather poor lot, but that is nearly always the case...

As an extra entry Sir C. Gzowski exhibited a fine plant of Cyclis...

The woodman has taken another wife partner in Miss Amanda Shaw...

Evergreen Ala.

Caldwell, the woodman, informs us that his company is not yet incorporated...

Milwaukee.

Business on the whole is fair, with a slight increase over the same time last year...

Carnations, especially white, are scarce. Some very fine large white asters are coming into the market...

THE ADVERTISEMENT.

Southern California Notes.

State of Trade.

All business has felt the general depression in southern California, and with this depression the florist, the seedman, the nurseryman, and the grower have all been compelled to hedge on their expenses and hang their heads. But one has suffered no more than other lines, and now that the tariff is settled, for the time being at least, there is a steady and healthier feeling prevailing, and business on the whole is gradually improving. In some sections, however, the trade has been intensified in California by prevailing local conditions. The low market prices for fruit and vegetables and crops has greatly retarded tree planting, and as a result the nursery business has been almost at a standstill, leaving a number of nurserymen have gone out of the business. The sale foremanics has been light, but in the way of ornamentals, propagators of first-class stock have done fairly well. The seedmen quite generally complain of light sales, and an unusually dull season. The florist trade presents some anomalous conditions. The last city census gives Los Angeles a population of over 100,000. This increased population has of course enhanced the demand for cut flowers and dried stock, but with this larger population has also come an increase of florist establishments, there being up to 100 florists and florists doing business in the city, yet saying nothing about private gardens. In a small way, "pick up change" selling has increased. Of course the demand is constantly growing for a better class of flowers, hence there is a gradual "grading up." Two or three of our flower stores are the best of the West Coast, and one or two in New York. The result will eventually be "the survival of the fittest."

Seed Farms in California.

The growing of a flower, field, garden and tree seeds is a branch of the business in which I have always taken a keen interest. All the conditions here are certainly favorable to seed and bulb raising in so far as climate, soils, and water for irrigation are concerned. This growing factor—or rather two, to be particular—that certainly is an obstacle, and that is cheap labor. There is a considerable number of laborers who are so hazardous when we come to compete with European growers. Another point that is a disadvantage is the fact that we do not appreciate the small economies of farming and gardening. The Western idea of a poor man's garden or "one row" still permeates the atmosphere. What we waste would support the European grower in many instances, and to defeat our aim for the present in becoming a seed-producing section. But in spite of all the creditable heading has been made. A number of purely seed and flower farms are already a feature in our southern California landscape. No are they necessarily isolated ones. A number are situated in Los Angeles County, two or three in Ventura County, one in Orange and San Diego Counties, while the dealers buy up from private sources and sell in quite a quantity of seeds and bulbs on the side. This latter phase of the trade really "cuts some ice." Elmo H. Meserole recently shipped 600,000 bulbs, while the German Fruit Company sent out some 30,000; possibly the complete shipment for the season. Los Angeles will aggregate 100,000 bulbs. But to return to seed farms and seed growing.

Possibly the largest seed growers are John Bales and John Bales, Jr., of Santa Paula, Ventura County. They have some 200 acres devoted to the business and produce by the acreage of such things as lettuce, cucumbers and onions, 80 acres in flower seeds—10 of which were in asters (geraniums) and for cut flowers. They supply crops for the farm, fruits, etc. They grow almost exclusively for the trade, and are not open to the public under direct contract for large Eastern dealers. Their specialty crops are asters, Begonias, stocks and geraniums, sweet peas, and leading novelties. In vegetable they buy particular stress on beans, onions and frame cucumbers. This firm has done reasonably well at the business, commencing in a small way, and gradually increasing to the present acreage as the business would warrant. In a more limited sense Mrs. Shepherd has made a success of her neighborhood with flower seeds, and enjoys the proud distinction of having introduced several improved strains in one or two instances new varieties.

# YOUR FORTUNE IN STRAWBERRIES!

The Strawberry King and his Remarkably Successful Career: How a Poor Boy Became Wealthy.

THROUGH one of those strange dispensations which often mock in real life the wildest imagination of the novelist, the publishers of AMERICAN GARDENING have become possessed of the story of the life and cultural methods of Henry Jerolaman, undoubtedly the STRAWBERRY KING OF THE UNITED STATES. We have prevailed upon Mr. Jerolaman to write the history of his life and a full description of his cultural methods, exclusively for the readers of AMERICAN GARDENING. Further than this and at our urgent solicitation we have prevailed upon him to make a contract to supply us One hundred thousand plants of the HENRY STRAWBERRY, which we will distribute only as premiums to subscribers to AMERICAN GARDENING. The unrivalled HENRY STRAWBERRY has positively never been advertised until now.

THE CONTRACT

*Publishers American Gardening.*  
Gentlemen,  
I readily agree to furnish you within the next twelve months in quantities as ordered. One Hundred Thousand plants (100,000) or any portion thereof, of the Henry Strawberry, to be used solely as premiums for subscribers to American Gardening and not to be sold.

Witness my hand and seal this 15th day of May, 1910.  
(Signed) Henry Jerolaman  
John P. Quinn

## The Best Berry of the Age.

Four Berries of the Henry, grown by Mr. Jerolaman, rounded a wooden quart measure. The berries were three-and-a-half inches through each way. Mr. Jerolaman's description of the wonderful berry in a recent issue of AMERICAN GARDENING has brought him hundreds of inquiries from the cream of the professional growers.

### A GOLD MINE AT YOUR OWN DOOR.

"If you hesitate is lost." It is not likely that such an offer or such an opportunity will occur again in years. More than one Strawberry grower in every town, village, and hamlet can come into a good thing through practicing the cultural methods and getting some of the plants which have made Mr. Jerolaman not only wealthy and well-known, but so wonderfully successful, by at once

### TAKING ADVANTAGE OF OUR OFFER:

For \$1.00 (check or money order preferred) we will forward you, by mail, postpaid,

## FIVE PLANTS OF THE UNEQUALLED HENRY STRAWBERRY

OF THE UNEQUALLED

And AMERICAN GARDENING One Year.

Plants to be shipped this Fall or in the Spring, as you prefer.

Mr. Jerolaman's story will be found in the first issues mailed you and his cultural methods will be published in time to be of service for Fall planting.

### OFFER EXTRAORDINARY

For every new subscription you send us at \$1.00, we will forward you, postpaid, as a premium, Five Plants of HENRY STRAWBERRY, at the same time we will also send Five Plants to the party subscribing through you. Thus a club of ten new subscribers entitles you to Fifty plants of this wonderful Strawberry, as well as each individual subscriber to Five Plants. This is a BIG OFFER to all who want to become larger holders of this wonderful Berry, never before advertised. Time is short, get to work at once if you wish to accomplish anything before frost.

Address: Pubs. AMERICAN GARDENING, P. O. Box 1697, New York.

## READ THE CONTRACT

The publication of the below article in a recent issue of AMERICAN GARDENING, has brought Mr. Jerolaman hundreds of letters from every part of the country.

### Strawberries Henry and Mary.

We have grown almost all varieties of berries, but have only found two really large fruited ones. The one is Mary, originated by the late H. Alley of this village, the other is called here on Boyden Farm, Henry. We grow tens of thousands of quarts from each variety every year, and they are without doubt the largest and best of all grown in the whole world. I have had this season thousands of quart jars where from five to ten berries would make an opening wooden quart, and I have preserved several in glass jars, with formalin, so that all who doubt can come here and see for themselves. Some of these berries in the jars measure thirteen inches around. I am the present owner of the Seth Boyden farm. Seth Boyden originated the first large strawberries, perhaps, in the world (Agricuturist and others); he died in 1870. I then bought his farm, and have continued to grow strawberries from that time to this, and will say that I am positive the plant called Henry is, beyond all doubt, not only the strongest plant, but the largest, best, hardiest, and sweetest strawberry ever yet produced; color, dark crimson, it is perfect (staminate), very large, round, and no oxocorns grow on it. I have grown it for the past four years for market in a small way, and this season nearly one-half of all that I grew was Mary; it will out-produce any strawberry plant that I have ever known, four-year-old plants giving very large, and just as fine berries as plants one year old. The plants are yet have shown no disease, while all other varieties, such as Great American, Jersey Queen, and nearly all varieties except those so far mentioned, are diseased in the plant. The Henry this season could not stand the hot sun and nearly one-half of all the plants burnt and dried up while full of berries. Mary will not bear beyond seasons, and will be set every year, while of Henry, not a single plant has died, either old or young. It is the finest berry type of the last. I am picking large berries from the Henry to-day, July 15.—HENRY JEROLAMAN, N. J.

Mr. Jerolaman will not answer any further correspondence except through the columns of AMERICAN GARDENING.

## NOW READ THE ADVERTISEMENT

MESSRS. STEVENS, SIMPSON & CO., Commission Merchants, 232 West Street, New York City, state they handle the HENRY Strawberry, and have realized for it the highest prices obtainable for any outdoor stock coming into New York market. Mr. Simpson further states that, in his opinion, as grown, packed and shipped by Mr. Henry Jerolaman, it is the BEST HOME MARKET BERRY in existence. For SIZE, COLOR, and SWEETNESS, and in its KEEPING QUALITIES, IT HAS NO EQUAL; these many points in its favor rendering it easy for the grower to realize considerably more per quart than the regular market value of Strawberries generally.

Brookline, Mass.

Grafted Rose Acaer.

E. Palmer is having good success with grafted roses and good results will not be likely to return to this method. It was explained to a lot of Bride who were grafted and cropped last season. They are looking well. It was thought now and then that plants from plants grafted last Winter; the buds are small, but are increasing in size. First crop was immense. Plants were set out about eight weeks since. Bridesmaid was put-bound when planted, but is coming right along.

He finds the following plan the best and which is practically a repetition of what was one tried here. This method is a short time since, but will bear repetition, the subject attracting attention from so great a distance as Woodbridge, New Mexico.

Instead of throwing away the plants after Spring blooming, head them in out-doors until the weather becomes cold and the leaves fall, then lift and place in a frame so as to be easy of access when needed. December is the best month to graft. When grafted and potted, bring the plants along steadily; don't hurry them, and they will make the better stock. While they are in the house, water it and it is not too late now to take care of the old stock, if not already thrown out, they no objection to the use of new wood. Secure the Manetti stock in the Fall, trim and head in in moss in boxes which places in the house. This induces the roots to start a little, the wood remaining dormant. This is found advantageous when the grafted plants are potted later.

There is nothing mysterious or expensive in this method, and from my own observation a few days since these plants are equally as robust as some of the same varieties grown on other elaborate and expensive scale.

Mr. Palmer utilized his violet houses this Summer by planting Sappie's asters, and is cutting some grand specimens. As these are rather expensive when bought outside, it will be well to make a note of this for future guidance. I know several who are disappointed with the aster outside, but it is a beauty grown inside. Queen of the Market has done finely, but it is only too soon to be ready cutting. W. M. is the best early variety.

Fall River, Mass.

Frank Duffton is rebuilding three houses, one to contain pans. I noticed that from force of circumstances a batch of Cane Weddellias has been standing in a shady spot outdoors all Summer; the plants vigorous growth is remarkable. Doubtless the season has been very favorable, but they beat all plants grown under glass for color.

George Smith has just completed a rose house 175x25 and one 75x25 feet. L-shaped, a fine house of cypress with a room for piling up plants and for planting some well-grown stock in same.

C. Warburton has hardly finished telling what a good time he had when he learned at the convention. He is planting a capital stock of carnations; roses and violets are its first-class.

Norwich, Conn.

J. F. Smith has made considerable additions to and improvements on his plant. In carnations Daybreak is the only kind that rusts badly with him.

Chrysanthemums are all grown in pots and look first rate. Mr. Smith believes in taking late cuttings. He will quote a list of carnations pretty plants.

MANURE.

Fresh and well rotted horse manure. Manure for Macrorrhizous and especially for Scabious suitable for shipping by Pullen's R. R. to R. H. & O. and J. & W. Wood, Philadelphia, Pa. The Fulton Street, Philadelphia, Pa.

One of the Western Delegates.

Many florists through Missouri, Kansas and Nebraska have had business relations with George M. Kellogg of this city, but few perhaps this number have had the opportunity to look through his great cut flower factory two miles from Pleasant Hill. The place itself consists of over 70 acres of fertile ground, and on the highest point of it is the residence of its owner and his range of greenhouses consisting of almost 150,000 square feet of glass. From a small beginning only a few years ago, brought about through a desire to store a few plants over Winter, which caused him to build a small greenhouse. Mr. Kellogg has added from year to year to his glass structures until he today has the largest range of glass in the state; and with the exception of a very small space devoted to a few decorative plants in one of his houses, the entire plant is devoted to the growing of plants for cut flowers, principally roses. The varieties grown are such as the 'Crim. Maid', 'Perle' and 'American Beauty'; of the latter a specialty is made and the 300,000 feet of glass erected in 1878 is devoted almost entirely to this very marketable rose.

Thousands of bulbs are forced each year, and several houses are devoted to cuttings and seedlings. Everything in the greenhouses just now is looking very well, the houses having been renovated by white washed and painted in the inside, benches, practically making them the same as brand new. Mr. Kellogg is always on the alert for improvement, and makes several changes this year, which, while not absolutely necessary, will redound greatly to his benefit.

The office building and cold storage capacity for cut flowers have not been quite sufficient for the business, he is just erecting a large new office building at the lower part of his place. The first floor of it is partially underground in the slope of a hill, one-half being a cold storage cellar, the walls of which are built entirely of concrete, the base 18 inches, and the top solid rock and sloping gradually to the top, where they are about 12 inches wide. The cold storage is 18 by 12 feet in diameter and 60 feet in length. The banks of earth have been left on both sides about a foot wide and 30 inches high to be used as shelves, but doing so will not diminish the capacity of the cellar, being solid and cemented on both sides and top. The walk in the center is also cemented and well drained so that the place can be kept perfectly clean. A large refrigerator is connected with one end of this room and will help to cool it. The other half of the basement will be used as a sort of shipping room where the boxes after being packed in the cool room will be nailed shut and wrapped for shipping. On the upper floor will be Mr. Kellogg's office.

Another improvement will be in the heating apparatus. Mr. Kellogg now has five large horizontal radiators of about 30-horse power capacity each. They are now at two different points on the place, but he is building a new one together at the lowest point connecting all the lines into one large new brick chimney, which he is building before passing it into the chimney, however, he is in heating the water in two hot water boilers which he is to build on top of the steam boilers, thus utilizing much heat which might otherwise go to waste and which he thinks will be sufficient to heat the two or two of his large houses which are 282, feet wide and 200 feet long.

Mr. Kellogg was at the Providence convention and was one of those who so generously offered to help out the S. F. E. should its treasury suffer through the visit to Omaha next year. M. H.

AMERICAN SEED TRADE ASSOCIATION.

JEROME B. RICE, Cambridge, N. Y., President; E. B. CLARK, Milford, Conn., Vice-President; S. E. WILSON, Watershed, Conn., Secretary and Treasurer.

Philadelphia—The Times of Saturday, September 11, contains a very interesting illustrated article on 'Burpee's Seed Farm at Doyleston, Pa.'

Harrisburg, Pa.—Harry L. Holmes succeeded to the firm of Holmes & McKubbin, on September 1.

The Harvest.—All over the country, excepting the Pacific Coast, where seeds are grown, we hear the same complaint—seed crop and sowing very low. Change is not nearly as good as predicted. The blight caused so much shrunken seed requiring to be cleaned out that the yield is light.

Most of the ruta bags and turnip seed has the same general appearance. Kale and turnip seed we regard as very good, but the crop is remarkably light. From the Eastern States we have this year very light—no more than half as much as expected, and every thing else in the same ratio. Egg plants, particularly the 'Blue Wonder' have a seed crop which is not pleasing, although it does no injury.

On Long Island lettuce is very good, and has yielded a fine crop, and the sample is remarkably good. A question naturally arises what will be the effect? We think it will cause an advance in price, particularly on Long Island productions. For the crop, prices with the grower are already fixed, but the question is, Can contractors be made to pay the same price for the present high prices for potatoes, and the light seed crop has made the farmers feel it is advisable to grow, unless at a considerable advance in price.

We look for higher prices for spinach next season, as there was not a seed of the 1896 crop in the growers' hands, and this year's crop is very light. Some of the buyers, by way of refusing orders for this year's crop, and the crop of 1898 cannot be shipped in time for next autumn's sales. This will create a demand for home-grown spinach for next year. We do not look for an advance in the price of American turnip seed, but bulbs already made much bigger than that of the imported seed, but we look for an increase in demand for this seed in the fall.

There is an improved feeling in the trade generally, dealers are beginning to see the back tiers of bags, which they have been working on for two years. While there is nothing particularly short at present, the indications are that there will be a recovery in activity in the fall, though slight, in trade which will have a good effect. The farmers, boy that they have not when they should be. The mail trade do not have a good business the coming year, all signs will fail, if the growers and shippers in the business, as it is reported it will, excepting in lines that do not materially affect the retail trade. There will be activity in every branch.

European Notes.

Spain Favorable Transplanting. A severe prostrance through the pages of the Florists' Exchange appears to have a magical effect upon the powers that be. In our paper in England for within 24 hours of the dispatch of last week's notes we were favored with a request for the seed of the plants where it was very badly needed. This has not only cleared the vermin off the seed, but has also had the effect of making us to push forward the work of transplanting to such an extent that within the next three days all the plants that are worth setting out will be resting where they are to remain.

With reference to the work of harvesting the balance of this season's crops, namely, turnip, and carrot, which have been some of the most satisfactory of our culture, right up to the finishing up in good shape. Spinach is much shorter than we had at first supposed. The weather in this country, particularly in very brick, stocks on hand in April next will be very light indeed. Nasturtium, for instance, the best varieties are yielding badly in western Europe (more). This, combined with the wholesale market, has put the growers of the new lucky growers to stand out for a considerable advance in price. The price keeps on creeping up, slowly it is true, but those buyers who are holding back in the hope of a fall, are likely to get left in the end. The market for auring very nicely, and provided we do not get an excessive amount of rain, there will be from three-fifths to four-fifths of a good crop on, the land that has been planted.

The excitement in the bird-seed market caused by the Greece-Turkish war has all subsided and the trade is absolutely stagnant. Canary will be plentiful. Hemp seed, a light, for the crop is very good. Corn, however, will fix the prices for these articles this season. EUROPEAN SEEDS.

# RECEIVER'S SALE!

THE ENTIRE STOCK OF PLANTS OF  
**PITCHER & MANDA,** at Short Hills, N. J.

**WILL BE OFFERED FOR SALE, WITHOUT RESERVE, ON  
OCTOBER 4th, 5th, 6th and 7th EXT.**

The Stock consists of over 100,000 PALMS in splendid condition, in such standard varieties as  
Areca Baueri, Areca lutescens, Cocos Weddelliana, Kentia Belmoreana, Kentia Forsteriana,  
Latania borbonica, Phenix reclinata, Livistona rotundifolia, etc., etc.

Also the finest stock of Adiantum Farleyense ever seen in this country, and a general assort-  
ment of other FERNS, as well as a very fine lot of Ornamental Foliage Plants containing many  
choice things not to be found elsewhere, together with all the Greenhouses, Packing Sheds, etc., and all  
the Real Estate, which will be sold in four distinct parcels as follows:

No. 1.-Containing about 10½ acres, on which are located all the greenhouses, with  
about 80,000 feet of glass, all in excellent condition; a good dwelling house, con-  
taining eight rooms; stable, store rooms, packing sheds, several hundred sash and  
frames, etc., etc. This is a specially favorable opportunity to purchase a well  
established Florist and Nursery business at a greatly reduced price, within three  
minutes' walk of the railroad station, and eighteen miles from New York City.

No. 2.-Contains about 3 acres, with a good dwelling house on it, within  
500 feet of the railroad station.

No. 3.-Contains about 6½ acres, now used as an Herbaceous Nursery, and is  
well stocked with the largest and best collection of these plants in the country.  
Close to railroad station.

No. 4.-Contains about 62 acres, well adapted for an excellent Nursery, Farm,  
or to cut up for building lots. This is situated on the main road between Short  
Hills and Summit, and one mile from each station.

## Cupid Sweet Pea.

A representative of the Florists' Exchange made a trip into Jefferson County, N. Y., for the express purpose of putting to an end all doubts as to what statements and expressions not distinctly favorable to the Cupid sweet peas were true.

That these dwarf sweet peas flourished in full splendor in the climate of California has not once been disputed, but at the same time the claim has been urged that this novelty would not develop in the East, as it did in the West, its home.

The Florists' Exchange has been desirous of obtaining positive evidence in this direction, and in presenting this present note and accompanying illustration, congratulates Messrs. W. A. Purpee & Co. upon what must be regarded as a vindication of the statements made by them in introducing this dwarf race.

The bona fides of gentlemen who have spoken of low germinating power, failure of the plants to flower, etc., is not contested—such doubtless was their experi-

entially when the sun shone on it and enhanced the brilliancy of the *Blanche Ferry* flowers, for such indeed they are that popular variety being the source whence the dwarf has sprung. The compactness of bloom as seen on the bed in question is a point for consideration; it did not run itself out with one burst of flower. The seed was sown 2½ inches deep in hills 2 feet 6 inches apart, and the whole then treated as a good sowing. The soil had received a surface dressing of lime, but this application can hardly have had much influence on the plants. We counted 121 stalks in blossom on one plant and an average of three flowers to the stem. The height of the plant was six to eight inches, and the spread generally two feet, while occasionally one would run to 30 inches and even more, while the individual blooms measured across the standard 1½ inches.

## The Pansy as a Bedding Plant.

In order to get strong and healthy pansy plants suitable for bedding, I have found that one must aim to produce me-

long and thin; it is with pansies as with chrysanthemums, when they are not transplanted when ready, they lose in vitality.

Never sow the seed too thick, no matter whether in drills or broadcast, good stout plants which have had enough room to develop, have more roots and are easier and quicker handled.

I have found it most practicable to sow in drills four inches apart; one can more readily weed the frame when necessary.

## Transplanting.

By November the plants will be ready to transplant into cold frames; this can be done any time during that month or December. Have the frames filled with rich fibrous soil to a depth of 8 to 12 inches; moist any good soil will do, but in a light soil the plants will make the thickest bunch of roots and consequently carry better when shipped; but the plants can, if necessary, quite well remain in the seed bed until the sun gets strong in February. From 3 feet 4

and open, you had better ventilate well and open the back and keep them robust. If pansies are sown much earlier than the 15th of August, they will, I believe, prove generally early unless a heavy frost at night and boards or such employed in place thereof.

## Final Packing.

When your plants are ready for planting out-of-doors and you have grown them in back and kept them most readily healed by forcing a fork under a lot of them, and lifting the whole cover together and re-rolled it. Always water the plants a few hours before lifting them. When we lift pansies for shipping, they are packed in boxes, round in boxes, round, without separate wrapping; we find they carry best in the manner and are usually lifted out of the boxes on arrival at the destination.

We frequently pack two layers in one box, when we do, a lid or bottom is made to fit in the box right above the top of the lower layer, where it rests on the four strips nailed to the sides of the box; this compartment is then filled with the lower one was, and if care is taken, that no foliage or roots extend over top of box, both layers will come out intact and fresh. The boxes are made of a mild iron size, and can be packed one on top of the other in the cars without the least injury to contents.

## Planting.

The plants are then planted in such beds as are found suitable for display at various points along our lines of railroad in well-prepared soil. The distance between plants should be immediately between 6 and 8 inches; a greater distance is advisable only where the soil is very rich, and they can have good attention.

The care after planting is of the greatest importance to be insisted upon, and duly held all Summer from April to October. If you plant your pansies in stiff bed water will be best kept close off; you can keep your bed pretty all season, but in light or sandy soil a pancy bed that grows in deep soil will do better. If you plant early, no matter how much care is taken, I find that it is best to try to keep them in the shade, even that long in a sandy soil and consequently we remove them sooner and plant something else in place.

## Varieties.

For a show at a distance and for hardiness and lasting qualities, I can particularly recommend *Goldsleeve*, *Lord Beconsfield*, *Bronze*, and *Empire*. While these four varieties have proved most excellent under all conditions, and make a good show in a bed on account of the strong colors. For choice coloring and for effect, at short range, would recommend the *Bugnot*, *Frimardeau*, *Malraugay*, *Faust*, and most any other good variety or strain such as recommended by our seedmen. For a good distance effect the bed must be 10 to 12 feet, not less, and plant one strong color in center and a border not less than 12 to 16 inches wide of a sash, purple, or contrasting color around the bed; the yellows, blues, or purples make the best borders for a distance.

If your plants are a trifle backward in March, apply a little blood and bone and will carry them to a supply of fertilizer; never try to force them on bottom heat; it will not be a success.

A. E. WOLLETT.

## Changes in Business.

MT. STERLING, Ohio.—G. H. Johnson has completed a greenhouse, 80x200 feet; will recently started in business.

CLEVELAND, O.—The F. R. Williams Co. has succeeded the Williams-Wilson Co., and will carry on the supply business. Mr. Wilson having retired and sold out his interest in the firm.

ELIZABETH, Harlan Co., Ohio.—Highland Nursery, Kawana, N. C., has opened an office at 1123 Tremont building here, to which all orders and correspondence should be sent. The Habitues of the Highlands Nursery have been satisfied, and the time has not yet passed. A number of hardy native American plants has been received from Mr. Kelsey by his late assignee.

Bed of Sweet Pea Pink Cupid, in Jefferson Co., N. Y.

ence. The evidence they supply does not prove the arguments however, but if taken with facts, such as are here adduced, goes to show they did not fully provide for the cultural demands of the plant.

Moreover, to the Florists' Exchange as representing the American seed and florist trade, certain remarks of foreign writers as to "non-pansy recommendations" being "strictly American," seem to demand an answer, and we add to our own expressions from observation of the grand bed of pink Cupid the evidence of the photographic camera.

The picture herewith reproduced represents a bed 50x40 feet in a spot a dozen or so miles inland from the shores of Lake Ontario where the soil is shallow and of a hard cold clay loam nature. The plants on this place are being grown for seed, and at the time of our visit (September 3) not only was the area a sheet of color, but there were evidences of what had been in the great profusion of seed-pods which were being carried, and furthermore the end was not yet for the buds still to show their blooms promised to make the sea of rosy pink just as the till frost should come.

As to the effect of pink Cupid as a leader, we confess the sight astonished us; it was gorgeous in the extreme, espe-

dium-sized stock plants; small ones do not make a display at once, and large ones are not easily moved, and certainly do not give satisfaction when shipped a distance. We grow here from 20,000 to 30,000 plants for ornamentation of our station grounds between Philadelphia and Pittsburgh and on some branches as well. We have consequently various climatic conditions and a goodly variety of soil to contend with.

## Sowing.

The idea is to have something pretty early in the season. While the pansy is quite hardy nothing is gained by planting your beds before the winter frosts are gone; if the ground is likely to freeze to a crust during night, the pansies had better be in the ground, which is much danger is over. We have found it safe to plant in month or two before we get cold.

By planting time one should have good strong plants just filled with their first flowers or buds, and to get this condition the seed is sown between August 15 and September 15 in a couple of batches; this gives one a succession, which is a convenience when ready to transplant them; the seedlings can then be handled in rotation before they overgrow and get too

inches each way is suitable space for the pansies while in frames.

## Winter Covering.

I have never found covering a necessity to keep the cold out, no matter how cold the weather may get; simply avoid excessive moisture, such as will gather where a light is broken. The best covering is glass; if you use that your plants are always sure to be early enough, as they will grow even in Winter when the weather is mild. We use here, in conjunction with sash, lids made of ½-inch worked lumber of the same size as the sash; these lids can be used as a substitute for glass over such stuff as panes or sashpanes, and as a cover over the glass to keep the cold out of the frames or when pestered with dogs traveling over the snow-bound frames at night.

## Ventilation.

During cold weather no attention need be paid to ventilation; it will take a great deal of sunshine to hurt pansies, and if you are in a low frame, later on, however, when the sun gets strong, more care is needed, and you will want to ventilate freely to your plants' benefit. You can regulate the earliness of your plants by the ventilation; if the Winter is warm

New York Florists' Club.

The attendance at the Club meeting on Monday evening was not so large as was anticipated, probably owing to the very humid weather. ... President Henshaw occupied the chair.

The late convention at Providence was the subject for discussion. John N. May spoke in large measure of the increased interest shown in the meetings.

Mr. May eulogized President Graham as being one of the most instructive to which the speaker had ever listened, the illustrations being extremely educational.

Touching on the beneficial nature of the trade, Mr. May considered that the man must be dull indeed who could not learn enough to pay him for the trouble of entering the profession.

Mr. Allen considered the Providence convention in several respects the greatest object lesson the Society had.

President Henshaw commented on the all-round training of the old-time gardeners and on a corresponding tendency towards specialization.

Mr. May said the young man in entering a commercial place, where a specialty was required, that he should have the knowledge there obtained was sufficient for him, made a great mistake.

ing it in the aggregate, was a most remarkable thing. It was run on three kinds of roses, three or four kinds of carnations, possibly a little mignonette, and a few other odds and ends in different sections.

Exchange and praised its qualities, closing with a few remarks on the success of the Lomburg Exposition. A remarkably fine display of canna was put up by Charles H. Allen, Floral Park, Austria, Idaho, and Burbank were in unusually fine condition.

Then his whole collection consisted of one small lot. He remained there until 1886 when he removed to 22 Dry street, where he built up a considerable trade, especially in the bulb and flower seed line.

Throughout his entire business life, he had met with varying success, often struggling with impaired health, a fact which greatly retarded his progress, and to which could largely be attributed his recent unfortunate embarrassment.

Mr. Henshaw then gave an interesting account of his recent trip to the botanical gardens of Europe, and other points of interest in the continent.

York last season. This was a plant from which good results would be obtained if taken care of in winter the same as mignonette, and given the same temperature as the carnation.

OBITUARY.

F. E. McAllister.

This week it is our sorrowful duty to announce the death of F. E. McAllister, seedsman, New York City, which occurred on Tuesday last, September 14.

The name of F. E. McAllister has been before the trade of the country for almost a quarter of a century, during which time he had conducted a seed and importing business in the city of New York, in the Exchange field, and garden seeds, bulbs, implements and supplies.

Throughout his entire business life, he had met with varying success, often struggling with impaired health, a fact which greatly retarded his progress, and to which could largely be attributed his recent unfortunate embarrassment.

Mr. Henshaw then gave an interesting account of his recent trip to the botanical gardens of Europe, and other points of interest in the continent.

York last season. This was a plant from which good results would be obtained if taken care of in winter the same as mignonette, and given the same temperature as the carnation.

The late convention at Providence was the subject for discussion. John N. May spoke in large measure of the increased interest shown in the meetings.

ing it in the aggregate, was a most remarkable thing. It was run on three kinds of roses, three or four kinds of carnations, possibly a little mignonette, and a few other odds and ends in different sections.

The late convention at Providence was the subject for discussion. John N. May spoke in large measure of the increased interest shown in the meetings.

Mr. May said the young man in entering a commercial place, where a specialty was required, that he should have the knowledge there obtained was sufficient for him, made a great mistake.

THE LATE F. E. McALLISTER.

THE LATE F. E. McALLISTER.

National Florists Board of Trade

C. S. Loder, New York, secretary of the National Florists Board of Trade, has as a copy of the third quarterly revised credit and information list of that association.

Plants and Flowers.

COLE'S KLONDRK.—Carl Hagenburger, Mentor, O., sends us a few leaves of the new cactus Klondike, which was shown and so favorably commented upon at the Providence convention.

Joseph Gibson.

Early Monday evening Joseph Gibson, for many years gardener for the late Gov. E. D. Morgan, and more recently for another notable florist, Benson Rock, Newport, died from a ruptured blood vessel. He had been out driving his horse and carriage, when the fatal complication raised his umbrella, which frightened the horse and in going on, he fell from the carriage, striking his head, and being carried to the hospital, where he died shortly after his arrival.

A. J. Swanger.

A. J. Swanger, nurseryman and florist, died at his home at Sillito, O., Tuesday, September 8, 1897. He had been suffering from nervous prostration caused by rheumatism.

Jesse K. Sharpless.

Jesse Keesey Sharpless, the originator of the Sharpless strawberry, died at his home in Catawissa, Pa., on September 10, 1897, at the age of 75 years. His name was the result of a series of experiments conducted by Mr. Sharpless, and his strawberry leaves have many small fruits, and was obtained from mixed seed of Jamaica, Charles Downing, Wilson, and Coburn Clery.

**BURQUAINVILLE!**

**FACTS.** The plants are strong, rapid growers. They are easily handled in all stages of growth. The two varieties offered are very readily propagated. They are not subject to any insect pests and are continuous bloomers for four to six months in the forefront of the year. The bloom-bracts are very durable on plant or in cut sprays. The color is showy and very attractive. Send for "Facts and Comments."

We offer nice stock of both varieties, from 5 inch pots.  
**GLABRA** (7 1/2 to 10 inches above pots, 4 to 6 shoots. GLABRA SANDERIANA, 15 to 25 inches above pots, 6 to 8 shoots. Price, \$50.00 per 100; 5 plants at 100 rates.

The above plants can be safely shipped by freight to points within a week's shipping distance of Pittsburgh.  
 We mail 4 nice burquainville plants of either variety, from 5 inch pots, by air, or 12 for \$7.50.  
**CASH WITH ORDER. THEO. F. BECKERT, Glenfield, Pa. NEVILLE HILTON, Salesman**

**ROSES.**

**Black Spot and Mildew.**

I have been asked several times if the small black spots, about the size of a pin-head, sometimes seen on the Gontier, were identical with the well-known spot; also its cause and cure. This is not what I know of black spot, but the white powdery mildew in disguise form, and is superinduced by excessive moisture and an insufficient circulation of air; so conditions the cause of these should be resorted to for its cure. It is not very dangerous, but has a tendency, in bad cases, to induce the green foliage to fall, which is a well-known habit of this variety.

In regard to mildew it is most advisable now, even though none be seen, to prevent its putting in an appearance, by painting every new and old tree on the heating pipes some sulphur and lime mixed together, half and half, to the consistency of cream. It should not be put on too strong—just enough being applied so that the fumes are perceptible.

It is a very good policy to observe cleanliness in the greenhouse at all times, by keeping all dead leaves picked up, and having all other rubbish that may accumulate both on top and under the benches removed.

Don't on any account neglect keeping the plants in dry property; it will be found that lots of roots and time are needed in this direction, as during this month the plants most generally make their best and most rapid growth of the season.

You are all doubtless aware that light is one of the most important factors for the production of fine flowers. If you have not already cleaned your glass on the under side, the work should be done on the first favorable morning. It is always select a bright day for this purpose, as in the course of the operation some condensation will be on the glass. It is always more or less matter on the under side of the glass that obscures considerable amount of the light. The same glass is used. We moisten the glass first, then rub it over with a rag, when a fine jet of water from the fine rose ridge to gutter plate completes the work.

If you want to grow some of that useful little polyantha rose, Clothilde Souperl, for spring sales or cutting during next Summer, now is the time to put in some cuttings in a hotbed. They root very quickly, and are best carried over early Winter in small pots, in a cool house.

While attending to our current work, we must not overlook procuring soil for our market. It is the duty of every man, many men who neglect this work until almost time for commencing replanting and setting out for the winter, that they are troubled greatly by the grass growing from the ground. That is not the only trouble, for it often happens that owing to pressure of other work, the soil is left unworked and becomes unsorted, irrespective of whether or not it is best adapted to the future plants. In this respect, it is important but that one of the fundamental principles in successful rose-growing is in the use of good soil and good material, so we should be most careful in its selection.

I find a soil that suits most varieties to be a good fibry and non-puddled soil of a medium heavy texture; that is, a soil not light or the extreme heaviness; and such soil is not found in low ground. Be careful to avoid that which has not been mowed or grazed for years, as the weeds and grass roots, if not pulled, are cetera, thereon makes it too light, and it has too much of a leaf-mould appearance which thorough working and good strong loam is what is needed; nothing of a mucky nature. It is sometimes preferable to dig some good material inside a city's limits to know where to get soil near enough at a reasonable cost. We were in that predicament once, and as we had to get our soil from a point six miles distant, we found the most expensively way to get the soil, as the canal was near by at both ends. Soil should not be drawn in wet weather.

Philadelphia.

Warm Weather Makes Business Quiet.

As regards the cut flower market there is very little to report. Business has been very quiet, so that the ordinary warm weather is the cause of this, as the buyers are still a ways and won't return until cooler weather is assured.

All kinds of flowers are more plentiful, and on account of fall trade the fallers get a great many first-rate trade. Beauty are being offered on the street at 5c each.

Asters are quite a glut; there was a large demand for purple ones this week on account of the Asters Convention, but few were to be obtained.

Violets are now coming in, but are very small and don't last long. R. M. Eisenberg is sending in some home-grown and finds ready sale.

Fred, Harold Married.

Fred, Elmer, the well-known uptown florist, was married on Wednesday last, and has taken his bride to Niagara to spend the honeymoon.

Outing.

On Wednesday last a party of about 20 went up to Morristown on the invitation of Hugh Hughes, gardener at the State House, and spent a very pleasant day looking over that immense institution. Mr. Hughes deserves great credit for his excellent management, in which the grounds are kept. The principal building is in front of the administration building, the first thing to catch the eye being an immense bed with ricinus in the center, edged with Salvia splendens. Two large tropical beds, a new bedding plant was noticed, cardoons were used to fill up spaces, and had an excellent effect. On the terraces, there have all done very well here this season. After inspecting the institution the party was entertained to dinner by the steward, and then entered carriages and were driven to the Morristown farm, after which an adjournment was made to a club-house on the banks of the Schuylkill River, where a very pleasant evening was spent. DAVID KIST.

SPECIAL FALL TRADE EDITION

OCTOBER 9, 1897.

THE FLORISTS' EXCHANGE always publishes its Special Editions with an eye single to the best interests of its advertisers; this is why its columns at such times are so thoroughly representative of all trade interests.

The FALL TRADE EDITION has annually been a great success; this year, on account of the boom which, without doubt, is here in real earnest, we expect our SPECIAL to prove more than ever an index to the business situation, and so are preparing for and have reason to expect this to be still better patronized than any of its predecessors.

The date set, October 9, marks the period when the effect of the Fall trade is just commencing to be felt; this is the auspicious moment to make announcements in order to maintain and increase business.

Our Special Fall Trade Edition is really

A TRADE ENCYCLOPEDIA,

and we sincerely trust that every firm with goods to sell will be represented in it. It will be a Business Edition for Business Men, and as such will, we trust, accomplish all the purposes which the publishers seek to gain on behalf of their friends—the advertisers.

of the Special will be mailed out to live members of the Florist, Seed and Nursery Trades. Advertisements must be in this office by Wednesday, October 6. To secure good position and display send in your copy as much earlier than the above date as you possibly can. First come, best served. Do not neglect to be represented in this Business Man's Edition.

The reading matter to be furnished with this edition will be fully worthy of our previous successes, and the special articles will be of the utmost value to all who grow plants.

When Writing Mention Florists' Exchange

**A Patent Factor.**

The Florists' Exchange is the most potent factor in the Florists' Union. W. H. DUBVETZ, Mattituck, L. I., Zone 8, 97.

*Washington.*

One Form of Government Competition Renewed.

For some time the Suburban Citizen has been making a study of the competition suffered by florists through government institutions here, and in its issue of September 4, it makes the following announcement:

"The Reform School people have taken the tip and backed down from their plans formed early in the Summer, and instead of asking Congress for \$6,000,000 for a new dairy building and dairy appliances, and \$750 for the purchase of cows. The florists are to be given a rest for a season and a new scheme is to be entered into for supplying the people of Washington with milk and butter. Of course the establishment of a large dairy plant would do great damage to all the dairymen in the district, and then we would afford the florists a season of relief for which they have been crying for some time."

*St. Louis.*

Market Conditions.

Another week of extremely hot weather finds us with still plenty of white and pink roses in the market, a slight shortage of Perle, and Meteor very short in demand, though short in supply. Quite a few varieties in the field are selling better than they have been for some time. Carnations are of very poor quality, and as they were better.

**The News.**

Fred Foster, recently of Milwaukee, has been engaged to assume the management of a new floral concern in this city which will be owned by a corporation of which Mrs. H. H. is the principal organizer. They have rented the store at 602 Olive street, a very central location, and promise to do very well.

Eugene Wurst, until recently gardener to Mr. C. S. Brown, has resigned his position and started in business for himself in East St. Louis, at the stand formerly belonging to August Miering.

While on a fishing excursion with three others of the employes of the Michel Plant and Bulb Company, John W. Muhlenschlager, for a number of years foreman of that company, fell into the Merrimac River, and losing a foot-hold, was drowned before his companions could reach him. His small children. He had been a faithful, conscientious worker and a thoroughly practical florist and mechanic, and leaves many friends among his late co-workers in this city.

*New Orleans.*

At last we have a little cooler weather. This has been a very hot, dry, long Summer, and plants have suffered more than any other city in the South. The weather is so poor as this year. Spring came in early and dry; all varieties commenced to flower, wood got very hard, and the late struck cutting; and the plants are very weak. The same may be said of roses in the ground. Caneaux would be very showy if it were not for the ravages of the worms. The past Summer I gave up one lot to Providence, R. I. and the entomologist of this city, in which to grow, but obtained no good results. Until we can find something to eradicate this pest there will be no use in planting canna's in the city.

In regard to the new flower glazing kinks, Italia and Austria, I don't think they will be any good for bedding; they are, however, grand when protected from glass. I have not seen anything better for general use than Mme. Crozy. I have succeeded best with Italia and Austria by growing them in water.

U. J. Virgin's roses are looking exceedingly well in the three new houses he built last year. He has changed from heating from hot water to steam and the test he has made of it has been very satisfactory.

M. Cook has just moved here. He has also built two very fine dwellings on his back square.

M. L. Vail has just bought three lots on Hurst street. He intends building there.

Most of the florists have got in their bulbs and seeds. They have also commenced to order their plants for all Saints' Day. HARRY PALWORTH.

**Simplicity in Greenhouse Construction.**

During our long experience we have not only made many improvements in greenhouses, but we have so simplified the construction that building a greenhouse is no longer a matter so full of complications as to tax the patience and the ingenuity of even the most intelligent mechanic. Our

**Clear Cypress Building Material**

is worked out in the best manner ready to be put up, and we furnish our customers such complete detail drawings that any workman of only ordinary capabilities can put it up correctly.

Write for Circulars or Estimates.

**MASTICOA**

**FOR GLAZING GREENHOUSES. SUPERIOR TO PUTTY IN EVERY WAY.**

It is not hardened by the extreme heat or cold that a greenhouse is constantly subjected to both by day and night. Masticoa is enduring and remains permanently elastic so that it is not forced out of place by expansion and contraction of the wood of the frame. It is also proof against rust. It is not dried out by the sun's rays. Masticoa is made of glass. With Masticoa can seal-in or use on the outside, but with a machine only.

## Government Free Seed Distribution.

The following paper on "The Government Seed Shop" was read before the National Horticultural Convention recently by J. E. Northrup, of Minneapolis, and is reproduced from the *Tri-Weekly*.

Two hundred years ago a brig from the coast of Malaga came driven by stress of weather into the harbor of Charleston, S. C. The captain, who then formed the acquaintance of Lauder Smith, and patented in a sack of rice. This rice, however, caused to be planted in his garden in the city of Charleston.

From this arose one of the great staple crops of the south, which soon amounted to value millions of dollars. Strangely related, doubtless, by such example, countless of the splendid opportunities which the country at that time offered for such an enterprise, in its vast and unknown range of soil and climate, and inspired with a patriotic desire to promote the welfare of his countrymen, Henry L. Ellsworth, the first commissioner of patents, caused the idea of sowing seeds of rare and rare seeds among the farmers of the United States.

Mr. E. did at his own expense from 1836 to 1839, when he asked and secured from Congress an appropriation of \$50,000 for the purpose of collecting and distributing rare and improved varieties of seeds and prosecuting agricultural improvements and sowing agricultural statistics.

From this small beginning, founded in seeds, has arisen the great government seed shop at Washington, the colossal hatching of the day. During the earlier part of its existence it has been very useful for this purpose seem to have been wisely expended.

The reports of the patent commissioners for succeeding years showed the importance that was attached to the sowing of seeds, that had proven of commercial value in other countries, and which were not known in the United States.

In distributing these seeds, great care was exercised that they should be sent only in the hands of experienced agriculturalists, who would give them intelligent attention, and be prepared to report fully as to their merits or demerits.

### WANTED RARE SEEDS.

The patent commissioner's report to Congress showed in detail the varieties which had been patented, and from which they were obtained, the quality of excellence for which they were sent, and the success or failure which attended their planting.

These reports went with expressions showing the keen interest with which these experiments were regarded. Charles Mason, commissioner of patents in 1857, in his report to Congress in the following year: "A prime object has been the introduction and naturalization of new and novel products, the most desirable to the United States. These have been placed in the hands of persons most likely to try and experiment with them, and a large number of the whole number tried, a single one shall prove as eminently successful and profitable to the people as ten others. The trouble and expense attendant upon all these experiments will be richly compensated by the advantage derived from the acquisition of a new commodity or its more value to the country than the acquisition of a new one."

It was in this spirit that the authorities in charge of the purchase generally and Congress itself participated in this work. In 1862 the department of agriculture was established, and the distribution of that act shows the importance with which this seed distribution was regarded.

"Be it enacted by the Senate and House of Representatives of the United States in Congress assembled, that there shall be established at the seat of government of the United States, a department of agriculture, the duties, powers and responsibilities of which shall be to acquire and diffuse among the people of the United States such useful information as may be connected with agriculture, in the most general and comprehensive sense of the term, and to promote the same, and to distribute among the people new and valuable seeds and plants."

It is not long since, before above expressed the distribution of seeds, for in the absence of a law, the department pointed commissioner of agriculture, in a special report to Congress, says:

"I see every day the seeds of plants practically grown into a sort of fungus of licit-

value in itself, and which needs to be removed in order to give vitality to the system." Further in his report he says: "Seeds distributed among the people must be new and valuable; new, in the sense that they must be of a kind that has not been previously sown, and valuable, in the sense that they possess some important quality above those of the ordinary varieties." He also mentions some peculiar property which renders them worthy of being a gift from the nation, and which would not be otherwise.

Following this high conception of the seed which I thought his department in charge, I thought I would try and distribute something less than one-third of the seeds distributed from the time they were sent out the previous year by his predecessor in office. This distribution I have been making for two years, and do not then cultivated in this country. It included seeds of cereals, grasses, hemp, flax, rye, ramie, opium poppy, sugar beets, sorghum, forest and shade trees, and many of the rarer varieties of plants, eschewed medicine and agriculture. The standard was not long maintained. Through the carelessness, incompetence, and finally, the absence of the department soon became the dumping ground for the commonest sorts. Complaints were made that the seeds sent under a "frank" was a cheap and easy way to "fiddle the vanity of a rural agriculturist." I do not know whether he was a farmer or a sailor.

Efforts have been made from time to time by various departments to put an end to this tide of paternalism, and to divert the food into its original channel, but it has become an enormous Government expense.

In his report for 1875 Gen. De Luc, on assuming the duties of commissioner of agriculture, said:

"I found that the distribution of seeds had grown into an evil of serious magnitude, and that many of the seeds sent under a 'frank' were of such kinds in use, and which could be bought in almost any seed store, so to say 'corrocy'."

### REPORTS NOT AVAILABLE.

In urging that all distribution of seeds be made direct by the department and not by the Congressmen, he said: "That of the seeds and plants that have passed through the hands of members of Congress in their capacity as farmers or growers have never been made that was being available by the department as agriculture."

"Notwithstanding the strong language of this report, Congress in the following year appropriated \$100,000 for the purchase of all the seeds, plants, and cuttings purchased by the department should be supplied to the States, and to the delegates in Congress, for distribution among their constituents."

The effects of this decree was that farmers in North Dakota received their full quota of cotton seed, while those in Alabama, Texas, and Michigan got their prize packages.

This unwise and statesmanlike method of distribution, by which the Government, however, for under it many farmers had an opportunity of inspecting seeds they were to receive, and to give their own distributions they had been presented with varieties with which they had been acquainted, and which they had seen and tried on days upon the farm.

Secretary Morton, in his report for 1875, says: "The extravagance and inutility of these distributions are apparent to any person who will investigate the matter, and the expenditure of \$400,000."

"That the distribution is regarded as a waste of public money, and the fact that out of 9,000,000 papers of seeds distributed among 1,800,000 citizens of the United States, only 540 acknowledged their receipt."

Several vigorous efforts have been made to put an end to this kind of demoralizing use of the public funds which has already consumed nearly three millions of dollars. By the character of the present secretary of agriculture is sufficient guarantee that he will not repeat the error of his predecessor in the distribution within proper lines, but the head of the department is not to be blamed for the error under the present act, it is mandatory upon him, to purchase the greatest quantity of seeds possible to obtain for the sum appropriated, and to send as three-fourths the packets for the use of Senators and Representatives.

It is really doubtful if Congressmen themselves are not the cause of this waste, then a source of endless annoyance, trivial correspondence and petty jealousies, but they can do nothing to put an end to it, they have a good many, for if a member of

Congress sends seeds to John Doe and fails to send any to Richard Roe he has made an enemy of Richard. In fact, to look upon a member of Congress who has a collection of seeds to each voter of his own political faith in the district.

It is a fair inference that the word means shall this "Old Man of the Sea" be thrown from our shoulders, and the attention of Congressmen directed to the only force which can accomplish it. Believing that this body of representative men is not only the best representative of the United States, will rise as one man in the effort to crush this monstrous evil, I have written this article, and hope that which I now beg leave to offer for your consideration.

### OFFERED RESOLUTIONS.

**WHEREAS,** Believing the free distribution of seeds, as at present conducted by the United States department of agriculture, is an unlawful and unwarranted departure from the terms of the act under which that department was created, and

And whereas, the distribution of common varieties, can in no wise advance the cause of agriculture, and the useful and beneficial purpose for which the early appropriations for the distribution of agriculture, is a collection of seeds in full sight of practice, and the same have become a burden upon the appropriations no longer exist, as the work is being done by the States, and by the various States, who are best acquainted with the needs and resources of their respective States,

**WHEREAS,** The farmers of America are not members of Congress, and are not entitled to their votes to be influenced by a package of seeds, and

**WHEREAS,** It is an insult to their intelligence and unjustifiable penalty of a law, a gross fraud and a waste of public property, the use of a noble department, which was created to enlighten and instruct, not to purchase, grade and sell.

**RESOLVED,** That it is an unjust discrimination against many merchants through the country, engaged in the selling of seeds, who can not get their goods to market, and are carried on by the United States Government, and that the Government, which is taxed to pay for the knife which is cutting their throats.

**Resolved,** by the Farmers' National Congress, in session at New York, that they earnestly request the president of the United States, our senators, representatives, and delegates in Congress, to cease the purchase of our fellow citizens all over the land, to stop the purchase, re-sale, and distribution of seeds, and to withdraw from the purchase of seeds, and to discontinue the sale of seeds to joint and individual efforts.

**Third,** That the secretary of this Congress, be and is authorized to prepare resolutions to the president of the United States, our senators, representatives, and delegates in Congress, and to procure for it as wide a publication as possible in the press.

## The Cosmos.

"That this plant will adapt itself to its environments is generally understood, that is, when a plant has the whole year in front of it, and it is not quite apt to take it, and frequently it will become perennial in habit. While perennials are generally more hardy, and flourish in climates, will become annuals, this is not generally, but frequently, the case. In the present year, we have seen a number of the Cosmos in Spring, Summer, and Autumn, yet so rapid is the growth of vegetation that our plants have had to be cut down, and the vegetables that require most of our Summer to reach perfection, can be ready to produce in the fall of the year. Four years ago we put out a few plants of *Cosmos* in a protected situation, and to our surprise, they were taken in the Spring. The young plants came up freely in the place, and some were so cut and selected their seeds, and we did not attempt to save them, but let them seed themselves, and came again in the following year. In the case of the *Cosmos* experiment, as we found the birds very fond of them. However, we secured a few plants, and from them saved seeds, which were sown as soon as the soil was in a fit condition to work. They came up in the Spring, and were first seen the last week in July. At the present writing, September 10, the plants are six feet high, and some of them are white and crimson varieties. Besides that, they are seeding very freely. Our plants were sown in a shallow bed, or shall have sufficient for a number of acres the coming season.

As to the seeds, we secured acquisition, as the plants come into flower fully two months earlier than those from seeds sown in the fall. In the south of Europe, we think if the seeds were sown in the fall, they would be ready to bloom could be had in flower by the first of August, thus extending their period of usefulness very nearly three months.

C. L. ALLEN.

## Experience with Jadoo.

In the early part of 1896 I was the recipient of a new soil (I may not term it) called Jadoo, and from the time that I had the fibrous was a quart of liquid manure, called "Jadoo" Liquid (Jadoo, I have seen it elsewhere, and for my purpose, and accompanying the goods was a request to subject them to a fair test, and to report on their merits. I was skeptical of its usefulness as a medium in which to grow plants, even though it was said to be a fertilizer, and I have noted horticulturists at home and abroad. Having the appearance of fibrous matter, resembling that of palm fronds, ferns, and pandanus in it, and carefully washed developments, in a few weeks the plants had become established, by their clean vigorous growth, clearly demonstrated its superiority over soil prepared in the usual way for such plants. After the pots were well filled with roots, I applied Jadoo liquid, in the proportions of one part liquid to 48 parts clear water, and these few plants continued to flourish, when under ordinary conditions a shift to a larger pot would be imperative. My employer and myself were much interested in the results of this new introduction, and the result of our conviction was the placing of an order for a quantity of Jadoo liquid, and a hogshead of Jadoo liquid, and from that day we began to use it in earnest.

Some growers assert that it is unnecessary to use a compost of peat, loam, and manure, and to use the soil of palms and ferns that I know to-day say such a compost is necessary. But since the introduction of the use of Jadoo, I have abandoned peat and sand so costly and use the fibrous almost exclusively. My plants, when sown, are given the preparation, being always ready for use, it retains moisture for a much longer period than any other soil, and as a natural sequence the top growth is better, larger leaves of strong color, and a more robust growth, and a greater resistance to insects; it does not retain so wet a soil, and it is equally admirably adapted for decorative plants of every description. They keep moist and healthy longer, and are more resistant to a high temperature by steam or hot air, whereas those grown in soil for the production of the same, have to be constantly watered, and are unprofitable for decorating. Such is the experience of those who have used Jadoo with plants. I have used "Jadoo" very successfully for hanging baskets and for the decoration of balconies, windows and porches. It retains the moisture for a long time in situations exposed to the direct rays of the sun.

I use it entirely for germinating seeds of every kind grown in a greenhouse. The production of the same are never caked, and the most delicate seeds can push their way through it, besides, it retains so wet a soil, and it is equally admirably adapted for every kind whatsoever.

I have not yet commenced to grow over-cold, but when the time comes for us to do it, Jadoo fibre will be my choice for the production of the same. Through out the past Winter and Spring I use Jadoo for my hydrocetes, begonias, and other plants, and especially gladioli, crotons, geraniums, melissas, ficus, pandanus, lilies, roses, carnations, and other plants. I have usually grown by the commercial sort, and I have produced, and they have been uniformly superior to those grown in soil.

Our hydrocetes were especially fine at Easter; to them I applied Jadoo liquid in the proportions of one part to 48 parts until they began to assume color, and the result that the flower heads were of a deep purple color, and they were all. My method of application is as follows: I have a tank in each house; I fill it with water, and I pump the water through the Kiley pump at the rate of 16 to 1, maintaining the correct proportion of the water to the Jadoo, and efficient and safe liquid manure, which will give equally good results when applied.

In using Jadoo fibre care should be taken to use smaller pots than you would use if you were to use soil, and if the spongy nature it requires to be packed firmly around the roots, of the plants, for I find it the easiest thing in the world to give it too much water.

**ADVERTISING IN THE FLORISTS' EXCHANGE PAYS.**

**Minneapolis, N. Y.**

At the Fair held here this week, the display of William L. Swau of the Scawaha greenhouse, Oyster Bay, was the center of attraction in the floral department. His magnificent exhibit of palms, some of the specimens of *Areca lutescens* spreading to a height of ten feet, excited the center stand of the building. Some fine specimens of araucaricus attracted considerable attention. Mr. Swau's collection, which consisted of over 200 pots and baskets, contained some fine specimens of ferns. P. Seudler of Glen Cove had a large display of palms, ferns, and greenhouse plants. John Lewis Childs of Floral Park, the finest display of gladioli ever seen here, and a large display of miscellaneous cut flowers. G. Rogers of Hempstead, a large assortment of greenhouse plants, geraniums, begonias and coleus. Ferd Boulton of Sea Cliff, some handsome floral designs, roses, carnations, and palms. Oasis Nursery Company of Westbury exhibited carnans, becaeos, and shrubs.

**Pittsburgh.**

Superintendent William Falconer of Schenley Park, is endeavoring to create a popular interest in the knowledge of cultivation of flowers. He has arranged and view- ing he has begun to give exhibitions, accompanied by talks on flowers, at each of the meetings of the Western Pennsylvania Botanical Society. The meetings are held in Science Hall of the Carnegie Institute, at the University of Pittsburgh at 8 P. M. At the last meeting a general exhibition of flowers in bloom was given, and especial attention paid to tropical water lilies and ornamental fruit shrubs. Friends in Philadelphia and Rochester, N. Y., sent material for the meeting. There is no charge, and anyone interested in gardens or flowers is invited.

**Trade Improves.**  
From all appearances trade in cut flowers has brightened here in the past few weeks, and it looks as if this condition would continue, as a good many orders for weddings have been received lately by the florists. Condition of stock is nothing to brag about. Carnations are very scarce, particularly pink ones, and roses are of inferior quality. Asters are fair, but not up to other seasons.

There has been a revival of trade in wedding orders, having had three the past week; at one of them he used a great quantity of Asparagus plumosus which made a very pretty decoration and was much admired. This grand vine in its native place is one of the varieties for all kinds of work, being supplied by F. Burk in large quantities. Mr. Raden has a large house devoted to its culture, giving strings of 10 and 15 feet in length.

**Notes.**  
No quorum at the last Club meeting, the weather being too warm.  
A letter from John Hoggan from London where he is spending a few weeks at the close of his European tour, states that he will be home in a few days. Mr. Raden has purchased a large lot of stock and intends to put up a few houses yet this Fall. He has a large charge of the New York land's place again, his old home it seems. A week's hot spell just about the time the plants are getting in blossom, is not what the growers like. The heat and the dry weather have caused the trees to shed their leaves and trees to be cut down usually; many trees in the parks are almost entirely divested of their foliage.  
E. C. RANDEMAN.

**The Pitcher & Manda Sale.**

The Reeder's sale of the entire stock of Pitcher & Manda, Inc., takes place at Short Hills, N. J., on Monday, Tuesday, Wednesday, and Thursday, October 4-7 (inclusive). The catalogue of the sale contains 125 illustrations of plants from the real estate. The stock which is in splendid condition embraces over 100,000 palms, the grand collection of foliage plants for which this firm was noted; an excellent stock of Adiantum Farleyense, cannas, palms, anemones which are some rare and valuable pieces, nursery stock; besides implements, office furniture, books, etc. This is probably the largest sale of horticultural products that has ever occurred in the United States. Cleary & Co., 60 West street, New York, will be the auctioneers.

Short Hills has for years been renowned for Adiantum Farleyense, and the stock that is now offered for public auction is no exception to that which in previous years has been sold in this town. The stock at the present time consists of 10,344 plants and nearly all of these are in decorative sizes that can be immediately put into use, no less than 5,323 pieces being in five and six-inch pots. Other ferns are in good condition and are offered in quantities. Adiantum cuneatum also is represented by 12,975 plants in three-inch pots, besides larger sizes.

Stove and greenhouse plants formerly were a great feature, but of late years the stock of these has been decreased, nevertheless the ones remaining a fine collection is evidenced by the fact that 310 distinct lots are offered. It may be well to here point out that there is an increased demand for these class plants, largely for the reason that so many people have dropped them. Five to ten years ago have been in the collection of drainage plants, but these are now a thing of the past. Willow, which has only been in this country four years, also D. Sanderaiana and other plants of the same kind are available, besides many decorative kinds of plants.

Among greenhouse plants there are many fine specimens. A quantity of 362 seedlings demand more than a passing notice. This stock is in various sizes from the comparative new yellow cells. R. Elliottiana and R. Pentlandii. These have originated from the parent stock of the latter stock, which originally cost \$15 to \$26 each bulb.  
During the last few years of the year the cultivation of palms from seed and in this way the Exchange has succeeded in producing a noble lot of clean, free, handsome plants such as will now grow in the Exchange pens, and which are sold into money quickly, being in the right condition to do so. These being over 100,000 plants, and the number of visitors to participate, and a house of Livingston rotundifolia is a pleasant memory.

**An Agricultural Congress.**

A Congress of Agricultural Industries will be held in Omaha, Neb., next year. The Executive Committee, composed of representative delegates from all State Boards of Agriculture, Agricultural Colleges and Experiment Stations, dairymen's associations, live stock breeders' societies, and other organizations related to the Exhibition, will convene in session for from two to four weeks, during which time the American Association of Agricultural Colleges and Experiment Stations, National Nurserymen's Convention, the Dairyman's National Association, and number of other national and state agricultural, horticultural, and pomological associations also will hold their sessions. The program of the Exhibition, Secretary Wilson, of the Department of Agriculture, has assured the managers of his cordial co-operation.

**NEW SINGLE VIOLET PRINCESS OF WALES**

The best single violet in cultivation, strong field clumps, \$5.00 per 100.

**CANNAS** Chas. Henderson and Paul Marquant ..... \$1.50 per 100  
Flamingo, dormant roots..... \$1.00 per 100

## CORRESPONDENCE.

*Insertion will be given to this column to all communications free from animus, but the opinions expressed do not necessarily reflect our own.*

## Winter Blooming Nymphaeas.

## Editor Florists' Exchange:

Mr. Tricker's perfectly satisfied that he has disproved the statement of the Haester Brothers respecting the winter blooming of nymphaeas. He wants it to be thought they are not an unusual winter blooming plant there to it. All that we have to go by is the statement of the editor of the *Gardener's Chronicle* and of these winter blooming nymphaeas growers against that of Mr. Deer's representative. Why we should credit the statement of the one in preference to the others, Mr. Tricker has not made clear. Probably the figures of the Haester Brothers are a trifle rosy; but I am also a little inclined to think the information which Mr. Tricker has gathered respecting the Haester establishment smacks suspiciously of having been gleaned while looking out of the window of a florist's shop. He tells him "no water lilies in bloom," and triumphantly reports their seedlings to "not so good as our own," and he reaches that conclusion when he had no means of making a comparison.

Once Mr. Tricker, I think, had no communication with the Haester Brothers, nor have I seen any of their figures beyond what Mr. Tricker takes pains to furnish, but I am not afraid to trust in the summer of 1891, as furnished by the gardening journal above mentioned.

Mr. Tricker, since he started in with the idea of setting me right in this matter, has changed his ground so often that I can exactly follow him. He stands at the present time. In last week's issue he trusts some of the progressive growers will do us the honor to come and be contending for that, "do some experimenting and give the fraternity the results of their experiments." A short time ago one of the principal reasons Mr. Tricker advanced against the winter cultivation of nymphaeas was the natural inclination of the flowers to close up just when the florist would want them to stay open, and now that he has or can get a remedy to compel them to remain open, he will have none of it. He says that by moneysing in this mystical manner with the "blooms" the natural flower is robbed of one of its true characteristics, that is, I suppose, toppling over when it wants to, "and it would be nothing more than an artificial flower." It is refreshing to get so much plain sense in one breath. Should there be any potency in this new preparation, it is welling to get it. G. W. OLIVER.

## Selections of Sweet Peas.

## Editor Florists' Exchange.

Noticing Mr. Hamilton's letter concerning the Hamilton County Horticultural Society's list of sweet peas, I called the attention of the committee to your article, asking them to give us a reply as early as possible. This committee was appointed to select a list of sweet peas suited to the amateur grower. The average buyer of seeds is as much at a loss to who he wants to buy as is the seedsmen's list as before; the varieties all appear good and desirable, yet he does not want them. He reads the list which he don't know. For his benefit this committee was chosen (men of much experience and their report could be generally follows.

W. F. GALE.

Nothing correspondence by Mr. Hamilton in our issue of 11th inst. in regard to selections of sweet peas, we take pleasure in replying to his inquiry. The first place the Hamilton County Horticultural Society appointed a committee to make a selection of the best 12, 24, and 36 varieties of sweet peas for general culture; that is, for ordinary home

garden culture, the object being to select for people to grow who are not matters of not familiar with the shades of the multitude of varieties, 12, 24, or 36 varieties which would give the representative shades. A committee was appointed, consisting of three practical growers, all thoroughly well posted on varieties and familiar with general sweet pea culture. The choice of the first 12 varieties published in your issue of the 11th inst. We note that exceptions are taken to *Pink Fire*, *Her Majesty*, *Venus*, and *Blanche Ferry*. Our reason for rejecting *Mars in Flight* of *Pink Fire* was its great tendency to burn in our locality. *Her Majesty* was selected particularly for its brilliant rose shade and its profuse blooming. *Venus*, *Blanche Ferry*, and *Blanche Ferry* are complicated for shade in any of the sweet peas named later by him, and which is a very popular selection in our locality.

We respectfully urge upon Mr. Hamilton the fact that we were not selecting for expert growers, but were selecting for

who are not as thoroughly posted on sweet peas as himself or associates, and we also suggest that the difference in locality and climate may have some trilling bearing upon our selections. For our own part we must insist upon holding to our original selection, and trust our reason will be sufficiently satisfactory to all growers. O. H. DECKER, chairman; D. ROMSON, W. J. ELDRED, committee.

## The National Charter.

## Editor Florists' Exchange.

As an original member of the S. A. F., one of the few that paid (voluntarily) double price, in order to get the show started, I have watched its doings with considerable interest.

Now the question comes up. Shall we have a national charter? If so, what shall the title be? It seems our rulers think S. A. F. is "a huckebery below

But why a national charter for the Society as now organized? What object could be gained, what purpose accomplished, or what use whatever. To re-constitute the Society on a new basis, institution, no matter what its name might be, or the impetus of its organization, would be necessary. Its character; it must be catholic in the broadest sense of the word. Its members must be representative men, such as would honor any position they might be called upon to fill. The motto should be "craft what our national representatives are to the people."

But why have a national society, one that would be an honor to our country, respected at home and abroad. Such a society would be a credit to our nation, which, in its way is all right and highly useful. Man is a social being and must meet his fellow-men on terms of social as well as human equality; he must have pleasures mingled with duties. Whatever his pleasure may be, he is born with a desire to be on top, without this feeling there would be no personal ambition or progress. He needs some stimulus to carry him onward and upward. Every man must have an ambition to excel in his calling; the rose grower to produce the best roses, the carnation grower the best carnations, and the fruit grower the best fruit.

Society is made up of links, or steps, one above the other, and all men are striving to reach the highest step. There is no exception to the rule, only that it is a disjoined, ungraded mass of honorable men and noble women. Like a public school, it needs grading. We clipped the following from one of your correspondents, some months or years ago, which expresses our ideas fully and clearly.

There are degrees in everything, that pertains to life and to government. There is the high and low in every walk, the amplitude and the bottom, trying to reach the top round of the ladder, and he can only reach it by slow degrees. But his ambition need not be to make an attempt is just what progress feeds upon. From the first year's existence of the S. A. F., we have seen that a national organization was necessary to a healthful and progressive as well as useful society. It is a mistake, indeed, to think of a society that belongs to local clubs or auxiliary societies.

The first link in the chain should be the local club where good fellowship, which is a conspicuous feature in the Florist's character, can have free play. A state, or district society, composed of such members as the subordinate society may elect, should be organized. Here business, not banqueting, should be in order. Members should be elected to serve for three years, one-third of the number to be elected annually.

The national society should be made up of representatives from the state societies, and to serve for five or more years. This society would very naturally be composed of the most intelligent and honorable men in the trade. Before that society all new plants and appliances should come on for their approval or disapproval. A certificate from such a body of men would carry weight, and the plant that had been awarded a certificate, would have a value because of that certificate, given by men acknowledged its authoritativeness and character. X.

## A New Strain of Comet Asters.

Our illustration is reproduced from a photograph that had been favored by a Gifford, who writes us on the subject as follows:

"I have raised a new strain of Comet aster; the plants are a mass of bloom when at their best, as many as 30 to 40 flowers grow on a one plant. The flowers are comparatively long-stemmed and measure from 4 to 5½ inches in diameter. The petals are of a light blue; their base, as being those of a chrysanthemum instead of an aster. I think it is a desirable new departure in this beautiful flower."

## Giant White Comet Aster.

the best variety of shades in twelve colors and those most readily grown to perfection. It seems difficult to realize that Mr. Hamilton and other expert associates have disapproved *Blanche Ferry* as being too far behind the times. We sincerely regret that this is the case, and must insist that she be placed very near the head of our list, bearing in mind that we are not prescribing a set of leaders for expert growers, but for the ordinary growing qualities in this section. *Ramona*, although a beautiful pea and of fine form, turns blue and is not sufficient to warrant its place in the first twelve. Brilliant, a very fine pea on the vine, turns blue and would not come within the circle of popular shades. *Little Doris* we find is very shy of blooming, and we can easily put up with *Blanche Ferry* in its place.

We trust Mr. Hamilton will take into consideration the fact that we are catering to a large percentage of the public their persimmon," that they must have a more noble title for their recognition, and to win the coveted prize, the S. A. F. has added O. H. (Ornamental Horticulturist). What a title! What does it mean? Is there anything in horticulture that is not ornamental? If so we have failed to see it. Is not the home garden, the well furnished garden, all desired vegetables and fruits, and well tended, in the direct line of ornamental horticulture, yet the aesthetic element in the S. A. F. cannot recognize the vegetable gardener, even though he cultivates flowers as well as an ornamental horticulturist. We think the man that is proud of his little plot, in which may be found a few flowers, much better entitled to the name of ornamental horticulturist, than a few of the flowers he loved in his mother's garden. We are not to be understood as ornamental horticulturist, but the love we bear for it is not the seller of flowers, fruits or vegetables, but the lover of them that is the horticulturist. To be a horticulturist, a man must needs both understand the principles of horticulture and practice them. If the name is to be significant, why not add to the five letters on the head, W. J. G. F.—"we are jolly good fellows."

BOURNVILLEAS!

FACTS. The plants are strong, rapid growers. They are easily handled in all stages of growth. The two varieties offered are very readily propagated. They are not subject to any insect pests. They are free and continuous bloomers for four to six months in the year. The bloom-bracts are very durable on plant or in cut sprays. The color is showy and very attractive. Send for "Facts and Comments."

We offer nice stock of both varieties, from 3 inch pots, 4 to 6 shades of color. ANDERIANA, 15 to 25 inches above pots, 4 to 8 shoots. Price, \$50.00 per 100; 5 plants at 100 rates.

The above plants can be safely shipped by freight to points within a week's shipping distance of Pittsburgh.

We mail a nice branched variety of either variety, from 2 1/2 in. pots, for \$1.00, or 12 for \$2.50. CASH WITH ORDER. THEO. F. BECKER, Glenfield, Pa. NEWELL JONES, 4 1/2 miles below Pittsburg, Pa.

FLORISTS.

We are having a share of the hot, dry spell which seems to be general over a large portion of the country. Coming as it does, it is not surprising that many of our plants, many may regard it as a positive injury to the successful accomplishment of many of our plants from the hot to winter quarters. We have not found this to be the case, although the weather has been very hot and dry since we commenced housing our stock, which was August 25. During this time we have had no rain, and the temperature has been very bright, while the temperature inside the houses ranged from 90 to 115 degrees, and in the shade from 80 to 90 degrees during the heated portion of the day. This is as warm as we had it in this part of July.

It is a rare occurrence in this neighborhood for the mercury to reach 90 in the shade and receive but very little rain, our plants that have been housed are looking none the worse for having undergone the ordeal of being kept during this hot period; in fact, they are all looking well and doing finely. The advantage of having a dry, moving atmosphere for a few weeks in succession shows plants that are well established in their growth to contend with; on the contrary, the foliage is firm and fresh looking, and in the shade from 80 to 90 degrees during the heated portion of the day. These which were housed during the last week in August and received but very little rain. We will continue to do this until we experience a change of weather, as the weather is now so warm, and it is well established to undergo day after day of hot sunshine without injury. During such weather the moisture soon evaporates, thereby giving disease little chance of developing. The percentage of dead plants among those which have been housed is very small; they will scarcely average 1 per cent. Our stock is now all in, with the exception of a few which are not yet from the rest. The first year seedlings we will leave out as long as it appears safe to do so, and that in many cases in bloom as possible, to prevent planting in worthless rubbish. The dry weather has checked growth considerably, and consequently they are not blooming very rapidly.

The first part of the season out-of-doors was a little too wet to induce the carnation to put forth its best efforts. It was rather favorable to the growth of rust, etc. The latter part, however, has been almost perfect, there being very little opportunity for rust, etc. The plants have an opportunity to offset the effects of the unfavorable weather earlier in the season. Taking all in all, our rust-affected stock has done very well, and has made very little progress. In fact, on varieties which were badly affected when planted, the rust has not had time to decide setback. This is due in large measure to the congenial weather we have been having, and it should be kept in mind that the plants have a point in housing rust-affected plants to keep the atmosphere dry and always fresh and moving. Such is, if possible, and as soon as the plants can do without it discontinue it entirely. Start the germs by spraying with them, as much as possible, the elements necessary for their growth, viz., moisture, stagnant atmosphere, etc. ...

## The Canadian Tariff.

The portions of the new Canadian law that affect horticulturists have already been received by the State Department, Washington, that bear particularly upon the seed, plant, and fruit, and kindred lines, read as follows:

## DUTABLE.

SEEDS, viz., garden, field and other seeds for agricultural or other purposes in small quantities, and unshelled seed, when in bulk or in large parcels, 10 per cent. ad valorem. When put up in small packets or parcels, 25 per cent. ad valorem.

FRUIT, viz., apple, cherry, peach, pear, plum, and quince of all kinds, and small peach trees known as June buds, 5 cents each.

— Grape vines, gooseberry, raspberry, currant and rose bushes; fruit plants, holly, and shade, lawn, and ornamental trees, shrubs, and plants, D. O. S., 20 per cent. ad valorem.

BLACKBERRY, gooseberries, raspberries, strawberries, cherries, and currants, D. O. S., the weight of the package to be included in the weight for duty, 2 cents per pound.

All goods not enumerated in this list are subject to any duties hereinafter declared free of duty by this act, and no special duties the importation whereof is provided for by this act, or which shall be subjected to a duty of 20 per cent. ad valorem.

## FREE LIST.

FLORISTS' STOCK, viz., palms, bulbous, cornus, tabernaemontana, spiraea, and lilies of the valley; seedling stock for grafting, viz., plum, pear, and other fruit trees, and seeds, viz., annatto, beet, carrot, fuchsia, mandarin, mustard, sowing and growing, and other seeds, and aromatic seeds which are not edible and are in a crude state, and not adapted for sowing, or for drying, grading or refining, or by any other process of manufacture, viz., anise, fennel, star, anise, fennel, coriander, cumin, fennel and fenel tree; seed pease and seed beans from Britain, Iceland, and other islands; and lux, yonicia, crude oil, locust beans and locust bean meal and cocoa beans, and other vegetable products.

— Ground, fruits, viz., bananas, plantains, pineapples, pomelo-grapes, lemons, limes, guavas, and other fruits; wild berries, wild strawberries, and wild raspberries; and trees, shrubs, and plants, D. O. S., 20 per cent. ad valorem.

## Exclusive a Trade Paper.

Entered at New York Post office as Second Class Matter July 10, 1897.

## For the Busy Man.

The Pitcher & Manda sale occurs October 4-7, next.

Rain storms in England have done considerable damage to the seed crops.

For the text of the Canadian tariff as affecting the florist and nursery trade, see this page.

Have you time to enter the "Point System" competition? See this page for particulars.

The premiums on the choice of stalls in the Boston Flower market were several hundred dollars in excess of market value.

Quite a quantity of chrysanthemum has reached the New York market this week; the Market arrive being Mme. Gasteller, on September 18.

The Washington Florists have petitioned the government institutions to stop free distribution of plants and flowers, on the ground that the florists' business is being injured.

Don't miss seeing the grand display of dahlias at the American Institute Show, in Madison Square Garden, New York, next week. The largest collection of dahlias ever brought together in an exhibition room, will be presented.

tribution of the diplomas and otherwise.

The present exhibition will give the honor of the metropolis as far as giving a full flower display is concerned, or will give the trade credit to be deeply thankful.

## Reflections on Current Topics.

"There is a danger, with the return of prosperity, that the credit system of being granted, and of its being extended for longer periods than has obtained during the depression, will be multiplied, and the result will be a general 'credit mania,' remarked a large grower to me the other day. Continuing he said: "This is a very dangerous thing, and ought to give their most careful and thoughtful consideration. The credit system of our day is a many other matters that affect every part of it; and it all comes about from the lax business methods of those who finally dispose of our products. There is no good reason why I should lie out of my money, because the retailer has not the fortitude to ask his customer for what rightly belongs to him. Taken as a class there are but few who may be considered prompt payers in the retail trade, and the excuse the others give for this condition is anything but business-like. The credit system is being extended and authorized and the onus of doing so rests on the retail sellers, among whom in this way many other matters that affect their welfare, there should be the heartiest cooperation. It can and should be done, and it is in many other matters that I have indicated to the fact that payment must be made within a certain limited time, it will be established by and by. The credit system will fall in with the changed conditions." This is an important topic, worthy of serious consideration by all who are engaged in existing unsatisfactory credit system is greatly desiderated.

Appreciation of the "going West" of the S. A. O. H. in creating a good deal of apprehension in the minds of many of its adherents in the "Plant World." Here we are to see a specimen of the population upon the venture which I overheard remark upon the fact that Western men will have it all their own way, next week, both in the matter of officers meeting and in the matter of business. As there will not be a large enough force of Eastern delegates present in Omaha to prevent this, we are to see a specimen of this contingency, but even were it to materialize, where is the harm, provided the specimens of the population which were kept intact, and the objects for which the Society was created, carried out?

"The Southern people have been giving the credit system a good deal of thought, and the following extract from the September issue of the Southern Florist and Gardener is of interest.

"It was well that some heed was paid to the view thus expressed (Chancellor Manow's) on the subject of credit, and when full heed is steadily paid to that view, and not till then, this Society in position to give the object of its being, for the most part, in name only. When the larger men of the calling come into position in the future, and when the element, from being able to take the more generous view, will be no need to make a distinction between the two and no vulgar discourtesies shown to any section; all recognizing in the work portion of the credit system, the best way, are conceived in the common interest of all.

"I notice that the authorities of the Transient Exhibition, at St. Louis, are calling for permanent exhibits from the trade during the continuance of the Exposition in the latter part of the year. Omaha people is attained, will it not be apt to interfere with the usual trade exhibition in the latter part of the year, which have heretofore proved so many an adjunct in the development of the Society's business.

"A Society's chrysanthemum show is likely to be one of the events of the exhibition in this Fall. The venture will be a big one, and it is to be hoped it will be supported by the ladies of the Society. The proposed plan of the exhibition being the opening of the show forming part of the opening of the exhibition, the value of the show in value from \$25 to \$100, has been promised and more are expected. The exhibition, however, will be held in the first and greenhouses of the 400, though there is a probability of the trade being held in the latter part of the year. It is not heard whether or not the attendance will be exclusive, nor have I ascertained the exact date of the exhibition. It is gratifying to see a returning interest in exhibitions by the society people of New York, and it is to be hoped, more or less,

from flower shows since the one held in Lenox Lyceum several years ago, when their patronage was freely given, but did not give the exhibitor the return of a financial failure.

"The S. A. F.'s new exhibit in German is 'Gleditsia,' merikanische Schmitt-Gleditsia and Kuznetsov's."

## New York.

The cool weather has had an appreciable effect upon the market; a better tone has prevailed throughout the week, largely owing to the fact that there were all kinds of stock. Had there been anything like an improved demand, doubtless there would have been a big advance in prices. As it was, the only effect produced was the possibility of cleaning out daily with but a slight advance in prices; but after the terrible depression and glut of the last few weeks, even to clear out was acceptable and quite a new experience. The aster has almost disappeared, which fact has helped out carnations and geraniums. The price of carnations has only advanced slightly, there being no extra call on any kind except Beauty, and carnations are selling at 100 per box, while these advanced special grades to \$3 and \$4 per dozen. There has been a great deal of interest to the tune of several hundreds of blooms per day, and many have been ordered with 40c, per dozen, for a price of 40c. The demand for bloom as a provision against a fall of good size and quality inferior or smaller bloom, making 25c. each. The carnations have been offered on Saturday and dealers were glad to receive a large quantity; during the week, but few violets have been ordered, but a larger quantity is expected for to-day.

Gladstone, generally speaking, of inferior grades, and realized but little; the price of the market was 100 per box, \$2 per 100 spikes. A large quantity of montrealis was offered and met with a ready sale at 100 per box, and a few 100, but blooms of this grade were scarce.

Chrysanthemums made their appearance on Saturday. Some of the new seedlings have been arriving each day since. The varieties were Lady Fitzroy, Mrs. T. J. Young, and Mrs. W. J. Young, Montmort. Prices varied from 12c. to 40c. per bloom; but the demand could not be met, and the supply of the latter supply was limited. Several large growers will begin cutting heavily Friday, and will begin to put up for sale. It is to be claimed the dignity of being first to cut in quality, but since Saturday that localities have been looking for a new supply. This section seems to have an unusual quantity of early blooms; many places are now looking for a new supply. The commission houses across town, chrysanthemums are arriving at the Cut Flower Exchange, Thirty-fourth street, New York. Mr. J. H. Young, Jr., of Jersey City, has received from Mrs. J. H. Young, Jr., a large quantity of chrysanthemums; Mme. Gasteller was the variety, the flowers being of good quality. The flowers are now in the midst of the season to arrive in this city.

Thomas Young, Jr., has for the past few weeks been suffering with tonsillitis and later with quinsy sore throat of a severe nature.

## Retailers.

Trade in this line has picked up generally. The stores are a little more active, and dinner-table work has been on the increase, together with general business.

J. H. Troy has returned from Newport, Rhode Island, and will be in the city hereafter, and will have a cut-flower store November in connection with his fancy trade at the corner of Broadway and Broadway. He will be the manager. Preparations for furnishing the above will begin October 1. L. J. is now looking around for plants, and visitors to Siebrecht & Son's store will find the millinery establishment next door is done away with, the partition taken down, and the store is being refitted. A large number of workmen are engaged and the alterations are being pushed.

Messrs. C. F. and G. Bahret of Poughkeepsie returned from Europe Saturday, and will be in the city hereafter. Messrs. P. F. and P. J. Hauswirth, Chicago, C. Miller, Springfield, Mass., and W. J. Young, Jr., Jersey City, N. J., are also in the city.

Exhibitors at Madison Square Garden in the horticultural section are rounded this week. The exhibition will be held in the sixth street entrance will be open for the receipt of exhibits, etc.

# RECEIVER'S SALE

THE ENTIRE STOCK OF PLANTS OF

PITCHER & MANDA, at Short Hills, N. J.

WILL BE OFFERED FOR SALE, WITHOUT RESERVE, ON

## OCTOBER 4th, 5th, 6th and 7th NEXT.

The Stock consists of over **100,000 PALMS** in splendid condition, in such standard varieties as **Areca Baueri, Areca lutescens, Cocos Weddelliana, Kentia Belmoreana, Kentia Fors-teriana, Latania borbonica, Phoenix reclinata, Livistona rotundifolia, etc., etc.**

Also the finest stock of **Adiantum Farleyense** ever seen in this country, and a general assort-ment of other **FERNS**, as well as a very fine lot of **Ornamental Foliage Plants** containing many choice things not to be found elsewhere, together with all the **Greenhouses, Packing Sheds, etc.,** and all the **Real Estate**, which will be sold in four distinct parcels as follows:

No. 1.—Containing about 10½ acres, on which are located all the greenhouses, about 80,000 feet of glass, all in excellent condition; a good dwelling house, containing eight rooms; stable, store rooms, packing sheds, several hundred sash and frames, etc., etc. This is a specially favorable opportunity to purchase a very well established Florist and Nursery business at a greatly reduced price, within three minutes' walk of the railroad station, and eighteen miles from New York City.

No. 2.—Contains about 3 acres, with a good dwelling house on it, within 500 feet of the railroad station.

No. 3.—Contains about 6½ acres, now used as an Heracloe Nursery, and is well stocked with the largest and best collection of these plants in the country. Close to railroad station.

No. 4.—Contains about 62 acres, well adapted for an excellent Nursery, Farm, or to cut up for building lots. This is situated on the main road between Short Hills and Summit, and one mile from this station.

# SPECIALTIES

...FOR THE USE OF...

# Florists, Nurserymen and Seedsmen

**Tubes for Mailing Plants.**  
Rather late in the season to advertise these, but we wish the trade to know we have them, and that they are the most practical method devised for that purpose.

# Catalogues for Growers, Seedsmen, Etc.

There are few, if any houses which rival ours in the completeness of outfit which we possess for the prompt and satisfactory printing of catalogues; our trade in this line is very extensive, and we are always ready to furnish estimates; large or small, it makes no difference. We have a fine catalogue of horticultural cuts; sent free on request.

# Certificates of Merit and Premium Cards.

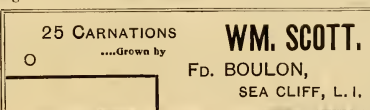

For Chrysanthemum and Flower Shows generally. We have some handsome designs on hand, drawn and engraved especially to our order, samples and prices of which we shall be very pleased to mail you on application. Clubs or associations desirous of having Certificates or Premium Cards drawn and engraved to order, can be accommodated. Prices promptly quoted on receipt of full details.

# Exhibition Plant and Cut Flower Labels.

The large growers of New York and vicinity are very proud in their admiration of our handsome black and gold waterproof Plant and Cut Flower labels for exhibition purposes. Never was a label gotten up which set a plant or cut flower off to so great an advantage. It gives the finishing touch to beauty. We have these labels in stock, in hundreds of names, covering all the popular Carnations, Chrysanthemums, Roses, etc. Send for sample and prices, and don't fail to provide yourself with a supply before your show comes off or you'll be sorry.

# Labels for Cut Flowers for Market Growers.

Did you ever stop to think that a neat, inconspicuous label, bearing your name and address, the name of the flower, and the quantity of flowers contained in the package, would be of wonderful assistance to you in business? We give here an idea of the label we refer to:-

The label is practically waterproof, and we furnish them very cheaply. In use by leading growers. Send for sample and prices.

# Addressing and Mailing for Catalogue Men.

Our painstaking system of keeping a record of all persons engaged in floriculture has resulted in giving us a list of over 10,000 names of commercial florists, nurserymen and seedsmen, which we have every reason to consider the most reliable and correct of all lists. These names we are prepared to address at a moderate figure, and invite your patronage. An unreliable list, even if the first cost is cheap, is unsatisfactory and a poor investment at any price.

We have also many thousand addresses suitable for retail catalogues; people interested in floriculture and gardening generally. Will be pleased to furnish prices and full particulars on request.

A. T. DE LA MARE PTC. and PUB. CO. Ltd. P. O. Box 1697, New York.

And all the leading new old Dahlies are now in full bloom on our Dahlias farm at Atoco, N. J. All interested are cordially invited to visit us and inspect them; also to visit the India Exhibition at Horticultural Hall, Broad street, below Locust, Philadelphia, Sept. 23rd and 24th.

# W. P. PEACOCK, Atoco, N. J. When Writing Mention Florists' Exchange Stationery for Florists.

Every florist in the land should have a complete supply of printed matter where-with to conduct his business in befitting style. We have the largest outfit in America devoted solely to horticultural printing, and we understand the wants of the trade. Below we quote two combination offers and would be pleased to supply you.

# \$5.00 Combination offer includes...

250 Noteheads, 5½x8½ ins.  
250 Envelopes, size 6½.  
250 Billheads, 7 in. wide, 8½ in. deep.  
250 Business Cards, 2½x4½ ins.  
250 Tags, size 2½x5½ in.  
Cash with order. Delivered F. O. B., N. Y.

# \$10.00 Combination offer includes...

500 Noteheads, 5½x8½ ins.  
500 Envelopes, size 6½.  
500 Billheads, 7 in. wide, 8½ in. deep.  
500 Monthly Statements, 5½x8½ ins.  
500 Business Cards, 2½x4½ ins.  
500 Tags, 2½x5½ in.  
One Day Book, 11 if these are not wanted subtract \$1.00.  
Cash with order. Delivered F. O. B., N. Y.

**PLEASE READ THIS BEFORE YOU ORDER.** Write plainly and send "copy" for each article wanted.

Noteheads will be furnished in smooth writing paper with ruled lines. Linnen paper, ruled or unruled, can be had instead if so ordered.

Envelopes are full commercial size and of good quality. Billheads will be furnished as above, but size 8½ in. wide and 4½ in. deep will be substituted when so ordered.

Cards are of good quality and ample proportions. Day Book and Ledger are large enough for ordinary purposes. Ledger is indexed and will suit your needs.

Special designs, trade marks, etc., engraved to order. A rose, violet, or other flower can be printed on your letterheads and billheads, plain or in color, to order. The quality of all the above work is guaranteed.

We can forward any of these combination offers with advantage to the purchaser, but it will not pay for him to distance to order a single item on account of the express charges. Address all orders to:

N. STUDER, Wholesale Florist, Anacostia, D. C. When Writing Mention Florists' Exchange

## Butted Glass

This is no longer an experiment, it has come to stay. There are various ways of making Butted Roofs, but the best way is with the

## Clipper Bar.

With this bar you can make a roof that is absolutely free from drip, and glass cannot be torn out by the wind. Butted glass makes a tight roof, a warm house and saves fuel. It lasts longer, looks better and costs less than the old-fashioned roof. But do not think that this is the only way for it is not; we furnish what people want and there is nothing in greenhouse material that you cannot get from us, and all of open-air-dried Cypress clear of bright sap, stained sap, knots and all other defects.

## ..The Water Garden..

BY WILLIAM TRICKER.

PRICE \$2.00. TWENTY-FIVE PER CENT. OFF TO SUBSCRIBERS TO FLORISTS' EXCHANGE.

This work contains nine half-photographs plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work. On heavy enameled paper. Elegantly bound. Large octavo.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

This Book is of vital interest to every Florist in the land, and all should buy it and read it. Introduce Water Gardens in your locality and make money.

**A. T. DE LA MARE Ptg. & Pub. Co., Ltd., P. O. Box 1697, New York City.**

## Buffalo.

While somewhat premature, it is almost a settled thing that the contract to build the splendid range of greenhouses at the Botanic Gardens will fall to an Eastern man. Judging by the plans and specifications, the structures will be the most handsome buildings yet erected. Professor Covell already has his eye upon some big stock to adorn them. The center dome will be 60 feet in height and it is his intention to fill the space as quickly as possible. After completion he will promise to be a most complete rockery is absorbing his attention. The arrangement of ground, the great seed-beds, to place the plants in the most favorable situations more than the formation. Though but partly finished, the plants are quite at home and being in a sheltered spot, it is expected a snowfall will cover and protect it through the severe weather. The area will be given later.

The herbaceous border is being extended 500 feet. The appreciation shown during the summer has inspired Mr. Covell to extend the area for the interesting class of plants. The majority are not yet started. The author saw in the distance a showy bed of the blue verbenas Venosa, the common aster at its best. It is one of our earliest and most pleasing to the eye. Of canna, Papa is the favorite this season; it looks grandly over some handsome seedlings raised here. A border of Yucca filamentosa around the canal beds illustrates the good use to which this plant can be put.

The houses are in excellent order, a few choice specimens of *Crinum* and *Clivia*, also superb *Adiantums* in 12-inch pots. *Nephrrolepis Duffii*, growing in the rocky crevices to be at home. *Scilla*, *Emilia* is being used as a carpet in the aquatic house; planted in the ground in open spaces is a splendid plant. Some pretty varieties of *Primula* *obconica*, ringed and bearded, are very old. *Cycas* are in the flower and use them more extensively next season.

Mr. Covell has made elaborate arrangements with Judson and his private opinion of its merits or demerits worth having. I noticed a bed of fibrous-rooted *Belamcanda*, great and shining, in a splendid visit in July, at which time they were very poor. Doubtless the cooler weather is responsible for this. Mr. Covell uses them more extensively next season.

## Pleasant Weather Continues.

A two-day's cold spell intervened the early part of this week, but no frosts were reported.

Trade inclines to quiet in a general sense. Good shipping trade was reported at Kesting's wholesale store on Wednesday. Flowers are ordinarily plentiful for the demands, but now an inclination to scarcity is noted.

N. B. Buddenbrock, now at 337 Elk street had a rush of funeral orders on Tuesday, which included a handsome Roman urn of carnations, besides ten other-finished pieces in variety. He is constructing a show house 60x20 feet in the rear of his store.

J. H. Rebeck had a country wedding decoration in Aurora on Thursday.

Autumn, N. Y.

Karl Armbruster has recovered a verdict of \$1,500 against the gas company of this city, because escaping gas from one of its street mains worked its way into his greenhouse and killed his plants. The case was carried up and the decision of the lower court was sustained.

## Hartford, Conn.

D. A. Spear has now one of the handsomest stores in New England. With the conservatory in the rear, it is well-equipped for a good plant trade.

John Coombs is rushing in carnations and violets, which are in prime condition.

## Central Falls, R. I.

G. T. Earle reports a busy season for funeral work. The demand for plants has begun and a good season is in prospect. He has a clean stock with which to meet the demand.

## Ramsey, N. J.

H. C. Hansen has bought the W. J. Thurston greenhouses. He will repair them and put them in condition to grow out flowers.

## Paterson, N. J.

Joseph Towell, who is in England, is seriously ill in an hospital there.

The Paterson Florists' Club, which is the youngest club in the country at the present time, held its third meeting on Wednesday evening, John G. Esler entertained the members with an account of the Providence convention and afterward went into a detailed account of the new fire insurance scheme. A good number of things he said: "It is among other things the national Society when the youngest florists' club in the United States, of whom not more than four persons are members of the S. A. F., should be anxious to know about the doings of the larger body at its annual meeting." After the talk was over and several questions had been answered, several members identified their intention of joining the national Society and making the journey to Omaha with the boys next year.

Capt. John J. Phelps, who has been summoned to Lake George, was elected and accepted the vice-presidency in a manner that at once made him a popular officer. He has a large number of members of the young club over which he presides. Great interest was taken in the fire insurance scheme. Several thousand dollars worth of insurance was guaranteed.

## Brookline, Mass.

The Boston firm is as strongly in evidence as ever. James has just posted up the contents of two houses, and there is stock enough left to plant over again. He has a large order to ship to New York.

Miss Vass has a pretty stock of chrysanthemums for the exhibition and will be all right at proper time.

Fred Palmer has made a big improvement on the grounds of the addition of a very convenient and handsome office.

## Lawrence, Mass.

Chas. Wingate returned home safely from the convention and is regaling the boys with stories of the great time spent there.

J. B. Halley and Thornton Bros. have made considerable improvements on their establishments. They have, in addition to their extensive plant houses, carry a magnificent stock of jarlineries and fine art.

## Cambridge, Mass.

W. E. Doyle has a book filled with orders for Fall delivery; his foreman, Mr. Murphy, predicts a good season and has a large well-grown stock to meet it. C. D. Bodley has a magnificent demand for the Boston firm, of which he has a grand stock.

## Salem, Mass.

McGe, Geary & Co. are pleased with the outlook. They regret to chronicle the illness of Mr. Geary, who has been troubled for several weeks with an affliction of the eyes. It was feared at one time that he would lose his sight entirely. But it is hoped with care he may soon be out again.

## Beverly, Mass.

G. A. Galloupe is much embarrassed by the refusal of his fellow-citizens to accept his declination of the mayoralty. It is not often one has the opportunity to decline the honor, but evidently Mr. Galloupe believes, with other members of the craft, that to preside over one's greenhouses nowadays is all he can do thoroughly.

## Holyoke, Mass.

E. H. Howland has re-painted his whole range and in place of two small houses has built a new one which shows house 28x70 feet, connecting with the office. Chrysanthemums are looking bright in the show house. He has some seedlings of much promise which will be exhibited for the first time Fall.

## Haverhill, Mass.

C. H. Kaubach celebrated Labor Day with a grand rush of funeral work. This branch has kept him so busy this season that several intended improvements have had to be held over for awhile.

Providence.

The Market.

Trade has been very quiet the past week, though slightly improved over the week previous. Funeral work is quite brisk and an occasional early opening of some large business houses with Fall goods serves to accelerate the trade.

Asters, gladioli, and other outdoor stock are plentiful and sell well. Violet plants about here are generally poor, but it is hoped that as the season advances they will improve as these are among the most favored flowers in this market, and for two or three years past there has been an increasing demand for them.

Good carnations and roses are rather scarce, though plentiful enough for the demand.

Horticultural Society.

The invitation of Mrs. Mary E. Jencks to the Rhode Island Horticultural Society to visit her place upon Jencks Hill, in Lincoln, brought a goodly number of members and their friends to that pleasant region last Saturday morning and afternoon. The ride was by one of Greene's barges.

Small Talk.

It is reported that T. O'Connor is to locate his store on Westminster street again this Fall.

Fairbrother & Wood have a very handsome new refrigerator to with beveled glass and mirrors.

E. D. Clark is erecting a one-story office building about 20x50 feet, adjoining his greenhouse on Pockwotton street.

E. J. Johnson has had his store, 171 Weybosset street, varnished, painted, and kalsomined.

John Macrae is rebuilding one of his houses and making other improvements at his plant on Smith street.

Richard M. Huestis has been appointed head gardener for Eldridge T. Gerry, Esq., at Newport, to succeed Harry Logan. A new violet house is to be erected on this estate.

The H. B. Smith Company of this city is putting in a cottage boiler with hot water coils at a William Jamieson's new greenhouse on Comstock avenue.

Frank Wise, proprietor of the Beaconside nursery, Manville, is having a new furnace placed in his main building.

In the Court of Aldermen last week a resolution was introduced appropriating \$15,000 for the completion of Roger Williams Park.

The following florists have joined the scheme of giving trading stamps to their patrons: Dorothy O'Connor, George Johnson & Son, and Fairbrother & Wood, of this city; Frank O'Reilly and A. L. Warner, of Pawtucket.

Louis D. Pierce, of Norwood, has returned from a week's yachting trip.

Sam Kinder has built a new greenhouse at Bristol.

Fairbairn Macrae and family are enjoying a three weeks' trip up the Hudson.

Thomas J. Johnston is confined to the house by an attack of rheumatism in the foot. W. M.

Business has opened up in good shape. Tom Johnston's predictions are evidently to be realized. That paper was theftproof of his life and stage freight alone prevented him reading it to us. Tom is at his best making up funeral pieces; at time of my visit he had the store nearly filled with some very fine specimens of the art.

Fairbairn Macrae's chrysanthemums are in the pink of condition.

Alex. Miller has the stock in prime shape at the Rhode Island greenhouses, and I learn that S. J. Reuter has a grander stock of roses and carnations than ever.

Alex. Bemie is rushing out bulbs as fast as possible to reduce the lot file for orders on hand.

W. Hazard is thinking of adding to his plant to supply his store at Tom'socket. George Johnson is on his way home from last reports much rejuvenated. He will not rest content until he brings with him that big huchsia bush he told about which he saw when on his trip to the Isle of Man last year.

W. S. Hogg has returned from his tour of Canada and the far East much refreshed by the outing. W. M.

New London, Conn.

John Spalding is so pleased with his trip to the convention that he may decide to run out to Omaha next year. When one at his period of life shows such vitality, the younger members should never think of getting tired. Mr. Spalding has a fine lot of chrysanthemums.

W. H. Mason.

YOUR FORTUNE IN STRAWBERRIES!

The Strawberry King and his Remarkably Successful Career: How a Poor Boy Became Wealthy.

THROUGH ONE of those strange dispensations which often mock in real life the wildest imagination of the novelist, the publishers of AMERICAN GARDENING have become possessed of the story of the life and cultural methods of Henry Jerolaman, undoubtedly the STRAWBERRY KING OF THE UNITED STATES. We have prevailed upon Mr. Jerolaman to write the history of his life and a full description of his cultural methods, exclusively for the readers of AMERICAN GARDENING. Further than that and at our urgent solicitation we have prevailed upon him to make a contract to supply us One hundred thousand plants of the HENRY STRAWBERRY, which we will distribute only as premiums to subscribers to AMERICAN GARDENING. The unrivalled HENRY STRAWBERRY has positively never been advertised until now.

THE CONTRACT

Publisher American Gardening. Gentlemen, I hereby agree to furnish you within the next twelve months in quantities as ordered. One Hundred Thousand plants (100,000) or any portion thereof, of the Henry Strawberry, to be used solely as premiums for subscribers to American Gardening and not to be sold. Address Mrs. P. O'Conroy (Signed) Henry Jerolaman

The Best Berry of the Age.

Four Berries of the Henry, grown by Mr. Jerolaman, rounded a wooden quart measure. Individual berries were three-and-a-half inches through each way. Mr. Jerolaman's description of this wonderful berry in a recent issue of AMERICAN GARDENING has brought him hundreds of inquiries from the cream of the professional growers.

A GOLD MINE AT YOUR OWN DOOR.

"He who hesitates is lost." It is not likely that such an offer or such an opportunity will occur again in years. More than one Strawberry grower in every town, village, and hamlet can come into a good thing through practicing the cultural methods and getting some of the plants which have made Mr. Jerolaman not only wealthy and well-known, but so wonderfully successful, by at once

TAKING ADVANTAGE OF OUR OFFER:

For \$1.00 (check or money order preferred) we will forward you, by mail, postpaid,

FIVE PLANTS HENRY STRAWBERRY OF THE U NEQUALED And AMERICAN GARDENING One Year.

Plants to be shipped this Fall or in the Spring, as you prefer.

Present Subscribers are entitled to this offer on renewal; if their subscription has not expired, it will be dated ahead.

Mr. Jerolaman's story will be found in the first issues mailed you and his cultural methods will be published in time to be of service for Fall planting.

OFFER EXTRAORDINARY For every new subscription you send us \$1.00, we will forward you, postpaid, as a premium, Five Plants of HENRY STRAWBERRY; at the same time we will also send Five Plants to the party subscribing through you. Thus a club of ten new subscribers entitles you to Fifty plants of this wonderful Strawberry, as well as each individual subscriber to Five Plants. This is a BIG OFFER to all who want to become larger holders of this wonderful Berry, never before advertised. Time is short, get to work at once if you wish to accomplish anything before frost.

Address Pubrs. AMERICAN GARDENING, P. O. Box 1697, New York.

For \$1.00 we will send AMERICAN GARDENING on three month's trial (13 weeks) to four separate addresses, and as a premium, Five Henry Strawberry Plants to the one getting up the club, HUSTLE.

**Montreal.**

**Club Meeting.**  
The regular monthly meeting of the Montreal Gardeners and Florists' Club, held last Monday, was well attended. The subjects were: "The whole, to be arranged with palms and foliage plants to form a series of groups and irregular banks and bays." A committee was appointed consisting of Messrs. Joseph Bennett, James McKenna, J. Eddy, A. Finlay, J. Holliday, J. C. Phillips, and the writer, to draw up plans and arrange to have the necessary palms and other plants on hand so that something entirely new in general arrangement may result. Everyone feels that something is necessary to do away with the sameness that is apparent in a sectional exhibition, and we are in hopes that from the brains of our best men some plan may be evolved that will meet with the hearty co-operation of the exhibitors, and that our coming Fall show will be a distinct advance in artistic taste and arrangement. In the report of the Executive Committee, the grand aggregate prizes were awarded to George Robinson, first; George Trussell, second, and C. A. Smith, third. W. WILSHIRE.

**Utica, N. Y.**

C. F. Seitzer has a house of smel. He has this ordered Marie taken for the aquar violet; a house planted and carried over is pretty, not a poor plant. No true flowers are now taken on, as good blooms are produced upon these, as upon the plants. When owing to an oversight, not on his part, mildew got into the roses, which are also very fine; fire was started at once and the evil is nearly remedied. This hint could be taken by many just now who will not start a fire, until it is too late. There is an abundance of mildew this season.

C. F. Baker considers Niphetos indispensable on the side bench. His recommendations Ed Jacket and Oeidea are away ahead of the several other varieties being planted in the house. W. M.

**Lancaster, N. Y.**

For the first time this Summer William J. Palmer, Sr., is resting on his oars after completing with the aid of his wife, fifteen houses of wood and iron of the best material, of course. They are a handsome and useful set of houses, and Barney will feel proud that ever; he used to grow some fine stock; now we shall see even finer.

Will Palmer, in commenting upon the business created by the G. A. R. gathering, thought a good time in making up a small bantoniere with a streamer of the tri-color, which sold at 10c like hot cakes. "Working out of nature, to the immortal, but it made no difference; they took just as well. He advises our "Incidental" brethren to do something upon this order next year when the Grand Army meets there. W. M.

**THE FLORISTS' FERTILIZER.**

Made by steam process from pure night-soil (liquid and solid matter), not adulterated with absorbents. Fully matured and combines all the necessary elements for the growth, vigor and enrichment of plants. Quick in action. Ground from 100 to 200 tons at a time.

**MASTIC**

FOR GLAZING GREENHOUSES. SUPERIOR TO PUTTY IN EVERY WAY.

It is not hardened by the extreme heat or cold that a greenhouse is constantly subjected to both inside and outside. It is adhesive and remains permanently elastic so that it is not forced out of place by expansion and contraction of the work. It does not crack, it is not dried up by the sun, it does not need re-glazing, thus saving time and expense. With Mastic Glazing Machine use on the outside, but with a machine only.

Highest Awarded Society of American Florists at Pittsburgh, 1895.  
Put up in gallons, \$1.00. Half gallons, 60c. Quarter gallons, 35c. Mastic Glazing Machines, \$1.00 each.  
Send for full descriptive circular and testimonials. Agents in all the principal cities.

	Per 100	Per 1000
1000 William Scott	\$6.00	\$50.00
2000 McGowan	6.00	50.00
200 C. A. Dava	12.00	
200 Mrs. Chas. Duhme	12.00	

All others-sold out.

## CANNAS.

JAMES DEAN'S NEW PEGIGRE CANNAS. WILL BE SENT OUT IN FEBRUARY.

**President McKinley.** Color brilliant crimson, with scarlet shading. Plant dwarf, growing from 2 1/2 to 3 feet high in rich soil. Foliage deep green with heavy chocolate margin. Plant stools freely and is abundant and very early bloomer. The flower heads are highly colored as in A. H. Jones Bouvier. The fringes are large, of good shape and held well above the foliage and the growth is compact and even. This variety may be considered a marked improvement upon Charles Henderson, Columbia and other crimson Cannas. The effect when massed is extremely brilliant, the color contrasting nicely with the deep green foliage. We place this variety at the head of the list of crimson Cannas, and believe that it will prove invaluable for bedding purposes. Certified.

**Defender.** Color clear yellow, striped with bright scarlet. Height 3 to 3 1/2 feet. Habit somewhat resembling Columbia. An early, very profuse bloomer, producing large heads of broad petaled flowers. Foliage clean, distinct, and a good grower. This Cannas will prove very effective for massing, as it produces a greater proportion of flowers to the foliage than almost any other yellow Cannas. Certified.

The attention of seedmen is called to the following list of standard bedding Cannas which we grow in quantity.

Chas. Henderson, A. Bouvier, Am Pichon, Midway, Chicago, Alex. Billard, Papa, Beute Potteville, Columbia, Flamingo, Madame Crozy, Souvenir de A. Crozy, Queen Charlotte, M. Messier, Premier, John White, Eldorado, Florence Vanhook, America, Count de Bouchard, L. E. Cabot, Burbank, Egalite, J. D. Cabot, Admiral Avellan, President Carnot, J. C. Vaughan, Leonard Vanhook and Souv. de Pres. Carnot.

We are prepared to fill large orders of the above. Send us a list of your wants and get our prices before ordering elsewhere.

New York.—The Stump & Walter Co. will shortly be incorporated under the Laws of New Jersey and will open early in October at 50 Barclay street, with a full line of seeds, bulbs and horticultural supplies. The officers of the company will be: President, J. H. Walter; Secretary, Henry Eicke; treasurer, G. G. Stump.

### European Notes.

**Weather and Crops.**  
By a shifting of the winds the cool and cheerless weather of the north and east has been transferred to the south and all over northern Europe very seasonable weather prevails. The heavy and cold rain and in some districts (snow) which have fallen in the south are likely to seriously injure the balance of our crops of carrots, leek, onion, lettuce, radish, cauliflower, and various of the cruciferous, and such food crops as French peas, panicles, potatoes, plums, portulaca, nasturiums, and various of the cucurbitaceae is also in the same position, while some of the late ripening herbs, peppers, and egg plants can hardly escape.

In the north things are a shade brighter than they were, which is not indeed very much to be desired, for moist weather has certainly improved the Brassicas all round.  
Brick Road for the spinach are now fully harvested and in all cases the discoloring effects of the storms are very apparent. The ground for this article has been very brisk during the past few days, and heavy shipments are being despatched to your side. An excellent variety of the prickly seeded type called Long Standing, has hardly received the attention that its merits deserve. It is fully as hardy as the parent variety, while the leaves are thicker and of a rich deep green color. It is sown with the prickly. It serves to bridge over the zulf between that variety and the Bloomsdale; while the quality of the produce is far superior to either.

**Cauliflower and Nasturium.**  
The cauliflower crop in northern Europe will be a fairly good one if favorable weather helps us for another three weeks. Modern prices are likely to prevail, and the seed will be sound. As regards nasturiums the tall varieties are doing quite up to our expectations, but dwarf varieties such as Empress of India, Cloth of Gold, King Theodore and Ruby King are very poor returns.  
Growing nasturiums is a sorry business in the best of seasons, but in a poor season like the present it can only end in loss.

Philadelphia.

Market Notes.

There has been quite a revival in the cut flower business the past week. All kinds of stock are moving better. The demand for flowers has improved very much, and it looks as if business has started up to continue for the season.

Flowers are advancing slightly, and are generally firmer for all flowers. Beauty is now bringing \$1.50 to \$2.50 per dozen, according to quality and stem. Sales of Beauty this week have been very good, some growers having to send to Philadelphia this week. Beauty is bringing \$1.50, while \$6 is obtained for some extra fine flowers. Meteor has also sold well at \$1.25 for roots. \$2.50 except Ferle and Niphetos, which average \$2 to \$3, and which are in good demand on account of their long white, prices averaging from 75c. to \$1.50.

Carnations are much improved; there is yet a scarcity of pink and red and extra fine white; prices averaging from 75c. to \$1.50.

Adelars are on the wane; the light colors have been selling very well and are still in demand. Dahlias have been asked for, and several of the stores are keeping them in hand. The demand, it is thought, has been brought about by the dahlias coming out this week.

Early Chrysanthemums. George E. Campbell was the first to cut these in this locality; he had a few Bergmann this week. Pennock Bros. have received some Mountmore from Strauss & Co. of Washington.

Sam'l S. Farnock is receiving some very fine Kabara from Edwin Loubale; large flowers with long stems, without a doubt the best received in this city for some time.

New Items. The shuttle-board contest started in the Florists' Club room this week, and is creating quite a stir. Contestants: there are 24 entries, these being divided into two squads and play on each Monday, Wednesday and Friday evenings.

The bowling contest commences on Saturday next, October 17th. Classes: Monday, Wednesday, Friday, Saturday, and third class Friday evenings. The best bowlers are: Fred Mehan, Alvin Kousler, Tom Young, Athelstan and Edwin Loubale's team (old members' team) lead on the latter team winning by a large margin. On Tuesday afternoon Thomas Mehan and Alvin Kousler had a match up to Washington, hoping to vanquish the Florists' Club; but the scores showed the latter team to be some 50 targets to the good.

The American Judo Club has been incorporated under the laws of the state of New Jersey.

Florists' Club. The meeting on Tuesday next promises to be the most interesting meeting for election of officers, and William K. Harris will tell the members how well they will benefit the trade the coming season.

A New Wholesale House. We have another wholesale concern, when William C. Smith has opened at 38 S. Sixteenth street. He is now fitting up the place and is now ready to receive consignments.

DAVID REES.

Providence.

The annual chrysanthemum exhibition of the Rhode Island Horticultural Society will be held in Music Hall, 280 Westminster street, on November 11, 12, and 13. Premiums amounting to more than \$10,000 will be awarded, with a competition set for the best six vases of ten named on long stems, in variety, all day.

A Large Greenhouse Planting.

H. A. Brown and several other gentlemen of Barrington, a suburb of Providence, are contemplating the erection of one of the largest greenhouse plants in New England. A plot comprising 100 acres of land on the Barrington Plot has been purchased. The exact number of square feet covered by the buildings will amount 50,000. They are now being drawn, and it is expected to be completed in the latter part of the year, before December 1. H. A. Brown, in the head of the new concern, was formerly connected with the New England grocery company.

Round and About. W. H. Trotter is about to build a wood and glass conservatory, 10x62 feet on Calder street, Pawtucket; glass and wood on roof.

William Wing will re-open his store at 47 College street, about October 1 for the season. The store has been newly painted in white and gold.

Miss Emily Sewell has returned to her home at 12 Johnson street after her summer's vacation. W. H. M.

CATALOGUES RECEIVED.

SCHLEGEL & FOTTLER, Boston, Mass.—Bulb Catalogue for Fall 1897. PIERONY NURSERY CO., Bloomington, Ill.—Wholesale Catalogue of Trees, Shrubs, Roses, etc.

FRISKE & CONARD Co., West Grove, Pa.—Catalogue of Bulbs, Roses, etc., profusely illustrated.

S. TAPLIN, Detroit, Mich.—Circular regarding his new hothel, for which patents have been granted in America, Germany, Canada, Belgium, England and France.

ELWANGER & HARRY, Rochester, N. Y.—General Catalogue of Fruit and Ornamental Trees, Shrubs, Roses, etc. Very complete, and containing a new stock catalogue that comes to our desk.

DANIEL B. LONG, Buffalo, N. Y.—Floral Art Catalogue of new stock catalogue for the use of retail florists. It treats on designs, colorings, and gives the most valuable customer practical ideas from which he can intelligently order arrangements of flowers. The work includes the illustrating in actual reproductions, direct from photographs, of different illustrations, made-up arrangements in flowers as well as panels, stairway decorations, etc. It also contains a circular matter on cut flowers, directions for ordering, etc.; hence it is fully and fully represents the retail cut flower trade. Its scope is ample, and entertaining florists readily comprehend that such a method, properly used, most largely stimulate and increase business.

LETTUCE PLANTS.

# Disinfecting the Soil.

Plants that were housed during the latter part of August and first week of September have been damaged by numerous small weeds, just large enough to handle. These could be removed by pulling or turning to the depth of an inch or so. If we do not advocate the frequent stirring of the surface soil, it is because of the fact that the soil beneath the surface soil will be filled with hundreds of small roots; these are really the feeters of the plant, and a plant does not get to work right until they are well established. Before this takes place we always make it a point to give some dressing of pure ground bone, and work it thoroughly into the soil to the depth of about one inch, immediately after the laying of the surface soil (the surface of the plant). To go as deep as that just about the stem would mean the destruction of many of our young roots. Here the bone meal should be worked in very lightly. Some may feel inclined to ask why I consider a top dressing of bone necessary or advisable, inasmuch as the soil is supposed to contain already a certain amount of bone? To this I would say that we must remember that the carnation is, under proper circumstances, a heavy root and bloomer, or at all events, it is our aim to have it such; and in order to attain this result we must give it the soil, rather than the temperature judiciously, and observe the hundred and one little odd and untold details that enter into any plant, but we must look ahead and see to it that that one inch except the soil of the soil at all times, and in the right proportion for the maintenance of the plants.

It is a question of drainage of the soil to liquid form so that it and the nitrogen in it will be carried by the soil and required for a couple of months to nourish the plants properly, we may know that as soon as a carnation requires an extra supply, we can give it.

But with phosphoric acid it is different. Phosphoric acid can be carried in this in its bone meal; and since it is quite impractical to apply it at different times, it is better to use it once, and the welfare of the plants at heart, a sufficient supply must be given before any harm will be done by undisturbing the roots.

There is more likelihood of underestimating the amount of carnation in regard to bone or phosphoric acid than of overdoing it. For a bench 3 1/2 feet wide and 10 feet long, there is a good supply of pallid of bone meal which is a little more than two gallons. If the soil does not already contain a goodly portion, I would advise to increase this amount by one-half. The soil should be thoroughly watered before season, so that it will not remain dry too long at a time; in fact, it should be kept rather moist when it is hot, either by watering, or by burning, or otherwise, which will be in a few days.

When this is done, the foundation for a good crop of flowers is laid. The ability of a soil to produce a lot of flowers, and success depends mainly on the supply of phosphoric acid it has to draw upon. It is this element that the plants use to form buds and blooms, while potash gives structure and color, and nitrogen gives them dependant on the other, and success must hang upon them all.

I have before advertised salt water, used as a spray on the flowers, and the eradication of red spider. I know of no other remedy so effective as this to destroy red spider on the flowers and the hold. A few applications will cure the worst attacks. Where several applications are necessary, let them be one week, ten, or twelve days apart; and during winter, a longer interval should be allowed. Use as much salt water as the hand will hold when about three-fourths of the flowers are covered with water; or there are many other uses for it, etc. Care should be taken to spray the plants thoroughly with water after each application, so as the top, so that no places be left where the spider may retreat and be comfortable. The salt water after being used will crystallize again on the plants, and remain some time, and be a complete barrier to the spider. After using it, work down in the hearts of the shoots and must be reached in some

other way, either by fumigation or otherwise.

This would be an excellent time to clean plants of spider, while there is still some of sunshine and the plants are small, admitting of more thorough and complete work. I am aware that when the carnation is treated properly, the conditions surrounding the plants are not such as would induce spider to develop, or to take on the condition better than cure. But if the plants are already infested with spider, these will either locate, or not locate, but will be tolerable for carnations.

I have also found the salt water spray the best remedy for sunles we have tried. The small a version to salt in any form, well known; and it can be relied upon for the destruction of pest, at a safe distance as long as any salt remains on the plants.

No fears need be entertained in regard to using salt in this manner, as the plants seem rather to like than dislike it. The good effects they seem to derive from its use is doubtless due to the percentage of potash the salt contains. With proper ventilation the development of spot, etc., from the use of salt need not be feared.

H. WENZEL.

## FLORIFEROUS VEGETABLE.

Insertion will be accepted in this column to all communications free from animus, but the opinions expressed do not necessarily reflect our own.

### Selections of Sweet Peas.

Editor Florists' Exchange.

The answer of the selection committee of the Hampden County (Springfield, Mass.) Horticultural Society adds a new phase to the discussion. It is therein stated that they were to select "for the best variety of shades in twelve colors and those mostly easily grown to perfection." This proposition was not mentioned in the original announcement, or it would have put a different face on the matter. We were first led to think that it was the varieties that were selected as being the best for general culture, but now it is the shades. Well, let us examine the matter from the committee's point of view—shades for general culture.

The following we will agree are the best of their shades: Aurora, salmon-pink stripes; Pearl and Purples; White; New Continent; grand-lavender; golden-cream; lemon; Lovely; light pink; Maid of Honor; white, edged with violet; Royal Rose, rose; Stanley, raisin.

We disagree as to the following being the best other shades: Mar, we examine their kinds: Firefly, Her Majesty, Venus, and Blanche Ferry.

Firefly is a true type, has the "damning" notch, and is small in flower, and will not stand the sun anywhere. Her Majesty is a true type. Mar, we think is better, both being of grandiora type, of good substance, large flowers and not too black in color, because it blackens in the sun, and Brillant because it blackens in the vase. Why are Firefly and Brillant both in black in both places? My experience with Brillant in the vase has been very satisfactory. The petals are very thick and keeping a week under good conditions. I examined Firefly in the gardens of several florists and in those of a number of amateurs, where it received only ordinary culture, and the flowers were the size of a penny, while Mar and Brillant were much larger under the same conditions. Even with my intense system of culture, I cannot get Firefly beyond an inch!

Her Majesty is grandiora, but never attains large size as compared with the introductions of the last several years, and she does not have a better shade of rose and you put in the first two shades in Royal Rose, and why take two shades of rose to put in the first two? If it is a shade of dark pink that is wanted, you have in Prim Donna, and a better one in America Seedlings, which contain several shades of pink.

As to Venus, its shade has been unique until the past season, when the pure apple-blossom America Seedling was first classed it, the latter being a giant flower, with the purest imaginable shadings, and it should be distinguished from Venus and separable. However, when included Venus in my protest, I was under the impression that the shade of the former for form and quality, as Venus is old type, and very small. Then the question of color remains, leaving that of form. Should a fine old colored type, notched, and short-stemmed variety be given place to a new flower of the same color and shade, but which is high-brid, large, and grandiora type?

My opponents either accident or design, in that it can almost be produced at will by hybridizing, but form, and the same expression of color, and shade, and should have the more value on that account.

As to Blanche Ferry, I disagree with the committee most emphatically. It is the time to form the opinion that you need more than one quality to recommend it—carelessness—and next season it will lose

that one, as a new long-tested sweet pea type. We have by no means the earliest firm alongside of it, two the Blanche Ferry, and the former. It is not a color, and not at all floriferous, and has a place only in the garden of the specialist, and for the collector and the aficionado. Its improved prototype, Little Dorrit, bears the same relation to it that the Scotch-broom bears to the Scotch mistle, being of giant size, grandiora, and of pure soft shading, and coming in from the north, where it has been. I have never seen a stand of Blanche Ferry which had 10 per cent. true—one-fifth of those I have seen of Little Dorrit. Out of an ounce of seed purchased from the product of this variety, I have sown 1200, and obtained 1000 pure white wings, which the typical Blanche Ferry should have. My Little Dorrit has been sown in bloom all the season, and this is the first complaint as to its non-floriferousness, that I have had. Neither have I seen a stand of Gray Friar being placed in the "break" list. Put a bunch of it, well grown, and take out the seed alongside any one of either of the sets selected by the committee, except the one I have here, and you will save every-day growers for whom the committee selected, to pass on them, and to one the Gray Friar will be selected as first choice.

I desire to thank the committee for their courtesy in answering my communication, and hope when they are called upon to make a similar selection next year, I will not fail to place before them the modern sweet peas of large size, and grandiora type, to be present, by counsel, to press their claims.

SAM A. HAMILTON.

## The Government Greenhouses.

Editor Florists' Exchange.

Your Washington correspondent, following the lead of Col. Bingham, Commissioner of the Public Buildings and Grounds, misrepresents the purposes of the Washington florists in their effort to secure fair play at the hands of, particularly, the said Col. Bingham.

The florists have no desire to curtail in the slightest the privileges of the President in "distributing his possessions" in the conservatories set aside for his use and pleasure, but they want it understood that they are violently opposed to the distribution of flowers, etc., from the propagating gardens, which have no sort of connection with the White House, excepting that the official head happens to control both, as Commissioner of Public Grounds.

The two establishments are intended to serve a distinct purpose; one is for the use of the President and the decoration of the White House and grounds, the other is for the plants for the decoration of the more public reservations. They are separate and distinct, having sub-heads; one head governs the other, public garden; separate corporate men and separate accounts, and in reality they don't mix even when decorating the White House. There is an explanation of the grounds of the President's curtailed, but we do mean to try to stop the very free distribution of flowers from the conservatories and grounds, which tries to hide behind an imaginary President's orders. It is contrary to the wishes of the commissioner's compliments, and any statement or insinuation to the contrary is wholly untrue. We are not in a hurry, we are afraid of, although Mr. Oliver claims we are "green with envy," etc. On this point, Col. Oliver, in his published interview Col. Bingham says:

We do not raise the kind of flowers that are used in the conservatories for decorative purposes; we do not grow roses of any great extent, nor are our

roses of such unusual beauty as to be in great demand outside of the conservatory, they "take the cake" with chrysanthemums. And why should they not be in great demand elsewhere? What is their back? Mr. Charles F. Hale grew the finest specimens of chrysanthemums ever grown in America, but because he could not afford to continue, as the government products were cheaper and more plentiful, he was obliged to demand for their products that are not so good, we all know how the price advanced. He has been quoted, or has almost any article in the estimation of a vast number of people. The bargain was not made on a large scale, it was much more so it is the case when "the whiskey cost nothing."

Each dollar spent by the office of public buildings and grounds for the production of roses (three or four houses), carnations (three or four houses), chrysanthemums grown in large pots for cutting, thousands upon thousands, is not a trifle of any sort, azaleas, poinsettias, etc., etc., at the propagating gardens, is diverted from its legitimate purposes, and, consequently, is misapplied greatly to our detriment.

We go farther than Mr. Oliver and state emphatically that so far as the amount appropriated for the conservatories there is not one dollar appropriated for the production of cut flowers, so far as this particular plant is concerned. I am glad Mr. Oliver published the extract from the law, and will add that we are perfectly well satisfied by his interpretation of that very clause. If by way, this amendment was secured by just such an amount of money, the heads of the lists kept quiet they will, many of them, soon be looking for a soft government position, without any idea of any satisfaction, to the fact that "Congress approves of our administration as well as our administration," in our last session it made an appropriation giving us an additional greenhouse.

Why do not many of our Congressmen have never stopped to investigate from what source these flowers are produced? Why do not some of our Congressmen have had the temerity to vote money for another greenhouse to benefit for supplying the conservatories with flowers, in this long-established custom?

And others, may have undermined the natural inclination of some who have come to the conclusion that whatever can be had at government expense, is acceptable and desirable. Why are not the quartermaster of the United States army fed and clothed these people and take in their stride, while they are to be paid as much right to do this as they have to distribute flowers?

If Professor Goway could extend his field of usefulness by "letting loose his bugs and germ diseases" in several more underground greenhouses, he would put the florists of the District of Columbia under additional obligations to him.

As a matter of simple justice, it is said that probably the Department of Agriculture, by its conservatories and of late years in the matter of distributing decorative plants and flowers than give the conservatories the credit and have good reason to believe, that this conservative policy will be continued; and if there were sufficient funds available where the Commissioner of Public Buildings and Grounds has directly interfered with the purchase of thousands of plants by supplying gratis to individuals, churches, etc., that which would otherwise be purchased from the conservatories, why should we not indulge in a display of "ill feeling" against the system? It would like to see what the donor of the U. S. Philadelphia, or any other city, would do if the Superintendent of Public Buildings and Grounds should attempt to distribute regularly, flowers to members of the Legislature and people of the State by the office in charge. Herein assertions is the head and front of his office.

In connection I will remind those who are responsible for, or defend this unreasoning and wasteful method of distributing the fruits of the old-fable of the boys and the frog, and in for the loss of our life it is death to us." J. R. FREEMAN.

## Fire Insurance Committee.

The fire insurance committee appointed at the recent convention at Providence, Rhode Island, are commencing their work. The florists of America who desire fire insurance to signify their approval of a national fire insurance organization, and who insure they would expect to take if the organization were effected, are being asked to indicate, by filling out and returning to the committee, what amount of insurance would be taken by many firms, to the aggregating of the sum over a quarter million dollars to date.

The committee are very much discouraged at such an outlook, as we had every reason to believe that we would have a million dollars of applications in less than two weeks from the time we began asking for the support of those who really wanted a fire insurance concern. It is true that all who have written have been thoroughly enthusiastic upon the subject, and a great many have urged us to go on, saying they would make application as soon as the organization was effected; but we believe that there are hundreds of florists who are anxious to have this association organized but who think it is not necessary for them to do so. For this reason, the advisory committee will carry in this regard, that they positively cannot go ahead until they have received a million dollars worth of insurance pledged. We cannot organize until such an amount is organized, and it is the duty of every florist who wishes this association to be organized among the florists of this time we began asking him to support it if it is organized. Individually, the committee are not particular to the amount of insurance, except for the general good of the trade, for it means a great deal of work and hard work, but we believe it can be fairly on its feet and in working order.

If we are to organize, we should do so on a national basis. We would like the minds of those who are interested, and we trust that to one in sympathy with this enterprise. We are offering a dollar of support to one of the undersigned committee by return mail. Do not delay, as the time is fast passing. Write to the member of the committee who is nearest you, or to the following: H. M. SAWYER, 1620 Olive street, St. Louis, Mo.; J. W. VESLEY, Fort Wayne, Ind.; J. G. ESLEY, Saddle River, N. J.; SCHWERTZ, Annapolis, Md.; L. M. PATTEN, Essexbury Centre, Mass.

## Chrysanthemum Society of America.

The committees judging new seedlings will be in session October 2, 5, 10, 15, and 20; November 6, 13, 20, and 27. Exhibitors should make their entries for which a fee of \$2 is charged for each variety exhibited to the secretary not later than Tuesday of the week the exhibition opens. For full particulars of the exhibition, write to the following addresses, express prepaid, will be completed, October 21 at New York:

BOSTON—A. H. FEWKES, Horticultural Hall.  
 CHICAGO—Eugene Baildousse, care of Dr. F. M. Hexamer, Madison Square Garden.  
 NEW YORK—Edwin Lonsdale, 1514 Chestnut street.  
 PHOENIX—B. W. Wintersteater, corner Fifth and Broadway.  
 PITTSBURGH—E. G. RICHARDS.  
 CHICAGO—W. N. RIDD, room 202, 185 Dearborn street.

SILVER CUP.

The Chrysanthemum Society's Silver Cup will be awarded to the grower who has secured the best six varieties, six blooms each (36 blooms). The first cup will be competed for on the 21st of August. Competitors should forward their blooms to Dr. F. M. Hexamer, Madison Square Garden, New York, express prepaid. Competition is open to all. No entry fee. Those desiring further particulars, please apply to Dr. F. M. Hexamer, Secretary, Adriaan, Mich.

### For the Busy Man.

Read the chroular letter of the Fire Insurance Committee on page 889.

Our next edition will be published next week. Look out for it; it will be a bumper.

Another wholesale cut flower commission house has been started in Philadelphia.

A list of the dates when the committee of the Chrysanthemum Society of America meet is given on page 882.

The Pfitzer & Mandl sale occurs next week. Plans in search of the class of goods to be sold should make it a point to attend.

Plants for Name.—(Hastingsck)—1. *Lathyrus pycnostachya* (Blackening Star).  
2. *Androsanthus* (Spring Star).  
3. *Geranium (Lady's Tresses)*. Please send fresh specimens of Nos. 2, 4, and 6, if possible.

### Special Edition Next Week.

Next week we shall publish "an edition that will prove of incalculable value to the majority of growers throughout the country."

The subjects to be discussed in this edition are the most common diseases of the rose, carnation, chrysanthemum, geranium and carnation. The illustrations of these diseases will be given in simple language by Professor Halsted, of New Jersey Agricultural Experiment Station; Professor Arthur, of Purdue University; Mr. Albert F. Woods, of the Division of Horticulture, U. S. Department of Agriculture, Washington, and others. Several fibrations of the results of a special investigation are provided, the object being to furnish to the general grower a handy means of identification of the various pests. We also will publish remedies that have proven successful in preventing, checking, and eradicating these diseases.

In addition to the foregoing, the issue will be illustrated by reproductions of several spots of a more or less humorous nature, taken from the late convention at Providence, showing excursions at the traps, etc., taken in the convention hall, etc.

There will also be given the opinions of several experts on that all-important subject, the manuring or feeding of roses. It will also contain a full and complete recapitulation of a description of the process of fumigating with hydrocyanic acid gas, and will be accompanied by suitable illustrations.

Our readers will therefore see that a great deal of money has been spent for them; and they, in turn, could confer no greater benefit on their fellow-craftsmen than to inform all such of the good things that the next week's issue will contain, and to encourage them to subscribe, or who may become at once, subscribers to the EXCHANGE.

### Fire Insurance.

From a communication received from the Fire Insurance Committee appointed at the Providence convention of the S. A. F. A. O. H., which we print elsewhere, it appears that the reports that were made with that hearty response to their appeal that was anticipated. Not a quarter of the amount of money which the committee to go ahead has been pledged.

It takes a million dollars to set this thing going and it will cost a million more, if not more, to get it done.

We are somewhat astonished at this result for the time being. We are, however, inclined to the belief that the matter has not received the attention to which its significance and its entitles, from those most vitally interested—and that includes every one owning or renting a house. We are, however, inclined to the belief that the matter has not received the attention to which its significance and its entitles, from those most vitally interested—and that includes every one owning or renting a house.

Half-stories and fire are two of the most destructive agencies with which the florist has to contend. He, therefore, needs means to secure themselves against the ravages of both should be encouraged and taken advantage of. The history of the Hall Association is a brilliant example of the triumph of optimism, keen insight and hard work over pessimism, narrow mindedness, and apathy.

Who, that has suffered from the ruthless hand of the fire, has not heard and who takes refuge under the compensating wings of the Association, has not blessed the day that such an organization was established and perfected? There are those who are inclined to the belief of success attended the institution and working of a fire insurance company. For a number of years the history of the latter, in that while we cannot control the elements, prevention and care of fire is a matter of our own choice. This is a contingency for which one would hardly look in a body of business men, and so a great many of our florists of America. Fear of incendiarism might deter many from joining; but under the leadership of the Association, we found the admission of a concern or firm

into the association, this fear is groundless, and the probabilities of self-inflicted incendiarism would not be one in five hundred.

It should be borne in mind, too, that this Fire Insurance Committee is not working for the benefit of any one particular matter; but for the general good. That being so, and if the trade desires such a benefit, it is its duty to contribute. The committee is entitled to your support. Let them have it.

### Reflections on Current Topics.

The trading stamp scheme has reached the florists' stores in provincial towns. The florists' stores are in a very bad boom business and please customers, being like a gigantic and irresistible force. The florists' stores are in a very bad boom business and please customers, being like a gigantic and irresistible force. The florists' stores are in a very bad boom business and please customers, being like a gigantic and irresistible force. The florists' stores are in a very bad boom business and please customers, being like a gigantic and irresistible force.

The other day I came across the under-noted tribute to the business ability of one of our leading seedsmen, who strikes me as well worth repeating here: Charles Austin Bates, an authority on direct sowing, in a recent issue of *Printers Ink*. "Hundreds of men have paid me for geraniums and carnations," he said, "but one was a dissatisfied, and that one was Mr. A. B. Surpe, the seedman. He was unhappy, but I did not hear of any serious fault in his advertising. I had a lot of trouble in his advertisement. It is something that is something to know your work is above criticism."

Advertising is a necessary annual expenditure as the payment of taxes or rent. Some small seedsmen argue that the florists' stores are in a very bad boom business and please customers, being like a gigantic and irresistible force.

"Now that some papers and magazines do not give credit for advertising, it is fraudulent or grossly exaggerated character, the confidence of readers in such advertising is being lost. It is time to realize that a good thing is worth advertising, and thus, making more sales, instead of increasing advertising actuals, reduces the cost of the goods. It is appropriate to quote the well-considered advice of the *Printers Ink* Bulletin: 'Franklin—My son, deal with men who advertise.' Verily, Surpe."

The florists' stores are in a very bad boom business and please customers, being like a gigantic and irresistible force. The florists' stores are in a very bad boom business and please customers, being like a gigantic and irresistible force. The florists' stores are in a very bad boom business and please customers, being like a gigantic and irresistible force.

On October 21, when the competition for the Society's cup will be sure to draw a crowd of chrysanthemum enthusiasts. The quality of the chrysanthemum exhibition of the Society is of itself insufficient to beget a crowd of enthusiasts. The quality of the chrysanthemum exhibition of the Society is of itself insufficient to beget a crowd of enthusiasts. The quality of the chrysanthemum exhibition of the Society is of itself insufficient to beget a crowd of enthusiasts.

### New York.

At last New York will have another botanical garden, which it is hoped will be a great success. The quality of the chrysanthemum exhibition of the Society is of itself insufficient to beget a crowd of enthusiasts. The quality of the chrysanthemum exhibition of the Society is of itself insufficient to beget a crowd of enthusiasts.

### Wholesale Market.

Business Saturday and Monday was very good, but since then it has fallen to less than half the volume of the previous week. The quality of the chrysanthemum exhibition of the Society is of itself insufficient to beget a crowd of enthusiasts.

Carnations were in heavy demand at the end of the week, selling out at \$1.25 to \$1.50 per 100. Since then inferior grades have accumulated, and the price has fallen to \$1.00 per 100. The quality of the chrysanthemum exhibition of the Society is of itself insufficient to beget a crowd of enthusiasts.

Cattleyas are selling fairly well, considering the number now arriving; first grade \$1.00 per 100, second grade 75c per 100, and damaged flowers, 20c to 30c; that is if they are fit to be used.

Victors are being asked for by the trade, but are yet very irregular in supply; the quality is also poor. The best variety realizes 50c, but more are sold at between 50c and 65c per 100. Dahlias are in better demand, and realize 1.00 per 100, and three buds, 25c.

Chrysanthemums, *Marysue* de Montaigne, *Bergmann*, *Lady Fitzgibbon* and *Gasteller* are quite numerous. The first named brings 1.00 per 100, the second 75c per 100, the third 50c, and the fourth 25c per 100. The quality of the chrysanthemum exhibition of the Society is of itself insufficient to beget a crowd of enthusiasts.

### The American Institute Show.

Next week's features of American Institute Fair at Madison square will be foliage and ornamental plants, orchids, hot-house grapes, fruit of various kinds, and a number of other things. The quality of the chrysanthemum exhibition of the Society is of itself insufficient to beget a crowd of enthusiasts.

### Visitors.

Mr. and Mrs. Halliday, Baltimore, Md.; J. B. Tully, Binghamton, N. Y., who was seeing his daughter off to Europe, and a number of other visitors visited the Dahlia Show. He is now studying that flower, claiming that there is an era of popularity in store for it.

R. M. Gardner & Co., horticultural advertiser, Fair at Madison square, has given up business at that stand. Cleary & Co., will have a large consignment of Dutch and English flowers, St. Albans, England, and will sell on October 15. The catalogue to hand enclosed in this issue, lists a number of established plants.

# TEN DOLLAR GOLD PIECE

Growers, Dealers and Business Men Generally

ARE BENEVOLENTLY REMINDED THAT OUR

## SPECIAL FALL TRADE EDITION

# WILL BE ISSUED OCTOBER 9.

And that, if they wish to take advantage of the last chance before time to get into this Special Edition, they must send in their copy AT ONCE, or telegraph us the amount of space they wish us to hold.

Do not let anything stand between you and the trade you seek. YOURS IS THE OPPORTUNITY NOW. Grasp it!

**10 COPIES** of the Special will be mailed out to live members of the Florist, Seed and Nursery Trades. *There will be no advance over the regular prices for advertising space.*

For the good things in store, to be carried in the reading matter portion of this great edition, see editorial columns.

THE FLORISTS' EXCHANGE, P. O. Box 1697, New York.

# Point System Competition.

A TEN DOLLAR GOLD PIECE  
...FOR THE BEST ESSAY...  
Extension of Allotment of Time.

THE "POINT SYSTEM" of judging exhibits has its adherents and its opponents, some of the latter having gone on record as advocating its abolition. But by the majority it is considered the best system of judging yet evolved, although by no means perfect.

In order to test whether it is not possible to evolve a complete practical system of judging by points, a system that would produce the same results under varying conditions of locality and judges, THE FLORISTS' EXCHANGE has decided to offer a Ten Dollar Gold Piece for the best exposition of the point system and its applicability to our exhibits, and especially solicits the views of those who have the subject most at heart—exhibitors and judges.

Coming at an opportune time, immediately preceding the Show season, we have no doubt the subject will be uppermost in the minds of many, and we look for a host of competitors.

Contestants are required to first state their proposition for the improvement of the system, then to demonstrate by succinct and clear analysis its practical working.

All manuscript should be clearly written, on one side of the paper only, and must reach us on or before Wednesday, October 6th, and articles should not exceed 1000 words. Address all essays to

POINTS, Florists' Exchange Office, Box 1697, New York.

**CALIFORNIA VIOLETS**

BOOKS RECEIVED.

MISSOURI BOTANICAL GARDEN, EIGHTH REPORT, 1897.—This report, like its predecessors, is replete with interesting information relative to the Botanical Garden, and the work has continued on there. In addition to Dr. Trelease's annual report, the book contains the following scientific papers: "The Mosses of the Azores," by J. Cardot; "The Mosses of Madeira," by the same author, with eleven plates illustrating the mosses; "The Mosses of the Azores," by Dr. Trelease's botanical observations on the Azores, together with a catalogue of their plants, divided into their several groups, and also an index to the genera found there, and fifty-five illustrative plates. There are appended to the report lists of books and papers published from the Garden or by its employees, and those published by instructors in the Henry Shaw School of Botany. These demonstrate the good work that is being accomplished by this important institution.

Trade Still Improving. Business is still looking up and stock improving. Chrysanthemums and Holly of the valley are with us in more Beauty is scarce. Bride and Bridemaid are in good supply. Carnations are scarce, and very early are a glut.

The First Chrysanthemum. A white chrysanthemum, Lady Fitzwygram, was received by writer from E. W. Hill of September 29th, six weeks in advance of 1896. Bloom good, stem very fair. Sold at 12 1/2c. each.

A Trip to Richmond, Ind. Wednesday morning, September 22, William Murphy, George N. Bartlett, and the writer paid a visit to Richmond, Ind. After reaching Hamilton, O., we found we had a couple of hours to spare, and therefore paid a visit to the greenhouses of Theodore Bock. He has one house in which he is testing many of the new varieties of chrysanthemums. Some are all right, others are very disappointing. Western King, as seen here, is one of the disappointments; although another "one-trial" may bring it up to perfection. Mr. Bock believes in testing all new varieties in pots as well as in the garden, and he is anxious to see the plants they have very little favor with him. Fred. Walz is a grand variety for pot cuttings, while its original color is pink, yet you can bring it pure white by setting the plants in a rose temperature.

Mr. Bock is also growing Anemone plumosa minus. This he raises in six inch pots for sprays and he sells large quantities of it. G. R. Gause & Co., at Richmond, are busy with others and other work; one of the special features here is Rex begonia.

E. G. Hill & Co.'s we found Lady Fitzwygram and Bergmann chrysanthemums ready for market, which is the earliest we have seen here. On the 10th and to-day, the 23d, the writer received and sold 100 bouquets to start chrysanthemum. We noticed several other houses filled with all the new varieties of merit. Some of the Japanese sorts look very promising, but the American varieties are in the lead so far as foliage goes. Carnations are benched and looking well. Some of the best we saw here, we have seen, they are clean and free from disease. I noticed one bench of seedlings which I have not so far seen here. A whole lot of Flora Hill and other varieties are yet in the field. Tulips seem to be quite an addition here, also three houses are devoted to arceas, kentias, and latanias. This firm is putting in a new hot-water boiler and getting ready for Fall and Winter business. E. G. GILLET.

Knoxville, Tenn. The Weather. We have had a long spell of quite hot weather; in fact, it has been a return of heat and rain, not so bad as we know. While I write (Sept. 26th) the glass registers 90 in the shade. Some nights have been in the 80's, but the weather is not so hot as pointed. Frosts are not looked for till about October 15. Grasses are coming very good. The yellow-fever scare does not affect us in the least. Outdoor carnations are blooming nicely. Scott and Kellogg are especially so. As soon as cooler weather sets in they will be a grand lot.

Street Fair and Carnival. This event which will be held October 12 to 16, promises to be quite a bonanza for the florists, as there are to be two flower parades, and large prizes are offered for the best decorated four-wheel carriage, surrey, pony cart, buggy, bicycle, cart, rickshaw, by goats, and cart drawn by dogs. Much interest is being manifested in this affair, and it is expected to have a heavy outpour of flowers and other things necessary for making a good show.

Florist-Crouch contemplates having a handsome float in the merchants' parade. Chrysanthemum Show. Owing to the street carnival, the Chrysanthemum Society is undecided about the holding of a show this year, as they decide not to hold one, the florists will have one of their own. C. W. Crouch has one house 100x18 filled with a fine lot of pot plants, many four feet through and well set. He has one house, 100x24, planted in benches, which promises to give some magnificent flowers. Two houses are ready for glazing and Mr. Crouch contemplates adding two more to his show place. This will give him one of the most elegant plants.

Hot-Bed Sash Tenons white-leaded. Corners secured with iron dowel pins. Every detail of construction perfect. Made of Clear Cypress Lumber. Quick Shipments. Is in good order and ready for service at once.

**HENRY A. DREER, 714 Chestnut PHILA. PA.**  
Street.

When Writing Mention Florists' Exchange

**Flabush, N. Y.**

Clemens Wabber has suffered a sad bereavement in the death of his eldest son, Clemens, which occurred on Monday last, the funeral took place Wednesday. He was attended by a large number of friends in the craft, whose sympathy for the bereaved was plainly witnessed. He had tested not alone by their presence, but also the large number of floral pieces sent, for all of which he has attractive friends, his business thus.

**Pittsburgh.**

Good Times Have Not Materialized. The good times that the newspapers are telling us about daily have not yet been felt. It is doubtful whether the coming Winter will be any better than last. There is always the old doing in the winter. The Jewish New Year caused a good demand for flowers. Stock of good flowers is well secured, roses and carnations. Roses are quoted at from \$4 to \$6; the best ones lately are from Old City; the variety being Meteor. Beauty set at \$3 per dozen, costing from \$10 to \$15 per 100. Carnations go at \$1.50, but the supply is not so large. Chrysanthemums are in, but so far no good ones have been seen. Asters are poor and scarce.

**Jettins.**

T. P. Langhans & Co. suffered a small loss by fire breaking out in the cellar in which they store their paper boxes, designs, etc.

The last meeting of the Club (a social one) was held on the first of August. John Rader, who returned from Europe a few days ago, gave a lengthy talk about his trip through Holland, Belgium, France, Germany, and England. He visited most of the largest places and was well acquainted with some of them, and in the manner that some stock was grown, particularly in France, where they have the finest chrysanthemums for Christmas holidays, where we are entitled to get them in good form for Easter. Mr. Rader is a good florist, and his talk was most interesting and highly appreciated.

The following firms have been awarded contracts for trees and shrubbery for Pittsburgh and P. O. West: J. H. G. Philadelphia; Andorra Nurseries, Philadelphia; and Ellwanger & Barry, Rochester, N. Y.

E. C. REINEMAN.

**Boston.**

**Market News.**  
Trade is quietly but surely improving. The cut flower business does not respond to expectations, but the plants trade is reported good in all sections of the city. Few poor chrysanthemums have made their appearance, but there is still demand for them. Goods to expect this time are: carnations, varieties prices ranging from \$1 to \$5 per hundred, and chrysanthemums, some of which are selling at satisfactory returns. There is a great call for violets, and the few single or double ones that come in are eagerly taken up.

**The News.**  
One of the startling events of the week in political circles was the rejection by the Board of Aldermen of Mayor Quincy's nominee for Park Commissioner, John M. Creed, was voted down by the Republicans with the aid of Alderman Dean, who had a favorite from South Boston, Charles M. May, who had one time practically agreed to appoint.

A rumor is current of the largest-sized greenhouse property which has occurred in this vicinity for many years. Ex-Alderman Whittier's estate, comprising some 150,000 square feet of ground, and a large range of glass has been bought by James Crowley, of Betham, who is a well known florist in all sections of the city. It is said the property changed hands for about one hundred and fifty thousand dollars. The late manager of the Boston Garden and Florists' Club at Horticultural Park, H. H. Bond, will give a history of Horticultural Journalism.

John H. Bond returned yesterday from the city. Mr. Doogie has some 200 seedling chrysanthemums, many of which are worthy of cultivation. It is rather remarkable that there were but a few chrysanthemums in the city. The New England Florist has given up its office in the Music Hall Building.

**Cleveland.**

**Trade Notes.**  
The slight improvement in business is noted since last writing. Store trade is reported fair, with prospects of still greater activity.

Stock in some lines continues in abundance, and prices remain about the same as last week. Home grown roses are quite scarce at present, but considerable good stock is being received from the West, and this of course relieves the scarcity here to a great extent. Retail prices range from 10c to 15c per dozen for per dozen for best. The wholesale price, as near as can be ascertained, is \$1.50 to \$3 per 100. Carnations are quite scarce as well, and sell at \$6 to \$10 per 100 at wholesale. Stock not of best quality. Asters are retailing 20c for 100, per dozen, and it is expected by many dealers that this price will be advanced very shortly. Prices received for the week were: \$6c to \$1 per 100. Asters are nearly gone, a few white still remain, and these are being held in the hope of a demand for them at retail by the dozen being very high. Stock of chrysanthemums will hold a place of prominence in the store windows, but stock is being poor. Prices remain unchanged.

**Chrysanthemums.**  
The first chrysanthemums of the season were displayed in the window of W. M. Gasser, retailing 20c for 100, per dozen, and made a very creditable show, which attracted the attention of passers-by. The first blooms being cut on the 24th of August. The variety was Marquis de Montmartre.

**Florists' Club Meeting.**

The regular meeting of the club was held on Tuesday evening last, and was well attended. The following officers for the ensuing year resulted as follows: President, A. Graham, re-elected; Treasurer, T. Hart, re-elected; Secretary, G. T. Titton, re-elected; and Secretary, S. N. Pentecost. The following were located on Detroit street, W. S., near corner of Pearl street. It was found necessary to hold a meeting on Wednesday and fourth Tuesdays of each month to second and fourth Mondays, and accordingly the next meeting will be held on immediate action taken. The next reg.

lar meeting will be held in the new hall on Monday evening, October 11.

**Bowling Club.**

A partial organization of the Bowling Club was effected at the meeting Tuesday evening. About forty members signified their intention to join the club, and it is expected that a strong organization will result. The first meeting will be held on Monday evening, October 4, and on the first and third Monday evening of each month thereafter.

**Notes.**

Wm. Boek, who for several years has been connected with A. M. Gasser, will leave this city next week for Kansas City, Mo., where he will open up a flower store about October 15.

W. R. Roach, representing J. B. Rice & Co., Cambridge, N. Y., was a visitor this week.

**St. Louis.**

U. S. T.

**Cool Weather Help Trade.**

Cooler weather is producing better flowers and necessitating an increase in price because of increased demand.

**Notices.**

The Krebs Floral Co. has opened this week. Their advent into the business has been a success. Their trade by thorough, judicious advertising, and everything appears to point to a successful future.

The Osterberg Bros. have been kept very busy with large funeral orders this week. In fact, almost everyone has had a fair amount of funeral work.

Harry Bunyard, representing Pitcher & Co., has spent a day or two in the city last week.

Jos. Engelgau at Grand and Lafayette avenues has been quite ill for some time, but is reported on the road to recovery.

Charles Terrell, 1308 Olive street, has finished putting in a few very fine fixtures and added a telephone to her conveniences.

**Trenton, N. J.**

The Inter-State Fair, held this week, proved to be a greater success than ever in all respects. The horticultural department was well represented, and in many instances of a high quality. The following are some of the exhibits: Palms, gladioli, and dahlias. G. Wainwright took first prize for collection of ferns and greenhouse plants, also collections of roses and zonal pelargoniums. In the floral pieces the competition was even more spirited than last year, from the fact that the old-time duel between the two cities was interrupted by the appearance of a third party this year—the Mercer Floral Co.—and the Floral Association of Trenton, some excellent work. For a laicy flora design Ribsam & Sons were first with a charming and original design, but titled "Dollar Wheel," which was represented by a large ship leaving America and sailing for collection of stars and various countries being represented by flag designs in their respective colors on large floral designs. The first prize was won by dahlias, carnations, geranium, etc., were used for the floral effects. G. Wainwright first second with a large column made up with dahlias in different colors, and for the main part showing excellent work. The Floral Association of Trenton awarded a special first for a cornucopia of valley, etc., a well-executed piece that was a credit to the exhibitor. A named company was also first for a floral basket. The Wainwrights were awarded for the following: funeral designs—wreath, altar, and cross.

**Toronto.**

There should have been a meeting of the association last Tuesday, but through the illness of our secretary, Mr. Carter, the meeting was postponed until the time came there was no quorum.

The show has improved somewhat, but the stock offered is not generally first class. We have had one sharp frost which has done some damage to the stock, but in sheltered places, even colous is still all right.

The Hort. of Philadelphia was in town last week.

THOS. MANTON.

When Writing Mention Florists' Exchange

## The Right Cypress for Greenhouse Material.

Have you heard of Cypress Greenhouse Material that has not been satisfactory? If you have it does not follow that Cypress is not the best lumber to use. There is White Cypress, Yellow Cypress and Red Cypress; there is Cypress that grows on the high lands and Cypress that grows in the swamps.

All of these different kinds are not suitable for greenhouse purposes. Do you know which kind is best and do you know that kind when you see it? If not you would better buy from those that do know and will deliver exactly what they sell. We introduced Cypress for greenhouse construction and pushed it to the front. We know all about it. For fifteen years we have made a specialty of furnishing it, and during this time we have built up a reputation that we cannot afford to jeopardize. We send out the best only.

## MASTICA

FOR GLAZING GREENHOUSES. SUPERIOR TO PUTTY IN EVERY WAY.  
It is not hardened by the extreme heat or cold that a greenhouse is constantly subjected to both inside and out. Mastica is adhesive and remains permanently elastic so that it is not forced out of place by expansion and contraction of the wood. It does not crack, it does not peel, it does not need retouching, thus saving time and expense. With Mastica can "bed" or "set" on the outside, but with a machine only.  
Mastics and Mastico Glazing Machine were given

HIGHEST AWARD OF SOCIETY OF AMERICAN FLORISTS AT PITTSBURGH, 1895.  
Put up in gallons, \$1.00. Half gallons, 60 cts. Quarter gallons, 35 cts.  
Mastical Glazing Machines, \$1.00 each.  
Send for full descriptive circular and testimonials. Agents in all the principal cities.

F. O. PIERCE CO., Sole Manufacturers, 170 Fulton St., New York.

When Writing Mention Florists' Exchange

## Washington.

Market News.  
Trade is reported to be about as dull as it usually is in midsummer. Flowers are plentiful, but, so far, there is little demand for them.  
Arenas Town.

J. H. Small, Jr., has been appointed part of the Judges of the Horticultural Exposition; the other judges are P. J. Berckmans of Atlanta, Ga., and J. H. Small, Jr. of the Department of Parks, Pittsburgh. Mr. Gardner C. Hubbard of this city is chairman of the jury of awards.  
The first session of the Harvard Botanic Garden, took in the horticultural establishments of this city during the early part of last week.

There is some talk of organizing a florists' club in this city, the old organization was known as the National Gardeners' Club and the Florists' Club of Washington having both gone to sleep several years ago. The former was organized during the year of the visit to this city of the S. A. F. The Florists' Club had its beginning several years before that period.

John D. Davidson has removed from 1032 1/2 Filbert Street to 1823 Filbert Street. Smith & Putnam of 1710 Pennsylvania avenue have retired from business; their store has been leased for a term of years by Davidson & Walker. Mr. Louie has opened a branch store at 1032 1/2 Connecticut avenue.

C. Strauss & Co. have built a good-sized palm house as an addition to their already extensive range. The house is intended for palms from temperate regions. It is filled at present with a batch of choice plants in six and eight-inch pots. Chrysanthemums and flowers which have been in bloom with Strauss & Co. for over a week; they have brought good prices.

Violets, scarcely recognizable as that popular flower, made their first appearance one week ago; they are very small and have very little odor to them.

W. R. Smith goes to Hagerstown to act as judge at the State Fair, October 10-12. J. H. Bingham, the officer of the War Department who is in charge of public buildings and grounds, was interviewed by the subject of the distribution of the surplus flowers grown for the White House. The general says that while he is perfectly willing to discontinue the custom of sending out flowers whenever he is ordered to do so by a superior officer, yet the matter has been exaggerated, claiming that more flowers are given to the hospitals and to societies of the poor than to the sick, than to the private parties. Col. Bingham expressed a wish to see some of the florists so that he could convince them that he was not a competitor in their business.

In the annual estimates submitted to the District Commissioners by the Superintendent of Charities, published this week, there is an item of \$1,000 for the erection of new greenhouses for the industrial home school.

The new rose, Mrs. Garrett, is showing up in fine form. The good is being that is the only objection the critics have to it so far. Miss Abt Chatterney, of which there are many plants, has benched this season, promises to be an abundant cropper. The buds so far as I have seen are small, and I should judge that this rose can be sold at as low a price as any other variety.

W. S. Clark has a house of Souv. du President Carnot in solid beds; the plants seemed less likely to throw their flowers all at one time by this method.

G. W. OLIVER.

Elmira, N. Y.  
Grove P. Rawson has been over-whelmed with orders for violets which he has been compelled to refuse, stock running out very early this season. His plants show the results of careful treatment. Chrysanthemums and roses are superior. There will come several breakers with the queen of autumn here this season.  
W. M.

Slingerlands, N. Y.  
Golding Bros. were one of my list who lost heavily on violets this Summer owing to heavy rains.

By careful forethought several thousands were carried over in pots, so there was nothing for or over selling, but a shortage in sales on plants. There seems to be a shortage in Marie Louise, judging by the reports I have received.  
W. M.

**Chicago.**  
 State of Trade.  
 Regulation Fall weather—warm days  
 and cool nights—prevailed the past  
 week, favorable to a better class of flow-  
 ers, and we are glad to say some ad-  
 vance in prices. Good long-stemmed tea-  
 roses have now reached the market,  
 among which is included the President Carnot  
 which is surely gaining in favor in this  
 market. However, a few more lots of  
 short-stemmed stock yet that goes at  
 \$2 and under, and this condition will  
 be maintained some weeks longer. The  
 plantations stock come in. As far as our ob-  
 servation goes, the plants, as a rule, are  
 very good, and we are glad to say some  
 change times. American Beauty are  
 coming better, too, the best selling at \$12  
 to 16 per 100. The carnations are too  
 many at these prices, the principal cuts  
 being yet short and medium.  
 Carnations have advanced to \$1 for  
 standards. Field-grown flowers came in  
 the latter part of the week in consid-  
 erable quantity, some fair ones going  
 at 75c to \$1, white taking the lead in price.  
 Asters are still coming in and seen to  
 sell at \$2 to \$3 per 100 such as they are.  
 The supply of auratum lilies is dwind-  
 ling, but yet sell at 75c a dozen.  
 Stocks in demand are the very plain  
 white, selling at \$10; asparagus gives  
 50c to 75c per string.  
 Allium does not rise above 50c a  
 100. There are big sales for common  
 ferns, which are now the stand-by for  
 growers.

Thousands of yards of lycopodium  
 which was used in the decorations of the  
 Wittbold in the decorations of the Hub-  
 clothing store. Craig also used a lot  
 of cinnabar and asparagus for Stevens & Co.'s  
 silk store, besides a lot of roses.  
 Growers of Baywood.

The carnations at this place with  
 all the growers are late plants and do  
 not of any importance will materialize  
 for a long time yet. The still prairie soil  
 they hot fall in the ground. A very  
 able combination, coupled with late  
 housing of the plants. William Kirkland  
 has the same quality of chrysanthemums  
 as last year, 800 or so, some buds  
 of the early varieties were forming well  
 at writing, but they are not extra early.  
 In roses Meteor, Belle, and Bridemaid  
 are in the best condition. Meteor here  
 has a habit of "cabbaging" and failing  
 to open to some extent.

Albert Amberg has considerably ex-  
 tended and re-built his plant, which con-  
 tains now 25,000 feet of glass. Young  
 are doing well, but will not give  
 heavy crops for some time yet. Carnations  
 were not planted September 22.  
 In chrysanthemums the roots are in  
 better condition than last year at this  
 time, and will later give fine crops.  
 In France has been discarded. Chrysanthemums  
 are doing well, but none especially  
 early.

Stolbery Bros. at Argyle Park, where  
 their chrysanthemums as usual, of re-  
 markable growth. Elvins, from grow-  
 ing in the Vermont-Morel type pink to  
 Evangeline following. Glory of the Pacific  
 and Yellow Queen are showing color  
 and are expected to be 15th. The sport  
 from Mayflower, of last year, gives great  
 promise. There are many of the best  
 of the ones all showing equally well. In  
 carnations their new Argyle is almost ex-  
 clusively grown this year. The first  
 showing, August 14, has the crop in now  
 being good flowers for the season. A  
 house of roses consisting of Bride, Fried-  
 land, and Morgan is in good shape.

John Louis, Missouri, has the  
 earliest chrysanthemums we have seen  
 yet. A variety sent by mistake as M. de  
 St. Louis, the yellow-Morel type pink to  
 bud at opening, but changing to white,  
 is now six inches in diameter, and  
 as we thought it will be a good flower.  
 This one, Lady Fitzgibbon, and Yellow  
 Queen already showing a mass of  
 buds will be ready October 12. Mrs.  
 Johnson will be ready by the 15th. Alto-  
 gether the 7,000 here are in better condi-  
 tion than we have ever had before.  
 Some of the varieties are planted 4 1/2  
 inches, and two to three flowers in this  
 size. Mr. Lang works upon the prin-  
 ciple that if flowers do sell cheap, grown  
 as he grows them, they still pay.

The Flower Show.  
 An executive committee of the (Chi-  
 cago Horticultural Society met Septem-  
 ber 22 to make final arrangements for  
 the chrysanthemum show to be held  
 November 9 to 13. Willis N. Rudd is to  
 be manager. The place selected is the same  
 as last year, being both the First Regi-  
 ment armory and Battery D on the lake  
 front. The committee feels certain of a

fine show again. There will be a grand  
 international competition in chrysanthem-  
 um, 5,750 specimens to be shown to be  
 being offered for the best 120 blooms in 12  
 varieties from each state, territory, and  
 Canada providing competition under  
 each class being restricted to blooms  
 grown in the state, territory, or province  
 specified. The winning exhibit from each  
 state competition will afterwards com-  
 pete in the grand international competi-  
 tion, class 72 for a premium of \$75. Final  
 premium lists may be had of W. N. Rudd,  
 secretary, 185 Dearborn street.

**Jettings.**  
 Soft coal will cost the florists 25c  
 to 35c per ton more than last year.  
 George H. Scott opens up a new com-  
 munity of the winning exhibit from each  
 state competition will afterwards com-  
 pete in the grand international competi-  
 tion, class 72 for a premium of \$75. Final  
 premium lists may be had of W. N. Rudd,  
 secretary, 185 Dearborn street.

The next regular meeting of the Florists'  
 Club is October 14.

**Baltimore.**  
**The Market.**  
 Stock is quite scarce and roses and  
 carnations have cut a sudden jump in  
 price. Chrysanthemums have made their  
 appearance, bringing \$1.50 per dozen.  
 Bergman was the variety. Lot and  
 Weber & Sons were the first to consign  
 chrysanthemums here. John Cook is  
 sending in some Carnot.

**Bulls.**  
 One peculiar thing is noticeable this  
 season, viz., notwithstanding the fact  
 that bulls cost the same on the other  
 side this year as last, a duty being paid  
 of 25 per cent. on their cost, the retail  
 bulls catalogues are offering the bulls this  
 year at the same price as last. In look-  
 ing over the different lists I find that  
 some concern in Philadelphia and New  
 York, or some classes of stock, make no  
 difference in their prices by the dozen, be-  
 tween wholesale and retail; besides, by  
 the handling a profit of only 25 per cent. is  
 allowed, over their wholesale price. Tak-  
 ing into consideration the cost of trans-  
 portation, handling, etc., there is little left  
 for the florist who buys of these houses,  
 especially when his trade is cut down,  
 through the sending of extra large broad-  
 cast to the customers on whom the local  
 florist depends to sell his bulls.

From observations some of these large  
 houses are carrying their bull advertising  
 in the magazines this year, which may  
 account for prices being the same  
 this year as last, with no hand 25 per  
 cent. profit is not margin enough to  
 handle bulls, and all local dealers will  
 make a mistake if they attempt to do so.

**Jettings.**  
 Jack Frost is at our door. Cosmos  
 are blooming late this season.  
 Violets are looking fairly well.

# DREER'S Special Offer Of AZALEAS

Expected to arrive early in OCTOBER. . . .

The Quality this season will be fully equal to what we have sent out for several seasons past, which has given universal satisfaction, which is shown by the greatly increased number of orders already booked.

**The Tariff** which has been increased to 25 per cent. on this class of stock will not affect the price, as we have been successful in making such arrangements with our Belgian growers (who are among the most successful specialists in this class of plants), which enable us to sell at the same prices as last season.

**The Varieties** we offer are such only as are known to us as the best plants, well set with buds.

**Shipment** can be safely made by freight to any part of the country, if orders are placed at once.

10 to 12 inch crowns, bushy and well set.....	\$35.00 per 100

When Writing Mention Florists' Exchange

## Some Late Blooming Shrubs and Vines.

The shrubs and vines which naturally bloom after midsummer do not, as a rule, fare so well as those which unfold their flowers in the earlier part of the season; this is when left to their own devices. This state of affairs is due to the long, protracted dry period, which is liable to occur during the late summer and autumn months. It will help those shrubs and vines wonderfully if the ground around their roots be covered for a few inches with some material which will prevent a too rapid evaporation of moisture.

*Caryopteris mastacanthus*, sent out lately as the blue spirea, is a most decorative subject or for its flowers. North here it is apt to be killed to the ground every winter, but this matters little, as it makes a most profuse growth and flowers at the usual time. It is in full bloom here about the middle of September. We have had it planted out in a fully exposed border for three years; the first winter it was killed to the ground, but since that time the wood has escaped from frost and has broken out nicely each spring. It is a native of China and Japan. Not only can this species be used for the above purposes, but by special treatment its season of blooming can be prolonged till Christmas. The late John Snel had a batch of it last season at that time. His method was to grow the plants in four-inch pots till near the usual blooming period, then cut back and shift into six-inch pots. The plants sent out fresh growths which made a wonderful display of color to the eye. In this part of the country the season seems too short to permit of their ripening seeds, but here in September cuttings will root in a cool propagating house; even the hard flowering wood demanded of the growers will answer satisfactorily.

*Hydrangea paniculata grandiflora* comes into bloom with us during the first half of August. Its merits as a florist's flower are well known to every cultivator here, and by taking the growths of the current year after the leaves have performed their function, cuttings may be put into lengths of about ten inches and putting them in rows in a sheltered position out-of-doors, trailing them in front. About two inches of the length of the cutting should be left above ground. As hard winters as ours they may be covered over with dead leaves.

The crepe myrtle (*Lagerstræmia indica*) seems quite unknown to many florists in the Northern States, for during the visit of the N. A. F. to Mount Vernon on the octonome, the finest specimen which they have been growing on the estate for over 60 years, although in full flower, were unknown to quite a large number. In the New England States it is, of course, classed as a tender shrub, but with a little protection, or even left the plants for the winter, splendid results are sometimes secured. Old plants have been found in perfect condition in the early part of the century. Seedlings will flower the first year from seed, if the winter is not so severe that they get killed to the ground. This sometimes happens to two-year-old plants, but by cutting them down they never hurt. Seedlings which do get cut to the ground sprout up again and bloom as if nothing had happened. There are nearly a dozen shades of red, pink, purple, and white. The easiest method of propagation is from seed, of which plants above two years old give a plentiful supply.

*Abelia rupestris*, the rock abelia, flowers from midsummer till frost. The flowers are small but very numerous. It is harder than the laegerstræmia. With us it is the most desirable of all the late flowering shrubs. Cuttings of the best growths put in any time during September or October in a cool bed will root, and the plants which the leaves should have the benefit of a humid atmosphere to prevent them from withering.

The chaste tree (*Chastaneas*) is a native of the shores of the Mediterranean. It has long panicles of bluish purple flowers, and is most desirable for growing shrub, as it seems to delight in hot dry weather. There is a variety with white flowers. The flowering period is from the middle of August till cool weather.

*V. campbellii* is a tall, wide-spreading shrub with loose panicles of pale blue flowers. There is an unnamed hybrid between these two species which is cultivated here, with very ornamental flowers and foliage. They ripen seeds freely which

should be sown when ripe and kept in a cool greenhouse.

*Lepodolobos*, or *Desmodium pentandrium*, is an herbaceous plant, but it is used and classed as a shrub. It makes a dense bush several feet high, with myriads of small, pea-shaped blooms. The white variety is useful for dry and warm climates, but cannot be obtained; the plants may be increased from cuttings of the growing shoots in July and August. *Prodrindron trichotomum*, a Japanese species, is quite a useful plant for poor soils. While it is in full bloom, Mr. C. Tetford has dense heads of bright pink flowers. It is hardly much further north, but loses its root case in winter. In the Southern States it has proved a most desirable species.

The striped althaea, *Hibiscus sylvicus*, are the best known of the late flowering shrubs. The variety *tohus albus* is a most useful one for floral work. It comes true from seed. The many handsome double forms are easily propagated from cuttings of ripened growths after the leaves have fallen.

*Clematis paniculata* has been widely advertised lately as a good flowering vine, and it certainly deserves wide cultivation. It blooms during the months of August and September, and the season is prolonged if the plants are given situations where the rooting, recommended by the growers, is better than other plants. If the seed is sown as soon as ripe, it will germinate in the following spring.

## The Chrysanthemum.

With cut blooms intended for exhibition there is no road to success as regards their perfect preservation, much depends upon good luck and the state in which the blooms were when cut.

It is an undesired fact that there is much misunderstanding among growers of the chrysanthemum, as to what qualities do in reality constitute a good bloom. Single and double, the latter to have its view. Other points or qualities may be set down as depth, solidity, breadth of petals, form, finish of flower and foliage, freshness, and most certainly, color.

There is one thing to which I wish to call special attention; it is the unsightly staking of chrysanthemum plants with willow and other stakes, reminding one of a cripple supported on crutches. They have neither grain, finish, nor even presence of color, nor flowers, with other form or coloring. If judged by a correct standard of coloring and finish of foliage it would be condemned and relegated to the rear. I trust the coming season that plants will be judged by a standard that will give us the best of the color, foliage, by the form and color of bloom, and that the plant shall exhibit only the best of its foliage, and not a forest of unsightly sticks supporting a weak stem with little or no foliage and colorless

The first chrysanthemum exhibit for prizes in this city was held at the Massachusetts Horticultural Society in 1861, and the prizes were \$17. In 1868 the exhibition was held at the chrysanthemum show, and the prizes were increased to \$75. At first the shows were on Saturdays, but in 1876 they were held days, and in 1896 the prizes amounted to \$1,200. The last exhibit surpassed all previous ones, and it is in the United States, and it is believed, was not outside in any part of the world. In the arrangement of the show, the result, the Society can justly take a large share of credit, with its encouraging, generous spirit, and the fact that Boston may well feel a just pride in the efforts of the growers who made it possible to give us such a show.

To be able to give a debt of gratitude is also due; nowhere in the world do the people have so much to be proud of as in the chrysanthemum. At the present time we stand on the threshold of some of the most important and most valuable improvements which technical schools are sure to bring. The goal of technical schools is to give us the best of the chrysanthemum, and when reached, there can be no doubt of the established value of the chrysanthemum, in a material sense, while aesthetically, in bringing it to its highest pitch of perfection there is no doubt that it will have succeeded in making it a joy forever.—E. M. Wood, of Natick, Mass., was Massachusetts Horticultural Society.

# FREE BOILER FUEL

When Writing Mention Florists' Exchange

"B. T. GALLOWAY,  
Chief Clerk of the Dept. of Agriculture,  
Washington, D. C.

"The Standard Steam Boiler No. 3 is equal to what you claim." \* \* \* On Jan. 6 it was 32° below zero. \* \* \* It kept me warm and would have done more."

FRED K. A. TAYLOR, Florist,  
Canastota, N. Y.

"It gives in heat full value for every pound of coal it consumes."

D. B. OWENS, Florist,  
Whitesboro, N. Y.

"It was a surprise to me to see how quickly the pipes were filled with steam."

C. A. VAN VALKENBURGH, Florist,  
Little Falls, N. Y.

"Your Little Giant Boiler is the most powerful for the size and price I have seen and I have used several high-price heaters."

J. CULVER VOORHEES, Florist,  
Somerville, N. Y.

"Your No. 1 Boiler is the best steamer I have ever seen."

CHAS. T. SMITH, Florist,  
West Nyack, N. Y.

"It runs with very little attention and is very economical in the use of fuel, and in every respect a first-class boiler."

C. B. HUMPHREY, Florist,  
Rome, N. Y.

"I purchased a No. 13 Little Giant Hot Water Boiler from you last November and am well pleased with its work. It heated 520 feet of 4-inch pipe, and I had to use care in firing to prevent the water from boiling over in the expansion tank. I intend making it heat another house 8012 feet that I propose building this coming summer. I have found the boiler all that could be desired."

JOHN MAJOR, Florist,  
Cokeville, Westmoreland County, Pa.

"The No. 2 Standard Hot Water Boiler we had from you last fall has been very satisfactory in every respect; works well, heats well and uses less coal than any boiler we have."

"SALTER BROS., Florists,"  
38 W. Main St., Rochester, N. Y.

"I am very much pleased with my No. 12 Little Giant Hot Water Boiler, and it is a Giant indeed. It heats so much that I am thinking of building on just as much more greenhouse as I now have, and feel quite confident it will take care of it all right. You need not hesitate at any time if any one wants to know about this boiler to have them write me."

M. S. WORDEN,  
North Adams, Mass.

"From what we have seen of the No. 13 Little Giant Hot Water Boiler we do not hesitate to say we believe it good for all you claim for it. We have never had need of a heavy fire, so do not know its power when urged to its best. We shall be glad to recommend it to any one in want of a first-class heater."

E. E. VENEN, Florist,  
Conestoga, Ohio.

OF THE

**Scollay "Invincible" Hot Water Boiler.**

IT IS ALL THAT ITS NAME IMPLIES, AND DON'T FORGET IT.

Cuts and Full Information Mailed on Application.

FARMINGTON, CONN., March 9th, 1896.

DEAR SIR:—The "INVINCIBLE" boiler you placed in my Carnation house I am pleased to say has given me great satisfaction. It has done all that you claimed it would do and could have done more if called upon. I did not have to run the boiler hard even when the thermometer stood 18 degrees below zero outside. It has proven itself to be "Invincible" in every respect. I find it to be a very economical boiler.  
 The one thing I like about it is that the heat does not all go up the chimney, which cannot be said about other makes of boilers I have on my place.  
 Your PORTABLE boiler I have run for three years and find it to be very economical and has done its work well in every way. Your boilers will do a great deal more than you claim for them. They are both "Invincible."  
 Yours very truly,  
 HUGH CHESNEY, Florist.

WESTBURY STATION, QUEENS CO., N. Y., March 10th, 1896.

DEAR SIR:—It gives me great pleasure to inform you that the "Invincible" boiler you put in my latest greenhouse has given the greatest satisfaction in every detail.  
 All the good qualities you claim for it I have found to be just as represented by you and in every way I highly recommend it.  
 Very truly,  
 MRS. CHAS. RUSSELL HONE.

## THE FEEDING OF ORCHIDS.

DR. KIRCHEN'S VIEWS.

In complying with the request of the Editor of the *Florists' Exchange*, to write an article on "The Feeding of Orchids," I should commence by saying that I feel I know very little about the subject. As a matter of scientific interest I have studied the subject for a number of years. My general knowledge in relation to the physiology of animals as well as that of plants, I have found has been of particular service to me in this study. But my practical experimentation has been for only a short period of a few months—since my last Spring's purchase of some eight thousand of the Fitcher & Mandt stock of orchids, which with its over five hundred varieties has given me an exceptional opportunity to experiment. This period of time is too short to furnish a sound basis upon which to found any very general conclusions. Nevertheless, I have reached some conclusions, and, inasmuch as most growers know even less than I do on this subject I am willing to state my views so far as they are formed, reserving the right to amend them upon further consideration.

In the first place, we know as a scientific fact that every form of organic life is composed of only a few elementary matters, and that every living form is composed of about the same elements. These elements or nourishing principles are absorbed from without in simple or complex chemical forms. As a rule, the more highly evolved an animal is the more complex and elaborated is its nourishment be. The same thing is largely true of plants. Some forms, as forest trees, are so constituted that they can dissolve their mineral nourishments out of the poorest soils. A vigorous native sour apple tree, by reason of its intensely acid secretions, can extract nourishment from such soil in sufficient quantities to produce a large yearly crop of sour, worthless apples, where the varieties producing fine, sweet, edible fruit would starve.

Our very finest flowers are produced by supplying them with proper nourishment in adequate quantities. Orchids, to my mind, represent the highest attained type in the floral world, and the conditions under which they are produced include peculiar methods of nourishment—methods which, I believe, it is practically impossible to successfully imitate in cultivating those plants under glass, and especially in foreign zones. Terrestrial orchids thrive under artificial culture with ordinary methods of feeding; but when we attempt to nourish epiphytal orchids, it is practically impossible to imitate the natural methods of feeding these plants, and through which methods, in conjunction with other influences, these floral forms as we now find them have been evolved.

Skilled orchid growers are of two opinions as to the feeding of orchids. On one side are those who say that orchids need only air, water, and peat to nourish them, while others consider that some accessory form of plant food is desirable. To superficial observation both methods of practice succeed equally well, but in fact, one sees such equality of success in differing practices that one is led to conclude that this arbitrary feeding is not a matter of much consequence, and that strict attention to other details of management is evidently more important. During the past months I have fed my orchids, and my stock has greatly improved; but I have compared my plants with those of other growers who have not done so, and which I am compelled to admit look equally well nourished. So I am brought face to face with the question, May not the improvement in my stock be due to the careful attention given in watering and ventilation? My houses are exceptionally well constructed in regard to ventilating conveniences.

There is a question in my mind if it pays to attempt to feed orchids in an auxiliary manner. The history of orchid culture is that of flowering the plants as long as they will produce well, and then replacing them with freshly imported stock. Am I inclined to think that this plan pays best, just as it pays best to throw away valley and other bulbs after forcing, and replace them with fresh

A Newspaper Man and The Oldest Delegate.

Enjoying a Snack Between Shots.

Preparing the Clam Bake.

stock. It is impractical to apply a concentrated amount of plant nourishment to the roots of an orchid at infrequent intervals, as we do to most terrestrial plants. An epiphytal orchid would not stand such treatment. To be healthy its roots must have abundant supplies of fresh air, and probably also of light. Orchids under the best of conditions are slow growers, and their nourishment is supplied to them highly diluted, but they continually, in almost uninterrupted rains, or invisible dense atmospheric moisture—a condition that it would never commercially pay to imitate, even if it were possible to do so.

There is no question in my mind that the elements of nourishment of orchids is very much the same as that for other plants, excepting in that it is of a more refined and delicate nature. These orchids seem to revolt against impurity either gaseous or solid. Prefatraction is allorther to them. Without healthy aerial roots successful orchid-growing is not possible, hence we see the difficulty in feeding them by ordinary methods. Their natural food, beside mineral elements, is the gases of the atmosphere that are absorbed by the moisture of the atmosphere and brought in direct contact with the orifices penetrating the velvium of their air root. The fact that orchids contain mineral elements was plainly demonstrated by Dr. Kedzie of the Michigan Agricultural College some two years since. I was much bothered to understand how these air plants got their mineral food; but I have been lately informed by several collectors, that in no case have they ever found an orchid where it did not grow in a position that would allow of the collection of the fallen leaves of deciduous trees or other vegetable refuse around the roots of the plant. This condition is well imitated by using peat for a potting material.

I do not dispute the using some form of orchid food that will conduce to their growth without being injurious to the feeding roots, but I think that it is possible to feed these interesting forms as successfully as does Dame Mother Nature. We can supply some of our conditions, or good growth, however, even better than is naturally given by the mother of us all, A. M. W. KIRCHEN, EAST ORANGE, N. J.

LAGER &amp; BURELL'S VIEWS.

We are often asked "Do orchids need to be fed?" From observations we should say yes.

—Taking everything into consideration, their native haunts as well as the artificial conditions under which we are striving to imitate nature in the culture of these plants, we have always forgotten until quite recent date, that besides fixing them up in pots or baskets or fastening them on to blocks or boulders, they need something else to feed at home, viz., something to live on.

With a little thought on the subject, it is comparatively easy to understand that wherever they grow they are continually absorbing food in the form of liquids or evaporating gases from constantly decaying organic matter. This we must bear in mind and not take place spontaneously in our greenhouses, and in order to supply this want and cause the plants not only to grow but to thrive and live long, we, for the present, know of no other agencies that will do this except occasional administration of food.

We do not by any means pretend to have mastered the subject; but our conclusions are formed partly by results obtained by us, as well as from observations at other places where feeding is practiced. We have not as yet used any chemical manures, but such as are used for roses in a weak form.

There are a great many orchid growers strongly opposed to feeding, because they claim it makes the plants soft and liable to rot. This we also admit to be true, providing the plants are grown shady in insufficient air and above all, in too much heat. If grown under the reverse conditions, better shoots and higher colored flowers and a longer life to the plants will be obtained.

LAGER &amp; BURELL, orchid growers and Importers, Summit, N. J.

ALFRED DIMOCK'S VIEWS.

I never advocate feeding orchids except a few of the large-rooted free-growing kinds. There are more orchids killed by feeding than any other method adopted to improve their culture, and no grower has been able to demonstrate to me how they benefit by it.

A. DIMOCK, NEW YORK.

**Frost Prevention.**

In a recent number of Garden and Forest, M. G. Kaina, of the Department of Agriculture, presents some facts about frost prevention. The snuggie and water methods are both dealt with. The former is made of almost any substance, such as dampened straw, manure, tar, sawdust, crude kerosene; in fact, anything which will produce a smouldering fire with much smoke and little blaze.

Besides these substances, various compositions have been put upon the French and other markets. One of these, Leston's (considered the best), is sold in the form of bricks, which weigh sixteen pounds, and cost about 15 cents each. They are placed about 30 feet apart, and lighted at the approach of danger. The snuggie formed will, in still weather be effective for about two hours, when it may be removed if necessary. The water method consists simply in a liberal drenching of the plants and the ground on the evening when frost is expected. If there be a risk of ground in the immediate vicinity of the plants to be protected it should be wetted down so that the air which flows over it toward the plants will be saturated with moisture. When general freezes overspread a wide area of country, nothing can be done to prevent injury, but when the fall of temperature is slight, either the snuggie or the water methods, or both together will prevent injury, which would almost certainly occur if nothing were done.

The New York Journal prints illustrated supplement for Sunday August 29 includes portraits of Mrs. T. B. Shepherd, Ventura, Cal., in the list of "women who have become famous." It also prints views from her garden.

# Azalea Indica

(Full Importation Ready About October 15th.)

The Azaleas which we supplied last season were admitted to be the best value for the money ever received by the many florists who bought them, and we can promise as good, if not better, stock and larger plants this coming season.

We have again made special arrangements with the largest grower of Azaleas in Belgium, and take pleasure in offering for delivery about October 15th, Indian Azaleas, double and single, all named varieties, leading market kinds, shapely plants, well headed, at the prices quoted below. These plants will be carefully packed and can be safely sent by freight to any part of the country.

When Writing Mention Florists' Exchange

**WM. MATHEWS'S VIEWS.**  
I have found the following varieties especially benefited by moderate applications of manure (either cow or horse) given once a week during the growing season, but never when the plants are resting, as follows: *Cattleya*, *Oncidium*, *Odontoglossum*, *Plinia*, *Stanhopea*, *Calanthe*, *Peristeria*, and, in fact, all terrestrial orchids. I have never used artificial manures of any kind, therefore cannot give an opinion on them.

Now comes the question as to use manure of any kind on such plants as *Cattleya* or *Helia* and allied kinds of orchids? I have tried, but never found any good results from its use on such kinds. But plenty of air be given and manure water freely used on, and will benefit the plants. The ammoniacal particles can be conveyed to the feeding roots. I have no doubt it will have a tendency to produce strong growth, etc. However, I do not believe in using liquid manure in a *Cattleya* or *Helia* and their allied families, if they are potted in the usual way with polshers, fern-root, peat, and chopped sphagnum, for surely the cloggy and mucky state that will be produced among the roots will have a tendency to prevent proper aeration of same, and the plant will suffer, when the next year arrives, to be forced into new growth it will have only diseased and rotten roots, and, consequently, will bring forth a very inferior stock, like the one of last year. This, of course, is a true sign of degeneration and finally spurious dissoluteness.

I believe the true science of *Cattleya* growing is to know when to rest them and how best to preserve the roots during their long resting season. A moderate temperature, plenty of atmospheric moisture, sufficient shade, and regular drainage is all-sufficient, and judging from some plants that I have had in culture upwards of a dozen years, I am free to say that I do not believe in artificial waterings or any application of a manure nature direct to the roots of *Cattleya*, especially if potted in the usual way.

WM. MATHEWS, Ulster, N. Y.

**A. HEBBINGTON'S VIEWS.**

On several occasions when in conversation with men of considerable growing experience in this country, the assertion has been made to me that orchids, more especially *Cattleya*, can be raised under cultivation, and possibly some pertinent query upon this point addressed to the Editor has been made. I desire the question of manuring orchids to be discussed in these pages. There are probably many better qualified to enlighten myself to contribute to this question, but if a few general remarks should draw attention, a discussion on this matter of profit to all, would result.

It is in every way a desirable subject to discuss, first, because orchids are coming more and more into prominence as commercial flowers, and, secondly, Mr. Lager, now home from an arid country, says that we are fast depicting the riches of our erstwhile orchid Klondyke, and when no longer enabled to draw upon this resource, deterioration of stock is likely to be disastrous.

By way of starting, everyone interested should look back to the *Florists' Exchange* of July 17, 1897, where on page 667 they will see an extract from the *Gardener's Chronicle*, of some experiments and results made and achieved by Mr. A. H. Snee, than whom no one is better qualified to speak of matters pertaining to orchid culture. I think it is most desirable, if the Editor will, to reprint here Mr. Snee's remarks; they are so pertinent and practical.

Mr. Snee experimented with an old and starchy variety of *Cattleya Trianae*. He says:

"I fed this plant once a week, during the growing season, with two or three ounces of water, which contained nitrate of potash, nitrate of ammonia, phosphate of ammonia and carbonate of magnesia, of the strength I had an ounce of nitrate of potash and half an ounce of nitrate of ammonia, with a small quantity of the other salts, with the result that the plant made a stronger growth and produced a greater number of flowers, which were brighter in color. In 1895 I used a larger number of plants and I was so satisfied with the result that in 1896 I used nitrate of ammonia and phosphate of ammonia each week during the summer to the rain water tanks of the *Cattleya* house. The total quantity of water during the summer was one pound of the nitrate of ammonia and one pound of the nitrate of potash, dissolved in water at the rate of 2.5 grains per gallon. Many of the flowers of the *Cattleya* this year were

larger, brighter, and had more substance than in previous years.

"This year I intend to increase the amount of water per gallon during the summer, that is to say, from May to September. I also propose to treat some of the plants with small quantities of phosphate of ammonia and carbonate of magnesia, in addition to the nitrate of ammonia and potash, and expect that I shall be able to make a favorable report on a future occasion on the results of the above treatment."

I expect further observations will prove that the assimilation of phosphates by plants will free the phosphorus, which combining with the nitrogenous matter, will be found to promote inflorescence, and will probably increase the germinating power of the seed of epithelial orchids.

The foregoing suffices to show that this matter of feeding is not imaginary theorising on the part of some impractical crank who would hesitate to practice what he preached; in fact, I think some of our best growers will admit that for some time past they have practiced, have not preached, and so far have been justified by results on the practical side. Why should it be otherwise, and whence arose the misconception that nothing but water can make the plants flourish? The roots of these plants? Air plants we used to call these epiphytal orchids, and we do not know how to grow them without a sufficient food, a natural ocean of superficial thinking; yet it does not require very deep reasoning to realize that the atmospheric conditions of a tropical forest and of a stuffy greenhouse are as widely removed from the other as the ground, though the purest of water may be given the plants in both cases. Give now if you want your growers to give the plants manorial assistance they will half deny the impeachment or admit it hesitatingly.

Why should we apologize for giving the plants what they need? Why should we have under cultivation, and what I am satisfied in my own mind they actually receive in abundance in the natural state? The manuring notion is repugnant to many because they only think of manure in its most offensive forms, that of the horse stable or the cow byre; but even this last can be and is now being used in right state or fitness. That manure of this description is a foreign element to orchids in a state of nature I do not deny, but the manure of the stable, tile gases which we all know escape from our manure piles when they have to find an atmospheric exposure, we know that these are some of the richest fertilizing elements and unless fixed in some other way are lost to us as surely as despatched in the atmosphere. Here, then, I believe, is just the form in which the *Cattleya* in the woods gathers to itself such nutriment as it needs; absorbed from the atmosphere in rain part, its source the ground covered with decaying vegetable matter below. We have imitated natural conditions only in part when we fix the nutriment in the form of salts, or on blocks with little compost through which the nutriment can find its way, and give access to all parts of the plant—root and leaf and branch. When conditions are favorable we imitate the tropical deluges of rain giving the plants a thorough soaking, and the surplus water falls below on the ground, and we can keep it to evaporate again, but only as pure water still. Now mark the difference after the surplus deluge and the sun bursts out. Do not the forests reek with steam from evaporation, and if that evaporation is not enough to dry the plants, the stimulus of decaying vegetation who shall estimate, at least now can deny, the rich fertilizing gases that are rising up from the soil. The plant and the orchid do not differ from other plants in that its dry weight consists of nutriment in atmospherically and added to the existing bulk.

As an actual detail in the best practice we probably have many a blossoming at the best methods, but one let us get generally convinced that manorial food is essential to the success of a multitude of cultivators we shall evolve more wisdom, clear reasoning and working in his best judgment in trying to meet the conditions of his case. Instead of the close growing, over-heating, non-ventilating conditions, the killing by kindness that we result in death to thousands of orchids, we shall have a more intelligent and successful inside have abundance of pure air always, cool waves sometimes, and mark the difference in the result. The efficiency, though horses and cows are not near at hand to furnish it. It is simply a different kind of nutriment, and a different problem for growers to solve is how best to adapt the conditions to meet

the needs as they are around us, not as we imagine they ought to be.

# THE Novelty for 1898. Dwarf Sweet Pea, Burpee's PINK Cupid

THIS little wonder, like the original Cupid, hails from California, having been discovered by C. C. Morse & Co., to whom we paid fifteen hundred dollars cash for the exclusive ownership when there were only 1060 seeds in existence. It is not a sport from the original White Cupid, but an actual departure from its parent, the tall Blanche Ferry. In habit and manner of growth it is strictly a Cupid, spreading from the root, from a foot to eighteen inches around, growing from six to eight inches high, and shooting up stems about six inches long, which bear, in full bloom at once, from three to four handsome blossoms, all borne close to the end of the stem.

The flower itself is pretty enough, but its attractiveness is doubled by its association with CURD,—the first colored Cupid to follow the famous dwarf white.

The standard of the flower is wide, not infrequently measuring an inch and a half, but not over an inch high, being developed later. It usually curves over a trifle from the top, partly concave, which gives the standard a distinct shell-shaped appearance. The standard is a bright rose-pink, while the wings are pure white or light pink. The wings are very large and finely formed; when pressed back against the standard they extend fully a quarter of an inch beyond it.

The substance of the blossom is peculiarly heavy and it will appear fresh and vigorous in a glass of water long after its long-stemmed parent has withered and died. The plant itself is vigorous and hardy, and those who had poor or indifferent success with White Cupid will find this variety easy to grow anywhere. The seed, which is black, is of wonderfully strong germination, and the plant an early bloomer, coming into bloom simultaneously with White Cupid.

Though flowering early it continues in bloom very late, bearing a profusion of blossoms so thick as to completely hide the plant itself. It will be worth a rival as a bedding and border annual, for its color and fragrance make it a rare novelty.

In our field crops the past season, both in California and New York, a large piece of them looks as if the ground were literally strewn with bright pink rose buds. No novelty of recent introduction has such beauty and grace combined in it as has Burpee's PINK Cupid. It is also delightfully fragrant, and will be admired by every one who sees it.

In regular sized packets (each containing twenty-four seeds):

Per pkt. 25 cts.; 5 pkts. for \$1.00; per doz. pkts. \$2.00.

Per 100 pkts. \$12.00.

In half-size packets (each containing twelve seeds):

Per pkt. 15 cts.; 2 pkts. for 25 cts.; or 10 pkts. for \$1.00.

Per 100 pkts. \$7.50.

Directions for culture in English, French and German printed upon each packet.

# Burpee's PINK Cupid.

Will be ready by November.

## Headquarters in Europe.

In order to accommodate the Seed Trade in Europe we have appointed the following well-known firms Special Wholesale AGENTS. These houses will supply seed of Burpee's PINK Cupid, in original packets, on the same terms as if the orders were sent direct to us, and will also furnish electrotypes for catalogue use.

Sole Wholesale Agents for Great Britain, Australian Colonies, and India.—Messrs. HURST & SON, 152, Houndsditch, London.

Sole Wholesale Agents for France, Belgium, Spain, Portugal, and Italy.—Messrs. VILMORIN-ANDRIEUX & CO., Paris, France.

Wholesale Agents for Germany, Holland, Austria, Russia, Denmark, Norway, and Sweden.—Mr. ERNST BENARY, Messrs. DIPPE BROS., HAAGE & SCHMIDT, HENRI NETTE, MARTIN GRASHOFF, FREDK. ROEMER, DAVID SACHS, and J. C. SCHMIDT.

Each firm named above has a complete set of electrotypes and is authorized to quote special prices by the thousand packets.

All orders from America (and Foreign Countries not named above) should be addressed to the Introdurers:

A Single Plant, exactly engraved from a photograph of Burpee's PINK Cupid.

The illustration above has been accurately engraved from a photograph of a single plant grown in ordinary culture, lifted and set in a pot on a platform, for the purpose of photographing on a level with the camera. Every plant in our seeds in California and New York, and at Fordhook Farm was accurately true to perfect Burpee's Cupid.—The flowers are always of full size, measuring from one and a quarter to one and three-eighths inches above the standard—covering a silver dollar.

As this plant is a fair sample we would state that it measured six to eight and one-half inches high by nineteen to twenty-four inches in diameter, spreading on the ground. We could give records of the number of flowers and buds, by actual count, on a single plant of Burpee's PINK Cupid, but will merely refer to the editorial in THE FLORISTS' EXCHANGE, September 1897, which says, "we counted 33 stalks in blossom on one plant and an average of three flowers to a stem."

## TWO OF MANY.

REPORT FROM MR. ECKFORD.

Wm. SHROPSHIRE, ENGLAND, September 18, 1897.

MESSRS. W. ATLEE BURPEE & Co., Philadelphia, Pa.

Gentlemen—I am pleased to tell you that the "PINK Cupid" seed that I received was good enough to send me for trial has been a great success. While Cupid has done much better than last year, but still not up to the Pink variety which holds its bloom better and consequently dries a much better display. I don't think too much can be said in favor of Pink Cupid. At present, it occupies a place of honor in my sweet pea.

Descriptions of Novelties will follow in a mail or two. I am afraid it will not be possible to send you "Cupid" seeds "this year; the crop is very small, but shall show definitely in a few days. I hope Mr. Burpee reached Philadelphia safely. Please give him my kind regards. I am, gentlemen,

Yours faithfully,  
HENRY ECKFORD.

## AMERICAN GARDENING.

A. T. DE LA MARIE PTO. and PER CO. LTD. PROPRIETORS, NEW YORK, September 18, 1897.

MESSRS. W. ATLEE BURPEE & Co., Philadelphia, Pa.

Gentlemen—Have just returned from a trip to Jefferson County, New York, where one of the most beautiful sights to me was a box of PINK CUPID. It was a mass of blossoms and buds, a delicious fragrance filled the air and that its past had been equally grand was evidenced by the seed pods, while the prouder for the rest of the season lay in the multitude of buds yet to expand.

Truly as a flowering bed for PINK Cupid is a success.

Yours faithfully,  
LEONARD BARON, Editor A. G.

### Exclusively a Trade Paper.

Entered at New York Post Office as Second Class Matter

Published Every Saturday

A. T. De LA MARE PTE. AND CO. LTD.

2, 4, 6, & Duane St., New York

P. O. Box, 1697. Telephone 2154 Central

REGISTERED CABLE ADDRESS  
Commercial Cable, Florez, New York

#### SUBSCRIPTIONS:

**\$1.00 per year** to United States, Canada and Mexico. **\$2.00 per year** to foreign countries (in postal union). Payable in advance. New subscriptions will commence with the first number after receipt unless otherwise ordered. Back numbers can be supplied when wanted.

The date on address label above which the subscription expires is that of the subscriber's receipt. No other receipt is sent.

#### ADVERTISEMENTS:

Copy must reach this office not later than Thursday in order to secure insertion in issue of the following date.  
**Rate, \$1.00 per inch.** Special positions at **one discount** on contracts for more than one longer.  
Orders from unknown parties must be accompanied by cash or satisfactory references.

### For the Busy Man.

Wm. A. Stiles, editor of Garden and Forest, and a Staff Commissioner of New York City, is dead.

The Chicago Horticultural Society, at its forthcoming show, will have an exhibit by artists and sculptors.

The Rev. W. T. Hutchins, the sweet pea specialist, is now devoting some of his attention to a study of the Dahlia, for which flower he predicts a great future.

Our Cincinnati correspondent is of the opinion that Lady Fitzgram christeneth a new greenhouse Mrs. F. Bergman in that locality as an early variety.

Secretary of Agriculture, Wilson, has been furnished by the Society of American Florists certain seeds furnished to his department by the Society. The Chief of the Treasury has decided that they must be furnished in packages, after the manner of former years.

### W. Fredrick Gude.

PRESIDENT-ELECT S. A. F. A. O. H.

See portrait on page 901.

We present herewith a photograph of the president-elect of the Society of American Florists and Ornamental Horticulturists. A brief sketch of his career appears on page 760 of the present volume of the *Florists' Exchange*.

Mr. Gude writes us that up to the present time he has received the most gratifying commendations from all over the country, both as regards the 1898 meeting at Omaha, and the president-elect of the Society.

### Arthur Donaghue.

VICE-PRESIDENT-ELECT S. A. F. A. O. H.

See portrait on page 901.

Mr. A. Donaghue, vice-president elect of the Society of American Florists and Ornamental Horticulturists, was born in Essex, England, on November 9, 1841. He commenced work as a gardener when a boy of eleven years, and has since been engaged in nearly all branches of gardening. He came to the United States in 1864, settling first in Chicago where he was employed by Edgar Sanders, well known to our readers, for a time. He then removed to Omaha, Neb., in 1867, and rented eight acres of ground, starting into market gardening. In this venture he met with varying success, on account of untoward weather conditions and troublesome insect pests. In 1872 he built three small greenhouses, which was the starting point of his florist career, and which has proven very successful

the business having grown steadily until now it embraces 35,000 square feet of glass.

The vice-president-elect is an enthusiast in the work of the S. A. F. A. O. H., and its members and the trade generally to day look forward with interest to the successful gathering at Omaha, which will doubtless crown the efforts of Mr. Donaghue and his Western brothers in the craft.

#### Reminiscence.

The following writer, that Mr. Sanders, in the light of recent events, may prove interesting:

In 1842 the writer, then a young journeyman plumber, wended his way up to London from his birthplace to a situation as under gardener at Walthamstow, Essex, seven miles north of the British metropolis. Among the crowd of young men then known as associates in this garden was one William, commonly called "Bill" Donaghue, son of a private gardener in that neighborhood. Our old comrade, Bill, was an elder brother of Mr. A. Donaghue, vice-president-elect of the Society of American Florists, and master of Omaha.

Along in 1864, or thereabouts, came a full-grown, well-to-do Englishman to the locality we now write from, and introduced himself as a son of my old-time comrade, Arthur Donaghue. He did not take long to convince me, young as he was at the time (it was well recalled with his family that he was a veritable chip of the old block, and I still fancy I can see in the features of this same Arthur Donaghue those of his father. And curious how common things stick to one through life; in the father's house, at the work, by the American clock, the first I had seen of Yankee invention, but which timepieces afterwards became as common as London-made words.

#### A Business Editor.

If, as has been stated, the "advertisements appearing in a paper are a pretty good indication of its value and character," we think we can claim for the *FLORISTS' EXCHANGE* a value and a character not possessed by any other journal engaged in the horticultural line, and in this statement our columns bear us out. Not only do the immense number of advertisements contained in this issue testify to the efficacy of the *FLORISTS' EXCHANGE* as a satisfactory "salesman," but they are also indicative of the prosperity that is generally manifest all over the country. From reports received from our numerous correspondents it is anticipated that the season just entered upon will be a busy and prosperous one. We sincerely trust that this will be so, and that with a return of good business will come a relaxation in the tightness of money, which, more than the dearth of trade, is still severely felt in many directions.

We stated in our announcement that the Fall of 1897 is being regarded by many of its predecessors. Results verify our predictions, and the present issue speaks for itself.

Allow us, however, to refer briefly to some of its leading features.

The Gardeners' Association is the first horticultural journal in America to present to its readers a full report of the proceedings of the annual conventions of the Society of American Florists, and this policy we have pursued for a number of years, believing it to be not only of benefit to the gardeners, but of an important part of the trade in general represented in our subscription list. It is a well-known fact that many who are anxious enough, are often deterred from attending the convention, and our opinion is, in that case, that by the present and participating in the good that is the enjoyment of having the convention and all that transpired there (or, at least, the cream of the affair) brought to you by means of the *FLORISTS' EXCHANGE* has "gone one" further than

has been the case in previous years. Already we have given our usual quota of the proceedings and happenings that may be expected for the detection both of those who were in attendance at Providence and Newport, and those who were not, and our views, portraying the delegates in various attitudes of the ornaments of a gentlemanly and forthright character, from photographs taken by our own photographers, will be of great interest to our readers who will experience the same amount of pleasure in looking over these pictures, and in discussing them.

The matter discussed we have touched upon elsewhere. We would draw special attention to the experience of our countrymen with the subject of feeding of orchids, and hope to see the discussion continued in these columns.

The chapter relative to the new fumigating process (hydrocyanic acid gas), furnished by Mr. Borsett, will, no doubt, prove acceptable to many.

In conclusion we beg to thank our customers for their continued confidence and support.

#### Reflections on Current Topics.

Some time ago I read in my daily paper that the hope-time energetic and progressive Chester County Carnation Society had disbanded; and not having any other reliable opinion on the subject, I columns for a long time. I have come to the conclusion that the information in the paper is not a very reliable source of news, for that an association with such a good and a healthy stock, should have later decided to set their faces in good many directions; even the point system as applied to judging carnations in their originality, and I would look for some of the old time-liver to bring me out twenty to give \$25 to the person who may not look in vain.

The offer of Secretary Herr of the American Carnation Society recently published in these columns, has evidently given rise to many opinions. Mr. Herr in that communication (see page 687, July 24 issue) pledges himself as one who is ready to give \$25 to the person in a sinking fund, the interest to be placed toward the running expenses of the Society, and to give \$50 to the person who reserve fund so contributed could be secured. It is believed by a number of our readers that the Society will be no obstacle removed, the secretary's proposition would meet with the approval of carnation lovers. If by incorporating the Society, or otherwise, all legal requirements as to technicalities could be met and overcome, and the secretary's plan put into practical operation, the resultant effects would be overestimated. I would like to see this matter fully discussed.

The settlement of the struggle between the promoters of the botanical garden of New York, and the representatives of public opinion, whereby the appropriation by the city of \$500,000 for the purpose of the garden, and the appropriation in compliance with law, will be filled with delight by all interested in the art of horticulture, and the horticulturists of New York. In its opposition to the whole scheme of establishing a botanical garden in New York, and the horticulturists, makers of the proposed plans and their work, and its persistence, but little fight or recognition is shown by gardeners whom the Sun calls "experts," have been a few of the amusing features of the situation. The "experts," however, who have a keener insight than others into such matters, state they can perceive in the garden, and the city, and the horticulturists, "wheels within wheels," which, fortunately for the country, have been, and will be, so arranged as to be immovable in the future. I hardly think the people and ridiculous assertion of the horticulturists, who have been so long at Dana (who so ably performed the task of being the mouthpieces of the objectors to the garden, and the city, and the horticulturists, that there is no need for an endowed garden in New York, and the horticulturists, who have been so long at Dana, and who have so forcibly championed. Progressive horticulturists, however, who have long felt the want of an institution such as the New York Botanical Garden in our country, and who have been so long at Dana, and who have been so long at Dana, we expect to see congregated the highest authorities on botanical science in all our country, and we expect to see, in the future, a sad commentary on our progressiveness, that horticulturists requiring the horticulturists, and the horticulturists, new species and varieties of plants are

compelled now to send their specimens to the old world for this purpose, because America has no institution where such work can be done.

It is only within a year or so that the private gardeners of the country began to band themselves together in the various associations, and in the horticulturists' movement; and already the beneficial influence of such organization is being felt in the horticulturists' movement. Floral exhibitions to be given this Fall under the auspices of the gardeners' associations, and the horticulturists' associations, and the horticulturists' associations, are well and to all appearances superseding their more æsthetic conferrers, the florists, are seen in the election of gardeners as officers in our florists' clubs, e. g., New York, where the positions of president and vice-president are both filled by private gardeners. All this goes to show that the trend of the times is toward a reversal of conditions of former days, when the horticulturists were the dominant factor, and the private gardener played but a subsidiary part.

The passing of the Fitcher & Mandan Floral Garden, and the horticulturists' question of the longevity of a large concern. There are big establishments that are being broken up, and the horticulturists' question for rapidity of expansion has probably no parallel, notwithstanding our horticulturists' question of the horticulturists' question, which it has lasted less than a decade. There is much wisdom in the old saw, "not to count our chickens before they are hatched"; and it is probably owing to a superabundance of optimism, among horticulturists, that the horticulturists' question has been heard reverberating the past week through this immense establishment.

It is a fact, however, that horticulturists for increased business, but unwise to be too far in the van. It is better to gradually increase business, and to gradually enlarge his facilities to the extent of overwringing the whole. We must creep, not walk.

#### American Institute Show.

The Horticultural Exhibition at Madison Square Garden, New York, given by the American Institute, continues an unqualified success. The dahlias of the first exhibit were of the highest quality, and a large number of the new varieties of cut flowers, and exotic plants of rare value are also noticeable. Fruits are of the highest quality, and a large number of the same can be said of vegetables. One of the chief attractions of the show is a fine display of *Præcox* Sandersiana, with 22 dahlias, exhibited by William Duckham, gardener to Dr. Willie James, Esq., Madison Square Garden. The horticulturists' presence was granted to this superb exhibit, and the horticulturists' presence was granted to this superb exhibit, and the horticulturists' presence was granted to this superb exhibit.

F. R. Henson Co. had a charming group of flowers, and a large number of bay trees distributed about the hall. This firm secured the best collection of bay trees, and a large number of bay trees distributed about the hall. This firm secured the best collection of bay trees, and a large number of bay trees distributed about the hall.

In the cut flower classes, John Lewis Childs, Floral Park, was first with a fine lot of flowers, and a large number of bay trees distributed about the hall. This firm secured the best collection of bay trees, and a large number of bay trees distributed about the hall.

A special feature of the week's display was a collection of Colombian grasses from the State of New Jersey, Summit, N. J., in all over 500 species, many of which are unknown and have not been seen since the collection of the horticulturists, and a large number of bay trees distributed about the hall. This firm secured the best collection of bay trees, and a large number of bay trees distributed about the hall.

**Hydrocyanic Acid Gas for Green-house Fumigation.**

In connection with our work on the diseases of plants grown under glass we have been forced to consider the eradication of some of the more common insect pests. This we tried to accomplish by the use of some of the remedies commonly recommended, but after repeated trials with different spraying mixtures and washes and by use of tobacco in its different forms, many of the insects in question were not destroyed, while the tissues of the plants so treated were weakened and more or less injured, making them more susceptible to the attacks of fungi. We were, therefore, forced to adopt some other means of combating these pests. With these objects in view, we carried on a number of experiments with hydrocyanic acid gas. This in most cases proved entirely satisfactory. The results of this work have appeared in the columns of the *Florists' Exchange* from time to time. There are, of course, many details and some minor changes in our methods that have not been published. It is the aim of the writer to review to some extent the various articles, and to make slight modifications and additions to our former methods of using the gas.

The deadly effect of the gas upon scale insects was discovered by Professor D. W. Coquillett, in September, 1886, in the Wolfskill orange groves in California. A full account of his experiments may be found in the Department of Agriculture Report for 1887, page 123. Since that time it has been very extensively used in California and other sections of the country in treating these pests upon orange trees. It is only a few years ago, however, that its use has spread to other branches of horticulture and floriculture. It is used for the purpose of destroying every first-class nurseryman in treating buds and stock brought into or shipped to this country.

The first successful experiments with the gas on greenhouse plants, as far as is known, were made three years ago under the direction of Mr. Albert F. Woods of the Department of Agriculture. These were successfully treated a house of ferns, adiantum and davallia, that were badly infested with scale. The scales were all killed without the slightest injury to the youngest growing fronds. The next experiment was the fumigation of a greenhouse which was filled with coleus (in varieties). There were 20,000 plants that were badly infested with the white tail mealy bug (*Orthezia insignis*).

Those in authority had exhausted the repertoire of remedies usually used in such cases with varying results in killing both insects and plants. In fact, the results were so discouraging that the authorities had about decided to throw out the entire stock. It was finally concluded to try the effect of the gas. The result was all that could be expected. All of the *Orthezia* were killed without injury to the plants. A number of the insects had loosened their hold upon the plant and had fallen to the ground, while quite a number, though dead, were still adhering to different parts. These would, however, wash off at the first good syringing.

Quite a number of plants of different varieties were placed in the farther end of the house so as to test the effect of the gas upon them. The last included *Alocasia macrorrhiza variegata*, *Anturium sp.*, *Arcen luteosens*, *Adiantum cuneatum*, *Cissis discolor*, *croton* (in variety), *colusa* (in variety), *Plectranthus buchanianii* (in variety), *Jacaranua minosifolia*, *maranta* (in variety), *nympheas* (in variety), *Pontederia crassipes*, *Phryllus variegatum*. A detailed account of this experiment appeared in the *Florists' Exchange* April 26, 1896, page 426. Since the above experiment, all the coleus cuttings made at the U. S. propagating gardens either for Spring or Fall stock, are fumigated before being put into the cutting bed. A detailed account and material to be used in this purpose may be found in the *Exchange* for December 19, 1896, page 1132. A box of this kind is also used for the purpose of removing the trays, it can be used for fumigating a small quantity of stock in the house, or to treat a box or boxes of miscellaneous plants.

The *Exchange* for February 13, 1897, page 147, will be found an article entitled "Fumigating Greenhouses with Hydrocyanic Acid Gas." The method of

applying the gas, of calculating the number of cubic feet of space in different style houses, and estimating the amount of material to be used, is there very carefully explained. We find that the best results are obtained when the jars are placed from 25 to 40 feet apart, depending somewhat on the width of the house. Not more than one-half to two pounds of cyanide should be used in each jar.

A house requiring two jars is shown in fig. 3, ready for fumigation. It will be

away with "hulling strips" to the sides of shallow walks or across deep ones. The strings are removed from the walks and are out of the way when going in and out from the jars preparatory to putting the cyanide in position they slip easier over the hooks than over the slicks, when the string is loosened at the door all of the bags drop into their respective jars at the same time. The strings used in each house should be kept convenient for other fumigations. In shallow walks it will

be found in the *Exchange* for September 4, 1897, page 758, and a second account by Mr. Safford in the following issue of the same paper, September 11, 1897, page 818. In this experiment all insects in the house were killed.

The advantages and disadvantages of the use of this gas in greenhouse work can be summarized as follows:

1. The effectiveness with which it acts.
2. Its rapid diffusibility.
3. Ease of application.

**Fumigating by Hydrocyanic Acid Gas.**

Fig. 3. Violet House, Requiring the Use of Two Jars, Ready for Treatment.

seen that the method of supporting the jars is somewhat different from that described in a previous paper; in some cases this latter method is more convenient. Small hooks are screwed into the ridge or snub-hooks directly over the walk, where each jar is to be placed. A string is run from the farthest jar back to the door and stretched a little to one side near the top where it can easily be reached. Place the string over the several hooks and instead the bag of cyanide, intended for the farthest jar, in position as

to set a shallow box, such as is frequently used for cuttings, on either side of the jar, as is shown in fig. 3. This will protect the plants on either side from being injured by spattering of the acid when the gas is given off. It is safer to use two paper sacks for each package of cyanide. If the cyanide remains any considerable length of time in the sack the paper becomes wet, in which case there is danger of its giving way before the person placing it in position could get out of the house. Using two sacks makes it much

4. It does not weaken the tissues of the plants when properly applied, but the method of using it has to be determined in each case.

5. It leaves no objectionable odor in the house; flowers such as violets being as sweet immediately after its work as before.

6. A decrease in the number of applications necessary during the season.

7. Its use in riding, imported or exported stock of insect pests.

Fig. 4. Violet Houses of Wm. G. Safford, Poughkeepsie, N. Y.

shown in the photograph. Next tie a string to the one already in position, and run it to the second jar. Place the string in the hook and attach the bag of cyanide as usual. This method could be repeated for almost any number of jars. This arrangement should be made and tested before the water and acid is put in the jars. It has several advantages over the one formerly used. The hooks are always in position and ready for use. It does

suffer, as the second sack will seldom wet through.

Perhaps the most extensive use of the gas in a commercial way was the treatment not long since of Mr. W. G. Safford's entire range of violet houses at Poughkeepsie, N. Y. An exterior view of his place is shown in fig. 4. The houses contain 70,000 cubic feet of space and about 10,000 violet plants that were infested with black aphid. A detailed account by Mr. Woods of the treatment will

its disadvantages are few:

1. Its deadly poisonous nature to man and beast. This is, however, reduced to a minimum if the instructions laid down are carefully followed.

2. It must be used at night (at least for the present) and during the winter months only on nights when the temperature outside is sufficiently high to allow of thorough ventilation in the houses for at least 30 minutes. 1. H. Doherty.

**4 ACRES FIELD-GROWN CARNATION PLANTS, 94,000.**

Our Carnations are grown with the greatest care and are first-class plants, free from disease. We pack light by our improved system of packing by which we can send them to all parts of the United States and Canada in perfect condition.

**CRIMSON SPORT, IVORY, DEAN HOLE, BUTTERCUP,**

# The "Plant Clinic" of The Florists' Exchange.

It is a pretty generally accepted fact that in spite of every care and precaution exercised, disease in more or less aggravated form will at times fasten itself upon plants as well as human beings, and when it does attack either ourselves or our products, it is well to know its nature so that a prompt remedy, if possible, may be resorted to. To know the nature of a disease is equally desirable. Although the "plant doctor" has been suggested, and wisely so, it is not to be understood that it is to become an established institution in our midst, and until such times as he does make his appearance among us, growers themselves will be called upon to prescribe and administer antidotes and medicines for the various ills to which their plants are subject.

In view of the prevalence of a desire for information on the several diseases that are met with in the cultivation of those plants which at present form the staples of our business, the following questions have been suggested, and wisely so, and a compilation of useful matter pertaining to this subject would at this time prove opportune and serviceable to a vast majority of our patrons. To that end, we set to work to secure the services of expert scientists to furnish us with simple descriptions of the pests most commonly encountered, so as to render easy their identification by the general grower, and also to obtain from several competent men who have had experience in preventing, checking, or otherwise combating such diseases, their mode of treatment, to which we now beg to present for the edification of our readers.

It is needless for us to point out the value of such an edition as this, which value lies in the handy means of reference which it affords as regards the cause and effect of the diseases dealt with, as also in the remedies known or suggested that it furnishes.

We desire to extend our sincere thanks to the scientific gentlemen who have so freely given of their knowledge in this respect, and to our friends, the growers, who have so readily and so willingly aided us in presenting what, in our opinion, is one of the most valuable and practical editions ever issued from our press.

## Fungus Diseases of Roses.

There are many kinds of fungous diseases of the rose recorded in the books, and only a few of the most injurious can be mentioned here.

The black spot (*Actinomyces rosea* Fr.). This, it is perhaps the most widespread and troublesome of the fungous diseases of the rose, and is so common as scarcely to require mention. It is usually first brought to the mind of every rose grower. When attacked by the *Actinomyces* the leaves are severely spotted with the characteristic dark circular spots, while elsewhere the leaves become pale and withered.

The fungus consists of fine threads which feed upon the substance of the rose leaf. The spores which would not grow from spore that has been brought through the air or in water from a mature black spot, fungus spores in diverging lines until the circular area is the size of a dime or even a half-dollar. After the growth has proceeded for a time small spores may be seen upon the surface of the spot. These are the spore-bearing places, after the skin of the leaf has been ruptured or thrown off, and multitudes of spores are produced, which are the "seeds" of the disease. In many cases the spores are sending their way to a healthy leaf, of inaugurating a new black spot.

With many other fungous diseases of plants, some varieties of roses are much more susceptible to the black spot than others, and therefore it goes without further saying that, other matters remaining the same, it is an important precaution to grow those sorts that are the least subject to the malady.

Roses are sometimes more or less covered with a powdery substance (mildew) as if the fine dust from a flouring mill had settled upon the leaves, many of which are somewhat in shape. This powdery substance consists largely of the spores of a fungus (*Sphaeria rosarum* Walp.) that bears the familiar name of rose powdery mildew. Fig. 1, c. This fungus does not send its filaments deep into and between the cells of the leaf and is, therefore, not so destructive as the black spot. Because superficial in its manner of feeding upon its host this mildew can be removed by the rubbing of the leaves and quickly become manifest.

There is another rose mildew (*Peronospora rosicola*) which grows in many ways from the one last mentioned. It is deeply seated, in that its fine filaments extend through all portions of the leaf, and afterwards produce upon the surface a fine growth that has suggested the common name of downy mildew for this fungous parasite. This mildew is closely related to the ones upon the grape, the chrysan, the greenhouse cucumber and several other of the destructive downy mildews.

Rose canes are sometimes covered with small pimples, each one of which abounds in spores. These microscopic spores ooze from the pimples or small rifts in the epidermis of the cane and germinate quickly and spread the disease. This is the rose anthracnose (*Chrysosporium roseum* Fr.), which is shown in a photograph of a plant nearly destroyed with it in the next disease. The disease is related to several of the worst diseases of other cultivated plants. Thus (*Gloeosporium*) it attacks the leaves of the raspberry (*Gloeosporium venetum* Spiz.) is another near relative of the spores in which it may be found, and it passes through its young parts by the trouble in the anthracnose falling upon the leaves or canes of the latter. The latter may also girdle the stem and thereby kill it.

A plant thus infested by the anthracnose may send up new canes from near the base of the stem, which in turn are likely to bear pale, sickly foliage and finally to be destroyed by the fungus that in this instance may send it directly from the old stem. This is one of the most contagious of the fungous diseases of the rose.

Some of the plants in rose houses have foliage that is badly marked with gray, irregular, often quite sun spots. If these spots are looked at closely—and a hand lens will assist greatly—they are seen dotted over with minute black specks, the spore-bearing organs of *Sphaeria rosarum* Ell. Fig. 1, b. In order that this trouble may have a common name and to avoid the word spot and any confu-

ply of blooms. While there are several causes for this sad state of things, one of the leading reasons for distress is a microscopic worm that works principally at and in the roots. These worms are in form like that of an ordinary earth, and under the microscope are seen in almost constant motion. These cause an enlargement of certain portions of the roots, which swellings are sometimes called galls. These galls or knots are easily detected with the naked eye when a plant is removed from the soil and carefully washed of the adhering earth. Fig. 3 shows the general appearance of a portion of a root of a rose that had sickened from the larvae of these worms. As the minute animals are not unlike the worms found in vinegar, they are some-

times with, and this naturally raises the question of how they first get into the bed. This may be in one or more of several ways. They may be already in the roots of plants, but in small numbers, when the plants are put in the soil. To guard against this, the roots should be examined as closely as possible for the galls, when the beds are set. All galled roses should be excluded. The nematodes may come in with the soil. Soil that has not been used in a garden for some time is not necessarily free, but if taken from a pasture or meadow, it may contain many nematodes. Then, again, they may be taken with the manure that is used in the garden.

Just what will be the best precaution remains for the practical rose grower to determine. Cold in excess will probably destroy the worms, and likewise a high temperature is inimical to them. Rose growers have made the experience of heating the soil of a small portion of the bed before setting the plants, and satisfied themselves that such treatment will pay. If manure is the chief vehicle of the worms, it may be possible to grow roses without so much of this constituent of the rose soil.

The fact is that the worms are doing us little damage and when they are once in a plant there is no known way of driving them out. New conditions may induce their disappearance, but the chances of a diseased plant may revive, but this is not to be expected under such circumstances.

It is possible that some substance may be put upon the soil that, while not injuring the roses, may kill the worms. This has been tried, and with favorable results. Sprinkle the line upon the surface of the soil, or better mix it with the soil, and each watering will tend to bring it in contact with the bodies of the worms. It is not unlikely that some of the fertilizer compounds may be found that at the same time they furnish food for the plants, will deal a death blow to the nematodes. Kainit may thus prove an effective remedy. It is suggested that some enterprising rosarian to take the matter in hand and demonstrate the truth or falshood of the above suggestion. It is easy to obtain and apply, and the amount to be used must be determined by M. H. Watson, Mass.

## GROWERS' PRACTICAL REMEDIES.

1. For mildew, but a limited experience in growing roses under glass.

For powdery mildew on roses in the open air, a solution of sulphate of potassium—one-half ounce to six quarts of water—applying the same with a syringe or brush, is found beneficial. Two applications are sufficient. If used before the plants become too hardy affected, it will be a good remedy for chrysantheums affected with mildew.

M. H. WATSON, MASS.

As regards to the diseases of the rose, such as black spot, mildew, etc., we find one of the most effective remedies for black spot is a syringe of Bordeaux mixture, or mildew, powdered sulphur sprinkled on steam or hot water. As regards to the diseases of the rose, we have used other remedies with more or less success, but it is our experience that the best remedy for black spot, and powdered sulphur for mildew are the safest and most effective. During the winter months, the roses should be examined and eradicated by dusting the plants with powdered sulphur.

THE FLORISTS' AND CONAN CO.

Anyone who has attempted to grow hybrid perpetual and hybrid tea roses in the open ground in the northern part of the country, has probably observed how few and how small they are to many of

roses with black spot, the expression "rose leaf blight" is proposed.

Before leaving the roses, and in answer to a question already asked, it may be said that the peculiar discoloration of the leaves of *La France*, for example, Fig. 1, d, is not due to a fungus, but to a disease which may be called "browning," is probably due to structural weakness permitting the leaves to become scalded by too great sun exposure.

The methods of treatment are given at the close of the consideration of the diseases of the chrysantheum.

## Eel-Worms In Roses.

During the past few years there have been many complaints on the part of rose growers because their plants failed to produce a healthy growth and good ap-

pearance of a vinegar eel.

The point that most interests rose growers is how to get rid of the pests. In order to do this it will be of much assistance to know where the worms come from—how they propagate and get into the plants. These eel-worms are much more abundant than generally supposed, and it is only when they are numerous that their mischief becomes apparent. The nematodes, as a rule, much more abundant in warm countries than elsewhere, and the unusual abundance of these pests in northern gardens, for the past few years, is likely due to the lack of freezing in the soil.

The greenhouses furnishes the proper condition for the propagation of the eel-worms, provided they are there to begin

**CANNAS**

**JAMES DEAN'S NEW PEDIGREE CANNAS WILL BE SENT OUT IN FEBRUARY**

**PRES. WM. MCKINLEY**

Color brilliant crimson, with scarlet shading. Plant dwarf, growing from 2 1/2 to 3 feet high in rich soil. Foliage deep green, with heavy chocolate margin. Plant stools freely and is an abundant and very early bloomer. The flower stems are highly colored as in Alphonse Bouvier. The trusses are large, of good shape and held well above the foliage, and the growth is compact and even. This variety may be considered a marked improvement upon Chas. Henderson, Columbia and other crimson cannas. The effect when massed is extremely brilliant, the color contrasting finely with the deep green foliage. We place this variety at the head of the list of crimson cannas.

**ALSO THE FOLLOWING GENERAL LIST OF CANNAS READY FOR IMMEDIATE DELIVERY:**

Chas. Henderson, A. Bouvier, Ami Pichon, Midway, Chicago, Alex. Billard, Papa, Beaute Pottevine, Columbia, Flamingo, Madame Croq, Souvenir de A. Crozy, Queen Charlotte, M. Meissner, Pierson's Premier, Italia, John White, Eldorado, Florence Vaughan, Austria, Count de Bouchard, L. E. Bally, Burbank, Eganale, J. D. Cabos, Admiral Avellan, President Carnot, J. C. Vaughan, Leonard Vaughan and Souv. du Pres. Carnot.

**GERANIUMS**

Clean, well-established stock, from 2 1/2 inch pots. The following varieties are now ready for immediate delivery: Mrs. E. G. Hill, Marvel, Mrs. A. Blanc, Madame Buchner, Rev. Atkinson, Double General Grant, Mme. Chas. Molin, S. A. Nutt, Beaute Pottevine, Leonard Kelway, Madonna, Prest. V. Dubois, W. A. Chalfant, La Favorite, and Mme. de la Roux.

Also a large lot of the following varieties ready for delivery in about six weeks: Alphonse Ricard, J. J. Harrison, Acteon, E. Leguere, Dr. Audiguere, Comtesse de Danne, Bonnat, Mary Hill, Bonne de Villenova, Comtesse de Castris, Triumph of Nancy, William Pitzer, Madame Jones, Glori de France, Madame Aulin, H. de Bonnier, Comtesse de Harcourt, Abilete or Wonder, Olivia, Dr. Kothera, James Kelway, L. Swartling, H. Dauthenay, Mme. Bruant, Benj. Schroeder, Columbia, Midsommer, Gertrude Pierson, McMahon, Silver Queen, Gettysburg, and a fine collection of Ivy Geraniums.

and believe that it will prove invaluable for bedding purposes. Certified. Trade prices 75c. each; \$60 per 100, from 4 inch pots.

**DEFENDER**

Color clear yellow, striped with bright scarlet. Height 3 to 3 1/2 feet. Habit somewhat resembling Columbia. An early, very profuse bloomer, producing fine large heads of broad petaloid flowers. Foliage clean, distinct, and a good grower. This canna will prove very effective for massing, as it produces a greater proportion of flowers to the foliage than almost any other yellow canna. Certified. 75 cents each; \$60.00 per 100, from 4 inch pots.

**BOSTON FERN**

Strong stock now ready, from 2 1/2 inch pots, at \$5.00 per 100; \$40.00 per 1000.

**CARNATIONS**

We have a fine lot of seedlings now under the third year's trial and shall offer as including the following colors: Snow white, bluish white, brilliant scarlet, clear silvery pink and deep Bridemaid pink.

**DAHLIAS**

We offer a fine collection of the best varieties in at reasonable prices. Before placing your orders elsewhere, write and get our prices.

Our Special Wholesale Price List for Autumn, 1897, is now ready and will be sent to any Florist upon receipt of his name and address.

**THE COTTAGE GARDENS, Queens, N. Y.**

**GERANIUMS DAHLIAS**

the weaker growing varieties, and especially the dark colored sorts, of the Roman and Boazetten type. We have frequently seen blocks of this class of rose that had lost nearly all of the foliage by the first of September. At the beginning of the present season we determined to give the Bordeaux mixture a thorough trial. We commenced spraying early in June when the plants were 8 to 10 inches in height and went over them every 10 or 12 days until the last of August. The result is that on the plants so treated we have had hardly a trace of mildew, and we have been almost entirely free from black spot, so much so that to-day, September 25, the dark colored varieties, Jacqueminot, Roman, etc., are as green as in their foliage in July, while Mrs. Laing, Paul Neyron, Fenner, etc., are a mass of bloom, with bright clear foliage. The marked effect of the treatment is shown in several rows of Crinson Rambler and Prairie Queen, where the tops had grown across the rows so closely that it was impossible to get the spraying outfit through them after the middle of July; up to this time they were as free from mildew as the rest of the field, but now both varieties are showing plenty of mildew, while varieties on either side of them in the same field are almost entirely free.

ROBT. GEORGE, of Storrs & Harrison, Ohio.

Black spot is always most troublesome in moist, cool weather; and although it has been known to affect roses both under glass and in the open ground for a good many years, there has been no remedy found for its cure so far. The very disagreement of the authorities is that it affects the action of the roots almost immediately it gets a foothold on the leaves.

The best preventive I have found, in my experience, is first to avoid giving any check to the plants in any form, either through giving insufficient water, or by over-watering, as at certain seasons roses extremely will unduly give a sudden check to active growth. This leaves the plants just in the right condition to start in the fall. The next is to avoid condensed moisture in the greenhouses at night which is very apt to occur (even if no water is used in the house whatever after early morning watering or syringing) more especially if the temperature falls anywhere near 50 degrees during the night. If the house is closed tight, there is sure to be a lot of condensed moisture on the plants in the morning; both or either of these conditions are almost certain to produce black spot.

To prevent these conditions it is much better to keep all the watering, syringing, etc., as early as possible after 9 A. M., keep an abundance of air on during the day, and at least maintain all night to avoid opening the ventilators wide at once to lower the temperature, by simply watching the weather; and more especially when the mornings are somewhat cloudy and cool, just as soon as the thermometer begins to rise or fall a few degrees let the ventilators be also in proportion, till all the air possible is circulating freely through the house. The same conditions and treatment are practically the best preventive of mildew that I have ever found.

In plant growing, as in nearly everything else, the greatest factor we all need to go to is common sense. If you want to raise healthy stock, follow nature's laws. Nature distinctly tells us that August heat is not good for, and January cold is not conducive to, opening choice flower buds; but she does tell us, in most indistinct language, that temperate weather of May and June, September and October is what roses especially delight in.

L. B. S. MAY.

Black spot on the leaves of the rose as grown under glass is caused, we believe, by too much water either on the foliage, which prevents proper evaporation by the leaf cells, or by too much water at the root, which so weakens the root growth and root action of the plant that it does not perform the work of evaporation properly. Place a hundred plants of any American Beauty in four black pots close together, and if too much water is constantly applied, and the growth is rank, the foliage will soon become so dense that evaporation from the soil is checked and that in turn will check evaporation from the leaves by weakening the root action, and black spot will soon commence. Take some 100 plants and spray them four or five inches apart on the bench so that evaporation can be greatly increased by allowing free circulation of sun and air, and the black spot will at once be checked. We believe the primary

Fig. 2. Rose Plant Nearly Destroyed by Anthracnose.

Fig. 3. Root Galls of Roses Caused by Eel Worms.

cause of all the trouble with black spot is from injudicious watering. Have a competent hand, do the watering and with due attention to firing and ventilation black spot will be a rare thing.

If evaporation is unduly checked it will show itself in different ways in different varieties of the rose. In Beauty, La France, Teston, Perle, etc., it will produce black spot. In Bride, Bridesmaid, Meteor, Morgan, etc., it will produce mildew. The reason for this is that of a number of varieties of roses some sort like Bride, Bridesmaid, etc., which when weakened by over-watering become still softer, and are readily attacked by mildew, the spores of which are always present, and only need a little additional dampness to make them propagate very freely.

We regard powdery mildew as simply an aggravated form of ordinary mildew, which will increase in proportion as the foliage is made softer and thinner by lack of air and excess of water.

Anthracnose seems to be a complaint in the rose brought on by general debility, and is only the outcome of a continuance of too much water, over-leaving, over-propagating, lack of fresh air and too loose planting, which last may be called the starting point of a good many evils. We formerly considered one foot each way was sufficient for roses. Only the other day we saw a bed of Bridesmaid, intended for "carrying over," planted 30 inches each way. This may seem like a big step, but it is a step in the right direction. C. A. M.

Professor Byron D. Halsted informs us that black spot is a very widespread and conspicuous disease of the rose, first described in 1826, now known in many countries, and often much dreaded. The professor must certainly possess the experience of rose growers everywhere, when he says that the disease is often much dreaded.

This disease was described in 1826; but I do not believe that the average rose grower of the United States has any recollection of it until the years 1882 to 1885. I well remember my experience with small lot of roses, which were being which looked well enough and grew strong during the summer, but after I had cut the first crop in the fall the plants were covered with black spot. It is probable that the plants got called about the period I was cutting them for the first time. From this disease the plants did not recover during the winter. This was my first experience with black spot, and at that time I knew no remedy for it. I now question very much if there be any known remedy which will kill the spores of this disease. But it is possible to keep the disease in check, by picking off all those leaves on which it has made its appearance. The steam pipes should be painted with flowers of sulphur, and the plants should be dusted with air-slaked lime.

In this matter as in other things, prevention is better than cure, and knowing as I do that black spot can easily be prevented, it seems strange to me that so much is heard of the disease existing in different parts of the country at times. However, I must admit that I am unfortunately located than many of my brother florists, in that I use natural gas for fuel. No florist can possibly know the advantage of this sort of fuel for use until he has tried it. Some readers of this paper may think that I exaggerate when I say that I have over 14,000 feet of glass and have not kept a night since leaving here six years ago.

I grew a house of American Beauty last year (20x100 feet), and I did not have a double handful of black spot leaves in the house during the entire winter season. These roses were planted July 15, and the ventilators were left wide open until cool nights in the fall. But, whenever the thermometer indicated 60 degrees outside I closed the ventilators half and ran steam around one 1½-inch pipe and returned pure by leaving the air on, and the steam pipe kept the moist, cool atmosphere from settling on the plants, and thus prevented favorable conditions for black spot.

The steam pipes should also be painted with flowers of sulphur and lined off as soon as the fires are started in the fall of the year. The house should be kept clean by the removal of all dead wood and leaves. Judgment must be exercised in watering, and surely we do not have a little fire bent in on with the ventilators partly open, in August and September, whenever the temperature falls to 60 or 55 degrees. As soon as the roses are planted it is imperative that the roof should be made waterproof. Good suc-

cess cannot be had when roofs are permitted to remain out of repair. If they are neglected, when any sudden check had been given my roses, black spot and mildew would appear on American Beauty and on the hybrid in the greenhouse. Such sudden changes as having it too dry, or too wet, or a sudden cold or a sudden frost, or a sudden change of place, produce conditions favorable for the disease. If these little details are observed and taken into account, it will be no need of ever being troubled with black spot or mildew in the rose house.

It is impossible to grow American Beauty in Indiana outside more than one or two weeks in the open air, because the changes in temperature and atmosphere are so great as to favor the disease. I have all my American Beauty plants inside in solid beds, this being their second year. They were cut back about July 15, and since that time they have made a strong, clean growth, and are perfectly free from red spider, black spot, and mildew. Had my house been closed tight on cool nights without fire heat, I sincerely believe that results would be entirely different from what they are.

W. W. COLES, JR.

\*\* In combating fungous diseases of the rose it is of the utmost importance first, to make ourselves thoroughly conversant with the conditions under which they most generally occur, and the nature of the diseases themselves. Then to take the most stringent measures for their prevention, by keeping our plants in the strongest and healthiest condition all the time. This can only be accomplished by close, everyday attention to the soil, and to such things as caris, water, air, heat and light. Healthy plants ward off disease more readily than do those that are weak. To take the first thing that comes along. The next five or six weeks before strong frost has commenced is a very critical period for the rose, for if the plants receive the slightest check it takes them a long time to get round again, which means considerable loss.

With the majority of growers whose plants are affected by fungous diseases during this season of the year, I believe the chief cause, nine times out of ten, can be traced to long, cold, and rather dry weather, or proper firing. There is very seldom a night now when firing should not be done. If we do, I can guarantee that the plants will be very warm at quitting time, the thermometer standing in the sixties, but the next day, or long before that, the temperature drops below the sixty mark, which it invariably does, we get that cool and damp atmosphere, and condensation on the inside of the houses which is a sure forerunner of trouble. It is very unwise to be negligent with the fire.

Ventilating and syringing, too, takes quite a deal of watching these days. I have advocated time and time again the free circulation of air through the houses at all times, and lots of it, but great care now must be exercised during a warm shine. If the wind be cold, that a chilly current does not strike the plants.

As regards syringing, if the weather be fine two or three times a week, if well done, is sufficient to keep out spiders, and to keep a great deal of moisture in the soil by turning on the hose every day in a rose house during the Fall months. When watering the root, get my plants one good soaking that reaches to the bottom of the bench, and then leave them alone until they are dry enough to take another.

As has been mentioned before, it sometimes happens that after every precaution has been taken to keep our plants entirely free from the disease, and that one or the other puts in an appearance; then steps should be taken to eradicate them at once.

Black spot is by far the worst disease we have to contend with, and, so far, I have never found a fungicide that will cure it. A leaf or part of one, when once affected will surely turn yellow and fall off in two or three days. The best way to combat black spot is to pick off immediately each and every leaf or part of one that has got it, and consign them to the fire. This disease is very contagious, therefore it is most advisable to pick off the leaves before the spores get ripe and burst, or the next time syringing is done they will be blown all over the house. If it is necessary to keep out spiders, the trouble attains a virulent form; but if it persists, a fine spraying on bright mornings with a dilute solution of carbonate of copper will tend greatly to its prevention, and if the plants are so badly infested with Beauty, have made a good growth and are otherwise healthy, a sulphur water may be made up with one-half pound of nitrate of soda

added to the barrel, given once a week, for two or three weeks, should make it entirely disappear.

Anthracnose is a very strange disease, occurring often on a seemingly healthy plant in the midst of healthy surroundings. While not so dangerous and not so often met with as black spot, it is nevertheless very contagious, and if once allowed to get a start will work through a whole house in a few days. Clean up the dead leaves and cut out the dead parts of the plant, after which they should be well-sprayed once a week with the ammoniacal solution of carbonate of copper, which is a very effective remedy. But don't use manure water as an advocate for black spot; on the other hand, withhold water at the roots to a reasonable extent

on the pipes where steam heat is used is the most effective way, and when the weather is too warm, to use artificial heat, close down the house a bright day after syringing, then go through the house with the bellows and fill the air full of sulphur. It quickly settles down, even all over the foliage, and by keeping the house closed tight, for ten or fifteen minutes, the warm temperature will make the sulphur much more effective. When ventilation is resumed, avoid putting up the ventilators full all at once; better raise them gradually. H. H.

**Fungus Disease of Chrysanthe-mums.**

There are several fungous diseases of chrysanthemums. The oldest known, and very common one being the mildew or Oidium. This consists of fine, cobwebby filaments that are confined to the surface of the leaf and give it the appearance of being dusted with flour. It is less destructive than most of the other kinds of chrysanthemum diseases.

The leaf spot is one of the leading troubles of the chrysantheum, and first appears in small brown spots upon the foliage, which increase in size cause the death of the leaf. The illustration, Fig. 4, is made from a leaf by sun printing and shows the location of the fungus (Septoria Chrysanthemii E. & A.) by the dark patches that are generally along the irregular margin of the leaf.

Fig. 5 gives a view of the microscopic structure of the fungus. A spore-bearing cavity is shown to the right imbedded in the substance of the leaf in which long slender bodies, the spores, are produced in great numbers shown more enlarged to the left. These spores, unlike many other kinds, are made up of several cells placed end to end. Barely blighted leaves have their surface covered with these spores that have come from the small openings in the spore cavities and may be carried by water at spraying time to other leaves and plants, and thus spread the disease. The Bordeaux or other remedy falling upon these spores kills them either when they are freshly issued from the diseased spot or after they have been carried to the surface of a healthy leaf. All badly diseased leaves should be removed and burned.

A second form of blight is shown in Fig. 6, which three years ago was being photographed full length. The fungus causing this distressing condition of

the chrysanthemum was discovered only a few years ago, and bears the long name of Cylindrosporium Chrysanthemii E. & D. It is a very common disease in California previously considered, and the affected plants are often stricken down so that they can hardly stand. To discover Mr. Dearness of London, Canada, describes the general appearance of the disease as follows: "The fungus can be easily recognized by the dark blotches usually about half to three-quarters inch in diameter. In these blotches are found the spore-horns or pits and beyond them the leaf turns yellow; not long afterwards they can be easily seen to dry downward to the stem." This condition of things is well seen in Fig. 6, where it is almost entire collapse of the foliage is shown.

There are varieties that are much more susceptible than others to this Cylindrosporium, and growers will need to take careful notes on this subject of the trouble and be guided accordingly.

A single leaf that is badly blighted with the blight in question is shown in Fig. 7. The large dark spots are located with order, and the remaining portions having lost their characteristic green color, the leaves present anything but a healthy appearance.

There are other fungi that interfere with the growth of chrysanthemums, as for example, one that attacks the cuttings and which increases to such an extent to damp off before the roots and buds start to grow.

Last, but not least, there is a genuine rust, probably Puccinia Tanacetii, D. C., that has made its appearance upon the chrysanthemum during the past season in an alarming extent. One florist has written me that he may lose his whole crop. This rust appears upon the foliage in numerous small chestnut spots, somewhat like those of the spider mite, through which the fungus has pushed itself and produced the heaps of oval brown spores. Its general appearance is not unlike the rust upon carnations to which it is closely related; but there is no reason to suspect that they are identical.

This rust is a fungus that establishes itself all through the plant before it begins to show any of the above symptoms, but little hope of relief in spraying.

Fig. 4. Chrysanthemum Leaf Spot.

until the plants begin to grow out of the disease.

Providing roses are growing in good, light houses and receive proper attention as regards ventilating, firing, etc., soiling very little need be feared from the white powdery mildew; but every year we see very bad cases of it which in many cases can be attributed to nothing more or less than neglect. When a house becomes badly affected, it takes quite a long time to get entirely rid of it; whereas if taken in time it is an easy matter. As soon as a mildew appears sulphur should be applied according to the methods given so many times in this paper. Painting it

Fig. 5. Leaf Spot Fungus Magnified.

The better method will be to pick off all affected leaves and burn them.

The remedies herein have been treated sufficiently in describing some of the diseases, but here are some remarks that apply to all of them, so far as may be a concluding paragraph. In the first place the stock from which roses and chrysanthemums are to be propagated should be of the very best. Here as with other plants, a weak, diseased plant may be expected to produce kindred settings are taken from it. There is in the seed place much to be done in the study of varieties and their susceptibility to fungous diseases. If there is a predisposition, so-called, to disease, the grower should, if possible, know it and turn aside from such sorts. For example, the chrysanthemum variety called Working should be swept off by disease in many places successively for years, and growers should rank this chrysantheum as being accordingly. In the third place, the blighted parts when they first appear are less in number should be picked off and burned.

As a last resort as here mentioned, but not in fact, is spraying; and if the grower is to use a fungicide it is wise to begin with it early and spray frequently and liberally. The Bordeaux is the standard mixture, and is made with varying proportions of the ingredients, but the following may be used as a substitute. Dissolve in sulphuric acid a few gallons of water; sink the lime and add a few gallons of water to it, dilute with to hold the total amount of water. Strain instantly. If a limess mixture is preferred and the foliage may be kept green, ordinarily, it may be made by dissolving five

ounces of carbonate of copper in three quarts of ammonia and adding 30 gallons of water. The mixture should be added to the ammonia, and the mixture diluted with water. While not quite so effective as Bordeaux, the fungicide has the advantage of not coating the plants with a white deposit.

There are evil worms that injuriously infest the roots of chrysanthemum, and these worms are the greatest enemy of the plant under the head of nematodes in rose roots.

In writing the above notes the author has drawn liberally on his previous published observations as found in the *Journal of the New York Experiment Station*, an address upon "Fungous Diseases of Ornamental Plants," *Chrysanthemum Annual for 1895*, the *Cultural Society*, and an article upon "Fungous Diseases" in *The American Chrysanthemum Annual for 1895*. The cuts are from the same sources; figures 6 and 7 by permission of the American Florist.

BYRON D. HALSETT, Experiment Station, New Brunswick, N. J.

GROWERS' PRACTICAL REMEDIES

Fortunately for me, I have been blessed with chrysanthemums that, for the most part, consequently have made no observations of the troubles you mention, beyond a few cases of mildew which I treated with sulphur. I shall read what others have to say with interest, as to be forewarned is to be forearmed.

A. HERRINGTON.

During my ten years of growing I had practically no trouble with disease in my chrysanthemums. About this season of the year the greatest trouble experienced is mildew, and I always found the best remedy was to water only in the forenoon, and when the nights were cool or muggy to start a moderate fire, with sufficient ventilation to cause a free circulation of air.

THOS. H. SPALDING.

From experience and observation we always associate rust on chrysanthemum with a high soil water in acid. This may result from over-watering, bad drainage, drip, etc. Such condition, particularly in the case of the Golden Wedding, seems to be conducive to rust. We endeavor to avoid this by very careful watering, and, practically, we have had no rust for the past two seasons, and no vestige of it this Fall, although too early to say so.

Mildew we seldom see on any but Chinese varieties, and only in the early part of the season, we dust with sulphur; later, when steam heat is used, sulphur is applied to these once a week as a preventive.

Leaf-spot and stem-blight we have had no experience with.

THEO. F. BECKETT, Penna.

In regard to the diseases of the chrysanthemum mentioned, I have had experience with mildew, and rust. The leaf spot has occurred with me usually when the plants have been grown in a cold frame the year before, and they have been practically free from it when the soil has been changed before planting.

Mildew can be as easily handled on the chrysanthemum as upon the rose by the use of sulphur, and I have used this one of the least of its troubles.

Rust upon the chrysanthemum seems to be entirely new to me, and I have never for the first time last season, principally upon the variety the Queen. It has been reported to me in chrysanthemum culture as its ally, the carnation rust, is on the carnation. I have found it on the chrysanthemum, and in the least. Some varieties seem to be proof against it, while others immediately succumb when it is infested.

A. H. FEWERS, Mass.

Perhaps one of the worst diseases of the chrysanthemum is the fungus rust, that is so prevalent in numerous localities this season. I think it is even worse to contend with than the one that made its appearance upon the variety Golden Wedding, and which it took several years to eradicate. This present form will be the most prevalent, and I have seen of a house without any apparent cause. The very best cure you can give your plants is to prevent it. I have tried all the usual (and some unusual) remedies, but have not been successful in such a case, with varying success; but I think that the Bordeaux mixture in weak solution, if used before it is seen, will check the rose of the disease. In this case, however, extreme measures are necessary; that is, to pull up the affected

plants by the roots and burn them; then bury those in proximity to where the affected plants were growing. This usually stops the trouble from spreading.

"Prevention is better than cure." I make it a point to go carefully over and examine the stock plants in the Spring, and if any of them show the least signs of rust they are taken to the thrush at once and burned. Varieties that we know to be susceptible to rust are usually kept by themselves, and in that way are easily examined and the rust noted before it has time to spread to others. The result of this system is, that this year we do not find a trace of the disease on any of our plants.

We make no exception to this rule in favor of new varieties that we buy. If any of them, on being examined, show

down on two or three plants and soak the soil just at a time when there is small chance of drying it out again. I have been in that fix and found it to be very conducive to getting a good dose of leaf spot, and then I had to hold my plants on the dry side to cure them. I don't believe that the trouble can be entirely killed, but it can be reduced from year to year by a selection of stock for propagating, which I take in the summer when the spot is there. With me not all the plants are affected by it, by any means, and there is plenty of time to select from, so that in a few years it may be entirely eradicated. I find picking of the leaves which show traces of it very beneficial, but I believe, that to prevent it is far better than to combat it after you have got it.

THOS. BOCK.

diseases to which the chrysanthemum is heir. We smoke with tobacco stems regularly once a week, and I have been able to show color, when we use the Rose Leaf Extract of Tobacco.

It is a pity that you may say that those few remarks are not to the point— that you of your letter demand that the simple solution of the matter be given. I know, in a great measure, keep at bay leaf spot, stem blight, and rust.

ABRAHAM MACRAE.

It is an accepted saying that life and death just reach each other—the preacher uses stronger language. The vegetable pageant grows and flourishes in the soil, in the plant life, aside from exercising the mind and pocket of the commercial grower. The conditions of soil, light, and air are so graduated that another steps to the front, and your work must be on the alert to meet the newcomer—more than half way.

There are many new phases of disease affecting chrysanthemums, as well as new pests, not down in the usual category, either of which may be more or less due to environment.

However, the limit of this brief article has more qualified to leaf spot, stem blight, mildew, and rust.

I consider that leaf spot and stem blight are both from the same cause, in relation, primarily, arising or resultant from insufficient drainage and unfavorable conditions of soil, light, and air, or over-crowded or the spraying of insecticides.

Leaf spot and stem blight are more commonly met with where plants are grown in solid beds. Insufficient air and drainage are the chief causes, and, but by no means least, over stimulation, particularly chemical fertilizers.

I think too much stress is laid upon the active principle of commercial fertilizers. There is no positive state that exists from reaction more or less, but that sterility. I only recommend chemical fertilizers, and those who use them to be intelligent and conservative to properly handle them.

On containers only on printed instructions or some one else's method—you need your own practical experience.

There is a positive state that exists from reaction more or less, but that sterility. I only recommend chemical fertilizers, and those who use them to be intelligent and conservative to properly handle them.

On containers only on printed instructions or some one else's method—you need your own practical experience. There is a positive state that exists from reaction more or less, but that sterility. I only recommend chemical fertilizers, and those who use them to be intelligent and conservative to properly handle them.

I know of a grower who largely uses chemicals—successfully as far as growing flowers is concerned—but the plants raised by the retailer, from its too perishable nature. Here is another phase of the subject of feeding plants. His work looks like this:

When we can have our different soils analyzed we shall be prepared to supply plant food more intelligently to special products. It certainly cannot be done on paper, formula are like that—so—of value as reduced to practice. Pay more attention to careful preparation of soil, and there will be much less need of artificial stimulants.

Mildew affects plants standing in draughts, and in the variety. Those that are subject to mildew ought to have more room treatment, and the light dusting of sulphur whenever it appears.

Mildew is the least of my troubles, as I have never had it on my plants. Dust or scald is a more serious problem. I cannot cope with it when once a plant is infested, and I have never seen this disease I always feel uncertain about.

I have observed that rust is less frequent on plants that are kept in a hot spell late in August doses one here and there with no other apparent reason than the plants are like that—so—of value as reduced to practice. Pay more attention to careful preparation of soil, and there will be much less need of artificial stimulants.

Various shades of rust are ordinarily characterized by thin or glazy foliage. On the whole, the season has been very favorable to the rust, and the things being equal, I confidently expect a fine showing as well as an increased amount of rust.

"In rain," the queen of grace and beauty, the same chrysanthemum is king of glories, and a monarch of the world. It survives in its season. GROVE P. RAWSON.

Fig. 6. The Cylindrosporium Chrysanthemum Blight.

any trace of rust, they are either returned to the firm of origin, or bought there, or else they are burned.

ALEX. MONTGOMERY, Mass.

In my experience in growing chrysanthemums, I have been troubled with mildew as well as leaf spot. Mildew can be prevented by being careful of strong draughts and seeing that the plants are not heavily watered over the foliage in dark weather. It is imperative that the doors be closed when the ventilators are open, so as to prevent cross draughts. The air on one side of a house, according to my experience, will never produce mildew, provided plants be not watered too late at night in cool or cold weather. At such times the houses must be dry before night, and in cold, chilly weather be careful not to allow cross air in any form. If these details are seen to and certain you will not need sulphur to kill mildew.

As to the rust on leaf spot is something I cannot claim, but I have it reduced this year to two out of 75 varieties. Modesto and George S. Conover had more of it, less in the early season, but at present they are clean. I find that excessive watering will produce leaf spot, very especially in varieties which are susceptible to it. I am very careful not to have any broken glass in the roof that in case of heavy rain will run the water of a row of glass will not run

It has been my good fortune to have my chrysanthemum (and I grow several thousand annually) free from all diseases to which this popular plant is subject, with the single exception of that grand variety Golden Wedding and also Challenge, have had no trouble whatever with any of the recent comers.

You will naturally say, "How can he keep his plants so clean?" Well, Mr. Editor, will tell you. First, I start out with a clean, light and airy house, which I keep clean all through the season. Second, I try to have my young plants, not hard scrubby stuff, such as you often see, but plants that are stocky and soft. As I grow several thousand from a limited number of stock plants, it is evident that propagating the same has to be begun early, say not later than April 1, and to keep those plants just right, when the 20 or 30-inch pots are full of roots, I turn them out of pots and set temporarily in a cold frame, especially required for the purpose, where they will get plenty of light, room, and fresh air. They are left there until they are ready to their permanent quarters about the 1st to 15th of June.

The soil in which they are grown is identical with my rose soil—good firm loam from pasture, with about one-fourth cow manure, and a liberal dash of bone-meal, and I turn them over good. Watering and airing at the right time, and to be one of the best preventives of

When Writing Mention Florists' Exchange

It is remarkable, however, that well-grown plants have less disease, suffer less when any is present, and have vitality enough to produce good flowers in spite of the culture and cultivation intensive further, in that it requires a careful picking of the leaves when grown through, thus reducing the liability to infection.

Stem rot I do not know, unless it be the rotting of one side of a plant, due to wilt and finally die away. There is another disease which attacks one side of the stem, the leaf on the side of the stem call light. Brown spot I know, and very bad it is. I was rather new; it was killing in 1870, being in the plants which came from a prominent dealer, and it showed most upon the leaves of the plants which were so imported with them. But, as my practice, with novelties is to take the tips of the young plants, and throw away the old plants, as they are usually too hard to do any thing with, I escaped it. Telling an acquaintance of my intention to throw these plants away, he thought he could clean them up with a mixture of lime and sulphur, and so I gave them to him. On revisiting his place last Autumn I found the mist in full bloom, and the plants as badly off as the first season. From the same dealer I found the stock of plants in full bloom this year. I have been fortunate, however, to escape it.

Growers will have noticed how some varieties are more liable to some form of leaf disease than others, and this will follow in the case of a new variety. In this matter what precautions are taken to prevent it. It was always a hard matter to keep the houses on Emma Fitzroy, and old Jardin des Plantes usually lost many leaves. I raised a variety which was very healthy, and I carried it to Boston. It was a magnificent show variety, but I finally discarded it on account of the wilting previously referred to. Every year some plants were affected. It was always difficult to keep houses on Mrs. Humphreys and White Cap.

Some are more liable to mildew than others. I can remember the Grand was the best in this respect. Golden Wedding, a more recent variety, will be remembered as taking mildew heavily. Often think of individuals among the human race in this particular, as the consumption and kindred diseases in them had their counterparts among plants, and was to a great extent inherited.

Sulphur is the base of all the fungicides I am acquainted with, and it is as good a thing to use as any. It is used with soap or hot water which should be taken off before the flowers expand, as the fungus spores are not so active in the shades and pinks. I remember some years ago, for mildew, I had sulphur put on the water pipes, which were under pressure, and being a wet day, I thought I would run up the temperature, and note the results. The temperature went up quicker than I expected, and as a result I found the house filled with a white mist. The temperature I heard of the result, but all came out well. Fostite I consider excellent, whatever its composition, but besides sulphur, I do not know of any other.

Thrips has been troublesome this season, and as some fungoid diseases are always present, I prefer to make a compound which will be an insecticide and fungicide as well. An ounce of sulphide of potassium to a gallon of hot water works well, and I have used sulphur and soot in the same way. HATFIELD, Mass.

and *L. candidum*. In Bermuda it occurs in the fields, attacking the plants when partly grown. Frequently the lower part of the plant remains healthy, while the upper portions become diseased. The trouble is also, without doubt, prevalent in the Netherlands, France, and Japan, for the writer has seen plants from bulbs grown in these countries as badly diseased as those from bulbs grown in Bermuda. In this country it appears wherever the bulbs are forced and from a commercial standpoint destroys from 25 to 60 per cent. of the entire crop. This estimate does not include the bulbs that fail to grow or that make stunted worthless plants. The loss from this source is seldom less than 5 per cent., and often exceeds 20 and even 30 per cent.

The work described in the Bulletin mentioned shows that the disease is due to a combination of causes. In the first place the bulbs have become weakened through improper selection and propagation, and this weakening is further increased by the attacks of mites and certain fungi and bacteria. Bulbs which have been weakened in this way might regain their strength if the mites and fungi could be kept down, but these which are naturally weak cannot be made strong. Fig. 2 shows a bulb attacked by mites and fungi. The new is honeycombed by mites and many of the scales are injured by them. A rough sketch of two mites magnified fifteen times appears near the middle of the plate. During the time the plants are being forced they may also be weakened by overwatering, or possibly some aspersion of the roots, or by allowing the roots to become too dry and then overwatering. The foliage of such plants may be free from spots and

the young leaves of plants having soft foliage. The injuries from these causes and from the attacks of insects and fungi are always more severe on the susceptible or naturally weakened bulbs.

The disease cannot be cured or even prevented by adopting any single course of treatment. The fact that the bulbs have become more or less weakened by improper cultivation, selection, and propagation shows the importance of adopting rigid measures to improve the stock. Only the strong and vigorous plants should be used for propagation. Crop rotation should be practiced in order to prevent the increase of mites and the injurious fungi. Leave the stems on the bulbs until ripe, and in all cases avoid premature digging. The forcing which forces the bulbs should exercise care in planting. Throw out all badly spotted bulbs, especially those having decayed bases, and plant in well-drained and well-aerated soil. Endeavor to keep down aphides and mites from the start, and exercise care in watering and ventilating. Avoid feeding with solutions of horse-cow and sheep manures, and use chemical fertilizers instead.

A bulletin describing the disease in full may be obtained by applying to the Department of Agriculture, A. F. Woods.

#### GROWERS' OPINIONS.

In regard to the Bermuda Lily disease, a few years ago when we had to contend with it, we picked out all the diseased plants and put them by themselves, treating them to every known remedy, but they never came to anything; so now, when we see any diseased among our plants, we take them out and throw

them out to develop the flowers is thrown all at once back into the bulb. This causes the bulb to grow out of proportion, which again induces the opening of the scales, thus allowing water, dirt, etc., to settle inside of the bulb, and causing the scales at the base to rot. A.

Fig. 1.—Plants Showing Effects of Lily Disease.

healthy bulb is always close on top. I can pick out every bulb in a lot which is going to get sick by simply opening the scales and looking at the base of a good solid bulb is never diseased.

The only preventive against this disease is lime water, used heavily once a week. But it must not be used before the plants are well rooted and grown to about six to ten inches in height. I found that on some plants where the leaves were showing a little disease, it entirely disappeared on further growth, through applying this remedy. A. SCRIBNER.

During my long experience in the business of floriculture, I have met with about all the likely plant diseases known to man, but I have given those little scientific study, and to give my knowledge any credit, way I feel, would be exposing myself to ridicule by my more learned brethren of the craft; but will say of the insect life, my only insecticide is tobacco in its various forms. I will not allow any of the various oils and soaps to be used on any establishment, although highly recommended as insecticides. I have found most of them more injurious to plants than to the insects; if they do not spot the foliage of the plants, they very often poison the soil.

W. K. HARRIS.

#### A Lily Bulb Disease.

During the past year a destructive wave of fungoid disease almost completely ruined the crop raised in Japan for exportation to Europe. The bulbs received for investigation showed every stage of the disease. In the worst condition, the base of the bulb is alone diseased and somewhat soft; this dissemination and softening of the tissue gradually spread from the base, until finally in the most advanced stage every part of the bulb is of a brownish color, and sufficiently soft to admit of being readily crushed into a pulpy mass between the fingers. Microscopic examination revealed the presence of slender, continuous, hyaline, branched hyphae traversing the tissues in every direction; the cell-walls are never pierced, but gradually dissolved, and it is only at the point of the disease that the starch granules become irregularly corroded and gradually dissolved. So long as the epidermis of the bulb-scales remain intact there is no trace of mycelium or fructification on the surface, but when the diseased bulb is dried to a soft pulp, or when a diseased bulb is cut open, the broken surface is within twenty-four hours covered with a dense, snow-white mycelium, which within three days becomes studded with numerous, upright, branched, and branched, the naked eye, miniature pins with round black heads. The occurrence of this particular disease in the culture and inoculations proved this similar to be correct. The fungus grows readily as a saprophyte on this statement are these. Through the characteristic superficial white

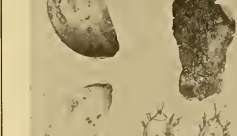

Fig. 3. Lily Disease—Bulb attacked by Mites and Fungi.

Two Mites, magnified fifteen times, are shown in center of plate.

disturbances, but usually the leaves are badly diseased, and finally succumb to them. The principal thing to look out for is to get healthy bulbs and you will be all right. This is my method. HENRY C. STRAIN.

The spotting and distortion of the flowers and foliage is often due to the direct attacks of several genera and species of aphides and of the young of the bulb mite, to the injection of water into the young leaves in watering or syringing, and to the presence of water between

them on the dirt plate, if it is only a waste of time to take care of them. The principal thing to look out for is to get healthy bulbs and you will be all right. This is my method. HENRY C. STRAIN.

The only cause of the lily disease that I can see is over-fertilization and too early cutting of the flowers. My reason for this statement are these: Through too early cutting, the sap distilled by

#### The Bermuda Lily Disease.

Extract from Bull. Ill. Vet. Phys. and Patholog., U. S. Department of Agriculture.

CHARACTERISTICS OF THE LILY DISEASE.—The lily disease is characterized by the spotting and distortion of the leaves and usually of the flowers, spotting of the base of the bulbs, generally a stunting of the plants. In severe cases the first leaves as they appear above ground are more or less distorted, and are marked with small, yellowish white, often longitudinal, and more or less irregular spots or streaks. The leaves cease slightly in size, continue to grow paler, and finally collapse, dry out, and turn light brown. In less serious cases the leaves become similarly affected, and finally the flowers show the shrivelled and distorted condition. The most badly diseased plants are shown in fig. 1.

PREVALENCE OF THE DISEASE AND ITS DISTRIBUTION IN THIS COUNTRY.—The disease is about equally severe on *Lilium longiflorum* and *Lilium Harrisii*, and has also been observed on *L. auratum*

When Writing Mention Florists' Exchange

floose mycelium, which within a week bears an abundance of fruit, on such varied culture media as prune juice, sterilized, decoction of bulb scales, etc. When spores were sown in a hanging-drop along with a very thin section of leaf, it was observed that the germ-tubes could not enter the tissue through the epidermis, and that the fungus formed those points where the cells were not protected by the epidermis.

Numerous experiments were made with other kinds of bulbs, and it was found that fungus refused to grow on onions, however much mutilated. On the other hand, daffodil bulbs are very susceptible to the disease, if the roots are broken, or a wound made in the bulb, and afterwards powdered with the spores, the disease showed itself within a few days, and was in due course followed by the characteristic fruit of the fungus. It was invariably found that, in cover much bulbs were mutilated and then inoculated with fungus spores, submergence for a few minutes in a 1 per cent. solution of salicylic acid or corrosive sublimate prevented the disease; in other words, all fungus spores coming in contact with the above-named solutions are destroyed, whereas the vitality of the bulbs thus treated is not at all affected. Dr. Halsted has described a somewhat similar disease, called "soft rot," as attacking the sweet potato in the United States. The fungus causing this disease (*Rhizopus nigricans*, Ehrh.) is similar to that which attacks under notice, causing the fly bulb disease.

In addition to the kind of fungus fruit already described, a second form, of sexual origin, called a zygospore, is present in the genus *Rhizopus*, several very large spalled zygospores were found in the matted mycelium present on bulbs in the glass jars, and, as preliminary tests belong to our fungus. Zygospores differ from the minute spores already described in containing a somewhat longer and longer period of rest before they germinate, by this means hiding the fungus over that time, and germinating when favorable conditions, climatic and otherwise, obtain. The minute spores, on the other hand, germinate immediately, and zygospores remain in the soil, or attached to the substance on which they were produced, for a minute period, and then described possess the capacity of germination the moment they are mature, and enable the plant to extend its area of distribution; and as these spores are produced very quickly and in immense numbers, it can readily be understood how rapidly the disease spreads when once introduced into a given locality. The fungus causing the fly bulb disease, although allied to *Rhizopus nigricans*, is quite distinct from this and every other known species.

SUMMARY.

The fly bulb disease is caused by a parasitic fungus called *Rhizopus necans*. The fungus cannot penetrate the unbroken tissues of the bulb, but gains an entrance through wounds, more especially broken roots. The amount of evidence forthcoming indicates that the bulbs are not diseased until after they are removed from the ground. The spores of *Rhizopus necans* are killed by a short immersion in a 1 per cent. solution of corrosive sublimate or of salicylic acid. Neither of these substances has any injurious effect on living bulbs, provided they do not remain in the liquid for more than fifteen minutes.

PREVENTIVE MEASURES.

The fungus is by no means confined to fly bulbs for its food, but, as experiments have proved, can live on a great variety of decaying vegetable substances; it may also occur as a parasite on other plants than lilies in Japan, as it readily attacks and destroys daffodil bulbs. Judging from the enormous amount of injury caused, it would appear that the fields where the lilies are grown must be saturated with the fungus, growing indiscriminately on various substances, and that it will continue along with other things, as a matter of course. If practicable, entirely new locations should be chosen for the new work. Even if this were done, great care would have to be exercised, so as not to import the fungus.

The spores are readily conveyed from one locality to another in the soil from the most common disease is one known as spot, which undoubtedly is the fungus. It is very small at first, but if the leaves remain wet for any length of time, it grows and multiplies very fast. So the remedy seems to be to keep the plants dry, as in a dry state the pest

will not develop. Carefully pick off all parts affected, and what watering there is to do should be done early in the day, so that the plants are dry by night. I have used air-slacked lime and Bordeaux mixture on the foliage, but the whole thing seems to hinge on their being kept as dry as possible, until you have mastered the trouble.

Violet Leaves injured by Larvæ of Gall Fly.

work, and cannot be in any way considered as a cause of the disease. Has SEE, in New Bulletin.

Violet Diseases.

There are a number of diseases affecting the violet, but some varieties are of such a robust constitution that they seem able to throw off disease; others not so strong are more easily affected, and where violets are grown year after

year, it is caused by pulling large runners instead of cutting them.

Another which we used to call heart rot is caused by the gall fly depositing its eggs in the young foliage, causing them to curl up and bend over and finally to rot. I have seen hundreds of plants with the hearts entirely destroyed. I think a few applications of hydrocyanic gas will stop the trouble. I know it will kill the mature fly, which is the cause of it.

The so-called violet spew I never have to complain of. I have bought plants at several places, which is the price of success. Get as good stock as you can procure, put the plants in proper temperature, which is about 35 degrees at night for M. Louise and 40 degrees for L. H. Campbell will do well at 40 degrees and over. Use common sense, give what nature gives to violets and you will meet with a reasonable amount of success. BENJAMIN CONNELL, PA.

The so-called violet spew I never have to complain of. I have bought plants at several places, which is the price of success. Get as good stock as you can procure, put the plants in proper temperature, which is about 35 degrees at night for M. Louise and 40 degrees for L. H. Campbell will do well at 40 degrees and over. Use common sense, give what nature gives to violets and you will meet with a reasonable amount of success. BENJAMIN CONNELL, PA.

The leaf rot I never had. In my opinion, it is brought on by keeping the plants too wet at the roots.

The so-called leaf wilt I never have met, but it is brought about through too much moisture in the air house.

It is my candid opinion that most of the causes of these troubles lie with the grower, and not with the plants. I have grown violets for over 25 years, 10 of them on Long Island; have never been troubled with any of the so-called violet diseases. But if I would close my houses tight when the glass stands at 60 degrees outdoors and at 50 degrees indoors, I would have lots of disease. The only and best remedy is the grower's own, and that is, to give close attention to airing, watering, and light.

GEO. T. SCHUMMERN.

Violet Spot.

From a Photograph by P.H. Dorsett, Div. of Veg. Pathology, Washington, D. C.

Still another disease of which I do not know the name, but I will describe it in this way: The edges of the leaf become wilty; you can hardly discern it at first until it begins to dry and whiten, until almost the whole leaf is involved. Now the cause is a difficult one to get at. It can be produced by using strong fertilizers which injure the root hairs, thereby

putting them in a condition so that they cannot absorb water, although there may be an abundance in the soil. Again, it can be brought on by nematodes or eel worms, as also by unfavorable conditions in the soil, and in the house. If the soil cools down as low as 20 or 30 degrees and continues in this condition for six or seven days during cold and cloudy weather, the roots of the plants are put in a condition that they cannot rapidly take up water. Then the weather sets warmer with bright sunshine, a rapid loss of moisture from the leaves results, and the roots in the cold ground cannot absorb moisture enough to meet the demand made by the foliage, the result being that the little cells in the leaf walls and the ones become fatty and wilted. As I said before, this trouble is not noticed until the leaf begins to turn white.

This brings up the whole question of the relation of the physical properties of the soil to the growth of the plant; that is, air, heat, and water, to crop production. WM. G. SALTWOOD.

WHAT OTHER GROWERS SAY.

To sum up in a general way I would say nothing counts so well with me as eternal vigilance, which is the price of success. Get as good stock as you can procure, put the plants in proper temperature, which is about 35 degrees at night for M. Louise and 40 degrees for L. H. Campbell will do well at 40 degrees and over. Use common sense, give what nature gives to violets and you will meet with a reasonable amount of success. BENJAMIN CONNELL, PA.

I have grown violets for over 25 years, 10 of them on Long Island; have never been troubled with any of the so-called violet diseases. But if I would close my houses tight when the glass stands at 60 degrees outdoors and at 50 degrees indoors, I would have lots of disease. The only and best remedy is the grower's own, and that is, to give close attention to airing, watering, and light.

I am sorry that I can give no information which will be of much benefit to those looking for a cure for the violet leaf wilt. I firmly believe that the former can be prevented, to a very great extent, by keeping the foliage dry at night, and I have followed the practice of keeping the such over the plants at night as soon as the dew begins to show itself, and by watering early enough in the day to allow the foliage to dry well before sundown.

As an evidence strengthening this belief have recently had experience. I had a quantity of surplus plants in a shaded but well-ventilated greenhouse, which we removed to an open frame. I found they were spotted in a few days, and they took on lot uncovered, and that others which were covered with boards at night, kept clean.

Those planted in frames for our own use are invariably covered with such. The latter resting here each end on a single scattering board on rafters which provide thorough ventilation, and over which I scatter a little green grass or weeds to supply necessary shade during hot weather, and which gradually dries and by degrees brings the plants to brighter sunshine and stronger light. This is the only cure for the disease, removed by sliding it off in dull weather with the back of a dry rake; and, in my opinion, it is better to use any other substance smeared on the glass.

I have never had much trouble with the dew being to show itself, and by watering is better than cure, and I think, as usual. J. R. FREEMAN, Washington.

CARNATION DISEASES.

Bacteriosis of Carnations.

The disease which has formed the subject of our present article is essentially the one so described by Arthur and Bailey in their bulletin on this subject, and that it is not caused by bacteria. Our material was obtained from many of the large centers of carnation growing in the United States, and through the kindness of Dr. Arthur, good specimens were recently sent in from Mr. Fred. Dornier's place near La Fayette, Ga. Summarizing the work as published in the Gazette, it may be said that:

(1.) The disease of carnations characterized by the symptoms already described and generally known as "bacteriosis" is widespread and destructive.

(2.) In the earlier stages of the disease neither fungi nor bacteria are present, so far as can be determined by the most careful microscopic studies and bacteriological investigations.

(3.) As the disease advances various organisms may appear, but their presence is not constant.

(4.) Infection experiments with such organisms, carried on under rigid bacteriological conditions, resulted negatively in every case.

(5.) A disease having all the characteristic symptoms of "bacteriosis" except the presence of a bacterium, is produced by the puncture of aphides, as was repeatedly proved by the sterilization of these insects on the plants.

(6.) That the aphides alone are responsible for the disease is proved by the fact that the injuries produced are not accompanied in the earlier stages by fungi or bacteria. The aphides, therefore, cannot be looked upon simply as carriers of some fungus or germ.

(7.) The disease similar to may respects to those produced by aphides also result from the attacks of thrips, an insect never previously mentioned as a carrier of ergasia, although generally overlooked by growers.

(8.) The carnation is a plant readily influenced by the conditions under which it is grown, and as a result the reaction to the attacks of aphides and the susceptibility to their attacks not only vary with varieties, but with individuals of the same variety. The plants grown under improper conditions will show more of the characteristic injuries from a given insect than those raised under those where all the conditions have been favorable for growth.

(9.) The selection and propagation of stock furnishing soil, moisture, light, and air, so adapted to healthy and vigorous growth, and keeping down to a minimum the number of aphides and thrips, will enable the grower to successfully combat the disease.

ALBERT F. WOODS.

Diagnosis of Carnation Diseases

Carnations are subject to many well marked diseases and a multiplicity of ill-defined disorders. Some of the diseases are so readily recognized that they can give the grower, who is well informed, the confidence of a master of the situation. It is able to detect the disease in its early attacks, and to some degree is usually able to check them sometimes to such an extent that the disease is only occasionally taken a survey of the enemy's camp, and see if the line of attack is being pushed forward. But every progressive carnationist will desire to have means for recognizing the various kinds of maladies, especially the most pronounced, and to get at the remedy, so far as any remedy is known.

The rather long list of diseases which follows should rightly no one but the careless grower, if plants properly grown and handled will rarely exhibit any of them, or only show them in a mild and inactive form. But every progressive carnationist will desire to have means for recognizing the various kinds of maladies, especially the most pronounced, and to get at the remedy, so far as any remedy is known. The rather long list of diseases which follows should rightly no one but the careless grower, if plants properly grown and handled will rarely exhibit any of them, or only show them in a mild and inactive form. But every progressive carnationist will desire to have means for recognizing the various kinds of maladies, especially the most pronounced, and to get at the remedy, so far as any remedy is known.

Rust.

The best known, the most dreaded and most talked about disease of the "divine flower," is fortunately the most readily

detected, is rust, a disease imported from Europe, and only known among us for the past six years. We shall probably never be able to drive it from the country, although it affects no plant but the carnation, and so we should learn to control it. It may be recognized by small blister-like swellings on the leaf or stem, usually somewhat larger than pin-heads, filled with a brownish powder that will adhere to the finger. At first the blisters have a thin covering, easily rubbed off, but it soon falls away, leaving a white, soft-like powder scatterers out. The powder is made up of the spores of the fungus *Puccinia carnationis*, which enters the plant by means of spreading the infection. No other carnation disease shows such a powdery character.

If rust has not yet appeared in the establishment, it should be watched for, sometimes as wide as the leaf, but often a burned. If already abundant, it should be reduced by hand picking, and by using a spray of copper sulphate (two pounds to 45 gallons of water) once a week. Additional precautions and aids are given in Bulletin No. 100 of the New York Experiment Station (Geneva, N. Y.).

Spot.

This disease is not difficult to recognize after once seeing it. It shows in form of rounded spots upon the leaves, sometimes as wide as the leaf, but often about half the width or less. The spots have a pale yellowish or whitish center, sprinkled with when mature enough with minute blackish points, like fly specks, which can be more easily seen by holding the leaf to the light. The border of the spot is dark, generally reddish, shading off into the healthy green of the leaf. A spot shows almost equally well upon both surfaces, as the tissues of the leaf are practically dead. When on the stem which it is especially injurious, the characters are not so well marked. It is caused by a fungus (*Septoria dianthi*) and is spread by minute spores.

The treatment of this disease is essentially the same as given above for rust. Although a disease not so much to be dreaded as rust, yet it should never be allowed to become abundant.

Bacteriosis.

This is a common disease, easily recognized in its earlier stages by numerous translucent dots, seen to the best advantage by holding the leaf to the light. For a time the surface of the leaf remains unaffected in either color or texture. Occasionally, however, even in the earlier stages, there is formed a slight water-soaked appearance. After a few days at the same time increasing in size, and the affected leaves die. If the translucent

The disease and its injury are sufficiently pronounced, it is to be kept in check by promoting the health of the plants, by avoiding wetting the foliage so far as possible, and by keeping the plants as nearly free from aphids and thrips as may be. Further details of

Fig. 1. Bacteriosis of Carnations. Yellow Spotting produced by Puncture of Aphides.

treatment may be found in Bulletin No. 59 of the Indiana Experiment Station (Lafayette, Ind.).

Black Spot.

This trouble has more often been called anthracnose, which is, however, an inappropriate name. It shows most on the lower leaves, especially the bases of the leaves and leaf sheaths. Moisture promotes its growth, and so it thrives best where the plants are thick and the lower leaves kept damp. It shows as black specks scattered over the surface of the dead and whitened leaf. If the leaf is looked at edgewise, the spots can be seen to stand up above the surface, and to consist of minute tufts of black bristles. The fungus (*Volvatella dianthi*) only occasionally attacks the stems, but is then especially injurious.

Although more readily detected on ma-

ture plants, it does its greatest harm in the cutting bed. It produces a rapid damping off. It attacks the cuttings at the surface of the sand, and causes them to soften and rot, sometimes showing the black bristly dots and sometimes not. See further under "Damping Off."

Fairy Ring.

This disease occasionally rises to a serious extent. It is a rounded, circular spot on the leaves of about the size of what is called "spot," but in this case the center of the spot is brown, and the outer edge or blackish rings of a minute velvet growth, bearing the spore which propagates the disease. The fungus (*Plectrosporum echinulatum*) kills the tissue of the leaf, so that the spot shows up upon both sides of the leaf. Sometimes the center of the spot will drop out, leaving a hole. The treatment is the same as for rust.

Black Mold.

This is a disease which only attacks feeble plants. It is a fungus (*Cladosporium biformis* nodosum) that spreads over the dead leaves and bases of the stems in a dark brown or blackish layer, having a firm velvety appearance. It is not confined to definite areas, and does not have a delicate outline. The fungus shows an evident preference for dead parts, especially dead leaves. No grower who looks after his plants later the summer times is likely to suffer from it.

The treatment is essentially the same as for "black spot."

Botrytis.

This fungus (*Botrytis cinerea*) probably is common in greenhouses, especially about well ventilated attics, and around dead leaves and stems, and in particular those that lie on the ground. When the air is warm, it will take root on the flowers, and sometimes it becomes so aggressive as to destroy flower buds before they are opened. It is a very common organism with an even layer of exceedingly delicate, fluffy, gray mold, which grows at an enormous rate. It also does injury in the cutting bench, to be spoken of next.

The treatment of the dead parts, and suitable ventilation, will usually keep it in check.

Damping Off.

This affliction, which shows most in the cutting bench, but also to some extent after the plants are potted out, is caused by a fungus which grows on the surface of the sand, the top drops over, and the whole cutting decays. The first symptom is a softening of the stem, sometimes to one sort, and at other times to another. Two of the most frequent causes of damping off in carnations have already been mentioned. The threads of the fungus overrun the surface of the sand, growing from the minute cuttings to the healthy ones. Sometimes cuttings in an infected bed succeed in rooting, but succumb after they are potted off.

The fungi usually start from decaying vegetable refuse, and the first thing to do is to stop the production of spores by clearing the house of dead stems, fallen leaves and blades, and especially to remove all cuttings as soon as they appear affected. Sprinkling sulphur or other chemicals over the cutting bed does little good. If much infected, by all means save further loss by throwing out the sand, cleaning the ground thoroughly, and refilling with sand never before used for a bench. Further prevention of damping off is to give the plants for a half an hour in a solution of lime sulphur of the strength of one ounce to one gallon of water. Further information can be obtained from Bulletin No. 94 of the Cornell Experiment Station (Ithaca, N. Y.).

Rosette.

The cause of this disease is not definitely known. It does not appear to be common or much to be feared, but is brought about by the stem failing to elongate, and the leaves, therefore, are kept close together in a rosette. The disease is caused by the stems forming crowded rosettes.

The simplest method of treating the disease is to destroy affected plants.

Purple Joint.

This is a still more obscure disease. It appears oftenest towards autumn, and shows at the joints, and the whole plant appears stunted. It seems to be due to the plants being brought out in some way, it may be by cold or sudden depression of temperature.

Cobering Petals.

The flower buds sometimes appear normal until time to expand, when it is found that the petals are agglutinated.

Fig. 2. Bacteriosis of Carnations. Yellow Spotting Produced by Thrips.

are sufficiently numerous, the leaves look yellowish, and afterwards they become whitish. The attack of parasitic bacteria has been given as the cause, but it is not clear whether it is ascribed to the puncture of thrips and aphid insects. See Figs. 1 and 2.

so that they cannot be separated without tearing. The petals continue to elongate and expand. It is thought that a too strong growth of the petals causes the trouble, but it has not been definitely proven.

#### Twittler.

This disease is seen both in the field and in the house. The leaves at the end of the stems are crumpled, and often held by the wind, but they are not prevented from straightening out. The stem also becomes distorted, and the whole shoot is a misshapen. Although not as common as studied as it should be, yet it occurs fairly often in the field, and is caused by insects (probably Rhopalosiphum dianthi) of the aphid sort, that hide beneath the leaves and suck the juices of the tender growth.

Cuttings should not be taken from plants with this disease, as the means usually employed against the green fly.

#### Root Galls.

This is not a common disease among carnations, at least not often recognized. The plant languishes, and the tissues gradually shrivel and turn brown from being attacked. The roots are found. Upon exposing the roots they are found to be covered with small abrupt swellings which are much more than the diameter of an inch thick, and at first of the same color as the normal roots, afterwards becoming more than black. They are produced by nematode worms (Heterodera radicola).

They should be traced not to transfer diseased plants from the field into the house. If the disease has once appeared, this should be original for the benches, and a new piece of ground selected for the next season's outside cuttings.

There are probably other diseases of carnation that will come to light by the same method of observation and close observation. Let us hope that they may be such as become evident along with a better understanding of the needs of the plant and of the conditions for its healthy development, and that we may have no further suppositions from Europe. Here is a "baker's dozen," and none of them are new to the florist who the grower who has learned the requirements of thrifty carnation culture, and who has the means for the prevention of disease.

(Trans.) J. C. AUSTIN, Purdue University, Lafayette, Ind. [In justice to Dr. Arthur, we would state that the article has not been "gotten ready" against time, owing to the pressure of his other duties. He explains that these diseases are very serious, and, unfortunately, we have been unable to procure any beyond those mentioned in the article of Mrs. Woods. Readers are, however, referred to the Indian Bulletin referred to for illustrations of "Insects" and to the American Florist of January 15, 1890, for illustrations of "Insects" and to the American Florist, and March 1, 1894, for others.—Ed.]

#### PRACTICAL PREVENTIVES AND REMEDIES.

An ounce of prevention is worth a pound of cure. We dig carefully, plant carefully, water carefully, and use grape cuttings, and in the winter, if it seems to appear we remove leaves showing it as far as possible, and burn them.

**PREVENTION.**  
I do nothing for any disease excepting to give plants the best culture I know how; and I have no disease excepting rust, and I have the same success under such treatment, and rust with me has never assumed to anything serious.

M. H. HARRIS.  
For rust I find nothing better than fresh air-slaked lime put on with Leggett's powder gun, which is one of the best. I have used it in the form of a kind of powder, and can be prepared of Joseph Beck & Sons, Boston. I powder it with a mortar and pestle in a few days; if there is any sign of rust this will, if followed up, stop it spreading. I have used it in the garden, and in the house. Besides lime is salt water—four ounces of common salt to three gallons of water—order it in the first eight days once in two weeks.

WM. SHERWOOD, Mass.

I do not work to the crops of dorastrating in the field, but in the house. I and my son have grown carnations for commercial purposes ever since their first year. I have not seen any other varieties have depended on maintaining their disease, but the plants and not been withheld.

There is no plant that grows with more native vigor than a carnation, and it becomes diseased only by a culpable error of the grower, or a flagrant treatment of its health.

If it become one disease, no therapeutic means, or a flood of water, or normal hygienic conditions are not sufficient to cure it.

I have fostered the germs of rust and inoculated carnations surrounded with the most beneficial conditions, and returned them to beneficial conditions, and they would leave them.

It cannot persist in a healthy temperature, no more than the yellow fever germ can develop on the Yankon river in Alaska.

L. L. LAMOR, Sr.

We have had more experience and loss from stem rot in the field than from any other disease. The cause of this is unable to solve, as the effects seem to be some under directly opposite conditions.

For instance, two varieties under special notice this season, a quarter of a mile apart, and in different soils, have been equally affected—a new seedling and Alaska. In one patch Alaska went out badly, while the seedling was but very slightly affected. The cause of this result was reversed with an apparent cause. I have always been inclined to believe that the cause of this is a cutting bench lung, and while this in some cases may be true, it is not always so, for the same variety will be affected with nothing of the sort, they being in the best possible condition at planting time. I have seen this result occur several times with this disease. We never spray our plants, and only water when absolutely necessary. I do not know of any other carnation grower who uses these methods. I think if these methods are carefully used to a great many of the carnations, the disease will be kept down away with assuming, of course, we start with a thing but healthy stock.

The carnation grower should start with good stock and clean houses. By careful and clean cultivation a vigorous stock will be raised, and the plants will be able to largely withstand the attacks of disease. Pipes should be kept clean, and the soil should be kept clean.

For rust we are dusting plants with powdered air-slaked lime; results encouraging.

Anthracnose has not troubled us. Under careful cultivation bacteriosis is present, but it is not a serious disease in varieties of weak constitution which should be discarded. While, as claimed by some, it is not a serious disease, it may originally follow attacks of disease, it seems to be readily developed by the use of cuttings from diseased plants; witness Della Fox. Stem rot is by far the most serious disease so far. We know neither cause nor remedy. Several yellow varieties seem especially subject to this disease. One planted with two lots of them in a house recently, all plants are strong vigorous, and are doing well, and the other lot was decimated, of the other lot, one was lost. The plants attacked were not so healthy, and the result was the same. I have seen this result in the field, and that the other, and from strong flowered shoots, the other lot from side shoots. I have seen this result in the field, and that the other, and from strong flowered shoots, the other lot from side shoots. I have seen this result in the field, and that the other, and from strong flowered shoots, the other lot from side shoots.

W. N. KENNEDY.

So much has been said, and so many different remedies, but I have not seen columns of your valuable paper concerning these pests that I feel the task is not too great for me to attempt to do, particularly when I have to disagree with one or all of the authors of these remedies. However, I will try to do this, and give my opinions in one or all of the articles which I may only take the liberty to express. I have seen the worst and was much talked of a couple of years ago, and in the matter short there is no remedy for it. I have used not enough Bordeaux mixture, its effect is not so good, and it is not so good to the world to eradicate it, if the condition of the houses are favorable to its propagation. I have seen it in the field, and in the house, and in large, and in small, and in the house wishes it as a matter of curiosity.

I have seen it in the field, and in the house, and in large, and in small, and in the house wishes it as a matter of curiosity. I have seen it in the field, and in the house, and in large, and in small, and in the house wishes it as a matter of curiosity. I have seen it in the field, and in the house, and in large, and in small, and in the house wishes it as a matter of curiosity. I have seen it in the field, and in the house, and in large, and in small, and in the house wishes it as a matter of curiosity.

When thrown on the market, I take their chances with the general stock; they are all consumptive and die young in age, but old in years, and I have seen many varieties running out in two or three years.

I long ago ceased to apply any remedy of any kind, and I have seen many of those affected plants which I receive every year from different growers. My own experience is that I have seen many varieties running out in two or three years. I long ago ceased to apply any remedy of any kind, and I have seen many of those affected plants which I receive every year from different growers. My own experience is that I have seen many varieties running out in two or three years.

While these remarks apply to rust, I have no doubt that similar treatment will bring about the same success with all other diseases of carnation. This disease, if it is one, I haven't had much experience with, consequently do not know much about it, but with all the different diseases to which the carnation is subject, I do not for an instant believe that any one of them is capable of worrying the grower. Last year I saw several collections of carnations, and I noticed the same thing, and concluded to try doctoring their plants (which is what I know much about) with rust; its terror is past and gone for ever.

JOSEPH REICMAN, Pa.

The subject of the diseases of plants is a study of wide scope, and of great economical value; but concerns the scientific specialist more than the grower. It brings in many other sciences, and it is to give that attention to the subject that I have been so much obliged to learn.

But it is the duty of each grower, especially in his business should give him sufficient insight to know the ordinary diseases of carnation, and to be able to detect them. This much knowledge seems almost essential to success, and properly so, as it is the only way that can help in guiding the intelligent florist in the right path. I have conceded this much to the scientific specialist, and at the same time would earnestly caution the enthusiastic plantsman not to go too far in the scientific direction, and to avoid the suppression or prevention of disease. I hold that nearly all (perhaps all) diseases of carnation are due to improper conditions. Therefore, the very best preventive is the proper care of the plants—

to give them a pure atmosphere, suitable soil, proper degree of light and moisture, and generally consistent conditions, and to avoid any other alter with specks, but also with varieties of any species, and the skill of the florist, and the conditions of the plants. With conditions just right and congenial surroundings, the diseases of plants are reduced to a minimum. Therefore, I would have little dependence in preventive and cure, but would rather trust to the skill and practical knowledge of the cultivator, who keeps his stock in the best condition, and who is free from attacks of tedious diseases.

With the best conditions, a man can do at times his plants will become the prey of his enemies. This to my mind, only one remedy is left, and that is to change of treatment, do not restore health, why make a hospital of our greenhouses, and our nurseries. In each case is to consign the sickly stock to the rubbish heap, and replace with some healthy stock, and I know that some varieties are much less subject to certain diseases than others. Then in the case of a disease, it is best to avoid disease it is best to plant those kinds that are exempt. This is shown in the very best of our carnation cultivation. A number of varieties are almost exempt from it if properly grown. I may give some of these varieties as examples. There are also a number of other kinds that show little disposition to take on any of the diseases of carnation.

It seems to me accounts in great measure for the fact that many growers are free from any of the diseases of carnation, especially subject to its attacks are badly preserved with it.

If we have any presumption on my part, but the truth is I have lost nearly all of my carnations to the disease of the cure of plant diseases. I have seen many of those affected plants which I receive every year from different growers. My own experience is that I have seen many varieties running out in two or three years.

2 YEAR OLD... ROSES 2 YEAR ...OLD...

These Roses have been potted some time and have made a nice bushy growth. I offer them while they last at \$5.00 per 100.

PERPETUAL BLOOMING ROSES.

Clothilde Souper, Leonie Osterlich, Mme. DeWattoville, Princess de Sagan, Ecole de Lyon, Sombrenil, Mine, Barthod, Mme. Welche, Francisca Kruger, Malmaison, Christine de Neuse, Duchesse de Brabant, Madame Elie Lambert, Rainbow, Fink Souper, Bride, Meteor, Triumph de Perret Here, Kaiserin, H. M. Stanley, Marie Lambert, Marie Guillon, Pierre Gaultier, Yellow Souper, Bridesmaid, Perle, Chas. Legrand, Mrs. Degraw, Marie Van Houste, Maman Cochet. (The above list in 2 1/2 inch pots at \$3.25 per 100; \$30.00 per 1000.

CLIMBING ROSES.

Two year old plants in the following varieties, \$1.00 per doz.; \$8.00 per 100. White Rambler, Yellow Rambler, Pink Rambler, Climbing Meteor. The above list in 2 1/2 inch pots at \$3.50 per 100; \$30.00 per 1000.

CLIMBING ROSES.

Two year old plants in the following varieties, per doz., 75c; per 100, \$7.00. Crimson Rambler, Empress of China, Golden Rambler, Rosa Wicharaiana, Climbing Perle, Mary Washington. The above list in 2 1/2 inch pots at \$3.25 per 100; \$30.00 per 1000.

HYBRID PERPETUAL ROSES.

Two year old plants in the following varieties, per doz., 75c; per 100, \$7.00. Paul Neyron, Coquette Des Alps, Magna Charta, Vick's Caprice, Ball of Snow. The above list in 2 1/2 inch pots at \$3.00 per 100; \$25.00 per 1000.

JOHN A. DOYLE, - Springfield, Ohio. When Writing Mention Florists' Exchange

..The Water Garden..

BY WILLIAM TRICKER.

PRICE \$2.00. TWENTY-FIVE PER CENT. OFF TO SUBSCRIBERS TO FLORISTS' EXCHANGE.

This work contains nine semi-photogravure plates, eighteen full page descriptive views of leading Water Gardens and Ponds, and numerous smaller pictures prepared with special reference to this work. On heavy enamelled paper. Elegantly bound. Large octavo.

The text describes all operations from the growing of plants in tubs to the large water garden, excavation of grounds, construction of ponds, adapting natural streams, planting, hybridizing, seed saving, propagation, the aquatic house, wintering, correct designing and planting of banks and margins, and all other necessary details.

This Book is of vital interest in every Florist in the land, and all should buy it and read it. Introduce Water Gardens in your locality and make money.

**FAIRVIEW FLORAL CO., BEATTY, OHIO.** When Writing Mention Florists' Exchange

young plants along in cold frames was a common source of this disease; neglect and the impossibility of proper ventilation, extremes of temperature, etc., all had their effect in producing stem rot. The stem at the ground usually became hard and woody, and once in this condition the disease would be sure to have a foothold. The placing of young plants in any position related to indoor growing is a fair way to invite stem rot.

Best planting, either in the field or the house, is smooth, and very common cause for the appearance of this pest. Plants are often set in a garden or field to a depth than is necessary to cover the roots lightly, will almost invariably die. In the house, the soil should be kept moist, but not soggy. Confined wet weather, humidity, etc., all help to produce the disease. In the better states that stem rot is incurable, and that cuttings taken from a plant affected by it will, to a certainty, develop it. I wish to modify this statement; as the past season's experience with stem rot has shown me that a plant may be treated with it in a mild form and still produce healthy cuttings.

Our experience was with Scott. Last year the first part of the season was extremely wet; there was much close, humid atmosphere; the plants were submerged for but 30 hours. The latter part of the season, however, was all that could be desired in the way of fine weather. The plants recovered fairly well, but all showed slight traces of stem rot, while a number of them, which were badly affected, died in the field. In housing these plants, only the very best were used. The good weather and judicious feeding soon brought the plants into good shape. In this way we managed to have the plants partly overcome the disease. We propagated only from the very best and thickest looking shoots, with the result that this Fall our Scotts are clean and perfectly healthy, showing no traces of the disease whatever.

From this I learn that good culture with plants not badly affected will offset the disease sufficiently for the propagation of clean stock from them. It is quite unnecessary, I believe, to propagate from plants which are very badly affected, unless they are not the cause of troublesome and dangerous disease we have to contend with in the culture of the carnation. H. WISNER.

**A Pre-cription Worth Trying for Rust on Carnations.**

Sulphide of potassium was used by the late H. E. Chittly, of Paterson, N. J., with more satisfactory results when applied to rust on carnations than any other of the numerous formulae which have been so freely prescribed. It is a matter of one pound of this chemical in a kerosene oil barrel, holding about 45 gallons of water, and syringed plants with this solution by a spray pump once a week. Under this treatment rust will not trouble carnations that are not affected with it, and the benefits derived are very marked. In the worst cases this will stop the rust entirely, but it is likely to break out again in one or two days on other parts of the same plant. While it is a matter of one pound, it is likely to prevent the spread of the disease to other plants. He considered it better to purchase the sulphide of potassium in one pound bottles, as then you have full strength; it may be procured in five-pound jars, but it becomes very rankly after having once been exposed to the air, losing its virtue. Potassium sulphide in a weaker solution than above named has been found the most valuable preventive for mildew on gooseberries.

We have trouble with black spot on Beauty and Meteor generally at this season, and I believe in starting fire soon enough, but we have not much trouble when firing all the time. The only way in my mind to prevent attention to ventilation, heating, or temperature, and cleanliness.

On carnations we have had rust and

bacteria (no rust this season up to the present) and believe a solution of salt and lime as above anything to help keep the disease in check. We do not take much notice of these diseases now, as they disappear in spring.

I have had no trouble with chrysanthemums till this year, and V. Morel has got something not good for it. It has not grown nearly as well as former years; leaves are imperfect and spotted or streaked with yellow. A few Bonaniums have shown the same. We had a little trouble with Bergmann first year, but that was the slight now. We never see the old mildew to hurt. I hope I will see some word in your paper that will help me find a cure for what the rust is. J. B. BERNETT, Montreal.

**A Dangerous Canna Disease.**

A fungus that quickly destroyed various species was recorded as long ago as 1854, when it was noticed at San Paulo, in Brazil. Quite recently on account of the destruction of canna by a certain disease, which was named fungus, Fredo Canne (Winter), has been received at Kew from Mr. J. H. Hart, superintendent of the Botanic Gardens, Trinidad. Diseased leaves are at first thickly studded with minute, yellowish spots; this appearance is quickly followed by blackening and death. The disease does not appear to have reached Europe or America as yet, and great care should be exercised in receiving living plants as the fungus, which is a close ally of the hollyhock rust (Basidium vacuicarium), if once introduced, would, in all probability, render impossible, for a time at least, the cultivation of cannae.

**An Exceptional Opportunity.**

We desire to call the attention of our readers to the advertisement on page 942, headed "For Sale—An Established Business." This is an excellent opportunity for some one with a moderate amount of capital to invest, and we recommend those so situated to communicate with Mr. Loder, who has the matter in hand.—Adv.

**Something Every Up-to-Date Florist Wants.**

**Stow's Midew & Red Spider Destroyer**

It is recommended by all that have used it, as the best article on the market for the destruction of Red Spider and Midew on rose plants. It is applied to the heating pipes, and when pipes are hot, instead of syringing the plants, you simply spray the pipes in the form of a fog, which carries the ingredients over the plants, killing the red spider and destroying the midew. Three applications of pipes per week, will keep your rose house in a clean, sanitary condition.

SAMPLE package, enough to paint 1000 feet of 4 inch, or 2000 feet of 2 inch pipe, \$1.00 special price on large orders. Full directions with each order. Shipping charges extra. Retail, 1/2 retail prices. Cash with order please.

**AMERICAN SEED TRADE ASSOCIATION.**  
 President, E. H. BERGER, 1514 Madison Ave.,  
 President, H. B. CLARK, Milford, Conn.,  
 At Vice-President, S. F. WILLARD, Hartford, Conn., Secretary and Treasurer.

New York.—H. H. Berger & Co. report business to be first-class, orders coming in freely for present, as well as Spring delivery. Their first large lot, consisting of Lilium longiflorum, has arrived in good condition. Large-sized bulbs, however, are again scarce. An important receipt from Japan is quinquina in few days. Messrs. H. H. Berger congratulate themselves on their removal to this city. They have taken a large lot on Ann street, within two blocks of their offices which are at 22 1/2 Broadway, 12th floor of St. Paul building, where all re-packing of stock is done, and all shipments for the Eastern States attended to. Their stock is well supplied by direct shipments from Japan to San Francisco, the stock being distributed from there.

Mr. S. B. Dicks, of Cooper, Taber & Co., London, leaves for Europe to-day (Saturday) on the Etruria.

**European Notes.**

**Anxiety for Aster Crop.**

Cool but comfortable, and no great harm done, fairly describes our position here in western Europe. As to the outlook in a general way, the conditions are not quite so favorable, and some of the growers are really anxious. Owing to a most beneficial rain which followed the lengthy drought, a number of plants, especially the early and small portions, which had succumbed before, as is the case almost everywhere, are again vigorously pushing down, are very visible, and unless drier and warmer weather sets in very quickly, much of the seed, particularly of the early varieties, will be of very poor vitality. Your readers will doubtless observe that this is the same old song, but we cannot get rid of this state of uncertainty until the moment that the dry clean seed is safely in the bags. Double zinnias have already suffered badly, many of the best flowerers are a mass of rot. In spite of the rain, nigoneetta is very promising; the crop of the Machet promises to be exceptionally good.

We were entirely dependent upon this year's crop, the price of asters would rule very high, but rumor has it that considerable fragments yet remain from the season just passed, and so prices will probably remain more moderate. Some of the growers are somewhat proud of the fact that their recent exhibit has earned for them the 1,000 mark prize, and a medal of gold or silver for each exhibitor.

Here in the west, turnips, rutabagas, and mangels continue to make good progress, and if present conditions continue, the shortage, caused by laying down much of the land to winter wheat, will be very serious.

EUROPEAN SEEDS.

**Cannas Burgundia and Bavaria.**

The two cannas named above, both from the lists of the originators of Italy, Austria, and America, have been favored by Professor Wagh, with the Vermont Experiment Station, who writes of them in the current issue of Garden and Forest as follows:

"We are somewhat disappointed in these two newest varieties, not because of the qualities, but on account of their close resemblance to Italia. Italia is a beautiful canna, to be sure, perhaps the best one of this class yet introduced, but

Burgundia and Bavaria are so much like it that a careless observer would pass them by as one and the same."

Both varieties are, however, of smaller stature than Italia and have smaller foliage. The flowers in all three are of a brilliant canary-yellow upon which two shades of rich, apricot-red are superimposed. In Burgundia the red colors are run together in the throat to make somewhat regular spots. Bicolors of the latter variety are of the clear yellow, like an exaggerated Queen Charlotte, in a few instances. In Bavaria the red of the darker red shade, while the lighter red is scattered in small dots and spots, and in Burgundia the latter giving an effect more like that of Florence Vaughan. Burgundia is almost a duplicate of Bavaria, and the latter with more of the dark overlying red than the former, and more of the leopardi spots than in the latter.

**COMING EXHIBITS.**

Secretaries of Shows will greatly oblige by forwarding particulars of their respective Exhibitions, for notification in this column.

**BOSTON.**—Massachusetts Horticultural Society. Here, November 25, inclusive. Robert Manning, secretary.

**WACO, TEX.**—Waco Florists' Society, November 10-12 inclusive. Mrs. M. B. Davis, secretary.

**WORCESTER, MASS.**—Worcester County Horticultural Society, November 24-25, 26, 27, 28, 29, 30, 31. A. H. Bacon, Worcester, Mass., secretary.

**CHRYSANTHEMUM SOCIETY OF AMERICA.**

The committees judging new seedlings will be in session October 9, 23, and 30; November 6, 20, and 27. Exhibitors should make their entries (with a few of the charged or new variety exhibited) to the secretary, not later than Tuesday of the week the hibernal meeting is held.

Blooms forwarded to any of the following addresses, express prepaid, will receive prompt consideration:  
 Boston.—A. H. Fewkes, Horticultural Hall.  
 Philadelphia.—Eugene Dailledonne, care of Dr. F. M. Hexamer, Madison Square Garden.

Philadelphia.—Edwin Lonsdale, 1514 Chestnut street.  
 Cincinnati.—W. H. Wittetstetter, corner Bond and Walnut streets.

Chicago.—W. N. Ridd, room 202, 185 Dearborn street.

**SEPTEMBER CUP.**  
 The Chrysanthemum Society's Silver Cup, to be offered annually, will be awarded to the best six varieties, six blooms each (36 blooms.) The first cup will be competed for October 21 at New York. Competitors should forward their blooms to Dr. F. M. Hexamer, Madison Square Garden, New York City, express prepaid. Competition is open to all. No prize money. Those desiring particulars should address Elmer D. Smith, secretary, Adrian, Mich.

**CATALOGUES RECEIVED.**

W. W. BARNARD & Co., Chicago.—Catalogue of Bulbs, Seeds, Florida Plants, etc.

JAMES GREIFER, Cincinnati, Ohio.—Price List of Wire Floral Design.

CORSAK & JOSEPH, West Grove, Pa.—Catalogue of Bulbs, Roses, etc.

LOVELL CO., Little Silver, N. J.—Illustrated Catalogue of Trees and Plants.

SAMUEL C. MOON, Morrisville, Pa.—Catalogue of Trees, Plants, Shrubs, Vines, Fruit Trees, etc.

PETER HENCKENSOFF & Co., New York.—Illustrated Catalogue of Bulbs, Plants, and Seeds for Autumn planting.

**CHRYSANTHEMUMS.**

Cut flowers will soon be here in larger numbers and varieties, and it is well to look after receptacles for them. I find that a glazed drain the answers first rate for storage purposes.

It is decidedly better to keep flowers in water 24 hours after being cut than to send them to market directly by the florist. It is better to have them where varieties are kept for exhibition they will have to be kept in storage for a week or more. When that happens water should be supplied every day and the plants should be cut occasionally. Try to put no more than six flowers in one vase; have the blooms stand straight up and give them plenty of air and among them. Under no circumstances subject them to draughts. A cool, clean cellar is the best place for them.

Glory of the Pacific ought to be right by the time you read this and Elvena and Golden Trophy will be in close after it, followed by such varieties as Mrs. H. Robinson, George S. Conover, and George Washington.

Pot plants will soon be that the stalks and tied into shape, so that the form will be all right before they are in bloom. Use just as few stalks and as little tying material as possible. Of course it is necessary to water them.

Now is a good time to make selections of pot plants for another year. I will name a few of the varieties among the newer ones, for this purpose, in a few

weeks. The present year has brought out more for such a use than we ever had before, and the result is a very large quantity of an increased number of dwarf groups of plants to grow on the variety that grows low, and five feet in height will never answer for a pot plant.

THOS. HOCK.

**QUESTION BOX.**

OPEN TO ALL. FEES TO ALL. Answers Solicited from Those Who Know.

(149) Steam or Hot Water Heating.—Which do you consider the best and cheapest for heating greenhouses—hot water or steam? We have 1000 feet of glass with a southern exposure and grow principally roses, carnations, violets, and bulbous stock.—MRS. F. L. FORD, Co.

Nearly all florists agree that for a single small greenhouse hot water is preferable to steam, but for large ranges of from 7,000 feet and upward, they are about equally divided between steam and hot water. Usage, modern greenhouse boilers and small wrought-iron water or steam? We have 1000 feet of glass with a southern exposure and grow principally roses, carnations, violets, and bulbous stock.—MRS. F. L. FORD, Co.

To sum up, my own choice for less than 2,000 feet of glass would be hot water with an elevated open tank and overhead flows, although the latter would by no means require less equipment than steam, and my experience has been that with a properly arranged system of piping it is rather more economical fuel.

L'Assommoir.

This week the curtain rings down on the final act in the very serious drama of the firm known from end to end of this country...

To a gentleman a decade ago possessed of ample wealth and with a more than usual knowledge of the florists' and fine plants, the establishment owed its inception and its consequent wonderful development...

Some day, not far remote, possibly, Dame Fashion may create the necessity for a dozen just such extensive plants...

That day will come, and many now fly to the rescue of the firm of James H. Pitteiler, we feel sure, when it is generally known that the enterprise had absorbed...

Strong efforts had previously been made to save the business by changing the nature of the product, and the stock of a more commercial character...

The sale was held on the premises, beginning at 10 o'clock, and continued until Thursday, October 7, with Mr. John P. Cleary as auctioneer...

The sale, as a whole, was a surprise to many, inasmuch as it had been predicted that the piling of so much stock on the market...

Small ferns of other sorts, on the whole, sold cheap, figures varying from \$1.50 to \$5 per 100; large ferns were sold, so that stock is widely distributed.

The prices that were obtained for stove and greenhouse plants surprised all who attended. This was largely due to the fact that the stock was hardly resold...

Several amateur buyers purchased small lots. It was in palms that the real genuine surprise came. Enormous as was the quantity of the stock...

Adelwald the Woodman Company, Evergreen, Ala., are issuing a very handsome illustrated catalogue of "South Florida Plants"...

five-hundred stock rearing 838, 840, and \$60 per 100. Another lot of 740 plants in two-inch pots fell to Julius Roehrs for \$100...

Early chrysanthemums are now becoming plentiful, but it appears that the day of the fancy plants has passed...

W. J. Habermehl's Sons are very busy with their department of florists' goods...

The meeting on Tuesday last was a banner one in point of attendance; it was the annual meeting and election of officers...

A Fire Insurance Question. Editor Florists' Exchange: With reference to the question I would like to answer the following pertinent question in your columns:

Why is it that fire insurance requires the guarantee of so much more business than did the Hall Association upon its organization...

Not Fulsome Advertisers! Nine years ago, Mr. A. T. De La Mare of New York, started a very modest little florists' publication...

A Handsome Catalogue. Caldwell the Woodman Company, Evergreen, Ala., are issuing a very handsome illustrated catalogue of "South Florida Plants"...

Sander's New Plants for 1897. This is a neat pamphlet of 28 pages containing an enumeration of the novelties offered by E. Sander & Co., St. Albin, France...

Handwritten notes and signatures at the bottom of the page.

CHANGES IN BUSINESS.

There has not been any perceptible change in business during the past week. All kinds of plants continue to sell well; the quality is daily improving...

CHANGES IN BUSINESS.

ARLINGTON, R. I. - S. H. North has closed the greenhouse here formerly run by William Hay.

WALSH, IND. - Alonzo Ush has opened a florist's establishment here.

RUTLAND, MASS. - Dennis A. Smith has erected a commercial greenhouse here, and will start in growing carnations by William Hay.

LOCKPORT, ILL. - The Morris Floral Company has been organized and will conduct a florist's business in Morris, W. H. Murphy, of this place, is its vice-president.

A Business that Pays.

A well paying business is something that every business man longs to own. It is the height of ambition of those in every line of trade, from the office boy up. It takes many years to build up such a business...

### Wm. J. Hesser's Palms.

Our illustration shows a shipment of palms made by William J. Hesser, of Parkersmouth, Neb., to the Board of Park Commissioners at Omaha, Neb. Mr. Hesser offered the plants when he used last season to decorate the Trans-Mississippi and International Exposition.

### Cleveland.

#### Trade Improving.

A gradual improvement in store trade is reported by all stockeepers. Stock, though limited in variety, is greatly improving in quality. House-grown roses, which a few weeks ago were very poor, have shown a marked improvement, and at this writing large quantities of very best grade are offered. Prices, however, have not changed and best stock brings from 75c. to \$1 per dozen at retail. Carnations show no advance in price, though stocks are much better than they were at previous writing, still retailing at 25c. to 35c. a dozen. Gladioli are about gone.

### St. Paul.

#### Hot Weather Affects Trade.

With such midsummer heat as we have had for the past fortnight, trade has not been very lively. Funeral work has been as good as, or better than, usual, but other lines are dull. Even fall weddings are not as numerous as of yore.

Cut flowers are abundant and good. The first crop of roses is now coming in, the quality good and the quantity proportionate to the weather. Carnations are also abundant and of good quality, the demand being about equal to the supply. Outside stock is dead and dying. Sweet peas are still coming in in small quantities, as are dahlias and gladioli.

There is a good demand for small flowers and ferns. They sell readily, and are frequently called for. There is also a nice trade in bulbs, jardinières, etc., for those who handle them. If more of the growers would solicit bulk orders for fall planting, a nice trade might be had

the more recent visitors were H. A. Buayard, Short Hills; C. Ford, Jr., of A. Herraun, New York; and J. A. Shaw, of Siebrecht & Sons, New York.

VERTAS.

### Ottawa.

A hasty visit to the exhibition last week showed that the Ottawa Florists and Horticulturists were still up to the standard. The leading features were palms, ferns, and groups of ornamental plants from Sorley & Sims, Graham Bros., A. French, and others. In cut flowers Graham Bros., C. Serin, and A. French were the leading exhibitors. In the amateur classes were some very fine exhibits of sweet peas worthy of special notice.

A visit to Strim's establishment showed everything in first-class shape; roses, especially Meteor, being in fine condition. Chrysanthemums were looking exceedingly well. A fine lot of pot plants give promise of an exhibition such as we have never seen before in this section of the country. Carnations were planted out in permanent quarters in the Spring, and the roof was being put over them at the

### Springfield, Ill.

At the State Fair here, held the past week, the competition in fruits and flowers was largely in the hands of the florists of Springfield. The arrangement of palms and other ornamentals was very effective, and some groups would compare favorably with the exhibits at the Fall show in Chicago. In cut flowers the dry weather and heat were responsible for some poor exhibits, still on the whole there was a very creditable display. There was a number of entries and considerable competition.

Brown & Canfield took firsts for collection of stove and greenhouse plants; six palms, twelve ferns, one fern of any kind; and in cut flowers, first by Beauty, Meteor, Bridsalmon, and six varieties of roses. They were also first for funeral design, and dinner-table arrangement. Louis Funerget also took a number of firsts for plants and cut flowers. V. H. Lightfoot won first honors for tea canons; H. F. Falkley for geraniums and begonias; M. S. Hiler was also a prize winner in the classes for roses and carnations; D. A. Hiltner, another very successful gentleman was also successful in the classes for dianthus, dahlias, asters, and petunias. Many florists are looking for collections of annual and heliopsis phlox and verbenas.

### Syracuse, N. Y.

The housing of carnations has been greatly retarded by the dry weather experienced in the early part of the month. Last week a splendid rain fell, and the work has been quickly rushed to completion. The plants are in fine shape, some being remarkably strong.

Trade has picked up considerably since the first of September. Roses are always in demand here; at the present time there are scarcely enough to go around, although good crops are being cut.

The parade on October 12 to celebrate the semi-centennial of the city has assured fact. The Central New York Horticultural Society will be well represented by a grandly decorated float. The Society will also take advantage of this opportunity to advertise the coming chrysanthemum show.

A house of Perles and Sunset at P. R. Quinlan Co.'s greenhouse is a grand sight. The grower has all the trim and without a blemish.

L. E. Marquise has better roses than ever before. His President rose being unusually good. Present Carnot rose is giving great satisfaction, and will undoubtedly be extensively grown next year.

For some reason or other carnations are slow to recuperate after planting the present lot. Those that were planted early are, however, doing well.

The wedding of Frank Marlow was a pretty affair, the house of the bride's parents being lavishly decorated with carnations. Mr. Marlow is a member of the Horticultural Society, and an enthusiastic amateur chrysanthemum grower.

E. D. Wheaton, of Little Falls, N. Y., has just returned to that city after a pleasant visit to his son, W. Wheaton, of this city.

Frost has appeared several nights recently, but no lawn tender, and no exposed locations. C. BANSON.

### New Orleans.

The strict quarantine system is causing great depression in business here. The florists can ship only by mail. Although shipping is slow, it is sufficient to get enough to bring all kinds of business to a standstill. H. P.

### Dubuque, Ia.

William Springfield committed suicide Monday last, by shooting himself in the head. He had been in business here for 20 years. He had not been feeling well lately, otherwise no cause can be assigned for his rash act. He was 60 years of age.

### Jackson, Mich.

On September 20 fire broke out in the boiler room at Lee & Co.'s greenhouse on Grand avenue, and the building was entirely destroyed. A new greenhouse, just erected, was also badly damaged. The firm estimates the loss at \$50,000, and their loss will reach \$300 to \$500. The origin of the fire is a mystery.

### PLATSMOUTH

Shipment of Palms made by Wm. J. Hesser, Plattsmouth, Nebraska, to Park Commissioners of Omaha. Palms will be used at Omaha Exposition next year.

spikes are very short and are used mostly in making up funeral work.

Some violets were seen, but these were from out of town. Some valley is offered, retail price being 75c. to \$1 per dozen.

Chrysanthemums are assuming a place of prominence, and as the retail prices become lower, they will become more popular. They bring \$2 and \$3 per dozen at retail, and a number of varieties are now offered among them by Messrs. Marquise, Montmort, M. M. Bergmann, Marion Henderson and Kate Robson.

#### Bowling Club.

The following officers were chosen for one year at a meeting on Monday evening: President, S. N. Pentecost; secretary, A. H. Graham; treasurer, H. A. Hart; captain, William Strade. After adjournment the balance of the evening was spent in bowling. The highest individual score was made by H. Kutz, 153 points being made in five frames. Any member of the Florists' Club can become a member of the Bowling Club upon payment of one year's dues—\$3.

#### Notes.

Evel Ann, Glenview, has two houses of chrysanthemums that are in splendid condition and promise good returns. Mr. An is now cutting *Marquis-de-Montmort*. The Cushman Gladiolus Co., Euclid, O., are harvesting gladioli bulbs; much of the new stock is now under cover. The bulbs are in good condition, sound and clean, but somewhat smaller than usual, the result of the long-continued drought in this section. Present weather is very favorable to the harvesting of all bulbs. Dry weather still continues and vegetation is suffering badly in all sections around here. We have had but one shower in the past six weeks and a good rain would be welcomed by everyone. G. A. T.

in that line, and hundreds of homes be embellished in the early spring.

#### Crop Conditions.

The growers have all been busy housing carnations and violets, potting bulbs, etc., picking chrysanthemum buds and making necessary repairs before winter sets in. Stock in general is in the best of condition, and should give all abundance of bloom. In roses, *Bride*, *Bridsalmon*, *Meteor*, *Testum*, *Heart*, *Perle*, *Wootton* and *Beauty* are the most generally grown. *Belle Siebrecht* has done well with some. I. L. May & Co. have put in a house of this variety and claim good staying qualities for it. For the counter trade, it ranks next to *Beauty*.

Carnations in this section have made an exceptionally good growth this season, and consequently more are being planted this fall than usual. *Dryad* and *Scot* are the leaders, with *Silver Spray*, *McGowan*, *Portia*, *Garfield*, etc., as second choice. *Rust* is unseason and known this season. Nature itself, with a plentiful supply of moisture and other necessary elements of cultivation, seems to eradicate this disease more effectually than all other remedies combined.

*Calliopsis* and *Calliopsis* is being housed. *Marie Louise* is principally grown here. *Calliopsis* is being planted quite sparingly, probably on account of its being later. However, I predict a bright future for this grand flower.

The May Co. have taken possession of their new quarters on Sixth and Minnesota streets. The Sixth st. store is devoted to the cut flower business. A description of this place will be given later.

The travelers are coming and going all the time, and almost without exception report increased sales. Among

time of our visit. They were looking well. A nice lot of young ferns is being grown from home-raise stock. Young ferns for dishes, jardinières, etc., were also in evidence, as was the veteran *Meteor*, who seems thoroughly acclimated by this time (to our Canadian climate). At Graham Bros., everything is looking first-rate; roses, carnations, chrysanthemums, etc., being all in the pink of condition. This firm is carrying a fine stock of palms of good decorative size, ferns in all sizes in quantities, and varieties to suit all requirements. They have as fine an assortment of dahlias as ever was brought to her.

J. Ehlers, one of the best gardeners we have had in this section of the country, has left us, and gone to New York to try his fortune on the American side. With his experience and ability, we shall expect to see his name appear before long as an exhibitor at some of the leading shows, as he has already taken high honors on this side of the line. He carries with him the best wishes of all the craft who are acquainted with him. VISITOR.

### San Diego, Cal.

C. R. Orent has returned from a three weeks' visit to Los Angeles. He has talked of some of the leading shows, as he has already taken high honors on this side of the line. He carries with him the best wishes of all the craft who are acquainted with him. VISITOR.

Robt. H. Asher has moved the Bartlett place on Golden Hill between 23d and 25th E and F streets. He will make a specialty of strawberries and cut flowers. The Saate F. R. R. folk are improving the depot grounds at the foot of D street, and propose to have one of the prettiest depot parks in southern California. R. H. A.

Also one Locomotive Boiler, 11 ft. 4 ins. long, fire box 3 ft., 9 ins., by 2 ft., 3 ins., with 28 ft. in. tubes, 6 ft. long, has been used for steam at 30 lbs. pressure. Will sell for \$50.00. Is in good order and ready for service at once.  
HENRY A. DREER, 714 Chestnut PHILA., Pa.

## Buffalo.

## Trade News.

Business hardly keeps pace with the unusual supply of fair and pleasant weather that has prevailed during several weeks. A moderate demand for funeral flowers is being met. The market is with fair call from out of town, recently, a rather light supply of flowers has been received.

Chrysanthemums are here in small numbers, but rather better than last week with Montmore from an eastern grower. A few superb specimens of the 1-11. Hebebeck showed both white and yellow, home-grown. Schlegel & Sons, of Rochester, sent Vivand-Joret and Florence Trel on Tuesday of this week, when David Scott, of Fredonia, supplied some of the same. The flowers were really the finest so far shown, and they promised Yellow Queen a few days later. A travelling wholesale price has been \$1.50 to \$2.50 per dozen.

Roses are still small in size, and can hardly be called plentiful in the general market. Palmer's are having a cutting of the Meteor ample quantity, and fair prices.

Most anything that might be named an aster, regardless of quality, is in demand.

Carnations are decidedly scarce, and violets are not of pleasing quality. Some really good ones were seen.

Conditions for lifting stock have been unfavorably dry, but most of this work has been done. A few frosts, the remainder of approaching cold, on Monday night of last week tended to hasten action in this respect.

## Jettings.

David Scott, of Fredonia, was a caller on Monday, this week. He reports the outlook for grape growers in the market for several weeks has not been encouraging. Low prices and slow sales so prevail that a margin of profit is out of the question. Seemingly it is a matter of but a short time that the fine established vineyards must be replaced by other culture.

George H. Lewis, an ardent flower lover and amateur, died on Saturday, October 1st. He was a devoted and generous supporter, both financially and in choice displays made from his greenhouses, in the Buffalo Florists' Club during certain past years.

W. W. Small of Jamestown, N. Y., was a caller on Monday of this week. Vt.

## Providence.

## The Market.

There has been a slight revival in the cut flower business here during the past few days, and the prospects are that this season's trade will be an unusually good one. Asters which have held the market for several weeks are now on the wane, but in their place come the queen of Autumn, the Rhode Island Greenhouses cutting of first quality, and the 1-11. Farquhar Macrae the day following. Dahlias have found a comparatively easy sale, but this which is so new and of unknown heretofore. The first violets made their appearance last week and are doing a good business. They came from Pawtucket, Warren and Johnston simultaneously. Carnations are continuing good and improving almost daily.

## Round and About.

A. Joseph Reynolds, with E. J. Johnston, has returned from his Summer's occupation in Florida.

Timothy O'Connor furnished the plant and floral decorations at the annual opening of the J. B. Barnaby Company last week.

## Norwich, Conn.

The florists here all seem to be doing a safe business and all carrying a good stock of the leading things. Joseph S. Smith has returned from the city and is on Main street. Alfred Hunt is up to date on all things pertaining to the business. Run a very nice and market things lively. The greenhouses of Gustave Gedulte are still being run by his son, Gustave.

Stephen Crane, of the Norwich Nurseries, is having a big run on California privet. He has been carrying a large shade tree to go to Massachusetts. Mr. Crane has almost doubled the size of his nurseries.

## Pittsburgh.

## Trade Notes.

Several good days the past week helped to boom things a little. Stock is showing a little more demand, especially quality and quantity. Chrysanthemums are rather too plentiful already, and as a result of this, the market is being run down to as low as \$1 per dozen for good blooms. The varieties mostly seen so far are the following: Indiana, Duke of Gloire of the Pacific; very few yellow yet. Roses are in good condition, particularly Beauty, and our *Marik* will (good cuttings) are still scarce. Dahlias are not down from year to year, selling at good prices.

## Jettings.

John Rader has broken ground for the erection of three houses; two of them, 28x120 and one, 16 feet, to 12x120 feet. Mr. Rader has been growing into a large stock of palms, decorative plants, and ferns the last few years, and this new addition will be devoted to the same purpose.

Andrew Neilson, representing the F. R. Pierson Co. of Perry Township, Hudson, N. Y., spent several days in the city this week.

Superintendent Falconer of Schenley Park, returned from Nashville, where he had been a member of the horticultural society of that city. Mr. Falconer on this trip picked up a variety of choice plants, which will shortly be on display at the Herbarium of the Botanical garden in St. Louis.

## Omaha.

## A Florist's Society Organized.

A Twenty-three of the florists of Omaha and neighboring cities met in the city hall, September 30, and formed the Nebraska Florists' Society. W. R. Adams, president; W. H. Miller, vice president; Jacob Hess, treasurer; E. C. Erling, secretary; trustees; L. C. Chapin, Benjamin Hass, Benjamin Hass, Jr., Charles E. J. Dever, E. C. Erling, Paul Flath, Omaha; W. J. Hesser, Plattsmouth; C. F. Crawford, Plattsmouth; J. C. Smith, Jacob Hess, Benjamin Hass, Omaha; F. W. Taylor, Lincoln; Robert Unger, Omaha, and W. F. Wilcox, Council Bluffs. The object of this is its principal object the preparation for the reception of the convention of the Society of American Florists and Ornamental Horticulturists, in 1898, and the interests of the trade in the "Trans-Mississippi Exposition." It has ever held to these subjects was laid over to the next meeting, October 14.

DONAGHUE, Jr.

## Cincinnati.

## Trade Still Improving.

Trade is steadily advancing all along. The market for flowers is good and plentiful, but in a sufficiency to supply the demand, and the market is kept well supplied. The carnations are selling daily and bring 75c. to \$1 per 100 wholesale. Roses still sell at \$1 to \$1.40 for teas, and \$1.25 to \$1.50 for doubles. Many roses are as yet scarce. Much damage is resulting from the dry weather in the West. It has ever held an experience in hauling water for greenhouse purposes, you may well say that the lot of the practitioner who does this work is not to be envied. The writer was very busy during the week, shipping plants to quantities in the city and large cities. Lady Fitzgibbon is a variety of carnations which has ever held a reputation, displace Mrs. Bergmann, as it is a much more graceful flower, with a more delicate coloring. It has ever held improved by a little more careful growing; 12½c. has been the ruling wholesale price. The carnations are not to be neglected along side would not fetch more than half that price. The general run of carnations is not to be neglected. It is at least ten days late; even the earlier sorts in this vicinity are not showing up. For the carnations to be ready on the 20th of the month before the old standard kinds and their way into this market, in quantity. E. C. GILBERT.

New York.

Wholesale Market. The week began in the early part of the week began to boom very considerably, but as has been the case now for several weeks, it fell away again by Wednesday so much so that Thursday was entirely in the buyers' favor. The sport of Saturday and Monday is getting to be a peculiar feature; for some weeks it has happened that Monday, which generally is regarded as an off day, has been the best. Owing to a very large funeral order on Monday, white roses were cut and cleaned out; since then these, with other colors, have been over-plentiful and prices low.

Chrysanthemums are now very plentiful. Marion Henderson, Merry Monarch, and Glory of the Pacific all made their appearance on Saturday, October 2; these with the varieties named last week helped to amply supply all possible demand. Prices were not very encouraging but, according to the size of the blooms generally, they realized all they were worth: \$1.25 to \$3 per dozen were taking figures. The variety 'Yellow Monarch' appeared Thursday, October 1. John E. Lager on the day following. The flowers were of excellent quality.

Carnations have sold steadily all the week, and good figures have been obtained. When the flowers were at \$1.50 per 100 was the usual taking price.

Bunches of improved quality have met with a little better demand and for a few hundred of exceptional quality \$1.50 per 100. The grower does not regret the present general supply or sales.

Cattleyas have been very plentiful and necessarily not very dear. They are placed at regular prices, many sales being effected at figures ranging from 20c. to 35c. per bloom, 40c. being the top notch for high grade.

Retail Trade.

One of the principal events of the week was the order on Monday for Monday, for Richmond, Va. Thorley had the order and had four men down there to take up the white roses of the day were used in it.

Two of J. H. Small & Sons' employees were in the city on Monday for the Sun Square Garden on Wednesday for the best hand bouquet. P. F. McKeeney taking third honors, and W. L. Trumppere second.

There has been an increase of theatre orders and a revival of the custom of sending baskets of flowers to ladies in their boxes. If this continues and becomes a habit, orders are in for a good thing, and growers will eventually benefit.

Auction Sales.

These sales are booming right along now; the attendance is good and there seems a general disposition to buy. A great sale of orchids from Gaudin & Co., England, will take place at the auction rooms of John P. Cleary & Co., 10 Vesey street, on Friday, October 13. The catalogue, as usual a very artistic one, has been issued.

Notes.

The Horticultural Exhibition at the American Institute Fair continues to improve as time goes on and promises in many of its departments to be an unequalled field success. On Monday and Thursday of next week roses will be one of the principal attractions, among other cut flowers and in pot plants, valley, eucalypta and geraniums.

Mrs. E. Langlander, Brooklyn's wholesale florist, was married on Tuesday, September 28, at the German Protestant Church, 370 West 42d St. to Miss Alice M. Schroeder.

Mr. E. Lager, Summit, N. J., will deliver a lecture this (Saturday) evening before the Gardeners' Society at 143 Madison street on the subject of "Orchid Collecting and Growing." Mr. Lager has recently returned from one of his adventures in collecting orchids in the mountains of South America, and his lecture will be of the utmost interest to horticulturists. The Florists' Club met on Monday evening, October 11, when it is hoped a final decision will be arrived at regarding the disposition of the Club's general fund valued at \$100. A large attendance is requested in order that this matter may be settled satisfactorily.

The Gardeners' Society will give a flower show forcharity in Hotel Astor, November 12 and 13, under the patronage of the Society Ladies of New York. J. H. Troy will be manager.

Baltimore.

Trade continues to improve. Chrysanthemums from Weber & Sons are coming in plentifully but are not very plentiful but limited. Carnations are getting better in quality; the same is the case with roses. There is no very brisk demand for flowers for weddings.

Holiday Brothers, whose stock is looking remarkably good this year, use a carnation support of four-foot galvanized wire stake bent in U-shape, and inverted, putting the stems in the middle, second stake is bent in like manner, and placed over the plant, crossing the first support. Corsy is tied around to support the plant. Many of the growers hereabout have adopted this plan and are pleased with it.

A pretty window-box was observed the other day in the window of a wholesale florist in the city. It was a combination of sword ferns and lavender phibungo, and produced a very striking effect.

Greenhouse building is nearly finished hereabout. Every one is looking forward to a good season.

Newport.

The final meeting of the Florists, Gardeners and Associates' Club of this city was held Saturday evening, October 2, 1937, at the home of Mrs. M. J. M. by the executive committee. This report showed a most gratifying state of affairs—all needs of the club had been carried out in a most harmonious spirit. As is known, the club was formed for the dispersal of a complete report and arranging a reception for the S. A. F. at the time of its annual convention; and that the effort was successfully completed by the letters read at the above meeting from the Florists' Clubs of Philadelphia, New York and Trenton, all of which were most complimentary.

Our boys are now united in booming the Horticultural and floral exhibitions for membership are to be considered at the next meeting.

Our boys are now united in booming the Horticultural and floral exhibitions for membership are to be considered at the next meeting. The club adjourned, sine die. Florist James S. Cowles, wife and youngest child, called by the St. Paul from New York on Wednesday, October 5, to be gone for three months, the time to be spent in the States and in St. Paul. Mr. Cowles evidently has considerable standing in the steamer line, as he was aboard at the time she was loaded on the Jersey coast, January, 1896.

Toronto.

Business is slow; improving; roses are plentiful and getting better in quality. Carnations are scarce. Violets are seen in quantity but are not very good; poor quality. Some good chrysanthemums are shown, in both pink and red.

The plant trade is also picking up, and our seedsmen all report the bulb trade as being very good this fall. Nearly all bulbs shown are of good quality.

We have not yet had a frost severe enough to cause any real trouble. Bulbs of gladioli, cosmos and other outdoor flowers are still coming in, but not of good quality. The ground here is very dry; we have had no rain for four weeks now.

But few bulbs have come in here this season from the United States; the duty is too heavy for the exporters.

Quebec, Pa.

Isaac Larkin is putting up six large greenhouses here.

Westfield, N. Y.

J. H. Dunn and Son are building a new greenhouse 100x220 feet, for snails.

Van Wert, O.

The Van Wert growers have undergone another change. A. J. Wagener, grower, having retired. The new grower, who has not yet assumed his duties, is Paul Vitman.

Vitman is looking fine, considering the quality of hot weather which still continues.

SPECIALTES

...FOR THE USE OF...

Florists, Nurseriesmen and Seedsmen Tubes for Mailing Plants.

Rather late in the season to advertise these, but we wish the trade to know we have them, and that they are the most practical method devised for that purpose.

Catalogues for Growers, Seedsmen, Etc.

There are few, if any houses which rival ours in the completeness of outfit which we possess for the prompt and satisfactory printing of catalogues; our trade in this line is very extensive, and we are always ready to furnish estimates; large or small, it makes no difference. We have a fine catalogue of horticultural cuts: sent free on request.

Certificates of Merit and Premium Cards.

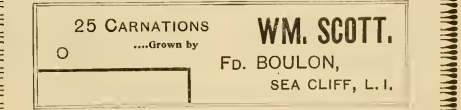

For Chrysanthemum and Flower Shows generally. We have some handsome designs on hand drawn and engraved especially to order, samples and prices of which we will be very pleased to mail you on application. Clubs or associations desirous of having Certificates or Premium Cards drawn and engraved to order, can be accommodated. Prices promptly quoted on receipt of full details.

Exhibition Plant and Cut Flower Labels.

The large growers of New York and vicinity are very pronounced in their admiration of our handsome black and gold waterproof Plant and Cut Flower labels for exhibition purposes. Never was a label gotten up which set a plant or cut flower off to so great an advantage. It gives the finishing touch to beauty. We have these labels in stock, in hundreds of names, covering all the popular Carnations, Chrysanthemums, Roses, &c. Send for sample and prices, and don't fail to provide yourself with a supply before your show comes off or you'll be sorry.

Labels for Cut Flowers for Market Growers.

Did you ever stop to think that a neat, inconspicuous label, bearing your name and address, the name of the flower, and the quantity of flowers contained in the package, would be of wonderful assistance to you in business? We give here an idea of the label we refer to:—

The label is practically waterproof, and we furnish them very cheaply. In use by leading growers. Send for sample and prices.

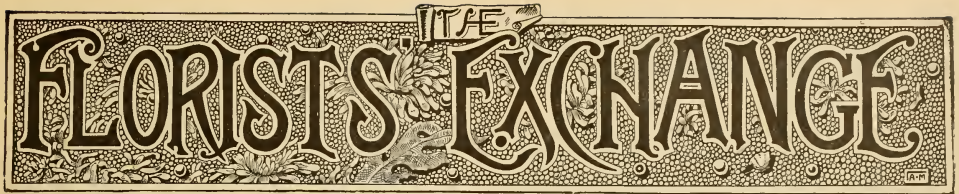

Addressing and Mailing for Catalogue Men.

Our painstaking system of keeping a record of all persons engaged in floriculture has resulted in giving us a list of over 10,000 names of commercial florists, nurserymen and seedsmen, which we have every reason to consider the most reliable and correct of all lists. These names are prepared to address at a moderate figure, and invite your patronage. An unreliable list, even if the first cost is cheap, is unsatisfactory and a poor investment at any price.

We have also many thousand addresses suitable for retail catalogues; people interested in floriculture and gardening generally. Will be pleased to furnish prices and full particulars on request.

A. T. DE LA MARE PGT. and PUB. CO. Ltd. P. O. Box 1697, New York.

We are a straight shoot and aim to grow into a vigorous plant.

A WEEKLY MEDIUM OF INTERCHANGE FOR FLORISTS, NURSERYMEN, SEEDSMEN AND THE TRADE IN GENERAL.

**HEINEMANN'S SEED NOVELTIES**

1898.

*Mossell's alpestris striata caestella.*  
Sky blue, actually pillar shaped, a striking novelty.

*Salpiglossis variegata superbissima.*  
A great improvement, best suited for American climate.

*Begonia hybrida gigantea "Mammuth"*  
Unsurpassed as bedder or pot plant. Flowers of immense size, lovely pale scarlet.

*Vicaria oculata "Bigod Brown"*  
Quite an original color, never seen in any other form.

*Cabbage: Erfurt Runder Kopf (Weisskraut), 1897.*  
The finest pickling sort in cultivation. Whoever tastes it is convinced of its superior quality. Excellent keeper, good size.

*Gloxinia crassifolia "Her Majesty Queen Victoria," '98.*  
Pure white, best for the market.

**SEEK TRADE REPORT.**

Points and information from seedsmen, and all interest in this column, solicited. Address all communications to Florists' Exchange, 114 Chambers St., New York.

**AMERICAN SEED TRADE ASSOCIATION.**  
 JEROME B. RICE, Cambridge, N. Y., President; E. B. BURDETT, Millerton, Pa., 1st Vice-President; S. F. WILLARD, Wethersfield, Conn., Secretary and Treasurer.

**New York.—**The Stump & Walter Co. have now opened their store at 50 Barclay street, with a fine line of seeds, bulbs, and florists' supplies. The young men composing this firm all possessed of vim and energy, and having had considerable experience in the business, feel confident of success in their new venture.

**To Fight Free Seeds.—**We are in receipt of a circular letter from J. A. Everett, seedsmen in New York, which makes the following proposition: 1. By contributing money to ask for, etc. 2. If defeated in this, to prosecute a law suit against the U. N. G. in earnest, which we believe can be done successfully.

2. Fight the seed distribution until the life is knocked out of it, or it will slip the life out of the seed himself.

3. An accompanying separate slip Mr. Everett announces that he is willing to subscribe \$50 toward the object stated, and that he is willing to have the object effected and plans agreed upon to warrant the government free seed distribution. Mr. Everett's official communication with the committee of the American Seed Trade Association, of which executive, Mr. W. Wood Richmond, Va. is chairman, on the subject of fighting the free seed distribution, and join forces with them.

**European Notes.**

**Weather Conditions.**  
 One of the most remarkable features of the present autumn is the entire absence of frost. When the snows fell round Grenoble in the middle of September we learned that we were in for an early and severe winter, but up to the present day no frost has proved to be well founded. The readings of the thermometer continue low, especially at night, but a succession of fairly heavy northerly winds serve to keep their dry, frosty breath from doing the injury seeds to proceed without any interruption.

The usual autumnal work in preparation for next season's crop is being rapidly pushed forward, and the land is in a healthy and productive state. We have not been accustomed to late.

**The Onion Maggot.**  
 The cooler weather is checking the ravages of insect pests, although the onion maggot appears to be as risky as of yore. No satisfactory means of destroying the vermin has yet been discovered, and the idea is gaining ground that the immense quantities of manure used in the culture of this crop are largely responsible for its existence.

**Lily disease.**  
 The same feeling exists with respect to the lily disease, particularly as it affects the plants in the south. It is a disease of France. The thrifty habits of the French cultivators in their dealings with such plants of this kind are well and justly known to those who have had occasion to reside for a time in their midst. It is only when the plants are sold and put into somebody else's hands that it is undoubtedly a serious menace to animal life may also have injurious effects on the human race, as in the case of bulbs. The shortage of sound bulbs of *Allium candidum* this season is very unfortunate, and the likelihood is increasing of remunerative prices to the growers during the past two years.

Judging by the size of the spikes of Roman Hyacinths now coming in from the hills, have fully regained their necessary vigor once more, and if the growers can be induced to refrain from the high culture indulged in '92 and '93 there need not be any repetition of the trouble. **EUROPEAN SEEDS.**

# Greenhouse Woodwork

Open-air-dried Cypress Lumber is more durable, and better suited to Greenhouse conditions, than kiln-dried stock. But you cannot get it from those that are engaged in the business in a small way—even though their entire business is confined to greenhouse material—if it takes a long time for the lumber to thoroughly dry and this means an investment in lumber that only those of large capital can make. The only way to have air-dried lumber is to buy green lumber and hold it until it dries. Those that order dry lumber from the producers of Cypress get kiln-dried stock. It is cheaper for them to kiln-dry than to hold the stock long enough to season it in the open air. We carry a large stock and fill all orders with open-air-dried Cypress clear of knots, sap and all other defects.

## USE.

During late Summer and early Fall we have been firing and ventilating more for the purpose of keeping out dampness than maintaining a given temperature; but it is now time that we turn our attention to the latter especially at night. A rose naturally is a deciduous plant, and therefore is not adapted to conditions that will cause it to go into a semi-dormant state, and therefore it is not safe to keep it so much air, and keeping the plants on the dry side at the root for any unreasonable length of time. I have seen many plants this time of the year, that were perfectly healthy in every respect, still they kept losing too many leaves at the bottom of the plant and otherwise had a decided Autumnal look. La France is the most sensitive variety I know of in this respect. I always run a little higher night temperature during this period, not lower than 40 degrees, and a trifle warmer according to the mildness of the weather. I am well aware finer flowers can be produced in a cooler temperature, but in my experience I have not found it consistent with the growth we are looking for. If our plants stop growing now they will keep in that condition a long time.

In regard to firing and ventilating, it will be found necessary on cold days not to drop the steam too early in the morning, and to put it up to be bright and warm. The day is pretty well along before the sun begins to warm up the houses, and therefore it is better to give some heat to help the day along. We always have a pile of wood in the cellars, and as soon as the weather begins to warm in the morning, we find it much better to put on a little fire to keep up the steam for such a short time, than to put on a very hard coal fire. Of course, where soft coal is used the wood would not be soed. One of our plants stop growing now they close up tight if there is frost in the air, and during this time, especially if there is a cold air, I am very careful about the amount of ventilation, at the same time putting it on little by little as the day advances, and reducing it off in the afternoon. By so doing we get all the benefit from the sun possible, and it happens very bright day the outside temperature stands about 50 degrees. During such times it is very easy matter for a man accustomed to rose growing, when walking through the houses, although the sun would not feel a chilly atmosphere if too much air is on. When using more artificial heat care must be taken that the temperature does not become dry. They should be examined thoroughly. H. H.

## PRESIDENCE.

Insertion will be given in this column to all communications from florists, but the opinions expressed do not necessarily reflect our own.

## Florists' Fire Insurance.

**Ellior Florists' Exchange.**  
The outlook for florists' mutual insurance is much more encouraging this week than last. About \$400,000 of business in all has been promised by the members, and it reports continue to come in as they have in the past few days the Association will be organized within a week. The cities are becoming interested, and the matter is to be presented at the various Florists' Mutuals. Many prominent florists are pledging their hearty support.  
Because the old-fashioned tumble-down greenhouses was dangerous, the insurance companies had just cause to charge high rates; but upon well-built houses of modern construction the present rates are far too high. Florists are compelled to pay from two to five times as much insurance upon their greenhouses upon their dwellings and stables, while the risk upon the former, if constructed upon modern principles, is little, if any, greater than upon the latter. Belief is now in sight for the florists if they want it.  
There is good reason to believe that a mutual association, conservatively managed and accepting no hazardous risks, can give better protection than any of the existing rates.

## QUESTIONS BOX.

**OPEN TO ALL FREE TO ALL**  
Answers Solicited from Those Who Know.

(150) **Red Spider on Violets.**—I have two greenhouses planted with M. Louise violets and the plants are healthy looking, but are badly infested with red spider. They are also infested with green fly, but I use no remedy as recommended in the EXCHANGE, and have about eradicated the pest. As for the red spider, I have tried not to spray, but have any effect upon it. I would like to know how I can eradicate the spiders without injuring the plants. My houses are 50 feet long and 10 feet wide. They have soil beds about one foot below the glass on the low side, and I walk one foot wide. I used 7/8 ounce of potassium cyanide, 1 1/4 ounces of sulphuric acid, and about 1/2 ounce of water, mixed by avoirdupois weight. After my experiment I found that the plants for about three or four days were so injured that where the gas was set off were burned. The young foliage especially was injured, but in a few days it grew again. In one house I used only six ounces of cyanide, in the other I used ten, proportionally, leaving the gas in only two weeks. In this case it seemed to me that the more cyanide I used the fewer were the pests. In a few days I repeated with the 7 1/2 ounce formula, killing all the green fly, but the red spider apparently survived everything. I am anxious to get rid of the red spider, and I believe that the potassium cyanide gas will help me. About how often would it be safe to use the gas, and should it be applied on Troy or on the adopted?—**CYANIDE VIOLET GROWER.**

—In our experience we have found that the hydrocyanic acid gas has very little effect on red spider. Sometimes the spiders are stifled by it for a few hours, but as soon as they get fresh air they are back on their legs as of old work. We consider the red spider the worst enemy of violets, and unless there is constant attention to their care, the start, and then nothing will stop it.  
The only suggestion we can make at this time is to spray the plants thoroughly as possible with water, using if it can be obtained, a pressure of 40 or 50 pounds. Our practice is to pump directly into our water pipes, and by using a nozzle with a very narrow slit we get a strong fan-shaped spray without using a great amount of water. This is quite a convenient thing, and if the water is apt to result in injury if too much water is put on. The spraying should be done in the evening, and then before 9 A. M., so as to give every opportunity for the leaves to dry, and then in the morning, if the dew or the crovas are thick they will not dry for two or three days, and in such cases the spider gets very thick. It is especially if cloudy weather come on. By beginning early in the season, however, the spider need not be so thick, and during this time of the year, when the plants are large, the water can be left off. If spider gets very thick, it may be described in a recent number of the EXCHANGE.  
—In answer to whether or not the proper amounts of material were used in making the gas in your case we cannot say without more details. It is not the size of the houses. From the results obtained, 7 1/2 ounces of the cyanide seems to be about the right amount, provided the plants would not have been injured at all if the material had been divided into a great number of small lots of one. As to the weights used, avoirdupois is correct.—**B. T. GALLOWAY.**

varieties of carnations, the most notable being a crimson named Patrick O'Mara. This same firm also raised 100 sorts of dahlias, including all the best kinds. The F. K. Pearson Co. put up a grand lot of decorative plants for the third week. J. F. K. took the lead in this line, making up a group covering more than 200 square feet with decorative plants of various and beautiful colors. Christmas carnations were not exhibited in any great numbers. Mr. Breancke showed 12 high quality plants from Pacific with four-foot stems, and marvelously well-furnished with foliage, making perhaps altogether the best showing of this variety ever yet seen. A. D. Rose, Jersey City, sent in a white sport from the above variety, the color is of the purest white. In all other respects it is the same as the type. Peter Strick also exhibited a yellow sport from Mrs. Henry Robinson. The color is a lemon or straw yellow, but owing to the flower having occurred on plants grown outdoors, it is a little difficult to describe faithfully. Mr. Strick also exhibited Mr. H. Robinson; A. Wenger, Merry Monarch and Yellow Monarch.

**Pittsburgh.**  
A Fairly Busy Week.  
The past week as a fairly busy one for the florists' trade; quite a number of wedding orders and the bride's bouquet created a demand for flowers. Stock is showing up better in roses and carnations. Our manufacturers are planning to shortly Bergman, and good flowers are sold in the markets at \$1 per dozen. The coming week will bring in some better varieties which will command better prices. Cosmos is scarce this season. Nothing.

Bull sales are slow and prices the same as usual in spite of the extra duty. W. Batz, of New York, Pa., was a visitor during the week.  
**Will Have a Flower Show Perhaps.**  
Pittsburgh may now consider itself on a par with the larger cities, as they have had a horse show which was a grand success financially as well as socially. Our manufacturers are planning to shortly Bergman, and good flowers are sold in the markets at \$1 per dozen. The coming week will bring in some better varieties which will command better prices. Cosmos is scarce this season. Nothing.

**WILL HAVE A FLOWER SHOW PERHAPS.**

# BOUGAINVILLEAS!

**CLABRA (?) and CLABRA SANDERIANA.**  
These plants are bound to become leading decorative subjects. The beauty and durability of their bracts, combined with their protracted flowering season, make them especially valuable for florists' use, for pot plants or for "cutting" purposes. In past seasons our plants have flowered almost continuously from Christmas Day; entire heads of Christmas bloom. Both varieties are strong, rapid growers, very easily handled, not subject to any insect pests, and not at all particular as to temperature. For Easter Pot Plants they are especially valuable, no trouble whatever to flower them, and can be sold for four to six weeks, if necessary.

Send for Circular of "FACTS AND COMMENTS."  
WE OFFER NICE STOCK OF BOTH VARIETIES, FROM 5 INCH POTS.  
Price, \$5.00 per 100; 5 Plants at 100 Rates.  
We will have 4 nice branched plants of either variety, from 2 1/2 in. pots, for \$1.00, or 12 for \$1.50.

## Orchids, Their Collecting and Culture.

Paper read by John B. Lager, Summit, N. J., at the New York Gardeners' Society, October 2, 1895.

Orchids, taking the word in a broad sense, are found nearly all over the world, but the homes of the most beautiful ones are, as we know, the tropics, and especially the epiphytes flourish in all that beauty and where they are found if not in great quantities, at least in luxuriance.

The number of these plants has been greatly diminished the last few years, great quantities have been torn from their native homes and sent to various countries, but what has done more in South America to reduce their numbers is the continually increasing plantations.

Great zones of forests have been cut down lately and the sensitive epiphytes have taken their places. The cut-leave region has suffered the most, its being the right elevation and temperature for the coffee tree, but other orchids have left the change as well, such as the most useful *Oncologytes*, etc.
