INDEX OF CONTENTS.

JULY TO DECEMBER, 1904.

(FOR SPECIAL HEADINGS SEE UNDER BOOKS; CERTIFICATES; LAW NOTES; NURSERY NOTES; OBITUARY; PLANT PORTRAITS; PLANTS NEW; SCIENTIFIC COMMITTEE; SOCIETIES; AND ILLUSTRATIONS.)

A

ABERDEEN Agricultural College, 220
Acer eriocarpum, 267
Aconitum Wilsoni, 241
Acorus Calamus as an insecticide, 131
Actinidia Kolomikta, 4
 Adaptation in plants, 17
Æcidium elatinum on the Silver Fir, 77; *Æ. punctatum* on *Anemone coronaria*, 4
Aëiator hand cultivator, the, 6
Aërides crispum, 134
Æsculus (Pavia) indica, 206
 Agriculture, Aberdeen College of, 220; the organisation of, 188
 Algae in water, destroying, 25
Aloe natalensis flowering at Durban, Natal, 347
Aloe, notes on the genus, 423, 458
 Alpine Garden Congress, the, 171
 Alpine-garden, the, 12, 167
Althaea ficifolia, 133, 347
Amaryllis Belladonna at Kew, 454
 America, marketing Peaches in, 304
 American Apples of high quality, 400
 American Tree-garden, an, 443
Amomum hemisphaericum, 4
Anemone cluster-cups, 4; *A. Robinsoniana*, 167
 Anglesea Castle, the auction sales at, 131
Angræcum Eichlerianum, 163; *A. infundibulare*, 130
 Antarctic expedition, seeds sent with the, 412
Aphelandra nitens, 362
 Aphis, the woolly, on *Auriculas*, 432
 Apiary, the, 7, 57, 93, 129, 169, 209, 239, 279, 319, 425
Apocynum sibiricum, economic uses of, 58
 Apple growing from a tree-trunk, 185
 Apple-mildew, ascospores of, 349
 Apple, a large fruit of Blenheim Pippin, 305; Devonshire Quarrenden, 431; Hambling's Seedling, 394; Lane's Prince Albert, 419; Langley Pippin, 282; Marbrée de Watervliet, 337; Newton Wonder, 41; Rev. W. Wilks, 253; Rose Hill, 367; the Mammees, 465; Titooka, 283; Wyken Pippin, 431
 Apples, a census of the best varieties of, 288, 297, 298, 314, 315, 333, 353, 372, 392, 430, 431, 451, 452; American, "bitter rot" disease, 249; Canadian, 431, 466; colour and flavour in, 275, 290, 306, 334, 353, 372; for exhibition, 296; most suitable for particular districts, a table of 298, 315; of high quality, American, 400; pictures on, 334; the colouring of, and nitrification, 12, 14
 Apples and Pears of similar appearance, 446
Araujia grandiflora, 237
 Arbor-day, at Eynsford, 390; in the West Indies, 416

Arboretum, the Segrez, 161
Aretotis aureola robusta, 238
Arethusa sinensis, 12
Aristolochia gigas var. *Sturtevantii*, 214
 Arnold Arboretum, the, 443
Arum *Arisarum*, 105, 208; *A. corsicum*, double-spathed flower of, 304
Arum, soft rot of the white (Richardia), 410, 466
Arundinaria nobilis, 12; *A. Simoni*, flowering of, 63, 77
Ascochyta viola, a fungus attacking Violets, 328
 Ash, abnormal phyllotaxis of, 133
 Asparagus, manures and soil for, 398
 Assessment of glasshouses in nurseries, 392
Astilbe Davidii, 115
Aucuba japonica, sex variations of, 113
 Auriculas and woolly aphis, 432
 Australia, Apples from, 208; notes from, 61
 Autumn tints, 320

B

BALMORAL, the gardens at, 127
 Bamboos, banks for planting, 243; flowering, 133; the seeding of, 116
 Bananas, Barbados, 368; the trade in, 241
Barleria flava, 399
 Baronshalt, Orchids at, 238
 Basing Park, Hampshire, 38
 Bassaleg, Potato-trials at, 244
 Bateson, W., awarded the Darwin Medal, 407
 Bean, the Tonquin, 440
 Beans, calyces of, pierced by bees, 132, 152; failing to set, 132, 152, 175, 190, 209, 226; some varieties of Broad, 87
 Beech Coccus, the, 58
 Beech-trees at Shipley Hall, Derbyshire, 451
Begonia corallina, 444; *B. Gloire de Lorraine* at Leyswood, a house of, 352; *B. Margaret Gwillim*, 90; *B. unifolia*, 25
 Begonias, at Twerton Hill Nurseries, 243; tuberous-rooting, 167
 Belfast Botanic Gardens, the, 417
 Belgian Chambre Syndicale anniversary celebrations, 389
 Belgian sand dunes, a botanic garden in the, 345
 Belgrove, Mr. W. E. Gumbleton's gardens at, 1
 Belladonna Lily, the Kew variety of the, 454
 Benevolent Institution, Gardeners' Royal, 60, 96, 336, 371, 389; annual dinner, 15
Berlandiera tomentosa, 4
 Betulaceæ, a monograph of the Order, 58
 Biologists, Association of Economic, 60

Birmingham, proposed summer exhibition at, 430
 Birthday honours, the King's, 10
 Bitter-rot of Apples, 249
 Blackbirds and lawns, 11
 Black-leg, a new disease of Potatoes, 28, 337
 Blasting tree-butts with gellignite, 371, 390, 412

BOOKS, NOTICES OF.—

Abbildungen der Orchideen - arten, 403; A General Review of the Genus *Pinus* (Dr. M. T. Masters, F.R.S.), 258; A History of Dunstable (Worthington G. Smith), 274; Amateur Gardeners' Diary and Dictionary, 409; A Naturalist in the Guianas (Eugene André), 197; An Indian Garden (Mrs. Henry Cooper Eggar), 366; A Practical Manual for Amateur Gardeners (W. Cowan), 54; The Journal of Agricultural Science, 258; Three Little Gardeners (L. Agnes Talbot), 366; The Pinetum Britannicum, 36; The Timbers of Commerce and their Identification (Herbert Stone, F.L.S.), 317; The Uses and Wonders of Plant Hairs (Kate E. Siyan), 113; Wayside and Woodland Trees (Edward Step), 54; "Who's Who," 430; "Who's

- Who "Year Book, 430; Year Book of the United States Department of Agriculture, 1903, 96
- Boston, U.S.A., English flowers at, 371
- Botanic Garden in the sand-hills (Belgium), a, 345
- Botanical Collections in St. Petersburg, 447
- Botanical lectures at Chelsea Physic Garden, 273, 291, 294, 390, 327
- Botanists, academic honours for, 151
- Botrytis cinerea, a disease of Strawberries, 35
- Bougainvillea "Maude Chetleburgh," 336; B. spectabilis, 452; B. spectabilis "Cannell's variety," 383
- Bowkeria triphylla, 109, 190
- British Association, the, 154, 173, 210
- British Science Guild, the, 113
- Broom's, Mr. J., garden, flowers in November in, 464
- Brotherston, Mr. R. P., awarded the Neill Prize, 10; (*Book of the Carnation*), 78
- Browallia elata major, 121
- Buchan Hill, Crawley, Carnations at, 77
- Buds, adventitious or otherwise, 185, 208
- Bulb crops, the French, 36
- Bulb-garden, the, 235, 286, 316, 367
- Bulbophyllum Weddelli, 382
- Bulbs, deeply buried, 235, 260; some new, 106
- Burbidgea nitida, 301; B. schizocolla, 301
- C**
- CABBAGES, manures and soils for, 398
- Cactus Dahlias, some good, 267
- Calceolaria violacea, 12
- Callicarpa purpurea, 432
- Callicoma serratifolia, 305
- Calliopsis aurantiaca flowering at Kew, 371
- Camellia, the, 53
- Campanula isophylla alba, 116; C. macrostyla, 153
- Canadian's impression of the Old World, a, 447
- Canada, Wheat growing in, 10; outdoor Grape cultivation in, 18
- Canker in Apples, 224
- Cape Town industrial exhibition, 58
- Carnation, a giant, 60; C., a pink-coloured, 411; C. America, 267-305, 353; C. Enchantress, 431, 466; C. Fascination, 453, 466; C. Fair Maid, 411; C. "Glacier," 353, 372, 393, 412, 431, 453, 466; C. "Glowworm," 95; C. King Solomon, 79; C. Lady Carrington, 95; C. Lady Linlithgow, 79; diseases of the, 75; the, 75
- Carnations at Buchan Hill, Crawley, 77; grown in coal-ashes, 88; soils and manures for, 88; some fine old varieties of, 367
- Carruthers, Mr. J. B., appointment of, in Straits Settlements, 274
- Cassia marylandica, 152
- Castanopsis chrysophylla, 152
- Cattleya × Germania superba, 106; C. labiata var. delicata, 364; C. Loddigesii splendens, 122; C. Mendeli "Meteor," 34; C. × Mrs. Kate Nye, 267; C. Mossiae "Mrs. C. H. Bramley Firth," 51; C. Warscewiczii Sanderæ, 122
- Cauliflower Veitch's "Early - forcing," 35
- Ceanothus rigidus flowering at Llandudno, 36
- Cedar of Goa, the, 275
- Cells of Wheat with mycoplasma of a rust fungus, 403
- Cemistoma lahurnella (*Laburnum* leaf-miner), 265
- Centranthus ruber, 11
- Centenary of the Royal Horticultural Society, 69
- Centropogon Lucyanus, 168
- Cercospora melonis, treatment for checking, 172, 436 [*Cucumber disease*]
- Ceropegias, leaf propagation of, 77
- CERTIFICATED FRUITS AND VEGETABLES.**—Apple "Hector MacDonald" (p. i., Supp., October 8); A. "King's Acre Bountiful" (p. i., Supp., October 8); A. Rev. W. Wilks, 230; A. "Werder's Golden Reinette" (p. i., Supp., October 8); Bullace "The Langley, 294; Crab Frettingham's Victoria, 230; C. Veitch's Scarlet, 230; Pear "S. T. Wright" (p. i., Supp., October 8); Potato Peckover, 433; P. Queen Alexandra, 433; Raspberry "Champion, 47; R. Red Diamond, 192; Strawberry "Alake," 14; S. Eythrope Perpetual, 230; S. "Reward," 14; S. "Laxton's Latest," 47
- CERTIFICATED PLANTS.**—Aconitum Wilsoni, 292; Alpinia Sanderæ, 46; Angraecum infundibulare, 82; A. Rothsechildianum, 230; Asparagus medeoloides myrtifolia, 323; Aster Peiry's Favourite, 229; Astilbe alba and A. rosea, 46; Begonia Argus, 191; B. Canopus, 46; B. Fearney Sanders, 292; B. Mrs. H. G. Moon, 292; B. Margaret Gwillim, 46; B. Washington, 118; Bulbophyllum Hamelini, 118; B. Weddelli, 293; Campanula × Fergusonii, 191; C. hybrida Isabel, 117; Capsicum annum var. conoides, 355; Carnation Adonis, 394; C. Bridegroom, 83; C. Carabas, 83; C. Enchantress, 394; C. Daffodil, 81; C. Duke of Norfolk, 83; C. Glowworm, 46; C. Joan, 14; C. King Solomon, 16; C. Lady Linlithgow, 46; C. Lord Charles Beresford, 355; C. Mrs. L. E. Best, 83; C. Mrs. M. V. Charrington, 83; C. Mrs. R. C. Cartwright, 83; C. The Old Guard, 81; C. The President, 394; Catasetum pileatum (*Bungerothii*) aureum, 395; Cattleya × F. W. Wigan superba, 82; C. × G. W. Law - Schofield, 324; C. × Iris, Prince of Piedmont, 230; C. × Iris var. aurifera, 230; C. × Iris var. Fascinator, 293; C. × Iris Westonbirt variety, 192; C. labiata Miss Kate Brazier, 324; C. I. Mrs. Francis Wellesley, 324; C. I. Mrs. Gustave H. Muller, 433; C. I. reedleyensis, 356; C. Mossiae alba Tracy's variety, 14; C. × Patrocinii Tring Park variety, 82; C. Portia Chardwar variety, 293; C. × Rosa Leeman, 293; C. × triumphans, 43; C. Warscewiczii Fran Melanie Beyrodt, 43; Chrysanthemum Arthur du Cros, 263; C. Buttercup, 326; C. E. J. Brooks, 293; C. Charm of the Winter, 414; C. Doris Rayner, 377; C. Dora Stevens, 355; C. Edith Smith, 293, 309; C. Emblème Poitevine, 326; C. G. F. Evans, 326; C. Goacher's Pink, 293; C. Golden Standard, 414; C. Jenny, 293; C. Kathleen Thomson, 309, 323; C. Mersham Yellow, 309; C. Margaret Brown, 326; C. Market Gold, 414; C. Miss Dorothy Oliver, 293; C. Miss Elsie Miller, 326; C. Miss Lucie Deveau, 263; C. Miss Mona Davis, 263; C. Miss Tackey Bird, 326; C. Mrs. A. H. Lee, 326; C. Mrs. A. T. Miller, 326; C. Mrs. C. Beckett, 293; C. Mrs. Swinburne, 394; C. Mrs. T. Dalton 377, 394; C. Mrs. D. Willis James, 292; C. Mrs. W. Knox, 292; C. Perle Rose, 293; C. Viola, 263; C. W. A. Etherington, 326; C. Walter Jinks, 309; C. W. Gooding, 326; C. Wiunie, 263; Clematis grata, 229; Codiaum Mrs. H. B. May, 14; Colletia macrostachya, 293; Colletia spinosa, 229; Coriaria terminalis, 292; Cotoneaster angustifolia, 394; Cryptophoranthus Lehmanni, 14; Cyripedium × aureum Lambianum, 433; C. callosum Sanderæ Hye's variety, 293; C. × Dom Carlos, 433; C. Fred. K. Sander, 293; C. × Helen II. var. Fascinator, 356; C. insigne sylhetense giganteum, 356; C. × King Edward VII., 293; C. × Miss Blanche Moore, 395; C. × Niobe Westonbirt var., 356; C. × Rolfei superbum, 395, 399; C. × Tracyanum, 433; C. × triumphans magnificum, 356; C. × W. R. Lee, Oakwood variety, 324; Dahlia Alexander, 229; D. Antelope, 229; D. Blush Queen, 155; D. Cockatoo, 229; D. Dorothy, 229; D. Edina, 192; D. Ella Kraemar, 229; D. Fairy, 192; D. Harbour Lights, 229; D. Helen Stephens, 229; D. J. B. Riding, 192; D. Little Mary, 229; D. Lord of the Manor, 229; D. Radium, 117; D. The Mikado, 229; D. Miss Bastone, 229; Neatness, 229; Unique, 229; William Hopkins, 192; Delphinium Mrs. J. Bradshaw, 14; D. Norman Hirst; D. bellatulum, 43; Furcraea longeva, 46; Gentiana dahurica, 81; Gladiolus Aphrodite, 81; G. Leader, 81; G. Miss Zena Dare, 118; G. primulinus, 155; G. Valdora, 118; Glaucium flavum tricolor, 46; Gomesa Binotii, 433; Helianthus × sparsifolius, 292; Hydrangea Hortensia nivalis, 229; Hypericum patulum var. Henryi, 229; Lælia × crispo-brosa, 43; L. × Illustris, 324; Lælia-Cattleya × Cappel Charlesworth's variety, 324; L.-C. Constance Wigan, 230; L.-C. × Digbyano-Warneri Eric Lucas, 324; L.-C. Digbyano-Mossiae Queen Alexandra, 293; L.-C. × Dominiana Tring Park variety, 14; L.-C. × Eximia Sander's variety, 230; L.-C. × Hy. Greenwood var. Imperator, 43; L.-C. × Pallas magnifica, 395; Liparis fulgens, 324; Masdevallia Burbidgeana, 192; Nepenthes × F. W. Moore, 292; Nerine excellens major tardiflora, 292; N. Lady Ffolkes, 292; N. Miss Shelley, 292; Odontoglossum × Andersonium Crawshayanum, 356; O. crispum Oakfield Sunrise, 43; O. crispum xanthotes Charlesworthii, 230; O. Uro-Skinneri splendens, 82; Philadelphus Lemoinei maculatus, 14; Pimpinella magna rosea, 14; Pink Edina, 192; Restrepia aspasienicum, 293; Rhus cotinoides, 293; Platycerium aleoicorne Mayii, 394; Rose "C. J. Grahame," 46; R. Countess Annesley, 46; R. Dean Hole, 30; R. Duchess of Westminster, 46; R. Mrs. F. W. Flight, 46; E. Mrs. O. G. Orpen, 30; Saccolabium gracile, 14; S. longecalcaratum, 43; Sternbergia lutea major, 292; S. Lord Breadmore, 66; Sweet Peas Cupid, 14; Henry Eckford, 66; John Ingram, 66; Tamarix hispida aestivalis, 155
- Ceylon, notes from, 203
- Chamaedorea, species with simple leaves, 202, 245
- Chamberlain's. Rt. Hon Joseph, garden at Highbury, 361, 391
- Chartley Castle, Stafford, 225

- Crinum Powellii, the parents of, 348, 393
- Croquet-ground, how to make a, 312
- Crown gall caused by a fungus, 389; on Apple, 371
- Cryptococcus Fagi (Beech-Coccus), 58
- Cuba, the Pines of Western, 98
- Cucumber, a coloured, 41; the "spot" disease of, 438
- Cucumber and Melon mould, 172, 436
- Cultivation, experimental, 4, 51, 123, 163, 347, 398
- Cunninghamia sinensis, a notable specimen of, 306, 322
- Cupressus macrocarpa poisonous to cattle, 466
- Cyananthus, the, 116
- Cymbidium cyperifolium, 347
- Cypella Herberti, prolonged flowering period of, 392
- Cypripedium, an abnormal, 220, 411; C. × Burbagense, 220,

C. Charlesworthii, a fine variety of, 353; C. Fred K. Sander, 307; C. Harrisianum, malformed, 411; C. insigne, "Oddity," 444; C. "Mrs. F. W. Moore," 346; C. \times Rolfei superbum, 399; C. \times Urania Rehder's variety, 152
Cytisus \times Adami, 274

D

DAFFODILS, early forcing of, 186
Dahlia Edina, 209; D. J. B. Riding, 226
Dahlia Show at the Crystal Palace, 189
Dahlias, 225; a selection of single-flowered, 285
Daniel, M., Gold Medal awarded to, 464
Darwin Medal awarded to W. Bateson, 407
Dean, Alexander, 343
Dean Hole, the late, 170
Decimal coinage and the metric system, 96
Deepdene, the gardens at, 274
Delphinium, a regular flowered strain of, 24, 56
Dendrobium aduncum, 51; D. bellatulum, 114; D. compactum, 400; D. crystallinum albens, 51; D. formosum giganteum, 3
Derris Fordii, 162
Desloges, M. Jarry-, Nepenthes from, 97
Deutzia kalmiflora, 202; D. scabra, 214
Devonshire Ferns, 233
D. anthus seedling, 77
Diascia Barbae, 321
Diffusion and osmotic pressure, 113
Dipodium pictum, habitat of, 19
Disa grandiflora, 116
Diseases, some plant, 313
Distemper, a washable, 6
Distribution of plants, geographical, 121
Douglas Fir, the Colorado variety of, 53, 153
Dracena Victoria, 242, 305, 372, 431
Drill Hall, the last of the Royal Horticultural Society's shows in the, 63
Drugs and perfumes at Aden, 242
Dublin Seed and Nursery Employes' Association, 408
Düsseldorf International Exhibition, 151, 212, 225, 237, 308
Dutton, presentation to Mr. A. F., 446
Dyer, Sir W. T. Thiselton-, lectures by, 273, 291, 294, 310

E

EALA, the botanic garden at, 463
Echinocereus acifer, 245
Edinburgh Botanic Gardens, hardy flowers at, 297
Edinburgh seed trade assistants' annual dinner, 408
Eggar, Mrs. H. C. (*An Indian Garden*), 366
Elaeocarpus cyaneus, 272
Elm, decayed, 109
Embankment gardens, flower-beds in the, 463
Emigration to South Africa, 116, 228, 412
Epidendrum cochleatum, 17; E. tricolor, 443
Erigeron speciosus var. rosea, 24
Eriobotrya japonica flowering at Bath, 305
Erysiphe graminis and its adaptive parasitism, 371
Essex, horticultural instruction in, 10
Eucalyptus corymbosa, 465; E. ficifolia, beauty of, 409

Eucharis grandiflora (amazonica), 412
Eugène André (*A Naturalist in the Guianas*), 197
Events of the year, 462
Evesham, watering plants by means of a fire-engine at, 97
Exacum affine, 121
Experimental cultivation, 4, 51, 123, 163, 347, 398

F

FABIUS, A. A. (*Cucumber-growing under Glass*), 60
Fairlawn, Orchids at, 342
Fendlera rupicola at Kew, 410
Ferns, Devonshire, 233
Ficus repens fruiting, 312
Fir, Douglas, the Colorado variety of, 53
Fire at South Devon Nurseries, 24
Flindersia maculosa, 408
Flowers, autumnal early, 122
Flora of the Pamir, 113; of Pompeii, the, 60; of the Transvaal, 62
Florida garden in May, a, 281, 329, 349
Florists, a new industry for, 172
Florists' flowers, 12, 221, 262, 267, 285, 367, 415
Flour, Palm, 53
Flower-bed representing the Japanese flag, a, 190
Flower-garden, the, 7, 23, 39, 57, 93, 111, 129, 149, 168, 187, 205, 223, 239, 255, 271, 302, 317, 335, 351, 369, 387, 405, 425, 445, 460
Flowers in season, 24
Forbes, Mr. A. C. (appointment), 41; (*English Estate Forestry*), 385
Foreign Correspondence, 51, 105, 222, 243, 316, 348, 400, 420, 438
Forest-trees, constitutional vigour in, and its effect on the crop, 362, 393
Forestry, 37, 267, 362
Forsythia europaea, 123
Fossil Plants, 392, 452
Fota, Lord Barrymore's gardens at, 2
Fouquieria columnaris at Kew, 390
Foxglove, a monstrous, 203
French bulb crops, the, 36
French Pears, 438
Frost in Staffordshire, severe, 393
Fruit Committee, the Departmental, 173, 389
Fruit crops, reports on the condition of the, 70, 76, 88, 108, 125, 143, 165, 183

Fruit-gatherer, a new, 208
Fruit Growers' Federation, the National, 337
Fruit-growing at Madresfield, 114, 174, 189, 208, 226, 259, 334
Fruit industry, the, 173
Fruit, pictorial designs on, 334
Fruit returns for 1903, 134
Fruit show, in Ireland, 272, 308; the great British, 241, 256, and Supplement October 8
Fruit, the colouring of, 26, 132
Fruits, Colonial and home-grown, 426; coreless, 446
Fruits under glass, 7, 23, 39, 57, 80, 92, 111, 129, 149, 169, 187, 205, 223, 255, 270, 287, 302, 319, 335, 351, 369, 387, 405, 425, 445, 461
Fuchsia "Madame Cornellisen," 274
Fuchsias with white corollas, 221, 243, 262
Fungus and Orchid roots, 25
Fungi, three-spored rust, 418; vegetative life of the rust, 403

G

GALANTHUS Elwesii, 225
Garden City Association, 189, 321

Gardeners, a caution to, 273, 275; the training of young, 453
Gardeners' Association, a worldwide, 150; the British, 10, 26, 130, 242, 321, 333, 337, 356, 374, 393, 408, 411, 420, 466
Gardeners' societies, influence of, 12
Gardening, successful amateur, 389
Gaut, Mr. R. C., 25
Gean-tree, a large specimen of, 63, 245
Geneva, horticultural science at, 389
Gentiana affinis, 24
Geographical distribution of plants, 121
Ginkgo biloba as an avenue tree, 88
Ginseng, the Korean trade in, 228
Gladioli at Langport, 97
Gladiolus primulinus, 190
Glass, coloured, for plant structures, 353
Glaucium flavum tricolor, 115
Gloeosporium fructigenum and canker, 249
Gloriosa Carsoni, 127; G. grandiflora, 188; G. virescens var. grandiflora, 128
Gloxinias with supplementary corollas, 95
Golder's Hill, Hampstead, 166
Gomphia decora, 22
Gourds, a lecture on, 192
Gracilaria syringella (Lilac leaf-miner), 265
Graft hybrids, 217, 225, 450
Grafting the Vine, effect of, 11, 430
Grape, "Cornichon Blanc," 251; G. "Melton Constable," 275
Grape-cultivation in Canada, 18
Grapes at Edinburgh, 226; at Melton Constable, 254; influence of grafting upon, 430; in the open, 446
Grasses, the leaf anatomy of British, 96
Greenhouses, an improvement in building, 172
Grenada, the Botanic Garden at, 423
Grey Towers, Nunthorpe, 49, 116
Growth and reproduction, 165, 133
Gunnersbury House Gardens, 26
Gurney, Mr. James, 305

H

HAGGARD, Mr. RIDER, and gardening, 76
Hall, the new Royal Horticultural, acoustic properties of, 76; facilities for loading at, 305; opening ceremony by H.M. the King, 69, 77, 99; and also Supplement, July 30
Halsham, John (*Every Man his own Gardener*), 51
Halton, Tring, Orchids at, 90
Hampton Court, the Grape-vine at, 430
Hardy fruit garden, work in the, 7, 22, 38, 56, 79, 93, 110, 128, 149, 168, 186, 204, 223, 254, 287, 303, 318, 335, 350, 369, 386, 405, 425, 444, 461
Hautbois, defective cropping of the, 85
Hawfinches, 189
Hedges, Holly, 234
Hedges, the management of, 141
Helichrysum angustifolium, 121; H. Cooperi, 154
Helicophyllum Alberti, 304
Helleborus niger angustifolius, 448
Hemerocallis citrina, 51; H. hybrids, 222; H., new varieties of, 189
Henslow, resignation of Rev. Prof. G., as Secretary to the Scientific Committee, 352
Herbaceous border, 115, 153, 198, 238, 347

Highbury, Mr. Chamberlain's garden at, 361, 391
High Trees, Redhill, 86
Himalayan Primulas, 262; Rhododendrons, 11
Hoe "Planet, Junr.," 174, 209, 245, 250
Hole, the late Dean, 207, 224, 226, 409
Holland House Flower Show, 40, 63
Holly hedges, 234
Hollyhock, memories of the, 415
Holly-tree denuded of bark, 11, 26
Honours to botanists, 10
Hooker, Sir Joseph, 189, 273
Hop, male plant of, 304
Horticultural mayors, 371
Horticulture, a national council of, in America, 409; the evolution of, 84
Housing of plants, the, 201
Howard, Keble (*The God in the Garden*), 55
Hudson, Mr. J. F., 225
Huernia oculata, 132
Hyacinth-glass, a new, 209
Hydrangea Hortensia, 259

I

IRELAND, early Potatoes in, 96; fruit-show in, 308
Iris Bismarckiana, 222; I. Saari, 147, 222; I. sofarana var. magnifica, 162; I. Sprengeri, 50; I. unguicularis flowering at Kew, 370
Irises, a note on, 42
Irish gardens, some interesting, 1
Income-tax Committee, the, 209
India, difficulties of gardening in, 442; fruit-trees for, 380
Italy, a Chrysanthemum and fruit exhibition in, 359

J

JACARANDA mimosaeifolia, 224
Japanese exhibits at the St. Louis Exhibition, 164
Japanese flag, a flower-bed representing the, 199
Japanese horticulture, 371
Japanese Larch, the, and disease, 371, 392, 411, 453
Japanese thank-offering of plants, 125
Jasmines, the cultivation of, 441
Jekyll, Gertrude (*Old West Surrey*), 54; (*Some English Gardens*), 337, 381
Job's Tears as food, 274
Johannesburg, flower show at, 274; horticulture at, 422
Jones, Mr. Aneurin, death of, 225
Jubilee, a gardener's, 390
Judging by points, 152, 174

K

KARE, proposed monument to the late Alphonse, 409
Kauri gum, the collection of, 142
Kew, Chrysanthemum at, 365; notes from, 4, 22, 127, 162, 182, 214, 237, 251, 274, 301, 316, 346, 362, 399, 423; Orchids in flower at, 274; Temperate-house at, 55
Kew market, proposed widening of, 288
Kendir Towika (*Apocynum sibiricum*), 58
Kerslake, Mr. G. H., medal presented to, 166
Khartum, gardening at, 96

Kitchen-garden, the, 23, 39, 57, 80, 93, 111, 128, 148, 169, 186, 205, 222, 239, 255, 270, 287, 301, 319, 335, 351, 369, 387, 405, 424, 445, 461
Kleinia Galpini, 316
Kniphofia breviflora, 153; *K. excelsa*, 153

L

LABURNUM leaf-miner, the, 265
Ladybirds, phenomenal numbers of, 225
Lady-gardeners, a new school for, 207

NOTES FROM COUNTY CORK.

BELGROVE.

DURING a few days' visit to the southern shores of Ireland, I had the pleasure of inspecting three most interesting gardens—namely, Mr. W. E. Gumbleton's, at Belgrove; Lord Barrymore's, at Fota; and Mr. R. H. Beamish's, at Ashbourne. Of the two first I propose to give a few particulars, which will, however, by no means be exhaustive, as in an article of limited length many rare and valuable subjects must necessarily be omitted. The first garden is familiar, by repute at least, to every reader of the Horticultural Press, for Mr. Gumbleton has for many years made a speciality of testing new flowering shrubs and plants, and, his predilection being well known to the leading nurserymen both at home and abroad, rarities generally find their earliest sanctuary in the British Isles in his grounds, where many of the new introductions have flowered for the first time. Belgrove is beautifully situated on a slope running down to one of the numerous creeks of Queenstown Harbour, and is rich in fine trees, which render the spot an ideal sylvan retreat.

In the conservatory I saw, amongst many other rare things, the new *Sophora viciifolia* (fig. 3, p. 3), closely allied to *S. Moorcroftiana*, from the Himalayas, said to be hardy, a shrub bearing bluish-white Pea-like flowers; *Verbascum simplex*, of shrubby habit, also new, throwing up three flower-spikes 4 feet in height (fig. 2, p. 2); *Calandrinia Howelli*, *Arctotis decurrens*, said to be the only plant

of the species in Europe; *Helichrysum Volkensii*, which I tried unsuccessfully in the open in South Devon; and a splendid plant of *H. Gulielmi* var., 5 feet in height and 2 feet 6 inches through, with glistening white flowers. This, Mr. Gumbleton thinks, is a distinct species (it is certainly quite unlike the type), or that if it is held to be a variety, it should be named *Meyeri*, after the introducer, Herr Leopold Meyer.

finest of the hybrid *Gazanias*. *Campanula Vidalii* (which flowered well with me in South Devon in the open, vide illustration *Gardeners' Chronicle*, vol. xxxiv., p. 330), *Calla Elliotiana*, species of shrubby *Clematis*, new *Salvias*, the best *Pentstemons*, all the named varieties of *Montbretia* and species of *Hemerocallis*, embracing the four fine hybrids of Herr Sprenger, fully described in *Gardeners' Chronicle*, August 15, 1903; *Parthenope*

FIG. 1.—IRIS GRACILIPES (JAPAN): FLOWER LILAC. FALLS WITH A YELLOW CREST.
(From Mr. Gumbleton's Garden.)

In the level garden stretching from the house many beds are cut on the lawn, while on one side is a wide, wall-backed border. Several of the beds are devoted to the best hybrids of different families of plants; thus, one was filled with all the latest *Heucheras*, of which *H. Pluie de Feu* was especially bright; another bed contained the best varieties of *Chrysanthemum maximum*, together with the new *Shasta Daisies*, named *Alaska*, *California*, and *Westralia*, just sent out; another was filled with the

Baroni, *P. ochroleuca*, and *P. Muelleri*, each occupied separate beds, thus affording the opportunity of comparing the merits of the different varieties or species at close quarters. Several of the beds were edged with the double white *Colchicum*, still a rare and expensive bulb; *Achillea linguata* var. *Buglossi* was also in the border.

Other noteworthy plants in this garden were the double yellow and orange *Meconopsis cambrica*, *Aconitum volubile*, *Potentilla argrophylla*, *Rhazya orientalis* with

blue flowers, *Incarvillea grandiflora* and the still newer *I. compacta*, *Anchusa Barrelieri* variegata, *Mertensia elongata*, *Cimicifuga dahurica*, the new shrub *Crossosoma californicum*, *Alfredia cernua*, *Erysimum brachycarpum*, a fine specimen of *Campanula vesicolor*, *Centaurea tauromenitana*, *Senecio rotundifolia*, a healthy bush of *Olearia insignis* just coming into bloom, *Lobelia rhynchoptala*, one of the Tree-Lobelias from North America, fully described and figured in *Gardeners' Chronicle*, June 29, 1901, p. 418; the pretty little *Iris gracilipes* (fig. 1, p. 1), a fine bush of *Lavatera assurgentifolia*, *Campanula michauxoides* 5 feet high, a yellow *Eremurus* from Beluchistan, which has been identified as *E. Bungei* var. *præcox*; new species of *Verbascum*, including *V. densiflorum*, a fine orange, and *V. Wiedemanni* with large purplish flowers; while trained against the wall, which was prettily enamelled with *Erinus alpinus* and its white and pink forms, was a fine plant of *Crinodendron Hookeri* (*Tricuspidaria dependens*), rich crimson with countless blossoms, in front of which was a large clump of the striking *Anemone Fannini* from South Africa, with giant leaves and great white flowers over 4 inches across. In a corner of this garden, against the wall, was a large shrub of the South African *Freylinia cestroides*, about 8 feet in height, which, however, has never flowered.

In the greenhouses was a fine collection of the best tuberous Begonias, and I was shown a plant of the new *Prenia lutea*. *Disa grandiflora* was present in quantity, and was particularly well grown; and amongst other plants I noticed *Ipomœa leptophylla*, a bush *Convolvulus*, which forms huge tubers sometimes weighing as much as 100 lb., and *Psychotria capensis*.

Of Water-Lilies Mr. Gumbleton possesses a large collection, comprising all the best species and hybrids. These are grown in brick tanks elevated above the level of the ground, so that the splendid blossoms are close to the eye.

In a trial-bed near the greenhouses I saw many new or rarely grown plants, a few of which were *Anchusa capensis*, the herbaceous *Sophora flavescens*, *Patrinia villosa*, an orange-flowered variety of *Linum flavum*, *L. salsoloides*, *Senecio chrysanthemoides*, *Illicium Henryi*, *Stanleya pinnatifida*, *Potentilla Salesoviana*, *Cacalia tuberosa*, *Coton-easter Fontanesii*, *Anaphalis cinnamomea*, *Adenocarpus anagrus*, *A. commutatus*, *Campanula laciniata*, and *Vernonia Sprengeri*.

Ostrya magnifica was growing strongly and throwing up a number of flower-stems. *Feijoa Sellowiana* was 6 feet in height and the same in diameter; the fine *Buddleia Colvillei*, which was the first of its species to flower in the British Isles, was about 20 by 20 feet, and was showing many bud clusters; *Carpenteria californica* was about 7 feet high, and had a far more healthy appearance than the majority of these plants in the South-west; a fine *Eucryphia pinnatifolia* was 8 feet in height, and close by was a good specimen of the rarely seen *E. cordata*, very distinct in its foliage. *Plagianthus Lyalli* was doing well, as was the rare *Ostryopsis Davidiana*. There were large collections of the newer Mock Oranges (*Philadelphus*), *Diervillas* or *Weigelas*, and *Deutzias*, *D. gracilis eximia* among the last-named being very beautiful.

On the sunny side of a lofty wall bounding the kitchen-garden many flowering shrubs and climbers were flourishing. *Habrothamnus sanguinea* and others of the same genus were in full flower; *Wistaria multi-juga* was finer than I have ever seen it in this country, covering some 30 feet in length of the high wall with thousands of its long flower-racemes fully 2 feet in length, the upper blossoms of which had just expanded; this plant has before now ripened seed. Close to it was growing the common *W. sinensis* with short but deeper-coloured

its white flowers freely; *Exochorda Alberti macrantha*, *Davidia involucrata*, *Veronica Lindsayi*, *Hamamelis mollis*, *Olearia moschata* and *O. nummularifolia*, among many others of the race; the bush *Lonicera Mackii* and *L. Alberti*, *Cladastis lutea*, *Adenocarpus decorticans*, and *Coprosma acerosa* with pale blue fruits. Those who are inclined to specialise in the genera *Kniphofia* and *Cortaderia* would gain an object-lesson at Belgrove, for of the former the collection embraces considerably over forty species and varieties, while of the latter all the known forms are grown.

The well cropped and cultivated kitchen-garden contains, among other things, Luther Burbank's very early or winter-fruited crimson-stalked Rhubarb. Under the genial guidance of their owner many other rare and beautiful subjects were inspected in this most interesting garden, of which lack of space prohibits mention.

FOTA.

Fota Island, on which is situated the Irish residence of Lord Barrymore, is renowned for its fine collection of Conifers and other trees, many of which are exceptionally handsome specimens; while flowering shrubs, hardy Palms, Bamboos, and Tree-Ferns are also largely grown. A beautiful specimen of *Pinus Montezumæ*, 35 feet in height, is one of the gems of the collection. Good examples of this are very rare in England, but there are fine ones at Tregothnan and Menabilly. *Abies grandis*, from California, was 70 feet in height, and the Japanese *A. firma*, 25 feet. A large example of the Mexican *Pinus patula* was about 60 feet high, but lost several of its branches in the gale of September 20 last year. That storm also levelled the finest specimen of *Cupressus macrocarpa* (which had a girth of over 12 feet) to the ground. The Mexican Sacred Fir, *Pinus religiosa*, is 60 feet in height, and a young *Cladastis tinctoria* is 12 feet high. An unusually large specimen of *Parottia persica* had a branch-spread of over 30 feet. This must be a marvellous sight when in its autumnal glory.

I noticed three bushes of *Edwardsia* (*Sophora*) *grandiflora* standing in the open, far away from any walls. All were covered with buds, the earliest of which were just expanding; and on the largest, 12 feet in height, hundreds of last year's seed-pods were hanging. A fine *Embothrium coccineum*, 25 feet in height and the same in diameter, was at its best, being a blaze of vermilion. Several suckers had sprung up around the tree, and these were flowering, though not so freely. *Cornus capitata*, better known as *Benthamia fragifera*, is 40 feet in height, with a like branch-spread; *Fagus Cunninghami*, 40 feet, and *Tsuga Brunoniana* the same height. *Magnolia Campbelli* is fully 30 feet in height, but is badly crowded by other trees; and *M. glauca* is 15 feet in height. Here I met with the finest specimen of *Berberis nepalensis* I have seen, 12 feet in height and 18 feet through. *Citris trifoliata* in the open is flowering abundantly, which shows that a wall is not absolutely indispensable to induce it to bloom in warm localities.

An exceedingly large bush of *Collettia horrida* in full flower was almost 20 feet in height and as much through, while *C. cruciata* was 8 feet high and 15 feet in diameter. The latter always flowers in

FIG. 2.—*VERBASCUM SIMPLEX*.
(From Mr. Gumbleton's Garden. See p. 1.)

bloom-racemes, which were more advanced. Mr. Gumbleton also possesses the pink-flowered form of *Wistaria multi-juga* known as *rosea*, but this plant has shown no flower up to the present. Of the many *Magnolias*, *M. Watsoni* was coming into bloom, and I was shown a symmetrical tree of *M. Campbelli* about 25 feet in height, standing in an isolated position, which last year bore 147 blossoms. Other shrubs and trees included a fine *Juglans ailanthifolia*, 30 feet in height, with very ornamental foliage; an immense shrub of *Daphniphyllum glaucescens* about 20 feet in height and as much in diameter, probably the largest specimen in the British Isles; *Buddleia asiatica*, bearing

November at the mouth of the "Dart," which is curious, as it has been proved to be merely a form of *C. horrida* that was in bloom in Ireland at the end of May. Other shrubs and trees that I noticed were *Lomatia ferruginea*, with foliage very like that of *Grevillea robusta*; *Aphananthe aspera*, *Davidia involucrata*, and a small example of the Parasol Fir, *Sciadopitys verticillata*. Amongst the plants clothing a high wall were *Clianthus puniceus* in full flower, *Asparagus deflexus* covering a space 10 feet square, *Trachelospermum jasminoides*, and *Coronilla glauca*, that had rooted into the mortar beneath the coping from its highest shoots. There were fine groups of *Trachycarpus Fortunei*, one isolated specimen being well over 20 feet in height; and I saw two healthy plants of *Phoenix senegalensis* 7 feet in height. The Tree Ferns are grown in a

plants had been grown some years at Gunnersbury House, and Mr. Hudson had raised a few seedlings of them. In view of the fact that most growers have indifferent success with this beautiful Dendrobe, it will be worth recording that the same plants have increased in vigour and are now making up their strong new growths for the next flowering season. Mr. Hudson thinks that the plant is not difficult to grow, if after flowering it be ripened in a sunny situation near the roof glass, and prepared to winter in a tolerably cool house, where it should be kept comparatively dry until the new growths begin in spring. Then it should be removed to a warm, sunny house, and be kept moist until the flowering commences again. It is necessary to observe the resting period in winter and the growing season in spring and summer. The large quantity of *Vanda cœrulea*, grown at Gunnersbury House is managed similarly, and the specimens are in fine condition.

spiked forms have furnished albinos, and, as with the coloured varieties, the white-lipped, short-spiked are much the better. A very fine form of *Cattleya Warscewiczii*, some good *Lælia tenebrosa*, *Cattleya Loddigesii*, and other showy Orchids are in bloom in the same house. J. O'B.

SOPHORA VICIIFOLIA.

THE pretty *Sophora viciifolia*, Hance (fig. 3), is a somewhat recent introduction from China, where it is rather widely spread, being found in the provinces of Yunnan, Szechuen, and Hupeh, and at elevations varying from 4,500 to 13,500 ft. In Yunnan, Mr. Hancock says, it is found in "hedges and wastes," and is "one of the commonest spring shrubs," while Dr. Henry speaks of it as "forming large heaths on barren soil." It is a spinescent shrub, compact and graceful in habit, and usually grows to about 4 feet in height. It has unequally pinnate leaves, 2 to 2½ inches long,

FIG. 3.—*SOPHORA VICIIFOLIA*: FLOWER BLUEISH-GRAY.
(From Mr. Gumbleton's Garden.)

spot entirely surrounded and overshadowed by trees, where no summer sun can penetrate. There are fifteen examples of *Dicksonia antarctica* ranging from 7 to 9 feet in height: these are associated with *Woodwardia radicans*, *Lomaria magellanica*, and other Ferns. In the ornamental water all the best of the Water-Lilies are grown, while on the island are splendid Bamboos and giant Gunneras. *Arundinaria Falconeri* was unfortunately flowering here, but *A. nobilis*, now said to be synonymous with *A. Falconeri*, showed no sign of flower. S. W. Fitzherbert.

ORCHID NOTES AND GLEANINGS.

DENDROBIUM FORMOSUM GIGANTEUM.

At the Royal Horticultural Society, October 11, 1898, Mr. Jas. Hudson, gr. to Leopold de Rothschild, Esq., Gunnersbury House, Acton, was awarded a Silver-gilt Flora Medal for a fine group of *Dendrobium formosum giganteum*, bearing in the aggregate seven hundred large white flowers with orange centres. Most of these

ODONTOGLOSSUM BICTONENSE SPLENDENS.

A remarkably beautiful form of this variable *Odontoglossum*, and an improvement on the variety figured under this name in *L'illustration Horticole*, is flowering in the gardens of Leopold de Rothschild, Esq., at Gunnersbury House, Acton. It came with some others from Guatemala, and Mr. James Hudson, the gardener at Gunnersbury House, has grown it into a strong plant, which is now flowering for the first time. The stout, comparatively dwarf inflorescence has a good show of flowers, the sepals and petals of which are yellowish, very closely barred with chestnut-brown, the labellum being bright rose colour. It is doubtless the best form of the species which has yet flowered, and its flowers have a striking resemblance to those of a good *O. Uro Skinneri*, which grows in the same locality. There are several distinct types of the species, the beauty of each set varying probably according to the locality in Mexico or Guatemala in which they were collected. The set with the shortest flower-spikes, to which the variety *splendens* belongs, has the largest flowers, and the very tall-growing form has much smaller and more angular blooms. Both the tall and the short-

with eight to eleven pairs of small, elliptic or obovate leaflets, and lax, six to twelve-flowered racemes, terminating short branches. The flowers are rather more than ½-inch long, and have a blue or bluish calyx (the blue colour being due, according to Dr. Henry, to cultivation), and a milk-white or bluish-white corolla. A good specimen is trained on the wall of the herbaceous ground at Kew, where it is still flowering. The accompanying figure was prepared from material communicated by Mr. Gumbleton, who obtained a plant under the name of *S. Moorcroftiana*, a species apparently not in cultivation. It is closely allied to *S. viciifolia*, but is more robust, more spinescent, densely pubescent, has yellow flowers, and a longer, more slender calyx. *S. viciifolia* is figured in the *Botanical Magazine*, t. 7883, and in Franchet's *Plantæ Davidianæ*, i., t. 14, in the latter work as *S. Moorcroftiana* var. *Davidi*. S. A. S.

PLANT PORTRAITS.

DENDROBIUM LEECHIANUM. A hybrid between *D. nobile* and *D. aureum*, described in 1882, *Revue d'Horticulture*, June 16.

PAEONIA LUTEA, *Moniteur d'Horticulture*, May 10.

KEW NOTES.

ACTINIDIA KOLOMIKTA, RUPRECHT.—A large plant of this hardy, free-flowering deciduous climber, sometimes known as *Kolomikta mand-schurica*, is in full flower at Kew, on a wall facing north-east. It is a native of China (Amur) and Japan, and has been in cultivation for many years. It is figured in the *Revue Horticole*, 1872, p. 395, f. 43. The inflorescences are born in short cymose clusters from the ripened growths of the previous season, and are so freely produced as almost to cover the entire plant with its creamy-white flowers that are about $\frac{1}{2}$ an inch in diameter. The stamens are very numerous, and by reason of their dark-purple colour very conspicuous. The leaves are 2 to 4 inches long. The species belongs to a class of plants rarely met with in cultivation, although most of them are extremely handsome, and suitable for covering walls or pillars, the lovely autumn tints of their foliage, which changes to bright yellow and red shortly before the fall of the leaf, being an additional feature. They thrive in almost any soil, but in order to ensure a good crop of flowers each season it is essential that the wood be well ripened. The growths should be frequently pinched or spurred back as growth is very free in the summer months.

BERLANDIERA TOMENTOSA, Nuttall.

This pretty greenhouse plant is now in flower in a pan in the Temperate-house, Kew. It belongs to the Natural Order Compositæ, and is one of a genus of four species, all of which are natives of North America, and of which this species is the only one introduced to this country. The flower-heads are from $1\frac{1}{2}$ to 2 inches in diameter, disposed in loose terminal corymbs carrying from three to seven flower-heads. The ray florets are bright yellow, and about $\frac{3}{4}$ of an inch in length, those of the disc being rather large and of a bright reddish-brown colour. The leaves are alternate, the lower ones being shortly petiolate, ovate, acute or obtuse, with crenate margins, varying from 3 to 6 inches in length, and from 1 to 3 inches in breadth. The upper surfaces of the leaves are dark green in colour, the under surface being covered with a whitish tomentum. The upper leaves are sessile, acutely toothed, and much smaller in size. The stems are terete, more or less erect, and covered with a dense white tomentum. Seeds of this plant were received at Kew in 1898, and several of the seedlings flowered the following year, when the plant was figured in the *Botanical Magazine*, t. 7680. The plants have not yet produced any seed at Kew, the stock being maintained from cuttings, which root freely in early spring. Chas. P. Roßfill, June 20.

AMOMUM HEMISPHERICUM.

This gigantic plant of the Order Scitamineæ, first flowered in cultivation at Kew in 1897, two years after its introduction to the Royal Gardens by Mr. H. M. Ridley from the Straits Settlements. When it first flowered it was growing in a large pan; since that time it has been planted-out in a bed in the Aroid-house (No. 1), where it has become thoroughly established, and is growing as vigorously and making growths as large as it is said to do in its native home (Java).

The following measurements are from one of the leafy stems of the plant now in flower:—Stem 15 feet high, 2 inches diameter at the base; leaves 2 feet long and 7 inches broad. The leaves are arranged in two rows, and are deep green on the surface, red-brown on the reverse. The plant is carrying six inflorescences, developed on peduncles varying in height from 2 to $3\frac{1}{2}$ feet; the flowers are $1\frac{1}{2}$ inch long, very numerous, and closely packed in a globose head having a diameter of 3 to 4 inches. They are enclosed by large red, ovate, mucronate bracts; calyx and corolla-lobes lanceolate, of a reddish

colour. The lip is the most prominent part of the flower, being of deep red colour with a bright yellow margin, protruding beyond the corolla. It is a bold and striking plant, though somewhat less showy in the inflorescence than the allied species, *A. magnificum*.

Plants of this genus should be grown in a stove temperature, giving them a very light open soil to grow in. *A. hemisphericum* is figured in *Botanical Magazine*, t. 7592. W. H.

CLUSTER-CUPS ON ANEMONE CORONARIA, L.

The parasitic fungi popularly known as "Cluster-cups," on account of the spores being contained in little cup-like structures, produced in clusters on the living leaves of various plants, are very abundant this year. The species called *Æcidium punctatum*, Pers. (fig. 4), is exceptionally abundant, covering the under surface of the leaves of *Anemone coronaria*, L., with its tiny cups with toothed edges. Diseased plants are readily recognised, even at a distance, by the

FIG. 4.—ÆCIDIIUM PUNCTATUM.

pale curled leaves supported on long leaf-stalks, which rise erect and much above the foliage of healthy plants. When a plant is once attacked by this disease it remains infected for life, as the mycelium passes into the rhizome or "tubers," where it is perennial. After being once infected a plant never blooms, and all diseased plants should be removed and destroyed, because during those seasons when spores are produced the danger of infecting adjoining healthy plants is great. Geo. Massee.

EXPERIMENTAL CULTIVATION.

(Continued from p. 354.)

2. SCHEME FOR WORK.—In determining the scheme of experimental work to be undertaken, an attempt should be made to distinguish between experiments and demonstrations, though both are educational and useful if well designed and properly conducted. In some instances it is difficult to separate these objects, but a good deal has been rather loosely termed experimental, when it is essentially of demonstrational value. The Association, which has been previously referred to, gives the most satisfactory definition I have seen, as follows: "Generally speaking, the term 'experiment' would be used where, for example, the unknown action of some new substance or of some substance put to a new use,

was under trial. A 'demonstration,' on the other hand, is generally regarded as the repetition of some well-known experiment, or some process whose results under normal conditions may be confidently predicted." In other words an experiment is devised for the purpose of obtaining fresh knowledge, but a demonstration should serve to make clear to others the knowledge already gained. A considerable proportion of the educational work performed under the various County Councils must of necessity be directed to demonstration, but this leads naturally to experiment, and in some cases with admirable results.

As a general rule, however, colleges, institutions, societies and similar bodies with a scientific organisation, are more likely to attempt true experimental work.

All the best authorities agree in strongly recommending those who are starting experimental work to select some one definite object, and to confine attention at first entirely to that. Experience will soon prove how important this is, for fresh questions and difficulties are constantly arising in connection with almost every subject that is investigated, often necessitating several other experiments before the first one can be even approximately terminated. Consequently, if numerous objects are to be studied at one time, the probability is that the investigator will be overwhelmed with details that he cannot deal with, and much uncompleted work will have to be discarded, meaning so much waste of labour, time, and money. Professor Wrightson, in the course of some useful hints, gives the following valuable injunction: "We must not ask Nature too many questions at once, but put a simple straight-forward question."

EXPERIMENTS IN MANURING.

By far the most numerous experiments in cultivation have been concerned with the application of manures of varied character and in different amounts to both field and garden crops. The work at Rothamsted, which has done so much to prove the advantages derivable from artificial manures when employed with knowledge and judgment, has been practically followed and extended by many observers. It must always constitute a largely important part of all researches, because it affects the economy of cultivation and crop production to a material degree. The system of assisting crops and maintaining the fertility of the soil that will give the best results in produce at the least cost, demands the attention of all, for it is one of the chief keys to success. Therefore, although it might appear at times that the manurial trials have been unduly extended, substantial results have attended the majority of experimenters, and much will always remain to be done in this direction.

Comparatively little has been undertaken of a systematic character as regards the manuring of garden crops, the chief part of the recorded efforts having concerned farm crops, or such roots as Potatoes, which are of importance both to the farmer and the market-gardener. The good work, which has been already performed by a small band of observers, might well be extended or repeated in other districts; and there are few sections of out-door experimental research which offer so wide a field of interest as the study of manures and their influence. Fruits, vegetables, and plants grown for their flowers would all repay further attention, as the particular results secured in one district, whether favourable or the reverse, require additional and repeated confirmation to render them of general service.

METHODS OF CULTIVATION.

The comparison of different methods of cultivation, as well as experiments on the rotation of crop, constitute another important and interesting department. Many valuable lessons can be

afforded under this head by means of demonstration plots. These may be employed to show the benefits arising from deep *versus* shallow cultivation, cleanliness and attention *versus* weeds and neglect, and many other practices that are well established, but which none the less require to be frequently repeated and impressed upon the minds of learners.

VARIETY TESTS.

The testing of varieties in a satisfactory manner offers many difficulties, but it is of too much importance to be excluded from consideration, the chief point being that all trials of the kind should be conducted in as uniform a manner as possible. Perhaps, as regards the general methods of dealing with the comparison of new and standard varieties of garden plants, there is room for much improvement, but most of the trials undertaken by the Royal Horticultural Society at Chiswick have been well conducted and carefully recorded, though the system requires some modification to bring it into accordance with other experimental work.

POT-CULTURE.

Pot-culture trials with any crops that are grown extensively can only be regarded as introductory to larger experiments, but though there has been some prejudice against such work as trivial, it has chiefly arisen either from a misunderstanding of the objects, or because the experimenters have themselves sought to draw general conclusions from incomplete or partial evidence. When conducted on the best systems, pot-culture trials are valuable and instructive in a high degree, leading to useful work with probably considerable economy of time and expense. An admirable example of this has been afforded by the pot-culture station of the Royal Agricultural Society, established under the Hills' Bequest, the work at which I have had the privilege of observing and studying since it was commenced. One great advantage is that in a small space, and with comparatively moderate expense, numerous preliminary matters can be dealt with, or difficulties and divergences which crop up in the course of other experiments can be elucidated or disposed of without departing from the original plan.

INSECTICIDES, FUNGICIDES, ETC.

One branch of experimental work which up to the present time has scarcely received the attention it deserves, is that concerned with the use of insecticides, fungicides, and weed destroyers, together with the appliances best suited for the purpose of distributing the various substances economically and effectually. A few attempts have been made at systematic comparative trials, but these have only been sufficient to prove how much remains to be done, or to demonstrate the benefit which would result from pursuing the work still further.

RECORDING RESULTS.

However well experimental work may be designed and conducted, there is one essential which demands constant consideration, and that is the method to be attempted of taking and keeping the records. Some years ago I was invited to inspect a series of most important experiments in cultivation, which had been well organised and managed for some years by an amateur horticulturist. The most exacting could find little room for criticism in the general plan, but for the want of a clearly defined system of recording the results, a great part of the earlier work was lost, or the records were so imperfect that no satisfactory comparisons could be made with the later observations. The subject is so serious that any great defect at starting can seldom be subsequently remedied without recommencing the experiments, which means a corresponding waste of time and money.

THE METRIC SYSTEM.

As the weighing and measuring of produce must always be a most important part of recording results in experimental cultivation, the first point to determine is the method to be adopted, i.e., whether the records are to be taken in the complicated, unscientific British system, or in the more convenient and simple metrical weights and measures. For over fifteen years I have had the latter in almost daily use in conjunction with the ordinary cumbrous methods, and I unhesitatingly decide in favour of the metrical system for the records of all experimental work, both on the score of convenience and for the still more important reason that the risk of error is reduced. Scientific investigators have long been employing this method in their laboratories, and there is no adequate reason why it should not also be adopted in garden and field work, as until the public have become sufficiently accustomed to the system it is not a very great difficulty to give general results in the British weights and measures also. *R. Lewis Castle.*

(To be continued.)

MEXICO.

J. ALBERTO McDOWELL, horticultural commissioner to the St. Louis exposition, returned recently from a trip through Vera Cruz, where he spent a great deal of time in search for material for the exhibit at St. Louis.

There were about forty men throughout the Mexican republic, under the direction of the horticultural commissioner, making collections of the cream of Mexico's plants. Heretofore the exhibits for the most part have been Cacti and Orchids, but this year it will be as complete as possible, consisting of all varieties of plants of commercial or other value.

It was proposed to make an extra fine exhibition of fibre plants, Sarsaparilla, Vanilla, and other medical plants; also an exhibit of tropical fruits in the natural state was arranged. This includes Pine-apples, Mangos, the different varieties of Bananas, Limes, Oranges, Mamey, Cherimoya and Aguacate. The rubber trees were also to be represented among the tropical export producers. With the fibre-producing plants were to be exhibited sisal Hemp, better known as Henequen, and the different varieties of Lechuquilla or rope fibre plants which have an immense market throughout the world. The manufactured products of all of these different plants will be displayed in the manufactures department.

The Cacti are to be planted in mosaic, or carpet-bedding form. As a background for some of the fine specimens, a car-load of volcanic rock was to be shipped to St. Louis, and the plants will appear in that just as they are seen throughout Mexico. In the horticultural hall there will be a large space for the flowering plants, and a pomological department for the exhibit of fruits. Weekly shipments of fruits will be sent constantly to renew the exhibit of this department.

As to the arrangements of the gardens little can be said, but it was expected to have the Mexican grounds enclosed with a low fence of native Bamboo, a beautiful variety of which has recently been found in Vera Cruz, and then cover the fence with native climbers. The native *Cobaea scandens*, one of the most beautiful flowering climbers, will be in evidence, as well as the *Ipomoea purga* or Jalapa drug, the *Mina lobata* and the *Bougainvilleas*. *Zacaton* will be exhibited among the plants. It produces long fibrous roots utilised for brushes. Its market is mainly in Germany, where there is great demand for the brushes made from it. The fibre of this plant was exhibited at the Pan-American exposition in the forestry department, and was especially attractive. McDowell has in his gardens at

Cuernavaca a lot of Orchids, Coffee plants and Palms being acclimated especially for transportation to the gardens at St. Louis. A great exhibit is planned for Coffee and Tobacco in their natural conditions. Mr. McDowell has spent more than a year in making his collections, going from the west coast of Jalisco to the Gulf coast. It is expected that all collections will come simultaneously to Mexico City in April. Then the hardier plants from the tablelands will be shipped during the early part of April, and the others kept here for a few days to be forwarded during the latter part of April. In all there will be about five carloads. [Publication deferred. Ed.]

GARDENING AT ST. LOUIS.

PROGRESS in the advancement of horticulture and floriculture and the development of that part of the United States designated as the Louisiana Purchase, form the theme for an allegorical tale that is beautifully told by flowers of the Universal Exposition at St. Louis.

The unparalleled growth of the country and the advancement of the science of horticulture have kept pace the one with the other, and the two tales are told in giant parallel columns that mark the main entrance to the gigantic and beautiful Palace of Agriculture, the largest of the Exposition buildings. The strips of ground, 210 feet long and 25 feet wide, immediately west of the four-acre Rose garden, have been provided for this unique and beautiful exhibit. The sections are identical in form and size. The section on the north tells the story of the purchase from France, in 1803, of the then possessions of Louisiana.

Then after the land had attained an importance second to no other section in the world, the name of McKinley, under whose administration the great Louisiana Purchase Exposition was projected and successfully embarked, appears. The story is carried up to date by showing the Union shield and the name of President Roosevelt. In circles within the floral scrolls surrounding names of Napoleon, who sold the territory, and Jefferson, under whose administration it was bought, appears the monogram "L. P." (Louisiana Purchase) in flowers. In similar scrolls surrounding the names of McKinley and Roosevelt, the monogram is "L. P. E.," showing the importance of the Louisiana Purchase Exposition, and the great work it has done and is doing for the States embraced in the purchase, and for the world.

On the south, in similar manner, is told the story of how horticulture and floriculture have kept pace with the development of the country in other respects. First in this section appears the name, in giant floral letters, "Henderson," emblematic of the great work accomplished by Peter Henderson, the seedsman. Then follows the fleur-de-lis, planted as an ornament and made to harmonise with the twin historical pictures. Then comes the word "Meehan," commemorating the work of Thomas Meehan, whose life was devoted to the development of the shrubbery and tree industry, and whose printed works on landscape gardens and planting have long been reckoned as the highest authority. Midway is the picture, and extending the full width of the 25-foot strip is shown the flag of the Louisiana Purchase Exposition, in its colours of red, white, blue, and yellow.

Next in the mammoth picture appears a section with the word "Shaw" in immense letters, and surrounded by a graceful scroll of living flowers. This section illustrates the work done in the interest of general horticulture by Henry Shaw, the philanthropist who founded the Missouri Botanical Garden, and who gave to St. Louis the famous Shaw's Garden and beautiful and extensive Tower Grove Park.

Another mammoth fleur-de-lis, bearing the

monogram "L. P. E.," with 1904 beneath, appears, and following this is shown the word "Morton" as a final feature for the wonderful allegory. This is in recognition of the services of J. Sterling Morton, a former Secretary of Agriculture, and who, when he was acting in that capacity, was responsible for the establishment of Arbor-Day. As a result of this act millions of trees have been planted in the cities of the United States, and the day is observed everywhere.

The two pictures have for a background a great stretch of greensward. Growing in this turf are the pictures that are a triumph in embroidery gardening. Foliage plants, bulbs and summer-blooming plants go to make up the details. Flowers that make up the exposition colours of red, white, blue, and yellow are employed, and all the colours that are necessary to the historical correctness of the picture have been chosen. *American Gardening.*

[It will be noted that Englishmen born form a large proportion of those whom Americans have delighted to honour. Ed.]

NEW INVENTIONS.

THE AÉRATOR.

THE Standard Manufacturing Company, of Derby, has sent us for trial a hand-cultivator or revolving rake, which is calculated to be very useful. Under suitable conditions it does the work of a hoe and a rake with efficiency and ease. For running between rows of Strawberries, Lettuces, and so on it is very serviceable, forming a fine tilth. For the preparation of seed-beds it would be very useful. Where the seeds are already sown, or in herbaceous borders, caution would be required in its use, but in all cases where surface-stirring is desirable the tool would be of signal benefit.

WASHABLE DISTEMPER.

Messrs. Sisson Brothers & Co., Hull, send a sample of their paint, for which they claim, and we believe with justice, special advantages.

NURSERY NOTES.

ROSES AT THE OSBORN NURSERIES, HAMPTON.

The proprietor of these nurseries is Mr. Will Tayler. One of the features in this nursery just now is the avenue of pillar Roses, which were planted some three years ago. This Rose avenue is of value as showing not only the comparative vigour, general freedom, profusion, and earliness of flowering in individual varieties, but also their character when growing upon a warm and well-drained soil, resting on a gravelly subsoil, with further beds of sand and gravel beneath this. Thus it happens in the wet or winter season that the land, lying under water perhaps for a short period, is quickly and rapidly drained and workable when the downpour has ceased. In the past winter it was generally felt in the district that the land was getting the only thorough wetting it has had for several years past, yet it is evident by the yellowing and falling of the buds that for some kinds this particular soil is still too dry. A helpful lesson may be deduced from this avenue of pillar Roses, all planted three years ago under similar conditions. Chief among the successful kinds appear Carmine Pillar, growing 10 feet high, with a great wealth of blossoms, and a wondrous array of colour. This variety is early on this soil, and, showing its suitability to light soils, some 5-foot lengths of new growths were apparent. In the bush form in the open quarter the same variety was exceedingly

brilliant and good. Another striking kind is Alice Gray, white flushed with pink. This was 10 feet high at least, with its clusters of buds trailing or drooping, forming, perhaps, the most graceful climber in the collection. The characteristic way this variety drapes the soil is quite notable. Blairii No. 2 is one of the hardiest of the hybrid China class; while Madame Abel Carrière, with large handsome fragrant flowers, is strikingly free and of fine effect. This fine pillar Rose is very handsome in foliage alone, and while teeming now with bud and blossom, has its full complement of flowers in autumn also. Macrantha, the largest single white, is 8 feet high, but is not yet in bloom. Very early and effective is Reine Olga de Wurtemberg, with foliage of quite a leathery texture, and the light crimson flowers are in rich abundance. Lady Penzance Briar, which forms quite a pyramid of growth loaded with flowers, is very beautiful. Longworth Rambler is very full of promise. Gustave Regis has long tapering buds. Climbing La France is fine; Dundee Rambler free and hardy; Bardon Job, only 6 feet high at present, is quite a study with its crimson flowers; and Baron de Wassenaer (Moss) has the largest flowers of its class. It is not yet in bloom, but there is a great wealth of buds in sight, and the habit is excellent. Many other well-known Roses are to be seen, and among the more recent novelties, England's Glory, a pink Gloire de Dijon, is highly regarded. Robin Lyth is one of Mr. Tayler's seedlings; as a garden Rose it is full of promise, of exceptional vigour. *E. H. J.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Barford, Dorking.

Cypripediums.—Most of these plants which require the greatest degree of warmth, as C. Stonel, C. Rothschildianum, C. Sanderianum, C. Lawrenceanum, C. "Transvaal," C. Calypso, C. Curtisii, C. barbatum, C. grande, C. oenanthum, C. supercilare, C. ciliolare, and many others, have finished blooming; and the plants should now be thoroughly overhauled. Clean them from all dirt and insect pests, and if any are pot-bound and require more rooting-space let this be afforded. If it is found desirable to increase the stock by dividing the plants, the present is a good time for the operation. Such fine species as C. superbiens (Veitchii), C. callosum and its variety Sandera, grow best in the Cattleya-house. Both are shade-loving plants, and should not be exposed to sunshine at any time, otherwise the handsome foliage will soon turn to a yellow, unhealthy tinge, and probably become infested with thrips and red-spider. All well-rooted plants will require pots of about two sizes larger than those containing them now, and as they usually grow and root freely they should be afforded a freely porous compost of peat and sphagnum-moss in equal proportions, with a moderate quantity of broken crocks and coarse silver sand mixed with it. Those plants which have sufficient room may be resurfaced with the same compost. For a few weeks after repotting and until the roots are active afford but little water to the compost, but spray the foliage over several times each day whenever the weather is warm and bright. When they have become re-established abundance of water at the roots will be necessary. Such varieties as C. Boxalli, C. villosum, C. Spicerianum, C. Schlimii, C. aureum, C. Niobe, C. Adrastus, C. Euryades, C. Juno, C. purpuratum, C. fascinator, and others, which do best in a cool shady part of the intermediate-house, may also be repotted. The above compost may be used, but these cooler growing varieties grow stronger and produce finer blooms if a little fibrous loam be added to it.

Platyclinis filiformis is now in full growth, and showing numerous flower-spikes. The plants will require plenty of root-moisture, and the foliage should be frequently syringed to keep it free from insect-pests. A shady position in the

Cattleya or intermediate-house suits its requirements admirably. P. glumacea, P. Cobbiana, and P. uncata, now that growth is completed, should be placed in the intermediate-house, and less water afforded until growth recommences. An occasional sponging and syringing of the leaves will keep them fresh and clean.

Odontoglossum citrosimum.—At the present time plants of this distinct Mexican species are starting well into growth, and should be repotted or top-dressed as becomes necessary. As this species does not make many roots, receptacles of the smallest size should be used. Shallow Orchid pans that may be suspended to the roof are preferable to baskets. Place a few pieces of Fern rhizome over the hole at the bottom, and for the compost use equal parts of peat, leaf-soil, and sphagnum-moss, adding a few small crocks and silver-sand. Surface the compost with about $\frac{1}{2}$ inch of clean-picked sphagnum-moss. Cut off all useless back bulbs, leaving about three behind the new growth. Suspend the plants to the roof of the Mexican-house, and for a few weeks after repotting keep the surface moss just moist. After that time a little more water may be afforded, but never allow the soil to become wet to saturation point. O. citrosimum requires a warm atmosphere by day, but cooler and moister conditions at night.

THE KITCHEN GARDEN.

By JOHN PENTLAND, Gardener to C. H. B. FIRTH, Esq., Ashwicke Hall, Marshfield, Chippingham.

Broad Beans usually grow strongly enough to be self-supporting, unless they are in a very shaded situation; but this season, although sown in the usual way, the crop in this garden is very weak in growth, and the plants are almost inclined to lie down. Pinch off the top of each plant several inches long, to check the upward growth, and cause them to strengthen. If the plants are infected with black aphid, syringe them with Quassia-water, or dust them with tobacco-powder.

Onions.—If the final thinning has not been done already, let the work be attended to at once. Leave the plants at about 4 or 5 inches apart, according to their strength, the characteristics of the variety, and to what is required in regard to the size of the bulbs. If very large bulbs are needed, the plants must be encouraged with stimulants, such as liquid-manure and guano dissolved in water. When applying such stimulants, always err on the safe side by giving weak applications and often, rather than strong doses, which often do more harm than good.

Celery.—The sooner all plants are put into the trenches the better. We do not believe in keeping them in the beds until they get too large, as the larger the plants the greater the check to their growth by transplanting. A day or two previous to moving them to the trenches, run the edging knife either way between the plants in the bed, cutting deep, they will then come up with "balls" (earth) attached, and suffer a less degree of check. We do not water the plants in the beds previous to lifting, believing that they recover more quickly if well watered when placed in the trenches. Choose a dull day for the work of transplanting.

Califlowers.—Continue to plant for succession as the demand requires. Where it is possible to do so take the plants up with a quantity of earth attached, and plant them with a trowel. On our soil it is difficult to get many root fibres along with a plant, and we therefore resort to the old plan of dipping the few roots in a paste made from equal parts of cowdung, clay, and soot. [An excellent practice under all circumstances. Ed.] In this they soon commence forming fibres, but the removal causes a great check to the plants.

Cleanliness.—In advocating the keeping of a garden free from weeds, I admit that I find it almost impossible to do so this season, for the weeds come here, there, and everywhere; and it is a continual fight to keep them from overgrowing the crops. We must follow up the work of extermination, and under no conditions allow any to seed. With unremitting attention we shall get the upper hand in time, may expect to have less to contend with in the future, and leave no disastrous legacy to those who may succeed us.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gr., Wrotham Park, Barnet.

Peach and Nectarine Trees.—These are now making clean, healthy growth. All the leading shoots and those required for fruit-bearing, filling up gaps, &c., should be preserved and made secure to the walls or trellises. Do not allow over-crowding of the shoots to occur; but before the young growths have become crowded a gradual reduction of the new growth should be practised. See that the fruits which have set and are now swelling up rapidly are not left too thickly on the trees; an even crop of well-developed fruits is preferable to a large number of inferior fruits. When the weather is bright and warm, syringe the trees each afternoon about 4 p.m. with clear water, taking care to well wash the under-side of the leaves in order to dislodge red-spider, &c. Trees that have been treated with quassia extract or some other insecticide for aphids should now be kept clean by the free use of water applied by the garden engine. Do not syringe the leaves sufficiently hard to damage them. Give attention to the very early varieties first, such as the Waterloo, Amsden, Alexander, &c., following on with Hale's Early, Early York, and then the mid-season varieties. If the trees have not yet been mulched lose no time in getting this done; it will help them to make strong, healthy fruiting wood, and to increase the size of the fruit.

Plums.—Several of the wall trees here are bearing good crops of fruit. Green-fly has been very troublesome, but repeated washings with soap-suds have cleansed the trees of this pest. All the leading shoots should be secured to the wall, and also a number of the young growing shoots should be trained in to take the place of the older branches. These growths when they are about two or three years old will produce the finest fruit. Cut back the rest of the growths to within four or five buds of the main branches. Mulching and watering will greatly benefit both the growth and fruit. Coe's Golden Drop, probably the best late dessert Plum grown, should be given special attention in regard to feeding and mulching. Syringe the trees at intervals with clear water, taking advantage of fine afternoons.

Red and White Currants.—These crop heavily when grown on walls facing east and west; and if properly netted and protected from birds, the fruits will hang and keep in excellent condition for many weeks. I have kept Red Currants sound until the beginning of September. Remove some of the young shoots, but do not use the knife too severely. Cleanse the berries and leaves before the fruit gets too forward, and mulch the roots with rotten manure. Should the soil be dry and of a somewhat light, gravelly nature, give a soaking of water occasionally.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. BURNS, North Mymms Park, Hatfield, Hertfordshire.

Schizanthus retusus and *S. retusus* *Grahami* are extremely useful for furnishing vases. The flowers of the variety *retusus* are pure white, with a deep yellow blotch on the lip—a beautiful combination of colour. *S. retusus* *Grahami* has the yellow lip, but the colour of the remainder of the flower is warm rose-pink. If seeds be sown now, the plants will flower at the end of the autumn. Three or four seedlings should be pricked into a 5-inch pot. During the summer the plants may be grown in a cold pit, but in the autumn they should be transferred to a sunny position at the warm end of the greenhouse.

Rhododendron (*Asalea*) indica.—Plants which flowered early, and having completed their growth have set the flower-buds, may be placed out-of-doors to "ripen" (harden) the wood. Stand them upon a layer of ashes, or preferably plunge the pots to half their depth in this material. Constant attention must be given to the work of supplying the roots with water, on account of the drying effects of the sun and wind. A good syringing morning and evening on fine days is of great assistance in maintaining the foliage in a healthy condition, and in preventing thrips. Later plants which are making their growth may

be assisted with occasional applications of weak liquid-manure, particularly those plants which have not been repotted.

Ericas.—The early-flowering varieties will now be growing freely, and require an abundance of fresh air during the day. On warm evenings the ventilators should be left sufficiently open to secure a circulation of air during the night. Do not permit other plants to crowd the *Ericas*; it is essential that the air should circulate freely around them. Great care is necessary in supplying water to these plants and to *Epacris*, but when the drainage is in good order and the plants are growing freely, liberal supplies are required. Soft-water is very necessary, and where the ordinary supply is "hard," rain-water should be used.

Epacris.—Where the plants were cut back and repotted, as advised in a previous Calendar, these will have made considerable growth. Ventilation may now be afforded freely, and if the house-room is required for other subjects, the plants may shortly be stood on ashes in the open-air.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Young Vines that were planted early in the season will have made considerable progress. Before the Vines have quite reached the top of the house, the leading shoots may be stopped, which will cause laterals to grow more freely; and these should be regularly stopped when two or three leaves have been formed, the object being to obtain canes of medium strength, well ripened, and with roots to correspond. Keep the soil of the border moist by frequent waterings, and when the roots are more numerous, afford a light mulch to prevent excessive evaporation. Keep a sharp look-out for red-spider, and if any is observed thoroughly syringe the foliage, but otherwise the syringe may be less frequently used. Let the night temperature be 70°, and when the canes begin to ripen afford more air and less moisture. Young Vines that have been raised from eyes should be repotted as soon as the pots have become moderately filled with roots. The pots may be 7 or 8 inches in diameter; they should be clean and provided with good drainage. For a rooting medium use light loam that is not very rich, with a sprinkling of Thomson's Vine-manure and sand. Make the soil moderately firm, and keep a night temperature of 70°, allowing a rise of 10° or 15° from sun-heat during day. Give close attention to watering, and seek to obtain well-ripened rods about 5 feet in length, stopping the lateral growths after the first leaf.

Figs.—Encourage the second crop by increasing the temperature by means of sun-heat, and afford an abundance of moisture in the atmosphere and at the roots. Close the house in the afternoon at a temperature of 85°. When the trees are bearing heavy crops of fruit, and the borders are well filled with roots, liberal supplies of liquid-manure are essential. It has been necessary to reduce considerably the number of fruits in a second house here, the second crop of which, as in previous years, we hope will last until the end of December. Give abundance of ventilation to Figs that are ripening. Thin out useless shoots, so that the sun's rays may thoroughly ripen the wood. After this date do not stop any shoots in the early-house. At this season a small scale insect is liable to make its appearance upon the wood and fruit of the Fig, which it is best to remove now by hand, and to bear the matter in mind when the trees are dormant that they may be thoroughly cleansed.

THE FLOWER GARDEN.

By A. B. WADDS, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

Subtropical Plants.—These plants require to be mulched, and watered frequently in dry weather. Provide stakes for any plants that require support.

Flower-seeds.—Seeds of Wallflower, *Myosotis*, and *Silene* may now be sown. Stretch a piece of net over the rows to keep the birds from dusting themselves in them. Seedlings of Brompton

Stocks and Sweet Williams may be transferred to a shady border. Slugs must be destroyed, or they will devour them all.

Carpet-bedding.—The beds should be sprayed over in the evening during dry weather, when the sun is off them. When heavy waterings have been afforded stir the soil with a small stick, or it will form a crust and greatly retard the plants from growing. Small offsets from *Echeverias* may be planted on a shady border to increase the stock.

Roses.—Hoe the surface of the ground frequently, and syringe the plants with quassia-water before the flowers open. Dishud any plants that require it. The variety *Mrs. W. J. Grant* should be included in every collection, for it has a soft, pleasing colour, and keeps good a considerable time when arranged in vases. Any Rose plants that are worthless and have lost their names should be marked when they are in flower, that others may be substituted for them in the autumn. If the weather be very dry, or the beds are raised, they may be mulched with cow-manure. Raised beds are not to be recommended.

Border Chrysanthemums, Lilliums and Gladioli will require to be staked neatly, the surface of the soil should be mulched, and water supplied when necessary.

Specimen Plants.—These may now be placed on the lawns, or if they consist of Palms and Ferns, and are sufficiently hardened, they may be plunged in the grass in the shade.

Rhododendrons and Azaleas.—Remove the old flower-trusses. Keep the grass cut down where it is too thick for the hoe. The soil should be covered with a thick mulch if possible. This will kill the weeds, and greatly benefit the plants. Any that are to be moved in the autumn should be marked according to their colours.

THE APIARY.

By EXPERT.

Wax-moth.—Keep down all wax-moth grubs. These pests are very numerous this year; also replace naphthalin in the back of hives, and allow no bees to get behind the dummy.

The Week's Work.—Honey should now be coming in very freely, and in good districts, where Sainfoin is abundant, the honey harvest should be good. The weather is not all the bee-keeper could wish for, the cold winds keeping many bees in their hives. As soon as sections are nearly filled up, lift up the crate and draw a carbolio cloth underneath it, and then put an empty crate underneath, placing the partly-filled one on the top. The bees will then travel through the empty crate to finish the section in the top. Another plan is to place a bee-escape under the filled section crate, and take them off next day. Or another method is to take them out singly from the crate and fill up again. All sections should be kept the same way up as removed from the hive, and stored away in a place of safety. All operations should be done in the afternoon if possible, working from the back of the hive, and always having the smoker at hand in case of need. It is better to have it there than be obliged to go for one at the time the hive is open. Hives that seem strong and no bees at work should be given immediate attention, if there is the slightest trace of foul brood. Call in an expert if you yourself do not know how to deal with it. Should the case be very slight spray each comb with Izal diluted as per instructions on the bottle, the cost of which is 1s. Spray the floor-board and body-box, and continue to keep the floor-board damp with it, also the quilt on the top bars. Should, however, the case be a bad one, it is best and safest to destroy the whole hive, including bees; but should the bees be very strong, shake the bees from the frames into a clean hive and placed where the old stock stood. Care should be exercised in this matter, in not touching any other hive until you have washed your hands in carbolio solution or Izal, or carbolio soap. All wax moths should be brought out and destroyed; ants should also be treated in the same manner by smothering them with kerosene. Replenish water near the hive. Each swarm should be dated and numbered for future reference.

APPOINTMENTS for JULY.

FRIDAY, July 22	Opening of the New Hall of the Royal Horticultural Society by His Majesty THE KING.
SATURDAY, JULY 2	Sutton Rose Soc. Show.
MONDAY, JULY 4	Maidstone Hort. Show.
TUESDAY, JULY 5	Scottish Hort. Assoc. Meet. Nat. Rose Soc. Show in the Temple Gardens, London. Croydon Hort. Soc. Show. Hanley Hort. Fête (2 days). Southampton Hort. Show (2 days).
WEDNESDAY, JULY 6	Lee and District Hort. Show. Roy. Bot. Soc. Exhibition, Regent's Park. Ipswich and E. of Eng. Hort. Soc. Show. Ealing Rose and Hort. Show.
THURSDAY, JULY 7	Rose and Hort. Shows at Norwich, Chipping Norton, and Walton-on-Thames.
FRIDAY, JULY 8	Brockham Hort. and Rose Show. Roy. Bot. Soc. Lecture.
SATURDAY, JULY 9	Windsor Rose and Hort. Soc. Exhibition. Warrminster Rose Show.
TUESDAY, JULY 12	Roy. Hort. Soc. Show at Holland House, Kensington (2 days). Wolverhampton Floral Fête (3 days). Hort. and Rose Shows at Gloucester and Wolverhampton.
WEDNESDAY, JULY 13	Nottingham Hort. Soc. Show (2 days). Ranelagh and Dist. Hort. Exhibition. Hort. and Rose Shows at Formby, Harrow, Reading, Stevenage, and Thornton Heath.
THURSDAY, JULY 14	Weybridge and District Hort. Soc. Show. Brentwood Hort. Exhibition. Highgate Hort. Soc. Annual Exhibition. Woodbridge Flower Show. Eltham Rose and Hort. Exhib. Potters Bar and Dist. Hort. Show. Rose and Hort. Shows at Bath, Helensburgh, Southsea, and Woodbridge.
FRIDAY, JULY 15	Rose and Hort. Shows at Gresford and Ulverston. Roy. Bot. Soc. Lecture.
SATURDAY, JULY 16	Manchester Hort. Soc. Rose Show.
TUESDAY, JULY 19	Roy. Scot. Arboricultural Soc. Exhibition of Forestry at Perth (4 days). Flower Shows at Saltaire and Tibshelf.
WEDNESDAY, JULY 20	Nat. Sweet Pea Soc. Show at the Crystal Palace (2 days). Agric. Soc. Show at Hauley (2 days). Hereford Rose Show.
THURSDAY, JULY 21	Leamington (St. John's) Hort. Show. Hort. and Rose Shows at Salterhebble and Halifax.
FRIDAY, JULY 22	Roy. Bot. Soc. lecture.
TUESDAY, JULY 26	Roy. Hort. Soc. Coms. meet; also Nat. Carnation and Picotee Soc. Show combined.
WEDNESDAY, JULY 27	Cardiff Flower Show (2 days). Newcastle-on-Tyne Flower Show (3 days).
THURSDAY, JULY 28	Chesterfield Hort. Soc. Show. Carnation Show in Birmingham Bot. Gdns. (2 days).
FRIDAY, JULY 29	Roy. Bot. Soc. lecture.

SALE FOR THE WEEK.

FRIDAY NEXT—

450 Imported *Odontoglossum Pescatorei*, also Established Orchids, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12.30.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—63°0'.

ACTUAL TEMPERATURES:—

LONDON.—June 29 (6 P.M.): Max. 71°; Min. 55°.

June 30.—Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden (10 A.M.): Bar., 30; Temp., 71°. Weather, bright sunshine.

PROVINCES.—June 29 (6 P.M.): Max. 66°. North of Ireland; Min. 58°. East Coast of England.

A Memorable Week.

THE week now closing will be historically interesting. It is expected that the last "Drill Hall" meeting has been held, and that in future the exhibitions of the Royal Horticultural Society will be held in the new buildings approaching completion in Vincent Square. During the chaotic period at South Kensington, and subsequently, the Society appeared on the verge of extinction, an outside Committee lent its aid to the Council, and made various suggestions. It did more. It recommended the acquisition, for the purposes of the Society, of the Drill Hall of the Scottish Volunteers in James Street, Westminster, and of the premises at 117, Victoria Street—the one for the exhibitions and meetings of the Committees, the other for the offices of the Society and for the housing of the Lindley Library. In spite of the notorious deficiencies, both establishments have well served their purpose. Now a new era is commencing. The Vincent Square building is nearly completed. It will afford vastly improved accommodation. The unremitting energy and organising faculty of the Secretary will, we have every confidence, ensure that the Society will in future have, what it has never had before, a home adequate to its requirements. Something is still lacking. We have had plenty of shouting, plenty of lip-applause, but those who were loudest in their protestations have hardly backed up their words substantially. It is to be feared that the new building may be hampered with debt, and that the Council will be harassed with difficulties which ought never to have arisen. There is still time, as the *Times* reminds us, and, before the KING and QUEEN formally open the new building on July 22 next, there is ample opportunity for those who derive the greatest benefit from the Society, and for others who have not yet contributed so much as the cost of a chimney-pot, to show that their clamour for a Hall was not purely selfish.

The week will also be memorable for the meeting of the Gardeners' Royal Benevolent Institution. When it was announced that the chair was to be taken by Mr. HARRY VEITCH, it was felt that the value of his services would be acknowledged by everybody, and that, apart from all personal considerations, every effort would be made to render his Chairmanship a success; and it was so. Mr. VEITCH must have been gratified by the homage paid him. It could hardly have been otherwise. We do him no more than justice when we say that his greatest satisfaction was experienced by the circumstance that the meeting over which he presided was not only a record one in point of numbers, but that no other has been the means of alleviating in an equal degree the sufferings and necessities of the class for whom he pleaded. The name of Mr. SHERWOOD must also be inscribed on the list of those "who love their fellow-men." His donation of £500 to the Gardeners' Benevolent, and of a like sum to the Gardeners' Orphan Fund, may surely be characterised as not the least important events of this memorable week.

The doings of the previous week, including the opening of the Educational and Forestry Exhibitions at Park Royal, Willesden, under the auspices of the Royal Agricultural Society, and the formal opening of

the Horticultural Department of the Reading University College, were also events of much importance, and are more fully alluded to in the following article.

To those who can look back even for only a few years to the state of instruction in

horticultural matters, and to the time when those who advocated the co-operation of practice with science were laughed at, or at least unheeded, the progress made of late must be eminently satisfactory. We have much, very much to do ere we can hope to rival our cousins in the United States, or our German neighbours, but we are beginning to recognise that, so far as agriculture and horticulture are concerned, we have much to learn from other countries. Deputations of farmers have visited little Denmark to see how it is that with inferior resources she is able not only to compete with, but to undersell us in our own markets. Similar visits have been paid to French and German forests, to Dutch farms, and Hungarian horse-breeding establishments. Such journeys would not have been made had we continued to be enshrouded in our own self-conceit. The very recognition of the fact that such visits were desirable is a sign of awakening. And what has been the net result? What is it that has given such an impulse to the practice of cultivation in countries from which at one time we thought we had nothing to learn, but which nevertheless flood our markets with produce, some considerable part of which might well be grown at home? All agree in the reply that it is to the spread of education, to the organisation of effort, and to the adoption of the principles of co-operation—in brief, to the spread of knowledge and the application of scientific methods to practical aims.

The question to what extent the State as such should render aid is a moot-point. One thing, however, is certain, that individual enterprise is not in all cases adequate to meet the requirements of the case. Look at the scores of educational and experimental stations in the United States, whose publications literally pour in upon us. They do for the farmer and the gardener what they could not do for themselves; first they get hold of the youths, train them, teach them to educate themselves, enable them to appreciate and turn to advantage the resources that lie open to them when well trained in practical work and well grounded in the principles which constitute the bank upon which they will have to draw in the future. When the pupils go out into the world the colleges do not necessarily lose sight of them, but keep in touch with them, if they so choose, by means of bulletins issued from the several stations. These publications keep them informed as to the progress of their science and their art, sound a note of warning where required, suggest measures of precaution when needed, and supply endless hints of the greatest value to the intelligent cultivator. Moreover, in any case of difficulty or perplexity there are the State officials to refer to for advice and suggestion. Nor are intensely practical matters connected with railway tariffs and markets forgotten. Combination and co-operation in the collection, supervision, and distribution of fruits, vegetables, and other market produce ensure regularity of despatch, uniformity of quality,

and consequently more satisfactory relations between growers and brokers than is possible when everything is left to individual enterprise. Our own Agricultural Department has lately shown signs of vigour in this direction, which are very encouraging to those who have the interests of cultivators at heart.

The Educational and Forestry exhibits at the recent Agricultural Show, though small in amount, were sufficient to show what excellent work is in course of accomplishment at Wye, at Chelmsford, and other colleges which have sprung into existence during the last few years. It is needless, of course, to speak of Rothamsted, for that stands apart without a rival in this or any other country, but the multiplication of agricultural colleges and experimental stations in the various counties for which we in past years pleaded so often, and as we feared in vain, is we rejoice to see in course of accomplishment. A visit to the Educational Department at Park Royal must have proved a most valuable object-lesson to many. Cultivators to whom books, lectures, diagrams, and figures appeal but lightly, must perforce have had their attention stimulated and their interest aroused by the objects there exhibited. When such concrete results are laid before them, the cultivators will feel more respect for the book-learning which rendered them possible.

Of course, to a very large extent what applies to agriculture applies also to horticulture, and the remarks pertinent to the one are applicable to the other. We are, therefore, especially pleased to have to record the official opening, on Friday, June 24, of the garden of the Horticultural Department of University College, Reading, by the Minister of Agriculture, the Earl of ONSLOW. The garden is familiar to very many of our readers as having been in the occupation of Messrs. SUTTON previous to their removal to their present more extensive trial-grounds.

Mr. Frederick Keeble, M.A. (Gonville and Caius College, Cambridge), is the Director of the Horticultural Department of the College, and Mr. Charles Foster, F.R.H.S., Instructor in Practical Horticulture. The Garden is under the direction of a garden committee, consisting of gentlemen in whom the greatest confidence may be felt.

Previously to 1902 the College possessed no garden for the teaching of practical horticulture. Instruction was given in the scientific principles of horticulture, but there was no effective provision for practical work. Interest in the department of horticulture had always been great, and for some months previous to their removal Messrs. SUTTON kindly permitted the department to make use of their glasshouses and land.

Mr. ALFRED PALMER then befriended the College by offering to lease to the Council on favourable terms the whole of the gardens and buildings thereon. These arrangements were concluded before the end of 1903. The tasks of plotting out the 7 acres of ground, of constructing nearly a mile of paths, and of establishing a Peach-house and vineries, were carried out by the students and staff, under the superintendence of Mr. FOSTER, the instructor in practical horticulture.

Broadly speaking, the department has three aims: (1) The first is the training of men and women in the science and practice of horticulture. The demand for such training increases year by year, and comes from many quarters. This cannot be better illustrated than by reference to the prospective careers of the students now in the department. Of the seventeen students, four

intend to become fruit-growers, two at home and two in the colonies; four to enter upon florist and nursery work; one to take a position in a seed-testing station; one to enter his father's nursery business; two to start market gardens, and the remainder either to work as lady gardeners or to manage their own private gardens. A system of scholarships makes provision for the training of professional gardeners. At present two such scholarships are held, and next year the Council is offering three scholarships, each of the value of £45, tenable at the gardens for one year. Mention should also be made of the invaluable service rendered by the gardens to the students of the College in their botanical and nature studies.

(2) The second aim is to carry out experiment and research whereby the sum of horticultural knowledge may be increased. Among researches now in progress attention may be called to the large plot devoted to a Potato trial undertaken in conjunction with the National Potato Society. Samples of the twelve chief Potato varieties are being cultivated under conditions rigorously similar. Their growths will be ascertained and the results will be carefully compared with those of similar trials carried on elsewhere.

(3) The department desires to be of practical service to the region round Reading. With this object an information bureau is being organised whence, for a small fee, expert advice in the management of gardens and orchards may be obtained, and whence also the services of trained gardeners may be secured.

The garden, as it is now, affords ample opportunities for most kinds of horticultural work, and no ground could be more conveniently situated in respect of the proposed new college buildings. Laboratory, class-room, and garden will be in immediate proximity to one another. The needs of market-gardener, florist, landscape gardener, will be effectively met; but, clearly, among the needs of the future will be ground for a fruit station. The acquisition hereafter of a suitable fruit station will complete the equipment of the Horticultural Department.

The garden contains 24 houses in all, utilised as follows:—1 and 2, Cucumbers and Melons; 3, Ferns; 4, Roses and Tomatos; 5 and 6, Tomatos; 7, Carnations; 8, Tomatos; 9 and 10, Melons and Cucumbers; 11 and 12, Cucumbers; 13, Peaches; 14, early vinery; 15, late vinery; 16, Cucumbers; 17, 18, and 19, Begonias; 20, 21, and 22, green-houses; 23, Cucumbers; and 24, Ferns.

The proceedings at the opening ceremony were commenced by the Chairman of the Council, OWEN RIDLEY, Esq., J.P., after which a statement was made by the Principal of the College, Mr. W. M. CHILDS, M.A., who explained the need that exists for the training in horticulture of those young men and women who intend to follow the profession as a means of livelihood. He pointed out the reasons for forming the horticultural department at the College and explained what the course of study there would be. He said that the students work for a diploma, the granting of which is authorised by the University of Oxford, the conditions of which are governed by a Committee which represents jointly the University of Oxford and the College at Reading, and includes representatives of the Royal Agricultural Society and the Royal Horticultural Society. In addition to this course, which lasts at least two years, and may last three, the students also take the examination of the Royal Horticultural Society, and sixteen having entered for the recent examination, Mrs. BENYON consented to present that day the certificates to the sixteen successful candi-

dates. There might, said Mr. CHILD, be some there who doubted the practical side of the horticultural training. He would invite such persons to visit the marketing shed and inspect the produce there, and remember that all of it had been cultivated in their own trial grounds by the students and staff. If any one doubted the scientific part of the curriculum, he would refer them to the shed, in which there were shown by diagram and actual example instances of those diseases which are so costly to the market-gardener—instances so set forth that they could be easily understood by those concerned.

The next speech was by Mr. ALFRED PALMER, Chairman of the Gardens Committee, who said that at present they had seventeen students, but they could accommodate thirty with very little more expense.

Lord ONSLOW, in declaring the Gardens open, delivered a very sympathetic speech, declaring that he knew of no establishment where such a horticultural training could be obtained as they were giving at Reading. He specially accentuated the desirability of facilitating the teaching of the principles of horticulture to those whose duty it will be to impart elementary education in the schools, and begged the College to arrange classes on Saturday afternoons as well as in holiday time for elementary school teachers. He should be extremely glad if the Board of Agriculture could assist such efforts as those that are being made at Reading, but with an income tax of one shilling in the pound in a time of "profound peace," he was afraid they must wait until the times were more propitious.

Mr. MARTIN JNO. SUTTON proposed a vote of thanks to Lord ONSLOW, which was seconded by Mr. FREDK. KEEBLE, M.A., who took the opportunity to speak appreciatively of the work done by Mr. CHAS. FOSTER, the Garden Superintendent, in the short space of time he has been there.

We afterwards walked through the gardens and inspected the crops, all of which were in excellent condition. The general state of these gardens, and the skilful cultivation shown in each of the crops, were praised by all. The indoor Tomato crop was exceptionally good, and the produce gathered together in the "marketing" shed in exhibition form was a sufficient testimonial to the skill of the cultivator.

MINLEY MANOR (see Supplementary Illustration).—Thirteen years ago we gave a description and illustration of this fine garden near Farnborough. It was then in course of construction under the superintendence of Messrs. VERTCH. It is remarkable for its resemblance to the gardens attached to old French chateaux; and this is appropriate enough, as the style of the mansion is also French in character. But besides this Messrs. VERTCH introduced large beds of flowering and other ornamental shrubs each, devoted to a single species, which are very effective; and here and there on the lawns are specimen flowering trees now of great beauty. The whole garden affords an admirable illustration of the way in which the rigidly formal garden near the house may, by imperceptible gradations, blend with the more distant wood and heathland. The plan of the winter-garden at p. 707 of our number for December 12, 1891, worked out in dwarf Conifers, green and golden, and Hollies of like colour, shows what effects may be produced in this way, and will remind the visitor of Chantilly and other French chateaux.

ROYAL HORTICULTURAL SOCIETY.—From the report of the examiners we learn that at the recent annual examination no fewer than 199 papers were sent in. More than 18 per cent. of the candidates were placed in the first class, 49 per cent. in the second, and 32 per cent. in the third class. Although the actual numbers of the candidates has declined, the quality of their work has appreciably improved, especially in matters pertaining to practical horticulture.

SIR JOSEPH HOOKEF.—All honour to the veteran botanist, who completes the 87th year of his age to-day, June 30!

"BIRTHDAY HONOURS."—Among those who were selected as the recipients of honours in connection with the King's birthday are Professor DEWAR and Dr. STEVENSON, who are to be knighted. Sir E. MAUNDE THOMPSON, the principal librarian of the British Museum, who is already a K.C.B., is gazetted as a Companion of the Imperial Service Order, and a like recognition is bestowed upon CHARLES FORD, Esq., late Superintendent of the Botanical Afforestation Department of the Colony of Hong-kong.

ROYAL GARDENERS' ORPHAN FUND.—We understand that the Treasurer of this institution, N. N. SHERWOOD, Esq., has written from Australia to give the Fund a special donation of £500. The generous and consistent support Mr. SHERWOOD has afforded the gardening charities is well known. This fresh instance of his liberality will be gratefully appreciated by the whole gardening community, especially in view of the fact that Mr. SHERWOOD has, as was announced at the dinner on the 28th ult., presented a similar amount to the Gardeners' Royal Benevolent Institution.

BRITISH GARDENERS' ASSOCIATION.—The Honorary Secretary asks us to state that owing to the pressure of correspondence, he hopes that intending members and others will pardon any delay there may be in answering their letters. Those interested in the Association, and willing to forward its interests, may render valuable assistance by applying for forms of application, &c., for distribution, or by sending the names of qualified gardeners likely to join. Donations towards the £250 required for initial expenses will be welcomed, it being felt that when the services of a paid Secretary and offices can be secured the Association will speedily be able to make its presence and influence felt.

LILACS.—M. HENRY, in the *Revue Horticole*, notes the production of inflorescences from suckers. We have seen a similar occurrence in *Ailanthus*. M. HENRY also notes the production of an inflorescence from the old wood of the Lilac. We have met with a like production from the old rods of a Vine.

ENGLISH ARBORICULTURAL SOCIETY.—On July 2, a visit will be paid by the members of this Society to the estate of the Marquess Camden, at Bayham Abbey, near Frant, Sussex. The annual meeting will be held at Aberdeen, from August 16 to 19, when Haddo House, Balmoral, and other estates will be visited. Mr. E. DAVIDSON, Haydon Bridge, Northumberland, is the Assistant Secretary, to whom communications should be addressed.

"THE BRITISH JOURNAL OF PHOTOGRAPHY."—We owe an apology to our contemporary for not previously offering our congratulations on his jubilee number; but we see that we are not alone in being unable, from press of matter, to insert contributions with the promptitude which is desirable. It is not too late to call attention to the admirable history that this number affords of the development of photography and of the progress of the *Journal*; whilst the biographical details relating to successive editors and contributors are of very great interest. We are glad to see a

notice to the effect that "advertisements are inserted absolutely without condition, expressed or implied, as to what appears in the text portion of the paper." Advertising agents, in their anxiety to "do business," are unconsciously doing their best to depreciate the value of legitimate advertisement, and to injure the reputation of those journals which do not strictly maintain the distinction between the advertising and the editorial departments.

MR. CHRISTOPHER DEAVIN, who has filled the position of gardener to Colonel the Hon. CHARLES HAY DRUMMOND, at Harewood Lodge, for the past twenty-five years, has retired, at the age of seventy-six, upon a pension.

INSTRUCTION IN HORTICULTURE.—The Education Committee of Essex, with a view of assisting teachers in the administrative county to gain a knowledge of gardening operations necessary for the successful working of school gardens and evening continuation school gardens, has decided to hold a holiday course in the principles and practice of horticulture at the Biological Laboratories and Garden at Chelmsford, in the month of August, 1904. The course will commence on August 8, and will meet daily for two weeks, provided a sufficient number of teachers make application to attend. The laboratories and garden at Chelmsford afford every opportunity for successful horticultural work, and the students will themselves perform all the necessary garden operations. Both men and women are invited to take the course. The Committee will defray travelling expenses once to and from Chelmsford, and will in suitable cases make a special allowance of 12s. 6d. per week towards the maintenance of candidates fulfilling the necessary conditions. Applications must be made on printed forms, to be obtained from the Secretary, County Offices, Chelmsford, and must be received by July 21 at latest.

VEGETATION IN LONDON.—According to Mr. MAWLEY's annual report of Phenological observations for 1903, the earliest date in which the first speck of green was visible on the Lime trees in the garden of the Bank of England was March 14, in 1893; the latest, April 20, in 1888. The trees were quite bare of leaves on October 17 in 1896, the earliest date; and on October 31, in 1895, as the latest date. The mean for sixteen years was March 29 for the vernal, October 24 for the complete fall of the leaf.

CLEMATIS.—The identity in essentials between the ordinary leaves and the parts of the flower is well shown in some Clematis flowers sent by F. R. MARSH, Esq., through Messrs. BARR. The outermost segments, instead of being petaloid, are present in the form of leaves—in some cases of large size and deeply lobed, quite as in an ordinary foliage leaf.

GARDENERS' OUTING.—On Saturday last about forty members of the Oxfordshire County Council horticultural classes visited Messrs. SUTTON's trial-grounds and the University College Gardens, Reading. The party was met at the entrance to the trial-grounds by Mr. LEONARD SUTTON, who gave them a hearty welcome. He afterwards conducted the visitors through the principal trials and greenhouses, explaining the chief points of interest. The party then proceeded to the University College Gardens, where they were met by Mr. F. KEEBLE, Director of the Horticultural Department, and Mr. C. FOSTER, the Superintendent of the Gardens. The impression gained in going through the greenhouses, which contained magnificent crops of Tomatoes, &c., was that of excellent order and cleanliness.

THE NATIONAL CHRYSANTHEMUM SOCIETY'S ANNUAL OUTING will take place on Tuesday, July 19, when the members and friends

will proceed, at 10.25 A.M., by special train from Baker Street Station (Platform No. 2), for Waddesdon Manor Station, calling at Finchley Road at 10.30, Harrow at 10.45, and Rickmansworth at 10.55. A visit will be made to the gardens and grounds at Waddesdon Manor by permission of Miss A. A. DE ROTHSCHILD.

FUNNEL ON CABBAGE LEAF.—From the Curator of the Royal Gardens, Kew, we have received a good example of a very common formation in Cabbages and in Lettuces. The midrib breaks away from the lower surface of the blade above its middle and forms a long slender stalk which expands above into a funnel-shaped, leafy "pitcher." On cutting across the midrib, as also the stalk of the pitcher, it will be seen that the

vascular bundles are arranged in a circle  as they are in shoots, not as they are usually in leaf-stalks, . The woody portion of the bundles is turned towards the centre, the bast or phloem towards the circumference.

WHEAT-GROWING IN CANADA.—A paper on this subject, written by Mr. W. SAUNDERS, Director of the Dominion Experimental Farms, gives some figures interesting to those who are fond of statistics or who are interested in the food supply of Britain. He says that "the area of land suitable for the growing of agricultural crops in Canada is so vast that when presented in figures the mind needs a deal of training before their full significance can be grasped. The total imports of Wheat and flour into Great Britain in 1902 were equivalent in all to about 200,000,000 bushels of Wheat. Were one-fourth of the land said to be suitable for cultivation under crop, the total crop (under favourable conditions) would be over 812,000,000 bushels. This would be ample to supply the home demand for 30,000,000 of inhabitants and to meet the present requirements of Great Britain three times over. This estimate leaves the large Eastern Provinces out of consideration. Summary: Land fit for settlement in Western Canada, 171,000,000 acres; present production of Wheat and other grains, about 125,000,000 bushels; and possible Wheat production, 800,000,000 bushels.

MR. R. P. BROTHERSTON.—The Neill Prize, which is in the gift of the Royal Caledonian Horticultural Society, was on June 22 awarded by the Council of that Society to Mr. R. P. BROTHERSTON, gardener to the Earl of HADDINGTON, at Tynninghame, East Lothian, as was announced on p. 406 of our last issue. The prize is awarded every second year in terms of Dr. PATRICK NEILL's will to some "distinguished Scottish botanist or cultivator." For this purpose Dr. NEILL, who was the first Secretary of the Society, bequeathed £500; and the prize, which amounts to about £30 on each occasion, has been awarded to, among others, such men as the late Prof. BALFOUR, JOHN SADLER, and ISAAC ANDERSON HENRY, of Edinburgh; WM. THOMSON, Dalkeith; DAVID THOMSON, Drumlanrig; MALCOLM DUNN, and MALCOLM MCINTYRE. Mr. BROTHERSTON, a native of Roxburghshire and now in his fifty-seventh year, served his apprenticeship with Mr. WM. THOM at Newton Don, a splendid type of the old-fashioned painstaking gardener, and a keen grower of hardy fruits, vegetables, and flowers. Lady ELEANOR BALFOUR was then alive, and under her influence everything new in Carnations, Pinks, Dahlias, Hollyhocks, Phloxes, and Roses was grown. After a few months at Leuchie, Mr. BROTHERSTON went to Mr. JAMES DOUGLAS, V.M.H., then at Loxford Hall, going through all the departments from the lowest to inside-foreman. After two years with Sir JAMES BUMLEES at Argyle Lodge, Wimbledon, he removed to Tynninghame, thirty years ago, in

succession to Mr. THOS. LEES. Mr. BROTHERSTON has accumulated a very good collection of horticultural literature, and with due respect for things old he is very much up-to-date. An afternoon at Tynninghame is all too short to do justice to the gardens under his care, which contain a fine collection of ornamental and flowering trees and shrubs, and herbaceous borders; and it may be that to his training under Mr. THOM and Mr. DOUGLAS is to be attributed his full knowledge of hardy fruits and his love of the Carnation, which he grows largely and well. Earnest, observant, and painstaking in all he does, his services are much sought after in the North in judging hardy fruits. Mr. BROTHERSTON contributes largely to current horticultural literature. He is the writer of *The Book of the Carnation*, recently published by Mr. JOHN LANE, and was the winner of the 1st prize in an essay competition on the cutting, arranging, and keeping of cut flowers in water, offered last year by Mr. and Mrs. MARTIN WHITE, of Balruddery, Dundee, under the auspices of the Royal Caledonian Horticultural Society.

ON THE EFFECTS OF GRAFTING ON THE VINE.—In a recent number of the *Comptes Rendus* is a paper by MM. LUCIEN DANIEL and CH. LAURENT, mentioning the results of their experience in Vine-grafting. "M. JURIE," say the authors, "has already shown that certain grafted Vines have shown variations in their habit and foliage; that the form of their bunches has been more or less modified in sympathy with the stock, and that this influence extends even to the seeds." The paper is a report on the effects of grafting on the anatomical structure of the grafts, and on the wines made from the berries. The following are the conclusions arrived at: "1. It is seen that the internal anatomy of the Vine varies under the influence of grafting exactly as the external appearance does. 2. The wine from grafted Vines differs noticeably from wine from ungrafted Vines, and the variations of its several constituents depend on the nature of the stocks. This change may be beneficial or injurious according to circumstances; that is, there are grafts that cause improvement and grafts that are detrimental. 3. Variations in the constituents of the wine from the same grafted Vine are not necessarily of the same nature. It is not, therefore, possible to select a single constituent—alcohol, for example—as a criterion of improvement."

HOLLY-TREE DENUDED OF BARK.

THE tree illustrated at fig. 5 [is growing] in moorland on the estate of Balthayock, Perthshire, the country seat of R. Wyllie Hall, Esq. Several stems in the foreground are in each case entirely denuded of bark for a length of about 12 to 18 inches. Not only is this so, but the exposed wood is quite dead and decayed to a depth of about half an inch all round. There is no mistake in the matter, for since the photograph was taken Mr. Bell, the forester on the estate, has, at my request, kindly sent me a 3-feet length of the basal portion of the trunk, seen at the extreme left of the photograph. The barking appears to have been done by rabbits eighteen or twenty years ago, yet every one of the several stems is carrying well-developed branches and healthy foliage. The main extremities of the branches are, however, in a considerable number of cases quite dead, and very probably there is no real growth, but rather a continuous but slow loss of weight. On the other hand, the stem at 4 feet above ground appears to have gained in thickness, so that an active cambium is apparently adding new wood annually. D. Storrie, Dundee.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

BLACKBIRDS TROUBLESOME ON A LAWN.—For the last three weeks the blackbirds here have been making themselves objectionable by pecking small round holes in the lawn, about an inch or two in diameter and the same in depth. Observation has shown that the birds are seeking for worms. They hop about, and on discovering a likely worm-hole energetically set to work with their beaks to unearth the worm, scattering fragments of turf around in their efforts. Till the

pretty. The *Centranthus* has a faculty of springing up from self-sown seeds in spots where it would appear to be an impossibility for the roots to spread or find sustenance. On the platform of a little station near Plymouth I saw, last year, a large plant of *Centranthus*, with several flower-stems about 3 ft. in height, that had sprung from a crack between the wall and the platform-tiles into which it was difficult to insert the blade of a knife. Another plant, with three stems about 18 inches in length, I saw the other day growing out of the mortar of a comparatively recent railway-bridge, about 10 feet from the ground. S. W. Fitzherbert, S. Devon.

FIG. 5.—HOLLY-TREE PARTLY DENUDED OF BARK IN PERTHSHIRE

birds were seen in the act the cause of these small holes was rather a puzzle, as the lawn in former years does not seem to have been disfigured in this way. Is this delving for worms a common practice with blackbirds? J. P., Carlisle, June 28.

CENTRANTHUS RUBER.—This plant, generally known by the name of Red Valerian, is now very effective in the South-west of England, where long stretches of railway-embankment are pink with many thousands of flowering plants, and old walls and cliff-faces are mantled with the same tint. Two varieties often occur in a wild state, one being pure white and the other deep crimson; but, as a rule, the pink type is dominant. The other day, however, I saw the almost precipitous side of an old, disused quarry in the neighbourhood of Torquay covered with the three forms in about equal numbers, and the effect was surprisingly

HIMALAYAN RHODODENDRONS.—In connection with the subject of Sir John T. D. Llewelyn's lecture at the last meeting of the Horticultural Club, I should like to mention the following facts bearing on the spring-tenderness of these species generally in this country. The late Capt. H. A. Mangles, whose labours in cultivating and raising Himalayan and Bhotan Rhododendrons from seeds is well known, was aware of the unsuitableness of the English climate for the cultivation of many of the species, our mild winters and the lack of snow or its early melting inducing early growth, which got cut by spring frosts. On the occasion of a visit paid to his garden at Vale Royal, Haslemere, early in the eighties, he mentioned to the writer of this note his practice of retarding the growth, and consequently flowering of his plants, by erecting mat shelters for them early in the winter, which shaded them from

sunshine. By so doing, and by planting the earlier growers on the north side of high walls, he succeeded in preserving most of his plants from injury. It would be undoubtedly a great gain to our gardens if we could introduce the hardier species mentioned by Sir G. Watt as being found in the mountainous districts of Burmah, China and Assam, seeing that these and hybrids from them would be very suitable for cultivation in the warmer parts of these islands. *F. M.*

ARUNDINARIA NOBILIS.—I was much interested in Dr. Stapf's foot-note to my remarks on *Arundinaria nobilis* and *A. Falconeri*, which in the South-west of England have for many years been grown as distinct species. I read Dr. Stapf's original article with care, and noted that he held the two Bamboos grown under these names to be identical. As I consider it to be eminently desirable that growers should know the correct names of the plants they cultivate, and that this knowledge should not be merely confined to botanists, I penned my note, which, as Dr. Stapf remarks, has had the effect of confirming his conclusions; for it appears that the *Arundinaria nobilis* sent by Mr. Rashleigh was really *A. Falconeri*, and that his *A. Falconeri* was *A. falcata*. It would be interesting to know what the Bamboos grown at Menabilly under the name of *Arundinaria falcata* really are, for they appear to be different from those grown there under the name of *A. Falconeri*, now said to be *A. falcata*. In the letter from Menabilly, referred to in my former note, occurs the passage—"Of *A. falcata* we have six nice specimens, about 16 feet high; the culms are a dark-green colour with the white down in their young state, and are more erect in habit than those of *A. Falconeri*, while the plant is a stronger grower." *S. W. Fitzherbert.*

ARETHUSA SINENSIS (see p. 403).—I believe that the plant which Mr. Elwes sent to Kew was one which I sent him; if so, it came originally with an imported plant of *Cypripedium bellatulum*. *C. W. Strickland, Hildenley, Malton.*

COLOURING OF APPLES, AND SOIL NITRIFICATION.—It has generally been believed that colour in Apples and other fruits is due to sunshine; and the more intense the light, the higher the tint, irrespective of the degree of nitrification taking place in the soil. There are some varieties that invariably take on high colour, either red or russet, in the North, where Apples generally are paler than in the South. I would instance the Red Calville, Calville d'Automne, Mère de Ménage, Manx Codlin, Kerry Pipin. This occurs whatsoever the character of the season. The same consistent and regular colouring occurs in fruits of the Peach, Apricot, Plum, Cherry, Currant, and Gooseberry. Exceptions are Strawberries of certain varieties, and Pears, and perhaps Figs, which are apt to be deficient in tint in wet, cloudy, unfavourable weather if this be long continued; and this deficiency is nearly always accompanied by lack of flavour. Before gardeners pin their faith on nitrification within the soil having influence on colour, something more than quasi-scientific assertion is needed, and the subject is well fitted for experiment in the new Royal Horticultural Society's garden at Wisley. *F. M.*

GARDENERS' MUTUAL IMPROVEMENT SOCIETIES.—Should any author at any time undertake the work of writing a history of the development of horticulture during the past and present centuries, he certainly will have to take special note of the origin and growth of the movement, which seems to be rapidly culminating in the formation of a gardeners' society for mutual improvement in every district or centre where gardening is practised. The dominating factors of this movement are, the desire for more intimate social intercourse between those engaged in the same vocation, a natural wish to have opportunities to converse with each other concerning gardening, and not least, an undoubted longing to obtain from each other such professional knowledge as is helpful for mutual improvement. There is perhaps no other vocation which incites individuals thus to come together for mutual instruction and mental welfare as gardening

does. At some future time perhaps these qualities may become important factors in gardening progress. *A. D.*

THE LARGE-FLOWERED MIMULUS.—One can sometimes find on a costermonger's barrow a plant that is well worthy the few pence paid for it. A few days ago I was able to secure in this way a few very fine forms of the Giant Mimulus, which seemed to recall something of the high level to which the flower had been brought a great many years ago, when it received more attention at the hands of the florist than it does in the present day, for in addition to their great size, the flowers were of fine shape and brilliantly marked. Evidently these Mimulus represented a strain which is grown for market, and kept by careful seeding up to a high degree of quality. The plants, when well rooted, were potted, the flower-buds being picked off so as to encourage a free growth; they will shortly have a shift into 32-sized pots, and as soon as established they will be stood out in the open and permitted to grow and bloom freely. Being of a somewhat brittle nature the main shoot should be securely fastened to a stick, and the side branches also made secure. I have found a few of the fine sprays of wood an excellent support to the side shoots. In hot, dry weather the plants need plenty of water, and being potted in rich soil, they scarcely need the aid of a fertiliser during the season, and being in the open-air they are much less liable to attacks of green-fly than when wholly cultivated under glass. Two or three pods of seed for future sowing might be saved from each plant, in order to keep up the high quality of the strain, or a particular variety might be propagated by means of cuttings, which strike readily enough. Up to recently it was possible to find named varieties of Mimulus in some popular plant catalogues; probably they have become lost to cultivation. An excellent Mimulus for pot culture is a large hose-in-hose yellow variety known as Golden Queen. The two large corollas, one issuing from the other, are pure yellow, and they are produced with great freedom; and as it does not produce seeds, there is no check in the succession of bloom from this cause. It is a strong grower, and most free branching. It is evidently a form of *M. luteus*, and quite hardy. So far, I have grown it only in pots, under glass, but this season I have quite a large plantation of it in the open; the plants are fast coming into bloom, and it may mature a few seeds in the open ground. Hose-in-hose forms of the Mimulus will sometimes put in appearance among seedlings of ordinary strains, but, like the hose-in-hose Primrose and Polyanthus, they produce but very few seeds, and only a small percentage of the seedlings can be depended upon to assume the hose-in-hose forms. Nothing that I have seen of this character among the Mimulus can compare with Golden Queen for size and beauty, and especially for floriferousness. *R. D.*

PLANT NOTE.

CALCEOLARIA VIOLACEA.

This pretty shrubby *Calceolaria* has been in flower for some weeks in the south-west, where it is quite hardy. Though a native of Chili, it is evidently hardier than its habitat would lead one to suppose, for I understand that it has lived in the open with the late Mr. Wolley-Dod in Cheshire. The largest specimen that I know of is in a garden in the neighbourhood of Truro, where it is 4 feet in height and as much through, while slightly smaller examples are comparatively common in South Devon and Cornwall. The helmet-shaped blossoms are very beautiful if the interior is inspected. The ground colour of this is pale mauve spotted with purple, while down the centre of the lower lip runs a broad band of bright yellow spotted with chestnut. It was introduced more than fifty years ago, and was formerly styled *C. Jovelliana*. Where the climate is too cold for planting it out permanently in the open, it makes a handsome greenhouse plant. It may be easily propagated from cuttings of the young wood. *S. W. Fitzherbert, S. Devon.*

FLORISTS' FLOWERS.

THE TIME TO LIFT TULIPS.

THE early lifting of Tulip bulbs is now generally recognised as a wise procedure. The skin is thereby helped to adhere closely to the bulb, and to gradually assume the pale chestnut colour indicative of the fully ripened process. As soon as the flower fades the bulbs rapidly ripen for removal. The fine rectified and breeder Tulips of the florists are generally lifted from the third week in June to the first week in July, but something depends upon the character of the season. It is not necessary the foliage shall have completely died down, though some wait for this stage. A very good test is applied by the florists—"So long as the clear stem below the flower will snap sharply on being bent, the time for lifting has not come, but when the stems will bend double without snapping off, the bulbs may be taken up."

The root fibres and foliage are no longer of any assistance to the newly-formed bulb, but they assist the development of the seed-pod if one has been fertilised for seed purposes. All that remains of the old bulb is a loose skin or two about the new one; it is possible to remove it without endangering the proper ripening of the seed pods; the new bulb may appear white, but the ripening process can be completed above ground as well as below it; its thin skin will thicken and take on colour; it will cling closely to it, and not peel off, as is frequently the case with bulbs lifted late. Heavy summer rains do the bulbs no good; the late lifted ones have had their skins thickened and hardened underground, but they quietly shed them, and so lose force by evaporation.

The florist takes the greatest care of his bulbs when lifted; they are placed in drawers having receptacles answering to the position of the bulb in the bed. As a rule the Tulip cabinet is so constructed that air can circulate among the drawers, ensuring cool and dry conditions for the bulbs.

In a forcible passage in one of his interesting papers on the Tulip, the Rev. F. D. Horner reminds us that though the Tulip bulb may be lying by in its drawer apparently at rest—though life may appear dormant, there is yet nothing of the character of suspended animation. "It is full of ripe and ready active juices, and those are stirred by such nerve and pulse as may be in vegetable life, and are used at once—though invisibly, in building up tissue and structure of next year's foliage, stem, blossom, and seed-pod, together with, least among the hidden wonders, the germ of the bulb to follow. Cut through the bulb when nearly ripe in June, and you shall see nothing but so many fleshy, juicy layers, united on a base or radical plate. But watch the bulb from time to time as autumn draws on, and you will see that its very shape has been gradually altering. Instead of losing flesh it seems to have gained it, and its tissues are fuller of sap than ever. They are tense and bright and fervent, while at the vital base of the bulb, its most vulnerable part, the coronal of fibres, with the point of every future rootlet, almost pricking through, is very prominent. Probably the pale tip of the young shoot, the 'guard leaf,' as it afterwards becomes, is already visible. But if not, dissection would reveal every leaf of the future foliage. Every petal of the coming flower, with every chance notch and imperfection of shape prefigured in it, every stamen, and the seed-pod, with its triple stigma. Only at this early stage the proportions of the various parts are not in their final order, for the embryo stamens are larger than the petals of the unborn flower, and there is little or no visible stem close by, and upon the radical

SOCIETIES.

ROYAL HORTICULTURAL.
THE LAST OF THE DRILL HALL.

JUNE 28.—The Society held on Tuesday last what it is believed will be the last meeting it will hold in the "Drill Hall." The last show was a fair example of the type of exhibition that has been held there during the past few years. The Hall was well filled with gay groups of flowering and foliage plants, fruits, and cut flowers, and there was a large attendance of visitors. Thus the Fellows have terminated an acquaintance with a Hall that afforded limited conveniences, even as a mere exhibition hall. It may be admitted that, although latterly it has been the best abused hall in London, it has nevertheless served well the purposes for which it was intended; and it should be remembered that it was recommended as a temporary expedient only, by the gentlemen deputed to find a hall for the Society's meetings, when the exhibition buildings at South Kensington became unavailable.

The Society's next exhibition will be held in Lord Ilchester's grounds at Holland House, Kensington, on July 12 & 13, and the following one in the new Hall in Vincent Square, Westminster, which will be formally opened by their Majesties the King and Queen, on Friday, July 22.

Floral Committee:

Present: W. Marshall, Esq. (Chairman); and Messrs. Geo. Paul, C. T. Druery, H. B. May, R. Dean, Jas. Hudson, W. Howe, R. Hooper Pearson, John Green, W. Bain, A. Perry, C. Jeffries, R. W. Wallace, C. E. Pearson, R. C. Notcutt, W. Cuthbertson, C. E. Shea, W. P. Thomson, E. H. Jenkins, W. J. James, C. Bick, J. W. Barr, E. T. Cook, George Gordon, and John Jennings.

The whole of one side of a centre table was occupied with a collection of *Streptocarpus* varieties, shown by Lord ALDENHAM (gr., Mr. E. Beckett). Many of the plants were in 8-inch pots, and bore strong, well-developed foliage, but carrying large clusters of flowers in many pretty shades of colour. The group deserves praise from a cultural point of view, and the strain is certainly a very fine one (Silver-gilt Flora Medal).

A charming group of Roses was displayed in vases by Messrs. PAUL & SON, the Old Nurseries, Chessington, N. Most of the types were included, the whole group presenting a very fresh and bright appearance, with the colours pleasingly blended. This large group was one of the finest in the hall (Silver Flora Medal).

Another lovely group of Roses was set up by Messrs. B. R. CANT & SONS, Colechester, all in admirable condition, and including most of the types of this popular flower. Ben Cant, Mme. Abel Chatenay, Liberty, and the new pillar Rose Maharajah, are a few varieties that impressed us as being especially good (Silver-gilt Banksian Medal).

MESSRS. GEO. BUNYARD & CO., Maidstone, Kent, contributed vases of Roses, principally climbing varieties, Bardon Job, macrantha, Perle des Ronges, Reine Olga de Wurtemberg, Liberty, Killarney, &c. The same firm also set up a number of spikes of Delphiniums.

MR. A. R. UPTON, Hardy Plant Nursery, Millmead, Guildford, staged nine pots of Rose "Zephyrine Drouhin," arranging vases of cut flowers of the same along the front. The bright rosy-pink flowers are very pleasing, and possess unusual perfume. It is an excellent climbing variety.

MESSRS. W. & J. BROWN, Stamford, set up a number of vases of Rose blooms, principally of the pillar kinds, and a number of pot-plants of zonal Pelargoniums of the Cactus type of flower. Some *Verbenas* and *Heliotropes* were also included in this display.

FRANK LLOYD, Esq., Coombe House, Croydon (gr., Mr. M. E. Mills), staged a group of hybrid Begonias, the shades of colour being chiefly of salmon and salmon-pink. Some were arranged in baskets, for which this type are eminently adaptable; some of them would also commend themselves as bedding plants, being very free-flowering and carrying their blooms well above the foliage (Silver Flora Medal).

MESSRS. JAMES VEITCH & SONS, Chelsea, brought English Iris in many curious and handsome varieties. A pleasing strain of Sweet William (*Dianthus barbatus*) was also shown with these, including a large Auricula-

eyed variety. Another group set up by the same firm contained some of Messrs. VEITCH's recent introductions, including several pleasing new Roses, of which the variety *Lney* is commendable. *Cornus Kousa* was shown, its white flowers much resembling those of a Clematis. *Streptocarpus* in this group were good, the variety *S. achineniflorus albus* being a handsome white variety, with flowers of good form. *Bougainvillea Sanderiana* was shown well (Silver Flora Medal).

MESSRS. KELWAY & SON, Langport, Somerset, had a remarkable collection of Delphiniums, quite the best in the Drill Hall. The spikes were massive, flowers large, and the colours varied and pleasing. Most of the varieties were named ones. Some good Gaillardias were also shown by Messrs. Kelway (Silver Banksian Medal).

MESSRS. H. CANNELL & SONS, Swanley, Kent, staged twenty-one varieties of Sweet Peas of the Cupid type, dwarf, well-flowered, and of pleasing colours. Bridesmaid, Mauve Queen, Beauty (blush-rose), Captain of the Blues (dark blue), and Her Majesty (carmine), are some of the best of those shown (Silver Banksian Medal).

MR. H. B. MAY, Upper Edmonton, showed eighty-two varieties of *Codiceums* (Crotons), set up very tastefully, the variety of form and colourings in the leaves being much admired. These plants were unusually well cultivated specimens (Silver-gilt Banksian Medal).

MR. L. R. RUSSELL, Richmond Nurseries, Richmond, staged a large group of well-grown ornamental stove and greenhouse plants, some large Palms at the background enhancing the effect. *Ficus Parelli*, good plants of *Dracena Sanderiana*, and *D. norwoodiensis* were noticed; *Marantas*, *Caladiums*, *Codiceums*, *Alocasias*, and *Aralias*, all well grown and prettily coloured, together with other members of this section of plants, completed a fine display, to which an edging of *Caladium argyrites* imparted a pleasing finish (Silver Flora Medal).

MESSRS. J. CHEAL & SONS, Lowfield Nurseries, Crawley, set up a group of flowering and ornamental foliage shrubs and trees, working in the group some cut flowers from the herbaceous border. *Phlox frutescens* was noted in this group with its Buddleia-like foliage and dense corymb of yellow flowers.

MESSRS. R. WALLACE & CO., Kilnfield Gardens, Colchester, had an extensive collection of hardy flowers. *Ixias* were shown well. Several species of *Lilium* were shown, including a nice batch of *L. Hansonii*. Good *Irises* were included; *L. Monnierii* is of exquisite yellow colour. *Centaurea pulchra major*, *Aconitum Lyneatum* and *Brodiaea coccinea* were also noticed in this large collection (Silver-gilt Banksian Medal).

Another large group of hardy flowers was staged by Mr. AMOS PERRY, Winchmore Hill, London, N. Here were many choice *Liliums*, *Ixias*, *Campanulas*, *Delphiniums*, &c. Some hardy *Nymphaeas* were presented, among which were *N. Gladstoniana* (large white) and *N. Laydekeri* lilacea. *Lilium pomponium* was good; *Ornithogalum pyramidale* was attractive, on account of its powerful odour (Silver Flora Medal).

MR. M. PURCHARD, Christchurch, Hants, included in his collection *Philadelphus Lemoinei maculatus* and *Pimpinella magna rosea*, for which awards were obtained; *Iris Kienperfi*, *Lilium Martagon album* (fine group), and *Potentilla California* and *P. Congo*, the latter of striking scarlet colour. *Coriaria japonica* was shown covered with its pretty red-coloured fruits (Bronze Flora Medal).

A group shown by Mr. R. C. NOTCUTT, Wood's Nursery, Woodbridge, included *Gillenia trifoliata*, *Coreopsis grandiflora*, *Hedysarum coronarium*, *Sidalcea candida*, &c.

MESSRS. JOHN PEED & SON, West Norwood, London, set up trays of alpine plants and cut hardy flowers in vases, trays of Roses, and tuberous-rooted Begonias.

MESSRS. WM. CUTHBUSH & SON, Highgate, London, N., set up a large group of herbaceous flowers—*Phlox decussata* in variety, *Paeonies*, *Liliums* (including *L. Krameri*), *Eremurus* and *Delphiniums*. The same firm also displayed a batch of Carnations. These were all of the Souvenir de la Malmaison type, with the exception of a few border varieties at either end. Duchess of Westminster, an improvement on the old double pink variety, was in good condition. Robert Burns, prettily displayed in a vase; Nell Gwynne (good white), Grace (fine pink), Lady Grimston (striped bright pink), were some of the finest shown. Messrs. CUTHBUSH also staged a new *Verbena* named Princess of Wales, with flowers of a deep heliotrope colour. This should prove an acquisition for bedding purposes (Silver-gilt Banksian Medal).

ALPINE GARDEN.

SAXIFRAGA GUILDFORD SEEDLING.

I HAVE tried several of the mossy Saxifragas with coloured flowers, and have found this variety to be the richest coloured of and certainly quite distinct from all others in the section. This plant is the latest of these coloured forms to flower. It is presumably a chance seedling from *S. Rhei*, the leaf characters being nearly identical. The plant is from 3 to 5 inches high when in flower, the stems being distinctly glandular. The peduncles, calyces, and flower-buds are reddish-crimson; the stem-leaves $\frac{1}{2}$ an inch long, acutely pointed and linear, even to the rosettes. In other kinds the upper stem-leaves are ovate, acuminate; the lower ones being twice or thrice cleft. I give this description because of the existence of a spurious kind. A site which is not exposed to full sunshine is best for this variety owing to the intensely coloured blossoms. E. J.

THALICTRUM ANEMONOIDES.

Anemone thalictroides, "Anemonella," "Rue Anemone," &c., are all names by which this dainty little *Thalictrum* is known in America. It is a curious plant with a thickened root-stock, somewhat resembling an *Anthericum*, its many slender stems bearing white, *Anemone*-like flowers with white pistils and yellow anthers. The individual flowers are less than an inch across, and arranged in little verticils of five, surrounded by a collarette of 3-lobed, *Adiantum*-like leaves on slender, wiry petioles. It is in no respect a rock plant, but one can grow it well amid small-habited Ferns in the cooler, semi-shaded sites of the rock-garden in a compost of grit, leaf-soil, or peat. It can also be grown well in a shady border. Old-established tufts, often a foot through in good specimens, are remarkably pretty, and in April and early May, when they are almost covered with flowers, no better plant can be desired than this little *Thalictrum* for frame cultivation in pans, treating them as one would treat *Epimediums*. It is quite hardy, and drought seems to be the only condition it cannot withstand. M.

THE ROSARY.

ROSE COUNT AMÉDÉE DE FORAS, T.

The *Journal des Roses* for April publishes a coloured plate of this Rose, sent out by M. Gamon of Lyons in 1900. It is described as of vigorous bushy habit, very free-flowering, and almost constantly in bloom in the season. The flowers are large, open well, very fragrant, and of a creamy-yellow colour shaded in the centre with rose-pink; the buds are elongate, conic. Our attempts to describe the colour pale before those of the writer in our contemporary, who notes the colour as "rose de chine, ombré d'aurore, centre nuancé de rose pêche, parfois crème saumoné."

Messrs. BARR & SONS, 11, 12, and 13, King Street, Covent Garden, London, had a collection of hardy cut flowers in vases, some spikes of Delphiniums being a prominent feature. Ixias, Irises, Peonies, Poppies, Heucheras, and similar flowers, were the principal features, and a collection of English Irises was included (Silver Banksian Medal).

Mr. R. LAIDLAM, the Shirley Nurseries, near Southampton, staged Pinks, Campanulas, Aquilegias, and a few other hardy plants.

Messrs. JOHN LAING & SONS, Forest Hill, London, S.E., showed a group of Gloxinias; also a group of stove and greenhouse foliage plants, Caladiums, Codiaeums, Cordylines, Begonia Rex, Alocasias, &c.—all well grown and of nice colours (Silver Banksian Medal).

A splendid collection of English Irises was shown by Messrs. WM. BULL & SONS, Chelsea. The colours in this group were as showy and beautiful as a collection of Sweet Peas.

Mr. CHAS. TURNER, Royal Nurseries, Slough, staged a number of vases of Pinks and a pan of Dianthus fragrans "Little Gem," with miniature white flowers.

Messrs. R. & G. CUTHBERT, Southgate, Middlesex, brought a collection of Gladioli; *G. roseo-maculatus* was good, and the old variety insignis occupied the background (Bronze Flora Medal).

Messrs. DOBBIE & CO., Rothesay, set up a number of Pansies and Violas, demonstrating the great advance which has been made in these flowers. Effie is a new variety, having a striking flower with a creamy centre, and a magenta-coloured margin; James Dodd is a good show variety. Adjoining was a group of Cactus Dahlias (Silver Flora Medal).

Messrs. HUGH LOW & CO., Bush Hill Park, Enfield, showed a number of Carnations, principally of seedling varieties. On another table this firm showed other Carnations, principally "Malmaisons," including a true yellow variety of this type, named Miss Alexandra James.

Messrs. SANDER & SONS, St. Albans, exhibited some very pretty hybrid varieties of Begonias obtained from B. Rex and B. Bowringiana; also a capital plant of the last-named species. "Our Queen" and "His Majesty" have been illustrated in these columns, and in addition a pretty variety named Mrs. H. G. Moon was shown on Tuesday.

Mr. H. MARKHAM, Wrotham Park Gardens, Barnet, exhibited a Sweet William named Elizabeth, of a peculiar shade of pink colour. The variety was recommended an Award of Merit on July 11, 1899.

Awards.

Codiaeum (Croton) Mrs. H. B. May.—This is a narrow-leaved variety of green and yellow colours. The leaves are spirally twisted to some degree, and have a pretty arching character. Shown by Mr. H. B. May (Award of Merit).

Carnation John.—This is a border variety with very large flowers of pale sulphur-yellow colour, and possessing a good calyx. Shown by S. MORRIS, Esq., Wretham Hall, Thetford, Norfolk (Award of Merit).

Delphinium Norman Hirst.—This variety has long bold spikes of somewhat closely-packed flowers. The flowers are of large size, purple in colour, with shading of blue, and having a lemon-coloured centre. Shown by Messrs. KELWAY & SON (Award of Merit).

Delphinium Mrs. J. Bradshaw.—In this variety we welcome a type in which the flowers are produced less thickly upon the spike. They are of large size, and pale blue in colour. The general appearance is much more graceful than that of the more densely flowered varieties. Shown by J. BRADSHAW, Esq., The Grange, Sontigate, N. (Award of Merit).

Philadelphus Lemouinei maculatus.—This is a most effective variety, remarkable from the fact that at the base of each petal there is a small blotch of purple colour, which forms a ring of purple around the centre of the flower. It is an exceedingly distinct variety, and will have a good effect in the pleasure-grounds. Shown by Sir TREVOR LAWRENCE, Bart., Burford (gr., Mr. Jaine), and by Mr. PRITCHARD, Christchurch Nurseries, Hants (First-class Certificate).

Psilacella nympha rosea.—A rose-coloured variety of a well-known British flowering plant, suitable for the herbaceous-border or wild-garden. Shown by Mr. PRITCHARD (Award of Merit).

Sweet Pea Cupid.—Messrs. H. CANNELL & SONS showed a number of varieties of the prostrate Sweet Peas, and obtained an Award of Merit for the strain.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair), Baron Schroder, Messrs. Jas. O'Brien (Hon. Sec.), de B. Crawshaw, J. G. Fowler, H. Little, W. H. White, H. A. Tracy, W. Boxall, J. W. Potter, R. G. Thwaites, W. Bolton, G. F. Moore, F. W. Ashton, A. A. MacBean, H. T. Pitt, F. A. Rehder, W. A. Binney, J. Colman, J. Douglas, W. Cobb, H. Ballantine, and H. M. Pollett.

From The Right Honble. Lord ROTHSCHILD'S gardens, Tring Park (gr. Mr. A. Dye), came a very remarkable and extensive group of Masdevallias, including upwards of fifty species, varieties and hybrids, several plants of some of them being present. The showiest of the hybrids were *M. × Rushtoni*, *M. × Gelengiana*, *M. × Cassiope*, *M. × Hebe*, *M. × Henrietta*, *M. Bocking* hybrid, and *M. × Courtlandiana*. Among the species were noted forms of *M. chimera*, one with nearly black flowers; *M. racemosa*, *M. radiosa*, *M. gemmata*, *M. O'Brieniana*, *M. simula*, *M. Carderi*, *M. Davisii*, *M. campyloglossa*, varieties of *M. ignea*, *M. caudata*, &c. With the Masdevallias were several singular *Pleurothallis*, such as *scaphosepalum gibberosum*, *oethodes*, and *punctatum*; *Phrysosiphon Loddigesii*, *Aërides japonicum*, *Luisia japonica*, the pretty pink-tinted *Disa venosa*, flowering for the first time under cultivation, and other singular species. At the back were the showy *Laelio-Cattleya × Mauve Queen*, *L.-C. × Aphrodite*, the new *L.-C. × Charles Linnaeus* (*Gottoiana × Warneri*), and the fine Tring Park variety of *Laelio-Cattleya × Dominiana* (see Awards). For the group a Silver Flora Medal was awarded.

Mrs. ERNEST HILLS, Penshurst (gr., Mr. Geo. Ringham), staged a good group of excellently well-grown *Miltonia vexillaria* of the best large-flowered type, for which a Silver Banksian Medal was awarded.

Messrs. SANDER & CO., St. Albans, staged an effective group, in which were many varieties of their fine strain of *Laelio-Cattleya × Martinetti*, *L.-C. × blancheyensis*, *L.-C. × Duchesnei*, *L.-C. × Aëis*, *Laelio × Yula*, *L. × cinnabrosa*, and other hybrids. Also in the group were a fine specimen of a distinct form of *Dendrobium superbum*, a pretty white-and-yellow *Thunia*, a large form of *Acineta Humboldti*, and other showy Orchids (Silver Flora Medal).

Messrs. JAS. VEITCH & SONS, Chelsea, showed a group of varieties of *Laelio-Cattleya × Canhamiana*, *L.-C. × Wellsiana*, *L.-C. × eximia*, *L.-C. × Dominiana langleyensis*, *L.-C. × Martinetti*, *L.-C. × Vesta*, *L.-C. × Aphrodite alba*, *Cattleya × Eros*, the white *C. Mossie Wageri*, and a very distinct white form of *Sobralia × Veitchii* (Silver Banksian Medal).

Messrs. HUGH LOW & CO., Enfield, staged a good group, in the centre of which was a selection of *Phalaenopsis*, including several *P. amabilis Rimestadtiana*, *P. × leucorrhoda*, and *P. Aphrodite*. Other good things noted were *Cattleya Mendeli*, with sixteen flowers on a comparatively small plant; *C. intermedia alba*, varieties of *Laelio-Cattleya × Canhamiana*, one with seven flowers; *L.-C. × Arnoldiana*, a very finely-coloured *Laelia tenebrosa*, *Oncidium divaricatum*, *Masdevallia melanoantha*, &c. (Silver Banksian Medal).

M. CHARLES VUYLSTEKE, Loochristy, Ghent, sent two forms of his handsome purple-blotched *Odontoglossum × ardentissimum*, *O. × coccineum*, *O. × mirificum*, *O. × bellatulum*, and a very pretty *O. × Harryano-crispum* (Silver Banksian Medal).

NORMAN C. COOKSON, Esq., Oakwood, Wylam (gr., Mr. H. J. Chapman), showed the handsome *Odontoglossum crispum Britannia*, a finely formed flower, purple at the back, and with very heavy purplish-brown markings on the sepals and petals. Also *Cypripedium × vexillario-fo*, a singular hybrid which shows *C. Fairieanum* derived through *C. × vexillarium* in a very marked degree.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr., Mr. Hopkins), showed *Cattleya Mossie* "Miss Etheldreda Harting," a charming white flower of fine proportions, bearing slight pale purple markings in front of the yellowish disc; and *Laelio-Cattleya × Pallas*, Westfield variety, a good bright rose-coloured flower with dark claret-crimson labellum.

C. J. LUCAS, Esq., Warnham Court (gr., Mr. Duncan), sent a light form of *Laelio-Cattleya × Martinetti*.

Messrs. STANLEY, ASHTON & CO., Southgate, showed *Scuticaria Dodgsoni*.

J. BRADSHAW, Esq., Southgate (gr., Mr. Whitelegge), sent *Lycaëte tricolor*, and a white form of it.

AWARDS OF MERIT.

Laelio-Cattleya × Dominiana, Tring Park variety (*L. purpurata* (dark variety) × *C. Dowiana*), from the Right Hon. Lord ROTHSCHILD, Tring Park (gr., Mr. A. Dye).—A magnificent and finely-coloured hybrid with large flowers, the sepals and petals of which are light purplish-rose; the broad and strongly crimped labellum dark ruby-purple, with some fine gold lines in the throat.

Cattleya Mossie alba, Tracy's variety.—A very singular white form, with flowers in shape resembling a white *Cattleya labiata*. From Mr. H. A. TRACY.

BOTANICAL CERTIFICATE.

Saccolabium gracile, from the Hon. WALTER ROTHSCHILD, M.P.—A very elegant little species from Ceylon, with slender growths and long decurved inflorescence of many small white flowers. It is probably the first plant of the species to flower under cultivation.

Cryptophoranthus Lehmanni, from the Hon. WALTER ROTHSCHILD, M.P.—A tufted plant bearing dark purple leaves, and with some resemblance to *C. Dayana*, though the singular hawk's-head-like flowers are longer, yellowish, densely spotted with dark chocolate-purple.

DISBUDDING OR RESTRICTING THE FLOWERS OF ORCHIDS.

At the commencement of the meeting, as previously announced, NORMAN C. COOKSON, Esq., moved—

"That the resolution disqualifying plants that have been disbudded be rescinded, and that in future reasonable disbudding be permitted, bearing in mind the strength and size of the plant and general appearance of the spike."

After discussion, an amendment that the rule as at present existing do stand, was put, and carried by the casting vote of the Chairman, the voting (eleven for, eleven against) being equal.

Disbudded Orchids therefore, as usual of late, will not be granted Awards, though they may be exhibited.

Fruit and Vegetable Committee.

Present: George Bunyard Esq. (Chairman), and Messrs. Jos. Cheal, W. Bates, S. Mortimer, A. Dean, E. Beckett, T. Coomber, Geo. Kelf, H. Markham, P. C. M. Veitch, H. Parr, J. Willard, Geo. Wythes, H. Somers Rivers, and A. H. Pearson.

A very meritorious collection of a dozen Pineapples and some Strawberries was shown by Lord LILANGAT-ROCK, The Hendre, Monmouth (gr., Mr. T. Coomber). The Strawberries included the varieties known as The Laxton, Leader, and Royal Sovereign, and were all of unusual size. The exhibit was awarded a Silver-gilt Knightian Medal.

Fruits of the "Papaw" (*Carica papaya*) were shown by JAS. EPPS, junr., Norfolk House, Beulah Hill, West Norwood, who had cultivated them (Cultural Commendation).

Messrs. LAXTON BROTHERS, Bedford, exhibited a large quantity of Strawberry fruits of great size and high colour. The varieties included The Laxton, Bedford, Champion (a cross from Noble and Sir Joseph Paxton), and Reward, described under "Awards."

Messrs. H. CANNELL & SONS exhibited a dish of Edward VII. Peas, the pods of which were of perfect form.

AWARDS OF MERIT.

Strawberry Duke.—This variety was shown by Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, Chelsea, and has been obtained from a cross between Frogmore Late Pine and Veitch's Perfection. The fruits are sometimes wedge shaped, at others, conical, but usually of irregular outline. They are very large in size, of rich red colour, and good flavour. From the specimens and plants shown the variety appears to be a prodigious cropper.

Strawberry "Reward."—This variety was shown by Messrs. LAXTON Brothers, who displayed a large quantity of richly-coloured fruits. It is described as a cross from Royal Sovereign and British Queen. The fruits are large in size, wedge-shaped, occasionally conical, very juicy, and of good flavour.

The Lecture.

At the afternoon meeting it was announced that the new Hall would be opened by the KING and QUEEN on July 22. A large number of new Fellows (71) was elected. A paper by M. VIVIAN MOREL, on "The Hybridisation of Roses," was read by the Assistant Secretary.

RICHMOND HORTICULTURAL.

June 29.—The thirtieth annual flower show of the above Society was held in the Old Deer Park, Richmond, on the above date, in glorious summer weather. The Roses made a grand display, the general quality being of a high standard. Handsome groups of plants were shown in the marquee appropriated to that class, the 1st prize for a group of plants in or out of flower being won by Hon. Mr. Justice SWINFEN-EADY with a circular group containing handsome foliage and flowering plants tastefully arranged and well grown. Several commendable non-competitive groups were also set up in this tent. Mr. L. R. RUSSELL had stove foliage plants; Messrs. WILLS & SEGAR had facing the entrance a group of Palms, Codieums, Nepenthes, Alocasias, &c., with a fine batch of Erica ventricosa magnifica towards the foreground. Mr. WILLIAM THOMPSON, nurseryman, Richmond, had a semi-circular group, the centre of which was Palms, Acer Negundo, &c., with an edging of Astilbe japonica (Spirea), Arrhenatherum bulbosum fol. var., and Liriope striata, the other half of the circle being completed by Mr. W. IETON, Putney, with Azaleas, Caladiums, Boronias, &c., who had a nice batch of Lily of the Valley in the centre.

The west end of this tent was furnished by a group of Lilium auratum, with a ground-work of Astilbe japonica (Spirea), and edged with Caladium argyrites.

On the left of this was another display, set up by Messrs. HUGH LOW & Co., consisting of fruiting Fig-trees and Vines in pots, a batch of varieties of Souvenir de la Malmaison Carnations, and a few miscellaneous greenhouse plants, the whole edged with Maidenhair Ferns.

Messrs. T. S. WARE, Ltd., Feltham, Middlesex, set up a large group of herbaceous flowers, and a charming group of Sweet Peas.

In the non-competitive groups staged by members of the trade, were exhibits of Roses from Messrs. W. SPOONER & SON, Hounslow, Surrey; Messrs. GEO. JACKMAN & SON, Woking, who included some vases of Sweet Peas. Boxes of Roses were good in this collection. Messrs. W. & J. BROWN, Stamford had greenhouse plants in addition to Roses.

Messrs. J. PEED & SON, West Norwood, had a large exhibit of Gloxinias of good size and colours, especially their cut blooms displayed in exhibition boxes.

Begonias were displayed by Messrs. T. S. WARE, LTD., Feltham, Middlesex. This exhibit was of high standard, all being double varieties of the tuberous-rooting section.

Mr. AMOS PERRY, Winchmore Hill, London, N., had an extensive collection of hardy flowers; a similar display being presented by Mr. M. PRICHARD, Christchurch, Hants.

Roses were especially fine, and the number of exhibits numerous, one large marquee being mainly filled with these charming flowers. The Gunnersbury Park Challenge Cup and 1st monetary prize of £6 was won by Messrs. R. HARKNESS & Co., Hitchin, with forty-eight Roses (three blooms of each variety). Among the most creditable blooms, Kaiserin Augusta Victoria and Madame Cochet were in the pink of condition. The flowers in this group had both size and substance. The 2nd prize group of Messrs. B. R. CANT & SONS, Colchester, also contained some well-developed flowers. Messrs. D. PRIOR & SON, Colchester, were 3rd.

A fine display of Orchids came from the well-known gardens of Sir F. WIGAN, Bart., Upper Sheen (gr., Mr. W. H. Young). The 1st prize six exotic Orchids shown by this exhibitor was not challenged; they would have to be especially meritorious to beat those exhibited.

The classes for FRUIT brought some fine produce, the three bunches of Grapes of Madresfield Court, shown by the Hon. Mr. Justice SWINFEN EADY (gr., Mr. Jas. Lock), being of a high standard of quality. This exhibitor was an easy 1st in Class 19 for a collection of fruit in not fewer than six dishes, distinct.

Some good VEGETABLES were also shown. In Class 17 for twelve distinct kinds, Lord ALDENHAM, Elstree (gr., Mr. E. Beckett), was 1st with a collection of high-class produce, including a very fine dish of Edwin Beckett Peas. This exhibit was very nicely set up over a groundwork of Parsley-leaves; the 2nd prize was won by the Right Hon. the Earl of DYSART, Petersham (gr., Mr. F. F. Conway). In this collection Cauliflowers were a feature.

The centre of one of the large marquees was occupied with the classes for table decorations, bouquets, baskets of flowers, &c.

The 1st prize for table decorations was won by the Hon. Mr. Justice SWINFEN EADY, Weybridge.

The 1st prize for a hand bouquet went to Messrs. PERKINS & SONS, Coventry, who are always prominent in this branch of the florist's art.

Mr. L. R. RUSSELL, Richmond, exhibited out-of-doors a large group of ornamental foliage, shrubs, and trees, with well-flowered plants of Crimson Rambler Rose.

Messrs. W. FROMOW & SONS, Chiswick, W., had a large circular group out-of-doors comprised mainly of Japanese Maples.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

ANNUAL FESTIVAL DINNER.

A RECORD!

JUNE 28.—The sixty-fifth annual festival dinner of the supporters of the premier horticultural charity took place in the Whitehall Rooms at the Hotel Métropole on Tuesday evening last. The occasion was remarkable for the fact that the Chairman was Mr. Harry J. Veitch, the popular Chairman of the Executive Committee, and one of the best known and highly esteemed men in the horticultural world. In previous years the chair at this function has been usually occupied by a distinguished nobleman, and it is therefore not surprising that nurserymen, market gardeners, salesmen, and gardeners generally, in addition to Mr. Veitch's personal friends, did their utmost to make the occasion successful, as an expression of their personal esteem for Mr. Veitch, and of their appreciation of the ungrudging labour he has given to the cause of the Institution in which they were all interested. Their efforts were crowned with success, and not only was there a record attendance—there being about forty more present than at any previous festival—but the amount of donations and subscriptions, £3,500, was also a larger sum than has ever been obtained on a similar occasion. Mr. Veitch was supported on his right by Sir Walter Smyth, and amongst these present were Messrs. J. Gurney Fowler, W. A. Bilney, Dr. Maxwell T. Masters, F.R.S., Arthur W. Sutton, Jeremiah Colman, Leonard Sutton, Jas. H. Veitch, George Dickson (Chester), Ed. Sherwood, J. Walker, D. Thomson, George Paul, O. Thomas, H. B. May, P. C. M. Veitch, J. Asshee, Geo. Monro, W. J. Cutbush, J. F. McLeod, Geo. Reynolds, Arnold Moss, M. J. Gleeson, — Hicks, W. Atkinson, P. Kay, J. Walker, W. Roupell, R. P. Glendinning, S. M. Segar, E. Rochford, J. Douglas, J. Melndoe, J. McKerchar, E. T. Cook, N. F. Barnes, William Barr, W. Y. Baker, &c.

After the Royal toasts had been observed with musical honours, the CHAIRMAN proposed that of "Continued Prosperity to the Gardeners' Royal Benevolent Institution." He drew the attention of those present to a little pamphlet that had just been published relating the history of the Institution since its establishment in 1839 until last Christmas. Mr. Veitch proceeded to say that the rules were drawn up originally with such wisdom that, excepting for a few modifications, they were the same now as then. At the first election the Committee were only in a position to elect one pensioner, now they had 207 on the books. The first Duke of Cambridge was the original President of the Institution. Mr. Veitch thought that it might be unhesitatingly claimed that the Institution is continuing to fulfil the objects for which it was founded. And if it was needed in 1839, how much more must it be required in 1904, when horticulture is practised in such a greater degree! It was truly a National Institution, for England, Scotland, Ireland and Wales derived advantage from it, and above all it was a Benevolent Institution—a fact that the Committee were desirous of emphasising—and not a benefit society. Candidates were asked no questions in regard to their religious views, no expensive building was maintained, and therefore all the income above the cost of employing a Secretary and one assistant, and of maintaining an office, printing, postage, &c., was available for pensioners. The pensioners included 121 men and 86 widows, of these five are totally blind, and some others suffer from total paralysis. Two are more than ninety years of age, forty-six are between eighty and ninety years of age, and 111 are between seventy and eighty years of age. As a rule none are awarded pensions under sixty years of age, unless they are from some cause totally incapacitated. These pensioners need an outlay of £3,796 each year. From invested funds they had only £830 yearly, and the annual subscriptions amounted to between £1,500 and £1,600, therefore there was a very large balance to be made good. There was a large reserve fund, but heaven forbid that they should touch it. The Institution had incurred a moral obligation to keep their pensioners in comfort the rest of their lives, and if some untoward circumstances should arise, and it was impossible to collect the amount of money that is collected now, what could be done unless there was a large reserve? Mr. VEITCH, related how in one case a gardener had subscribed a guinea a year for eighteen years, and was afterwards a pensioner for twenty years, whilst his widow is still living and receiving help from the Institution. Letters were read from several pensioners in which gratefulness was expressed in crude

but sincere language for the help received, and as the Chairman said, the comfort of the knowledge to them that the Institution would continue to support them, prolonged their lives. It was much regretted that the Institution is obliged to reject candidates each year. On the last occasion there were thirty-nine unsuccessful candidates; one of these was eighty-two years of age, and had already tried twice. It is probable that next year there will be as many as sixty or seventy applications for fifteen or sixteen vacancies.

The Victorian Era Fund was established in the Jubilee year, and is available for helping candidates awaiting election, while the Samaritan Fund is devoted to the relief of pressing necessity. The rules have been so framed that votes are placed to the credit of subscribers directly they apply for help, thus giving them an advantage, in proportion to the number of years they have subscribed, over those who are non-subscribers. Therefore Mr. VEITCH thought the Committee had a right to expect that gardeners would commence to subscribe whilst young. He said it was very gratifying that the Institution had auxiliaries in Bath, Bristol, Worcester, Liverpool, Reading, Exeter, Wolverhampton, &c., for it had been found that where these existed there became greater interest in the cause of the Institution. He appealed to those present to help the funds to the best of their ability. Were they not all of one large family, and was it not due to God's goodness that they too were not in a position in which they would be obliged to appeal for help from the fund? Mr. VEITCH said he had received subscriptions from Australia, New Zealand, and America; Mr. Sherwood had sent a donation of £500 from Australia. He pleaded eloquently for the gardener and gardener's widow, and said that if those present felt that the times are hard, how much more did they feel it for whom he pleaded? He concluded by quoting Goldsmith's words, "No luxury is so great as the luxury of doing good," and the following words: "Blessed is the man that considereth the poor," "Thou shalt love thy neighbour as thyself."

Mr. GEO. DICKSON (Chester) responded. In the course of his remarks he said gardeners were expected now to avail themselves of science as well as practice, but he was afraid that if they trusted too much to science rather than to practice it would be to the country's disadvantage.

The next toast was that of "Horticulture in all its branches," proposed in a humorous manner by JEREMIAH COLMAN, Esq., and responded to in an equally humorous vein by J. GURNEY FOWLER, Esq.

The toast of "Our Chairman" was in the hands of Mr. ARTHUR W. SUTTON, who commenced by telling the audience a secret, that the morrow would be the anniversary of Mr. Veitch's birthday. Upon this the company cheered again and again, and drank to Mr. Veitch's health with the greatest enthusiasm. Mr. Sutton proceeded to say that Mr. Veitch was born on June 29, 1840, and was educated at Exeter Grammar School. He afterwards went to Altona and France to study the languages, and subsequently studied horticultural science under Dr. Lindley at University College, London. He had easily taken the foremost place in horticulture in our day. The name of Veitch was a household word everywhere, and it was usually prefixed by the word "Harry," for as Mr. Harry Veitch he was familiarly known to gardeners. He took a very prominent part in the International Exhibition of 1866, and attended the first International Horticultural Exhibition held in Russia, and whilst at St. Petersburg had the honour of being received by the Czar of that time. In 1870 he became head of the firm at Chelsea. Mr. Veitch was not merely a practical horticulturist, but he was responsible for the authorship of two very well-known books, *The Manual of Conifers* and *The Manual of Orchidaceous Plants*. He was elected to the Council of the Royal Horticultural Society at the critical time when the Society left South Kensington, and had remained a member until the present time. Mr. Veitch was elected a member of the Committee of the Gardeners' Royal Benevolent Institution in 1868, but in the previous year he had been married, so that in 1868 he and Mrs. Veitch adopted the Institution as their eldest child. He was elected Treasurer in 1896, and Chairman of Committee in 1894. Whilst absorbed in business Mr. Veitch had done a very great deal to help his poor brethren, and for very many years he entirely supported two London missionaries to work in the district of Chelsea.

After the toast had been drunk with musical honours followed by long-continued applause, the Secretary, Mr. G. J. INGRAM, declared the amount of donations and subscriptions to be £3,500. Amongst the donors were the following:—Mr. Harry J. Veitch (Chairman), 100 gs.; Mrs. Veitch, 25 gs.; N. N. Sherwood, £100; J. Veitch & Sons, 100 gs.; Messrs. Rothschild, 100 gs.; Messrs. Sutton & Sons, 100 gs.; A. W. Sutton (Victorian Era Fund), 15 gs.; Mr. Leonard Sutton (Samaritan Fund), 10 gs.; Baron

Schroder, £100; W. L. Cory, 63 gs.; J. G. Fowler, 50 gs.; Mr. Solomon, 50 gs.; Jeremiah Colman, 50 gs.; W. Robinson, £25; R. M. Hogg, £25; W. Crump, 23 gs.; — Hicks, £22 10s.; Hurst & Son, £21; J. Sweet, £21; H. Parr, £20; D. W. Thomson, £20; McKellar, £16 17s.; Thames Bank Iron Co., 18 gs.; H. G. Cove, 13½ gs.; J. Hudson, 12 gs.; Geo. Paul, £13 8s.; H. J. Clayton, £16; John Heal, £12 12s. There was a large number of donors of £10 10s. and of smaller sums, the names of most of whom have been published in the advertisement pages of our issues for the last week and the previous week. Mr. Ingram also announced that there were fifty-two new annual subscribers of 1 guinea, six of 2 gs., and two of 5 gs. The sums contributed by the Covent Garden friends amounted to £407 14s. upon the lists of Mr. E. Richford, and Mr. George Monro.

Mr. VEITCH, in returning thanks, said that he was born of an excellent father and mother. To his father he owed all his business capacity, for he had ever been to him a wonderful example. Mr. Veitch thanked the stewards and all who had helped to obtain the success they had won.

Sir WALTER SMYTHE proposed the health of Mr. G. J. Ingram, the Secretary. This was drunk with enthusiasm; and after Mr. Ingram had responded, the proceedings terminated at a late hour.

SCOTTISH PANSY AND VIOLA.

THE first monthly meeting was held in the Religious Institution Rooms, Buchanan Street, Glasgow, on June 22, for the purpose of awarding Certificates to such new Pansies and Violas as might be deemed worthy. The awards were as follows:—*Fancy Pansies*, First-class Certificate to Mrs. Q. MacFadyean, yellow edged (Dobbie & Co.); Certificates of Merit to Jessie L. Arbuckle, white edged (Kay); Provost Thomson, bronze colour (Kay); Mrs. W. Sinclair, lemon edged (Dobbie & Co.); Mary B. Wallace, yellow edged (Dobbie & Co.). *Show Pansies*, Certificates of Merit to Provost Thomson, dark self (Kay); and James Stirling, primrose self (Dobbie & Co.). *Violas*, Certificates of Merit to Edie, an improved "Butterfly" (Dobbie & Co.); and Griffie Smith, in the way of Dr. MacFarlane (Dobbie & Co.). Next meeting July 13.

Obituary.

ALEXANDER SCLATER.—Gardeners all over the United Kingdom will learn with regret of the death of Alexander Sclater, who acted as manager for thirty-five years of Messrs. Thomas Methven & Son's seed warehouses, Edinburgh. Mr. Sclater died on June 23, and was interred in the Grange Cemetery last Saturday. The funeral was attended by most of the principal nurserymen and seedsmen, and gardeners of the Scottish metropolis and its vicinity.

ANSWERS TO CORRESPONDENTS.

APPLE SHOOT: F. H. From the appearance of the shoot we imagine the branch below to be attacked with canker. There is no fungus present on the specimen sent.

AUCUBA: T. A. Perhaps your plant is a male. This species will not produce berries unless there exist male and female plants in the immediate surroundings.

CACTUS: T. A. We cannot be certain of the species to which you allude, but it is probably a *Rhipsalis* or a *Cereus*.

CALCEOLARIAS: Park House. There is no evidence of the presence of any fungus or insect.

CARNATIONS: J. H. W. Plant quite unhealthy. The leaves show the beginnings of a fungus attack, *Helminthosporium echinulatum*.—*D. H. R.* The leaves were all shrivelled. They appeared to be attacked by eel-worm, but from such indifferent material we cannot form a definite opinion.

CARROTS: J. W. Specimens received shall be examined.

CUCUMBERS: J. S. The condition is easy enough for the botanist to understand. The outer portion of a Cucumber is a part of the stem, and one function of the stem is to bear leaves. The condition is not uncommon, but the reason why we cannot tell. Some extraordinary specimens have been figured in our columns from time to time.

CURIOUS PLANT: J. V. Your plant is the common Rocket, *Hesperis matronalis*, which has become fasciated—a very common circumstance among *Asparagus* and other plants.

CUT FLOWERS: An Apprentice. We have seen a preparation which claims to preserve cut flowers in water, although we have not tested its efficacy to do so. It is named Junofloris, and is obtainable from the horticultural sundriesmen.

CUTTING HOLLY HEDGE: H. These hedges are usually trimmed in the spring (April) or in autumn (September). If you cut them in September they will have a neat appearance until growth takes place six months or more later. If the hedges are of a considerable size it would be almost an endless task to cut them with sécateurs; nor do we think this necessary in cases of small-leaved varieties.

DISA GRANDIFLORA DAMAGED: E. T. The "rust" seen on the flowers and leaves is a common appearance with *Disa grandiflora* when grown in too warm and too moist an atmosphere. Probably the removal from the moist to the dry house which you mention developed the injury. It would be better to place the plants outdoors under a north wall and to keep them wet, sprinkling them overhead night and morning for the remainder of the summer.

FRUIT-HOUSE: H. O. Y. In England the best houses for Vines, and other fruits have span-shaped roofs running from north to south, or lean-to roofs, facing directly to the south. The house you describe should be suitable. Under the sunnier skies of America it may not be so necessary as here that the aspect should be due south.

GRASS FIELD: H. H. As many of the grasses will now be seeding, it will be best to burn the grass before digging the ground, or the seeds would give you much trouble. You would probably require very little manure in the first year, but littery dung from the stables would do no harm.

INSECTS: A. S. The insects are the larval stage of the ladybird, *Coccinella*.

INSECTS INJURING LAURELS: S. H. The caterpillars are those of two species of leaf-roller moths, one being a Tortrix and the other a Tineid. The most effectual remedy would be to collect the rolled-up leaves and injured shoots at once, and burn them. An application of Paris-Green (poison) might check their ravages, but as many of the caterpillars have nearly done feeding, we fear that it is now too late to apply this insecticide.

LABURNUM VULGARE: J. H. P. You may easily obtain plants by sowing seeds.

LAWN IN AMERICA: H. O. Y. The varieties of grasses employed for the making of lawns would not succeed equally well in America. You had better study the lawns in your neighbourhood, and learn what grasses will succeed best. To imitate the English lawn by sowing the same grasses would result in failure. Plantain, Dandelions, and Dock should be spudded out of a lawn, or you may place a drop or two of carbolic acid in the centre of each plant, which will very soon kill them.

LIME TREES: Curious. For various reasons, we should never recommend Limes to be planted in town streets, but we should not believe in any injurious "emanations" in the case you mention. If the perfume from the blossoms should eventually prove objectionable, it would cease in a few days.

MOWER: J. H. P. Address your enquiry to one of the firms who manufacture lawn-mowers, who will be likely to recommend you a machine of the type you require.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—*G. W. T.* *Sisyrinchium striatum*.—*A. K.* *Zephyranthes Atamasco*; the Carnation is of a good colour, and fragrant.—*Max Leichtlin.* A species of *Campanula* which seems new to us.—*Betts-hanger Park.* We do not recognise the fruit.—*W. W.* 1, *Rosa macrophylla*; 2, *R. blanda*.—*Comrie.* *Festuca loliacea*.—*R. N. H.* *Cattleya Mendeli*.—*Vitis.* 1, *Masdevallia triaristella*; 2, *Masdevallia simulia*; 3, *Masdevallia polysticta*; 4, *Pleurothallis macrolepharis*; 5, *Stelis ophioglossoides*; 6, *Physosiphon Loddigesii*.—*R. G.* 1, *Dendrobium aduncum*; 2, *Bulbophyllum affine*; 3, *Eria obesa*.—*F. A.* *Helix Soleirolii*, a close-growing Corsican

plant, which is grown in gardens for decorative purposes like moss.—*A. R. U.* *Acampe multiflora*.—*J. H.* 1 and 3, varieties of *Cypripedium Curtisii*; 2, *Cypripedium ciliolare*.—*A. J.* 1, *Agrostemma coronaria*; 2, *Corydalis lutea*; 3, *Tradescantia virginica*, white var.; 4, *Tropeolum polyphyllum*; 5, *Spiraea filipendula*, double; 6, *Dielytra eximia*.—*G. B.* *Anchusa* sp.—*Fliz.* 1, *Spiraea aorbifolia*; 2, *Deutzia scabra*; 3, *Spiraea opulifolia*; 4, *Philadelphus coronarius*; 5 and 6, *P. grandiflorus*.—*W. K.* 1, *Polemonium caeruleum* var. *alba*; 2, *Pyrola rotundifolia*; 3, *Sedum rupestre*; 4, *Kalmia angustifolia*; 5, probably *Rhododendron dauricum*; 6, *Styrax* sp.; 7, *Valeriana Phu aurea*; 8, *Smilacina bifolia*; 9, *Lysimachia vulgaris*; 10, *Phillyrea*; 11, Probably a *Vaccinium*. You send more than the number, and most of them not in bloom.—*H. W.* *Dendrobium Pierardi*.—*H. G. R. B.* 1, *Phyllocactus crenatus*; 2, *Crassula coccinea*.—*A. L. B.* Flower decayed, probably *Lilium Kramerii*.—*J. T.* *Inula glandulosa*.—*E. L.* *Odontoglossum Harryanum*.—*C. E.* 1, *Veronica spicata*; 2, *Escallonia macrantha*; 3, *Spiraea arifolia*.—*A. W. B.* Proliferous Roses, extremely common, but the cause is not satisfactorily known.—*W. C.* *Habenaria bifolia*.—*Scottie.* 1, *Begonia weltoniensis*; 2, *B. fuchsoides*; 3, *Ophiopogon spicatum*; 4, *Lygodium scandens*; 5, *Adiantum formosum*; 6, Perhaps *Eucomis*.—*W. M.* 1, *Juniperus sinensis*; 2, *Juniperus sinensis* Golden variety; 3, *Cupressus (Retinospora) obtusa*; 4, *Cinnamomum zeylanicum*; 5 and 6, not recognised, send in flower.—*J. T.* 1, *Odontoglossum luteo-purpureum*; 2, *Lælia tenebrosa*.—*J. R. G.* 1, *Clematis*, perhaps *montana*; 2, *Acer eicarpum*; 3, *Pyrus Aria*; 4, *Robinia pseudoacacia variegata*; 5, *Lilium pomponium*. Specimens all withered and badly packed.—*J. H. H. J.* 1, *Thuya dolabrata*; 2, *Retinospora filifera*; 3, *Viburnum*—we do not recognise the species; 4, *Saxifraga crassifolia*.—*Zero.* 1, *Campanula glomerata*; 2, *Ajuga reptans*; 3, *Phalaris arundinacea*, Gardeners' garters.—*Jang.* 1, Spanish Iris; 2, a composite near *Coreopsis* (?), specimen insufficient.

PEACHES: F. G. Fungus attack (see next week). Cut away the affected branches and burn them.

PHLOX: G. S. We do not know the cause of your plants going wrong in the way they do. The base is diseased and the leaves are abortive.

PLUM-TREE: H. H. The scale should have been treated earlier. As the Plums will soon be ripening, you cannot use strong insecticides until the autumn.

ROSE AND FRUIT-TREES: W. B. B. The fungus on Rose-leaves is *Actinonema rosæ*. Spray with potassium sulphide, $\frac{1}{2}$ oz. to 1 gallon of rain-water. This is most effective when used early in the season as a preventive, before the fungus gains a foothold. *Fusicladium dendriticum* is attacking the Apple-leaves. Spraying with dilute Bordeaux-mixture in the spring is the most certain remedy.

STRAWBERRIES: J. H. We cannot determine the reason why your fruits do not ripen. The spots on the leaf are due to the presence of a fungus, which is very common, and does not as a rule hurt either plants or fruit materially.—*A. E. E.* From the appearance and flavour of the gathered fruits we judge them to be of the variety Royal Sovereign. The labels may have been misplaced. Send fruits to a trade grower of Strawberries. Dress the plants with flowers-of-sulphur after the crop has been gathered.

TOMATOS: Reader. Your signature is not at all appropriate. Every week almost we mention this disease, and have figured it repeatedly. Burn your plants. See the Calendar of Garden Operations published at this office at 6d.

COMMUNICATIONS RECEIVED.—*W. P. R.*—The Electrician.—*Land.*—*Pennick & Co.* (photos).—*Dr. Bonavia* (photos).—*W. T. D.*—*Little & Ballantyne*.—*A. W. S.*—*J. H. V.*—*S. A. S.*—*B. ADAPTATION TO CIRCUMSTANCES.*

ECOLOGY has come to stay. Botanists, in America and France especially, have for some considerable time been studying the effects of the "direct action of the external conditions of life" upon plants, to use Darwin's expression; and the conclusions, both from observations in Nature and of experiments, are that the forms and structure of plants, upon which the distinction of species is based, are the direct outcome of external agencies to which the plant responds, and so builds up the tissues required, which are in every case most beneficial under the circumstances in which it finds itself.

Linnaeus, 150 years ago, recognised that the *facies* of plants growing together under any marked conditions was more or less uniform. Numerous geographical botanists, such as Grisebach, have described many such floras; but it is only of late years that the subject of ecology has been treated on a physiological basis, as Dr. Schimper says in his masterly work, and thorough investigations have been made into the anatomy of plants, illustrating their correlations with the soil and climate.

* "The Influence of Dry and Moist Air upon the Form and the Structure of Plants," by M. Ph. Eberhard (*Ann. des Sci. Nat.*, t. xviii, p. 61, 1903)

When Darwin taught us to believe in Evolution, the process by means of which such "adaptations" as are revealed between the plant and its environment, were fixed, was thought to be natural selection. Taking for granted that such was the case, any encouragement to test or prove if it were so or not was chilled, being presumably unnecessary. French botanists, however, who did not take kindly to the idea of natural selection, pursued the even tenour of their way; and so we have the results of their researches and experiments conducted without any preconceptions.

M. Constantin is a notable instance in France, and M. Warming, of Copenhagen, is another, both of whom have shown that the forms and structure of plants are strictly correlated to their environments; and that inductive evidence was ample to justify the belief that they are the results of direct causes and effects. In other words, they proved to be the result of what Darwin called the "direct action" of the environment, which, as he said, is quite capable of giving rise to new varieties "without the aid of natural selection," the alternative to his supposed "indefinite" action.

Though a very large amount of inductive evidence is easily procurable, ample to substantiate this view, there is now a considerable accumulation of experimental proof, and the important paper herein referred to is a case in point.

As the two extreme causes or influences upon plants are excessive drought and a moist soil and atmosphere, M. Eberhardt has done well to confine his experiments to investigate the effects of an intensely dry air and a saturated one.

After describing his materials and method of procedure, he gives the effects on numerous plants grown in a dry, a moist, and a normal atmosphere respectively, both as to the internal anatomical details and the external morphological structure of organs. There is a perfect uniformity throughout in the effects which he describes in detail upon each species used, and he concludes with a general summary.

To take a few cases. First, with regard to the epidermis of the leaf of a *Lupin* (illustrated). In dry air the cells are very small, with nearly straight walls, accompanied by many stomata; whereas in moist air the cells are very large, with wavy margins, and there are few stomata. In fact, the proportions are 15 for dry, 5 for moist, and 7 for normal air, on the same area.

The influence of drought upon shoots is to increase the number of internodes; while a moist air diminishes them; but whereas they are shortened in the former, they are elongated in the latter. The uniformly dwarf habit of high alpine plants is thus explained. As dry air greatly reduces the size of the leaf, we thus have a natural interpretation of such shoots and leaves as are characteristic of Cupressinæ, alpine Veronicas, Lycopodiaceæ, &c.

Taking the stem of *Populus nigra* (illustrated), very marked differences appear. In dry air the cortex is diminished, sclerenchyma and wood are greatly increased, and the pith reduced. On the contrary, in moist air the former are as greatly reduced and enfeebled, with a very large pith.

In the stem of a *Cotoneaster* still greater differences prevailed. In dry air the pith

had almost vanished, the wood and sclerenchyma being very greatly augmented; whereas in a moist air the wood does not even form a zone, but remains as isolated fibrovascular bundles, with large interspaces for medullary rays.

Another feature is the vastly increased amount of collenchyma in such stems as usually possess this tissue, e.g., *Aster sinensis*. Quite analogous differences occur in petioles.

In a vertical section of a leaf in dry air there is seen to be a thickened cuticle, an increase in the number of rows or layers of palisade cells, even to the exclusion of the usual lax lacunous mesophyll.

The following is an abridgment of the writer's conclusions on the effects of drought:—

1. *External morphology*.—Dwarfing, with increased rigidity of the stem; diminished length, but increase in the number of internodes. Reduction of the size of leaves and stipules, with an increase of the thickness and depth of colour; an increase of hairiness and an earlier leaf-fall.

2. *Internal Anatomy*. — Epidermal cells smaller in size, with straight walls. Reduction of cortex and pith. Increase of secretory canals and their secretions, as well as raphids. Increase of sclerenchyma, collenchyma, and wood; the generative layers being very active. A hastening of the development of bark. An increase in the number of vessels in the wood, with a thickening of their walls. The effect on the leaves as mentioned above. Under a moist air precisely the converse takes place.

M. Eberhardt has thus proved conclusively by his excellent experiments the conclusions previously arrived at by inductive evidence for the effects of drought and moisture herein described are precisely the same as those to be seen in plants, as of the desert on the one hand, and subaquatic conditions of life on the other. In my work on *The Origin of Plant Structures* (1895), I referred to all these details as being due to the direct action of the conditions of life, coupled with the responsive power of protoplasm within the plant. Critics of my book demanded experimental proof; M. Eberhardt has now supplied it. *George Henslow.*

ORCHID NOTES AND GLEANINGS.

EPIDENDRUM COCHLEATUM.

"IN an examination of specimens of *Epiden-
drum* from many parts of South Florida, not a
single one has been seen with a 'normal' column,
so that it may be safely assumed that *Epiden-
drum cochleatum* has given rise to a three-
anthered race exclusively occupying this part of
the State at least. The pollen of the lateral
anthers — which are applied to the stigma —
germinates *in situ*, as proven by microscopic
examination; while the pollen of the third or
normal anther does not reach the stigmatic
surface. Plants growing in my greenhouse, and
thus removed from the possibilities of insect
fertilisation, have produced seeds freely. It is,
therefore, safe to conclude that the variety is
self-fertilised. When an anomaly is sporadic,
and found only in a few individuals, it is
merely of teratological interest; but when the
'anomaly' becomes constant in plants occurring
over a large area, it seems worthy of recognition
as a varietal character." Oakes Ames, "*Contribu-
tions from the Ames Botanical Laboratory*, No. 1,
Cambridge, Mass."

COLONIAL CORRESPONDENCE.

THE INDIAN TULASI.

WITH reference to the paragraph in the *Gardeners' Chronicle* for January 16, 1904, p. 48, I beg leave to state that the Indian Tulasi or Tulsi plant, which is worshipped by Hindus, belongs to the genus *Ocimum*, natural order Labiatae, and is not *Michelia champaca*. *Michelia champaca*, Linn., is a tree, whereas the species of *Ocimum* are shrubby plants; moreover, so far as I know, the *Michelia champaca* tree is never wor-

The outdoor cultivation of the Vine has increased extensively round those portions of the fruit-belt of Ontario which border on the Lakes; and experience has taught that a good, heavy clay loam suits the Grape-vine admirably. Heavy dressings of manure are not encouraged, but cow-manure is most beneficial to the canes when exhausted.

Three-year-old Vines are generally planted here, and the canes are allowed to go unpruned during the first spring. In the autumn they are cut back to the ground, leaving an inch or two of wood beyond and three or four buds in all. In

this way, with occasional careful inspections, good fruit of some varieties may be stored with success until the following spring. C. H. K. Baillie, Winona, Ontario, Canada.

HOW I MADE AN ORCHID-BASKET.

One of my sons was manager at the terminus of the line that brought the sugar from The Homebush Mill; the terminus was, of course, in original forest, and near his house, in the base of an *Acrostichum*, grew a plant of *Cymbidium madidum* [*albuciflorum*]. His saddle-horses had access to the tree on which it was growing, and

FIG. 6.—ROSE ULRICH BRUNNER: ABOUT HALF SIZE. (SEE P. 24.)

shipped by the Hindus, while *Ocimum sanctum* and *O. villosum* are. K. Baneyu, *Ledgering Clerk, Office of the Director, Land Records and Agriculture, Punjab, Lahore, India.*

NOTES ON OUTDOOR GRAPE-VINE CULTIVATION IN CANADA.

Although the weather last winter was so unusually severe in the Ontario (Canada) fruit-growing districts, the outdoor Grape-vines appear to have suffered very little. There are many varieties of the Grape grown by Canadians which are hardy enough to withstand cold 20° or more below zero; but the plan of layering-in the cane before the winter sets in seems to be largely adopted by some growers.

the following spring the buds are reduced to two, and in the autumn the growth is cut back to 4 feet or so, and fastened on to the long lines of trellis which are such familiar objects in the vineyard districts.

The following varieties withstand the cold climate, and have proved themselves to be best adapted to outdoor cultivation:—Moore's Early, Concord, Early Lindley, Campbell, Warden, Vergenne's Niagara, Moore's Diamond, and a few others of somewhat irregular productiveness. Good bearing canes of these varieties will, as a rule, yield from 16 to 20 lb. of fruit each. The fruit is gathered when dry, and placed in a cool-room for a week or ten days, when it is packed in shallow boxes without the use of paper; and in

one of these animals took to eating the *Cymbidium*. He did not like to see it destroyed, so he sent it to me. I had to make a basket for the plant, and did it in this way. I cut off from an "Iron-bark" log three 5-foot lengths, and let them into the ground 18 inches deep, forming a triangle 3 feet 6 inches across at the top. I bored an auger-hole in each log near the top. I next cut off several 3 feet 6 inch lengths from a Cedar log, splitting off from these as many pieces as were necessary to fill in between the three let into the ground, tapering them at their lower ends to form a V; and as they were split from the outside the interior of the whole was rounded. A hole was made in the top of each to correspond with the three let into the ground. As many

of these pieces were filled in between the three as to form a round, good-shaped flower-pot 3 feet 6 inches at top, the same height from the ground, wire through all the holes held the top together, and I filled the basket nearly to the top with chopped-up *Acrostichum* base, the only material we have to grow Orchids in, having no peat and no sphagnum-moss. The *Cymbidium* was placed on the top and filled the basket comfortably. The plant grew well, and the second year had twenty-three flower-stems nearly 2 feet long. It was close to the rustic porch, constructed of red Mangrove, and covered with a grand plant of *Beaumontia*

HABITATS OF DIPODIUM.

In the *Botanical Magazine*, plate 7951, appears an excellent figure of *Dipodium pictum*, Rehb., 61.; and in the description of it Mr. Hemsley says that the records are not very precise, but, from the incomplete notes of collectors, it appears that *Dipodium pictum* and *D. paludosum* start in the ground and grow up trees. This is certainly true of *D. pictum*, a very common plant in the Malay peninsula. It inhabits woods, which may be called open woods for this part of the world, where the woods are usually very dense, and is usually to be found in the wetter parts of them. It is

vain. I think its locality there must have been turned into a Rice-field, and so it has been destroyed. It appears to be very rare in the peninsula now, though abundant in Labuan and elsewhere further east. H. N. Ridley, *Botanic Gardens, Singapore*.

PUBLIC PARKS.

I SHOULD esteem it a favour if you would inform me whether there are any public parks or gardens in England and the Colonies, other than those in this Colony, which are also more or less nurseries? As you are aware we have in this

FIG. 7.—ROSE LA FRANCE: ABOUT HALF SIZE. (SEE P. 24.)

grandiflora. The porch is over the steps that lead on to the front verandah, and although not a gaudy Orchid, the *Cymbidium* was ornamental and deeply interesting. After some time, however, we wished the plant farther away; we began to experience a disagreeable smell, and in a short time it became dreadful. Our noses soon led us to the basket, and between the uprights I could see the body of a large black snake. How the brute came to die there I do not know; and as it was near the bottom it could not be got out without destroying the whole thing. Of all smells there is nothing to compare with that of a decomposing black snake; but, like many other disagreeable experiences, it came to an end, thanks to the ants and the hot weather. D. Buchanan, Mackay, Queensland.

found sometimes straggling on the ground, and eventually climbing up, usually, quite small trees, which it encircles with its roots. It does attain the height of 5 or 6 feet occasionally, but more usually is 2 or 3 feet high. It is certainly not very floriferous in its wild state. I have only once or twice seen it in flower wild, but it blooms easily and often in cultivation, either on stocks, in pots, or on trees in the garden. It is not often panicked, as it is figured, usually being simply racemose.

D. paludosum, Rehb., on the other hand, does not climb at all so far as I am aware. It inhabits open, hot swamps, and is, I believe, always terrestrial. I have never met with it myself, for though Griffith was the first to find it, at Ayer Panas, in Malacca, I have sought there for it in

country a number of "botanic gardens" so-called, but not one of them fulfils one of the first principles of a botanic garden; all engage more or less in trade. They do not hide the fact, as, for example, the oldest public garden in the Eastern Province is known as Grahamstown Botanic Gardens and Eastern Province Nursery. Even public parks supported by Government grants and from municipal revenue make a practice of selling pot-plants, cut flowers, &c. This has been the case at the park from which I write, and although we have two nursery firms in the town, besides an intelligent coloured florist, an attempt is to be made to enlarge our nursery business and, if possible, make the park self-supporting! I have pointed out the futility of such an attempt, but to no purpose. The average

colonial is much at sea with reference to public parks and botanic gardens. He calls the former a botanic garden, and the latter a park, and in nine cases out of ten would, if he were asked to define a botanic garden, describe it as "a garden where they sell trees, plants, and flowers." Unless I am greatly in error I believe such a state of affairs exists in no other part of the British Empire; but I wish to be quite certain, hence my enquiry. *H. F., Cape Colony.*

[We have often had protests about this state of things, which is, we believe, not peculiar to South Africa.]

EMIGRATION TO SOUTH AFRICA.

I should be pleased if you could spare a short space for the benefit of young men thinking of coming to S. Africa. There are frequently advertisements in the Gardening papers for young men to come to this colony on starvation wages. Thirtyshillings and £2 a week look well on paper, but as the cost of living here is more than double that at home, and clothes are very dear, one requires much more than one's wages to be able to get on. Fourteen shillings a week at home would go further than £2 in Africa. Young men should by no means sign any agreement to work for less than £3 per week. There have been many young fellows come out here in consequence of advertisements, but they have abandoned gardening, and now I often see them engaged in other work. *One who has been bitten.*

NURSERY NOTES.

COMBE WOOD.

A VISIT to Combe Wood, near Kingston, Surrey, is always a source of delight to the plant-lover. Its undulating surface is brilliant now with Golden Yews of surpassing splendour; at another time Rhododendrons and Azaleas or Roses form the dominant attractions. Woods now in the full beauty of their leafage form the boundaries, and here and there are peeps over Wimbledon Common, and in the blue distance the chalk hills of Surrey. These are features which everyone can admire and appreciate; but in addition to this the plant-lover is pleased with the order and "keeping" of the nursery, and above all things delighted with the wonderful collection of rare and interesting plants it contains. A long day might be spent in the investigation of these treasures, and the visit would have to be repeated at frequent intervals during the season. For here are collected and displayed the many interesting and beautiful things introduced by the Veitchian firm from China and Japan, from the Himalayas and we know not where besides—plants collected by the late John Gould Veitch, by Maries, by James Veitch, by Sargent, and in these later times by Wilson. Many of the introductions of the last-named collector are not yet named, they are grown under number, and we must possess our souls in patience till they are in a condition to be distributed and spoken of. Of their numbers and diversity, those who saw the wonderful collection of dried specimens exhibited last year before the Royal Horticultural Society may form some notion. An idea of their quality may also be gained by recalling a few hardy plants that have already been distributed, such as *Astilbe Davidii*, *Davidia involucrata*, *Jasminum primulinum*, *Senecio tanguticus*, *S. clivorum*, *Actinidia chinensis*, and various Vines. But these are but a fraction of what is to come.

On the slope of a slight declivity the visitor might fancy himself in a forest of Japan or Central China. Here the trees and shrubs have grown into specimens. In full bloom at the time of our visit were *Cornus Kousa*, *Carpenteria californica*, *Fremontia californica*, *Magnolia Watsoni*, the perfume of whose beautiful flowers is

FIG. 8.—NEW STRAWBERRY LAXTONS' REWARD.

Obtained an Award of Merit at the last meeting of the Royal Horticultural Society. (See p. 21.)

almost too strong to be agreeable; *Meliosma myriantha*, well named; *Viburnum tomentosum*, *Buddleia albiflora*, *Hydrangea Thunbergii*, with deep-blue flowers. Besides these there are Maples galore, Poplars, Cornels, Pavia, Marleas, Brambles of strange appearance, *Clerodendron trichotomum*, *Styraxes*, Hornbeams, and Vines. The generic names are, indeed, familiar, and we should not make mention of them but to emphasise the fact that the species are not of the common herd, but rarities and novelties of the first order; many the profane eye has not yet seen, and would not recognise if it had. We must wait till the time comes. Let the reader

take our word for it that when it does come the reputation of Messrs. Veitch for the introduction of novelties will, if that be possible, be enhanced.

We have mentioned *Cornus Kousa* with its sheets of snow-white flowers, but we have not previously seen the variety in which the broad bracts, snow-white on the under surface as usual, are of a rich rosy-pink on the upper, thus affording in colour a resemblance to a gigantic *Hydrangea*. Hardy shrub-lovers please note. They are not likely to come across a more beautiful object than this.

But this wonderful Japanese hill-side is not the only place where these treasures are displayed.

FIG. 9.—STRAWBERRY ROYAL SOVEREIGN.

The most popular Strawberry at the present time. (See p. 21.)

(Much reduced.)

Many find a place among better-known specimens alongside a long walk which borders the nursery, and in the slip adjoining are hundreds of Wilson's introductions, growing on till they show themselves in their true character. Many of the Vines are already proving themselves to be exceedingly ornamental. On the Eucryphas, the Stuartias, the Escallonias, and the hosts of older introductions, there is no space here to dilate, but we cannot resist saying something about the Conifers, for which this nursery

Among the pillar Roses particularly striking were Una, with large white single flowers; Paul Transon, like Alberic Barbier a derivative from Wichuriana; Lucy, with very large single shell-pink flowers; Wallflower, and Cecilia, the latter a cross between a Sweet-Brier and a Moss. But we must stay our hand, the richness and interest of the plants are enough to deter a hurried note-taker, and when the note-taking had to be done in a pelting shower under an umbrella, the process was not facilitated.

FIG. 10.—STRAWBERRY TRAFALGAR.

A large, rather pale-coloured, but good-flavoured fruit. (See p. 22.)

has always been famous. The plants of *Sciadopitys* are something specially remarkable, densely pyramidal, well furnished masses of foliage, very striking in the young state, and some bearing cones. Some of these have been lifted and grown in tubs, so that we shall not be surprised to see them at some of our exhibitions in the near future. The Golden Yews, as has already been mentioned, were startling in their brilliancy as we saw them in the sunshine following a shower. Other noteworthy coloured Conifers are the silver-leaved variety of *Cedrus atlantica*, and the yellow-leaved form of the same species, which is interesting, but not so remarkable as to colour as the Yew, or the golden variety of the Lawson Cypress.

BEDFORD STRAWBERRIES.

THE work of criticising varieties of Strawberries always requires the exercise of considerable discrimination, and when it has to be done in the midst of such an extensive collection of seedling varieties as Messrs. Laxton Brothers possess at Bedford, the conclusions arrived at by individuals are apt to vary very much. So it was on July 1, when experts from London and elsewhere visited these nurseries, and made an examination of the new varieties that Messrs. Laxton have succeeded in raising by the cross-fertilisation on an intelligent basis of well-known sorts and unnamed seedlings. A Strawberry may be judged from several standpoints. The question was

asked, "What is the first quality that should be sought in a variety of Strawberry?" Some one answered, "Vigour of constitution;" another "Free-cropping quality," others "Flavour in the fruits," "Solidity or firmness of flesh of fruit," whilst one person remarked that flavour mattered little, because this quality could be supplied by the use of sugar and cream! From such a view the writer entirely dissociates himself, for whilst the cultivator may require vigour of constitution as a necessary quality in his plants, and the market grower insist upon cultivating only heavy cropping varieties, the consumer, whose opinions are seldom given consideration, has a right to expect that Strawberries should possess a certain amount of flavour and sweetness in themselves. Before going to view the plants in the beds, the party tasted fruits of The Laxton, a variety obtained from a cross between Royal Sovereign and Sir Joseph Paxton. This variety gained a First-class Certificate from the Royal Horticultural Society in June, 1901, and has since been distributed to the public. The fruits are quite as early as those of Royal Sovereign; they are large in size, rich in colour, of good flavour, and firmer in the flesh than is Royal Sovereign. It crops freely and grows vigorously.

The first variety we examined upon reaching the beds of growing plants was Bedford Champion, a new seedling obtained from crossing a seedling from Noble and Sir Joseph Paxton, with another seedling from Scarlet Queen and John Ruskin. The plants grow in the manner of Noble, and are very vigorous. The fruits are of very large size, almost round in shape, very smooth to the palate [as the seeds are nearly buried in the flesh], and possess moderate flavour. The trusses are enormous, and being such a heavy cropper the variety may become useful to market growers. It is an excellent fruit for consumption in hot, thirsty weather.

The variety that gained an Award of Merit at the last meeting of the Royal Horticultural Society is shown in fig. 8. It was obtained from a cross between Royal Sovereign and British Queen, and has been named Laxton's Reward. This variety, which will not be distributed until next season, appears to be a good grower; it crops abundantly, and the fruits, ripening in mid-season, attain to large size, and in shape are generally like a cockscomb, but occasionally more like a cone, many of the fruits being of the irregular form shown in the illustration. The flavour is better than that of Bedford Champion; the flesh is firm and of rich colour.

Messrs. Laxton have much difficulty in matters of nomenclature, and as varieties continue to supersede varieties, the names become more or less confusing. Here is such a case. The firm have already upon the market a good late fruiting Strawberry known as Latest-of-All, but we were shown on July 1 a later acquisition, obtained from crossing Latest-of-All with a very late-fruited unnamed seedling. The variety obtained from this cross appears to be at the very least one week later in ripening than Latest-of-All, and so it has been named "Laxton's Latest"! It is therefore in name and in deed "The Latest," but not "Latest-of-All." The fruits were still green, whilst those of Latest-of-All were commencing to ripen, and those of Givon's Late Prolific, another excellent variety (raised by the gardener at Givon's Park), were commencing to show colour. Another new variety, "The Bedford," is from a cross between the varieties Sir Charles Napier and Latest-of-All. The fruits are firm in flesh, rather short, but tapering to a point, in colour similar to those of Sir Charles Napier, and possessing good flavour.

We have mentioned some of the most important of the new varieties that have been named with a view to distribution. But in addition to these there

are scores of varieties fruiting at Bedford that possess no names, and it is not necessary therefore to allude to in detail here. They are all results of intentional crosses, and the parentage in each case is known and recorded. We were invited to taste any of these, and thus help Messrs. Laxton in determining which are best. The work of raising such a number of seedling varieties every year and keeping them separate from each other until they fruit, and eventually in determining which varieties shall be destroyed and which retained, is exceedingly onerous, demanding not only much time, but great care, experience, and skill. This work has been pursued at Bedford ever since the late Mr. Laxton distributed the variety known as Traveller thirty years or so ago. The greatest success that has been obtained hitherto was the raising of Royal Sovereign (figured in *Gardeners' Chronicle*, July, 1896, and reproduced now at fig. 9), for while it may be safely asserted that there are extremely few gardens in the British Isles in which Royal Sovereign is not cultivated, it is equally true that in some gardens its popularity for forcing in pots and for fruiting out-of-doors in beds is so great that the variety has ousted almost all others from cultivation. It was raised from a cross between Noble and King of the Earlies. In the unnamed seedlings referred to above, the variety Latest-of-All appeared to have been used very frequently as a parent, and it may be placed on record that a seedling from Waterloo and Captain, and another from the varieties James Veitch and Vicomtesse Héricart de Thury, satisfied the writer's opinion of what good Strawberries should be. But tastes differ, and at the present day some appear to prefer a slightly acid fruit, for when sweet fruits of exquisite flavour were tasted we heard such exclamations as "Insidious," "Not sufficiently refreshing," &c., and when a more acid variety was under examination such remarks as "Nice brisk flavour," "Very refreshing," &c.

The collection at Bedford includes almost all the known varieties of repute, including the good-flavoured, pale-coloured Trafalgar (see fig. 10), Vicomtesse Héricart de Thury (figured in *Gardeners' Chronicle*, June 22, 1895), Black Prince (excellent for preserving), British Queen, Pilibasket (a prodigious cropper), Sensation, Leader, Mentmore, Dr. Hogg, A. F. Barron, Louis Gauthier, President, Keen's Seedling, John Ruskin, La Grosse Sucrée, Monarch, &c.

The firm is also making crosses between varieties of the "perpetual" fruiting section, with a view of obtaining improvement; and the cross-breeding of Black Currants and other kinds of fruit is engaged in. The latest acquisition is a tiny seedling plant from a cross between the Plum and Apricot. A similar cross has, we believe, been already obtained by the "Horticultural Wizard," Mr. Luther Burbank, U.S.A.

KEW NOTES.

GOMPHIA DECORA, Lem.—Flowering in the Victoria-house is a specimen of this handsome stove shrub; it is now very little in cultivation, though introduced many years ago by Messrs. Henderson. It belongs to the Natural Order Ochnaceæ, a not very extensive order of trees and shrubs, growing chiefly in tropical America, where this species is said to make a shrub varying in height from 10 to 15 feet. The bright yellow flowers are produced in a crowded panicle, some 6 inches in length, terminating the branches; the individual flowers have a diameter of nearly 1 inch. The inflorescence lasts in good condition for quite a month. The cultural conditions required are much the same as those given to *Ixoras*, except that for *Gomphia* the soil should consist chiefly of good fibrous loam. It is figured in the *Botanical Magazine*, t. 5262, under the name of *G. olivæformis*.

SENECIO MACROPHYLLUS, Bieb.

This fine hardy herbaceous perennial is now making a bold display in a bay outside the Lily-house. It is a handsome species for planting in large masses for effect, as is shown by the bed of about fifty plants now in flower. The leaves are glaucous and very large, being 2 to 3 feet long and 9 inches to a foot broad. The flower-stems of the plants at Kew are from 3 to 4½ feet high, having dense pyramidal heads of bright yellow flowers, the inflorescence being about 1 foot long, each composite flower having a diameter of 1 inch. There are three to five ligulate flowers, and usually eight disc flowers. The inflorescence opens from the top downwards. This species should be grown in a rich loamy soil, the ground being dug deeply previous to planting, thus affording the strong roots every chance of developing, which is absolutely necessary for the production of strong crowns. Propagation is effected by means of seeds or root-cuttings. When once a stock is obtained, the best method is to divide the large clumps into small pieces containing about three crowns. This operation should be carried out just when the first signs of growth appear, which is usually at the end of March or early in April. This *Senecio* prefers a somewhat shady position, and requires abundance of water when in full growth. It was introduced from the Caucasus in 1896.

LISTROSTACHYS FORCIPATA, Kränzlin.

This is a very pretty and curious species, now flowering in the warm Orchid-house. It was sent to Kew in August, 1901, from Buea, in the Cameroons, W. Africa, and flowered the following year. The plant presents the appearance of a small rigid-leaved Iris, having leaves from 3 to 6 inches long and about $\frac{3}{4}$ of an inch broad, usually having six leaves on each plant. Several specimens are contained in a 6-inch teak basket, and they have produced nine racemes, each about 2½ inches long, and bearing individually from twelve to eighteen flowers. The flowers are white and semipellucid; the sepals and petals are curved towards the column, giving the flower a semi-globose shape; the spur is nearly an inch long. This is a charming little stove Orchid, easy to grow, and very free in flowering. It succeeds well in a basket in a mixture of peat and moss. *W. H.*

NOTICES OF BOOKS.

THE COUNTRY GENTLEMEN'S ESTATE BOOK.

This is a most useful compilation, edited for the Country Gentlemen's Association, 2, Waterloo Place, Pall Mall, by Mr. W. Broomhall. It is a veritable encyclopædia on matters connected with estate management, estate work, and forestry, whilst gardening receives a smaller share of attention, so small, in fact, that it might have been omitted without detriment to the book. The chapter on estate law is very useful for reference; indeed a similar remark applies to most of the sections of this volume, the contents of which are too voluminous and diverse to allow of anything but a general encomium being offered. A table of contents facilitates reference, and numerous illustrations add to the attractiveness of the work.

CASSELL'S POPULAR GARDENING.

This useful publication continues to be issued in fortnightly parts. The work is edited by Mr. W. P. Wright, and the practical instructions given in the letterpress are elucidated by coloured plates and (for the entire volume) over a hundred other illustrations. It is well described as being "an illustrated cultural guide for amateur and professional gardeners," and should be appreciated by the public to whom it is specially addressed.

The Week's Work.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gr., Wrotham Park, Barnet.

Raspberries.—Examine these beds once again before placing nets over them to protect the fruits from birds, &c., and remove any further young growths springing up near the fruiting-canes that will not be wanted either for producing fruit or for increasing the stock next year. Be careful to avoid overcrowding. If the Raspberry-plantation be neglected at this season, the rows will become a mass of young useless canes. If the ground has not been mulched already, apply a good layer of well-decayed manure along each row as soon as the suckers that are not required have been pulled out, and then afford a good soaking with liquid-manure. The roots of the Raspberry do not penetrate deeply, and on light lands especially, feeding and mulching are essential. Apply a mulch and afford water to young suckers that were taken up at an early period and planted to produce fruit next year.

Gooseberries.—If the land is of a light nature a few good soakings of manure-water will more than repay the labour entailed. Bushes growing in deep loam will continue to bear and make suitable fruiting-wood for many years together, with but little attention, apart from the annual thinning and pruning, &c. Varieties which will be kept for dessert purposes should be afforded water at the roots, and if the leaves are infested with red-spider, syringe them thoroughly with clear water. Do not overlook the nursery beds; keep them free from weeds, and use the Dutch-hoe occasionally between the rows, affording water as the state of the weather may render this needful.

Strawberries.—For the making of jams and preserves those varieties of medium size and good colour should be grown. One of the best is Vicomtesse Héricart de Thury. Gather the fruits when they are dry and cool, and be careful not to bruise them by putting too many into one basket. Gather the fruits without the stalks, and let them be sent to where the jam is to be made as soon as they have been picked.

Packing large fruits of Strawberries for travelling.—These should be gathered very carefully before they become over ripe, and be packed when quite cool. If the fruits are gathered overnight, lay them out separately in a cool fruit-room until morning. Pack the fruits tightly, each one in a single leaf, resting on a layer of cotton-wool. Let the leaves be soft and pliable. When the box is filled, cover the fruits with thin Vine-leaves, and then a sheet of tissue-paper and thin wadding should complete the packing. Cord several boxes together, and label them "Fruit—with care," in red ink. Boxes are much better than hampers.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

Cattleyas.—Such species as *Cattleya Mossiae*, *C. Mendeli*, *C. Skinneri*, *C. Warneri*, *C. intermedia*, *Lælia elegans*, *L. purpurata*, and a large number of the various hybrids which have recently passed their flowering stage, may either be re-potted, or if they have sufficient pot-room, should have some of the old compost carefully picked out, after which the plants should be re-surfaced with fresh material. When re-potting *Cattleyas* and *Lælias* the beginner should bear in mind that over-potting is an evil, especially where the plants are potted in the mixture now so generally advocated; the smaller the pot the better the safeguard against injury from excessive water at the roots. For full information as to re-potting these plants, compost, &c., the reader should refer to the *Orchid Calendar* in the issue for April 23, p. 262. At this season many of the plants after being disturbed by re-potting will not appear quite so robust as usual, and in some cases slight shrivelling of the pseudo-bulbs will occur; but no harm will result if they are afforded water with care, and the atmospheric conditions of the

house are what they should be. As the young growths lengthen and roots become numerous in the fresh material, the pseudo-bulbs will regain their normal condition. It is bad practice to saturate the plants with the object of inducing the pseudo-bulbs to retain their plumpness, because during the time the soil is wet the old roots are gradually but surely decaying, and the new roots will not thrive in excessively wet material. On no account should the soil below the surface moss be allowed to become very wet. Plants of *C. Warneri*, after making a quantity of roots, should be placed at the cooler end of the house, because, so far as growth is concerned, the plants will be at rest. The same remarks apply also to *Lælia purpurata* and its varieties; and it is advisable to keep this species in a resting condition as long as possible, because the growths that start at this season seldom produce strong flowering growths, while those that can be retarded, and that will recommence to grow during the autumn months, will form the best pseudo-bulbs, and produce more and better flowers. *C. gigas* and its free-flowering variety *Sanderiana* are developing their flower-buds, and should be kept at the warmer end of the house, so that the flowers may develop properly. A little extra water may be afforded to the roots. When the plants have flowered, gradually expose them to more sunlight and air. At the same time gradually decrease the supply of water at the root. The repotting of *C. gigas* and its varieties should be done if needful when the last-made growths commence to send forth new roots from their base. After repotting, only sufficient water to prevent undue shrivelling of the pseudo-bulbs will be needed. When the plants have become re-established they will enter upon a long season of rest, during which time they should be kept, if possible, in a cool dry, well-ventilated position in the intermediate-house.

THE KITCHEN GARDEN.

By JOHN PENTLAND, Gardener to C. H. B. FIRTH, Esq., Ashwicke Hall, Marshfield, Chippenham.

Mint for Early Forcing.—From the present time until the middle of August insert occasional batches of cuttings in order to insure a good supply of Mint during winter. The work can be carried out indoors during wet weather. Prepare some boxes by placing a few crocks at the bottom, over which put a layer of rough leaves and turfy loam, from which the fine soil has been sifted. Fill up the box with equal parts leaf-mould, loam, and sand. Press this moderately firm, and having made the surface level, cover it with a slight layer of sand. Select strong, healthy cuttings from 3 to 4 inches long, and remove them with a sharp knife, cutting below a joint. After removing the two lower leaves, dibble the cuttings into the boxes at about 2½ inches apart. Afford a good watering, and place the boxes in a cool frame, shading them until they have become established; or during the present month they may be placed in a shaded position out-of-doors. In districts where the fungus attacks the leaves, it will be found that the cuttings now put in, if given proper attention, will in most cases remain healthy, and afford a supply of green leaves when the old plants in the beds are denuded of their foliage. In some localities where I have lived Mint was one of the strongest-growing plants, and grew very often in places where it was not wanted. Here the plant does best on the north side of a wall, but in such a position it is a long time starting into growth in the spring. A quantity of the leading growths should now be cut and tied up into small bunches. Hang these up to dry in an open shed; they will be found useful if at any time the supply of green Mint should run short.

Chives.—These plants are now in bloom, and the flowers should be cut off unless required for seed.

General Work.—Attend to the thinning of crops Turnips and Kohl Rabi are apt to get overcrowded, and if neglected the roots will be inferior in quality. Many crops require to be planted out, and no time should be lost before

carrying out this work, as the season is fast advancing. Peas require to be afforded stakes, and should be earthed-up. In some of the southern counties a sowing of seeds of some approved early variety may yet be put in. Maintain a supply of salads by the sowing of seeds at frequent intervals.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Vineries.—In good weather fire-heat will only be required at night, but at night the temperature outside continues very low at present, being occasionally as low as 35°. In dull wet weather the fires should be pushed a little early in the morning to raise the temperature to 75°. Give close attention to ventilation, and allow no moisture at any time to condense on the berries. Where Grapes of Muscat of Alexandria are approaching ripeness, afford them a high temperature during the day if it can be obtained from sun-heat. The temperature at night should not fall below 70°. Do not allow the borders inside or outside to become dry before affording them water. At closing time in the afternoon damp very freely all available surfaces in houses in which the Grapes are swelling, using for this purpose diluted liquid-manure. This will maintain a humid atmosphere charged with ammonia, which will check red-spider. During the "stoning" period in late houses afford liberal ventilation as a means of preventing injury from scalding, afterwards less air will be necessary until the berries commence to colour. Examine the bunches, and remove small and seedless berries with care, or a blemish will result.

Peaches and Nectarines.—When the fruits have been gathered in succession-houses, treat the trees as previously advised for those that fruited earlier. Keep the borders moderately moist in houses in which the fruits are being gathered, and afford liberal ventilation. In houses containing fruits approaching to maturity discontinue the syringing. Trees in later houses where "stoning" is completed should have all laterals springing from the shoots of this year and any over-strong shoots removed. Tie in the young growths, but avoid overcrowding. Expose the fruits above the foliage in order that they may attain to high colour and good flavour. Afford plenty of water to the roots of the trees, and use the syringe freely to keep the foliage clean.

THE FLOWER GARDEN.

By A. B. WADDS, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

The Wild Garden.—The grass may now be cut where Narcissus and late-flowering bulbs have flowered. Plant-out any Lilies that have flowered in the houses. All ground should be marked that contains bulbs, so that additions may be made in the autumn if desirable. Allow the seed pods to remain on Bluebells, and any other bulbous plants that it is desirable should increase in quantity. Heaths will require to have water afforded them should the weather continue dry. Train the growths of climbers on trees and bridges, and afford them water. Remove the grass and weeds from about the stems of the climbers. Afford repeated waterings of liquid-manure to Camellias and Palms.

Pansies and Violas.—Propagation should be commenced as soon as possible. The small off-sets make the best cuttings, and those that can be taken off with a small heel to them; the large growths are useless. Choose a shady situation, and prepare some good gritty soil, such as scrapings from the roadway. The weeds that come up in these scrapings are a drawback, as the cuttings are liable to be disturbed when pulling them out, but if the weeds are removed soon enough little harm is done. When taking the cuttings they should be immediately put into a can with water, and inserted in the soil before they flag. A three-light frame is more satisfactory for this purpose than putting the cuttings in the open. If there

is no frame available, put a post and rail round the beds to support some material for shading the cuttings.

Shrubberies.—Hoe the surface of the ground. Weeds that cannot be dislodged by means of the hoe should be cleared out with the rip-hook; mulch and afford water to shrubs that require moist conditions. Dry winds are very penetrating, and have a bad effect on shrubs that have been moved recently. Afford stakes to any that require support.

Rockery.—Frequent waterings will now be necessary, and the work should be done in the evening. Remove the seed-vessels from plants, and make the plants appear as tidy as possible. *Adiantum pedatum* requires abundance of water. Afford fresh sphagnum-moss to *Sarracenias*; these being planted in a moist and shady position will not require much attention.

General work.—Make good all arrears of work, such as edging and weeding of walks, clearing shrubberies, scythe-mowing under the boughs of specimen trees, &c. Where the gravel on the paths is of a loose nature, it is difficult to keep it in proper order in dry weather. It is of little use to roll the paths without first applying a good soaking of water. Weed-killer may be applied where there is no Box edging. With care it may be used close to the grass verge. Let the work be done during settled weather. Turf that was laid in the spring will require watering. Grass verges should be trimmed neatly; if they are allowed to grow too long the seeds will fall on the walk and cause much trouble.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. BURNS, North Myms Park, Hatfield, Hertfordshire.

Kalanchoe flammea.—The propagation of this species by means of the leaves and basal shoots may be undertaken directly the plants have done flowering. The young shoots may either be placed singly in small pots, or may be inserted to the number of eight or ten in 5-inch pots, which have previously been filled with a compost of loam and sand in equal proportions. In propagating from the leaves, let these be pulled carefully off the plant, and without further preparation lay them on the surface of the soil in pots or pans filled with the compost named above. The leaves may be placed somewhat closely together, and each one should be provided with a peg to keep it in position. Only the base of the leaf should be covered with soil. Place the pans and cutting pots on a shelf in a house having an intermediate temperature, or at the cool end of the stove, and withhold water until it is seen that roots have been formed, when the soil may occasionally be lightly watered. There is a danger of the leaves rotting if water be given earlier. In due course the bases of the leaves callus over, then the roots are produced, and finally the young shoots appear. When these are about 2 inches high they should be potted singly into small pots. The compost for this potting may consist of three parts loam and one part leaf-soil, adding plenty of coarse silver-sand and some broken brick-rubble or crocks to keep the soil porous.

Bulbs for Early Forcing.—No time should be lost in ordering bulbs of Roman Hyacinths, Polyanthus Narcissus, Freesias and retarded Liliums, if it is desired to have these in bloom at the earliest date possible. For this purpose bulbs of good quality should be obtained, and this is especially the case with regard to Roman Hyacinths. Polyanthus Narcissus Early Snowflake is a very desirable variety for early forcing. Among the retarded Liliums the varieties of *L. speciosum* and *L. longiflorum* will be found most serviceable.

Miscellaneous.—Lapagerias growing freely in tubs or pots will require copious supplies of water, and occasionally weak liquid-manure may be afforded them. If large blooms of tuberous-rooted Begonias are required, remove the female flowers as soon as they can be seen, and leave only one male bloom to each flower-stem.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

APPOINTMENTS.

FRIDAY, July 22 { Opening of the New Hall of the Royal Horticultural Society by His Majesty THE KING (at noon).

FOR THE ENSUING WEEK:

SATURDAY, JULY 9 { Windsor Rose and Hort. Soc. Exhibition.
Warminster Rose Show.

TUESDAY, JULY 12 { Roy. Hort. Soc. Show at Holland House, Kensington (2 days).
Wolverhampton Floral Fête (3 days).
Hort. and Rose Show at Gloucester.

WEDNESDAY, JULY 13 { Nottingham Hort. Soc. Show (2 days).
Ranelagh and Dist. Hort. Exhibition.
Hort. and Rose Shows at Formby, Harrow, Reading, Stevenage, and Thornton Heath.

THURSDAY, JULY 14 { Maidenhead Horticultural Soc. Show.
Weybridge and District Hort. Soc. Show.
Brentwood Hort. Exhibition.
Highgate Hort. Soc. Annual Exhibition.
Woodbridge Flower Show.
Eltham Rose and Hort. Exhib.
Potters Bar and Dist. Hort. Show.
Rose and Hort. Shows at Bath, Helensburgh, and Southsea.

FRIDAY, JULY 15 { Rose and Hort. Shows at Gresford and Ulverston.
Roy. Bot. Soc. Lecture.

SATURDAY, JULY 16 { Manchester Hort. Soc. Rose Show.

SALES FOR THE WEEK.

TUESDAY NEXT—Clearance Sale of the whole of the Orchids, Stove and Greenhouse Plants, &c., at the Old Hall, Southborough, Tunbridge Wells, by order of the Exors. of C. B. Powell, Esq., by Protheroe & Morris, at 11.30.

FRIDAY NEXT—Fine Imported Orchids, by order of Messrs. Sander & Sons.—200 lots Established Orchids, 300 Cattleya Mendeli, Retarded Lilies, Spiraeas, &c., at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12.30.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—63° 3'.

ACTUAL TEMPERATURES:—

LONDON.—July 6 (6 P.M.): Max. 77°: Min. 55°.

July 7.—Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden (10 A.M.): Bar. 30.2; Temp., 66°. Weather, bright sunshine.

PROVINCES.—July 6 (6 P.M.): Max. 72° 3', East Coast of England; Min. 55°, North of Ireland.

blooms with which Messrs. HARKNESS, of Hitchin, secured the Nurserymen's Challenge Trophy for the year. Mr. E. B. LINDSELL's lot, which secured the Amateur's Trophy, was scarcely inferior. The minor groups were almost invariably good—some remarkably so.

If we had to pick out the best Roses in the Show, we should select Mildred Grant, Kaiserin Augusta Victoria, Frau Karl Druschki, White Maman Cochet, and Susanne Rodocanachi.

We must, however, refer to our detailed report for full particulars of a memorable Show—so fine, that one could but lament the enforced absence of the President, Dean Hole, and of the founder, Rev. H. HONYWOOD D'OMBRAIN. We heard that lament expressed on many sides.

This has been a wonderful Rose year generally, and, as is often the case, some one or two Roses assert their supremacy. Wherever we have been this year, William Allen Richardson has been flowering with extraordinary profusion and beauty. So has our old friend Gloire de Dijon, but Blairii No. 2, of which we give a figure in our Supplementary Illustration, has been a disappointment—how far this is general we do not know. La France (see fig. 7, p. 19) still holds her own; and Ulrich Brunner (see fig. 6, p. 18) was present in a number of collections at the Temple.

Lady Gay (fig. 13, p. 29) is one of many seedlings from Crimson Rambler, the flowers being of a cherry-pink colour. For the opportunity of illustrating it we are indebted to Mr. M. H. WALSH, Rose Specialist, Wood's Hole, Massachusetts, who describes it as a Rose of the highest merit. From the same gentleman we have received an illustration (fig. 12, p. 28) of his group of Rambler Roses at the Spring Exhibition at Boston U.S. The group comprises Debutante, Hiawatha, Babette, Minnehaha, Sweetheart, and others. The small plants in six-inch pots are "Wedding-bells," a semi-double pink-coloured variety. The illustration shows how well adapted these Roses are for forcing.

Whilst Teas and Hybrid Teas are supplanting Hybrid Perpetuals, new blood has been introduced by Lord Penzance's Briars and their derivatives, and by the crosses with Wichuriana. The resources at the disposal of the rosarian are vast and varied. Not the least service that the National Rose Society can render is to encourage their development.

It is seldom that the National Rose Society awards two Gold Medals to new varieties exhibited at the metropolitan exhibition, but at the recent show it did so. The varieties, "Dean Hole" and "Mrs. O. G. Orpen," thus distinguished are described on p. 30, as well as they could be from the specimens exhibited, but it is not until they have come into general cultivation that their value can be accurately determined. Two other new varieties were awarded Cards of Commendation.

HORTICULTURAL CLUB.—An excursion of the members of the Club is fixed for Wednesday, July 27, to Langley Park, near Slough, and East Burnham Park, where Mr. and Mrs. HARRY VEITCH offer hospitality. Burnham Beeches, and Dropmore will be visited, and the party will dine at Skindell's Hotel, Maidenhead, at 6.30. Those intending to take part in this outing should communicate with the Secretary, Mr. E. T. COOK.

SIR DANIEL MORRIS, who is now in this country for a short time, was the recipient of the degree of D.C.L. from the University of Durham on June 22.

FORESTRY IN NORTH WALES.—The University College at Bangor has instituted a Forestry Department under the management of Mr. FRASER STOREY.

FLOWERS IN SEASON.—From Mr. HENKEL, of Darmstadt, we have received flowers of:—

Erigeron speciosum var. *rosca*.—A species of moderate height, with sessile, cordate, lanceolate leaves, and heads of flowers each about 1½ inch across, with spreading narrow lilac rays and yellow disc florets. It is a very attractive plant.

Delphinium.—A new annual variety with flowers on long, slender stalks loosely arranged. The flowers are quite regular with no spur, doubled by multiplication of petals; the segments are deep blue, the inner ones bearing a central crest of golden-yellow hairs. A very handsome and interesting form.

Gentiana affinis.—A species with broadly lanceolate leaves, about 4 inches long and 1 in breadth. Flowers blue, in close tufts in the axils of the leaves, near the top of the stem; each flower an inch or more long, tubular, with a short, five-lobed limb, the segments erect, scarcely separating one from the other. It comes from Arizona.

MR. ARCHIBALD SMITH.—We occasionally note the fact that a large proportion of the most distinguished horticulturists of the United States are Britons born. So successful are they that they do not as a rule return to the land of their birth. But now we have to chronicle an exception. Mr. ARCHIBALD SMITH, for sixteen years manager of the seed business of JOSEPH BREEK & SONS, of Boston, Mass., is about to return to this country. Mr. SMITH was born at Stranraer, served in various capacities, amongst others under PETER HENDERSON, when that gentleman was manager for Mr. PERKINS, of Northampton. Eventually Mr. SMITH went to the States, where, according to the *Florist's Exchange*, he secured the respect and goodwill of his associates. Mr. SMITH has acquired the seed business in Market Street, Oxford, carried on by Mr. PRINCE.

MR. LEWIS CASTLE, the manager of the Duke of BEDFORD's Experimental Fruit Farm, who has had great experience in practical horticulture, the cultivation and marketing of fruit, and who is the author of various prize essays, is open to an engagement.

FIRE AT AN EXETER NURSERY.—A fire broke out recently at the South Devon Nurseries, Alphington Road, Exeter, the property of Mr. CHARLES SCLATER. The property consists of a dwelling-house and potting-shop. The house and its contents were entirely destroyed in a very short time. Mr. SCLATER and his family, who had retired to rest, had difficulty in escaping. The house, a large one, and the property destroyed is estimated at between £800 and £1,000. The loss is partially covered by insurance.

THE WEST INDIA COMMITTEE CIRCULAR.—A special number devoted to the agricultural industries of the West Indies was issued on the 28th ult. It opens with a portrait of Sir DANIEL MORRIS, the illustration being accompanied by a brief account of his career. What he has done for the development of cultural industries in the West Indies since his appointment as Imperial Commissioner of Agriculture is narrated in some detail in the number before us, which also contains the substance of a lecture delivered by Sir DANIEL before the Committee, and a report of his speech at the dinner of the Club on the 22nd ult. Whilst not neglecting the interests of the sugar planters, stress is laid upon other subjects, such as fruit-growing, Onion-culture, Cotton cultivation, and other subjects, which are shown to be very valuable items in developing the resources of the island. Scientific research and the spread of agricultural education are also subjects to which Sir DANIEL has done his best

The Temple Rose Show.

THE Committee of the National Rose Society ought to feel happy. The weather on Wednesday was all that could be desired. The arrangements worked smoothly, thanks to the excellence of the organisation; and as to the Roses—well, we do not think the most critical of oldest inhabitants could find serious fault. The Show was held in two long narrow tents, and one of wider dimensions. On entering there were pergolas and climbing Roses, which formed a pretty feature. In these tents also were arranged the groups of "decorative" Roses, for the most part much too densely packed and heavy. In the larger tent were some exquisite table decorations in the centre, and cut Roses along the sides. Taking one class with another, the quality of the Roses as to size, texture, colour, and luminosity was superb. We do not think anything finer in its way was ever seen than the collection of seventy-two

to foster, so that the improved prospects of the West Indian industries are due in no slight measure to the enlightened energy of the Commissioner. A most interesting communication to this periodical is furnished by H. HESKETH BELL, Esq., the Administrator of Dominica. The whole of the interior, we are told, is covered by virgin forest. Of course this is destined in the future to give place to plantations of Cacao, Rubber, perhaps Cotton, and other tropical products. A road 17 miles in length has been constructed into the centre of the island, so that the development of the country needs now the judicious outlay of capital and the enterprise of educated cultivators. It is to be hoped that means will be taken to preserve in its natural condition a considerable proportion of the island, and to secure the services of some competent collector to investigate its botanical riches.

MR. R. C. GAUT (Leeds University), who was successful in gaining the National Diploma in Agriculture in the recent May examination, has now passed the final examination for the B.Sc. Degree (first division) in Agriculture, Victoria University. The degree was conferred last Saturday at Manchester. Mr. R. C. GAUT received his training in the science and practice of Agriculture and Horticulture in the following places, viz., Berwick Hall, Shrewsbury; Établissement Horticole (Mons. DELARUYE CARDON), Ghent; Royal Botanic Gardens, Kew; Alton Towers; and for the past five years at the Yorkshire College (now University of Leeds); and the Yorkshire Council for Agricultural Education's experimental farm at Garforth, near Leeds.

PANSIES AND VIOLAS FROM SCOTLAND.—More attention has been devoted to these old florists' flowers in the North than anywhere else in this country, and it is quite in keeping with the order of things that we received quite recently a number of handsome varieties of these old-fashioned flowers from the firm of Messrs. DOBBIE & Co., Rothesay. The great improvement which has taken place in these flowers was evinced in this collection, for not only were the flowers of large size, but the colours and markings on them were most handsome, and among the selfs especially were flowers that were of the most lovely shades of colour. The popularity of these plants for bedding purposes in spring and early summer can be gauged from the enormous quantities that pass through Covent Garden Market at that season.

BOTANICAL AND HORTICULTURAL REPORTS FROM OTTAWA.—There have recently been published the Reports of the several departments of the Ottawa Experimental Farms (Appendix to the Report of the Minister of Agriculture for 1903). In these reports will be found the results of many important and carefully conducted experiments in agriculture, horticulture, and arboriculture, the outcome of practical and scientific work in the fields, barns, dairy and poultry buildings, orchards and plantations at the several experimental farms; also of scientific research in the chemical laboratory bearing on many branches of agricultural and horticultural work, and of information gained from the careful study of the life histories and habits of injurious insects, and the methods by which noxious weeds are propagated and spread, together with the most practical and economical measures for their destruction. In the report of the Entomologist and Botanist this subject is fully treated and illustrated.

BEGONIA UNIFOLIA.—Professor WILLIAM TRELEASE contributed, at the St. Louis meeting of the American Association for the Advancement of Science, an interesting paper on an ecologically aberrant Begonia, found by him last summer a few miles above Iguala, in the Mexican State of Guerrero. "The plant was growing in abund-

ance, and differed from all the other species that I had seen in possessing only a single radical leaf, through the sinus of which a few-flowered scape arose, naked except for a rather small leaf-like bract subtending its single branch, and much smaller bracts in the inflorescence proper. The plant has been referred to the *Huszia* group, which is that of the so-called tuberous Begonias, some of which are now popular in cultivation, nearly all of them coming originally from the Bolivian or Peruvian Andes. *B. monophylla* is said to produce a tuber 9 lines thick, and to have a single, stalked, 12 to 15-nerved, very shortly pilose leaf, which is cordate or sometimes peltate, and rather large flowers. Aside from its northern distribution for a species of the section *Huszia*, the rather uncertain source of its closest relative, *B. monophylla*, and the single leaf which, like the latter, it produces, *B. unifolia* is of interest in that its single large leaf is closely applied to the rock or talus in the crevices of which it is rooted, so that its subterranean parts are thus given the same kind of protection afforded by the similarly appressed basal leaves of the stag-horn Ferns, *Platyserium*."

DESTROYING ALGÆ IN WATER SUPPLIES.—The importance of maintaining all water supplies at the highest degree of purity and wholesomeness is too well recognised to require discussion. The United States Department of Agriculture has recently published a bulletin dealing with this problem of purifying water, and Messrs. G. T. MOORE and KARL F. KELLERMAN, in the summary of their pamphlet, declare that "the disagreeable odours and tastes so often present in drinking water are due almost exclusively to algæ, although the economic importance of studying these plants has not been recognised until recent years. These algal forms are widely distributed, and reservoirs are often rendered unfit for use by their presence. The methods now known for preventing the objectionable odours and tastes have been found either too costly or ineffectual. A new, cheap, harmless and effective method was therefore required to rid reservoirs of the pests, and it has been found that copper sulphate in a dilution so weak as to be colourless, tasteless, and harmless to man is sufficiently toxic to the algæ to destroy or prevent their appearance. The mode of application makes this method applicable to reservoirs of all kinds, pleasure ponds and lakes, fish-ponds, oyster-beds, watercress-beds, &c. It is also probable that the method can be used for destroying mosquito larvae. At ordinary temperatures one part of copper-sulphate to 100,000 parts of water destroys typhoid and cholera germs in about three to four hours. The ease with which the sulphate can then be eliminated from the water seems to offer a practical method of sterilizing large bodies of water. Definite knowledge in regard to what organisms are present, the constitution of the water, its temperature, and other important facts are necessary before it is possible to determine the proper amount of copper sulphate to be added. A microscopical examination thus becomes as important as a bacteriological or chemical analysis. No rule for determining the amount of copper sulphate to be added can be given. Each body of water must be treated in the light of its special conditions."

"FLORA AND SYLVA."—The July number contains figures of two showy *Achilleas*, the one with white flower-heads, *A. lingulata*; the other with dense yellow heads destitute of ray-florets, *A. clypeolata*. An enumeration of the species suitable for cultivation is given. A similar list of the species of *Viburnum* is published. What a valuable thing *Nicotiana Sandera* is, is shown by the coloured figure, representing a form with deep rose-coloured flowers. It is a hybrid between *N. Forgetiana*, hort. Sander, crossed with *N.*

alata. This plate is also accompanied by an enumeration of the cultivated species of *Nicotiana*. The rich collection at Castlewellan are passed in review, and a protest made against defacing our gardens with statues.

GARDENERS' CRICKET.—Last week the students at the Royal Horticultural Society's Gardens, Wisley, played a cricket-match with the neighbouring village of Ripley, the students winning by sixteen runs. Mr. HOULSTON for the students carried his bat through the innings for forty-one runs, not out.

"BOTANICAL MAGAZINE."—The July number contains coloured figures and descriptions of—

Vellozia trichophylla, Hemsley, t. 7962.—A very striking, shrubby *Amarylloid* from East tropical Africa, figured in our columns in 1903, vol. ii., p. 425, fig. 167, under the name *V. equisetoides*.

Geonoma gracilis, Linden and André, t. 7963.—A very elegant tropical Palm with arching pinnate foliage, the segments being broadly linear. It is a native of tropical America.

Spathoglottis Hardingiana, Parish and Reichenbach, t. 7964.—A native of Northern Burma, with loose, elongated, many-flowered racemes of lilac flowers, differing from its near allies in the small lateral lobes of the lip.

Chrysanthemum ornatum, Hemsley, t. 7965, figured in *Gardeners' Chronicle*, 1904, i., p. 51, as *C. marginatum*, which is erroneous.

Pitcairnia spathacea, Grisebach, t. 7966.—A species with narrow, elongate, spine-margined leaves, and panicles of rose-coloured flowers. Native of Argentina.

ICONES SELECTÆ HORTI THENENSIS.—The fourth volume of this valuable publication has now been issued. The plants figured in the two last fascicles are enumerated below. The illustrations are excellent and the critical text full of information of great value to botanists. The illustrations are taken from plants cultivated in the garden of M. VAN DEN BOSSCHE at Tirlemont, and the work is to be had only from his agent at 5, Grande Montagne, Tirlemont, Belgium.

CRASSULA TRACHYANTHA, t. CII.
GAYLUSSACIA RESINOSA, t. CLII.
PARACARYUM HELIOCARPUM, t. CLIII.
CALCEOLARIA VIOLACEA, t. CLIV.
CHENOPODIUM NITRARIACEUM, t. CLV.
BILLARDIERA SCANDENS, t. CLVI.
TELEPHIUM IMPERATI, t. CLVII.
FRAXINUS MARIESII, t. CLVIII.; a Veitchian introduction, very ornamental in the flowering stage.

HOLMSKIOIDIA SANGUINEA, t. CLIX.; a native of subtropical Himalayas, belonging to the Verbenaceæ and allied to *Clerodendron*. The calyx expands into an unsymmetrical, brightly-coloured cup encircling the base of a curved tubular corolla.

ENCEPHALARTOS VILLOsus, t. CLX.; this plate is accompanied by an enumeration of all the species described up to this date. We may point out that the *E. acantha*, described by us in 1878, is referred by Sir W. THINSELTON DYER to *E. Fridericii* Gussone (see *Gardeners' Chronicle*, January 4, 1879, p. 11).

FUNGUS CO-OPERATION IN ORCHID ROOTS.

—The following are the conclusions arrived at by M. NOËL BERNARD as published in the *Comptes Rendus*, t. 138, p. 828, March 28, 1904:—"I have already reported," says M. BERNARD, "that I have succeeded in isolating by pure cultures an endophytic fungus of an Orchid. This hyphomycete appeared in some hybrid Cattleyas (*C. Mossiæ* × *Lælia purpurata*) grown in the houses of M. MAGNE, of Boulogne-sur-Seine. I have demonstrated that seeds produced by cross-fertilisation of the same plants, do not germinate when sown aseptically or with any ordinary micro-organisms; while on the contrary, if an aseptic seed is contaminated with the hyphomycete in question, the seeds do germinate and produce young plants similar to those raised under glass, and infested as they are. Doubtless, therefore, this hyphomycete is really the normal endophyte of this plant. Starting

from these premises, M. BERNARD endeavoured to cultivate the endophytes of various other Orchids. To accomplish this he simply collected on the spot, in exhausted tubes, the roots of Orchids, the infested parts of which were then transferred to "salep gelose" in sterilised tubes. From the roots of *Cypripedium insigne* grown in a house in the Caen Botanic Garden, he obtained with other micro-organisms a hyphomycete morphologically identical with that which he had isolated from the *Cattleya* plants. The germination of the seed showed that the fungus was really a normal endophyte. The thick, fleshy roots of *Spiranthes autumnalis*, gathered in September near Alençon, furnished him in various experiments with a hyphomycete which does not differ in morphological characteristics from those previously mentioned. Although he has not, in this case, tested the germinating powers of the seeds, it is almost certain that this is indeed the endophyte of this Orchid.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Mr. CHARLES FOSTER, of University College Gardens, Reading, has forwarded the sum of £1 2s. in aid of the above Institution, being the amount collected amongst the Oxfordshire County Council Class when visiting the College Gardens.

THE "HORTICULTURAL DIRECTORY."—We are asked to state that the editor of the *Horticultural Directory*, 12, Mitre Court Chambers, Fleet Street, London, would esteem it a favour on the part of all head gardeners who have changed their addresses since October last if they will send him a notice of their new address. Nurserymen, seedsmen, and florists who have changed either their address or title are likewise requested to notify the editor.

PUBLICATIONS RECEIVED.—*The Hour Glass* (Mitford Lane, Strand).—*The Queensland Agricultural Journal*, May. With the usual articles upon agriculture in general, and tropical industries in particular.—*Thirty-first Annual Report, Board of Park Commissioners, San Francisco*, for year ending June 30, 1902. A general synopsis of the work accomplished with the appropriation allotted to the park. Details many improvements.—*Bulletin No. 97 of the Hatch Experiment Station of the Massachusetts Agricultural College: A Farm Woodlot*. The purpose of this Bulletin is to set forth a single definite concrete example of practical forestry under conditions typical of nearly the whole State, and of large areas in neighboring States. Hence it deals with the products required, the species of trees, their reproduction and succession, and it is appropriately illustrated.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

AN INTERESTING PHENOMENON.—I have a large plant on a south wall of *Clianthus puniceus*. It is about three years old. For the last two years it has insisted in throwing out flower-buds in November, which are all destroyed later on by frost, as well as a considerable portion of the plant itself. This is an Australian plant, and November in Australia would be about the beginning of summer. It would seem therefore that this plant cannot adapt itself to a change of climate in its inflorescence, and take to flowering in the beginning of our summer, but retains the habit of throwing out flower-buds at the time of the Australian summer! In the open here it is quite useless, as it is half killed every winter. Near Penzance, however, it seems to fare differently, for in the *Gardeners' Chronicle* of March 5, p. 156, it is stated that the *Clianthus puniceus* was in flower in the first week of February. E. Bonavia, M.D.

BAMBOOS, NYMPHÆAS, ETC., AT GUNNERSBURY HOUSE.—The thirty species and varieties of Bamboo which Mr. James Hudson, gardener to Leopold de Rothschild, Esq., has so skilfully arranged in the Bamboo-garden there have thoroughly established themselves, and all are vigorous, and many have assumed gigantic proportions.

Mr. Hudson considers it most necessary in establishing these and many other foreign plants in the open ground to give copious supplies of water, especially in the early part of the summer. In one part the large foliage of *Juglans Sieboldi* and of *Aralia mandshurica variegata* are very effective. The many varieties of *Nymphæa*, white, yellow, and red, have formed great patches of colour on the lake, and in the more sheltered garden nooks the blue *Nymphæas* and the *Nelumbiums* are about to make a good show. The Japanese-garden, with its quaint Bamboo bridges and summer-houses, surrounded by native Japanese trees and shrubs, forms a remarkably novel feature; and the imitation "ruin," so cleverly formed by Mr. Hudson, facing a blank wall, to represent parts of an old castle, is now beautified by a fine set of rock-plants, Roses, &c., flowering in the interstices provided for them. Roses are in great profusion at Gunnersbury House this season, one bed of over 500 plants of *Caroline Testout* being specially beautiful. J. B.

OSMUNDA REGALIS.—In the *Gardeners' Chronicle* for June 25, p. 407, I was interested in reading of a fine *Osmunda* in the St. Petersburg Garden. The dimensions given of that plant induced me to measure one in the grounds here, which I discovered about five years ago growing in a wood upon this estate about 16 miles from its present position. The stem is 2 feet high, and has a circumference of 8 feet, upon which are seven crowns, and the number of fronds seventy, the great proportion of them being 2 to 3 feet long. I had the honour during the month of June to accompany the members of the Ashmolean Natural History Society of Oxfordshire through the grounds here, when one of the party informed me that this plant had been removed from its original position, to which some had been frequent visitors. My employer was informed that this fine plant had been moved. Of course he possessed the knowledge that his gardener was the culprit. I state this incident to show the interest sometimes taken in objects which may appear obscure. W. Fyfe, Lockinge Gardens, Wantage.

LARGE-FLOWERED MIMULUS.—Your correspondent on p. 12 may be interested to know that the giant-flowered *Mimulus* was raised in our nurseries at Forest Hill. On May 24, 1887, we were given a First-class Certificate by the Royal Horticultural Society for our strain, which is now distributed under the name of *Queen's Prize*. James Carlier & Co.

BRITISH GARDENERS' ASSOCIATION.—The Royal Caledonian Horticultural Society is making arrangements for a special train to take gardeners from all parts of Scotland to the Shrewsbury flower-show on August 17. If Scotch gardeners wish to benefit by the above association this would be a good opportunity to call a meeting, say at the Raven Hotel, Shrewsbury, to discuss the matter. If Mr. W. Watson could attend such a meeting to explain how far the association has progressed, and open a branch office in Edinburgh, with a committee of gardeners and nurserymen to work in unison with the head office and receive subscriptions, and take particulars of candidates in the North, who are naturally unknown to Southern committee, it would do good. Jas. Hamilton, gr. to Sir Jas. Miller, Bt., Manderston, Duns, Berwickshire. [The further remarks about the management of the Association should be addressed to the Committee. Ed.]

THE COLOUR IN FRUITS.—I do not think that "F. M.'s" were expression of doubt, on p. 12 of your last issue, as to the relevancy of my "quasi-scientific assertion," helps us much. The difficulty of absolute proof being reached by any kind of experiment is probably greater than "F. M." supposes. We shall have to be content with corroboration by facts pointing more or less in the same direction. Against a few varieties of Apples named by "F. M.," I have marshalled the whole of the exhibition table-fuls, as formerly shown at the Crystal Palace, representing hundreds of varieties, generally poorly coloured in continuously dry seasons. Indeed, I can add a piece of evidence which further confirms my theory. About four or five years, ago in one

of the annual shows referred to, one of the best known West of England fruit-tree growers, on an occasion when the general show was conspicuously green, had a very well-coloured exhibit. "I presume the difference between your well-coloured exhibit and the general green tone of the show arises from your irrigating or well watering your fruit plantations?" "Certainly that is so; we could not in the absence of rain obtain such colour without the application of plenty of water." Of course this leaves the question of the actual influence of nitrification on colouring still merely an hypothesis, but there may be observers and experimenters who could add to the evidence of which I gave three examples on p. 395 in your issue for June 18, and whose records might contribute to the solution of the problem. Considerable differences of colouration in Apples may be seen at any large show as the result of a combination of influences of aspects, soil, elevations, and weather, &c. The very excellent, far too little known early autumn Apple, *Gravenstein*, when produced in Europe, is prominently yellow with a few lively crimson stripes on the sunny side. The same variety, as imported since a couple of decades from Canada and sold annually at Covent Garden, is invariably rich crimson with no vestige of yellow; also its quality is far less desirable than in home-grown fruit, not unlike the difference between the Canadian Ribston and this genuine British favourite, which is also much in favour of the home-grown article. H. H. Raschen, *Sidcup, Kent*.

PROGRESS.—I read in the last issue of the *Gardeners' Chronicle* two most interesting articles—viz., 1, "A Memorable Week;" and 2, "Progress." These show many golden opportunities for the rising generation who intend finding their living in one or other of the various branches of horti-agriculture, &c. There is, of course, always much to learn in the cultivation of anything; but in my opinion the difficulty does not lie so much in the want of knowledge how to cultivate as to how to find a remunerative market after the crops have been grown. I am here as an old practitioner with a small bit of land, the staple of which will grow anything; but I am at a loss to know how to turn it to remunerative account, and would be very pleased to have a visit of any of those new scientific horticultural experts who know so well not only how to make things grow, but also how to make them pay. At the dinner of the Gardeners' Royal Benevolent Institution there were some very excellent speeches, but the one which pleased me most was that of Mr. George Dickson, of Chester, who said "he was afraid that if they trusted too much to science, rather than to practice, it would be to the country's disadvantage." A good market is worth cartloads of all this so-called science. It is our markets and the carriage to them which want putting on a proper basis. After that we will be very pleased with all the help science can give us. W. Miller.

HOLLY-TREE DENUDED OF BARK.—In reference to the Holly-tree denuded of bark, mentioned by Mr. Storrie on p. 11, I may mention two cases of bark-stripping I saw. 1, Some Beech-trees that were stripped by a horse 6 feet from the ground; they lived for two or three years, but the foliage gradually got weaker, till the store of material in the cells was used up. The Beech-trees were at Moffat, being from 1 foot to 18 inches in diameter. One tree had a thin strip of bark left leading to one branch; the difference between that branch and other parts of the tree was very noticeable. 2, A plant of *Vitis heterophylla variegata* that had about half an inch of its stem injured, so that there was a zone of dead dry wood, but as it did not stop the flow of water the top went on growing, but in a sickly manner, and so would have died later. Alex. D. Benney, 14, Knowe Terrace, Stanwix, Carlisle.

— On p. 11 there was a figure of Holly trees denuded of bark. I have no doubt if rabbits did not do all the mischief they did their share. If rabbits can get any foot support, they will climb up a good way. When starved for other food, and taking advantage of a deep fall of snow, they will bark both big trees and small ones a long way up. They are very fond of eating the bark round the butts of even Beech trees. From these

depredations trees never thrive. It is not uncommon, where an excessive number of rabbits is preserved, for breadths of underwood totally to disappear. They are very fond of Hazel. Deer will work much mischief if allowed to roam and browse in woods. Horses for downright mischief will bark trees. They are very fond of browsing on Scotch, Austrian, and other Pines, as well as Spruce and all other varieties of the Fir tribe, i.e., when they can reach these branches in a young state. They will not touch Cupressus Lawsoniana, but sheep will eat it greedily. Water-rats (voles) are very interesting little animals, but they, too, are often mischievously

THE ROSE SEASON BEGUN.—It is always interesting to observe at this season of the year which of the many and widely contrasted varieties of the Rose come first into bloom. One of the earliest of these is invariably the beautiful Austrian Briar, Rosa Harrisoni, one of the loveliest and most evanescent of all flowers. Nothing could be sweeter than this incomparable gem; nothing more transitory. But perhaps it is all the dearer to our fond imagination that its life is so brief. An exquisite contemporary of Rosa Harrisoni in my garden is Jeannie Deans, one of the most richly endowed of the famous Penzance Briars, semi-double, with crimson flowers of the

which has much the same colour and characteristics as Margaret Dickson, is the extremely charming flesh-coloured Clio, raised many years ago by Mr. Wm. Paul, of Waltham Cross. Not seldom those varieties which receive least attention grow most vigorously and flower most luxuriantly. A Rose, not less than a Lily or a Carnation, may be greatly weakened or even killed by kindness, resulting in what is termed hypertrophy. This is especially true of late-planted and somewhat delicate varieties, which have received too many manurial stimulants before they have become correspondent with their environment, or in other words habituated to the

FIG. 11.—VIEW OF THE ROSE GARDEN AT KING'S WALDEN, BURY, TAKEN FROM THE TOP OF THE CHURCH.

inclined. They will set to work and gnaw round the roots of young Poplars, Oaks, and Hollies until they either tumble them down or the trees suddenly wither, and on examining the base you will find the water-vole has been there. They do not appear to do this for food, but for downright mischief. I put a barrage across a small streamlet here, which dams the water for a distance of 150 yards. This forms a delightful home for the voles. They are rather tame, and will allow one to approach pretty close before they dive into the water. I call them my little beavers. It is amusing to see them swimming along the water, and they can run quite as nimbly along the bottom of the stream as they do on dry land. What a pleasure it must be to an animal in hot weather to be naturally amphibious! *W. Miller, Berkswell.*

brightest hue, and very fragrant leaves. The artistic contrast created by those varieties is grandly effective, and I would strongly advise all cultivators who possess them to grow them side by side. Among Hybrid Perpetuals, one of the earliest is Margaret Dickson, which, seeing that one of its parents was Lady Mary Fitzwilliam, is really a half-hybrid Tea. This I cannot but consider the finest variety for garden cultivation that Ireland has produced, and that is saying much, for some of the grandest Roses of the last decade have come to us from Newtownards, in the Emerald Isle. I have already indicated in a contribution to the *Gardeners' Chronicle* its truly marvellous capability of growth; it is also a profuse bloomer, and its flowers open with great facility. Another invaluable Rose for the garden,

nature of the soil. Atmospheric influences (which were not very favourable on the confines of the present season) have also much to do with plant deterioration and premature decay. I have already lost several precious introductions this year; such, for example, as Gertrude and Longworth Beauty; and assuredly it was not for lack of adequate attention. It was the theory of Wordsworth that every plant "enjoys the air it breathes;" but many Roses of recent origination have obviously not the vitality to enjoy it very long. Perhaps in many instances soil less highly fertilised, applied to their tender and sensitive roots, might have a different and more invigorating effect. The earliest of the Hybrid Teas this season have been Clara Watson, Caroline Testout, and Viscountess Folkestone, of which the last-mentioned is one of the most floriferous and

fragrant Roses within the range of my experience. It is, in my estimation, by far the most valuable creation of the late Mr. Henry Bennet, even if we take into consideration the merits of Mrs. John Laing, a Rose whose lilac-pink I do not wholly admire, and whose pendulous habit I cannot but deplore. Caroline Testout I have already had magnificent in dimensions, one imperial flower of this majestic variety, half-way up a venerable Apple-tree, being nearly 7 inches across. The majority of the Noisette Roses, and not a few of the dark-coloured Hybrid Perpetuals, such as Horace Vernet and Duke of Edinburgh, are not yet (July 3) in bloom; but they promise to be finer than usual this season. During the last week the most effective of the Tea Roses have been Souvenir d'un Ami, and its pure white derivative, Souvenir de S. A. Prince. The new Roses whose appearance I anticipate most eagerly are Frau Karl Druschki, Corona, Mr. Ben Cant, and Florence Pemberton. These are exceptionally vigorous growers, and cannot fail, wherever adequately cultivated, to produce very memorable floral and artistic effects. The flowers of such varieties as Mildred Grant and Alice Lindsell are unquestionably impressive, but they are unfortunately few. David R. Williamson.

ANOTHER POTATO DISEASE, "BLACK-LEG."

FROM a correspondent in North Hants we have received specimens of Potato haulms wilted and discoloured, with the intimation that "they look all right to-day, and to-morrow are dead." The lower part of the haulm, by the ground, is blackened, hence it has been called "Black-leg." The tubers are small and few. Close examination disclosed no fungus threads or spores, and the whole disease seemed involved in mystery, until we turned to the reports of the outbreak of a destructive disease in the United States, which has been attributed to *Rhizoctonia solani* (Kuhn). The first account of its occurrence was recorded in 1901, but it came under notice in Long Island in the summer of 1900, when Potato growers complained of wilting of the haulms, caused by a stem-rot. Afterwards, in thirty plantations, the threads of *Rhizoctonia* were found to be constantly present in the pith, and on the outside of the stems and roots.

In many sections large haulms gave promise of an abundant yield, but at digging time it was found that so few tubers had set that it would not pay to dig them. It was not uncommon for haulms to set an unusual number of small tubers, or "little Potatos" as they were called. These were often found in compact clusters, and so small as to be worthless. Another condition was the dying of the Potato plants.

The threads of the fungus are often found on the surface of the stems and tubers, where they give rise to irregular dark masses or nodules, known as sclerotia, which vary in size from that of a grain of sand to half an inch or more in diameter.

Plants when attacked whilst young, if not killed outright, are dwarfed, and usually die before the close of the season. In some cases the disease attacks the plant just below the surface of the ground, producing a stem rot which was at first called "collar rot" or "black ring." When the attacks are not so severe as to cause death, there is a conspicuous clustering of the branches or terminal leaf groups, and ultimately dying of the entire tops. In the specimens examined, the stems above ground showed discoloured areas of soft decay, whilst below the soil were numerous lesions in the form of brown dead areas. In those before us the base of the stem is blackened and dying.

There is still a great deal that is mysterious about this disease, since the plants may really be dying or dead, and yet exhibit neither threads nor

spores of fungi. It has been suggested that in the earlier stages the mischief is caused by bacteria, but of this there seems to be no positive evidence. It might be possible that the bacteriosis, attributed in some cases to *Bacillus solanacearum*, is implicated in this disease. The earliest indication of this latter disease is the sudden wilting of the leaves, which soon hang limp and shrivel up. This is followed by discoloration and collapse of the stem.

It is reported of the Black-leg disease that it is causing great ravages in Germany, and in some localities producing a loss of 75 per cent. in the crops, and investigations are still in progress to discover the causes and mitigate the effects of this new scourge.

Up to the present two forms of seed-treatment have been recommended—that of corrosive sublimate, which does not appear to prevent the disease to any appreciable degree; and the for-

FIG. 12.—EXHIBITION OF RAMBLER ROSES BY MR. M. H. WALSH AT THE MASSACHUSETTS HORTICULTURAL SOCIETY AT BOSTON, MARCH 24 TO 27, 1904. (SEE P. 24.)

malin seed treatment, which is stated to prevent the disease to a very marked extent. The formalin treatment is as follows: Add half a pint of formalin (40 per cent. strength) to 15 gallons of water; soak the seed tubers in it for two hours, then cut and plant.

It must be remembered that the soil in which diseased plants have been growing would not be a fit situation in which to plant seed Potatos, however much disinfected, until it is clearly ascertained that all germs of the disease have been killed out of the soil.

It may be noted that in one plant sent, which was thoroughly dead and in process of decay, a white mould was present in all its parts. The conidia were profuse, colourless, from subglobose to cylindrical (8μ diam. to $30 \times 8\mu$). There can be no suspicion that this is anything more than a saprophyte, which was flourishing on the decaying debris, and not in any way related to the disease. Nevertheless it is prudent to note any facts which may occur during investigations, whilst so much still remains obscure. M. C. C.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JUNE 28.—*Present*: Dr. M. T. Masters, F.R.S. (in the chair), Messrs. Gordon, Massee, Chittenden, Worsdell, Shea, Saunders, and Douglas; Dr. M. C. Cooke, Sir D. Morris, K.C.M.G., Revs. W. Wilks and G. Henslow, Hon. Sec.

Vegetable Products of West Indies.—Sir D. MORRIS gave an interesting account of the cultivation and introduction into the English markets of new fruits now being raised. Thus, the Litchi has been brought fresh from Trinidad: its cultivation requires alternations of bright sunshine and water, so that its success depends upon artificial irrigation in the dry season. Mangos can now be also imported fresh, as well as much improved Smooth Cayenne Pine-apples, of the type grown in St. Michael's, the average price being 4s. Bananas, usually imported from Jamaica and Costa Rica, are now

received from Barbados. The fruit is of the dwarf species, *Musa Cavendishi*. They realise 4s. in England, the price at home of a bunch being 1s. They are packed in paper and cotton-wool, with the soft part of the leaves. The ship's hold being well ventilated, the moisture evaporates, and the fruit is thus kept cool and fresh. Immense quantities of large Onions are also grown; £84,000 worth were sent in a few weeks to New York. Cotton is also again being cultivated, the Barbadoes realising the highest prices.

Root Fungi in Orchards.—Dr. COOKE reported on samples received as follows:—"The specimens were pieces of bark of an Apple-tree, from near Bristol, permeated with mycelium. The fungus normally proceeds from decaying wood in the soil, as *Pholiota squarrosa*. There is no known method of saving the trees (see *Journal of the Royal Horticultural Society*, xxvii.; p. 32, 1903). If the roots are only slightly attacked, they may be cleaned and pruned, then washed with some fungicide. Infected trees in an orchard should be trenched round, the soil cast up, sterilised, and all old wood burnt. All toadstools in orchards should be thoroughly destroyed in the young state."

Diseased Tomatos.—Plants received from Berwick-upon-Tweed were examined by Dr. COOKE, who

observes: "The symptoms appear to be those of the 'Tomato Wilt,' a kind of bacteriosis to which Potatoes are also liable (see *Journal of the Royal Horticultural Society*, xxvii., 1893, p. 819). Diseased plants should be removed, as they are liable to infect others. There should afterwards be a change of crops on the ground. Nothing will cure the infected plants."

Rose - leaf Black Blotch. — Dr. COOKE described diseased leaves, sent from Bicester, as follows: "The blotch on Rose-leaves is a most common disease on Roses of all kinds, and is caused by a fungus named

powder of flowers-of-sulphur, mixed with a little lime. If it does not check the disease, then spray with solution of sulphate of iron. Let sulphur have the first chance."

Pears attacked by Midges. — Mr. SAUNDERS reported as follows upon samples received from Newtown: "The Pears are attacked by the 'Pear midge' (*Diplosis pyri-vora*), or rather by its grubs [see *Gardeners' Chronicle*, June 25, 1904, p. 412]. The parent insect, which is a small two-winged fly, lays its eggs in the blossoms as soon as they are sufficiently open for it to be able to do so;

the trees. Perhaps a more certain method of obtaining the same end is, during the winter, when there is not much work to be done, to remove the soil to the depth of 2 inches, and burn, bury, or scatter it, so that the birds can pick out the little chrysalids formed by the grubs; fresh earth should be used to replace that which was taken away."

THE NATIONAL ROSE.

METROPOLITAN EXHIBITION.

JULY 6.—The National Rose Society held its annual exhibition in the Gardens of the Inner Temple, Thames Embankment, London, on Wednesday last in delightful weather. The show was one of the best ever held by the Society, and the quality of the Roses was unusually high. The year 1904 will come to be known as one in which there was a hountiful display of Roses, as may be seen by driving along the country lanes at the present time, and noting the lavish displays in the cottage gardens.

Two Gold Medals were awarded to new varieties, and two other varieties were commended. The arrangements were very good, owing to the energy and courtesy of Mr. Ed. Mawley, honorary secretary, assisted by Mr. Wright, Mr. Reader, and other officers of the Royal Horticultural Society, who lent their aid to the daughter society.

NURSERYMEN.

(MIXED ROSES.)

The Champion Trophy and Gold Medal of the Society accompanied the 1st prize for seventy-two blooms, distinct varieties, and they were won by Messrs. R. HARKNESS & Co., Hitchin, who had one of the most magnificent collections of flowers ever shown in this class. The varieties were as follows:—*Back Row:* Her Majesty, Prince Arthur, Mrs. John Laing, Countess of Oxford, Florence Pemberton, Dr. Andry, Bessie Brown, Captain Hayward, Mildred Grant, Marquise Litta, Marchioness of Londonderry, Rev. Alan Cheales, Mrs. W. J. Grant, Gustave Piganneau, Eugénie Verdier, Ulrich Brunner, Caroline Testout, Madame Hausemann, Danmark, Gladys Harkness, Mrs. Ed. Mawley, Alfred Colomb, Lady M. Beauchere, and Etienne Levet. *Centre Row:* Le Havre, Frau Peter Lambert, Duchess of Bedford, Medea, Earl of Dufferin, Maréchal Niel, Duke of Wellington, Alice Lindsell, Madame Delville, Princess Beatrice, Horace Vernet, Comtesse de Nadaillac, Comte de Rainbaud, Maman Cochet, Marie Rady, Mrs. Sandford, Suzanne-Marie Rodocanachi, Frau Karl Druschki, A. K. Williams, White Maman Cochet, Duke of Edinburgh, Muriel Grahame, Grand Mogul, and La France of '99. *Front Row:* Lady M. Fitzwilliam, Oscar Cordel, Ulster, Charles Darwin, K. A. Victoria, Comtesse de Ludre, Madame Gabrielle Luizet, John Stuart Mill, Ernest Metz, Duke of Teek, Duchess of Portland, Sir Rowland Hill, Souvenir d'Elise Vardon, Marie Baumann, Marie Verdier, Fisher Holmes, Comtesse de Caledon, Pierre Notting, Souvenir de S. A. Prince, Exposition de Brie, Killarney, Louis Van Houtte, The Bride, Dupuy Jamain. We have not attempted to particularise the best blooms in this exhibit, for all were excellent. The 2nd prize was won by Messrs. B. R. CANT & SONS, The Old Rose Nurseries, Colchester, and here again there were some very fine flowers, the collection being better than many collections that in previous years have won the premier position. The varieties Maman Cochet, Mildred Grant, Mrs. W. J. Grant, Mrs. Edward Mawley, Medea, and others were capital. 3rd, Messrs. FRANK CANT & Co., Braiswick Nurseries, Colchester, whose collection contained the best bloom of a hybrid Tea variety shown in the Nurserymen's classes. There were four competitors in this class this year, as against five last year.

Forty distinct varieties, three blooms of each.—This class, as usual, made a very brilliant show, and the 1st prize collection, exhibited by Messrs. A. DICKSON & SONS, Ltd., Newtownards, Ireland, was particularly attractive. Their collection included the best Roses other than Hybrid Tea, Tea, or Noisette exhibited in the Nurserymen's classes. Some of the more conspicuous of the trebles were the varieties Dean Hole, Suzanne Marie Rodocanachi, Bessie Brown, Caroline Testout, Mrs. W. J. Grant, Marquise Litta, Marchioness of Dufferin, Frau Karl Druschki, &c. Messrs. B. R. CANT & SONS were 2nd; and Messrs. F. CANT & Co., 3rd.

FIG. 13.—NEW RAMBLER ROSE "LADY GAY": COLOUR OF FLOWERS CHERRY-PINK.
(SEE P. 24.)

Actionema Rosae (see *Journal of the Royal Horticultural Society*, xxvii., 1902, p. 42, pl. iii., fig. 50). It may be mitigated by spraying, but, as yet, has not been effectually cured. All fallen diseased leaves should be burnt, in order to prevent infection of healthy leaves. The diluted copper sulphate solutions are usually employed. They should be applied early, and when the leaves are young, and but little trace of the disease is seen."

Grape Vine Anthracnose (Glauosporium). — Dr. COOKE reports as follows upon diseased fruit received from Wiltshire: "The disease on the berries is in a very young state, so that there are no conidia at present, and it may succumb to treatment. The use of rich stable manure tends to increase the disease, or render the Vines liable to attack. Try dusting with

the grubs are soon hatched, and at once make their way into the centre of the embryo fruit, which they very soon destroy. There does not appear to be any way of effectually dealing with the fly, or preventing them laying their eggs in the blossoms. Trees which are in a position and of a size that the fruit can be easily examined should be carefully looked over, and any that are found to be becoming distorted, or showing signs of the characteristic black markings, should be gathered and burnt; any Pears that fall prematurely should also be collected and destroyed. In the course of next month the ground under the infested trees should be given a good dressing of kainit (not less than half a ton to the acre); this will have the effect of killing the grubs which have left the Pears and have buried themselves in the soil beneath

Forty-eight blooms, distinct varieties.—The 1st prize in this class (from which exhibitors in the larger classes were excluded) was won by Messrs. J. BURRELL & Co., Howe House Nurseries, Cambridge. This firm showed the following varieties:—*Back Row:* Gustave Piganneau, La France, Horace Vernet, Mrs. W. J. Grant, Abel Carrière, Lady Clanmorris, Star of Waltham, Gladys Harkness, Maman Cochet, Marie Baumann, Duchess of Portland, Dupuy Jamain, Mildred Grant, Captain Hayward, and Papa Lambert. *Centre Row:* Bridesmaid, Dr. Sewell, White Maman Cochet, Dr. Andry, Mrs. John Laing, Mme. Charles Crapelet, Bessie Brown, Jean Souper, Alice Lindsell, Chas. Lefebvre, Frau Karl Druschki, Alfred Colomb, Muriel Grahame, Sultan of Zanzibar, John Ruskin, and Fisher Holmes. *Front Row:* John Stewart Mill, Mme. Cadeau Ramey, Ben Cant, Ethel Brownlow, Victor Hugo, K. A. Victoria, Marie Verdier, Comtesse de Nadaillac, Lady M. Beaulere, Souvenir de Pierre Notting, Earl of Dufferin, Marchioness of Londonderry, The Bride, Hélène Guillot, and Ulster. The 2nd prize was won by Messrs. G. & W. H. BURCH, Peterborough. There were excellent blooms of Her Majesty, Countess of Caledon, White Lady, Mamie, Mildred Grahame, &c. 3rd, Messrs. JOHN JEFFERIES & SON, Cirencester. There were four collections in this class.

Twenty-four blooms, distinct varieties.—Mr. GEORGE PRINCE, Longworth Nurseries, Faringdon, showed a truly magnificent collection of flowers in this class and obtained 1st prize. He had the following varieties: *Back Row:* White Maman Cochet (Silver Medal bloom), Ulrich Brunner, Mildred Grant (extra good), Marchioness of Dufferin, Frau Karl Druschki, Prince Arthur, Souvenir de Pierre Notting, and Mrs. Ed. Mawley (extra large size). *Centre Row:* Ulster, Florence Pemberton, Captain Hayward, Comtesse de Nadaillac, Louis Van Houtte, Kaiserin Augusta Victoria, Killarney, and Bessie Brown. *Front Row:* Muriel Grahame, Gustave Piganneau, Bridesmaid, Mrs. W. J. Grant, Souvenir de S. A. Prince, Caroline Testout, Souvenir d'Elise Vardon, and Marquise Litta. 2nd, Mr. CHAS. TURNER, Royal Nurseries, Slough, who had a very fine collection, in which the varieties Bridesmaid, Ulrich Brunner, Ellen Drew, and Mme. Jules Graveaux were particularly good. 3rd, Mr. JOHN MATTOCK, New Headington Nurseries, Oxford. The collection included a prodigious bloom of Mrs. Ed. Mawley, which had it opened more kindly would have been an exceedingly remarkable flower. There were eight exhibitors in this class.

TEAS AND NOISETTES.

The principal class for Teas and Noisettes was that for *twenty-four blooms, distinct varieties*. Mr. GEORGE PRINCE, Longworth Nurseries, Faringdon, was 1st with a fine display. Souvenir de Pierre Notting, White Maman Cochet, Catherine Mermet, Bridesmaid, Maman Cochet, all especially meritorious; also grand blooms of Ernest Metz, Mrs. Edward Mawley, Souvenir de S. A. Prince, Comtesse de Nadaillac, Innocente Pirola, Cleopatra, Maréchal Niel, Souvenir d'un Ami, The Bride, Souvenir d'Elise Vardon, Golden Gate, Empress of Russia, Marie Van Houtte, Hon. Edith Gifford, Madame de Watteville, and Cornelia Koeh. The 2nd prize was won by Messrs. B. CANT & SONS, Colchester; the varieties Maman Cochet, Madame Cusin, and Muriel Grahame being especially good. Messrs. FRANK CANT & Co., Colchester, were 3rd.

Twelve blooms, distinct varieties.—1st prize was awarded to Messrs. J. BURRELL & Co., Cambridge, who showed the following varieties: Mrs. Edward Mawley, Comtesse de Nadaillac, White Maman Cochet, Boadicea, The Bride, Souvenir de Pierre Notting, Muriel Grahame, Ethel Brownlow, Souvenir de Elise Vardon, Innocente Pirola, Maman Cochet, and Bridesmaid. The 2nd prize was awarded to Mr. JOHN MATTOCK, New Headington, Oxford, whose exhibit must have run very close in the competition for 1st honours. The varieties Mrs. Edward Mawley, White Maman Cochet, Étoile de Lyon, and Comtesse de Nadaillac, were shown in perfection. Messrs. JOHN JEFFERIES & SON, Cirencester, were 3rd.

ROSES IN VASES.

The Society increases the encouragement given to the showing of Roses in vases from year to year. The long stems and foliage, together with the more graceful pose of the blooms, afford a much better effect than can be obtained from blooms shown in boxes.

Twenty distinct varieties, three blooms of each.—The flowers in this class being shown in vases, had a very fine effect; each vase contained three blooms of one variety. The 1st prize was won by Mr. CHAS. TURNER.

The varieties that appeared to best advantage included Maman Cochet, Frau Karl Druschki, Mrs. John Laing, Tom Wood, Ulrich Brunner, and K. A. Victoria. 2nd, Messrs. GEO. COOLING & SONS, Bath, who had a very good collection; and 3rd, Mr. GEO. MOUNT, Canterbury.

Class 8, for fourteen distinct varieties displayed in three in vases, brought some charming exhibits, although the group set up by Mr. GEO. PRINCE, Longworth, Faringdon, was an easy 1st. Every flower in this handsome collection was good. Mrs. Ed. Mawley, Madame de Watteville, Comtesse de Nadaillac, and Maman Cochet being especially noteworthy. Messrs. FRANK CANT & Co., Colchester, were 2nd; and Mr. JOHN MATTOCK, New Headington, 3rd.

Twelve distinct varieties, seven blooms of each.—Not more than six varieties of Teas or Noisettes were to be included. This Class brought many competitors, the whole exhibits being of high standard throughout, and keen competition ensued for the premier places, the 1st of which fell to Messrs. F. CANT & Co., Braiswick, Colchester. Effectively displayed in taller vases at the back, with perfect flowers on strong growths, carrying the blooms well above, this group was much admired. Mrs. E. Mawley, Fisher Holmes, Killarney, Mildred Grant, Kaiserin Augusta Victoria, Captain Hayward, Mrs. W. J. Grant, Mrs. Crawford, Gladys Harkness, Bessie Brown, Marquise Litta, Frau Karl Druschki, all were in the pink of condition and hard to be surpassed. The 2nd prize group, staged by Messrs. ALEX. DICKSON & SON, was also meritorious; 3rd, Mr. GEO. MOUNT, The Rose Nurseries, Canterbury.

Nine distinct varieties of Teas and Noisettes, seven blooms of each.—Mr. GEO. PRINCE's group won 1st prize in this class, staged on a dark table ground, the vases carrying blooms of high quality, of which Mrs. Mawley, White Maman Cochet, Madame de Watteville, and Muriel Grahame were some of the finer displayed. Mr. GEO. MOUNT, Canterbury, was 2nd, with some pleasing vases of blooms, the variety Mrs. E. Mawley being especially prominent. Mr. JOHN MATTOCK, Oxford, was 3rd.

GARDEN OR DECORATIVE ROSES.

This interesting section was well represented, and occupied the major portion of the centre of one of the long tents near the entrance. These were especially displayed in such a manner as to show the foliage and habit of growth of each variety exhibited, and very charming was the result, forming an object-lesson as to the lovely and numerous varieties of this popular class of Roses.

For thirty-six distinct varieties two growers competed—Mr. JOHN MATTOCK, Oxford, and Messrs. PAUL & SON, Cheshunt, the 1st and 2nd prizes being awarded in the order named. The quality of the flowers in Mr. MATTOCK's group was superb, and the individual bunches in the various vases would have done justice to any bride for a bouquet. Marquis of Salisbury and Souvenir de Catherine Guillot were especially fine, although it was difficult to discriminate among a group of such high standard.

Eighteen distinct varieties.—The 1st prize was awarded to Mr. GEO. PRINCE, Oxford, among whose group were several pillar varieties. Mme. A. Chateau was shown well; Marquis of Salisbury was of a fine colour. The 2nd prize in this class fell to Mr. CHAS. TURNER, Slough, whose Crimson Damask and Lady Curzon, both large single varieties, were shown in fine order. 3rd, Mr. GEO. MOUNT, Canterbury.

Eighteen distinct varieties of Summer-flowering Roses (Hybrid Perpetuals, Hybrid Teas, Teas, and China Roses not admissible). There were five exhibitors, who presented some favourable displays. Messrs. GEO. COOLING & SONS, Bath, were placed 1st, with chiefly climbing and Provence varieties. Una, a beautiful large white single variety, was conspicuous, the bud-stage being especially delightful; Madame d'Arbly was also shown well in this group. The 2nd prize group, shown by Mr. CHAS. TURNER, Slough, was also a very fine collection; Messrs. PAUL & SON, Cheshunt, were 3rd.

ROSES IN POTS.

Messrs. PAUL & SON, Cheshunt, were awarded a Silver-gilt medal for a group of Roses in pots, illustrating the value of these plants for bedding purposes. The plants were in 8-inch pots and grown about 1½ to 2 feet in height. They were well-flowered, being principally Tea and hybrid-Tea varieties with a few hybrid perpetuals. Three trained standard plants of Wichuriana varieties gave a pleasing relief to the group.

MEDAL ROSES.

The Society's Gold Medals for premier blooms shown by nurserymen were awarded as follows: for the best Hybrid Tea Rose, Mildred Grant, shown by Messrs. F. CANT & Co.; the best Tea or Noisette, White Maman Cochet, shown by Mr. GEO. PRINCE; and the best other than Hybrid Tea, Tea, or Noisette, Ulster, shown by Messrs. ALEX. DICKSON & SONS.

OPEN CLASSES.

For twelve distinct varieties of hybrid Teas, Messrs. A. DICKSON & SONS, LTD., Newtownards, were placed 1st with twelve meritorious flowers, including White Lady, Alice Lindsell, Bessie Brown, Mildred Grant, Lady Clanmorris, Marquise Litta, Kaiserin Augusta Victoria, Killarney, Mrs. David McKee, Mrs. W. J. Grant, Lady Mary Fitzwilliam, and Caroline Testout. Messrs. B. CANT & SONS, Colchester, were 2nd, Mildred Grant being especially fine. Messrs. PAUL & SON, Cheshunt, and Messrs. FRANK CANT & Co., Colchester, were equal 3rd.

Twelve white or yellow Roses of any type.—These charming flowers were displayed in vases, according to the conditions of the schedule. White flowers predominated, especially the variety Frau Karl Druschki, which variety, shown by Messrs. FRANK CANT & Co., Colchester, won the premier honour. The KING'S ACRE NURSERIES, LTD., Hereford, and Messrs. B. CANT & SONS, Colchester, were 2nd and 3rd respectively with the same variety as won the 1st prize.

Twelve blooms of any other variety than white or yellow, to be displayed in a single vase, brought some magnificent flowers, all of favourite varieties, such as Mildred Grant and Mrs. E. Mawley. The latter variety, shown by Messrs. FRANK CANT & Co., Colchester, was awarded 1st prize; Messrs. B. CANT & Co., 2nd, with Mrs. E. Mawley; KING'S ACRE NURSERIES, LTD., Hereford, with Mildred Grant, 3rd.

NEW ROSES.

The Society's GOLD MEDAL was awarded in two instances to new varieties that have not been previously exhibited. One of these was named Dean Hole, and was shown by Messrs. ALEX. DICKSON & SONS. It is presumably a Hybrid Tea, and somewhat resembles in colour and form the variety Mrs. Mawley, but the colour is rather richer and the form a little better.

The other variety awarded a Gold Medal was named Mrs. O. G. Orpen, and was shown by Mr. O. G. ORPEN. It is a climbing Damask Rose, with single flowers of a rich shade of pink colour, 4 to 5 inches in diameter. It is a strong grower, and has large, vigorous-looking foliage. The variety would be especially suitable for cultivation against a pillar.

CARDS OF COMMENDATION

were awarded to the two varieties following:—Irish Harmony, shown by Messrs. A. DICKSON & SONS, a single Rose of pale cream colour, some 6 inches or more in diameter, the orange-coloured anthers having a good effect. It is said to form a magnificent bush. The foliage is bright and very smooth. Lady Betty, also exhibited by Messrs. A. DICKSON & SONS, is of the Hybrid Tea class; the petals are reddish-rose on the exterior, and bronze or buff-coloured inside.

New Roses since 1901, issued by nurserymen of the British Isles, were represented by some exquisite specimens, showing the great advance made in these lovely flowers in such a short period. Mildred Grant was again in the foremost position. The box containing the prize group, shown by Messrs. B. CANT & SONS, Colchester, contained Mamie, Mildred Grant, Robert Scott, Frau Karl Druschki, Hélène Guillot, Jean Batnatois, Apotheker G. Hofer, Alice Lindsell, Florence Pemberton, Lady Moyra Beaulier, Ben Cant, and Edith D'Ombrian.

For nine blooms of any new Roses, the variety Mildred Grant was again to the fore, Messrs. F. CANT & Co., Colchester, being placed 1st with that variety; 2nd, Messrs. DICKSON & SONS, LTD., Newtownards, with the same variety; 3rd, Messrs. B. CANT & SONS, Colchester, with Frau Karl Druschki.

The Challenge Cup offered for twelve vases of New Seedling Roses or distinct sports, in not fewer than six varieties, was won by Messrs. A. DICKSON & SON, LTD., Newtownards. Lady Derby is a handsome blush flower on a cream ground, of exquisite shape, with a good centre. Lady Barham is another good variety with strong growth. Lady Betty is cream-blush coloured. Harry Kirk is perhaps the finest in the group; it is a cream Hybrid Tea, with flowers of good substance and a

pleasing form. It has the appearance of being a robust grower. The variety Mrs. John Bateman also deserves mention.

DECORATIVE CLASSES.

The decorated arches in Class 24 found many admirers among the visitors, several well-trained arches of climbing Roses being presented. That shown by Messrs. PAUL & SON, Cheshunt, was literally covered with flowers, the varieties Wallflower and Leuchtstern being trained on either side of the Bamboo arch, the former variety having large clusters of semi-double flowers on long axillary shoots, quite the handsomest variety shown in this manner. Mr. GEO. PRINCE was 2nd with varieties Leuchtstern and The Garland; Mr. CHAS. TURNER, Slough, 3rd, with superb specimens of Crimson Rambler.

In the section for *button-hole Roses*, shown in vases of nine distinct varieties, Mr. JOHN MATTOCK, Oxford, won the 1st prize with charming little flowers, contrasting sharply in size with some of the members in other classes, yet perfect in shape and of exquisite colours. Mr. PRINCE, Oxford, was 2nd; and Mr. GEO. MOUNT, Canterbury, 3rd.

The *single Roses* are all charming, and when seen in clusters, such as prevail in Leuchtstern, they are delicious. The gorgeous flowers of Rugosa, and such varieties as The Lion, are not lacking in size, and are as striking and brilliant as Poppies. For twelve distinct varieties of this type, Messrs. FRANK CANT & Co., Colchester, were 1st with, among others, Rugosa rubra, Irish Modesty, macrantha, and himalaica. Mr. JOHN MATTOCK, Oxford, was 2nd; Messrs. PAUL & SON, Cheshunt, 3rd.

The class for *three sprays of Roses, suitable for ladies' wear*, with any foliage or grasses, brought five competitors. Mrs. O. G. ORPEN, Colchester, was placed 1st, her design being light and graceful, tiny pillar Roses being used with Maidenhair Fern and Asparagus foliage. Mr. JOHN MATTOCK, Oxford, was 2nd, his design having only Rose foliage and tiny polyantha Roses. Miss J. B. LANGTON, Hendon, was 3rd.

AMATEUR SECTION.

CHAMPION TROPHY CLASS.

Thirty-six blooms, distinct varieties. In this, the leading class, six exhibitors competed, the 1st prize going to E. B. LINDSELL, Esq., Hitchin, whose blooms were of large size, clean, and of perfect shape, and comprised the following varieties:—Bessie Brown, Ulrich Brunner, Alice Lindsell, Marquise Litta, Caroline Testout, Gustave Piganneau, Ulster, Alfred Colomb (very fine), Mildred Grant, S. M. Rodocanachi, Frau Karl Druschki, F. Michelon, Mrs. J. Cocker, A. K. Williams, Bridesmaid, Louis Van Houtte, White Maman Cochet, Mme. Hausmann, La France, Duke of Wellington, Comtesse de Nadaillac, Horace Vernet, Souvenir d'Elise Vardon, Comte Raimbaud, Her Majesty, Beauty of Waltham, Madame E. Verdier, M. Baumann, Duchess of Portland, Marie Verdier, K. A. Victoria, Mrs. J. Laing, Medea, Fisher Holmes, Mrs. Grant, and Marchioness of Londonderry. The 2nd prize went to a Gloucester grower, CONWAY JONES, Esq.; Mrs. E. Mawley and Mildred Grant being extra fine on this stand. 3rd, The Rev. J. H. PEMBERTON, Havering-atte-Bower.

Twenty-four blooms, distinct.—This class was an extra one open to all amateurs who had not previously won either the Champion Trophy or the 1st prize in this class, and of five competitors the leading place was secured by F. DENNISON, Esq., Birmingham, with a stand of large and well-coloured blooms; 2nd, M. WHITTLE, Esq., Belgrave, Leicester; 3rd, CONWAY JONES, Esq.

Twenty-four blooms, distinct varieties (open to all amateurs).—Five exhibitors again competed, the 1st prize going to E. B. LINDSELL, Esq., his blooms being very clear and bright—Maman Cochet, Bessie Brown, and Mrs. Mawley were among the best; 2nd, Rev. J. H. PEMBERTON; 3rd, O. G. ORPEN, Esq., Colchester.

Twelve distinct varieties (triples).—In this class E. B. LINDSELL, Esq., was again 1st with some magnificent blooms, the variety Frau Karl Druschki in this stand being also awarded the Silver Medal for the best Rose other than a Hybrid Tea, Tea, or Noisette; the blooms of Mildred Grant and Alfred Colomb in this stand were also very fine. F. DENNISON, Esq., was 2nd; 3rd, CONWAY JONES, Esq.

For nine blooms of any Rose except Tea or Noisette.—These were shown in a single vase. Mr. LINDSELL was again 1st with Alice Lindsell; 2nd, H. V. MACHIN, Esq.; 3rd, Rev. J. H. PEMBERTON.

THE TWO FOLLOWING CLASSES WERE OPEN ONLY TO GROWERS OF FEWER THAN 2,000 PLANTS.

Twenty-four blooms, distinct.—1st, E. M. EVERS-FIELD, Esq., Horsham; Comte de Raimbaud in this stand was very fine, and the bloom of Mildred Grant was awarded the Silver Medal for the best hybrid Tea. 2nd, A. SLAUGHTER, Esq., Steyning, Sussex; 3rd, R. F. HOBBS, Esq., Worcester. Seven exhibitors competed.

Eight distinct varieties, three blooms of each.—R. F. HOBBS, Esq., was 1st with a good stand, the variety Mildred Grant being very fine. 2nd, E. M. EVERS-FIELD, Esq.; 3rd, A. SLAUGHTER, Esq.

THE FOLLOWING CLASSES WERE OPEN ONLY TO GROWERS OF FEWER THAN 1,000 PLANTS.

Twelve distinct varieties.—The competition in this class was very keen, nineteen good stands being in competition. The 1st prize was awarded to C. F. H. LESLIE, Esq., Hertingfordbury, for a very fine stand of blooms; 2nd, C. PAGE, Esq., Enfield; 3rd, A. E. FARNDEN, Esq., Sutton, Surrey.

For Five Blooms of any Rose, except Tea or Noisette.—These were shown in a single vase, and there were sixteen exhibits, the 1st prize going to G. MOYLES, Esq., Hitchin, for the variety Mildred Grant; 2nd, C. PAGE, Esq.; 3rd, G. A. HAMMOND, Esq.

OPEN TO GROWERS OF FEWER THAN 500 PLANTS.

Nine blooms, distinct varieties.—Twenty-two stands were in competition, the 1st prize going to WILLIAM UPTON, Esq., Belgrave, Leicester; 2nd, R. W. BOWYER, Esq., Hertford Heath. Only six competed with six blooms, the 1st prize going to K. H. GIFFORD, Esq., Edensor, Surrey. For five blooms in a vase, sixteen competed, the first prize going to A. C. TURNER, Esq., Edgware, for the variety Frau Karl Druschki; 2nd, R. W. BOWYER, Esq.

OPEN ONLY TO GROWERS OF FEWER THAN 200 PLANTS.

Twelve exhibitors staged stands of six blooms. 1st., W. R. HAMMOND, Esq., Burgess Hill; 2nd., F. J. NIGHTINGALE, Esq., Sutton.

Seven other extra classes were provided for amateurs, that for twelve blooms being open only to those who had not previously won the Pamsy Cup. Eight exhibitors staged, the 1st prize going to M. WHITTLE, Esq., Leicester.

In the Maiden classes for six blooms. F. SPENCER, Esq., Harrow, was 1st as an exhibitor who had never previously exhibited at the National Rose Society's shows.

E. P. SUGDEN, Esq., was 1st in the class for exhibitors who had not previously won a 1st prize; and E. R. SMITH, Esq., Muswell Hill, N., 1st as an exhibitor growing within eight miles of Charing Cross. Twenty-four exhibitors competed in the first-mentioned Maiden class.

R. F. HOBBS, Esq., was 1st for six blooms of new Roses, the best being Alice Lindsell and Mildred Grant.

TEA AND NOISETTE SECTION.

(TROPHY CLASS.)

Eighteen distinct varieties.—Six stands were in competition, the 1st place being won by A. H. GRAY, Esq., Bath, who therefore won the Challenge Trophy; 2nd, O. G. ORPEN, Esq.; 3rd, CONWAY JONES, Esq. The best blooms in Mr. GRAY's stand were Mrs. E. Mawley, White Maman Cochet, Bridesmaid, and Maman Cochet.

The last-mentioned exhibitor was also 1st in the next class, that for eighteen blooms, distinct, open to amateurs, irrespective of number of blooms grown; 2nd, ALFRED TATE, Esq., Leatherhead; 3rd, Rev. F. R. BURNSIDE.

Eight distinct varieties, three blooms of each.—Five exhibitors staged in this class, Mr. GRAY being again the leading competitor, followed by C. JONES, Esq., and the Rev. F. R. BURNSIDE. Mrs. E. Mawley, Comtesse de Nadaillac, Maman Cochet, and White Maman Cochet were the best varieties in each stand. Mr. GRAY was 1st for a vase of seven blooms of one variety with Mrs. E. Mawley.

OPEN TO GROWERS OF FEWER THAN 500 PLANTS.

Twelve blooms, distinct varieties.—Among eight competitors, all staging excellent blooms, the 1st prize was won by R. F. HOBBS, Esq.; 2nd, J. WAKERLEY, Esq., Rainham; 3rd, M. WHITTLE, Esq.

OPEN TO GROWERS OF FEWER THAN 200 PLANTS.

In the Class for nine varieties, nine exhibitors competed, the 1st prize going to Dr. PALLETT, Earl's

Colne, Essex; 2nd, G. H. BAXTER, Esq., Brentwood; 3rd, G. MOYLES, Esq.

R. W. BOWYER, Esq., was 1st for six blooms distinct; 2nd, A. C. TURNER, Esq., Edgware, among thirteen competitors. An extra class in this division for four varieties, three blooms of each, brought ten competitors, the 1st prize going to A. SLAUGHTER, Esq.; 2nd, G. H. BAXTER, Esq.

EXHIBITION ROSES IN VASES.

Quality of the blooms was the first consideration with the judges.

For nine distinct varieties, five blooms in each vase, there were but two exhibitors, the 1st prize going to A. H. GRAY, Esq.; 2nd, H. V. MACHIN, Esq., Workop.

Six distinct varieties, seven blooms of each.—In this class there was the same number of competitors, Mr. GRAY being again 1st; 2nd, Miss B. LANGTON, Hendon, N.W.

For five distinct varieties, five blooms of each, two only to be of Teas or Noisettes, four exhibitors competed, the 1st prize going to E. R. SMITH, Esq., Muswell Hill, N., for a very bright exhibit, the best being Ulrich Brunner, Caroline Testout, and Mildred Grant. 2nd, Miss LANGTON.

DECORATIVE SECTION—LADIES.

In these classes style and arrangement were the first considerations with the Judges.

Class 64 was for a decoration of cut Roses for dinner-table, arranged with any cut foliage, Ferns, or grasses, space allowed 8 feet by 6 feet. There were eight competitors, and the 1st prize was awarded to Miss J. B. LANGTON, Hendon, for a very pretty arrangement of the blush Rosa macrantha with trails of Asparagus Sprengeri and Adiantum cuneatum set up in low vases. Mrs. O. G. ORPEN was 2nd; 3rd, Miss D. M. OLIVER, Tollington Park.

For a Bowl of Roses, lightly arranged with Rose foliage only, ten competed, the 1st prize going to Mrs. O. G. ORPEN; 2nd, Miss J. B. LANGTON.

A Vase of Roses, arranged with any foliage.—Mrs. H. E. MOLYNEUX was 1st; 2nd, Miss LANGTON. Ten competed.

Baskets of Cut Roses.—From nine other exhibitors, the 1st award was won by Mrs. G. LEWIS, Watford; 2nd, Mrs. ORPEN.

GARDEN OR DECORATIVE ROSES.

The leading class in this section was for—

Eighteen distinct varieties, not fewer than three trusses of each, space not to exceed 8 feet by 3 feet.—Here Mr. Menze, gr. to A. TATE, Esq., Leatherhead, was a very easy 1st, with a very fine collection, well set up. The varieties were Reine Olga de Wurtemberg, Alistair Stella Gray, Boule de Neige, Bardon Job, Augustine Guinoisseau, Rêve d'Or, Marquise Balbrano, Gloire Lyonnaise, W. A. Richardson, Lady White, Marquis of Salisbury, Hebe's Lip, Perle d'Or, Wallflower, graefilis, Anne Marie de Montravail, Eugénie Lamesch, and Gloire de Rosamène. 2nd, Rev. J. H. PEMBERTON; 3rd, H. V. MACHIN, Esq.

For twelve distinct varieties, Mrs. A. F. PERKINS, Hohnwood, Surrey, was 1st; 2nd, Miss B. H. LANGTON; 3rd, J. B. FORTESCUE, Dropmore. There were four competitors in each of the two preceding classes.

Six bunches of distinct varieties.—There were eight exhibitors, the 1st prize going to C. GORDON CLARK, Esq., Leatherhead. Five exhibitors staged six vases of Sweet Briar Roses, the 1st prize going to Mrs. E. HORNE, Reigate; 2nd, Lady SUTTON BENHAM, Newbury. The 1st prize varieties were Lucy Ashton, Rosa Bradwardine, Anne of Gierstein, Any Robsart, Brenda, and Meg Merrilies.

With six distinct varieties, suitable for Buttonholes, ALFRED EVANS, Esq., was 1st with Ma Capucine, Marie Van Houtte, Mine. Hoste, Anna Olivier, Rubens, and Mme. Pernet Ducher; 2nd, C. CLARK, Esq.

Five distinct varieties of Decorative Roses (three sprays of each arranged to show the decorative value of the varieties). 1st, Mrs. A. F. PERKINS, with Celestial, Marquis of Salisbury, Wallflower, and Claire Jacquier; as the best; 2nd, Miss LANGTON; 3rd, L. MCKENNA, Esq., Twyford. Six competed.

MEDAL ROSES.

The Society's Gold Medals to the premier blooms in the Amateurs' Classes were awarded as follows:—For the best Hybrid Tea Rose, Mildred Grant, shown

by E. M. EVERSFIELD, Esq., Horsham; the best Tea or Noisette, White Maman Cochet, exhibited by the Rev. F. R. BURNSIDE; best Rose other than Hybrid Tea, Tea, or Noisette, Frau Karl Druschki, exhibited by Mr. LINDSELL in the class for twelve trebles.

ROYAL BOTANIC.

JULY 6.—The most important exhibit came from Messrs. BARR & SONS, King Street, Covent Garden, who staged a large and varied collection of hardy flowers (Gold Medal).

Messrs. J. PEED & SONS, West Norwood, staged a fine group of Caladiums, among which were noted H. J. Chapman, soft pink with bright ribs; Mrs. John Peed, red, with darker centre and narrow green margin; Silver Queen, good white; La Lorraine, deep red; Fastuosum, and other good varieties (Gold Medal).

Lady ALICE DUNDAS, of Middleton Lodge, Yorkshire, showed some good blooms of Malmaison Carnations, the variety Princess of Wales being very bright in colour (Cultural Commendation). Mr. W. BAYLOR HARTLAND, of Cork, Ireland, sent Galega Hartlandi variegata.

Mr. Sicklemore, gr. to Dr. BOXALL, staged fifty varieties of Sweet Peas, having good bunches of well developed blooms (Silver Medal).

Miss ADAMSON, South Villa, Regent's Park (gr., Mr. G. Kelf), showed good fruits of Dr. Hogg Peach and three varieties of Melons, including "Regent's Park," a netted variety with scarlet flesh, for which a Certificate of Merit was awarded (Silver Medal).

Messrs. LAXTON BROTHERS, of Bedford, showed Strawberries.

Mr. J. P. HARVEY, of Kidderminster, sent samples of a new fertiliser, the result of using which Mr. A. COOMBS showed good Strawberries, Tomatos, Cucumbers, and Ferns.

HANLEY HORTICULTURAL FETE.

July 6, 7.—The annual horticultural show at Hanley (Staffs) was opened on Wednesday last, and proved to be one of the most successful yet held in this town, which is surrounded by a very large population. The weather having been extremely good, it is believed the attendance will prove to be greater than on any similar occasion. The arrangements were in the hands of Mr. Jos. Kent, Secretary, and the show is given the support of the county borough authorities. We can only refer to a few of the principal classes.

Group of plants arranged for effect, in or out of bloom, not to exceed 300 square feet: the 1st and special prize was won by Messrs. CYPHER & SONS, Cheltenham; 2nd and special, Messrs. ARTINDALE & SON, Sheffield; 3rd, Mr. WM. VAUSE, Leamington.

The best group of Orchids in bloom, arranged for effect, not to exceed 100 square feet: was shown by the Duke of SUTHERLAND, Trentham; 2nd, Messrs. CYPHER & SONS; 3rd, Mr. JOHN ROBSON, Altrincham.

A group of Malmaison and other Carnations in pots, arranged for effect, obtained a 1st prize for Mr. JOHN ROBSON, Manchester.

Six plants in flower, distinct varieties (Orchids excluded), 1st, Messrs. CYPHER & SONS; 2nd, Mr. WM. VAUSE; 3rd, Mr. T. BOLTON, Oakmoor.

Six plants in flower, distinct, and six fine foliage plants, distinct, 1st, Messrs. CYPHER & SONS; 2nd, Mr. WM. VAUSE.

Messrs. CYPHER & SONS had also the best collection of eight exotic Orchids, distinct; 2nd, Duke of SUTHERLAND; 3rd, Mr. JOHN ROBSON.

ROSES.

The display of Roses was unusually good. The best collection of seventy-two, distinct varieties was shown by Messrs. R. HARKNESS & Co., Hitchin; 2nd, the KING'S ACRE NURSERIES Co., Hereford.

The best collection of forty-eight distinct varieties was shown by Messrs. TOWNSEND & SONS; 2nd, Messrs. PERKINS & SONS.

Mr. W. H. FRETTINGHAM won the 1st prize for thirty-six distinct varieties, three blooms of each variety; 2nd, Messrs. HARKNESS & Co.

The best lot of twelve new Roses, distinct varieties, introduced in 1902, 1903, and 1904, was shown by Messrs. PERKINS & SONS.

For twenty-four hybrid Teas, distinct varieties Messrs. HARKNESS & Co. were 1st; 2nd, Messrs. PERKINS & SONS; 3rd, Messrs. TOWNSEND & SONS.

The best collection of twenty-four Tea or Noisette Roses came from Mr. PRINCE, Oxford; 2nd, the KING'S ACRE NURSERIES; 3rd, Messrs. TOWNSEND & SONS, Worcester.

FRUIT AND VEGETABLES.

For a dessert table decorated with flowers and foliage, plants in pots being allowed but not Orchids; and not more than fourteen dishes of fruit selected from the list given: 1st, the Earl of HARRINGTON; 2nd, the Duke of WESTMINSTER; 3rd, the Earl of CARNARVON.

The best dinner table decorated with flowers and foliage only, plants in pots allowed: 1st, Mr. W. VAUSE; 2nd, Messrs. JENKINSON & SON, Newcastle (Staffs.).

For a collection of twelve dishes of fruit, not fewer than eight kinds, and not more than two varieties of a kind, to include black and white Grapes; each collection to be decorated with flowers and foliage: 1st, the Earl of LONDESBOURGH; 2nd, the Earl of HARRINGTON; 3rd, Lady BEAUMONT. The Earl of HARRINGTON was awarded the 1st prize for decoration: the Earl of LONDESBOURGH, 2nd, and Lady BEAUMONT, 3rd.

The best collection of six dishes of fruit, distinct kinds, to include two bunches black or white Grapes, or both, was shown by the Duke of WESTMINSTER; 2nd, Lord BAGOT.

For four bunches of Grapes, two black and two white, the Earl of HARRINGTON won the 1st prize; 2nd, Lord BAGOT; 3rd, Lady BEAUMONT.

For two bunches Black Hambro' Grapes: 1st, the Earl of HARRINGTON; 2nd, the Dowager Lady HINDLEY, Droitwich.

For two bunches black Grapes, any other variety: 1st, Lord BAGOT; 2nd, the Earl of HARRINGTON, Elvaston Castle, Derby.

For two bunches of White Muscat Grapes: 1st, the Earl of LONDESBOURGH; 2nd, Lord BAGOT.

For two bunches Grapes, any other variety, white: 1st, Lord BAGOT, Blythfield, Rugeley; 2nd, Mr. JOSEPH DRAKES, Market Rasen.

The best six Peaches came from the Duke of WESTMINSTER; 2nd, Lord BAGOT.

The best six Nectarines came from the Earl of CARNARVON, Brethby Park, Burton; 2nd, the Marquis of NORTHAMPTON, Castle Ashby, Northampton.

The best dish of twelve Tomatos was shown by the Earl of CARNARVON; 2nd, the Earl of LONDESBOURGH.

The prizes offered for a collection of vegetables grown from Messrs. SUTTON & SONS' seeds were won by the Earl of CARNARVON, 1st; Mr. J. DRAKES, 2nd; Mrs. SWANN, Oswestry, 3rd.

For a collection of vegetables grown from WEBB'S seeds: 1st, the Earl of CARNARVON; 2nd, Lady BEAUMONT; 3rd, Mrs. SWANN.

For a collection of vegetables grown from HEWITT'S seeds: 1st, Lady BEAUMONT; 2nd, Earl of CARNARVON.

NON-COMPETITIVE EXHIBITS FROM THE TRADE.

Medals were awarded as follows:—Mr. A. J. A. Bruce, Chorlton-cum-Hardy, Saracenias, Small Gold Medal; Messrs. Peed, London, Gloxinias, Large Gold Medal; Mr. Sydenham, Birmingham, Sweet Peas, Large Silver Medal; Messrs. Dobbie & Co., Rothesay, Sweet Peas, Violas, and Dahlias, Gold Medal; Messrs. Webb, Wordsley, Sweet Peas, &c., Silver Medal; Messrs. Artindale & Son, Sheffield, Violas, &c., Large Silver Medal; Mr. Hinton, Warwick, Sweet Peas, Large Gold Medal; Mr. Bentley, Leicester, Roses, Gold Medal; Messrs. Blackmore & Langdon, Twerton, Bath, Begonias, Gold Medal; Messrs. Dickson, Ltd., Chester, herbaceous flowers, Large Silver Medal; Mr. Child, Acock's Green, herbaceous flowers, Silver Medal.

SCUTICARIA DODGSONI.—This plant was shown at the last meeting of the Royal Horticultural Society by C. H. FEILING, Esq., Southgate (gr., Mr. STOCKING), not by Messrs. STANLEY, ASHTON & CO.

ANSWERS TO CORRESPONDENTS.

APPLES: Zola. The Codlin-moth. It is too late now to do anything but burn the affected Apples. Next year, in spring, spray the flower-buds with weak Bordeaux-mixture. For Onion-grub, see *Calendar of Garden Operations*, to be had from this office, price 6d.

CALCEOLARIA: A. H. M. See the answer of an expert last week. The disease is at present a mystery. It is all too common.

CARROTS: J. W., Horsham. The disease is due to a fungus—*Phoma sanguinolenta*. Later on the root becomes diseased, hence the safest course is to remove all affected plants before the diseased portions fall and infect the soil.

CEAAR DYING ON LAWN: F. E. S. The death may have occurred through drought at the roots, caused by the cutting of drains in the vicinity, or through the subsoil having become dry owing to the decrease in the rainfall for several seasons past.

CELERY: K. & B. Without further particulars as to details of cultivation we cannot answer your question. The plants have died at the roots, but the foliage is healthy.

CHIMONANTHUS FRAGRANS: C. E. It is not unusual for this winter-flowering plant to bear fruits.

CUCUMBER: R. V. & Son. See answer in last week's number, and refer to former volumes for figures.

HOLLY HEDGE: E. A. The Holly should be transplanted in April, or early in autumn. Choose a strong-growing variety with leaves similar to those of the hedge, which you do not describe. You omit to say how high the proposed close fence would be, and at what distance it would be placed from the hedge. We cannot therefore say whether it would be likely to injure the hedge or not.

MANURES: E. E. If you intend to apply farm-yard manure only, you may use it at the rate of 20 tons per acre.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—Ukon. *Polemonium humile*.—S. H. *Tropæolum peregrinum*, *Kerria japonica*, shrub. Uncertain about the Rose.—Land. 1, *Sparganium simplex*; 2, *Scleranthus annuus*; 3, *Echium vulgare*.—A. L. *Rhododendron cinnabarinum*.—Albus. *Tradescantia virginica*, the Spider-wort.—Zola. *Pellaea flexuosa*, often called *Platyloma flexuosum*.—A. C. R. 1, *Oncidium ornithorhynchum*; 2, *Eria bicolor*; 3, *Sarcanthus pugioniformis*.—T. H. W. 1, *Geranium pratense*; 2, *Salisburia adiantifolia*; 3, *Cornus mas*; 4, *Weigela rosea*; 5, *Campanula glomerata*; 6, *Sidalcea malvaeflora alba*; 7, *Veronica spicata*; 8, *Lychnis chalcadonica*; 9, *Geranium Endresii*.—G. R. 1, *Anthriscus vulgaris*; 2, *Heracleum sphondylium*; 3, *Humulus lupulus*; 4, *Lotus corniculatus*; 5, *Medicago lupulina*; 6, *Vicia cracca*.—C. S. C. *Spiræa confusa* alias *S. media*.—F. C. 1, *Ehus Cotinus*; 2, *Symphoricarpus racemosus*; 3, *Spiræa Douglasi*; 4, *S. callosa*; 5, *S. confusa*; 6, *S. opulifolia*.—A. H. 1, *Geranium sanguineum*; 2, *Sedum rupestre*; 3, *S. glaucum*; 4, *Saxifraga*, specimen insufficient; 5, *Alchemilla alpina*; 6, *Saxifraga umbrosa*.—S. R. 1, *Stachys lanata*; 2, *Spiræa filipendula*, double variety; 3, not recognised; 4, *Delphinium cardinale*; 5, *Astrantia major*, rose-coloured variety.

PEACHES: F. G. A parasitic fungus called *Entomosporium maculatum* is the cause of the disease. The only thing to do at present is to cut off and burn all diseased branches. Next spring, when the leaf-buds are expanding, spray with a dilute solution of Bordeaux-mixture to guard against a repetition of the disease.

PHLOX: Y. S. The disease is of insect origin. Each stem is mined down the centre by the maggot of some insect, which in some instances is still present.

POTATO: W. P. The appearance of tubers in the axils of the leaves is not uncommon. It sometimes arises from some injury to the tubers below ground.—F. W. T. See note on p. 28 of this issue.

ROSE: E. N. Send to some Rose-grower.

ROSE CAROLINE TESTOUT: J. K. B. This was doubtless an excellent specimen of this magnificent variety of Rose, but the numerous and large petals had fallen during transit.

WIRE-NETTING: W. F. O. To be quite safe you should use wire having $\frac{3}{4}$ -inch mesh. There is no reason why the bushes should become infested with red spider more than formerly, but certain other and larger insects may increase after excluding the birds, their natural enemies.

WHITTY-TREE: De St. In *A Dictionary of English Plant Names* (James Britten), the Whitty-tree is described as being *Pyrus Aucuparia*. The Whitty-Pear is either *Pyrus domestica* or *P. torminalis*. The Whitten tree is *Viburnum Opulus*.

PARKINSON'S "PARADISE."*

THE recent reprint in *facsimile*, and the republication of John Parkinson's celebrated work, by Messrs. Methuen & Co., reminds us of the debt we owe to him as one of the earliest lovers of hardy flowers, who left us a record in good and plain English of what they were and how to grow them. He was a herbalist, as were his rivals Gerard and Johnson, and he lived in stirring times, when Elizabeth, James I., and Charles I. occupied the throne. Of the man himself very little is known, and no literary details, except his published books, are known to exist. He resided in the parish of St. Martins-in-the-Fields, and possessed a garden in Long Acre, in which he grew the rarities his friends, correspondents, and collectors sent to him from time to time. It is to Parkinson that we owe the intro-

duction of the garden Rhubarb, it having been sent to him, as he himself tells us, by Dr. Matthew Lister "from beyond sea." Two contemporary portraits of our author are known to exist—viz., the wood-cut in the first edition of his *Paradisus*, the one in his *Theatrum Botanicum*, and in both he holds in his hand an inflorescence of *Lychnis chalcedonica flore-pleno*—the double flower of Bristowe or Nonesuch, of which he thought very highly. A modern statue to his memory was erected some few years ago in the Palm-house at Sefton Park, Liverpool, by Mr. H. Gates Thompson (see *Gardeners' Chronicle*, May 17, 1902, p. 318).

The *Paradisus* appeared in 1629, and the *Theatrum Botanicum* in 1640, and he died on August 6, 1650, having been born in the year 1567. A so-called second edition of the *Paradisus* was published in 1656, but is merely a reprint on thicker paper. It would nowadays be very interesting to know the original publisher's prices for copies of both the first edition and the reprint. During the eighty-three years of his life in London he must have seen and heard much of which he maintains a discreet silence in his books. In his younger days the great Queen Elizabeth was making her progresses, and, aided by Cecil, was laying the foundations of our naval supremacy of to-day. Parkinson would be about twenty-one years old when Elizabeth's fleet and the winds of heaven made short work of the great Armada from Spain. He may have seen Essex beheaded, and he was alive amongst his flowers when Raleigh, William Shakespeare, and Lord Bacon died. He may have seen and known Pepys, Evelyn, Gerald, Johnson, and John Tradescant II., sometime gardener at Hatfield, and many more of the celebrated people of the period.

Parkinson's book was produced before the era of greenhouse flowers or our so-called hothouse or stove plants, and relates to "all sorts of pleasant flowers our English ayre will permit to be noursed up." In other words, it is emphatically a book of hardy flowers, although herbs, roots, and fruits also find a place in his delightful pages.

The first plant he alludes to is the Crown Imperial, and the last is the Virginia Vine, or rather Ivy (*Ampelopsis quinquefolia*), the climbing propensities of which he minutely describes. He draws a distinction between ordinary perennials, such as Carnations and Pinks, *Lychnis*, Primroses, Violets, Stock Gilliflowers, and Aquilegias, which he calls English flowers, and many bulbous plants, *Cyclamen*, *Helleborus niger*, &c., which he speaks of as "outlandish" flowers. The word "outlandish," indeed, seems to have been used by Parkinson in a similar sense to that in which the word "imported" is used by ourselves to-day.

The flowers of the *Paradisus* are mostly of European origin; but some came from the Levant or Asia Minor, and a few others from Northern Africa and from North America, especially from Virginia, which Raleigh and others had recently explored. We may imagine John Parkinson as ever eager and alert for news of the wonderful vegetation of other countries, at a time when news travelled slowly, and importations were, as a rule, in the hands of the rich and powerful only. Nevertheless his strong and virile personality and his position as herbalist to King Charles I. and his beautiful young French Queen, must have brought him many

friends, and given him influence with the explorers of his time by sea and land. In any case the flowers, vegetables, and fruits he names and describes show us plainly that gardens were or might have been well stocked two or three centuries ago.

In considering the garden flowers of 1629, we must remember that not alone were imports and additions of exotics few and far between, but that there were no hybrids, and even cross-bred seedlings were accidental, and not the things ardently sought for as they are to-day. Even if specialists had appeared they were but few and far between. In any case we have ample evidence that Tulips, Narcissus, amongst bulbs, and Carnations and Pinks were, even at so early a date, both numerous and valuable in the gardens. Bulbous plants especially were doubtless imported from Italy and Holland, and curiously enough were at first sold in London by the merchant grocers of the period, or by the so-called Italian ware-housemen. The number of species and varieties of Narcissus, ninety-six in all, mentioned by Parkinson, has struck many modern growers of these spring flowers as being peculiar, but of course he had Bauhin's *Pinax*, and probably other Continental works to refer to as well, and he doubtless inserted some kinds that did not exist at the time in his own garden. Be this as it may, many forms of *N. pseudo-Narcissus* and of *N. poeticus* were known, and these represent the bed-rock or parents of all the finest modern seedlings as known to-day. In a word, so far as this genus is concerned, it is the increase in knowledge and its judicious application, rather than the increase of species or raw materials that has enabled us to improve so much on these and other garden flowers of nearly three centuries ago.

It is difficult for us to realise to-day the great interest the illustrations in this book, rude as they are, must have occasioned in the early seventeenth century. That they were in many, even if not in most cases copied from earlier works would not rob them of novelty in the eyes of those who saw them for the first time in 1629. The first edition is printed on good linen paper, but it was so thin that illustrations and letterpress in many cases show through the pages. The size is folio, and the old notion of the block-books is so far kept up that the figures of different flowers are all cut together on wood blocks the size of the letterpress page.

The title-page and frontispiece is combined, and represents the Garden of Eden as seen in the mind's eye of Switzer and other artists of the time. Palm, Orange, and Vine, the Banana, Pineapple, and other fruit trees grow beside a meandering stream, while in the foreground there are figures of Lilies, Hepaticas, Anemone, Dog's Tooth Violet, *Cyclamen*, Tulips, Carnation, Colchicum, and many other flowers. There are birds in the trees and fishes in the stream, with that complete angler, the common Heron, stolidly watching them from the bank according to ancient custom. Here also we may get a glimpse of Adam and Eve in all their primal simplicity; Adam is pruning a tree, while Eve gathers fruits and vegetables for dinner. The Carnation is as tall as Adam, and the Anemones and Tulips are as big as Eve; but such trifling inconsistencies do not detract from the interest

* "Paradisi in Sole. Paradisus terrestris or a Garden of all sorts of pleasant Flowers which our English Ayre will permit to be noursed up with a Kitchen Garden of all manner of Herbes Rootes and Frutes for Meate or Sauce vsed with vs and an Orchard of all Sorte of Fruithbearing Trees and Shrubbles fit for our Land together with the right Orderinge Planting and Preserving of them and their Vses and Vertues collected by John Parkinson Apothecary of London 1629." Reprinted in *facsimile* by Messrs. Methuen & Co., London, 1904. Price £2 2s. net.

of the picture, nor from the naïve spirit and boldness of the scheme.

Parkinson's book really represented to seventeenth-century gardeners and amateurs the *English Flower Garden* of to-day. Not alone was it the first original work in English on hardy garden flowers, but it was the first gardening book illustrated by so many wood blocks especially prepared for its pages. The volume itself is a folio of 612 pages, with frontispiece and title-page, dedicated to the young Queen Henrietta Maria, and 780 plants are represented on 109 page-blocks or tables. As Pulteney* says, "a modern florist wholly unacquainted with the state of the art (of gardening) at the time Parkinson wrote, would perhaps be surprised to find that his predecessors could enumerate, besides sixteen described distinct species, one hundred and twenty varieties of Tulip, sixty Anemones, more than ninety of the Narcissus tribe, fifty Hyacinths, fifty Carnations, twenty Pinks, thirty Crocuses, and above forty of the Iris genus. In the orchard we find above sixty kinds of Plums, as many Apples and Pears, thirty Cherries, and more than twenty Peaches."

The garden vegetation of Parkinson's book would be practically that known to Shakespeare and others who wrote or sang in Elizabethan times, and one can see now and then even in our own day how well the hardy flowers and architecture of that golden era agree and harmonise with each other.

The excellent reprint lately issued by Messrs. Methuen & Co. deserves all praise, being clearly and accurately printed on good paper, and issued in appropriate covers. It will enable many to add this charming old book to their libraries that could scarcely hope to secure an original copy in these days of high prices and increased demand. Thirty years ago this fine old book could be had for as many shillings as it now fetches pounds; but after the late Mrs. H. J. Ewing alluded to the work so sympathetically in *Mary's Meadow*, in 1883, the price advanced by leaps and bounds until £10 to £25 or more for complete and perfect copies is now obtained at auction sales. The publishers of the reprint are to be congratulated in having placed the classical old work within the reach of hundreds of modern readers interested in hardy flowers and the history of gardening in England.

ORCHID NOTES AND GLEANINGS.

CATTLEYA MENDELI METEOR.

UNDER this name in the late Dr. Smee's collection there was a plant of *Cattleya Mendeli* which rarely produced perfect flowers, although when perfect or nearly perfect flowers appeared, they were very beautiful. The plant was one of an importation the whole of the specimens in which displayed the same peculiarity in a greater or less degree. The plant referred to passed into the collection of Edward Roberts, Esq., Park Lodge, Eltham, and it has now produced an interesting and pretty inflorescence of three flowers, all dissimilar. The lowest flower has no coloured labellum as it is generally seen, but is made up of three sepals and three petals, all blush-white. The column tells something about the confusion of the segments, for it is double, and has two sets of anthers, disclosing the fact that the flower is made up of parts of two flowers in combination.

* *Historical and Biographical Sketches*, 1790, pp. 142, 143.

This arrangement is again demonstrated in a very interesting manner by the other two perfect flowers, which arise from a single stem at the base, which divides about half an inch up, and each division carries a perfect flower. But for the bifurcation, what is called an abnormal flower would have resulted.

One of these two perfect flowers has blush-white sepals and petals, and large carmine-crimson labellum beautifully veined as usual in this variety when perfect. The other, or twin-flower, is similar, except that one-half of the labellum is white and the other coloured.

ODONTOGLOSSUM CRISPUM "BOLTONI."

Our illustration (fig. 14) represents this finely blotched *Odontoglossum*, which was shown by R. G. Thwaites, Esq., Chessington, Christchurch Road, Streatham (gr., Mr. Black), at the recent Temple Show. The plant is said to have flowered

FIG. 14.—ODONTOGLOSSUM CRISPUM "BOLTONI."

Colour white, flushed with rose, and heavily blotched with purple.

out of an importation made by Mr. William Bolton, of Warrington. The variety, on account of the rich dark purple markings of the flower, attracted experts very much, and when the plant has become stronger the variety will be one of the best of its class. J. O'B.

CULTIVATION OF ORCHIDS IN LEAF-MOULD.

An important feature of the Horticultural Congress, organised by the Société Nationale d'Horticulture (Paris) last May, was a communication from M. L. Duval concerning the practical use of leaf-mould in cultivating Orchids of all genera. The *Revue Horticole* for July 1 gives us the following details on this subject:—

"In cultivating Orchids in leaf-mould success depends entirely upon skilful watering. The more nutritive, the denser, and the less permeable medium requires extra moisture. Thus a newly-imported plant should have the soil dry, and only the immediate vicinity of the bulbs should be moistened. Water is thus supplied gradually, and soaks in more and more deeply in proportion as new roots grow out into the leaf-mould, so that moisture and the roots spread simultaneously through the soil. The progress of the roots should be noticed, as this guides the watering necessary after occasional repotting.

"Further, as much as possible, watering should only be done on dry and sunny days that the moisture may be absorbed, but water may be freely sprinkled between the pots and on the stages.

"Even well-established Orchids in full vigour and growth need but moderate supplies of water, sufficient to moisten but not to saturate the mould; and if by accident it is saturated, the plant should be raised from the pot and left in the air for some hours to regain its normal state: moist but not saturated. In every case Orchids grown in leaf-mould must never be watered as are those in sphagnum, or disaster will ensue."

LÆLIA × PSYCHE.

Under this name Messrs. Charlesworth & Co. exhibited at the York Gala a pretty hybrid raised between *L. tenebrosa* and *L. × Latona* (*purpurata × cinnabarina*). An inflorescence

taken from a plant of the same hybrid, obtained by Eustace F. Clark, Esq., Chamonix, Teignmouth, from Messrs. Charlesworth, represents it as a fairly showy hybrid with the sepals and petals of a reddish-ochre colour, the labellum being purple with dark purple veining, the sides of the tube white. The colour is nearest to *L. × Latona*, but the flowers are larger.

VEGETABLES.

POTATO SYON HOUSE PROLIFIC.

"Not half as much 'boomed' as its merits deserve," was the remark of Mr. May recently when I visited the gardens at Northaw House. The batch observed growing at Northaw is a very even lot. The haulm is sturdy and robust. Mr. May finds this variety practically free from disease. Northern Star, Discovery, Eldorado, Evergood, &c., are this season being given a trial by the side of Syon House Prolific. The vegetable garden at Northaw, though not extensive, is nevertheless exceptionally well cultivated. H. Markham.

SUTTON'S SNOWBALL TURNIP.

I cannot speak too highly of this Turnip. The roots are perfect in form and pure white in

colour. The rind is quite tender if the roots are pulled and cooked at the proper time, and their flavour is excellent. Seeds should be sown at intervals of about three weeks, and the plants should be encouraged to grow fast.

VEITCH'S EARLY-FORCING CAULIFLOWER.

This variety is unsurpassed for evenness in size, compact pure white heads, and fine flavour. It is a first-rate variety for the table during the latter part of May, and in June and July. The seeds should be sown early in January in boxes in a gentle heat, and the seedlings should be potted off into 3-inch pots and grown on in gentle heat until

THE ROCK GARDEN.

SAXIFRAGA McNABIANA.

ALTHOUGH by no means rare, this plant is worthy of more extensive culture, and is deserving of a place in every collection of hardy plants. It is easy of cultivation, and by its profuse blooming well repays any care bestowed upon it. It succeeds admirably when planted on the higher situations of the rockery in a compost consisting of good loam mixed with a little sand and leaf-mould. It is also a good plant for the front row of the herbaceous border; it must be grown in a situation where it obtains plenty of sunlight. It can be easily increased by division, either in the early spring or after it has done flowering. *J. Kelley.*

SAXIFRAGA KOLENATIANA.

This distinct and pleasing species is of easy cultivation. The rosettes of leaves bear some affinity to those of *S. aizoon* in point of size and form, but are greener, and have decidedly less of the incrustated character which marks the latter species and all its forms. The pale-green leaves of the above are oblong-obtuse, pitted with a few white spots at the margin. The rosettes are generally more cupped than in *S. aizoon*; the growth clustered and less spreading. The flowers are so copiously spotted with bright pink that under artificial light they appear quite of a self-rose or pink shade. But the groundwork of the petals is actually white, although copiously spotted with pink. The species is a native of Asia Minor. While a plant succeeds admirably in a soil largely composed of chalk, with nuggets of the chalk about its roots, another plant is quite as vigorous in a mixture of loam and manure such as one would employ for *Chrysanthemums*, except for a larger proportion of grit.

SAXIFRAGA GRISEBACHII.

When, in the early days of 1903, this distinct Macedonian species was exhibited at the Drill Hall, and obtained the First-class Certificate, the plants without exception gave one the impression, so far as the barren rosettes of leaves were concerned, of a rather large form of *S. calyciflora* (= *media*). At the present time, after growing for eighteen months in this part of Middlesex, the plants have quite an altered appearance, some of the larger rosettes having a diameter of fully 3 inches. In this stage any grower of Alpines may be excused for mistaking the plant for *S. longifolia*, a seedling half-grown. I need hardly say the plant is more striking than formerly, and one naturally looks forward to a flowering as much increased in proportion as the plant now is. Few novelties in this large interesting genus have attracted so much attention as this very early-flowering species. The plant is one of the most easy to grow, and as it makes abundant roots will repay for liberal treatment, including ample summer waterings. *E. Jenkins, Hampton.*

STRAWBERRY MOULD.

STRAWBERRIES require moderate rain when the fruits are forming, but after that, much sun and drought are necessary. A disease which one very often observes, in particular after sudden changes of temperature or rain, is caused by a parasitic fungus called *Botrytis cinerea*, Persoon. The fungus develops whitish or bluish-green velvety patches on the fruits, and often one finds two or more berries as it were "glued" together by the mould, as is shown in Fig. 16. The disease appears suddenly and spreads rapidly, as may be observed on freshly-picked Strawberries, when kept for a little while. Examined under the microscope the mould is seen to consist of numerous fine threads (mycelium), which branch frequently and become entangled with

those from another fruit, and thus cause the fruits to stick together. Many of the branches bear numerous small spores (fig. 17), which are easily broken off and are carried about in the air, reproducing the disease. The fungus only attacks fruits that have been injured by birds or wasps. When picking the fruits, care must be

FIG. 16.—STRAWBERRY FRUIT ATTACKED BY THE FUNGUS BOTRYTIS CINEREA.

taken not to handle them more than is necessary. To prevent birds getting at the berries the fields should be netted, as is done in most gardens. If, when picking the fruits, "mouldy" ones are met with, they should be removed from the field and burnt, to kill the spores. No artificial methods of

FIG. 17.—THE FUNGUS BOTRYTIS CINEREA.

prevention can be employed. The commonly used fungicides are poisonous, and would poison the fruits when sprayed with them. Strawberries are provided with little or no natural protection, such as is afforded by the "bloom" of Plums, Pears, or Apples. The wax layer on the Strawberry is very minute, and cannot protect the fruits from an attack of the fungus. *Hans Güssow, F.R.M.S.*

FIG. 15.—LUPINUS POLYPHYLLUS ROSEUS.

the end of February, gradually hardening them for planting-out in well-prepared and sheltered quarters of the garden at about the second week in March. The heads will then be fit to cut at about the end of May, and the supply will continue until July, when the variety Walcheren is ready for use. *C. J. Ellis, Warren House Gardens.*

LUPINUS POLYPHYLLUS ROSEUS.

This is a pleasing variety of the perennial Lupin. It was exhibited by Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley, at the Temple Show, when the Floral Committee recommended it an Award of Merit. The flowers are rosy-pink coloured, with the lower half of each flower of slightly paler hue. This variety should prove a valuable acquisition for cultivation in the herbaceous border.

In paging the work, during its publication in Parts, the description of each Tree commenced page 1; but each sheet was distinguished by a Signature No. in addition to the usual signature.

The Trees described number 44, and the sets of No. Signatures range from 1 to 46, including the three miscellaneous subjects at end of Vol. III.

B. B. Woodward.

FORESTRY.

PEDUNCULATE AND SESSILE OAKS.

SOME time ago [see *Gardeners' Chronicle*, vol. xxxiii., 1903], a number of letters appeared in the *Gardeners' Chronicle* about *Quercus pedunculata* and *Q. sessiliflora*, but none of the writers seems to know anything of the various little differences between the two. Mr. Simpson, who writes a good deal on matters of forestry, says that practically there is no difference between them, because he finds in Oak woods many intermediate forms between them. This is no doubt quite true, because the nurserymen raise their seedlings from mixed seed, and they are planted indiscriminately, so that a large part of what are grown in woods are practically mongrels. But the true species are very different in various ways. The leaves of pedunculata are perfectly sessile, oblong, and deeply sinuous; whilst those of sessiliflora have a leaf-stalk $\frac{2}{3}$ of an inch long, and are the shape of a Chestnut leaf, with a

serrated edge, so that I have usually called it the "Chestnut-leaved Oak." The branches, in the young trees especially, grow in a more ascending manner than in the other species, and the appearance of the two is very different, each having a distinct beauty of its own. There seems to be evidence that sessiliflora affects poorer and drier soil than suits pedunculata; it certainly is commoner in mountainous parts of the North of England than further South. Loudon says that pedunculata never grows naturally from seed on stony or poor soil. Then there is some reason to suppose that old Oak roofs, which in several instances have been supposed to be Chestnut, are really the wood of sessiliflora, which does not show what timber merchants call the silver grain so much as the common Oak does. I certainly have seen a plank from a very old Oak roof which seems to show less silver grain than an ordinary Oak board. On this subject I have a very interesting letter by Mr. Thos. Blashill, discussing the question of the timber of the two Oaks and Chestnut, in which he says that he does not know

of any difference in the wood of the two Oaks, but that he knows of several instances of old roofs being said to be of Chestnut, but that in all these cases they were really of Oak. At any rate, the lighter green and the very different habit of the Chestnut-leaved Oak make it desirable, when planting for ornament, to grow the two kinds separately, instead of growing only the ordinary mongrels that are usually planted. M. Levassieur, of Orleans, advertises seedlings of true pedunculata, and I have from Messrs. Little & Ballantine, of Carlisle, seedlings said to be of true sessiliflora. C. W. Strickland, Hildenley, Malton.

PLANT PORTRAITS.

BARKLYA SYRINGIFOLIA (Leguminosae), *Maiden Forest Flora N. S. Wales*, t. 31.

BASING PARK, HAMPSHIRE.

[SEE SUPPLEMENTARY ILLUSTRATION.]

THIS is the seat of W. H. Nicholson, Esq., and is situated about eight miles from Alton, and as many from Petersfield. The mansion is most pleasantly placed in a well-wooded park. It is of Ionic design, and has been much improved by the owner during the last forty years. The elevation is about 700 feet above the sea-level. Now that the new railway is open, the gardens are within ten minutes' walk of Privett station—a great convenience.

The drives are well planned, and extend in a winding manner through the park, showing the beautiful undulations of the ground and the timber to advantage. The carriage-drives are planted at the margins with *Araucaria imbricata*, *Deodora Cedars*, and other ornamental trees.

The grounds are rich in handsome trees and Conifers. *Sequoia gigantea* is over 60 feet high, and has a trunk circumference of 16 feet at 3 feet from the ground. It is magnificently branched. Close to it is a remarkable specimen of Weeping Beech, with a spread of branches 60 feet in diameter, the bole a yard through at the base. The branches, sweeping the luxuriant turf right through to the centre, render this an imposing specimen. *Cedrus Libani* is seen in the Supplementary Illustration to this issue. An *Araucaria imbricata* on the south side of the lawn is 50 feet high, with a stem diameter of nearly a yard 2 feet from the base. *Abies nobilis* is a fine tree, but is showing unmistakable signs of age. *Cupressus Lawsoniana* is not less than 40 feet in height and most shapely. *Abies Nordmanniana* is of fine proportions and about 50 feet high. *Taxodium distichum* is noteworthy, as is also a very fine Weeping Ash; and *Æsculus aurea*, 30 feet high with a shapely head, standing on the lawn, is a fine object.

On each side of a terrace walk 100 yards long in front of a very fine orchard-house are some exceedingly good specimens of Portugal Laurel and Irish Yew planted alternately.

Flowering shrubs are represented by huge clumps of *Rhododendrons*, *Deutzia crenata*, fl.-pl., *Rhus Cotinus* (a fine bush), *Magnolias*, *Spiræa Reevesii alba*, Persian Lilacs, &c.

THE FLOWER GARDEN.

This department is not extensive but it is interesting. Many plants are grown in huge masses for cutting; such plants as *Gladiolus Colvillei*, The Bride, were grand. The plants were flowering for the third year in a bed in the kitchen-garden, giving abundance of huge spikes of their dainty flowers. *Montbretias*, *Salpiglossis*, *Clarkias*, *Lupinus atrosanguineus*, *Anemones*, *Carnations*, *East Lothian Stocks*, *Lobelia cardinalis* Firefly—an exceedingly fine batch. These and many more subjects are found extremely useful for supplying the demands of such a large establishment.

The flower-garden proper, as seen in the Supplementary Illustration, is composed of a series of beds around a central basin, in which Water-Lilies are luxuriating. The beds are massed with the usual summer occupants, such as tuberous *Begonias*, *Pelargoniums*, *Heliotropes*, *Marguerites*, &c., all planted with a view to giving masses of colour, backed up as they are with a thick background of *Rhododendrons* as seen from the mansion.

Never have I seen *Tropæolum speciosum* growing more freely or flowering more abundantly than in this particular site, planted at the foot of the *Rhododendrons*, and entwining its shoots amongst the leaves; the cool northern aspect seems to agree with its requirements to the letter.

A capital collection of hardy Ferns and a neat

rockery, upon which are being established choice alpine, occupy the western end of the lawn. *Shortia galacifolia*, *Dianthus alpinus*, *Gaultheria trichophylla*, *Gentiana acaulis*, and *Arenaria grandiflora* are thriving vigorously.

On the western corner of the mansion, just hidden by the Cedar in the illustration, is a magnificent plant of the variety of Golden Ivy known as Mrs. Pollock. A wall facing south, 12 feet high, running in a westerly direction, is clothed with flowering plants, as *Wistarias*, *Magnolias*, *Ceanothus Veitchii*, *Chimonanthus fragrans*, *Garrya elliptica*, &c. *Roses* are grown in quantities; the newer varieties are being added as they appear.

PLANT HOUSES.

These are numerous and well adapted for their requirements. The conservatory adjoining the eastern end of the mansion is a huge structure, in which are planted grand specimen Tree-Ferns, *Camellias*, &c. The roof is almost entirely covered with *Tacsonia van Volxemii* in rude health and floriferousness.

A compact newly-built span-roofed house for Carnations contains a grand batch of the popular varieties of Malmesbury and tree types. The stove contains *Caladiums*, *Gloxinias*, *Crotons*, *Pancratiums*, *Eucharis*, *Orchids* in variety and quantity, *Dipladenia boliviensis*, and *Brearlana* are, like the foregoing, in rude health, showing the treatment accorded being evidently of the right kind.

FRUIT HOUSES.

These comprise six vineries, Melon, Peach, and Cucumber-houses, besides a large orchard-house 100 yards long, in which Plums are largely and most satisfactorily cultivated. Especially fine are cordon-trained trees of *Gisborne's*, *Pond's*, *Prince of Wales*. Other varieties growing in various forms and bearing huge crops are *Purple Gage*, *Coe's Golden Drop*, *Monarch*, *Victoria*, *Wyedale* (an excellent late Plum), and *Jefferson*. *Peaches* and *Nectarines* include such sorts as *Stirling Castle*, *Early Beatrice*, *Rivers' Early York*, and *Royal George*. *Cherries*, too, are bearing a heavy crop of handsome fruit; *Elton* and *Governor Wood* are conspicuous for fruit of high quality.

The vineries contain heavy crops of desirable table fruit rather than huge bunches for show purposes. The varieties *Foster's Seedling*, *Lady Downes*, *Madresfield Court*, and *Black Hamburg* were carrying full crops of shapely bunches. *Melons* are a feature, growing in shallow boxes at the back of the Pine-stove. Such varieties as *Ringleader*, *Jubilee*, and *Hero of Lockinge* are cropping most freely, one plant in a 10-inch pot is carrying a second crop of ripe, handsome fruits, quite equal to those usually seen as the first crop.

THE KITCHEN GARDEN

is extensive. Huge quantities of everything that such a garden can produce are needed to meet everyday wants. *Peas* are especially a full crop of handsome pods. *Sutton's Early Giant Marrow* is remarkable, each pod carrying no fewer than ten or eleven *Peas* of high quality.

Hardy fruits, including *Strawberries*, are largely and well grown; all the leading varieties are introduced, and they succeed well. *Gooseberries* trained as branched cordons are a feature, carrying crops of handsome fruits.

Mr. T. Down, the gardener, is to be congratulated on the manner in which he is improving this garden in all departments, renovating the worn-out trees and otherwise making additions where beneficial, at the wish of a generous and an appreciative employer: E. M.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

Dendrobiums.—Plants of *Dendrobium Phalænopsis* that are in small pots or shallow Orchid-pans are now making roots freely and strong, vigorous growth. They should be given every encouragement until the new pseudo-bulbs are completed. Elevate the plants near to the roof-glass in the warmest house or plant-stove. They delight in as much sun-heat as it is possible to afford them, and very thin shading only is necessary even during the hottest day in summer. When thoroughly well rooted the plants require almost unlimited supplies of water, with abundance of atmospheric moisture after the house is closed and the shadings are removed for the day. *Dendrobium Bensoniæ* and its variety *xanthinum* is now passing out of flower, and the new growths have already made considerable progress. These growths commence to push out numerous new roots when only a few inches high, so that if the plants require larger pots or fresh compost they should be afforded at once. Put the plants in the smallest pots or pans that they can be got into, afford plenty of drainage material, and only a very thin layer of fibrous peat, leaf-soil, and moss in equal proportions. This *Dendrobium* requires an abundance of water at the roots whilst growing, therefore by placing the plants in small receptacles there is less fear of the young growths damping-off than when larger ones are used. Let the plants be placed alongside and under the same conditions as *D. Phalænopsis*. All of the racemose section of *Dendrobium*, as *D. thyrsiflorum*, *D. densiflorum*, *D. suavisissimum*, &c., and the taller-growing varieties as *D. Dalhousieanum*, *D. moschatum*, *D. fimbriatum*, &c.; also the rare hybrids *D. illustre*, *D. porphyrogastrum*, *D. virginia*, *D. Dalhousie-nobile*, *D. formosum-Lowii*, and the autumn-flowering *D. formosum* may now be safely repotted if this is necessary. At Burford the racemose section grows best in a shady part of the Cattleya-house, while the other varieties mentioned delight in plenty of heat and moisture all through the growing season. *D. infundibulum* and its variety *D. Jamesianum* are also starting to grow, and may be repotted if necessary. Both plants come from high elevations, and should be grown in a cool, moist, shady part of the intermediate-house, affording them plenty of water at the roots during growth. Some growers cultivate them very successfully under the same conditions as the cool *Odontoglossums*.

The Cool-house.—The dwarf-growing *Promeneia* (*Zygopetalum*) *citrina* is now flowering in the cool-house with the *Masdevallias*. Two or three plants well furnished with their pretty yellow flowers form lovely objects when suspended low down from the roof. It will succeed in small, well-drained, shallow pans, in a compost of peat, leaf-soil, and sphagnum-moss, and may be suspended with the small-growing *Masdevallias*, or where such plants as *Odontoglossum Kossii* and *O. Cervantesii* succeed. The same cultural remarks apply to *P. stapelioides*, *P. Rollinsonii*, *P. micropterum*, and such species as *Ærides japonicum*, *Angræcum falcatum*, *Sarcochilus Hartmannii*, *S. Fitzgeraldii*, and the rare *Octadesmia montana*.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gr., Wrotham Park, Barnet.

Apple-trees, whether trained as bushes or otherwise, growing on the Paradise stock and bearing heavy crops of fruit, will require to be fed at the roots. These surface-rooters should be afforded artificial manure and a top-dressing or mulching with well-rotted manure from the stock-yard. Previous to applying a mulch rake a few inches of the top soil from under the trees to form a basin fully 2 feet from the stem. Apply the artificial manure, and then afford a good soaking with water, and cover with a mulch of suitable manure to preserve the moisture in the soil. Afford further waterings when necessary, and occasionally apply liquid-manure instead of clear water. The fruits

should be thinned out, varying in degree according to the size the fruits of the variety attain to, and its habit of growth.

Treatment of Grafts.—Trees that were grafted in the spring will now require to have the scions supported with small sticks, which should be first tied to the stock. This will prevent the scions from being blown off or broken during stormy weather. Any young growths that are showing about the heads of the stocks should be cut away, so that all the strength of the tree may be directed towards the development of the scion. Make the labels secure, and let the names of the varieties be written distinctly, that no confusion may arise afterwards.

Fig-trees on walls.—Before these become crowded with large leaves and new wood, examine the trees and remove any useless shoots that are not required for filling up wall space or for fruiting next year. Tie shoots of medium strength over the older wood, and some may be trained back in a downward direction to furnish the walls from bottom to top with short-jointed fruiting wood, that will mature before the end of the season. As a rule, Fig-trees grow strong enough to be fruitful, but if the roots are in a very restricted space supplies of water and manure should be afforded them. Trees that have been planted by walls in favourable localities, and have been allowed to make unrestricted growth, often produce very heavy crops of excellent fruits, the variety Brown Turkey in particular.

Vines.—Continue to see that the leading growths are neatly secured to the trellises as often as necessary. These young shoots grow very quickly at this season, and if neglected soon become entangled and are somewhat difficult to separate. Stop all the young laterals two joints above the bunches of Grapes, if this has not been done already. Should the berries swell satisfactorily and appear likely to make moderately good bunches, thin out the berries somewhat, removing the smallest with a pair of Grape-scissors, and taking care not to prick the skin of those that are left for ripening. Should mildew appear dust the leaves with flowers-of-sulphur, and syringe it off with clean tepid water after the mildew has been destroyed.

THE FLOWER GARDEN.

By A. B. WADDS, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

Carpet-bedding Plants.—*Alternantheras* have not made much growth, and every encouragement should be given them by damping them overhead in the evenings, and by keeping the surface-soil loose by stirring it with the point of a small stick. *Mesembryanthems* will require to be pinched back, or they will soon overrun other plants. All "dot" plants that are plunged in pots will require water very frequently, for in the general watering afforded the beds they will not receive sufficient to soak through all the soil in the pots.

Begonias.—In view of the present hot weather, Begonias that are growing in the sunshine should be afforded a mulch with some manure from a spent Mushroom-bed. Hoe the ground over first, and take away all the weeds. Begonias will require to be watered, or the best results will not be obtained.

Seeds.—Place a few Yew-boughs over the beds in which seeds were sown a few weeks ago, to protect them from hot sunshine, especially if the seedlings are not making satisfactory progress. The boughs may be removed as soon as the sun has left them in the afternoon, and the seedlings be damped overhead. Use the hoe as soon as the seedlings can be seen; and if aphids put in its appearance, apply a small quantity of soot. Prepare some good, moderately rich ground, so that it may be ready when the seedlings need to be transplanted. A partially shady border is preferable, but not essential, as the plants will be better able to withstand a severe winter if put out in the open.

The General Work upon the flower-beds and borders for some weeks to come will include close attention to watering and weeding, and it will be necessary to afford stakes to those plants that require support. The work of watering should be done in the evening during hot weather. Regulate

the growths of plants in the beds, in order that each plant may have sufficient room to develop. *Calceolarias* do not like dry weather, but they should not be watered overhead, as this would knock the flower-trusses down. The plants should be afforded a mulch to keep the roots cool and prolong the flowering season. Other flowering plants should be potted-on, in preparation for planting in the place of the *Calceolarias* when these have flowered, if the stock of the *Calceolarias* can be spared.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Peaches and Nectarines.—The old proverb, "A stitch in time saves nine," may be very appropriately applied to the early autumn planting of Peaches under glass. A moderate crop of fruits may be obtained in the first season after planting, provided the work is given sufficient forethought. A selection of suitable trees for the positions it is intended to furnish may be made now. Preference should be given to those that have clean, clear stems free from knots. In the planting of houses with "lean-to" roofs having a moderate extent of trellis, and, as is too often the case, a brick wall of considerable dimensions separating the ground-level from the glass, standard or half-standard trees are preferable. By planting such trees a greater proportion of light is secured under them, and the sun's rays are able to reach the border. In the case of span-roof houses running north and south this is of less importance, the light being much more abundant. The amount of trellis space generally allowed Peach-trees is too limited, the result being that the knife has to be used freely, and gross, unfruitful wood is produced. When the trellis space is very limited, the rooting space or border should be limited also. For example: after ten years, a trellis, 18 feet by 28 feet, against which one or even two trees may be planted, having a border 6 feet wide by 2 feet deep, including 12 inches of drainage, and containing fibrous roots and being under perfect control, will be found sufficient. But at the time of planting such trees the borders need only be made 3 feet wide, thus allowing for two additions of 18 inches each to be made during the first ten years. If fibrous loam of yellow colour can be procured, there may be added between the layers of unbroken turves some charcoal, half-inch bones, lime-rubble, and good wood-ashes, and the whole be made perfectly firm. Leave the border open upon both sides, whatever the form or position of the house may be, so that a free circulation of air may pass through and under the border. I prefer a level border, or one that only slightly slopes towards the stems of the trees. Water can then be more conveniently applied than if the slope were reversed. If there should be an opportunity, such a border may be made during the next two months.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. BURNS, North Myms Park, Hatfield, Hertfordshire.

***Campanula persicifolia* and *C. persicifolia* alba.**—*Campanula pyramidalis* and *C. calycanthema* are very commonly grown in pots for decorative purposes, but those who have not grown the blue and white varieties of *C. persicifolia* in pots should try them. Being quite hardy, the plants can be wintered in any rough frame, where they will make steady progress. When well established in their flowering pots, they may be introduced into gentle warmth in batches, and a succession of excellent plants secured for decorative purposes from early spring until June. The flowers are also very useful in a cut state. For either purpose this species is much less stiff in appearance than the others. Their propagation and culture are very simple. Side growths may be taken at once from plants which are to be found in most herbaceous borders, and inserted singly in 3-inch pots. Let the cutting pots be placed in a shallow frame, which must be kept close and shaded during sunshine until the cuttings have taken root. When well rooted transfer the plants to 6-inch pots. A

suitable compost may consist of three parts loam, half-part leaf-soil, and half-part rotten manure. After the first year it will be found more convenient to take the cuttings from the pot plants as soon as they have passed out of flower, as by this system the plants may be placed in their final pots in good time.

Camellias which are in need of re-potting may be taken in hand immediately the new growth is completed, and before the flower-buds become prominent. Loam and hard fibrous peat in equal proportions, together with some sharp silver sand and a little broken charcoal, form a suitable compost for *Camellias*. Loam which contains very little lime is preferable, and where the only loam obtainable is of such a nature that *Rhododendrons* will not succeed in it, let the proportions be loam one part, and good hard peat three parts. Do not disturb the old ball more than is necessary to remove the drainage material, and as much of the old soil as is unoccupied with roots. Let the pots be well drained, and in potting ram the soil evenly until it is as firm as that of the old "ball." Before commencing to pot the plants make sure that the compost and the roots are moist, and then a copious syringing, morning and evening, will supply all the water that will be necessary for several days. If the plants are grown in a house having a southern aspect, shade will be necessary during bright sunshine.

THE KITCHEN GARDEN.

By JOHN PENTLAND, Gardener to C. H. B. FIRTH, Esq., Ashwicke Hall, Marshfield, Chippenham.

Turnips.—Sow seeds at intervals from the present until the second week in August in sufficient quantities to meet the demand there will be in autumn and winter. Although a crop of Turnips may be expected from any good garden soil containing sufficient lime, a portion of the ground which has been occupied by early Cabbages or Cauliflowers, if not required for other crops, can be utilised for the purpose to best advantage. Afford such ground a thorough dressing of farmyard-manure and lime. Dig deeply and bury the manure well below the surface. Before sowing the seeds and previous to raking the ground, afford another dressing of lime. If this be done, the lime will be well mixed with the surface soil during the process of raking. Draw lines for the seeds at about 14 inches apart, and when doing so stand at right angles with the hoe and bring the soil to the one side away from the line, instead of getting partly in front of the hoe, a position in which the hoe pulls the soil in front, instead of clearing itself every stroke. The manner described above is that in which the work should be performed, but it is too seldom practised. Some good varieties of Turnips for sowing at this season are American Stone and Chirk Castle. Chirk Castle, a black-skinned variety, is a good one for keeping in winter. Orange Jelly I have recommended in previous Calendars as an excellent variety where yellow-coloured Turnips are in demand. Early White Milan for present sowing will answer perfectly as regards quality if the soil and situation are suitable.

Mushrooms.—Let no time be lost in commencing to gather a good supply of horse-droppings for the making of beds next month. Success will to some extent depend on having the manure prepared well by exposing it in an open shed for a considerable time to atmospheric influences, and by frequently turning it over, the details of which have been given in previous Calendars. Attend to beds in bearing and keep them as cool as possible. Damp the floors, walls, and coverings with paraffin and water in equal parts, applied through a very fine "rosed" can. Keep the water and paraffin well mixed during the application of the liquid. Dust the beds slightly with salt to prevent maggot, which is the common pest of summer Mushrooms. Should the beds become dry, water them with liquid-manure made from cow dung, adding a little salt.

Work in General.—Now that the weather is hot and dry, use the hoes almost constantly until all weeds are cleared away. Afford water to any crops that require it, and especially to plants which have been put out recently.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 16	Manchester Rose Show. German Gardeners' Club meet. Roy. Scot. Arboricultural Soc. Exh. of Forestry at Perth (4 days).
TUESDAY, JULY 19	National Chrysanthemum Society's Outing. Saltaire and Shipley Rose Show. Tibshelf Rose Show.
WEDNESDAY, JULY 20	Nat. Sweet Pea Soc. Show at Crystal Palace (2 days). Hereford and West of England Rose Show.
THURSDAY, JULY 21	Horticultural and Rose Shows at Halifax and Salterhebble. St. John's Hort. Soc. Leamington, Show. Carnegie Dunfermline Trust Summer Show (2 days).
FRIDAY, JULY 22	Opening of the New Hall of the Royal Horticultural Society by His Majesty THE KING (at noon).
FRIDAY, JULY 22	Handsworth Hort. Soc. Exh. (2 days). Roy. Bot. Soc. lecture.

SALE FOR THE WEEK.

FRIDAY NEXT—
150 *Cypripedium glaucophyllum* (new), new Colognyne, Phaius, Vandas, *Dendrobium* McCarthiae, Established Orchids, Palm Seeds, Retarded Lilies, &c., at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12.30.
(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick —63'4".

ACTUAL TEMPERATURES:—

LONDON.—July 13 (6 P.M.): Max. 79°; Min. 58°.

July 14.—Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden (10 A.M.): Bar., 30'2; Temp., 75°.

PROVINCES.—July 13 (6 P.M.): Max. 75°. S.E. Coast of England; Min. 59°. W. Coast of Ireland.

The Royal Horticultural Society. FORTUNE at the present time favours the premier Horticultural Society. Long may it do so! May it, to use a gardening phrase, ripen the wood and enable the Society to build up a reserve for the future! The first and foremost consideration at present is the completion of the Hall. Funds, and many of them, are still required if the Hall is to be opened free from debt and the Council is to be relieved from anxiety as to the future. Would that more of the Fellows and more of those who profit by the opportunities which the Society offers them would in their degree follow the noble example of Baron Sir HENRY SCHROEDER! We all know that but for his generosity and energy the Hall scheme would not have been floated at all; and now we have the special gratification of announcing that the Baron has taken upon himself the cost not only of removal of the books and portraits belonging to the Trustees of the Lindley Library, but also of providing new cases and the entire furniture for the new library. The sum of £1,000 will, it is to be hoped, not only be adequate for the fitting of the library, but leave a balance to be added to the very scanty, almost infinitesimal, sum at the disposal of the Trustees for the purchase of books and the proper maintenance of the library.

The Show at Holland House was held under the most favourable conditions as to weather, and the gay scene in the meadow

contrasted well with the serene beauty of the Elizabethan mansion—in London, it is true, but not of it. Among those to whom the President expressed the thanks of the Society at the luncheon, surely there was none to whom a greater measure of gratitude is due than to the Earl and Countess of ILCHESTER. Flower-shows are common enough nowadays, but a flower-show in such surroundings is assuredly something out of the ordinary way. Her Majesty the QUEEN was one of the early arrivals, and expressed herself well pleased with the exhibition.

The Show on the whole was up to the average, though not so rich as that at the Temple some weeks previously, and the Roses, owing to the advanced season, did not reach the standard attained by the National Rose Show last week. Messrs. PAUL & SON, of Cheshunt, deservedly won the Sherwood Cup for the best arrangement of Roses.

It is curious that, as at the Temple Show, the most novel exhibit was contributed by a foreigner. This time it was Messrs. WAVEREN & KRUIFF, of Sassenheim, near Haarlem, who attracted universal attention by their fine group of hybrid Astilbes, in which the usual white feathery inflorescence of some plants was mixed with various shades of rose and pink in others. This group and the noble specimen of *Furcraea*, brought from the Scilly Isles by Mr. DORRIEN-SMITH (fig. 20), constituted the most remarkable features of the Exhibition, for full details of which we refer to another column.

At the luncheon Sir TREVOR LAWRENCE alluded to the fact that this was the centenary year of the Society, and to the remarkable incidents connected with it, such as the completion of the Hall and its approaching opening by the KING, and the splendid gift of the garden at Wisley by Sir THOMAS HANBURY. Nearly a thousand new Fellows had joined the Society in the present year, so that the number now on the books was eight thousand three hundred and one.

Sir TREVOR took the opportunity of thanking the several Committees for their disinterested labours, and of recognising the services of the judges. Mr. GEORGE PAUL responded for the Committees, and while so doing called attention to the presence of Sir DANIEL MORRIS, a former Treasurer of the Society and Assistant Director of Kew, now doing excellent work in developing the resources of the West India Islands. Mr. PAUL spoke appropriately of the harmony and accord existing between the Council and the Committees.

Mr. MCINDOE returned thanks for the judges; and a cordial vote of thanks was proposed to the President at the instigation of Mr. KER. So pleasantly passed off the little function, when Council, Committees, and judges meet ("tis only once a year") to reciprocate good feeling and incite the Fellows to further exertions.

The next ceremonial of the Royal Horticultural Society will be the formal opening of the new Hall on Friday, July 22, by His Majesty the KING. The proceedings will, it is believed, be of a purely formal character, no exhibition as such will be attempted. Large as the Hall is, it would not be adequate to admit all the Fellows, or even a large proportion of them, and hence it has

been found requisite to limit the number of those present to those who have special invitations from the Council, or who purchase tickets. If there were an exhibition, the Fellows would be enabled to exercise their right, not only of personal admission, but of introducing a number of friends, so that some limitation became necessary, and this, as was pointed out in sundry announcements at Holland House, could only be effected by avoiding a public exhibition.

LORD ONSLOW AT SWANLEY HORTICULTURAL COLLEGE.—On Monday, July 11, the annual distribution of prizes took place at Swanley Horticultural College. Sir JOHN COCKBURN opened the proceedings. He said that in these days, when new avenues of activity for women were continually being opened up, he thought that there was a special corner for them in the shape of horticulture. He believed that the work done at Swanley had a bearing on the national prosperity, for every day our agricultural work was becoming more horticultural; cultivation grows continually more intense, and women can well turn their attention to what in France is known as "Petite culture." Sir JOHN COCKBURN had also a word to say with regard to the Colonial Section of the College, and he concluded his remarks by alluding to the great success obtained by the students of the College at the recent examination of the Royal Horticultural Society. The Earl of ONSLOW, President of the Board of Agriculture and Fisheries, then presented the prizes, this being the second occasion within the last few weeks in which he has officially recognised the teaching of horticulture. After touching upon the advantages of teaching women how to grow garden-produce, how to rear poultry and tend bees, Lord ONSLOW pointed out how useful such a College as Swanley might be made in the preparation of teachers of Nature-study, Sir HENRY MCCALLUM, the Governor of Natal, gave a brief but extremely interesting account of the work going on in his colony. He described the "Cash on Delivery System," by which the railways collected produce from the grower, delivered it direct to the consumer, collected the money, and paid it over less 5 per cent. for their trouble. He urged intending workers in Natal, and particularly girls, not to trust to Kaffir labour, but to learn to do everything for themselves. He finally spoke of the College for Horticulture which has been established in Natal, and when replying to a vote of thanks suggested that families rather than individuals should at first settle at Natal, promising that if a settlement could be made as a result of the efforts at Swanley it should bear this name.

NATIONAL ROSE SOCIETY.—It may interest our Rose-loving readers to know that the receipts in gate-money at the National Rose Society's recent exhibition in the Temple Gardens, and from the sale of tickets, exceeded those from the same sources last year by nearly £100; while, in a great measure owing to the Show's being held in such a central position in London, 100 new members have during the last two months joined the Society, bringing up the total number of members to over 1,100.

SOCIÉTÉ FRANÇAISE D'HORTICULTURE.—The Society will on July 28 visit East Burnham Park, near Slough, on the invitation of Mr. HARRY J. VEITCH, who will also accompany the party to Dropmore. The train leaves Paddington at 2.30 P.M. Those coming from other starting points are requested to be at Slough Station at 3.15 P.M., when brakes, kindly ordered by Mr. VEITCH, will be in readiness. Mr. G. SCHNEIDER, of 17, Ifield Road, Fulham Road, is the President.

'HYBRID CLEMATIS.—A few weeks since we had occasion to figure a hybrid raised at Mantua by Professor FRANCESCO MARCHI between *C. coccinea* and *C. lanuginosa*. In the current number of the *Revue Horticole* we find a coloured illustration and description of three varieties which originated from crossing *C. coccinea* (perennial) with one or other of the large-flowered Jackmanni section. The three varieties figured are Madame Raymond-Guillot, purple; Madame Moret, red; and Madame Lerocet, rosy-lilac. A full description is given by M. F. MOREL. The form of the flower in all cases is spreading, not vase-shaped, as in *coccinea*.

COLOURED CUCUMBER.—Messrs. MACK & MILN, nurserymen, Darlington, have forwarded to us an interesting colour sport in a Cucumber. The fruit is of a deep orange colour, somewhat similar to that which is seen in the seeding stage of a Cucumber. Indeed, we imagined this to be a ripened fruit, but were assured it was not so, and that the fruits commence to colour when but a few inches in length, becoming darker as they develop. The variety is Rockford's Market. Coloured Cucumbers may be a novelty, but we prefer them as green as possible.

MR. A. C. FORBES.—Our correspondent Mr. A. C. FORBES has been appointed Lecturer in Forestry by the Council of the Durham College of Science, Newcastle. He has had a practical training in the Knowfield Nurseries, Carlisle, and in the woods at Cullen House, Banffshire. He attended Dr. SOMERVILLE's class in Forestry and other classes in kindred subjects at Edinburgh University, and obtained medals in Forestry and Agricultural Botany. He afterwards proceeded to the Prussian Forest Academy at Eberswalde, and in 1892 was appointed forester on the Marquess of LANSDOWNE's estate in Wiltshire. In 1902 he became forester to the Marquess of BATH, on whose estates he had charge of 4,000 acres of woodland. He holds the diploma in Agriculture and the first-class certificate in Forestry of the Highland and Agricultural Society of Scotland, and has obtained two important first prizes for essays on Forestry subjects.

THE LATE M. MICHELI.—This gentleman was an expert cultivator as well as an eminent botanist. His herbarium has been presented by his widow to the city of Geneva, already extraordinarily rich in botanical collections.

IRIS KÄMPFERI.—We have received some fine blooms of this charming Japanese Iris from Messrs. V. N. GAUNTLETT & Co, Redruth. The flowers were of large size and in many beautiful colours, the veinings and markings on some of the varieties being highly pleasing. Judging from the quality of those received, this firm are evidently very successful as growers of these handsome flowers.

STOCK-TAKING: JUNE.—The value of our imports is £43,196,784, as against some £41,295,550 for June, 1903, or a gain of £1,901,234. The following is our usual condensed summary of imports:—

IMPORTS.	1903.	1904	Difference.
	£	£	£
Articles of food and drink—duty free	10,204,043	9,847,946	—356,097
Articles of food & drink—dutiable	7,845,909	8,727,040	+881,131
All other Imports...	23,245,598	24,621,798	+1,376,200

It is worthy of note here that the last-issued record of "Corn averages" gives the following result, the prices being per quarter, compared with the same period last year:—Wheat, 26s. 4d. (—1s. 5d.); Barley, 18s. 8d. (—1s. 11d.); Oats,

17s. 1d. (—1s. 5d.)—minus on all prices. As to fruit imports, the following in an interesting tabular resumé:—

IMPORTS.	1903.	1904.	Difference.
	Cwt.	Cwt.	Cwt.
Fruits, raw—			
Apples	41,125	125,435	+84,310
Apricots and Peaches	1,171	1,786	+315
Bananas ... bunches	342,334	427,395	+85,061
Cherries	51,790	139,787	+87,997
Currants	5,465	18,538	+13,073
Gooseberries	14,862	21,666	+6,804
Grapes	1,106	1,083	—23
Lemons	135,874	90,513	—45,361
Nuts—Almonds ...	3,250	5,908	+2,658
Others used as fruit	57,836	26,635	—31,201
Oranges	348,276	375,490	+27,214
Pears	696	781	+85
Plums	519	352	—167
Strawberries	25,695	27,773	+2,078
Unenumerated ...	10,450	15,981	+5,531
Vegetables, raw—			
Onionsbush.	351,938	347,746	—4,192
Potatoescwt.	1,510,589	2,038,411	+527,822
Tomatoes	146,895	153,813	+6,918
Vegetables, raw, unenumerated ...value	£39,615	£49,446	+£9,831

The imports of fresh flowers for the past month figure at £12,475. We can find no record of exports of nurserymen's products. The wood and timber imports are valued at £2,798,213, an increase over June, 1903, of £59,911. The total of the imports for the past six months is £271,953,771, against £260,529,889—a gain of no less than £11,423,882. As to the value of the

EXPORTS

for the month of June, the figures are £24,069,770; for the same period last year, £22,271,960—gain, £1,797,810. The final figures give the results of six months' exports as follows: £144,116,667, as compared with £142,522,625 for the same period in the previous year—a gain of £1,594,042.

CARNATION SHOW AT BIRMINGHAM.—The Midland Carnation and Picotee Society's Show will be held at the Botanical Gardens, Edgbaston, on Thursday and Friday, August 4 and 5, these dates having been fixed after the provisional dates July 28 and 29 were printed in the *Gardeners' Chronicle Almanack*, published at the beginning of the year.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

BEAUTIFUL WILD WALES.—The Riviera of Wales that lies between Menai Straits and the broad and sandy estuary of the Dee is at all times and seasons a lovely bit of country, but never more so than in the flowery glamour of mid-summer days. Even by rail it is charming, as the sunlight plays on the mountains and glistens on the sea; but the top of a coach is even better, and apart from its steepest roads, the bicyclist and the pedestrian may enjoy the beauty of its upland and the coast-scenery at a reasonable cost and with much pleasure. Beautiful Wales lies between the velvety mountains and the silvery sea, owing its popularity to both attractions—attractions so subtle and variable as to defy the pen and pencil alike, strive as strenuously as one may. Just at present every hedgerow and roadside, not omitting those modern reservations for our native wildings, the railway embankments, are really flowery wild gardens. The balmy Alder is in full flower everywhere, and every hedge is wreathed with Honeysuckle and wild Roses. Every ruined castle is a study in wall-gardening, none the worse for being natural. Over now, of course, is the Golden Furze or Gorse of the sunny banks and rocky declivities. Over, also, are the

Violets and the pale Primroses of spring, but every hedgebank is purple with Foxglove spires, and the old masonry at Conway Castle is crimsoned over with *Centranthus* or Valerian, and wild Roses on a carpet of Ivy-green. In the early spring the walls of Conway Castle and town alike are golden with Wallflowers, but at present the crimson Valerian, and the Pellitory, and the Roses have full sway. The tenantry of this old stronghold to-day are the starlings, the jackdaws, and the owls, while arch and tower, keep and dungeon only remain as "footprints on the sands of time." Conway and Carnarvon Castles were built by the same man, Henry Elreton, under the personal superintendence of Edward I, and having served their purpose more or less effectively in the history of progress, now remain as mere relics of the past. The roofless banqueting-hall echoes no longer to the sound of minstrelsy or of revelry by night, while guard-room and tower, the tiny little chapel and the Queen's chamber, are alike forsaken and forlorn. All is empty and desolate, but for memories and traditions, which like the wild flowers still cling to the silent walls. Wales on the mountains or by the sanded shores of the sea is lovely as ever, and one need not wonder at George Borrow in his love for wild Wales, for her rivers, waterfalls, and glens, for her piquant people, and for their gift of mysticism and of song. F. W. B.

OSMUNDA REGALIS.—I am rather puzzled at the description given of "fine specimens" of *Osmunda regalis* in your recent issue, in which the fronds are described as from 2 to 3 feet long. At Kew, in the rock garden, they are certainly double this length, and on the upper Dart I have seen the Fern so large as to resemble coppices at a distance, and on closer inspection I have been able to walk under the fronds, which reached considerably over my head. It is recorded as reaching 12 feet in height, and I consider this as by no means exaggerated. Fronds 2 to 3 feet are therefore comparatively small, and certainly do not justify the term "fine specimens." The size of the crowns described is certainly considerable, but at the Dart station I have in view, the entire ground consisted of huge continuous masses of caudex, covered with those dense-growing aerial rootlets peculiar to the species. C. T. Drury, F.L.S., V.M.H.

ROSE CRIMSON RAMBLER SPORTING.—Until this season we have never found this Rose give other than its rich crimson clusters of blossom, but recently almost the first to open were some pink-coloured sprays, the individual flowers of larger size than the type, semi-double, and more reflexed than imbricated. This occurred on two plants growing within a few yards of each other. Is it likely to be a reversion to some parental characteristic? Such sports, however, would have no commercial value, since there are others already named of this colour, and obtained from seeds, still, it is interesting, because Roses, unlike *Chrysanthemums*, are not usually so sportive in their floral dress. The plants under notice are healthy and flowering vigorously, so that the change of colour is not due to debility or accident. W. S.

APPLE NEWTON WONDER.—On p. 395 of the *Gardeners' Chronicle* for June 18 there was a letter from Mr. A. H. Pearson, Lowdham, respecting this Apple. He stated that he knows of no grower in either King's Newton or Melbourne who has planted the variety extensively. If Mr. Pearson cares to come to Melbourne station, I will gladly meet him, and show him where there are 2,000 trees in bearing, and upwards of 2,000 Crab and Paradise stocks ready for grafting. He also claims to be the distributor of this variety. I think that is hardly correct, for although Messrs. Pearson bought fifty trees, and also exhibited Apples which won at the Crystal Palace show, and they may have sold many trees, the raiser has done the same thing. In my experience this is one of the best Apples in cultivation. T. Salisbury.

MAGNOLIA WATSONI.—A plant growing under this name, as received from the nursery, has a very fine effect as a single specimen on the grass; its foliage is very striking and bold in appearance by reason of its large size and colour.

Although the specimen I am writing of is 11 feet high, I have not seen it flower. It is of very quick growth and quite hardy here, although in very exposed districts it may possibly get cut by spring frosts by reason of commencing growth so early. It is the earliest of several species growing near. At the present time some of the leaves, which are not fully developed, are 18 inches long and 8 to 10 inches wide, of a thick, leathery texture, dark olive-green on the upper surface, the under surface, deeply ribbed, is quite tomentose in appearance; these very prominent ribs towards the axils are of a light chocolate colour, which becomes lighter as they extend through the leaf. *W. H. Clarke, Aston Rowant Gardens, Oxon.* [This *Magnolia* was illustrated in the *Gardeners' Chronicle*, April 27, 1895, p. 516. Ed.]

IRISES.—I have noticed this year that an unusual number of my Irises have borne flowers with an abnormal number of segments, generally an increase from the usual six to eight. This was also noticeable among a large collection of Irises in my brother's garden at Hersham, and a friend at Tunbridge Wells reports the same circumstance. My collection of Irises is a small but fairly representative one of the different sections of the tall May and June-flowering Irises, including species; and in previous years I have observed that some are inclined to sport that way, notably *I. flavissima*, which has had one or two flowers with eight segments. This year every spike on a large plant had one and some two or three flowers with eight segments. A plant of "Thorbeck" with five spikes had a flower with eight segments at the top of each. In all cases it was the earliest flowers that had an increased number of segments, and in nearly every case it was the top flower of the spike. They occurred in all the sections and several species. It would be interesting to know if this has been observed generally throughout the country this year, and if so, what is the probable cause. It seems that soil or situation cannot have anything to do with it, as here I have a shallow soil on chalk on the brow of a hill, while my brother's garden is on sandy soil, comparatively low-lying and sheltered. Nor can it be due to any special methods of cultivation, for neither here nor at Hersham are they cultivated in any special sense—they just grow, nothing in the way of any mulch or artificials having been added to the soil of the Iris borders since they were made up for planting three years ago, and at Hersham they have been in the same position much longer; so that there seems some reason to think it may be due to the very wet season last year and the genial spring of this. The fact of these flowers being confined to the early ones and those at the top of the spike seems to indicate that the more immediate cause may be an abundance of food. On the other hand some are, I believe, of the opinion that reduplication of the floral whorls is caused by the opposite condition, dryness and a poor soil. More often than not these flowers were perfectly regular, all parts of the floral whorl being increased by one; and this regularity is striking when it is considered what a strong ancestral bias must be overcome in departing from the typical flower of six segments to one with eight segments. Several of these flowers, however, had only two stigmas, one of which was then generally bent over the reverse way to its usual position and lay superposed on the other. In one case (*pallida dalmatica*), showing the possible line of development, there were only three separate falls, but one was half again as broad as the others, and was slightly cleft at the apex, giving the petal a heart shape; the corresponding stigma was broader, and the stamen was practically two stamens joined together back to back. One may ask, Would a race of Irises with eight segments be desirable? I think it would in some cases, especially where the segments are comparatively narrow and bright coloured, and where the standards and falls are distinctly contrasted. In *Queen of May* and *Shorbeck*, for instance, the result was pleasing whether looked at from a distance or close to, and the increased size of the flower is then, I think, an advantage. Others, however, such as *pallida dalmatica*, *Mme. Chereau*, and all the variegated and squalens varieties, though they made a bigger

splash of colour at a distance, would not bear a close view. They looked crowded, and had lost something of their symmetry of form. *A. J. Bliss.*

THE COLOURING OF APPLES AND SOIL NITRIFICATION.—I am a Jersey gardener, and Apples, Pears, and Strawberries are largely grown in Jersey. The island is blessed with a fair amount of sunshine, and I have noticed that, unless there is a good proportion of nitrogen in the soil as well as sunshine above, if we get the colour in the fruit we lose flavour, and that to obtain both colour and flavour we must prune our trees properly and feed them properly. I have grown two trees of *Louis Bonne* of Jersey on the same plot of ground 12 feet apart, the one I have top-dressed in September and pruned on the short spur system, the other I have pruned back leaving from 4 to 6 inches of wood beyond the fruit-buds. From the first tree I gathered a heavy crop of well-coloured fruits of good size and flavour, and from the other a fair crop of fruits, lacking that bright rosy colour which is desirable

to carry on the business of importers and exporters of and dealers in fruit, vegetables, flowers, &c. No initial public issue.

MR. JOHN EDWARD SADLER, who represented Messrs. Jas. Backhouse & Son, Ltd., York, for many years, and recently Messrs. Rd. Smith & Co., Worcester, has been appointed representative for Messrs. Clibrans, Altrincham and Manchester.

MARKET CULTURE OF STRAWBERRIES.

OUR illustration, fig. 19, shows a common scene in our market gardens at this season. It is usual for the pickers to commence work soon after 2 A.M., continue until about 9 o'clock, when the Strawberries are sent to Covent Garden Market. All hands are called off, the fruit is weighed, and the foreman pays each gang (checks to the value of their gathering. The check is made of brass, and is exchanged for cash on pay-day.

FIG. 19.—A SCENE IN A MARKET GARDEN IN STRAWBERRY TIME.

and of inferior flavour. The same results have been obtained with *William's Bon Chrétien*. Unless a good top-dressing is afforded in September, and the trees are pruned on the short spur system, we may get fruits of good size and shape, but minus that grand flavour and juicy saline which we expect to find in a good Pear. In the cultivation of Apples, Cherries, Plums, Peaches, and above all Strawberries, if there is a fair amount of sunshine and the ground is properly dressed in the autumn, the trees and bushes are pruned properly, you may be sure of a good crop of fruits possessing large size, bright colour, and good flavour; but whatever the amount of sunshine and no top-dressing afforded, with improper pruning, the fruit will be inferior in colour, size, and flavour. *P. B. Le Cras, 2, Berkham Place, Lower Compton, Plymouth.*

TRADE NOTICES.

CROSBY AND HOLDSWORTH, LTD.—The above-named Company has been registered with a capital of £3,000 in £5 shares. Object, to acquire the business carried on at Hull as M. J. Holdsworth; to adopt an agreement with Margaret J. Holdsworth and Hannah E. Durlay to buy and sell in the United Kingdom, Channel Islands, Europe, America, or elsewhere, all kinds of fruit, vegetables, flowers, nuts, seeds, bulbs, and roots, and

Obituary.

ALFRED MADOUX.—The death of M. Alfred Madoux, the well-known orchidist, is announced.

RITCHIE BROWN.—A wide circle of friends will learn with much regret of the decease of Mr. Ritchie Brown, who died at Nursery House, Altrincham, on the 9th inst, in his fifty-first year. Mr. Brown was born at Lesmahagow, Lanarkshire, and came of a family who had been connected with forestry and horticulture for six or seven generations. He was apprenticed in Hamilton, after which he went for a period to Messrs. Dickson & Turnbull, of Perth, subsequently as manager for about five years with Thomas Imrie & Sons, of Ayr, representing that firm throughout the United Kingdom. On leaving there he took up the management of Charles Daly & Sons' Nursery, Coleraine, Ireland, and in 1884 was appointed nursery manager to Messrs. Wm. Fell & Co., of Hexham, which post he held for a period of thirteen years. In 1897 he was appointed to fill an important position at Altrincham in the Forestry and Landscape departments of Messrs. Clibrans, in whose service he was at the time of his death. Mr. Brown was one of the founders of the English Arboricultural Society, having been a member

twenty-two years. He acted as local secretary for Cheshire up to the time of his death. For many years he was a member of the Council, and took an active part in all matters concerning the welfare of the Society. He was a man of untiring energy, and an ardent supporter of everything appertaining to forestry. For some time past he represented the firm of "Clibrans" in the South of England, and at the end of last year he contracted a severe chill, which brought on pneumonia, confining him to bed until his death.

THE COAT-OF-ARMS OF SIR WALTER COPE, THE ORIGINAL BUILDER OF HOLLAND HOUSE.

ROYAL HORTICULTURAL. Exhibition at Holland House.

JULY 12, 13.

THE Royal Horticultural Society held its third exhibition in the grounds of Lord ILCHESTER, at Holland House, Kensington, on Tuesday and Wednesday last. The weather was glorious, and the meeting very enjoyable indeed to those present, many of whom doubtless took the opportunity to inspect Lord ILCHESTER'S remarkable garden. As an exhibition the Holland House Show will not compare favourably with that at the Temple, because, owing to so much more space being available, there is not the "weeding out" there is at the Temple, and consequently many exhibits at Holland House contained very commonplace plants and cut flowers. But some of the arranged groups had a conspicuously good effect. The FLORAL COMMITTEE recommended one First-class Certificate, ten Awards of Merit, and two Gold Medals to new or rare plants. The ORCHID COMMITTEE adjudged three First-class Certificates, two Botanical Certificates, and three Awards of Merit. The FRUIT AND VEGETABLE COMMITTEE recommended Awards of Merit to a new variety of Strawberry and a new Raspberry.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), J. Douglas, F. Sander, H. J. Chapman, H. A. Tracy, H. Little, J. Charlesworth, F. W. Ashton, A. A. McBean, W. Boxall, H. M. Pollett, W. H. Young, J. W. Odell, de B. Crawshaw, J. Colman, R. G. Thwaites, F. A. Rehder, M. Gleeson, H. Ballantine, G. F. Moore, T. W. Bond, and H. T. Pitt.

There was a very good show of Orchids, but the number of groups was not great, as, in consequence of the hot weather, many species are out of flower.

Messrs. SANDER & SONS, St. Albans, staged a fine group, excellent in every respect, the grouping in irregular sections with lighter plants suspended over being very effective. The whole arrangement had the pots concealed by short green moss and light foliage plants. Hybrids were well represented, and what is perhaps now more important several newly-imported species were shown. Among the large-flowered Cattleyas were a good set of albinos. *Cattleya* × Mrs. Myra Peeters (Warneri alba × Gaskelliana), *C. Mossie Wageneri* superba, and *C. M. W. xanthoglossa* were fine pure whites, the last named having a very rich yellow lip. *C. Mossie Reineckiana* varieties, *C. M. Sunset*, a delicately-tinted variety, with much yellow on the lip; *C. M. "Prince of Wales,"* a charming

blush-white in the section of *C. M. Reineckiana*; *C. M. vestalis*, and others were also very handsome. Of the hybrids, several of the best will be found in the list of Awards. Others very handsome were *Laelio-Cattleya* × *elegans* "King Edward," *L.-C.* × *Eclipse*, *L.-C.* × *D. S. Brown*, *L.-C.* × *Lord Kitchener*, good forms of *L.-C.* × *Martineti*, *L.-C.* × *Antigone*, *Cattleya* × *Gaudii*, *C.* × *Whitei* superba, large and very bright in colour. Among the *Cypripediums* were good *C.* × *Ultor*, *C.* × *Rolfes*, and *C.* × *Phoebe*. A collection of varieties of *Miltonia vexillaria* presented the fine large white *Miltonia vexillaria* "Queen Alexandra," and the brightly-coloured *M. v. superba*. Other special species and varieties noted were *Cattleya Harrisoniana* alba, *Odontoglossum Uro-Skinneri* album, *O. citrosum* purpurascens, *O. ramosissimum* (with five spikes), a number of the fine Java form of *Phalenopsis aroabilis*, *Bulbophyllum barbigerrum*, *Vanda cerulea*, *Saccolabium guttatum*, the new variety of *Dendrobium superbum*, *D. bicameratum*, and a large number of other interesting and showy plants.

JEREMIAH COLMAN, Esq., Gaddon Park (gr., Mr. W. P. Bound), staged a very effective group, lightly set up with graceful foliage and fine specimens of Pitcher-plants. Trained along the front were very long and finely flowered spikes of *Oncidium macranthum* which imparted a novel feature. Forms of *Odontoglossum crispum*, which were scarce in other groups, were well represented, the best of the spotted forms being *O. crispum* Mary Colman, *O. c. Mrs. Jeremiah Colman*, *O. c. Bonnyanum*, and a fine purple-spotted variety flowering for the first time. Others specially attractive were *Laelio-Cattleya* × *Sunrise*, a clear yellow; *L.-C.* × *callistoglossa* superba, rich in colour; good forms of *Cattleya Mossie*, including *Reineckiana*; *Cypripedium callosum* Sandere, *C. Godefroyae* leucochilum, *Masdevallia Veitchiana*, *Lycaste leucantha*, *Epidendrum prismatocarpum*, &c.

Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young), had a small, select group made up of *Sobralia macrantha*, *S. xantholeuca*, the pretty *S. x. Wiganie*; a finely-coloured *Laelio-Cattleya* × *eximia*; the very beautiful *Zygopetalum* × *Roehlingianum*, *Phalenopsis violacea*, *P. speciosa*, *Cattleya Mendeli* Lowie, *C. x Adonis*, good *C. Gaskelliana*, *C. Eldorado*, *Cypripedium superbiens*, *C. Lawrenceanum* Hyeannum, *C. Parishii*, *C. Godefroyae* leucochilum, and *Cochlidia Noezliana*.

Messrs. CHARLESWORTH & Co., Heaton, Bradford, staged a very fine group, the centre of which, at the back, contained a finely-flowered batch of *Oncidium macranthum*, on each side being a selection of the Brazilian *Oncidiiums*, and a number of good forms of *Odontoglossum crispum*. Hybrid species and varieties were equally well represented, among the hybrids being the pretty orange and purple *Laelio-Cattleya* × *Adolphus*, a very remarkable set of *L.-C.* × *Canhamiana*, ranging from pure white with dark rose lip to rose with purple labellum; *L.-C.* × *Hippolyta* var. *Phoebe* in several varieties; the pretty *L.-C.* × *Remula*, *L.-C.* × *Aphrodite*, white and rose forms; *L.-C.* × *Ingrami*; *Miltonia vexillaria* varieties, including the purest white form, *M. v. albiflora*; *Brasso-Laelia* × *Digbyano-purpurata*; albino *Cattleyas*, including *C. Mossie Wageneri*, *C. M. Reineckiana*, and a very clear white *C. Gaskelliana* alba; *Cattleya* × *Niobe*, *Anguloa uniflora*, *Aerides l'Ansoni*, the rare and handsome white *Mormodes luxatum eburneum*, *Vanda cerulea*, *Barkeria spectabilis*, *Zygopetalum stapelioides*, &c.

At the end of the large tent Messrs. HUGH LOW & Co., staged a good representative group, the central plant of which was a charming specimen of *Cattleya Gaskelliana*, a large and finely-formed rose variety with ten flowers. Around it were *Cypripedium* × *Shillanum*, *C. x macropterum*, *C. x gigas* Corndean variety, *Cattleya Gaskelliana* alba, *C. Harrisoniana* alba, *Laelio-Cattleya* × *Canhamiana* varieties; *Dendrobium* × *rhodostoma*, *Aerides expansum* Leonæ, a selection of varieties of *Phalenopsis Aphrodite*, and a plant of the pretty little *P. amethystina*; *Odontoglossum Schlieperianum citrinum*, of two shades of yellow, the singular *Bulbophyllum Sanderianum*, and nice specimens of the rosy-lilac *Disa* × *Langleyensis*.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood), sent *Cattleya Gaskelliana* Rosslyn variety, a very large and finely-formed rose-tinted flower, and *C. Warscewiczii* Rosslyn variety (see Awards).

J. FOSTER ALCOCK, Esq., Northchurch, Berkhamstead, showed *Cypripedium* × *Gloriana* (*Harrisoniana* superbum × *niveum*), a model flower with whitish ground colour effectively tinted with purplish rose.

R. BRIGGS-BURY, Esq., Bank House, Accrington (gr. Mr. Wilkinson), showed *Cypripedium Lawrenceanum*

Hyeannum Bank House variety, a large green-and-white flower with a slight brownish tint on the lip; and *Odontoglossum crispum* Oakfield Sunrise (see Awards).

CONTINENTAL EXHIBITS.

Mr. OTTO BEYRODT, Marienfelde, Berlin, staged a very bright group of excellent varieties of *Cattleya Warscewiczii*, of which the beautiful pure white *C. W. Fran Melanie* Beyrodt secured a First-class Certificate. Mr. BEYRODT also showed the rare natural hybrid *Odontoglossum* × *Brandtie*, and the clear yellow *O. Schlieperianum* Beyrodt's variety.

M. CHAS. VUYLSTEKE, Loochristy, Ghent, staged an interesting group of his hybrid *Odontoglossums*, including *O. x ardentissimum* Cybele and *Eclair*, two very pretty rose-purple blotched forms; *O. x Rolfes* Melpomene and *L'Aurore*, two very large and handsomely-formed white varieties prettily spotted with purple; *O. x bellatulum*, and other hybrids.

M. JULES HYE DE CROM, Coupure, Ghent (gr., Mr. Coen), showed a gigantic white *Miltonia vexillaria* splendidly grown, and which bore two strong spikes; and a very large and finely-marked *Odontoglossum* × *Rolfes*.

Awards.

FIRST-CLASS CERTIFICATE.

Laelio-Cattleya × *Hy. Greenwood* var. *Imperator*, from Messrs. SANDER & SONS, St. Albans.—A gigantic form of the type, and an improvement in every respect. Inflorescence four-flowered. Sepals and petals broad, white tinged with purple. Lip very showy, purple in front, pale yellow in the throat.

Odontoglossum crispum Oakfield Sunrise, from R. BRIGGS-BURY, Esq., Bank House, Accrington (gr., Mr. Wilkinson). A very singular form in which the stalked petals have traces of the labellum and are of a reddish-chestnut colour, tipped with white. It received an Award of Merit, March 13, 1900, and was illustrated in the *Gardeners' Chronicle*, March 24, 1900, p. 181. As now shown there was much more colour on the petals.

Cattleya Warscewiczii Frau Melanie Beyrodt, from Mr. OTTO BEYRODT, Marienfelde, Berlin.—A most beautiful form with pure white flowers, the front of the lip being bright purple. In this form the yellow usually seen on the lip of other forms has almost disappeared, and an albino, with the exception of the purple on the front of the lip, resulted.

AWARDS OF MERIT.

Cattleya Warscewiczii, Rosslyn variety, from H. T. PITT, Esq. (gr., Mr. Thurgood).—A very handsome flower, white, delicately tinted with rose-pink, the darker colours of the type being suppressed.

Cattleya × *triumphans* (*Dowiana aurea* × *Rex*), from Messrs. SANDER & SONS.—A very pretty flower, resembling most nearly the rare *C. Rex*, and with pure white sepals and petals. The labellum is formed like that of *C. Rex*, but broader and more crimped. The throat, however, has the same prismatic arrangement of purplish-crimson colour, merging into the bright mauve-purple front lobe, the fringed margin of which is white.

Laelia × *crispa-brosa* (*crispa* × *tenebrosa*), from Messrs. SANDER & SONS.—A distinct hybrid, with flesh-coloured sepals and petals, and broad rose-coloured lip with dark purple veining (Botanical Certificate).

Saccolabium longicaulestratum, from Messrs. SANDER & SONS.—An interesting species with whitish, rose-tinted flowers closely arranged, and prominent large white spur.

Dendrobium bellatulum, from Messrs. SANDER & SONS.—A dwarf nigro-hirsute species, described in the *Gardeners' Chronicle*, April 2, p. 258. Flowers ivory-white with red markings on the labellum.

Floral Committee.

Present: H. B. May, Esq., in the chair; and Messrs. W. Bain, Geo. Nicholson, Ed. Mawley, A. Perry, C. R. Fielder, H. J. Cutbush, W. Howe, C. Blick, C. J. Salter, J. Jennings, J. F. McLeod, C. T. Drury, G. Renthe, E. H. Jenkins, Geo. Paul, J. W. Barr, Chas. Jeffries, W. J. James, Jno. Green, W. P. Thomson, R. C. Notcutt, W. G. Baker, R. Wilson Ker, W. Marshall, R. Hooper Pearson, and James Walker.

ROSES.

Messrs. G. PAUL & SON, Old Nurseries, Cheshunt, had a group of Roses beautifully arranged, chiefly of the decorative sorts, but also included good blooms of all types, the tall plants of the Rambler type, among which were large bunches of cut blooms lightly

arranged, made a bright effect. The group was well "finished" and the ground was covered without being crowded (Sherwood Cup).

On the opposite corner Mr. G. MOUNT, Canterbury, had a fine group, the Crimson Ramblers being very good; large bunches of Caroline Testout, Mrs. W. J. Grant, Fisher Holmes, Frau Karl Druschki, Hon. Edith Gifford, and other good sorts were prominent. Altogether a beautiful arrangement. Mr. GEO. MOUNT also showed some most charming Roses—vases, boxes, and pots, all containing grand specimens of these lovely flowers. A box of flowers of Mildred Grant was superb; Mrs. W. J. Grant was also in fine condition.

Messrs. B. R. CANT & SONS, The Old Rose Nurseries, Colchester, exhibited a fine lot of Roses, in which Blush Rambler was excellent. It had evidently been taken from a plant growing just as vigorously as the Crimson Rambler is wont to do. A good number of exhibition varieties was also shown.

Mr. DAVID RUSSELL, Essex Nurseries, Brentwood, Essex, staged several exhibition boxes of Roses with vases of pillar and polyantha varieties at the back. Some very fine blooms were noticed. The same exhibitor showed fifty-six varieties of Sweet Peas in vases, including the new variety Countess.

Mr. G. W. PIPER, Uckfield, Sussex, showed a small collection of Roses, including a new climbing polyantha variety, Aceitana. The flowers are light pink with a lighter centre, evidently a very prolific variety. Sunrise is a charming button-hole Rose.

Messrs. ALEX. DICKSON & SONS, Ltd., Newtownards, Co. Down, staged vases of single Roses, Irish Masterpiece, being a large-flowered variety of this section with rosy-coloured petals. Irish Elegance and Irish Star, two new varieties, were included. Messrs. DICKSON also presented some new hybrid Tea varieties.

Messrs. GEO. JACKMAN & SON, Woking, Surrey, set up a fine collection of hardy cut flowers, also Roses in boxes and vases. A good batch of Iris Kämpferi was noticed, also Nymphaeas and some good forms of Delphiniums. The Roses included garden varieties, also Teas and hybrid Teas. Bessie Brown, a hybrid Tea, was especially fine.

BEGONIAS, &c.

Messrs. BLACKMORE & LANGDON, Twerton Nurseries, near Bath, showed a magnificent group of tuberous-rooted Begonias, which consisted wholly of double-flowered varieties, all of which were of the highest merit. The Right Hon. Joseph Chamberlain (deep crimson), Mrs. Heathcote (yellow), Mrs. A. Hall (clear bright salmon colour), Marella (white, with pink, pectee-like edge), Marchioness of Bath (white), and Mrs. Portman Dalton (glorious pink colour, extra fine petals, like those of a beautiful Rose), were some of the most attractive flowers.

Messrs. T. S. WARE (1902), LTD., Feltham, had a group of Begonias, in which the double-flowered white variety Mary Pope was given especial prominence, there being a number of plants arranged in the centre. Other good double flowers were Queen Alexandra (of a pale tint, with bright red, pectee-edge to the petals), Mrs. W. L. Ainslie (yellow), Mr. W. G. Valentine (pale lemon colour), &c.

Mr. A. LL. GWILLIM, Cambria Nursery, New Eltham, Kent, showed very choice Begonias, including single and double-flowered varieties. One of these is described under Awards. There were also Mr. J. Portbury (bright red colour), John Peed (rich salmon-red), Cupid (pink), all double, and Goliath (orange-coloured single).

Messrs. JNO. LAING & SONS, Forest Hill Nurseries, London, S.E., exhibited a group of tuberous-rooted Begonias, in which single and double-flowered varieties were about evenly balanced in number.

Messrs. B. R. DAVIS & SONS, Yeovil, Somerset, set up a large group of tuberous-rooting Begonias. Edging plants of Nepeta, Ferns, Panicum, &c., gave a pretty finish. Some very handsome flowers were shown in this collection, borne on well-grown plants in 6-inch pots. Several new varieties were included.

Messrs. H. CANNELL & SONS, Swanley, Kent, set up a group of Begonias, all of single tuberous-rooting varieties, in numerous shades of colours, some of the flowers being over 7 inches across. Humea elegans and suitable-sized Palms at the back, with a row of Echeveria farinosa, pleasingly set off this showy group.

A large exhibit of Sweet Peas, Pelargoniums, and tuberous-rooting Begonias was displayed by Mr. H. J. JONES, Ryecroft Nursery, Lewisham, all in first-class style, and displayed in good taste. The collection of

Sweet Peas was very comprehensive and charming. glass vases being used for their display. The exhibit of Pelargoniums was also first-class, and included most of the finer varieties.

FLORAL DECORATIONS.

The only exhibit in a special class for three bowls of flowers was one from Mr. CHAS. RUSSELL, florist, Pembroke Square, Kensington. The vases were filled with Iceland Poppies, Lilies, and Roses respectively; and although the bowl of Liliuns was of excellent effect and quality, that of the Poppies was meagre, and the colours did not harmonise with the blue Centaureas used; while the Roses were poor in quality, and arranged in too crowded a manner. 2nd prize was awarded, mainly for the boldness and grouping of the Lilies, the flowers of which should have been shown naturally, but the anthers had been removed.

HARDY FLOWERS.

Mr. AMOS PERRY, Winchmore Hill Nurseries, London, N., exhibited a very extensive group of cut flowers of hardy plants, apparently of most species now in flower. Mr. Perry had also an illustration of a water garden, in which were shown flowers and leaves of most of the best Nymphaeas, and in other vessels the water Hyacinth in flower, and other species suitable for cultivation in water.

Messrs. GEO. BUNYARD & CO., Royal Nurseries, Maidstone, exhibited a collection of hardy flowers, including some of the most showy species now in flower. Schœnia Cassiniana, which is not quite hardy, was exhibited in flower in a pan.

Messrs. T. S. WARE, Ltd., Feltham, Middlesex, showed a large quantity of cut hardy flowers. Many fine and meritorious flowers were included, Romneya Coulteri, Campanula pelviformis, Clematis erecta, &c.

Messrs. R. WALLACE & CO., Kilnfield Gardens, Colchester, set up a group of hardy plants. The plants were staged on the ground in the centre of a tent, and the members, being arranged in a representative manner, gave a pretty effect. Iris Kämpferi, a fine display of Liliuns, including a good batch of L. Henryi and L. excelsum, Eremurus Bungei, and the hybrid form Shelford (E. Bungei x Olgae), were especially noted. The interesting annual, Campanula macrostyla, was shown well, its Petunia-like flower and torpedo-like style and marbled petals being most interesting.

T. BRADSHAW, Esq., The Grange, Southgate (gr., Mr. Whitelegge), in his collection not only presented a charming and comprehensive collection of flowers, but demonstrated the proper manner in which to display these to the best advantage. Staged on a white table-ground in vases and épergnes, each group of flowers was arranged without overcrowding.

Mr. M. PRICHARD, Christchurch, Hants, exhibited some excellent hardy cut flowers; Iris Kämpferi were a feature, Spiraea palmata was good, also Gladioli.

Another fine group of hardy cut flowers came from Mr. B. Ladhams, Shirley Nurseries, near Southampton. Gaillardias were shown well; Scabiosa caucasica, Pentstemon Newbury Gem, Hemerocallis aurantiaca major, and Platycodon alba were good.

SWEET PEAS, VIOLAS, &c.

Mr. C. W. BREADMORE, Nurseryman, Winchester, exhibited some strongly-grown Sweet Peas, including some new varieties which were shown before the Committee for Certificate, but no awards were made.

Messrs. J. K. KING & SONS, Coggeshall, Essex, also showed bunches of Sweet Peas, &c.

Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley, made an exhibit of Sweet Peas, and a number of hardy border plants were represented by cut flowers.

Messrs. T. WARE, Ltd., Feltham, Middlesex, showed a fine collection of Pinks, Sweet Peas, and Roses. The Sweet Peas were arranged with good taste, fancy Bamboo vases being utilised for the purpose.

Messrs. DOBBIE & CO., Rothesay, exhibited Sweet Peas, Violas, Pansies, and Cactus Dahlias. The Sweet Peas, charmingly displayed in vases, with colours well intermingled, made a very pretty group, Countess Spencer, Marchioness of Cholmondeley, and Mrs. H. K. Barnes being included. The Pansies and Violas included many meritorious varieties, the black staging used throwing them well into relief.

Some flowers of a new Sweet Pea, "Gladys Unwin," were exhibited by Mr. WM. J. UNWIN. The variety strongly resembles Countess Spencer.

CARNATIONS.

Mr. JAS. DOUGLAS, Edenside, Great Bookham, Surrey, showed some of his specialties in Carnations,

all border varieties save three kinds of Souvenir de la Malmaison. The others included Kaffir (dark crimson), The Dawn (rosy-pink), Trojan (pure white). Several varieties are described under "Awards."

Messrs. D. S. WILLIAMS & SON, Upper Holloway, London, staged some choice varieties of Carnations in pots, principally Malmaison varieties, Princess of Wales, Mrs. Trelawney, Mrs. H. J. Jones, being some of the finer varieties displayed. A few border varieties were arranged at the back.

A very fine exhibit was set up by Messrs. CUTBUSH & SON, Highgate, N., the display occupying the whole of one of the side tables in Tent 4. The collection was arranged in first-class style, and the flowers and plants were shown in splendid order. A collection of Carnations in vases was a prominent feature, these pleasing flowers being displayed in a highly decorative manner. A Bamboo épergne of Malmaison "Princess of Wales" was handsome, the blooms themselves being highly creditable. Climbing Roses in pots, Verbenas, Ericas, Boronias, Lantanas, Hydrangeas, &c., suitably interspersed with foliage plants, completed a very choice display. Lantanas "Barnet Heliotrope" and "Barnet Bronze" are both pleasing varieties of this useful greenhouse flower. Messrs. Cutbush also set up a group of herbaceous flowers.

Messrs. GEO. BOYES & CO., Aylestone Nurseries, Leicester, showed a group of Carnations, also a number of cut flowers arranged in glasses.

FERNS.

Mr. H. B. MAY's group, from Dyson's Road Nurseries, Upper Edmonton, extended nearly the whole length of one side of the centre stage of the large tent, the space being filled with choice plants. The collection consisted of upwards of 250 species and varieties, many of them being shown in large specimens. Among the most prominent were Polypodium Mayi, which is a variety of P. sporodocarpum, and one of the most beautiful garden varieties we have, but like others with plumose fronds, it does not produce spores, and consequently will never become very plentiful; Pteris Summersi, another remarkably beautiful plumose form; Nephrolepis Piersoni, which seems to improve under culture, and may be easily increased from the spreading rhizomes; Adiantum Farleyense, in splendid condition; many Davallias in large specimens; D. fijiensis and its varieties robusta, elegans, and magnifica; Platycerium Willinkii, and athiopium; Polypodium Schneideri, P. hirsutum, P. crassinervium, P. phymatodes cristata, P. quercifolium, and several pretty small-fronded, spreading sorts, grown on moss-covered stems, of these P. vacciniifolium, P. salicifolium, P. squamulosum, P. lycopodioides, and P. vacciniifolium album (with pretty little silvery-grey fronds on woolly rhizomes); Pteris tricolor, P. flabellata, P. ludens, and others of the Doryopteris group. Aspleniums were well represented, including A. Mayi, A. grandis, and other varieties which came from A. pterioides, A. radicans, A. caudatum, A. nobilis, and others; Gymnogrammas, the best gold and silver varieties, and choice Adiantums.

Messrs. HILL & SONS, Lower Edmonton, exhibited a group occupying a large space on the ground, and some of the choicer small plants were partially hidden. The background was made up of large specimens of Dicksonias, Polypodiums, Davallias, Todeas, Nephrolepis Fosteri, and others on cork stems. In the foreground a great variety of shades in colour were seen, though not so many of the red-tinted sorts as we sometimes see. The soft, pale-green fronds of Asplenium marginatum contrasted well with the deep green of Lomaria procer. Lomaria L'Herminieri with bright red-tinted fronds; L. attenuata, of a soft pink hue; Nephrodium erythrosorum, Leucostagia immersa, Nothochlana sinuata, Pteris Regine and P. R. cristata, Gymnogrammas (gold and silver), Gleichenia Mendii, G. dicarpa longipinnata, and G. flabellata, all showed various shades; Lygodium dichotomum, Brainea insignis, Onychium auratum, Polypodium Meyerianum, Davallia Veitchii, D. repens, Pteris Childsi, Lindsaya retusa, Adiantum Veitchii, and others, the whole forming a most attractive group. When we see what a beautiful effect can be produced with Ferns, it seems remarkable that choice collections are not more frequently seen.

FINE FOLIAGE AND OTHER INDOOR PLANTS.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, exhibited a group of flowering and foliage plants arranged in the large tent. It was certainly one of the finest groups we have seen. One of the best features was the fine baskets of Nepenthes standing up on pedestals above the other

plants; *N. Mastersiana*, *N. Burkei* excellens, *N. mixta*, *N. Curtisii* superba, *N. Amesiana*, and others, all having very fine pitchers. Large plants of *Alocasias* of several sorts; *Phyllotanium Lindeni*, *Maranta Sanderiana*, *Dracena Victoria*, *Coccoloba pubescens*; tall

divide the brighter colours. In the foreground [were some good plants of *Tillandsia zebrina* with long flower-spathes of bright scarlet. The whole group was well finished off, with almost every plant showing to advantage.

A. Veitchii and *gracillima*, *Ficus Parcelli* in well grown plants, *Jacaranda mimosaefolia* and *J. Clauseniana*, fine specimens of *Dracena Victoria*, and many other choice species made up a light and effective group. Mention should be made of a large bunch of

FIG. 20.—*FURCRAEA LONGEVA*.

Grown in Mr. Dorrien Smith's Garden at Tresco Abbey, Scilly, and exhibited by him at the Holland House Show. (See p. 46.)

plants of *Codiaeum Warreni*, *Nestor*, &c., were effectively used. *Caladiums* included some highly-coloured sorts—*La Lorraine*, *Lady Moseley*, *Baroness Schroder*, and *Rio de Janeiro* being very good. In the centre of the group were some well-flowered greenhouse *Rhododendrons*, and *Carnations*, including "*Malmansons*" and border varieties. *Canas* were another bright feature. In the background were *Lilium Henryi* standing up among tall *Cocos flexuosa*. Some choice *Ferns* were used to

Messrs. W. BULL & SONS, King's Road, Chelsea, had an effective group of foliage plants. Tall specimens of *Dicksonia antarctica* and other Tree *Ferns* with *Palms* in the background, *Davidsonia pruriens*, a most effective plant with large, pinnate leaves, the long oval pinnae serrated, the young leaves of a soft bronzy-brown; *Caladiums* of the brightest sorts, *Codiaeums*, including *Flamingo*, *Reidi*, *Emperor Alexander*, *Cheloni*, and others; *Aralia elegantissima*,

the beautiful *Bougainvillea Maud Chettleburgh*, the finest of this genus.

Messrs. F. SANDER & Co., St. Albans, made a fine display of foliage and flowering plants. *Nicotiana Sanderae* was well shown, many of the plants having flowers of a more pleasing shade of colour than when first exhibited. It is an effective plant in groups, but its value will be most appreciated for planting in the open ground. *Marguerite Queen Alexandra* was shown

as an improvement on 'Coronation,' the flowers being better filled with quilled florets in the centre. *Begonia Bowringiana*, a very distinct variety, the woolly leaf stalks and under sides of the leaves of a rich crimson, the surface deep green with a lighter zone; *Begonias* Our Queen, His Majesty, Mrs. H. G. Moon, and other good hybrids of the Rex type; *Asparagus Sprengeri variegata*, *A. myriocladus*, *Pandanus Sanderi* (a fine specimen with long leaves regularly striped with yellow), a grand specimen of *Polypodium Knightiae* with very long feathery drooping fronds, *Heliconia Edwardus Rex* (a very large specimen), *Ficus pandurata*, *Phoenix Roebelinii*, *Furcraea Watsoniana*, *Araucaria Rex*, *Vriesia Forgetiana*, &c.

Mr. RUSSELL, Richmond Nurseries, Surrey, filled one large corner space with a beautiful lot of bright foliage. *Codiaeums* were a feature, and included fine plants of *Golden Ring*, *Warreni*, *Aigburth Gem*, *Reidii Adonis*, and well-coloured plants of the old favourite *angustifolia*; *Alocasia macrorrhiza variegata*, *A. mortefontaineensis*, and other large-leaved sorts, *Maranta zebrina*, *Dracena Victoria*, *D. Sanderiana*, *Ananassa sativa variegata*, well-coloured *Caladiums*, with tall Palms and some fine specimens of *Cordylina Russelliana*, the dark bronzy foliage of which contrasted well with the brighter hues.

Messrs. R. & G. CUTHBERT, Southgate, put up a large and effective group. *Lilium auratum*, *L. longiflorum*, *L. lancifolium*, and *L. tigrinum* were well shown; *Crassula coccinea* arranged in the centre was very bright; several good sorts of Ivy-leaved *Pelargoniums*, *Beauty*, *Supreme* (a fine pink variety), *Her Majesty*, *Incomparabilis* (a fine scarlet), and others; *Tuberose*s, tall plants of *Hydrangea paniculata grandiflora*, arranged among *Cocos flexuosa*, made a good background.

Mr. ICETON, of Putney, had a group, in which were retained *Ghent Azaleas* and *Lily-of-the-Valley*, *Lilium auratum*, *L. longiflorum*, arranged with foliage, *Bambusa Simoni variegata*, *Cocos flexuosa*, *Eurya latifolia variegata*, *Caladiums*, and other foliage plants.

Messrs. PEED & SON, West Norwood, put up a large group of *Caladiums* arranged with Ferns; the bright colours showed up well. The varieties were of the best and brightest Rio de Janeiro, Mrs. J. Peed, Silver Queen, Madame Léon Say, and many others were worthy of note.

Messrs. JOHN LAING & SONS, Forest Hill Nurseries, had a group of *Caladiums*, composed of a considerable number of plants of moderate size, exhibiting a number of varieties.

Mr. W. WELLS, Ranelagh Nurseries, Leamington Spa, exhibited a group of plants, in which *Asparagus myriocladus*, *Codiaeums*, and other foliage plants were included.

Mr. R. ANKER, agent for FRANZ DE LAËT, Contich Les Anvers, Belgium, exhibited a group of miniature and other succulent plants, also some plants of the dwarf-growing *Nertera depressa*, well covered with its scarlet fruits.

Messrs. JAMES VEITCH & SONS, in addition to other things, exhibited a group of plants which included *Lobelia tenuior*, *Fuchsia Sylvia*, a very effective variety with a double white corolla and brilliant red calyx; *Streptocarpus achimenesiflorus albus*; *Rehmannia angulata* in flower, &c.

Messrs. J. & W. BROWN, Stamford and Peterborough, exhibited a group of greenhouse plants in which *Verbenas* Scarlet King and Miss Willmott, also *Fire Dragon* and several new varieties of *Cactus*-flowering *Pelargonium* were conspicuous.

Mr. H. B. MAY, in addition to Ferns, showed a good collection of zonal and Ivy-leaved *Pelargoniums* in pots. The plants were all well flowered, and included the most useful sorts for market work. *Blanche* (white), *Lord Kitchener* (crimson), *Lady Dorington* (pink), Mrs. H. Stedall (deep salmon), *Princess Charles* of Denmark, and *Gustave Larsen* were specially worthy of note.

Messrs. JOHN PEED & SON, West Norwood, London, showed *Gloxinias*, which, considering the lateness of the season, were highly creditable.

Mr. VINCENT SLADE, Taunton, Somerset, set up a collection of Zonal *Pelargonium* bloom in vases, together with some of the Ivy-leaved section. They were displayed on a white table ground with small Ferns worked in the group.

Messrs. B. S. WILLIAMS & SON, Upper Holloway, furnished one corner of tent No. 4 with a group of *Hydrangea Hortensia*, some large Palms at the back being used for effect.

MISCELLANEOUS.

Messrs. REAMSBOTTOM & CO., Geashill, King's County, Ireland, brought a collection of *Anemones*, including a large batch of King of Scarlets and The Bride. The single Irish *Anemones* were very charming, reminding one of gorgeous Poppies.

Miss WILLMOTT, Great Warley, Brentwood, staged a number of plants of *Verbena* "Warley Scarlet," a variety eminently suitable for bedding purposes.

Messrs. WM. BULL & SONS, Chelsea, staged a collection of *Gladioli* and baskets of white Brighton Gem *Pelargoniums*.

A group of hardy *Nymphaeas* in pans was shown by L. CURRIE, Esq. (gr. Mr. Profit), Muley Manor, Farnborough, Hants. The beautiful bluish shades on many of these handsome if somewhat stiff flowers were delightful.

GROUPS ARRANGED IN THE OPEN.

Messrs. JAMES VEITCH & SONS, Chelsea, brought a number of well-grown plants of *Sciadopitys verticillata* in tubs, arranging a number of pot plants of *Campanula peregrina* as a frontage for the collection, and thereby partly destroying the effect of the handsome *Sciadopitys*.

Mr. DAVID RUSSELL, Brentwood, staged a large group of ornamental foliage plants, *Acers*, *Aralias*, *Retinospora plumosa* in variety, *Hollies*, arborescent *Ivies*, *Golden Yews*, and other ornamental *Conifers*, &c.

Mr. L. R. RUSSELL, Richmond, staged a group of tree *Ivies* of various types, including gold and silver-leaved varieties, &c., most of the arborescent forms of this plant being included.

Messrs. W. FROMOW & SONS, Chiswick, W., had a well-arranged group of ornamental foliage hardy plants. Several tall hardy *Bamboos* were arranged at the back, standards of other members being worked among the group. The groundwork was comprised mainly of Japanese *Maples*, &c.

A very fine group of similar plants was set up by Messrs. THOS. CRIPPS & SONS, Tunbridge Wells, Kent, whose collection included some handsome types of Japanese *Maples*, *Vitis* species, *Ivies*, fancy *Oaks*, *Conifers*, &c.

A showy group of *Phlox decussata* was set up by Mr. JOHN FORBES, Hawick, some giant forms of *Pentstemon* and some good spikes of *Delphiniums*. A crimson *Pentstemon* was noticed named *Crimson Gem*. Lord Kitchener, Albert Edward, and Eugène Sandow are good forms of *Delphiniums*.

AWARDS MADE BY THE FLORAL COMMITTEE

Alpinia Sanderi.—This is a first-class variegated variety, of excellent effect when as freely variegated as the plants shown by Messrs. SANDER & CO. (see fig. in Supplement to *Gardeners' Chronicle*, April 18, 1903) (First-class Certificate).

Astilbe "alba" and "rosca".—One of the finest features of the show was a group of a dozen or so plants of *Spirea* shown by Gv. VAN WAVEREN & KRUIJFF, of Haarlem, Holland. There were two varieties, one having white flowers (said to have been obtained from a cross between *Astilbe* × *Lemoinei* × *Spirea compacta*), and the other rich pink-coloured flowers (said to have been obtained from crossing *Spirea compacta* with *Astilbe chinensis*). The plants were from 2 to 3 feet high, and bore strong inflorescences of showy flowers, much superior to anything previously seen in *Spireas*. The pink flowered variety appeared to be just as strong-growing as the white variety. The Floral Committee recommended the award of a Gold Medal for these plants.

Begonia Canopus.—A double flower of rich yellow colour and large size. Shown by Messrs. B. R. DAVIS & SONS, Yeovil (Award of Merit).

Begonia Margaret Gwillim.—A large double flower of rich yellow colour. Shown by Mr. A. LL. GWILLIM (Award of Merit).

Carnation Glow-worm.—A border variety with bright scarlet flowers, of good form, and possessing non-splitting calices. Shown by Mr. JAS. DOUGLAS, Bookham (Award of Merit).

Carnation King Solomon.—A border variety of considerable distinctness. The colours are purple, red and cream, being thus a "fancy." Shown by Mr. DOUGLAS (Award of Merit).

Carnation Lady Linlithgow.—Apparently a border variety of rich rose colour, approaching to cerise. The flowers have large, smooth petals, only slightly fragrant. Shown by Mr. MARTIN R. SMITH (Award of Merit).

Furcraea longera (see fig. 20, p. 45).—A magnificent inflorescence of this Mexican species of *Amaryllidaceae* was shown by Mr. DORRIEN SMITH, Treco Abbey,

Scilly Isles. The inflorescence was 10 or 12 feet high, and there are few localities in Britain where the species would succeed. The Floral Committee awarded a Gold Medal. We have a photograph of this, or a closely allied species, grown under glass by Mr. Mullins, of Eastnor Castle Gardens.

Glaucium flavum tricolor, a brownish-crimson variety of the Horn Poppy, with chocolate mark at base of each petal.—Shown by Messrs. WALLACE & CO. (Award of Merit).

Rose "C. J. Graham".—A new hybrid Tea Rose of deep crimson colour, and therefore a welcome addition to this section (Award of Merit).

Rose "Countess Annesley".—A new hybrid Tea Rose of beautiful pink colour, and broad, good petals (Award of Merit).

Rose Duchess of Westminster.—This variety has large flowers which open a rich rose colour, and become paler, being then of a tint similar to that of *La France* (Award of Merit). The three varieties enumerated above were shown by Messrs. ALEX. DICKSON & SONS.

Rose "Mrs. F. W. Flight".—This is another "pink Rambler." The flowers are of large size, pink with white centre, produced in enormous trusses. Mr. F. W. FLIGHT, Cornstiles, Twyford, Hants (Award of Merit).

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq., Chairman; and Messrs. W. Bates, Geo. Reynolds, W. Poupert, W. H. Divers, H. Parr, A. H. Pearson, G. Norman, W. Fyfe, S. Mortimer, Geo. Woodward, G. T. Miles, J. Willard, J. Jaques, Geo. Kelf, Jas. Gibson, H. Balderson, F. Q. Lane, Jas. Cheal, R. L. Castle, and W. Pope.

Whilst the exhibits of fruits were comparatively few, yet they were generally very good. The best without doubt was that staged at one end of a long tent by Messrs. G. BUNYARD & CO., The Old Nurseries, Maidstone. This comprised some twenty Apple and Cherry trees in pots and numerous dishes of fruit. The Apple trees in good fruit were chiefly *Emperor Alexander*. The Cherries included *Kirtland's Mammoth*, *Bigarreau Napoleon*, *Black Tartarian*, *Emperor Francis*, and others all well cropped. The dishes, of which there were twenty-four, included of black Cherries, *Noir de Schmidt* (very fine), *Werder's Early Black*, *Knight's Black*, *Bohemian Black*, *Bundell's Black Heart*, *Black Tartarian*, and *Turkey Heart*. The light-coloured fruits included *Bigarreau de Munster*, *Kentish Bigarreau*, *Early Amber*, *Frommore Bigarreau*, *Abbesse d'Oignies*, *Florence*, *Bigarreau Napoleon*, and others. There were also excellent samples of *Strawberries* *Eleanor*, *Givon's Late Prolific*, *Latest-of-All*, *Sir Joseph Paxton*, *Louis Gautier*, and *Dr. Hogg*. These dish fruits, especially the Cherries, proved to be exceedingly attractive.

H. PARTRIDGE, Esq., J.P., Bletchingley, Surrey (gr. J. W. Barks), set up a handsome collection of fruit inclusive of good *Black Hamburg*, *Buckland Sweet-water*, and fairly good *Foster's Seedling Grapes*; *Stanwick*, *Elruge Nectarines*, *Violette Hâtive* *Peaches*, *Royal Jubilee*, *Little Heath*, and *Royal Sovereign* *Melons*, and excellent samples of *Givon's Late Prolific Strawberry*, and *Raspberries*.

Messrs. JAS. VEITCH & SONS, Chelsea, had two large boxes of their fine new Strawberry *The Alake*, one to show sample, and one cropping qualities; also that fine variety *President Loubet*.

Mr. A. H. T. MONTMORENCY, Carrickmines, Dublin, had fine fruits of *Latest-of-All*, *Monarch*, and *President Strawberry*, but they somewhat lacked our usual English colour.

Messrs. LAXTON BROS., Bedford, had in very fine form their new variety *Laxton's Latest*, the product of a seedling from *Latest-of-All*.

From J. B. JOEL, Esq., Northaw House, Potters Bar (gr. Mr. J. May), came two boxes of superb fruits of *Waterloo Strawberry*.

The Duke of NORTHUMBERLAND (gr. Mr. W. C. Leach), sent from Albury, Guildford, samples of *Eleanor*, *Lord Napier* and *Waterloo Strawberries*, the latter being much the finest sample. From the HORTICULTURAL COLLEGE, Swanley, came Apples *Lady Sudeley* and *Beauty of Bath*, the latter well coloured; and a *Melon* *Swanley Hero*. Mr. WHITMORE, Birchwood Nursery, Swanley, sent fruits of new *Melons*; and from Mrs. HOLT (gr. J. Bundy) came a few fruits of *Passiflora edulis*.

The only vegetables seen were two dishes of a fine podded Pea, King's No. 1, shown by J. K. KING &

SONS, Coggeshall, Essex; and a dish of a handsome red Tomato, Lord Roberts.

Awards of Merit.

Raspberry "Champion." This was sent by Mr. G. BENWELL. Not only were there numerous dishes and baskets of the fruit, but canes (old and new) showing strong growth, and bearing out the statement that the plants continued to fruit for two months, were also staged. The fruits were the size and colour of Superlative, but more rounded in shape.

Strawberry "Laxton's Latest."—The fruits of this late-fruited variety are of large size, dark red colour, and good flavour (see remarks in last week's issue, p. 21). From Messrs. LAXTON BROS.

HORTICULTURAL APPLIANCES.

Mr. BENTLEY, of Hull, had in quantity his famous Insecticide, and Weed-Killer, with other things. VALLS & Co., Coleman Street, E.C., had their excellent Beetle-killer or insect-destroyer. H. STANLEY & Co., South Norwood, showed in this a solution termed Slug Death, a name which conveys its purpose.

The ANGLO-CONTINENTAL GUANO WORKS, Leadenhall Street, showed guanos, various other manures, and sundries.

Mr. H. PATTISON, Streatham, S.W., had horse-shoes for lawn-mowing, the merits of which have now been well tested. D. DOWEL & SON, Hammersmith, had pots for Orchid-culture, and other forms of pottery.

Messrs. CORRY & Co., Finsbury Street, London, had a long stand, including numerous manure samples, Niquas Insecticide, Lethorion, and various other articles. Mr. J. GEORGE, Putney, had Mushroom-spawn, peat samples, manures, nicotine fumigators, &c.

W. POORE & SONS, Cheapside, London, had an exhibit of hot-air and hot-water heating apparatus for amateurs' greenhouses.

Messrs. JOHN FELS & Co., Berkhamstead, showed plant and tree stakes, mallets, and other useful objects.

The excellent Four Oaks undentable syringes from Sutton Coldfield were in strong force; and very interesting were the knapsack and hand-sprayers, with other objects, shown by DE LUZY FRÈRES, of Camberwell.

The well-known tree and plant tubs of diverse shapes and sizes shown by Messrs. CHAMPION & Co., City Road, E.C., were there; as also was a big collection of sundries, pottery, syringes, tools, and other things, staged by Messrs. OSMAN & Co., Commercial Street, London.

W. HERBERT & Co., Hop Exchange, London, showed samples of peat, labels, sprayers, and manures.

Messrs. WOOD & SON, Wood Green, N., had a remarkably complete collection of sundries, ranging from 20 feet Bamboo rods down to the smallest thing needed in a garden; also soils, fertilisers, baskets, and a myriad of other things.

Messrs. FENLON, Whitefriars, London, had excellent heating apparatuses, especially for small greenhouses and halls, also other useful contrivances.

Mr. J. PINCHES, Camberwell, had a large sample of his imperishable Acme plant and tree labels.

Messrs. DOULTON & SONS, Lambeth, had flower vases, garden and hall pottery, edging tiles, and other things.

Messrs. PULHAM & SON, Newman Street, W., showed a pretty piece of miniature rockwork artistically planted, and also admirable garden vases and seats.

T. DYER & Co., Finsbury, E.C., showed ladders, tools, benches, and much of mechanical interest.

Messrs. H. CASTLE & SONS, Milbank, London, had numerous garden seats in various patterns, made from the teak of old war ships, which are very durable.

Mr. G. W. RILEY, Norwood Road, Herne Hill, sent a dozen of garden summer-houses or arbours of rustic patterns, all diverse, and exhibiting great excellence in construction.

AWARDS MADE BY THE COUNCIL.

GOLD MEDAL.

Jas. Veitch & Sons, Chelsea, for Stove, Greenhouse, Hardy, and Flowering Plants.

Sander & Sons, St. Albans, for Orchids.

Dorrien Smith, Esq., for *Furcraea longeva*.

T. Cripps & Sons, Tunbridge Wells, for Acers and Hardy Plants.

A. Dickson & Sons, Newtownards, for Roses.

Blackmore & Langdon, for Begonias.

Messrs. Waverin, for Astilbes.

SHERWOOD CUP.

1st, Paul & Son, Cheshunt, for Roses.
2nd, G. Mount, Canterbury, for Roses.

SILVER CUP.

H. B. May, Edmonton, for Ferns and Flowering Plants.

L. R. Russell, Richmond, for Trees, Shrubs, &c.

G. Bunyard & Co., for Herbaceous Flowers and Fruits.

T. S. Ware, Ltd., for Alpines and Herbaceous Flowers.

W. Cutbush & Sons, for Carnations, Irises, &c.

J. Peed & Son, for Gloxinias and Caladiums.

R. Wallace & Co., for Herbaceous and Bulbous Plants.

Amos Perry, for Herbaceous Plants, &c.

Charlesworth & Co., for Orchids.

John Bradshaw, Esq., for Hardy Plants and Flowers.

H. J. Jones, for Sweet Peas, &c.

J. Laing & Sons, for Begonias.

J. Hill and Son, for Ferns.

J. Colman, for Orchids.

W. Bull & Son, for Stove and Greenhouse Plants.

M. Prichard, for Alpines and Hardy Flowers.

Laurence Currie, for Water-Lilies.

Barr & Sons, for Hardy Flowers and Pigmy Trees.

H. Partridge, Esq., for Fruit.

C. W. Breamore, for Sweet Peas.

SILVER-GILT FLORA MEDAL.

D. Russell, for Hardy Trees.

B. R. Cant & Sons, for Roses.

Dobbie & Co., for Pansies, &c.

C. Vuytsteke, for Orchids.

B. S. Williams & Son, for Gloxinias.

J. Jackman & Sons, for Roses and Herbaceous Plants.

Sir F. Wigan, for Orchids.

SILVER-GILT BANKSIAN MEDAL.

G. Reuthe, for Alpines, &c.

R. Farrer, for Alpines.

R. & G. Cuthbert, for Flowering Plants.

B. R. Davis & Sons, for Begonias.

SILVER FLORA MEDAL.

A. L. Gwillim, for Begonias.

H. Low & Co., for Orchids.

J. Cheal & Son, for Herbaceous Plants and Shrubs.

G. & A. Clark, Ltd., for Hardy Flowers.

SILVER BANKSIAN MEDAL.

J. Forbes (Hawick), for Hardy Flowers.

Jones & Son (Shrewsbury), for Sweet Peas, &c.

Fromow & Sons, for Hardy Trees.

Ladhams, Ltd., for Herbaceous Plants.

V. Slade, for Pelargoniums.

J. B. Joel, for Strawberries.

R. Anker, for Cacti.

Hobbies, Ltd., for Sweet Peas, &c.

HORTICULTURALSUNDRIES, IMPLEMENTS, &c.

SILVER-GILT FLORA MEDAL.

J. Bentley, Ltd., Chemical Works, Hull.

Pulham & Son, Newman Street, Oxford Street, W.

W. Wood & Son, Ltd., Wood Green, N.

G. W. Riley, Norwood Road, Herne Hill.

Osman & Co., 132, Commercial Street, E.

SILVER FLORA MEDAL.

H. Castle & Sons, Ltd., Baltic Wharf, Westminster.
The Anglo-Continental Guano Works, Leadenhall Street.

The Four Oaks Nursery and Garden Sundries Co., Sutton Coldfield.

Champion & Co., 115, City Road, E.C.

Doulton & Co., Ltd., Lambeth.

Fenlon & Son, Tudor Street, Whitefriars.

James George, Redgrave Road, Putney.

T. Syer & Co., 45, Wilson Street, Finsbury Street, E.C.

SILVER BANKSIAN MEDAL.

Valls & Co., 16, Coleman Street, E.C.

Corry & Co., Shad Thames, S.E.

De Luzy Frères, 99, Lilford Road, Camberwell, S.E.

D. Dowel & Son, Ravenscourt Avenue, Hammer-smith.

W. Herbert & Co., 2, Hop Exchange, S.E.

H. Pattison, Farm Avenue, Streatham, S.W.

R. Pinches, Crown Buildings, Camberwell.

BRONZE BANKSIAN MEDAL.

Wm. Poore & Co., 139, Cheapside, E.C.

DUTCH HORTICULTURAL AND BOTANICAL.

JUNE 15. At a meeting of the Floral Committee on the above date the Committee awarded First-class Certificates to *Lathyrus grandiflorus*, from Mr. B. RUYS, of Dedemsvaart; *Epiphronitis Veitchii*, a hybrid from *Epidendrum radicans* & *Sophranitis grandiflora*, from Mr. C. J. KKKERT, of Haarlem; *Rose Perle des Neiges*, from Mr. T. VAN DER WESSEL, of Elze, Holland. Certificates of Merit were awarded to *Heuchera sanguinea grandiflora*, from Mr. B. RUYS, of Dedemsvaart; *Meconopsis cambrica fl. pl.*, from Mr. B. RUYS, of Dedemsvaart; and *Gypsophila repens praecox*, from Messrs. VAN NAMED BROTHERS, of Zwijndrecht. The following plants gained an Honourable Mention: *Dianthus multiflorus*, from Mr. B. RUYS, of Dedemsvaart; *Odontoglossum crispum Trianae*, from Mr. C. J. KKKERT, of Haarlem; a collection of single *Anemone coronaria*, eighteen varieties, from Mr. P. W. VOET, of Overveen, near Haarlem; a collection of twelve varieties of *Heuchera*, from Messrs. WEZELENBURG & STASSEN, of Leyden.

MAIDSTONE ROSE SHOW.

JULY 4. The annual exhibition of the Maidstone Rose Society took place on the above date, in the gardens of "Somerfield," London Road. The show was in every way a great success. The blooms staged were above the average, both in quantity and quality, and competition was exceedingly keen.

Sir Marcus Samuel's Silver Cup was awarded Mr. WAKELEY for a splendid collection of twenty-four choice blooms; the National Rose Society's Silver Medal for the best Tea, Noisette, or Hybrid Tea Rose in the show was given to Mr. C. C. WILLIAMSON for a beautiful flower of *Lady Moya Beauchere*; while Ulrich Brunner, shown by Colonel PITT, secured the Society's Bronze Medal.

EALING HORTICULTURAL.

JULY 6. The annual exhibition of the above Society was held in the beautiful grounds of Gunnersbury Park on the above date, and was a great success. Cottage and Allotment Garden produce was a feature of the exhibition, the quality of the general exhibits was good, although not of the high standard of twenty years ago. There were two classes for groups, and the exhibits generally were neat and tasteful. Floral decorations filled one tent, the competitors being ladies. A fine group of plants from Gunnersbury Park was staged by Mr. GEO. REYNOLDS. Messrs. FROMOW & SON, Turnham Green; Mr. L. R. RUSSELL, Richmond, and some other local nurserymen contributed collections of plants. Roses were shown well, the Society's Silver Cup for twenty-four blooms being won by Mr. W. OWEN.

SOUTHAMPTON HORTICULTURAL.

JULY 6, 7. The annual summer exhibition was held on the Royal Pier, and was a success. The exhibits were more numerous in all sections, except fruit, than in any previous year. Groups of plants arranged for effect showed a distinct improvement. Roses and Sweet Peas were numerous and good, and vegetables were excellent, as they always are at Southampton.

PLANTS.

The principal class for plants was that for a central group of miscellaneous subjects, arranged for effect in a square space 10 feet by 8 feet. Five competed, making a nice display down the centre of the pavilion. The 1st prize was easily won by Mr. E. WILLS, The Nurseries, Winchester Road, Southampton. Mr. H. W. Hill, gr. to E. G. MERCER, Esq., Bassett, was 2nd.

For four specimens of stove or greenhouse plants, Mr. T. Hall (gr. to Sir S. MONTAGUE, Bart., M.P., South Stoneham House, Southampton) secured the leading award with medium-sized, freely-flowered plants; Mr. WILLS was 2nd. Mr. HILL also won 1st prize for four Ferns. Tuberous Begonias were well shown. Mr. Mitchell, gr. to J. WILLIS FLEMING, Esq., Chilworth Manor, Romsey, won 1st prize for double-flowered varieties.

ROSES.

The leading class was that for thirty-six blooms distinct. Messrs. D. PRIOR & SONS, Colchester, easily won 1st prize with large, fresh examples of popular varieties; Messrs. JARMAN & SONS, Chard, were 2nd. For twelve varieties, three blooms of each, Messrs. PRIOR were again successful; Messrs. JARMAN were 2nd. Messrs. PRIOR followed up their previous successes by winning 1st prize for twelve blooms of Tea or Noisette varieties; Messrs. JARMAN were 2nd.

For six blooms of any one dark variety Mr. G. H. Kent, gr. to Mrs. E. CROFT MURRAY, Mervale, Ryde, Isle of Wight, won with *Le Havre*. For a similar number of any one light variety, Mr. KENT was again successful with medium-sized, clean examples of *White Maman Cochet*.

In the following classes gentlemen's gardeners and amateurs only competed. For eighteen distinct blooms,

Mr. NEVILLE was 1st; and Mr. KENT, 2nd. For twelve blooms of 'Tea or Noisette' varieties, Mr. NEVILLE was again successful; and Mr. KENT, 2nd.

The most tastefully dressed vase of Roses came from Mr. MITCHELL, Chilworth; a similar honour falling to Miss MINNIE SNELLGROVE for a basket of Roses.

Sweet Peas were numerous and good. For nine bunches, Mr. C. W. BREADMORE, High Street, Winchester, won, with excellent flowers. Messrs. JARMAN & Co., Chard, were 2nd.

For Messrs. TOOGOOD's prizes for six bunches, Mr. J. M. SHEPPARD, Manor Farm, Swaythling, won 1st prize.

Mr. J. Matthews, gr. to Mrs. MALTRY, Botley, secured Mr. SYDENHAM's premier award for nine bunches; while Mr. J. Hughes, gr. to A. P. RALLI, Esq., Twyford, won that offered by Mr. C. W. BREADMORE for nine bunches.

Messrs. B. LADHAMS & Co., Shirley Nurseries, Southampton, had the best exhibit of twelve hardy border flowers; a like honour falling to Mr. G. Ellwood, gr. to W. H. MYERS, Esq., M.P., Swanmore Park, Bishop's Waltham, for nine bunches.

FRUIT AND VEGETABLES.

Fruit was staged in small quantity. Extra fine Strawberries came from Mr. MATTHEWS in the class for two dishes. Sir J. Paxton and Royal Sovereign were the varieties.

Vegetables were abundant. Mr. BECKETT, Aldenham House Gardens, Elstree, won both Messrs. Sutton & Sons' and Messrs. Toogood's prizes for six dishes with remarkably fine produce. Mr. Bowerman, gr. to Lord BOLTON, Hackwood Park, Basingstoke, was 2nd in each class; Mr. ELLWOOD coming next amongst twelve entries in the latter class.

TRADE EXHIBITS

were numerous. Gold Medals were awarded to Messrs. B. LADHAMS & Co. for hardy flowers, and to Messrs. TOOGOOD & SONS for Sweet Peas in pots and as cut flowers. Silver-gilt Medals to Mr. C. W. BREADMORE, Winchester, for Sweet Peas; and to Messrs. B. DAVIS & SONS, Yeovil, for tuberous Begonias. Silver Medals to Mr. ELLWOOD for three dozen bunches of garden Roses; to Mr. E. WILLS for wreaths, &c., and decorative plants; and to Messrs. JARMAN & Co. for Roses, &c. First-class Certificates were awarded to Mr. C. W. BREADMORE for Sweet Peas Reggie Breadmore, Douglas Breadmore, and Cyril Breadmore.

WANSTEAD AND LEYTONSTONE HORTICULTURAL.

JULY 7.—This Society held its thirty-eighth annual show on the above date in the grounds of The Warren, Wanstead. The number of exhibits was 560, an increase of 111 on last year. The competition in some classes, notably those for groups of plants and for table decorations, was very keen. The Gloxinias and Begonias exhibited by Mr. H. G. DAY (gr., Mr. W. Hammond) were remarkably fine, as were also Sweet Peas shown by Mr. W. JONES.

THE WOLVERHAMPTON FLORAL FETE.

JULY 12, 13, 14.—This show was held under favourable circumstances, and was very successful. The principal exhibitors were Messrs. Cypher & Sons, who had miscellaneous stove plants; Mr. John Robson, of Altrincham, who sent Malmesbury Carnations; Messrs. Webb, of Stourbridge, had a fine exhibit of Sweet Peas; Messrs. Dickson, of Chester, and Messrs. Jarman, of Chard, one of herbaceous plants. Begonias were shown by Mr. Davis, of Pershore. For Roses Messrs. Harkness & Co., of Hitchin, won the 1st prize for seventy-two, and also for forty-eight distinct varieties.

Exhibits and exhibitors were much the same as usual at large shows in the provinces. There were twelve more exhibitors and 150 more entries than last year. As showing the importance of this annual show, some idea of the numbers of visitors may be gathered from the fact that in 1901 the receipts amounted to £2,118, and in 1903 to £1,762. The judges included Messrs. Owen Thomas, A. MacKellar, W. Crump, J. Wright, N. F. Barnes, J. Deacon, Rev. J. H. Penoberton, R. Dean, W. Cuthbertson, P. Blair, J. Wallis, R. Cock, and A. Coombes.

GARDENERS' DEBATING SOCIETIES.

READING AND DISTRICT GARDENERS'.—The first evening meeting of the summer session was held, by permission of Mrs. Harrison, at Shiplake Court. Between seventy and eighty members, accompanied by the President, Mr. Leonard Sutton, left Caversham Lock by steamer, and on reaching Shiplake were met by Mr. J. Hall, the head gardener, Mr. W. Barnes, Chairman of the Association, and other members who had journeyed by road from Bear Wood, Wokingham, Maidenhead, Henley, &c. A move was at once made to the kitchen-garden, the borders of which were gay

with Irises, Canterbury Bells, Delphiniums, and other perennials. The vegetables appeared remarkably well, especially Potatoes and Peas. In the vineries the crop of Grapes was a heavy one, and the bunches and berries were of fine size. The party wended its way to the pleasure-grounds and Rose-garden; the latter at this time of the year is a feature here, and many varieties of Roses flourish well. The annual outing will take place on Tuesday, July 19, and, by kind permission of Mrs. Lionel Phillips, a visit will be made to Tydney Hall.

LAW NOTES.

CLIBRAN v. BUCKLOW BOARD OF GUARDIANS.

AN important appeal against the poor-rate assessment of a packing-shed and nursery land was made at the Cheshire Quarter Sessions on June 29 by Mr. Clibran, nurseryman, of Hale. Owing to the pressure upon our space we are compelled to hold over the particulars of the case until our next issue, but it may be stated now, that in some measure the appeal was successful.

ENQUIRY.

MOORE'S VEGETABLE CREAM MARROW.—Can any reader inform "An Old Gardener" how long this variety has been in cultivation? [About thirty-eight years. Ed.]

ANSWERS TO CORRESPONDENTS.

APPLE: J. W. L. G. We are unable to name the Apple.

BEGONIA: New Reader. The leaves are affected with mite; spray with tobacco-water. The Grape has the spot disease. See answer to "A. L. G."

CAMELLIA: A. T. C. J. We suspect the flower-buds dropped in the winter, owing to the roots having suffered from drought on some occasion. This is a frequent cause of the buds dropping at that period.

CARNATIONS: J. E. H. There is no disease present. The cuttings have been badly rooted in the first instance, and the few roots present have been unable to support the plants during the rapid period of growth.

CLAIM FOR EXPENSES: F. G. B. 1, You have no claim; 2, the wages you asked seem to us fair.

CLEMATIS FLOWERS: T. C. Examples of median proliferation. See Masters, in the *Transactions of the Linnean Society*, Vol. xxiii, pp. 359 and 481.

CUCUMBER: E. A. Cucumber-spot, *Cercospora melonis*. Burn the affected plants. Turn out the soil, and start afresh in a new house. If you cannot do this, spray the plants with 2 oz. liver-of-sulphur to 3 gallons of water, to which 2 oz. of soft-soap are added.

EMPLOYMENT IN KEW: Go-Ahead. Candidates must be more than 20 years of age and not more than 25 years. It is necessary that they have had five years' experience at least in good private gardens or commercial establishments. You will not be eligible therefore until two years or so. Write to the Curator, Royal Gardens, Kew, after that time.

FOXGLOVE: E. M. Very common; not due to hybridisation, but to several of the uppermost flowers running together into a regular cup.

GARDENER'S NOTICE TO LEAVE: E. D. We believe you are entitled to a month's notice or a month's salary.

GOOSEBERRY LEAVES: F. L. B. and E. C. *Aecidium grossulariæ*. Burn the leaves affected, and spray the bushes with liver-of-sulphur— $\frac{1}{2}$ oz. to 1 gallon of water. See illustration in *Gardeners' Chronicle*, May 14, 1904, p. 319.

GRAPES: A. L. G. The berries are badly affected with the spot disease (*Gloeosporium*). Burn the affected bunches as far as you can, and

spray the others with liver-of-sulphur, $\frac{1}{2}$ oz. to 1 gallon of rain-water.

HYDRANGEAS: R. M. C. Very fine. Did you use any special manure?

IRISES: F. A. See note on p. 42.

LUPIN: H. J. A very pretty variety that is worth perpetuating.

LYCASTE SKINNERI: W. M. Probably the plants have been overwatered at some time, causing the roots and eventually the young growths to decay. Frequently the new growths will damp off in this manner through drip from the roof, or by the indiscriminate use of the syringe when damping down. *Lycastes* do not require very much water until their new bulbs begin to show, but afterwards they may be given water almost without limit.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—W. J. B., Ltd. We cannot recognise the Rose. Send to some grower—G. H. 1, *Gloriosa superba*, warm greenhouse; 2, *Fuchsia*, we do not know the variety; 3, *Santolina incana*; 4, *Scolopendrium vulgare*; 5, *Nephrolepis cordata compacta*.—J. L. 1, *Valeriana* species; 2, *Symphytum patens* [?]; 3, *Chrysobactron Hookeri*; 4, *Asperula cynanchica*.—F. F. F. *Kalmia latifolia*.—A. H., *Orton*, *Syringa japonica*.—Newport, *Dendrobium moschatum*.—Nuneham, *Salvia Bethelli*.—Carnation, *Oncidium sphacelatum*.—H. D. W. *Vicia cracca* and *V. orobus*. Neither were numbered. Half an *Agaricus* arrived in bad condition, but it is undoubtedly *A. arvensis*, the "Horse" Mushroom, with which taste, odours, and spores all agree, but the "ring" had disappeared.—Wandering Jew, *Olearia macrodonta*.—J. C. *Lilium elegans*.—J. M. S. 1, *Pavia* species; 2, *Weigela rosea*; 3, send when in flower; 4, *Berberis vulgaris*; 5, *Lycium sinense*; 6, *Platanus orientalis* var. *acerifolia* (Maple-leaved Plane); 7, *Eunonymus europæus*; 8, *Pavia rubra*.—F. McD. 1, *Campanula glomerata*; 2, *Galega officinalis* alba; 3, *Sedum spurius*; 4, *Linaria hepaticifolia*.—G. P., *Harrogate*, *Nicotiana glauca*, illustrated in the *Bol. Mag.*, t. 2837. —P. J. P. *Agrostemma coronaria*; *Eccremocarpos scaber*, a useful summer climber outdoors. —F. G. B. *Deutzia crenata flore-pleno*. —Hants. *Cattleya Leopoldii*.—V. H. 1, *Oncidium maculatum*; 2, *Oncidium cheiroporum*; 3, *Lælia albida*; 4, *Cattleya intermedia*; 5, *Pleurothallis ornatus*; 6, *Stelis ophioglossoides*. —J. M. *Arauja graveolens*, figured in the *Gardeners' Chronicle*, September 8, 1888. —W. W., *Bagshot*. 1, not recognised; 2, *Spiræa opulifolia*; 3, *Cistus ladaniferus*; 4, *Hypericum pulchrum*; 5, *Potentilla variabilis*; 6, *Acer campestre*.

ODONTOGLOSSUM CITROSUM: W. M. You cannot do better than follow the cultural directions that were given in our "Orchid Calendar."

PEARS: G. W. G. Cracking from disproportion between the supply of water and its utilisation by the fruit. *Fusicladium dendriticum*, a fungus, is also probably present. Cut the branches back in autumn.

PICEA SHOOT DISEASED: J. R. We cannot see either insect or fungus. Is the drainage right, or is the tree suffering from the drought of the last few years?

POTATO DISEASE: W. H. Spray with Bordeaux-mixture, which may check if it cannot cure the malady. See *Calendar of Garden Operations*, to be had from our Publisher for 7 $\frac{1}{2}$ d., post free.

PLUM SHOOT DISEASED: Savoir. Silver-leaf, due probably to a fungus at the root. Cut away the affected branches and burn them. You must remove your furniture before the expiration of the term for which you have notice to quit.

COMMUNICATIONS RECEIVED.—R. A. R.—J. G. Westou.—S. & S.—A. J. S.—W. Rae.—H. S. W.—Wimble.—S. W. D.—W. E. B.—W. R.—J. K. J.—W. S. R.—D. S. A.—Narcissus.—C. D.—W. E. L.—Messrs. Dobbie & Co.—M. C. T.—F. B. B.

GREY TOWERS IN SPRING.

GREY TOWERS, Nunthorpe, the seat of A. J. Dorman, Esq., is situated in a beautiful part of the Cleveland district, and is about one mile from Nunthorpe Station, N.E.R. The mansion, which is built of ironstone, is a fine architectural structure. Its grey towers, from which it takes its name, can be seen rising from amongst the trees for miles round, and form quite a conspicuous feature in the landscape.

The pleasure grounds comprise some 46 acres of land, much of which has recently been added. The scenery from these grounds is very fine. It takes in on one side a fine view of some of the most noted amongst the hills of Cleveland, viz., Roseberry Topping and Easley Hill. Upon the summit of the latter is a monument erected to the memory of Captain Cook, the celebrated navigator, who was born in the village of Marton, and went to school at Great Ayton, both of which places are situate close under the hill. The country is well wooded, although many of the plantations are young. The pleasure grounds are upon sloping undulating ground, and these are the great feature of the place. There is no attempt at geometrical designs or closely-trimmed lawn, except in close proximity to the house. Everything possible has been done to preserve and maintain the natural beauties of the landscape. Some grass walks, which are kept cut close for convenience, lead to different parts of the grounds, but elsewhere the natural herbage

is allowed to grow rampant. Many wild flowers are growing among it, together with Narcissi, Daffodils, Tulips, Fritillarias, Primroses, and other spring flowers.

Passing from the mansion to the right and through shrubberies, some fine borders and clumps of Rhododendrons in great variety and Ghent Azaleas were to be seen at the time of our visit. Amongst these are planted spring-flowering bulbs, in which the Darwin and old-fashioned border Tulips are well represented. To the left a fine collection of the Coniferae has lately been planted, and judging from the luxuriant growth and fine appearance of some of the larger specimens planted some time ago, in course of time these will be most interesting.

Amongst the shrubs, of which there is a great variety, Prunus Pissardi with its purple foliage, Forsythia viridissima, Japanese Maples, Berberis Darwinii, B. stenophylla, Cydonia japonica, and varieties of Rubus are particularly noticeable. Groups of border flowers give to the whole a bright appearance—viz., Doronicum pardalianches var. Harpur Crewe, Lychnis diurna flore-pleno, Heuchera micrantha, Arabis, Alyssum, and Aubrietias in variety, Pyrethrum Tchihatchewii with its Daisy-like heads is rampant; Grape Hyacinths and Eremurus himalaicus were just throwing some strong spathes of flower.

At the bottom of the pleasure-grounds is a large lake, in which Water-Lilies in variety and other water-plants are growing. On the banks of the lake are mounds covered with Dogwood, Rubus, &c. In the moist places are Spiræas and Trollius in variety, Caltha palustris, Forget-me-nots, a purple-flowering Cardamine, and other interesting plants. A very large group of Saxifraga cordifolia var., with its bright deep-pink flowers, is a striking object in the distance. At the back of the lake immense groups of Rhododendrons, plantations of Conifers and deciduous trees intermixed, add to the beauty of the landscape. Turning back from the lake and looking towards the house one obtains a fine bird's-eye view of a large rockery and alpine-garden, which, with its border shrubberies, is about 7 acres in extent. The whole is arranged with considerable taste and skill, and reflects great credit upon Mr. A. Findlay, the head-gardener, under whose supervision the whole design has been planned and carried out. On the top of some of the hillocks, Pinus parviflora and other rock Coniferae are growing. Patches of Erica vulgaris carnea, E. v. aurea, E. mediterranea, Gentiana acaulis, a hybrid named G. celestina with lovely blue flowers, Lithospermum prostratum, Aubrietia deltoidea grandiflora, Alyssum montanum, &c., to which may be added Andromeda japonica, its young growths tipped with purple-red; Cassinia fulvida, with golden stems and foliage; and the yellow Gorse standing out grandly, all combined to produce a magnificent sight.

Examining the rockery and alpine garden more closely, the following were noted:—Phlox subulata, a double form of the Ground or Moss Pink; Euphorbia villosa, yellow and green; the charming little Box-leaved Berberis dulcis nana, Irish Heath, Menziesia polifolia, Fritillarias in variety, Anemone nemorosa (white), A. Robinsoniana (large azure-blue), A. alpina (white, growing in damp places), A. blanda, Ramondia Nathaliae (growing out of the fissures of the rock), the rare Cardamine trifolia (creeping in moist places), Arenaria balearica (a pretty little Corsican creeper with white flowers), running over damp stones, forming a close, dense moss like carpet, just commencing to flower in the more sunny spots), Orobis vernus (purple and blue), Iris pumila, Aponogeton distachyon (with its pretty, sweet-scented flowers growing in the water), Tritelia uniflora (the spring star-flower),

Phlox verna (just coming into flower), Geum montanum, Phlox amoena, Armeria leucantha, Andromeda tetragona (with its white, Lily-of-the-Valley-like flowers), the rare Andromeda vitellina (yellow), Primula Allionii (which does well here running over the stones), Allosorus crispus (most luxuriant in a little nook), Androsace sarmentosa (wedged in amongst the stones and running over them), Echeverias in variety, Saxifraga Camposii, S. Wallacei, S. granulata, fl.-pl. (Fair Maids of France), little patches of Hutchinsia alpina (white, full in flower), Polygala Chamæbuxus, Thymus corsicus (on the walks, soon to form a nice, soft carpet to walk upon), and a host of others too numerous to mention. The whole arrangement shows evidences of the work of a master-hand. Visitors to the North interested in this branch of horticulture would be amply repaid if they would inspect this fine collection. Alfred Gault.

NEW OR NOTEWORTHY PLANTS.

POTENTILLA NEPALENSIS VAR. WILLMOTTIÆ.

Four examples of a very pretty little Potentilla were exhibited at the Royal Horticultural Society's show held at Holland House, Kensington, on July 12 and 13, by Messrs. Sander & Sons, St. Albans, under the above name. This plant has a very remarkable history. About two years ago Messrs. Sander received from their collector Forget, then in the province of Santander, in Columbia, seeds of what he described as a "fine dwarf Potentilla." They were sown, and when the plants flowered a short time ago, a plant was submitted to Kew for determination. The flowers immediately recalled those of the Himalayan Potentilla nepalensis, Hooker, and a comparison with both dried and living specimens confirmed the impression, the chief difference in the living plants being that the novelty was much dwarfer, indeed under 6 inches high. Equally dwarf examples, however, are found among Himalayan dried specimens, and although such might be expected to lose this character to some extent under cultivation, I am told that in some forms the habit is constant. The thought then naturally arose, Can there be any mistake in the record? or, at least, were the specimens obtained from some garden? But the collector, I am assured, states that the plant occurs "wild." If so, it is a most remarkable geographical discovery. It is not remarkable that a Potentilla should occur in Colombia—for P. andicola, Benthams, is a native of that country; and P. Dombeyi, Nestler, by some regarded as a variety of the preceding, occurs in Chili—but it is remarkable that a Colombian mountain plant should so closely resemble another from the Himalayas, on the other side of the globe, that it is almost impossible to find characters to separate them. The agreement occurs throughout the shape and texture of the vegetative and floral organs, even extending to the colour and details of the achenes and styles, when seen under the microscope. It is true that according to Lehmann, who monographed the genus, the nearest ally of P. nepalensis is P. Thurberi, A. Gray, from the mountains of New Mexico; but that species, which is also in flower at Kew, is easily distinguished by the silvery under surface of the leaves, the darker flowers, and some other differences. Mr. Forget should be invited to give full particulars of his interesting discovery. The four plants exhibited were like the one sent to Kew. They formed neat little tufts, under six inches high, bearing flowers over an inch across, and having petals of a brilliant magenta-rose—in short, miniature editions of the beautiful P. nepalensis. R. A. Rolfe.

IRIS SPRENGERI,

SIEHE.

A NEW species, the smallest of the *Oncocyclus* group. It grows in the Lycaonian Taurus at an altitude of 6,500 feet. It is of easy cultivation. This dwarf plant is only 4 inches high. The rhizome is creeping and forms runners. Leaves 4 to 5½ inches wide and about 4 inches long, greyish-green, nearly sessile (stemless?). Ovary 1 inch long, mostly enclosed within the bipartite spathe. This spathe is very long, and almost reaches to the top of the flower. Outer petals clear yellow with bright purple-red spots and veins. Beard golden-yellow. Inner petals silvery-white veined with purple-red and black. Stigma golden-yellow spotted with brown and veined with black. Stamens grey. The plant is as interesting as it is beautiful. I first found it in 1903. W. Siehe, Mersina.

FIG. 21.—IRIS SPRENGERI, Siehe. (Natural Size.)

NURSERY NOTES.

A SCOTTISH HARDY PLANT NURSERY, TORBREX, ST. NINIAN'S, STIRLING.

AMONG the few nurseries in Scotland practically entirely devoted to hardy flowers is that of Mr. Mungo Chapman, Torbrex, St. Ninian's, Stirling, one of moderate extent, but containing many good plants. Mr. Chapman was well known for many years as the head gardener to Mr. Charles Jenner, at his wonderful place at Easter Duddingston, Edinburgh—an appointment he retained until the death of his employer led to the disposal of the property with its unique garden of alpine and shrubs. Some seven years ago Mr. Chapman became tenant of his present nurseries, and it is gratifying to learn that he finds an increasing share of business fall to his lot. The nucleus of the collection was formed from that of his late employer, by permission of the trustees, and there are among the plants a considerable number but rarely seen in an ordinary nursery.

The establishment is only a short distance from the St. Ninian's terminus of the Stirling tramway

lines, and is thus convenient of access. Mr. Chapman's house is of some historical interest, as it has attached to it the tradition that Prince Charles Edward stayed in it in the course of his ill-fated enterprise to recover the British Crown. In front of the house are some rockeries and beds filled with some good plants. Among these is *Mimulus Burnettii*, the hybrid between *M. luteus* and *M. cupreus*, a free-growing, hardy plant. Here also are *Waldsteinia geoides*, *Alyssum saxatile* fl. pl., *A. olympicum*, the pretty *A. spinosum*, and others of the genus; several *Erodiums*, such as *macradenium* and *alpinum*; *Saxifrages* in great variety, with such good alpine *Dianthi* as *D. alpinus*, *nitidus*, &c. *Linum arboreum* does well here; while the *Helianthemums* are well represented by such as *H. lunulatum*, *H. Jubilee*, and one or two more of Mr. Hill-Normand's sports, with a number of good single forms. The pretty *Linnaea borealis* seems thoroughly happy, and

sections, such as *valdensis*, *Boydii*, and other alpine in demand and preferred in pots by some purchasers.

In the nursery lines are numbers of good alpine and border flowers, together with a large stock of dwarf and other shrubs. Among the alpine flowers are several good *Primula* species, such as *frondosa*, *japonica*, *sikkimensis*, and others; with *Saxifrages*, *Sedums* and *Semprevivums* in much variety.

A good many dwarf and tall *Campanulas* are also cultivated, and I noted as representative of the various other hardy alpine and border flowers, *Platycodons grandiflora* and *Mariesii*; *Oxytropis campestris*; dwarf, early and late-flowering *Phloxes*; the old double purple *Rocket*; *Rodgersia podophylla*; *Vancouveria hexandra*; *Epimedium pinnatum*, *Muschianum*, &c; *Incarvillea Delavayi*, very good here; the double form of *Meconopsis cambrica*; *Pterocarpus* or *Scabiosa Parnassi*; *Chrysogonum virginianum*; *Achillea ægyptiaca*; *Gentiana lutea* (in flower); *Statice latifolia*; *Salvia pratensis*; *Aster alpinus*, in several forms; *Geums*, *Heucheras*, *Irises cristata* and others of both dwarf and tall habit; *Anemone alpina* and *A. sulphurea*; *Cheiranthus Dillenii* and *C. alpina*; *Dryas octopetala* and *D. Drummondii*; *Erigerons*; *Enothera M. Cuthbertson*, *Iberises*, and many more.

The shrubs are very interesting, and one was pleased to see two plants of rather uncertain hardiness, according to some, in flower in the open in this exposed nursery. These are *Buddleia globosa* and *Ribes speciosum*. Neither of these is grown on a wall, though partly protected by the shelter of a low one. Both bloom freely and have been grown without protection. There is a very good collection of shrubby *Spiræas*, such as the varieties of *S. japonica*, *S. opulifolia*, *S. arifolia*, and others of the best and most distinct varieties.

A number of out-of-the-way *Roses*, such as the old one known in Scotland as "Prince Charlie's Rose," *R. alpina*, and several species are cultivated here. *Atragene alpina*, New Zealand *Veronicas* in many forms, *Piptanthus nepalensis*, *Cornuses*, *Gaultherias*, such as *procumbens*; *Bryanthus erectus*, *Olearias*, such as *Haasti* and *Gunniana*; *Escallonia Phillipiana*, *Abies orientalis*, *A. Clanbrassiliana*, *Juniperus spherica*, and some other *Conifers* of dwarf and taller habit; *Lupinus arboreus*, *Genistas*, *Cytisuses*, *Cotoneasters*, and a large number of other shrubs of evergreen and deciduous habit, are cultivated here in the hardest possible way. There are also small stocks for propagation of a number of plants not yet well in commerce or which have become scarce. The nursery, although, as already remarked, not large as nurseries go, is worth visiting in many ways, and Mr. Chapman's own knowledge of plants makes a call upon him one of more than ordinary interest. S. Arnott.

MESSRS. JOHN POPE & SONS, KING'S NORTON.

This nursery was founded in 1750 by Luke Pope, whose portrait as he appeared in 1788 adorns the front page of the cover of some of the catalogues issued by the firm, and whose lineaments suggest a typical Englishman of the day. Luke Pope erected a residence on the Handsworth Nursery, in which the present proprietor, John Pope, and his father, Henry Pope, were born. In the early sixties the rapid extension of industrial Handsworth necessitated a change of site further into the country, and the business was removed to King's Norton, to a position near the parish church and railway station. Here, again, smoke and other troubles were found to affect the well-being of plants, and resort was had to a more favourable spot a mile distant towards the country, where there is now an acreage of some 35 to 40 acres. This is known as the Middleton Nurseries; those near the station, which are largely dismantled, provide convenience,

such *Pentstemons* as *P. humilis* and *P. Menziesii* are doing well. There are also *Dryas octopetala*, the interesting *Astragalus Tragacantha*. New Zealand *Veronicas* in considerable variety, *Lithospermum prostratum*, *Globularias*, several choice dwarf *Conifers*, including *Dacrydium Franklinoi*, only a shrub in this country, though attaining 80 to 100 feet in height in Tasmania, where it is known as the Huon-tree. A notable plant here is an usually good specimen of *Teucrium pyrenaicum*, which many find difficult to grow to such a size as at Torbrex. Dwarf *Campanulas*, such as *pulla*, *G. F. Wilson*, *alpina*, and the choice *C. Allioni*, and many others are well grown in a suggestive way on these rockeries; while in one of the beds there is a good plant of the effective *Aciphylla Munroii*. *Ourisia coccinea* does unusually well and flowers freely.

In the nursery itself a distinct feature is the comparatively small number of plants in pots, by far the greater portion of the stock, even of those classed as alpine, being cultivated in lines in the open ground and kept without any protection. The main portion of the stock in frames consists of some of the choicer *Saxifrages* of the different

for packing, storage, &c. Here, at Middleton, Mr. John Pope and his family reside, at what is known as The Ericas, and behind the residence are the nurseries. The main south and west line of the Midland Railway runs through the lower-most portion of the grounds, which gradually fall away on a slope towards the valley. Here can be seen three span-roofed houses in divisions, each 300 feet in length, mainly devoted to a supply of plants, cut flowers, Tomatos, &c., for the Birmingham and other markets. In addition to these erections, but near the residence, is a range of nine commodious glass-houses, two or three of large size, all occupying a position on one side of the nursery. The general character of the soil is that of a clayey loam of good heart, which well repays proper cultivation.

Behind Mr. Pope's dwelling-house is a small terrace-garden of choice alpine plants, which is under the care of Mrs. Pope, and contains many interesting subjects brought from abroad on the occasion of visits, with some home treasures. There are side borders also, and it is shut off from the nursery grounds by specimen deciduous and evergreen trees and shrubs. By the side of this is a bulb-garden. Here, too, is a span-roofed house devoted mainly to Auriculas, show and alpine, and certain species of Primulas. There is a collection of the best named sorts of show and alpine Auriculas, and numerous seedlings of good quality; some forms of *Primula intermedia* were particularly attractive. Near by, under the shade furnished by quarters of ornamental trees, and revelling in the coolness afforded by the shade, were patches of double Primroses in large-flowered varieties, including the fine double crimson, also of the large yellow Evelyn Arkwright, blue varieties and others. Such cool and shady spots appeared to afford a congenial locality for many choice hardy plants.

Daffodils are largely grown for market, and for supplying the trade with bulbs—a branch of nursery work which has been carried on for many years, for Mr. Pope was among the first to note the growing commercial importance of the flower, and also its value for exhibition purposes. The Daffodils are grown in large beds, and the fine character of the blooms testifies to the suitability of the soil and the careful culture given. The raising of seedling Daffodils has been followed for years, and beds of seedlings can be seen in the spring-time from one to six years old, as the seedlings rarely bloom until the latter age. During the time of my visit the seedling beds were being carefully examined, and any one of promise was duly marked.

One of the specialties of the firm is the Clematis, both spring and summer-flowering varieties, which are largely grown for the trade. As a general rule stocks of *C. vitalba* are mostly employed for grafting, those of *C. flammula* are used for some of the late varieties. Stocks of *C. vitalba* are raised from seeds gathered from the hedgerows in late summer, and laid out on mats to dry. As soon as the seeds are ready they are sown in pots; they germinate quickly and stocks are soon formed: they are used when a year old. Grafting is done in the early days of March; the grafted plants are ready for re-potting in about six weeks; by June the plants are 4 feet in height and ready for sale. New varieties are promptly added to the collection, and some of the most popular among the newest are Colette Deville, reddish-carmine, a vigorous grower; Elise Späth, dark purple-violet; Flammula, rubro-marginata; a new snow-white form of Jackmanni; La Fontaine, blue tinted with crimson; Madame Moser, creamy-white, becoming purer with age; Marcel Moser, a large-flowered variety, mauve with red bar; Mathieu de Dombasle, violet margined with purple; Nellie Moser, white and mauve; and Ville de Limoges, pure white with double blossoms.

Roses, and especially the newer varieties, are grown for the trade as well as for ordinary sales. One of the varieties in the greatest demand is Frau Karl Druschki; another is Alberic Barbier, one of the Wichuriana group, which has evergreen foliage like that of the old Aimée Vibert; another is Dorothy Perkins; also The Farquhar, a cross-bred Wichuriana type of a very bright pink colour and fully double; and numerous other novelties. Mr. Pope said he regarded H.P. Frau Karl Druschki and H.T.'s Mildred Grant and Madame Ravary as the three most popular Roses of the day.

Ivies, both green and variegated, form another feature in this establishment. The most popular of the variegated kinds are madeirensis variegata and the Golden Irish. The first-named of these does well in the Birmingham district, and is to be found on the walls of many villa residences.

Down in the valley are three long span-roofed houses in which a great variety of subjects are grown for the supply of the stand in the market hall. Stephanotis is largely planted out, so are Roses and Tomatos. Then there are such subjects as Hydrangea paniculata, Astilbes, Asparagus Sprengeri in hanging baskets, Azaleas, &c. Close by is a frame-work 300 feet in length, for one of the horticultural travelling structures, 100 feet in length, and 30 feet in width. One-third is used for early Daffodil-blooms, and enormous supplies of bloom are obtained in this way; the middle division is for Tomatos, and the third for Chrysanthemums. The glass structure is readily moved on rails placed on brickwork as required.

Of out-door nursery stock there is a great variety, and an ornamental character is given to the nursery by the planting of handsome specimens of Japanese Acers and such subjects. Archways of Roses span many of the walks, and much that is inviting is to be noticed. Fruit-trees, Roses, &c., fill large spaces in the open. R. D.

ORCHID NOTES AND CLEANINGS.

CATTLEYA MOSSIÆ "MRS. C. H. BRAMLEY FIRTH."

FLOWERING at Ashfield Hall, Marshfield, Chippenham, the residence of C. H. B. Firth, Esq., is a singularly beautiful and distinct form of *Cattleya Mossiæ*, to which has been given the above distinguishing name.

A flower kindly sent is of large size and well proportioned. The sepals and petals are white with a very delicate flush of pink or lavender, no more pronounced than the similar colour which may often be traced on a good pearl. The lip, which has a beautifully undulated and fringed margin, is of the same pearly tint, the base having a light orange hue, and the front has a marbling of a decided blue colour, which fades to lavender towards the margin. Among the many varieties of the Reineckiana section of *C. Mossiæ* it is one of the most distinct.

DENDROBIUM ADUNCUM.

A very fine form of this pretty and uncommon species is flowering with R. G. Thwaites, Esq., Chessington, Christchurch Road, Streatham. The flowers are white and wax-like in substance, slightly tinted with purple, and with a bright purple anther-cap. The species generally has solitary flowers, or short racemes of two or three, but in Mr. Thwaites' variety the racemes bear five to seven flowers. The plant was imported from Singapore, but whether it was collected in that locality or not is not known. The type has been recorded from Assam, and from the Lo-fan-Sha Mountains, China. Probably the one now flowering may be a larger and stronger form from a new locality.

It is also interesting as pointing a moral often referred to in the *Gardeners' Chronicle*, viz., the

advisability of securing young specimens by cutting of the pseudo-bulb, or by division, for the double purpose of securing strong young plants free from the inactive parent-stock, and in order to establish the safety of the plant.

In this case, as in thousands of others, the parent-plant died. But Mr. Black, the gardener at Chessington, had taken cuttings of the pseudo-bulbs, which in a very short time were larger than the old plant at its best, and considerably more vigorous.

DENDROBIUM CRYSTALLINUM ALBENS.

Flowers of the typical rose-tipped form of *D. crystallinum*, and also of an albino of it, have been received from Eustace F. Clark, Esq., Chamonix, Teignmouth. The variety *albens* has milk-white sepals and petals with but the faintest trace of pink on the sepals, the labellum being rich yellow tipped with white. The species is very pretty and distinct, and easily recognised by its remarkably narrow and elongated anther. Like its companion *D. Bensonæ*, it is not a robust grower, and consequently periodically becomes scarce. Too much heat in the resting season accounts for the loss of a large proportion.

FOREIGN CORRESPONDENCE.

NAPLES.

HEMEROCALLIS CITRINA is a very fine night-blooming plant. The sweet-scented, clear yellow flowers are visited by many nocturnal butterflies, and I have especially observed the great *Sphinx nerii* and *Sphinx ligustri* and others. The flowers open in the afternoon about 5 o'clock, and are faded by 10 o'clock next morning. They are very interesting because the three outer segments are recurved, whereas the three inner ones are erect. It seems that this species is widely diffused in China. Mr. Charles Sprenger has received it from Shen-shi, and also from Hupe. The Shen-shi form grows more luxuriantly than that derived from Hupe. Many hybrids have been raised from this new species by reciprocal crosses between it and *H. citrina*. William Müller, Vomero, Naples.

EXPERIMENTAL CULTIVATION.

(Continued from p. 5.)

PREPARING FOR WORK.—When a piece of land has been selected for experimental purposes, the first consideration is to see that it is clear of all the more troublesome weeds, especially Twitch, Docks, Bellbine, &c. A thorough system of preparatory cultivation will be necessary if these pests are present in any quantity, and in taking such land the expenses that will be thus incurred must be set off against the rent or price. If the land be not sufficiently cleaned it will be a continual source of trouble in routine work, besides materially interfering with the objects of the experiments. It is far better in every way, when possible, to secure land that has been subjected to good and clean cultivation, and if a record of the system of cropping can be had for several preceding years it will prove helpful.

Occasionally, however, for various reasons the only land available or suitable in other respects may be some which has been neglected, and in consequence is foul with the worst of weeds. Two courses are open in this case; one is to subject the ground to a thorough breaking up by horse or hand labour, and allow it to have a summer fallow, clearing and burning the Twitch, &c.; the other is to prepare it, and crop it with a good cleansing crop like Potatoes. The chief objection urged against cropping is that if the land has been previously analysed, it will either necessitate taking another series of analyses; or if the first alone are depended upon, the record

may not be quite correct as regards some of the soil constituents. In comparison with the importance of having the ground thoroughly clean, this is a small matter, and if the whole of the land is treated in the same manner as regards cropping and manuring, it will be in an equal condition for any subsequent treatment. As to which course is preferable, the state of the land must determine: if it be excessively foul a summer fallow is the only one which will prove effectual; if it be only moderately bad the cropping will answer the purpose and yield some return for the expense incurred.

As soon as the land is in satisfactory condition, some decision must be arrived at with regard to the character of the work to be carried out, so that the ground can be planned accordingly. The level portions should be allotted for manurial experiments, and if there are parts of irregular form, these can be best devoted to variety trials, if these are contemplated, or to some other work which will not require the land to be kept to the one purpose continually. Not only is it desirable to prolong manurial experiments over a considerable period, but there are few other purposes for which the plots can be employed without producing divergent results owing to the altered character of the soil. The general scheme should, therefore, be divided into the permanent and temporary plots, and careful consideration is required in this, so that if the former have to be extended it can be done without disturbing the whole plan.

PLANS AND ARRANGEMENT.

In laying out the ground a quadrangular plan should be adopted, and if the land is irregular in outline, the portions which do not come into the square can be devoted to ornamental borders or beds. But it is very undesirable, merely for the sake of avoiding formality in design, to introduce curved or irregular plots in the general plan. For convenience in working, cropping, and recording results, square or oblong plots are the most suitable in every way. It will also be found advantageous to have them as nearly equal in size as possible, or where different sizes are adopted the smaller plots should represent some definite proportion of the larger ones, such as half or quarter, &c., as all these apparently small considerations ensure a material saving in after labour and trouble.

The size of the plots adapted for different crops has already been discussed, and it is unnecessary to add to what has been said on the point, except to emphasize the importance of avoiding unduly small plots whenever the crops are to be calculated by the acre.

A narrow divisional path or strip of unoccupied ground is desirable between most adjoining plots, but some arrangement of the sort is essential between plots devoted to different manurial experiments. A path 1 to 2 feet wide is convenient for many reasons, in which case the plots and paths can be permanently marked out with stakes. In some farm experiments, however, the whole of the land is ploughed and cultivated, the plots and paths being measured off and marked out each season. This is a needless trouble in most instances if it can be avoided, or wherever the land is cultivated by hand labour for garden plots.

Some experimenters advocate the exclusion of the margins of plots from the records of crops, while others prefer the introduction of central, neutral, and normal plots alternately with those having special treatment. Much can be said in favour of the last-named method, the chief point against it being the greater space required for carrying out a few experiments. Ample compensation is secured for this in the increased power of checking the results by comparison with numerous control plots. Wherever land is much varied in physical or chemical constitution,

it is the only way to arrive at reliable conclusions. In fact, most of the highest authorities are agreed that the control plots give the key to the whole of the experimental work. A distinction is, however, made between repeated normal check plots, and those in which no manure is applied. The Report of the Agricultural Education Association has the following note that deserves attention:—

"In many cases the unmanured plot is duplicated, but a second unmanured plot may often be a most unsuitable check plot. When the crop is one which is usually unmanured, then the unmanured plot is grown under normal conditions, and two such plots may measure the natural variation of the soil; but when the crop is one which is always manured, then the stunted crop grown without manure should not be used to indicate the natural inequalities of the soil, for it is always liable to distort them. In the case of moderately good soils it will usually magnify these inequalities, and in very poor soils it will have the opposite effect."

Still, beyond what is here stated there is much that could be said in favour of repeated control plots, though they are rendered less necessary if the main plots are in duplicate, and these are situated in different parts of the ground. To obtain average results of any value, the inequalities of the soil must be shown in the records, for it is obvious that one plot manured or treated in a certain way in one portion of the land may give quite as extreme results as a normal or check plot in an unfavourable or specially advantageous position.

PLOTS AND LABELS.

The arrangement of plots on the duplicate system to separate the two series conveniently, without introducing too great a difference, may be illustrated as follows. If eight plots are to be provided they can be arranged in three ways, the numbers showing the relative position of the plots.

1 2 3 4 5 6 7 8			
5 6 7 8 1 2 3 4			
1 2 3 4	5 6 7 8	1 5 4 8	
8 7 6 5		2 6 3 7	
4 3 2 1		3 7 2 6	
5 6 7 8		4 8 1 5	

Six plots can be conveniently arranged in this way—

1 2 3
4 5 6
3 2 1
6 5 4

Five plots or fewer are best with central or neutral plots (0), on this plan—

1 0 2 0
0 4 0 3
2 0 1 0
0 3 0 4

These notes are only intended to give an idea how the matter may be dealt with, the scheme can be modified according to the form of the ground and the requirements of the experimenter. But any system which brings the duplicate plots into adjoining positions is open to objection, and it practically involves a waste of effort.

SYSTEM OF LABELLING.

When the plans have been prepared the method of labelling the plots in the ground and entering them in record-books must be given consideration. A system of continuous numbering from 1 onwards is simple and convenient, but in prolonged or much-divided work it compels the use of high numbers, and as some of the experiments are completed or drop out for various reasons it leaves the numbers disconnected. Another way is to take a definite and short series of successive numbers for each group of associated experiments, or for each season, and then label them series A, B, C, &c., with the respective

numbers attached. It is generally preferable to have the plots themselves numbered, and if any subdivision becomes requisite the secondary plots can be indicated by asterisks, as, for example, 1, 1*, and 1**; but where this can be avoided it is better to start a fresh series.

Labelling to be rendered reasonably durable and efficient presents some difficulties, but many neat and excellent labels are now procurable from manufacturers who make a speciality of the subject. It is desirable to have a uniform style throughout, as the appearance is more business-like. Where small cast-iron labels are employed, which are secured to wooden stakes, they should be of such a size that they are protected at the back, otherwise the corners are very liable to be broken, and the projecting portions prove a frequent source of trouble to the workers. In several establishments lead is largely employed, cut into strips or squares, and with sets of punches both letters and numbers can be stamped on. If the indented parts are then filled with white lead, a legible and durable label is produced, which is scarcely affected by the weather. At periods when experimental grounds are under the inspection of visitors, a label briefly describing the experiment is sometimes placed to each plot. For permanent work, painted enamel metal labels are used suspended on suitable stakes, in other cases stout cards clearly printed and well varnished are suitable, but these require to be either nailed to stakes or placed in metal cases. If wooden bases are used for metal labels they should be of sound material and well tarred; failing this, constant trouble will be experienced in the renewal of the supports or in the loss of labels. R. Lewis Castle.

(To be continued.)

THE ROCK GARDEN.

THALICTRUM DELAVAYI.

THIS is one of the most beautiful additions to this genus that have been made for a long time. The species is a good flowering plant, and distinct by reason of the rich violet tone of the sepals. The large array of conspicuously exerted anthers is not a feature in this kind, as is the case with so many well-known sorts. The plant grows 2 feet or more high, but as yet I have experience only of small specimens. The triternately compound leaves are of a blue-green shade, the segments very minute, from roundish oval to wedge-shaped. The growth is comparatively slow, and in the elegant, delicate texture of the leaves the plant bears some resemblance to the very rare *T. pubescens*. The above species will be best dealt with among the rarer plants in the rock-garden, and should be afforded a deep root-run. My solitary specimen is growing well in turfy-loam and cow-manure.

CONANDRON RAMONDIODES.

Large examples of this choice Japanese plant are very desirable in those gardens where rare hardy plants are valued. Such specimens flower very profusely, and are attractive for a long period. The leaves are frequently of large size, approaching to 1 foot in length and $\frac{1}{2}$ foot in breadth. The blossoms are about 1 inch across, borne on a freely-forked corymbose cyme, and are lilac-pink in colour, or of a deeper hue if somewhat exposed. The plant loves the shade, and if treated as a perfectly hardy subject is quite herbaceous. If cultivated in a frame the plants retain their handsome foliage for the greater part of the year. The full beauty of the species will probably not be realised by permanent cultivation in the open garden unless in a few favoured districts. For the alpine house it would prove excellent, or colonised in a shady frame with a good depth of very sandy peat for its roots. E. J.

THE CAMELLIA.

ONE could not help noticing in the spring that the leading floral decorators in London showed by the designs in their windows that the white Camellia is now much employed in wreath-making, while it is also used in other designs. This fact may be taken as indicating that a reviving interest is being taken in the Camellia and its culture. The assistant to Messrs. W. Paul & Son, Waltham Cross, who staged the fine collection of plants and cut blooms at one of the meetings at the Drill Hall, stated that the last three years had witnessed an increase in the demand for plants.

It has been said that "all the flowers in the conservatory in winter and spring must give way to the Camellia." All may not agree about the beauty of a particular variety, but in a good collection, such as that from Waltham Cross, there are shapes and colours for all. Camellias may be divided into five classes: the perfect single, with its circle of ray petals and centre of golden anthers; *Donkelaari* and *reticulata* represent the semi-double type (the latter, to be seen in all its superb beauty, should be in the form of a tall specimen planted-out in a conservatory); the severely cupped type, of which the charming soft pink-and-white *Madonna* may be taken as a representative; *alba plena* represents the reflexed form; and intermediate between these two is the new large deep bright-rose *Duchess of York*. The extremes of size may be looked for in the bold and striking *Mathotiana* and the small *C. M. Hovey*.

Among the light varieties was one bloom, small in size but perfect in form, bearing the name of *Sandade de Camillo Aureliano*, white with a citron centre; this seemed to be a model of what a Camellia should be. Other fine varieties are *Marchioness of Exeter*, large pale rose; *Conspicua*, bright deep rose; *Boadicea*, soft pink with an edging of white to the petals; *Montironi vera*, white with slight flakes of rose, charming; and *Adelina Benvenuti*, blush flaked rose.

In addition to the noble foliage of the Camellia, glistening green, and when in high condition always pleasant to look upon, there is to be taken into account the amount of cutting to which it can be subjected. Gardeners do not grudge the sacrifice of so much wood and foliage as their forefathers did, because the simple process of wiring can be applied to any flower which has a good calyx, so the blooms can be utilised without sacrificing a bud or leaf; and when skilfully wired it can remain in a bouquet quite as good and nearly as long as those which have the natural wood and leaves attaching to the blooms. Messrs. W. Paul & Son deserve the gratitude of lovers of the Camellia for enabling them to see it at its best, both in the form of plants and cut blooms. R. D.

NUTRITIVE PROPERTIES OF PALM FLOUR.—

M. R. GALLERAND contributes to a recent issue of the *Comptes Rendus* an account of the nutritive properties of the flour of the Palm, *Medemia nobilis*, or the *Sathranabe*. This tree in the Ambongo district of Madagascar covers large areas by the borders of the sea and in the neighbourhood of running water. The *Sakalaves* cut down the trunk, which contains from 4 to 10 lb. of pith; this pith they dry, pound and sift. A certain quantity of the flour thus obtained was submitted to M. JUMELLE by M. PERRIER DE LA BATHIE, who obtained it, and it was analysed in the chemical laboratory of the Marseille Faculté des Science. The most noteworthy property of this flour proves to be its comparative richness in albuminoid substances. In this particular the *Sathranabe* pith exceeds the Potato, the Manioc, the Sweet Potato, and the Igname, as these tubers contain respectively an average of 6, 23, 3.30, 3.88, and 7.24 per 100 of these nitrogenous

substances. The quantity of starch is slightly in excess of that in the Sweet Potato, but less than that in the other three tubers.

THE COLORADO VARIETY OF THE DOUGLAS FIR.

In the *Gardeners' Chronicle*, of April 18, 1903 (vol. xxxiii., p. 244), I drew attention to the confusion which exists regarding the identity of the Colorado variety of the Douglas Fir, and I also, in the same place, referred to the extraordinarily slow growth in height of some plants I had seen in the previous summer in Peeblesshire, which were supposed to belong to this variety. At the

FIG. 22.—THE COLORADO VARIETY OF DOUGLAS FIR.
Age about 10 years; height above ground 4½ feet.

time I saw the Peeblesshire plants, I endeavoured to secure a satisfactory photograph of one of them, but owing to their unsuitable surroundings, I was unsuccessful in this. Quite recently, however, through the kindness of Mr. Massie, of Messrs. Dicksons & Co., 1, Waterloo Place, Edinburgh, to whom the plant was sent for identification, I have had an opportunity of obtaining a photograph (see fig. 22) of a plant which seems to be identical with the Peeblesshire plants in every respect. As may be seen from the photograph, this plant is quite distinct in habit from the ordinary green or Pacific form of the Douglas Fir, the main side branches, instead of spreading out almost horizontally, as in the Pacific form, take a more or less upright course, and this, coupled with the short internodes of its stem, gives the plant a more bushy appearance than that assumed by the Pacific form, and a branching habit not unlike that of the Scots Pine when of the same height.

A few particulars regarding the height, &c., of this specimen will give readers of the *Gardeners' Chronicle* some idea of the slow rate of height growth which this variety makes. The plant had been cut over at about 6 inches above the

ground, and the total height of the plant above the ground was 4½ feet. At the point where the stem had been cut through I counted the number of annual rings, and found this to be seven, so that the plant must have been at least ten years old. The following are the annual growths in height of the leader shoot for the last five years, taking them in backward succession:—1903, 14½ inches; 1902, 13 inches; 1901, 6½ inches; 1900, 4 inches; 1899, 2½ inches, giving a total height growth of less than 3½ feet for the whole period, and leaving a little over a foot as the aggregate growth of the first five or more years. A. D. Richardson, Edinburgh.

NOTICES OF BOOKS.

OUR MOUNTAIN GARDEN. By Mrs. Theodore Thomas ("Rose Fay"). New York: The Macmillan Co. London: Macmillan & Co., Ltd.

THIS is an interesting account of how a wild tract in New Hampshire was transformed into a comfortable and enjoyable home. "The land," says Mrs. Thomas, "was a wild, uncultivated tract of about 25 acres upon the mountain-side. It was partly wooded, and strewn with great boulders of all kinds and sizes. At its lower end flowed a tiny brook, which spread over a small hollow into an ugly marsh. The underbrush grew on all sides so rankly that one could not walk 20 feet from the house."

The new inmates superintended the building of every inch of their residence, thus ensuring the attainment of their particular wishes. Similarly with the garden, "avenues were made to sweep broadly over accommodating clearings; wayward paths meandered alluringly through the woods; the marsh was turned into a pond; ugly, unsightly growths were pruned away, and pretty nooks and corners began to appear, which seemed to call for flowers and Vines to add grace and colour to complete their beauty."

To start a garden thus from the very beginning is not possible to many of us on this side of the Atlantic, but we can at least be interested in reading how "Felsengarten" was gradually formed and beautified. The author proves yet again that personal experience is by far the best teacher, and discourses pleasingly of her discoveries and methods. The spelling of the names of plants needs revision; and surely many more than those mentioned in the list could have been induced to flourish! The illustrations add much to the attractions of the book.

A MANUAL AND DICTIONARY OF THE FLOWERING PLANTS AND FERNS, by J. C. Willis, M.A.; second edition. (Cambridge University Press.)

The utility of one of the most serviceable books for botanical students was impaired by the original plan of publication in two volumes, and by the circumstance that Part I. was intended to supplement Part II., as Part II. was wanting in co-ordination! The author's appointment as Director of the Peradeniya Garden at the time the book was passing through the press was also unfortunate. The second edition now published has been greatly improved as to the "co-ordination" of its contents. The hints given to the student as to how he may profitably make use of botanic gardens and museums are excellent, and supply a much-felt want. Similarly the hints on field work, what to do and how to do it, are most useful. Directions for collecting, preserving, and examining specimens are provided. Part I., so far as it goes, forms an excellent compendium of the general morphology, classification, and natural history of flowering plants. It will be specially valuable to the beginner from its modernity of treatment, though older students will

find that, like M. Jourdain, they have been availing themselves of prose without knowing it, and that much that is set forth as new is really like old jewellery in a new setting.

The second part comprises an alphabetical catalogue of the principal families and genera of flowering plants, with a few details as to their peculiarities and uses. Some of the synonymy quoted might well have been omitted, as it is hardly wanted in a handbook of such small proportions, and it is, moreover, of a doubtful character; thus, to cite one instance, under *Abies*, we find "*Abies californica*, Hort. = *Tsuga Douglasii*." The first name, whatever may once have been the case, finds no place in garden lists of the present day, and is omitted from the *Kew Hand-List of Conifere*; while the second was never generally adopted, and is now supplanted by the name *Pseudotsuga*. As details of this character are unprofitable, and only serve to confuse the beginner, they might well be left to the monographer, whose irksome duty it is to pry into these matters.

The paragraph relating to *Retinospora* requires modification, as the *Retinospora* condition is not confined to the seedling stage, as may be seen in adult plants of *Juniperus sinensis* or *Cupressus pisifera*, and the peculiar arrangement is not always retained throughout the life of the tree, since reversions—or shall we say progressions?—to the normal form are so common that they often serve to give the clue to the species to which the form belongs.

The little volume is full of interesting details not to be got elsewhere without consulting many books, as, for instance, the explanation of the hairy pedicels of the Wig plant, *Rhus Cotinus*, as an adaptation to secure the dispersal of the seed by means of the wind. Whilst the Manual will be of great service to the stay-at-home student it will be of special use to the traveller and to the resident in localities where access to botanical libraries is difficult or impracticable. Its small size, as well as the comprehensiveness of its contents, will render it a cherished possession by the botanist under the circumstances we have named, and a worthy companion of the *Treasury of Botany*.

EVERY MAN HIS OWN GARDENER, by John Halsham. With illustrations by Carine Cadby, the Rev. F. C. Lambert, and the Author. (London: Hodder & Stoughton, 27, Paternoster Row.)

Every man who can garden is nowadays anxious to publish experiences that seem new to himself, for the benefit of others. Here is yet another book wherein the author almost gleefully sets forth his little triumphs over difficulties in the hopes of thereby helping others to success. Every man must be so far "his own gardener" that no amount of reading can teach him as much as a few hours' personal experience with spade and hoe. At the same time books are a necessary supplement to self and even to *viva-voce* teaching, and while there is a place for the cut-and-dried text-book, there is also one for the chatty writer such as Mr. Halsham. He here tells us about soils and tilths, and crops and manures; with hints on seed-raising, herbaceous borders, the hot-bed, and other departments. "Making the Most of a Garden" should prove one of the most useful chapters; indeed all are full of more or less helpful suggestions.

The illustrations deserve attention. Some are working diagrams for tying, nailing, pruning, and other operations; others are reproductions from photographs. The portraits of plants, unlike the pictures on cheap packets of seeds, do not flatter the originals, but, on the contrary, hardly do them justice. We commend the book to gardening-lovers who like a friendly confidential style of literature, differing from technical

dryness as widely as it does from gush about pet plants and colours. It is refreshing not to meet eccentric characters with odd names, such as are brought nowadays into many books purporting to be mainly about gardens.

THE HONEY BEE: ITS NATURAL HISTORY, ANATOMY, AND PHYSIOLOGY. By T. W. Cowan, F.L.S., &c. Illustrated with seventy-three figures. Second Edition. (London: Houlston & Sons, Paternoster Square.)

Bee-keeping, like other industries, is vastly altered in scope of late years. Scientific appliances have ousted the straw skep and the tongs and frying-pan serenades, and bees are studied, not as colonies only, but as individuals. In this book, Mr. Cowan, a well-known expert, gives us a second edition of the *Honey Bee*, and his object is "to embody in a compact form all recent discoveries found scattered in the various periodicals and proceedings of societies." He treats his subject from the standpoint of its anatomy and physiology, and much microscopic investigation is here summarised.

The modern bee-keeper, like the modern agriculturist, is required to know and to adapt his practice to scientific principles, not to work merely in the footsteps of his forefathers, learning nothing and forgetting nothing. Mr. Cowan's book will not teach him the manual operations of bee-keeping, but will instruct him concerning the anatomy, physiology, and consequent powers and requirements of the wonderful little beings who work for him. It possesses an excellent index, is copiously illustrated, and may be thoroughly recommended for the lucidity and accuracy of its contents.

OLD WEST SURREY: SOME NOTES AND MEMORIES. By Gertrude Jekyll. With 330 Illustrations from Photographs by the Author. (Longmans, Green & Co., 39, Paternoster Row.)

We know now that we may expect from Miss Jekyll a book that is interestingly written and prettily illustrated. In the one before us the author has not so much to say about gardens as about the homes of the people and their manners and possessions. Beginning with the, "Cottages and Farms," we are shown many buildings as charming to see as they were doubtless uncomfortable to inhabit, and all of styles that are passing or have passed away. Within these homesteads we come to the furniture, often ugly enough, save in some cases where it has the beauty of appropriateness to its surroundings. From furniture we pass to household utensils and ornaments, and to other details of old-fashioned country life in and out-of-doors.

Changes in recent years have been many and swift: "In the old days hay was mown with the scythe and made with the fork and rake. All the tools wanted hung in a small space in the labourers' back kitchen or out-house . . . Now to be fully equipped for hay-making, there are a number of horse implements, the larger ones requiring a pair of horses, and all these cumbersome things involving so much housing and care are for use within perhaps four weeks of the year."

Miss Jekyll cannot write a book dealing with so many phases of rural occupations without making some mention of cottage gardens. "The most usual form of the cottage flower-garden is a strip on each side of the path leading from the road to the cottage door. But if the space is a small one it is often all given to flowers. Sometimes, indeed, the smaller the space the more is crammed into it. . . . There is scarcely a cottage without some plants in the window; indeed the windows are often so much filled up with them that their light is obscured. The wise cottagers place them outside in the

summer, to make fresh growth and gain strength. These window-plants are the objects of much care, and often make fine specimens. . . . The cottage gardens always seem to me to speak of the joy of life and cheerfulness of disposition that are such fine attributes of the character of our genuine country-folk. It was more clearly shown two generations ago, when men's lives were less hurried and more concentrated, and when the simple country life was fuller and more satisfying."

The last chapters of this fascinating book speak of the country folk themselves, their manners of life, of speech, and of their dress.

The book for older readers has one drawback. The writer of it regrets that the notes were not made earlier; to us it seems almost too soon. In spite of the march of civilisation, the bellows, the patchwork quilt, and many other of Miss Jekyll's old-time objects are still in daily use. In turning her pages and looking at the pictures we meet with many articles by no means obsolete: interesting, no doubt, but hardly so in the sense here intended. *Old West Surrey* serves a good purpose in preserving records of what will some day be venerable, and should therefore not be allowed to pass into oblivion, but much of the subject-matter applies equally well to other counties. The particular spot dealt with is "the south-western corner of the county of Surrey; so near indeed to the actual corner that the adjoining portions of Hampshire and Sussex come within a radius of a very few miles, and are considered as within the district. . . . The practical boundaries of our country that we commonly call West Surrey, without any reference to parliamentary or other authorised divisions, are the long chalk line of the Hog's Back on the north, with its eastern prolongation beyond Guildford, and the Weald of Sussex to the south." The illustrations are excellent, and the book well got up.

JERSEY AND GUERNSEY GROWERS' YEAR-BOOK.

A publication of the greatest value to growers for market, salesmen and others. There are numerous tables very useful for reference, and numerous practical papers on matters of cultivation. We are glad to see a spirited protest against the retention of our "antiquated and by far too complicated system of money, weights, and measures." As to money, it is shown how a decimal system could be introduced without changing a single coin. In another issue it would be advisable to keep the advertisements apart from the text.

WAYSIDE AND WOODLAND TREES. By Edward Step, F.L.S. (London: Frederick Warne & Co.)

The scope of this little book is well defined in the preface. It is not meant as an "addition to the numerous treatises upon silviculture or forestry, but to afford a straightforward means for the identification of our native trees and larger shrubs, for the convenience of the rural Rambler and Nature-lover. The list of British arborescent plants is a somewhat meagre one, but all that could be done in a pocket-volume by way of supplementing it has been done, by adding some account of those exotics that have long been naturalised in our woods, and some of more recent introduction that have already become conspicuous ornaments in many public and private parks."

This, then, is a book of portable size, to be taken into the woodlands to help the traveller in identifying the species around him. The letterpress is plainly written and not uninteresting, as it is not merely a description of the aspect of each tree, but gives a pleasant account of the uses, associations, and history connected with it. This in itself might not be sufficient to initiate the un-

learned into the differences between Elm and Hornbeam, Yew and Juniper, and so on, but the text is aided by the illustrations. These are from photographs and are excellent. Each tree is shown under three aspects—in summer, in mid-winter, and showing the bole only; and the excellent practice has been followed of photographing the same individual under these respective conditions. Smaller illustrations show spray of leaves, flowers and fruits. Remembering always that it is not intended as a rival to more important works, this pocket guide should prove a reliable and agreeable companion.

THE GOD IN THE GARDEN. By Kable Howard. (London: Chapman & Hall, Ltd.).

A novel, or, to use the sub-title, an "August Comedy," the scene of which is a garden of the type peculiar to fiction. Here the familiar, strange-mannered, tender-hearted spinster tends flowers of many hues, and is at once the butt and the (disguised) good genius of the village in general and of lovers in particular. Shakespeare, the old gardener, is another well-known character, both in and out of fiction, and all who love their plants have suffered from his rule-of-thumb restrictions and his frequent grumbles. The book will give the novel-lover a pleasant hour, as it ends happily in the orthodox manner.

HEATING BY HOT-WATER.

A third edition of Mr. Walter Jones's treatise on heating by hot-water, on hot-water supply, and on ventilation, has been published by Messrs. Crosby Lockwood & Co. As many at this season will be overhauling their hot-water apparatus or erecting new structures, we cannot too strongly advise the careful study of this book, which is adapted to the requirements both of the expert who has to construct, and of the gardener who has to make use of the apparatus. Both will find in the book such a large body of information of the highest value that it should be kept on the shelf where the most useful books of reference find a place. It would be a good thing if young would-be housekeepers were instructed in the proper working of kitchen-boilers before incurring the responsibilities of housekeeping.

THE TEMPERATE-HOUSE, KEW.

THIS magnificent range of houses, composed of five compartments, is the largest plant structure in the world. It was designed by Mr. Decimus Burton, and the work of erecting the central block and octagons was undertaken by the contractors, Messrs. W. Cubitt & Co., in 1860. The octagons were completed in 1861, and the central structure in the following year. The completion of the north and south wings was left in abeyance for over thirty years. In 1895 it was definitely decided to complete the whole structure, and the work commenced in July. The south end was finished in 1897, and two years later, the north end, the cost of the whole building having been about £60,000. A brief account of the dimensions of the structure may be of interest to readers of the *Gardeners' Chronicle*. The large central division is 216 feet long, 140 feet wide, and 60 feet high. The north and south ends, known respectively as the Himalayan and Mexican houses, are each 116 feet long, 64 feet wide, and 38 feet high. The two octagons which divide the north and south wings from the central structure are each 54 feet in diameter, and 35 feet high.

The sections are joined together by four lobbies, each of which is 12 feet long by 7 feet wide. Beyond the wings are entrance porches, each 12 feet by 8 feet. The extreme length of the building is thus 628 feet, the greatest width being 164 feet.

A path 10 feet wide extends throughout the whole length of the building, while numerous narrower

paths divide the rest of the space into large beds or borders. The central house is devoted principally to Australian and other greenhouse plants, tree-Ferns, Palms, &c. These are planted-out for the most part in borders, where they reach large dimensions. The Acacias are made an especial feature, a large number of species being grouped together in one large bed, while numerous fine specimens are planted at intervals all around the house. In March and April, when the bulk of the species are in flower, they constitute one of the most attractive features of Kew. Altogether there are about sixty distinct species of Acacia grown in this house.

Thyrsopteris elegans, a plant which is only found on the island of Juan Fernandez. The fructification of this Fern is peculiar, the whole of the lower pinnae on a fertile frond being specialised for the formation of spores, each pinna becoming a raceme of stalked involucras; these, when ripe, turn a dark-brown colour, and remain on the plant for a considerable length of time. *Dicksonia glauca*, *D. Menziesii*, both natives of the Sandwich Islands, and *D. Wendlandi*, a native of Guatemala, are also thriving well under these cool conditions.

The principal plants which strike one on entering this house, however, are four immense speci-

FIG. 23.—VIEW IN THE TEMPERATE-HOUSE, ROYAL GARDENS, KEW.

Two large beds at the northern end of the house are entirely devoted to the culture of Tree-Ferns, while numerous large specimens are distributed throughout the rest of the house. It will suffice if the dimensions of a few of them be given:—*Cyathea medullaris* does especially well, and there are numerous fine specimens, one in particular being 35 feet high, with a spread of fronds 30 feet in diameter; *Alsophila excelsa*, with a stem 35 feet high and a 25-feet spread of fronds; *A. australis*, with a stem 12 feet high, and an immense head of fronds; *Dicksonia antarctica*, numerous fine specimens, one in particular with a stem 20 feet high and 2 feet in diameter at the base. *D. fibrosa*, *D. squarrosa*, *Cyathea dealbata* are also very fine. Among the rarer Ferns which thrive in this house are

men *Araucarias*, which tower up to the roof of the house. The oldest of these is *A. excelsa*, which is well over 100 years old, and is probably the largest and oldest plant of its species in the country. According to Smith's *Records of Kew*, p. 66, it was introduced from New South Wales in 1793. *A. Cunninghamii* (Moreton Bay Pine) is one of the original plants sent to Kew in 1826 by Allan Cunningham, who was the first to discover and introduce it to this country.

Of *A. Bidwillii* (Bunya Bunya) there are two large specimens; both were brought to Kew in 1846 by Mr. T. Bidwill, of the Sydney Botanic Gardens. In order to keep these large and strong-growing species within limits they have frequently been pruned back hard and the leader removed for a distance of 10 feet or so; this, if

anything, has improved their appearance, as they are all of neat symmetrical shape and densely furnished with growths. Many fine specimen Palms give a welcome change of character to the rest of the vegetation. *Jubaea spectabilis*, with an immense head and a trunk about 3 feet in diameter at the base, occupies a prominent position near the centre of the house. There is little doubt that it is one of the "several plants raised from seeds collected in Chili in 1843 by the botanical collector, Thomas Bridges" (Smith's *Records of Kew*, p. 111).

The Date-Palm (*Phoenix dactylifera*), 40 feet high, is a conspicuous object flanking the central walk, and is a source of much interest to the untravelling visitor. It is a female plant, and flowers annually. Of *Trachycarpus* (*Chamærops*) *excelsa* there are two large specimens, one of which is 50 feet high, and the other 40 feet. When in flower each spring these are a lovely sight with their numerous large inflorescences of bright yellow flowers. The large gallery which runs round this house, at a height of 30 feet, affords the visitor a ready means of seeing these large specimen plants to the best advantage. This is especially noticeable in the case of the Tree-Ferne, where one requires to look down into the head of the plant, in order to appreciate their full beauty. Several species of Bamboos, which are too tender for out-door culture at Kew, also find a home in this house. The plants on the stages are grouped together in sections representative of the flora of certain geographical areas. Plants from New Zealand, for instance, being grouped together, while other positions of the stages are devoted to plants from Temperate America, Temperate Asia, Temperate Africa, Australia, South Europe, and the Canary Islands.

The south octagon is devoted to the culture of specimen Oranges and Lemons, which are grown in large tubs. The north octagon is given up to Myrtles, Bays, Olives, and other half-hardy plants; these are, all trained as standards, pyramids, and other shapes, and are kept as formal-looking as possible. In the autumn both octagons are used for a display of *Chrysanthemums*.

The Himalayan-house is principally devoted to Himalayan *Rhododendrons*, of which a good collection is grown at Kew. The more tender species, together with many of their finest hybrids, are grown in this house, many of the species reaching large dimensions. The last two seasons have been particularly favourable for this class of plants, the result being a fine display of flower this last spring. Many other tender plants also find a place in this house. A large specimen of *Clematis indivisa*, trained upon wires near the roof, produces masses of its pure white flowers each spring. Another large climber deserving special mention is *Lonicera etrusca* var. *superba*, without doubt one of the finest greenhouse climbers in cultivation. *Buddleia Colvillei* has been in full flower, as also the rare yellow *Pæony* (*P. lutea*). A beautiful red *Primrose* (*Primula mollis*) is largely used for carpeting the ground amongst the *Rhododendrons*, many of the plants being quite 2 feet in diameter, and covered in the season with hundreds of flowers.

The Mexican-house is devoted to plants which require the temperature of an intermediate-house. These largely partake of a Mexican character, the south end being occupied with large Agaves, *Opuntias*, *Cereus*, &c., which are planted-out in a rockery built up of large and conspicuous pieces of limestone. The rest of the house is devoted to the culture of plants of the subtropical regions of both hemispheres. Such fine flowering shrubs as *Lagerstræmia indica*, *Brunfelsia calycina* and its varieties, Java *Rhododendrons*, *Alberta magna*, *Gardenia Thun-*

bergia, &c., all thrive and make large bushes in this house. Other results of this house have been the fruiting of such interesting plants as the Tree-Tomato (*Cyphomandra betacea*), the Mango (*Mangifera indica*), the Loquat (*Eriobotrya japonica*), one of the Papaws (*Carica cundinamarcensis*), and the *Granadilla*. *Chas. P. Raffill*.

DELPHINIUM.

AT p. 24 we noticed the receipt from Mr. Henkel, of Darmstadt, of a blue Delphinium with regular flowers almost devoid of spurs and with an increased number of petals. Each petal had a distinct claw or stalk, while the blade was marked by a fringe of orange-yellow hairs. The illustration we now give (fig. 24) shows at a a flower of the natural size seen from the side; at b a section across the flower showing the arrangement of the petals, &c.; at c a section lengthwise through the flower; and at d a detached petal. The flower is an illustration of the condition known as regular peloria with multiplication of the petals. The stamens and pistils were normal.

FIG. 24.—ABNORMAL DELPHINIUM.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

Angraecum Eichlerianum.—Among Orchids that are not generally cultivated is this species, a fine plant of which is now in bloom here. The plant is about 6 feet in height, and the pretty, greenish-white flowers, thirty-two in all, are produced, some in pairs, others singly, from the top to the base of the plant, which is therefore a lovely and attractive object. The plant being of scandent habit, should be fastened to a Teak raft, and fixed firmly into a pot filled with crocks, covered thinly with living sphagnum-moss. It should be stood in an upright position upon the stage in the hottest house, and where it can be afforded shade at all times. As the plant does not appear to require any period of rest so far as growth is concerned, it should be well sprayed over with tepid rain-water whenever it appears to be in the least degree dry.

Sarcanthus peninsularis.—This charming botanical species is now in flower. The individual flowers are small, but the gracefully-crowded racemes, of which there are about three dozen on the plant, have a very inviting appearance. This species requires similar treatment to that recommended for *Angraecum Eichlerianum*.

Such plants as *Spathoglottis aurea*, *S. Fortunei*, *S. Lobbi*, *S. Kimballiana*, *S. plicata*, *S. Vieillardii*, and the hybrid *S. aureo-Vieillardii*, being now in full growth, they will need liberal supplies of water. The plants should be suspended on the shady side of the warm house, and as the grass-like foliage is liable to the attack of thrips,

periodical spongings and vaporisings are necessary. The same cultural remarks apply also to *Geodorum citrinum*, *G. pictum*, *G. Augustii*; also to the rare *Eulophia guineensis* and *E. congoensis*, both of which are producing flower-spikes from the base of the half-developed growths.

Schomburgkias.—Such *Schomburgkias* as *S. tibeticus*, *S. Kimballiana*, *S. Humboldtii*, *S. Sanderiana*, and *S. Thomsoniana*, which have hollow, horn-like pseudo-bulbs, require much sunshine at all times, and as they are now commencing to grow, should be placed in the lightest position available in the hottest house. They thrive equally well either in pots or baskets, but prefer a shallow rather than a deep rooting medium, and this should consist of equal parts coarse peat and a little sphagnum-moss. Abundance of water is necessary all through the growing period, but when the new pseudo-bulbs are fully made up afford less moisture, and place the plants where they will obtain uninterrupted sunlight and plenty of fresh air. It is essential that the new growths should become thoroughly matured, and that the plants be afforded a long decided rest to ensure their flowering regularly. Those species with fusiform pseudo-bulbs, as *S. Lyonsii* and *S. undulata*, will grow under similar conditions, but prefer a greater depth of soil. *S. crispa* succeeds best in the temperature of the *Cattleya*-house if afforded a very light position.

Microstylis.—Very pretty and interesting are some of the varieties of *Microstylis* which flower at this season. Some of them have curiously constructed flowers, and others possess charmingly coloured foliage. The genus is a large one and contains many species with little beauty to recommend them, but those following are worth growing: *M. Scottii*, *M. purpurea*, *M. bella*, *M. congesta*, *M. metallica*, *M. discolor* and *M. Wallichii*. *Microstylis* require similar treatment and compost as are given to the *vestita* section of *Calanthes*.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gr., Wrotham Park, Barnet.

Strawberry-plants.—Proceed with the work of layering runners, so that the quantity of young plants required for making new beds to fruit next year may be obtained as early as possible. Strong, well-matured crowns are required to produce heavy crops in the first year after layering, and especially of the variety *Royal Sovereign*. Peg the runners in small pots containing sweet, moderately rich soil, pressed firmly, and leaving ample room for the application of water. Select strong runners from the most healthy plants; any which have not been allowed to bear fruits would be preferable. Layers already made will need to be supplied with water during dry weather. If time permits and water is plentiful, soak the old plants as well. Plants of the variety *Royal Sovereign* for supplying early fruits should be put out at 18 inches apart on a warm border, the soil of which has been afforded a moderate amount of manure. Let the ground be made firm, and at the time of planting the soil of the border and the roots of the plants should be in a thoroughly moist condition. Much injury from drought is sometimes sustained by *Strawberry* plants immediately after planting.

Strawberry Plants that have Fruited.—As soon as the plants have ceased bearing, provided no further layers are required, remove all runners and some of the old leaves. Pull out any weeds and rake away any rubbish there may be, then slightly loosen the surface of the soil, apply a sprinkling of artificial manure if needed, and mulch with fresh manure. Should the weather continue dry soak the plants thoroughly with water in order to encourage new growth as soon as possible. If the land is very light and the plants have been heavily cropped, repeated waterings will be essential. A quantity of young plants should be raised yearly, and the layers should be obtained from fresh stock occasionally.

Early Peaches.—Thin out the fruits of these for the last time; such varieties as *Alexander*, *Waterloo*, &c., ripen up very quickly, and if neglected the fruits are apt to be small. Do not overcrop, but regulate the quantity of fruits according to the strength and vigour of each

tree. Soak the soil about the roots thoroughly with manure-water, and keep the foliage clean and free from red-spider by frequently syringing them with clear water. Remove any further shoots that are not needed and shorten the sub-laterals. Keep the leaders neatly secured to their respective positions, and gradually expose any fruits that are shaded by leaves, so that they may obtain better colour.

THE KITCHEN GARDEN.

By JOHN PENTLAND, Gardener to C. H. B. FIRTH, Esq., Ashwicke Hall, Marshfield, Chippenham.

Blanching Celery.—This operation requires more time and attention than are sometimes afforded, and the result is that an inferior article is sent to table, when it might have been made equal to the best. No doubt the character of the soil and situation has much to do with the growth of the plant, but a well blanched and crisp head, having a nutty flavour, though of only moderate size, is preferable to a large, coarse head, which unless ground by an expert is often deficient in many points of quality, "blanching" being usually one of these. In order to obtain the best results let the work of "earthing-up" be done often and moderately, drawing a little earth only to the plants on each occasion. Before drawing any soil towards the plants, examine the lines, and remove all the short leaves and any extra growths that appear round the base; then tie a piece of matting round each to keep the leaves erect and prevent the soil getting into the heart of the plant. Under no circumstances tie it up too tightly, but allow ample room for the centre leaves to make their way to the light without getting crippled. After the work has been completed, and should the ground be dry, afford the roots a thorough soaking of water. If this is not done previous to drawing the soil to the plants it will take a greater quantity of water to do it afterwards. An hour or so after the watering has been done, if there are many slugs, it will be necessary to apply a dressing of lime along the sides of the trenches. On light, fine sandy soil the work of "earthing-up" can then be commenced. Break down the sides of the trenches with the spade, and make fine; then take hold of each plant singly in one hand and draw the soil up to it with the other, making it sufficiently firm to keep the plant upright, and the leaves in the position in which they have been left by the hand. On soil of a stiff, clayey nature the work is not so easily managed. Slugs usually find a shelter in the crevices of the soil, and injure the plants to such an extent that it is sometimes necessary to dig a dozen heads before getting three that are fit for table. To prevent such injury we have tried many expedients, paper collars amongst the rest, but nothing has had so good an effect as sawdust. In the use of this it is not necessary to fill up the whole trench, but to proceed as follows: Break down the sides of the trench in the usual way; this will form a backing for the sawdust, 3 or 4 inches of which should be pressed round the neck of each plant, adding the same in height as the plants require it.

Work in General.—Any arrears of planting should be finished as soon as the weather will allow. Attend to the stopping of Tomatos, and if Vegetable-Marrows are not setting their flowers well, pollinate the female flowers in the morning. Sow seeds of Lettuce and Radishes for succession.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Vines intended for forcing early next season.—The canes should be well ripened by this time. Keep the atmosphere of the house cool and dry. Afford no more water to the borders than is sufficient to keep the roots in a healthy condition. All laterals should be closely stopped. If the borders are in an unsatisfactory condition, this will be found a convenient season to make preparation for lifting the roots. Obtain some fresh loam and clean drainage material. The outside border need only be operated upon this season, and the inside border next year. In numerous instances some difficulty is experienced in procuring suitable material for the making of new, or even the renewal of old borders. In such circumstances,

borders in a sour state may be considerably benefited as follows: Open a trench the length of the border 12, 18, or 24 inches wide, in proportion to its extent; then remove the soil and drainage the full length and depth, so that a free circulation of air may pass through and under the border. Remove all mulching and inert soil that is near to the roots, and afford full exposure to sun and air for a time. The border will then crack in all directions, and these cracks should be filled carefully and well with $\frac{1}{2}$ -inch bones, charcoal, and fine soil mixed together, the greatest proportion being bones. Afford a light watering, and cover with damp mats, to guard against excessive drought or heavy rains.

Vines for forcing early that were not forced early last season.—When the crop of fruits has been cleared, thoroughly clean the rods and foliage by repeated fumigations and the use of the syringe. Should the canes appear insufficiently ripened (matured), the house may be kept a little closer for a time during the day, to enable the canes to make plump buds. Sufficient moisture in the atmosphere and at the roots will be needed to keep the foliage in good condition. Should the weather be cold and wet, afford fire-heat during the day, accompanied by abundant ventilation; and after the canes have become fully matured, give full ventilation at all times.

Melons.—Guard against over-cropping, as one of the chief causes of bad finish and indifferent flavour in the fruits, besides being highly prejudicial to the plants. Unless the plants are very strong, two or three fruits will be found much more satisfactory than a larger number. Endeavour to keep the foliage in good condition until the fruits have ripened, failing which high quality cannot be expected. Afford copious supplies of diluted drainings from the stables to plants swelling fruits, applying the liquid at the same temperature as that of the atmosphere of the house. Damp all the available surfaces with liquid manure at closing time. Expose the foliage to the light. In houses where fruits are ripening, keep the atmosphere dry, and maintain a constant circulation of dry warm air, which will greatly improve the quality of the fruit.

THE FLOWER GARDEN.

By A. B. WADDS, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

Borders of Herbaceous Plants.—Any such borders on the sides of the kitchen-garden walk that are backed by pyramidal fruit-trees will require to be afforded water, as they are suffering from the effects of dry weather. This is the fourth week since much rain has fallen. As the plants pass out of flower cut them over and afford them at once a good mulch of rotten manure. Attend to the staking of other plants, and where there is Box-edging to the paths, be careful that the plants are not permitted to hang over or touch the Box, or they will soon disfigure it. Use the hoe over the surface of the ground, and any weeds that are seeding should be cleared away after they have been displaced by the hoe. The seeds of some of the newer or choicer varieties it is wished to perpetuate may be gathered when ripe. Place them in a canvas bag and label them; they will then be ready for sowing after a few weeks' time.

Dahlias.—These should be thickly mulched with fresh horse-manure, if possible, and supplied with water. Regulate the shoots and pinch off all deformed flowers. If Pompon varieties are required for exhibition the flowers should not be thinned severely, neither do they need so much feeding, because small refined flowers are preferable. The flowers of the "Show" Dahlia being heavy, require to be tied up separately, and the plants need much water. The "Tom Thumb" and dwarf bedding Dahlias are very bright when massed in beds—these are now growing well and will give good results after a few weeks' time.

Roses.—Fully-blown flowers may be gathered before the petals fall and be spread out thinly on a mat in a cool frame to dry, where they must be turned over every day. Do not expose them to hot sun too much or the flowers will lose their aroma. Dried flowers are appreciated for use in the dwelling rooms. Seed

pods should be cut off at the same time, that the second crop of flowers may have a better chance. The present is a good time to afford the beds a dressing of ichthemic guano or other stimulant, but water should be applied after the manure. The fly has just made its appearance, and it will be necessary to syringe the plants with quassia water.

Evergreen Shrubs that were transplanted from the flower-beds last spring, and are required for a similar purpose in the autumn, must be attended to by syringing and watering as each may require. The growths also may need to be tied in and regulated. They may be syringed with weak Quassia-water to keep them clean when the plants get pot-bound and dry. If any of the plants are "pot-bound" and become very dry, take them out and immerse them in a tub of water for several hours.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. BURNS, North Mymms Park, Hatfield, Hertfordshire.

Souvenir de la Malmaison Carnations.—These and other summer-flowering varieties are passing out of flower, and preparations should at once be made to raise the plants for flowering next season. The most simple method of propagation, and the one generally adopted at this season, is that of layering. A frame or pit which has been occupied by early vegetables or salads presents the most ready means, as it will without further preparation contain the necessary depth of soil. After well loosening the soil with a fork, the plants should be turned out of their pots and planted in the frame in a sloping position, in order that the shoots which are to be layered may lie upon the soil. In some instances the soil in the vegetable-frames may be sufficiently fine to be used for the actual layering, but where this is not the case a finely-sifted compost must be prepared, and a small quantity placed around each plant after it is planted out. Use the healthiest plants to propagate from, and if they are infested with insects they should be cleansed before planting them. Choose plants with shoots of a medium length, for if these be too long a proportion of the plants will flower prematurely, and if too short it is difficult to layer them effectively. Remove the leaves from the base of the shoot that is to be layered as far as the third or fourth joint from the point. Then with a sharp knife make an incision on the underneath side of the shoot, drawing the knife in the direction of the point of the shoot, and cutting through one joint. A slit an inch in length will be sufficient. The shoot should then be firmly but gently pegged down among the fine soil, which should cover the base of the layer. After layering, give the soil a good watering. The subsequent treatment consists in keeping the soil moist by sprinkling with water through a fine rose, affording shade during sunshine, and keeping the frame somewhat close until rooting takes place. The layers should then be severed from the plant, and after two or three days lifted carefully and potted into $3\frac{1}{2}$ or 4-inch pots. Water the plants and place them in a cold frame, which should be shaded during sunshine and kept somewhat close for a few days, after which air must be freely admitted.

THE APIARY.

By EXPERT.

In some parts of England bees appear to be unusually busy throwing out swarms, and when honey is required the swarms should be returned to the parent stock in the evening, after taking away the queen. In hives where an extra large quantity of drones appear, the hive should be examined and the brood comb cut out and destroyed, and where possible the queen taken away and a young one introduced in her place. Old queens are often found to produce an unusual number of drones. Wax grubs should also be destroyed before they destroy the whole colony. All appliances in the apiary should be dipped into a solution of Izal; one cannot be too particular about this, especially in goods bought secondhand. Stocks which are not working in the sections should be examined as to the cause, and in any case of suspected foul brood immediate steps should be taken to stamp the same out. Sections should be placed in a secure place as soon as they have been removed from the hive, and in the meanwhile look out for a market.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

- TUESDAY, JULY 26**—Roy. Hort. Soc. Coms. meet; also Nat. Carnation and Picotee Soc. Show in the New Hall, Vincent Square, Westminster.
- WEDNESDAY, JULY 27**—Horticultural Club Annual Outing. Cardiff Flower Show (2 days). Newcastle - on - Tyne Flower Show (3 days).
- THURSDAY, JULY 28**—Chesterfield Hort. Soc. Show. Soc. Franc. d'Hort de Londres visit Burnham Beeches.
- FRIDAY, JULY 29**—Roy. Bot. Soc. lecture.

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick —63.3°.

ACTUAL TEMPERATURES:—

LONDON.—July 20 (6 P.M.): Max. 78°; Min. 59°.
July 21.—Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden (10 A.M.): Bar., 30.1; Temp., 71°; Weather bright sunshine; rain wanted.

PROVINCES.—July 20 (6 P.M.): Max. 75°, Home Counties; Min. 56°, N. of Ireland.

The Beech Coccus.

The appearance of a white, cottony fluff on Beech-trees is so common that most people will pass it over as of little moment. Those, however, whose investigation is less superficial will not take matters so easily, and will be interested in the remarks made by our correspondent Mr. BROTHERSTON, who writes:

At present there is not a little consternation evinced concerning the safety of Beeches on account of the prevalence of what used to be called Coccus, but now *Cryptococcus Fagi*, on many trees. It is a question if this almost microscopic insect effects the amount of mischief that is laid to its charge, and on account of which so much fear is entertained concerning the very existence of so many specimens of this noble tree. For one thing it is no new pest, old people have known it all their lives, and not only that, but have an acquaintance with trees that have sheltered and fed generation after generation without any apparent distress to themselves. I have watched a young tree for more than a quarter of a century, and it has gone on increasing in size and stature all that time, and at present is in the perfection of health, notwithstanding the innumerable colonies of the Beech-coccus that are congregated on its bark. The only difference discernible between unaffected trees and this is that the bark of the latter is covered with low warty excrescences in which the greater part of the coccus congregates. These warts are no doubt a result of the insects' possession, but that they are harmful is another question. If they are responsible for the decay of the bark of Beech-trees and their subsequent death, one would expect that some indication of bark decay would be apparent in this instance. But it is not.

Still more interesting is the fact that old Beech-trees in the vicinity of this young one occasionally die as they stand, and some of these have not one coccus on their bark. Two old trees within less than a stone's-throw indicate by their foliage and growth that two to five years hence will see the limit of their life. One of these has a very few cocci here and there on its bark, which is dying in patches; the other is quite free from coccus, and it has reached the

stage when the bark is so badly decayed that pieces are falling off. Experience shows that trees such as these are decayed at the root—a result of old age, possibly accelerated by unsuitable soil, especially when too wet. It seems to me that if the insect is indigenous, then there is not much fear of its being greatly mischievous to its host. We know that its relatives, the Kermes of the *Quercus coccifera* and the cochineal insect in the case of *Opuntia*, effect no appreciable harm on these plants.

Happily, the insect is not difficult to kill; but it possesses two incidental environments that render it difficult to get at to kill. The one is the white woolly covering with which the smallest solitary individual envelops itself, and which in the case of colonies is present in greater quantities, acts as a protection against the greater number of insecticides. The other is the almost impossibility of getting an insecticide into the intricate recesses of the bark in which the insect hides itself. The cheapest and most effective killing-agent is undoubtedly petroleum. One part of the latter to 200 parts of water, or rather soapy water, kills the insect, but it is not sufficiently strong to penetrate the inner parts of the bark, and a much larger proportion of petroleum is therefore needed. When applied hot, or at 110° to 150°, the penetrating power of the mixture is greatly increased, and where it is possible to use a syringe or garden-engine to apply it with, either should be used. Spraying-machines fitted with rubber cannot be employed in the use of petroleum-mixtures without damaging the fittings. Usually an ordinary whitewash-brush will be found the most convenient tool with which to apply the insecticide. With that, a long ladder, a galvanised pail to hold the liquid, and a double hook to hang it on a step of the ladder, the apparatus is complete. The operator commences at the highest point, applying the liquid freely, and works downwards, missing no part of the bark. Wherever the mixture reaches the insects will be destroyed. But they are certain to be replaced by others, and therefore it is necessary to repeat the application till all are destroyed. Where only a few trunks are infected, hot soap-suds with petroleum added is a capital killing agent. Pine-aphis syringed with a mixture of soap-suds and petroleum are instantly destroyed. Years ago I had a number of Scots Fir and Abies nobilis to clear of this insect, and three applications have left the trees quite clean ever since. I have found it equally effective with the insects that infest Abies Nordmanniana, and I believe it will be equally valuable in the case of other insect-infected trees.

MAGNOLIA CONSPICUA (see fig. 25).—The exigencies of a weekly paper have to be met, regardless of anachronisms, which must be our excuse for giving in a number when a July sun is shrivelling the foliage of many trees, an illustration of a tree whose blooms we look to as a sign that spring is at hand. *M. conspicua* is one of the deciduous species flowering before the leaves are fully out, and always excites admiration. There is a fine example at Gunnersbury House, which was figured in our issue for March 9, 1891, when we took an opportunity to review the whole of the deciduous species now in cultivation. To that article we may refer for full particulars. The tree we now figure is in the gardens of Col. PH. ROBIN, La Fantaie, Jersey, by whose gardener the photograph was sent to us.

THE HOLLAND HOUSE SHOW.—As was stated on p. 47 of our last issue, Messrs. BARE & SONS, King Street, Covent Garden, London, were awarded a Silver Cup for a collection of hardy flowers and pigmy trees. The exhibit was not described in our general report owing to an inadvertency.

TOWN TREES.—We have often occasion to mention those trees which thrive best in the vitiated air of towns. Everyone knows and values the Plane, but it is not everyone that thinks of the Fig, and yet those that pass through the Temple or Finsbury Circus, and various other open spaces in London, must notice how superior it is to the Lime or to the wretched Lilacs and Privets found in such situations. The Mulberry is also a good town tree, and the Ailanthus may be recommended. Ginkgo is excellent, but rarely seen.

KENDIR TOWIKA.—Under this name M. MICHOTTE calls attention to a plant grown in Turkestan, the fibre of which is used for the fabrication of fishing-nets. The plant turns out to be *Apocynum sibiricum*. Its culture might be economically important, as in the manufacture of paper, if the cost of production could be lessened. Full details are given in the *Revue des Cultures Coloniales*.

CAPE TOWN INDUSTRIAL EXHIBITION.—An international exhibition on a large scale will be held in Cape Town from November to February inclusive. This will be of great importance in developing a market for British goods. The London office is at Palmerston House, Old Broad Street. The managing directors for the United Kingdom are W. J. AYLWIN and J. REYNOLDS.

BETULACEÆ.—Mr. HUBERT WINKLER contributes to ENGLER's *Pflanzenreich* a monograph of this family, including the Coryleæ, as well as the Betulaceæ proper. To the first group belong *Carpinus*, *Ostrya*, *Corylus*; to the second group, *Betula* and *Alnus*. The commentary is in German, but the description of the genera is fortunately in Latin. A group containing the Hornbeam, Hazels, Birches, and Alders is one of great importance, economically as well as botanically. The monograph is copiously illustrated, and has a full index.

MANURING SUGAR-CANES.—In a pamphlet containing a summary of the results of the manurial experiments carried on under the direction of the Imperial Department of Agriculture (for the West Indies) at Antigua and St. Kitts-Nevis during the year 1902–3, the chemist in charge of experiments (Mr. WATTS) pronounced the following opinion:—"It will not be found to pay to apply artificial manures to plant Canes in the Leeward Islands, but planters are advised to concentrate all their efforts on the preparation of the soil by cultivation and the use of pen-manure. With Ratoons, however, the case is different. Maximum crops can only be obtained by the use of artificial manures." For these Mr. WATTS recommends "the application of 2 to 3 cwt. of nitrate of soda, or 1½ to 2½ cwt. of sulphate of ammonia, with which ¾ cwt. of sulphate of potash and 1½ to 2 cwt. of either basic superphosphate or superphosphate may be employed with advantage. It is clearly proved by these experiments that nitrogen in a rapidly acting form is required for Ratoons."

LONDON CITY MISSION VISIT BUCKLEBURY.—On Thursday, July 14, the generous hospitality of Mr. and Mrs. ARTHUR W. SUTTON was extended to missionaries of the London City Mission. Over 400 were entertained for the day at Bucklebury Place, the host and hostess personally doing everything possible to make the outing a happy one. The Archdeacon of London was among their special guests.

MIDLAND AGRICULTURAL AND DAIRY INSTITUTE.—The annual meeting and opening of extensions by Sir THOMAS H. ELLIOTT, K.C.B. (Secretary to the Board of Agriculture), will take place on July 27, at 3.15 p.m., when the certificates granted during last session will be distributed. The nearest railway station is Kegworth (Midland Railway), 1½ mile.

FIG. 25.—FINE SPECIMEN OF *MAGNOLIA CONSPICUA* FLOWERING AT LA FANTASIE, JERSEY,
THE RESIDENCE OF LT.-COL. PH. ROBIN. (SEE P. 58.)

ASSOCIATION OF ECONOMIC BIOLOGISTS.—From Mr. W. E. COLLINGE, of the University of Birmingham, we have received the following communication:—"For some time past workers engaged upon various problems connected with economic biology have felt the need of some organisation whereby they could meet from time to time to discuss these different problems with fellow-workers, so as to bring out suggestions and to prevent unnecessary duplication of work, and generally to promote and advance the economic side of biological science. With a view to the formation of such an association of economic biologists, I have briefly discussed the matter with a few fellow-workers, and I shall be pleased to receive an expression of opinion or suggestions from any others. The idea at present in my mind is an association somewhat on the lines of the American one, which would include and welcome all investigators and teachers in economic biology in its widest sense. Mr. FRED V. THEOBALD (Wye), Mr. ROBERT NEWSTEAD (Chester), Mr. A. E. SHIPLEY (Cambridge), Mr. CECIL WARBURTON (Cambridge), and others have expressed themselves in favour of some such scheme."

GARDEN AND FARM PRODUCE BY RAIL.—That was a happy thought of an official of the Great Eastern Railway Company to carry small parcels of produce from homesteads to houses in town at a cheap rate, to be delivered without extra charge within the five-mile radius. The idea took a good grip on public attention, and recently the Traffic Manager informed us that the number of such parcels carried during the first six months of the present year was exactly 94,000, compared with 91,000 for the same period last year, or an increase amounting to 3,000 parcels. Only success can be desired for the scheme.

ENGLISH ARBORICULTURAL SOCIETY.—A visit was paid on the 2nd inst. to Bayham Abbey, Sussex, the seat of the Marquis CAMDEN, to inspect the woods and coppices. Mr. GEORGE MARSHALL, the President, and a numerous company attended. The Chestnut coppice is cut over every eleven or twelve years. Regret was expressed that owners of forest-land were now planting Chestnut instead of Oak, so that Oaks were becoming scarce. A German expert who was present congratulated Lord CAMDEN's agent on the good management of the estate. It is to be hoped that this meeting will ensure an accession of new members.

FRUITS, NUTS, AND VEGETABLES FOR FOOD AND MEDICINE.—We have received a pamphlet by Mr. BROADBENT on *Fruits, Nuts, and Vegetables; their Uses as Food and Medicine*, which seems in refreshing contrast to the fervent writings of fanatic vegetarians. It is quite true that vegetable products have many virtues when well grown and well cooked, and that "it would be a great boon if it were possible to purchase vegetables grown with properly-matured manures and at moderate prices." The little book mentions most of the well-known fruits, nuts, and vegetables severally, with notes on their respective virtues, and hints for growing, cooking, or serving them.

CONNECTICUT AGRICULTURAL STATION.—The twenty-seventh report of the Connecticut Agricultural Experiment Station (for 1903) reveals the valuable work undertaken in analysing fertilisers, feeds, and other products, test-seeds, &c., for the citizens of Connecticut. The results of analyses and investigations of general interest are published in bulletins and collected in the volume before us. We note, in addition to the above-named subjects, information concerning insect and fungus pests, tobacco, and so on. Where necessary, excellent illustrations supplement the text.

POMPEIAN FLORA.—Dr. WITTMACK contributes to the *Gartenflora* an interesting description, with lists, of the vegetable remains found among the ruins of Pompeii. These throw considerable light on the knowledge of the plants cultivated by the early inhabitants of that part of Italy. Dr. WITTMACK bases his observations largely upon researches that have previously been made, and confirms and adds to these notes of his own examination, microscopical and otherwise, of the seeds that have been found among the *débris*. Out of 160 of these remains, all of which were charred and many so caked together as to be unrecognisable, Dr. WITTMACK identified 130 as seeds and fruits. Considerable allowance had to be made for the change produced by the burning, which had reduced the seeds to about one-third of their natural size, caused complete separation of the embryo, and had loosened the husk (epispem) from the rest of the seed. Among the frescos many are of a fanciful nature and represent physiological impossibilities, and others are inspired by a knowledge of the flora of the Nile. They are therefore not to be depended upon as guides to the botany of the time. No remains of any species of Orange have been found, and the white Mulberry, so notable a feature of the flora of the Italy of to-day, is absent altogether, though the black Mulberry exists in abundance. In one instance pickled Olives were found enclosed in a glass jar, and they still retained something of their original flavour. Needless to say, all the plants of American origin, such as Agaves, Cactuses, Maize, and Tomatos, that are so largely grown in Italy nowadays, are missing. Dr. WITTMACK found most of the best known cereals, many roots, fruits in considerable variety, among them being Apples, Plums, Pears, Almonds, Pomegranates, and Medlars, Mustard, several species of Iris, Gladiolus, Narcissus, several Palms and Conifers, Vine, Ivy, and other familiar plants. The article is completed by an ample bibliography of Pompeii, in which further details are to be found of this most interesting subject.

NATIONAL POTATO SOCIETY.—The schedule of the National Potato Society's Show, which is to be held at the Crystal Palace on October 11 and 12, has been issued. Many of the large seed firms give special prizes, and a particularly interesting class is that for the best exhibit of Potatos in the show, the prize in which is the cup, value 10 guineas, presented by Sir JOHN T. D. LLEWELYN. Copies of the schedule may be had from Mr. WALTER P. WRIGHT, Postling, Hythe.

CUCUMBER-GROWING UNDER GLASS.—An excellent treatise on this subject is published by Mr. Fabius, Redlands Nursery, Emsworth, Hants. To be a successful Cucumber-grower, says the author, all depends upon the man; no amount of advice, instruction, or assistance can be of any use in the absence of that one condition. The publication of this little book might therefore seem superfluous; but it is really far from being so, and the most severely practical man will derive many a hint from these pages. The whole routine of cultivation, from the sowing of the seed to the cutting of the fruit, is clearly expounded, and the questions relating to soil, heating, and other essentials are fully entered into. Hygiene and preventive measures are most important in Cucumber-growing, for if the soil contains eel-worms, or fungus-spores are introduced with manure, the cultural conditions which suit the Cucumber also favour the fungi. The soil should be sterilised by steam if possible, if not by stacking the loam in layers with gas-lime intervening, and keeping it at least twelve months before using it. The close, stuffy atmosphere of a Cucumber-house is most favourable for the growth of fungus-moulds of all kinds; the importance of free ventilation is thus emphasised.

Overcrowding the plants of course favours the spread of the fungus. The maintenance of an even temperature is also of primary importance, and the watering should be most carefully attended to. Think first, and water afterwards, is Mr. Fabius' advice, and excellent it is. Indeed, we have rarely seen a book in which science (that is, knowledge derived from careful observation) has been more judiciously applied to practice. If all "book-knowledge" were of this kind, we should not hear much about the uselessness of book-learning.

GARDENERS' ROYAL BENEVOLENT INSTITUTION: BRISTOL AND BATH AUXILIARY.—We are informed by Mr. J. MILBURN, Superintendent of the Victoria Park, Bath, that at the recent Rose show at Bath (July 14), the Committee of this local Auxiliary had a stall for the sale of flowers, &c., to raise funds on behalf of the Institution, and that by such means a sum of £15 ls. 4d. was obtained. The Committee desires to thank exhibitors and others who helped by gifts of flowers on this and previous occasions. The example set at Bath and some other places might be adopted advantageously at nearly all horticultural exhibitions.

A GIANT CARNATION.—We recently saw at Dover House Gardens, Roehampton, what is probably one of the largest specimens of any type of Carnation in the country. The plant was of a variety of *Souvenir de la Malmaison*, and had about 190 growths, each of which was secured separately to a neat, thin stake. Every growth produces at least one flower, therefore the plant has yielded nearly 200 large flowers. The specimen is cultivated in a pot measuring about 15 inches in diameter. Mr. J. F. McLEOD's success in the cultivation of Carnations is well known, and the collection under his charge this year has been specially good. On many occasions he has cut some 300 flowers at one time to send to Mr. J. PIERPONT MORGAN, who has a very high appreciation for this type of Carnation.

PUBLICATIONS RECEIVED.—*Cassell's Popular Gardening*, Parts 3 to 9.—Circulars and Agricultural Journal of the Royal Botanical Gardens, Ceylon, Vol. II., No. 7. *Castilloa or Panama Rubber*, by J. C. Willis and Herbert Wright; No. 8, *Carda Rubber*, by the same authors; No. 9, *Shal-hole Borer*, by E. E. Green; Nos. 10 and 11, *The Royal Botanic Gardens, their Organisation, Work, and Relation to the Public*, by J. C. Willis; *Black Grub or Cutworm*, by E. E. Green.—From the Royal Botanic Gardens, Ceylon. Administration Reports, 1903. *Report of Mr. J. C. Willis, Director.*—*Agricultural Bulletin of the Straits and Federated Malay States*, April. Devoted chiefly to articles on the Rubber industry. *The Agricultural Gazette of New South Wales*, May. With notes on Forestry, Viticulture, &c., and an article by W. S. Campbell on Practical Vegetable and Flower Growing.—*The Agricultural Journal of the Cape of Good Hope*, June. Mr. C. P. Lounsbury contributes a paper on Revised Plant Import Regulations.—*Annual Administration Report of the Forest Department of the Madras Presidency for the year ending June 30, 1903*. A record of twelve months' labour, and of the condition of the State forests during 1902 and 1903.—*Report of Work of the Agricultural Experiment Station of the University of California*. From June, 1901, to June, 1903. In the Botanical section much valuable work was done in identifying and reporting upon specimens. Viticulture also received much attention. United States Department of Agriculture: *Some Miscellaneous Results of the Work of the Division of Entomology*. An illustrated record of valuable investigations.—*Report of the Work and Regulations of the Technical Instruction Committee, Essex Education Committee*, 1903. Four short horticultural courses were held, and the quality of the work done was quite up to the high standard of previous years. Ten students did well at the Royal Horticultural Society's examination. In the agricultural section the laboratory and field work was satisfactory. *The Agri-Horticultural Society of Madras, The Annual Meeting*, March 29, 1904. With a brief and satisfactory report for the year then ended.—*The Transvaal Agricultural Journal*, April. A quarterly periodical. The present number contains Botanical Notes, Vine Growing, The Persimmon, &c. The notes on Native Economic Plants, by J. Burt-Davy are excellent, and so are the plates that illustrate the journal. We may have occasion to refer to this, and other publications at greater length on another occasion.

STRAWBERRY "THE ALAKE."

IN fig. 26 is shown a fruiting spray of the new Strawberry "The Alake," a variety exhibited by Messrs. Jas. Veitch & Sons at the Royal Horticultural Society's meeting on June 28. The variety was raised from a cross between Frogmore Late Pine and Veitch's Perfection, and was recommended an Award of Merit by the Fruit and Vegetable Committee. The fruits are of very large size, and, as will be seen from the illustration, are frequently very irregular in outline. They possess rich colour and good flavour, and the variety is apparently a prodigious cropper.

dissolve tough meat. The emanations from this tree will dissolve and digest albumen, and it is the custom of the natives to hang meat and chickens in the branches of a tree to render them tender and edible.

The uses of the Papaw are numerous and varied. The bark is used in the manufacture of ropes; the fruit is edible, and is sweet, refreshing and agreeable.

The ripe fruit is eaten as we eat Melons. Salt enhances the flavour, and some users add sugar. The fruits must be perfectly ripe when eaten raw, as when green they contain a strongly-marked acrid principle. The colour of the ripe fruit is more or less that of the yellow Musk-

The seeds are eaten as a delicacy. They have quite an agreeable taste, something like Watercress, and with a piquancy slightly suggestive of the Mustard family. Macerated in vinegar, they are served as a condiment.

In hot climates meat must be eaten immediately after slaughter. (It often reaches the pot an hour after killing.) The Papaw helps to overcome this. Rubbed over tough meat it will render it soft, and change a piece of apparent leather to a tender, juicy steak. It is put into the pot with meat, enters into soups, stews, and other dishes, which are made more edible and digestible.

NOVA SCOTIA.

Report of the School of Horticulture of Nova Scotia, by Prof. Sears, Director.—"The past year has been the best in the history of the School; the experimental orchard at Wolfville is beginning to give some useful data for the present and promise for the future, while the mole orchard-work has put us in touch with the fruit interests all over the provinces." With regard to the fruit season: "Never was there a season that opened so discouragingly and closed so successfully. The crop is large and of the finest quality."

WEST INDIES.

Cotton Cultivation.—Recent numbers of the *West Indian Bulletin* contains a full report of Cotton cultivation in the Sea Island districts of the United States and in the West Indies. It includes not only articles on cultivation of Cotton, but also on the factories or "gineries," the pests attacking the Cotton-plant, and a great variety of information indispensable to everyone interested in Cotton cultivation in the colonies. Extra copies may be obtained from Messrs. DULAU & Co. Price 6d., post-free 8d.

Sugar-cane Diseases.—Mr. Lewton-Brain, the Lecturer in Agriculture, has published the substance of three lectures delivered by him before the Barbados Agricultural Society, under the auspices of the Imperial Department of Agriculture, at the head of which is Sir Daniel Morris. The diseases referred to attack canes to a greater or less extent in all the sugar-producing colonies in the West Indies. The root disease (Marasmius) was especially prevalent at Barbados last year, and it was largely due to the attacks of this fungus that the sugar crop of 1903 (35,000 hhds.) was lower than any during a period of thirty-four years. It was even lower than in 1895, when the ravages of the rind fungus (*Trichosphaeria*) reduced the normal crop of 56,000 hhds. to 36,000 hhds., and led to the practical abandonment of the Bourbon cane. The principal canes now cultivated are the White Transparent and seedling canes. A conservative estimate, after making every allowance for unfavourable seasons and other circumstances, has placed the loss due to the attacks of fungoid diseases at Barbados during 1903 at 10,000 hhds., of the value of £70,000. If we take into account the loss sustained in molasses also, the total loss in 1903 would not fall far short of £100,000. It was with the view of aiding the planter to control the diseases affecting his crops, especially in these days of low prices, that the lectures delivered by Mr. Lewton-Brain were organised. It is recommended that tops for planting should be selected from healthy canes only; that where the disease shows itself in small patches in the fields, these should be isolated by a trench (about a foot deep) dug round them, so as to prevent the disease from passing through the soil and attacking healthy canes; that all cane stumps whatsoever should be dug up and destroyed either by burning or being heaped up and treated with quicklime; and that where a field has been

FIG. 26.—NEW STRAWBERRY "THE ALAKE."

COLONIAL CORRESPONDENCE.

AUSTRALIA.

Journal of the Department of Agriculture of Western Australia, February, 1904.—Contains various notes; a report on the Conservation of Water, by A. B. Fry; a paper on By-products of the Grape, and Gardening Instructions for March.

The Agricultural Gazette of New South Wales, February.—Contains useful information on the usual subjects. We note that a coating of boiled linseed-oil and Stockholm-tar (used in equal parts) painted over Apple-trees for 3 feet from the ground effectually protected the trees from damage by hares, and did no harm to the plants. It would probably prove equally efficacious against other pests.

THE PAPAW IN QUEENSLAND.

The Papaw is widely distributed over tropical Queensland, and is most agreeable and nutritious. Quite universal is the knowledge of the property that has given to the Papaw its world-wide fame, viz., the power of its milky juice to soften and

Melon. The sweetness of its resinous, pulpy juice clings to the tongue, and remains for some hours.

Excellent preserves are made of the ripe fruit, which for this purpose is boiled down in sugar and candied, like Citron. At the sugar houses slices of the Papaw are often seen seething in hot syrup. The slices of Melon combined with some acid fruit is made into native tarts. The fruit is also stewed and served at table. The green fruit is made into plain and spiced pickles, which are highly esteemed.

The fruit, just before ripening, is peeled and sliced, macerated in cold water, with frequent changes of water for some hours; the then macerated fruit is dropped into boiling water, boiled sharply, and served as a vegetable.

The green leaves or slices of the green fruit of the Papaw are rubbed over soiled and spotted clothes, and by its power of dissolving stains Papaw has acquired the name of "Melon bleach." The leaves or a portion of the fruit are steeped in water, and the water is used in washing coloured clothing, especially black. The colours are cleaned up and held fast.

very badly attacked by root disease it should be thrown out of cultivation in canes, treated with lime, and planted with other crops for a period of at least one year—preferably two years. These recommendations are of so simple and practical a character that no difficulty need be experienced in carrying them out; and especially, as the probability is, that they would be the means of saving a considerable portion of the loss to the sugar industry of this island, which was estimated last year by responsible officers of the Department at £100,000.

MANURING SUGAR-CANES.

From the Imperial Department of Agriculture for the West Indies we have received and acknowledged two volumes of Reports on experiments with Sugar-cane, carried on in the Leeward Islands. The important subject of manuring is

sulphate of ammonia. Remunerative results will be obtained without the use of potash or phosphate, but a small additional profit may be expected from their use: $\frac{3}{4}$ cwt. of sulphate of potash, and $1\frac{1}{2}$ to 2 cwt. of either basic phosphate or superphosphate may be employed. It is quite clear, however, that nitrogen, in a rapidly acting form, must be used if good ratoon crops are to be grown."

We have received a list of seeds available for exchange from the Botanic Gardens, Georgetown, British Guiana. Applications should be addressed to the Superintendent.

TRANSVAAL FLORA.

One of the great pleasures attending botanising trips in the country around Johannesburg is the frequency with which plants hitherto not met

seems to be a strange isolation, probably in some measure caused by the remarkable variation of soil, which show the strata plainly on some of the hillsides. As an instance of how closely some of the plants follow certain formations, I found *Primula farinosa* blooming in profusion on the limestone, its area being restricted by an outcrop of grit. *G. W., Johannesburg.*

ROSES IN THE TRANSVAAL.

Whatever may be the drawbacks in other respects in the Transvaal, the florist has nothing to complain of, and especially the rosarian. Flowers of all sorts thrive and bloom admirably, here if properly tended, and Roses bloom splendidly and for many months with little attention. All my thousands of Roses are on their own roots. I have a man now at work putting in cuttings in.

FIG. 27.—VIEW OF ONE OF THE LAST EXHIBITIONS HELD IN THE DRILL HALL, BUCKINGHAM GATE, WESTMINSTER. (SEE P. 63.)

dealt with at much length, and the results of many trials are, for practical purposes, briefly summed up thus:—"Plant canes, when the field in which they have been planted has been properly tilled and manured with pen manure, require no artificial manure. When the soil is in good condition, but it has been found impossible to give the proper dressing of pen manure, then artificial manures may prove remunerative; under these circumstances it is suggested that either $1\frac{1}{2}$ to 2 cwt. of sulphate of ammonia, or 2 to $2\frac{3}{4}$ cwt. of nitrate of soda be given in one application. A small additional profit will probably follow from the use of $\frac{3}{4}$ to 1 cwt. of sulphate of potash together with phosphate, either $1\frac{1}{2}$ to 2 cwt. of basic phosphate, or a similar amount of superphosphate. All these manures should be given early. For ratoon canes nitrogen is very necessary, and this may take the form of 2 to 3 cwt. of nitrate of soda, or $1\frac{1}{2}$ to $2\frac{1}{2}$ cwt. of

with, or passed unnoticed, suddenly present themselves in great beauty of flower, and literally covering a particular area. Some of the rarer kinds may only be found in perhaps one small patch, and although they may perhaps exist in greater quantity in some other locality, their position here seems to indicate that they are slowly dying out. Recently I found a pretty lilac-flowered *Selago* in great beauty, but very locally confined to a narrow outcrop of conglomerate at the eastern edge of the high upland plain from which the ridges and valleys of the Klipriversberg radiate into the Klip valley. I only saw the same thing once before, like a line of Heather, with the boundary as straight as if laid out with a line. The same with some of the *Gladioli*, which grow in patches. One pretty scarlet species with yellow stripes grows only in one small area. Of *Stapelia*, I have found but one patch, and with many other species there

the open ground, and at least eight out of ten of the cuttings will root, although no sort of shade or shelter is provided. During the long Rose season I cut from fifty to one hundred dozen fine blooms every day. I have great numbers of Rose "*Archimedes*," which begins flowering in September, is still finely in bloom, and will continue for more than a month; so that this Rose alone gives us flowers for over nine months every year. It is a wonderful bloomer, something like *Mme. de Watteville* in colour, but with more of a *Noisette* bud. It is excellent for button-hole flowers.

Our climate is quite different to that of the Cape. Our rainy season sets in in October and continues until April. Then for five months we do not expect a single shower. So much the better, as we get sharp hoar-frosts nearly every night, as at present, but beautiful bright sun all day and every day. *J. H., Johannesburg, May 30.*

THE LAST OF THE DRILL HALL.

ON Tuesday next the Royal Horticultural Society's Committees will meet for the first time in the new Hall in Vincent Square, Westminster, and in conjunction with the exhibits before those Committees there will be the annual display of the National Carnation and Picotee Society's show. The capacity of the new Hall will therefore be put to a somewhat severe test at the very outset; but whatever its shortcomings, there is no doubt that it will afford much better facilities for the accommodation of the Committees, and for the ladies and gentlemen who are good enough to deliver lectures from time to time. It may be here mentioned that Mr. Bidgood will at the 3 o'clock meeting on Tuesday next deliver a lecture on some of the phenomena connected with Orchid life. The lecture will be illustrated with lantern-slides, and is likely to prove very interesting.

In passing from the Drill Hall, however, it may be placed on record that, in spite of its many inconveniences, it has provided an accessible site for the holding of the fortnightly exhibitions, and having been originally recommended for temporary use only, until the Society could obtain a home of its own, it has on the whole satisfactorily fulfilled its purpose. That excellent exhibitions have been held in the building is well known to most of our readers, and a photograph, which is reproduced at fig. 27, showing a portion of one of the last that was held there, will serve to perpetuate its memory.

On Friday, after these pages have gone to press, the new "Home" will be opened by His Majesty the King. Various addresses from kindred Societies will be presented, so that the event will be a red-letter day in the Society's history.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

THE ROYAL HORTICULTURAL SOCIETY'S SHOW AT HOLLAND HOUSE, JULY 12 AND 13.—As a country visitor may I give a few of my impressions of this show? The leading nurserymen had fine and interesting exhibits of their various specialities. Private exhibitors were not numerous; horticultural sundriesmen were well to the fore. One exhibitor called my attention to a cage for Sweet Peas. I told him I preferred ordinary Pea-sticks. One of the best outlays I ever had for a shilling was a walk round the grounds of Holland House. To me, an old gardener of upwards of fifty years' experience, the sight of this old-world English garden in the midst of the whirl of London was a treat, possessing as I do memories of Penrhyn when visited by Her Majesty Queen Victoria and the Prince Consort; Belvoir, with Mr. Ingram in his prime; and Tortworth Court, in the days of Mr. Crump. I met the courteous superintendent of the Royal Horticultural Society, and I saw that grand old gardener, Canon Ellacombe, getting about with all the enthusiasm of a youth. I heard some one inquiring after his rheumatism; he said he had handed it over to the rising generation. I should like to see such a place as Holland House in the Canon's charge for ten years, to introduce his hardy treasures in his own way. *R. M., Newbury, July 18, 1904.*

FLOWERING OF ARUNDINARIA SIMONI.—There was considerable correspondence last year as to the flowering of *Arundinaria Simoni*; this does not seem uncommon, it has flowered with me, and the plant died; but I have this year three plants of *Phyllostachya Boryana* flowering, one established with a fine growth, and the other, newly planted, but all are looking healthy in the leaves and growing—unlike *Simoni*, which appears to have lost all life. *G. H. Palmer, Lackham, Lacock, Wilts.*

WILD CHERRY (GEAN-TREE).—While rambling recently about some of the places in the suburbs

of this city (Aberdeen), I saw what I consider a unique specimen of the Gean-tree (*Cerasus sylvestris*, or *vulgaris*) growing in the grounds of Aahgrove House, belonging to the Royal Lunatic Asylum. From the size and beauty of the tree as a specimen I think it should be recorded. Looking at the tree from the south, it is a most striking object, beautifully balanced, and, as it appeared at the time, a mass of rich white bloom (see fig. 28). Viewed from the east, the expanse of branches is greater, but its symmetry is somewhat destroyed by showing the division of the head. The stem is 10 feet long from the ground to where the two great branches divide; girth at ground, 11 feet 6 inches; girth at 5 feet up, 8 feet 6 inches; girth at 10 feet up, 12 feet; spread of branches, east to west, about 48 feet; spread of branches, south to north, about 53 feet. The height of the tree is about 50 feet. I am not aware of any specimen of this tree in the country which exceeds this, certainly not in Scotland, as far as I have information; and it would be quite

that the manure they produce is so plentiful that it can hardly be given away. No one supposes that considerations for the welfare of land cultivation and crop production will influence horsekeepers in reference to the change and almost disaster that the conversion of their vehicles into motor ones may produce. Possibly, seeing how plentiful horses seem to be, many persons may smile at the suggestion that there may become presently a manure famine. But whilst the claims of cultivators grew with the increase of population and land under cultivation, there should necessarily be a material increase in manure-production. How severely farmers would in time be hit were the demand for hay, straw, and corn greatly to decline is necessarily a matter for the agricultural interest—an interest that is always so ready to grumble, and equally ready to call upon Jupiter for help. Presently perhaps, as the manure supplies from London and great towns become less, "corners" in manure may grow up—indeed, nothing is more likely—and the

FIG. 28.—A FINE SPECIMEN OF THE GEAN-TREE IN ABERDEEN.

impossible to have a more beautiful example or a more telling object in the landscape. It is growing in a light calcareous soil overlying granite, is probably sixty to a hundred years old, and at present is in perfect health. If not damaged by accident, it is likely to grow for many years. It would be interesting to know from any of the many readers of the *Gardeners' Chronicle* of other outstanding specimens of the Gean, and how they compare with the above. *Chas. S. Francis, Aberdeen.*

MOTORS AND MANURE.—When a London jobmaster states that the introduction of motor vehicles has already taken 5,000 horses from the streets of the metropolis, the statement becomes to gardeners generally, and to market growers specially, a matter of profound interest. Practically, the question arises, What is to become of gardening generally, and market gardening particularly, if, owing to the abolition of the useful horse as a means of locomotion, the manure supply, hitherto an absolute essential to gardening, should come to an end? There are seasons when London is so full of horses

small cultivator may then have to grow his crops on starved soil, or depend on doubtful plant-feed elements, so freely boomed under the very proper designation of "artificial." If there be 5,000 horses fewer fed and bedded in London than there were a few years ago, it becomes obvious that with the growth of motor production and of electric traction that in the succeeding space of time not merely 5,000 but 10,000 horses may be displaced; and if that depletion continues, where shall we be twenty years hence? The abandonment of the horse as a means of locomotion, whilst creating a revolution in our social life, must of necessity eventually lead to the ruin of both agriculture and commercial horticulture. Doubtless the artificial manure merchants will tell us that in such case, so far as crop foods are concerned, they can supply the possible deficiency. It will be a bad day for the land in Old England if ever it has to depend on quack medicines [the term "quack" only applies to remedies of unknown composition and unauthenticated properties Ed.] for health and strength. Some day, too, perhaps the nation may be rudely awakened to the sacrifice now being

made by pouring vast quantities of plant or crop food into the sea, as is now done in the form of sewage. These things become matters not to be lightly regarded, A. D.

POTATO DISEASE.—I was much interested in the description, on p. 28, of another Potato disease. Can it be the same that has been here for several years? I saw a patch a few miles from here, a few days ago, of the variety Dalmahoy, the plants of which were worthless. I asked the owner to dig up a root, and I found what I expected, viz., numerous millepedes (*Julus pulchellus*, I believe), also a very small beetle (*Bathyscia Wollastoni*). These pests have been very troublesome here for several years, the Potato plant attacked becoming quite worthless. I always find the two pests together; they attack the old tuber (set) generally, but will affect new tubers also. When attacked some chemical change seems to set up in the old tuber. The plant that was previously healthy assumes a curled, scorched appearance, dwindles, and dies. I believe the *Julus* sets up some chemical change in the old tuber. About two years ago I sent some of the beetles by request to the insect department of the British Museum. I have found soot and lime put round each tuber when planting to be very effective in keeping the pests away. A. J. Staines, gr. to J. H. Monins, Esq., Ringwould, nr. Dover.

THE RAISING OF SEEDLING STRAWBERRIES AT MESSRS. LAXTON BROS. NURSERIES, BEDFORD.—The cross having been made and the parentage recorded, the fruit is picked as soon as fully ripe, and laid by to become thoroughly dry; the seeds are then carefully extracted and sown at once in boxes 3 ins. deep, the soil used having been first carefully baked to destroy any fungus germs and the larvae of insects. The seeds are sown thinly on the surface and lightly covered with soil. Some seeds germinate at once, some not until the spring. Mr. Laxton said that if sowing is not done by the beginning of August, it is better to delay doing so until the spring. So soon as the seedlings are large enough they are pricked off into other boxes to grow into larger size, and as soon as strong enough, they are transplanted to the open ground to mature and produce fruit. The most promising varieties are marked for trial, and half-a-dozen or so of runners laid down of each, to plant for a further trial. It is two years or practically three years before any fruit is produced and a test can be applied and a selection made. Mr. Laxton stated that it took ten years to fully test a variety, as it varies according to the character of the season. The seedlings are planted-out in pairs of lines, the lines being 2 feet apart, and the plants 15 inches or so apart in the lines. Between each pair of lines comes 4 feet of unoccupied ground for the purpose of layering. The shoots producing layers are brought out into the 4 feet space and rooted in small pots. In this way any mixture of sorts is prevented. R. D.

STRAWBERRIES.—Royal Sovereign, Fillbasket, Waterloo, and Monarch have stood the dry weather better than any other varieties, of which we have about ten. W. A. C., Shirley Park Gardens, Croydon.

Obituary.

EDMUND HYDE.—There died, on the 14th inst., at Ealing, Middlesex, in his 95th year, a gentleman who, apart from his general love of gardening pursuits, demands notice here as having been the first to suggest the use, in horticulture, of cocoanut-fibre. In some manufacturing concern in which he was associated vast quantities of cocoanut-fibre accumulated, for which there was no use, and which could not readily be destroyed. The idea occurred to Mr. Hyde that it might be serviceable as a mulch or for other horticultural purposes. With the aid of the late Donald Beaton, experiments were made to such purpose that nowadays the difficulty is to get enough of the material. It was in Mr. Hyde's garden that plants of the wild form of *Primula sinensis* were first flowered in this country.

DAVID MITCHELL.—The death is recorded in the *Journal of Horticulture* of Mr. David Mitchell, formerly gardener to the Duke of Hamilton, and subsequently in business as a nurseryman and auctioneer. He died on the 14th inst., at the age of seventy-nine years, at Comely Bank, Edinburgh, where he lived for several years past in comparative retirement.

SOILS AND MANURES FOR SPECIAL CROPS.

(Continued from p. 404.)

VIOLETS.—We have been favoured by Mr. A. L. Wilton with the chemical constituents of Violets grown under glass, which are as follows:—

Chemical composition of 1,000 Violet plants, including roots (cleaned), and of 100,000 Violet blooms as picked for market.

Composition.	In 1,000 Plants and Roots.	In 100,000 Violet Blooms.
Water	lbs. 257	lbs. 114
Organic matter	52	14
Nitrogen	1.5	0.4
Ash	6.9	1.2
Total	317.4	129.6
Composition of the Ash:—	Per cent.	Per cent.
Potash	25.30	51.28
Soda	7.96	4.27
Lime	9.61	8.54
Magnesia	3.63	7.70
Phosphoric acid	5.38	11.11
Sulphuric acid	4.95	7.70
Chlorine	3.95	4.27
Silica and iron	40.12	5.13
Total	100.00	100.00

These facts are particularly interesting, because so far as we know, they are the first complete analyses which have been made of Violet plants and blooms grown under glass.

The first thing thing that calls for attention in the above data is the very large proportion of water both in the Violet plants and flowers, with the consequent small amount of organic matter or dry substance. Thus, the Violet plants consist of about 81 per cent. of water, and 19 per cent. of organic substance; while the blooms consist of about 88 per cent. of water, and only 12 per cent. of organic substance. This assuredly points to the fact that, if the gardener is to ensure vigorous and uninterrupted growth of Violets under glass, he must have a sufficiency of moisture in the soil in immediate proximity to the mass of root-fibrils which branch out from the root-stock.

In the composition of the ash we see how large and important a part potash plays both in plants and flowers. One-quarter of the ash of Violet-plants is composed of potash; and more than one-half (51 per cent.) of the ash of Violet-blooms is composed of the same constituent. Phosphoric acid is also particularly essential for the production of vigorous blooms: this element is found to bear an important relation to some of the metabolic processes in the organised part of Violets.

SOIL FOR VIOLETS.

These plants do well in good clay loam, such as is used for Roses, or in a sandy or gravelly loam. A sandy type of soil, however, should contain abundant fibrous matter from decayed grass-roots or farmyard manure, or should have about one-sixth of good leaf-mould mixed with it at the time of preparing the beds for the young plants. It is probable that independently of the liberal supply of all necessary plant-food constituents in farmyard manure its beneficial effects upon such succulent plants as are Violets, are in a considerable degree due to its influence on the mechanical condition of the soil, rendering it more porous, hence more moisture-retaining, and, therefore, more easily permeable to the mass of fibrous roots.

The amount of manure needed in the compost must be determined by the richness of the original soil. A good, rich clay loam requires one part cow or horse-manure of fair quality, three or four months old, to four parts of soil composted as for Roses. It is best not to add

any bone or other fertiliser. The compost should be thoroughly limed as it is being made up, by adding a liberal sprinkling of quicklime to each layer of soil. The manure should be thoroughly incorporated with the soil by the time the latter is put into the beds. Thorough steam sterilisation of the soil will kill eel-worms, root-rot fungi, spores of *Botrytis*, and numerous other parasites and pests that trouble the Violet grower. Lighter types of soil will take one part manure to three parts of soil, otherwise they may be treated the same as above-mentioned. The greatest danger in Violet growing is in getting the soil too rich, and thus encouraging leaf instead of bloom production.

LATER FEEDING.

We have seen from the foregoing chemical analysis that the amount of nitrogen, phosphates, and even of potash removed from the soil by a crop of Violets is comparatively small, and if well composted soil and farmyard manure are used no further feeding is necessary or desirable.

If, however, feeding should become necessary for any reason, it is safest to use manure-water made as recommended for Roses; but it should not be used oftener than once in three weeks, and only during active growth or when active leaf-growth is desired. If there is indication of a lack of phosphoric acid, which will be shown by reddening of the leaves along the veins and a tardy development of flowers, use steamed bone-meal at the rate of 1 lb. to 30 square feet, one application being usually sufficient; or if the soil contains considerable lime, superphosphate can be used at the rate of 10 oz. to 100 square feet, applied either in water (50 gallons) or sprinkled dry between the rows. If there is any doubt about the soil containing sufficient lime, which is an important constituent of both Violet plants and blooms, give the plants a watering with freshly-made lime-water—1 peck freshly-slacked lime to 50 gallons of water for 200 square feet. This should be applied several days previous to the application of the superphosphate. Two or three applications of superphosphate at intervals of two or three weeks should be sufficient. As stated above, the greatest danger in Violet growing is over-feeding. If the soil should be found too rich, treat as recommended for over-feeding of Roses. J. J. Willis, Harpenden.

(To be continued.)

LAW NOTES.

ASSESSMENT APPEAL.

An important point in assessment was involved in an appeal made at the Cheshire Quarter Sessions at Knutsford, on Wednesday, June 29 and following day, by Joseph Hargate Clibran, nurseryman, of Hale, against the assessment by the Bucklow Board of Guardians of certain property of his in the parish of Hale.

In his opening statement Mr. Trevor Lloyd said the respondents were the Assessment Committee of the Bucklow Union, and the appeal was against the poor rate assessment. The dispute now concerned two assessments—of a packing shed and nursery land. The shed was put down at a gross rental of £100 and rateable value of £75, and nursery land at £105 and £94 respectively. The appellant contended that the assessment was made on an erroneous basis. According to Act of Parliament it should be rated as agricultural land, for under a certain section, which he read, agricultural land was defined as arable, meadow, or pasture land, allotments, &c., and it was stated that land kept as a park or pleasure ground did not come under the term. He therefore submitted it was clear that nursery land came under the head of agricultural land. One shed concerned was a flimsy

structure, and was used for packing purposes, only a tenth of the whole building was used as offices, the building being solely used for the business of a nursery. He submitted such a building came under the same category as a hayshed or farm-building, and that there were further deductions to be made, as farm-buildings were as a rule built substantially, and had longer lives. The building concerned had a life of fifteen to twenty years, and the renewal fund must be deducted to get at the rateable value. Five per cent. was about the amount a landlord would expect to get on his outlay in erecting such a building, and, deducting the renewal and repairs, the figures were brought down to about £40. The appellant was content to have the property rated on the same basis as the highest rated farm in the district. The respondents submitted that more profit was made with the land being used for the purposes of a nursery, and that therefore it must be rated higher, but he held that that was not the proper way to look at the matter. They should consider the value of the land and what a hypothetical tenant would give. Mr. Clibran rented some land from the Hale District Council, and he held that the assessment of the land concerned was much higher than in the other case. Mr. Lloyd also intimated that there was some dispute as to measurements of the land.

The appellant gave evidence describing the property.

Mr. Marsham asked if "this wretched, flimsy structure" was not the largest in the kingdom devoted to such a purpose, and the appellant smilingly acknowledged that it was.

Replying to Mr. Marsham, the appellant said that in the building there were seventeen offices, and that he had from twenty to forty clerks, the number varying. There was a tramway in the shed, and the building was so equipped that work could be done as expeditiously as possible.

Mr. Clibran was cross-examined at great length by Mr. Marsham, after which Benjamin Slade, estate agent, valued the holding at £85 per year, gross, including the house, and £76 10s. would be the rateable value. Separating the house from the land, he allowed £20 for the house, and this would leave £65 gross. Allowing for the usual 10 per cent. off, which was the amount allowed in this district, the rateable value of the holding was brought to £58 10s.

Mr. Clibran was recalled, and stated that the rent paid by him at Hale was £194 6s. for 68 acres.

For the defendant authority Mr. Marsham said that Mr. Clibran and his father had carried on a very extensive business as nurserymen, and had their headquarters at Altrincham for a considerable time. They removed their headquarters to Hale, and took their large staff with them, and had to make adequate accommodation in offices. They had taken half an acre of land and covered that with a building which was not a mere shed, but was in point of fact a more or less permanent building with offices on one side and a potting place on the other.

Mr. Marsham then proceeded to read from Mr. Clibran's catalogue as to what the appellant stated there, when Mr. Lloyd observed that this was a trade puff. Mr. Marsham objected to this, and said it could not puff the length or breadth or height of the building. The adjectives used, such as "flimsy," were advocates' puffs. The Assessment Committee had endeavoured to look at this matter in a serious light. They knew what was right between one ratepayer and another. First of all Mr. Clibran gave the usual notice of objection to the Assessment Committee, and upon that being brought before them they thought the best course to take was to call in some independent valuer and take his opinion. They invited applications from half a dozen people,

and selected Mr. Cross. Mr. Cross made his measurements and put down a price which he thought to be reasonable. The proper rent for the office would be £150 per year. The Assessment Committee met Mr. Clibran, and the matter was talked over in a friendly manner. Then they reduced the amount until they reached the figure of £70, and then they said, "We cannot go any further, and if he objects he must appeal." Was it reasonable to suggest that a net rent of £70 per year was too much for a building of this kind? That was what was being objected to, and he submitted that it was a very reasonable and very low net rent, and that the further deductions had been altogether exaggerated for the purpose of this appeal.

There were other nurserymen in the district, continued Mr. Marsham, and every one of them is rated at more than the one against which this appeal was brought. The land in question was valuable accommodation land, and it was on the main road, and on three sides out of four there were roads.

Isaac Bush, overseer for Hale, and a nurseryman, gave further evidence; and then William Edward Cross, of the firm of Cross & Son, surveyors, of Manchester, said he had made special and careful inspections of the shed and land. The situation was a very convenient one. He valued the land at £150 per year, and considered the building would last for forty years.

Mr. Lloyd remarked that his learned friend seemed to take it for granted that the land should be rented as nursery land. This was the whole issue. The land must be taken as agricultural land, he submitted, and must be taken the same as the land around it, irrespective of what was grown upon it. It was quite clear that they were rating the crops. Mr. Cross had put it at £4 per acre, and rated it as nursery land, and he (Mr. Lloyd) submitted that the Act said nursery land was included in agricultural land. They were over-rated to a very great extent.

The Bench then retired, and after an absence of about fifteen minutes returned.

The Chairman stated that in respect to the land it might be taken that the legal point of view was the one he expressed previously, that they must take the land as it was. On that footing the Bench confirmed the rate as far as the rate was concerned—viz., that it would stand at £105 gross and £94 rateable value, subject to any variation in the $1\frac{1}{2}$ acre mentioned previously. With respect to the packing-shed and so-called buildings they had come to the conclusion that the rate was too high, and that it must be reduced from £100 gross to £90, and from £70 rateable value to £55. In respect to the costs they should direct each party to pay his own. *Condensed from the "Altrincham Advertiser," July 1.*

THE ROSARY.

ROSE PHILIBERT BOUTIGNY.

A HYBRID Tea of good size and form and rich carmine-crimson colour. It was raised at Rouen by M. Boutigny as the result of a cross between Reine Marie Henriette and Victor Hugo. It is stated to be of robust habit and a continuous bloomer. It is figured in the *Journal des Roses* for May.

PLANT PORTRAITS.

RHODOSPHERA RHODANTHEMA (Anacardiaceae), *Maiden Forest Flora N. S. Wales*, t. 32.

IRIS PALLIDA, with yellow-variegated leaves, *Revue de l'Horticulture Belge*, July.

FIGUS DIVERSIFOLIA, shown in the fruiting condition, *Revue de l'Horticulture Belge*, July.

VEGETABLES.

POTATO TRIALS AT READING.

MESSRS. SUTTON & SONS are conducting this year, in their seed grounds at Reading, trials in relation to Potatoes of an unusual character and of great interest. Their object is to determine three things. First, the effect of soils and situations on the constitution or growth of varieties; second, the effect on growth of diverse methods of storing during the winter of seed tubers; and third, the results of shoot or cutting propagation now so largely practised to increase certain varieties now being put into commerce. These trials all differ materially from those that seedsmen ordinarily conduct, as they are usually made to test the relative productiveness of varieties, the quality or the correctness of various stocks.

In relation to the first test, that of the effect of soils and situations on growth, some seven or eight well-known and popular varieties are utilised. Their names can be given after the lifting takes place and tuber produce is seen in the autumn. In each case there are planted sets from southern-grown seed, tubers from Lincolnshire and from Scotland. The results are remarkable, as in each case growth on the southern-grown sets is late, dwarf, and weak; indeed is exactly characteristic of so many breadths of Potatoes seen in diverse directions grown from home-saved seed-tubers. Both the Lincoln and the Scotch tubers give quite strong, robust tops, really as robust as Potato-tops well can be, although the Scotch-grown tubers give, of these, the most even robust growth. The results, so far as haulm-growth is concerned, are astonishingly in favour of Lincoln or Northern seed; and it is no wonder that, having found similar results in previous years without specially testing to that end, the firm is getting its stocks grown in Scotland.

In the second case, the test applies to methods of wintering the seed tubers, and there are numerous varieties used for the purpose. Certain sets of these varieties were set up in shallow boxes last autumn, and wintered in the light and in a cool place, with the natural result that they sprouted in due course strongly, and so remained in robust form till planted. Then certain similar sets, selected from tubers that had been kept in pits in the too common way in the winter, and unsprouted, were planted in alternate rows. The result is, that the plants from the first-named sets are doubly strong, and show conclusively that pit storing of tubers greatly conduces to weakness and deterioration.

In the third trial one variety of Potato only was used, and from tubers started into growth in gentle warmth; in due course the first shoots were taken off and rooted singly in pots, as cuttings are; then the second batch of shoots, and finally the third, were removed and treated in the same way. These batches were kept separate, and were also planted outdoors separately. Still further, the tubers making a fourth break of shoots were also planted. The results, as seen on June 24, were that the second set of shoots was rather stronger and certainly more forward than were those of the first batch, whilst the third was distinctly weaker than either. The planted tubers give quite weak growth, as might well have been expected. The object of this trial (and it is a considerable one) is to see how far propagation by cuttings conduces to weakness or otherwise, and also whether or not second and third-shoot growths give as good results as the first shoots do. A. D.

SOCIETIES.

NEWMARKET HORTICULTURAL.

JULY 7.—A successful show was held on the above date. The judges were — for plants, flowers, and groups, Mr. W. Cox, head gardener at Cheveley Park, and Mr. R. Davidson, head gardener to Earl Cadogan, at Culford Hall; for vegetables, Mr. W. Hooper, head gardener to Mrs. Robinson, Dullingham House, and Mr. A. Ranson, head gardener to Mr. P. P. Gilpin, Clarehaven; for honey, bread, and cooked Potatoes, Mr. D. Game; and for allotments, Mr. H. Lydiatt, head gardener to Sir Daniel Cooper, Bart., Warren Tower, and Mr. G. Aslett, head gardener at Soham House. The principal prizes were taken by Sir Daniel Cooper, Bart., Sir James Miller, Bart., Mr. H. Bullmann, Mr. T. Williams, Mr. Percy Heaton, Mr. T. Jennings.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

JULY 11.—The quarterly meeting was held on the above date, Mr. Curtis in the chair. Three new members were elected, making a total of sixty-five this year up to the present time. Five member were reported on the Sick Fund. The amount of sick pay for the month was £20.

GLOUCESTERSHIRE ROSE.

JULY 12.—The sixteenth annual exhibition of Roses, in connection with the Gloucestershire Rose Society, was held in ideal summer weather at Gloucester on the above date. Unfortunately the hot weather experienced during the past week had materially affected exhibition Roses, and several well-known nurserymen who had entered for the show had to withdraw at the last moment, the best blooms having been spoilt by the continued drought and scorching sun.

There was only one entry (instead of six promised) in the nurserymen's class for seventy-two varieties, the sole exhibitors being Messrs. ALEX. DICKSON & SONS, Newtownards, Co. Down. The same well-known Rose-growers were awarded 1st prize for twenty-four varieties, twelve varieties of Teas (three of each), twelve single trusses of any one dark Rose (Horace Vernet), and twelve single trusses of any light Rose (Dean Hole). Messrs. JEFFERIES & SON, Cirencester, won a 1st prize for thirty-six varieties, John MATTOCK, of Oxford, a 1st for eighteen varieties, and two other first prizes for six bunches of Moss Roses, and twelve bunches of garden Roses. Mr. Henry Drew, of Longworth, Berks, won a similar prize for twelve varieties, Teas or Noisettes.

Mr. CONWAY JONES, of Hucclecote, Gloucester, confined his entries to the open amateur classes, in which he was very successful. Among his successes he secured the Society's silver medal for the best Tea, with a superb bloom of White Maman Cochet, Mr. FOLEY-HOBBS, of Worcester, carrying off the Society's silver medal for the best hybrid Tea, with a grand specimen of Mildred Grant.

In the city of Gloucester amateur classes the Corporation prize for twelve varieties, and that offered by the City High Sheriff for six Teas (both pieces of plate) were awarded to Mr. J. H. CROXFORD. The silver medal awarded to Gloucestershire cottagers for twelve varieties was won by Mr. J. MIDDLECOTE, of Matson, near Gloucester.

SCOTTISH PANSY AND VIOLA.

JULY 13.—The second monthly meeting was held in the Religious Institution Rooms, Buchanan Street, Glasgow, on the above date, for the purpose of awarding certificates to such Pansies and Violas as might be deemed worthy. The following awards were made:—

Fancy Pansies. First-class Certificate to Mary Philips (KAY). Certificates of Merit to Provost Thomson (KAY), Mrs. Campbell, Jeanie Carswell, Nellie Curson, Mrs. W. Sinclair, and Mary B. Wallace (all except the first and second from Messrs. DOBBIE & CO.).

Show Pansies.—Mrs. R. Smith, white ground; Katie, yellow self; and A. Paterson, white self (all from Messrs. DOBBIE & CO.).

Violas.—Certificates of Merit to Lady Grant (FRATER), J. H. Watson (KAY), Effie (DOBBIE & CO.), and R. Mackellar (DOBBIE & CO.). Also Certificates of Merit to new Lobelia Blue Jacket (ATCHISON BROS.). Next meeting August 10.

THE NORTH PECKHAM AMATEUR CHRYSANTHEMUM.

The annual outing of the members and friends, including ladies, was made to Gatten Park Gardens, the residence of JEREMIAH COLMAN, Esq., where Mr. Bound showed the party through the Orchid-houses and other parts of the garden. A move was made subsequently to the Chrysanthemum nurseries of Messrs. W. WELLS & CO., of Earlswood, the large collection of Chrysanthemums there causing much surprise.

DEVON AND EXETER GARDENERS' SUMMER OUTING.

THE thirteenth annual outing took place on the 13th inst., when the members took train for Launceston, the ancient capital of the county of Cornwall. On arrival there the party first inspected the very beautiful granite church of the sixteenth century, which is noted for the richness of its carving inside and out, the outside reminding one of the florid style of Roslin Abbey in the North. The visitors then proceeded to the ruined Castle of Launceston, one of the landmarks of the district, where a professional friend and surveyor described its peculiarities and much of its bygone history.

After lunch, brakes and char-à-bancs conveyed the party by the hilly and precipitous roads leading from the town, which hangs on a steep hillside, to Lifton Park, the seat of Mr. Frank Bradshaw, whose gardener, Mr. Pugh, conducted his brother gardeners over the gardens. In passing, some very fine specimens of Begonia "President Carnot" were noted with a wealth of flowers.

The next halt was at Werrington Park, the seat of Mr. J. C. Williams. That is an extensive establishment, and everything from beginning to end was in first-rate order. Houses full of Calanthes, Cyripediums, Cologynnes, frames of Disas, a cabinet of Todea superba, and splendidly-cropped vineries of Muscats, Gros Colmar, Lady Downe's Seedling, Black Hamburgh, and other popular Grapes. Out-of-door fruit was abundant and fine in quality. In the large conservatory, which is paved in mosaic and lighted by electricity generated on the estate, were banks of Gloxinias, a number of well-grown Fuchsias and Begonias, also huge masses of heavily-flowered Streptosolen Jamesoni. The well-kept appearance at every turn in this establishment was a pleasing and notable feature of the place, and reflected the utmost credit on Mr. Murtou's good management.

LOUGHBOROUGH GARDENERS' MUTUAL IMPROVEMENT.

JULY 13.—The members and friends of this Association had their annual outing on the above date. Three special saloon carriages conveyed the party to Burton-on-Trent. By special permission the celebrated Bass's Brewery and Steam Cooperage were visited before luncheon. The party proceeded afterwards by brakes to Byrkley Lodge. The matchless houses of Muscat Grapes were much admired, and the general condition of the gardens was excellent.

The party next proceeded to Rangemore, and was conducted by Mr. Bennett through the gardens and grounds. There is much to admire at Rangemore: every department bears the mark of good culture. The Souvenir de la Malmaison and Tree Carnations are of the very best. Figs appear a specialty. Peaches, Grapes, and orchard-house trees are excellent. The party passed through the pleasure grounds, and noted the new addition of 50 acres which is now being laid out. The lower rooms of the mansion were inspected and the works of art appreciated. The day was one of very great enjoyment and interest.

PORTSMOUTH HORTICULTURAL.

JULY 14, 15.—The annual show was held in the Pavilion on Southsea Pier. The display of Roses was but a moderate one. The leading class for forty-eight distinct varieties was won by Mr. G. H. Kent, gr. to Mrs. E. CROFT MURRAY, Ryde, Isle of Wight, who was the only exhibitor: he staged neat, well-coloured flowers. For twelve dark-coloured H.P. flowers in four varieties, and in other classes, Mr. KENT again won 1st place.

In a local class for twelve flowers of any section, Mr. G. H. Hoare, gr. to Dr. TULLIS, Southsea, was 1st; Mr. W. TRIGGS, 38, North End Avenue, Portsmouth, 2nd.

Garden Roses in eighteen varieties made a great display, so well were they staged by Mr. G. Ellwood, gr. to W. H. MYERS, Esq., M.P., Swanmore House, Bishop's Waltham.

Hardy flowers in twelve bunches distinct were excellent, Mr. KENT winning the 1st prize.

MANCHESTER ROSE SHOW.

JULY 16.—"Manchester weather" did not prevail upon the occasion of this Show, for it was perfect from every point of view. As a show there have been better ones at Manchester, but this may be accounted for by the prevailing warm and dry weather which prevented several good Southern Rose-growers from putting in an appearance. The quality of the Roses shown was good.

The space devoted to the show was the Grand Avenue, recognised by all to be a most delightful and cool spot for a Rose Show, the greenery hanging from the roof providing a natural and beautiful shade, while the large Palms, &c., with which the sides of the building are furnished added considerably to the effect of the exhibits. It is quite evident that Man-

chester will shortly have to hold a show of Sweet Peas, as year by year the number of exhibits from trade and private growers increase.

Fine exhibits came from Messrs. Henry Eckford & Sons, Wem, Salop (Sweet Peas); Mr. H. Goolden, of Moberley, Cheshire (Sweet Peas); and Messrs. Dickson & Robinson, of Manchester (who showed a collection of English Iris, in addition to herbaceous flowers, and were awarded a Silver Medal); Messrs. Gibson & Co., Bedale, Yorks (herbaceous cut flowers, a Gold Medal); and Messrs. Dicksons, Ltd., Chester (flowering plants and Roses, Silver Medal).

The prize-list included the following winners for Roses:—Sixty distinct single trusses (nurserymen): 1st, Messrs. Alex. Dickson & Sons, Co. Down; 2nd, Messrs. Robert Harkness & Co., Hitchin; 3rd, King's Acre Nurseries, Hereford. Thirty-six distinct single trusses (nurserymen): 1st, Messrs. Alex. Dickson & Sons; 2nd, Mr. Geo. Prince, Berkshire; 3rd, Mr. Henry Drew, Berks. Twenty-four Teas or Noisettes (distinct), single trusses (nurserymen): 1st, Mr. Geo. Prince; 2nd, Mr. Henry Drew; 3rd, Mr. John Mattock, Oxford. For twenty-four single trusses (amateurs): 1st, Rev. J. H. Pemberton, Essex; 2nd, Mr. Richard Park, Bedale; 3rd, Mr. E. B. Lindsell, Hitchin. Twelve distinct ditto: 1st, Mr. W. Boyes, Derby; 2nd, Mr. E. B. Lindsell. Twelve Teas or Noisettes: 1st, Mr. Foley Hobbs; 2nd, Mr. Richard Park.

NATIONAL SWEET PEA SOCIETY.

JULY 20, 21.—The show held at the Crystal Palace on the above dates was well worthy of the efforts of the Committee, being one of the best displays yet seen. New varieties were not numerous, but those of last year's introduction were seen in splendid condition.

NEW VARIETIES.

Henry Eckford, which gained the Society's Silver Medal (offered for the best new variety), is of a peculiarly pleasing shade of clear orange colour, shading off to salmon. It has a well-rounded standard and good wings, and reminds one of *Gorgeous*, but is better in all points. From Messrs. H. ECKFORD & SONS.

Lora Breamore (BREAMORE).—Cream-coloured with a bronzy shade and slight marking of pink; broad standard and large wings (First-class Certificate).

John Ingram.—Somewhat resembles the variety *Lord Rosebery*, but is of a brighter shade of colour; flowers of large size, with a well-rounded standard, and most of the flower-stems carrying four good blooms. From Mr. Silas Cole, gr. to Earl SPENCER (First-class Certificate).

Douglas Breamore.—Large, well-formed flowers of rosy-red colour flaked and striped with greyish-white. From C. W. BREAMORE, Winchester (Highly Commended).

Lady Aberdare, a fine, bright rosy-pink flower, from C. W. BREAMORE (Highly Commended).

Several others were submitted to the Committee, but failed to gain any recognition. Of these *Helen Lewis*, from Mr. WATSON, of Ham Common, was a promising variety of an orange shade of colour, with four flowers on a stem; but the sun had taken the colour out of some flowers.

Gladys Unwin, which has previously been exhibited, was again submitted, but failed to obtain favour. It is certainly a very good variety, but rather too much like *Countess of Spencer*.

In various exhibits the variety *Countess Spencer* showed some variation in colour, but was good wherever seen.

COMPETITIVE CLASSES.

In the classes for separate colours, two bunches of each, there was a large competition. In that for *white varieties* Dorothy Eckford was a long way ahead of all others, the 1st, 2nd, and 3rd prizes all going to that variety. In *blush varieties* the 1st prize went to *Sensation* and *Duchess of Sutherland*; 2nd to *Modesty* and *Countess of Aberdeen*.

For *Crimsons*, King Edward and Scarlet Gem took the 1st and 2nd prizes, but for the 3rd Salopian and King Edward were selected.

Coccinea obtained 1st, 2nd, and 3rd prizes in the class for *Cerise* flowers.

Rose and Carmine.—Lord Rosebery and Prince of Wales took the 1st prize, and Lord Kenyon appeared in the 2nd prize exhibit.

Pink.—The 1st prize was won by the varieties Mrs. Knight Smith and Janet Scott, two new varieties; 2nd prize by *Lovely* and *Prima Donna*; 3rd by *Prima Donna* and *Countess Spencer*.

Orange shades.—The varieties Miss Willmott and Lady Mary Currie won the 1st and 2nd prizes, and *Gorgeous* appeared in the 3rd prize exhibit.

Yellow and Buff.—The Hon. Mrs. E. Kenyon, Dora Breamore, and Queen Victoria were in the prize-winning exhibits.

Lavender.—Lady Grizel Hamilton and Countess Radnor took honours.

Blues.—Countess Cadogan, Navy Blue, and Captain of the Blues were the best.

Mauve.—Dorothy Tennant, Fascination, and Admirable obtained the prizes, but in other exhibits Princess May was one of the best of this shade.

Violet and Purple shades.—Duke of Westminster and Mrs. W. Wright were the best.

Maroons.—Othello and Black Knight were in all the best exhibits.

Magenta shades.—George Gordon and Captivity were best.

Picotee edged.—Lottie Eckford and Dainty were the varieties in the 1st, 2nd, and 3rd prize exhibits.

Striped and Flaked Reds and Rose.—Jessie Cuthbertson and Mrs. J. Chamberlain took 1st prize, but the variety America was shown in the 2nd prize exhibit, and Aurora in the 3rd prize exhibit.

Purple and Blue Flaked and Striped. Princess of Wales and Senator secured the prizes.

Bicolors.—Prince Edward of York, Jeannie Gordon, and Triumph won prizes.

Fancies.—Gracie Greenwood and Lottie Hutchings took the 1st prizes, Duchess of Westminster and Mrs. Fitzgerald were shown in the 3rd prize exhibit. In all the above classes there was much competition.

COLLECTIONS.

In the special class for nineteen bunches there were eight competitors, the 1st prize going to A. G. HAYMAN, Hapsford House, Frome (gr., Mr. Packland); 2nd, to Mr. S. Cole, gr. to Earl SPENCER, Althorp Park, Northampton; and the 3rd, to Mrs. A. TIGWELL, Harrow View, Southall.

In the "Classification" class for nineteen varieties there were four exhibitors, Messrs. I. HOUSE & SON, Westbury-on-Trym, 1st; Mr. C. W. BREADMORE, Winchester, 2nd; and Mrs. FRANK BREWER, Beckley, Sussex, 3rd.

In the class for thirty-six distinct varieties there were five competitors, and the one who would have taken the 1st prize was disqualified through the varieties not being considered all distinct. Messrs. I. HOUSE & SON took 1st; Mr. C. W. BREADMORE, 2nd; and Mrs. T. ROTHERA, Burton Joyce, Notts, 3rd prize respectively.

In the class for twenty-four bunches, distinct, there were only two entries, Mr. BREADMORE taking 1st, and Messrs. HOUSE & SON 2nd.

In the class for twelve varieties the same competitors came in, but honours were reversed.

In the classes not open to the trade there was a larger competition, and the exhibits were of good quality. The sorts mentioned in the list for separate colours were all prominent in these classes.

There was a good competition in the classes for table decorations, vases, and epergnes, and many of these were very effective.

NON-COMPETITIVE EXHIBITS.

Mr. BAKER, of Wolverhampton, made a fine display, and was awarded a Gold Medal, as well as the Crystal Palace Company's Medal.

Mr. H. J. JONES, Ryecroft Nursery, Lewisham, showed all the best varieties, well displayed, having about 100 large bunches, and in the foreground some light arrangements in stands (a Gold Medal).

Messrs. C. STARK & SON, Great Ryburgh, had a collection of about fifty sorts, including some of their own raising (Silver Medal).

Messrs. H. ECKFORD & SONS put up a large collection in their usual good form (Silver Medal).

Mr. C. W. BREADMORE, of Winchester, staged about 125 varieties in good bunches, and was awarded a Silver-gilt Medal.

Messrs. J. LAING & SONS, of Forest Hill, staged about sixty varieties (Silver Medal).

Messrs. CANNELL & SONS, of Swanley, had a good collection of Sweet Peas, also other annuals and hardy flowers (Large Silver Medal).

Messrs. T. S. WARE, Ltd., Feltham, furnished a long table with Sweet Peas and foliage (Silver-gilt Medal).

HOBBIES, Ltd., Dereham, exhibited Sweet Peas, Roses, and Carnations, making a good display (Gold Medal, also Medal of the Crystal Palace Company).

Mr. G. Crabbe, gr. to T. LLOYD DAVIS, Esq., of Park House, Addlestone, staged a collection of about forty varieties of Sweet Peas, the flowers being very fresh and bright.

Messrs. J. PEED & SONS, Roupell Park Nurseries, Norwood, were awarded a Large Silver Medal for a fine display of Gloxinias.

SCHEDULES RECEIVED.

COTTINGHAM AND DISTRICT SOCIETY'S Annual Flower and Poultry Show, to be held in the Grange Park, on Thursday, August 18, 1904. Secretary, Mr. F. W. Thompson, 50, Hallgate, Cotingham, E. Yorks.

STOCKPORT AND DISTRICT SOCIETY'S Chrysanthemum, Flower and Fruit Show, to be held on Friday and Saturday, November 11 and 12, 1904, in the Volunteer Armoury, Stockport.

DULWICH CHRYSANTHEMUM SOCIETY'S annual exhibition on Tuesday and Wednesday, November 8 and 9, 1904, to be held at the Baths, East Dulwich (Green). Hon. Sec., Mr. C. A. YOUNG, 319, Crystal Palace Road, East Dulwich.

CHIPPENHAM AND DISTRICT HORTICULTURAL SOCIETY'S Exhibition on Wednesday, August 10, 1904, in the grounds of Hardenhuish Park.

MIDLAND CARNATION AND PICOTEE SOCIETY'S Exhibition, to be held in the Botanical Gardens, Edghaston, on Thursday and Friday, August 4 and 5.

REMARKS.—A quantity of very inferior Tasmanian Apples are on the market. Green Walnuts, per bushel, 4s. 6d.; half, 2s. 6d. The Beets named above are new produce; some in bunches, per dozen, 2s. 6d. to 3s. 6d. Cherries, black, 5s. 6d. to 7s.; Amée, 5s. to 6s.; Napoleon, 9s. to 10s. Mangos (Jamaica), per dozen, 9s. to 12s. Vegetable-Marrows are becoming abundant, per bushel, 1s. 6d.; pads, 2s. 6d. Yorkshire Peas, in bags, 3s. to 5s. Many samples of Potatoes are small.

POTATOES.

St. Malo, 5s. 6d.; Home-Grown, 4s. to 6s. per cwt. John Bath, 32 & 34, Wellington Street, Covent Garden.

COVENT GARDEN FLOWER MARKET.

Trade is falling off considerably, but there is still a good supply of pot plants. The yellow Chrysanthemum segetum is seen in large quantities, and they have to be sold very cheaply. Marguerites fetch very low prices; Campanula isophylla and C. Mayi are now obtainable; Coreopsis, well flowered in pots, are very showy, and there are some good Canas in flower; Crassula coccinea is very bright in colour.

Fuchsias vary much; some plants are still very good, but others are inferior. Of zonal Pelargoniums, the larger portion is of poor quality. In Ivy-leaved Pelargoniums there are some fresh, well-flowered plants of Galilee and Madame Crousse. Mignonette is plentiful and good. There are large quantities of Coleus, but they are unsold, and would not fetch the value of the pots. Liliums are very good. There are still a few plants of summer-flowering Ericas and Boronia elatior. There are Crimson Rambler Roses, well-flowered, bushy plants in 5-inch and 6-inch pots, but there is very little trade for them. Other Roses in pots move very slowly. There are still a good many Ferns in all sizes. The large plants in 8-inch pots find little demand; a good many of the ordinary sorts in 5-inch pots sell, also small plants. Aralia Sieboldi in 5-inch pots sell slowly, at low prices. There is still a little trade for small Palms. One grower who had fine large Kentias and Latanias told me he did not get an enquiry for them. It will be quite unexpected if there is any trade before September, except for very limited quantities.

CUT FLOWERS.

Hardy flowers are still in great abundance, but trade is very dull. Best Carnations, which have sold so well through the season, now remain on hand. The trade for Roses is also falling off. Lilium longiflorum is not quite so abundant, but L. candidum is over plentiful. L. lancifolium, roseum, and album, also L. auratum, are all good. Considering the hot weather, Sweet Peas are very good, and continue over plentiful. Gaillardias are seen in large quantities. Gladioli of the Bride type in several colours, also G. brecheleyensis, English Irises are still good. Stocks and Asters are plentiful, and there are a few Dahlias. Mr. P. Ladds, of Swanley, had some Chrysanthemums about a week ago, Madame Desgranges and the yellow-flowered variety. They were disbudded flowers, and they made from 1s. to 1s. 6d. per bunch of from six to eight blooms. A. H., July 16.

FRUITS AND VEGETABLES.

GLASGOW, July 21.—The following are the averages of the prices during the past week:—Grapes, English, 1s. to 1s. 9d. per lb.; Belgian, 8d. to 1s.; Cherries, 6s. to 8s. per 3½ sieve; Strawberries, Scotch, 3d. to 6d. per lb.; Lemons, 4s. to 6s. per box, and 6s. to 10s. per case; Melons, Valencia, 1s. to 2s. per case; Mushrooms, Scotch, 10d. to 1s. 2d. per lb.; Tomatoes, English, 5d. to 7d. per lb.; do., Guernsey, 4d. to 6d. do.; do., Scotch, 5d. to 8d. do.; do., Spanish, 12s. to 17s. per case; do., French, 3s. to 4s. 6d. per crate; Onions, Valencia, 4s. 6d. to 5s. per case.

LIVERPOOL, July 20.—Wholesale Vegetable Market (North Hay).—The following are the averages of the current prices during the past week—prices varying according to supply:—Potatoes, per cwt., Kidneys, 6s. 9d. to 8s. 6d.; Early Regents, 5s. to 6s. 3d.; Up-to-Date, 3s.; new, 1s. 9d. to 2s. per lb.; Turnips, 6d. to 10d. per dozen bunches; Carrots, 8d. to 10d. do.; Parsley, 6d. to 8d. do.; Lettuce, 6d. to 9d. per dozen; Cucumbers, 1s. 6d. to 2s. 6d. do.; Cauliflowers, 1s. to 2s. do.; Cabbages, 6d. to 1s. do.; Peas, 3s. 6d. to 5s. per hamper. Fruit: Oranges, Valencia, 7s. to 10s. per case; and 9s. to 16s. for better sorts; Melons, Valencia (mostly green), 3s. 6d. to 6s. 6d. per case; do., yellow, 9s. 6d. to 10s. 6d. do.; Tomatoes, English, 4s. to 5s. 6d. per case; do., Spanish, 2s. 6d. to 3s. do.; Apples, Lisbon, 7s. 6d. to 9s. do.; do., Oporto, 3s. 6d. to 7s. do.; Lemons,

Palermo, 4s. 9d. to 8s. do.; do., Naples, 7s. 6d. to 10s. 6d. per box. *St. John's*—Potatoes, 1d. per lb.; Peas, 8d. to 10d. per peck; Cucumbers, 3d. and 6d. each; Gooseberries, 1d. and 2d. per lb.; Cherries, 4d. and 6d. do.; Strawberries, 4d. and 8d. do.; Currants, Black, 6d. do.; do., red, 5d. do.; Peaches, 2d. to 6d. each; Apricots, 1s. per dozen; Grapes, English, 2s. to 3s. per lb.; Pines, foreign, 3s. to 5s. each; Mushrooms, 1s. 6d. per lb. *Birkenhead*—Potatoes, 1s. per peck; do., new, 3d. to 4d. per 5lb.; Cucumbers, 2d. to 4d. each; Currants, Red, 4d. and 6d. per lb.; do., Black, 5d. and 6d. do.; Strawberries, 4d. and 6d. do.; Gooseberries, 1d. to 3d. do.; Peas, 9d. to 1s. per peck; Grapes, English, 2s. to 3s. per lb.; Cherries, 3d. to 6d. do.; Pines, foreign, 2s. 6d. to 4s. 6d. each; Mushrooms, 8d. to 1s. per lb.; Tomatoes, English, 1d. to 7d. do.

ANSWERS TO CORRESPONDENTS.

* * The reports which our Correspondents have kindly sent us upon the condition of the **FRUIT CROPS** will be published in our next issue.

APRICOTS CRACKING: *S. C. M.* If the other trees in the house are in good health, it shows that the mischief is constitutional or peculiar to that one tree. The fruit looks quite healthy, so that we are unable to give any definite answer to your question.

BEGONIA REX: *C. W. A.* Why address the Publisher on such a subject? The plant is suffering from mites, greenfly, thrips, and other insects. The plant, moreover, looks as if the watering had been carelessly done. Try dipping the plant in tobacco-water.

BRITISH GARDENERS' ASSOCIATION: *B. Pearce.* You should write to the Hon. Secretary, Mr. W. Watson, Kew Road, Kew. We believe, however, that you will have to wait until you have had five years' experience before your application for membership will be entertained.

CEDAR: *E. C. M.* We find neither insect nor fungus. Perhaps the tree is showing the effect of the last few years' drought.

CŒLOGYNE-LEAVES SPOTTED: *Dendrobe.* Your specimen seems to be very vigorous, although the leaves are spotted. It is probable that condensed moisture falling on the plant at night may have caused the damage, or it may be that syringing overhead has contributed to the mischief. *Cœlogyne cristata* needs abundance of rain-water at the roots when growing, and should never be allowed to become dry enough to cause the pseudo-bulbs to shrivel, even in the resting season. We advise you to cut all the old damaged leaves off and burn them. Keep the plants moist and shady, and rest them in a cool-house later.

CUCUMBER: *Perplexed.* The spot-disease so often mentioned lately. See specially the *Gardeners' Chronicle*, October 4, 1902, p. 241, and September 5, 1903, p. 184.—*W. E.* The Cucumber and Melon spot is caused by the fungus *Cercospora melonis*, and attacks plants growing under any kind of treatment. But though an attack is not necessarily the result of neglect, there is no doubt that the high temperatures and humid atmosphere employed in the common method of forcing the plants into fruit are of the greatest assistance to the disease, as they tend to its increase.

CUCUMBERS: *G. H.* The plants are not likely to suffer from the bleeding that follows the cutting of fruits.

GREEN PEAS, TO BOTTLE: *C. B.* Shell the Peas, put them into dry, wide-mouthed bottles, and shake them together, so that they may lie in as little space as possible. Cork the bottles closely, and seal the corks. Bury the bottles in the driest part of the garden, and take them up as they are wanted. They ought to keep good for four or five months.

IVY: *T. R.* We find neither fungus nor insect. Have you been syringing or spraying? All you can do is to cut the Ivy close in and burn the clippings.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—*M. C. T.* 1, Probably a form of *Campanula rhomboidalis*, but no flowers remained; 2, *Veronica cupressoides* (white variety); 3, send in flower—not recognised from specimen received.—*A. M.* 1 and 2, *Bromus giganteus*; 3, *Bromus sterilis*.—*G. M.* Cut-leaved Alder, *Alnus glutinosa*

variety.—*R. P.* We cannot name the particular Briar. The flower is *Veronica Traversi*.—*K. & B.* The Martagon Lily, *Lilium Martagon*.—*W. C. & Co.* *Combretum coccineum* alias *purpureum*.—*S. & S.* *Salvia Horminum*.—*Veronica.* 1, *Alstroemeria aurantiaca*; 2, *Spiraea Douglasi*; 3, *Lysimachia vulgaris*; 4, *Chelone barbata*; 5, not recognised; 6, *Epilobium lancifolium*; 7, *Campanula Trachelium*; 9, *Eryngium alpinum*; 10, *Lychnis chalconica*; 11, *Lychnis dioica*, double; 13, *Polygonum affine*; 14, *Gualtheria Shallon*; 15, *Escallonia macrantha*. We name double the number we undertake to do. A small contribution to the Gardeners' Orphan Fund would therefore be acceptable.—*Phyto.* 1, *Linaria hepaticifolia*; 2, *Hypericum pulchrum*; 3, *Lapsana communis*.—*E. M. A.* 1, *Smilax aspera*; 2, *Tradescantia virginica*; 3, *Polygonum orientale*; 4, *Phyllostachys* species; 5, *Campanula Trachelium*; 6, *Sidalcea malvaeflora*; 7, *Deutzia crenata*, double.—*G. H. S.* *Bromus giganteus*.—*L. R. R.* 1, *Sagina procumbens*; 2, *Dianthus sinensis*; 3, not recognised; 4, *Prunella vulgaris*; 5, *Sedum album*; 6, *Armeria vulgaris*; 7, *Sedum acre*; 8, *Viola cornuta*; 9, *Centaurea moschata*; 10, *Zephyranthes Atamasco*; 11, *Lilium superbum*; 12, *Lilium Martagon*. You send more than six—the least you can do is to send a small contribution to the Gardeners' Orphan Fund.—*F. W. C. S.* 1, *Lotus Jacobæus*; 2, *Digitalis lutea*; 3, *Dracocephalum Ruyschianum*.—*A. E. R.* 1, *Juniperus nana*; 2, *Retinospora dubia*; 3, *Retinospora ericoides* of gardens; 4, *Sedum reflexum*; 5, *Sedum glaucum*; 6, *Dianthus* sp.—*W. S.* *Valeriana* (or *Centranthus*) *ruber*, the Red Valerian.—*Trafalgar.* *Mesembryanthemum acinaciforme*.—*H. C.*, *Bridgewater.* *Hemanthus puniceus*, a South African *Amaryllid*.—*W. P.* 1, *Adiantum formosum*; 2, *A. Pacotii*; 3, *A. Waltoni diffusum*.—*E. Cosmos.* *Hippeastrum stylosum*, illustrated in the *Botanical Magazine*, t. 2278. The flower you send is abnormal, two of the segments being joined. It will thrive in a warm greenhouse or conservatory.—*W. R.* 1, *Trachelium cœruleum*; 2, *Ceanothus azureus*; 3, *Alstroemeria aurea*.—*R. G. H.* 1, not found; 2, *Vicia hirsuta*; 3, *Sium latifolium*; 4, *Aira cœspitosa*; 5, *Sium angustifolium*; 6, *Ranunculus sceleratus*.—*R. S.* The specimens are so bad that we cannot undertake to name them.—*H. B.* 1, *Centranthus ruber*; 2, *Galega officinalis*; 3, *Echinops Ritro*; 4, *Phygelius capensis*; 5, send when in flower; 6, *Acanthus spinosus*.—*S. H. T.* Why address the Publisher on such matters? 1, *Hedysarum coronarium*; 2, *Campanula pyramidalis*.—*A. B.* We only undertake to name six, you send many more. You should send a small contribution to the Gardeners' Orphan Fund. 1, *Spiraea Ulmaria*; 2, *S. Ulmaria*, double-flowered; 3, *Astrantia europæa*; 4, *Thymus Serpyllum* variety; 5, *Lysimachia nummularia*; 6 and 7, *Lilium umbellatum*; 8, *Dianthus casius*; 9, *Armeria maritima*; 10, *Veronica officinalis*; 11, not recognised.

NARCISSUS SEEDS: *Narcissus.* Not at all unusual. Sow the seeds at once in pans filled with sandy loam, and put them in a cold frame. The young bulbs may be planted in sandy loam in a south border next season, and they will not flower until they are three years or more old.

NECTARINES: *C. C. M.* Your fruits were over-ripe, and had been bruised by pinching or other injury. Send particulars.

NUT-TREES: *G. W.* The system adopted in Kent is to plant a young tree with about 18 inches of clean stem, from which the eyes have been cut out when young. Each tree has about six or eight strong shoots on the top, to form the branches. These should be cut back in the winter to an outside eye, leaving about 1 foot of the previous summer's growth. This will encourage the tree to grow outwards, and thus form the basin-shaped tree as seen in Kent. All growths except the leader can be broken without severing them. This is better than cutting, as it allows the broken part to take some of the sap, and thus prevents a second growth. This broken part, with a portion below the break, can be cut away at the winter

pruning. The knife and saw are very much used, with the view to get the trees into shape, and which never seems to injure them in the least. A much quicker plan is to use hoops, and tie the branches slightly down to them. If suckers grow from the base, a hoe should be used to draw the soil away, so as to break them off at the junction; do not cut them. Following this practice, acres of trees may be seen, each standing in a hole of from 6 to 12 inches deep, and the large roots radiating from the base are exposed. These are very old trees. But you must begin the "benting," as it is termed in Kent, when the trees are quite young. Do not throw the soil back after the bushes are established. *G. B.*

PEACH-TREE: *C. B.* Afford more lime to the soil.

POTATO DISEASE: *G. W.* Seems to be the Potato-rot. Spray the plants with Bordeaux-mixture, and you may save a large proportion of the crop.

ROSES: *Wimble.* To obtain the best results from Roses in pots for flowering in early winter, repot the plants in August, using for a rooting medium a compost of three parts good loam and one part well-rotted manure, together with a little bone-meal and some silver-sand. Remove all flower-buds as soon as they appear, from the time of repotting until about a month before the plants are required to be in flower. Then place the plants in a house having a minimum atmospheric temperature of 45° to 50°, and only prune them sufficiently to remove any weak wood.

SILVER-LEAF DISEASE: *C. D.* There is a certain amount of mystery connected with the origin or cause of this disease; but some cultivators have found that applications of sulphate of iron to the soil have a good effect upon trees showing the symptoms of attack. You might try the effect of this, and, if not satisfactory, then remove the tree.

"SPOT" ON GRAPES: *G. H.* The disease is caused by the fungus *Gloeosporium*. You must not spray with the liver-of-sulphur after the berries have commenced to change colour.

VINES: *E. S.* Weakly-grown Vines; leaves scorched. Are some of the panes of glass defective.

WALNUTS, TO PICKLE: *A. S.* Scald the Walnuts, and use them for pickling before they have a hard shell. This scalding will enable you to rub off the skin easily. Put them into a brine of salt-and-water strong enough to float an egg (about 6 oz. of salt to a quart of water). Let them stand three days, then put them into fresh brine, and let them soak three days longer. Now put them once more into fresh brine and let them soak four days. They are then fit for the jar. Have ready prepared equal parts of black Pepper, Jamaica Pepper, Allspice, and Ginger; a quarter of a pint of Cloves, the same quantity of Mace, and a pint of white Mustard-seed. Beat these ingredients together in a mortar, but do not pound them fine. Put the Walnuts into a jar in layers, and over each layer strew some of the mixed seasoning. Then have ready some vinegar, boiled, with sliced Horseradish and Ginger, and cover the Walnuts with it. When quite cold, cork and bladder the jar. This pickle is much improved by the addition of a little garlic and tarragon, boiled with the vinegar. Quantities must depend on the quantity of Walnuts, and whether they are preferred with much or little flavouring; 2 oz. of ginger, 2 oz. of black pepper, 4 blades of mace, 2 oz. of mustard-seed, 8 cloves stuck into 2 cloves of garlic, is sufficient for half a gallon of vinegar. *E. M.*

COMMUNICATIONS RECEIVED.—*R. W. R.* A reply will be sent later on; in the meantime we acknowledge with many thanks the receipt of 2s. 6d. for the Gardeners' Orphan Fund.—*H. Sun*, New Eltham (many thanks; we will examine them).—*Miss Winter* (photos under consideration; many thanks).—*W. G. S.*—*A. H.*, Jersey (photograph).—*E. Webb & Sons* (photograph).—*M. THE CENTENARY OF THE ROYAL HORTICULTURAL SOCIETY.

MANY of our readers will remember the discussion which took place some few years since as to the most appropriate method of celebrating the centenary of the Royal Horticultural Society. At that time the lease of the gardens at Chiswick had still several years to run, and although the conditions for successful gardening in that locality were steadily going from bad to worse, yet many thought it better to remain there for some few years, and to devote the energies of the Society to the erection of a suitable building for the fortnightly meetings of the Society, for the provision of offices and Committee rooms, and for the accommodation of the Lindley Library. Others, though they could not but recognise the necessity for a proper establishment, yet gave precedence to the scheme for forming a new garden. Various sites were examined, reported on, and eventually condemned. Meanwhile the inconvenience and the inadequacy of the existing Drill Hall and of the offices were becoming more and more apparent, and the state of things became in fact almost intolerable. No one who visited the offices and library in Victoria Street during the last few years, or who experienced the unsuitableness and insufficiency of the accommodation provided at

the Drill Hall, could any longer doubt that the provision of a new home for the Society was the most urgent requirement to be fulfilled.

By a most fortunate coincidence the competing claims of those who considered a new

BARON SIR HENRY SCHROEDER, BART.,
To whose generosity the adoption of the Hall
scheme was primarily due.

garden as the first necessity, and of those who held that a proper "home" was the most essential consideration, have been adjusted in a most satisfactory manner.

Thanks especially to Baron Sir HENRY SCHROEDER in the first instance, and to the

new Roman Catholic cathedral, midway between Victoria and St. James's Park stations, and only a few minutes' walk from Victoria Street. That Hall is now completed, and was officially opened on Friday the 22nd inst., by H.M. the KING, who was accompanied by H.M. the QUEEN and by the Princess VICTORIA. The proceedings on that occasion are given in detail in another column. Suffice it here to say that they were of the most satisfactory character. The spaciousness and excellent lighting of the Hall were the subjects of universal approval. Nor could the arrangements made by the Council and their hard-worked Secretary fail to elicit the heartiest commendation. Everything worked smoothly. A certain stately simplicity and a unity and directness of purpose seemed to pervade the whole of the arrangements, personal or material. The most cordial thanks and the warmest congratulations are due to all those who have been instrumental in carrying out this scheme. The Hall only is sufficiently complete for use at present, and its facilities were further tested on Tuesday last, when not only was there held one of the ordinary fortnightly meetings, but the Carnation Society also held its annual show in the same building. This is indicative of the use which the special societies will, we trust, make of the Hall in future, and so obviate even the appearance of schism. The address from the National Rose Society, signed by the DEAN of ROCHESTER, and presented by Mr. E. MAWLEY, is another welcome indication in the same direction. Foreign societies were also not backward in their congratulations to the parent Society on this happy occasion.

There remains but one thing for the Fellows and exhibitors, who derive such benefit from the Society's meetings, to do, and that is to clear off the debt on the building as soon as possible. A pound apiece from each of the existing Fellows, still more the doubling of their annual subscriptions for a year or two, would suffice to bring about this consummation. Surely it is not unreasonable to hope that the Fellows will follow the example set them by their Majesties and contribute of their means to free the Society from encumbrance!

Whilst we are complacently congratulating ourselves on the erection of the Hall and offices we have yet further reason for profound gratitude. There can be no longer any question whether "home" or "garden" should have precedence—we have both. Sir THOMAS HANBURY, as our readers are aware, has, with fine prescience and recognition of the requirements of the Society, presented, in trust to the Society, the beautiful and interesting garden at Wisley formerly belonging to Mr. G. F. WILSON. Houses are in course of erection there, and it is hoped that in the near future adequate provision will also be made for the establishment of a research laboratory under the superintendence of a competent scientific director. For the present, however, we think the main energies of the Society should be devoted to the completion of the "Headquarters," and to the extinction of the building debt.

And thus a satisfactory answer has been obtained to the eagerly debated question, How best shall we celebrate the Centenary of the Royal Horticultural Society?

FIG. 30.—VIEW FROM THE PORCH OF THE NEW ROYAL HORTICULTURAL SOCIETY'S HALL, LOOKING OUT ON VINCENT SQUARE—10 ACRES OF GRASS!

(Photograph by J. Gregory.)

liberality of Lord ROTHSCILD, Messrs. H. J. ELWES, ARTHUR SUTTON, Mr. N. N. SHERWOOD, Mr. PIERPONT MORGAN, and others, a fund was started for the erection of a Hall in Vincent Square, Westminster, behind the

REPORT ON THE CONDITION OF THE FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS.]

THE WORDS "AVERAGE," "OVER," OR "UNDER," AS THE CASE MAY BE, INDICATE THE AMOUNT OF THE CROP;
AND "GOOD," "VERY GOOD," OR "BAD," DENOTE THE QUALITY.

THE CARNATION.

In reviewing *The American Carnation, and How to Grow It* (see *Gardeners' Chronicle*, July 11, 1903, p. 16), I was particularly struck with the difference between the type of Carnation favoured in America and the best of our English varieties. The author has great faith in the possibilities of the American Carnation. He says, "Its culture is rapidly extending to Europe. Large establishments in the vicinity of London are now forcing it in quantity during the winter months, the flowers being sold at the Covent Garden Flower Market in London. Belgian and German florists are also undertaking its culture on an extensive scale, and many of the sons of German florists now visit the United States to serve apprenticeships in the leading Carnation establishments, returning in a year or two to their native land to engage in the winter culture of the American Carnation. Thus the utility of the American race for winter forcing is being universally recognised, and within the next generation we may expect to see it in cultivation throughout the horticultural world, wherever climatic conditions permit." This is from the American point of view, and probably they think that no Carnations are worth considering in comparison with their own. Evidently form of flower, substance, and arrangement of petals are not thought of any consequence. It is fortunate that a number of the newest and best varieties are illustrated from photographs. Three different photographs are given of a variety producing flowers of the largest size, but with the petals very irregular and deeply toothed; and this is the characteristic of most of them. The author says, "The shell petal so much valued by the English grower seems to be but little liked by the American public, for the reason that in our climate during bright, sunny weather, the moisture evaporates from the edges of the petals, drying them up, and drawing them together toward the centre in a cup-shaped manner, thus producing a sleepy appearance in the flower, which is fatal to its sale." The above remarks may apply to hot, summer weather; but surely in winter the sun cannot be so powerful; and yet it is stated that even in February and March the flowers take on their sleepy "character," and that in April and May they are comparatively valueless. There must be greater difference in climate between England and America than most people are aware of, unless this author is mistaken. I grow thousands of Carnations, including, as is well known, all the best border and show varieties, form, substance, and "shell" petal being specially desiderated; the plants are fully exposed to the sun without shading of any kind during the months of July and August, and even in the hottest seasons I have never noticed any "sleepiness" in them. The American cultivators have the flowers they can grow, and they tell us that "as far as artistic taste is concerned, there is as much to be said in favour of the ragged yet artistic, graceful appearance of the heavily-fringed Carnation as there is in favour of the perfectly formal flower of the English grower." There the matter may rest, and be left to individual tastes. More important are the diseases and pests we have to deal with in England and America, and we may learn something from American cultivators.

BACTERIOSIS.

It is supposed that the bacterial disease (Bacteriosis) was imported from America with the Carnations into English collections; it is a very troublesome disease, and editors of some gardening papers tell their correspondents to deal with it in a drastic manner. By holding a Carnation-leaf to the light the disease can be readily recognised in the form of small dots, which develop rapidly; the leaf becomes greenish-yellow, and ultimately dies off. The more recent observations made of this disease in America have led cultivators to the conclusion that it is caused by the attacks of various insects, "such as red-spider, thrips, and more particularly aphids." As this is supposed to be a very dangerous disease, it would be well if this matter could be set at rest. Amongst the thousands of Carnation-growers in this country, very few of them have any scientific knowledge of diseases, and see their choice plants dying before their eyes, and are quite unable to do anything for them. For instance, this bacterial disease is either caused by insects, as suggested above, or in some other way. If by insects, it is easy enough to keep the plants, when grown under glass, quite free from thrips and green-fly by fumigating. Red-spider is more tenacious of life, but it can be kept off by syringing. I can quite believe that the small dots on the Carnation-leaves are caused by red-spider, and the effects of this pest's persistent attacks is the same as that of Bacteriosis; the lower leaves die off first, followed by the higher ones in succession. The author states that "the various fungi infesting Carnations will not prevail to any extent if the plants are kept in a clean, healthy, growing condition." This is a grave error. If the fungoid disease is caused by insects in the first place, there may be some truth in it. But the most troublesome disease Carnation growers have to deal with is "rust."

CARNATION "RUST."

This is purely a fungoid disease, and attacks plants more freely when they are in vigorous growth, especially such as have been stimulated by artificial manures; and the broad, succulent foliage of Malmaisons is more liable to be attacked than the more slender stiff foliage of the border Carnations. The disease develops between the membranes of the leaves, and as growth progresses a boil or blister is formed, which speedily forces itself through the thin membrane, and the spores are scattered. There is no doubt that the best way to eradicate this disease is by cutting off the diseased parts before the fungus bursts out into active life. The plants should be looked over once a week, and in a small collection a few minutes will suffice.

CARNATION "SPOT,"

under the name of *Septoria Dianthi*, seems also to be prevalent in America; the climatal conditions most conducive to its development are "when a hot dry season is followed by a continuous spell of wet, cold weather, and then again by periods of intense heat." It is very troublesome in this country, and is a source of much anxiety to cultivators of Carnations, who are greatly alarmed when they see their plants badly attacked by this disease. Bordeaux-mixture,

amoniacal solution of carbonate of copper, and other mixtures are recommended for this as well as for rust and other fungoid diseases. I question much if the remedies are not worse than the disease. In the case of "spot," it is little use trying to remove it or arrest its progress by applications of these or any other solutions. The worst of the leaves may be cut off and burned, although I do not think it is infectious, as I have seen a particular variety very badly injured by "spot," whereas another variety in juxtaposition with it had not a leaf injured. Plants badly attacked, if removed to a position near the roof of a dry, airy greenhouse, will recover, and grow out of the disease as the days lengthen in the early spring months.

"FAIRY-RING SPOT."

A more deadly disease than "Spot" is described in *The American Carnation* as "Fairy-ring Spot" (*Heterosporium echinulatum*). It is stated to have been imported from Europe in 1892 or 1893, and that it had been known in England for a quarter of a century. "The spores are brown in colour, and when produced in great numbers with the threads, darken the spots. At this stage the spots possess different shades of colour, according to the number of spores produced. The growth of the fungus from the centre of the spot is centrifugal, and the darker colour is apt to be arranged in concentric lines or rings, representing a miniature fairy-ring."

"STEM ROT."

Another disease, "Stem Rot" (*Rhizoctonia*), is described at length; it is stated to be caused by a fungus, and so fatal is it in its effects that "during some unfavourable seasons it has destroyed almost the entire stock of some growers." It is said to attack the plants in the fields, causing great losses; but is even more destructive when the plants are brought into the houses in August and September. As much as 90 per cent. of some stocks are destroyed by it—an alarming percentage truly. They have arrived at the conclusion that the mycelium of the fungus travels through the soil from one plant to another, and that it seems to remain in the soil as resting spores ready to fasten on the plants as soon as the roots come in contact with the soil. Here would probably be the value of sterilised soil for striking cuttings, and growing on the plants in their early stages. Lime in the soil has been tried, but has not proved a preventive. My own experience with stem-rot in England has been confined to few cases, and in every one of them the cause has been easily traced to layers or growths, taken from one or more, that was forming to throw up a flower stem. In some cases such plants will grow away and do well, but frequently they will die of rot owing to the pithy nature of the stem; there is no fungoid disease, in the first place, but, as is well known, there are species of fungi ever ready to fasten on decayed or decaying vegetable matter, but they will not spread to healthy plants. I fancy the author is altogether wrong in supposing that such a disease as this has been common or even existing in England during the last twenty-five years, causing such wholesale destruction, and spreading so rapidly and fatally as he describes. Jas. Douglas.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS for AUGUST.

TUESDAY, AUG. 2	Scottish Horticultural Association Meeting. Dudley Horticultural Exhibition (3 days).
THURSDAY, AUG. 4	Midland Carnation and Picotee Society's Show in Edgbaston Botanical Gardens, Birmingham (2 days).
SATURDAY, AUG. 6	Crewe Cottage Hospital Horticultural Exhibition.
TUESDAY, AUG. 9	Royal Horticultural Society's Committee, in New Hall, Vincent Square, Westminster. Bishops Stortford Horticultural Society's Show.
WEDNESDAY, AUG. 10	Royal Botanic Society, Anniversary Meeting. Chippenhall Hort. Show.
THURSDAY, AUG. 11	Taunton Deane Horticultural Society's Show.
SATURDAY, AUG. 13	Sheffield Horticultural Show.
TUESDAY, AUG. 16	Exmouth Horticultural Society's Show (2 days).
WEDNESDAY, AUG. 17	Shropshire Horticultural Society's Show at Shrewsbury (2 days).
THURSDAY, AUG. 18	Aberdeen Horticultural Society's Show (3 days).
FRIDAY, AUG. 19	Devon and Exeter Horticultural Society's Show at Exeter.
TUESDAY, AUG. 23	Royal Horticultural Society's Committee Meet in New Hall, Vincent Square. Brighton Horticultural Society's Show (2 days).
WEDNESDAY, AUG. 24	Harpden Horticultural Society's Show.
FRIDAY, AUG. 26	Royal Botanic Society, General Meeting.
WEDNESDAY, AUG. 31	Reading Horticultural Society's Show. Bath Floral Fête and Band Committee Exhibition (2 days).

SALE FOR THE WEEK.

FRIDAY, AUGUST 5—Imported and Established Orchids, at Protheroe & Morris's Rooms, at 12.30.—326 cases of Liliun Harrisii, Kentia Seeds, &c., at Protheroe & Morris's Rooms, at 2 o'clock.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick —63'2".

ACTUAL TEMPERATURES:—

LONDON.—July 27 (6 P.M.): Max. 68°; Min. 59°.

July 28.—Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden (10 A.M.): Bar., 30.1; Temp., 66°; Weather dull, with bright intervals.

PROVINCES.—July 27 (6 P.M.): Max. 64°, S. Coast of England; Min. 55°, N.E. Coast of England.

The Fruit Crops.

We were all expecting a full crop. Never within recollection was there so splendid a promise so far as bloom is concerned. But promise and fulfilment are not one and the same. Nevertheless, as our records show, the fruit crop as a whole is decidedly good. Our reporters hail from all quarters of the British Isles, from the Orkneys to the Channel Islands, from Kent

to Galway. For the most part they are old and valued friends, who know our requirements, and have rendered us a similar service for many years. We take it then that the reports give as fair a general estimate as is possible, and what does it amount to? Let us take Apples, as from our present point of view the most important crop. From Scotland, out of 52 estimates, more than half report an average crop, 22 indicate a crop above, and only 3 below average. In England, out of a total of 165, the figures show no fewer than 83 above and 71 average, as contrasted with 11 recorded as below average. In Wales, Ireland, and the Channel Islands the proportions are about the same.

So far as Plums are concerned, out of 49 reporters in Scotland, 21 give an average crop, but only 9 over and 19 under. In England, out of 163 records we find 64 marked average, only 12 over, but as many as 87 under. The Plum crop, therefore, is decidedly bad.

Cherries, which were so laden with bloom in Kent (the Cherry county), are rather disappointing. In England, out of 155 returns, 76 were noted as average, 18 as over, and 61 as under.

Small fruits is a composite heading, including Gooseberries, red and white Currants, and Raspberries. The general record is decidedly good.

Looking at the figures recording the Strawberry crop, we find everywhere an excess. In Scotland, out of 52 reporters 19 note an average, 33 record a crop over, and not one is below average. In England, out of 165 reports, 33 are average, no fewer than 131 above average, and only one below.

The general summary given above will furnish further details to those fond of statistical enquiries.

In subsequent issues we shall print some of the remarks obligingly sent us by our correspondents, including information upon the best varieties of Apples for particular districts.

NEPENTHES MASTERSIANA is in flower in the Brussels Botanic Garden. We are authorised to say that any hybridist wishing to experiment with the pollen of this species can obtain pollen on application to M. LOUIS GENTIL, the Curator.

ACOUSTIC PROPERTIES OF THE ROYAL HORTICULTURAL HALL.—In connection with the opening of this Hall on July 22, the following interesting letter has been received by the Architect from Lieut. CHARLES GODFREY:—

21, Lancaster Road, Westbourne Park, W.

July 22, 1904.

DEAR SIR,—I congratulate you on the acoustic properties of your new Hall, opened this morning by the King and Queen in Vincent Square.

I purposely went amongst the audience whilst the Band was playing, and was delighted with the effect produced, although I had only twelve members of my String Band playing.

I imagine it will also be most effective for any vocalists, should concerts be at any time given there, judging from the clearness with which the speakers' voices were heard.

It is one of the nicest halls I have ever played in.

Yours faithfully,

(Signed) Lieut. CHARLES GODFREY,
M.V.O., R.A.M., R.C.M., G.S.M.

A NEW EDITION OF "BABINGTON."—Students of British botany will prick up their ears at the announcement of a new edition of

this favourite British Flora. This ninth edition has been confided to the care of two careful and conscientious botanists, Messrs. HENRY and JAMES GROVES; and the publishers are Messrs. GURNEY & JACKSON, of Paternoster Row.

NEW RASPBERRY.—The new variety of Raspberry, Penwill's Champion, which was recommended an Award of Merit at the Holland House Show, was exhibited by Mr. G. PENWILL, 80, High Street, Totnes.

A GARDENER'S YEAR.—Since the "Year in a Lancashire Garden" of the late H. A. BRIGHT was published in our columns, there has been a host of imitators who have produced books of very unequal degrees of merit, some not to be recognised as gardening books at all, others which do really correspond to their titles. Running through the columns of the *Queen* just now is a series of articles by Mr. RIDER HAGGARD, detailing the author's experiences in such a way as to be really useful as well as readable. No doubt they will be separately published later on, and if so an acceptable addition will be made to the list of real gardening books.

ENTERTAINMENT AT THE ST. MARYLEBONE CEMETERY, EAST FINCHLEY.—On Saturday the 23rd inst., Mr. THOS. BEVAN, the Superintendent of the St. Marylebone Cemetery, East Finchley, entertained Mr. GEO. SCHNEIDER, the President

of the French Horticultural Society, the Secretary, and a number of young Frenchmen and Belgians at present located in this country, and invited a few horticultural friends to meet them. After inspecting Messrs. CUTBUSH & SON'S Carnations in their Finchley nursery, which adjoins the Cemetery, the party partook of tea in the open near Mr. BEVAN'S residence, and then a visit was paid to the Cemetery grounds, which is a veritable pleasure-garden; the series of flower-beds and borders and a large number of the graves are aglow with flowers, which, under Mr. BEVAN'S care, were in excellent condition. Mr. BEVAN said that it was only by means of unremitting attention to watering that the many flowering plants were kept in such charming condition during the hot weather.

WITCHES' BROOMS.—The singular outgrowths on the Silver Fir have long been known to be the result of a fungus, *Æcidium velutinum*; but it has been left to Professor FISCHER, of Berne, to prove that the same fungus in another form grows on Chickweed and allied plants (*Stellaria*, *Cerastium*). Spores from the Silver Fir inoculated on the Chickweed produce the disease, and in like manner the spores from the Chickweed when inserted on the Silver Fir produce the *Æcidium*. A short account of Professor FISCHER'S experiments is given in the last number of the *Journal of the Board of Agriculture*.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

SEEDLING DIANTHUS.—Mr. Lindsay, Kaimies Lodge, Murrayfield, N.B., has at present a series of interesting seedling *Dianthus* in flower. They are the result of a cross between *D. integer* and what is said to be a form of *D. deltoides*, and which Mr. Lindsay knows by the name of "pulchellus." The flowers are pure white with a narrow crimson eye, but the plant in habit of growth and foliage has nothing in common with the maiden pink. The crosses possess the peculiarities of both parents; some of them indeed might be called a larger "pulchellus" with the deeply dentated petals of *D. integer*. The former, it may be said, is a "good doer." A specimen with which Mr. Lindsay favoured me is blooming profusely, and forms a notable addition to the large family of *Dianthus*, while a selection from the new crop now in flower will give another good variety. *D. Burnetii* is also flowering on Mr. Lindsay's rockeries. Of the *D. neglectus* type, I have seen it elsewhere this year thriving very well indeed. *Fettes Mount Mule-Pink* is also splendid. I have never seen it finer than at Kaimies Lodge, which, it need hardly be added, is replete with rare and good plants flowering in great profusion. B.

LEAF-PROPAGATION OF CEROPEGIA SANDERSONI AND C. WOODII.—The accompanying sketch (not reproduced) shows leaves of these two *Ceropegias* that have developed small tubers and roots in the cocoa-nut fibre of a propagating-frame. The leaf-stalk of *C. Sandersoni* has callused, and, not being a tuberous species, will probably throw out more roots and produce a stem from their midst. In the case of *C. Woodii* the leaf-stalk has developed into a small tuber, from which the root has grown, and I expect will in time emit stems, as in adult plants. This power of leaf-propagation probably exists in *C. Barklyi* and other succulent-leaved kinds, which I hope to experiment with. I am endeavouring to collect the various species of this interesting but neglected genus, and shall be glad to correspond with any of your readers having *Ceropegias* to exchange. W. E. Ledger, 5, Wilton Road, Wimbledon. [The bulbs referred to above may be seen on reference to our illustration of *C. Woodii*, first described in *Gardeners' Chronicle*, Nov. 20, 1897, p. 358. *C. Sandersoni* was also illustrated in these pages in 1870, p. 173. Ed.]

PEAS, ETC.—Much is written on crops of Peas and the best sorts to grow. The variety *Gradus* succeeds with us well, and is equal to the seedsmen's description. For the second time it has proved a reliable Pea, although it required fourteen weeks to get into full pod this year, against twelve weeks last year. We have five rows 25 yards long, and it is a boon where quantities of good marrow Peas are in request. I do not know another Pea that is so early and carries such a heavy crop of pods of such large size. Veitch's Earliest Marrow came into use in twelve weeks, and carried a heavy crop of somewhat smaller pods, and has the advantage of a shorter haulm, deeper colour, and excellent flavour. This hill-top, close on the sandstone, and with very porous subsoil, is proving very dry this year for most crops; but fruit is plentiful. Strawberries, Raspberries, Gooseberries, Currants of both sorts, and Pears are abundant. Apples, Apricots, and Plums are moderate crops. J. G. Wilson, Chevet Park Gardens, Wakefield, July 18.

SOUVENIR DE LA MALMAISON CARNATIONS AT BUCHAN HILL, CRAWLEY.—A very fine collection of these is grown in the gardens of P. Saillard, Esq., including all the best varieties in cultivation. The plants are in excellent condition this season, being entirely free from disease. One house contains about 300 splendid plants in 8-inch pots, many of them carrying from twelve to fifteen fully-developed flowers of excellent quality. The plants are dwarf and sturdy, with fine healthy foliage close to the pots. Two houses have been devoted to their growth. The following varieties are grown in large quantities—*Calypso*, *Sir C. Fremantle*, *Princess of Wales*, *Sir Evelyn Wood*, *Churchwarden* (extra fine), *Prime Minister*, *Mercia*, *Lady Grimston*, *Lady Ulrica*, and *Thora*. The vineries at this establishment are quite worth inspection. One house of *Black Hamburg* has just been cleared, and the *Muscathouse* is just now in fine condition. Several hundred perfect bunches are colouring beautifully. The adjoining vinery contains chiefly black varieties—viz., *Madresfield Court*, *Frankenthal*, *Hamburg*, *Black Muscat*, &c., carrying about 500 bunches finely finished, the foliage being particularly clean and healthy. The foregoing is a long range of lean-to houses, well constructed and ventilated, and without doubt is one of the best in the country. The late vinery is a span-roofed house, and not fewer than ten varieties of Grapes are grown—*Alicante*, *Lady Downes*, *Gros Maroc*, *Gros Colmar*, *Mrs. Pince*, &c. The Vines are in perfect health, and laden with fruit from top to bottom. The Vines have been planted about twenty-two years. Mr. Martin has had charge of them eighteen years, so that great credit is due to him and his staff of assistants for the excellent condition they are in at the present time. R. H. H.

TORTWORTH COURT.—Will you kindly rectify a slight mistake on p. 63, probably made by my indistinct writing. It was Mr. Alexander Cramb who was gardener at Tortworth Court when I was there in the sixties, and who was a frequent contributor to the *Gardeners' Chronicle*. R. M., Newbury, July 25, 1904.

MOTORS AND MANURE.—Your correspondent "A. D." (p. 63) has called attention to a most vital matter. No doubt, for the health of London, the fewer horses kept there the better; but fewer horses mean a diminished manure supply for the market gardeners and farmers in the metropolitan area. But London lays the whole world under contribution to supply its daily food. The Cæsars, when Rome was in the zenith of its power, drew their luxuries and necessary food from all the then known world; but the Roman Cæsars had a limited *menu* compared with Londoners of to-day; and now, when we consider how much of the world's fertility is consumed in London, and the sewage treated as a waste product to poison the fish of sea and rivers, the question is—who shall arrest this wasted stream of fertility, and instead of allowing it to pollute the waters, return it to the earth to fertilise the same? The elements of fertility are there; who shall arrest them and apply them to the soil in a manner effective but not offensive? We are waiting for that benefactor. When he

comes on the scene we shall not have cause to regret the loss of horse-manure. R. M., Newbury, July 25, 1904.

ARUNDINARIA SIMONI FLOWERING.—I have heretwo plants growing in pots which flowered last season and ripened a good crop of seed. In due time this was gathered, and placed on a sunny greenhouse shelf for about a fortnight or three weeks. It was then sown in a pan in soil consisting of equal parts peat, loam, leaf-mould, and sand, and placed in a propagating-house, where it germinated in about a fortnight to three weeks. About 30 per cent. or more of the seed grew, and the seedlings were potted off in small pots, and are now nice promising plants. I would say respecting the old plants that one of the two at present shows no sign of vitality, but the other is growing away freely and again showing flower at the points of the shoots. J. L., Maryfield House, Exeter.

THE WEATHER.—We have had our share of a glorious rain, accompanied by much thunder and lightning. The rain of course will do a great amount of good to many crops, especially to Turnips and Mangolds, and I do not think it is yet too late to help Potatoes, which were showing signs of distress. The haulms of the variety *Duke of York* appeared to suffer most. Lime trees put on a sickly yellow appearance and then began a plentiful dropping of leaves. *Ailanthus glandulosa* might with advantage in many cases be substituted for the common Lime. Doubts were beginning to be heard how much longer Apple trees would hold their fruit, as some were already beginning to drop. These rains will, I hope, stop all that, and I am sanguine now they will go on and make a good finish. On my *Yucca gloriosa* there is a splendid spike of inflorescence; the plant together with the spike stands 9 feet high; it is the most gorgeous flower of the kind I ever saw. I believe it is best to take off the side shoots when they come, and grow them on as I have done this one; in this way the flower or panicle comes much stronger than when the shoots are left to flower on the parent plant, i.e., after the centre panicle has been cut out. W. Miller, Berkswell, July 25.

THE ROYAL HORTICULTURAL HALL.

(Continued from p. iv. of Supplement.)

Roof.—The whole of the roof of the Exhibition Hall is of glass, supported by steel principals forming three centre arches spanning the entire width of the Hall, and surmounted by a lantern for ventilation. A portion of the end of the Hall, next Bell Street, consists of a steel and glass screen 61 feet in width.

Glazing. The glazing of the roof and screen end is of rough cast plate glass upon Messrs. Heywood & Co.'s patent system of glazing.

Floors.—The floors are laid with rift-sawn pitch pine blocks on Mr. Duffy's "Acme" system.

Decorating. The walls are pleasingly decorated in ornamental plaster by Mr. J. M. Boekbinder from the architect's designs, and the panelled dados and balustrading are of Oak.

Heating.—The warming of the Exhibition Hall required very serious consideration owing to the large expanse of glass, and the system adopted, after consultation with Messrs. Handcock & Dykes, the advising engineers, provides for warming the roof by means of low-pressure steam pipes carried across the roof principals, and having upwards of 1,000 square feet of radiating surface.

The body of the Hall is warmed by means of fresh air drawn from outside through ducts, and, after being filtered, washed and warmed in heating chambers in the basement, propelled into the Hall by electrically-driven fans. In summer time the fans will deliver cool washed air.

The whole of the heating and ventilating has been executed by Messrs. Kinnell & Co., of Southwark Street, S.E.

Lighting.—The Exhibition Hall and the annexes are lighted by hanging electric arc lamps, and incandescent electric lighting is provided by brackets around the walls.

Basement.—Storage for chairs and other properties is provided in the basement under the Exhibition Hall. The boiler-house and cloak-rooms are situated in the front portion of the basement.

Lecture Room.—Upon the first floor, approached either directly from the street or from the entrance hall by a separate staircase, is a lecture room, 46 feet long by 23½ feet wide, fitted with lantern appliances.

Upon this floor are also three large Committee rooms, available for use as retiring rooms in connection with the Exhibition Hall.

Second Floor.—The whole of the second floor is reserved for the exclusive use of the Society, and is approached from the street by a separate entrance and staircase, in connection with which an electric passenger elevator is provided. Upon this floor are the Library, Council-chamber, Secretary's room, and two offices for clerks.

Library.—The Library, where, in addition to the Society's collection, will be housed the famous Lindley Horticultural Library, is 47 feet long, 23½ feet wide, and 13½ feet high with coved ceiling. Windows are arranged along the upper portions or the side walls, and top lighting is provided in addition. The decorators will be of Oak and ornamental plaster, and the floor of polished Oak. The bookcases and furniture for this room are being supplied by Messrs. Cowtan & Sons, of Oxford Street.

Council-chamber.—The Council-chamber, situated at the Bell Street end of this floor, is 33 feet long, 23½ feet wide, and 13½ feet high. The coved ceiling is of plaster enriched with fruit and flowers in high relief. The walls will be lined with panelled Oak work surmounted by an entablature of moulded and carved Oak, and the floors will be of polished Oak.

Third Floor.—Upon this floor is provided accommodation for the Hall-keeper, and a chamber for the electrical machinery of the elevator.

Generally.—The whole of the administrative portion is lighted by incandescent electric light, gas being also laid on to every floor for heating or lighting. The heating will be by means of low-pressure steam radiators in conjunction with open fireplaces. The joinery upon the upper storeys is of Australian Oak [?], and the floors of pitch-pine blocks. For the door furniture and electroliers use has been made of hammered "Pewtal," a white non-tarnishable metal, supplied by "Art Fittings, Limited." The electrical installation has been carried out by the National Electric Wiring Company, of Victoria Street.

The buildings are protected against lightning upon the method already installed by Mr. Hillingworth Hedges at St. Paul's Cathedral and Westminster Abbey, the whole of the metal work on the roof being connected by conductors, so that should any portion be struck, the electricity will be led to the ground to the patent earths provided.

All parts of the building are connected by means of an interchangeable system of telephones.

NOTICES OF BOOKS.

THE BOOK OF THE CARNATION, by R. P. Brotherston. (John Lane.)

THIS is one of the many useful handbooks on practical gardening edited by Mr. Harry Roberts, and without desiring to make invidious comparisons, we may say it is one of the best. Its comprehensiveness and its thoroughness, having regard to the fact that the whole book contains fewer than one hundred pages, are really remarkable. Mr. Brotherston summarises for the benefit of the gardener what is known concerning the botany, the history, the literature, the cultivation, and the propagation of various species and the varieties of *Dianthus*. The result is the production of a handy little volume, which will appeal to those of varied tastes. The antiquary and the bookworm will appreciate Mr. Brotherston's delvings into the flower-lore of the sixteenth and subsequent centuries, the cultivator will find just the hints he wants to ensure him success in growing these plants, whether under glass or in the open; the florist will see that his exacting requirements are catered for, the physiologist will derive useful information and valuable suggestions from these

pages, and the hybridist may profit from the facts here published. It must be remembered that it is not the ordinary Carnation only that is treated of, but also the Picotee, the Tree-Carnations, the Malmaisons, the Pinks, and Sweet Williams, and the mules or hybrids. At present the self-coloured varieties of Carnation with smooth

practices are happily gradually dying out, and may advantageously be relegated to the manufacturers of artificial flowers.

The Malmaison, in spite of its unwieldy size, is a great favourite. Nevertheless it taxes the skill of anyone not a specialist to grow it satisfactorily. Mr. Brotherston traces the origin of

FIG. 35.—CARNATION KING SOLOMON. (SEE P. 79.)
A "fancy" border variety; colours purple, crimson, and yellowish-white.

edges to the petals are most in favour with the generality of people and for market purposes, but the French and the Americans are introducing varieties with fringed petals, such as our forefathers delighted in; whilst the "florists" still revel in their flakes and bizzars, and other forms all beautiful and interesting, but spoiled in the estimation of those who are not of the elect by over-"dressing," and specially by throttling with card-board collars. These

this race to a French raiser, M. Laine, no further back than 1857. This newcomer was the original Souvenir de la Malmaison. Lady Middleton appeared in 1870, and Pink Malmaison in 1875.

"It is," says Mr. Brotherston, "a curious trait in connection with this trio derived from a common stock that the last-named is accounted the easiest to cultivate, and Lady Middleton, the most capricious."

This is another illustration of the fact that the

individuals of a single species may vary very greatly among themselves in their life-functions. Identity, or we may more correctly say apparent identity, in outward characteristics by no means coincides with uniformity of physiological func-

history of the Marguerite section. We are, against our will, obliged to content ourselves with a mere allusion to the sections on the Pinks and on the various hybrid varieties, but we have already said enough to show that those in-

which that source of delight may be attained. The rapidity with which the pollen loses its efficacy is remarkable. The book is illustrated with reproductions from photographs, and has a sufficient index.

Another less pretentious booklet on *Carnations Pinks, and Picotees*, is the work of Mr. E. Hasler Potter (Dawbarn & Ward). It is full of practical suggestions, with numerous appropriate illustrations, well suited to the requirements of the novice. The demands of exhibitors are attended to. The section on diseases and insect-pests requires further expansion in a new edition. The book ends with a series of cultural directions for each month in the year.

TWO NEW CARNATIONS.

At the present time, when Carnations are fully in flower, there is especial interest in new varieties of value. In fig. 35 we illustrate a new border variety, named *King Solomon*, shown by Mr. J. Douglas, of Edenside Nurseries, Great Bookham. It gained an Award of Merit at the Holland House Show. The bases of the petals are almost white, or salmon-white, but higher up are crimson, until at the apex they are purplish-crimson flecked and striped with darker crimson, and having a few intense purple, almost black stripes.

The variety *Lady Linlithgow* is shown at fig. 36. This is also a border variety, and it obtained an Award of Merit at the same exhibition. The flowers have large, smooth petals, non-splitting calyx, and the colour is rich rose, only slightly fragrant. The variety has been raised by Mr. Martin R. Smith, Warren House, Hayes, Kent, to whom we are indebted for the opportunity of illustrating it.

The Week's Work.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gr., Wrotham Park, Barnet.

Morello Cherries are grown in most private gardens on the north side of walls, and trained in a fan-shaped manner. Examine the trees before the fruits become too advanced, and neatly secure in their proper positions the young shoots required for fruiting next season and for filling space, &c. Let the foliage be cleansed, and then apply nets for the protection of the fruits against birds. Do not lay-in the young shoots too thickly, but be careful to preserve a sufficient quantity as near to the main stem as possible, to be trained to take the place of older branches which have become somewhat bare of fruiting wood. The *Morello* produces fruit both on spurs and on young wood, therefore the trees should be kept from bottom to top well furnished with young shoots. If the new growths are too numerous, those not required may be shortened to within a few buds of the base, but not closer than this. Some of the young shoots may be tied to the older wood with wet bast, and others should be made secure temporarily by using short lengths of the prunings, or of Privet twigs; but it is necessary to fasten the leaders with shreds and nails. If the roots of the trees are in need of water, let it be supplied in sufficient quantity thoroughly to soak the soil. If the soil is poor, a little chemical manure or liquid from farmyard manure may be applied.

Budding Fruit-trees.—The budding of fruit-trees is not much practised in private gardens, except for restoring the symmetry of a tree, or for filling bare places on the main branches, but Peaches, Nectarines, Cherries, Plums, &c., may be budded very easily. The work should be done in a similar manner to that practised when budding Roses. Use plump buds, and let the operation be done when the bark will part freely from the stem. The buds will remain practically dormant during the winter, but will grow very strongly in the following spring. Grafting may be done in spring if any buds fail to grow.

FIG. 36.—CARNATION LADY LINLITHGOW.

Flowers rich rose colour.

tions. Mr. Brotherston points out the necessity of growing on the *Malmaison* varieties from the layers without a cheek, and his recommendations as to cultivation may be read with great profit.

We should have been glad to have seen a little more detail as to the differences in habit and "grass" between the *Malmaison* and other varieties, and a few more particulars as to the

terested in the cultivated forms of the genus *Dianthus* will find both pleasure and profit in reading what Mr. Brotherston has to say about them.

In an appendix, Mr. Martin Smith notes the delight experienced by the cross-breeder when he succeeds in raising "a really good new variety," and goes on to detail the procedures by means of

Gooseberries.—Dessert varieties bearing good crops of fruit for late supplies will need to have their roots supplied with water. If the bushes be shaded during hot weather, the berries will keep fresher and more plump. It will be necessary to protect the fruits from birds, by using fish-netting or other material to cover the bushes. If Gooseberry and Currant-bushes are grown in squares, probably the cheapest and best way of affording protection to flower-buds and fruit is to cover the beds with wire-netting, resting the wire on a strong frame-work. When once this has been done it will last for many years.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorset.

Cypripediums.—Such dwarf-growing species as *C. bellatulum*, *C. niveum*, *C. concolor*, *C. Godefroyæ* and its variety *leucochilum*, also the various hybrids obtained from such species, are all general favourites, and a specimen plant of either variety when well flowered is greatly admired. Many cultivators find these species and hybrids more difficult to manage than any other section of the genus, and when once they get into an unhealthy condition it is seldom that they regain their former health and vigour. The present is a good time to examine the plants and to repot those that require it, but repotting should not be done oftener than is really necessary; the roots being very brittle, they are often injured during the process. Previous to repotting, it is advisable to allow each plant to become rather dry. Then the pot in which the plant is growing should be broken gently with a hammer, the stale and loose materials carefully removed, leaving the drainage untouched if surrounded with roots. Place the plant into a larger pot, which should be well drained, and fill up with a compost consisting of good fibrous yellow loam and leaf-soil, freely intermixed with small nodules of broken bricks, chalk, or limestone, covering the surface with a thin layer of sphagnum-moss. There is no need to raise the plants above the rim of the pot, as watering is made more easy if the soil and collar of the plant are just below the rim. Shallow pans are generally advocated, but I prefer pots with holes for suspending them near to the roof-glass. Cultivate the plants in a position in the Cattleya-house where the foliage will be within a foot of the roof, and where the plants will be but thinly shaded at any time. These species, especially *C. niveum*, should be well supplied with water at all times; this applies particularly to plants which may be in a dry atmosphere; but where the atmosphere is naturally moist, less water will suffice while the plants are at rest. The plants should be taken down two or three times every week, and if they are in the least degree dry let them be dipped in a pailful of tepid rain-water, the water just covering the surface of the compost. It is necessary to sponge the foliage occasionally, but care must be taken not to raise the succulent leaves above the level of the pot, or they will crack, and become permanently injured.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. BURNS, North Myms Park, Hatfield, Hertfordshire.

Nerines.—These bulbs, having rested since May, will commence to throw up their flower-spikes during next month, and any plants requiring to be repotted should be given attention, in order that the operation may be carried out while they are still dormant. The general practice is to repot these plants as seldom as possible, the idea being that the bulbs flower more freely when the root-room is restricted. So long, therefore, as the plants when treated in this way continue to flower satisfactorily they may well be left alone. Our plants are potted every second or third year, and flower very freely. When, however, bulbs which have made and matured their growth on a shelf in full sunshine in the greenhouse refuse to flower, it may well be surmised that the line between restricted root-room and actual starvation has been passed. In such a case it would be well to shake the whole of the soil from the roots, and repot the bulbs in compara-

tively small pots, placing large single bulbs in pots 5 inches in diameter, and those of smaller size in 3½ or 4-inch pots. Large specimens, composed of clusters of bulbs, may either be divided or repotted entire, using pots of the same size or only slightly larger than they are in at present. Let the pots be thoroughly well drained, and afford a compost consisting of three parts loam and one part leaf-soil, adding plenty of coarse silver sand. The soil need not be watered until the flower-spikes or the foliage appears, when a good watering should be given, and thereafter afforded as often as may be necessary to keep the soil moist. Later, when the plants are in full growth, liberal supplies will be required, especially in the case of those which have not been repotted.

Cyclamen seeds may now be sown in pans filled with a sandy compost. Cover the seeds with about a quarter of an inch of soil, and place the pans in a cold frame. Keep the soil in the pans moist, and afford shade during sunshine.

Cinerarias, Primulas, and Herbaceous Calceolarias.—Further sowings may be made at this time to provide plants for flowering in late spring.

THE KITCHEN GARDEN.

By JOHN PENTLAND, Gardener to C. H. B. FIRTH, Esq., Ashwicke Hall, Marshfield, Chippingham.

Onions.—Autumn-grown Onions which were planted out in the spring are now finishing their growth, and should have their necks twisted to stop the upward flow of sap. This will cause the bulbs to plump up and mature better than if the plants be allowed to develop much top-growth, which they would be likely to do if heavy rains should succeed dry weather. Any that may be mature should be "pulled" and exposed to the sun, with their roots towards the air, that the bulbs may get as hard as possible before they are stored. These details are necessary, because if there is the least moisture in the ground on which they lie, and the roots come in contact with the soil, they will commence to grow again. Wattle-hurdles make a good base, or rail-hurdles covered with wire-netting are suitable, as they allow for a circulation of air round the bulbs. Attend to late crops, and encourage them by frequent waterings of liquid-manure. Dig some vacant ground and supply it with manure, in order that it may be ready when the winter varieties have to be sown next month.

Cabbage.—Sowings may now be made of early varieties. On our soil we find none to equal the variety Wheeler's Imperial, if obtained true. It stands through the winter well, and becomes fit for use early in the spring. Seeds should be sown in the first week in August, and the young plants should be put out as soon as they are ready, so that they may get thoroughly established before there is any frost. We very seldom have a plant run to seed, either from August or spring sowings. Earliness depends very much on the aspect of the border on which the plants are placed. We find that those on a border facing south-east, and sheltered from the north-east and west, become fit for use nearly a fortnight earlier than in any other position we have. Clear the ground of early crops, which have been cut over, unless the plants are required to produce "sprouts." Plants from late sowings may yet be planted; they will produce useful little "heads" late in the autumn.

Work in general.—Clear all ground of early crops that are now useless. Wheel manure on to such ground, and dig it up roughly, so that the sun and air may act upon it before the ground is required for another crop. This work is often neglected owing to pressure of other work, and the ground is left to lie until it is required. This may succeed in the case of open, loose soil, but it will not succeed long on heavy, binding soil.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Grape Muscat of Alexandria.—This fine Grape has a tendency to shrivel and become discoloured. The cause of this is sometimes difficult to understand. But such disfiguration will be certain to arise during intense sun-heat, unless the

bunches are well protected by foliage, sufficient care is given to the matter of ventilation, the roots are provided with plenty of water, and the Vines are allowed to make a moderate amount of growth. No shading is used here, but if the present hot weather continues, and the amount of good foliage is not great, it will be well to use tiffany or double fish-netting during the hottest part of the day. Afford liberal ventilation, and an abundance of water at the roots. Give close attention to outside borders. Even under a moderate mulching the soil soon becomes dry if the weather be very hot and windy, and if it does Muscats will be sure to suffer.

Madresfield Court Muscat.—When commencing to colour, the berries are apt to split, but if liberal ventilation be given day and night at that time, if a moderate amount of lateral growth be allowed, and there be plenty of water at the roots from the time the berries are set until they are ripe, "splitting" will give but little trouble.

Straubberries.—Our best supply of runners has been furnished by the young plants planted out last year, but with more than a month of dry weather and scorching sunshine the layers have not made rapid progress. No time should now be lost in transferring them to their fruiting pots, if this has not been done. We usually employ pots of 6 inches diameter. Put 1 inch deep of clean drainage material at the base of each pot, and cover this with moss, and scatter a little soot amongst it. Use the best loam procurable, and make this more or less firm, according to the character of the soil. A moderately dry compost should be used; if wet it will shrink from the sides of the pots after the work is finished. If a heavy soil be rammed too severely water-logged plants will result. Put the plants in a shady situation for a few days after potting and syringe them once or twice each day, then they may be transferred to an open sunny position and be placed on a hard base. When the plants have become well established afford water freely. Remove all runners as they appear. The variety St. Joseph, in 5-inch and 6-inch pots, and possessing strong crowns and pots full of roots, we are now allowing to flower in batches sufficient to keep up the supply of ripe fruits for some considerable time.

SOCIETIES.

ROYAL HORTICULTURAL.

FIRST EXHIBITION IN THE NEW HALL.

JULY 26.—The first exhibition of the Royal Horticultural Society in its new Hall in Vincent Square, Westminster, took place on Tuesday last. In conjunction with this meeting, the annual show of the National Carnation and Picotee Society was held. The exhibition was disappointing, as it suffered from the presence of the Carnations, many of which, being staged on boards, helped but little to give a furnished appearance to the building. On future occasions we hope it will be found possible to arrange the stages in a less formal manner. The effect of the shows would be greatly enhanced if a raised circular stage could be erected in the centre of the Hall in such a manner as to afford relief and contrast to the arrangements in other parts of the building. With the Hall itself visitors expressed themselves delighted; and when there has been sufficient time for the arrangements to be adjusted to the new circumstances, there will be plenty of space, and the full amount of light will enable visitors to inspect the exhibits. As it is, the warmest congratulations are due to the officials for the admirable manner in which, under severe pressure, they have carried out the arrangements.

THE FLORAL COMMITTEE recommended five Awards of Merit, two of these being to varieties of *Gladiolus* and two to varieties of Carnation. The remaining one was to a species of *Gentian*, *G. dahurica*.

THE ORCHID COMMITTEE recommended two First-class Certificates and two Awards of Merit. Among remarkable novelties was *Angraecum infundibulare*.

THE FRUIT AND VEGETABLE COMMITTEE made no award to a novelty, but recommended a "Hogg"

Medal for a remarkable display of Gooseberries made by MESSRS. JAS. VEITCH & SONS, and two other Medals to collections of Pine-apples, Figs, and Peaches.

It may be stated that the Orchid and Fruit Committees sat in one of the annexes on the ground-floor, and the Floral Committee in the other annexe (see fig. 32, p. ii. of Supplement).

In the afternoon a lecture was delivered by Mr. BINGOOD on Orchids, in the Lecture-room upstairs.

One hundred and twenty new Fellows were elected, as against thirty-five at the similar meeting last year.

Floral Committee.

Present: W. Marshall, Esq., Chairman; and MESSRS. C. T. Drury, H. B. May, C. E. Shea, R. C. Notcutt, Jas. Walker, J. F. McLeod, R. Hooper Pearson, R. Wilson Ker, A. Perry, Geo. Gordon, W. Cuthbertson, R. W. Wallace, G. Reuthe, H. J. Jones, W. P. Thomson, E. H. Jenkins, M. J. James, E. T. Cook, Harry Turner, Jas. Hudson, and W. Howe.

MESSRS. W. J. STOKES & SON, Trowbridge, exhibited a perennial *Campanula*, *Hillside Blue*, said to be a hybrid between *C. carpatica* and *C. persicifolia*. The plants were about 2 feet high, and bore purplish-blue flowers, partly resembling those of *C. pyramidalis*, the influence of *C. carpatica* being not so apparent.

MESSRS. WM. BULL & SONS, King's Road, Chelsea, exhibited a group of stove foliage plants, including an excellent plant of *Dracena Victoria*, also *Caladiums*, *Codiaeums*, &c.

MESSRS. J. HILL & SON, Lower Edmonton, London, N., had a large exhibit of Ferns, composed of seventy-five species and varieties, this very representative collection being shown in excellent condition (Silver Flora Medal).

Mr. H. B. MAY, Dyson's Road Nurseries, Upper Edmonton, exhibited a group of Ferns and choice foliage plants. The ferns consisted of very pretty plants of attractive varieties of many genera. Particularly noticeable were *Polypodium Mayii*, several varieties of *Gymnogrammas*, good plants of *Adiantum tenerum Farleyense*, &c. (Silver Banksian Medal).

MESSRS. JAS. VEITCH & SONS, Ltd., Royal Exotic Nurseries, King's Road, Chelsea, exhibited a group of plants in which their effective variety of *Buddleia variabilis*, known as *Veitchiana*, was shown capitally, some of the specimens being 10 feet high. *Astilbe Davidii* also was shown in very large plants, with its purple flower spikes 5 feet to 6 feet high. This new *Astilbe* is an exceedingly effective plant for the flower-garden. A white *Astilbe* growing as high as *A. Davidii*, but having a different mode of inflorescence, was shown; and *Inula racemosa* with large yellow flowers, some of which are produced in axillary racemes. *Buddleia albiflora* resembles *B. variabilis Veitchiana*, except that the flowers are nearly white. MESSRS. JAS. VEITCH & SONS had also a group of plants of their new double *Fuchsia Sylvia*, with white corolla and bright red calyx, described in previous issues. It is the most effective of white double-flowered *Fuchsias* (Silver-gilt Banksian Medal).

MESSRS. JNO. LAING & SONS, Forest Hill Nurseries, London, S.E., exhibited a group of double and single-flowered *Begonias*, many of the varieties being very pretty, particularly *Lady Cardigan* (single white) and *Lady Londonderry* (double white or faint blush).

HOBBIES, LIMITED, Dereham, Norfolk, made a very large exhibit of cut Roses, arranged in bamboo stands and vases. They soon drooped under the influence of the bright sunshine.

Mr. C. ESCHWEILER, Oudenbosch, Holland (agent for England, Mr. A. HEMSLEY), exhibited *Weigela* (*Diervilla*) *Hortensia nivea*, the centre of the leaves of which is described as being rich golden-yellow colour, but the specimens shown were not in condition.

MESSRS. R. & G. CUTBERT, Southgate Nurseries, Middlesex, exhibited a group of one hundred splendidly grown plants of *Lilium speciosum*, in which the varieties *alba* and *rubra* were represented by plants 4 and 5 feet high, some of which had produced twelve flowers each. We have rarely if ever seen a group of this Lily exhibiting better cultivation (Silver Banksian Medal).

Mr. L. R. RUSSELL, Richmond Nurseries, Surrey, exhibited a beautiful group of *Codiaeums*, *Caladiums*, *Cordylines*, *Palms*, and other decorative plants (Bronze Flora Medal).

Mr. JNO. SCOTT, Brooklyn, N.Y., U.S.A., exhibited plants of a dwarf-growing variety of *Nephrolepis exaltata*, and known as "*Scotii*." From its appearance in small and larger pots we think it will prove to be valuable.

CARNATIONS.

Lord SALISBURY, Hatfield House, Hatfield, Herts (gr., Mr. Geo. Norman), exhibited about forty bouquets of Carnations in glasses. These flowers were of fine quality and were nicely arranged. The most striking varieties included H. J. Cuthbush (scarlet), Lady Ridley (white), The Breton (white), Agnes Sorel (crimson) (Silver-gilt Flora Medal).

Mr. A. F. DUTTON, Bexley Heath, Kent, made an exhibit of Carnation flowers in his usual charming fashion. Arranged loosely with very long stems, each bunch was like a beautiful shower bouquet. The varieties *Royalty* (rose-coloured), *Harry Fenn* (deep crimson), *Fair Maid* (salmon-pink), were superb (Silver Flora Medal).

Mr. J. H. GOODACRE, Elvaston Castle Gardens, Derby, exhibited a variety of *Souvenir de la Malmaison* Carnation named *Countess Eva*, but it had little merit.

MESSRS. HUGH LOW & CO., Bush Hill Park Nurseries, Enfield, exhibited a collection of Carnation flowers, representing a large number of varieties, but the method of staging and a free use of *Asparagus* resulted in the flowers failing to display themselves to the best.

MESSRS. JAS. VEITCH & SONS, Chelsea, exhibited an extensive group of Carnations in pots. A large number of "tree" and border varieties was included.

Mr. JAS. DOUGLAS, Edenside Nurseries, Great Bookham, showed flowers of new border Carnations, two of which are mentioned under "Awards."

MESSRS. GEO. BOYES & CO., Aylestone Park Nurseries, Leicester, also exhibited a group of Carnation flowers.

MESSRS. T. S. WARE, Ltd. (1902), Feltham, also exhibited Carnations, &c. (Silver Flora Medal).

MESSRS. PHILLIPS & TAYLOR, Lily Hill Nurseries, Bracknell, showed Carnations in pots, also cut blooms. Mrs. W. Charrington (a very good yellow) and *Bomba* (salmon-red) were specially good, and the plants were well furnished with clean healthy growths.

MESSRS. CUTBUSH & SONS, Highgate, made a fine display with Carnations, including border, *Malmaison*, and tree varieties (Silver Banksian Medal).

Mrs. HARCOURT ROSE, Beechlands, Sussex, exhibited a number of seedling varieties of Carnation of good quality, but not better than existing varieties.

HARDY FLOWERS.

MESSRS. WALLACE & CO., Kilnfield Gardens, Colchester, exhibited a group of hardy flowers, in which we noticed *Lilium tigrinum splendens*, *L. Humboldtii*, *L. chalcidionium*, *Delphinium sulphureum*, *Eurothera speciosa*, and other good species.

MESSRS. DORRIS & CO., Rothesay, N.B., and Essex, exhibited a large collection of flowers of varieties of Pansies and Violas which created such a show as one could hardly have expected after the excessively hot weather recently experienced (Silver Flora Medal).

MESSRS. G. GIBSON & CO., Leeming Bar, Bedale, exhibited varieties of herbaceous Phlox and bunches of other hardy flowers.

THE GUILDFORD HARDY PLANT COMPANY, Guildford, in a collection of hardy flowers, included *Lychnis chalcidionia*, *Rhus Cotinus atro-purpurea*, *Yucca filamentosa*, *Acanthus mollis*, and many other species.

P. WATERER, Esq., Fawkham, Kent, made a charming exhibit of varieties of herbaceous Phlox. These were shown in large sprays inserted in glass jars or vases, all of which were covered with delicate green drapery. The quality of the flowers, the drapery, and the arrangement of the colours were alike effective and charming; a large glass epergne was furnished with lilac-coloured and white flowers (Silver-gilt Flora Medal).

Mr. M. PRICHARD, Christchurch Nurseries, Hants, exhibited a collection of hardy flowers, including *Montbretias*, herbaceous Phlox, *Gladioli*, Carnations, *Campanulas*, &c. (Silver-gilt Banksian Medal).

LAURENCE CURRIE, Esq., Minley Manor, Farnborough, Kent (gr., Mr. Profit), exhibited a group of flowers representing *Marillac's* new *Nymphaeas*, and other species arranged in pans with natural foliage. A few Bamboos were placed at the back, and it was a similar exhibit to that from the same gentleman at the Holland House Show (Silver-gilt Flora Medal).

MESSRS. KELWAY & SON, Langport, Somerset, showed *Gladioli* in their usual good style, the large collection including some very fine new varieties. Of these, *Aphrodite* (almost pure white) and *Leader* (creamy-yellow) gained Awards of Merit. Sir Dighton Probyn (a mixture of amber and pink), and King Edward VII. (orange-scarlet), Carlton (a peculiar shade of purple and cerise), and others with flowers of great size may

be noted. For so early in the season one of the finest exhibits we have seen (Silver-gilt Flora Medal).

MESSRS. J. CHEAL & SONS, Lowfield Nurseries, Crawley, Sussex, exhibited Sweet Peas, Dahlias, and hardy flowers.

MESSRS. WEBB & BRAND, Saffron Walden, exhibited double Hollyhocks in grand style, long spikes of good blooms in a variety of distinct shades of colour—Gaiety (flesh-pink), *Crimson Queen* (crimson), Mrs. Bailey (pale-flesh), *Exullim* (almost black), *Scarlet Gem* (scarlet) *Peri* (creamy-white), and many others, all with flowers of the best quality (Silver Floral Medal).

MESSRS. CARTER & CO., Holborn, showed seedling *Petunias*, single and double varieties. Among the doubles were some very fine fimbriated flowers in various shades; and the singles included some very pretty pink, blue, purple, and the dark-veined varieties.

Mr. AMOS PERRY, Winchmore Hill Nurseries, made a good display with hardy flowers—*Nymphaeas*, *Iris Kämpferi* varieties, *Gentiana septentida*, *Arnebia echioides*, some pretty *Veronicas*, and other choice flowers (Eronze Flora Medal).

MESSRS. JONES & SON, Shrewsbury, had about fifty varieties of Sweet Peas; also some fine vases of Carnations Mrs. Nicholson (pink, beautifully clove-scented) and *Moni* (salmon-rose) (Silver Flora Medal).

AWARDS OF MERIT.

Border Carnation The Old Guard.—An excellent and large flower of rosy-crimson colour, possessing good petals and a non-splitting calyx. Shown by Mr. J. DOUGLAS.

Border Carnation "Daffodil".—This is a pleasing yellow-coloured flower, that possesses an advantage over *Cecilia* on account of the calyx remaining good. Shown by Mr. JAS. DOUGLAS. Neither of the above varieties possess much perfume.

Gladiolus Leader.—A very desirable variety, owing to the pretty tint of the pale yellow flowers. Shown by MESSRS. KELWAY & SONS.

Gladiolus Aphrodite. A fine, bold flower, white, except very little colour in the interior. Shown by MESSRS. KELWAY & SONS.

Gentiana dahurica.—A sub-prostrate species, with growths 8 or 9 inches long. The tube of the flower is whitish inside and out, but the segments are rich blue; flowers rather more than an inch long, and nearly one inch across. Shown by MESSRS. W. CUTBUSH & SONS.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair), Baron Sir H. Schroeder, Jas. O'Brien (Hon. Sec.), de B. Crawshaw, H. J. Chapman, H. A. Tracy, W. H. Young, J. Gurney Fowler, H. Little, W. Boxall, F. J. Thorne, J. Wilson Potter, H. Ballantine, A. A. McBean, F. W. Ashton, J. W. Odell, H. T. Pitt, R. G. Thwaites, N. C. Cookson, F. A. Rehder, J. Charlesworth, J. Colman, H. M. Pollett, W. A. Binley, and J. Douglas.

The various groups contained an unusually large number of rare and curious species, and the very remarkable, large *Angreum infundibulare*, from the Right Hon. Lord ROTHSCHILD'S gardens, was one of the most extraordinary species ever introduced (see Awards).

MESSRS. CHARLESWORTH & CO., Heaton, Bradford, were awarded a Silver-gilt Flora Medal for a very fine group, in the centre of which was a batch of a good type of the blue *Vanda cerulea*; on each side were arrangements of fine forms of *Laelio-Cattleya* × *callistoglossa*, and interspersed *Laelia* × *Digbyano-purpurata*, *L. × Helen*, the pretty reddish-crimson *L. C. × Penelope*, *L. C. × Rudolph aurifera*, *Cattleya × Hardyana*, home-raised; *Masdevallia torta*, *M. calura*, and other *Masdevallias*; the pretty white purple, spotted *Cypripedium* × Mrs. Herbert Druce, and other *Cypripediums*; *Cattleya Gaskelliana alba*, *Celogyne Sanderiana*, *Oncidium macranthum*, and a fine form of *Cattleya* × F. W. Wigan, which secured a First-class Certificate.

MESSRS. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for a large and interesting group. Massed together were a number of very curious and pretty species, including *Vanda limbatia*, *Polycyrenis muscifera*, with a spike of curious insect-like flowers, a singular *Bolbophyllum* with a raceme of reddish flowers; *Houlletia Broeklehurstiana*, *Polystachya Leonensis*, the pretty *Pachystoma Thompsoniana*, *Dendrobium Fytchianum*, *Saccolabium retusum*, a large reddish-crimson form of *Mormodes badium*, and other singular species. Among the *Cypripediums* were the very dark-coloured *C. × Lamonteanum*

superbom, *C. glanduliferum*, *C. callosum* Sanderae, &c. Good hybrids noted were *Cattleya* × *Wavriniana*, a very fine and showy flower; *C.* × *Parthenia* Princess, a wax-like white flower with delicate rose markings on the lip; *C.* × *Shakespeare*, *C.* × *Vulcani*, forms of *Laelio-Cattleya* × *blotchleyensis*, *L.-C.* × *Martineti*, *L.-C.* × *Hy. Greenwood*, and other *Laelio-Cattleyas*. Also remarkable were *Catasetum macrocarpum viride* and *Masdevallia Harryana* Sanderae, a good white flower with a slight yellow shade. The variety is nearly an albino of the best type of *M. Harryana*. Messrs. SANDER also showed *Laelio-Cattleya* × *Purple Emperor* (*callistoglossa* × *Warszewiczii* Rothschildiana) with a fine claret-purple labellum which had scarcely developed.

Messrs. HUGH LOW & CO., Enfield, secured a Silver Flora Medal for a good group, in which varieties of *Cattleya* Gaskelliana were well displayed; also *C. bicolor* Grossi, *C.* × *Mary Gratrix*, *Brassavola Digbyana*, *Mormodes pardinum aureum*, &c. A fine feature was a large pan of *Cypripedium* × *gigas* Corn-deani, and under a bell-glass were the very handsome *Cypripedium* × *l'Ansoni* (Morgania × Rothschildiana), *C.* × *Maudiae* and *Phalaenopsis violacea*, *Bollea celestis*, *Dendrobium cruentum*; other good species were also represented.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood), was awarded a Silver Banksian Medal for an interesting group, composed of a selection of *Phalaenopsis amabilis* Rimestadiana, *Odontoglossum crispum*, a fine specimen of *Laelia xanthina*, *Cattleya* × *Mrs. J. W. Whiteley*, *Epiphronitis* × *Veitchii*, *Nanodes Medusa*, *Stanhopea tigrina*, *Cypripedium callosum* Sanderae, *Lycaste leucantha*, *Sophrora-Cattleya* × *Chamberlainiana*, a fine specimen of *Odontoglossum Uro-Skinneri* album (Cultural Commendation), and *Cattleya* × *Thurgoodiana* (Luddemanniana × *Hardyana*), a pretty flower nearest to *C.* × *Hardyana*, but with a light patch on the lip.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr., Mr. Hopkins), showed as *Cypripedium* × *Harveyanum* (Stonei × *Leeanum*) a rather pretty hybrid very much resembling *C.* × *Alice* (Stonei × *Spicerianum*); *C.* × *vexillifera*, and the very richly-coloured *Laelia* × *Iona* nigrescens.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr., Mr. Stables), sent *Odontoglossum* × *loochristyense* Theodora, a very distinct variety showing more of the white of a good *O. crispum* than any other form; the flowers were distinctly blotched. Also *O.* × *Crawshayanum* (Hallii × *Harryanum*), *O. Harryanum* rosefieldense, and *O.* × *elegans* var.

E. W. BECKETT, Esq., M.P., Wood Lea, Virginia Water (gr., Mr. Baskett), sent a fine branched inflorescence of the reddish-crimson *Renanthera coccinea*.

W. P. BURKINSHAW, Esq., The West Hill, Hesse, Hull (gr., Mr. Barker), again showed his beautiful *Cattleya Warszewiczii* "White Queen," which had previously taken an Award of Merit; sepals and petals pure white, lip marbled with dark rose.

W. W. MANN, Esq., Bexley, Kent (gr., Mr. J. Simon), showed a fine plant of the typical rose-lipped *Oncidium lanceanum*, and another of a nearly white-lipped form, with two spikes. The plants were splendidly grown.

Mr. A. J. KEELING, Westgate Hill, near Bradford, again showed the yellowish-white *Masdevallia Harryana* alba.

JEREMIAH COLMAN, Esq., Gatton Park, Reigate (gr., Mr. Bound), showed a group of plants, for which a Silver Banksian Medal was awarded. Included were *Cattleya* Mrs. J. W. Whiteley, *C. Patrocinii*, *C. gigas*, *Laelia xanthina* with sixteen flowers, *Stanhopea tigrina*, *Lycaste leucantha*, *Cypripedium callosum* Sanderae, *Epiphronitis Veitchii*, *Sobralia Veitchii*, *Odontoglossum crispum*, &c.

AWARDS.

FIRST-CLASS CERTIFICATE.

Angraecum infundibulare, from the Right Honble. Lord ROTHSCHILD, Tring Park (gr. Mr. A. Dye). A very large and interesting species with broad white front to the lip, which is openly displayed. The basal part is continued into a greenish funnel-shaped spur some 6 inches in length, and is prolonged into a slender tail about 6 inches in length, which forms a tendril-like support for the heavy flower by curving abruptly over one of the adjacent roots. The sepals and petals are greenish, lanceolate, and each over 2 inches in length. The flowers are borne singly on trailing stems bearing bright green, narrowly ovate leaves. The remarkable species seems to have been first made known by dried specimens collected by Barter on Prince's Island, W. Africa (Lindl. in *Journ. Linn. Soc.*, vi. (1862), 136). It has never before flowered under cultivation. The

plants were collected by Major H. B. Rattray on the Victoria Nyanza, Uganda, in 1902, a widely different locality from that of the original record. The Hon. Walter Rothschild received A. Rothschildianum, and others said to be new, from the locality named. A. infundibulare is very fragrant.

Cattleya × *P. W. Wigan superba* (Schilleriana × *Dewiana aurea*) from Messrs. CHARLESWORTH & CO.—A very fine hybrid with the characteristic leaning towards *C. Schilleriana* of all the hybrids of that species. Sepals and petals of a delicate yellowish-cream colour tinged with pale purple. Lip rosy-crimson veined with purplish-crimson, and with a distinct golden-yellow blotch in the centre.

AWARD OF MERIT.

Cattleya × *Patrocinii*, Tring Park variety (*Cattleya Leopoldii* × *Loddigesii*, fine var.), from the Right Hon. Lord ROTHSCHILD (gr., Mr. A. Dye).—Five plants of a batch raised at Tring Park by the Hon. WALTER ROTHSCHILD were shown. Two were of indifferent merit, two similar to the best form of *C.* × *Patrocinii*, originally imported as a natural hybrid, and one, the Tring Park variety, by far the most beautiful of its class. Sepals and petals broad, purplish with bright dark-purple spots. Lip white at the base, rose on front and side-lobes.

Odontoglossum Uro-Skinneri splendens, from J. WILSON POTTER, Esq., Elmswood, Croydon (gr., Mr. Young).—A very handsome variety, with broad honey-yellow sepals and petals marked with chestnut-brown, and fine labellum entirely covered with bright dark-rose-coloured spotting.

Fruit and Vegetable Committee.

Geo. Bunyard, Esq. (chairman), and Messrs. H. Balderston, J. McIndoe, S. Mertimer, A. Dean, G. Kelf, H. Parr, H. Markham, J. H. Goodacre, F. Q. Lane, J. Jaques, Geo. Wythes, G. Norman, J. H. Veitch, A. H. Pearson, Owen Thomas, and R. Lewis Castle.

Magnificent Figs and Peaches were shown from the gardens of Lord SALISBURY (gr. Mr. G. Norman), Hatfield, Herts. There were about four dozen fruits of the variety of Fig Brown Turkey, of very large size and well coloured. Two dozen fruits of Royal George Peach were equally good. From the same garden were exhibited three good fruits of Melon Hatfield Favourite, a yellow fruit of moderate size and good flavour (Silver Knightian Medal).

From the garden of H. L. BISCHOFFSHEIM, Esq., Warren House, Stanmore, were exhibited twenty-two Pine-apple fruits, for which a Silver Knightian Medal was recommended.

Seedling varieties of Melons were shown by F. A. BEVAN, Esq., Trent Park, Barnet (gr., Mr. H. Parr); Rt. Hon. J. CHAMBERLAIN, Highbury, Birmingham (gr., Mr. J. Deacon); and Captain Holford, Westouirbirt (gr., Mr. Chapman); but no awards were recommended.

Mr. G. PENWILL, 80, High Street, Totnes, again exhibited "Penwill's Champion" Raspberry, which gained an Award of Merit at the Holland House show.

Yates' "Purple Pod" Pea was shown by Mr. H. YATES, Sutton, Hounslow. This variety has rich purple-coloured pods of larger size than purple ones are usually.

Messrs. T. RIVERS & SON, Sawbridgeworth, exhibited fruits of their fine new early-fruited Peach Duke of York, which has already been awarded an Award of Merit.

Mr. WILL TAYLER, nurseryman, Hampton, exhibited fruits of the Peach Libra, which has also received an Award of Merit from the Society.

Mr. W. DEAL, Jun., Kelvedon, Essex, exhibited pods of a new Pea, Brookland's Prize, described as a heavy cropping second-early variety.

Cucumber "Progress" was shown by Lord BELPER, Kingston Hall, Derby (gr., Mr. Cooke). The fruits were of large size, fair shape, and good colour.

Messrs. H. E. & W. LACK, Sheep Street, Wellingborough, exhibited Lack's Monster Red Currant, and two varieties of Gooseberries.

Messrs. T. SPOONER & SONS, Hounslow Nurseries, Middlesex, exhibited fruits of Mr. Gladstone, Early Red Margaret, July Queen, Beauty of Bath, and Red Astrachan Apples; also Morello Cherries. These early varieties of Apples are already ripe, especially Early Red Margaret.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, exhibited a magnificent collection of Gooseberries. The fruits were arranged in baskets, and represented as many as eighty-seven varieties. These were backed by fifty cordon-trained plants in pots. These had been cut from the open

ground, were from 3 to 5 feet in height, and were literally wreathed with ripe berries. All the best dessert and culinary varieties were included in the collection of fruits, amongst which were the new varieties Langley Gage (white), Langley Beauty (pale yellow), and Golden Gem, all of which have good flavour, particularly Langley Gage, which is exceedingly rich and sweet (Hogg Medal).

Messrs. SUTTON & SONS exhibited several fruit-bearing plants of *Solanum guatemalense*. The fruits are juicy, with a flavour of Melon. A figure will be found at p. 160 of our number for March 7, 1903.

Lecture on Orchids.

The 3 o'clock lecture was delivered by Mr. BIDGOOD in the room to be devoted to that purpose on the first floor. In spite of the great heat, the accommodation was infinitely superior to that afforded by the Drill Hall, and no doubt the comfort and convenience of lecturer and audience will now be more considered than was possible under the old arrangements. The lecture consisted in the explanation of a very large series of coloured photographs representing many genera of Orchids and their hybrids, which were thrown on the screen. The large size of the representations and the interesting remarks of the lecturer rendered this a very delightful lecture. Considerable stress was laid on the pigments, which were in many cases double, thus a red overlying a yellow pigment produced the chocolate spotting so remarkable in some forms of *Odontoglossum crispum*. Some of the pigments are liquid, others solid. The effect of hybridisation on the distribution of colour was also pointed out, and some of the variations were shown to be consistent with Mendelian principles. Mr. GURNEY FOWLER, who presided, proposed a vote of thanks to Mr. BIDGOOD, which, it is hardly necessary to say, was carried by acclamation.

NATIONAL CARNATION AND PICOTEE.

JULY 26.—A very good show indeed, was the general opinion of experts. Though the white-ground Carnations and Picotees were somewhat sparingly shown, they were bright in colour, some of the scarlet bizarres being of fine quality. The selfs, yellow-ground, and white-ground fancies, and the chaste yellow-ground Picotees, were particularly fine, and numerous shown, especially in the amateur classes. The light in the new Hall showed off the flowers to the best advantage, but the wide tables sadly needed some plants down the centre to relieve their nakedness of appearance. Should the Society hold its exhibition in the Hall again, tables 4½ feet in width would be better than those 6 feet in width. The arrangements of the Carnation show left a good deal to be desired.

Bizarre and Flaked Carnations.—Three collections of twenty-four blooms competed. Mr. F. A. WELLESLEY was placed 1st, having in the order of the blooms as read from left to right, C.B. Master Fred, P.F. Gordon Lewis, P.P.B. William Skirving, S.F. Mrs. J. J. Keen, P.F. Geo. Melville, C.B. Master Fred, R.F. Pandora, S.B. Robert Houlgrave, R.F. Thalia, S.F. Guardsman, S.B. George, P.F. Geo. Melville, P.P.B. W. Skirving, S.B. J. Beswick, S.F. Sportsman, P.F. Gordon Lewis, S.B. Robert Houlgrave, C.B. J. D. Hextall, R.F. Merton, C.B. J. S. Hedderly, S.B. Admiral Curzon, P.F. Chas. Henwood, C.B. J. W. Bentley, C.B. J. S. Hedderly. 2nd, Mr. MARTIN R. SMITH, Hayes (gr., C. Blick), who had some pure and highly refined flowers, and experts were heard saying the position of these two stands should have been reversed. Some of his chief blooms were S.F. Harwood (brilliant in colour), P.P.B. Chloe, P.F. Sweet Nell, P.P.B. Melford, R. F. Mia Cara, C.B. Lord Nelson, P.P.B. Romola, R.F. Latnam, P.P.B. Inca, S.B. Phryne, P.P.B. Lilith, S.F. Damio, &c.; 3rd, Mr. C. TURNER, Slough.

Self Carnations.—These were brilliant and striking. Mr. F. A. WELLESLEY being once more placed 1st with twenty-four blooms—Sir Bevis, Agnes Sorel, and Gil Pole: crimson and scarlet, Etna, Comet, and H. J. Cutbush; rose, John Pope and Ophelia; pink, Pink Pearl, Ivo Sebright, and Mrs. F. W. Flight; terra cotta, Benbow; yellow, Almoner, Mrs. Charrington, and Germania; white, Much the Miller, Gloriosa, and Wild Swan; purple, Mrs. Mestyn, some of the foregoing being in duplicate. Mr. M. R. SMITH came 2nd, also with some finely-finished blooms, having of maroon shades, Ebbie, Grand Vizier, and Karo; scarlet and crimson, Etna and Comet; rose, Rosamond, Anna Boleyn, Bridegroom, and Floradara; pink, Mrs. Guy Sebright; white, Hildegard and Much the Miller; yellow, Cecilia and Daffodil. 3rd, Messrs. BLACKMORE & LANGDON, Twerton, Bath.

Fancy Carnations.—These were also of superb development. With twenty-four blooms Mr. M. R. SMITH was placed 1st, having insignificant blooms of Admiral, Mrs. A. Torrens, Infanta, Hesperus, Paladin, Thos. A. W. Jones, Mountjoy, Merlin, Cavalier, June, Royal George, C. Martel, Molly Maguire, The Seer, Amphion, and Hidalgo, some being in duplicate. 2nd, Mr. F. A. WELLESLEY, who had in very fine character Persens, Bredick, Professor Cooper, Hidalgo, Monarch,

Argosy, Falcon, C. Martel, Miss L. Webb, Mrs. F. A. Wellesley, Horsa, and Galileo. 3rd, Messrs. BLACKMORE & LANGDON.

Picotees, white ground.—Mr. M. R. SMITH took the 1st prize with a collection of refined blooms, having H.P.E. Amy Robsart, H.Ro. Little Phil, L.P.E. Lavinia, H.Ro.E. Blink Bonny, L.R.E. Mrs. Gorton, H.Ro.E. Mrs. Sharp, H.Ro.E. Kenneth, L.Ro.E. Fortrose, H.P.E. Miriam, H.Ro.E. Duchess of York, H.Ro.E. Lady Louisa, H.Ro.E. Clio, L.P.E. Pride of Leyton, H.Ro.E. Dainty Lady, L.P.E. Somerhill; some of the foregoing being in duplicate. 2nd, Mr. F. A. WELLESLEY, who had in fine character H.Scar.E. W. H. Johnson, H.Ro.E. Little Phil, H.Ro.E. Lady Louisa, L.R.E. Mrs. Barron, H.R.E. Ganymede, L.P.E. Somerhill, L.Ro.E. Nellie, H.Ro.E. Mrs. Payne. 3rd, Mr. C. TURNER.

Yellow Grounds.—In this class magnificent blooms were staged by Mr. M. R. SMITH, who was placed 1st with Leonora, Verena, Espoir, Astarte, Chryseis, Iscult, Earl Erik, Peri, Ida, Lucy Glitters, Dalkeith, Mrs. W. Heriot, Countess, Star, and Kohinoor, duplicates making up the number. Mr. F. A. WELLESLEY came 2nd, also with fine blooms, having Countess Verulam, Daniel Defoe, Gronow, Lady St. Oswald, Hesperus, Gertrude, Mrs. W. Heriot, Lauzan, Mrs. Durrant, Othello, &c. 3rd, Mr. C. TURNER.

With six self Carnations, one variety, Mr. M. R. SMITH was 1st with Daffodil, the finest yellow self yet raised; Mr. F. A. WELLESLEY, 2nd, with Germania; Mr. C. TURNER, 3rd, with Sir Bevy.

With six blooms of a yellow ground, fancy, Mr. M. R. SMITH was 1st with King Solomon (red and maroon on a yellow ground), very fine (fig. 35). Mr. F. A. WELLESLEY came 2nd with Westfield Seedling (cream, heavily edged with crimson maroon). Messrs. BLACKMORE & LANGDON were 3rd with Richness.

With six blooms of a fancy Carnation, Mr. M. R. SMITH was 1st with Algot, flamed with rosy-red on white. Mr. F. A. WELLESLEY came 2nd with Millie. Mr. SMITH was also 1st with six blooms of a yellow-ground Picotee, having Mrs. W. Heriot, having a wide edge of rose on a deep yellow ground—a perfect flower as shown. Mr. WELLESLEY came 2nd with the same; and Mr. C. TURNER, 3rd, with Artisan.

With twelve distinct varieties of selfs, fancies, or yellow-grounds, three blooms of each, undressed, Mr. M. R. SMITH was 1st; and Messrs. BLACKMORE & LANGDON, 2nd.

Carnations, Single Blooms.—S.B.'s: Robert Houlgrave, from Mr. R. SYDENHAM, came 1st; Mr. W. SPENCER, Junr., was 2nd and 3rd with the same. C.B.'s: J. S. Hedderley, from Mr. W. SPENCER, was 1st; Mr. WELLESLEY came 2nd and 3rd with Master Fred. P.P.B.'s: William Skirving was placed 1st and 2nd from Mr. WELLESLEY; Mr. J. FAIRLIE came 3rd with J. S. Hedderley. P.F.'s: Gordon Lewis was 1st and 2nd from Mr. WELLESLEY; and also 3rd from Mr. R. SYDENHAM. S.F.'s: a bright flower named J. J. Keen was 1st, but with no exhibitor's name; Guardsman was 2nd, from Mr. A. R. BROWN; and Sportsman was 3rd. R.F.'s: Mr. W. SPENCER came 1st with Thalia; Mrs. Rowan was 2nd, from Mr. J. MITCHELL; and Mrs. Lord 3rd, from Mr. R. SYDENHAM. Self White: Mrs. Eric Hambro, from Messrs. PEMBERTON & SON, was 1st; Mr. R. C. CARTWRIGHT came 2nd; and Mr. E. CHARRINGTON, 3rd, both with Much-the-Miller. Scarlet: 1st, Mrs. L. E. Best (brilliant scarlet, fine in the petal), from Mrs. BEST; 2nd, the same; Mr. A. R. BROWN coming 3rd with Carabas (quite scarlet). Rose: 1st, Mr. E. CHARRINGTON, with Carabas (bright rose); Mr. WELLESLEY was 2nd with Mrs. E. W. FLIGHT; and Mr. CARTWRIGHT, 3rd, with Mrs. Guy Sebright. Maroon: 1st, Mr. R. SYDENHAM, with Edward Curtis; Mr. CARTWRIGHT, 2nd, with Sir Bevy; and Mr. W. PARTON, 3rd, with Ralph. Yellow: 1st and 2nd, Mr. W. SPENCER, with Mrs. M. V. Charrington; Messrs. PHILLIPS & TAYLOR came 2nd with the same. Buff: Mr. CARTWRIGHT, 1st with Mrs. R. C. Cartwright (a peculiar shade of orange-apricot); and he was 2nd with the same; Mr. R. SYDENHAM was 3rd. Yellow ground: 1st, Mr. CARTWRIGHT, with Argosy; 2nd, Mr. WELLESLEY, with Mrs. F. A. Wellesley; and Mr. SPENCER, 3rd, with J. A. Rowberry. Other fancies: 1st and 2nd, Mr. M. R. SMITH, with Millie; 3rd, Messrs. PEMBERTON & SON, with Voltaire.

Picotees, Single Blooms. H.E. red: 1st, Mr. A. R. BROWN, with Brunette; 2nd, Mr. J. J. KEEN, with Ganymede; 3rd, Mr. BROWN, with Isabel Lakin. L.E. red: 1st and 2nd, Thos. William, from Mr. CARTWRIGHT; 3rd, the same, from Messrs. PEMBERTON & SON. H.E.P. Amy Robsart was 1st and 2nd, both from Mr. SMITH; Mr. R. SYDENHAM came 3rd with Beau Nash. L.E. purple: 1st and 2nd, Mrs. Farquhar, from Mr. W. SPENCER. H.E. rose: 1st, Mr. SMITH, with Little Phil; Mr. CARTWRIGHT 2nd with the same; Mr. R. BROWN 3rd with Lady Louisa. L.E. rose: 1st, Mr. CARTWRIGHT, with Fortrose; 2nd, Mr. WELLESLEY, with the same. H.E.Y.G.: 1st, Mr. SMITH, with Mr. Walter Heriot; 2nd, Mr. BEADLES, with Gertrude; and 3rd, Mr. SMITH, with Verena. L.E.Y.G.: 1st, Mr. CARTWRIGHT, with

Childe Harold; 2nd, Mr. H. MATHIAS, with Pilgrim; and 3rd, Mr. BEADLE, with the same.

Premier Blooms.—Bizarre: C.B. Master Fred, Mr. F. A. WELLESLEY. Flake: P.F. Gordon Lewis, also from Mr. WELLESLEY. Self, John Pope, bright rose, from Messrs. BLACKMORE & LANGDON. Fancy: Voltaire, from Mr. PARTON; H.E.W.G. Pic. P.E. Amy Robsart, from Mr. R. SMITH. L.E.W.G. Pic. Pride of Leyton, P.E., from Mr. CARTWRIGHT. H.E.W.G. Verena, from Mr. SMITH. L.E.Y.G. Mrs. W. Heriot, from Mr. WELLESLEY.

In the 2nd division of the schedule, the twelve best Carnations, bizarres and flakes, came from Messrs. W. PEMBERTON & SON; Mr. W. SPENCER being 2nd. Mr. A. R. BROWN was 1st with twelve self Carnations; and Mr. W. SPENCER, 2nd. With twelve fancies, Mr. W. SPENCER was 1st with twelve superb blooms; and Messrs. PHILLIPS & TAYLOR, 2nd.

With twelve white-ground Picotees, Messrs. W. PEMBERTON & SON were 1st; and Mr. A. R. BROWN, 2nd. With twelve yellow-ground Picotees, Mr. SPENCER was again 1st with highly-developed blooms; and Mr. A. R. BROWN, 2nd.

The best six self Carnations of one variety were those of Mrs. M. V. CHARRINGTON; Mr. A. R. BROWN coming 2nd with John Pope. The best six blooms of any yellow-ground fancy Carnation were those of Monarch, from Mr. E. NASH; Mr. BROWN coming 2nd with Voltaire.

The best six blooms of a fancy Carnation were those of Orion, from Mr. H. MATHIAS; Messrs. PHILLIPS & TAYLOR winning 2nd with Ivo Sebright.

The 1st prize stand of six blooms of any one variety of Y.G. Picotee came from Mr. H. MATHIAS, who had an unnamed flower; Mr. SPENCER coming 2nd with Gronow.

The blooms in the foregoing classes were all shown on ordinary stands, the varieties the same in the main as those shown in the larger classes.

The best six varieties of selfs, fancies, or yellow-grounds, undressed, three blooms of each, shown in bottles, came from Mr. W. SPENCER. Mr. A. R. BROWN, 2nd.

DIVISION III.

The number of blooms in Classes 25 to 33 inclusive did not rise above six, but the competition was very keen generally, and some very good blooms were staged. The principal prizewinners were Messrs. R. C. CARTWRIGHT, W. H. PARTON, J. FAIRLIE, and W. BEADLE, Mr. CARTWRIGHT being particularly successful. There was also a class for three varieties of undressed blooms shown in threes.

DIVISION IV.

comprised a number of small classes (35 to 43 inclusive), in which the competition was good; and there was a class for six blooms for maiden growers also.

CERTIFICATED VARIETIES.

Seedlings.—A large number was staged, and Certificates of Merit were awarded to the following:—Duke of Norfolk, a bright scarlet self, brilliant in colour and perfect in petal, extra fine; and Bridegroom, bright rosy-pink self, a superb flower of the finest quality, both from Mr. JAMES DOUGLAS; to Mrs. M. V. Charrington, a highly refined yellow self, distributed by Messrs. PHILLIPS & TAYLOR; to Mrs. L. E. Best, a brilliant carmine-scarlet self, intense in tint, and having fine quality of petal, from Mrs. BEST; and to Carabas, a very fine rose self, stout in substance and excellent in petal; and to Mrs. R. C. Cartwright, a distinct, attractive, and refined apricot self, both from Mr. R. C. CARTWRIGHT.

Plants in Pots.—A goodly number of these were shown, and if those in the class for twelve specimens and for one specimen had been stood along the centres of the tables between the boxes of blooms, which made a dreary and naked display, the effect of the show would have been considerably heightened. With twelve plants in pots, Mr. M. R. SMITH was 1st, having well-grown and bloomed examples of Blanche Armida (pinkish-rose), Countess Carrington (a lovely blush self), Gronow, Mrs. Kate Hambro, Sir Bevy, Goldy Locks, &c. Mr. A. F. FULLER was 2nd.

The best single specimen was Countess Carrington, from Mr. SMITH; Mr. FULLER being 2nd with an unnamed variety. With a large group Mr. SMITH was again 1st, having plants well-grown and finely-bloomed, chief among them Countess Carrington, Miss Maud Sullivan (delicate pink), Comet, Ellis (maroon-crimson), Orestes, Pagree, Cygnet (creamy-white), &c.; he being the only exhibitor. Mr. A. F. FULLER was the only exhibitor in the class for a smaller group having unnamed specimens.

Decorations with Carnations.—No bouquets were staged in the class for two. There were some pretty vases, Mr. W. SPENCER taking the 1st prize. There were also sprays of Carnations and buttonholes.

Silver Cups.—A Silver Cup was offered in each Division for the exhibitor obtaining the highest aggregate of points. That in Division I. went to Mr. M. R. SMITH, in Division II. to Mr. W. SPENCER; in Division III. to Mr. R. C. CARTWRIGHT; and in Division IV. to Mr. D. WALKER.

SOUTHAMPTON ROYAL HORTICULTURAL.

SOUTHERN COUNTIES CARNATION SHOW.

JULY 22.—As usual this exhibition was held on the Royal Pier, Southampton, but this year under the auspices of the Royal Southampton Horticultural Society, the former special Carnation Society having ceased to exist. The show was on the whole a good one considering the lateness of the Carnation season.

CARNATIONS.

The leading class was that for twelve blooms distinct of flakes and bizarres. Four exhibitors entered, the premier award going to Messrs. W. PEMBERTON & SON, Harden Nurseries, Bloxwich, for clear, well-defined examples of popular sorts. Especially good were George Melville, Thalia, and W. Prescott. Mr. C. Bick, gr. to MARTIN SMITH, Esq., Warren House, Hayes, was 2nd. Mr. HAYWARD MATTHIAS, Thames Ditton, Surrey, 3rd.

For six flowers of a similar type, J. J. SHELTON, Esq., Rosedale, Churchfield, was 1st with 'even flowers. Mr. J. FAIRLIE, Avenue Road, Acton, 2nd.

Fancy varieties.—Nine competed in the class for twelve flowers, distinct. Mr. BICK won the premier award for good examples of Mrs. Annie Towers, Admiral, Merlin, Hidalgo, and Juno. Messrs. PHILLIPS & TAYLOR, Braeknell, Berks, were 2nd; and Messrs. BLACKMORE & LANGDON, Twerton, Bath, 3rd.

For six flowers, distinct, Mr. J. FAIRLIE was 1st.

Selfs.—In the class for twelve flowers, distinct, Messrs. PHILLIPS & TAYLOR won with good examples. Agnes Sorel, Much the Miller, Hillegarde, Bomba, and Sir Bevy were noteworthy. Mr. C. BICK was a good 2nd.

Half-a-dozen varieties were best shown by Mr. J. F. KEEN, Avenue Road, Southampton. Mr. W. NEVILLE, gr. to F. W. FLIGHT, Esq., Cornstiles, Twyford Winchester, 2nd.

Undressed or Border varieties, for which a special class was made, were not plentiful. For twelve distinct, Mr. E. J. WOOTTON, Knowle Lodge, Fair Oak, was the premier prizetaker; Messrs. BLACKMORE & LANGDON, 2nd.

For six varieties distinct, self or fancy varieties, amateurs only, Mr. NEVILLE won with Mrs. F. W. FLIGHT, W. NEVILLE, and a lovely seedling, White Lady; Dr. YEO, Holmforth, Alverstoke, 2nd.

PICOTEES.

For twelve white-ground varieties, Messrs. W. PEMBERTON & SON, won with neat specimens; Mr. HAYWARD MATTHIAS, 2nd.

Mr. J. F. KEEN won the 1st prize for six varieties; Mr. E. H. BECKLAND, Southgate House, Winchester, was 2nd.

Yellow-ground flowers.—For twelve blooms in not fewer than six varieties, Mr. BICK won against four competitors with Queen Mab, Lady Freemantle, Astarte, Sylvia, and Maritana; Mr. WOOTTON, 2nd.

Dinner-tables decorated with Carnations or Picotees made an interesting feature. Five competed. Miss MINNIE SNELLGROVE, Oxford Road, Southampton, won quite easily with an arrangement of pink flowers, pleasingly intermingled with suitable greenery.

Mrs. BLACKMORE had the best stand or vaso of Carnations or Picotees.

Mr. E. WILLS, florist, Above Bar, had the best Carnation bouquet—a really pretty exhibit.

Trade Exhibits were good. Gold Medals were awarded to Messrs. B. Ladhams & Co. for hardy flowers; to Mr. C. W. Broomfield, for Sweet Peas. Silver-gilt Medals to Mr. W. Garton, Roselands, Woolston, for stove and greenhouse plants; to Messrs. Toogood, for Sweet Peas. Silver Medal to Messrs. Jones & Son, Shrewsbury, for Sweet Peas and hardy flowers. Certificate of Merit to Messrs. W. Cutbush & Son, Highgate, for Carnations; and a similar award to Mr. J. Douglas, Edenside Nurseries, Great Bookham, for Carnations in great variety.

TRADE NOTICE.

MACKENZIE & MONCUR, Limited, have acquired the business of Messrs. Mackenzie Brothers, Edinburgh Foundry, Slateford Road, Edinburgh, and have added to their business of hothouse builders, heating, ventilating, and sanitary engineers, that of architectural and general ironfounders. The electric lighting of mansions and public institutions will form a special feature of the business. The foundry is equipped with the latest labour-saving appliances, and is capable of turning out the highest class of castings at moderate rates.

MR. F. J. CROOK, late gardener to Captain M. Aynesley, Hall Court Gardens, has purchased a nursery business at Curdridge, near Botley.

ENQUIRIES.

VEGETABLE TUMOURS.—"Do tumours exist in plant-life made of cells of the embryonic type? What is the exact difference between the adult and the embryonic cells as regards the method of cell-division? *L. B. W.*" [The questions here raised are intricate and of such importance that we submitted them to the highest authority on the subject. Prof. Farmer kindly furnishes the following reply:—"So far as is known at present, no growths exist in plants that are exactly comparable with the malignant tumours of animals, except the 'aposporous' growths that occur in Ferns. The correlative productions of 'apogamy' present many points of analogy, but the correspondence is not precise, when the details of the cellular changes are borne in mind. But many local growths, e.g., those produced by some fungi, do resemble the 'benign' tumours of animals in essential features, i.e., they are due to the rapid but strictly localised hypertrophy of the living cells of the tissues affected. There is no difference between 'adult' and 'embryonic' cells in their mode of division, but those adult cells which are thus capable of multiplication either already possess the characters or revert to those of embryonic cells. Your correspondent probably refers to reproductive cells when using the term 'embryonic.' The characters of the divisions of the reproductive cells sooner or later deviate in a remarkable and constant manner from those witnessed in ordinary dividing cells. The nuclei of the latter at each division exhibit a definite number of structures of a rod-like form. These are the so-called 'chromosomes.' The chromosomes of the nuclei pass through very definite series of changes in form during each division, but in the reproductive tissues (e.g., the tissue of an anther that is destined to give rise to pollen-grains) one very easily recognised division is unlike all its predecessors, in that half the number of chromosomes is present, and their shapes are also very different. When once this has taken place all the descendants of such a cell retain the reduced number of chromosomes. Finally from these cells are formed the sexual cells, each of which will unite with a corresponding one of the opposite sex at fertilisation. From this union there results once more a cell with the full number of chromosomes, since each nucleus of the two conjugating cells possessed only the reduced (halved) number of chromosomes as the consequence of the intercalation of the peculiar division already referred to. *J. B. F.*"]

NECTARINE FRUITS SHRIVELLING.—"I would feel obliged if you could assist me in finding out the cause of the skin of Nectarines turning a grey colour and shrivelling just as they are ripening. I enclose three samples of fruit. I have gathered some just before ripening, others have left on tree until ripe, but both fruits turn the same. Two trees in the same house, Rivers' Orange and Pineapple Nectarine, both turn the same, and by the end of the second day are unfit for table. *F. W.*—and *Grower, St. Albans.* [The injury is probably caused by the excessive bright sunshine acting upon exposed fruits. Allow the fruits to be shaded a little by foliage, and take care the roots do not suffer from want of water. *ED.*"]

Obituary.

JOHN BLACKIE.—Many of our readers will regret to hear of the death, on the 16th inst., of Mr. John Blackie, President of the Edinburgh Market Gardeners' Association. Mr. John Blackie, who was in business as a market gardener, was a native of Leith, and belonged to a family who for over a century have been market gardeners in the burgh. He took the greatest interest in the affairs of the Edinburgh Market Gardeners' Association, and had been its president for twenty-five years. The Association numbers 170 members, and some years ago he received from them a handsome presentation of a drawing-room timepiece and ornaments, in recognition of his successful services in connection with the dispute with the Edinburgh Corporation over the rights and privileges of the gardeners in the use of the Waverley Market.

The case was stubbornly fought, and lasted over three years. It was taken by the Corporation to the House of Lords, and there settled in favour of "Blackie and Others" for the market gardeners. The Association was represented at the funeral, and sent a very handsome wreath.

*** * EDITOR AND PUBLISHER.**—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all communications relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the EDITOR. The two departments, Publishing and Editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are misdirected.

BURNED PAPER: *N. E.* The ash would be chiefly carbon, with perhaps a little potash. It would do as a dressing for lawns or to lighten heavy soil, but would not be worth paying for.

CROSSING OF BEGONIAS: *H. D.* Remove all the male flowers from the female plant, then take a camel's-hair brush, and with it take the pollen from a male flower of another plant, and transfer the pollen to the stigma of one of the female flowers. It is better to do this before the female flower is fully open, and to remove with a fine pointed pair of scissors one of the flower segments. By applying the pollen in this manner the possibility of fertilising by insect agency is obviated.

GLOXINIA: *H. T.* The appearance of a second corolla as an outgrowth from the first is not unusual. Years ago there was a strain which constantly produced such flowers. You will notice that the position of the purple colour is reversed in the supplementary corolla.

GRAPES: *Palmer's Green.* The disease is due to a fungus *Gloeosporium*, too often mentioned in our columns. You can do nothing now but burn the Grapes. Next season spray the young leaves and flowers with liver-of-sulphur (oz. to 1 gallon of rain-water).

INSECTS ON PALMS AND FERNS: *Palm.* The narrow black insect on the Palm is the "black thread scale," *Ischnaspis filiformis*, and among them are a few examples of the equally injurious *Palm-scale*, *Florinia florinae*. Both species have either been introduced on plants from abroad, or from some locality within the British Isles. Both species are equally hard to kill, and it is only by frequent applications of some kind of insecticide that these insects can be destroyed. No insects were found on the Fern-fronds, but they have the appearance of having been attacked by thrips. *E. N.*

INSECTS ON PEACH AND VINE: *A. S., Cheshunt.* Both species are scale insects. That on the Vine is *Pulvinaria vitis*, and that on the Peach, *Lecanium persicae*. The adult forms of both species are dead, but if you carefully examine the branches you will find the minute, brownish young insects partly hidden under the semi-detached bark of the Vine, and on the undersides of the branches of the Peach. In winter strip the Vines, and give them a dressing of paraffin emulsion or any other insecticide such as is used for mealy-bug. The paraffin emulsion has also been found an effectual remedy for the Peach-scale. *E. N.*

LILIES: *H. Temple.* *Lilium testaceum*, *Alstroemeria Pelegrina*.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*A. B. C.* *Dendrobium Bensoniae*.—*P. K., Friar.* 1, *Campanula cenisia*; 2, *Sempervivum Boutignyanum*; 3, *Houstonia serpyllifolia*; 4, *Campanula car-*

patica alba; 5, *C. turbinata pallida*; 6, *C. rotundifolia*, pale variety; the species is exceedingly variable.—*W. B.* *Lilium auratum*.—*S. 1.* *Galega officinalis alba*; 2, *Santolina incana*.—*J. H. P.* 1, *Spiraea filipendula*; 2, *Aconitum Napellus* (very poisonous); 3, *Funkia subcordata*; 4, *Sedum reflexum*; 5, *Heracleum sphondylium*; 6, *Ginkgo biloba*.—*J. S., Sligo.* 1, *Astilbe japonica*; 2, *Spiraea Lindleyana*; 3, *Dracocephalum Ruyschianum*; 4, *Veronica Andersoni*; 5, *Potentilla sp.*; 6, *Campanula unifolia*.—*J. G.* Varieties of *Statice sinuata*.—*H. S. S.* *Aërides falcatum*.—*W. C. S.* 1, *Cypripedium oenanthum*, or closely allied garden hybrid; 2, *Catasetum cristatum*.—*G. H. S.* Thanks for 2s. 6d. for the Gardeners' Orphan Fund. 1, *Ligustrum sinense*; 2, *Myrica Gale*; 3, *Deutzia crenata*, double flower; 4, *Spiraea Douglasi*; 6, *Lysimachia clethroides*; 10, *Glaucium luteum*. The others next week.—*J. M. S.* *Oncidium leucocochilum*.—*Steil Tom.* *Trachelium cœruleum*, *Achillea Ptarmica*, double flower.—*W. B. W.* *Clarkia pulchella*, double. We cannot name the Rose; send it to some grower.—*W. R. C.* *Artemisia vulgaris*.—*T. A.* The numbers were disarranged. Send again, and make the numbers more secure.

NOTICE TO QUIT SERVICE: *Anxious to Know.* A month's notice or a month's wages is generally sufficient.

PEACH: *G. H. H.* We cannot name the Peach, which arrived in a smashed condition.

PEACH-LEAVES: *A. W. R.* No disease is present. The injury must have been caused by the sun's rays, unless you have sulphured the hot-water-pipes, or had an exceedingly hot dry atmosphere. Examine the border, and see if it needs water.

PROLIFEROUS ROSES: *R. M. L.* The cause of green-centred Roses is not known. It is probably climatal. Growth should, under ordinary circumstances, stop in the centre of the flower, but for some reason or other it continues.

RASPBERRY-CANES: *P. R.* No fungus or insects. Entomologist says perhaps some insect may have entered the canes below the dead portion, but there is no evidence to show this. It may have resulted from sudden changes of temperature.

RICHARDIA PENTLANDI: *R. S.* This species, like the rest of the *Richardias*, was introduced from South Africa.

TOMATOS: *T. A. T.* The Tomato plants have rotted at the collar. The soil seems very heavy and sodden. Use a more porous soil, and exercise increased care in affording water.

TOMATOS: *J. R. T.* There is no fungus, but imperfect ripening, perhaps from some deficiency of potash in the soil. Mint not found. The disease is probably that known as the Mint-rust, and you had better destroy the stock and plant afresh from a new source.

TARRAGON: *T. H. C.* Not one of the three is the true Tarragon, but what they are we cannot say.

VINE ANTHRACNOSE: *G. P. and A. B. C.* The Grapes are affected with Anthracnose, described and figured in *Gardeners' Chronicle*, July 8, 1893, fig. 10. Nothing can save the Grapes for the season, but the disease must not be allowed to spread to other Vines. Cut away and burn all diseased parts, and syringe with diluted Bordeaux-mixture, so as to kill all germs which may have got dispersed. *M. C. C.*

WALLFLOWER AND HONESTY: *W. F. & Co.* The specimen had withered, but probably the trouble is, as suggested, "Finger-and-Toe." Application of gas-lime to the soil may be beneficial, and take care not to plant any cruciferous plant in the same soil for some years.

COMMUNICATIONS RECEIVED.—*W. N., D. D., T. A. S.*—*Sutton & Sons*—*D. W., G. P., G. F. T., E. M., R. D., J. U., T. H., W. W., Pettigrew*—*W. D., H. H., J. L.* and others (fruit forms received too late for inclusion in table)—*F. Moore*—*Expert*—*W. C., J. W., W. H. B., W. M., T. H. S., J. O'B., R. A., R. C. T. D.*—*Rev. H. Friend*—*A. J., A. K. D., W. (For Markets and Weather, see p. x.)

SIR TREVOR LAWRENCE, BART., K.C.V.O., V.M.H., PRESIDENT OF THE
ROYAL HORTICULTURAL SOCIETY.

THE OPENING OF THE NEW HALL OF THE ROYAL HORTICULTURAL SOCIETY BY H.M. THE KING, ACCOMPANIED BY H.M. THE QUEEN AND H.R.H. THE PRINCESS VICTORIA. SIR TREVOR LAWRENCE, THE PRESIDENT, IS READING THE ADDRESS TO HIS MAJESTY.

[From a photograph by Messrs. Fradelle & Young.]

THE OPENING OF THE ROYAL HORTICULTURAL HALL by THE KING.

FRIDAY, JULY 22, will be a memorable day in the history of the Royal Horticultural Society. The new buildings, which mainly owe their inception to Baron Sir HENRY SCHROEDER, were opened by H.M. the KING, who was accompanied by H.M. the QUEEN and H.R.H. Princess VICTORIA. Half-an-hour after noon the Royal Party arrived, and were received at the entrance by the

menced with the reading of an address by the President, Sir TREVOR LAWRENCE, Bart., V.M.H., as follows:—

TO THE KING'S AND QUEEN'S MOST EXCELLENT MAJESTIES.

MAY IT PLEASE YOUR MAJESTIES,—

We, the President, the Vice-Presidents, the Council, and the Fellows of the Royal Horticultural Society—who now number more than 8,000—venture,

The first [Charter of the Society, granted by H.M. King George the Fourth [Third] in 1809, set out the objects for which the Society had been founded—namely, "The Improvement of Horticulture in all its branches, ornamental as well as useful."

Through the collectors sent out by the Society during the forty years from 1821 to 1861, great numbers of beautiful and useful trees, shrubs, and plants have been introduced into, and acclimatised in, the British

FIG. 31.—VIEW OF THE EXTERIOR OF THE ROYAL HORTICULTURAL HALL.
(From a photograph taken by Messrs. Fradelle & Young on the day of the opening, July 22, 1904.)

President, members of Council, and officials of the Society, who were severally presented. Their Majesties walked in procession to a raised dais erected in the centre of one side of the building. Save for a few Palms at the back of the platform, nothing in the way of decoration was attempted, but the fine proportions, spacious area, and light appearance of the Hall, produced a most favourable impression. The business of the meeting com-

with our loyal duty and greeting, to welcome Your Majesties to our new Hall.

The Centenary of the Society, which was founded in March, 1804, is rendered memorable by the erection of the Building in which we are assembled, and by the acquisition, through the generosity of Sir Thomas Hanbury, K.C.V.O., of a celebrated garden, in place of that at Chiswick, which had become unsuitable for the purposes of the Society owing to the advance of suburban London westward.

Isles. The success attending these expeditions may be realised when the late Mr. Andrew Murray was able to say, with undeniable truth, in his *Book of the Royal Horticultural Society*, "The results" (of the work of the Society's collectors) "have affected the appearance of all England. Nowhere can a day's ride now be taken where the landscape is not beautified by some of the introductions of the Royal Horticultural Society."

Added to this, professional gardeners have been

greatly assisted and encouraged by the help and support of our Society in the elaborate and valuable work of hybridisation and selection, by which new and improved varieties of plants, fruits, and vegetables have been raised in vast numbers.

The Fortnightly Shows of the Society have achieved a widespread celebrity. At them all the more interesting new plants, as well as the more important results of skilled horticultural effort, are first seen and first submitted to the judgment of the most competent experts in the kingdom.

The adherence of the Society to the work of promoting horticulture in all its branches can hardly fail to secure the approbation of the garden-loving race over whom Your Majesty reigns. This is shown by the rapid increase in the number of its Fellows, which has risen from about 1,300 in 1887 to 8,150 now.

highest efficiency the science and art of horticulture. And in thanking your Majesties for your presence here to-day and for the warm interest you have ever shown in the Society, we desire to assure you that the valuable help of the illustrious Prince Consort gave the Society in days of serious difficulty—now some forty-five years ago—has never been forgotten.

The following report of the Building and Appeal Committees, by Mr. J. GURNEY FOWLER, Treasurer of the Society, was then presented to His Majesty by BARON SIR HENRY SCHROEDER, Bart., V.M.H., Chairman of the Appeal Committee:—

MAY IT PLEASE YOUR MAJESTIES,

On behalf of the Building and Appeal Committees, we venture humbly to submit the following report on

of the London Scottish Volunteers, at Buckingham Gate, Westminster, where they have been held up to the present time. They have been ever increasingly popular, and the Society has enjoyed the favour and support of horticulturists, and of the public generally, without interruption.

A few years after the removal of the shows to the Drill Hall, we began to find the accommodation insufficient, the Hall being at times inconveniently crowded, both by exhibitors (who have often not had sufficient space to properly stage their exhibits) and by Fellows of the Society, and others, who have not had proper facilities for seeing and studying the plants shown.

At the same time, the office accommodation at Victoria Street, Westminster, which has always been very limited, has for many years been wholly inadequate for carrying on the increasing general office and routine work of the Society.

Your Majesty, as long ago as 1890, addressed the Fellows in the following words:

"I sincerely hope your labours to obtain a Hall may be successful, for I feel sure it would be of the greatest use and advantage."

Since these encouraging words were spoken, the need for the Hall has increased beyond all expectation, and the project has never been absent from our hopes and our thoughts; and it is this Hall and building, the final result of many long years of hope deferred, but of sustained effort, that your Majesty has graciously consented to declare open to-day.

FIG. 32.—INTERIOR OF THE NEW ROYAL HORTICULTURAL HALL, SHOWING THE TWO ANNEXES WHICH CAN BE USED AS COMMITTEE ROOMS.

(From a photograph by Messrs. Fradelle & Young.)

Every day witnesses advances in many directions, but no art or science has progressed more rapidly during the last fifty years than that of horticulture. The demand for flowers and fruits has grown to such an extent that it has developed a great and valuable industry, and the countenance which Your Majesties have graciously extended to our Society has largely assisted in creating, guiding, and helping this valuable national asset.

We take this opportunity of expressing our enduring obligations to your Majesties for the many and gracious visits you have in years past paid to our Society's shows—visits which have done much to encourage us in our efforts to foster and maintain in the

the erection of the building in which we are honoured by your Majesties' presence to-day.

For very many years the fortnightly and other shows of our Society have been one of the most effective means towards securing the objects we have in view—viz., the diffusion of more correct knowledge of what plants should be grown, and of how they may and should be cultivated.

These fortnightly gatherings were first held at the Society's early home in Regent Street, and for many years afterwards they took place at South Kensington. When, however, in 1887, the gardens there were surrendered to the Royal Commissioners of the 1881 Exhibition, the Society moved their shows to the Drill Hall

adequate for carrying on the increasing general office and routine work of the Society.

Your Majesty, as long ago as 1890, addressed the Fellows in the following words:

"I sincerely hope your labours to obtain a Hall may be successful, for I feel sure it would be of the greatest use and advantage."

Since these encouraging words were spoken, the need for the Hall has increased beyond all expectation, and the project has never been absent from our hopes and our thoughts; and it is this Hall and building, the final result of many long years of hope deferred, but of sustained effort, that your Majesty has graciously consented to declare open to-day.

Much difficulty was experienced in finding a suitable site for the building, but we are happy in thinking that our present situation leaves nothing to be desired. Funds had also to be collected, and more than thirteen hundred donations have been received from all classes of the horticultural community and others, amounting in all to £26,000.

£14,000 still remains to be raised before the Society can regard itself as the unfettered possessor of its Hall and building fully equipped.

The main purpose of the building is the holding of our Fortnightly Shows, but other interests have not been lost sight of, and we have reason to believe that the Hall will often be in demand for numerous other

which you allude, and for which you are indebted to the goodness of Sir Thomas Hanbury.

The love of horticulture has increased immensely in this country within the last century, owing in part, no doubt, to the greatly extended facilities enjoyed by our people for visiting rural places; and no science deserves more encouragement than that which tends to promote the study of the art of gardening and to stimulate a taste so wholesome and elevating as the love of trees and flowers.

Our visits to your exhibitions have always given us great satisfaction, and I remember and

fondation. Cet événement séculaire sera plus qu'une fête de famille, plus qu'une solennité nationale. Son éclat rayonne sur le monde entier. Tous ceux qui, dans les deux hémisphères, aiment les plantes, s'uniront en pensée avec vous, pour saluer ces deux grandes dates : 5 Mars, 1804, et 5 Mars, 1904 ! Aucun d'eux ne peut oublier la puissante impulsion donnée par vos fondateurs à la culture des végétaux. Personne ne peut nier la part considérable prise par leurs successeurs au développement constant de ce mouvement horticole dont nous saluons aujourd'hui, émus et charmés, le radieux épanouissement.

Il suffit, en effet, de jeter un instant les yeux sur la longue liste des membres qui honoraient par leurs tra-

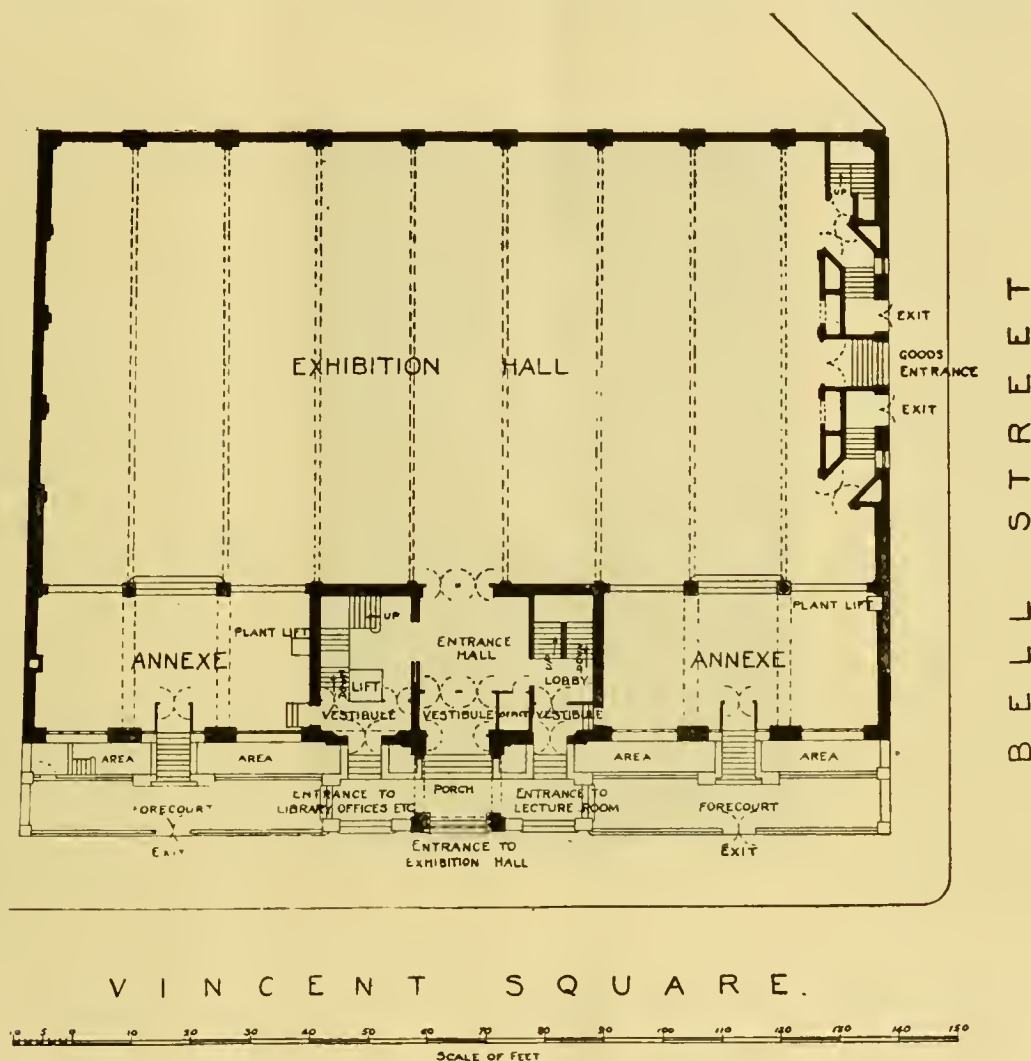

FIG. 33.—GROUND-PLAN OF THE ROYAL HORTICULTURAL HALL.

(Prepared from the Architect's amended design, which includes an entrance porch, &c.)

purposes. In addition to the Hall, we have now ample office accommodation, and a proper home for the Lindley Library, which is of such great use to all students of horticulture.

HIS MAJESTY'S REPLY.

The KING, in reply to the Society's address, said :

"In the name of the Queen and myself I thank you for your loyal and dutiful address. I am very glad that you have at length obtained a suitable Hall for your beautiful and interesting shows, and adequate accommodation for your library and for the performance of the official work of the Society, and it is with great pleasure that the Queen and I are here to-day to declare these new buildings open.

We are pleased also to be able to congratulate the Society on having acquired the garden to

am touched by your allusion to the interest which my dear father took in your Society. The Queen and myself wish that every success may attend the opening of this new hall and its adjoining premises, and that the centenary which we are celebrating this year may prove to be the occasion of an accession of prosperity to the Royal Horticultural Society." (Applause.)

An address from the Société Royale d'Agriculture et de Botanique de Gand was then presented by Dr. MAXWELL MASTERS, F.R.S., Officer of the Order of Leopold, corresponding member of the Institute of France, on behalf of Comte de Kerchove de Denterghem, Président de la Société:—

MONSIEUR LE PRÉSIDENT,—

Le 5 Mars, 1904 [March 7], la Royal Horticultural Society fêtera le centième anniversaire de sa

vaux votre illustre Société pour apprécier combien fut utile au monde civilisé le concours de tant d'intelligence et de si nombreux dévouements. Les théories scientifiques qu'ils ont émises, sont aujourd'hui indiscutées. Les plantes introduites sous vos auspices ornent actuellement nos jardins et nos serres. Un grand nombre de celles-ci se sont si heureusement acclimatées qu'elles sont devenues presque des ornements naturels de nos parcs et de nos parterres. Quel homme, voyant ce que vous avez accompli en l'espace de ce siècle, resterait insensible devant la grandeur, la puissance et la persistance des efforts déployés par la Société Royale d'Horticulture de Londres !

Créée en 1808, la Société Royale d'Horticulture de Gand est de quatre ans votre cadette ; elle a contractée avec sa sœur aînée de Londres, des rapports d'amitiés profonds et durables, depuis le jour où, sur son livre d'or, elle recueillait les signatures des plénipotentiaires anglais venant de signer à Gand le traité

de paix de 1815! Toutes deux, nos Sociétés poursuivaient le même but: unir la théorie scientifique et l'habileté pratique de manière à confondre théoriciens et praticiens, botanistes et jardiniers, dans un même effort vers la perfection des cultures.

Pendant un siècle, sans défaillance, sans faiblesse, sans lassitude, vous avez jalonné la route de l'avenir en signalant et en récompensant tous les efforts.

Scmblable à l'arbre admirable qu'il a choisi pour emblème, votre cercle reste, comme le chêne, toujours ferme et vigoureux, étendant ses rameaux puissants à l'ombre desquels l'horticulture se développe en sécurité dans tout l'empire Britannique!

Puissiez-vous continuer *in aeternum* votre tâche civilisatrice! Puissiez-vous ne jamais cesser de briller comme un phare éclatant, pour le plus grand honneur de l'horticulture anglaise et pour la plus grande joie de l'horticulture du monde entier!

Se souvenant, non sans émotion, des temps si lointains de sa fondation, la Société Royale d'Agriculture et de Botanique de Gand adresse à sa sœur bien aimée, la "Royal Horticultural Society," l'expression de ses félicitations cordiales et des vœux bien affectueux qu'elle forme pour sa longue, durable et féconde prospérité!

Ad multos annos!

Le Président—C^{te}. DE KERCHOVE DE DENTERGHEM.

Gand, le 1 Mars 1904.

Le Secrétaire-Général—E. FIERENS.

The NATIONAL ROSE SOCIETY was represented by Mr. E. MAWLEY, who presented the subjoined address:—
TO THE PRESIDENT AND COUNCIL OF THE
ROYAL HORTICULTURAL SOCIETY.

In the name and on behalf of the National Rose Society—one of the oldest of the special Horticultural Societies in the kingdom—we desire to give expression to the congratulations and hopes which all the horticulturists and Horticultural Societies of this country are feeling at this most auspicious celebration of the Centenary of the Royal Horticultural Society.

We venture to express the belief that to-day marks the beginning of a new era of even yet more distinguished success in the history of the old Society, from which—we take this opportunity of publicly stating—the National Rose Society has, at all times and in all possible ways, received the most generous and ungrudging assistance and support.

Signed on behalf of the National Rose Society,

S. REYNOLDS HOLE, D.D.,

Dean of Rochester, President.

EDWARD MAWLEY, Secretary.

The congratulatory address from the Verein zur Beförderung des Gartenbaues in den preussischen Staaten was then presented by Dr. MASTERS:—

AN DIE ROYAL HORTICULTURAL SOCIETY
IN LONDON.

HOCHVEREHRTE GESELLSCHAFT.

Zu dem Tage, an welchem Sie in Gegenwart Seiner Majestät des Königs, Ihrer Majestät der Königin, und der Königlichen Familie die Eröffnung Ihres eigenen Heims; Ihrer Gartenbauhalle, und damit zugleich das Fest Ihres 100-jährigen Bestehens feiern, erlaubt sich auch der Verein zur Beförderung des Gartenbaues in den preussischen Staaten seine herzlichsten Glückwünsche auszusprechen.

Ist doch die Gründung Ihrer Gesellschaft vorbildlich gewesen für die Bildung unseres Vereins im Jahre 1822, wie für so viele andere Vereine in den verschiedensten Ländern.

Als einer der ältesten unter diesen, hat unser Verein die Leistungen Ihrer Gesellschaft im Laufe der vielen Jahrzehnte stets mit Bewunderung verfolgt. Mutig sind Sie vorwärts gedrungen, trotz mancher Schwierigkeiten, und wenn der Gartenbau in England auf einer so hohen Stufe steht, so dürfen Sie sich mit Stolz sagen, dass Sie dazu ganz besonders beigetragen haben.

Heute haben Sie eines Ihrer höchsten Ziele erreicht: ein eigenes Heim! Wir empfinden ganz mit Ihnen

dieses Glück, um so mehr, als auch wir nach einem eigenen Heim streben, das freilich noch in weiter Ferne liegt.

Mögen in der neuen Gartenbauhalle die grossartigen Leistungen Ihrer Gesellschaft nun um so schöner zu Tage treten und das neue Jahrhundert für Sie ein ebenso segensreiches, die Gartenbauwelt des gesamten Erdballs befruchtendes sein wie es das abgelaufene war.

Das wünscht aus vollem Herzen.

Der Verein zur Beförderung des Gartenbaues in den preussischen Staaten:

Der Direktor-gezeichnet, Freiherr VON CRAMM, Wirklicher Geheimer Rath, Excellenz, Herzoglich Braunschweigischer Minister, und Bevollmächtigter zum Bundesrath.

Der General-Sekretär, Prof. D. L. WITTMACK, Geheimer Regierungsrath.

MR. EDWIN J. STUBBS.

The Architect of the Royal Horticultural Hall.

(From a photograph by Elliott & Fry.)

[TRANSLATION.]

TO THE ROYAL HORTICULTURAL SOCIETY,
LONDON.

MOST ESTEEMED SOCIETY,—

The Horticultural Society of Prussia takes the opportunity of offering you its most hearty congratulations on the day on which, in the presence of His Majesty the King, Her Majesty the Queen, and other members of the Royal Family, you will open your own Home, your Royal Horticultural Hall, as a celebration of your Centenary.

The foundation of your Society served as an example for the formation of our Society in the year 1822, and also for the inauguration of similar Societies in other countries.

As one of the oldest of these, our Society has always followed with admiration the actions of your Society in the course of its many decades. You have courageously advanced in the face of many difficulties, and now that horticulture has attained to such pre-eminence in England, you may justly recognise that you have contributed to this proud position in an exceptional manner.

To-day you have gained one of your highest aims—the acquisition of a Home! We sympathise fully with you in your good fortune, the more so because we too are endeavouring to secure our own Home, though this at present looms in the far distance.

May the grand achievements of your Society shine with a still brighter light in the new Hall, and may the new century prove as fortunate for you, and as beneficial to the horticulture of the whole globe, as has been that which is closed!

These are the most hearty wishes of the Horticultural Society of Prussia.

Signed—

The Director, BARON VON CRAMM, Actual Privy Councillor, Excellency, Minister of the Duke-dome of Brunswick, and its representative in the Bundesrath.

The Secretary-General, Professor Dr. L. WITTMACK, Privy Councillor.

THE PRESIDENT of the Society then requested His Majesty to be graciously pleased to declare the Royal Horticultural Hall open, and on His Majesty assenting, the architect, Mr. Edwin Stubbs, who was presented by the President, submitted to His Majesty plans of the Society's offices erected in conjunction with the Hall.

HIS MAJESTY then said: "I HAVE MUCH PLEASURE IN DECLARING THIS ROYAL HORTICULTURAL HALL—THIS MAGNIFICENT HALL—OPEN." (Applause.)

Before leaving the Hall the QUEEN was pleased to accept a bouquet of Orchids from LADY LAWRENCE. Princess VICTORIA accepted a bouquet of Souvenir de la Malmaison Carnations from MISS LAWRENCE. Into the composition of the bouquet presented by Lady Lawrence to H.M. the Queen entered appropriately enough *Odontoglossum crispum* long known as O. Alexandræ. This favourite Orchid was discovered by Hartweg, one of the Society's collectors, and introduced to cultivation by Weir, another of the Society's collectors.

As their Majesties left the Hall Lieutenant Charles Godfrey's band played the National Anthem, and the assembly cheered heartily, the applause being taken up vigorously outside the Hall as the Royal party drove away.

THE NEW HALL IN VINCENT SQUARE, WESTMINSTER.

THESE buildings, erected to commemorate the Centenary of the Royal Horticultural Society, have been built upon an almost rectangular site on the north-east side of Vincent Square, Westminster, overlooking the playing fields of Westminster School, an open space of some 10½ acres in extent.

The frontage to Vincent Square is 146 feet, and the side frontage to Bell Street, in all, about 122 feet. Messrs. G. E. Wallis & Sons, Ltd., of Maidstone, are the contractors for the superstructure.

The excavations and concrete foundations were carried out by Messrs. John Mowlem & Co.

The buildings, erected from the designs of Mr. Edwin J. Stubbs, architect, are faced with red bricks, and have dressings of Portland stone. The central frontage is occupied by a porch of Portland stone, forming the principal entrance to the Exhibition Hall, flanked on either side by the entrances to the administrative portions upon the upper storeys.

In order to obtain the maximum space for the holding of the Society's flower shows, the whole of the ground storey, except the portion occupied by a small entrance hall and the necessary staircases, has been devoted to this purpose. The buildings are so arranged that the Exhibition Hall and lecture room, with cloak rooms and retiring rooms (which comply with the regulations of the London County Council for public buildings, and will be licensed for music and dancing), may be let for entertainments without interfering with the privacy of the Society's library and offices.

Exhibition Hall.—Entering at the principal entrance sets of oak doors lead into the entrance hall, beyond which another set of oak doors gives access to the Exhibition Hall, 141 feet long, 75 feet wide, and 48 feet high to the underside of the roof lantern.

From the entrance side of the Exhibition Hall two annexes, each about 46 feet long, 24 feet wide, and 17½ feet high, extend to the front of the building.

A musician's gallery is provided at the end of the Exhibition Hall.

From the Exhibition Hall and annexes five separate exits, in addition to the main entrances, lead directly into the streets.

(For continuation see p. 77.)

THE DEFECTIVE CROPPING OF THE HAUTOBOIS.

PROFESSOR E. ZACHARIAS, in the Proceedings of the Natural History Society of Hamburg, 1903, has an interesting paper on this subject, from which we summarise what follows. It has for many years been a matter of common knowledge among gardeners in this country that the varieties of *Fragaria elatior*—the Hautbois Strawberry of gardens—are apt to "run out," as the entire or partial failure to bear fruit is commonly termed, and the remedy is well known, viz., the interplanting with plants of the male sex. For many years past the poor crops of Hautbois varieties in the Vierlanden district have been the subject of much complaint on the part of the cultivators, notwithstanding the fact that the plants grow with vigour. The few fruits, moreover, that come to maturity exhibit incomplete development, and the opinion prevalent among the growers is that the plants have degenerated owing to long cultivation.

In order to put the matter to the proof, Professor Zacharias obtained in 1901 a number of plants from a grower, and

planted them in the Hamburg Botanical Garden. The grower stated that the growth of his plants, production of runners, and flowering were satisfactory, but that the set of fruit was greatly deficient. The plants flowered in the Botanical Garden in 1902—3, and an inspection of the flowers showed extremely short and small stamens, the pollen-sacs or anthers becoming quickly of a brown tint, producing no pollen-grains. Only occasionally were better pollen-sacs observed, which gave pollen in variable quantities. Those flowers which gave a number of fuller developed anthers were mostly larger than those having only sterile ones. The greater number of the plants might be regarded as females. The vegetative parts showed good development, and yet but few fruits set, and these were not well formed. The little seed obtained in 1902 was incapable of vegetating. Runners were taken in 1902 and planted in the usual manner. From fifty-six of these plants there flowered only twenty-three in the following year; and of the forty mother plants only five showed bloom in the same year (1903).

In the summer of 1901 Professor Zacharias sent a quantity of the plants from the grower previously named, as well as some taken from the edge of a ditch (garden escapes) in the grounds of another grower, to Graf zu Solms-Laubach, at Strassburg. Concerning these plants the Count wrote in July, 1903: "The plants fruited abundantly after a bed of the male *Fragaria elatior* was planted close by them."

In the summer of 1902 the author received a large number of runners from a cultivator whose plantations had afforded good crops of fruit. These runners were planted in the Hamburg Botanical Garden in the usual fashion—i.e., in groups of three—and, as is the usual practice, two being robust and one weaker. When the plants flowered in 1903, out of fifty-eight, only fifty-two bore flowers; and of these thirty-eight had mostly deformed, twelve well-developed anthers, and two which, besides one inflorescence each of abortive anthers, possessed one that was well developed.*

These plants may be described as female, male, and monoecious. The anthers when well developed were rich in pollen, and in general, so far as it was examined, the pollen appeared to be of normal quality, with only a few shrivelled grains. The abortive anthers with relatively short filaments formed no pollen. The female flowers were in general rather smaller than the male; on the other hand the male inflorescences were always much shorter than the female; moreover the male plants were mostly weaker and the runners also weaker than the female and monoecious plants. On none of the male plants was any fruit observed, while the females carried a good set of fruit.

In regard to the division of the sexes of *Fragaria elatior*, the same circumstances occur in the wild state as was observed among the cultivated plants in the Botanic Garden, but the variations show numerous deviations.

The grower from whom the fruitful plants in the Botanic Garden were obtained leaves of set purpose several "wild," that is male, plants in his beds, whilst the grower who

* In all the first blooms of the male plants the anthers were deformed.

furnished the barren plants makes it his practice to root up every "wild" plant, and he believes that fruit-bearing plants degenerate into "wild" ones.

The observations taken in the Botanical Garden afford no support to this theory. This grower's beds were planted with runners during two generations taken from female plants which depended for the pollination of their flowers upon the few flowers produced on the female plants.

Some authorities have recommended the rooting out of all male plants, as, we suppose, for the simple reason that they bear no fruit, and are in no way useful (see Gloede, *Les bonnes Fraises, deuxième édition. Paris, 1870*). This writer stated that the male plants, because they bore no fruits, were more vigorous than the others, and smothered them; hence the males must be rooted up, or only males would remain. It is just possible that Gloede knew of a variety or possessed one which bore both male and female blooms on the same plants, but on this point he is silent.

According to Keen, of Isleworth, a celebrated cultivator at the beginning of the last century (see *Transactions of the Horticultural Society of London*, ii., 1817, "On the Cultivation of the Strawberry in the open ground"), "a form of *Fragaria elatior* exists which has the male and female organs in the same blossom, and bears very freely; but that which I most approve is the one that contains the male organs in one blossom and the female in another. This bears fruit of the finest colour and of a far superior flavour. . . . I consider one male to ten females the proper proportion for an abundant crop."

My own practice was to plant three or four males in beds of four feet in width and ten feet long, distributing them about equidistant among the females in each bed. The beds were planted at eighteen inches from plant to plant, and two-and-a-half feet alleys were made between. The second year after planting the runners were allowed to run across the alleys, and fresh alleys cut across the beds, and the plants, both old and new, were cleared off the alleys, thus providing a large proportion of new plants well interspersed with males. I do not remember ever to have had a bad crop. If Hautbois are kept strictly to single plants and runners not allowed to spread, failure is often invited.

It may be stated that the name "*Vierländer Erdbeere*" is only used in Hamburg and not in the Vierlanden; and in other parts of Germany the variety is known as the "*Zimmt-Erdbeere*." *F.M.*

THE ROSARY.

ROSES AT ST MARY'S ISLE,
KIRKCUDBRIGHT.

PROBABLY no private garden in the south-west of Scotland possesses such an extensive collection of Roses as that at St. Mary's Isle, Kirkcudbright, N.B., the property of Captain Hope, Royal Navy, and under the able charge of Mr. James Jeffrey, a correspondent of the *Gardeners' Chronicle*. The gardens are of the most delightful kind, the natural advantages being skilfully supplemented by means of tasteful planting and great cultural skill. This summer the Roses have been exceedingly fine, so that a few notes taken on the occasion of a recent visit may be of interest.

A large number of climbing Roses are planted against the walls of the mansion and against the verandah, which in July presented a most delightful appearance, with a cloud of Roses clambering about it, and giving an exquisite effect. Among the best of these were Aglaia, a great success at St. Mary's Isle, both against the verandah and as a pillar; Rêve d'Or, which does extremely well; and Carmine Pillar. Close to the house there are also several pillar and weeping standard Roses; the best of these will be referred to again. Mr. Jeffrey's house is literally embowered in Roses, not only the walls being covered, but there are arches and pillars of the same flower all about it, while the walls adjacent are brightened by the Roses among the Ivy and other climbers which cover them. Here one may note how much brighter and better coloured is the Wichuriana Rose Pink Roamer in shade than when in full sun. On the south wall of Mr. Jeffrey's house *R. gigantea* is being tried, and from the growth it is making it gives every appearance of being a success. On this wall Gloire de Dijon blooms generally in April.

On entering the garden one was delighted with the many weeping and pillar Roses in perfect bloom. There are about 500 pillar and weeping Roses in the gardens, and many were literally covered with bloom. Here Aglaia again comes well to the front, both as a pillar and as a weeping Rose. Thalia is remarkably fine, one pillar 11 feet high in particular being visible a long way off, and of striking effect with its myriads of small white flowers. Then Leuchtstern was charming, and could hardly be surpassed in its own way by any in the collection. Universal Favourite was exceedingly fine also, and others noted as particularly good were Corona, Gardenia, Souvenir de la Malmaison, an old purplish-coloured Moss Rose unnamed, Ruga, Ruby Queen, Félicité-Perpétue, Anne of Gierstein, Alister Stella Gray (a favourite here), Reine Olga de Wurtemberg, Madame Alfred Carrière, with many other Roses of various classes, including as a matter of course Crimson Rambler, which does exceedingly well at St. Mary's Isle.

Noticeable among the Roses, both as a pillar or on a wall, was the old Flora, a favourite with Mrs. Hope, and known on that account as Mrs. Hope's Rose. Its beauty is of the highest kind, and it is grown in such quantities as to constitute a remarkable feature. There is a wall 100 yards long entirely covered with it, while it is prominent everywhere, and is literally loaded with many thousands of its full rosy flesh flowers. The other side of this wall is occupied with Tea and Hybrid Tea Roses, which are great favourites. These comprise such as Irish Star, Corallina (a great success and very free from mildew), Wm. Allen Richardson, Francisca Kruger, Sunset, Boadicea, Empress Alexandra of Russia (the drooping carriage of whose flowers detracts from its value), Dr. Grill, Chameleon, a splendid plant of Rêve d'Or, Sulphurea (rather tender), Enchantress, Catherine Mernet, Isabella Sprunt, Golden Gate (rather tender), Corinna, Meta, (extra good), Sylph, Anna Olivier (very good), Hon. Edith Gifford, Bridesmaid, Rubens, L'Idéal (very subject to mildew here), Her Majesty (always good), and Maréchal Niel (which does well on this south wall). At an angle of this wall there is a remarkably fine plant of Crimson Rambler, which has thousands of blooms upon it this season.

In the garden adjoining the glasshouses there are wooden trellises covering a sloping bank mainly facing the south, and these are covered with Roses, old and new. Here the single Polyantha was very fine. The Rose beds are extensive, and contain a large number of the best Hybrid Perpetuals, Teas, and Hybrid Teas, with some of other sections, such as the Bourbon Mrs. Paul. Among the best were Frau Karl Druschki,

Caroline Testout, Merveille de Lyon, Hon. Edith Gifford, Baroness Rothschild, L'Innocence, Souvenir d'Alphonse Lavallée, La France, Madame Derrux Donville, Mabel Morrison, Eugène Furst, Mrs. W. J. Grant, and many more which cannot be mentioned. All were remarkably vigorous, and many good show blooms could have been cut from the beds. Everywhere throughout the gardens Roses abound, and of all classes, from the Austrian Briars to the old Scotch Roses; and in all forms, some clambering up trees, some occupying beds by themselves—in fact, every available method is adopted, even the roof of the Mushroom-house being covered with the Queen of Flowers. S. A.

ROSE CRIMSON RAMBLER.

To convert this summer-flowering Rose into a "perpetual," it suffices, according to M. Charles

a wing has been added on the north-west; at the other end rises a fine clock-tower, which forms a very conspicuous object. The view from the mansion is extremely picturesque, the character of the landscape, already described, with the beautiful grounds of High Trees itself, making it a most charming spot. The ground in front of the mansion is laid out as an Italian garden, and the beds seen in our illustration are comprised of two artistic scrolls worked out in Box edging. At the farther end, to the left of our picture, is a very fine Azalea garden, which has undoubtedly been very pretty, although the flowers are now over. Still more to the left a flight of stone steps leads to a stone plateau, especially built to enjoy a commanding view of the Surrey hills, with the town of Reigate in the valley below. We were enchanted with this scenic effect, the like of which it is rarely one's

FIG. 37.—HIGH TREES, REDHILL.

Baltet, in the *Revue Horticole*, to insert on strong growths of the Rambler some buds of *Rosa polyantha* Madame Norbert Levavasseur.

HIGH TREES, REDHILL.

SITUATED a short distance from the town of Redhill, on the high ground near to Redhill Common, from which extensive and panoramic views are obtained of the lovely Surrey hills and of the Weald country, stands High Trees, the home of M. Marcus, Esq. A more ideal spot on which to erect a residence it would be difficult to find, and certainly none nearer the Metropolis. Nestling below are the towns of Redhill and Reigate, with the winding gravel roads, a patch of water here, with a church spire rising there, the golden Gorse and blue Heather seeming almost to reach and merge with the towns themselves; such a scene as Linnell, who resided in the neighbourhood, loved to depict.

The residence at High Trees cannot lay claim to any antiquity, though probably the farmhouse which it supplanted was an old domain. The house is a square-built stone structure, to which

privilege to enjoy. Unless it were pointed out, one would little suspect the presence of a huge fort, recently built to guard the approaches to London, nestling among the Beech-trees on the summit of the hills in front. Looking towards the south-east from this eminence, one obtains an uninterrupted view of the Kentish Downs, and the elevation at which High Trees itself is situated is then apparent, for an escarpment on the side of the hill runs abruptly to the glen below. This slope, which is well wooded, has been converted into a kind of wild-garden, and a winding path carries one along its zigzag course through some of the loveliest natural scenery. The ground beneath the trees at the time of my visit was carpeted with Bluebells, to be succeeded by other of our native flowers. Conifers and flowering trees, such as *Pyrus* and *Prunus* species, &c., have been planted in this part of the grounds, and are succeeding well. The Conifers are quite a feature of the place, and have been judiciously planted among the native trees, most of them forming handsome specimens.

The view from the front drive is very striking and good; *Abies grandis*, *Araucaria excelsa*,

Cupressus Lawsoniana, *Sequoia gigantea*, *Pinus sylvestris*, and others mingling with the Beech and other native trees. Shrubs and trees do well at High Trees, and in spring-time especially are full of interest. Leading to the glass-houses and kitchen-garden is a high wall, on which is trained *Magnolia grandiflora* and *Wistaria sinensis*, both luxuriating, and earlier in the season covered with their charming flowers.

Rhododendrons one would not expect to find suited to this chalky subsoil, yet they grow and flower as though in their natural habitat; indeed, some beds of these plants grew to such bounds that they had to be cut down in order to conserve the view; but this severe treatment has only encouraged them to break into new growth with great vigour. Another shrub belonging to the same family as the *Rhododendron*—viz., the *Arbutus*—was also represented by

through the trees and past the tall clock-tower. Where sheltering trees have protected the fruit-bushes are fine crops of Apples, Pears, and Plums, but those which have felt the fury of these cold blasts have little or none.

The glass-houses are devoted to growing only those fruits and flowers which are suitable for use in the mansion, hence no rare and interesting plants are to be found, but Carnations, Begonias, *Spireas*, *Pelargoniums* (principally show varieties), *Eucharis grandiflora*, and other members which supply plants for decoration or cut bloom. There are five vineries and five Peach-houses, the latter occupied by well-trained trees carrying plentiful crops in all stages. Tomatos, Melons, Cucumbers, and Figs are also cultivated.

The grounds are in excellent order, and reflect the greatest credit upon the head gardener, Mr. J. B. Mead, and his staff.

the variety should be more extensively grown. It is very much esteemed by my employer and his friends here, but I do not know its name. *Thos. H. Sutton, gr. at Sturford Mead, Corsley, Warminster, July 21.* [The specimens sent confirmed our correspondent's statement. The flavour was excellent, but the number of peas in the pod was small. Ed.]

BROAD BEANS.

In Bunyard's Exhibition Longpod, and in the rather broader-podded Seville Longpod, we see evidence of the great improvements made in the Longpod type during late years. In the Mammoth Green Longpod put into commerce a few years ago by Messrs. W. W. Johnson & Son, of Boston, we also see what a stride has been made towards improving the green Longpods. Boston is in the midst of the Bean-growing districts of Lincolnshire, and at the recent exhibition of the Boston Horticultural Society, at which Longpod and Windsor Beans were finely shown, the Mammoth Green Longpod held its own against Bunyard's, the pods being long, handsome, and well filled. The green Beans are regarded as of superior flavour, and as they retain the green colour when boiled, they have come to be esteemed for table purposes.

The Windsor type has also been considerably improved, the samples of the Monster Windsor (a speciality of the firm above named), seen at the Boston show, were very fine, averaging four Beans in each, and in not a few cases five; and this in a season when, as far as Lincolnshire is concerned, Broad Beans have suffered severely from the black or smother-fly. The pods are therefore small generally; but if fine weather continues, the seed growers anticipate the samples of Beans for seed purposes will be good. The old Windsor Bean of years ago contained on an average two Beans in a pod; then came the Harlington Windsor with three Beans in a pod; and now comes the Monster Windsor with four Beans, and when specially grown for exhibition producing five. In this way the Broad Beans are led along the line of improvement, and with the most satisfactory results. *R. D.*

NEW OR NOTEWORTHY PLANTS.

SINNINGIA REGINA, SPRAQUE, N. SP.
(§ LIGERIA).*

This species was exhibited last year at the Ghent Quinquennial Show as "*Gesneria Regina*," by M. De Smet-Duvivier, from whom a plant was purchased for Kew, where it flowered in April and May, 1904. From the most cursory glance it was obvious that the plant was not a *Gesneria*, and on examination it proved to be a *Sinningia*. ("*Gloxinia*" of gardens), allied to *S. discolor* and *S. Menziesiana*. *S. Regina* is reported to have been introduced with a *Cattleya* from Brazil, but until this is confirmed by properly authenticated wild specimens, the possibility of a hybrid

* *Sinningia Regina*.—Caulis semipedalis teres carnosus, 4–5 lin. diametro, breviter pubescens, ut foliorum pagina inferior petioli pedicellique purpureus, foliorum paria 4–5 gerens. Petiolus plano-convexus, supra versus laminam leviter excavatus, 1–2½ poll. longus, pilis patentibus inaequalibus pubescens; lamina late ovata, basi auriculato-cordata, 4–8 poll. longa, 3–6 poll. lata, crenata, marginibus apiceque acutiusculo paulo reflexis, supra subtiliter velutina, subtus glabra, venis lateralibus utrinque 9–11, supra impressis, ut lamina contigua albidis. Pedunculi 4–6 in axillis tribus superioribus omnibus orti, 2–4 poll. longi, ut calyx patenter birsuti. Calyx viridis, lobis patentibus. 1½ lin. connatis, ovato-lanceolatis, 8–9 lin. longis. Corolla glanduloso-pubescent violacea, intus pallidior purpureo-maculata, tubo 2 poll. longo, ima basi valde antice curvato, postice carinato, carina anteriore multo minus conspicua, supra ovarium lateribus anticeque contracto, ventre valde inflato pallido, ore 8–9 lin. lato, lobis 4–5 lin. longis, 5–6 lin. latis. Glandulae oblongae distantes subaequales, 3 anteriores apice leviter curvate. Stylus persistens. Ovarium dense villosum.

FIG. 38.—PEAS GROWING IN STURFORD MEAD GARDENS.

some fine specimens, plentifully carrying the young fruits, which in the winter-time are so pleasing. One specimen of *A. Unedo* was quite 25 feet in height and as far through. In the lower grounds already mentioned is a notable example of *Abies grandis*, rising to over 100 feet in height.

Several flower-beds, mostly planted in the mixed system of bedding, with well-filled flower-vases, occupy positions on the lawns and terraces around the house; and a small rosary leads into the kitchen garden. This is admirably situated on the warm slope of the hill, naturally screened by the surrounding trees, which have the disadvantage of draining the borders somewhat during the summer. Good crops of vegetables occupy the breadths utilised for this purpose, and fruit-trees are plentifully planted along the borders by the paths. Beautiful as this spot appears in summer, one can see evidences of the effects of the cold north-west winds which in winter sweep

VEGETABLES.

AN OLD VARIETY OF PEA.

I AM sending a dish of green Peas gathered from a very old variety. I have grown it myself over thirty years. My father gave the late Mr. Hill, of Keele Hall Gardens, Staffs., some seed over forty-five years ago. Mr. Hill wished to supply his employer's table with Peas of first-class quality and good flavour. The Peas will cook sweet and tender, if getting a little old, better than any other Pea I know. I am sending a plant to show what the height of it is even during this dry, hot season; the culms have grown 7 to 8½ feet high, although they have not been watered or mulched. Yet the land is very dry and the temperature in the shade has been 76° to 86°. The photograph reproduced at fig. 38 was taken by my employer, H. Theodore Cookson, Esq., when the plants were in flower. I think

origin cannot altogether be excluded. There is this to be said, however, that the wild forms of many genera of Gesneriaceæ—e.g., *Episcia*—form very puzzling series, of which some of the members might easily be attributed to hybridisation, were their origin unknown.

Sinningia Regina is a strikingly handsome plant, about 9 inches high, with dark green velvety leaves, purple on their under surface. The flowers are pale violet and drooping, and are borne on long flower-stalks, four to six together in the axil of each leaf; as two successive pairs of leaves are usually close together on the stem, the effect is that of two many-flowered whorls, and is very fine. The duration of the flowering period is about six weeks, so that this plant is likely to become a favourite.

Besides its relationships with *S. discolor* and *S. Menziesiana*, *Sinningia Regina* shows considerable resemblance to some of the earlier forms of "*Gloxinia*" figured in the illustrated botanical periodicals early in the last century, though this may seem extraordinary to those who are only acquainted with the modern "*Gloxinia*," the result of continuous selection and hybridisation.

One of the parents of our modern "*Gloxinias*" was *Sinningia speciosa*, a very short-stemmed plant with bluish-violet drooping flowers; this is shown in Loddiges' *Botanical Cabinet*, No. 28, where it is said to come from "South America"; and rather improved forms of the same in Maund's *Botanist*, No. 105, and in Paxton's *Magazine of Botany*, xii., p. 267. A form with reddish under surfaces to the leaves, and which approaches *S. Regina* in the colour of the flowers as well, appeared in Curtis' *Botanical Magazine*, t. 1937. After this, caulescent forms made their appearance, such as are figured in Loddiges' *Botanical Cabinet*, No. 1566; in *Botanical Magazine*, t. 3206 (a white-flowered variety), and t. 3934, where the leaves are larger and variegated. One of the first hybrids was *S. Youngiana*, which was raised by Marnock about the year 1837, by the impregnation of *S. velutina* with the pollen of *S. speciosa*, and this was figured in Paxton's *Magazine of Botany*, vii., 51, and later in the *Botanical Magazine*, t. 4954. Other new forms were due to the introduction from Brazil in 1840 of the variety *rubra*, which was at once made use of by nurserymen for hybridising, for we find some of the results figured as early as 1844 in the *Botanical Register*, xxx., t. 48, where *S. guttata* is said to have been the pollen parent.

The turning-point in the history of our cultivated "*Gloxinias*," however, was in 1845, when an erect and regular-flowered plant was raised by Mr. John Fyfe, gardener at Rothesay, Bute; this had a white corolla with a violet centre, and five perfect stamens, instead of the four usual in Gesneriaceæ. Unfortunately for the systematic botanist, no exact record of its parentage was made, though in *Flore des Serres*, t. 311, where it was figured three years later, *Sinningia speciosa* is stated to have been one of the parents.

After this progress was easy, and we find a white flower with crimson centre in Regel, *Gartenflora*, iii., t. 76 (1854); pink and bluish-purple forms in *Flore des Serres*, t. 1002, and a great variety of shades in tt. 1434-6; still more striking colours are shown in *La Belgique Horticole*, vi., p. 161 (1856), where we have violet corollas with yellow centre, and white with red and yellow centre. Except that the pendulous form of flower is rather more in evidence, some of these latter plates show the "*Gloxinia*" practically as it is to-day. T. A. S.

THE GINKGO AS AN AVENUE TREE.—We have often had occasion to recommend the Maidenhair-tree, *Ginkgo biloba*, alias *Salisburia adiantifolia*, as a town tree; and we are confirmed in our opinion by an illustration in the *Florists' Exchange* for July 9, showing a fine avenue of these trees in the city of Washington. The tree is easily transplanted, is relatively free from insect and fungus pests.

SOILS AND MANURES FOR SPECIAL CROPS.

(Continued from p. 64.)

THE next horticultural plant to which attention is directed is the *Carnation*, which, by reason of its great merit, has during recent years rapidly forced itself into an important place in the floral trade. The great variety of colour, fragrance, beauty of form, and keeping quality of the *Carnation* have made it a decided favourite with all lovers of flowers.

A plant of so much importance in the floral trade is certainly one reason why its proper culture should be carefully considered; therefore Messrs. A. F. Woods and R. E. B. McKenney have included it in the glasshouse plants under special treatment.

THE CARNATION.

In regard to the chemical composition of the plant, we find that lime and potash run very much together; both of these plant-food elements seem to take part in the transport of carbohydrates (starch) and the conversion of available organic substance into "building material." Hence, upon the sufficiency in the soil of these two substances depend to a very large extent the successful growth and development of the *Carnation*. In outdoor culture as much as 1,000 lb. of lime per acre is sometimes applied for *Carnation* growth, and potash in an available form is very essential.

The following table shows the chemical composition of the *Carnation*-plant, with its roots, and separated stems and leaves:—

Selected constituents in the *Carnation*.

Constituents in the ash:	Whole plant.	In roots.	In stems and leaves.
	P. cent.	P. cent.	P. cent.
Potash	29.2	21.5	33.6
Lime	22.6	25.9	19.5
Magnesia	2.2	2.3	2.1
Phosphoric acid ...	12.6	8.9	14.0

These figures point to the fact that the *Carnation* requires a well-balanced manure, which shall be of a staying character rather than one of too forcing a nature—a plant-food which becomes available slowly but regularly.

SOILS.

The *Carnation* especially requires a soil that drains rapidly, and one permanently good in aération. The very light or very heavy types of soil should, therefore, be avoided. A good clay pasture-loam or sandy loam is desirable, with plenty of root-fibre. Lime should be added to soils not already well supplied with this material. Special attention must be given thoroughly to incorporate whatever manure is used with the soil by repeated turnings. Four parts of soil to one part of well-rotted stable-manure, and 10 lb. to 15 lb. of bone-meal, may be added to each cubic yard of soil-compost. Many growers use much more bone-meal than this, sometimes as much as 30 to 40 lb. per cubic yard; but it is safer to use the smaller amount and supply any deficiency later. The compost should, as already mentioned, be thoroughly worked over several times before use.

If the compost is made in the autumn, one part stable-manure to three parts of soil can be used, and from 20 to 25 lb. of bone-meal to the cubic yard. At the first turning of the compost, 4 to 6 quarts of pure wood-ashes per cubic yard may be added if the soil is light; or if heavier, use air-slaked lime at the same rate. If wood-ashes cannot be obtained, use 5 oz. of sulphate of potash per cubic yard of soil. After the plants are set in the house they will require no feeding till the roots have taken thorough possession of the new soil. Any feeding before this time will

be likely to do harm and will do no good. Early feeding can be given, as in *Roses*, by a light mulch of well-rotted stable-manure. As the days grow shorter and colder, however, mulching should be discarded and liquid feeding used, as recommended for *Roses*. Wagner's solution, mentioned under "*Roses*," is one of the best artificial combinations, furnishing nitrogen, phosphoric acid, and potash. It may be used about once in ten days or two weeks as required, or it may be alternated with liquid organic manures, as is the case with *Roses*. The *Carnation* is more sensitive even than the *Rose* to overfeeding, especially during cloudy weather or semi-dormant periods, or when the roots are not well developed. If the soil becomes too rich, treat as in the case of overfed *Roses*.

CARNATIONS IN COAL-ASHES.

The Connecticut Experimental Station has done some very suggestive and valuable work in growing *Carnations* and other glasshouse crops in sifted bituminous coal-ashes and a mixture of 3 per cent. of peat-moss. This medium contains practically no plant-food. All that the plants get has to be added in the form of artificial fertilisers. One hundred square feet of bench space requires of nitrate of soda, 3 lb. 14 oz.; superphosphate, 18 oz.; sulphate of potash, 1 lb. 13 oz. This should be thoroughly incorporated with the ashes and peat before setting out the plants. Under the conditions of the experiment, this medium was found superior in some respects to rich compost made in the ordinary way.

The *Carnation* is very subject to fungoid diseases, some varieties being more liable to attack than others. Solutions of carbonate of copper and ammonia have been used with good effect, but all depends upon taking the work in hand early in the season. J. J. Willis, Harpenden.

(To be continued.)

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and General Summary, ante, pp. 70—76.)

IN our last issue was published a series of tables containing reports on the present condition of the fruit crops, and we now commence the reproduction of abstracts from the remarks with which our valued correspondents, who supplied the tabular matter, have also favoured us. In addition to these remarks our correspondents have, in almost every case and at our special request, indicated which in their opinion are the six best dessert Apples, and the six best kitchen Apples, for planting in their own neighbourhood. We desire to thank our correspondents heartily and propose to summarise their votes, dividing them into districts. The result of the poll will be published some time before the planting season commences. It is hoped, therefore, that the information will be of interest to all, and of service to those who will have reason to plant Apple-trees in a district with which they are more or less unfamiliar.

O.—SCOTLAND, N.

ORKNEY.—Fruit crops this year are nearly all that can be desired; but a storm in June accounts for the bad appearance of Pears. Our soil is a stiff loam, with a subsoil of clay and gravel. Altitude, 40 feet; aspect, south-east; site, partly sheltered. Thos. McDonald, Balfour Castle Gardens.

ROSSSHIRE.—After a fine display of blossom fruits set very freely. Apples, Pears and Plums are a splendid crop, and on young clean trees the quality is excellent. Gooseberries, Raspberries, and Currants are an exceptionally heavy crop. The soil here is of a medium consistency, very fertile, and of a warm nature. *Henry Henderson, Cromarty House Gardens.*

— We have no Apples, the buds having all been eaten by oulfinches. Pears, Apricots, and Peaches are not grown outside. There is an average crop of Cherries of good quality. Gooseberries and Raspberries are excellent. Strawberries and red Currants are an average crop. The crop of black Currants is enormous. Plums on walls are an average crop. The weather here has been very dry for the last two months. *Harry Low, Braemore Gardens, Garve.*

1, SCOTLAND, E.

ABERDEENSHIRE.—All fruit crops, excepting that of Gooseberries, are much better than last year, although not heavier than they have been previously. The soil is a medium loam on a pan subsoil, which provokes canker in Apples. *James Grant, Rothie Norman Gardens.*

— Apples and Pears have every appearance of being a good crop. But I am afraid the fruits will be small in size owing to the lack of moisture in the soil. Plums are under average. The soil is very heavy, stiff clay. *John Brown, Delgaty Castle Gardens, Turriff.*

BANFFSHIRE.—The fruit crops earlier in the season looked very promising, but owing to badly ripened wood and cold winds, and insufficient moisture at the roots, the fruit, which set well, has failed to swell. Small fruits are abundant; Strawberries are extra prolific, the variety "Leader" has proved to be of special value here on our heavy soil; Royal Sovereign is too soft to stand well, Viscomtesse Héricart de Thury is difficult to excel. Gooseberries are most abundant. Black and Red Currants are in perfect health. *J. Fraser Smith, Cullen Gardens.*

BERWICKSHIRE.—The fruit crops, on the whole, are good. Fly and other insect pests are not so numerous as in former years. We have a good loamy soil, part on clay, which seems to suit our fruit crops fairly well. *John Cairns, The Hirsell Gardens, Coldstream.*

— The soil here is light, good, and deep, in some places quite 18 inches deep. The fruit crops are very good and clean. Altogether this is a record summer here, and gardens are looking well. Strawberries are wonderfully fine. *James Hamilton, Manderston, Duns.*

CLACKMANNANSHIRE.—The Apple crop in this district is the best we have had for many years, and the fruit crops on the whole are very satisfactory. *A. Kirk, Norwood Gardens, Alloa, N.B.*

FIFESHIRE.—Small fruits are yielding exceptionally good crops. Black Currants are the heaviest crop of the season, the bushes being bent to the ground with fruit. The soil here is good, but on a cold clay bottom. *William Henderson, Balbirnie Gardens, Markinch.*

FORFARSHIRE.—Apple and Pear-trees had a fine show of bloom, but very few fruits of the latter have swelled, most of them having fallen after what appeared to be a good set. Apples are not a regular crop, some trees being very thin; but others are extra good and require thinning. *W. McDowall, Brechin Castle Gardens.*

— The fruit-crops in this district are rather disappointing, not being equal to the promise of the blossom in spring. The soil is a light loam, and does not seem to favour a long life to fruit-bearing trees. Apples especially suffer much from canker, and only a few varieties thrive well. Strawberries require replanting every three years; Currants and Gooseberry

bushes, &c., also require to be renewed frequently. *Thos. Wilson, Glamis Castle Gardens, Glamis.*

HADDINGTONSHIRE.—There was a profusion of blossom on all kinds of fruit-trees, but the "set" was, with the exception of Strawberries and Gooseberries, a very poor one. Gooseberries and Strawberries are enormous crops, alike in heavy and in light soils. Black and Red Currants are exceedingly poor with us, both as to crop and quality. Wineberries, Logan-berries, Brambles, and Raspberries promise well. Fruit-trees of all kinds are healthy, and more than usually free from disease and insect-pests. *R. P. Brotherston, Tyninghame, Prestonkirk.*

— The fruit crops in this locality are again very irregular, and although there was a splendid show of blossom on Apple, Pear, and Plum-trees, the amount of fruit that set properly differs greatly in certain places. Small fruits are a good crop, with the exception of Black Currants, which in some parts are a failure. Most of the soil here is shallow, and of a very sandy nature, resting on a subsoil of sand and gravel. In some parts there are broad strips of heavy loam, which is very fertile, and on which splendid crops of Strawberries and stone fruits are grown. *William Galloway, Gosford Gardens, Longniddry.*

KINCARDINESHIRE.—I never saw the blossom finer on all fruit trees than it was this season, but owing to some unaccountable circumstance there was not such a good set of fruit as one would have expected—probably owing to the wood not being properly ripened the previous season. The soil here on Deeside is of a light, sandy nature. *John M. Brown, Blackhall Castle, Banchory.*

MIDLOTHIAN.—Fruit trees were unusually full of flower, but the weather at the flowering period was cold and sunless. The soft or kitchen varieties of Apples are carrying good crops. Some varieties that were equally well flowered, and are usually good bearers, have no crop. Pears, both standard and wall trees, are carrying good crops. Small fruits and Strawberries are extra heavy crops. The fruit-trees and bushes are infested with insect-pests. *James Whytock, Dalkeith Gardens, Midlothian.*

6, SCOTLAND, W.

ARGYLLSHIRE.—We had fewer late frosts than usual, and fruit-blossom on walls and in the open set abundantly. In the garden the soil is a sandy loam, part of the orchard is peaty, and, as we get a heavy rainfall, which averages almost 60 inches per year, and much dull weather, we have to attend carefully to the root pruning of fruit trees. Plums on walls, especially the varieties Victoria and Kirke, are sure croppers; Raspberries never fail—the variety Superlative bears wonderful crops and lasts for a long time. Small fruits generally bear heavy crops. We need wet weather. *D. S. Melville, Poltulloch Gardens, Lochgilphead, N.B.*

AYRSHIRE.—All our fruit crops are good, excepting Pears, which were a mass of bloom, but did not set. Our soil is very light and sandy. *Thomas Gordon, Ewenfield Gardens, Ayr.*

DUMFRIES-SHIRE.—Crops of all kind are good. We have had a very fine spring and summer. The thermometer has only once touched the freezing-point since April 10. There is an uncommonly large set of Apples; Lord Grosvenor and Barton Freebearer have been thinned to the extent of three-quarters of their number. The soil is heavy, with a good percentage of clay. *John Urquhart, Hoddam Castle Gardens.*

— After the bad seasons we have passed through in recent years, it is gratifying to be able to report a good fruit year. All over this district (with one or two exceptions) we hear satisfactory accounts, both as to the quantity and

the quality of the fruit. Apples and Plums are over the average, and Pears, Peaches, Nectarines, Cherries, and Apricots can compare favourably with the best of fruit years. Bush fruits are also good, Raspberries and Gooseberries giving an excellent return. Strawberries are an extra good crop, all over, and the weather has on the whole been dry and warm, so that gatherings of this fruit have already been secured in good condition. Generally speaking, our climate is not the best for growing high-class fruit. Our soil is light and shallow, and the climate damp and subject to sudden and extreme changes all through the year. *John Mackinnon, Terregles, Dumfries.*

— Gooseberries, Black Currants, Raspberries, and Strawberries are over average. Red and White Currants are not quite so good. Apples, Plums, and Cherries are an average crop. Pears are under average; they never succeed well here as our soil is too light. It is a light sandy loam, subsoil red sand, with gravel beds. *Jas. McDonald, Dryfeholm, Lockerbie.*

KIRKCUDBRIGHTSHIRE.—We have in this district an excellent crop of all kinds of fruit. This is more than was expected after the wet and sunless autumn we had to ripen the fruit-buds. The soil here is very poor on a gravelly bottom. *N. Macfadyen, Glenlie Gardens, New Galloway.*

WIGTONSHIRE.—Fruit crops in general are very satisfactory. Apples, Pears, and Plums upon walls have required considerable thinning. Plums on bush and standard trees are not so plentiful. Strawberries and small fruits are abundant, and being favoured by a fair amount of moisture, followed by heat, the ripening process goes on as well as could be desired. The soil is sandy loam resting upon a fairly porous substratum. *James Day, Galloway House Gardens, Garliestown.*

2, ENGLAND, N.E.

DURHAM.—This garden is near the sea, and on the limestone, which, from its dry nature, requires a deal of rain during the summer. Strawberries do not come to perfection, but vegetables succeed well. Blight is very bad, and the trees are covered with aphid and honey-dew. Unless rain comes soon the crops will be partly spoiled. *Robert Draper, Seaham Hall Gardens, Seaham Harbour.*

YORKSHIRE.—Apples are a very heavy crop. Pears are also good, but they suffered from Pear-mite, which is increasing in this district. Currants are good, but are dropping their leaves owing to fly. Gooseberries are a heavy crop and free from the leaf-caterpillar. Strawberries are a splendid crop. The soil is a light loam overlying sand, and the manure we use is chiefly leaf-mould. *John McClelland, Ribston Hall Gardens, Wetherby.*

— In the spring there was a promise of abundant crops; Apple, Plum, and Cherry-trees were in most gardens in this district very full of flower; Pears were not so promising owing to the cold, sunless autumn. Some trees on walls, including the varieties Marie Louise, Easter Beurré, Beurré Diel, and Brockworth Park, have good crops, but many varieties are thin and scarce of fruit. Plums on strong clay land have nearly all dropped off, on limestone and chalk sand they are about half a crop. Apples have dropped very much, the very dry June (rainfall $\frac{3}{4}$ of an inch) being too dry for them. The Loganberry is looking splendid, and Strawberries are extra good in crop and quality. *Bailey Wadds, Birdsall Gardens, Yorks.*

— The fruit crops in this locality exceed my expectation. Strawberries are a remarkable crop on strong soils, but the recent hot weather affected greatly the plantations on lighter soils. The soil in this garden is strong. In some

instances Gooseberries suffered much from the ravages of birds on the buds. Green-fly has been much in evidence on Red and Black Currants. We also had an attack of Black Currant bud mite, but with timely picking off the affected buds and syringing the bushes with extract of Quassia, we have succeeded in checking it and have a good crop of fruit. *John Snell, The Gardens, Farnley Hall, Otley.* [We shall be glad to hear of the state of the bushes next year. Ed.]

— There was abundance of blossom on fruit-trees, but the crop of fruit is scarcely so heavy as was anticipated. Apples are plentiful, although many varieties are not bearing. Pears bloomed profusely; the fruit, however, did not set, the crop therefore is light. There are good crops of Victoria Plums, but other varieties are very thin; small fruits are a good average. Aphides have caused much injury on Cherries, Plums, Peaches, and Currant bushes. The soil in this garden is a medium loam, overlying sandstone. *J. S. Uper, Wigganthorpe Gardens, York.*

— The subsoil of this district is chalk, and over this is a layer of clay-loam, varying in depth from 1 to 4 or more feet; on the higher ground the soil is lighter and not so deep. Shallow soils are not suitable for fruit-trees when resting on chalk or gravel. In the early part of this season all fruit-trees gave great promise; there was an abundance of blossom, and, with the exception of Pears, Plums, Peaches, and Apricots outside, all other fruits are over the average. More rain would have prolonged the Strawberry season, and greatly assisted all other fruits to produce size and flavour. Aphids has been troublesome on Currants, Gooseberries, Plums, &c. *John Allsop, The Gardens, Dalton Hall, Dalton Holme, Beverley, East Yorks.*

— Apples are not so plentiful as the show of bloom led us to expect. Some varieties have no fruits, and others bear an average crop of good fruits. Pears on walls are plentiful and good; pyramids are almost blank. Plums on walls are an average crop, and good. Apricots are scarce, but good. Peaches appear fairly well. Small fruits are heavy, but blight and fly are very bad, especially on Black Currants. The ground, even where mulched, is cracked, and much in want of rain. *Charles Simpson, Newby Hall Gardens, Ripon, Yorks.*

— There was an abundant blossom on Apple and Pear-trees, but not so on stone fruit-trees, excepting Plum-trees. For the first time in twelve years we have a very thin crop of Apricots. Of Plums, there are good crops on Victoria, Jefferson, and Kirke's, growing on east and west walls. Cherries are a very thin crop. Apples good. The two best-cropping Pears are Louise Bonne of Jersey and Marie Louise. Strawberries have been and are abundant, and fine in size and quality. An old variety, raised by a clergyman near here some forty years ago—viz., Newton Seedling—has come out the best for preserving purposes. Our soil is a stiff, loamy one, resting on magnesian limestone. *Henry J. Clayton, Grimston Gardens, Tadcaster.*

— Apples vary in this district this season, some varieties cropping very heavily here, although the same varieties within a mile or so are quite a failure. Here Lane's Prince Albert is carrying a very heavy crop, also Domino, Keswick, Codlin, Bismarck, Warner's King, and Cockpit; Ecklinville Seedling is again a failure, both in the garden and orchard. Plums vary much. Victorias and Rivers' Early Prolific are the best. Damsons are a very heavy crop. Apricots are a thin crop. Pears very moderate. All bush fruits are remarkably good. Strawberries have been the best I have had for some years, Royal Sovereign, Leader, Monarch, and Vicomtesse Héricart de Thury, being the best. *A. E. Sutton, Castle Howard Gardens, Welburn.*

(To be continued.)

BEGONIA "MARGARET GWILLIM."

Much improvement has been made in recent years in tuberous-rooting Begonias, and any further advance in these lovely flowers must be difficult of attainment. Several meritorious flowers were exhibited at the recent show at Holland House, including the one depicted in our illustration at fig. 39. It was shown by Mr. A. L. Gwillim, Cambria Nursery, New Eltham, Kent, under the name of "Margaret Gwillim," and had large, well-shaped flowers of a rich yellow colour, being nearly six inches across. The Floral Committee recommended it an Award of Merit.

FIG. 39.—BEGONIA "MARGARET GWILLIM."
(Much reduced.)

ORCHID NOTES AND GLEANINGS.

HALTON, TRING.

THE beautiful gardens of Alfred de Rothschild, Esq., near Wendover, have to be kept always showy and interesting summer and winter. In winter the arrangements of coloured foliage among the various tints of the handsome Conifers and other shrubs give bright and pleasing effects, and in summer there is a profusion of well-arranged flowers.

The plan of the gardens is that by means of plantations of fine trees and shrubs a series of gardens may be formed, and in each a distinctive character, changed every year, is maintained, and each garden is kept as unlike any of the others as possible. Thus there is an ever-changing beauty and variety of garden scene which amply compensates for the great amount of skill and attention required in the production.

The problem how to beautify the broad shrubberies and plantations which map out the different garden nooks with flowers in summer, without injury to the beautiful Conifers and other trees so much needed to be perfect in winter, was one which exercised Mr. de Rothschild and his clever gardener, Mr. R. C. Sanders, considerably. Climbing Roses injured the trees, and in most seasons their flowering time was short. Climbers of other kinds were objectionable because of their

fitful periods of flowering and more particularly because they were unsightly and injurious to the valuable trees after they had passed out of bloom.

Basket gardening on a novel plan was at last resorted to, and the result is that the part of the garden near the mansion affords a charming scene, in which large masses of brightly-coloured flowers appear as if borne on the different trees among which they are arranged.

The scene of this pretty garden is laid on the slope beside the mansion. The terrace has a very handsome geometrical garden arranged with carpet-beds, but with Lobelias and other dwarf-flowering plants taking part with the coloured-leaved Alternantheras and other bright dwarf foliage plants.

On a lower level is a rocky cascade falling into the small lake with brightly-coloured Water-Lilies, and stretching away beyond is an irregular, cleverly-planted shrubbery, in which the bluish tints of *Picea Parryana glauca* and similar Conifers, the bright yellow of the Golden Yews, and the various greens of the other shrubs give a sufficiently beautiful effect. But in summer flowers are wanted, and that too without disturbing the permanent plantation. The desired end is cleverly met by arranging scores of large baskets of Ivy-leaved Pelargoniums among the trees and shrubs, each basket being placed where flowers on the trees would be desirable, and not in lines or other arbitrary arrangement. The result is a brilliant show of flowers among the trees, naturally arranged, high up among the Conifers and lower among the dwarf shrubs, mingling with the tall Fuchsias which form prominent features in the arrangement of flowers which merge the smooth turf beneath with the shrubbery above. The first and smaller nook has baskets of Ivy-leaved Pelargonium Souvenir de Chas. Turner, giving countless heads of magenta-rose flowers; the longer stretch beyond, and enclosing the lawn with its pretty Indian-tent luxuriously furnished, and its handsome vases filled with Begonias and other bright flowers, having large baskets of the pale rose variety Madame Crousse. The baskets of flowers are raised upon invisible supports, and not suspended, they can therefore be naturally arranged where the bloom is wanted without injury to the trees; and when winter comes they are removed to the greenhouses until they are required for another year.

Noting other pretty garden scenes we pass by the skating-lake, encircled by banks and massed beds of close-growing shrubs. The banks are brilliant with the colour of Golden Yews and Privet, and relieved by the bright green of the Box hedges and bushes. The subsoil is chalk, and some trees and shrubs do not thrive well on it, but Box and Yew are fine subjects here. Large masses of *Olearia Haastii*, *Berberis stenophylla*, *Hedera Helix arborea*, and other close-growing subjects are here effective.

Beyond extends part of the Chiltern Hills, some of the hilly ground forming part of the estate being approached by a zig-zag walk and a pretty chalet reached on the high ground. Bamboos are planted in favourable situations, those by the edge of the water thriving best. In the cool rockery grotto, with stepping-stones over the water and a cool summer-house at the end, its backing of *Bambusa gracilis* is very pretty and appropriate.

Next comes the oval Italian garden enclosed by ornamental marble masonry, the niches bearing valuable statuary. The centre is of short grass with several large ornamental vases and with a beautiful mosaic walk round the central oval. But few flowers are used in this costly garden, yet it has many attractions and is a cool and pleasant retreat in hot weather.

Another turn leads to a very large fountain with a broad expanse of water round it and a

suitable arrangement of trees and flowers. Concealed in the stone-work at the side of the basin, and protected by plate-glass, are a large number of electric lights, which give a novel and charming effect when the light is turned on while the fountain is playing at night.

All over the seemingly endless ranges of borders filled with bright flowers, various devices are used to carpet or cover all the soil in the beds. In the shrubberies the lower branches are pegged down to cover the soil, and in the flower-borders different low-growing plants are used for the same purpose. Variegated ground Ivy forms an excellent carpeting; different varieties of Saxifraga, Sedum, and other moss-like plants are used. One plant much used for carpeting the borders in the winter-garden, and also in the flower-garden, was purchased as *Parietaria selaginoides*, but appears to be identical with the Corsican *Helxine Soleirolii*, a mossy Urticaceous plant. It can be multiplied to any extent, like *Selaginella*, and thrives well in almost any situation.

Of the countless plants used in the outdoor gardening, specially effective were a brightly variegated herbaceous *Phlox decussata*, effectively displayed in several arrangements; *Ophiopogon Jaburan variegatum*, masses of bright gold and green foliage; *Scrophularia variegata*, which forms a bright white-and-green edging, and is specially desirable for the country because rabbits dislike it. Fuchsias in great variety are very beautiful and covered with flower, but the last season, being very wet, it is said they were then much better. Shrubby Begonias are among the best and most certain of flower-producers, and are very effective this season.

The winter garden, with its lofty dome and rich mosaic paving, has the borders planted with bright flowers; and Palms, Bamboos, and foliage plants are arranged around. The spaces between the glass on the sides are closely clad with *Cobaea scandens* and *Ficus radicans* and *repens*, an arrangement which supplies an effective background without taking up too much space; for the object in the beautiful winter garden is effectively to decorate it with plants and flowers, and yet leave space for its other uses.

THE GLASSHOUSES.

Passing Mr. Sanders's comfortable dwelling, with rosary and flower-garden beside it, and along walks through broad borders of herbaceous perennials, Lilies, &c., which give good supplies of cut flowers, we come to the extensive ranges of glasshouses. In the garden around the mansion all is for beauty and effect; here everything is for utility, and for supplying the wherewithal to keep up the display. Long ranges of vineries, Peach-houses, Fig and Cherry-houses, Melon and Cucumber-houses in excellent bearing, tell of the useful side of gardening.

The plant-houses have a neat range of propagating-houses, and a goodly number filled with "decorative" plants in all stages. Carnations fill several houses, the *Malmaison* varieties having an enormous quantity of bloom. Of the other kinds *Carnation King Arthur* (large dark scarlet) and *C. Cecilia* (a large, floriferous, clear yellow) are two of the best, and grown in quantity.

Of decorative plants *Phyllanthus nivosus* and *roseo-pictus* almost fill a house; *Caladiums* one side of another house; *Dracenas*, *Crotons*, *Aralias*, and *Anthuriums* several houses. *Dracena Godseffiana* and *D. Sanderiana* are largely grown for all purposes, from the single plant in a small pot to the gigantic basket for suspending in the large houses. They are handsome always, and *D. Godseffiana* particularly so when covered with scarlet berries. Orchids are little grown, only good batches of *Dendrobiums*, *Calanthes*, and one or two others being accommodated. The large stove houses have a good show of ornamental

foliage plants, and the ranges of pits good stock for winter flowering, one range filled with *Nerine Fothergilli* major, about to send up flowers, being especially good.

The large kitchen and fruit gardens, although entailing extra labour this summer, are in excellent condition. All fruits, except Pears, are bearing well, and of the Pears some kinds are satisfactory. Strawberries have cropped heavily, and bush fruits been generally good.

others who have sent them to Reading for trial. All this is necessary in order that the firm may have exact knowledge of the value of each variety they include in their catalogue, and by this is meant their comparative value in relation to varieties distributed by other firms. As may be seen from the illustration the plants were put out in rows and kept to a single stem. We have seldom, if ever, witnessed a heavier crop of fruit than that collectively borne by these

FIG. 40.—TRIAL OF TOMATOS IN MESSRS. SUTTON AND SONS' NURSERY, READING, SHOWING THE PLANTS ON ONE SIDE OF THE HOUSE ONLY.

NURSERY NOTES.

TOMATO TRIALS AT READING.

In fig. 40 is shown an illustration of a house containing an experimental trial of Tomatos in the nursery of Messrs. Sutton & Sons, Reading. The house was specially erected for this purpose last winter. Nearly one hundred varieties have been planted, there being six plants of each variety. Though there are some exceptions, the primary object has been to test varieties that are more suitable for cultivation in houses than in the open air. Another extensive trial is made out-of-doors, consisting of 250 trial rows, comprising almost all the varieties in commerce, and in addition a number of unnamed seedlings that have been raised by Messrs. Sutton & Sons themselves, or by

plants. The foliage was ruthlessly trimmed off before the photograph was obtained, because it was intended directly afterwards to select some of the best fruits for seed purposes, and this can be done more conveniently when the foliage has been removed. It is necessary to explain this in case any of our younger readers should conclude that the excessive mutilation of the plants had anything to do with promoting the crop of fruits.

We will refer to some of the more important varieties in the house, omitting individual reference to unnamed seedlings, as that would serve no purpose. The earliest variety to mature fruits is *Earliest-of-All* (Sutton), bearing a good crop of fruits of medium size, and as free from corrugation as such early-fruited varieties can be obtained. Next to these plants was noticed the old stock of *Earliest-of-All*, having less

smooth fruits, also a few plants of an exceedingly early ripening variety obtained from the Continent. This has very small and corrugated fruits, but though of no economic value at present, it will be used as a parent in cross-breeding. Indeed, this has been commenced, and the result of the first cross was bearing fruits. Magnum Bonum has larger fruits than those of Earliest-of-All, is of similar habit to that variety, but does not ripen so early. Winter Beauty is a well-known variety for fruiting in winter and early spring, and is an excellent sort for the supply of the market. Satisfaction (Sutton) has fruits somewhat larger in size than those of Winter Beauty, and is otherwise of much the same type. Abundance is one of the most productive varieties, with fruits of rather less than average size, which are produced in large clusters. Sutton's A1 has been well known for some years, and is one of the very best, having large, round, "Apple-shaped" fruits; it is a very free bearer. Eclipse (Sutton) has smooth fruits, which in shape are between those of the A1 and those of the "Perfection" type, which generally are more or less flat in comparison with their depth. Best-of-All (Sutton) is one of the best main-crop Tomatoes, having an abundance of smooth-skinned, heavy fruits. Those of Perfection (Sutton) are still larger, and are frequently used for exhibition purposes. Dessert (Sutton) has small fruits, and the variety is consequently recommended for dessert; and Cluster (Sutton) has still smaller fruits, of Pear-shape, and would be suitable for garnishing, decorating, &c.

"Wonder of Italy" is a variety obtained from Italy that produces enormous clusters of small Plum-shaped fruits, very much lacking in solidity. It is largely grown in Naples, and the immense clusters of fruits are hung up and dried for use in winter. Sutton's Open-Air is a very heavy-cropping variety producing large fruits, and the fruits being somewhat corrugated it is only recommended for cultivation out-of-doors.

We next saw the "Peach blow" and other varieties having fruits with pubescent skin, suggestive of that of a Peach. Turning to the yellow-fruited varieties, Golden Nugget is an early-ripening variety, having large clusters of small, round, yellow fruits: Sunbeam (Sutton) has distinct, egg-shaped fruits, and Prince of Wales is a heavy cropping sort, but Golden Perfection is one of the best, having solid, smooth fruits.

Some of the varieties raised by other firms and grown at Reading for comparison included Ham Green Favourite, Stirling Castle, Frogmore Selected, Duke of York, Conference, Up-to-Date, Holmes Supreme, Alice Roosevelt, The King (very fine), Lister's Prolific (very heavy cropper), Webb's Regina (an excellent variety), Hackwood Park, Swanley Superlative, and Laxton's Early Prolific. The most desirable improvement that could now occur in Tomatoes would be that of better and enhanced flavour.

In one of the houses there were several plants bearing ripe fruits of the Melon Pear (*Solanum muricatum*, also known as *S. guatemalense*); a fruit was illustrated in these pages, March 7, 1903, p. 160. Mr. Arthur W. Sutton cut one of these, and we thought it very agreeable, being juicy, and possessing flavour resembling that of a fully ripe Pear. Mr. Sutton also showed us the trials of Peas, which consist of 1,000 varieties, including 300 unnamed seedlings.

Messrs. Sutton have commenced cross-breeding with a view of improving the three-podded Pea sold on the Continent, which was illustrated in these pages on October 10, 1903, p. 258. It has been found that a Pea that produces pods in pairs is capable of greater productiveness than one that produces pods singly, therefore the triple-podded Pea, if equal in other respects, would be the most productive. Unfortunately the Pea is naturally a very short-lived annual, and it appears difficult to obtain varieties that will continue to fruit for longer than a few weeks.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Epidendrum radicans should be more largely cultivated; its corymbiform raceme of brilliant red flowers is very useful in a cut state. The plants have now commenced growth, and may be re-potted if necessary in a compost consisting largely of sphagnum-moss with a little peat and coarse silver-sand mixed with it. Being of semi-scandent habit, the young shoots should be tied around a few neat stakes, keeping the young growths well up to the light. When trained in this manner the flowers are very effective. Throughout the growing season abundance of water is necessary. This species may be easily propagated by removing the offshoots and inserting them thickly around the edge of a pot filled with compost. Let the plants be in the lightest position available in the intermediate-house. These cultural remarks apply also to the new and distinct hybrid, *E. Boundii* ×. Both plants when grown strong will remain in bloom for several months together.

The Work of Watering.—At this season of the year much time is taken up in watering, and few matters are more important. In addition, care is necessary in affording the plants shade from hot sunshine and in admitting fresh air to the houses. Such Orchids as the deciduous *Calanthes*, *Phaius*, *Mormodes*, *Catasetums*, *Cycnoches*, *Chysis*, &c., are now in full growth, some of them are already commencing to form their new bulbs, and if the plants are healthy and the pots have become full of roots, the plants will require more water at this period than at any other time of the year. The supply should be continued until the growths are fully made up and the leaves of deciduous varieties commence to turn yellow and fall away. *Cypripediums*, *Bolles*, *Pescatoreas*, *Sobralias*, *Epidendrums*, *Bulbophyllums*, *Cirrhopetalums*, *Megaceliniums*, *Cymbidiums*, &c., all require copious waterings each time they become dry. Those species which do not possess pseudo-bulbs, as *Aërides*, *Angræcums*, *Vandas*, *Phalanopsis*, *Saccolabiums*, *Sarcanthus*, *Renantheras*, *Luisias*, &c., should be afforded water often enough to keep the sphagnum moss on the surface fresh and green.

Several of the earliest *Dendrobiums* are finishing their growth, and if too much water be afforded them, they will commence to grow again and fail to flower well at the proper season. Late-growing varieties should not be allowed to get dry until the new growths are finished. *Cattleyas* and *Lælias* that were potted in the new leaf-soil mixture, should also be very carefully watered, merely sprinkling the surface moss each time it becomes dry, using a fine rosed watering pot for the purpose. Injudicious and heavy waterings will soon cause the leaf-soil to become sodden, when the roots will decay, and the plants become spotted and diseased. In some districts where the houses are at a high elevation and well exposed to the light and air, *Cattleyas*, *Lælias*, and their hybrids are greatly benefited by light overhead syringings several times each day during very hot weather, but in low-lying situations it is unsafe to do this.

Spray the Mexican *Lælias* each afternoon at closing time; they will thrive better for the extra heat and moisture for a few hours before sunset. All the Chimæroid *Masdevallias* should have their foliage well syringed every day and be frequently watered at the root, whilst those of the coccinea, *Harryana*, and *Veitchii* sections should be watered only when the compost becomes dry. The *Odontoglossums* generally should not be kept in a saturated condition at this season or the old roots will decay, and the foliage become thin and weak. Afford air to all the houses whenever practicable. The shading material on the cool houses should be kept down during the whole time the sun shines on the roof. The blinds on the other divisions, especially *Cattleya*, *Lælia*, Mexican and *Dendrobium* houses, should not be let down so early in the morning as heretofore, and they should be pulled up earlier in the afternoon as the season advances.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Cucumbers.—To keep up a supply of this favourite salad through the autumn and winter months, seeds should now be sown in small pots. The plants intended for autumn fruiting may be expected to supply fruits in six weeks from the time of sowing the seeds. These plants may be developed rather freely, whereas those which will fruit in winter should be encouraged to make strong, sturdy plants, and be allowed to cover the trellis with vine before developing fruits; the pots or beds also, whichever may be preferred, should be limited in size, and be well filled with roots. Improved Telegraph is a good variety for this purpose. Plants bearing fruits in houses and frames should have all exhausted growths and leaves removed once each week, to make room for young bearing shoots. If the plants appear weakly crop them lightly, and if they are vigorous stop each shoot at one joint beyond the fruit. Afford ventilation early in the morning, and do not postpone the afternoon syringings on hot days until the atmospheric temperature has fallen too low. Avoid over-cropping, but provide the roots with moderate supplies of diluted liquid-manure. Any empty frames may still be planted with Cucumbers.

Tomatos.—Plants intended for fruiting in winter, now in 6-inch pots, if grown in the open, will be sturdy and short-jointed. Before the pots become overcrowded with roots, shift the plants into the pots in which they will fruit, convenient ones being 8 inches in diameter. The soil should consist of a good fibrous loam, to which may be added lime-rubble and wood-ashes in a moderately dry condition. When potting, allow space in each pot for applying light top dressings, and see that the plants are made thoroughly moist at the roots before shifting them into larger pots. Place the plants on a hard base in a sunny, sheltered position in the open-air if the weather is good; but if it is wet, place them under glass until the roots have taken hold of the new soil. Six weeks in the open afterwards will considerably benefit the plants.

Cherries.—Supply trees in pots with plenty of water at the roots, and syringe the foliage freely to keep it clean. Now that the trees have plump buds be careful not to excite them into premature growth. Trees growing in borders will also need to be supplied with water at the roots, and should they be weakly afford them diluted liquid-manure. Fumigate the house occasionally to keep aphides in check.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. BURNS, North Mymms Park, Hatfield, Hertfordshire.

Violets.—The present dry weather is very trying to plants growing in light shallow soils, and, if the means are at hand, all possible assistance should be afforded them where *Violets* are urgently required during the autumn and winter. Copious waterings, followed by a mulch of some light material, such as manure from an old hot-bed, leaf-soil, or short lawn-grass, is of great assistance, as is also the liberal use of the syringe morning and evening. Where red-spider has made its appearance, it may be kept in check by sprayings of "Spidacide." All "runners" must be promptly removed, and the plants confined to a single crown.

Richardia Elliottiana and *R. Pentlandi.*—When the foliage of these plants begins to turn yellow, the supply of water should be gradually reduced until the leaves die down, when it must be withheld altogether. When the soil in the pots is quite dry the plants may be stored in any place which is free from drip, provided that the atmospheric temperature does not fall much below 45°. Or the tubers may be taken out of the soil and stored in a box of dry sand, where they will winter perfectly well so long as the sand be kept dry and the temperature does not fall below the figures mentioned above.

Roman Hyacinths and *Polyanthus Narcissus.*—Bulbs should be potted at once in order to flower early. They may either be placed to the number of three or four in a 5-inch pot, or planted some-

what thickly in boxes, according to the purpose for which they are required. A compost consisting of one-half old potting-soil and one-half fresh loam, together with a little well-rotted manure, will be suitable. The pots containing the bulbs should then be placed out-of-doors and covered with ashes to the depth of 3 inches. For the early batches a shady position should be selected, but those for succession should be plunged in the open.

"Show" and "Fancy" Pelargoniums.—Cut the growths back to within an inch or two of the old wood, and place the plants in a cold frame or pit to "break." They may be afforded a watering, after which a syringing overhead twice a day will afford the plants sufficient moisture until they break into growth. Usually many more growths are produced than are required, therefore disbudding is necessary. In the first instance the weak and badly placed shoots should be removed, leaving those which are about equal in point of strength, and subsequently further reducing the number if necessary. When the shoots are an inch or two in length let the plants be repotted. Shake all the old soil from among the roots, and at the same time shorten the latter slightly, and place the plants in pots only just large enough to contain the roots comfortably, allowing room for a little soil around and among them. A suitable compost may consist of three parts fibrous loam and one part flaky leaf-soil, together with some coarse silver-sand. The plants should be potted firmly, and should be provided with light shade for a few days. Afford water sparingly until the plants are well established. Cuttings may be inserted at the present time, and they will form useful decorative plants by the spring. Select from among the prunings short-jointed and well-ripened shoots of the current season's growth, and shorten them to a few inches in length. Insert these singly in thumb-pots filled with sandy soil, and place them on a greenhouse shelf or in a cold frame, where they will make roots readily.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gr., Wrotham Park, Barnet.

Peaches.—There will be much to do in the hardy fruit garden until the work of training, summer pruning, and the gathering of the fruit is finished. We have just completed training the shoots of such early Peaches as Waterloo, Alexander, &c., taking the tops off some of the leaves to expose the fruits after they had been thinned sufficiently. The ground around the trees has been mulched and afterwards thoroughly soaked with water for the last time before the fruits ripen. To have these early Peaches good-flavoured the fruits must be gathered when a little under ripe and then taken to a cool airy fruit room and placed separately on some soft dry material such as cotton-wool, &c. By this treatment the flesh will ripen well through to the stones and the outer flesh will not become woolly. By gathering the Peaches when thus under-ripe there is less danger of bruising the flesh when detaching them from the branches. If the fruits are to be bottled it is better to have trays that will hold about three dozen. Place some soft material at the bottom of the trays, and gather the fruits whilst under-ripe, putting the Peaches carefully in the trays in such a manner that they will not touch each other. Place the trays in the fruit-room, and do not handle the Peaches except to take one up to see if it is properly ripe. If it is ripe convey the trays containing the fruits to where they will be bottled. In this way I have taken some hundreds of fruits without them suffering any damage. Peaches ripened in mid-season are best for bottling. Following Waterloo and Alexander are the useful varieties Hale's Early, Early York, Dagmar, &c. Although these fruits are not so large as those of the mid-season varieties, they maintain succession until these latter are fit for use. Train-in the required number of shoots if this has not yet been done. Syringe the foliage thoroughly and afford water to the roots. Do not permit the trees to ripen an excessive number of fruits.

Insect pests.—Preserve the fruits from damage by earwigs, wasps, flies, &c. The best method of

catching earwigs is to place pieces of Bean-stalk or similar hollow stems at intervals over the trees, placing the ends under the branches close to the walls. Examine the stems every alternate day, and blow or shake out the earwigs into a pail containing water and paraffin. Bottles containing beer or some other sweetened liquid will serve to catch wasps and flies. We have seen but few wasps this year. Complete the pruning of all kinds of fruit-trees as quickly as possible, whether espaliers, bushes, cordons, &c. Upright cordons, if planted rather widely apart, should have a few young shoots trained to the walls at intervals, not only for the covering of the brickwork, but for affording fruit. Take care that no trees suffer from drought at the roots; and should red-spider infest the leaves, get the engine to work, thoroughly washing every part of the leaves until they are freed from the pest.

THE FLOWER GARDEN.

By A. B. WADDS, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

Bulbs.—Beds of Anemones that have flowered, and that have proved to be thin and irregular, may be taken up and replanted at once. Plant them in a fresh piece of ground and apply plenty of leaf-mould or similar material. If a change of ground is needed, Tulips and Hyacinths may also be lifted and sorted into sizes, otherwise they are best left where they are, but should be afforded a good top-dressing of rotten dung or an application of a chemical manure.

Bamboos.—Afford plenty of water to these, especially to those that were planted last spring. Mulch the ground with cow-manure, or ill-effects will follow from the present dry weather.

Hydrangeas.—Afford farmyard liquid-manure two or three times a week to plants flowering in beds.

Spring-flowering Plants.—Wallflowers, Myosotis, Silenes, and other spring-flowering plants will be ready for transplanting on to a cool border. Choose a dull day for this work if possible. Shade the plants if the weather remains very bright, and damp them over each morning and evening. Loosen the surface soil by means of the hoe after a few days, or the ground will get hard through the waterings.

Pæonies.—When the growths have withered cut them off, and fork over the soil lightly, then apply a mulch of good rotten manure, and afford water afterwards if necessary. These remarks will apply to the Moutan as well as to herbaceous varieties. Remove all shoots from the stocks of Moutan Pæonies that appear below the grafts.

Hardy Ferns.—Copious supplies of water will be needed to keep these fresh and green. If the ground is breaking away from the rocks or stumps, some peat-moss fresh from the stables may be rammed firmly down in the crevices. Mulch the ground and apply water afterwards.

Border Carnations.—As the varieties pass out of flower these may be layered in good "sharp" (porous) soil, including plenty of road-scrappings and leaf-mould. The beds or borders will not appear unsightly if the work be done neatly. The layers will make better plants for transplanting in September than if the work be delayed. Afford the plants a thorough soaking with water before commencing the work of layering, and subsequently damp the layers overhead each morning and evening.

Flower-beds.—Stir the surface soil occasionally. Lobelia planted under a wall for effect has been disappointing. Being planted over the roots of the climbers the plants get too dry, and applications of hard water do not improve the flowers or foliage. Pelargoniums still hold their own in a dry summer. Petunias and Tropæolums are among the best hot-weather plants. Verbenas dislike the hot weather, and are dying off. Calceolarias planted early are a blaze of colour; those planted later are a failure.

Magnolias planted against a south wall, and perhaps unfortunately on a bank not wide enough to give the roots proper room, will be losing colour, and if not repeatedly watered will drop their flower-buds; apply liquid farmyard manure.

General work.—Dry weather still prevails here,

and the work of watering is very heavy. The mowing of lawns must only be done when quite necessary, especially banks which quickly show the effects of the machine. It is better to mow them with the scythe in dry weather. If turf which was laid last spring under trees is cracking, afford it a good top-dressing of soil, sweeping it into the crevices previous to affording water. Clean away leaves and other rubbish, and cut grass verges. The lawns being brown and bare, everything must be done to make the flower-garden as tidy in appearance as is possible under the circumstances. To roll walks laid down with Sussex gravel would be waste of time and labour.

THE KITCHEN GARDEN.

By JOHN PENTLAND, Gardener to C. H. B. FIRTH, Esq., Ashwicke Hall, Marshfield, Chippingham.

Potatoes.—The haulms of early varieties are ripening fast, and the tubers should not be allowed to remain in the ground longer, or they may become diseased. Choose a fine day, and lift the tubers when the ground is dry. It is an old practice to leave the seed-tubers in the ground or in some exposed place to become green, but I do not recommend it, as I have on several occasions seen tubers which were perfectly free from disease when taken up get very much diseased afterwards by being exposed to the atmospheric changes out-of-doors. It appears only natural that disease should follow if the tubers for any length of time are allowed to remain on wet or damp ground, exposed to all the rain that falls and the night dews, all of which I consider are the agents which assist the spores to develop. Therefore lift the tubers in as dry a condition as possible, and keep them so. Grade them when taking them up, or as soon afterwards as possible, and store the seeds tubers in a dry airy place, preferably on shelves with a lath bottom through which the air will circulate. I strongly recommend a dusting of dry-slaked lime amongst the tubers as they are being stored; it serves to dry up any moisture that may be about, and prevent any spores of the disease that may be present from making growth. Tubers that are fit for table should be stored in a cellar or some convenient place in a heap, and a covering of hay or straw put over them sufficient to exclude wind and light. If wind is allowed free access, it will give the tubers a yellow tint, while much light will cause them to become green; and either will cause them to have an inferior flavour. I also recommend lime to be dusted amongst the tubers to be used for table, when storing them, as it improves the quality.

Seed sowing.—Make a sowing of Cabbages, as was advised in last week's Calendar, if not already done; also sow the varieties of Lettuce All-the-Year-Round, Bath's Black Seeded, Brown Cos, and Hardy Hammersmith. Another sowing of Endive may be made, and Parsley must not be forgotten. If this was not put in as previously advised, it should be sown in beds on which frames can be placed later. It is not yet too late for making a sowing of round Spinach, and a sowing of Onions should be made at once.

THE APIARY.

By EXPERT.

As full sections are removed from the hive those partly filled should be placed to the front to enable the bees to finish them off; this will be found better than placing on more empty sections and a little later on having to remove them only partly filled and unfit for sale. Care should be taken when removing sections not to scratch or mark them in any way, and they should also be kept up the same way that they are removed from the hive and deposited in a place of safety, where the bees and wasps cannot get to them. Care should also be taken in using the smoker that no liquid falls out on to the sections, as they look very bad when stained. Wax-moth will be breeding very quickly now, and should be destroyed. Any stocks which have not done well should be thoroughly looked into and treated according to their necessities. All takes of honey should be recorded to each hive for future reference. Any little sign of robbing should be noticed, and a remedy given. Keep a good supply of "lzal" still in use for dipping dummies, &c.; also for washing the hands.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the **EDITOR**, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, AUG. 6	{	Soc. Franc. d'Hort. de Londres meet.
		German Gardeners' Club meet. Crewe Memorial Cottage Hospital Horticultural Fête.
TUESDAY, AUG. 9	{	Roy. Hort. Soc. Comms. meet.
WEDNESDAY, AUG. 10	{	Bishops Stortford Hort. Soc. Show.
		Royal Botanic Soc. Anniversary Meeting. Chippenhams and District Hort. Exhib.
THURSDAY, AUG. 11	{	Taunton Deane Hort. Soc. Show.
SATURDAY, AUG. 13	{	Sheffield Hort. Show.

SALE FOR THE WEEK.

FRIDAY, AUGUST 12—Imported and Established Orchids, Bulbs in variety, Retarded Lilliums, &c., at Protheroe & Morris, 67 & 68, Cheapside, E.C., at 12.30 o'clock.
(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick —62°9'.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 3 (6 P.M.): Max. 88°; Min. 64°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday (10 A.M.): Bar., 31°4'; Temp., 84°. Bright sunshine.

PROVINCES.—Wednesday, August 3 (6 P.M.): Max. 81°, S.E. Coast of England; Min. 60°, N.W. Coast of Ireland.

The Evolution of Horticulture. THE high position to which horticulture has attained could not have been better attested than by the recent opening by the KING and QUEEN of the new Hall of the Royal Horticultural Society and the character of the assemblage which was privileged to witness it. After many vicissitudes the germ of that Society, originating in the brain of its founder a century ago, has developed into a magnificent organisation universally recognised as fully competent to deal with the varied phases and interests of horticulture as in the process of evolution they present themselves. The history of that Society is already a matter of public knowledge, and we may, therefore, refrain from entering into it here, confining ourselves rather to the consideration of the various factors which have been at work in the development of the cult generally.

First and foremost, of course, we must place those natural processes which have been at work for æons altogether independently of human co-operation. It is these which underlie and

induce variation in type, generally of small degree, but sometimes of very marked character, which by the process of natural selection have led to the evolution of an infinite number of different kinds of plants, which the botanist ranges to the best of his ability under orders,

tion must have been at work to give him any material at all, however humble, to operate upon. With this subtle faculty the vegetable world, to say nothing of the animal, has proved to be as plastic in form as the potter's clay, and as amenable to selection on given

FIG. 41.—CARNATION "LADY CARRINGTON": COLOUR OF FLOWERS SALMON-PINK.
(SEE P. 95.)

genera, and species; and the florist, in these later days, splits up again into an infinity of varieties. Without this subtle faculty of change, man could do absolutely nothing but assist in propagating over and over again the same monotonous types; and, even granting this, we have to assume that at man's advent evolu-

lines as could be desired. A common weed like the wild Cabbage is worked up into a thousand diverse types, nutritive and ornamental; a simple wild and insignificant flower like the normal Chrysanthemum is elaborated into a brilliant galaxy of stately and diverse blooms to form a special cult for scores of societies through-

out the world, and so on. Were the parental features invariably exactly transmitted, both the above examples would still be unattractive weeds, and nothing more; but given diversity and direction by selection, and we have the results aforesaid.

The faculty of variation is then indubitably the first essential, since, like life itself, it is the mani-

equally beautiful flowers developed by absolutely wild and unsophisticated plants, which owe their beauty entirely to some subtle interrelations between themselves and the insect world, whose province it is to fertilise them, and to attract which the beautiful flowers have been shaped, enlarged, and gorgeously tinted. Horticultural evolution as distinct from natural evolution has

and other collections with a view to their propagation and perpetuation. Here, however, comes in the general benefit derived from ever-increasing travelling and transport facilities coupled with a better understanding of exotic plant-needs and improved capacity for meeting them. In the old days explorers often worked in vain, the plants either dying in transit owing to the duration of journey or exposure to low temperature *en route*, or perishing on arrival from defective treatment. The invention of the Wardian case, the shortening of ocean transit, and last but not least the introduction of the hot-water system of warming glasshouses have immensely facilitated the introduction of tender exotics and their subsequent culture on congenial lines. It is to the above causes that we may mainly attribute our present floral wealth; but there is still another essential, and that is supplied by the Royal Horticultural Society, viz., a central body of recognised experts whose province it is to determine what are really improvements and so keep progress within proper lines. It is a human failing to regard one's own geese as swans, and it is due no doubt to this that an immense number of plants annually appear before the Committees only to be rejected, while without such a check the public would undoubtedly be often invited to purchase "novelties" which, if they were really such at all, would be novelties on wrong lines. Evolution in short, especially when hybrids are in question, if without skilled guidance, would result in a chaos rather than in an orderly improvement on higher and better lines; and it is this last and final factor which really received the Royal approval at the opening of the new Hall.

TWO NEW CARNATIONS.—In our last issue we illustrated two new varieties of Carnations, which were exhibited at the show recently held at Holland House. In figs. 41 and 42 we now present illustrations of two further seedlings, each of which is recommended for its good qualities. The variety "Glow-worm" is a bright scarlet-coloured border variety of good form, and possessing non-splitting calices. Flowers were exhibited by Mr. JAS. DOUGLAS, and they obtained an Award of Merit from the Floral Committee. This distinction was not extended to the variety "Lady Carrington"; but we have no hesitation in recommending it, for the flowers possess good form, fine petals, rich salmony-pink colour (almost similar to the "Blush" *Souvenir de la Malmaison*), and, more than all, a degree of pleasing perfume. This variety was shown by Mr. MARTIN R. SMITH, Warren House, Hayes, Kent, to whom we are indebted for the flowers shown in our illustration.

ROYAL HORTICULTURAL SOCIETY.—We have received a pamphlet from the Secretary containing particulars of the Society's Autumn Rose Show to be held on September 20, the great Autumn Show of British-grown Fruits on October 4, 5, and 6, and the Show of Colonial-grown Fruits and of Preserved Fruits on December 13 and 14, 1904, all to be held in the Royal Horticultural Hall Vincent Square, Westminster.

GLOXINIAS.—Every now and then some correspondent sends us specimens of Gloxinias with a double bloom, a supplementary corolla emerging from the outer surface of the first. The condition is very variable—sometimes only a lobe or two is thus formed, at other times the lobes cohere into a complete double corolla, the colouration, which is inside in the ordinary corolla, being reversed in its position in the supplementary one. The condition is figured in *Vegetable Teratology*, pp. 451 and 452, and at the time of the publication of that volume the condition was so "fixed" that a "strain" of such flowers was produced and was offered in commerce. Since that time the strain has died

FIG. 42.—CARNATION "GLOW-WORM": COLOUR OF FLOWERS SCARLET.

festation of the Creative power and the Creative ideas which we symbolise by the term nature. Variation under selection nowadays plays probably the more prominent rôle in horticultural evolution, especially when combined with hybridisation; and the great majority of the beautiful flowers now exhibited are due to this. We must, however, by no means ignore the

been dependent also upon other factors than those named.

Our flower-shows nowadays comprise plants from all parts of the world, and, as we know, the Royal Horticultural Society has played an important part in such introductions by sending out a small army of investigators to likely regions, and distributing their discoveries to national

out, save for the occasional occurrence of specimens such as we have alluded to. Messrs. PARSONS, of Swansea, now send us pure white flowers of this character, which they tell us are reproduced from seed, and come very true and regular. No doubt by continued selection improvements will be effected.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—"At a meeting of my Committee, held on the 22nd inst., the following resolution was unanimously adopted, which I was desired to forward to you: 'That the best thanks of this Committee be tendered to the *Gardeners' Chronicle* for its unvarying kindness to the Institution at all times, and more especially in connection with the recent successful and record anniversary festival dinner in aid of the funds.' GEO. J. INGRAM, Secretary."

YUCCA GLORIOSA.—We hear from various quarters of the flowering of this noble shrub. To Mr. WARRENDER, of Pinuer, we are also indebted for a photographic representation of two fine specimens; but, in view of the fact that similar illustrations have frequently been given in these columns, it is not necessary to repeat them.

KHARTUM.—The associations connected with this desert city are sad and grim. Lord KITCHENER, who rescued the country around from savagery, proved himself as great at construction and organisation as he was in military operations. An illustrated article in *Le Jardin* is devoted to the city of Khartum, which, thanks to the constructive tendencies of KITCHENER, is now a fine city, planted with trees and suitable as a resort in winter. The embellishment of the city was confided to a French gardener, M. DEKON, who immediately on his arrival had 30,000 men placed at his disposal, with instructions to proceed with all speed. Ruins were cleared away, the ground levelled, streets cut, lined with Acacias (*Albizia Lebbeck*), and gardens formed. Amid the Date Palms are fine specimens of *Araucaria brasiliensis*, Cypresses, *Pinus australis* and insignis, and many others which do not resent the heat and drought to which they are subjected. Thus Khartum, which used to stand for murder and rapine, is now a centre of civilisation and enlightenment.

EARLY POTATOS IN IRELAND.—We are glad to find that in County Cork successful attempts are being made in the cultivation of early Potatos for the English and Scotch markets. The returns for the present season vary from £40 to £80 per acre.

FLOWER SHOW AT SANDRINGHAM.—The annual show of the Sandringham Estate Cottage Horticultural Society attracted 7,000 people to the King's Norfolk home on the 27th ult. Many excursion trains from considerable distances arrived at Hillington and Wolferton crowded to the utmost capacity, while on all the roads leading to Sandringham were endless processions of waggonettes, motors, and other vehicles. By the King's permission, the show was held in Sandringham Park, and the whole of the grounds, greenhouses, and gardens were thrown open to the public, a concession that was highly appreciated.

YEAR-BOOK OF THE UNITED STATES DEPARTMENT OF AGRICULTURE, 1903.—This is a monument to the industry of the editor, Mr. G. W. HILL, and his assistants, Messrs. B. STALLINGS and GREATHOUSE. The Department has extended its work in all parts of the country during the past year, and has directed active efforts to the stamping out of foot-and-mouth disease in some States; to studying the Cotton-boll weevil elsewhere, and to demonstrating the growing of Cotton successfully in spite of the

presence of the pest. Encouraging progress has been made in all the lines of research with which the Department is charged. The work of the Bureau of Plant Industry has been pushed with vigour in all branches. Forestry has been especially studied, and the experiment stations have proved highly successful in the various districts. In addition to the reports there are herein included many (illustrated) papers on such subjects as Soil Management, Cultivation of Corn, Cold Storage of Apples, New Fruits, Drug Plants, and other agricultural matters. The volume also includes various tabulated statistics of the crops of the past year.

GRASSES.—M. L. LEWTON BRAIN has lately published in the *Transactions of the Linnean Society* a valuable paper on the leaf-anatomy of British grasses, showing how the structure may be modified by the conditions under which the plants are growing, and how the several species may to a certain extent be distinguished one from another by different structural arrangements.

'FLORA CAPENSIS.'—Another part of this work, edited by Sir W. T. THISELTON-DYER, has been published. It contains an instalment of the *Scrophulariaceae*, elaborated by Mr. HIERN.

"BOTANICAL MAGAZINE."—The August number contains coloured figures and descriptions of the following plants:—

Zingiber spectabile, Griffith, t. 7967.—A very curious and handsome Malayan species, with dense flower-spikes of golden-yellow bracts, from the axils of which proceed orange-spotted flowers. Kew.

Vanda pumila, J. D. Hooker, t. 7968.—A pretty, free-growing Orchid, with deliciously fragrant flowers. The flower-segments are greenish with purple spots, the lip whitish with purple and yellow stripes. Native of Sikkim. Flowered at Glasnevin.

Thunbergia primulina, Hemsley, t. 7969.—A curious and beautiful species from East Tropical Africa, with palmately-lobed hairy leaves. The yellow corollas are singularly like those of a Primrose. Kew.

Tecoma shirensis, Baker, t. 7970.—A Tropical African shrub, with unequally-pinnate, nearly glabrous leaves and terminal racemes of irregular curved flowers, the yellow corollas of which are marked with scarlet stripes.

Euphorbia viperina, Berg., t. 7971.—A singular-looking species, with long snake-like cylindrical stems, studded with fleshy tubercles, but without spines. South Africa.

SWANLEY HORTICULTURAL COLLEGE.—An address at the inauguration of the "Nature-study Course" was given, on the 1st inst., by Sir JOHN COCKBURN, from which we extract the following:—"The introduction of Nature-study, together with manual training and a knowledge of modern geography, was transforming the curriculum, and, by sharpening the intelligence and cultivating mother-wit, was enabling ordinary book lessons to be more quickly assimilated, thus proving a labour-saving device in education. The method of Nature-study was not analytical, but dealt with everything in its proper environment, as—

'parts of a stupendous whole,
Whose body Nature is, and God the soul.'

The child-mind was not scientific, but imaginative and artistic, like that of prehistoric man. Unnecessary terminology should be avoided. The proper sequence of apprehension was first the thing itself, then its image, last its verbal sign or name. A well-devised label was, however, often an indispensable convenience. Nature-study formed a fitting introduction to books, which should always be regarded as explanatory and supplementary, never as

primary. The best and most beautiful book of all was the book of Nature, called by Longfellow "the manuscript of God." Nature-study struck one of the keynotes of true education, for it riveted attention and excited interest; the mind thus aroused could easily be led in any direction. The teacher should be a fellow-observer, and after leading up to the point should permit the child to have the full joy of discovery. Nature-study furnished excellent physical, intellectual, and moral training. With more Nature-study there would be less need of enquiries into the causes of physical deterioration. Moreover it inculcated the love of country life. City crowding had formed a necessary stage in social development. It promoted solidarity and urbanity, but it was only a passing stage. There was grave national danger in an undue rush of population to the centre. Rome died of apoplexy, and Nature-study came as the herald of a more normal and healthy existence. It therefore had a special patriotic significance, and the County Councils were to be commended for the manner in which they encouraged it."

ENQUIRY INTO DECIMAL COINAGE AND THE METRIC SYSTEM.—The purport of this pamphlet is indicated in its long title: *An Enquiry into and an Explanation of Decimal Coinage and the Metric System of Weights and Measures*, by EDWIN ANTHONY. "The conclusion to be drawn is that our weights and measures may be decimalised without great dislocation, and a system produced which is practically equal if not superior to the metric system." As regards coinage: "Decimal coinage can be introduced quickly and easily by issuing one new gold and one new silver coin, and without withdrawing any of the coins at present in circulation." We hope that some day our antiquated and cumbersome systems may be superseded by the simple and more practical decimal system; but the advance is one which those in authority seem strangely slow in encouraging.

ROSE-GROWING.—Under this title Mr. D. GRANT McIVER has published a small and thoroughly practical treatise on Rose-growing and propagation. It is intended especially for amateurs, and may safely be commended to their notice as containing in plain language, devoid of sentimentality, just what the beginner wishes to know. The illustrations of certain varieties of Roses would have been better omitted, as they occupy space which might have been better filled. The publishers are Messrs. DAWBARN & WARD.

THE CLIMATE OF THE TRANSVAAL.—The occurrence of severe frosts in the Transvaal will come as a surprise to many; yet a correspondent writing in June says he is busy with burst pipes and taps, and sends us the following records:—June 11, temperature 8° F., or 24° of frost; June 12, temperature 11°, or 21° of frost; June 13, temperature 18°, or 14° of frost. Our correspondent has had experience of Canadian winters also, and cites for Winnipeg in January, 1899, 48° below zero F., = 80° of frost!

ORNITHOGALUM THYRSOIDES.—This plant has been found to be extremely poisonous to horses in Cape Colony, producing symptoms of inflammation of the intestinal canal.

DAHLIAS.—Those who are interested in the culture of Dahlias, and who are conversant with the French language, will find it profitable to peruse a little treatise on the subject by M. VAN DEN HEEDÉ, of Lille. After a summary of the history of the flower—which, if we remember aright, differs somewhat from that current in this country—M. VAN DEN HEEDÉ goes on to give cultural details. In this way the reproduction from cuttings or from seeds, the planting, staking, and the care to be bestowed on the plants, are dealt with, as well as the cultivation in pots and the diseases to which the plant is

subject. Lists of the most desirable varieties in the several sections, as well as a monthly calendar of operations, are given.

EVESHAM.—The late rains have been beneficial to the fruit crops in this district. In order to check the falling of Plums, a steam fire-engine was made use of with advantage. Market-garden produce has suffered considerably, but the late rains may remedy matters.

"FLORA AND SYLVA."—The August number of this periodical *de luxe* contains an article on Strawberries, with the general principles of which most gardeners must concur. The Strawberries which find favour in the market are not those which are of the first quality as regards flavour. A similar remark applies to Peas, Tomatos and other crops. The grower looks to what will pay rather than to intrinsic excellence. It is not a case of survival of the fittest in the abstract, but of the concrete survival of that which is the fittest for a particular purpose. We do not think Sir HENRY THOMPSON'S dietum will meet with universal assent, and no evidence is given to support it, whilst it is certainly opposed to the tradition that LINNÆUS cured himself of gout by the use of Strawberries; but then these were not the market varieties we know. Mr. CARL PURDY has a useful monograph on Californian Erythroniums, and Mr. O'BRIEN a similar article on Gloriosas.

STRAWBERRIES.—As our reports have shown, the crops generally have been very heavy; and now we hear of 80 tons being despatched on one evening from Wisbech; and one grower is recorded in the *Daily News* as having sent off 24 tons in one day.

NEW PLANTS.—Not content with the publication of figures and descriptions of the living plants in his garden at Tirlemont, Belgium, M. VAN DEN BOSSCHE has now undertaken the publication of a similar work, intended to illustrate the riches of his herbarium. Under the title of *Plantæ novæ vel minus cognitæ ex herbario horti Thenensis*, M. DE WILDEMAN has edited a series of descriptions with the critical judgment of which he has given so many proofs, and beautifully illustrated by lithographic plates by M. A. D'APREVAL. In the part before us are figured *Kigelia Ikalie*, De Wildeman, t. i.; *Cissampelos Wildemaniana*, V. d. Bossche, t. ii.; *Heinsenia Lujæ*, De Wildeman, t. iii.; *Oncolea angustipetala*, De Wildeman, t. iv.; *Gladiolus morrumbalaensis*, De Wildeman, t. v. The five new plants now figured form part of the collection made in Mozambique by M. E. LUJA.

NEPENTHES.—From M. JARRY-DESLOGES we have received a selection of pitchers of various forms of *Nepenthes*, grown at his residence in the Ardennes, which are extraordinary for their size and splendid colouring. Among them are:—

N. NORTIANA, with a curved horn-like pitcher of a rich claret-red colour, heavily blotched with deeper coloured spots, tapering at the base, gradually dilating upwards, about 1 foot (31 cent.) long, exclusive of the lid. The midrib is prolonged at the apex, at the back, into a short, thick unbranched process. The wings are narrow and fringed, and are deeply recurved, margin or rim (3–4 cent.) undulate, lobed, finely striated, and marked with alternating blotches of greenish-yellow and deep red. The interior of the throat, exposed by the raising of the lid, is green, heavily blotched with reddish-purple. Lid 13 cent. by 10 cent., broadly oblong, pale green, heavily blotched with reddish-purple.

Two other forms are similar to the preceding, but with smaller and distended pitchers, whose reflexed margins are gorgeously coloured with various shades of orange and red:—

N. BALFOURLIANA.—Pitchers about 1 foot (31 cent. long), tubular, slightly curved, green, with a few purplish spots near the top; wings narrow, ciliate; rim recurved, 5–8 cent. deep; undulate, lobed, finely striated with alternate stripes of red and green; midrib excurrent at the apex beneath the lid into a pin-

nately branched slender process; lid 9–10 × 8–9 cent., greenish spotted; upper part of throat green, heavily spotted with red.

N. SANGUINEA.—Pitcher about 10 inches (25 cent.) exclusive of lid, dilated in the centre, tapering to each end finely, puberulous, deep red without blotches, midrib, prolonged at the apex at the back into a long, slender, tendril-like process 3 cent. long; wings narrow, with long, ciliate margins; rim narrow, recurved, finely striate, uniformly red; interior of throat glaucous, grey, with a few purple and yellow spots; lid 8–9 cent., self-coloured red.

FLOWERS IN SEASON.—From MESSRS. KELWAY & SON, of Langport, we have received a box of their Gladioli, the quality of which is too widely known to render it necessary for us to dilate upon them. Among the more remarkable are:—

Amphora.—Flowers nearly regular; segments rounded, snow white.

Mrs. F. Field.—Segments pointed, white.

Kenrygn.—White flaked with rose-pink.

Morris Dancer.—Scarlet flaked with white.

Batrice Kelway.—Rose-pink flaked with pink, and with a central white stripe.

Happy Match.—Three outer segments and inner upper segment rose-pink with a central white stripe; two innermost segments smaller, recurved, primrose-yellow edged with pink.

Arct. Patrick.—Flowers large, outer segments broad, deep rose-pink; two inner segments smaller, deep rose, with a central white stripe.

GUIDE-BOOKS RECEIVED.—*Orsted, Limpsfield, and Edenbridge*, The Homelands Handbooks, Vol. 36 (22, Bride Lane, Fleet Street, E.C.); an interesting and well-illustrated guide-book, rendered more useful by the addition of an Ordnance map.—*Holidays on the South Coast and the Isle of Wight* (London, Brighton & South Coast Railway); a pamphlet with illustrations, and written in German, French, and English in parallel columns.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

MR. CHAPMAN'S NURSERY AT ST. NINIANS.—I have read the account of hardy plants at this Scottish nursery, from the pen of Mr. S. Arnott, on p. 50. The short-lived splendour obtained from the method of massing tender exotics is absent in flower-gardens planted wholly with hardy plants, some of which do not bloom for more than a month or two at the most. But this feature is readily got over by employing mixtures of different species in the beds in contradistinction to one bed of one species, the former method being now generally followed, unless it is desired to obtain the finest display at a given period of the summer or autumn, in which case the plants chosen must be those that are in the best condition at the particular season. Once planted, such hardy herbaceous perennials need not be disturbed by the gardener more than once in three or four years, excepting in the case of very vigorous or wide-spreading species, or for the purpose of substituting some other more suitable ones. Those who put the massing of bright colours in flowers first, will perforce still employ the older mode of planting with comparatively tender plants, which succumb to the first sharp autumnal frosts, leaving the beds bare of vegetation, unless spring-flowering bulbs, Wallflowers, *Myosotis*, *Honesty*, *Saponaria*, *Silene*, *Pansies*, *Aubrietias*, *Heucheras*, procumbent *Phloxes*, &c., are planted in the beds in the month of October. Mr. Arnott makes mention of several plants succeeding satisfactorily so far north as Stirlingshire which are usually considered as being rather tender. Of such I may indicate the *Veronicas*, *Olearias*, and *Escallonia Phillipiana*. Perhaps he will kindly state if these, and *Platycodon grandiflora*, *Incarvillea Delavayi*, *Chryso-gonum virginianum*, *Statice latifolia*, and *Eno-thera M. Cuthbertson*, are safe out-of-doors without protection. In regard to *Buddleia globosa*, this showy shrub is, if sheltered from the north and east winds, quite hardy in cold localities in all parts of England, and consequently in West Scotland; whilst *Ribes speciosum*, on the contrary, requires covering as a protection against frost, even when planted on east or west walls, otherwise it flowers sparsely or not at all. It was my practice to cover the entire plant (in that

instance 16 by 10 feet) with ripe *Asparagus-haulm* 4 inches thick, with bast-mats over all, making the covering thicker over the stem and root-stock. Any information afforded by the writer with regard to soil, aspect, propagation, and hardiness, is especially valuable to would-be cultivators of little-known species, and for such many readers of these pages would be very grateful. F. M.

ROSE PAPILLON.—This vigorous-growing Tea Rose, distributed by Nabonnand in 1882, is one of the best of the climbing Tea section. It is exceedingly free and continuous in blooming, being one of the earliest to flower here, and continues to bloom as freely as ever when most other climbing Roses are passing out of flower. I have counted twenty to forty blooms on a single truss, each individual flower measuring 3 to 5 inches in diameter. The colour is a coppery-salmon-rose, the coppery shading coming out very prominently towards the base of each petal, and gradually lightening out to blush towards the edges of the flower. The shell-shaped petal enhances its beauty. Grown as a pergola Rose here it is a great success; but either as a pillar Rose or for covering a wall or fence it would prove equally good. W. H. Clarke, Aston Rowant Gardens, Oxon.

CLIANTHUS PUNICEUS.—On p. 26 Dr. Bonavia, under the heading of "An Interesting Phenomenon," speaks of this *Clianthus* throwing out flower-buds in November, and also refers to a note written by me which appeared on March 5, recording its being in flower at Penzance early in February. With me at Kingswear, South Devon, *Clianthus puniceus* is very precocious, for a plant about 10 feet high, growing against a south wall, has for the last three years produced its first flowers just before Christmas. From that time a few blossoms were always to be seen on the plant, these increasing in number through the months of March and April, and in the first week of May forming a sheet of scarlet. At Penzance at the beginning of February I saw a plant growing against a wall bearing a dozen fully expanded flowers, and a few days later I met with a bush specimen growing in an open bed, with no wall in its vicinity, which held three or four fully-open blossoms. The white-flowered variety, which is growing on the same wall as the type, flowered with me in April. It was literally covered with budding flower-racemes, of which, as it is a small plant, I removed all but six at an early stage of growth. The flowers of this form are not snow-white, but have a suspicion of faint yellow in their colouring. They afford, however, a charming contrast to the scarlet colour of the type. S. W. Fitzherbert.

MOTORS AND MANURE.—In the *Gardeners' Chronicle*, p. 63, your ever-vigorous correspondent, Mr. "A. D.," appears to have had a kind of nightmare over the shortage of manure which he fears will happen in the course of a few years, when 20,000 or more horses will have to give place to make room for so many of those non-manure-producing motors. This mantle of pessimism which Mr. "A. D." appears to have put on is very different from that which we have been in the habit for a long time of having from his facile pen, and we hope it will only be of temporary duration, and that he need not trouble himself as to where farmers, gardeners, and market gardeners are to find their indispensable manure say twenty years hence or thereabouts. Surely this is one of those cases where we might look for some crumb of comfort in the old proverb—viz., that "Sufficient unto the day is the evil thereof." When years ago it was seen that our railways were likely to come into general use, it was feared that horses would be displaced. Quite the contrary happened; they were in greater demand than ever; and I fancy we are yet a long way from the time when we are to see the last load of stable-litter being drawn out of London. Expensive motors are just now the rage amongst the wealthy classes, but when the novelty of the fad wears off—and this may be hastened when a few more serious accidents have been added to those which have already happened—it is not at all improbable that then there may be a perceptible

hull in their dangerous use, followed quickly by a general return to the by far safer and more dignified equipment of a handsome carriage-and-pair, to which no motor that I have yet seen can be compared. True, their speed is enormous, but they are dangerous in the extreme. Accidents, when they happen, are so sudden that a moment of time is often all that is between life and death, yet all this is risked, and the wish is to go faster still. Any day, and the sooner the better, we may expect to hear a cry raised in high places to put a stop to the dust and smoke left behind on the roads by the passing of those hideous monsters of locomotion. When this much is accomplished, their speed reduced to something like safe limits, and the people's comfort safeguarded, their use may then be tolerated. But for commercial purposes both steam and petrol lorries for heavy haulages have come to stay, and they have already done more towards reducing exorbitant railway charges than all the written remonstrances which from time to time have been addressed to the respective railway companies. Heavy goods are loaded up from various factories with just half the handling which would be the case were they sent by rail, without delay and without breakages, always a source of trouble and annoyance. But running the risk of occupying too much of your valuable space, is it not a fact that many [some] of the larger market gardeners and fruit-growers have already adopted either the steam or the petrol lorry? If so, they have practically put themselves out of court, and have no *locus standi* to make complaint against anybody else's making use of any form of Mother Shipton's horseless carriages. If this is the case, the shortage of manure at some remote period does not appear to give them much concern; and nightmares as to what will happen twenty years hence are not likely to disturb their slumbers. *W. Miller, Berkswell, July 25.*

POLYGONUM BALDSCHUANICUM.—This distinct species, which is one of our most beautiful flowering plants, is proving hardy and well adapted to our Scottish climate. At Kyle Villa, Davidson's Mains, Mr. Porter has a large established specimen on a southern aspect of his house, which from early June till autumn produces most profusely long trails of its peculiarly-tinted whitish flowers. A native of Eastern Bokhara, one feels naturally sceptical about introducing to prominent places a plant of this kind, but it has only to be seen to secure a welcome. For decorating purposes as a cut flower it is at once distinct from all others and very suitable. Mr. Porter grows many other good things not usually found in gardens. Fortin's giant Lily of the Valley, for instance, is thriving immensely both in the villa garden and in a larger one in the immediate vicinity, where beds of it are grown, its large, dock-like foliage being proportionate to the immense spike of flowers it produces in season. *B.*

POLLEN STEALING AGAIN.—Allow me again to bring this forward for the sake of other people. At Holland House show I bought of Mr. Sander a fine variety of *Cochlioda Noezliana*, having previously seen that its eighteen blooms contained all the pollinia. The plant was on show for the two days, and was then and there wrapped in paper and handed to my son. On arrival here I found only seven pollinia remained (and some of them in unopened buds at the tip of the spike). Of course, now that *Cochlioda* has become so valuable as a parent of a new coloured race, it is a cheap way of obtaining its pollen; but if the thief gets his deserts his fertilised plant will die under the pods. Publicity at any rate will not enable him to proceed so easily next time. *De B. Crawshaw, Sevenoaks.*

PEAS.—If your correspondent, J. G. Wilson, would try Sutton's Early Giant Pea he would find it equal in every respect but one to Gradus. I have often counted eleven Peas in a pod, and its cropping capabilities are equal to those of Gradus; but sown at the same time it comes in about one week later. I should be very glad if J. G. Wilson could tell me what methods he uses to get early Peas in twelve or fourteen weeks; I mean, of course, in the open ground. I sowed the variety Sutton's Harbinger on February 2, and thought I did well to gather Peas the first

week in June. If there is any method or variety of Pea to come in sooner I for one should be glad to hear of it. *S. G. Smallridge, Holfield Grange Gardens, Coggeshall, Essex.*

STRAWBERRY LAXTON'S "THE LATEST."—This has proved with us a most valuable late variety, the first fruits ripening on July 13 and the last on July 29. Some of the berries were very large, measuring as much as $6\frac{1}{2}$ inches in circumference. The colour is deep red; the flesh firm and of first-rate flavour. The colour and solidity remind me of the old Elton Pine, but "The Latest" is free from the objectionable acidity of the older variety. The habit is compact, and the constitution appears to be good judging from the manner in which my plants fruited, although they were very small when received on October 20 last season. I consider this to be the finest introduction in Strawberries since the variety Royal Sovereign was introduced. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

THE PINES OF WESTERN CUBA.—Since writing the description of the Pines of Cuba, *Gardeners' Chronicle*, March 19, 1904, my attention has been called to an article by M. Arthur Morelet, *Bull. Soc. Hist. Nat. Moselle*, vol. vii. (1885), pp. 97—101, in which two new Pines discovered by the author in Western Cuba and the Isle of Pines are described as follows:—

P. TROPICALIS (Nob.).—*P. foliis geminis, sub decem pollicaribus, glabris, multistriatis, dorso convexis, facie concavis, marginibus tenuissimè serrulatis; vagina membranacea, brevi, griseo-albescente, rami versus apicem patentes; ramuli crassi, rigidi, squamosi, valde resinosi; gemmæ squamis lanceolatis rubescentibus longissimè ciliatis; strobilus pendulus, parvus, ovoideus, brunneo-lutescens, squamis, depresso-pyramidalis. Crescit in insula Pinorum nec non in littore meridionali insulae cubensis.*

P. CARIBÆA (Nob.).—*P. foliis ternis, sub octo pollicaribus, acerosis, triquetris, sub lente seriatis punctulatis, marginibus tenuissimè serrulatis; vagina rufescente, brevi; ramulis cinerascensibus squamæ tenues adnate; gemmæ angustæ, elongatæ; strobilus pendulus, parvus, ovoideus, sordide cinerascens, squamarum umbone valde depresso. Crescit in insula Pinorum.*

Pinus tropicalis is identical with *P. tortuocarpa*, Shaw; and Pinus caribæa with *P. bahamensis*, Griseb. Morelet's names antedate all others for these two Pines, and should be substituted for the names now current.

The cones of *P. tropicalis* are erroneously described as pendent. On approaching the trees the contrast between the pendent cones of *P. caribæa* and the patulous cones of *P. tropicalis* is so obvious that the local carpenter who guided me to the Pines called attention to this character as an infallible means for distinguishing the two species.

No mention of Morelet's names can be found in the *Index Kewensis*, and they seem to have been overlooked in all monographs of the genus Pinus. *George Russell Shaw, Boston, U.S.*

MELONS.—I enclose a photograph of a house of Melons grown in 15-inch pots, every alternate pot containing two plants. The variety of Melon shown is the result of a cross between Messrs. Sutton's Royal Favourite and the old Guernsey Al White Flesh. I have grown this seedling Melon successfully for five years. The soil is a somewhat adhesive yellow loam. I use no stable manure, but the following chemical manure: sulphate of ammonia, one part; sulphate of potash, one part, and superphosphate of lime, three parts. The whole is mixed together and used in the process of watering. The fruits of this Melon are beautifully netted when ripened, and in colour are golden yellow. *Alfred Hannis, Gorseland Vinery Cottage, St. Andrews, Guernsey.* [The photograph showed an excellent crop of large-sized fruits. Ed.]

PLANT PORTRAITS.

ACACIA BAILEYANA.—*Revue Horticole*, July 16; *Gardeners' Chronicle*, 1894, i., p. 37, f. 4.

BOOK NOTICE.

MISS ORMEROD.*

Even a superficial glance at this book affords some idea of the immense amount of work accomplished by Miss Ormerod during the seventy-three years of her useful life. Endowed with uncommon ability and persistency, she mastered several languages; whilst her energy as an investigator, writer, and artist, her special study of insects injurious to stock and crops, placed her in the first rank of economic entomologists, and gave her a unique position as a go-between the severely scientific expert and the practical cultivator.

The very interesting autobiography gives an account of her youth, and tells how the appearance of a rare locust had much to do with arousing her interest in insects. Soon after this Miss Ormerod began seriously to study entomology; to catch specimens, examine them microscopically, and identify them as far as possible.

In 1877 a characteristic book was published, entitled *Notes for Observations of Injurious Insects*, wherein "I suggested," says the writer, "how much a series of observations in relation to insect ravages on food-crops was to be desired; this not merely for scientific purposes, but with a view of finding means for lessening the amount of yearly loss which tells so heavily on individual growers, and also on the country at large." This, though not the first entomological treatise published by Miss Ormerod, gave the key-note to her life's work. Further reports on injurious insects were constantly published, and her leaflets concerning the Warble Fly, Pea Weevil, Crane Fly, and many other pests, had an extensive circulation among agriculturists. Miss Ormerod was for ten years consulting entomologist to the Royal Agricultural Society, and her work in connection with this, added to her lectures and the preparation of her books for publication, occupied her time very fully. Her ample means enabled her to work without thought of remuneration, and she found leisure for a voluminous correspondence, not merely relating to business, but with the many friends who appreciated her social qualities.

No notice of Miss Eleanor Ormerod would be complete without mention of her elder sister, Miss Georgiana, an excellent artist and valuable collaborator, whose death in 1896 made a great blank in the home-life.

It was in 1900 that the University of Edinburgh conferred upon Miss Ormerod the honorary LL.D.—a distinction which she highly appreciated, as is evidenced in the work before us. Her letters on the subject afford an insight into her character, and show how genuine was her delight at this public recognition of her services.

The autobiography before us should serve to still further increase public interest in Miss Ormerod and her work. Details of her home-life, many family portraits, views of the author's homes, &c., help towards a fuller understanding of her career. It need hardly be said that the correspondence included in this volume will be read with great interest by specialists, while the reminiscences of country-life in times gone by will appeal to the general reader. The plan adopted by the Editor in arranging his materials is somewhat confusing, and has led to some repetition; nevertheless, the reader will acquire a very good idea of the intelligence, industry, disinterestedness, and humour of a very remarkable personage. Those who are interested in the study of heredity and the transmission in families of more than average ability, will find much material ready to their hand in these pages.

* Eleanor Ormerod, LL.D., *Economic Entomologist*. Autobiography and Correspondence. Edited by Robert Wallace. With portrait and illustrations. (London: John Murray, Albemarle Street.)

THE OPENING OF THE NEW HALL.

The opening of the Royal Horticultural Hall, built to commemorate the centenary and for the better accommodation of the shows of the Society was a unique event in the history of horticulture. Yet a far greater and more enduring testimony to the Society's labours and exertions during the past century is to be found in the improved methods of cultivation, and in the many new kinds of fruits and vegetables, flowers and plants, trees and shrubs, the introduction of which we owe to the Society. To many of these we have become so long accustomed that we have forgotten to whom we owe the pleasures that we derive therefrom.

The work of the Hall Building Committee has, as we know well from past experience, been one of arduous and often anxious labour from the

articles of necessity, which the Society has endeavoured to improve and to multiply.

Ornamental gardening was regarded by the Society as a second or subordinate department of its pursuits. But utility, as manifested in the production and improvement of vegetables and fruits and the introduction of new ones, remained its chief and primary designs. The most common vegetables, the Cabbage, the Potato, and other esculent plants of the cottage garden, have received no less attention than the rarest productions of the earth. As a result the whole of the contents of our gardens have been changed.

There are few, if any, prominent names associated with British Horticulture during the last hundred years which are not also linked with that of our Society. Founded by men like John Wedgwood, William Forsyth, and Sir Joseph

over, gave their lives [in the prosecution of their search for new plants and varieties. The new additions and fresh importations received from them have added more than anything else to the wealth of beauty which may be enjoyed in both the public and private gardens of our country. The new plants thus discovered in almost every part of the four continents, and other importations of the Society, were all first grown at or introduced to Chiswick, and from thence distributed over the British Islands, our foreign possessions, and other places abroad.

We hear, too, of the possibilities of a horticultural research station in the near future, and it is, indeed, high time that such a station should be erected in England. Foreign countries have already numerous stations of this kind where botanical laws of nature are thought out, questions

FIG. 43.—THE INTERIOR OF THE COUNCIL-ROOM IN THE NEW ROYAL HORTICULTURAL HALL, OF WHICH A DESCRIPTION WAS GIVEN IN OUR LAST ISSUE.

(From a drawing kindly furnished by the Architect.)

time of their appointment until now, when we see the outcome of their efforts. We rejoice that a large part of the Building Fund has already been subscribed, and we shall hope shortly to hear that the balance required has been supplied. It would indeed be a general calamity if the Society's work were to be crippled by having to pay this sum from its income, already none too large for its manifold and national objects and exertions. Any reduction of capital would obviously bring with it a corresponding reduction of income, and consequently a curtailment of the Society's usefulness.

Comprehending horticulture in its widest extent, yet not interfering with matters which more properly belonged to botany or to agriculture, the Society from the first took under its care all the variety of produce which the garden can yield as food and sustenance to man. And very soon many of such productions, which had formerly been objects of enjoyment, became

Banks, it also owes more than we can imagine to Thomas Andrew Knight, whose eminent talents and profound and extensive knowledge of vegetable nature, combined with his devotion and attachment to the Society, proved singularly beneficial to its interests. It was also largely due to his valuable physiological and practical papers in the *Transactions* that amateurs as well as gardeners began to take a higher and more extended view of that science, which now forms the amusement of the one and the occupation of the other.

Many of the Society's intrepid collectors will always be remembered by the trees and plants named after them, and to one especially, Robert Fortune, our empire in India will ever be indebted for the introduction of the Tea industry from China. Don, Forbes, McRae, Potts, Parkes, Hartweg, and Weir, and more than any other, Douglas, form a list of names of which any Society might be proud; most of whom, more-

of vegetable physiology are investigated and new discoveries are made as to the effect on plants of light, electricity, atmosphere, and other matters. The initial cost of the station and part at least of the endowment for its annual upkeep and staff should be provided by those who will profit in their business and in their gardens by the results of the investigations there conducted.

It pleases us of the British Empire to think of how the Royal Horticultural Society has served as a model for similar associations in different parts of the world, and that it is still recognised as the leading horticultural institution at the opening of its second century of public work and utility.

The Journal of the Society, first published in 1807, was the pioneer of the many publications devoted to horticulture which are now issued at weekly, monthly, or longer intervals. Yet the Society's Journal is still one of the most valued of the many privileges of the Fellows. S.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JULY 26.—*Present*: Dr. M. T. Masters, F.R.S. (in the chair); Messrs. Odell, Hooper, Saunders, Douglas, Gordon, and Bidgood; Dr. M. C. Cooke, Prof. A. H. Church, F.R.S., Revs. W. Wilks and G. Henslow (hon. sec.).

Aspen Poplar with galls.—Mr. ODELL showed branches on which the globular galls of *Eriophyes pustulatum* were remarkably abundant.

Solanum guatemalense.—Mr. SUTTON exhibited fruiting plants of this species. The egg-shaped fruit is known as the "Melon-Pear." These are remarkably juicy, cool, and with a distinct flavour, suggesting the name.

Heath malformed.—Mr. KITSON, of Newton Abbot, sent flowers of the common Heath, with the petals free, and only four stamens opposite the sepals, which were subpetaloid.

Carnation sport.—Mr. ROBERTS, of Croxley Green, Herts, sent a stem bearing two flowers, one a self rose-coloured flower, and the other an ordinary bloom of Lottie Collins, from a plant layered last year from the latter. The sport may possibly be a reversion to the rose-coloured flowers of the wild *Dianthus caryophyllus*.

POTTERS BAR AND NORTHAW COTTAGE HORTICULTURAL.

JULY 14.—The thirty-fifth annual exhibition of this very popular Society was held on the above date in the lovely grounds of Mr. A. M. Nathan at Little Heath Wood. The weather being delightfully fine there was a very large attendance during the afternoon. This year there was an additional attraction in the first exhibition of the Potters Bar and District Amateur Rose Society, of which Viscountess Enfield is president. There were two spacious marquees, and the exhibition was a very fine one. Messrs. CUTBUSH were to the fore with a magnificent display of Hertfordshire Roses not for competition, and about fifty varieties of Sweet Peas, including some new varieties. The vegetable classes were of great excellence.

HUNTS HORTICULTURAL.

JULY 20.—Hinchbrook, with its gardens of Oriental and real old English beauty, crowded with the loveliest of Roses and flowers, was, through the kindness of the Earl of Sandwich, made the venue of the County horticultural show on the above date. The show, which was inaugurated last year, only included the town of Huntingdon and parishes of Brampton and Hartford, but this year the Committee of Management decided to widen the scope of the Society, so to embrace the whole county. Liberal support was forthcoming, and a magnificent show resulted.

Arranged in four large marquees, the exhibits made a really first-class display. They numbered more than double the total of last year, the figures running almost to 1,500. In the cottagers' section there was an excellent collection of fruit and vegetables, and the keenest of competition prevailed, especially in the vegetable department. The open classes constituted a charming exhibition, and, taking the dry season into account, were excellent. In this section splendid competition reigned between Mr. Barson, the Earl of Sandwich's gardener, and Mr. Lockie, Mr. A. J. THORNHILL's gardener. Mr. Barson was the more successful, and his beautiful products in all departments were worthy of their premier position. Mr. Lockie, however, made some capital exhibits, and carried off a number of prizes. Mr. JOHN E. PERKINS, of Huntingdon, made a brilliant display of Cannas and Carnations. Mr. WINTER, of Hemmingford, showed a collection of vegetables. Messrs. W. & J. BROWN, of Peterborough, had a large collection of lovely Roses and Carnations; and Messrs. WOOD & INGRAM, of Huntingdon, also had a stall of Carnations.

BOSTON HORTICULTURAL.

JULY 20, 21.—For over thirty years this Society has held an annual exhibition, which is very popular in the district, and is attended by a large number of persons. Several classes are open to all comers, including cut Roses. The best twenty-four blooms were staged by Messrs. G. & W. BURCH, Peterborough. Most of the blooms were remarkably good. Mr. T. M. BRADLEY, Peterborough, was 2nd, and they occupied the same positions with twelve varieties. Messrs. BURCH were also 1st with twelve varieties of Tea-scented

Roses. A special silver cup was offered for twenty-four bunches of hardy herbaceous and bulbous plants; this was won by Messrs. W. & J. BROWN, Peterborough, with a very good assortment, well staged; Messrs. H. W. KILLINGWORTH & Co., Boston, were 2nd. Another handsome special prize was for the best and most attractive horticultural exhibit, filling a space of 50 feet. This was won by Messrs. ARTINDALE & SON, Sheffield, who staged a fine lot of Carnations and other flowers, floral decorations, &c.; and they also took the 1st prize for a championship bouquet, having an elaborate one made of Orchids. The best group arranged for effect also came from the Sheffield firm.

Plants were shown in several classes, cut flowers also, with fruit and vegetables. Sweet Peas were numerous, and most of them very good.

Vegetables and hardy fruits were numerous, the vegetables from cottagers were very good, and their Red, White, and Black Currants particularly fine.

Messrs. W. W. JOHNSON & SON, Ltd., set up a large stand of cut flowers, including Sweet Peas. They also had a growing plant of their new main crop Potato, Diamond, to show what a lusty grower it is, and yet not too tall.

HANDSWORTH HORTICULTURAL.

JULY 22, 23.—Fifty years ago, when Handsworth was an open country district instead of a populated area as it is at present, floriculture flourished in its midst. The Handsworth and Lozells Floricultural Society held three and four exhibitions annually, and there were also in existence one or two special floricultural societies. Then came a period of horticultural inaction until 1885, when the Handsworth Horticultural Society was formed, and it was content for sixteen years to hold a small 'show in the "Austins." Four years ago the Society launched out upon a wider scale, and commenced to hold its exhibitions in the Victoria Park. These have grown in importance each year, and with a little more experience in management and improvement in details, there is no reason why the exhibition should not in a short time rival those of Wolverhampton and Leicester.

Great interest centred in the division open to all. The 1st prize group of plants, arranged on a space of 300 feet, was staged by Messrs. J. CYPHER & SONS, Cheltenham, one of those rich and elaborate arrangements this firm is in the habit of setting up. Mr. G. H. KENDRICK, Edgbaston (J. P. Macdonald, gr.), was a close 2nd, and Mr. W. VAUSE, Leamington, 3rd. There were classes for a collection of stove and greenhouse plants, a table of tuberous Begonias, for Fuchsias, Coleus and Caladiums, good examples of each being shown, &c.

Handsome prizes were offered for a collection of fruits in not fewer than ten and not more than fifteen varieties. Mr. J. H. GOODACRE, Elvaston Castle Gardens, took the 1st prize with a fine collection of seventeen dishes, two of them being in duplicate; he had excellent Madresfield Court, Black Hamburg, Gros Maroc, and Muscat of Alexandria Grapes; excellent Peaches and Nectarines, Figs, Plums, Melons, &c. Mr. T. BANNERMAN, The Gardens, Blithfield, Rugeley, was 2nd; and Mr. J. READ, The Gardens, Bretby Park, 3rd. With three bunches of Grapes Mr. GOODACRE was again 1st; Mr. BANNERMAN, 2nd.

Some excellent Roses were shown in the Open-to-all Division. Mr. GEO. PRINCE, Longworthy, was 1st with some excellent specimens, the Hybrid Perpetuals brilliant, and the Hybrid Teas fine in quality. Messrs. PERKINS & SON, Coventry, were 2nd. With twelve blooms of Tea Roses Mr. GEO. PRINCE was again 1st; and Mr. JOHN MATTOCK, Oxford, 2nd—both staging very good blooms.

Carnations were shown in two classes, and bunches of Violas made a pretty display. Table decorations, arranged on tables 8 feet by 4 feet, constituted an attractive feature.

Sweet Peas were largely shown in classes in which Mr. R. SYDENHAM and others offered special prizes: those offered by Mr. A. R. BROWN for bizarre and flaked Carnations and white-ground Picotees, brought some charming blooms.

A large number of honorary exhibits was staged by the trade and private growers. A silver cup, a gold medal, and a money prize had to be awarded among them, with silver medals. The Cup fell to the lot of Mr. GEO. PRINCE, who had a collection of Roses of high quality; Messrs. BAKER, Wolverhampton, took the Gold Medal, also with Roses; Messrs. HEWITT & Co., Solihull, were awarded the money prize for Carnations and cut flowers. Silver Medals were awarded to Mr. G. HANCOX, for foliage plants; Messrs. CAW & Co., for cut flowers; B. R. DAVIS & SON, Yeovil, for double Begonias; J. MATTOCK, for Roses; JARMAN & Co., Chard, for cut flowers in variety; TUPLIN & Co., Newton Abbot, for Carnations; and Messrs. SIMPSON & SON, for Sweet Peas.

DURHAM, NORTHUMBERLAND AND NEWCASTLE HORTICULTURAL.

JULY 27.—This show, held on the above date at Newcastle-on-Tyne, was a representative one, and the quality of the exhibits as well as the number of entries in the various classes far exceeded those of late years. Unfortunately the climatic conditions were unfavourable, and the attendance of visitors was affected thereby.

In the non-competitive collections, Messrs. F. SANDER & SONS, St. Albans, staged a group of Orchids and foliage plants.

Messrs. J. CHARLESWORTH & Co., Bradford, had a display of hybrid Cattleyas and Cypripediums which were very attractive.

Messrs. BALSHAW & SON, Scarborough, sent Carnations, Lilliums, and flowering and foliage stove and greenhouse plants.

Messrs. KENT & BRYDON, Darlington, sent a large miscellaneous group, which was very effectively arranged.

Messrs. STORMONTH & SONS, Kirkbride, had hardy plants and flowers.

Mr. J. W. BARBER, Newcastle-on-Tyne, showed a miscellaneous group of flowering stove and greenhouse plants.

Mr. J. FORBES, Howick, sent a large group, in which Phloxes, Pentstemons, various herbaceous plants, and Carnations were well represented.

Mr. J. DOUGLAS, Bookham, Surrey, had also a choice collection of Carnations.

Messrs. FELL & Co., Hexham, sent a large group of hardy trees and shrubs, giving a light and ornamental effect as arranged with various hardy herbaceous plants and flowers.

Messrs. J. THOMPSON & SON, Forest Hill, Newcastle-on-Tyne, sent a large group of Carnations, Sweet Peas, and annuals.

Messrs. GIBSON & Co., Leeming Bar, Bedale, sent a group of cut hardy flowers.

Messrs. ARTINDALE & SON, Sheffield, sent a group of Violas and Carnations.

Mr. H. A. INNES, Newcastle, had an extensive group of Cactaceous plants.

COMPETITIVE CLASSES.

Five groups of miscellaneous plants, 20 feet by 10 feet each, were staged, and were very effectively arranged, but unfortunately a few cut flowers had been used, and in consequence some of the best groups were disqualified.

In the class for six specimen plants in flower the pitmen had it to themselves, and the huge specimens of Clerodendrons, Rondeletias, Allamandas, Lapagerias, &c., were marvels of cultural skill and care.

Among the cut-flower classes for bouquets and dinner-table decorations, the local trade made a grand display. The Roses in almost all the open classes were good. The premier awards went to Messrs. DICKSON & SON, Newtownards, and Mr. HUGH DICKSON, Belfast.

The prizes for Sweet Peas and Carnations were keenly competed for, and the quality of the flowers shown was above the average.

In the large class for flowers of hardy herbaceous plants, Messrs. EDMONDSON, Newcastle, and GIBSON & SON, Bedale, were the winners with fine groups of cut blooms very neatly arranged.

Vegetables were not so good as usual, nor were the exhibits so numerous.

FRUIT.

The fruit generally exceeded in quality that usually exhibited at this show. In the class for eight dishes of fruit, distinct, the Earl of LONDENBOROUGH (gr., Mr. J. C. McPHERSON), Londesborough Park, was 1st; Lady BEAUMONT (gr., Mr. Nicholls), Carlton Towers, 2nd; the Earl of DURHAM (gr., Mr. E. Combey), 3rd.

For four dishes Mr. McPHERSON was again 1st; Mr. G. PEARSON, Brancepeth, Durham, 2nd; Mr. NICHOLLS, 3rd.

In the class for four bunches of Grapes, not fewer than two varieties, Mr. NICHOLLS was 1st; 2nd, J. HUTTON, Esq. (gr., Mr. T. Cowperthwaite).

For two bunches Muscat, Mr. McPHERSON was 1st, with fine finished bunches of Muscat of Alexandria; Miss MUSCHAMP (gr., Mr. W. Mark), Corbridge, 2nd.

For two bunches of White Grapes, any other variety, Mr. NICHOLLS was 1st with Buckland Sweetwater.

For two bunches of Black Grapes, Mr. W. NICHOLLS was 1st with finely-finished Black Hamburg.

The best dish of Peaches was shown by Mr. J. C. McPHERSON; Mr. NICHOLLS being 2nd.

Mr. E. COMBEY was 1st for a dish of Nectarines.

For two dishes of Strawberries Mr. N. MACFARLANE, Alnwick, was 1st.

Mr. McPHERSON was 1st for twelve fruits of Tomatos.

In the amateurs' class for four dishes of fruit, Mr. COWPERTHWAIT was 1st.

THE HORTICULTURAL CLUB.

THE annual excursion took place on Wednesday, July 27, and, thanks to the hospitality accorded to the members and their friends by Mr. and Mrs. HARRY J. VEITCH and the general arrangements made by Mr. VEITCH, some fifty-odd participants spent a most delightful and instructive day. The weather fortunately was only a little chequered by occasional showers, and even this was more than counterbalanced by the prevailing freshness of the landscape after the previous heavy rainfall. The party went down by the 10.55 train from Paddington in two saloon carriages, and being met at Slough by their host, had a delightful drive by brake to Langley Park, the residence of Sir R. Harvey, Bart, where, by permission, they had an opportunity of inspecting a number of remarkably weird examples of Japanese bronzes, nightmarish combinations of dragons, Cupids, and fierce-looking lions with yard-wide grins upon their very open countenances, prior to viewing the greatest marvel of all, the renowned Cedar of Lebanon, which forms the chief attraction there among many. This Cedar utterly transcends all ordinary ideas, owing to its immense size and the peculiar decumbent habit of its branches, the lower of which spread horizontally in all directions to a great distance, completely covering with still rapidly spreading foliage a circle of no less than 100 yards circumference.

Penetrating this, we reach an enormous trunk which towers to a great height, sending out similar but smaller branches to some elevation, and finally forming a grand mass of foliage, somewhat more on normal Cedar-like lines. The main lateral branches are seen to be of huge girth in themselves, and resting upon the soil at a considerable distance from the trunk, spread out into wide sheets of vigorous verdure to form the circle aforesaid. To look at this tree one would believe it to be at least one thousand years old, judging by ordinary standards of growth, and yet it is computed to be no more than 150 years old, and certainly not 200, as the Cedar of Lebanon had not been introduced into this country so long ago. In the same garden is an extraordinary example of the common Spruce Fir. This, too, appears to have caught the spreading habit of the Cedar, its lowest branches radiating horizontally and resting on the soil. It differs, however, in the fact that a large number of these branches have rooted, and while still attached have formed a ring, or rather thicket, of good-sized trees, more of which appear to be in process of formation. The most curious feature is observed when this thicket is entered, as it can be here and there, when it is seen that each tree is joined to the main trunk by a slender branch an inch or so in diameter and a yard or two long, which at the rooting point suddenly swells out to a foot or more thick, which continues horizontally for a few yards and then lifts perpendicularly to form the tree proper.

The effect is very odd and shows that so soon as the rooting of the branch was perfected, the resulting young tree ceased to contribute an appreciable annual ring to the connecting link. After these, the beautiful collection of Bamboos, &c., was visited and much admired, and the party then proceeded *via* Black Park to East Burnham Park, the seat of Mr. Harry Veitch, where a generous luncheon was provided and also afternoon tea, when Mr. Veitch's beautiful gardens, poultry, aviaries, &c., to say nothing of the houseful of artistic treasures, had been duly investigated. Subsequently the party was driven to Maidenhead, *via* the renowned Burnham Beeches and the celebrated grounds of Dropmore, where an appropriate finale to a delightful day was enjoyed in the form of a capital dinner at Skindells Hotel, prior to the home journey thence to Paddington. That Mr. and Mrs. Veitch's abundant kindness found due recognition in a hearty vote of thanks need hardly be stated. C. T. D.

CARDIFF AND COUNTY HORTICULTURAL.

JULY 27, 28.—The sixteenth annual show held under the auspices of the above Society took place in the Sophia Gardens, Cardiff, on the above dates. The Society has every reason to be gratified with the increased number of entries and the quality of the material exhibited this season. The only thing to be regretted is that the weather was so unpropitious on the opening day.

Taking into consideration the recent dry weather, the Roses staged, both as regards number of exhibits and general excellence, were one of the features of the show; and in this respect it was remarked by several of the visitors that it was one of the best shows seen outside of London this year. Sweet Peas were also well represented, and added their quota to the general excellence of the show. The vegetables considered through and through were of a very high quality, and were a credit to the growers.

PLANTS.

The competition in the open classes for specimen plants was not very keen. For two flowering and two foliage stove and greenhouse plants, Messrs. J. CYPHER & SONS, of Cheltenham, were easily 1st with *Crassula*

coccinea and *Statice intermedia* as flowering plants, and *Croton mortefontaineensis* and *Kentia Fosteriana* as foliage plants. W. J. BUCKLEY, Esq., Llanelly (gr., Mr. Carpenter), took 2nd place with *Bougainvillea Sanderiana*, *Clorodendron Balfourianum*, *Croton Baron de Rothschild*, and *Kentia Belmoreana*.

For a group of miscellaneous plants arranged for effect in a space of 150 square feet, Messrs. J. CYPHER & SONS won 1st prize again. The grouping was light and graceful, and the plants choice and well grown. Two plants not often seen in gardens nowadays were freely used in this collection, and were the source of some inquiry from visitors, viz., *Chironia baccifera* and *Origanum Dietamnus*. W. J. BUCKLEY, Esq., took 2nd place in this competition; whilst W. W. LAWES, Esq., of Trowbridge, was placed 3rd.

In the Amateur class W. J. BUCKLEY, Esq., took 1st prize for a group of mixed plants in a space of 50 square feet; Mrs. EVAN LEWIS, Llandaff, 2nd; and JAMES HOWELL, Esq., Cardiff, 3rd.

For a group covering a space of 25 square feet, C. WALDRON, Esq., Llandaff, was placed 1st, and Mrs. EVAN LEWIS, 2nd.

A large group of foliage plants, consisting mainly of well-coloured *Crotons*, was exhibited by the Marquis of BUTE (gr. Mr. H. Farmer), but was not put up for competition.

CUT FLOWERS.

As previously stated Roses formed one of the main features of the show, but owing to the heavy rains experienced in the district lately the blooms staged by the local growers were not so good as might otherwise have been the case, and as a consequence the majority of the prizes went to the competitors from a distance. In the collection of twelve distinct varieties of Roses, three blooms of each, Mr. H. DREW, of Longworth, took 1st prize, and Mr. GEO. PRINCE, of Longworth, 2nd. For a similar collection of Teas or Noisettes the same exhibitors were placed as in the previous class. Messrs. J. JEFFERIES & SON, of Creneester, were awarded 1st for a collection of twenty-four distinct varieties, and also 1st for a collection of 18 distinct varieties of Teas or Noisettes. Mr. GEO. PRINCE was awarded 2nd in both of these classes.

For 12 blooms of any one variety other than Teas or Noisettes Messrs. JARMAN & CO., of Chard, took 1st with a box of Mrs. John Laing. Messrs. S. TRESEDER & SON, Cardiff, took 1st place for a box of 12 blooms of any one variety of Tea or Noisette, the variety shown being *Medea*.

In addition to the prizes gained by Messrs. JEFFERIES & SONS in the foregoing classes they were awarded the Royal Horticultural Society's Silver Medal for having the best exhibit in these same classes.

In the Amateur division the principal prize-winners were R. F. HOBBS, Esq., Worcester; S. ROBINSON, Esq., Cardiff; and A. TOWNSEND, Bridgend.

The competition class for a collection of cut Roses shown with their own foliage and flower bud and arranged for effect in a space of 6 feet by 3 feet, was a keen one, and resulted in the production of the brightest piece of colour in the show. Mr. J. MATTOCK, of Oxford, took the 1st place, his collection containing among other varieties those following:—*Madame A. Chatenay*, *Dorothy Perkins*, *Liberty*, *White Maman Cochet*, *Souvenir de Catherine Guillot*, &c. Mr. GEO. PRINCE was placed 2nd, and some of the best varieties in his group were *Marquis of Salisbury*, *Mrs. Grant*, *Georges Schwartz*, and *Lady Battersea*. Mr. J. CROSSING, Penarth, and Messrs. S. TRESEDER & SON, Cardiff, were 3rd and 4th respectively.

HARDY HERBACEOUS PLANTS

were well shown, Mr. W. TRESEDER, Cardiff, taking 1st prize for a collection of cut flowers covering a space of 45 square feet. Messrs. STOKES & SONS, 2nd; and Messrs. H. & W. EVANS, Llanelly, 3rd.

In addition to other florists' flowers, there were some pleasing groups of *Carnations* and *Picotees* shown with their own foliage and buds—a much more rational and artistic method of exhibiting these lovely flowers than when they are boxed, collared, and dressed.

Messrs. I. HOUSE & SON, Bristol, put up a fine collection of eighteen distinct varieties of Sweet Peas, for which they were awarded 1st prize. Unfortunately, the use of a purple background of art drapery detracted very considerably from the colour of many of the varieties shown. R. BATHURST, Esq., took 2nd, and T. J. DUGMORE, Esq., 3rd places in this competition.

FRUIT.

The competition in the fruit classes was not so strong as one would wish to see at such a place as Cardiff. The date of the Show is, however, a little too early for the generality of hardy fruit, and the few Apples staged would have been very much better left upon the trees to ripen. Currants and Gooseberries were good, and were an indication of what can be done in the neighbourhood.

For two bunches of any black Grapes, Sir A. HENDERSON, Wellington, was 1st; and T. J. THOMAS, Esq., Aberdare, 2nd, with the variety *Black Hamburg*; T. S. CARTWRIGHT, Esq., Llandaff, was placed 3rd, with two bunches of *Madresfield Court* much larger in every way than the two foregoing, but unripe.

For two bunches of any white Grape, T. S. CARTWRIGHT, Esq., was 1st; R. ENGLAND, Esq., Rumney, 2nd; and E. H. EBSWORTH, Esq., Llandaff, 3rd.

Sir A. HENDERSON took the 1st prize for the collection of six dishes of dessert fruit: T. S. CARTWRIGHT, Esq., 2nd; and E. B. EBSWORTH, Esq., 3rd.

For a dish of five Peaches the Marquis of BUTE took 1st prize with a magnificent lot of Princess of Wales. The Marquis also added considerable interest to the fruit collection by exhibiting several pot Vines laden with well-developed and highly-coloured fruit, also Pines and Melons, none of which were for competition.

VEGETABLES.

For a collection of vegetables, consisting of nine distinct kinds, Sir A. HENDERSON was successful in gaining 1st place; Mrs. JENNER, Wenvoe, Cardiff, 2nd; and JOHN DEACON, Esq., Bridgend, 3rd.

Potatoes were shown in excellent condition, although from the purely culinary standpoint the individual tubers seemed to be verging too much to the large size. E. B. EBSWORTH, Esq., was 1st for eighteen white kidney tubers; Mr. H. R. CYPHER, Cardiff, was 1st for eighteen coloured kidney tubers; and Colonel SANDFORD, Wellington, 1st for eighteen white round tubers; and E. B. EBSWORTH, Esq., 1st for the same number of coloured round tubers.

A good display of all kinds of vegetables was made both in the Open and Cottagers' classes, and the competition evoked was very satisfactory.

TRADE EXHIBITS.

Some of the most noteworthy trade exhibits were made by Messrs. SUTTON & SONS, Reading, who showed a fine collection of *Gloxinias*, for which they received a Gold Medal; Messrs. T. S. WARE & CO., Feltham, *Begonias*, for which they were also awarded a Gold Medal; Mr. M. PRITCHARD, Christchurch, showed a choice collection of heraceous plants (*Silver-gilt Medal*); Messrs. WATERER & SONS, Bagshot, a stand of retarded *Lilies* and *Lily of the Valley*, for which they obtained one of the Society's *Silver-gilt Medals*.

In addition to the special awards already mentioned, the Royal Horticultural Society's Gold Medal was awarded to the Marquis of BUTE for collections of plants and fruits; the Cardiff Society's Silver Medals to Mr. VINCENT SLADE, Taunton, for *Zonal Pelargoniums*; to Mr. H. R. GOOLVEN, Manchester, for *Sweet Peas*; to Messrs. C. PHELPS & CO., Cardiff, for *Gloxinias* and *Roses*; and to Messrs. BLACKMORE & LANGDON, Bath, for *Begonias*.

Silver-gilt Medals were also presented to Mr. W. TRESEDER for *Dahlias*, and for bouquets, sprays, and baskets of flowers.

SOCIÉTÉ FRANÇAISE D'HORTICULTURE DE LONDRES.

ANNUAL OUTING.

The members of this Society, accompanied by a few friends, passed a very pleasant afternoon on July 28, when they had their annual outing. Last year the Society was invited by Mr. Peter Kay to inspect his famous vineries at Finchley, and as the *personnel* of the Society changes very considerably each year, it is a desirable thing that these young Frenchmen, who come to this country for the double purpose of learning the English language and of obtaining an insight into British horticulture, should be given an opportunity occasionally of visiting some representative establishment, and of enjoying social intercourse with British gardeners. Such means as these have an effect wider in its scope than would appear at first sight, for the young men who return to France (half a hundred each year) carry back with them pleasant memories of the time they have spent in England, and such international intercourse tends to beget a better understanding between the two peoples, owing to the increased knowledge each obtains of the other.

The much-respected President, Mr. George Schneider, had on this occasion arranged a trip to Burnham Beeches, being invited there by Mr. Harry J. Veitch. The party left Paddington rather late at 3.20 p.m., and travelled by a special saloon carriage to Slough, where they were met by Mr. Veitch with three large brakes provided by that gentleman. After a pleasant drive, Mr. Veitch's residence at East Burnham Park was reached. Here tea was served immediately under a tent on the lawn, and directly afterwards Mr. Veitch conducted the party through his pleasant gardens, pointing out a beautiful view of Windsor Castle. After admiring the lake and the Water-Lilies and other objects, but regretting that time would not allow of a visit being made to a wild garden Mr. Veitch has made in the midst of a wood, the party again mounted

the brakes, and, after cheers had been given for Mr. and Mrs. Veitch's hospitality, we were hurried off to

DROPMORE.

Our readers have many times heard of the glory of Dropmore, the residence of the Hon. J. B. Fortescue. Mr. C. Page, the gardener, met the party and conducted them through as much of the grounds as time would permit, everyone admiring the extraordinary and magnificent specimens of coniferous and other trees for which Dropmore will be famous for many years to come. We can only refer here to the most striking of these trees.

Proceeding to a point immediately in front of the mansion we had a very pretty view of Windsor Castle, and noted a fine tree of the white Birch, also a white Poplar bearing much Mistletoe, and immediately at our feet some of the wild Heather left in the condition it was before the grounds were formed. Then Mr. Page pointed out a splendid tree of *Tsuga Mertensiana* (*Abies Albertiana*), which it is said was given by John Standish many years ago to Lord Grenville, who then lived at Dropmore. Mr. Page remarked that he afforded the tree a top-dressing each year, putting over the roots about 1 inch deep of leaf-mould and clayey marl obtained from the lake.

Next was a specimen of *Pinus monticola*, still growing fast: *Abies grandis*, planted in 1861, which has lost its leader, but is a very remarkable tree; *Pinus Escarena*, planted (like the *Gardeners' Chronicle*) in 1841. It has a very thick stem and a distinct habit of growth. *Cedrus atlantica* was much admired for its large dimensions, and good condition. *Pinus ponderosa* (*Benthamiana*) was very fine, also *Picea Pin-drow*, 30 feet to 40 feet high. The finest specimen of *Sequoia gigantea* was approaching 100 feet high, and has a stem at least 7 feet in diameter at the base. It was planted in 1862, and is a glorious tree.

Then was seen an excellent tree of *Pinus insignis* planted in 1839, in which the true characteristics of this handsome species are now fully developed. We afterwards admired *Pinus Strobus*, *Tilia argentea* (a handsome Lime, the leaves of which are white on the under surface), the magnificent Cedar avenue (there exists no information in respect to the year in which the trees were planted), tall Scots Firs with their reddish stems all aglow with the rays of the setting sun shining upon them, and two extraordinary specimens of the Douglas Fir (*Pseudo-tsuga Douglasi*). Of these two trees it was difficult to admire one more than the other. The taller specimen is 127 feet high, and was planted in 1830; but the other, though not so tall, has a more spreading habit, and its bottom boughs sweep the ground for a distance of nearly 20 yards. This tree is still growing very fast, and has extended on one side alone as much as 6 feet during the past four years. Other exceptionally good trees included *Pinus Lambertiana* (planted in 1845), *Cryptomeria japonica*, and *Tsuga Brunoniana*, the Himalayan Hemlock Spruce. This latter tree is probably the best of its species in this country, and by reason of the silvery colour of the undersides of the extra long leaves, its effect when breezes lift up the slender branches is most beautiful. An excellent illustration of this rare species, prepared from the Dropmore tree, was published in the *Gardeners' Chronicle*, October 16, 1886. In many districts this beautiful species is considered to be too tender, but in the position this specimen occupies at Dropmore it succeeds well. Before all the attractions of Dropmore were exhausted it was necessary to rejoin the brakes and drive to Slough, to catch the 8.55 P.M. train for London.

BASINGSTOKE FLOWER SHOW.

AUGUST 1.—The twenty-eighth annual show was held in Goldings Park, and was successful in every way. The exhibits of Plants were numerous and of good quality. Mr. Wasley, gr. to J. B. TAYLOR, Esq., Sheffield Manor, Basingstoke, was 1st with fine specimens.

Mr. G. Best, gr. to F. D. LEYLAND, Esq., The Vyne, Basingstoke, was successful with a group of miscellaneous plants arranged for effect. Tuberous Begonias were a feature, for which Mr. W. Green, gr. to S. E. BATES, Esq., Mangdown, won the premier award.

Cut flowers were numerous, especially herbaceous varieties. For twelve bunches, distinct, Mr. Hunt, gr. to J. MOSS, Esq., Fern Bank, Blackwater, was 1st with a choice assortment.

Although Roses were poor in quality, Carnations and *Picotees* were remarkably fine.

Grapes were shown well, also Peaches, some fine fruits of *Alexandra Noblesse* Peaches being excellent. Nectarines and Melons were also well in evi-

dence, Buscot Park Seedling of the latter fruit being the best green-fleshed Melon exhibited.

Vegetables were numerous and of a high standard of quality. Mr. BOWERMAN won the premier prize for eight dishes.

SCOTTISH HORTICULTURAL ASSOCIATION.

JULY 30.—Nearly 100 members of the Scottish Horticultural Association responded to the invitation of Messrs. Dicksons, Ltd., Edinburgh, to inspect their Nurseries at Craigmillar. The grounds were in high-class order, and the members freely expressed their approbation. The breadths of young Scots Fir and Larch, particularly the Japanese Larch, were interesting. Flowering shrubs, herbaceous plants, alpinas, and general nursery produce are all alike well done. Apples, Pears, Plums, and Cherries deserve a special word of praise.

The usual vote of thanks concluded a most interesting outing.

LEICESTER ABBEY PARK FLOWER SHOW.

AUGUST 2, 3.—The Flower Show was one of the best held in the neighbourhood in recent years, and, favoured with brilliant weather, attracted a large number of visitors.

PLANTS.

Groups of plants arranged for effect were a leading feature, the 1st prize of £20 falling to Messrs. JAMES CYPHER & SON, Cheltenham. Mr. W. VAUSE was 2nd.

The latter was placed 1st with six stove and greenhouse plants, of which three were in flower. Mr. W. FINCH, Coventry, was 2nd.

Mr. FINCH was 1st with six exotic Ferns, staging some good specimens.

The best specimen plant in bloom was *Bougainvillea glabra*, from Mr. VAUSE. There was also a class for eight miscellaneous plants.

CUT FLOWERS.

Roses.—With thirty-six blooms of *Roses*, Messrs. A. DICKSON & SONS, Newtownards, Belfast, were 1st, having generally large full fresh blooms, chief among them being *Horace Vernet*, Mrs. Davison (a pale rose with a deep fleshy tint in the centre), *Marie Verdier*, *Lady Ashdown*, *Bessie Brown*, *Chas. Lefebvre*, *Ulrich Brunner*, *Her Majesty*, *Ben Cant*, a fine bloom of *Star of Waltham*, &c. With twenty-four blooms of *Roses*, Messrs. A. DICKSON & SONS were again 1st; and Mr. H. DREW, Longworth, Berks, 2nd. With twelve blooms of one variety, Messrs. A. DICKSON & SONS were 1st with *Frau Karl Druschki*; and Mr. H. DREW, 2nd, with *Mrs. J. Laing*. With twelve *Teas* and *Noisettes*, similar positions were again held by these two growers. With twelve *Teas*, one variety, Messrs. A. DICKSON & SONS were 1st with the variety *Lady Roberts*; and Mr. H. DREW, 2nd, with *White Maman Cochet*. The best *Rose* selected from the foregoing classes was *Star of Waltham*, ten very fine examples being contained in Messrs. A. DICKSON & SONS' 1st prize box of thirty-six blooms.

Roses were also well shown by amateurs and private gardeners.

Carnations and *Picotees*.—These flowers are always a leading feature at Leicester, especially in the Amateurs' classes, in which the competition was very keen.

In the open class for twelve *Carnations*, bizarres and flakes, Mr. A. R. BROWN, Handsworth, Birmingham, was 1st with good and bright flowers.

With twelve self *Carnations*, Mr. R. C. CARTWRIGHT (gr., Mr. Rudd), was 1st with large, bright flowers, and Mr. A. R. BROWN, 2nd. With twelve yellow-ground *Carnations*, these two exhibitors again held similar positions.

With twelve white-ground *Picotees*, Mr. A. R. BROWN came 1st with excellent blooms, and Mr. RUDD, 2nd.

There were also classes for single blooms of bizarre, flaked, and self *Carnations*, and for *Picotees*.

Cut Stove and Greenhouse Flowers.—The best stand of twelve bunches came from Sir A. MUNTZ, Bart. (gr., H. Blakeway); Mr. W. HORLOCK being placed 2nd.

Hardy Annuals in bunches made an effective display. The best twelve bunches came from Mr. W. WRIGHT, Jun.; Mr. J. H. HILL being 2nd.

Mr. W. BARSBY had the 1st prize for twelve bunches of zonal *Pelargoniums*, tastefully arranged in vases.

Mr. W. WRIGHT, Jun., had the best twelve blooms of fancy *Pansies*, and Mr. J. H. HILL the best six blooms; Mr. H. YEOMANS taking the 1st prize with twelve bunches of *Violas*.

Floral Decorations, Open.—Mrs. H. CARNALL, Court Florist, London Road, was 1st with a hand bouquet. Messrs. W. & J. BROWN, Peterborough, were 1st for a bride's bouquet. Mr. H. BLAKEWAY won the 1st prize for a basket of flowers.

For twelve bunches of hardy herbaceous and bulbous

flowers Mr. JAS. WRIGHT, Leicester, was 1st, and Mr. W. WRIGHT, Jun., 2nd.

FRUIT.

The fruit exhibited was decidedly good. With eight dishes, with a Pine allowed, Mr. J. H. GOODACRE, The Gardens, Elvaston Castle, Derby, was 1st, with a well-balanced collection. Mr. J. READ, The Gardens, Bretby Park, Chesterfield, was 2nd.

In the class for 8 dishes, Pine excluded, Mr. J. H. GOODACRE was again 1st. Mr. W. J. DRAKE, Market Rasen (gr. J. Brown), was a good 2nd. With four varieties of Grapes, two bunches of each, Mr. GOODACRE obtained the 1st prize. Mr. GOODACRE was the only exhibitor of a Pine-apple, taking the 1st prize with a good fruit of the variety *Queen*.

Mr. J. BROWN took the 1st prize for two bunches of Black Hamburg Grapes. Mr. GOODACRE was 2nd. Mr. NISBETT came 1st with two bunches of Muscats, having fine berries, clean and bright, though lacking in colour. Mr. GOODACRE was 2nd with fruit of a better colour, but the berries a little past their best.

With two bunches of blacks other than *Hamburg*, Mr. GOODACRE was 1st with *Madresfield Court*. Mr. J. SWANWICK was 2nd with *Muscat Hamburg*.

With two bunches of any white Grape but *Muscat*, Mr. BROWN was placed 1st with very fine *Foster's Seedling*; Mr. NISBETT coming 2nd.

The best six Peaches came from Mr. SWANWICK; Mr. NISBETT was 2nd. Mr. BLAKEWAY had the best dish of Nectarines.

There were good dessert and Morello Cherries. Gooseberries and Currants were also shown.

Fruitables were of fine quality. Mr. E. BECKETT, Aldenham House Gardens, took the 1st of Messrs. SUTTON & SON's special prizes with some very fine produce; Mr. J. HUDSON was 2nd. The latter took the 1st of Messrs. HARRISON & SONS' special prizes, and they also offered prizes for Sweet Peas. Mr. J. HUDSON also won the 1st of Mr. R. PRINGLE's special prizes, also for a collection of vegetables. Mr. H. CHAMBERLAIN took the 1st of Mr. R. STDENHAM's special prizes for Sweet Peas with a very fine collection.

A large tent was filled with produce shown by cottagers and allotment holders.

Miscellaneous collections were very numerous, and supplied several fine features. *Gold Medals* were awarded to Messrs. MACRIMMON & FULTON, Leicester, for various cut flowers, decorations, &c.; to Mrs. CARNALL, Leicester, for floral decorations, &c.; to Mr. F. BROWN, Market Bosworth, for cut flowers, &c.; to Mr. W. BENTLEY, Leicester, for an excellent collection of *Roses*; and to Messrs. DOBBIE & CO., Rothsay, for *Roses*, *Cactus Dahlias*, &c.

Silver Medals were awarded to Mr. J. BARROW, Leicester; C. WARNER, Leicester; HARRISON & SONS, Leicester; C. HOLDEN, Hinckley; JAS. WRIGHT, Leicester; CLIBRAN & SON, Altrincham; W. L. PATTERSON, A. DAY, Coventry; F. M. BRADLEY, Peterborough; and W. & J. BROWN, Peterborough.

SCHEDULES RECEIVED.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL SOCIETY'S grand flower show, to be held in St. Andrew's Halls on Wednesday and Thursday, September 7 and 8, 1904. Secretary and treasurer, Mr. Hugh Mackie, 55, Bath Street, Glasgow.

TRADE NOTE.

CROP REPORT FROM HOLLAND.—As usual, we have the pleasure to hand you the following report on the present condition of our crop this year. On account of the very wet weather which prevailed last autumn, some biennials were sown very late, and in some parts they could not be sown at all. Consequently the area of Beets, Mangels, Turnips, Parsleys, Corn Salad, &c., is not so large as was first proposed. Our mild winter did not kill any plants. In spring we had excellent weather, so that field work, sowing, and planting took place under the most favourable circumstances. This spell of fine weather has lasted ever since up to the present time, so that as a whole the prospects of the crop are good. Cauliflowers look good and promise a good crop. White Cabbage, Red Cabbage, Savoy, Brussels-Sprouts, and Borecole have developed very well, look healthy, and promise a good crop. Turnips and Swedes—owing to the unfavourable weather in autumn, part of these were sown too late or were not sown at all; a good deal, however, has developed very well, and promises a good average crop, with the exception of some few varieties.

such as Milan. Kohl Rabi—a good deal got lost; small crop. Mangel-Wurzel and Sugar Beet look good. Beet stands pretty well. Carrots as a whole promise a fairly good crop. Parsnips and Scorzonera—good crop. Corn Salad—middling; some sowings have failed. Radishes look good. Spanish Radish—little planted, as some sowings failed last autumn—looks good. Onions are mediocre—the bulbs were not healthy. Garlic Bulbs—good. Celeriac—unhealthy; small crop. Parsley—plain Parsley good; rooted Parsley middling. Borage—very good crop. Chervil—average crop. Spinach promises an average crop. Peas—very good. Cucumbers—mediocre. Dwarf Beans and Running Beans—good as a whole; some plants are poor on account of weak germination; hard winds have also done some damage.

Flower Seeds.—After two years, which were most unfavourable for flower-seed growing, we are now glad to say that, owing to the fine weather in spring, the actual situation of the crops as a whole is promising. *Sluis & Groot, Enkhuizen.*

ENQUIRY.

CAN any of our readers supply a correspondent with a method of trapping bats?

MARKETS.

COVENT GARDEN, August 3.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

REMARKS.—Both Cherries and Strawberries are now over. Black Currants, 6s. to 7s. 6d. per sieve; red do., 5s. to 6s. per sieve. Raspberries, 3s. to 3s. 6d. per cwt.; do., per gallon 1s. 6d. English Plums, River's Early Orleans, 2s. 6d. to 3s. per sieve. Apples, St. Julien, Lord Suffield, and Keswick Codlins, 1s. 6d. to 2s. 6d. per half bushel; Gladstone, Beauty of Bath, and Quarrendens, 2s. 6d. to 4s. do. Walnuts, which are now mostly woody, 1s. to 1s. 6d. per sieve. Prices for Potatoes have a downward tendency.

POTATOES.

Home-grown, 80s. to 120s. per ton, John Bath, 32 & 34, Wellington Street, Covent Garden.

COVENT GARDEN FLOWER MARKET.

WE are now at the end of the season, and after to-day the Market will only remain open on Tuesdays, Thursdays, and Saturdays for pot-plants, and on Mondays, Wednesdays, and Fridays for cut flowers. The plant trade is now practically finished, many growers having already vacated their stands, which they will resume in September or October. Buyers requiring stock for any special purpose will still be able to procure it from the few growers who keep up a regular supply all seasons. Verbenas are still very good, also White Marguerites. Zonal Pelargoniums King of Denmark, Ville de Poitiers, Hermione, and F. V. Raspail are good, but mixed sorts are very poor. Hydrangea paniculata in bush plants and standard are good, also H. Hortensia. Plants of Acalypha hispida (Sandersiana) are obtainable; Crassula coccinea is good; the hybrid varieties are now over. Campanula isophylla alba and C. Mayi are plentiful; some are of poor quality. There are still some good Fuchsias, but the best are passed. Good Rhodanthe may still be bad; while Mignonette, Chrysanthemum segetum, Spiraea (Hoteia) japonica and other spring-flowering plants still hold out. Lilium longiflorum of various sizes are very plentiful, but sell slowly. L. auratum, L. lancifolium, album and rubrum are evidently sold at a loss to the growers. Palms are still seen, but there is practically no trade for them. Codiaeums (Crotons), Caladiums, Cordylines and other foliage plants, are not wanted, and can only be cleared out at very low prices. In Ferns there is still a little trade, and a few growers keep up a display, but many have stopped sending for the season. A few fine plants of Nephrolepis exaltata in large pots and in baskets are to be seen. Asparagus Sprengeri is good in 48's, also larger-sized plants. Buyers sometimes have difficulty in getting material for special work during the dull season, but that is not the case this season.

CUT FLOWERS.

There is very little trade for choice flowers, and only at the week end do ordinary flowers find any demand.

Most Roses are very small, but are still plentiful. Carnations are very prominent, border varieties being over abundant; Malmaison and American varieties are also in excess of all demands. Sweet Peas are not so good, though there are a few of fine quality to be seen. Lilium longiflorum is abundant, one grower having a stand full of fine blooms on long stems; L. laucifolium, album, and roseum are also over plentiful. Herbaceous Philox, especially the white, is very good. Asters are over plentiful, some are English grown, but many come from France. Gladiolus "The Bride," from the open ground is very plentiful; G. hrenchleyensis is also seen in large quantities. Gaillardias, Gypsophila, Stocks, Chrysanthemum leucanthemum, and other hardy flowers are seen in abundance. One grower still continues to bring in Iceland Poppies in good condition. Chrysanthemums are more in evidence. All kinds of cut foliage and Fern is over plentiful. Hardy deciduous foliage, some of which is very good, is now much used in preference to choicer material. A. H., July 30.

FRUITS AND VEGETABLES.

LIVERPOOL, August 3.—Wholesale Vegetable Market (North Hay).—The following are the averages of the current prices during the past week—prices varying according to supply:—Potatoes, per cwt., Early Regents, 4s. to 5s. 6d.; Kidneys, 5s. to 6s. 6d.; new, 1s. to 1s. 6d. per 21 lb.; Turnips, 4s. to 9d. per dozen bunches; Swedes, 3s. 6d. to 4s. per cwt.; Carrots, 8d. to 9d. per dozen bunches; Parsley, 6d. to 8d. per dozen bunches; Onions, foreign, 4s. 6d. to 5s. 6d. per bag; Lettuce, 4d. to 8d. per dozen; Cucumbers, 1s. 6d. to 2s. 6d. do.; Cauliflowers, 10d. to 1s. 9d. do.; Cabbages, 6d. to 1s. do.; Peas, 2s. 9d. to 4s. 9d. per hamper; Beans, 1s. 9d. to 2s. 6d. do.; Kidney Beans, 1s. 9d. per peck. Fruit: Grapes, Almerias, Castiza, 8s. to 7s. 6d. per barrel; superior do., 8s. 6d. to 10s. 6d. do.; Denias, 2s. to 3s. 6d. per barrel for white; and 6s. to 7s. 6d. for colours; Apples, Operto, 5s. to 7s. 6d. per case; do., Lisbon, 5s. 6d. to 8s. do.; Melons, 4s. 3d. to 5s. 3d., and 6s. to 7s. 6d. for 21's and 36's per case; a few lots at 7s. to 8s. per case; Oranges, Valencia, 8s. to 20s. per case; Naples, 7s. 6d. to 8s. 9d. per box; Lemons, Palermo, 4s. 6d. to 7s. 6d. per case; do., Naples, 6s. to 9s. per box; Tomatoes, Valencia, 5s. to 7s. per case; Onions, Valencia, 4s. to 4s. 6d. per case; Operto, 4s. 6d. to 6s. do. St. Johns —Potatoes, new, 1s. 2d. to 1s. 6d. per peck; Peas, 1s. per peck; Cucumbers, 3d. and 6d. each; Gooseberries, 2d. per lb.; Cherries, 4d. do.; Currants, black, 5d. do.; do., red, 4d. do.; Peaches, 2d. to 6d. each; Apricots, 1s. per dozen; Grapes, English, 1s. 6d. to 2s. 6d. per lb.; Pines, foreign, 3s. to 5s. each; Mushrooms, 1s. per lb. Birkenhead:—Potatoes, new, 3d. to 4d. per 5 lb.; Cucumbers, 3d. and 4d. each; Currants, red, 4d. and 5d. per lb.; do., black, 5d. and 6d. do.; Gooseberries, 1d. to 2d. do.; Grapes, English, 2s. to 3s. 6d. per lb.; Cherries, 6d. to 8d. per lb.; Mushrooms 8d. to 1s. do.; Tomatoes, 1 1/2d. to 6d. do.; Peas, 5d. and 1s. per peck.

GLASGOW, August 3.—The following are the averages of the prices during the past week:—Grapes, English, 7d. to 1s. 9d. per lb.; Belgian, 7d. to 9d. do.; Scotch, 7d. to 9d. do.; Strawberries, Scotch, 2d. to 4d. per lb.; Lemons, 4s. to 6s. per box, and 6s. to 10s. per case; Melons, Valencia, 4s. 6d. to 6s. per case; Tomatoes, English, 6d. per lb.; do., Scotch, 5d. to 9d. do.; do., French, 2s. to 5s. per crate; Mushrooms, Scotch, 10d. to 1s. 2d. per lb.; Onions, Valencia, 4s. 6d. to 5s. 10d. per case; Peas, Dutch, 3s. per bushel; Currants, Red, 1s. to 2s. per cwt.; do., Black, Irish, 20s. do.; Gooseberries, Scotch Warrington, 9s. to 10s. do.; Carrots, Dutch, 5s. to 6s. per hamper.

THE WEATHER.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Wisley, Surrey. Height above sea-level 150 feet. The following are the "mean" readings for the week ending July 30, 1904.

1904.	TEMPERATURE OF THE AIR.				TEMPERATURE OF THE SOIL at 9 A.M.				UNSHED.				
	At 9 A.M.		DAY.	NIGHT.	LOWEST TEMPERATURE ON GRASS.	At 1-foot deep.	At 2-foot deep.	At 4-foot deep.		RAINFALL.

Remarks.—Thunderstorm on the 30th.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 30, is furnished from the Meteorological Office:—

"The weather during this week was very dull over the kingdom generally, with occasional heavy thunder-

storms over England and at some Irish stations. In Scotland the weather continued dry.

"The temperature was again above the mean, except in Scotland, E., the excess ranging from 1° in England, N.E., the Channel Islands, and England, S.W., to 4° in England, E. The highest of the maxima were recorded either at the beginning or end of the period, and ranged from 83° in England, S., and the Midland Counties, to 73° in the Channel Islands, 72° in Scotland, N., and to 71° in Scotland, W., and Ireland, N. The lowest of the minima, which were mostly registered during the latter half of the week, varied from 42° in Scotland, N., and England, N.W., to 54° in the Channel Islands.

"The rainfall was extremely heavy in several English localities, especially in the Midlands and England, S.W., but in England N.W. the fall was less than the normal. At Hillington during a thunderstorm on Saturday afternoon, 1.56 inch fell within 35 minutes. In all the Scotch districts the fall was much less than the mean, and only equal to it in Ireland, S.

"The bright sunshine was very deficient except in Scotland, N. The percentage of the possible duration ranged from 38 in the district just named, 35 in the Channel Islands, and 32 in England, S., to 16 in Scotland, E., and to 11 in England, N.E."

THE WEATHER IN WEST HERTS.

More heavy rain.—This was another warm week, but not nearly so warm as the three preceding weeks—the highest temperature in the thermometer-screen on only one occasion exceeding 74°. On one night, however, the exposed thermometer never fell lower than 56°, which is the highest minimum reading as yet recorded here this year. The ground is still unusually warm, the temperature at 2 feet deep being 3° warmer and at 1 foot deep 4° warmer than is seasonable. No rain has fallen during the last two days, but during the previous six days (July 25–30) 2½ inches was deposited—which is equivalent to a watering of 13 gallons on each square yard of surface in my garden. Of that amount 8 gallons has since come through the bare soil percolation gauge. Notwithstanding the recent heavy rainfall, not a drop of water has come through a similar gauge on which short grass is growing, which only shows how very dry the soil in that gauge must have previously become. There occurred two heavy thunderstorms on the 30th ult., one of which began soon after 1 o'clock in the afternoon, and the other shortly after 5 P.M. The former was much the most severe of the two—indeed, during the nine minutes ending 1.30 P.M. the rain was falling at the mean rate of nearly 1½ inch an hour. The sun shone on an average during the week for 4½ hours a day, or for about 1½ hour a day less than is usual at this season. Calms and light airs have again prevailed. The mean amount of moisture in the air at 3 P.M. has been 5 per cent. in excess of a seasonable quantity.

JULY.

A very hot month.—There have been only three previous Julys in the last eighteen years which have had so high a mean temperature. On seventeen days the highest reading in the thermometer-screen exceeded 75°, on four of these days rose to or above 80°, and on the hottest day to 85°. On the coldest night of the month the exposed thermometer fell to 42°, which is the highest extreme minimum registered by that instrument that I have yet recorded here in July. Moderate quantities of rain were deposited on the first two days of the month, while six days at the end of it were excessively wet. But in the intervening three weeks there was no rain worth mentioning. Rain fell altogether on only ten days, and to the aggregate depth of 3 inches, or more than half an inch in excess of the July average. No rain-water at all came through the gauge on which short grass is growing during the month, and none through the bare soil gauge until the last week, when the percolation amounted to 8 gallons. The winds were, as a rule, below the average in strength; in fact, at no time did the mean velocity for any hour exceed 15 miles. The mean amount of moisture in the air at 3 o'clock in the afternoon was 4 per cent. below the average in July for that hour. *E. M., Berkhamsted, August 2, 1904.*

COLONIAL NOTES.—We have received the following publications: *The Agricultural Gazette of New South Wales*, June. Contents: Universal Nomenclature of Wheat, N. A. Cobb; Fern and Orchid Pests, W. Froggatt; Curing the Lemon, W. J. Allen, &c.—*A Critical Revision of the Genus Eucalyptus*, by J. H. Maiden. Part IV.—*The Forest Flora of New South*

Wales, Parts VI. and VII., by J. H. Maiden.—From the Imperial Department of Agriculture for the West Indies, *The A.B.C. of Cotton Planting*, compiled by Officers on the Staff of the Department.—*Natal Plants*, vol. 2, Part IV., Grasses, edited by J. Medley Wood, A.L.S.—*Report upon the Botanical and Agricultural Department, Gold Coast*, for 1903. The Cocoa and Cotton plantations have greatly developed during the year, and a Botanic Station was established at Tarkwa.

*** * EDITOR AND PUBLISHER.**—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all communications relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the EDITOR. The two departments, Publishing and Editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are misdirected.

ASPARAGUS: *J. M.* We can detect no disease in the roots whatever. The failure must be due to something unsuitable in the cultivation.

BOOK ON VINES: *D. C. Barron's Vines and Vine Culture*, price 5s. 6d., post-free, from the Publisher of the *Gardeners' Chronicle*. Red-spider is generally the result of too dry an atmosphere in the house. Damp the surfaces in the house frequently, and if necessary, apply a paste made from flowers-of-sulphur over the hot-water pipes, or dust the leaves over with sulphur.

CARNATIONS: *Northern.* A very pleasing variety, of which there are dozens in commerce as good. It has several good qualities, but hardly pronounced enough to duplicate existing varieties.

CUCUMBER WITH LEAF: *J. W.* This is not unusual. As the outer portion of a cucumber is a swollen branch, enclosing the true fruit, and seeds within it, it is not remarkable that it should occasionally do as other branches do, and produce a leaf.

ERADICATING PLANTAINS: *T. H.* Removal with a sharp knife, taking care to cut below the crown, is a very simple, quick, and efficacious method of ridding grass of these plants. Do not dig them out with the blade, which would leave unsightly holes and cause injury to the turf, but just make a clean cut. Another plan is to apply a corrosive substance, such as sulphuric acid, or even common salt, in the crown of the Plantain, which is eventually killed through its action. The latter is used in the grass vistas at Kew.

EXHIBITING ALPINES: *J. E.* An exhibit of alpine plants is greatly enhanced by arranging them in as natural a manner as possible; and unless expressly forbidden in the schedule, a setting of rockwork would be effective. You should visit other shows where alpine plants are exhibited, and note any good systems practised there. You must be entirely governed by the schedule of the particular society in which you are competing.

GOOSEBERRIES: *G. P.* Syncarpy, or union of two fruits, is not very uncommon.

GRAPES WITHERING: *W. S.* Your Grapes are affected with the disease known as "shanking," which is probably due to some defect in your borders. If they are badly drained this would cause it; on the other hand, drought would have the same effect. Avoid anything that would give the Vines a check.

INSECTS: *R. W., Cranleigh.* The clerical of the Tussock-moth, *Ogryia pudibunda*.

LIST OF PRIVATE GARDENERS: *Max John.* See the *Horticultural Directory*, 12, Mitre Court Chambers, Fleet Street.

MUSHROOM-BED: *Agaricus.* From the nature of the material of which the beds are composed it can hardly be expected that they may be made quite free of other species of fungus and of minute insects. These pests may be reduced very considerably if the manure be turned frequently and made quite "sweet," as it is termed, before being made into beds. The manure might also be partly sterilised by heating it; but whether it would be equally good for the cultivation of Mushrooms afterwards we do not know.

NAMES OF FRUITS: *M. L. 1, Warner's King; 2, Peasgood's Nonsuch; 3, Cox's Orange Pippin.* Pear not recognised; send when in season. Whilst we are willing to name fruits so far as our opportunities permit, our correspondents should not send specimens until fully grown. The numbers should be stuck on with stamp-waste, not pinned.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*A. I.* Veronica, Andersoni; *Linaria cymbalaria.*—*W. W. 1, Holcus mollis; 2, Aira caespitosa; 3, Agrostis vulgaris; 4, Ranunculus repens; 5, Potentilla Tormentilla; 6, Galium verum.*—*Correspondent. 2, Retinospora dubia; 3, Retinospora ericoides.*—*R. N. H.* *Odontoglossum aspidorhinum*, and *Oncidium Gardneri.*—*G. H. S. 5, Inula Helenium; 7, Senecio japonicus syn. Erythrochate palmatifida; 8, probably a Carduus species not recognised as received; 9, Scabiosa ochroleuca.*—*C. & Son.* We are not able to name the plant from the material sent. It seems a Malvaceous plant, but may be quite different. Send when in flower.—*Phyto. 1, Circea lutetiana; 2, Tagetes nana; 3, Pelargonium "Achievement"; 4, Begonia weltoniensis; 5, B. Marshalliana.*—*F. J., Grimsby.* *Aërides multiflorum.*—*M. A. 1, Vanda coerulescens; 2, V. parviflora; 3, Pleurothallis ornatus.*—*W. C., Bushey.* *Vanda Roxburghii.*—*Exon.* *Oncidium Lanceanum.*—*R. B. W.* *Rosa moschata alias R. Brunoni.*

NECTARINES: *W. D.* Are you quite sure that the mildew is not due in some degree to drought at the roots? We think the injury we saw on the fruits was due to the direct rays of the sun having scorched the skin; and it may be in the identical part that a previous attack of mildew had rendered less capable of withstanding any extreme conditions.

PALMS: *F. S.* The leaves are badly infested with scale insects, and should be thoroughly cleaned with a sponge and a solution of soft-soap mixed with a little Fir-tree oil. Do not report the plants at present, but be careful in the matter of watering, and maintain a moist atmosphere in the house. To encourage growth in the plants you might apply a top-dressing, delaying repotting until the spring those that require it.

PINUS EXCELSA: *Correspondent.* Attacked by a *Chermes*, like that on the Larch and other Conifers. It is very difficult to extirpate. Spraying with petroleum-emulsion if practicable might be of service.

SEA SAND: *A Constant Reader.* Sea sand has been found to be very useful in the cultivation of plants, but it is necessary that it be made free from salt, either by washings or by exposure for a long time on the banks. It is not all smooth, but varies considerably according to the locality from which it is obtained. If Reigate sand can be purchased easily it will answer all purposes even better than sea sand.

COMMUNICATIONS RECEIVED.—*W. H. D., G. R. S., Boston, U.S.; Kelway & Son—R. P. B., A. D., J. O'P., B. B. W., T. L., W. G. S., E. C., E. W., & Son—J. W., Max John, Berlin—J. T. GROWTH AND REPRODUCTION.*

AFTER discussing and describing the two antagonistic processes known as the "vegetative" and "reproductive" respectively, the authors give their first generalisation as follows: "A decrease in nutrition during the period of growth of an organism favours the development of the reproductive parts while abridging the vegetative parts."

In illustration of the comparative effects upon the "straw" and the "grain" of Wheat by fertilisers, they found, as a result of growing the Wheat upon fertilised and unfertilised ground, there was, as expected, a decided gain in both; but while the increase of grain was considerable, it was by no means so great as the increase of straw, and that the proportion of straw to grain was, in spite of the increased yield, in reality lessened, as seen in the following averages:—

	Weight of Straw.	Weight of Grain.	Proportion of Straw to Grain.
Av. unfertilised...	2,811 lb.	1,540 lb.	1 : 0.55
Av. fertilised ...	3,880 lb.	1,842 lb.	1 : 0.48

Similar differences resulted from treating grain to a short bath of hot water, e.g.:—

	Weight of Straw.	Weight of Grain.	Proportion of Straw to Grain.
Untreated ...	3,737 lb.	1,716 lb.	1 : 0.46
Hot-water bath ...	4,555 lb.	1,908 lb.	1 : 0.42

They then note the common fact that "wild plants rooted in thin soil on rocks often bear single flowers as large as all the

remainder of the plant." "The poorer the conditions for growth, the more effort the organisms put forth towards seed-bearing. . . . It would seem to imply that the weakest and least favoured individuals, being most fruitful, are most likely to be perpetuated, in evident contradiction to natural selection."

But another factor comes into play as a corrective, and that is expressed by the authors' second generalisation — "Large seeds produce stronger plants, with a greater capacity for reproduction than small seeds of the same kind." It was formerly thought that it was immaterial whether the seeds were small or large, and the opinions of Sir J. Banks, Haberlandt, and others are quoted. Experiments with various grains, Peas, Beans, &c., have incontestably proved the fact that large seeds not only give rise to stronger vegetative growth, but to greater fertility. Thus Marck took three sizes of English Beans, and planted them April 24. Their growth was noted up to maturity on July 12, with the result that the larger the seed the taller the stems and the more numerous and larger the leaves. The offspring of the larger seeds exerted a greater force also in piercing the soil.

"Lehmann separated Peas into three grades, large, medium, and small, planting 528 seeds of each. The larger seeds were possessed of greater inherent strength than the smaller, the number of seeds growing from each lot being 480, 478, and 423 respectively. The resulting produce is shown as follows in grains:—

	Peas.	Pods.	Vine.	Total.
Large ...	1,814	437	3,170	5,421
Medium ...	1,495	357	2,630	4,482
Small ...	998	280	2,010	3,288

The proportion of Vine to fruit is—for large, 1 : 0.71; for medium, 1 : 0.70; and for small, 1 : 0.64.

Similarly with Indian Corn, the product of fifteen plants (6 grains weighed over 400 milligrams, and nine under 300 each) gave a greater average weight of ears for the large than for the small seed; the average weight of the cobs from large seed being 53 grams; that from small seeds, 47.

To test the question whether the result would be different if the seeds were planted according to weight instead of number, as this would tend to crowd the smaller seeds if all three kinds were sown on equal areas, Lehmann found that the harvest was greatly in favour of the larger seeds, both per area and per plant, as the following statistics prove:—

	Per Area.	Per Plant.
Large ...	2,307 grms.	6.40 grms.
Medium ...	2,224 "	4.40 "
Small ...	1,590 "	2.34 "

The authors' remark upon this, that "a practical lesson is very pointedly brought out here, that in sowing farm-seeds the amount of the harvest depends quite as much, and it may be more, upon the size of the individual seeds as upon the weight or measure sown per area."

"Is it not apparent that large seeds show great superiority over small seeds in numerous requirements that enter into successful plant life? It is especially noticeable that in this display of greater vigour both vegetative and reproductive parts are benefited: and while the individual plants are making a more successful fight in promoting their present welfare they are enabled to provide

more abundantly for the next generation by producing a better crop of seeds."

These properties the authors regard as first "acquired from external conditions," and then "hereditary, from the energy stored in the seed."

They give their third generalisation as follows:—"Large seeds give rise to plants with a greater development of the reproductive parts and uses of vegetative parts than small seeds do."

This was established by Lehmann's experiments, which showed that the larger seeds not only grow into larger plants, but those which have fruiting parts more strongly developed, they also produced those which have fruiting parts more strongly developed than the associated vegetative parts."

Similarly Marck found with Peas that the weight of Peas of first quality was nearly three-fourths of the whole harvest raised from large seeds, and only about one-third of that from small seeds: thus—

Weight of Peas (grams).

		1st quality.	2nd quality.
Large	1,375	554
Small	540	1,045

In conclusion, the authors say:—"It seems reasonable to assume that in the ultimate analyses we are dealing with acquired and inherited tendencies. . . . As the food-supply is lessened, a greater effort is made on the part of the parent plant to enhance the chances for perpetuity; but at the same time the largest seeds, having the greatest potentiality, stand the best chance in the future struggle; and although the best-nourished plants produce the fewest seeds, their greater size gives them decided advantages over seeds from starved plants. The two laws acting together, therefore, aid in maintaining the perpetuity of the species and its full measure of vigour."

It may be added that when some experiments were made at Chiswick to test the Jensen method of protection against the Phytophthora, it was found that those rows which had been planted with whole Potatoes produced a greater produce than was the result of cut portions. Both with these and large seeds the *rationale* appears to be that the young plant being more highly nourished in both cases gets a good start, which enables it afterwards to take the lead, as described in the above paper. *George Henslow.*

FOREIGN CORRESPONDENCE.

ARUM ARISARUM.

In the autumn of 1901 I planted several tubers of *Arum arisarum*, which flowered in the following spring, showing the characteristic bent upper part of the spadix, &c.; in 1903 I saw to my surprise this part of the plant only slightly bent, and the upper part of the spathe not arched but straight. I now marked the place where the plants grew with a stick, and watched them till the leaves had disappeared in December. This spring, when the flowers expanded, there was nothing more to be seen of *Arum arisarum*, the plants differing in nothing from *Arum italicum*. The latter species I have not in my garden, so crossing is impossible; besides, it does not occur in the vicinity of this place. I think this note may interest your readers. Has anyone seen a similar phenomenon? Correspondence invited. *M. Buysman, Middelburg, Holland.*

* Essay by Messrs. J. C. Arthur and D. T. MacDougal, New York. [The heading is our own. Ed.]

ORCHID NOTES AND GLEANINGS.

CATTLEYA × GERMANIA SUPERBA.

THE crossing of *C. granulosa* Schofieldiana and *C. × Hardyana* by Messrs. Charlesworth & Co., Heaton, Bradford, resulted in a very showy batch, varying in point of colour, but always desirable. In the variety *superba*, of which a fine inflorescence is sent by Captain G. L. Holford, Westonbirt, Tetbury (gr. Mr. H. Alexander), it appears at its best. The flower is like that of *C. × Hardyana*, rendered firmer in texture and consequently more lasting by the influence of *C. granulosa*, whose features are strongly displayed in the deeply-cut side-lobes of the lip and in the long isthmus which divides the front from the basal portion. The sepals, petals, and side-lobes of the lip are lilac-purple closely veined with rose-purple; the crimped and fringed front lobe of the lip purplish ruby red.

SOPHRO-LÆLIA × LÆTA ORPETIANA.

A flower of this fine hybrid, for which he received an Award of Merit at the Royal Horticultural Society, March 25, 1902, is sent from the collection of Captain G. L. Holford, Westonbirt, Tetbury (gr., Mr. H. Alexander). The flower, which is of a vivid purplish-crimson, with yellow base to the lip, measures $3\frac{1}{4}$ inches across, and the petals are each $1\frac{1}{4}$ inch wide. The shape of the flower is similar to that of *Sophranitis grandiflora*. The plant is of dwarf habit, and the flowers proportionately very large and brilliant.

CORYANTHES SPECIOSA.

The remarkable genus *Coryanthes* is not common in cultivation, though examples are occasionally seen in flower at Kew and elsewhere. The annexed figure (fig. 44) shows part of a four-flowered inflorescence of *Coryanthes speciosa*, which formed a conspicuous object in the group exhibited by Messrs. Hugh Low & Co. at the last Temple Show. It is interesting as being the original representative in the genus, and indeed dates from 1827, when it was described and figured in the *Botanical Magazine* (t. 2755) under the name of *Gongora speciosa*. The plant had flowered in the collection of Richard Harrison, Esq., of Aigburth, Liverpool, in May, 1827. It is said to have been sent from Victoria Hill, above Bahia, by Henry Harrison. The genus *Coryanthes* was established four years later to include the present plant, *Gongora macrantha*, and a novelty which had flowered in the Liverpool Botanic Garden, which received the name of *C. maculata* (*Botanical Magazine*, t. 3102). The generic name, signifying "helmet-flower," is admirably descriptive. Messrs. Low's plant was introduced from Pernambuco, and agrees precisely with the original. The prevailing colour may be described as light yellowish-brown. The scape in this instance is erect (whether because tied up or not is uncertain), but the flowers have assumed their normal pendulous position. In the original figure both scape and flowers are drawn as erect through some misapprehension, for Mr. Harrison's gardener is said to have observed that the cup at the base of the labellum was rapidly filled with "honey" (as the watery fluid secreted was then supposed to be), which would have been impossible in the position shown in the drawing. The species is very nearly allied to the variable *C. maculata*, and Lindley remarks that the hood affords the surest mark of recognition, being almost exactly hemispherical in *C. speciosa*, but distinctly curved forwards in *C. maculata*. The economy of this remarkable genus has already been detailed in these pages (1882, i., p. 593; 1884, i., p. 482; 1885, i., p. 144; ii., p. 103). As regards culture, it may be briefly said that they succeed when grown in baskets suspended in the warmest house under the same treatment as given to Stanhopeas. *R. A. Rolfe*.

SOME NEW BULBS.

SCILLA BIFOLIA PALLIDA "CHARMER."—Mr. Jas. Allen, of Shepton Mallet, who is best known as a raiser of new Snowdrops, has paid much attention to the improvement of other bulbous flowers. Among those on which he has worked have been the *Scillas*, flowers in which there is a good deal of room for improvement. Among the varieties of *S. bifolia* raised by him is a very pretty form of *S. b. pallida*, which he calls *Charmer*. It resembles the type greatly in its flowers so far as form is concerned, but the blooms are of good size and of a delicate porcelain-blue. It has been a good doer since it came to me in 1902.

SCILLA BIFOLIA "NYXIE."

Another pink-flowered seedling of Mr. Allen's raising is *Nyxie*, which is even finer than *S. b. Pink Beauty*. It opens a little later, and has rather deeper-coloured blooms on opening than those of the latter. It is also of dwarfer and neater habit, and holds its flowers well up to the eye. Last season it was exceedingly beautiful.

SCILLA BIFOLIA "PINKERTON."

While in several respects greatly inferior to *Pink Beauty* and *Nyxie*, *Pinkerton* has much deeper-coloured blooms than these two, and it blooms a little later than either. The flowers

FIG. 44.—CORYANTHES SPECIOSA.

SCILLA BIFOLIA "PINK BEAUTY."

It is well known to those who grow the pink and flesh-coloured forms of *Scilla bifolia* that these do not seed so freely as the blue forms, while they appear also to be less free in their growth, especially the original *S. b. rubra*, which is now scarce. Mr. Allen, however, has been more successful than many, and he has selected several pink forms from his seedlings. Of the three of these in my garden *Pink Beauty* is the earliest, while it is not only of a pretty true pink, especially just after opening, but it has also larger and better formed flowers than the variety of *S. bifolia* called *rubra*. It is, indeed, among the best of all the forms of *S. bifolia* in cultivation, and much better than the white or flesh-coloured varieties in commerce.

are, however, considerably smaller and more starry in form, while the habit is not so good as either of the foregoing. Still, its bright pink colour, fading less after being open for some time than that of *Nyxie* or *Pink Beauty*, makes it an acquisition. I have had it since 1901, but it has increased but little in that time.

CHIONOSCILLA SPHINX.

These hybrid *Chionoscillas* are very interesting plants, and the best of them are exceedingly attractive in their season. Of a few named ones I have here, all raised by Mr. Allen, I prefer upon the whole that called *Sphinx*. It has large, well-formed flowers of an indescribable shade of blue, with perhaps a touch of lilac about it, and without the white eye which exists in the greater

number of these *Chionoscillas*. It was apparently raised between *Chionodoxa sardensis* or *C. Luciliae* and *Scilla bifolia*. One would think from the colour that it was from *C. sardensis*, but its sturdy habit is more what one would expect in a hybrid between *C. Luciliae* and *S. bifolia*.

X CHIONOSCILLA PENYI.

This is a capital plant with good-sized, well-formed flowers of a deep blue, with a small white eye. It has done well since I got it in March, 1902, although it has not increased much as yet. With the preceding and succeeding one I should include it among the best three of the *Chionoscillas* I have grown here. Its flowers are of good size, well formed, and freely produced on fairly

SEEDLINGS FROM THE CHIONOSCILLAS.

A few years ago Mr. Allen kindly sent me some seeds from his *Chionoscillas*. These were duly sown, and all have come into bloom, some for three years at least. Mr. Allen had been studying the *Chionoscillas* before, and had found the same results as have been given me in my growing the seedlings from his seed. They are a most singular lot altogether. In general the majority hark back to the *Scillas* rather than to the *Chionodoxas*, but a few are true *Chionodoxas*, while still fewer have followed the seed-bearer and are *Chionoscillas*. What one is surprised at, however, is the large proportion of poor *Scillas* among these seedlings. Instead of gaining greater vigour, these have become depauperated,

GREENHOUSE-FURNISHING.

The illustration (fig. 45) gives a fair example of a greenhouse furnished with flowering plants, among which *Hydrangeas* take a prominent part, along with Ivy-leaved *Pelargoniums*, *Campanula isophylla*, *Crassula*, show *Pelargoniums*, and many others, showing what may be done in a mixed collection. The view was taken in the gardens at Arundel House, Maxwell Town, Dumfries.

VEGETABLES.

NEW EARLY PEAS.

AMONGST many novelties in Peas there were some very fine samples, and this has been a season

FIG. 45.—GREENHOUSE AT ARUNDEL HOUSE, DUMFRIES.

stout stems, although it droops a little when in bloom. It was raised by Mr. James Allen.

CHIONOSCILLA ABUNDANCE.

"Well named!" is one's thought on studying this charming hybrid plant, for it blooms freely, while its flowers are in good numbers on each stem. They are a brighter blue than those of *Penyi*, and the small white eye is quite an ornament to the blooms. Then the flowers are well up to the eye, and my small group of flowers from a bulb sent me by Mr. Allen in March, 1902, will please one any time one may be passing the border in which this *Chionoscilla* is grown. These *Chionoscillas* are delightful little plants, resembling more the *Chionodoxas* than the *Scillas*.

and are not worth keeping except for the purpose of practical illustration or experiment. On the other hand, some of the *Scilla*-like varieties are really pretty, and the diversities are quite remarkable. Had I only more space and time at my command, I should like to follow up these and their progeny throughout a series of generations. *S. Arnott*, *Carsethorn-by-Dumfries*, N.B.

KILRUDDERY.—The gardens belonging to Lord MEATH, near Bray, Ireland, were visited on the 27th ult. by a party consisting of members of the Irish Gardeners' Association and Benevolent Society. Mr. and Mrs. BURBIDGE accompanied the visitors, who were conducted round the pleasure grounds by Mr. CHILDS.

to try vegetables, for we had no frost to interfere with the well-being of the seedlings and plants.

The variety *Carter's Eight-Weeks* is very prolific, and in all other respects satisfactory. It contains all the best points of those two good varieties *American Wonder* and *William I.*, and in this season has grown only 2 feet high, whilst all Peas with us have grown higher than usual consequent on the dull weather.

Mayflower is a first early marrowfat, a cross between the famed *Daisy* and *William Hurst*. The haulm is very robust, and pods are freely produced, and altogether it is a most desirable novelty. It is extremely prolific, and well adapted to the requirements of both large and small gardens.

Early Morn.—This famous Pea still holds its reputation, it being the finest of its section. I have it sown by the side of many different varieties, but it well sustains the superiority claimed for it—that of being the earliest marrow. It is a first-rate Pea for exhibition. When grown well it reaches 5 feet in height, but commences to flower at 3 feet.

Lightning has been very good, and was in fact the earliest from which we gathered. It is an abundant cropper.

Victor Marrowfat Pea is another marrowfat, as its name implies. It possesses a combination of many of the most desirable varieties, and its dwarf, bushy habit will win it a front place in dwarf early Peas. The pods are produced in pairs, and this very freely, and the Peas are most delicious. Fine for large or small consumers, and a variety that requires no sticks, which is a great consideration with many near large towns, where sticks form an expensive item.

Dwarf Monarch is another robust variety that comes in after, and forms an excellent succession; bears large pods; blunt-ended, after the Autocrat type; very prolific. Peas a deep green.

Buttercup, a type of Daisy Pea, but a week or more earlier, is a very fine, robust form of Pea, bears freely pods of great length and size in pairs; the pods are of a beautiful green, and the Peas are very rich; it has grown well this season, and very strong. Another variety which need not have sticks; the better if short sticks were used, as the foliage and pods are so heavy they ought to be kept off the ground.

Extra Early Daisy Pea.—This is an early Daisy Pea, a very dense and robust grower; dark foliage, and a wonderful cropper of fine pods.

With such a lot of new varieties, the public in a short time ought to be supplied with good Peas in the market now, though some old varieties die a hard death.

Popular varieties of main-crop include such fine varieties as Torpedo, Stratagem, Edward VII., Model Telephone, Model Telegraph, G. F. Wilson (one of the very best Peas under any and all circumstances), Commonwealth, Battleship. These are all first-class varieties, and worthy of extended cultivation. *W. A. Cook, Shirley Park.*

CAULIFLOWERS.

For early work I find Sutton's "Magnum Bonum" Cauliflower a splendid variety in every respect. From seed sown the latter part of January, I cut beautiful heads, commencing early in June and continuing until the middle of July. Veitch's "Early Forcing," also a fine variety, came in about the same time from seed sown on January 14. I followed much the same method of culture as described by Mr. Ellis, on p. 35, of the *Gardeners' Chronicle*.

SUTTON'S "ALL HEART" CABBAGE.

I sowed seed of this variety early in February, and grew on in gentle heat until they made nice sturdy plants, when they were gradually hardened off and planted-out in March. They have been fit for use now for the past three weeks. This is a fine cone-shaped Cabbage, very tender when cooked. I cut one Cabbage weighing 4 lb. *Geo. H. Head, Kingsdon, Taunton.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS AT THE END OF JULY.

(See Tables and General Summary, ante, pp. 70-76.)

(Continued from p. 90.)

3, ENGLAND, E.

CAMBRIDGESHIRE.—There is a remarkably heavy crop of Apples, Pears, Peaches, and Nectarines, and all small fruits. Owing to the drought many Apples have fallen off, but there is still a very heavy crop of good fine fruit. *R. Alderman, Babraham Gardens, Cambridge.*

ESSEX.—Apples are a tremendous crop in this part of Essex, the fruit being clean and very promising in appearance, and the trees healthy and vigorous. The crops of Plums and Pears generally are not so heavy as they promised to be some weeks ago. Young trees (pyramids) of Beurré d'Amanlis, Beurré d'Aremberg, Beurré Diel, and Durondeau are carrying good crops of clean fruit. Monarch Plum is fairly well cropped. I never saw a finer crop of Strawberries than we had grown on a deep loamy soil sloping southward; the variety was Royal Sovereign, and the fruits were of immense size and of fine quality. *H. W. Ward, Lime House, Rayleigh.*

LINCOLNSHIRE.—There was a wealth of blossom, although it came late, and at first one thought crops would be over the average for all kinds of fruits; but a cold spring, and the ground—a brown loam upon a variable bottom, principally ironstone and clay—remaining wet and cold quite late in the spring, together with an unfavourable autumn for ripening the wood previously, account for some of the crops being under the average. Peach-blossom was small, still it set; but many of the young fruits eventually fell off. Currants and Gooseberries are a grand crop. Apples are splendid—abundant, and of good quality. Pears suffered much from the Pear-midge, still they are an average crop. *H. Vinden, Harlaxton Manor, Grantham.*

—The Apple crop is heavy. Pears are not abundant, although the samples are very good. Plums are bad. Cherries are an average crop, but of bad quality. Peaches and Nectarines are very good, and highly coloured. Apricots are about the average. Gooseberries and Red, White, and Black Currants have very heavy crops, and the samples are good. Strawberries and Raspberries are both good. Filberts and Cobnuts are very scarce. The Walnut-trees in the park have an average crop. Water has had to be used freely. *F. J. Fleming, Weelsby Old Hall Gardens, Grantham.*

—From the soft, unripened condition of the wood noticed at pruning-time, I expected poor returns from the fruit-trees this season. However, the unexpected has happened; we had the most perfect weather when the trees were in bloom, and the Apple crop is with me a record one for the eighteen years I have had charge here. The soil is a pure blue clay; the situation well sheltered from north and east. *J. Coward, Haverholm Priory, Steaford.*

NORFOLK.—The season 1904 will probably furnish us with a record year for fruits, with the exception of stone fruit, which suffered greatly from sharp winds and cold nights at the time of flowering, followed up by sharp attacks of insect-pests, and in places mildew. Possibly the wood being in such an unripened condition, the trees had less resisting power than usual. Stone-fruits in some places are very good, in others very bad. Apples are falling very largely, on account of the drought; but a third can be spared with advantage. Strawberries were the best crop for many years, and of high quality, although some crops mildewed badly. Black Currants were a heavy crop, where bullfinches did not damage

the trees in winter. Other bush fruits have also been very satisfactory. Our soil is mainly light and sandy in character. *E. C. Parslow, Shadwell Court Gardens, Thetford.*

SUFFOLK.—The fruit crops in this district, with one or two exceptions, are excellent. Most varieties of fruit set well, but the continued dry weather since the beginning of June caused a quantity of fruit to drop. Still there is a heavy crop. Such varieties of Apples as Bramley's Seedling, Lane's Prince Albert, Peasgood's Nonsuch, and The Queen are amongst the best. Pears on the whole are good. Plums are variable; the crops on trained trees are fairly good, but on standard trees the fruit is thin and foliage much blighted. The Apricot crop is thin. Peaches and Nectarines set well, but there is only an average crop; some of the trees are much affected with blight. Strawberries have borne an enormous crop, and the fruit of good quality. The variety "Leader" is the favourite amongst market growers in this district. With the exception of Black Currants, small fruits are abundant. Figs (outdoors) are doing well this year. In this district, except on the borders of the Waveney Valley, the soil is of a close, tenacious character, resting on a clayey subsoil. After heavy rains the surface, under the influence of a bright sun and a drying wind, becomes quite hard, which can only be remedied by a speedy application of the Dutch-hoe amongst the growing crops. *H. Fisher, Flitton Road, Bungay, Suffolk.*

—In this district we have many kinds of soil. Crops on sand and gravel are suffering from drought; on the moor and clay fruit is doing well. There are a few Plums in places, but the Plum crop as a whole is very small. Black Currants are better this season than usual. Potatoes are suffering very much from want of rain; we have not yet been able to earth them up. *H. W. Nutt, East End Farm, Flitwick.*

4, MIDLAND COUNTIES.

BEDFORDSHIRE.—The fruit crop in this district, taken collectively, is an excellent one. Strawberries and all small fruits are record crops, but suffered from the prolonged drought, the rainfall from May 21 to the end of July only amounting to 1.1 inch. The excessively dry atmosphere has also caused Apples to drop freely. The soil is a very heavy loam, overlying a deep bed of gault. *Henry Nimmo, Cranfield Court Gardens, Woburn Sands.*

—The fruit crops in the gardens here give promise of a fair average, except Apricots. Should the drought continue, I am afraid a great many of the Apples and Pears will fall, as our soil is very sandy. *W. C. Modral, Old Warden Park, Biggleswade.*

—The fruit crops in this district are looking much better than they have done for the past three seasons, with the exception of standard Plums, which are rather below the average this year owing to late frosts when they were in flower. Small fruits in the neighbourhood are looking very promising, and we anticipate a most bountiful crop. The Strawberries in this district have never given the grower such good returns as they have this past summer. The soil is mainly a good loam on a subsoil of chalk and clay, other parts consisting of a stiff clay, which is very suitable for the cultivation of Strawberries. *George Mackinlay, The Gardens, Wrest Park, Amphill.*

BUCKINGHAMSHIRE.—The prospects of a good fruit year were never brighter than in the spring of 1904. Fruit-trees of all kinds were covered with blossom, and no sharp frosts came to destroy the bloom. The drying easterly winds in early June were in a great measure responsible for the damage done by fruit pests this year. The young shoots of Cherries, Damsons, and Plums

were crippled, and the leaves curled, which may be the cause of many of the fruits falling. Pears are a scanty crop. Apples are abundant. Gooseberries are a good crop, although the mite has been troublesome in some gardens owing to the dry weather. Red and White Currants are good where the aphides has been kept down. Strawberries are abundant and of good flavour. The soil about here is mostly a loamy gravel, very favourable to most fruit crops. *John Fleming, Wexham Park Gardens, Slough.*

— After two bad seasons, fruit-growers have promise of a good fruit year. The only light crop in this neighbourhood is Pears, which, owing to that destructive pest the Pear-midge, will not be more than half an average crop, although I notice the variety Josephine de Malines has escaped this pest. Apples are splendid, the fruits being clean, and promise to colour well; all the varieties are cropping splendidly, and thinning has been a big task. Plums are good. Peaches and Nectarines excellent. Strawberries were of good flavour, but the season for these has been a short one. *Chas. Page, Dropmore Gardens, Maidenhead.*

— The fruit crops in this district are very good indeed. Apples are abundant; Pears are about an average crop, promising at the present time to be of fairly good quality. Plums vary considerably in different places, those trained on walls are very good. Cherry-trees trained on walls are carrying good crops, the varieties Elton, Black Circassian, and Bigarreau Napoleon are excellent sorts, which follow each other in rotation in ripening. In the orchards in this locality, a variety named Black Bud is extensively cultivated for market purposes, the fruit keeps well and is not liable to crack. Peaches and Nectarines are very abundant. Waterloo is generally the first to ripen. Waterloo, Amsden June, and Alexandra will soon be ripe. Ilale's Early will follow, to be succeeded by such later kinds as Sea Eagle, Princess of Wales, and Princess. In this neighbourhood hills and valleys abound, the soil being fairly good for fruit cultivation in the latter. It consists generally of a good rich loam, in which fruit-trees do well. Chalk prevails in some districts and crops up to within a foot of the surface, rendering the land unsuitable for fruit-growing. The uplands abound with strong loam and clay, on which Apple-trees, especially such kinds as Blenheim Orange, do well, and produce excellent crops of fruit. *Geo. Thos. Miles, Lord Carrington's Estate Office, High Wycombe.*

— Our soil here is very cold and heavy, and bad for the cultivation of some kinds of fruit-trees, much of the wood not ripening unless the season is warm. Apples are an average crop, and on the whole good. Pears are scarce, and the quality inferior. Plums are under the average, there being in some orchards no crop at all. The quality of all bush fruit is excellent, and the crops are heavy. Strawberries have yielded the heaviest crop known in this district for many years, and the quality is good. Nuts are an average crop, but the trees are blighted in places. Peaches are carrying a fair crop, but earlier in the season the trees suffered much from "blister," from which they are now recovering and making satisfactory growths. This has been an exceptional season with us, from the fact that we escaped the usual late frosts—a rarity in this neighbourhood. *W. Hedley Warren, Aston Clinton Gardens, Tring.*

— The Apple crop is enormous and has required thinning twice. Pears set well, but a lot of the fruit has fallen. Plums are not so good as first promised. Strawberries have been an enormous crop, the fruit—especially on last year's layers—being of very fine quality. The intense heat toward the end of the season brought the Strawberry crop to a premature close. *H. Walters, Waddesdon Gardens, Aylesbury, Bucks.*

To be continued.)

DECAYED ELM.

At p. 11 of the *Gardeners' Chronicle* for July 2, "J. M." gave us an account of a Holly tree. I had the good fortune to see what had once been a splendid Elm on an estate about a mile from Baileygate; it had, I presume, been struck by lightning at perhaps 30 feet from the ground, stripping off all the bark except three narrow strips, which remained uninjured to about 20 feet. These obtained a supply of water from the root, and thus life was sustained until new branches could be formed. How long since it took place I cannot tell, but it must have been many years ago. Life in the bark is still kept up, and now it has a very nice head of living

FIG. 46.—DECAYED ELM.

A A, dead trunk, its top, B, broken off at a height of about 30 feet; C, base, hollow and rotten; D D, live bark; E, coalescence of strips of live bark; F F, young branches growing from D and E.

branches, but the trunk is completely dead, and has been so for many years. The base is rotten and undermined by rabbits and other vermin. *D. D., Bournemouth.*

PLANT NOTES.

BOWKERIA TRIPHYLLA.

A SMALL specimen of this rare South African Scrophulariaceae shrub is now in flower with me in the open. I only know of it in one other garden, which is situated on the undercliff in the Isle of Wight. In that garden there are two specimens, the largest of which is about 7 feet in height. When I was there on July 1, both were bearing buds. My little plant was raised from the largest of these. It is barely 18 inches in height, but has one expanded flower and two buds. The flower is pure satiny-white and shaped somewhat like that of a *Calceolaria* with a hood and lip. In size it is just 1 inch across and measures the same from the top of the hood to the base of the lip. The lip protrudes very little, being only a $\frac{1}{4}$ -inch in depth. The flowers are borne singly at the axils of the leaves on pedicels about $1\frac{1}{2}$ inch in length. The leaves are corrugated and shiny on the upper surface and are 5 inches in length and $1\frac{1}{2}$ inch in breadth.

MUTISIA DECURRENS.

This gorgeous climber is now in flower with me. The large blossoms, which are $4\frac{1}{2}$ inches across, are somewhat like those of a glorified *Gazania*, but are more graceful in form and brighter in colour. The recurving ray-florets give the flower a very elegant effect, and the rich orange colouring is exceptionally bright, indeed in the sun it appears tinted with scarlet. This *Mutisia* is rarely seen in gardens, and is difficult to procure. A friend told me the other day that he had been vainly endeavouring to obtain a plant for three years. I had one three years ago, which died, and for a year and a half I was unable to get one to replace it; however, in the spring of 1903 I received two plants from different sources almost simultaneously; these were planted in a foot of loam, peat, and sand over a deep layer of broken bricks and stones, for I was led to believe that my first plant died from stagnant moisture at the root. Behind them was the gable end of a little building facing south-west, on which wire netting was tightly strained. Over the wire-netting a plant of *Polygonum Baldschuanicum* was trained, and the *Mutisias* were planted one at each side of it and left to their own devices. They elected to grow up behind the *Polygonum*, and when the leaves of the latter fell were seen to have gained a fair stature. They continued to grow the whole winter, and finally emerged, one on each side of the top of the gable, rather over 6 feet from the ground. Here, two twiggy, dry branches were firmly fixed, which the *Mutisias* soon clung to with their tendrilled leaves and commenced to form buds. Twelve of these were produced, which have been and still are very handsome. The plants get the sun from 11 A.M. till 3.30 P.M.

LONICERA HILDEBRANTI.

I lately visited Robert Veitch & Son's nursery at Exeter, and amongst many other interesting things saw this giant Honeysuckle in fine bloom in a glasshouse. I cut a couple of bloom-trusses to take home with me, and found on measuring the perfect flowers that they were 5 inches in length, and nearly 3 inches across the open mouth. The blossoms are bright yellow in colour and very fragrant. I know of five plants doing well in the open in the South-West, and I myself have one growing against an open wall, which is doing well, but as it was only planted out this spring it is too early to speak confidently as to its succeeding (see *Gardeners' Chronicle*, September 17, 1898, p. 219). *S. W. Fitzherbert.*

TREES AND SHRUBS.

THE POPLAR.

EVERY traveller through France knows too well the monotonous straight lines of Poplars, and perhaps tries to find compensation for their ugliness in the notion that they are a valuable asset to the rural population. And so, indeed, they are, as anyone may see for himself who will consult an excellent work, entitled, *Un Arbre Utile, le Peuplier*, par L. Breton-Bonnard (Paris: Rothschild; 5s.). The author does not confine his remarks exclusively to one species of *Populus*, but mentions and describes all that are in cultivation, and as his descriptions are illustrated with cuts, the value of the book is obvious. After the description of the several species and varieties, the author goes on to discuss the cultural details connected with planting, reproduction, general management, diseases and injuries of the trees, and their economic value. It is thus a most comprehensive treatise, which may be commended to the attentive consideration of all planters.

DECIDUOUS TREES.

Under the title of *Handbuch der Laubholzkunde*, Mr. Camillo Karl Schneider has published the

first part of a full descriptive catalogue of the trees and shrubs native to, or cultivated in, the open-air in Central Europe, together with the Bambuseae and the Cactaceae. It is in the German language, with very numerous contractions and symbols which make it rather irksome to consult. The necessity for economising space has rendered this condensation unavoidable, as may be judged from the circumstance that no fewer than sixty-two species of Willow (*Salix*) and twenty-three of Poplar (*Populus*) are enumerated, together with varieties and hybrids. The value of the book is largely increased by the very numerous illustrations, which will be of great service in facilitating the determination of the species even in the absence of leaves. The part before us contains the Salicineae, Myricaceae, Juglandaceae, Betulaceae (in which *Corylus* is included), Fagaceae, including Castanea and Pasania. The adoption of such names as Castanea Castanea should not pass without protest. It is rather startling also to find some of the Japanese Oaks removed from the familiar *Quercus* to the little-known Pasania. Admitting the desirability of making a distinction surely all requirements would be met by retaining the almost universally adopted *Quercus* and making Pasania a subgenus or section. But any amount of eccentricity may be pardoned in individuals, so long as others are at liberty to adopt or to ignore the changes of nomenclature as they please! It seems impossible to induce gardeners in general to abandon the use of the word "*Geranium*," which is absolutely wrong, so that we have little expectation that they will adopt Pasania. This differs from *Quercus* only in a few minor technicalities, the importance of which will be estimated differently by different botanists. Let us hope that the Vienna Congress, to be held next year, may uphold and amend, where proved to be necessary, the rules laid down at Paris in 1867, and save our successors from the distressing vagaries of nomenclature now rampant. In any case, there is every reason to praise the thoroughness of the work before us, which may be had from Williams & Norgate or other foreign booksellers.

A NEW PITTOSPORUM.

M. Yoshida, in the *Journal de la Société d'Horticulture du Japon*, gives a figure of a new *Pittosporum*, *P. illicioides* of Makino, found wild in the province of Harima. It is a handsome evergreen shrub, resembling in external appearance the *Illicium anisatum*, having shining green leaves and umbels of greenish-yellow flowers. We infer that it will be hardy in this country, at least in the south.

BOOK NOTICE.

THE CLASSIFICATION OF FLOWERING PLANTS, by A. B. Rendle, M.A., D.Sc., &c. Vol. I. Gymnosperms and Monocotyledons. Cambridge University Press.

This is a book whose advent will be hailed with acclamation by those who are desirous of estimating the influence on our systems of classification of the more recent discoveries in the minute anatomy of plants and in the construction of cells, and by those who are interested in ascertaining to what degree our ideas as to the relationships of plants must be influenced by the study of the anatomy of fossil plants. We may expect that the clues originally furnished by Hofmeister from the comparative study of development in Cryptogams will be largely increased in number by the investigations of Williamson, Scott, and others in the comparative anatomy of fossil plants. For this reason we are glad to find in the present volume details as to the structure of certain families of plants now extinct, such as the Cordaites and the Bennettitaceae, groups allied to the Cycads. These details are comparatively inaccessible to the student of recent systematic

botany, but they are of great importance from a systematic point of view.

Whether the details relating to pollination, such as dichogamy and various other methods of fertilisation to which Dr. Rendle devotes some pages, have any but subordinate value, so far as classification is concerned, may well be doubted. Their importance seems to be rather physiological and adaptive rather than genealogical, and if this be so, whilst they would fitly find a place in a treatise on physiology, they are not looked for in a treatise on classification.

Dr. Rendle follows the arrangement proposed by Engler, which is probably the one most in harmony with the present state of knowledge; and at the end of each principal section he gives a list of the more important books and memoirs cited, a list which, had space permitted, might usefully have been extended.

In treating of the Orchidaceae, Dr. Rendle follows the arrangement proposed by Pfitzer, dividing the Order first of all into Diandrea with two stamens (including Aspostasinæ and Cypripediæ), and Monandrea with one stamen only as in the great majority of the Order. This large division is then subdivided into two, Basitonæ and Acrotonæ. The Basitonæ have the pollen masses (pollinia) stalked, the stalks or caudicles are at the base of the pollinia, and the anther is persistent. This group includes the Ophrydiæ. The Acrotonæ have the pollen-masses either without stalks or caudicles, or, if there is such an appendage, it is at the apex of the pollinium, and the anther is deciduous. This subdivision comprises the remainder of the Order, and is further subdivided into some twenty-eight tribes and a large number of genera, the distinguishing characteristics being such as are most readily appreciable by the Orchid-grower such as the terminal or lateral character of the inflorescence, the "vernation," or way in which the leaf is rolled up in the bud, the development of the stem, and the form and relative size of the lip.

In a final chapter Dr. Rendle gives a "general review," in which the kinship of the several orders and their derivation from one another or from a few primitive types is discussed. This, though highly speculative, is very interesting, and so long as its suggestive nature is recognised, and it is not looked on as dogmatic, it will prove valuable by stimulating further research, and thus increasing our knowledge. Numerous illustrations and an excellent index add to the value of the work. We heartily congratulate the author on the partial accomplishment of a difficult and laborious task. The part before us does but whet our appetite for what is to follow.

The Week's Work.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gr., Wrotham Park, Barnet.

Raspberry-canes.—As soon as these have finished fruiting, the nets which have been employed for protecting the berries from birds should be removed, and, when dry, neatly folded up, labelled as to size, &c., and, if not required for use again this season, put away in a dry, airy shed, where they will not get damaged. I usually hang them from the roof in a lofty shed near the stoke-hole, where they are nicely out of the way, and kept dry throughout the winter months. After removing the nets, go over the beds and cut out the canes which have borne fruit, taking care to draw them out without damaging the leaves of the remaining canes more than can be helped. The prompt removal of the old canes gives the younger ones a better chance to develop more fully, and the additional sun and air admitted will assist the ripening of the canes, and greatly increase their productiveness. After removing the worn-out canes and any of the young growths not required for stock, &c., clean the land of weeds and rubbish; and if the weather continues

dry and warm, apply a fresh mulch of manure. One or two good soakings of water will also be very helpful. Autumn-fruiting kinds, such as Belle de Fontenay, &c., sometimes produce a nice crop of large fruit late in the season, which, if not of very high flavour, is useful as a change. These latter kinds should be kept moderately thinned, and mulched if the soil is shallow and dry about the roots. Net them over early, and when the fruits are ripe gather them daily. In damp weather the berries quickly decay.

Cherries.—May Duke, Governor Wood, Kent Bigarreau, Napoleon Bigarreau, and Early Rivers have been our heaviest croppers this season, the trees all bearing well. All the fruits, with the exception of Napoleon Bigarreau, have been gathered, so that the trees may now be gone over after removing the nets. All foreright shoots should be cut back to within four buds of the base, and these leaders, which have almost completed their growth, should be made secure to the walls or trellises. As soon as tying, &c., is finished, use the garden-engine to thoroughly cleanse the foliage and the trees generally.

Young Orchard-trees.—It will be advisable to go over all the newly-planted trees and examine the ties. Any that are too tight must be loosened and retied, otherwise harm may be done to the trees. Water the roots of any trees that are suffering from drought.

Nuts.—Bushes, especially young ones, should be duly thinned in the centre, and any soft, spongy growth or suckers removed. In Kent, where many acres of land are devoted to Nut culture, the bushes are kept well open in the centre, and are trained vase-shape to about 7 feet in height. The branches are kept furnished with small shoots, which in good seasons bear enormous crops of large Nuts.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Dorking.

Calogyne cristata.—Among late winter and early spring-flowering Orchids, *Calogyne cristata* and its varieties maxima, "Chatsworth," Lemoniana, and the pure white hololeuca, are all useful plants for cutting and decorative purposes generally. As these plants are now pushing both root- and leaf-growths freely, they will require a gradually increasing supply of water at the roots until the new pseudo-bulbs are fully developed. Although these plants require plenty of moisture at the roots, still a certain amount of discretion in watering at this period is necessary, as the tips of the leaves turn black, and many young growths decay if the plants are kept in a saturated condition. *C. cristata* and its varieties require more water when the new pseudo-bulbs commence to form than at any other time. The coolest end of the Cattleya-house, or a light position in the intermediate-house, is the best position for them. There are numerous varieties of *Calogyne* that should now be repotted if they require it, the more important being *C. asperata* (Lowii), *C. Massangeana*, *C. Sanderiana*, *C. corrugata*, *C. Cumingii*, *C. Dayana*, *C. flaccida*, *C. graminifolia*, *C. pandurata*, *C. speciosa*, *C. tomentosa*, *C. Schilleriana*, *C. barbata*, *C. elata*, *C. ocellata*, &c. A compost of fibrous peat and sphagnum-moss in equal parts will suit the majority of these varieties, but for the stronger-growing varieties a little fibrous loam and coarse silver-sand added to the peat and moss is beneficial.

In the Cool-house such *Oncidiums* as *O. spilopterum*, *O. phalenopsis*, *O. cucullatum*, *O. nubigenum*, *O. dasytyle*, *O. cristatum*, *O. virgatum*, *O. olivaceum*, *O. Lawrenceanum*, *O. Mantinii*, *O. unicorn*, *O. concolor*, *O. varicosum*, *O. Wheatleyanum*, and others that are starting to grow will now require fresh material to root in. All of these grow best in ordinary flower-pots with wire handles attached. They can then be suspended close to the glass in the roof of the house. One-half of the compost should consist of leaf-soil, the other half of peat and moss in equal parts, adding a little coarse sand. Pot them as ordinary greenhouse plants, and cover the surface of the compost with about $\frac{1}{2}$ inch of living sphagnum moss. All the *Oncidiums* mentioned should be kept just moist at the roots during their season of growth. The distinct *Cochlioda Noetziana*, *C.*

vulcanica and *C. sanguinea* should also be repotted now that they are starting to grow. Treat them in the same manner as advised for the *Oncidiums*.

Boilers, &c.—While this summer weather lasts a good opportunity is afforded to have the heating apparatus thoroughly overhauled and put in working order for the winter season. The boilers and pipes should be emptied and cleared of all sediment; they should not be left empty, but refilled at once. Cracked sockets and loose joints in the hot-water pipes should be made good, all valves and air-taps should be oiled, and the overflow and feed-pipes put in order. The flues round the boilers, fire-bars, and ash-pit doors should also receive attention. Where it is found necessary to put in additional pipes, valves, &c., the present time is best for such work to be done. While operations are in progress the plants in the hottest houses should be kept on the dry side, and less atmospheric moisture is needed than when everything is in full working order.

THE KITCHEN GARDEN.

By JOHN PENTLAND, Gardener to C. H. B. FIRTH, Esq., Ashwicke Hall, Marshfield, Chippenharn.

French Beans.—In some of the Southern Counties a few of these may now be sown on a well-sheltered border with a south aspect, arranging the lines so that frames can be placed over them when there is any danger from frost. In places where the supply has to be kept up without a break it will be advisable to make a sowing in pots out-of-doors. These can be removed to the forcing-pits when the outside temperature becomes unsuitable. Keep plants in bearing well picked, for if some of the pods are allowed to grow and become stringy, the plants soon get exhausted. The same remarks apply to Scarlet-Runners, which should be kept close picked to insure a supply for a long period. See that the plants are well mulched, and kept moist at their roots.

Cabbage Sprouts.—In a previous Calendar we advised keeping some of the old Cabbage stumps for sprouting in places where they were likely to be required. In some gardens where space is limited these are often depended upon for a supply. Cabbage being a gross feeder, soon impoverishes the soil, and unless it is replenished the returns will not be satisfactory. Now the soil is moist after the recent rains, apply a thorough mulching of rich manure, covering the ground between and round the stems with manure at least 4 inches deep. This will conserve the moisture, and if water is given when the mulching is completed it will wash in the manure and benefit the roots.

Carrots.—In gardens where a continuous supply is required, make a sowing of Early Horn on a border well exposed to the sun. Arrange this sowing so that frames can be placed over them for protection in the autumn.

Asparagus-beds.—At this season the beds are too often neglected. Those situated in a moist place that were well mulched, as previously advised, will not have taken much harm, but during dry weather the birds often by scratching expose the roots. Where such is the case, put on fresh mulching, working it well between the stems, taking care not to injure them. If at times liquid-manure, guano-water, guano dusted between the growths over the bed, or a dressing of salt be given, they will stimulate the roots. Care should be taken when using them to remember that a little at a time and often is the proper manner to apply all artificial manures.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. BURNS, North Myms Park, Hatfield, Hertfordshire.

Gesneria exoniensis.—The flowering season of this showy winter-blooming plant may be extended to the early spring by starting the tubers in successional batches. It is, however, useless to attempt to start them into growth until they have been thoroughly rested; the tubers, though potted-up and placed in the stove, cannot be induced to start much before their proper season. It is by retarding the tubers that the flowering season may be most easily prolonged, the latest

batch being kept back until the plants exhibit signs of starting into growth. Tubers which have been rested since the spring may be started now. Let them be potted singly in 3-inch pots, keeping the top of the tuber about $\frac{1}{2}$ an inch below the surface of the soil. A suitable compost may consist of sand, loam, and leaf-soil in equal parts. Place the pots in the stove, and afford water sparingly until growth commences. In order to preserve the beauty of the foliage, the syringe should not be used overhead. When the roots reach the sides of the pots the plants should be placed in 5-inch pots, and subsequently some of the strongest may be shifted into pots a size larger.

Begonia socotrana.—Prior to the introduction of the newer varieties of winter-flowering Begonias, one was always endeavouring to induce this species to flower in the early part of the winter, but the necessity for this no longer exists, and it is now most useful when in bloom at its proper season, which is from about the middle to the end of winter. A portion of the stock may be started now, and the remainder in a month's time. Let the clusters of bulbils be divided into smaller clusters of about six or eight, and pot these in loam, leaf-soil, and sand, using small well-drained pots. This Begonia enjoys a high temperature and a moist atmosphere, and should be grown near to the glass, in order to prevent the flower-stems from becoming drawn. When the plants are well rooted they should be afforded a shift into 5-inch pots, which will be sufficiently large enough for all but very strong plants to flower in.

Heliotrope.—Bushy plants growing in small pots may be shifted into 5-inch pots, and stood on ashes in the open air, or plunged outside in the same material until September. These, if placed in a light, warm structure during the autumn, will be most welcome for house decoration at that period.

Alocasias.—These and the ornamental-foliaged Anthuriums should be examined from time to time for red-spider or the "Begonia-mite." If either of these pests be allowed to establish itself on the foliage, much disfigurement will result. If a rusty appearance shows itself on the undersides of the leaves, or along the mid and lateral ribs, the foliage should be well sponged with an insecticide. Only the injury caused by the mite, and not the insect itself, can be seen with the naked eye.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Pines.—At this season of the year it is often necessary to re-arrange the plants and separate the fruiting sets from the non-fruiting ones, also to give the plants suitable autumn and winter quarters according to their different stages. Next year's fruiting sets should now be supplied with fresh plunging material, such as spent tan or decayed leaves; at the same time thoroughly cleanse the interior of the house. The strongest of the plants will now be fruiting. Go over these and carefully remove any suckers and a few of the bottom leaves. A little of the surface soil may at the same time be removed and replaced with a rough sandy loam, to which a sprinkling of guano is added. This top-dressing should be made firm. Suckers from the summer-fruiting plants will soon be ready for repotting, and these may be divided into two batches, using 8 or 10-inch pots respectively. Later suckers may be wintered in 6-inch pots. Give gradually less water to "Queens" intended for starting early next season; at the same time admitting a good allowance of air, and keeping the plants well up to the glass. Plants swelling off their fruit should be allowed a moderate atmospheric moisture, admitting air at the top of the house early each morning to allow of the escape of moisture before the sun becomes too powerful. Do not let these plants whose fruit is now ripening suffer from want of water; on the other hand, do not keep them too wet. Allow a free circulation of air, and damp the paths occasionally when very hot. Should it be desirable to retard any of the fruit, move the plants to a cool, shady house, and give abundance of air.

Figs.—Trees that have supplied a second crop of fruit should finish bearing for the season, and be allowed to rest. See that the shoots have not become overcrowded, and remove all weak and unfruitful wood. Ventilate to the full extent day and night. Trees in a fruitful condition will show a third crop; these should be removed. Watering must be attended to, in order to prevent the foliage becoming limp; with the exception of this, much further attention to them will not be required. When the wood is well ripened, Figs will endure a fair amount of dryness at their roots, but this is not the case when the fruits are swelling. The wood and foliage being now fairly well ripened, a good opportunity is presented for clearing the trees of red-spider and scale. Should these pests have made progress while the fruit was ripening, syringe the trees at intervals of a few days with one of the many advertised insecticides. Afterwards, by a free use of the syringe, thoroughly cleanse the wood and foliage. Trees carrying fruits that are swelling should be given manure-water at the roots. Syringe the trees daily, and give air early in the morning. Expose the fruit well to the sun.

THE FLOWER GARDEN.

By A. B. WADDS, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

Propagating.—In places where a change of plants is required for the flower-beds every season, sufficient stock should have been planted out for propagating purposes in a spare piece of ground. Such plants as Pelargoniums, Calceolarias, Lantanas, and Heliotropes that will be required next season should have their cuttings taken now, and if room was left between the rows of the old plants they may be dibbled in close to the stock plants to keep them in their varieties, and to make good plants by the autumn. Keep all blooms pinched off the stock plants, and apply the hoe well among the plants.

Lavender.—The flowers may now be gathered. When cutting leave all the stem to the flower-spikes and tie them up in bunches to hang in a cool place. Cuttings of this plant may now be taken; they strike readily if placed in a cool frame well shaded from the sun.

Roses.—The second supply of flowers are fast coming on, and waterings of liquid-manure will be beneficial to them. Some of the varieties such as Mrs. J. Laing and Mrs. Grant will require disbudding. The latter variety makes very little growth here, and too much bloom. The promise of a good autumn display is very evident. Secure shoots of Crimson Rambler for protection against the wind, and cut the old trusses off as soon as they have faded. Remove some of the old shoots, taking care not to overdo it. As soon as the flowers are off, syringe well with some insecticide.

Sunflowers.—Tall varieties planted in exposed positions should be staked; for which purpose small, rough, straight Larch poles are very suitable, as they do not readily blow about with the wind. These plants will require plenty of water and mulchings.

Violets.—Keep the ground about these well hoed, the side shoots cut off, and the plants watered, syringed, and mulched.

Flower Seeds.—The gathering of these should be done as soon as they become ripe. This especially applies to Iceland Poppies and other small-seeded flowers. Seed-gathering should be done when the seed-vessels are dry.

Montbretia Potii.—These are now furnishing a good supply of bloom, and will require plenty of water, especially if the weather continues hot and dry.

Bulbs.—When time permits soil should be got ready for the planting of these. Where the soil is clayey it should have incorporated with it any material that will lighten it, such as old soil from the potting-shed, the soil, rotten leaves and manure from the spent hotbeds, road scrapings, or anything of that nature. Mix in a small quantity of bone-meal, lime, and soot, and turn the whole over a few times in order to thoroughly mix it. Look over any bulbs that are stored; any showing signs of growing out should be at once planted.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, AUG. 13	Sheffield Horticultural and Rose Show.
TUESDAY, AUG. 16	Exmouth Horticultural Society's Show (2 days).
WEDNESDAY, AUG. 17	Shropshire Horticultural Society's Show at Shrewsbury (2 days).
THURSDAY, AUG. 18	Aberdeen Horticultural Society's Exhibition (3 days). Cottingham and District Flower and Poultry Show.
FRIDAY, AUG. 19	Devon and Exeter Horticultural Society's Show at Exeter.
SATURDAY, AUG. 20	German Gardeners' Club meet.

SALES FOR THE WEEK.

MONDAY, AUGUST 15—Great Trade Sale of Dutch Bulbs, over 5,000 lots, by Protheroe & Morris, at 67 and 68, Cheapside, at 10 o'clock.—Consignment of L. Harrisii, Palm Seeds, &c., at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 2.

THURSDAY, AUGUST 18—Great Trade Sale of Dutch Bulbs, over 3,500 lots, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 10 o'clock.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—62° F.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 10 (6 P.M.): Max. 70°; Min. 58°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, Aug. 11 (10 A.M.): Bar., 29.9; Temp., 64°. Overcast.

PROVINCES.—Wednesday, August 10 (6 P.M.): Max. 74°, S.E. Coast of England; Min. 55°, West Coast of Ireland.

The Revival of the Verbena.

THE Verbenas which occasionally come under the notice of the Floral Committee of the Royal Horticultural Society for awards, take some of us back fifty years or more, the quality of bloom of Miss Willmott, Warley Scarlet, Princess of Wales, &c., reminding us of the leading varieties in cultivation at that time, such as Mrs. Woodroffe, Boule de Feu, Brilliant de Vaise, Robinson's Defiance, King of Scarlets, Purple King, and others. EDMONDS, of Great Ormesby; GEO. SMITH, of Islington; KENDALL, of Stoke Newington; CHAUVIERE, of Paris, and others were then the leading raisers. There was at that time a large demand for Verbenas for bedding purposes and, to some extent, for exhibition, the plants being shown in pots rather than as cut blooms. What might then have been truthfully termed a startling advance was made when, in 1855, Mr. C. TURNER sent out from the Royal Nursery, Slough, three varieties raised by Mr. EDMONDS,

who was gardener to the Dowager Lady LACON, at Great Yarmouth, viz., Bluebeard, Lady Lacon, and Wonderful. These three were figured by ANDREWS in the *Florist* for April, 1855, and after making due allowance for the proneness of the artist to portray ideal rather than actual flowers, yet our recollection of the varieties showing such a distinct advance in form and colour were of a character to impart an enormous impetus to the interest then being taken in the Verbena. Mr. EDMONDS preferred the white eye in his productions, so they became known as Auricula-flowered Verbenas.

If the Verbena is again becoming popular, and the work of improving it is to be seriously prosecuted, then it would be well if raisers could obtain possession of EDMONDS' three varieties of 1855 for employment as seed-parents.

It was the sight of these varieties which fired the late Mr. CHAS. J. PERRY, of Birmingham, with a desire to try his hand at improving the Verbena to a yet greater degree of excellence than had hitherto been attained—a work in which he succeeded beyond all expectation. He produced large and finely-rounded "pips," borne on bold, symmetrical trusses; and he set the fashion of exhibiting cut Verbenas in bold and striking bunches—a practice which was soon generally followed. But as he grew all his Verbenas under glass, this method of culture somewhat injuriously affected the constitution of the plants. Many of his best varieties were found to be practically useless for bedding out, though Mr. PERRY always contended that he raised solely for exhibition purposes, and simply as cut flowers. There must be some living who can remember the stands of twenty-four bunches he was in the habit of staging at the Royal Horticultural Society's shows at South Kensington, at the Royal Botanic Society's exhibitions, and at those held at the Crystal Palace.

When illness compelled Mr. PERRY to give up raising Verbenas, the work was continued by Mr. HENRY ECKFORD, then gardener to the Earl of RADNOR, Coleshill, Berks. For years previously ECKFORD had been at work raising Dahlias, zonal Pelargoniums, and other florists' flowers, as well as selecting and raising fine strains of vegetables—pioneer work of a valuable character—before he began his successful labours with the Sweet Pea. He raised many seedling Verbenas; but, recognising that its greatest value consisted in its adaptability for bedding purposes, he grew all his seedlings in the open-air, and brought back to the Verbena rare constitutional vigour. Many varieties of his raising were named and distributed, until the time came when, through leaving Coleshill, the culture of the Verbena had to be abandoned by him. His collection passed into the hands of Messrs. KEYNES & Co., of Salisbury, who at one time grew named Verbenas largely for the trade. If they have still in their possession a brilliant scarlet-crimson variety bearing the name of Lustrous, it would be found invaluable as a seed-parent at the present time.

Those who may undertake the work of improving the Verbena should seek to produce rounded, flat "pips," well displayed on bold trusses. Profusion of bloom is a natural characteristic of the Verbena, but a compact habit can be secured only by care-

ful selection. Some improvement in the form of the pip is highly necessary.

The late JOHN WILLS also interested himself largely in the improvement of the Verbena, and even introduced double varieties, which we have never seen since. Probably they fell victims to a mysterious disease which discouraged growers, and led them to abandon the cultivation of the Verbena for a period.

TROCHETIA BLACKBURNIANA (see Supplementary Illustration).—We are indebted to Mr. BEDFORD, of Straffan House Gardens, Kildare, for the specimen from which our illustration was taken. It is a Sterculiad, native of Mauritius, an island in the Indian Ocean, another occurring, according to the *Botanical Magazine*, in St. Helena, in the Atlantic, with the whole continent of Africa, on which no species of the genus has yet been found, in between the two islands. It may be easily judged that there is plenty of room for speculation as to the why and wherefore of this distribution. In cultivation it is a stove shrub, with the leaves more or less covered with soft, brown, stellate hairs. The flowers are on long stalks, with oblique petals, with a white ground, bright red along the veins, and with revolute margins also red. Mr. WORTHINGTON SMITH's drawing shows the leaves and flowers of their natural size, a section through the flower exhibiting the arrangement of the parts and the ovoid, mucicate pollen-grains, the latter seen as magnified 200 diameters. A coloured figure was given in the *Botanical Magazine*, t. 7209.

NATURE-STUDY COURSE.—In an address to the students attending the Nature-study course at the Swanley Horticultural College, Mr. J. C. MEDD referred to the scheme put forward by the League of the Empire for affiliating schools in Great Britain to those of the same grade in the Colonies with a view to the pupils of the affiliating schools corresponding with one another on matters affecting their school life and surroundings. The proposal has met with the most cordial support from the Ministers of Education in the different Colonies, and already several schools have become thus linked together. He could conceive of nothing better calculated to interest children in their work, widen their outlook, break down the parochialism that had been so harmful in the past, and to inspire those with whom the future of the Empire would rest with a sense of its solidarity and grandeur. Mr. MEDD also spoke of the openings for remunerative employment which women thoroughly qualified in Nature-study subjects might probably find. The desire to make the instruction in rural, day, and continuation schools more appropriate for rural children was universal, but competent teachers were scarce. The difficulty could be most easily solved by grouping schools and engaging peripatetic teachers for special classes; and he strongly urged the students present to have the matter brought to the notice of their respective local authorities.

OUR WILD PLANTS.—The Rev. G. ADRIAN WOODCOCK has published the substance of a lecture he gave on "How to make Notes for a Rock-soil Flora" (Louth: J. W. GOULDING & SON; price 1s.). This is a very valuable and suggestive pamphlet, giving indications as to the relationships between particular plants, the soils they grow on, and the conditions to which they adapt themselves. Those who imagine that botany consists merely in finding out the names of plants will have their mental horizon considerably extended by the perusal of this lecture. It is so full of details and of rational inferences from them that it should be perused not only by field botanists, but by all who are interested in the tillage or management of land.

SEX-VARIATIONS OF AUCUBA JAPONICA.—

Since the introduction of the male plants of *Aucuba japonica* to Europe in 1863, many curious sex-variations have been noticed. M. LOMBARD-DUMAS has been observing some of these, and has obtained some interesting results, which are published in a recent number of the *Bulletin de la Société Botanique de France*. M. DUMAS found that certain of his old male plants were suddenly metamorphosed into young female plants, but remained sterile in spite of his attempts at artificial fecundation. Of two cuttings taken from the same male shrub, one produced small corymbs of female flowers, though preserving their male appearance; the other formed fine trusses of male flowers. Male trusses of this latter plant varied the following year, and yielded numerous hermaphrodite flowers, a few more or less normal male blooms, and rarely female flowers with no ovary, although provided with a stigma sometimes normal, sometimes bifid or even trifid, and in the form of a recurved horn.

READING FLOWER SHOW.—The Secretary informs us that this event will take place on the 24th inst., and not on the 30th, as recorded in our list of appointments for August.

CARNATIONS.—MR. MARTIN SMITH writes that his new seedlings show a great advance in yellow-ground Picotees, fancies, flakes, and bizarres. He expects to astonish the "fancy" next year.

"DIFFUSION AND OSMOTIC PRESSURE."—

The circulation, so-called, of the sap depends upon certain physical and chemical factors, which are considered in a work bearing the above title. The author is DR. BURTEN EDWARD LIVINGSTON, of the Department of Botany of the University of Chicago. In his thesis he gives a general view of the whole subject, which will be of value to the student. The following citation will show that the problems connected with the ascent of the sap are not yet solved:—"Just how the sap is raised in trees is not surely known. There are at present two main theories to account for it: (1) it is supposed to be raised by periodic pumping action of living cells in the trunk; (2) it is supposed that evaporation and the resulting osmotic concentration in the leaves will draw it up from the roots, the cohesion of the minute water-columns being supposed to be of sufficient magnitude to prevent their being broken by the strain." The volume in question is issued from the University Press of Chicago.

HOW TO GET RID OF PLANTAINS ON LAWNS.

—A correspondent of *American Gardening* makes use of kerosene for this purpose. With a small squirt oil-can he deposits two or three drops of the oil on each Dandelion or Plantain, with the result that the intruders disappear.

FLORA OF THE PAMIR.—A few years ago we used to hear a good deal about the "Pamir," a desolate mountain region between 41° and 46° E. longitude and 37° to 40° N. lat., concerning the exact limitations of which there was some difference of opinion between ourselves and the Russians. One consequence of this dispute was the acquisition of an increased knowledge of the territory and its products. Now we have before us a *Flora of the Pamir* by Madame OLGA FEDTSCHENKO. Fortunately the names of the plants are given in Latin, so that we have a complete list of the plants in that tongue, together with bibliographical references, while the extended comments are in Russian. Four hundred and eighty-five species, including one Fern (*Cystopteris fragilis*), are enumerated. The plants are mostly herbaceous perennials, bulbous plants, including several species of *Allium*, with very few trees (species of *Salix* and *Betula*). Statistical tables and a map of the country (unfortunately in Russian) are included. The

illustrations show a dreary waste of rock with snow-mountains in the distance; but the existence of cattle is a proof that herbage is not altogether wanting.

CLOVER-SICKNESS.—It is well known that Red Clover grown for years in succession on the same land is very apt to fail. Various causes have been assigned for this failure. Mr. HANS GÜSSOW, in a paper in the *Journal of the Royal Agricultural Society*, discusses these alleged causes and comes to the conclusion that the real cause of the disease is the fungus known as *Sclerotinia ciborioides*, the black seed-like "sclerotia" of which may often be seen in the stems of the Clover, and may also be found in the soil in which the plants are growing. No satisfactory remedy has yet been devised. The burning of the plants and of the top layer of soil is a "counsel of perfection."

THE BRITISH SCIENCE GUILD.—It has been a frequent subject of comment that, although the contribution of this country to the progress of science has been second to that of no other nation, the English people do not manifest that interest in and belief in the powers of science which are noticeable among the peoples of the Continent or of America. In spite of the efforts of many years the scientific spirit, essential to all true progress, is still too rare, and, indeed, is often sadly lacking in some of those who are responsible for the proper conduct of many of the nation's activities. It is with the view of attempting to remedy this evil, and to bring home to all classes the necessity of applying scientific treatment to affairs of all kinds, that the proposal is made to bring together those convinced of this necessity by founding "The British Science Guild." The objects and organisation of the Guild, as we learn from a circular before us, will be entirely disconnected from party politics, and are as follows:—

OBJECTS.

- (1) To bring together as members of the Guild all those throughout the Empire interested in science and scientific method, in order, by joint action, to convince the people, by means of publications and meetings, of the necessity of applying the methods of science to all branches of human endeavour, and thus to further the progress and increase the welfare of the Empire.
- (2) To bring before the Government the scientific aspects of all matters affecting the national welfare.
- (3) To promote and extend the application of scientific principles to industrial and general purposes.
- (4) To promote scientific education by encouraging the support of universities and other institutions where the bounds of science are extended, or where new applications of science are devised.

METHODS OF ATTAINING THESE OBJECTS.

- (a) By Publications. (c) By Conferences and Lectures.
- (b) By Meetings. (d) By Deputations.

The Organizing Committee has elected Sir Norman Lockyer, President; Lord Avebury, Honorary Treasurer; Lady Lockyer, Honorary Assistant Treasurer, and Mr. C. Cuthbertson, Honorary Secretary.

It was resolved that Life Members of the Guild shall pay, on admission, 2 guineas, which includes a registration fee of 2s. 6d., and that Annual Subscribers shall pay, on admission, 5s., and in each subsequent year 2s. 6d. It was also resolved that donations may be accepted.

THE USES AND WONDERS OF PLANT-HAIRS.

by KATE E. STYAN. (London: BEMROSE & SONS, Ltd., 4, Snow Hill).—Miss STYAN does not pretend to offer the results of her own investigations, but makes use of those of various authorities, arranging them for the understanding of even the unlearned. In the subject of plant-hairs she treats of an important department of vegetable physiology, and readers may be grateful to her for interesting and enlightening them unexpectedly. The authoress divides plant-hairs into those that are (1) Protective, (2) Defensive, and (3) Assistive. "Hair" is of course a vague term,

and comprehends the finest down at one end of the scale, and thorns and spines at the other. The little book is appreciatively written, and made extra clear by illustrations showing magnified hairs and their structure. We recommend the publication to young naturalists who have not yet grappled with more important text-books.

SANSEVIERA LAURENTII.—A species discovered by the late Prof. LAURENT at Stanleyville, Congo, and introduced to the Botanic Garden, Brussels. The tufted leaves are oblong lanceolate, green with broad marginal greenish-yellow bands, and narrower stripes of the same colour in the centre of the leaf. It is described and figured in the last number of the *Revue de l'Horticulture Belge*.

TRIALS AT WISLEY.—We have received from the Secretary of the Royal Horticultural Society a list of the flowers, fruit, and vegetables of which trials are suggested during 1904–5 in the Society's Gardens at Wisley:—

Floral.—Violas: six plants of each variety to be sent in February, 1905. Carnations: three plants of each variety, to be sent in February, 1905. Cactus Dahlias: two plants of each variety to be sent in May, 1905.

Fruit and Vegetables.—Plums and Apples bush trees to be sent by end of October, 1904. Peas: half-pint of seed of each variety to be sent by February, 1905. Potatoes: twenty tubers of each variety, to be sent by February, 1905. Broccoli: half-ounce of seed of each variety, to be sent by February, 1905. Tomato: twenty seeds of each variety to be sent by August 30, 1904, for winter trial.

All the above should be addressed to the Superintendent, Royal Horticultural Society's Gardens, Wisley, Ripley, Surrey. If by rail, per London and South Western Railway to Horsley Station.

EUCALYPTUS.—The fourth part of Mr. MAIDEN's critical revision of the genus *Eucalyptus* (Sydney: W. A. GULLICK) contains numerous illustrations and details concerning *E. incrassata* and *E. fecunda*. Numerous varieties are established, some of which have been held to be distinct species.

VILMORIN MEMORIAL.—The subscriptions up to the present time amount to 10,135 francs (over £400). This amount has been contributed by 872 subscribers, a large proportion of whom have contributed small sums of 1 franc and several of 50 centimes, a gratifying test of the esteem in which the late HENRY DE VILMORIN was held by all classes. We shall be happy to transmit to the Treasurer, M. BOURGUIGNON, any sums that may be entrusted to us for the purpose.

VISITORS TO THE ROYAL GARDENS, KEW.

—The number of visitors from July 31 to August 2 was 112,022.

PUBLICATIONS RECEIVED.—*Biennial Bulletin of the Women's Agricultural and Horticultural International Union*, No. 15, July 15. A pamphlet containing a paper on Forestry by Mr. C. S. OWEN, and a record of women's work.—*County of Monmouth: Report of the Organising Secretary to the Technical Instruction Committee, Agriculture, Horticulture, and Arboriculture*. "The horticultural instruction given at the Farm School, Little Mill, is being continued, and the lectures given at Usk in May were concluded, and will commence again in September."—*Agricultural Bulletin of the Straits and Federated Malay States*, May. Contents: Tapping Scars in Old Wood, Rubber Planting in Southern India, Cotton Notes, Rame, Parasitic Fungi on *Hevea brasiliensis*, &c.—*Report on the Botanical and Afforestation Department, Hong Kong*, for 1903. Records progress made in planting and keeping up the Eotanic Gardens, and the increasing number of visitors to them.—*The Botanical Magazine*, Tokyo, April 20. Includes articles in German and Japanese.—*Journal de la Société d'Horticulture du Japon*, May 31. This includes articles in Japanese, and a description, in French, of *Cypripedium macranthum*, with illustration.—From the Michigan State

Agricultural College Experiment Station. Division of Horticulture: Bulletins Nos. 213 and 214, *Small Fruits for 1904* and *Tomatoes and Potatoes*, by L. R. Taft and M. L. Dean.—Bulletin of the Agricultural Experiment Station of the Louisiana State University: *Rice*, W. C. Stubbs, W. Dodson, and C. Brown.—From the United States Department of Agriculture: *Catalogue of Exhibits of Insect Enemies of Forests and Forest Products at the Louisiana Purchase Exposition, St. Louis, 1904*.—Farmers' Bulletin, No. 198: *Strawberries*, by L. Corbett.—Bureau of Plant Industry, Bulletin No. 60: *A Soft Rot of the Calla Lily* (?), C. Townsend; and No. 65: *Reclamation of Cape Cod Sand Dunes*, by J. Westgate.

DENDROBIUM BELLATULUM.

THIS pretty little species was discovered some years ago by Dr. Augustine Henry in Yunnan, growing at an elevation of 5,000 feet. Later, Messrs. James Veitch & Sons imported a small number of plants of it through their collector, Mr. Wilson. Last year Mr. W. Micholitz, collecting for Messrs. Sander & Sons, St. Albans, found it growing on Oak-trees at Lang Bian, in Annam, at a high elevation, and flowering in November and December. A consignment was sent to Messrs. Sander, who recently exhibited plants of it, from one of which our illustration (fig. 47) was prepared. It is a cool-house plant of the nigro-hirsute section of *Dendrobium*, its ivory-white flowers with orange-red markings on the lip being nearest to *D. cruentum* in general appearance.

FRUIT GROWING.

MR. CRUMP, in the *Madresfield Agricultural Club's Quarterly*, makes the following remarks on the planting and care of fruit-trees, remarks which, however discouraging, deserve attentive consideration:—

"We have the important fact before us that during the past twenty years, upwards of 20,000 of the very best fruit-trees have been gratuitously distributed amongst the tenantry on the Madresfield Court estate. And, reasoning from analogy, there is a right to expect some kind of show for such a heavy item and so great generosity, or, in other words, some sort of profitable results to the tenants, to say nothing whatever of what we should also now be able to see, viz., that valuable asset, the permanently increased value of the property, if one could but find these 20,000 plantations of healthy, well-cared-for trees. It is to be feared that if a census were taken not more than a tithe of the aforesaid 20,000 would be found to exist at the present time. It is to be hoped that the recipients will be able to contradict me and prove to the contrary.

"In passing, it may be mentioned that at the Worcester Summer Assizes four years ago, a well-known valuer of fruit-trees, in his evidence, assessed the value of some fruit-trees about ten years planted at an average of £6 per tree, and some trees only a few years older were considered to be of £10 value each. If we accept these figures, or even take an average of £5 per tree for the trees (say 10,000), which should be at least ten years of age, we have a total value of £50,000 to which these trees might fairly be expected now to have attained, to say nothing of the value of those more recently planted; but if we compare these figures with actual facts we must admit the comparison is more than odious. And the only legitimate conclusion we can draw is that the present system of fruit-cultivation is a failure, although everything has hitherto been done with the very best of intentions by those most concerned. As a matter of fact the average British farmer never does take kindly to fruit-growing, and it is to be feared he is too conservative in his ideas and too wedded to that old doggerel phrase, 'It was my father's custom and so it shall be mine,' ever to learn rightly the very

important lessons to be derived from the school of experience, which, coupled with intelligent and enthusiastic application, are necessary to commercial fruit-growing. It is extraordinary that with all the facilities offered, no one has had the enterprise even to attempt any thorough system of fruit-tree planting on the same lines as entered upon for any other farm crop, that is, by giving up a certain area of land entirely for that purpose. The plan, or rather want of a plan, usually adopted, is a kind of compromise, consisting of the filling up of vacant spaces in grass or cornfields, where trees of a similar kind have died from old age, having naturally exhausted the soil for a considerable distance round about. The planting is invariably done during frosty or very wet weather, when the soil is waterlogged; a small, deep hole is made, and the roots are thrust in perpendicularly, instead of being carefully spread out horizontally near the surface. No stake, fence, or mulch is given for weeks, if at all, and the trees are left to the tender mercy of rabbits, stock, &c. No pruning or other attention is given, rank weeds and coarse

LOCKINCH CASTLE, WIGTOWN-SHIRE.

A VISIT to the Wigtownshire seat of the Earl of Stair is of much interest. The extensive and well-kept grounds were aglow in spring with the flowers of Rhododendrons and deciduous Azaleas, which are mostly planted on slopes and banks. With the Rhododendrons and Azaleas are growing *Kalmia latifolia* and *K. angustifolia*, whilst quantities of large bushes of *Andromeda axillaris* with tiny white flowers were seen, and several specimens of *Magnolia conspicua* in flower; *Choisya ternata* was represented by numerous large bushes covered with starry white flowers; *Piptanthus nepalensis* on walls and in the open was also in flower. *Olearia macrodonta*, which flourishes here, would soon be in flower. There are many large shrubs of 15 or more feet in height of *Cotoneaster frigida*.

Amongst other shrubs noticed in the grounds were *Acer Negundo variegatum*, *A. palmatum atropurpureum*, *Acacia dealbata*, *Ailanthus glandulosa*, *Aralia spinosa*, *Arbutus Unedo*, *A. Andrachne*, *A.*

FIG. 47.—DENDROBIUM BELLATULUM: FLOWERS CREAMY-WHITE, LIP ORANGE-RED.

grasses are allowed to flourish, sucking out the moisture required by the tree's roots, leaving the young previously well-cared-for tree to a terrible struggle for bare existence, which invariably ends in a hide-bound, poverty-stricken state of chronic debility. Thus is the matter of fruit-growing brought into disrepute, and only false results are obtained.

Isolated cases are known where the trees were purposely planted very deeply in order to save the trouble of staking—a fatal mistake for the poor unoffending trees. We have also known trees supplied to order one season and simply laid in by the heels when received and not planted until the next season. Such a state of things is unpardonable, and shows the necessity for plain speaking. *William Crump, V.M.H., Madresfield.*

MISSOURI BOTANICAL GARDEN.—The fifteenth annual report gives full details of the progress of the garden and school of horticulture. The intentions of Mr. SHAW, the founder, have been carefully carried out, and the report gives evidence of steady progress in all departments.

procera, *Paulownia imperialis*, *Veronica imperialis*, *V. salicifolia*, *Viburnum tomentosum* var. *plicatum*, *Ligustrum sinense*, *Caryopteris*, *Mastacanthus*, *Osmanthus ilicifolius*, *Desfontainea spinosa*, *Coronilla glauca*, *Rhus Cotinus*, *R. typhina*, and *R. glabra laciniata*. There are also many fine clumps of Bamboos, *Gunnera manicata*, *Arundo donax*, and some good healthy specimens of *Cordylina australis*, *Yucca gloriosa*, *Eryngium pandanifolium*, *Eremurus himalaicus*, and *Fatsia japonica*.

On a south wall below the flower-garden near the castle amongst many other plants were *Clanthus puniceus* with bright flowers, and *Metrosideros floribunda*. On this wall also were noted healthy plants of *Eriobotrya japonica*, *Eugenia Ugni*, *Aloysia citriodora*, *Berberidopsis corallina*, *Ceanothus "Gloire de Versailles"*, and large, healthy plants of *Romneya Coulteri*; *Clematis montana* in flower, *Solanum jasminoides*, the large-leaved *Myrtle*, *Schizophragma hydrangeoides*, *Benthamia fragifera*, *Habrothamnus elegans* showing flowers, *Jasminum revolutum*, and *Smilax aspera*. The Golden Hop is trained up poles, as is also *Polygonum Balduianicum*. On the castle walls *Euonymus radicans variegatus* has reached a height of 20 feet, and has leaves

of twice the ordinary size, and with gold-coloured variegation. There are large circular beds of *Hydrangea Hortensia*, *H. paniculata grandiflora*, *Lilium auratum*, *Hyacinthus candicans*, and *Kniphofias*.

A circular piece of water contains a collection of the best varieties of the Marliac hybrid *Nymphaeas*, and in this lake or lock many fine clumps of *Richardia æthiopica* are naturalised, and were throwing up many spathes. *F. Street*.

HERBACEOUS BORDER.

GLAUCIUM FLAVUM TRICOLOR.

THE tricolor form of the well-known "Horned Poppy" is certainly one of the most striking of hardy border plants. The plant is of biennial duration, of sufficient hardiness to endure the winter in the open in not a few places in the British Isles. The leaves are deeply cut and spinous, while the silvery character that is characteristic of its growth renders it at once distinct and picturesque. This easily-grown plant would be most effective on the larger rockery, provided ample space could be given to it; and whether grown here or in the border, a well-drained soil and sunny position must be allotted to it. Unlike most variations of a species, the above-named is not of garden origin, and appears to have been first introduced from Asia Minor. A very fine exhibit of this showy plant was in the hardy plant group of Messrs. Wallace & Co., Colchester, at the recent Holland House Show. The handsome blossoms are of reddish-orange colour, with an approach to chestnut-red, and are rendered the more conspicuous by a large ovate blotch at the base of each segment. The long seed-pod which succeeds the flowering stage is also a notable characteristic of the genus.

G. flavum (type), also called *G. luteum*, is a desirable plant. The large flowers are yellow in colour.

G. Fischeri has woolly foliage and blossoms of a reddish-flame colour; it is well worthy of growers' attention. This plant and *G. flavum*, with its varieties, may be regarded and treated as biennials, sowing the seeds from May to July. Where only a few plants are required, the seeds may be sown with advantage in pots, either singly or early thinned out to single plants, transferring to their flowering positions as soon as large enough.

G. corniculatum (phœniceum), though probably more strictly an annual, will in some instances submit to the same treatment as the first-named species.

ASTILBE DAVIDII.

The more one sees of this fine plant the more one recognises its value in the hardy plant garden. The colour of its flowers, if not an absolute novelty among hardy plants, is rare and very effective, and we only recall the *Lythrum*s and *Liatris* that approach the colour of the above-named *Astilbe*. The plant possesses its own characteristics in a low, widely-spreading tuft of much-divided leafage, and issuing therefrom in almost close columnar outline are the many inflorescences of reddish flowers. The examples—indeed, they were specimens—exhibited by the Messrs. Veitch in the Royal Horticultural Hall, Vincent Square, June 26, had flowering stems 7 feet high, and on some plants fully a score of flowering stems were seen. Judging by the widely-extending leaves, the plant is peculiarly well suited either for free, open grouping or for isolation, and in either case will create a new feature in the garden.

The plant shown for the first time at the same meeting as *Astilbe alba* reminds one greatly of the original exhibit of *Spiræa astilboides* of a score or more years ago. The plant now referred to is certainly of a bolder type—a giant form it may be—yet possessing the same broad characteristics generally. *E. Jenkins*.

"LA VILLA ED IL GIARDINO."—Under this title has been published the first number of an Italian publication to be issued monthly. It is published at 31, Piazza Rusticucci, at Rome, and is devoted to the interests of horticulture. An excellent illustration of the *Nelumbium* growing in the lake at the Villa Pamphili is given, and there are articles on the culture of *Vandas* and other plants.

FIG. 48.—GLAUCIUM FLAVUM VAR. TRICOLOR.

Flowers orange-red with a black spot, edged with gold colour at the base of each petal. The flower-bud to the left shows the curious cap-like calyx becoming detached.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

GREY TOWERS.—In reference to an article in your issue of July 23, I should like to say that all the alpine and wild-garden was not laid out by myself. The mansion was built originally by W. R. J. Hopkins, Esq., in 1865. The garden proper was laid out under his supervision by Mr. Green, a landscape-gardener of some repute at that time. The property came into Mr. Dorman's hands some ten years ago. The garden was then remodelled by Mr. Milner. Afterwards we added the alpine and more natural portion, which your correspondent so ably describes. This work was carried out by Mr. Richard Potter. I therefore hasten to give that gentleman the credit which has been given by mistake to myself. *A. Findlay.*

THE SEEDING OF BAMBOOS.—At the present time there are three varieties of Bamboos seeding at Menabilly—namely, *Arundinaria Simoni*, *Phyllostachys Henonis*, and *P. Castillonis*. Several clumps of *A. Simoni* are seeding, in some of them only one or two culms are producing seed, while the rest of the clump, often the greatest portion of it, is not showing fruit at all. Doubtless the fertile culms will wither and die; but will the other non-seeding culms of the same clump die also? What has been the experience in this respect of other growers of Bamboos? As regards one whole clump of *P. Henonis* which seeded last year, this clump, though weakened and sickly, has not died, but some of it is looking fairly well, though not so healthy as before. As to *P. Castillonis*, only one small clump of the several larger clumps growing at Menabilly is showing seed; and I shall be sorry if fertility causes death to this species, as I much admire the plant with its pretty and distinct colouring of the culms and fine foliage. I have not heard of this variety seeding in other places, but shall be glad to know the experience of other growers. I hear that a specimen of *Bambusa Falconeri* or *nobilis* in this neighbourhood, and which I believe is one of my offshoots, is flowering; but all my fine specimens of this variety, which are now nearly thirty years old, seedlings of my original grand specimen, are yet flourishing, and sending up fresh culms 25 to 26 feet high. Their death and disappearance would cause sad gaps in my gardens. *J. Rashleigh, Menabilly, August 5, 1904.*

—We have had clumps of these plants flowering this summer, viz., *Phyllostachys Boryana*, *P. Castillonis*, and *Arundinaria Simoni*, and in the two first-named no new growths are being pushed up from the base. The reason of their flowering cannot be that the two past summers of 1902 and 1903 were particularly tropical. I noticed our plants back in the winter were going to bloom by the shoots being much heavier, causing the growths to droop over much more than is usually the case, and now they are in full flower, many of them at the points touch the ground after a shower of rain. Some varieties appear to flourish for years and show no flower. We have immense pieces of *Arundinaria japonica*, *A. quadrangularis*, *Phyllostachys aurea*, *P. nigra*, *P. Quiloi*, *P. viridi-glaucescens*, neither of which have as yet showed any signs of flowering. *J. Mayne, Bicton, Devon.*

DISA GRANDIFLORA.—A remarkable display of this lovely terrestrial Orchid was exhibited by Mr. J. Sargent, gardener to Henry Hansard, Esq., "Millfield," Cobham, at the Oxshott flower-show held in the Manor House grounds, Stoke d'Abernon, on July 20. The plants, arranged in a group, were not for competition, and were marvels of good culture. They were grown exclusively in shallow pans, and averaged ten spikes to a pan, each spike containing five or six bold flowers. It is very seldom that one has the opportunity of seeing this difficult plant grown in such good form. *W. H. Bailey, Oxshott.*

GRADUS PEA.—I have always held a high opinion of this variety, and was pleased to note the remarks of Mr. J. G. Wilson on p. 77 in your issue for July 30, but I was not aware until this season that it was a first early variety, and suitable for sowing towards the end of January. Even in this genial climate we could not gather

under seventeen weeks from the time of sowing, ours being sown on January 23. Do I gather from your correspondent's remarks that when he says it took fourteen weeks to get into full pod that he means the Peas were ready for the kitchen by that date? If so, it would be interesting to know the date upon which he sowed, and whether outside or whether in pots and eventually planting out as the season advanced. *Devonian.*

THE CYANANTHUS.—Few among our rock garden plants are more beautiful than those belonging to the small genus *Cyananthus*, of which there are some eight species recognised in the *Index Kewensis*. Of these only some two or three (probably only two) appear to be in cultivation in these Islands, but these are deserving the attention of all who can afford them their few requirements. They must be ranked as among the choicest of our plants, and their value to us is enhanced by their flowering period being later than that of many alpine flowers. They are frequently at their best in August, and at that time their lovely blue flowers are always most welcome, seeing that the alpine garden is then duller and less attractive than earlier in the season. With the exception, perhaps, of *C. barbatus* (not, so far as I am aware, in cultivation in the United Kingdom), which is a native of China, these flowers come from the Himalayan regions. Like many plants from these quarters, they have their idiosyncrasies, and it is not always easy to hit upon their precise requirements. Nowhere have I seen the *Cyananthus* do so well as on a low terraced rockery with a full west exposure, and in a district where the rainfall was higher than the normal average for the United Kingdom. I am aware that this is hardly the position recommended by some experienced growers, but I do not think the plants referred to, and in the garden of a very able alpine grower, could easily be surpassed. A dry position, facing south-east, with a compost of leaf-mould and sand, with some loam added, as well as a little grit, is the prescription of another able cultivator. I think, however, that a west exposure and plenty of water in summer would be better; my own experience also being in favour of this. With a good dry soil and subsoil the *Cyananthus* requires and delights in more copious supplies of water in summer than are frequently afforded it; but, on the other hand, it should be kept drier in winter. This can best be secured by throwing off the winter rains by means of a sheet of glass or a slate a little elevated above the plants. In summer watering I find it desirable to keep the water applied by the watering-can off the foliage of the *Cyananthus*. It can be grown either in a crevice of the rockwork and depending from it, or on a flat and almost level terrace. The species of *Cyananthus* most commonly met with is *C. lobatus*. This is a very beautiful little plant with ornamental, prettily-lobed, light green foliage, and handsome purple-blue flowers with a white centre. It is of trailing habit, and when in bloom is one of the most charming rock-plants in existence. It is best propagated by seeds, but the plant should be kept dry overhead if it is desired to save seeds, as the water gathers in the calyx of the flower and rots the seeds, or prevents them from forming. It is a truly delightful plant of the highest order of beauty. *C. incanus* appears to be met with sometimes under the name of *C. inflatus*, a recognised species, which I am not yet satisfied is in cultivation in this country at present. At least the plants I have seen called *C. inflatus* were simply *C. incanus*. It is a very beautiful species with smaller flowers, which are more numerous produced than those of *C. lobatus*. They are of a soft blue; while the oval leaves, which are only slightly lobed, are beautifully covered with soft silky hairs. This is a very desirable species, although it appears to be less hardy than the preceding. Like it, it ought to have some shelter from excessive rainfall in winter. *S. Arnott, Carsethorn-by-Dumfries, N.B.*

CAMPANULA ISOPHYLLA ALBA.—We are so accustomed to see this charming trailing plant grown in a pendent direction that the production of it in the form of quite large pyramids naturally excites surprise. I think it very doubtful whether there are in the kingdom two such fine

pyramids of this plant as are now in the possession of Mr. Durrant, of South Park, Reigate. These plants are growing in 10-inch pots. They measure from the bottom of the pot, which is completely draped with foliage and snow-white flowers, to the apex about 4 feet in height, and low down fully 3 feet through. The method of training is as follows:—A funnel of wire-netting, about 6 inches in diameter and 3 feet in length, is fixed with the aid of stakes in the centre of each plant, and the growths kept within it until the tip is reached, when they are allowed to grow out laterally, thus in time forming these remarkable pyramids. Mr. C. J. Salter, of Woodhatch Gardens, who saw these specimens with me on the 30th ult., was as much surprised and pleased with them as myself, and has resolved to see Mr. Durrant, to induce him to bring this pair of specimens to the Horticultural Hall at the next meeting. I hope he may be successful, as I am sure the plants would secure considerable attention, not only for the fine culture shown, but also for their novel appearance. Mr. Durrant has also some good large examples of this *Campanula* as trailing or vase-plants, and in this way they too are very beautiful. Doubtless this *Campanula* owes something of its popularity to the snowy whiteness of its flowers; but its trailing, free-growing, and flowering habit adds much to that popularity. As a window plant, inside or out, hanging in pots or growing in window-boxes, it cannot be excelled. *A. D.*

STRAWBERRY FOR WET WEATHER.—I find no Strawberry withstands rain better than the old Elton Pine. *D. S. M., Poltalloch, Lochgilphead.*

EFFECT OF INSECT BITES ON CHLOROPHYLL.—We are, of course, well aware that the bites and stings of many insects have very peculiar effects upon the subsequent growth of plants in the shape of galls and other malformations, but, so far as we know, the far-reaching but temporary effects in chlorophyll, as evidenced by change of colour, due to the mere devouring of even small parts of the foliage by weevils and caterpillars, have neither been recorded nor accounted for. In my own experience it very frequently happens that the presence of these vermin in Ferns is clearly indicated to me by the normally healthy green colour turning to a very pale whitish tint, and this not merely in the immediate vicinity of the pests and the wounds caused by them, but even in adjacent fronds of considerable size. Root affection is out of the question, since the weevil in the beetle stage does not touch them, any more than does the caterpillar, and yet the entire chlorophyll of a plant is affected by merely local bites, which in the case of both classes of vermin we do not regard as in any way venomous, but simply locally destructive. Furthermore, if we remove the depredators the normal green tint is resumed in a few hours. Aphides, which pierce the epidermis and withdraw the sap by suction, have no such effect, though in their case it would be more easily understood. We may also excise parts of fronds without any such pallor resulting. The cause of such wide effects is therefore a mystery, while they indicate a sensitiveness to distant influences which, though unaccompanied by motion, rivals that of the Sensitive-plant itself. *C. T. D.*

EMIGRATION TO SOUTH AFRICA.—In a recent issue "One who has been Bitten," in advising young men not to emigrate to South Africa for a less wage than £3 per week, is surely writing of one particular place in South Africa, and if so his note is rather misleading, as it would appear as if it applied to the whole of South Africa. As South Africa comprises nearly 900,000 square miles, it is obvious that in so vast an area the cost of living, &c., varies considerably in different towns. Had "One who has been Bitten" given the name or names of the particular place or places to which he refers he would have done a real service to many intending emigrants. A few months since I engaged an experienced gardener to go to the western province of South Africa at £8 10s. per month. I have since heard that he is satisfied, and his employer is also satisfied. I have had experience in Cape Colony, and I have found that a fair margin of the monthly wage of £9 could be put away for some future

date. As I know several first-class men holding good positions in South Africa, I will endeavour to gather information from those who are living in widely separated towns, and report to you later for the benefit of those to whom it may be of service. *W. Miles, Isleworth.*

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 9.—The display of plants, &c., at the fortnightly meeting at the Hall in Vincent Square was not a large one; no doubt many of the exhibitors are holding back for the premier provincial show at Shrewsbury on the 17th inst. Still, there were several meritorious exhibits, notably a fine collection of Gladioli from Messrs. KELWAY & SON, who are hard to surpass in this beautiful flower. The attendance was meagre, doubtless owing to counter attractions at the seaside and other holiday resorts. Although the weather was warm and bright sunshine prevailed, one could not but appreciate the conditions obtaining in this handsome building—the absence of stuffy atmosphere, and the entire freedom from crush when examining the various displays. The light, too, is excellent, enabling one to estimate the shades of the various flowers with a nicety not possible in such a building as the Drill Hall. After the walls are properly seasoned, they will receive the colouring which is necessary to tone them down.

The Committees, which must work far more pleasantly in their new environment, recommended several awards to novelties, the Orchid Committee granting a Botanical Certificate to *Bulbophyllum Hamelinii*, and the Floral Committee four Awards of Merit.

The FRUIT COMMITTEE did not find much to occupy their attention, although they had some exhibits on which to pass judgment, including an extensive collection of fruit and vegetables from the University College Gardens, Reading, and miscellaneous small exhibits of fruit from several other exhibitors.

Forty-nine new Fellows were elected to the privileges of the Society at the general meeting in the afternoon.

Floral Committee.

Present: H. B. MAY, Esq. (Chairman); and Messrs. Chas. T. Drury, C. Blik, Jas. Walker, R. C. Notcutt, C. J. Salter, Chas. Jeffries, Geo. Gordon, Amos Perry, Chas. Dixon, Wm. Howe, J. Jennings, Chas. E. Pearson, H. J. Jones, W. P. Thomson, E. H. Jenkins, W. J. James, Chas. E. Shea, W. Cuthbertson.

LORD ALDENHAM (gr., Mr. E. Beckett), Elstree, staged eighteen vases of spikes of *Pentstemon*, all named varieties, including several new sorts, of which Lord Aldenham is a large crimson-coloured flower with a pleasing white throat; Mrs. E. Beckett has rosy flowers, the petals edged with darker rose colour; Lord Lister is a fine scarlet; Rachel is also a meritorious variety. Adjoining the *Pentstemons* was a pretty group of hybrid *Streptocarpus*, the trusses being tastefully arranged in fancy glass vases, and set off with sprays of Maidenhair Fern. The size and shape of the flowers were excellent, the colours ranging through all shades from pure white to dark purple. All the varieties were unnamed (Silver Banksian Medal).

MR. S. MORTIMER, Farnham, Surrey, staged a choice display of Cactus and Show Dahlias. These were very artistically displayed, and formed a most pleasing group. Most of the finer varieties were included, and the individual blooms were well grown. Royal Scarlet is a new variety of the colour indicated by its name, of a pleasing form and of large size. Another unnamed yellow seedling was meritorious, also one having a light centre with a mauve edging. Among such an extensive collection of first-class varieties it is difficult to discriminate, but we may mention H. J. Jackson (very dark crimson), Mrs. Winstanley (fine scarlet), and Mrs. John Barker as being especially meritorious. Among the show types Mrs. D. Saunders, T. W. Girdlestone, and Mrs. Saunders were especially prominent (Silver Flora Medal).

MR. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, set up a large miscellaneous group, in which *Campanulas* were a feature; varieties of small Ferns in 60's were worked along the front of the group, and several larger plants were interspersed through the whole. Plants of *Nerium Oleander rosea splendens* (well flowering) occupied the centre of the group, and varieties of *Campanula isophylla*, including C. i. Mayii, also *Solanum jasminoides*, *Swainsona galegifolia*, and shrubby *Veronicas* were the principal features of this extensive exhibit (Silver Banksian Medal).

MESSRS. VEITCH & SONS, in addition to a collection of hardy flowers tastefully arranged in vases, set up a number of pot-plants of *Begonia Rex*, including several new varieties of these showy plants, of which B. M. de St. Valière is very pleasingly marked. Several well-flowered plants of *Pancratium fragrans* were staged at the background. The centre of the group was occupied with a number of plants of *Begonia Washington*, for which an Award of Merit was obtained. Messrs. VEITCH also displayed plants of *Buddleia variabilis Veitchiana*, carrying long racemes of lavender-coloured flowers; and *Senecio clivorum*, which forms a handsome plant in a damp situation. These are both introductions by Messrs. Veitch, through their collector, Wilson, from Northern China (Silver Banksian Medal).

MESSRS. J. HILL & SON, Barrowfield Nurseries, Lower Edmonton, set up a group of *Brainea insignis*, relieved with other suitable plants. This collection was very extensive, and not being cramped for space was displayed to good advantage. The *Braineas* were all specimen plants, well grown, and having clean, well-coloured fronds. Pillar plants of *Lygodium dichotomum* and *L. japonicum* were dotted among the group, and a suitable edging of *Ficus radicans variegata* and small Ferns completed the group (Silver Banksian Medal).

Another group of Ferns, displayed by Messrs. W. BULL & SONS, King's Road, Chelsea, consisted of Tree-Ferns with smaller varieties of Ferns as an edging. *Cyathea dealbata*, *C. medullaris*, *Dicksonia antarctica*, *D. glauca*, were the principal members (Silver Banksian Medal).

MESSRS. R. & G. CUTHBERT, Southgate, Middlesex, set up an extensive group of *Lilium lancifolium album* and *L. l. rubrum*, having a groundwork of Ferns, small Palms, &c., and an edging of vases of *Phlox decussata* "La France," interspersed with Maidenhair Ferns. This was an extensive group and nicely arranged. The *Liliums* were excellent (Silver Banksian Medal).

HARDY PLANTS.

There were several large groups of hardy flowers staged on this occasion, and not a few interesting plants included.

In the group from Mr. AMOS PERRY, Winchmore Hill, were large masses of the best *Eryngiums*, and such plants as *Helenium pumilum magnificum*, *Echinacea purpurea*, *Platycodon grandiflorum*, &c., the fine *Helianthus* "Golden Ball." *Phloxes* were very showy, also *Liatrix spicata*, and *Asclepias tuberosa* with red orange heads of blossoms. *Verbena venosa*, a climbing Polygonum, many Water-Lilies, and other showy things were shown in quantity.

The Sweet Peas from DOBBIE & CO., Rothesay, were a feature. The exhibit was instructive as showing the differences between North and South in the time of flowering, &c. From seeds sown on the same date, somewhere about Good Friday, the flowers came in perfection from Bute, while the ripened seed-pods as seen in the centre of the group were from the firm's branch establishment in Kent. The flowers were very fine in quality, and well disposed in handsome bunches. Some sixty or more vases were staged of a representative collection. Countess of Radnor, Countess Spencer, King Edward VII., Pink Friar, America, Stella More (yellow), the old Gorgeous, and others were included (Silver Flora Medal).

The exhibit from Messrs. BARR & SONS, Covent Garden, included excellent white and coloured *Phloxes*, some good Gladioli, and many varieties of the hybrid Water-Lilies, *Delphiniums*, &c. *Spigelia mari-*

landica, with scarlet tubular flowers, was an exceptional plant, and in good condition. *Gladiolus dracephalus*, with bronzy and yellow flowers, was also of some interest.

Phloxes were abundantly shown by Messrs. GUNN & SONS, Olton, Birmingham. There was quite a large collection of kinds, for the most part well known.

The Gladioli from Messrs. KELWAY & SONS, Langport, were an exceptionally fine lot of flowers, probably one of the best exhibits sent from this firm. Where all were good it is difficult to make a selection, but the following include some very distinct varieties—King of Gladioli (crimson scarlet, very bold and handsome), Bona (yellow), Kenwyn (yellow and fawn), Saltpetre (lovely soft salmon with few spots on the lower petals on a yellow ground), Sultan, The Khedive (both very dark), Miss Wade (almost tubular in form, and white with crimson central stripe), Ajax, Brantford, and Arthur Toms were other showy varieties. A full-length table was occupied by this exhibit (Silver-gilt Flora Medal).

In the exhibit from Mr. M. PRITCHARD, Christchurch, we noted a fine array of *Montbretias* in variety; also *Gladiolus Childsi* in many distinct forms. The white *Scabiosa caucasica* was especially good, and a richly-coloured Day Lily named Dr. Regel was perhaps the finest thing in the group. It is of the purest orange, strongly fragrant, and very refined. *Kniphofia Leonon Queen* (meritorious, clear in colour, and distinct), *Rudbeckia Golden Glow*, the striped *Helenium*, with the white form of *Gladiolus dracephalus*, were other good things in Mr. PRITCHARD's group.

The group by Messrs. CHEAL & SONS, Crawley, embraced such hardy flowers as *Phloxes*, *Eryngiums*, *Montbretias*, &c., with Cactus Dahlias, *Tamarix odessana*, of which a nice lot of sprays were seen, is very pleasing with its pale-pink flowers.

The Messrs. CUTBUSH & SONS, Highgate, also contributed cut hardy flowers. In this group were many good *Phloxes*, Lilies of the speciosum and tigrinum sections, Sunflowers, *Montbretias*, the double scarlet *Lychnis*, several of the best perennial *Marguerites*, Day Lilies, and other things. Among the *Phloxes*, Mrs. E. H. Jenkins, *Roi des Blanchés*, and *Fiancée* were all prominent in the pure white section.

MISCELLANEOUS.

A border Carnation named Merrie England was shown by Mr. JAS. DOUGLAS, Great Bookham. The plant is very free flowering, and was exhibited as cut from the plant without thinning the blooms. The colour is yellow flaked with red.

A seedling Carnation named Strongbow was brought by another well-known Carnation-grower, MARTIN R. SMITH, Esq. The flowers are large, having a primrose ground blotched with dark crimson towards the apex of the petals.

MR. H. W. G. MORRIS, Chipping Norton, also sent three seedling Carnations. Roy Morris is a large self-flowered crimson.

A seedling *Anthemis* was sent by Messrs. J. BLYTHE & SONS, Castle Douglas, N.E.

Two small plants in pots of *Ribes sanguineum* were exhibited by RALPH BROCKLEBANK, Esq., Haughton Hall, Tarporley. The plants were in the seedling stage, and exhibited gold-coloured foliage.

MESSRS. T. ROCHFORD & SONS, Ltd., Broxbourne, sent plants of *Adiantum cuneatum*, var. *Harrisonii*, in which the leaf segments were deeply frilled. This is a very similar variety to *A. heterophyllum*.

MR. JAS. ROSS, Alexandria, N.E., sent blooms of *Chrysanthemum maximum* "Queen Alexandra." An etiolated sport of *Acalypha musaica*, named Cowbarnii was exhibited by A. MARC, Esq., Tring.

W. C. BULL, Esq., Ramsgate, sent a very fine spike of *Gladiolus* "Mabel," a large cream coloured flower, pleasingly suffused with rosy-pink.

MR. JOHN ROBSON, Hale Road, Altrincham, brought a plant of *Bouvardia Humboldtii*, var. Mrs. G. H. Kerslake, with corymbs of large pure white flowers.

AWARDS.

Campanula hybrida Isabel, a dwarf, compact, free-flowering member of the carpatia section. The open flowers are most nearly related to those of *C. c. pelvi-formis*, while the colour is a clear deep violet-blue, and very showy. Shown by Mr. M. PRITCHARD, Christchurch, Hants (Award of Merit).

Dahlia "Radium", a very handsome Cactus variety, with long curving and pointed florets. The colour is

very pleasing in orange and pale-fawn with yellow centre. From Messrs. JAMES STREDWICK & SON, St. Leonards-on-Sea (Award of Merit).

Begonia Washington, a richly-coloured and dwarf-growing plant, that in its freedom and sturdy growth should prove of value in beds in the open. The colour is intensely rich crimson; the medium-sized flowers are produced on short, stout, slightly ascending stalks. The habit is excellent. Shown by Messrs. J. VEITCH & SON, Ltd., Chelsea (Award of Merit).

Gladiolus Valdora.—A very handsome spike, with large, widely-extended flowers. The colour is white with a suffusion of red and pink, and a suspicion of yellow low in the tube of the flower (Award of Merit).

Gladiolus Miss Zena Dure.—A flower of creamy-white and lemon-yellow colour, with red lines in the lower petals. A similar tone of colour is also seen at the base of the flower (Award of Merit).

Both the above were shown by Messrs. KELWAY & SONS, Langport, Somerset.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; and Messrs. Jas. O'Brien (Hon. Sec.), W. H. Young, H. M. Pollett, H. A. Tracy, de B. Crawshaw, F. Wellesley, W. Boxall, H. Little, G. F. Moore, M. Gleeson, T. W. Bond, W. Cobb, J. Douglas, J. G. Fowler, and H. Ballantine.

Several groups of good hybrids and some rare species were staged, but apart from the Medals, only one award was made, viz., a Botanical Certificate to the curious *Bulbophyllum Hamelinii*, from Glasnevin Botanic Gardens.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for a very interesting group, in the centre of which was a fine specimen of *Vanda Lowii* with four long pendulous racemes of flowers. Arranged with it were three specimens of *Angraecum Eichlerianum*, a showy set of varieties of *Laelio-Cattleya callistoglossa*, L.-C. × *Bletchleyensis*, and L.-C. × *callistoglossa*. The finest in colour was L.-C. × *Bletchleyensis Non Plus Ultra*, a large flower of a glowing rose-purple with rich claret-crimson lip. Among the *Cypripediums* were the new C. × *Williamsonianum* (Lecanum × *Ellipticum*) with the peculiarly elongated and extended petals usual to hybrids of its class. The pretty round dorsal sepal was white with an emerald green base and dotted purple lines; petals yellowish tinged and spotted purple; lip of a brownish-rose hue. C. × A. de Lairese had three spikes bearing together a dozen fine flowers; C. × *tonso-Rothschildianum*, a large yellowish flower finely marked, was very distinct. C. × *Rothschildovillosum*, C. × *Annie Measures*, C. × *Flambeau*, C. × *Harveyanum*, C. × *Transvaal*, and C. × *callo-Rothschildianum*, were also well shown; and *Cattleya* × *Patrocini-aurea*, a pretty rose-coloured flower with yellowish centre to the lip.

Messrs. CHARLESWORTH & CO., Heaton, Bradford, secured a Silver Flora Medal for a good group rich in showy hybrids, among which were good varieties of *Cattleya* × *Lord Rothschild*, C. × *Niobe*, C. × *Iris*, C. × *Germania*, C. × *Mary Gratrix*, two fine varieties of *Laelio-Cattleya* × *Madame Chas. Maron* (*Digbyana* × *Warszewiczii*), and other showy hybrids. The centre of the group was of *Oncidium incurvum*, with many elegant white-and-rose sprays. On each side were specimens of *Vanda cornuta*, one with four spikes; also present were *Miltonia Schroderiana*, M. *Regnellii citrina*, M. × *Bleuana grandiflora*, *Brassia Lawrenceana longissima*, *Cynoches chlorocheilon*, *Cypripedium* × *Io maximum magnificum*, and the pretty C. × *Princess* (*Fairieanum* × *Mons. Coffinet*).

Messrs. JAS. VEITCH & SONS, Chelsea, were awarded a Silver Banksian Medal for a neat group of hybrids, including good forms of *Laelio-Cattleya* × *callistoglossa*, L.-C. × *Remula*, L.-C. × *Epicasta*, L.-C. × *Clonia*, *Cattleya* × *Niobe*, C. × *Atalanta*, &c.

Messrs. CRIPPS & SON, Tunbridge Wells, showed a very effective group of about one hundred excellently well-grown plants of *Disa grandiflora*, well furnished with large bright scarlet flowers, and for which a Silver Banksian Medal was awarded.

Messrs. HUGH LOW & CO., Enfield, showed a group in which were a fine specimen of *Cypripedium grande*, good plants of *Cattleya guttata*, C. *Loddigesii*, C. *Warszewiczii*, C. *granulosa*, and C. *bicolor*. Of the last-named one variety had purplish-chocolate sepals and petals and rose lip; and the variety *Grossii* had an unusually broad rosy-lilac labellum.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr., Mr. Hopkins), showed *Cypripedium* × *Heiro*, Eden-

side variety (*Lawrenceanum* × *Chamberlainianum*), a very pretty hybrid, with the round upper sepal yellowish-green, with dark purple lines; petals ciliate, greenish, closely marked with nearly black spots, lip rose, yellowish at the upper edge and with purple warts on the infolded side-lobes. Mr. WELLESLEY also showed *Cypripedium* × *Wiertzianum* and *Bleu's* variety of it, which is larger and more closely marked; the pretty *Cattleya* × *Patrocini*, Westfield variety, and *Cattleya Eldorado crocata superba*, pink with large orange disc to the lip.

AWARDS.

BOTANICAL CERTIFICATE.

Bulbophyllum Hamelinii, from F. W. MOORE, Esq., Botanic Gardens, Glasnevin, Dublin. A very extraordinary species first introduced from Madagascar by Messrs. SANDER & SONS ten years ago, but not flowered in gardens until 1902, when it first flowered at Glasnevin.

The inflorescence sent had a stout compressed stem about 8 inches in length, terminating in a decurved closely-set cylindrical head of flowers, each about $\frac{1}{2}$ -inch long, and $\frac{1}{4}$ -inch wide. The number of flowers in the raceme was over 100, each flower being furnished with a broadly ovate purple-spotted bract, which in some stages exceeds the length of the flower and covers it. The upper sepal is concave at the base and recurved at the tip, the lateral ones meeting in front, all white, lightly marked with purple on the inside, and more heavily on the outside. Lip hinged, broad and tongue-like, white beneath, dark purple above; column white; petals subulate, inconspicuous. It is malodorous like *B. Beccarii*. The plant has large compressed yellowish-green pseudo-bulbs, furnished with thick leathery dark-green leaves, the whole reminding one of *Oncidium ampliatum*. It grows best on a bare raft or shallow basket, with but little peat or moss. It should be grown in a warm house.

Fruit and Vegetable Committee.

Present: A. H. Pearson, Esq. (Chairman); and Messrs. Jas. Cheal, H. J. Wright, S. Mortimer, Alex. Dean, Geo. Kelf, R. Lewis Castle, James H. Veitch, Henry Parr, Owen Thomas, F. Q. Lane, G. Norman, W. Poupart, and H. Somers Rivers.

The principal group submitted to this Committee was an extensive collection of vegetables and fruit staged by THE UNIVERSITY COLLEGE, Reading. The group occupied the whole of a lengthy table, and contained useful specimens of vegetables and fruit, grown for ordinary market purposes. Tomatoes were excellent, such standard varieties as *Chemin Rouge*, *Champion*, and *Conference* being shown to perfection. Potatoes were also good, and in numerous varieties. Onions, Beans, Parsnips, Beet, Cauliflowers, Cucumbers, Cabbage, &c., were included. Some excellent Melons were noticed, and a box of well-finished Peaches and Nectarines. The group would have been somewhat enhanced by a more judicious method of arrangement; still, the whole was highly creditable, and illustrative of the good work carried on in the gardens at Reading (Silver Knightian Medal).

Mr. G. PENWILL, Totnes, Devon, staged fruits of their new Raspberry *Penwill's Champion*, which received an Award of Merit at the Holland House Show.

Mr. W. A. COOK, Shirley Park, sent an unnamed seedling Tomato and a box of well-grown fruits of "Amsden June" Peach. The Tomatoes, which were said to be of excellent flavour and cropping qualities, were disqualified on account of being unnamed.

Miss ADAMSON, South Villa, Regent's Park, sent a collection of dessert Plums, all choice varieties and well grown, especially when the fact of their being grown so near the metropolis is considered. The varieties included Early Transparent Gage, Kirk's Golden Gage, McLaughlin Gage, Green Gage, Reine Claude Comte Althain, Jefferson, and Emperor (Silver Banksian Medal).

Sir A. K. OSBORN, Bart., Chicksands Priory, Shefford, Beds., sent two dishes of Apple Gladstone. This is a highly coloured fruit, and is one of the very earliest to ripen. Unfortunately the flavour is acid and sharp, and the flesh mealy. The same variety was also displayed by W. ROUELL, Esq., Harvey Lodge, Roupell Park.

JOHN HODGES, Esq., The Rusper Vineries, Fay Gate (gr., Mr. T. M. Le Pellay), sent two stands of black Grapes of the varieties Alicante and Gros Maroc respectively. Some of the former bunches were large and of good shape; the Gros Maroc required a little deeper finish.

Messrs. T. RIVERS & SON, Sawbridgeworth, sent a box of the new Peach *Peregrine*. The fruits were of large size and finely coloured, while the flavour is said to be excellent. The same firm also brought a box of Plum Golden Transparent Gage.

Mr. H. PARR, Trent Park, New Barnet, sent six fruits of Tomato *Coronation*. The fruits were of large size, the six berries weighing as much as 5 lb. Large size in Tomatoes is not desirable, a medium-sized fruit is more in demand.

NEWBURY HORTICULTURAL.

AUGUST 1.—The fifty-sixth annual show of this well-known Society was held on the above date in the beautiful grounds of Goldwell Park, an ideal place for a show. There was no lack of visitors, and there was a record entry for fruit and cut flowers. In the large plant classes Mr. CHAS. ROSS, of Welford Park, was the leading exhibitor.

For stove and greenhouse plants in bloom, Mr. T. SURMAN, Donnington Grove, had nicely-flowered specimens, including good *Clerodendrons* and *Stephanotis*. Mr. C. ROSS, Welford Park, had the best collection of large foliage plants, having fine *Crotons* and *Alocasias*. The best specimen foliage plant also came from this exhibitor; while Mr. T. SURMAN was 1st for the best specimen plant in bloom. *Gloxinias* were plentiful, while *Begonias* made a good display.

A class which creates interest at Newbury is the model conservatory arrangement or grouping for effect. Some distinct features of arrangement were seen, and the premier award was secured by Mr. J. HOWARD, Benham Park Gardens.

Roses were fewer in number than usual, the hot weather doubtless being the cause. Messrs. COOLING & SON, Bath, and J. R. TRANTER, Henley, had some choice blooms. Lady SUTTON's exhibit was 1st in the Amateur classes, and Mr. H. SMITH's, 2nd. Messrs. J. T. MERCHANT and ABERY had the best bridal bouquets. Messrs. SMITH and SURMAN the best Sweet Peas.

Carnations made a grand show, though a few of the blooms lacked size. Mr. A. GALT, Aldermaston Court Gardens, was an easy 1st; Mr. ROSS, 2nd.

Dahlias were good. Mr. TRANTER was an easy 1st with perfect flowers; Mr. BOSLEY, 2nd.

For twenty-four bunches of cut flowers the 1st prize was taken by Mr. SMITH; Messrs. ABERY, 2nd.

The fruit shown was excellent. Mr. HOWARD was 1st for a collection, and Mr. WATERHOUSE 2nd.

Mr. HOWARD was 1st for a collection of vegetables, having excellent Duke of Albany Peas, Windsor Castle Potatoes, and Ailsa Craig Onions; Mr. SURMAN was 2nd.

Amateurs and cottagers also made a display both of vegetables, plants, and cut flowers.

We heartily congratulate the Committee on the excellence of their arrangements and the continued success of the Society.

BRITISH PTERIDOLOGICAL.

AUGUST 1.—The usual annual meeting of this Society was held at Bowness-on-Windermere, on Monday, the August Bank Holiday, when, owing to the unavoidable absence of the President (Dr. F. W. Stansfield, of Reading), Mr. Chas. T. Drury, F.L.S., V.M.H., one of the vice-presidents, took the chair. Both the Secretary's and Treasurer's reports demonstrated the success of the Association, financially and numerically; and as an item of the formal business of the meeting, Mr. W. H. Phillips, of Belfast, was elected President for the coming year, Dr. Stansfield's professional duties having induced him to resign. Mr. Phillips, ranking as he does as one of the pioneers of the cult, and the finder of a number of the choicest varieties, is undoubtedly peculiarly qualified for the position.

Mr. Drury, though unprepared with a formal address, emphasised the particular points which render the British Fern cult of special interest. In no other branch of horticulture is it possible to accumulate and exhibit splendid collections of distinct and beautiful varieties, wholly and entirely independent of exotic or foreign introductions. For some occult reason, British air seems to inspire Nature with novel ideas in the Fern direction, so that we are constantly being enriched with the results. He furthermore pointed out that, thanks to the careful records kept for the last half-century and more, a mass of information has accumulated which is being recognised as of great value in connection with the vexed question of variation and its laws.

Obviously the sports are not dependent upon cultivation, as many thought, since all the marked types originate wild. The recent results of Professor Farmer's research, and embracing the discovery of an analogy between the forms of the cells in cancer and those of the abnormal reproductive cells in Ferns, were also touched upon as additional evidence that the study of Ferns in their varietal forms could lead to results of immense value, apart from the mere acquisition of more and more beautiful ones. Mr. Drury then read a paper on the British Polypodies, which will eventu-

ally appear on the Society's report. A number of fronds and plants were exhibited for naming, and among the latter was a beautiful new variety of the hard Fern, *Blechnum spicatum*, found in the Black Mountains of Ireland by Mr. W. Porter. This has a heavy flat foliose crest divided into three on the lines of the Prince of Wales's feathers, and was consequently named *B. s. triplicatum*, Porter, and given a Certificate of Merit. Mr. Alex. Cowan exhibited fronds of a fastigiate form of *L. dilatata* found in Scotland, another of Nature's novelties, and quite distinct from any known variety. *L. dil. fastigata* was the name given thereto. The Society then resolved to meet at the same place and time in 1905, and with a hearty vote of thanks to the Chairman the function concluded.

STANSTED FLOWER SHOW.

AUGUST 3.—The thirteenth annual show was held on the above date at Blythwood, and in all respects was one of the most successful the Society has had. A special feature was the dinner-table decorations, eighteen tables being tastefully arranged by ladies. In the evening the grounds and dairy at Blythwood were thrown open to the visitors. Exhibits not for competition included Roses and herbaceous plants from Messrs. PAUL & SON, Old Nurseries, Cheshunt; group of plants and collection of fruit from Sir JAMES BLYTH (gr. Mr. J. Richardson); Dahlias and Carnations from Dr. ROWELL, C.M.G., and a collection of vegetables from G. ALDER, Esq. (gr. Mr. Atkins). In the Hargrave Stansted competitive classes the best group of plants came from C. GOLD, Esq. (gr. Mr. Clarke). The best Peaches were shown by C. GOLD, Esq., Jun. (gr. Mr. Amey), and the 1st prize grapes by Mr. GRIPPER. The amateurs' and cottagers' exhibits were excellent.

MIDLAND CARNATION & PICOTEE.

AUGUST 4, 5.—This took place as usual in the show-house of the Botanical Gardens, Edgbaston, Birmingham, the competition being keen in all the classes. The bizarre and flaked Carnations and white-ground Picotees, the yellow-grounds and fancies, were all of good quality, the white-ground Picotees being especially fine; the self Carnations, being among the earliest to flower, were small, though very showy. The arrangements made by Mr. THOS. HUMPHREYS, the Curator, were excellent, so that the flowers were seen to great advantage. There was, as usual, a large attendance, and social amenities were observed by a large party sitting down to luncheon in the grounds, under the chairmanship of Mr. ROBERT SYDENHAM.

Carnations, Selfs.—The class for twelve varieties brought five exhibits, Mr. R. C. CARTWRIGHT, King's Norton (gr. Mr. Rudd), taking the 1st prize with good blooms of Her Grace, Carabas, Sea Gull, Enchantress (a beautiful rose self), Benbow, Mrs. Guy Sebright, Sir Bevis, Germania, Cassandra, Ensign, Barras, and Comet. Mr. A. R. BROWN, Handsworth, was 2nd. Among his flowers were Gloriosa (a beautiful blush self) and John Pope (a grand rose self). Mr. C. H. HERBERT, Acocks Green, was a very good 3rd.

There were nine competitors with nine selfs, Mr. W. H. PARTON, King's Heath, having well developed blooms of W. H. Parton (a rich maroon self of fine quality), Seagull, Benbow, Sappho, Mrs. E. Hambro, and Germania; 2nd, the Rev. G. A. GOTTLWALTZ, Droitwich, who had John Pope, of which he was the raiser, in fine character; 3rd, Mr. W. H. TWIST, Yardley.

Picotees, Yellow Grounds.—There were seven competitors with twelve varieties, Mr. A. W. JONES, Sleaford, taking the 1st prize with splendid blooms of Lady St. Oswald, Isolt, Gronow, Lucy Glitters, Mrs. W. Heriot, Chryseis, Coquette, Peri, Countess Verulam, Lord Napier, Gertrude, and Dalkeith. Mr. C. F. THURSTAN came 2nd with some fine blooms; and Mr. C. H. HERBERT, 3rd.

The class for six blooms brought eight competitors, Mr. W. H. TWIST taking the 1st prize with finely developed blooms of Gronow, Alcinous, Lady St. Oswald, Daniel Defoe, Countess Verulam, and Gertrude; Mr. W. H. PARTON was 2nd; and Mr. J. MITCHELL Walsall, 3rd.

Carnations, Fancy.—There were seven stands of twelve varieties, some splendid blooms being staged. Mr. R. C. CARTWRIGHT came 1st with Voltaire, Professor Cooper, Argosy, Ormonde, Queen Bess, Amphion, Galileo, Hidalgo, Emperor, Perseus, Cantatrice, and Ivo Sebright. Mr. A. W. JONES was 2nd, his blooms being very near indeed to those awarded the 1st prize. Mr. A. R. BROWN was 3rd.

In the class for six fancy Carnations there was good competition also.

Picotees, White Grounds.—There were five collections of twelve blooms, Mr. F. W. GOODFELLOW, Walsall, taking the 1st prize; Messrs. W. PEMBERTON & SON, Walsall, being 2nd. Here again the flowers were of very fine quality.

The best six blooms were shown by Mr. J. EDWARDS, Blackley, Manchester; he had in superb character H.P.E. Ganymede, L.P.E. Lavinia, H.Ro.E. Mrs. Bes-

wick, H.P.E. Fanny Tett, H.P.E. Mrs. Openshaw, and H.P.E. Lady Louisa. 2nd, Mr. W. H. TWIST; 3rd, Mr. H. BOYS. Most of the flowers shown in this class belonged to the purple-edged section.

Carnations, Flakes and Bizarres.—With twelve blooms Messrs. W. PEMBERTON & SON were 1st with C.B. Robert Houlgrave, P.F. Gordon Lewis, R.F. Merton, P.F. George Melville, R.F. Thalia, C.B. J. S. Hedderly, P.P.B. George Rudd, S.F. Sportsman, P.P.B. W. Skirving, S.F. Flamingo, S.B. Robert Lord, P.P.B. Sarah Payne. 2nd, Mr. C. H. HERBERT; 3rd, Mr. C. F. THURSTON. With six blooms, Mr. J. EDWARDS came 1st, he had J. S. Hedderly, Robert Lord, Sportsman, P.P.B. J. D. Hextall, R.F. Mrs. T. Lord, C.B. Robert Houlgrave; 2nd, Mr. E. C. ROSSITER.

Single Blooms.—The following is the order of merit for the various types—Scarlet bizarres: Admiral Curzon and Robert Houlgrave. Crimson bizarres: Arthur, a fine new variety; J. S. Hedderly, and J. D. Hextall. P.P. bizarres: William Skirving and Geo. Rudd. Scarlet flakes: Guardsman and Sportsman. Purple flakes: Gordon Lewis, which was 1st and 2nd. Rose flakes: Rob Roy, Mrs. T. Lord, and Mrs. Rowan. H. red E. Picotee: J. Smith and Brunette. Light red E.: Thos. Williams, won all three prizes. H.P.E.: Mrs. Openshaw and Fanny Tett. L.P.E.: Pride of Leyton and Lavinia. H.Ro.E.: Mrs. Payne, Apisie, and Lady Louisa. L.Ro.E.: Favourite and Nellie. Y.G. Picotee: L. E. Pilgrim and Lord Napier. Y.G.P.H.E.: Lucy Glitters, Iscult, and John Whitham. Y.G. fancy: Queen Bess, Monarch, and Hidalgo. Fancy Carnation: Ivo, Sebright and Millie. Selfs, white: Mrs. E. Hambro and Much the Miller. Blush: Seagull and Blushing Bride. Yellow: Germania took the first three prizes over all the newer yellows. Buff: Mrs. R. C. Cartwright (a fine new variety) and Benbow. Rose: John Pope (extra fine) and Carabas. Scarlet: G. W. Crane (fine in colour) and Isinglass. Dark crimson: W. H. Parton (new), this was so fine that it won all the leading prizes. Purple: Cassandra, Richard Dean, and Jupiter. Any other dark self: Jocelyn and Lady Jane Grey, both shades of heliotrope.

Undressed and Border Carnations.—These were largely shown, and their fine character was the theme of general commendation. In these classes a little dressing of the petals is permitted, but as little interference as possible is desired. Complaint was however made that this is carried too far, the calyx being manipulated. But it is felt to be extremely difficult to limit the permission. Twelve selfs, each bloom in a small vase, 1st, Mr. R. C. CARTWRIGHT; 2nd, Mr. A. R. BROWN. Mr. W. H. PARTON was 1st with six selfs; Mr. A. W. JONES with twelve fancies; Mr. W. H. PARTON with six; and then followed eight classes in which three blooms of one variety were staged in small vases.

The amateur cultivators, who grow only a limited number of plants, had five classes open to them, in which the blooms were shown on cards, the competition being very good.

Premier Blooms.—The selection of these gave the judges some trouble. Bizarre Carnation C. B. Arthur, from Mr. R. SYDENHAM; flake P. F. Gordon Lewis, from Mr. E. C. ROSSITER; Picotee, white ground, heavy edge, H.P.E. Mrs. Openshaw, from Mr. T. W. GOODFELLOW; light edge, Thos. William, from Messrs. W. PEMBERTON & SON; heavy edge, yellow ground, Dalkeith, from Mr. A. W. JONES; light edge Y.G., Child Harold, from Mr. W. H. PARTON; Y.G. fancy, Queen Bess, from Mr. A. W. JONES; self, W. H. Parton, from Mr. R. SYDENHAM. The best undressed self was Much the Miller, white, from Mr. T. R. WARD; Y.G. Picotee, Mrs. W. Heriot, from Mr. A. W. JONES; fancy, Henry Gough, from Mr. A. R. BROWN.

Certificates of Merit were awarded to the following seedlings:—Yellow-ground fancy Cadmus, heavily marked with bright scarlet on a bright yellow ground, from Mr. R. C. CARTWRIGHT; Mrs. R. C. Cartwright, orange-buff, extra fine, also from Mr. CARTWRIGHT; and to yellow-ground Picotee Mrs. C. Mansell, in the way of Child Harold, but distinct, from Mr. C. H. HERBERT.

Miscellaneous Exhibits.—There were several miscellaneous exhibits of an interesting character, and the Society's Silver-gilt Medal was awarded to Messrs. GUNN & SON, Olton, and to Messrs. HEWITT & CO., Solihull, both with fine exhibits of cut flowers. The large Silver Medal was awarded to Mr. W. A. WATTS, St. Asaph, for a fine collection of Carnations shown in trumpet vases; to Messrs. DAVIS & SONS, Veovil, for Begonias; to Messrs. DICKSONS, Chester, for cut flowers; to Mr. M. PRITCHARD, Christchurch, for hardy flowers, and Silver Medals to Mr. J. LAMBERT, Southampton, for Carnations; Mr. S. MORTIMER, Farnham, for Cactus Dahlias; to Mr. V. SLADE, Taunton, for zonal Pelargoniums, and to Mr. J. H. WHITE, Worcester, for cut flowers.

Some pretty floral decorations with Sweet Peas were shown in small tables, Mrs. MARTIN took the 1st prize; there were also bouquets, sprays, and buttonholes, and Mr. R. SYDENHAM's special prizes for Sweet Peas brought six collections, Mr. T. JONES, Ruabon, taking 1st prizes with very fine examples of the newer sorts.

SCOTTISH HORTICULTURAL ASSOCIATION.

AUGUST 6.—THE visit to Dalkeith Gardens was postponed to the above date, when over one hundred members took advantage of the opportunity to inspect these famous gardens. The weather unfortunately was unpropitious, rain falling continuously, and sadly marring the pleasure of the outing. The borders were excellent, especially the scroll border on the east lawn, which was never finer. *Lobelia Waverley*, of much the same shade of blue as *Wave of Blue*, was employed here with telling effect. Carnations are a feature, these being cultivated in the vegetable-quarters in vast numbers; and of the vegetables it may be said they are extra fine.

The display of bloom in the plant-houses was quite as fine as had previously been remarked on the outside. In the warmer structures a grand batch of *Hymenocallis* was just throwing out spikes, and a houseful of *Calanthes* was remarkable for the vigour and health of the plants. Of fruit, Melons were bearing freely, and Pines were in the usual good condition for which they have so long been celebrated at Dalkeith; Peaches unfortunately had not set so well as usual, but the growth promises well for another season. In the vinerias large bunches were entering on the ripening stage. It was the general remark how well Mr. Whytock had everything in hand. After a walk through the grounds, a company of 101 was entertained at tea by Mr. McHattie, the usual votes of thanks concluding the proceedings.

DUNDEE HORTICULTURAL ASSOCIATION.

AUGUST 6.—The members' excursion to Brechin Castle Gardens took place, in conjunction with the Broughty Ferry Horticultural Association, on the above date. Arriving by train at Brechin the company was met at the station by Mr. McDowall, the head gardener, and from thence conducted through the grounds to the spacious ranges of glasshouses, where everything was observed to be in a clean, healthy condition. The plant houses presented a very bright and gay appearance. The fruit houses are not confined to fruit alone, but made attractive with foliage and flowering plants. The lawns, pleasure-grounds, flower-beds, and borders have all an attractive appearance. In the vegetable and fruit garden the same good order and management are seen. After tea, which was served in the verandah at the stables, Mr. David Storrie expressed the company's thankfulness to the Earl of Dalhousie for granting permission to inspect his beautiful domain.

Obituary.

MR. RICHARD GORTON.—This gentleman, who was a strong supporter of floriculture in the North, died at his residence, The Woodlands, Eccles, on the 2nd inst., at the age of seventy-two years. A florist of the old school, he took a deep interest in all special floricultural societies and their work, the alpine *Auricula* being his favourite flower, and few men had a keener appreciation of the properties of florists' flowers, and more warmly advocated their observance. He was a raiser of alpine *Auriculas*; the *Carnation* and *Picotee* were also favourites with him. He usually attended the *Auricula* shows held in the Midlands and at Manchester.

MRS. WM. RICHARDSON.—This estimable woman, wife of Mr. William Richardson, the foreman at the Hassocks Nurseries of Messrs. W. Balchin & Sons, passed away on the 2nd inst., after a short illness, at the age of forty years, leaving a young son.

JOHN HINDE NEWBERRY.—It is with great regret we record the death of Mr. John Hinde Newberry, which took place very suddenly on Thursday, August 4, in his sixty-fourth year, after an operation which had apparently been successful. For over forty-five years he had been in the employ of Messrs. Hugh Low & Co., formerly at the Clapton Nurseries, and recently at Bush Hill Park Nurseries, Enfield. Most visitors to the nurseries during the past forty years have come into personal contact with him. He came to Clapton in 1859 from Upwey, Dorchester, where his father carried on a nursery; and John Hinde was not only an excellent correspondent and book-keeper, but a thoroughly practical man, few being able to handle spade or

knife better. He was interred at Edmonton Cemetery on August 6, a good many of the old Clapton and Bush Hill friends being at the funeral. He leaves four sons, three daughters, and a large circle of friends to mourn his loss, his wife having died two and a half years since.

TRADE MEMORANDUM.

HEWITT & CO., LTD.—Mr. Addenbrooke has been appointed managing director in the place of Mr. J. Evans. Mr. Spinks is attached to the Company as before. The principal nursery is at Solihull, and there are branches at Edgbaston and depots in Birmingham.

MESSRS. RANSOMES, SIMS & JEFFRIES, of Ipswich, have had the honour of supplying a motor lawnmower to H.M. the KING for use in the gardens of Buckingham Palace.

ENQUIRY.

CAN any reader recommend a correspondent a simple, inexpensive form of level on tripod stand?

*** EDITOR AND PUBLISHER.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all communications relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the EDITOR. The two departments, Publishing and Editorial, are quite distinct, and much unnecessary delay and confusion arise when letters are misdirected.

ABIES NOBILIS: J. M'C. The gouty swellings are caused by an insect, Chermes. Cut away the diseased branches and burn them. Spray the tree with petroleum emulsion. (See *Gardeners' Chronicle*, p. 109, July 22, 1882).

BOOKS ON SOUTH AFRICA: C. South African Flowering Plants, by Rev. Prof. G. Henslow; published by Messrs. Longman & Co. We do not know of any work on gardening or farming in the colony you mention.

BOOK ON TOMATOS: Constant Reader. We do not know of any work containing a lengthy description of the history of the Tomato.

CEDAR OF LEBANON: C. R. W. We do not know all the circumstances, but think it likely that the tree is suffering from the years of drought that we had prior to 1903. Perhaps the tree is an old one, and is slowly dying, as so many are about London. Examine the trunk carefully to see if there are fungi attacking it. Remove the decaying branches flush with the trunk, if that be possible, and paint over the wound with tar.

CONIFER: S. Devon. It is probable that your Conifer has got injured at the roots. Perhaps it is in unsuitable soil. If not sufficiently moist you might try the effect of a thorough watering. Liquid-manure would not be likely to be beneficial in its present condition. Many trees all over the country are only now showing the disastrous effects of the series of dry summers we had prior to 1903.

CORRECTION.—We are informed that an error was committed when we stated that Mr. Pitt was awarded a Silver Banksian Medal for a group of Orchids at the recent show in the new Hall. No medal was awarded to Mr. Pitt on that occasion.

CUCUMBER: G. M. The condition you mention is due to some temporary check during growth. What caused that you should know better than we.

CUCUMBER-SPOT: J. H. Frequently described and figured in the *Gardeners' Chronicle*. See specially October 14, 1902, p. 241, and September 5, 1903, p. 184.

CURLED GREEN: L. S. M. It is very likely to have been crossed, as you suggest. The members of the Cabbage family readily cross with one another, and have produced the numerous diverse forms and types seen in our gardens.

DAHLIAS: H. B. We do not find any particular dimensions specified. Consult the catalogue of the National Dahlia Society, to be had from P. W. Tulloch, Esq., Forest Cot, Balcombe, Sussex.

DAFFODIL CROSSING: H. V. M. It is impossible to answer your inquiry in brief. The sum of research seems to indicate that in both the animal and the vegetable kingdoms, the influence of the male is on the whole the greater in determining the characters of the offspring. But this law will not be found to be uniform in dealing with a limited number of flowers. Nothing short of a large number of repeated experiments will teach you whether such flowers as you name should be used as pollen-parents or seed-bearers respectively, and it will certainly be better to begin by effecting your crosses both ways. You should work with a considerable number of flowers, and keep accurate records. G. H. E.

FLOWER-SHOW SCHEDULE: S. G. S. We have not seen the schedule, but assuming your statement to be correct, we think the judges were in error. The two Galegas are quite distinct. A Lily bulb is an herbaceous plant, and may, in the absence of any statement to the contrary, be exhibited with herbaceous plants. Some judges, however, object to this. The white Bryony, *B. dioica*, is likely to be poisonous to cattle. The black Bryony, *Tamus*, is probably dangerous, but we have no experience of it.

GARDEN PLAN: R. W. S. We counsel you, if you want further advice, to seek the assistance of some landscape gardener who can visit the spot and see its capabilities, the level of the land, whether there is a distant view to be had, and so on. So far as we can tell from your plan not much need be done if the lawn is in good order. We should certainly not remove the Weeping Ash. We should fill up the north-east corner with a clump of Rhododendrons or other shrubs to hide the formal right angle. At the other corner (N.W.) near the rockery you might plant a group of flowering Cherries or other spring-flowering trees. A specimen Conifer might be placed near the south-east angle. A few flower-beds, especially Rose-beds, might be cut out on the lawn near the margins, but by no means let them be so many or so large as to interfere with the fine sweep of the lawn. On the bank behind the rockery some Wichuriana Roses might be allowed to scramble at the base of the trees.

GARDENERS' ADDRESS BOOKS: A. N. *Horticultural Directory*, 12, Mitre Court Chambers, Fleet Street, London; and *The Garden Annual*, 17, Fumival Street, Holborn, London, E.C.

GARDENERS' ASSOCIATION: B. F. G. Write for the pamphlets issued by the Committee, and obtainable from the Honorary Secretary (pro tem.), W. Watson, Esq., Descans House, Kew Road, Kew.

IMMATURE FIGS DROPPING: E. P. I have known this failure since 1862, when I first saw it at Highgate. There is no fungus, and I could never detect any, although I have searched many times. It was at one time a common complaint of those who tried to grow Figs in the open that as soon as they became as large as Gooseberries they dropped, and not a fruit was matured. I could never solve the mystery. M. C. C.

JUDGING: W. C. L. We have no data on which we can answer your question. The fee varies in different cases from one to two guineas and upwards.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—G. M. *Lilium chalcidonicum*.—A. B. 1, *Inula Helenium*; 2, *Lychnis chalcidonica*; 3, *Agrimonia* sp.; 4, *Lythrum Salicaria*; 5, *Betonica rosea*; 6, *Polygonum* sp. The cup-like flowers of the Fox-glove result from the running together of two or three of the topmost flowers.—W. B. *Lycium sinense*, commonly but erroneously called *L. barbarum*.—F. B. M. *Helianthus* (*Harpalum*) *rigidus*.—G. H. S. *Kolreuteria paniculata*.—W. S. *Olearia Haastii* (New Zealand).—Roebuck. *Cypripedium Parishii*.—V. A. R. 1, *Oncidium pumilum*; 2, *Oncidium pubes*; 3, *Sophranitis violacea*.—T. R. 1, *Dracena ornata*; 2, *Codiaeum* (*Croton*) *Johannis*; 3, *Codiaeum variegatum*; 4, *Dracena stricta*; 5, *Codiaeum Weissmanii*; 6, the Palm may be *Areca lutescens*; 7, *Dracena variabilis*; 8, garden Fuchsia, cannot be named; 9, *Dracena pulcherrima*; 10, *Codiaeum Queen Victoria*.—Cosmos. *Hippeastrum stylosum*, illustrated in the *Botanical Magazine*, t. 2287. We replied to your question before, in our issue of July 23, p. 68.—F. I., Grimsby. A light form of *Oncidium Gardneri*.—W. M. *Crococsmia imperialis*.—W. W., Bagshot. 1, *Juncus communis*; 2, *Juncus effusus*; 3, *Campanula rotundifolia*; 4, *Festuca ovina*; 5, *Blechnum spicant*; 6, *Lysimachia vulgaris*.

NYPHÆAS: Correspondent. We do not publish coloured illustrations, and if we did we should not sell them. We do not know of any special work on the subject, but any of the more important gardening books contain full descriptions as to treatment, &c.

NOTICE: J. O. Your notice should have been dated from the 8th, not the 2nd.

PEACHES: H. W. 1, *Crimson Galande*; 2, *Abec*. Specimens arrived in a crushed condition.

PEAR: G. E. S., Plymouth. The Pear is attacked with a fungus—*Ensieladium dendriticum*, frequently described and figured in our columns. Burn the affected leaves and fruits as far as you can, and next year spray the leaves and shoots with weak Bordeaux-mixture.

PROPAGATING DAPHNE, &c.: *Anxious One*. The choicer varieties and species of *Daphne* are usually grafted on *D. indica* or *D. laureola*. They may, however, be propagated from cuttings taken in the autumn and inserted in well-drained pots with peaty soil and covered with a bell-glass. Keep the cuttings in a cool house in the winter, and in the spring introduce into gentle heat. *Luculia gratissima* can be propagated from cuttings inserted about now, placed under a bell-glass, and for two or three weeks allowed a gentle bottom heat. They are not easy subjects to propagate. If seed can be obtained this will germinate freely.

STRAWBERRIES: Auldearn. The flowers were probably not fertilised. See leading article in *Gardeners' Chronicle* for August 6.

TOMATOS: J. C. The disease is caused by a fungus—*Cladosporium fulvum*, often mentioned in the *Gardeners' Chronicle*. Burn the affected plants and spray the healthy ones with liver-of-sulphur 4oz., to a gallon of rain-water. Do this at intervals of a week or ten days.

VINES: B. M. A bad case of "shanking," the exact cause of which is still uncertain, but probably it is due to the attack of a fungus. In your case the bunches look as if they had not been sufficiently thinned, and are carrying more berries than they can ripen properly.

COMMUNICATIONS RECEIVED.—J. M.—W. S.—J. McC.—R. H. P.—E. S. C.—E. H. J.—G. B.—G. D. (photograph, with thanks)—G. W.—Rev. G. T. L.—J. M.—W. H. P.—Antigua—Waveren & Kruijff, Haarlem—T. W.—W. W.—T. GEOGRAPHICAL DISTRIBUTION OF PLANTS.*

THIS formidable volume, with upwards of 800 8vo pages, and full of beautiful photographs and other illustrations, is a masterly reservoir of literature upon the new branch of botany known as "Ecology," or the study of plants in their natural homes.

Linnaeus in 1763 observed that plants brought from various countries could be recognised by their "facies" or general appearance as inhabitants of special environments, and many writers have described the plants characteristic of certain districts, as for instance, Griesbach, in his *Vegetation of the Globe*; but since evolution, thanks to Darwin, has been brought to bear upon plant distribution, in addition to mere description, we have entered upon the study of plant-structures in relation or adaptation to their various kinds of environment.

"Darwinism" attributes all such adaptations to natural selection, but the more

recent observers regard the conditions of life as the main cause, together with the responsive power of the plants themselves. These were Herbert Spencer's "two factors" of evolution.

Dr. Schimper's mind was in a transition state, for he observes (p. 24) in alluding to certain degradations in aquatic plants:—"It is only doubtful whether they are to be attributed to natural selection or to the direct influences of water." He was not aware of Mr. McCallum's experiments with *Proserpinaca*, in which by inducing artificial osmosis, he caused the superfluous water to escape from the protoplasm, so that "entire" leaves were formed under water instead of the normal filiform ones.

All through the book, however, Schimper invariably speaks of the influence of the environment as the direct or definite cause of variations of structure.

The book is divided into three parts—viz., I., The Factors; II., Formations and Guilds; III., Zones and Regions.

In the first part there are six chapters, dealing with the influences of Water, Heat, Light, Air, Soil, and Animals. Each is very brief; but they give the substance of present day knowledge, and a long list of works—principally German—dealing with them.

Under "Water" he describes the well-known structure of aquatic plants, and adds some interesting details of the structure of "drift fruits" with floating tissues.

Under "Heat," besides the extreme zero points, he notes that "The absolute extremes of plant-life are not identical with those of all its functions. Each function has its own extremes, and at a certain degree of temperature its optimum." This being the case, by only noting zero points, the results of Phenology are not always satisfactory; for differential variations of the functions are too much ignored. "The life of a plant is made up of thousands of separate actions, each of which is performed within its own ranges of temperature, and exhibits its own optimum temperature." The total would be the harmonic optimum.

Numerous figures illustrate adaptive structures of the tissues in accordance with each "Factor," and each chapter closes with a long bibliography.

In Part II. the Climatic and Edaphic (*i.e.*, influences of the soil) factors are described, giving rise to "formations," these being the general types of vegetation, characteristic of districts, due to these factors. There are three types—viz., Woodland, Grassland, and Desert, each of which is ably discussed.

He then considers "Guilds." These consist of lesser groups, such as Climbing plants, Epiphytes, Saprophytes and Parasites, as well as Insectivorous plants. In each case the correspondence between the external conditions of life and the structure of the plant is shown, thus suggesting that true epiphytes probably arose from accidental ones, which, having acquired the necessary characteristics, then became "fixed." Similarly with saprophytes, the transition from the green to a colourless condition is the result of adaptations to conditions of life. "The change in the mode of nutrition causes a change in the structure and ecology of the plant." That sentence may equally apply to every cause and every responsive change.

Part III., on "Zones and Regions," is divided into five sections—viz., the

Tropical, Temperate, Arctic, Mountain, and Aquatic zones or regions. Each of these sections contains from two to ten chapters, and treats of the subjects systematically and in detail. They show the effects of heat, water, light, &c., on growth in shade and in the open, including the protections adopted against desiccation.

The periodic phenomena in the functions of plants are described, in which there is no absolute rest, such occurring in only some functions. Then follows a full description of tropical districts, both those constantly moist and those constantly dry. Abundance of excellent photogravures from nature illustrate the effects of moisture and drought respectively. A similar treatment with illustrations applies to temperate and arctic regions, the effects of the climate being well shown in each case.

The peculiar characteristics of mountains having a rarified air, a rich amount of light, and various aqueous precipitations, have corresponding effects upon plants, these adapting their structures according to their requirements.

As stated, each chapter is very short, but the whole book pretty well covers the entire field of geographical botany, while the important lists of authors dealing with the various details of this vast subject are very valuable to students. Ecology is now a well recognised branch of botany, and this splendid work of Schimper's—whose death all botanists will deeply deplore—will form a substantial basis for all future workers in this field to build upon. *George Henslow.*

PLANT NOTES.

HELICHRYSUM ANGUSTIFOLIUM.

WE do not find this plant in *Nicholson*, nor do we remember to have seen it in gardens, on which account we think it may be well to call attention to it. Our specimen came from Mr. Cuthbertson, of Rothesay, and is a perennial plant, with wiry, erect branches 2 to 3 feet high, and covered with grey down; the leaves are linear, revolute at the margins, channelled above, with a prominent green midrib beneath. The yellow flower-heads are very numerous in terminal corymbs, each flower-head about $\frac{1}{4}$ -inch long, cylindric, with several rows of appressed oblong obtuse bracts, the inner ones linear, covered with small glands at the back, not visible except by the aid of a lens. It is a showy plant, suitable for the centre of the herbaceous border. It is a native of Southern Europe.

BROWALLIA ELATA MAJOR.

This plant is a very pretty addition to the cool-house at this season of the year and onwards. The flowers, of a charming blue colour, are much larger and more effective than those of *B. elata*, and are much appreciated either on the plants or when used as cut bloom. The plants may be raised from seeds or cuttings; the latter, if put in now, will make nice plants in 48-sized pots for flowering in the late autumn or early spring months. They should be given cool treatment, with a little fire-heat at night when the weather is cold. They are easily cultivated.

EXACUM AFFINE.

This pretty flowering annual deserves to be more extensively grown, if only on account of its very fragrant odour. For this reason it is most useful for the embellishment of the various flower-vases, &c., in the mansion or conservatory, being especially adaptable for small vases or jardinières, and as a frontage to groups of plants,

* By Dr. A. F. W. Schimper, translated by W. R. Fisher, B.A.; revised and edited by Percy Groom, M.A., D.Sc., F.L.S., and I. B. Balfour, M.A., M.D., F.R.S. (8vo, pp. 824, Index; with a photogravure portrait, five collotypes, four maps, and 497 other illustrations. Oxford, at the Clarendon Press).

&c. It is easily raised from seed sown in the spring or autumn. If sown in the autumn and grown on it will last a long time in good condition. *W. A. Cook, Shirley Park.*

ORCHID NOTES AND GLEANINGS.

FLOWERS FROM SOMERGHEM.

FROM the Marquis de Wavrin, Château de Ronsele, Belgium, come flowers of several remarkably fine Orchids, among which are—

Cattleya Loddigesii splendens.—A very handsome, brightly coloured flower, measuring nearly 6 inches across at its widest, the sepals and petals being each over an inch and a quarter wide. Sepals and petals bright purplish-rose. Lip white inside, pale lilac out. Disc and side lobes pale yellow, front lilac.

Cattleya Warscewiczii Sanderæ.—A larger flower than those borne on the plant for which Hamar Bass, Esq., secured a First-class Certificate at the Royal Horticultural Society, June 11, 1895, but with the same bright colouring and slight suggestion of *C. × Hardyana*. The flower is 8 inches across the petals, which are 2½ inches wide. Sepals and petals purplish-lilac; lip almost entirely glowing velvety purplish-crimson, with two small yellow patches on the side lobes, and some fine yellowish-red lines from the base.

Lælio-Cattleya ×.—A singular hybrid imported with *L.-C. × elegans* from Brazil, and suggesting a secondary cross between that variety and *L.-C. × Schilleriana*, which is generally found in the same locality. It is formed like *L.-C. × elegans*. Sepals and petals whitish, tinged with light purple, darkest on the reverse side. Lip white at the base; light rose-purple in front and on the tips of the side lobes.

Remarkable progress is made at Somerghem in the matter of raising hybrid Orchids, and in point of quick flowering the case of *Lælia × De Geestiana*, which was entered for the Holland House Show, but passed out of flower a day or two earlier, may be cited. It is the result of a cross made by M. De Geest, gr. to the Marquis de Wavrin, between *Lælia Jongheana* and *L. flava*, March 8, 1900. The seed was sown March 21, 1901, and the first flowers appeared June 21, 1904, being the first hybrid with *L. Jongheana* as the seed-bearer to appear, and that too in a very short time. It was shown at Ghent and accorded a First-class Certificate, and described as bearing four flowers on a spike, each about 3 inches across, white, with a much frilled labellum with rich orange centre.

NEW OR NOTEWORTHY PLANTS.

PINUS NELSONI.*

THIS Pine was collected by Mr. E. W. Nelson, of the United States Biological Survey, in June,

* *P. Nelsoni*, n. sp.—Branchlets very slender, conspicuously glaucous, becoming ashy-grey. Leaves 2½ inches long, in threes, their margins serrated and their ventral surfaces, in this specimen, cemented together, so that the fascicles appear to be monophyllous: basal sheaths persistent, stomata on all surfaces, fibro-vascular bundles single, hypoderm cells large, mostly one row deep (here and there two rows) and enclosing the marginal resin ducts, which are often wanting; strengthening cells also above and below the fibro-vascular bundles. Cones subterminal, symmetrical, about 2½ inches long, nearly cylindrical, and borne on very long, stout, curved foot-stalks. Apophyses approximately rhomboidal, the transverse diameter considerably the longer. Umbos dorsal, their bases very broad transversely but longitudinally compressed, forming very conspicuous, more or less reflexed, nearly triangular protuberances all over the surface of the cone. Seeds large and wingless. Nelson! No. 4501. *Nat. Mus., Washington.*

1898, on a mountain above Miquihuana, near the border line between the States of Tamaulipas and Nuevo Leon, in North-eastern Mexico. It is the lowermost of the Pines on this slope.

Pseudo-monophyllous fascicles are not uncommon among Pines as varietal forms. Mayr mentions such varieties of *P. Thunbergii* and *P. densiflora*; *P. sylvestris monophylla* is a well-known form of the Scotch Pine, and there is a rarer similar variety of *P. strobus*. More material must be obtained before the true significance of this character for this species is understood.

In nearly all Pines a mechanical tissue is developed which forms an interior hard dorsal plate on the cone-scales. The cells of this tissue have thick walls, are hygroscopic, and act, under dry and wet conditions, to open and close the cones. In such species as *P. Cembra* and *P. albicaulis*

EARLY AUTUMNAL FLOWERS.

NOTHING in Nature is more silent and unobtrusive than the floral transition of one season into another throughout the whole course of the ever-varying year. Perhaps the gradual development of summer into autumn is the least noticeable of all; yet, to the experienced and impressionable cultivator, the latter season, even on what may be termed the confines of activity, has its own characteristics. There is for example, a perceptibly cooler atmosphere, more adapted than that of its warmer and more rapidly forcing predecessor, for preserving the perfect form and prolonging the life of our loveliest flowers. Sweet Peas, it is manifest, do not endure with equanimity a burning heat; they are never more impressive than in August

FIG. 49.—PINUS NELSONI.

this tissue is wanting; in fact, the presence or absence of this dorsal plate is a convenient character for distinguishing the cones of *P. flexilis* from those of *P. albicaulis*. Our Pine in this particular corresponds with *P. albicaulis*, and has no dorsal plate on the cone-scales. Such cones do not spring open, but shrink in drying sufficiently to partly uncover their seeds. If the seeds escape the crow and the squirrel, their spontaneous release must depend on the disintegration of the cone. Concurrently with the absence of the stereome tissue, the wood strands, which form the skeleton of the scales, are exceptionally weak in this type of cone, as if, indeed, special provision were made for their early decay.

The structure of the cone, its extraordinary peduncle, the unexampled persistency of the basal sheath in a Pine of such affiliations, all combine to establish *P. Nelsoni* as a new and very curious species. *George Russell Shaw.*

and September, when they have coolness and moisture, and the clear and pure atmosphere which they love so well. Roses, no doubt, are less numerous than they were in July; but I always imagine that their formation is finer, because their central petals are not so much exposed to the burning beams of the merciless sun; their exquisite colour also is retained much longer. Many of the varieties which are chiefly valuable for garden cultivation are for the second time in fragrant bloom; supreme among those splendid autumnal treasures being such splendid hybrid Teas as Viscountess Folkestone, by no means exhausted by its marvellously luxuriant summer floriferousness; the magnificent Caroline Testout, not seldom fully 6 inches across, a giant among Roses, by many rosarians regarded as a derivative from *La France*; Clara Watson, a glorious Rose, whose artistic capabilities, especially as a climber, have never yet been adequately recognised; Lady Mary Fitzwilliam, White Lady,

Papa Gontier, and Madame Pernet Ducher, all of which have proved themselves "perpetual" acquisitions.

Several of the most effective Hybrid Perpetuals, such as the velvety-crimson Duke of Edinburgh, Horace Vernet, Duke of Wellington, and Charles Lefebvre, flower somewhat too late in summer to afford the privilege of producing autumnal flowers; but on the other hand we

of which the variety last-mentioned has, like certain Tea Roses, a pendulous habit, which more than half conceals its richly-coloured blooms. Such varieties of recent origination as Alice Lindsell and Mildred Grant, however imposing their individual flowers, are by reason of their extremely moderate growth and susceptibility to atmospheric influences, to be regarded as essentially "exhibition" productions. They grow

achieved this year, and quite as much may be asserted of *Tropæolum peregrinum* (which is especially beautiful when grown upwards through the branches of *Prunus Pissardi*), and that glorious Peruvian climber, the great *Nasturtium*.

The Sweet Peas are also magnificently ornamental, while the snow-white purity of the fair Madonna Lily, shining everywhere through the garden, instinctively recalls to our remembrance those immortal words:—"Even Solomon in all his glory was not arrayed like one of these." David R. Williamson.

FORSYTHIA EUROPÆA.

IN the *Gardeners' Chronicle* of January 16, under the heading of "Trees and Shrubs," you call attention to *Forsythia europæa*, saying that it had been in the Berlin Botanic Garden for several years, but that it had not as yet bloomed. We post you a photograph of a branch in bloom cut from one of the plants in our nursery, which is without doubt the first plant of its variety to bloom in America. So far, we have only heard of its existence in one or two places. We, in common with others, did not know of the existence of an European species until a recent period, and wonder how it could have escaped the attention of botanists so long.

The late Mr. Thompson, of Ipswich, offered seeds of it four years ago, from which our plants were produced, and he only offered the seeds one season. This shrub is a good compact grower, of an upright habit, with no procumbent or drooping branches. Its flowers are about the same size as those of *Forsythia suspensa*, but are of a lighter shade of sulphur-yellow colour, the flower-stems are shorter or the flowers nearly sessile; and we should think when the plants attain age they would become very attractive. In foliage it is similar to *F. suspensa*; but the habit, as stated above, is very distinct from that variety.

Forsythia suspensa is the finest early-blooming shrub we possess here, forming when in bloom glorious drooping bushes of deep golden-yellow, which are very showy, and most attractive. John Charlton & Sons, Rochester, N.Y., U.S.A.

EXPERIMENTAL CULTIVATION.

(Continued from p. 52.)

RECORDING RESULTS.—The record of the results of experiments as far as they can be determined by observations in growth, &c., or by weighing the total produce, requires most careful treatment, and the method to be adopted should be well considered beforehand. With a large proportion of field and garden crops the weight of the whole plant and that of its root, stem, leaf, fruit, or seed (according to the part which it is the special object of the cultivator to obtain) is the chief point to be recorded, and this is secured when the crop reaches the stage at which it can be harvested for immediate use or storing. But in most cases the quality of the produce must also be ascertained before an adequate idea can be gained of whether any experimental treatment has been successful or the reverse. In some instances this can be readily accomplished by grading the produce and affixing a money-value at the average current market rates—a rather arbitrary matter, perhaps, and one which might show very different results from the same treatment in different years. Where the use of various manures is concerned, and the value of both crops and applications would have to be stated, this plan has been opposed with good reasons.

Dr. J. A. Voelcker has stated his opinion as follows in special reference to farm crops, though it also applies to many garden crops: "The value of the results consists in the actual crop yields produced by the different manurings; these

FIG. 50.—FORSYTHIA EUROPÆA IN FLOWER AND FRUIT:
FLOWERS YELLOW.

have this consolation—that if they have only one season of flowering, it is greatly prolonged. Exceptionally valuable for their "perpetuality," if such a term indeed be admissible under any conditions, are Captain Hayward, Clio, Mr. Cranston's Crimson Bedder, and Margaret Dickson; while as much may be affirmed of many of the finest Noisettes and Teas; Bouquet d'Or, William Allen Richardson, and Mme. Pierre Cochet being prominent among these. Of the new Roses the grandest alike in growth and productiveness have been Frau Karl Druschki, Florence Pemberton, Corona, Ard's Pillar, and Field Marshal,

as a rule, about 1½ feet high, produce two stout, short stems, and an equal number of gigantic blooms from 5 to 7 inches across; we sadly require more Roses now-a-days of the type of Viscountess Folkestone, La France, or Margaret Dickson.

This is the favourite season for climbing flowers, which generate most beautiful and memorable effects during what may be termed the intermediate season of the regal Rose. Seldom has the radiant *Tropæolum speciosum*, which occasionally flowers in my garden to a height of 15 feet, created grander pictures than it has

stand on record, and are always capable of being compared the one with the other, whatever the price of grain or of the manures used may be. In fact, the yield is the only unvarying factor in such a computation, for by the mere alteration in price of one manure or the other, or of the grain, a result may be made to be remunerative which before would have resulted in loss, or *vice versa*." Grading and the expression of the results as first, second, or third qualities can, however, be done without giving money values; in fact, unless some such plan be followed, misleading records frequently result. It is possible to have a crop which exceeds in weight that of another of the same kind, and yet the former may contain so large a proportion of low-grade produce as to be of much less value to the growers. Experimental work should be designed to improve cultivation and benefit all concerned, and the final test of this must be the financial results either in the reduction of expenses, the increase of crops, or the improvement of quality.

MONEY VALUATION.

The principal difficulty in connection with grading without money valuation is that the standards may vary from year to year, and according to the varieties grown. The third grade of one variety or of one season may be equal to the second grade of another, and this is especially the case with fruit and vegetable crops. The money value, it is true, will also vary greatly in seasons of scarcity and plenty, but taken in conjunction with the proportions of the grades, and the total weight, more trustworthy conclusions can be secured as to the effects of the different experiments than when weight alone is taken.

When the investigation is directed to ascertain the effects of certain treatment upon stem or leaf growth, additional methods of recording results will have to be tried. The measurement of leaves, stems, and branches will become necessary wherever weighing does not afford a sufficiently comprehensive gauge of the progress. For measuring leaves an ingenious little instrument has been employed by scientists engaged upon very elaborate work, and Dr. Horace Brown, F.R.S. (who has conducted so many important experiments on the absorption of carbon dioxide and the formation of starch by leaves) speaks highly of its utility and accuracy. Extensive work in leaf-measurement has been carried out at the Woburn Experimental Fruit Farm, and as the result of some thousands of observations on the three varieties of Apples, Bramley's Seedling, Cox's Orange, and Pott's Seedling, the area of individual leaves was determined to be practically equal to three-fourths of the length multiplied by the breadth. Mr. Spencer Pickering, F.R.S., stated on p. 60 of the first report (1897), that the "constants obtained with Bramley, Cox, and Potts, were 0.733, 0.765, and 0.752 respectively, these being ascertained by cutting out facsimiles of the leaves in a sheet of paper, weighing them and comparing their weights with those of a measured area of the paper." It is obvious that in any such system the paper should be of even substance throughout, and the weighing must be done with sensitive balances, and by a hand trained to delicate work of the greatest accuracy.

MEASURING OF TOTAL WEIGHT.

With many plants, as with those in pots, the measuring of the total weight with the length and number of branches may be requisite, besides ascertaining the number and area of the leaves. For small trees, the stem girth and height with the spread of the branches may be requisite, while possibly in some instances the number of flowers produced will need to be recorded. The effects of treatment upon the time of growth

starting and the maturing of produce must be observed, also the liability to or the immunity from attacks of insects and diseases should be noted. In short, the keenest continual observation is essential throughout the period of development of all plants under experimental culture, as frequently a matter which may appear of small consequence at the time will throw light

enced and skilful chemist there is abundant work in the determination of ultimate results, where every means at the immediate command of the horticulturist or agriculturist has been exhausted.

CHANGES IN WEATHER.

A record of weather changes ought to be kept wherever outdoor experiments are conducted; and though a complete set of instruments is not needful, and full meteorological observations cannot be expected for every separate set of experiments in the same district, all stations of a permanent character should be well supplied in this respect. The essential facts required are the maximum and minimum temperatures, the rainfall, the direction of the wind, and the general character of the weather, especially with regard to sunshine, cloudiness, and the moisture present in the air. To rank as a meteorological station two series of observations each day are requisite, but for practical purposes this is not essential. The lowest temperature during the night 3 or 4 feet above the ground and on the surface, and the highest during the day, will give the extremes, with which we are most concerned. The duration of these extremes, which is another matter of importance, cannot be determined if two observations are taken. Where the establishment is of sufficient importance a sunshine recorder is a valuable instrument, but the best forms are expensive and demand much care. Registering thermometers in various excellent forms are obtainable, and if the observations are taken at 9 A.M. each day we then obtain the lowest reading for the past night and the highest for the preceding day, these constituting the really essential points. A general watchfulness should be exercised, so that sudden changes, violent storms, &c., may be recorded, as when plants are in the first vigour of growth with immature foliage considerable harm may often result from transient occurrences; and this especially applies to the time of flowering for seed and fruit-bearing plants. What is required, in fact, is as complete a history as possible of the plants' progress from the commencement of growth until harvesting time, with a record of all the circumstances during that period likely to assist or to nullify the treatment accorded. Puzzling or seemingly negative results may frequently admit of some explanation when the whole of the facts are collected.

BOOKS FOR CONTAINING RECORDS.

The record books to be employed must be ruled up or printed in the form best adapted for the particular crops to be dealt with, and few general directions can be given that will be of service. Still, it is advantageous, if the same experiment is repeated for several years with the same crop, to have the succeeding season's records together in one book, so that they may be compared with the least possible trouble. It is found as observations accumulate that a good deal of labour is lost unless a carefully-devised system of booking is followed from the beginning. Another point is that small books are unsuitable for extensive or prolonged work, as all the essential matters bearing upon each crop should be recorded with every season's results, and they are then available for reference at any time. It is desirable also that the books should be kept in two sets—one in which the observer enters all his notes direct, and the other to which they are transferred and classified for preservation. When the crops are of such a nature that they cannot be dealt with immediately they are gathered or harvested, and they have to be stored, the produce from each plot must be accurately and securely labelled with some material which is not likely to be destroyed or rendered illegible, metallic numbers being as convenient as anything. If only a short period is to elapse between

FIG. 51.—*BULDOPHYLLUM HAMELINII*.
Flowers lilac-purple. (See August 13, p. 118.)

upon subsequent results that might be otherwise inexplicable.

The actual variation in the constituents, or the food-value of produce, is a further matter of importance which will have to be decided by chemical analysis. But this does not come within the scope of these notes, which are intended to deal only with such work as a trained cultivator should be capable of performing. For an experi-

the gathering and the recording, it is helpful to have books of perforated tickets, so that the name, plot, date, &c., can be entered on one portion that is affixed to the produce, the counter-foil to be retained for comparison or as a check if necessary.

THE "NET" WEIGHT IS NECESSARY.

One source of error needs to be carefully guarded against where the crop or produce to be recorded cannot be placed directly in the scales, and it has to be weighed in a vessel of some kind, and that is to make sure that the necessary deduction is always made to obtain the net weight. The best way I have found to ensure this is to enter the gross weight and make the deduction afterwards right through the series of observations. The figures are then available for checking and correction, but if the weight of the vessel is subtracted each time and the net weight only entered, any mistake that is passed cannot be corrected afterwards. Again, if the English system of weights is followed, it is preferable to take the first observations in pounds.

mainly upon commercial lines. It is seldom that the search for knowledge and the information required for its best utilisation can be combined in one scheme. In the effort to extend knowledge or improve practice in cultivation, much will often have to be done that is not merely unprofitable, but is a source of material loss. A large part of the enormous work of observation, recording, labelling, and preserving accuracy in all the details, is quite outside the routine of cultivation, and represents a heavy item in the expenses, both directly and indirectly. Economy in labour can seldom be carried out with satisfaction. *R. Lewis Castle.*

(To be continued.)

A JAPANESE THANK-OFFERING.

At harvest festivals and similar occasions for thankfulness, we are wont to decorate our churches with flowers and fruits. It is interesting to see that the Japanese testify their gratitude in a similar way. The illustration (fig. 52), which we copy from the *Journal de la Société*

Apples set a huge crop, but the effects of the dry weather thinned them largely, and fruits are still falling, but quite sufficient will be left. Currants and Raspberries are rather small, and require moisture badly. Gooseberries are excellent. Damsons are an average crop. Plums in some cases are very good, in others the fruits failed to stone. Our soil is heavy, but well drained. *J. C. Tallack, Shipley Hall Gardens, Derby.*

DERBYSHIRE.—The fruit crops generally are good, with the exception of Red Currants. Our soil is a strong loam for the most part, resting on clay. *T. Keetley, Darley Abbey, Derby.*

— The enormous crop of all kinds of fruit, both inside and out, is a pretty general surprise after the wet, cold, and sunless season of 1903. I think the present results will upset the prevailing theory that a bright sunny summer is necessary to ripen the young growth and mature the buds for the benefit of the succeeding season. Last spring was free from the usual late frosts that have so many times completely destroyed the fruit crops. *J. H. Goodacre, Elvaston Castle Gardens, Derby.*

FIG. 52. GROUP OF DWARF TREES ARRANGED BY THE JAPANESE AS A THANK-OFFERING FOR ONE OF THEIR RECENT VICTORIES.

and convert them subsequently (if desirable) into tons, hundredweights, and quarters. Similarly with the metrical system, if the weighing is in kilos and grams, the result should be set out in full as—

kilos grams
4 674;

but when there is anything below 100 grams the nought must be always prefixed (as 4.074), or considerable errors may creep in. This is the greatest danger in the use of the metrical system, and demands most careful attention, especially when there is a pressure of work and time is short.

EXPENSES OF EXPERIMENTAL WORK.

The expenses of experimental work are so much greater than these necessitated by ordinary cultivation, that due consideration must be given to this aspect before commencing any scheme. The subject cannot be entered upon fully here, but it is necessary to point out the possible danger of forming too low an estimate at starting, as that invariably leads to after disappointment and probably the ultimate discontinuance of at least a portion of the work. Under some very favourable and exceptional circumstances it may be possible to render experimental cultivation a profitable undertaking. But in such cases it must be founded upon a commercial basis, and conducted

d'Horticulture du Japon, shows one use that is made of these curious dwarf trees in which the Japanese take so much pride. At least they represent years of labour and care, and in that sense are fitting symbols of the gratitude the Japanese experience at their successful prosecution of the war. The group in question was arranged as a thank-offering for one of their recent successes. Now that their island home is secure from danger of invasion, the victorious Japanese will have cause for yet deeper thankfulness.

REMARKS ON THE CONDITION OF THE FRUIT CROPS AT THE END OF JULY.

(See Tables and General Summary, ante, pp. 70-76.)

(Continued from p. 109.)

CHESHIRE.—The fruit crops in general are good here, but all are very much in need of rain. Red, White, and Black Currants are dropping their leaves through the blight. Strawberries are plentiful and good. Raspberries are a fair crop. Gooseberries are also plentiful. *W. Chester, Chatsworth Gardens, Chesterfield.*

DERBYSHIRE.—Pears set a very heavy crop, but many of the fruits have dropped, and in some cases the Pear-trees are quite bare of fruit.

HERTFORDSHIRE.—The soil here is chiefly a very strong loam, resting on clay. Apples set very freely, necessitating thinning. Pears flowered very freely, but did not set well. Plums both flowered and set fairly well. Cherries also flowered very freely, but the fruit dropped badly at the stoning period. Peaches and Nectarines are both heavy crops, and liberal thinning was necessary. Small fruits are the heaviest and best crops for the past five years. *C. R. Fielder, North Mymms Park, Hatfield.*

— I have much pleasure in stating that the fruit crops in this district are quite up to the average. Cherries and Apricots are a little under a full crop, but taking the fruit crops generally they are most satisfactory. Our soil is a yellow sandy loam, clayey in places, which we find well suited for growing Strawberries, Melons, and Roses. *C. E. Martin, The Hoo Gardens, near Welwyn.*

— The fruit crops generally are not nearly so satisfactory as they promised to be early in the season. Most trees flowered abundantly, and the setting of fruit was good, but much, especially the stone fruit, failed to swell. Both dessert and Merello Cherries are bad, the latter with us being practically a failure. Most kinds of Plums are excellent, but the larger varieties of Damsons are

very scarce. Strawberries and bush fruits were never better, except Black Currants, which are badly infested with mite. The soil here is a stiff retentive clay. *Edwin Beckett, Aldenham House Gardens, Elstree.*

LEICESTERSHIRE.—The soil here is a medium strong loam, with a clay subsoil, consequently fruit trees makes robust and late growth. The crops are the best we have had for some years. Pears thinned themselves to an average crop. Apples are falling, but there are more than enough left—in fact they will require more thinning. For the first time in three years we have a full crop of Black Currants, but unfortunately they have suffered from blight and aphid. The Strawberries have been abundant, but owing to the drought they will soon be over. *Louis Gauthier* has been remarkable for its prolific crop. Raspberries, Gooseberries, and Red Currants are full crops. Stone fruits have been rather disappointing on account of many of the fruits falling in the early stages of growth. *Daniel Roberts, The Gardens, Prestwold, Loughborough.*

— This is the best fruit season for crops of all kinds which we have had here for many years. The partial failure of Plums on standard trees is quite unexpected, as flowers were abundant and healthy, and we had neither frost nor cold north-east winds this year during the flowering period. Small fruits are abundant, and are ripening in excellent condition. Strawberries have given a heavy crop, with fruit sound and of good flavour, the dry weather allowing them to ripen without decaying. Pears are not such a heavy crop as I expected, and the Pear-midge (*Diplosis pyrivora*) has caused much havoc among some varieties. A few of the Apple-trees have failed to set their fruit, owing chiefly to the excessive wet of last autumn. *Bess Pool* (the latest variety to commence growth) is a notable instance of this influence. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

NORTHAMPTONSHIRE.—Apples are suffering from the effects of the drought, and the fruit will be very small if no rain comes to swell them. Our soil here is ironstone near the rock. *H. Turner, Fineshade Abbey Gardens, Stamford.*

— Crops of Apples, Pears, and Plums are good. Strawberries on young plantations have been splendid, but the dry weather has curtailed the crop considerably on three-year-old plantations. Raspberries are plentiful, also other small fruits, but all are needing rain. The soil is a stiff clay, and with the wet spring, followed by continued hot weather, it is now very hard and dry. *J. Shennan, The Gardens, Holdenby House, Northampton.*

NOTTINGHAMSHIRE.—On the light gravelly soils in this locality many Apples and Pears have dropped through the dry condition of the weather. *Amos Parr, Holme Pierrepont Hall, Nottingham.*

— The fruit crop generally is very good here this season, and the trees are clean and free from blight. There are grand crops of Apples on the large orchard trees, bushes, and pyramids; these have been all heavily mulched, and the fruit is swelling well. Black Currants are a fine crop, and this I attribute to good mulchings. Raspberries and Gooseberries are both plentiful and good. Strawberries carried very heavy crops—*Royal Sovereign, Waterloo, and Louis Gauthier* being all extra fine. *J. Roberts, Welbeck Gardens, Worksop.*

— Fruit-trees in this district passed the flowering period entirely uninjured by frost, and there was promise of the heaviest crop in recent years. Cold winds in May and June, however, made green-fly very prevalent, and now the drought is causing young fruit to drop in numbers. Prompt rain to swell what remains

would still give us a good all-round crop, but the prospect of a record year is gone. The soil here is keuper clay with alluvial drift in the Trent valley. *R. J. Pearson & Sons, Chilwell Nurseries, Lowdham, Notts.*

NOTTINGHAMSHIRE.—Abundance of all kinds of fruit prevails, with the exception of Plums, which suffered from frost and cold winds. The soil here is light and sandy, and everything is suffering at the present moment from want of rain, the rainfall here since April having been exceedingly light. *A. W. Culloch, Estate Office, Newstead Abbey, Nottingham.*

OXFORDSHIRE.—The Apple crop is heavy, and promises well. Strawberries were a very heavy crop, and produced splendid fruits. Raspberries and Currants are good. Plums are scarce, as are also Apricots. The soil in these gardens is a light sandy loam on gravel and chalk. Fruit-trees here grow remarkably clean and healthy without exception; but the soil here gets very dry during the months of July and August, which is very trying to newly-planted fruit-trees, &c. *John A. Hall, The Gardens, Shiplake Court, Henley-on-Thames.*

— Our soil here is, on the whole, very poor and stony, the subsoil consisting of either gravel or chalk. Trees of all kinds bloomed well with us, except Pears, and although the weather was fairly good at the time of blossoming, much of the fruit on the Apple-trees did not set; the reason of this may be due to the green state of the wood last autumn, when fruit-buds could not have matured properly. The cold winds spoiled some of the Apricot bloom. The Gooseberry grubs have been very troublesome. *A. J. Long, Wyfold Court Gardens, Reading.*

SHROPSHIRE.—Apples are a remarkable crop here. I have taken 90 per cent. of the fruit off most trees and have still left too many on. Pears are a full crop and the fruit is in good condition, but, like most other fruits, they require rain badly. Plums and Damsons are sadly in need of rain; the latter are casting a lot of their leaves. Small fruits are abundant, especially Black Currants and Strawberries, also Raspberries. This seems with us the best year as regards fruit since 1893. *A. S. Kemp, Broadway, Shifnal.*

(To be continued.)

NURSERY NOTES.

MESSRS. ED. WEBB & SON.

MANY of the leading seedsmen are fortunate in possessing ground for their "trials" on the side of one or other of the great railway lines, and they are therefore seen by many thousands of persons as they travel through the country. Not so Messrs. Ed. Webb & Son. Their trial grounds are at Kinver in Staffordshire, a remote village which is nearly four miles from the nearest railway station, and nearly five miles from Stourbridge. It is true that in late years the provision of a light railway from Stourbridge to Kinver has made the place rather less inaccessible than previously, but of the thousands who travel thereby, few, if any, are interested in such specialised gardening as seedsmen are bound to practise in order to maintain their stocks true, and to obtain new varieties of superior quality. Notwithstanding these circumstances, however, Messrs. Webb carry out a series of trials, the results of which are just as important as they would be if practised under the constant observation of the travelling public, and in a locality less removed from the beaten track. The firm has a first-class reputation for agricultural seeds, and trials in this department are just as necessary as they are in the horticultural department. These are also made at Kinver, and as there are 1,200 acres of freehold land, there is no difficulty in

providing for them all, and in growing besides crops of seeds of particular specialities, such as their "Chevalier" Barley, "Emperor" Cabbage, &c.

We were shown a new variety of Barley, a selection from "Chevalier," which will be distributed under the name of "Binder." In a measure it possesses the qualities of Chevalier and Burton Malting, and is especially recommended because of its unusually upright character of growth, which will make it convenient for mowing and binding by the mechanical cutter. Messrs. Webb are fully aware that farmers are only able to make grain crops remunerative at all by adding to the value of the grain that of the straw also, and they believe that in the "Binder" Barley and a new white Oat they will distribute next season, cultivators will find the straw to be of greater value than usual, the Oat especially possessing straw of exceptional length and strength. There are upwards of fifty trials of Wheat, eighty of Oats, nearly forty of Barley, forty of Cabbage, nearly fifty of Beans, sixty of Onions, sixty of Cauliflowers and Broccoli, forty of Carrots, forty of Turnips and Swedes, and fifty of Mangolds.

The Peas include upwards of 150 varieties, amongst which are several unnamed seedlings. The soil being of a very light character, many of the crops have felt the effects of drought severely and the Peas amongst them. Most of the varieties were quite past bearing, but the exceptions are well worth remark, because they were sown on the same date in April, yet were yielding excellent Peas for table use on August 8. The varieties Mainstay and Masterpiece were about the same height, 3 feet. Each had good pods of commendable shape, and containing nine or ten large Peas in each pod. Mainstay is nearly a week earlier than Masterpiece, but both appear to be well worth growing. Another variety yielding good Peas was an unnamed seedling, growing 2 feet high. It will probably be distributed next season, and is likely to become of considerable value. "Kaiser" is a new late-fruited main-crop variety, apparently of excellent merit, but past yielding at the time. Another good main-crop Pea is Astronomer. It has dark green pods, but rather pale-coloured Peas, and there are ten large Peas in each pod. Senator and Promotion had both ripened their pods, but were recommended as good maincrop varieties.

Wordsley Wonder is a first-class second early Pea that is well known and generally appreciated. It grows 3 feet high, and though the pods are not of large size they are so packed with Peas that the yield is very heavy, and the Peas have extra good flavour. During the dry weather black-fly has been very troublesome upon some plants. The Broad Beans have been quite spoiled by this pest, and from these Beans it has spread to the Scarlet Runners, and to some Mangolds now seeding, which is specially unfortunate, as the selection of Mangolds is of the choicest possible.

There are many trials of annual flowering plants, and some of these were producing very gay effects, whilst others were less successful owing to the drought. Among these latter were some of the Stocks, and all the varieties of Chinese Asters. But the Nasturtiums presented a blaze of colour, and among them the varieties Golden King (yellow) and King of Tom Thumbs (scarlet) were most effective. Meteor, rich crimson, of the same type, may be preferred by some, but is less bright. Clarkias were capital, and were flowering abundantly in batches all true to colour, of which there is much variety. Single and double-flowered varieties were alike alive with bees, who evidently gather considerable honey from them. Godetias were in equally good condition, and a variety named "The Bride," white, and another one with double rose-coloured flowers, were as even in growth as

possible, and perfectly true. Of Candytufts we were specially impressed with "Snowflake," a very fine variety, and "Midget," only 3 inches high, excellent for edgings or for the alpine garden. *Lupinus albus coccineus nanus*, a pretty Lupine, about 1 foot high, with white and pink-coloured flowers, would probably be appreciated by some even who have little admiration for the taller-growing Lupines of other colours. The Carnations were hurried past flowering by the hot sunshine, but there is a large breadth of plants, also of herbaceous or perennial Phloxes, Sweet Peas, Mignonette, and other flowering species, of which space will not allow us to write in detail. But we must mention a new Stock named *Admiration*, with large white and pink-coloured flowers, which is said to be useful as a "Ten-week-Stock," or may be sown in July. The branching habit of the plants, and their free-flowering, was remarkable, the dry weather notwithstanding.

bloom. Our illustration (fig. 53), for which we are indebted to Mr. DOPSON, shows a group of *Yucca recurva* in Kennington Park. It is interesting not only for its appearance, but also as a proof of the value of these plants for town squares and similar confined situations. Many of us can still remember Kennington Park as it was half a century ago—a desolate waste. Things are different now.

BALMORAL.

VISITORS who have had the privilege this summer of visiting the grounds of Balmoral Castle have much to see and admire, but one new feature has arrested universal attention. In the curve formed by a belt of deciduous trees on rising ground on the east side of the lawn from the main entrance drive, a magnificent border of hardy herbaceous plants has been laid out. To

alba, *Eryngium amethystinum*, *Erigeron speciosus superbum*, *Centranthus ruber*, *Veronica spicata alba*, *Chrysanthemum maximum*, *Pyrethrum uliginosum*, *Spiraea palmata*, *Campanulas* of sorts, *Chelone barbata*, *Sidalea Listeri*, *Liatris spicata*, *Monarda didyma*, *Achillea ptarmica fl. pl.*, *Scabiosa caucasica*, and many newer sorts too numerous to mention.

Several fine clumps of Golden Rod, Monkshood, and Michaelmas Daisies, autumn Anemones, Perennial Sunflowers, &c., were only in bud, and rich and effective as the border already is, it will be much more so by the end of August, for the 900 feet altitude of Balmoral is not conducive to early flowering. To be planted so lately as April, and in such a dry summer, it shows very careful cultivation and management to have effected such a happy result in the short period of three months. J. L.

FIG. 53.—YUCCA RECURVA IN KENNINGTON PARK.

A great breadth of ground had just been sown with seeds of the celebrated Emperor Cabbage. About 2 acres are seeded each season, and nearly 1 ton of seed obtained if the weather is good. Some of the warehouses at Wordsley are now being filled with wool, and the "hands" are picking and sorting it. Messrs Webb have many departments in their business. Immediately after the wool has been handled, the Hops will need attention, for the firm deals largely in this crop. They have also a large manure manufactory at Saltney, near Chester.

YUCCAS.

THE present season seems to have been remarkable for the flowering of Yuccas. From many quarters we have received information of the blossoming of these noble plants, especially *Y. gloriosa* and *Y. recurva*. The pathway in an ordinary front garden of a suburban residence in the western suburbs is just now remarkable for a double line of Yuccas in full

brighten the somewhat sombre colours of Pines, Birches, &c., forming the background of the border, large clumps of various-coloured shrubs, including Purple Plum, Golden Elder, &c., have been introduced into the edge of the belt with great effect, relieving the plainer green of tree foliage, and bringing into bold relief the rich masses of bloom in front. In laying out the border, old-fashioned ideas as to herbaceous planting have been completely set aside, and the bolder and grander method of planting in masses has been carried out. Great care and skill have been displayed in the selection of varieties and in the harmonious blending of colour, and the effect even now, when many of the varieties are not in bloom, is very charming.

With an ideal background and amid a scene of great sylvan beauty many old favourites are specially noticeable, amongst whom may be mentioned *Lychnis Chalcedonica*, *Lythrum roseum superbum*, *Bocconia japonica*, *Galega officinalis*

KEW NOTES.

GLORIOSA.—A new and beautiful species of *Gloriosa* has been lately flowering in the stove. It is a really handsome kind, worthy of ranking along with the recently introduced *G. Rothschildiana*, which many are now familiar with. It is remarkable that two such fine species should be added to this limited genus at comparatively the same time, after the great number of years that *G. superba* has held its own, almost unchanged, as the garden plant of the genus.

Specimens of the plant now under notice were collected by Mr. A. Carson, B.Sc., of the London Missionary Society, and were sent by him to Kew amongst many other dried specimens. He collected the *Gloriosa* at a place called Fwambo, situated about 50 miles south of Lake Tanganyika. Mr. Baker named it *G. Carsoni*, in honour of the collector. A botanical description is given in the *Kew Bulletin* of 1895, p. 74, in which Mr. Baker says: "A very distinct novelty, with flowers like

those of the finest forms of *G. virescens*, Lindl. . . it would make a handsome garden plant." The tuber of the specimen now in flower was sent to Kew last year by Mr. Phillpot, this being the first introduction to the Royal Gardens of a living specimen. The tuber was rather small, but has produced a growth 8 feet in length, the habit of which is very similar to that of *G. superba*; the flower has a diameter of 4 inches; the segments are 3½ inches long and three-quarters of an inch wide at the broadest part; the colour is a bright brownish-red, turning a deep dull red with age. The segments have a margin of golden-yellow, and near the base are entirely of this colour; the margin is only slightly undulated; the filaments and style are green, anthers yellow. Possibly the fine colours and good forms of these recently-introduced species may be the means of producing some pretty hybrids, that will make this genus more popular than it is at the present time.

GLORIOSA VIRESCENS VAR. *GRANDIFLORA*, Baker.

This pretty variety has also been in flower in the stove. The flowers are much larger than in the type, the colour being a clear, pale yellow. It is certainly a very beautiful *Gloriosa*, though it has no claim to newness, for it was discovered by Mr. Gustav Mann at Fernando Po in 1860, and was figured in the *Botanical Magazine* at that time (t. 5216) under the name of *Methonica grandiflora*, Hook. Notwithstanding its early introduction, it is as yet very little in cultivation. The tuber of the plant now in flower was sent to Kew last year by J. T. Last, Esq., who found it growing near Zanzibar. This is a very variable variety, both in the habit of growth and in the colour of the flowers, according to the conditions under which it exists in nature. W. H.

STRAWBERRIES IN 1904.

THE season of 1904 commenced here on June 23, being much later than usual, and owing to the intense heat and drought, it finished abruptly on July 21. The quality of the berries, as grown in our open fields, has been good, but owing to drought in the flowering and setting time, the berries have been smaller than usual. Taking all things into consideration, the noted Kent sort, Sir Joseph Paxton, has been the best, and when fully ripened (not as gathered for market) it has been of rare quality. Among newer varieties are those following:—

Fillbasket has proved remarkably fine in crop and quality, its long, pointed fruit being very handsome, and in this dry season of good flavour, and I think will prove a reliable berry.

The *Laxton* has given a heavy crop, but with us it is not so early by three or four days as *Royal Sovereign*. The quality under the drier conditions of 1904 led me to think that it may be a dependable sort for hot seasons; but the quality is not so good as I could wish.

The *Khedive* has not borne out its reputed character of resisting the drought, and evidently is not suitable for our calcareous soil. The plants are very weakly, and the fruits small.

Climax is a large, hollow berry, of inferior flavour, and can be dispensed with, as in *Royal Sovereign* we have still the best all-round Strawberry either for forcing or for the open ground.

Givon's Late Prolife has been superb, as in 1903, and is without doubt the very best late Strawberry, large in size, continuous in bearing, and splendid in flavour, with deep rich colour.

President Loubet (Veitch) is a promising new late sort of the Waterloo type.

Of the new kinds I have tasted but not grown, Veitch's *Atake* (figured on p. 61, July 23), is an enormous berry of the Leader style, angular-crested in shape, but of fine rich flavour.

Laxton's Reward (figured on p. 20, July 9), is a very handsome berry, and likely to prove a gain; but personally I prefer *Laxton's Bedford*, as it is a globe-shaped berry ripening to the point, and of a bright shining red colour, very taking. These I shall grow and report on in 1905, if all is well.

The Kent Strawberry growers have had a grand season, and the crops have been very large and unusually good for size and colour. But the red-spider and drought appear to have very seriously injured the foliage towards the end of the season.

The grand and more than welcome rains of July 24, 25, 26, have been most helpful to us nurserymen who have to cater for supplying Strawberry plants in pots and runners. But, in any case, they must be later than usual; and the British Queen race, and the high quality sorts as *Frogmore Pine*, *Countess*, &c., will, I fear, be unequal to the demand.

I need scarcely allude to the old-established favourite sorts, as *President*, *Goliath*, *Louis Gautier*, *Vicomtesse Héricart de Thury*, &c. Notwithstanding all the recent introductions they are still indispensable.

Several new alpine and autumnal-bearing kinds are under trial, and I note that *St. Joseph*, *St. Antoine de Padoue*, and others, are already full of green berries, so that there is scarcely a break in the supply, and they will continue till October. *George Bunyard*, Maidstone, July 27, 1904.

The Week's Work.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gr., Wrotham Park, Barnet.

Strawberry plants.—Runners that were layered last month in small pots filled to within half an inch of the rim with good loam, or on turves cut in small squares, should now be ready for planting out in single lines 2 feet apart each way, or a trifle less, in the rows for the less robust varieties. They may also be planted in triangular patches, allowing a space of 4 inches between each of the three plants set out. If for supplying early fruits on a warm border, a distance of 18 inches apart will be ample to allow each plant to grow for one season only. The land should be in good heart, deeply cultivated, with plenty of manure added, and made more or less firm according to the nature of the soil. If the land is already prepared for the reception of the plants, all that is now required is to give the surface a good dressing of soot and to run the hoe through it. Set out the line and plant firm, seeing that the roots are well supplied with water before and after planting. Keep all the early varieties together on one side of the beds, and the later kinds on the other side. See that they are properly and correctly labelled as the work proceeds, and thus avoid any confusion at a later date. Plants so treated should yield a very heavy crop of large early fruits next year, and especially the variety *Royal Sovereign*, which I always consider is better for being treated in this way, and allowed to fruit for one season only and then destroyed.

Early Apples.—Varieties as *Gladstone*, *Red Juneating*, and other early kinds with soft flesh, should be looked over every two or three days, and as the fruits approach ripeness let them be gathered and put into a cool fruit-room. These kinds soon go dry and woolly, and are useless for dessert if not consumed at the right time. In many gardens where blackbirds, &c., are numerous, the trees will have to be protected with fish-netting (if not too large) to save destruction after the fruit ripens. Beauty of Bath, Irish Peach, Kerry Pippin, Lady Sudeley, and Worcester Pearmain are all useful Apples, to keep up a continuous succession.

Pears.—*Doyenné d'Été*, although small, is very juicy and sweet when gathered from the tree about two days before it is ripe. *Beurré Giffard* will be found very useful, and later on *Williams' Bon Chrétien*. All these early Pears must be watched and gathered at the right time, otherwise the fruits are of but little value. They should be gathered at intervals to keep the supply as long as possible. See that all the trees carrying heavy crops are deluged at intervals with water

to increase the size of the fruits and the trees generally, and especially those whose roots are near the surface.

THE KITCHEN GARDEN.

By JOHN PENTLAND, Gardener to C. H. B. FIRTH, Esq., Ashwicke Hall, Marshfield, Chippenham.

Cauliflowers.—Where convenience can be obtained for protecting these plants during the winter, make arrangements now for a suitable place to form the seed-bed, choosing a sunny, sheltered spot for the purpose. Form the beds so that frames can be placed over them when required. Apply a thorough dressing of slaked lime previous to manuring and digging the ground, and when this latter is finished give another dressing of lime previous to sowing, raking it well in when preparing the ground for the seed. This precaution is necessary to guard against slugs. Previous to sowing the seed tread the ground moderately firm. Make the first sowing on the last week in this month, to be followed by another sowing on the second or third week in September, the time of sowing to be governed by the locality, whether north or south. If these plants are sown too soon and a mild autumn follows they make too much growth, and are difficult to keep during the winter should the latter prove very severe. Small sturdy plants winter better, and do not receive such a check when being transplanted in the spring. Sow thinly, and prick the seedlings off into frames or handlights as soon as they are ready. The old variety *Early London* is a reliable variety for winter work. In Yorkshire we found *Veitch's Autumn Giant* when sown at the same time as *Early London*, stand the winter well, and followed the latter variety in succession. We intend giving it another trial this winter.

Prickly Spinach.—A sowing should now be made in lines about 7 or 8 inches apart, or if the space is limited, at 1 foot apart, planting other vegetables, such as *Coleworts*, between alternate lines. Prepare the ground well by giving it a good dressing of manure, deeply digging and incorporating the manure as much as possible with the soil.

Selecting and Gathering Seeds.—Everything that has been noted of special merit should, if possible, be saved. Choose a bright day for seed-gathering, and see that they are well matured before gathered; after which expose them as much as possible to the sun to thoroughly dry them.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorset.

Vanda teres, *V. t. alba* and *V. Miss Joaquim* have now passed their flowering season, but, owing no doubt to the absence of sunshine during the last autumn, the stems were not sufficiently matured, consequently the plants have failed to bloom satisfactorily, although the growth has been luxuriant. These plants will now need attention. Some growers cut off the stems about 2 or 3 feet from the top and insert them in beds of growing sphagnum, tying each stem firmly to neat, strong stakes. The method is a convenient one in many ways, especially where space is of consequence, but as a rule the spikes produce only three or four flowers, whereas, if cultivated in the following manner, the plants invariably give double the quantity of bloom. About half-a-dozen stems are fastened to three or four teak rods, made like a raft. The lower part of the raft is inserted into a pot in an upright position, and made secure with thick pieces of crock, over which is placed a layer of sphagnum. When the plants have overgrown the length of the rafts, about 3 feet of the stems of the plants, together with the upper part of the raft, should be carefully sawn off and lowered into a fresh pot. Another new raft should then be screwed on to the upper part of the old one, to which the top stems should be tied. For a few weeks after disturbance the plants should be carefully shaded; by that time some of the young roots will have adhered to the new wood, when the plants may be gradually exposed to direct sunlight. The lower parts of the old stem which have been cut off, if kept well syringed, will soon send out fresh growths, when new rafts may be added to them.

The particular requirements of these terete-leaved Vandas are met by plenty of sunshine and copious overhead waterings several times a day during active growth. The Mexican house is the best place for *V. teres*. If given plenty of fresh air during the day, when the sun is shining upon the plants, and a thorough syringing at closing time, they will bloom profusely. The distinct hybrid *V. Miss Joaquim* grows best at the hottest end of the plant stove, where the stems receive uninterrupted sunlight. *V. Hookeriana* should be treated in a similar manner. The proper time to cut the stems, repot, &c., is in about three weeks hence. *Vanda Amesiana* and *V. Kimballiana* should be grown in the same house as *V. teres*, and in such a position that the air can circulate freely around them. *Angraecum Eichlerianum* is another Orchid whose roots cling firmly around teak-wood rods, and at the present time it may be cut down in the same manner as advised for *V. teres*. The plant delights in a hot, moist atmosphere during its season of growth. *Renanthera coccinea* is in full growth. The plant should not be disturbed now, the roots entwine themselves firmly around a large Birch pole. It should, during its growing season, be placed in a similar position as *V. Miss Joaquim*, but during the winter a cool, dry situation is the best place for it. *R. Sterei* and *R. matutina* should have identical treatment. Plants of the rare *Vanda Sanderiana*, *Aërides Lawrenceæ*, its buff-coloured variety *Sanderiana*, and *A. Rohaniana*, are now showing their flower-spikes, and should be liberally supplied with water until the flowers are past. Every care must be taken to preserve both roots and flower-spikes from all insect pests, particularly cockroaches. None of these plants that are weak or unhealthy should be allowed to produce a flower-spoke.

THE FLOWER GARDEN.

By A. B. WADDS, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

The Rockery.—The repeated waterings of late will in many places have washed away the soil from around the plants. Where this has occurred some good soil should be pressed round the plants thus exposed. This will induce fresh side shoots to root in the soil. The new growths thus formed may be taken off in a few weeks, and will be useful for increasing the stock. Remove all old flower-stems, dead leaves, and seed-vessels; any seeds contained in the latter may be sown as soon as ripe. A frame should be near the rockery for increasing the stock of any of the plants, also for protecting those members of the rockery which are not quite hardy.

Flower Seeds.—The gathering of these should be done as they become ripe, that of Iceland Poppies if left too long gets scattered by the wind. The best varieties of *Delphiniums* should be selected for seed-saving, also *Sweet Williams* and any other plants that will do for the "wild garden." The seed should be placed in bags, hung up in a dry shed, and labelled.

Dahlias.—The frequent attention given to Dahlias during the past few weeks will now be amply repaid in an abundance of good flowers. Keep all old flower-heads picked off, and remove some of the side shoots. It is well to give old stools plenty of room. Fresh mulching should be given the plants, as the old mulching will have had all the manurial qualities washed out. Cactus varieties required for exhibition purposes should be thinned. Pompons may be left without thinning, as they are required to produce a number of small, well-shaped flowers. The single Dahlias are useful just now for decorative purposes, being light and of good colours, there being plenty of good varieties to select from. Small quantities of Peruvian guano are very efficacious in developing the colours of these flowers.

Carpet Bedding.—Cuttings of plants from these should now be taken, and inserted round the sides of 60-pots. If plunged in a good brisk bottom-heat, and kept shaded, they will strike readily. The cuttings should be taken without disfiguring the beds. Those shoots which have to be removed in order to keep the beds in their allotted spaces will suit admirably for the purpose of propagating. Keep all flower-heads picked off *Mesembryanthemum* and *Echeveria* plants. If

kept neat and tidy for the next month, the carpet-bedding designs will then be seen at their best.

Climbing Roses.—These will have become crowded with growth during the past few months, and should now have a few of the old shoots removed. Weak-growing varieties should have the old shoots cut out, especially those that are unhealthy, and the young shoots tied in and given every encouragement to grow. *Rêve d'Or*, one of the best climbing varieties, has made enormous growth this season, and will require plenty of room for the young shoots to develop. This variety does not like hard pruning. *Crimson Rambler*, which is now over, may be slightly cut back. *William A. Richardson*, if on a south wall, will keep blooming for some time. All these Roses will benefit by a good washing with clear water as often as possible.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Early Pot Vines.—Every endeavour should be made to get the wood thoroughly matured before turning the plants outside. The foliage must also be thoroughly developed before the plants are placed outside, or they will get tattered and torn by rough winds before the proper development of the buds from which the future crop of fruit is expected is completed. Take all possible care of the foliage, and stand the plants in a sunny, sheltered position against a south wall. If the pots were plunged while under glass, when removed outside give slight protection for a time from the direct rays of the sun.

Young Vines of this season's planting will be benefited by a little warmth from the pipes, at the same time maintaining liberal ventilation in the house. A gradual shortening of the laterals should be resorted to.

Vines.—Where ripe Grapes are hanging it will now be necessary to protect the fruit from wasps and flies, which are making their appearance in considerable numbers. We find nothing more effectual for this purpose than placing wasp-proof hexagon netting over the ventilators. It is necessary when using this netting to have it of sufficient width to allow the ventilators to be opened to their fullest extent, for without plenty of ventilation Grapes will not ripen well, nor remain in good condition when ripe for any length of time at this season. Judgment must be exercised with regard to the supply of water at the roots, and when considered necessary it should be applied early in the day, but only in sufficient quantity to keep the foliage fresh and the fruit from shrivelling. Stop all laterals sufficiently close to allow a free circulation of air between the foliage and the glass.

Peaches and Nectarines.—Early forced trees which have now lost their foliage should be pruned according to their requirements. Those trees which received full attention as the season advanced will require little, if any, pruning. Use every means to secure rest for the trees, taking care, however, to allow the trees sufficient water at the roots, using the syringe occasionally. Should the borders be considered unsatisfactory, no better season than the present could be chosen in which to renew them. Remove the soil down to the roots of the trees and add fresh whole turves, working-in half-inch bones, wood-ashes, charcoal, and lime-rubble, make the whole firm, and give a moderate watering.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. BURNS, North Mymms Park, Hatfield, Hertfordshire.

Gardenias.—Plants that were cut back in the spring with a view to securing a supply of flowers at the end of the summer, will have made good growth by the present time. The plants should now be afforded more ventilation for a time, to ripen the growth and set their flower-buds. A frequent cause of bud-dropping in the case of plants grown in pots, is due to the omission to remove the young shoots which are frequently produced alongside the flower-buds, and which, if allowed to grow, divert the energies of the plant from the flower-buds, and in most instances cause them to fall. Young plants in need of repotting may be

afforded a shift now, they will then become well established before the winter. If the potting be carried out without unduly checking the plants, they will quickly root into the new soil, and continue to make good growth. *Gardenias* enjoy full exposure to the sun, and while making their growth should be given a high temperature, and abundant atmospheric moisture. A suitable compost for potting consists of three parts of good fibrous loam, one part leaf-soil, together with some coarse silver-sand, and a little well-decayed manure. Every effort should be made to keep the plants free from mealy-bug and scale. Paraffin and water may be used as an insecticide with safety on such smooth-leaved plants as *Gardenias*, adding a wine-glassful of the oil to 3 gallons of water. If infested with mealy-bug the plants should be taken out-of-doors, laid on their sides, and well syringed with the insecticide, taking care to keep the mixture well agitated with the syringe during the operation. This may be repeated every ten days until the plants are clean, but should be discontinued when the flower-buds begin to show themselves.

Paneratiums.—While these plants are in bloom they may be removed to a cooler house with safety, and in this way a lengthened succession of flowers may be obtained. *Paneratiums* are very subject to the attack of thrips, and when the plants are in flower the best mode of destroying these insects is to sponge the plants with tobacco-water, or some other insecticide. When such plants as *Paneratiums* and *Amaryllis* are being sponged the mature thrips often take refuge between the close-growing bases of the leaves, but they can be destroyed if a stiff feather is dipped in the tobacco-water and pressed down between the leaves.

Primulas.—All but the latest batches should now be in the pots in which they are to flower. Grow them on a cool, moist staging, and protect them from strong sunshine. Provide liberal ventilation; *Primulas* are frequently spoiled by keeping them in too close an atmosphere. During the summer a cold frame facing north suits them well. Give the earlier flowering plants some clear soot-water, while a little artificial manure may occasionally be sprinkled on the surface of the soil.

THE APIARY.

By EXPERT.

Work in the Apiary.—The season almost past, will, I am afraid, have turned out as a whole anything but satisfactory for bee-keepers, the cold nights in the early spring being the cause to a very great extent. Those who were fortunate enough to have kept their hives warm and fed on through May, will no doubt have done better. There should not be any honey or comb lying about to set the bees robbing, and all entrances should be closed to about half the width. If, however, the hot weather continues, the entrance must be left, and a cloth dipped in carbolic acid laid over the front and near the entrance, or a little carbolic powder sprinkled about will answer the same purpose. A piece of glass is often found to prevent robbing, by standing up in front of the entrance. All partly-filled sections can be taken off and extracted, unless they are kept for feeding later on. In examining hives and taking away frames of honey, do not keep the hives open longer than is necessary. As the slightest thing will induce your bees to rob, the extracting should be done as far away from the apiary as possible. As soon as the frames are taken out they should be extracted; being warm from the hive the honey will be thrown out much easier, and in the evening the frames can be placed back in their hives for the bees to clear out; they can be removed later and packed away. Stocks that have done badly should be examined and requeened if healthy, and if not the usual methods taken as described previously in these articles. There are plenty of chances of securing good queens at very little cost now, as people are destroying their bees in the skeps. A fellow bee-keeper can be asked to secure one when driving bees, or do the same yourself; by building up your weak stocks now by the medium of adding driven bees, a weak stock will be rendered strong for next year. The bee-keeper should remember that twelve strong stocks of bees are worth double the number of weak ones.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, AUG. 20—German Gardeners' Club meet.
 TUESDAY, AUG. 23—
 { Royal Horticultural Society's
 Committees Meet.
 { Royal Oxford Hort. Soc. Show.
 Brighton Hort. Soc. Show
 (2 days).
 WEDNESDAY, AUG. 24—
 { Harpenden Hort. Soc. Show.
 Reading Hort. Soc. Show.
 THURSDAY, AUG. 25—Flower Show at Sandy.
 FRIDAY, AUG. 26—
 { Royal Botanic Society, General
 Meeting.

SALES FOR THE WEEK.

MONDAY NEXT—
 Trade Sale of Dutch Bulbs, at 67 and 68, Cheapside,
 E.C., by Protheroe & Morris, at 10. 3000 lots.
 WEDNESDAY NEXT—
 Trade Sale of Dutch Bulbs, at 67 and 68, Cheapside,
 E.C., by Protheroe & Morris, at 10. 3000 lots.
 THURSDAY NEXT—
 Trade Sale of Dutch Bulbs, at 67 and 68, Cheapside,
 E.C., by Protheroe & Morris, at 10. 3000 lots.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced
 from observations of Forty-three Years at Chiswick
 —61°.

ACTUAL TEMPERATURES:—

 of Ireland.

The Garden
of England.

It is not to be supposed that Kent was always, as now, the Garden of England, and at all times famous for Hops and Cherries. Until the time of King HENRY VIII. it may be supposed to have shared in the desolation and poverty from which the rest of the country was suffering. It was to RICHARD HARRYS, the King's Fruiterer, that an improvement was due. It may be said of him that he found England a wilderness and made a considerable part of it a rich and pleasant garden. Tillage was at a low ebb, sheep-farming being considered more profitable in the then state of the wool trade, and the rural population was in difficulties.

While the poor starved the rich lived largely on Flemish and French produce. But the King's Fruiterer could not see why England should not have orchards of her own, and in the year when the lesser monasteries were suppressed he did what in him lay towards founding that period of comparative prosperity and internal peace which culminated in the latter part of Queen ELIZABETH's reign. Of greater importance perhaps than his undertaking in itself, was the fact that its wonderful success incited men to exploit in other ways the fertility of the soil, and so brought back more people to the land.

An article in *Longman's Magazine* for August is written by Mr. EDWARD WRIGHT "In Praise of Richard Harrys," and it is from that article that our remarks are here abridged. Mr. WRIGHT quotes from WILLIAM LAMBARDE'S *A Perambulation of Kent*, a delightful work, and familiarly known as "Lambarde's Kent." He extracts the following description of Tenham parish:—

"Heere have wee, not onely the most dainty piece of all our Shyre, but such a Singularity as the whole Brittainish Iland is not able to patterne. The Ile of Thanet, and those Easterne parts, are the Grayner; the Weald was the Wood; Rumney Marsh is the Medow plot; the Northdownes towards the Thamysse be the Conygarthe, or War-

reine; and this Tenham, with thirty other parishes (lying on each side this porte way, and extending from Raynham to Blean Wood), bee the Cherrie gardein and Apple orcharde of Kent."

That the district still deserves this description the official returns of the Board of Agriculture plainly show.

It was in this favoured district that "Our honest patriote RICHARD HARRYS (Fruiterer to King HENRIE the 8) planted by his great coste and rare industrie, the sweete Cherry, the temperate Pipyn, and the golden Renate. For this man, seeing that this Realme (which wanted neither the favour of the Sunne, nor the fat of the Soile, meete for the making of good apples) was nevertheless served chiefly with that Fruit from forrein Regions abroad . . . and those plantes which our auncestors had brought hither out of Normandie had lost their native verdour . . . he (I say) about the yeere of our Lord Christ 1533, obtained 105 acres of good ground in Tenham, then called the Brennet . . . and with great care, good choise, and no small labour and cost, brought plantes from beyond the Seas, and furnished this ground with them, so beautifully as they not onely stand in most right line, but seeme to be of one sorte, shape, and fashion, as if they had been thorow one mould, or wrought by one and the same patterne."

Seven years after the planting of the New Garden, as it was called, £1,000 worth of Cherries was produced from 32 acres of the land. Rumours of such extraordinary crops created an interest in fruit-growing even to the remotest parts of England, and many country gentlemen obtained grafts from Tenham. When Mr. JINGLE passed through Kent in his memorable journey, he found the beautiful county maintaining its reputation, and it still does so. On the whole, agriculture has made gigantic strides during the last half century, and the work of scientists should be generally acknowledged, considering how it has been the means of achieving this progress. It is not, however, science that suggests whitewashed tree-trunks, barbed wire, and other unpicturesque objects in orchards; these are the result of the growers' greed of gain, which also tends to produce fruit inferior in quality but superior in quantity, and makes the consumer sigh for the "choyce and rare" fruits of long ago, instead of the comparatively "heavy croppers" of to-day.

ANGRÆCUM INFUNDIBULARE, Lindl. (see Supplementary Illustration).—Our illustration represents a flower of this remarkable species, for which the Right Hon. Lord ROTHSCHILD (gr., Mr. ARTHUR DYE), was awarded a First-class Certificate at the Royal Horticultural Society, July 26, and which was duly recorded and described in the *Gardeners' Chronicle*, July 30, p. 82. The plant was originally discovered by BARTER many years ago on Prince's Island, West Africa, but never introduced into cultivation until it was again found by Major H. B. RATTRAY, then of the King's African Rifles, on the Victoria Nyanza, Uganda, in 1892. The discoverer likened its fragrant flower to "an Arum Lily with a green, funnel-shaped spur and curved slender tail," and the rough description is not inapt. The broad labellum of the flower is pure white, the spur is pale green, and the more slender tail duller green. The manner in which the slender spur is curved over one of the adjacent roots is suggestive of its being a provision to steady the heavy, slender-stalked flower, and facilitate its fertilisation by the agency of

some large insect. It requires to be grown in a warm, moist, and tolerably shady house. It appears to be very free-growing. A good specimen of it is in the collection of Sir TREVOR LAWRENCE, Bart. (gr., Mr. W. H. WHITE), but although obtained six months earlier than the Tring Park plant, it has not yet bloomed.

SIR TREVOR LAWRENCE.—By an oversight we omitted to mention that the excellent portrait of Sir TREVOR LAWRENCE which we gave in our number for July 30, in connection with the opening of the new Hall in Vincent Square, was taken from a photograph executed, like the others that we gave on that occasion, by Messrs. FRADELLE & YOUNG, of Regent Street.

BRITISH GARDENERS' ASSOCIATION.—We are asked to publish the following reminder: Kindly allow me to remind readers of the *Gardeners' Chronicle* who are interested in the British Gardeners' Association that the Committee of Selection cannot proceed further until the sum of £250 has been secured to meet the cost of a central office in London, a paid secretary, and other expenses, and till 500 gardeners have joined the Association. Of the £250 required, about £100 has been subscribed and promised, whilst the number of applications for membership up to the present is fewer than it should be. Expenses so far have been more than covered by donations received for the purpose; we are therefore in a position to keep donations towards the £250 and entrance-fees and annual subscriptions untouched until the Association is established on the lines prescribed by the prospectus. Forms of application and copies of the prospectus may be obtained from me. Candidates should send copies of their testimonials, or a stamped addressed envelope if originals are sent. Entrance-fees and subscriptions will be returned to candidates who are not elected. Secretaries of gardeners' societies are invited to co-operate with us in the effort to establish an association of professional gardeners by inducing their members to join it, and by holding meetings for the purpose of making its aims and objects known. Arrangements will be made by the Committee for a series of meetings in various centres for the purpose of more fully explaining the objects of the Association and increasing the membership. It is hoped that the Association will be brought up for discussion by every gardeners' society throughout the kingdom during the coming winter. It is only by the exercise of patience and perseverance, and a determination on the part of all qualified gardeners to combine, that the desired improvement in their condition can be brought about. W. Watson, Kew Road, Kew.

NEPENTHES MASTERSIANA.—Messrs. JAS. VEITCH & SONS send us a specimen showing two leaves fused into one at the base, each bearing a pitcher at the extremity. The union was complete to about the middle, so that the appearance was as if one leaf had divided into two tendrils with their pitchers.

SWEET PEAS.—We lately received from Mr. M. CUTHBERTSON, of Rothesay, a box of cut flowers of Sweet Peas of the leading varieties. Among the whites were Duchess of Westminster (flushed with rose), Lady Ormsby Gore, Maid of Honour. Pink colours were represented by Chancellor, Colonist, and Prince of Wales (deep rose), Mrs. Dngdale, Miss Willmott. Coccinea is a splendid red; Duke of Westminster (purple), Mars (scarlet), Navy Blue (blue), &c. The colours were finer than we are accustomed to see inland.

POISON—CAUTION.—For selling a bottle of XL-All Ant Destroyer, containing sufficient nicotine to kill from 75 to 150 persons, a City firm of ironmongers has been fined by the Lord Mayor of London. The bottle was not labelled poison,

the vendor was not known to the purchaser, nor was any entry made in a poison register. Mr. DOBBS, for the defence, raised the point that the compound was not a poison within the meaning of the Pharmacy Act, because it was intended to be used for horticultural purposes, and not as a medicine. It is much to be desired that all poisonous substances or compounds, by whomsoever sold, and for whatever purposes intended, should be labelled "Poison."

ACORUS CALAMUS AS AN INSECTICIDE.—The Sweet Flag (*Acorus calamus*) has been lately turned to a new use. Mr. H. N. RIDLEY, in the *Agricultural Bulletin of the Straits and Federated Malay States*, mentions that the Malays often cultivate the plant for medicinal purposes. The *Acorus* is aquatic, and bears sword-like leaves about 3 feet long, and a creeping stem. This aromatic plant, he says, is used by the Malays as follows:—"The dried roots are pounded to powder, and spread round the base of a tree. All the ants die where it is scattered, and no others come up to the surface to replace them, as in the case of other insecticides. The experiment was tried for ten days and found to be efficacious. The plant is so common and so easily grown in any wet ditch that it may be well worth trying it further." It seems as though troublesome termites might be thus kept under in various tropical and semi-tropical localities.

THE BIG GOOSEBERRY SEASON.—The champion Gooseberry at the Harborne Gooseberry show weighed 26 dwts. 5 grs. The heaviest in our records is London (37 dwts. 7 grs.), shown at Cheddle by Mr. JOHN FLOWER, in 1852.

CARDIFF GARDENERS AT READING.—About sixty members of the Cardiff Gardeners' Association visited Reading lately, and were shown over Messrs. SUTTON's Royal seed establishment. On arrival at Reading at 10 o'clock the party was met by Mr. ARTHUR SUTTON, one of the partners, and escorted to the Market Place, where they inspected the various indoor departments. Subsequently they were conveyed by electric car to the seed trial grounds, where luncheon was served. After visiting the conservatories, the party went up the river in a launch to Henley-on-Thames, and went over the gardens of Park Place, Mrs. NOBLE providing tea.

THE ANGLESEY SALES.—The principal feature of interest (says the *Liverpool Mercury*) in the pleasure gardens was a group of Japanese dwarf trees. The idea was generally entertained that phenomenal prices would be obtained for these oddities, and it was with something of a shock that people found them going for sums ranging from 15s. to £8. Major HUGHES, of Plas Llangoed, was the largest buyer, securing a Bamboo for 15s.; a *Punica granatum*, fifty-six years old, for 75s.; an *Acer palmatum*, fifty-four years old, for £6 15s.; and a forest Maple, sixty years old, for £8. Dr. WOODHOUSE, of Llandudno, secured all the patriarchs of the group, paying 70s. for a 150-year-old *Cycas revoluta*; £6 for a *Thuja obtusa*, 131 years old; and £6 for a 166-year-old *Lagerstroemia*. A *Carpinus japonica*, fifty-one years old, went to Mr. HODGKINSON for £5 15s. A double-flowering Cherry was secured by Mrs. HUGHES HUNTER, of Plas Coch, for 5 guineas. Colonel PLATT bought a 126-year-old *Thuja obtusa* for £6 15s., and a *Podocarpus chinensis* for £6. Major TURNER spent 42s. 6d. on a 42-year-old *Nandina domestica*, and Mr. LORT secured a 50-year-old Oak for £6 15s. 6d., the total for the dwarfs being £76 8s., which is said to be quite as much as the Marquis paid for them. The contents of the Marquis of ANGLESEY's kitchen garden, unsold on Tuesday, were disposed of on the 11th inst., the total proceeds being under £50. The only feature of

interest in the sale was a collection of Orchids, and these went at a literally ruinous sacrifice. For example, a lot of fifteen *Oncidiums* were knocked down to Mr. GRIFFIN, of Haydock, for 5s. The same purchaser secured eight *Zygopetalums* for 5s., and a group of six *Maxillarias* for 5s. A pot of *Cattleyas* and two pots of *Lælia* were sold for 5s. A hanging basket of *Stanhoepia* and a pot of the same went for 4s. Three pots of *Lycaste* realised 3s. A pot of *Cœlogyne* and another of *Cymbidium* went for 5s., twenty-four *Cypripedium* for 2s., and eight *Calanthes* for 9s. A keen fight between two bidders resulted in Mr. SPEED, of Bangor, securing twelve large *Dendrobiums* for 40s.

STOCK-TAKING: JULY.—The Trade and Navigation Returns for the month of July have a story to tell the reverse of that recorded for June. We have dropped the rise both of imports and exports for the month, but show an increase in the total for the seven months which have passed away. The value of the imports of foreign and colonial produce of all descriptions is placed at £40,956,601 as against £45,653,320 for the same period last year—a decrease of £4,696,719. It is affirmed that the purchasing power of the masses is affected by the taxation of articles of food. The total imports for the past seven months are valued at £312,893,391, as compared with £306,086,900 for the same period last year, showing a gain of £6,806,491.

IMPORTS.	1903.	1904.	Difference.
	£	£	
Articles of food and drink—duty free	10,268,913	9,282,435	—986,478
Articles of food & drink—dutiable	11,131,149	8,584,739	—2,546,419
All other imports...	24,253,258	23,089,436	—1,163,822

The value of the month's importations of flowers was £2,884, against £3736 in July, 1903, or a decrease of £852.

IMPORTS.	1903.	1904.	Difference.
	Cwt.	Cwt.	Cwt.
Fruits, raw—			
Apples	80,147	82,076	+1,929
Apricots and Peaches	5,810	8,636	+2,826
Bananas ... bunches	270,107	394,366	+124,259
Cherries	46,684	76,765	+30,081

Potatoescwt.	1,047,235	1,008,102	—39,133
Tomatoes	227,361	235,824	+8,463

It will doubtless be interesting to note that of dried fruit we imported last month to the value of £28,846, against £13,637 for the same period last year, or an increase of £15,209.

THE EXPORTS

for the month were valued at £24,783,582, against £25,875,545, a decline of some £1,091,963. For the period of seven months—January to July—the figures are £168,900,249, against £168,398,170—or a gain of £502,079. Among the exports for the past month may be noted that of fruit, preserved and otherwise—£61,483, against £56,426 for the same period last year—an increase of £5,057.

PETUNIAS.—Summer bedding plants have not in many cases been up to the usual standard this season, owing to the dry conditions which prevailed when planting was over, many of the plants making but little growth and failing to furnish the beds. Petunias, on the other hand, have flourished well, the season suiting them admirably, and they have made excellent growth and flowered plentifully. Some flowers of *Petunia* have been sent us by Messrs. JAMES CARTER & Co., High Holborn, London, measuring quite 6 inches across, and of excellent shades of colour. They are known as the Empress Petunias, the strain showing results of careful and judicious selection.

POTATO NORTHERN STAR.—Messrs. BRADLEY BROTHERS, of Bardney, Lincolnshire, have received the following from Houghton, in Australia:—"We dug the crop of the first consignment of Northern Star Potato we purchased from you, and the yield has more than exceeded our expectations; 140 lb. were lifted for every pound of sets planted, and the sale of them is proving satisfactory." The above refers to a consignment sent by Messrs. BRADLEY in December, 1903, and the same Australian firm have asked for a quotation from Messrs. BRADLEY for a considerable quantity this year.

"AMERICAN FRUITS."—This is the title of a new monthly "International journal for nurserymen, growers, dealers, and shippers of fruits of all kinds, circulating in the United States and Canada, and in foreign countries." As "*American Fruits*" is declared to be the highest grade of horticultural publication issued from any press in any country, it is obviously unnecessary for us to say anything in its favour. We notice a portrait of, and note on, the career of Mr. W. T. MACOUN, who has charge of the Botanic Garden, Ottawa, as well as of the central experimental farm. He is the son of the Dominion botanist well-known in botanical circles in this country.

GARDENERS AT CRICKET.—The Royal Gardens, Kew, Cricket Club journeyed to St. Albans on Saturday, the 13th, and succeeded in defeating the Anguloa C. C. (Messrs. SANDER & SON) by twenty-two runs. The visitors greatly enjoyed their outing, being shown round the nursery after the match, and entertained at an excellent high tea provided by Mr. SANDER. The Royal Gardens C. C. is having a very enjoyable and fairly successful season, their heaviest defeat as yet being inflicted by Messrs. ROCHFORD, with whom, however, the Kewites are not without hopes of being able to cry quits after an encounter at Kew on Saturday, 27th inst.

A FORECAST OF THE SEED CROPS.

It is now possible to give some particulars as to the probable yield of the seed crops in the coming season; the information supplied is based upon a personal survey of the crops in the principal seed-growing districts of this country, and upon reliable advices from abroad.

Peas.—It is a remarkable fact that about July 20 in last year many of the early varieties of Peas were still producing bloom; but at the corresponding period in 1904 the early varieties were being pulled for harvesting—so much do the weather and seasons change and affect produce. In reference to the prospect of the crop of seed for the present year, it is only a reasonable expectation that after the very wet season of last year the condition of stock-seeds would be so indifferent that the growth of the plants would be correspondingly inferior, the result being that the present season's harvest is likely to be a very thin one. Another factor as governing the scarcity was the fact that the

price fetched by Peas last season was so high as to be a great inducement to sell what would otherwise have been sown, and so the breadths put out are smaller than usual. It seems quite certain that seed Peas will gradually rise in value, and some sorts will be as dear as last year. This remark applies particularly to the late varieties, especially as it is anticipated that none will be forthcoming from the Continent; the crops saved in New Zealand are also reported to be very short. In Canada seed Peas for stock were sown a month later than usual on account of the inclement weather, but it is too early to speculate as to the probable yield of seed in the Canadian Pea-districts.

Broad Beans.—The crops in Lincolnshire and in the adjacent Bean-growing districts are seriously affected by the black or smother-fly; its ravages are affecting both the size of the pod and the Beans within it, though it is probable, given the continuance of fine weather, the samples will be good.

Beans, Kidney, Runner and Dwarf.—Generally speaking, the breadths and plants are thin, and in certain localities, where there have been experienced recent rains, the flowers are now setting their pods more numerous than previously. Reports from Germany which came to hand a short time ago stated that the crops of Beans had been injured by frost. Subsequent reports are of a more favourable character.

Turnips, White and Swedish.—So extremely short is the yield, that it is said the crop may be written off as practically nil. The main cause of this extreme scarcity is the wet character of the autumn, which prevented stock seeds from being sown. In certain districts, where some growers are more fortunate in the character of the soil and could sow, the soddened and cold character of the ground resulting from the rains which followed prevented the plants from thriving as well as could be desired, and in the case of Swedes in particular, what plants survived were seriously affected by canker. It is confidently expected that prices for the best qualities of seeds will be very high.

Mangel Wurzel.—Fine drying weather, with wind and sun, had the effect of hardening the surface of the soil to such an extent that the plants did not thrive in a satisfactory manner, and thus the yield of seed has been materially affected. Better results are anticipated from some parts of Essex, but the black-fly has infested many crops, and it is anticipated that Golden Tankard and Golden Globe, with other forms of the choicer stocks of Globes, will command double the prices of last year.

Cabbages.—Varieties chiefly grown for cutting in spring, such as the Offenham, Ellam's Early, and Wheeler's Imperial, have run to bloom in a very imperfect manner; and the plants are small, owing to the continued wet weather, therefore seeds of these varieties will be scarce. In more favourable localities, where there is an improved growth, the crop appears to be satisfactory.

Onion.—The Onion-plant for seed is not so plentiful as last year, and bulbs for planting for seeds another year appear to be scarce and small. It is assumed that the plantations made for seeds in 1905 will be as limited as those in 1904.

Carrot.—The seed crop in this country so far looks well. From France comes the report there is great danger to the Carrot crop from the small white maggot which appears in the flower-heads and practically destroys the crop. It is a pest which is found difficult to grapple with.

Lettuce.—Very little Lettuce-seed is now grown in this country for seed-saving. In the Lettuce-growing districts of France and Germany the crops are favourable, and it is anticipated a fair yield will be forthcoming.

Cress.—Average breadths of Cress were sown, and it is expected there will be both a good yield and good samples.

Mustard.—Seeds are plentiful and cheap, and samples good.

Parsley.—Good breadths are out for seed purposes, and so far the crops promise very well.

Home-grown Flower Seeds.—Nasturtium: Seeds of Nasturtium were scarce last year, but this season promises a good crop. Sweet Peas are also promising well. Wallflowers: All promise well except the yellow section, of which there is a likelihood of a scarcity. That fine selection of the dark known as Vulcan has become very popular.

Potatos.—Great breadths were planted, but they do not appear to be so uniform in growth as is generally the case, and blank spots are visible. In the Potato-growing districts it is thought improbable that high-priced varieties, like El Dorado and Northern Star, will give such results as are anticipated from the high prices of the seed. Many rivals to these varieties are being announced. *Pisum*.

FIG. 55.—*HUERNIA OCULATA*.
Flowers purple with a white centre.

HUERNIA OCULATA.

This interesting little plant was first introduced in 1880 through Captain Een from Damara-land to Kew, where it flowered in June of the same year. It was published in the *Botanical Magazine*, t. 6658, in 1882, but seems to have been lost.

In 1901 Mr. Dinter sent living specimens of the plant from Windhoek to Messrs. Haage & Schmidt, Erfurt, and to this garden. It has since been well established, is easily propagated, and new flowers annually from August to October.

The stems in our plants are shorter and the flowers more numerous than those in the figure in the *Botanical Magazine*, while the flowers appear just above the soil.

The stems are five-angled, the angles being flat and compressed, and the sinus between them is deeply cut. They are of a dull, glaucous green colour, overwashed with brownish spots. The teeth of the angles are patent, triangular, decurrent at the base, with a very faintly articulated acute point representing the very rudimentary leaflet.

There are about six flowers produced on a short, thick peduncle thrown a little above the

soil. Several subulate bracts are present. The pedicels are short, 2 to 3 lines in length. The segments of the calyx arising from a narrow lanceolate base are subulate, and as long as the tube of the corolla. Corolla campanulate, $\frac{3}{4}$ of an inch broad, the five larger lobes short, triangular, with five nerves at the back; the intermediate five are minute. The colour of the corolla is greenish outside with rose at the base, and having brown stripes at the lobes, the whole being finely tuberculate or papillate. The inside of the tube is also finely papillate. The limb is dark brown-purple, velvety, and sharply defined from the pure white of the tube, the base of the tube and the column being spotted with fine pink markings.

The outer corolla in our plants is nearly quite adnate to the column, the lobes and the sinus between them are only faintly indicated, quite different to the figure in the *Botanical Magazine*, whilst the rest agrees with it. Despite these slight differences I have no doubt that my plant belongs to the Hookerian species. Mr. Dinter named it *H. Bernsmanniana*, under which name it appeared in Haage and Schmidt's catalogue. Although a native of South-west Africa, its nearest allies are the *H. Penzigi*, N.E.Br., from Abyssinia, and *H. coccinea*, N.E.Br., from Somaliland, all characterised by the campanulate flowers without fleshy limb, and the short conical segments of the inner corolla. *Alwin Berger, La Mortola*.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

COLOURING OF FRUIT.—The question of the colouring of Apples and other fruit is one of importance, and demands the attention of growers. There are several reasons why they should consider the matter. First of all, fruit badly coloured is always flat and insipid in flavour when compared with that of well-coloured fruit. Their market value is lowered, for fruit badly coloured never sells so well as that with a rosy cheek. To a great extent the colouring rests in the hands of the cultivator. True, he cannot produce sun and air, but he can give the fruit every facility to catch what there is of either by giving attention to the trees in the right way and at the right time. It is not the man who with saw and billhook proceeds to cut and maim the trees in winter who produces next year's crop of well-ripened, delicious fruit, but he who takes care how he plants, and if the subsoil is not genial takes care that no tap-roots have a chance of penetrating to it; one who through the summer months prevents the centre of the tree from being crowded with useless growth that has only to be cut away in winter. I am aware there is much to do in summer, but a little extra labour now will be well repaid in the following season, not only in the quantity but in the quality of the fruit. Care should also be taken in the gathering of the fruit. In the case of market fruit we should learn from importers and others the value of selection and good packing if we wish to compete with imported fruit. I am quite sure that by judicious attention to summer pruning we may materially improve both the quality and the quantity of home-grown fruit. *D. D., July 28, 1904.*

CALYX PIERCED BY BEES.—During the last few days I have noticed that although our Kidney Beans are in full bloom, and are being visited by thousands of bees, the yield of Beans is very poor. On one stalk, out of twenty-three blooms only one has succeeded in forming its fruit. Being curious to know the why and wherefore, I watched. My father attributed it to lack of moisture; but this is not the case. The fact is, the visits of the bees are useless in the majority of cases. Instead of the bees pitching on the stem and moving the curled keel away to reach the entrance to the nectary, the insects have found an easier way. They work round the ventral side of the flower, and extract the nectar by means of two holes which are pierced through the calyx-

Cube into the nectary. In some cases the short sepals on the ventral side has been torn away, and one large hole made. Whether the bees actually do this I am unable to say, but there are certain small insects in many flowers which might possibly help at the work. In any case, the bee obtains the nectar without doing the necessary labour. The Kidney Bean should be carefully watched, and notice taken of the means it uses to prevent such abortive visits. I should like to know whether this is common, and also whether it has been observed before. *Charles Langton Lewis, Plymouth Road, Penarth.* [Quite a common occurrence. Ed.].

FLOWERING BAMBOOS.—With regard to Mr. J. Mayne's note on p. 116 upon flowering Bamboos, I may say that there is a number of *Phyllostachys Henonis* in these gardens. I observe that all plants of *P. Henonis* which were transplanted from the open ground with a good ball of soil have fruited this season, and are unfortunately dead, or nearly so. I have also noticed that where established plants have been overhung by trees, and have been comparatively starved, they also have fruited. Other established plants which were in a better position have thrown a few fruiting culms, which were at once cut out. Plants turned out of pots with the culms intact are thriving, and in only one instance can I see a culm of this year's growth flowering. It is evident that the plants in these gardens that are flowering so freely are those that have received a check by transplanting or have been overhung by trees. I am afraid Mr. Mayne will lose those Bamboos where all the culms are flowering. *J. W. Miles, Mandeville House, Isleworth.*

— In answer to Mr. Rashleigh's note, p. 116, I may say that I have this year seen *Phyllostachys Castillonis* in flower in three gardens, as well as *P. Boryana*, *P. Henonis*, and *Arundinaria Simoni*. Early in the spring I heard from a friend that his specimens of *P. Henonis* were flowering, and shortly afterwards closely inspected some particularly fine examples in Cornwall, but could detect no sign of flower. During the past week, however, on again visiting the same garden, I found that the majority were seeding, some on every culm. Last month in a Devon garden, where a plantation of Bamboos was made in May, 1903, I found that four out of eight clumps of *P. Henonis* were seeding. Three of these were small plants about 6 feet in height and were bearing seed on every culm. The largest, 14 feet in height, had only one flowering culm, which was cut out, so that unless it produces seed on the at present flowerless culms, it should not suffer. It was stated some time back in these columns that *Arundinaria Simoni* did not die after seeding, but plants that seeded last year have every appearance, up to the present, of being dead. Of two large clumps that seeded last summer, one has been untouched and the other cut down, but neither has shown the slightest sign of life up to this date. In Cornwall a very large clump of this Bamboo was cut down last year while in full flower. This clump almost immediately threw up a host of small shoots ranging in height from 1 foot to 4 feet, all of which seeded, and the plant is now apparently quite dead. A short time ago I was looking at a clump of *Arundinaria Simoni* that seeded last year, and the owner pointed out that it was not dead, as here and there a green leaf was visible. On examining these, however, we found undeveloped flower-buds immediately beneath them. From what I have seen up to the present, I have serious doubts of this Bamboo recovering when it has seeded on every culm. When at Fota at the end of May, numbers of fine specimens of *Arundinaria Falconeri* on the island were flowering, but the Bamboo grown there under the name of *A. nobilis* showed no sign of flower. *S. W. Fitzherbert.*

ALTHÆA FICIFOLIA.—A specimen of this plant has been cultivated in my garden for the last ten years. Last year I saw that there were red instead of yellow flowers on the plant; but as, according to Schkuhr, *Bot. Handbuch*, the plant sometimes produces flowers of a dark red colour instead of yellow, I took no particular notice, as the characteristic digitate leaves were present. This specimen is now flowering again, and is now nothing

else but *A. rosea*, the well-known Hollyhock. The flowers are rose not red coloured. I have no other Hollyhocks in my garden. *M. Buysman, Middelburg, Holland.*

ABNORMAL PHYLLOTAXIS OF ASH.—I send a photograph of a leader shoot of the common Ash (*Fraxinus excelsior*), which shows a $\frac{3}{8}$ spiral arrangement of the leaves instead of the normal opposite and decussate one. The shoot is one of four showing the same arrangement which I found in January last on the banks of the river Boyne, 2 miles or thereby below the town

FIG. 55.—ALTERNATE LEAVES IN THE COMMON ASH.

of Navan, in the county of Meath, Ireland. The plants from which the shoots were produced were growing in a clump of several hundreds, but I did not observe any of the others to have any but the normal arrangement. The plants were from 8 to 10 feet in height, and the strongest of the previous year's leader shoots showed growths of from 4 to 5 feet in length, the abnormal ones in no way differing from the others in this respect. Although abnormalities of the leaf arrangement are sometimes seen in the short, stunted shoots of old Ash trees, this is the first instance of the sort which has come under my observation in the case of young trees. *A. D. Richardson, Edinburgh.*

"GROWTH AND REPRODUCTION."—It comes as a sort of corollary to the opinions put forward by Professor Henslow on the effects of sowing large seeds for reproductive purposes, that it should recently have been urged that one reason for deterioration in Potatoes is due to the common practice of planting comparatively small tubers, or portions of large ones, in preference to whole large ones. That whole Potatoes do, as a rule, give better results than portions, is universally

admitted; the question as to the effect on the constitution of any variety of Potato, by continually planting the smaller rather than the larger tubers, seems not to have been determined. Doubtless the planting of small tubers ranging from 2 to 3 ounces, or the cutting up large ones into small portions, is practised chiefly as a matter of economy. The larger tubers can be sold profitably or consumed, but the smaller ones have except for planting purposes no material commercial value. It is worthy of note, as bearing on this subject, that very fine bulbs of Onions, or roots of Carrots, Parsnips, Beets, or similar products, when allowed to produce seed, invariably reproduce finer progeny than do those of lesser dimensions. Those growers who seek to improve Peas or Beans by selection solely, mark and save for seed the finest pods. It is matter for careful observation, needing to be continued over several years, to ascertain how far a stock may deteriorate or improve if every year small tubers only be planted in one case, and large tubers in the other. There is no need for experiment to show the evil effects of bad winter storage of tubers. That has done Potato stocks immense harm in the past, and will continue to do great harm so long as growers persist in doing what is so unwise and unnatural. Then, allied to this question of experimenting on the results of planting year after year large and small tubers, there is another point of exceeding interest that applies largely to seed-producing as well as to tuber-producing vegetables, and that is—what effects do change of soil and variations of climate produce? The subject opens up an almost illimitable range for experimenting, and there should be no better place in the kingdom for such work than the Wisley garden, with its fresh soil, clear, free air, and ample space. But the whole thing, which has greater value for horticulture than even the testing of new varieties of vegetables each year, needs to be done under the most continuous and careful supervision, both of scientific and of practical horticulturists. *A. Dean.*

GRADUS PEA.—When I wrote about Gradus Pea, I did not wish to institute a comparison with growers in favourable districts for early cropping of Peas. We cannot obtain Peas fit for use, so far as I know, in this part of England, before the last week in June, therefore your Essex correspondent will understand that I do not mean the precise date that they are fit, but the number of weeks that elapse between sowing the seed and gathering the pods. I gathered Peas on June 24, 1903, sown outdoors, and this year I was a week later, although I sowed a week earlier. To prove how quickly Gradus develops, I will give an illustration. I was told on May 28, that a large house party would be staying here about the first week in August, so on May 31 I sowed extra rows of Gradus, and on August 2 (nine weeks) I gathered a peck of full pods. My remarks did not refer to Peas sown under glass. I use Chelsea Gem for that purpose, which after planting out are covered with mats or bags. *J. G. Wilson, Chevel Park Gardens, Wakefield.*

— I have read with interest the articles on Gradus Pea, but with me Sutton's Giant came to perfection sooner than Gradus, as the latter, sown on March 15, was gathered on June 25, whereas Sutton's Giant, sown on March 23, was gathered on June 23, being about ten days less time than Gradus. Both varieties carried good crops of Peas, especially Sutton's Giant. Now that this interesting question on Peas has been raised, I should like growers to state their opinions on the merits of tall and short Peas, and whether the short varieties give such heavy and continuous crops as the taller kinds. *Devonian No. 2.*

THE CONGO FLORA.—We have received the second fascicle of a work entitled *Études de Systématique et de Géographie Botaniques sur la Flore du Bas et du Moyen Congo*. It contains 131 pages of descriptive text, and seventeen quarto plates. The botanical details are supplied by M. DE WILDEMAN, and the plates are executed by M. Menger. About seventy Orchids are catalogued, comprising several new species. The publication will be of great value to botanists.

FRUIT RETURNS FOR 1903.

THE official statistics of the Board of Agriculture for the year 1903 are interesting to all concerned with stocks and crops. As regards fruit-growing, the acreage of small fruits and of orchards is tabulated according to each county, so that the principal fruit-growing areas are seen at a glance.

The six counties showing the largest areas under cultivation are as follows, the figures representing acres:—

	Small fruits.	Orchards.
Kent	22,447	28,046
Hereford	746	27,604
Devon	1,414	27,214
Somerset	584	25,055
Worcester	4,294	22,072
Gloucester	1,590	20,324

The total area for England under small fruit is returned as 68,968 acres and 233,286 acres under orchards.

The Welsh totals are 1,230 acres of small fruits, and 3,748 for orchards.

Scotland claims 5,954 acres of small fruit and 2,449 of orchards, and the total for Great Britain is 76,152 of small fruit and 239,483 acres of orchards.

In addition to home-grown fruit, our markets are well supplied with produce from the colonies and from foreign countries, Apples being in greatest bulk and the United States our largest contributors, sending over 2,381,619 cwt. from a total (for foreign countries) of 2,828,328 cwt.

Still more important supplies come from British possessions. Australia sends 185,893 cwt. of Apples in all, of which 29,373 cwt. are from Victoria, 11,842 from South Australia, and 144,678 from Tasmania.

Canada contributes 1,545,455 cwt., the Channel Islands 9,861—all British possessions together sending in a total of 1,741,218 cwt. of Apples, and foreign and British (imported) sources together a grand total of 4,569,546 cwt.

AERIDES CRISPUM.

WE are pleased to be enabled to give an illustration (fig. 56) of a fine specimen of *Aerides crispum*, taken from a photograph of one which recently flowered with H. R. East, Esq., Sompting Abbots, Worthing, and Coorg, India, from which latter place the plant was doubtless imported.

That so beautiful an Orchid, once one of the reigning favourites in Orchid collections, and one of the most effective at exhibitions many years ago, should be slighted by Orchid collectors in our times, tells pointedly of the influence of fashion in flowers, and of the fickleness of those who are swayed by it. Whether a plant is a favourite or not does not affect the question of its beauty; although it practically rules the market value. A note of some of the prices realised at the sale of Mr. Cox's Orchids, in the *Gardeners' Chronicle*, July 10, 1847, p. 455, records that the plants of *Aerides crispum* then brought from £16 to £21 each; to-day probably they would not fetch so many shillings.

Aerides crispum has a wide range of habitat, generally at high elevations on the Western Ghats, India, and consequently there is some variation both in the habit of the plant and the quality of its flowers. The plant flowering with Mr. East, by its longer, narrower leaves, and large flowers, seems to be of the variety known as *Lindleyanum*. The species was first discovered by Wallich in Southern India, and flowered for the first time in 1841 in the gardens of Sir Richard Brooke, at Norton Priory, Cheshire, being then named *Aerides Brookei*. A more slender form is known as *A. crispum* Warneri.

Aerides of this class are not generally successfully grown in gardens; the chief reason of failure consists in their being kept too warm and

moist during the winter season, and not being allowed a proportionately cooler resting season at that time. Generally speaking these Indian *Aerides* would pass the winter in a cool-house or vinery better than in the Orchid-house. In spring they should be removed to warmer and more moist growing quarters, and kept growing until the resting season comes round again. The flowers, which are very fragrant, have the sepals and petals white, tinged with rose-purple at the back and tips of the segments. The base of the lip is white striped with purple, the front lobe amethyst-purple. It lasts a considerable time in bloom.

Cucumber-formed Melon.—Mr. ODELL also exhibited a variety of Melon with the form of a large Cucumber. The form comes true by self-pollination.

Watsonia with aerial corms.—Mr. Chittenden showed stems bearing axillary corms similar to the bulbils normally occurring on bulbiferous Lilies.

Bamboo flowering.—Mr. Bowles showed a flowering spray of *Phyllostachys Boryana* of a remarkably elegant character, being superior in this respect to many of the other Bamboos.

Plantains with foliaceous bracts.—Mr. Bowles also showed specimens of *Plantago major* and *media* in this not rare condition. They come true by seed. He also brought leaves and a flowering spike

FIG. 56.—AERIDES CRISPUM.

SOCIETIES.

ROYAL HORTICULTURAL.
Scientific Committee.

AUGUST 9.—*Present*: Dr. M. T. Masters, F.R.S., in the chair; Messrs. Odell, Chittenden, Saunders, Douglas, and Bowles; Revs. W. Wilks and G. Henslow, Hon. Sec.

Datisca cannabina, *Parthenogenesis in.*—Mr. ODELL showed female flowering branches with swelling ovaries; but as the pistil is protogynous, and the only male plant grew at a distance of a hundred yards, the fruit was apparently forming without fertilisation.

Proliferous Clover.—Mr. Odell also showed specimens of this not uncommon monstrosity, in which the carpels are virescent, the carpellary leaves being both simple and trifoliate.

of *P. maxima* from Greece of an almost gigantic size.

Apples Falling.—Mr. Dunlop, of Loughgall, writes as follows:—"With regard to the great 'dropping' of Apples, some kinds were very heavily 'set,' but very few remain, especially Royal Jubilee, which hitherto always sets well. Other kinds have fallen elsewhere, e.g., Lord Derby, but it is good here. The 'Queen' has also gone terribly, but that is their habit. It was noticed that bees were very scarce in the brightest days; would that have anything to do with the Apples falling off? Is there any list known of self-fertile Apples in this country? Is it true that some sorts fertile in one season might yet be sterile in another?" In reply to these questions Mr. Chittenden observed that from his experiments with both Apples and Pears, as a general rule they require to be fertilised by insects; but Stirling Castle, though usually self-fertile, was not so this year. With regard to

Pears it was the same, but Conference and Durondeau are both self-fertile. As the Apples referred to as dropping appeared to have been formed, it was thought that the great heat, acting upon heavy crops in an immature state, was the probable cause. It was not stated whether seeds were forming in the Apples or not.

White Melilot and Foxglove, produce of.—Mr. HENSLOW mentioned an instance of a seedling plant which accidentally appeared in his garden. It grew to a height of 5 feet, and bore some 300 racemes of various lengths. These were arranged into seven groups according to length, and the average number of the one-seeded pods in each group was ascertained by counting them on some half-dozen or more racemes taken at random. The total number of seeds was thus found to be about 15,660. Each plant required an area of 3 square feet, as the longest branches spread over a circle with a diameter of 2 feet; so that this one plant would have supplied enough seed for 1 acre and 380 square yards. In the case of a gigantic plant of a Foxglove, the number of seeds was approximately a million and a half.

TAUNTON DEANE HORTICULTURAL.

AUGUST 11.—The thirty-seventh annual show of this Society, held on this date, is said to have been the most successful ever held. Probably two dozen finer specimen plants in bloom have not been seen this season than those staged by Messrs. JAMES CYPHER & SON, of Cheltenham, and W. VAUSE, of Leamington, while in every other department of the show quality ranked high. A large tent was filled with the produce of cottage gardens.

The morning opened wet, but the weather improved before noon, and there was, as usual, an enormous attendance. It is obvious that, as the schedule of prizes contained 176 classes, requiring the services of twelve judges, only a few of the more salient points can be noticed.

Specimen Plants.—The class for twelve stove and greenhouse plants in flower brought three collections. Messrs. J. CYPHER & SON were placed 1st with three very fine *Staticea*, *Ixoras*, *Bougainvillea glabra* and *Sanderiana*, *Erica Maroccaniana*, &c. Mr. VAUSE came 2nd, with three large *Ericas*, *Ixoras*, *Allamandas*, *Bougainvillea*, &c. Mr. W. BROCK, Exeter (J. Rowland, gr.), was 3rd. With six specimens, Messrs. CYPHER and VAUSE were again 1st and 2nd. Mr. VAUSE was 1st with a group of plants arranged for effect; and Mr. BROCK was 2nd.

Some good flowering *Begonias* were staged by Miss HEALE, Taunton (W. Hayward, gr.). Single and double zonal *Pelargoniums* and *Fuchsias* were also shown; and two collections of six *Cockscombs*, which recalled the days when this old-fashioned flower was seen at its best.

Messrs. CYPHER & SONS took the 1st prize for four *Orchids*. They had the best new plant in a pale-coloured *Ixora*, and also the best new foliaged plant in *Croton Turnfordensis*. Several classes of specimen stove and greenhouse plants were shown. Foliage plants were also well shown in the open division. Ferns were also shown.

Hardy herbaceous and bulbous plants were numerous and in good character. Collections of Sweet Peas were numerous, especially in the class in which Mr. R. SYDENHAM offered special prizes. In the Amateurs' division the competition was equally keen.

Floral decorations were represented by some charming designs set up in two classes.

Fruit was of good character, though there were fewer collections than usual. With eight dishes Mr. J. W. FLEMING, Romsey (gr., J. Mitchell), was placed 1st with excellent Muscat of Alexandria and Madresfield Court Grapes, Peaches, Nectarines and Apricots, Figs, Apples and Melons; Lady ASHBURTON, Romsey (gr., J. Hall) was 2nd, also staging good fruit. With four dishes Lady ASHBURTON was 1st, and Col. SANDFORD, 2nd.

In the Amateurs' division very good stove and greenhouse plants were shown by Mr. W. BROCK and Col. SANDFORD, Mr. BROCK being placed 1st with twelve and six specimens, Col. SANDFORD taking the 1st prize with four. Mr. BROCK also had the best group arranged for effect. *Begonias*, Zonal *Pelargoniums*, *Fuchsias*, *Achimenes*, Ferns, *Coleus*, *Lilies*, *Caladiums*, *Cockscombs*, &c., were all shown in good character. In the open division, cut flowers were largely shown, and there was the best display of *Roses* seen here for a few years past. Mr. GEO. PRINCE, Oxford, was much to the fore, showing excellent blooms for the late period of the year. He was 1st for thirty-six and eighteen blooms, also for eighteen Teas, Messrs. J. JEFFERIES & SONS, Cirencester, taking the 2nd prizes in each class. Mr. PRINCE had excellent examples of Her Majesty, Frau Karl Druschki, Charles Lefebvre, Ulrich Brunner, Bessie Brown, Mildred Grant, Ben. Cant, and J. B. M. Camm. Show *Dahlias* in good character were staged by Mr. W. TRESEDER, Cardiff, who gained

the 1st prize for twelve blooms. Messrs. J. CRAY & SONS, Frome, were 1st with twelve Fancy *Dahlias*, also with six bunches of Single varieties and nine bunches of Pompons; Mr. W. TRESEDER coming 1st with six bunches of *Cactus* varieties, all being well shown.

Melons, Peaches, Nectarines, Apricots, dessert and culinary Apples, Pears, Plums (light and dark), Currants, and Gooseberries were all largely shown. Apples and Pears were somewhat undersized; purple Plums were in most instances small and unripe.

For *Vegetables*, in addition to special prizes offered by Messrs. Sutton & Sons and others, there were over thirty classes in which vegetables were shown by gardeners. The Vale of Taunton certainly favours the production of fine vegetables.

Trade exhibits of a miscellaneous character were numerous, and special awards were made to Mr. George Prince, for *Roses*; to Messrs. I. House & Son, Westbury-on-Trym, for *Phloxes*, *Delphiniums*, &c., a fine contribution; to Messrs. Blackmore & Langdon, Twerton, for *Begonias*; to Messrs. Kelway & Son, Langport, for *Gladioli*; to Messrs. Jarnan & Co., Chard, for cut flowers; to Mr. V. Slade, Taunton, for a group of *Roses*, and also for zonal *Pelargoniums*; to Mr. M. Fritchard, Christchurch, and J. H. White, Worcester, for hardy flowers; to Messrs. R. T. Veitch & Son, Exeter, for plants and cut flowers of a varied and interesting character; to Messrs. Child & Herbert, Acorns Green, for *Carnations* and *Picotees*; to Mr. W. B. Smale, Torquay, for *Dahlias* and other subjects; to Mr. W. Treseder, Cardiff, for *Cactus Dahlias*; to Mr. W. L. Pattinson, for *Violas*, &c.

BISHOPS STORTFORD HORTICULTURAL.

THE thirty-fifth annual show was held at The Grange, the seat of John Barker, Esq., amidst beautiful surroundings, and proved a great success.

For foliage plants, Col. ARCHER HOUBLON was 1st; Mr. GOLD 2nd; and the last-named was 1st for twelve plants, six foliage and six in bloom.

For groups of tuberous *Begonias*, a class that is of great interest in this district, Wm. SMITH, Esq., was 1st, having small plants but of splendid quality; Mrs. A. TAYLOR being 2nd.

Mr. JOHNSON was a good 1st for group of early *Chrysanthemums*; Mr. BARKER for *Fuchsias*.

The open class for twenty-four bunches of cut flowers was one that caused much interest, and the premier award was easily secured by Messrs. PAUL & SON, Cheshunt, they having splendid flowers; Mr. H. A. HARE was 2nd. For twelve bunches Mr. W. GEE was 1st; and Mr. G. GOLD 2nd.

In the classes for *Dahlias* Mr. BARKER was 1st for *Cactus*; and Messrs. GOLD, WATTS, and BARKER for *Pompons*.

Table decorations were a great feature; Miss H. M. CLAYDEN, Saffron Walden, being 1st; Miss A. F. HARWOOD 2nd.

Fruit was a special feature, and mostly of good quality. For a collection of fruit, Messrs. ARCHER HOUBLON and BARKER were the leading exhibitors, in the order named.

Vegetables made a grand display. For collection of twelve varieties, Mr. A. JEFFERIES was a good 1st; 2nd, Mr. J. BARKER.

The miscellaneous groups made a great display. That from Messrs. PAUL & SON was very telling.

Mr. MORTIMER, Farnham, had a magnificent collection of *Dahlias*, and received two First-class Certificates for new *Dahlias*.

Mr. JAS. DOUGLAS, Edenside, Bookham, received a First-class Certificate for a splendid *Carnation*, "Strongbow."

Messrs. BIRCH, Peterborough, had cut *Roses*; Messrs. RIVERS, Sawbridgeworth, a very fine lot of fruit-trees in pots; Messrs. RUSSELL, Richmond, staged a very choice group of foliage plants; Mr. PERRY, Winchmore Hill, herbaceous plants.

SHROPSHIRE HORTICULTURAL.

EXHIBITION AT SHREWSBURY.

AUGUST 17 & 18.

Wet Weather on the Opening Day.

Champion Grape Prize again awarded to Mr. Shingler.

SINCE the first exhibition was held under the auspices of this Society in 1875, increasing prosperity has followed the excellent management that has been practised. The Committee and its Secretaries, Messrs. H. W. Admitt and W. W. Naunton, soon learned that it would be impossible to hold successful exhibitions on a large scale in a country town like Shrewsbury, unless the means for providing the prizes could be obtained partly from a section of the public that is not specially interested in horticulture. The sports and high-class music that are provided each year in connection with the Shrewsbury Show are the means thus employed.

They are means rather than an end. The horticultural show is the chief object of the Shropshire Horticultural Society, and visitors to that show need have nothing to do with the "sports" unless they are so inclined, for they are held in a different part of the Quarry grounds. But such sports have an extraordinary amount of attraction for many people, and being held in conjunction with the flower show, they constitute such an event that thousands in the neighbouring counties, as well as in Shropshire, feel justified in making holiday in order to visit Shrewsbury. The attendance last year suffered on the second day from continuously wet weather. In 1902 the number of visitors was 75,000. The receipts last year were £983 19s. 9d. on the first day, and £1,357 on the second day. The entries this year amounted to nearly 3,000. The amount of prize money offered at the first exhibition in 1875 was £200, a very small sum compared with that awarded during the present week—£1,100. The event draws a very large number of professional gardeners to Shrewsbury, and on this occasion the number was larger than usual owing to an excursion from Scotland, which brought some to Shropshire who had never previously seen a Shrewsbury Show. The excursion, however, was not so popular as it was expected to be, the number coming by this means being little over a hundred.

The principal tents were lighted with electricity on the Tuesday night to enable exhibitors to continue their work during the night in cases where this was necessary.

There is, perhaps, no one circumstance capable to such a degree of marring a flower show held under the conditions of that at Shrewsbury, as wet weather. On the opening day rain began to fall as early as 5 o'clock in the morning, and it rained continuously until 1.30 P.M., increasing in degree.

When the judges commenced their duties at 10 o'clock there was a perfect deluge, and the rain being so heavy it found its way through the tents in countless places, wetting exhibitors, judges, and reporters indiscriminately, and blurring these notes as they were written.

The choice Grapes in the "Champion" class and the fruit generally suffered damage. As the plants and grass became saturated, there arose a mist in the tents that partly obscured the atmosphere. To attempt to move from one tent to another was almost the same as wading through the Thames would have been.

The attendance was much smaller than is usual on the opening day, but those people who did attend remained for the greater part of the time in the tents. There were nine tents, and the exhibition generally was as full and as good as ever.

FRUIT has been and still remains the most interesting feature at Shrewsbury, and the Grapes and hot-house fruits generally were capital, though in the special classes for Grapes in exhibits of two bunches there may have been rather fewer than on some previous occasions. Mr. Goodacre has again done exceedingly well, and the Champion Cup for Grapes has been won by Mr. Shingler, who also won it in 1902.

Messrs. JAS. CYPHER & SONS won the 1st prize for both groups of plants arranged for effect in the open classes. There were fine displays of cut flowers, including *Dahlias*, Sweet Peas, and most hardy species. Tuberous *Begonias* were grand, there being several honorary exhibits of these plants, as well as others in the competitive classes. The exhibits from members of the trade would have made a show in themselves.

VEGETABLES were as good as they are usually at Shrewsbury; no greater praise could be given them.

FRUIT.

TABLES ARRANGED AS FOR DESSERT.

The first class in the section for fruit was one for a dessert table, decorated with plants in pots, not exceeding 5 ins., cut flowers (Orchids excluded) and foliage. The tables measured 10 feet by 4 feet 6 ins. each. Not more than fifteen dishes of fruit were permitted, and exhibitors had to select these from a list published in the Society's schedule. Each table was covered with a white cloth, and the cut flowers, &c., were shown

in epergnes and vases, and as tracery. There were four exhibitors, and the 1st prize was gained by the Earl of HARRINGTON (gr., Mr. J. H. Goodacre), who had the best collection of sixteen dishes of fruit, and many other 1st prize exhibits.

The fruits shown by the Earl of HARRINGTON and the number of points awarded each dish will be seen in the following table:—

	Possible No. of Points.	Points awarded.
Apples	7	7
Figs	7	6½
Grapes (black)	10	7
" (white)	10	7
" (white)	11	7½
" (white)	10	7
Melons	8	7
"	8	7
Nectarines	8	6½
"	8	6
Peaches	8	6½
"	8	6
Pears	7	6
"	7	6
Plums	6	5½
Beauty of flower and foliage ...	8	6½
Harmonious blending of colour	10	8
General arrangement for effect	10	8

151 121

The varieties were as follows: Grapes, Muscat of Alexandria and Madresfield Court; Apple, Ribston Pippin (excellent); Pears, Williams' Bon Chrétien and Souvenir du Congrès; Nectarines, Pineapple and Elrue Plum, Transparent Gage, Peaches, Royal George and another; also very fine Figs and two Melons. The decorations consisted of Schizanthus and Bridal Wreath (*Franea ramosa*), arranged in trumpet-shaped glasses, with a little green Asparagus, &c.; 2nd, GRANVILLE FARQUHAR, Esq., Eastnor Castle (gr., Mr. Mullins), who was awarded 116 points, and had a very pretty exhibit of choice produce; 3rd, the Hon. MEYNELL-INGRAM, Temple Newsam (gr., Mr. Dawes), who obtained 95½ points; and 4th, Mr. F. NEED, Great Malvern (gr., Mr. J. Jones), who obtained 91½ points.

COLLECTIONS OF FRUIT.

There were six exhibits in the class for a collection of sixteen dishes of fruit in sixteen distinct varieties, not fewer than twelve kinds, not more than two varieties of a kind. Each exhibit was shown in a space of 8 feet by 4 feet 6 inches. The 1st prize consisted of £16, and the remaining five classes were allotted £36. Each exhibit was relieved with suitable decorations of cut flowers, &c., but these constituted another competition, for which prizes were awarded. The 1st prize was won by the Earl of HARRINGTON, Elvaston Castle, Derby (gr., Mr. J. H. Goodacre). Of Grapes he had very long, heavy bunches of Muscat of Alexandria, scarcely so well coloured as usual; Chasselas Napoleon, also rather green; Black Hamburg, and Madresfield Court. Both of these Black varieties were better finished. There were two excellent Melons, Here of Lookinge and Countess; Peach Royal George, Nectarine Lord Napier and another, Figs Brown Turkey, Apricot Hemskirk and Morello, Plum Jefferson, Strawberry St. Joseph, Apple Gasconne's Scarlet, and Pear Souvenir du Congrès. The Apples were especially remarkable for large size and high colour, and the other fruits were of high merit. The 2nd prize was won by GRANVILLE FARQUHAR, Esq., Eastnor Castle, Ledbury (gr., Mr. G. Mullins). He had very fine bunches of Gros Maroc and Black Hamburg Grapes, moderate-sized bunches of Foster's Seedling and Muscat of Alexandria, also excellent Brown Turkey Figs, Stirling Castle and Bellegarde Peaches, Lady Sudeley Apple, Stanwick Elrue Nectarine, large Early Apricot, Melons, Cherries, Gooseberry Duke of Sutherland, &c. 3rd, F. CORBETT, Esq., Impney Hall, Droitwich (gr., Mr. F. Jordan), who had better-finished Muscat and other Grapes, of smaller size than those in the other exhibits already mentioned; very large Washington Apples, excellent Peaches, Moorpark Apricots, &c. 4th, J. DRAKE, Esq., Orford House (gr., Mr. J. Brown); and 5th, the Hon. Mrs. MEYNELL-INGRAM, Temple Newsam, Leeds (gr., Mr. R. Dawes).

The prizes for the decorations employed in this class were awarded as follows:—1st, F. CORBETT, Esq.; 2nd, Earl of HARRINGTON; 3rd, GRANVILLE FARQUHAR, Esq., and 4th, J. DRAKE, Esq. The object which

exhibitors should aim at in the arrangement of these decorations should be to obtain a bright effect, free from the least appearance of heaviness.

Collection of twelve dishes of fruit.—There were only two exhibits in this class for a smaller collection, and the 1st prize was awarded to Lord BIDDULPH, Ledbury (gr., Mr. J. Dawes). He had a very large, extremely heavy bunch of Black Alicante Grapes, the remainder of the Grapes being moderate in finish, but above the average in size. His Peaches and Nectarines were very good, and the remaining dishes above average quality. This exhibitor also gained 1st prize for the decorations. The only other exhibit was one from Mrs. F. NEED, Malvern (gr., Mr. J. Jones).

Collection of nine dishes.—Out of three exhibits in this class, the best was one from Mrs. SWAN, Halston Hall (gr., Mr. C. Roberts). The exhibit contained excellent Gros Maroc and Buckland Sweetwater Grapes, also Alexander, Noblesse Peaches, Lord Napier Nectarine, Late Duke Cherry, Moorpark Apricot, Brockworth Park Pear, The Peer Melon, and Monarch Plum, all of which were of choice quality. 2nd, C. F. K. MAINWARING, Esq., Ellesmere (gr., Mr. Chas. Wilkes), whose collection included two dishes of Peaches and two dishes of Nectarines, thus losing variety, there being no Cherries, Apricots, or Plums in the collection. 3rd, Rev. T. M. BULKELEY OWEN, Tedsmore Hall (gr., Mr. Langley). The awards for decorations in this class were won in the same order as the prizes for fruit.

CHAMPION GRAPE CLASS.

[1ST, MR. SHINGLER.]

(Silver Cup goes again to Norfolk.)

This contest is the third that has taken place for the magnificent Silver Cup, value £52 10s., which was illustrated in these pages in August, 1902. In the first year the Cup was won by the Marquis of Hastings (gr., Mr. W. Shingler), and last year by the Earl of Harrington (gr., Mr. J. H. Goodacre). It is necessary that the Cup be won three times before an exhibitor may claim it as his property. It is offered for the best collection of twelve bunches of Grapes. This must include four or more distinct varieties, and it is not permissible to show more than four bunches of any particular variety. The judges were instructed to judge each bunch on its individual merits, and award points. The maximum number of points allowed for the variety Muscat of Alexandria was 11; for each of the other varieties of black or white Muscat Grapes, and to Black Hamburg, 10 points; to any other variety of Grape, 9 points. The bunches were arranged on boards, and each exhibit was allowed a table space of 8 feet by 4 feet 6 inches in two tiers 2 feet 3 inches in width. Superior cultivation and "finish" were to be considered of the greatest importance. The conditions of this contest will be the same in future competitions for the Challenge Cup. Each collection of Grapes was decorated with flowers or foliage plants, but this was done to secure a good effect in the general show, and was not considered at all when awarding the prizes for Grapes. Instead of this, three additional prizes were awarded for the decorations, as has been the case formerly, therefore it happens sometimes that the exhibitor who secures the highest award for Grapes, gains only a 3rd prize for the decoration he has employed. On the occasion under notice there were five exhibitors in this class, and there were, consequently, sixty good bunches of Grapes. The 1st prize was, as has been stated, won by Lord HASTINGS, Melton Constable, Norfolk (gr., Mr. Shingler), who has thus won the Cup for the second time.

Bunch.	Variety.	Maximum No. of Points.	No. of Points obtained.
1.	Alnwick Seedling ...	9	8½
2.	Madresfield Court ...	10	9
3.	Muscat of Alexandria ...	11	11
4.	Muscat of Alexandria ...	11	11
5.	Madresfield Court ...	10	9½
6.	Black Hamburg ...	10	9½
7.	Gros Maroc ...	9	9
8.	Muscat of Alexandria ...	11	10
9.	Madresfield Court ...	10	9½
10.	Madresfield Court ...	10	10
11.	Muscat of Alexandria ...	11	9½
12.	Gros Maroc ...	9	9
Total ...		121	115½

From the table above given it will be seen that the collection shown by Mr. SHINGLER was very nearly perfect, for the judges awarded a total of 115½ points out of a possible 121 points. At the same time it may

be admitted that the judges' pointing was rather "high," to adopt the word used by exhibitors. Bunches No. 3 and 4, though awarded maximum points, were not, in our opinion, the best Muscats we have seen, nor the best ever seen at Shrewsbury, No. 4 especially lacking in "colour." But apart from this detail the collection was excellent. The Gros Maroc were perfect, Madresfield Court very nearly perfect, Black Alicante and Black Hamburg excellent. Mr. Shingler's collection was much better than the one which gained the 2nd prize. This was won by the Earl of HARRINGTON (gr., Mr. J. H. Goodacre), who obtained a total of 109½ points. In no single instance were the maximum points awarded to a bunch in this collection. The varieties were Muscat of Alexandria, Madresfield Court, Black Hamburg, Muscat of Alexandria, Cooper's Black, and Black Alicante. 4th, GRANVILLE FARQUHAR, Esq., Eastnor Castle (gr., Mr. Mullins), with 92½ points; and 5th, Hon. Mrs. MEYNELL-INGRAM, Temple Newsam, Leeds (gr., Mr. R. Dawes), with 76½ points.

The prizes for decorations were awarded as follows: 1st, GRANVILLE FARQUHAR, Esq.; 2nd, the Earl of HARRINGTON; and 3rd, the Hon. Mrs. MEYNELL-INGRAM.

GRAPES.

In addition to the Grapes shown in the Champion Class, and in the classes for collections of fruit, there is always a fine display of Grapes at Shrewsbury in classes arranged for special varieties, in most instances the exhibits being of two bunches each.

Four bunches.—The best exhibit of four bunches of Grapes, two bunches of a black variety and two of a white variety, was from Mr. T. LAMBERT, Oswestry, who had very large bunches of Muscat of Alexandria and Madresfield Court; 2nd, C. F. K. MAINWARING, Esq., Oteley, Ellesmere, who had Muscat of Alexandria and Black Hamburg; 3rd, Lord TREVOR, Brynk-walt, Chirk (gr., Mr. W. Dawes), with the same varieties. There were seven exhibits.

Black Hamburg.—There were as many as eleven exhibits of two bunches of this Grape, most of which were of first-rate quality. The 1st prize was won by the Earl of HARRINGTON, who had heavy bunches of deeply-coloured berries; 2nd, E. A. YOUNG, Esq., Tan-y-Bryn, Bangor; and 3rd, JNO. BRINTON, Esq., Moor Hall, Stourport (gr., Mr. W. H. Wilson). There were nine exhibits of single bunches of this first-rate black Grape, and the 1st prize was won by E. A. YOUNG, Esq., Tan-y-Bryn, Bangor (gr., Mr. A. Ruddock); 2nd, Lord TREVOR; and 3rd, GRANVILLE FARQUHAR, Esq.

Two bunches of Black Grapes.—There were three exhibits in this class, the 1st prize being won by Messrs. D. & W. BUCHANAN, who showed shapely bunches of Madresfield Court; 2nd, Earl of HARRINGTON, with rather small-berried bunches of Muscat Hamburg; and 3rd, E. A. YOUNG, Esq., with the same variety.

Madresfield Court (two bunches).—This most handsome of black Grapes was shown by five exhibitors in a class for two bunches, and the pair from Mr. T. LAMBERT, who was awarded 1st prize, were magnificent examples, being of good length, shapely, and possessing grand colour; 2nd, Lord HASTINGS, and 3rd, Earl of HARRINGTON.

Black Alicante (two bunches).—There were only two exhibits of this Grape, and the better of these came from Lord BIDDULPH; J. BAYLEY, Esq., Llanfair fechan (gr., Mr. C. Richardson), obtained 2nd prize.

Any other black Grape.—In this class there were ten exhibits, and the 1st prize was awarded to splendid bunches of Gros Maroc exhibited by C. F. K. MAINWARING, Esq. The size of bunch and berries in this case was remarkable, and the berries were perfectly coloured; 2nd, Lord HASTINGS, with the same variety.

White Muscats (two bunches).—The best exhibit of two bunches was one from the Earl of HARRINGTON, who had two moderately-good bunches of Muscat of Alexandria, very highly coloured; 2nd, J. BAYLEY, Esq., who had better bunches and better berries, but they were not coloured perfectly; 3rd, Lord BIDDULPH, with the same variety.

The best exhibit of a single bunch came from the Earl of HARRINGTON; 2nd, F. CORBET, Esq.

LOCAL CLASSES.

In a class for two bunches of Black Hamburg Grapes (open only to residents in Shropshire), Lord TREVOR won 1st prize, and C. F. K. MAINWARING, Esq., 2nd prize.

A similar class for Madresfield Court was won by Captain HEYWOOD LONSDALE, Shavington Hall, Market Drayton (gr., Mr. Jas. Mills); 2nd, Mr. T. LAMBERT.

Among classes restricted to residents in Shropshire there were further classes for Grapes, also for Apples, Pears, Plums, and for six dishes of hardy fruits, in all of which very good produce was exhibited, possibly owing in some measure to the good influence of the Society in the neighbourhood.

OTHER FRUITS.

Peaches.—There are always some good Peaches shown at Shrewsbury, and on this occasion there were eleven exhibits of single dishes of six fruits each in addition to the Peaches shown in the collections of fruits. The 1st prize was won by the Earl of LATHOM, Ormskirk (gr. Mr. B. Ashton), who had very handsome, richly-coloured fruits of very large size, the variety being Royal George; 2nd, Lord BIDDULPH, with Sea Eagle; and 3rd, Major CLIVE, Hereford (gr., Mr. R. Grindrod), with Belgarde.

Nectarines.—Nectarines were exhibited splendidly, and there were eleven dishes of six fruits each. The 1st prize was won by the Earl of SANDWICH, Huntingdon (gr., Mr. J. Barson), 2nd, the Earl of HARRINGTON, who showed Early Rivers, and 3rd, E. P. THOMPSON, Esq., Whitechurch, Salop (gr., Mr. W. A. Webster), who had the variety Lord Napier.

Twelve Gage Plums.—There were four exhibits in this class, three of which were very good. The 1st prize was won by Transparent Gage, from the Earl of HARRINGTON.

Twelve purple or red Plums.—There were seven exhibits. The variety Kirke's was awarded 1st prize as shown by the Earl of HARRINGTON; a dish of purple Plums from Mrs. SWANN, Halston Hall (gr., Mr. C. Roberts), obtained 2nd prize.

Cherries.—Single dishes were shown by eight exhibitors, the best being from E. A. YOUNG, Esq., Bangor.

Apricots.—There were as many as eleven dishes of six fruits of Apricots, and the fruits from Major CLIVE, who showed the variety Early Red, were excellent in size and quality; Lord BIDDULPH won 2nd prize; and the Earl of CHESTERFIELD, Holme Lacy (gr., Mr. Humphreys), 3rd.

Melons. There were three classes for Melons—one for green, one for white, and one for scarlet-fleshed varieties. In each of these classes a large number of competitors staged fruits, which were afterwards judged from the point of view of flavour, and three prizes awarded in each class.

GROUPS OF PLANTS ARRANGED FOR EFFECT.

One of the largest marquees at Shrewsbury is always furnished with magnificent groups of stove and greenhouse plants arranged to produce a good effect. At no exhibition are better groups of the kind shown than at Shrewsbury, and on this occasion they were as varied and interesting as ever. Class 4 was for groups of miscellaneous plants in or out of flower, arranged on spaces of 300 square feet each. There were four exhibitors in this class, but Messrs. J. CYPHER & SONS easily won 1st prize. The foliage plants were richly coloured, and were freely interspersed with delicate-tinted Cattleyas and other flowering plants; 2nd, G. H. KENRICK, Esq., Whetstone, Edgbaston (gr., Mr. Macdonald); 3rd, Mr. W. VAUSE, Leamington.

Group of Ornamental Foliage Plants, Palms and Ferns to occupy a space of 300 sq. ft. (flowers and plants in flower excluded).—Here again Messrs. J. CYPHER & SONS, of Cheltenham, secured the premier award. The principal colour in this artistically arranged group was furnished by Codieums, and relieved with Aralias, Palms, and Begonias; 2nd, G. H. KENRICK, Esq., Edgbaston (gr., Mr. J. V. Macdonald).

SPECIMEN PLANTS.

Fifteen Stove and Greenhouse Plants.—Not fewer than ten of these were to be in bloom. The 1st prize of £20 was secured by Messrs. J. CYPHER & SONS, Cheltenham, with well-flowered specimens of *Ixoras salicifolia*, *Williamsii* and *Duffii*, *Staticea profusa* and *intermedia*, *Dipladenia regina*, *Erica Marnockiana*, *Bougainvillea Sanderiana*, *Allamanda grandiflora*, *Rondeletia speciosa* major (past its best), *Codieums Sunset* and *Victoria*, and three Palms. 2nd, Mr. W. VAUSE, Leamington, with smaller and somewhat sparsely flowered plants.

Six Stove or Greenhouse Plants.—Messrs. J. CYPHER & SONS, Cheltenham, gained the 1st position with large

shapely specimens, including *Staticea profusa* and *intermedia*, *Ixoras Duffii* and *Williamsii*, *Allamanda nobilis*, and *Erica Austriana*; 2nd, Mr. W. VAUSE, Leamington Spa, who had three *Ericas*, *Bougainvillea Cypheri*, *Allamanda nobilis*, and *Codieum angustifolium*; 3rd, T. SUTTON TIMMIS, Esq., Cleveley, Allerton (gr., Mr. B. Cromwell).

Thirty Stove or Greenhouse Plants.—These were required to be shown in pots not exceeding 10 inches in diameter, and Orchids were not to be included. The 1st prize collection in this class, from Mr. LAMBERT, Oswestry, was a wonderful example of the gardener's skill. The most noteworthy examples were *Ixoras Duffii* and *Pilgrimi*, *Acalypha Sanderiana*, *Allamanda Williamsii*, and *Codieum Evansianum*; 3rd, Messrs. J. CYPHER & SONS; 3rd, T. SUTTON TIMMIS, Esq., Cleveley, Allerton.

A class for the best single specimen stove or greenhouse plant in flower only brought two exhibitors, of whom Messrs. J. CYPHER & SONS won 1st prize with an *Ixora*, and Mr. W. VAUSE 2nd prize with an *Erica*.

The best collection of four exotic Ferns was shown by T. SUTTON TIMMIS, Esq., who also showed the best group of *Caladiums*.

There was a class for thirty miscellaneous plants, in moderately small pots. These were of sizes most useful for use in decorations. The 1st prize was won by Mr. T. LAMBERT.

A new class was that for Cannas in pots, but the only exhibitors were Messrs. H. CANNELL & SONS, of Swanley, whose exhibits of these plants are so well known to readers of the *Gardeners' Chronicle*. The exhibit covered a space equal to 12 feet by 4 feet, and included nearly fifty varieties.

Some of the best tuberous-rooting Begonias were shown by Messrs. T. S. WARE, Ltd., Feltham, who obtained a 1st prize for six plants.

Excellent plants of a size suitable for the decoration of tables were shown by T. SUTTON TIMMIS, Esq., whose *Codieums* were particularly pretty and of high colour. There were *Gloxinias*, zonal *Pelargoniums*, and other flowering plants; also *Coleus*, *Codieums*, and other fine foliage plants in special classes.

The *Codieums* from Col. W. GORDON-PATCHETT, Shrewsbury (gr., Mr. J. Swain), were very finely grown plants, several feet high.

MESSRS. BULL'S SILVER CUP.

The Rt. Hon. Lord HOWARD DE WALDEN, Audley End, Saffron Walden (gr., Mr. James Vert), won a Silver Cup offered by Messrs. W. Bull & Sons, King's Road, Chelsea, London, for the best collection of six plants of species introduced to commerce recently by Messrs. Bull. The species shown were *Ceropegia Woodii*, *Dracena Victoria*, *Davallia lucida* (a very pretty Fern), *Heliconia illustris*, *Ficus radicans* variegata, and *Anemia rotundifolia*.

There was one other exhibitor.

CUT FLOWERS.

An important section of the display of cut flowers is that for exhibits of bouquets and other floral devices. They were staged in the large marquee containing the fruit, and commanded a large share of attention from the public.

In a class for a bride's bouquet and two bridesmaids' bouquets, Messrs. JENKINSON & SON, Newcastle, Staffs, won 1st prize. The bouquets in each case were composed of Orchids, and arranged in a light and pleasing manner; 2nd, Mr. JOHN GAULT, Kilmaleolm; 3rd, Messrs. FELTON & SONS, Hanover Square, London.

The best bride's bouquet was also shown by Messrs. JENKINSON; 2nd, Mr. W. J. GARNER, Altrincham; 3rd, Mr. JOHN GAULT.

For a bouquet of flowers for the hand (Orchids excluded), Messrs. JENKINSON also excelled all other exhibitors, having a lovely arrangement of *Odontoglossums*, *Oncidiums*, *Cattleyas*, &c.; 2nd, Mr. W. J. GARNER.

For a floral harp, the 1st prize went to Mr. W. TRESEDER, Cardiff, the principal flowers used being *Liliums*, *Stephanotis floribunda*, and *Pancratiums*, over a groundwork of white Asters. Pale-coloured *Cattleyas* and *Odontoglossums* gave a touch of colour at the upper corners, whilst the "threads" were composed of *Lilies of the Valley*. 2nd, Messrs. JOHN POPE & SON, King's Norton, Birmingham; 3rd, Messrs. FELTON, Hanover Square, London.

The best floral cross, not exceeding 4 feet high, was shown by Messrs. FELTON & SON; 2nd, Mr. W. TRESEDER.

Messrs. FELTON had also the best floral wreath; 2nd

Mr. W. TRESEDER; 3rd, O. ROBINSON, Esq., Alderley Edge (gr., Mr. John Nixon).

In a class for a basket of cut flowers for the drawing-room, O. ROBINSON, Esq., won 1st prize.

The best hand-basket of cut flowers (Orchids excluded) came from Messrs. FELTON & SON, who had *Carnations* and *Lily of the Valley*. 2nd, Mrs. M. E. JONES, Bieton; 3rd, O. ROBINSON, Esq. (gr., Mr. John Nixon).

HARDY PERENNIALS.

Collection of Hardy Perennials, Roses excluded.—The exhibits in this class were very good. 1st, Mr. MAURICE PRICHARD, Christchurch, Hants, had a superb collection of seasonable flowers, comprising excellent examples of *Montbretias*, *Coreopsis*, *Erigeron speciosus* major, *Crinum Powellii*, *Kniphofia* "Dr. Regel," *Delphiniums*, *Phloxes*, *Campanulas*, and *Glaadiolus princeps*; 2nd, Messrs. HARKNESS & SON, Bedale, Yorks; 3rd, Messrs. J. COCKER & SONS, Aberdeen; 4th, Messrs. G. GIBSON & CO., Leeming Bar, Bedale.

DAHLIAS.

Collection of Cactus or Decorative Dahlias.—There were five competitors in this class, and after a close contest Mr. W. TRESEDER, Cardiff, was awarded 1st prize; Mr. S. MORTIMER, Rowledge Nurseries, Farnham, 2nd; and Messrs. KEYNES, WILLIAMS & CO., Salisbury, 3rd prize.

For a collection of Dahlias of any varieties, Mr. W. TRESEDER was again awarded 1st prize; Messrs. J. CAMPBELL & SON, High Blantyre, N.B., 2nd prize; and Messrs. KEYNES, WILLIAMS & CO., Salisbury, 3rd prize.

There were numerous classes for Sweet Peas, the 1st prize in a class for which prizes were offered by Messrs. JONES & SON, Shrewsbury, was won by Mr. C. PEPLOW, Bieton Heath. In the class for which prizes were offered by Mr. R. SYDENHAM, the 1st prize was won by W. H. BANKS, Esq., Kingston. The winner of the 1st prize in Class 44, for which Mr. ECKFORD offered prizes, was won by Mr. T. JONES, Bryn Penylan, Ruabon, the collection shown including eighteen varieties.

For cut *Carnations*, Mr. W. B. W. VERNON WELSH, Frankton, Oswestry, won 1st prize; and in another class, Mr. A. R. BROWN, Handsworth, was 1st.

VEGETABLES.

Although some old well-known exhibitors of these garden products were absent, yet there was in most classes considerable and keen competition. The quality generally also was as usual excellent, and it is but fair to say of the best that it seemed to be quite unsurpassable. The exhibits from Aldenham Park and Ormskirk were, as may be anticipated, of the finest description; indeed, we have never seen Mr. E. Beckett in better form.

For the six valuable prizes offered by Messrs. Jas. Carter & Co., London, there were unfortunately but two competitors. These were Lord ALDENHAM, of Elstree, Herts (gr., Mr. E. Beckett), who had in a collection of nine kinds superb *Ailsa Craig Onions*, *Goldfinder Potatoes*, *Duke of York Tomatoes*, *Scarlet Perfection Carrots*, *Standard Bearer Celery*, *Autumn Giant Cauliflowers*, *Model Leeks*, good *Peas*, and handsome *Runner Beans*. The Earl of LATHOM, Ormskirk (gr., Mr. B. Ashton), was 2nd.

There were eight collections in the class for nine kinds of vegetables, valuable prizes being offered by Messrs. Sutton & Sons, Reading. Here Mr. E. BECKETT was again 1st, having solid white *Celery*, *Prize-taker Leeks*, *Perfection Tomatoes*, *Windsor Castle Potatoes*, *Ailsa Craig Onions*, *Mammoth Cauliflowers*, *New Intermediate Carrots*, *Best-of-All Runner Beans*, and *Duke of Albany Peas*, a superb sample; Mr. B. ASHTON was again 2nd; Col. R. MIDDLETON, Ross (gr., Mr. G. W. Smith) 3rd; G. D. FABER, Esq., Wallingford (gr., Mr. Jas. Dymock) 4th; Mr. G. W. BASTIN and Mr. C. WILKINS coming 5th and 6th.

Messrs. WEBB & SONS, Wordsley, Stourbridge, also offered liberal prizes for collections, but limiting them to six kinds of vegetables. Here Mr. ASHTON was a good 1st, having very fine exhibits, repetitions largely of those already named. Mr. Bastin, gr. to Sir A. HENDERSON, M.P., of Inscot Park, Berks, was 2nd, and Mr. W. Pope, gr. to the Earl of CARNARVON, Highclere Castle, Newbury, was 3rd. Other prizes were taken by Mr. BARSON, Hinchbrook; Mr. H. FOLKES, Hemel Hempstead; and Mr. F. J. BARRATT, Ellesmere.

The same firm's class for a dish of *Tomatoes* of specified varieties brought numerous exhibits, the fruits generally well coloured and of quite moderate dimen-

sions. Mr. J. WESTON, Hodnett, had the best; Mr. Folkes, gr. to the Right Hon. F. HALSEY, Hemel Hempstead, was 2nd; Mr. ASHTON coming 3rd, and Mr. READ, Brethly Park, 4th.

In the class for nine kinds, prizes given by Messrs. R. Smith & Co., Worcester, the competition was again good, Mr. BECKETT being again a good 1st with very fine quality. The varieties were chiefly repetitions of those already named. Mr. ASHTON was again a worthy 2nd; and an able Welsh competitor, Mr. R. A. HORSPOOL, of Ruabon, was 3rd. Other winners were Mr. JONES and Mr. G. DAVIES.

Mr. Edwin Murrell, Shrewsbury, had classes for eight kinds and six kinds. In the class for eight dishes, Mr. Townsend, gr. to J. B. ACKROYD, Esq., Chalfont Park, Bucks, was 1st with excellent exhibits; Mr. E. Jones, gr. to the Misses HOWELL, Rhwyport, 2nd; Mr. E. Walker, gr. to Sir W. HONYMAN, Coton, Whitchurch, 3rd; and Mr. Birch, gr. to Col. E. W. HERBERT, Orleton Hall, 4th.

Mr. J. Abbott, gr. to Mrs. GUISE, Hadnall, took 1st place in the smaller class.

SOCIETY'S PRIZES.

A class for twelve dishes, for prizes offered by the Committee, again brought Mr. BECKETT to the front with splendid products. It was, indeed, difficult to say of his remarkable exhibits which were the best, all being so very fine. Cucumbers, Parsnips, Turnips, and Beet helping to make up the extra dishes. Here Mr. BASTIN came a good 2nd; and Mr. HORSPOOL ran him close as 3rd. Potatoes were remarkably clean and good, Mr. ASHTON having the best three dishes; Mr. E. CUMBERBATCH coming 2nd; and Mr. W. POPE 3rd. For one dish of six tubers, Mr. A. DICKSON was 1st. With six Tomatoes, Mr. J. WESTON, Hodnett, was best; and for a brace of Cucumbers Mr. BARSON took 1st place, with long, handsome fruits. There was great competition in the class for a single dish of Peas, Mr. ASHTON having much the greenest and freshest. Mr. BARRETT showed the best heads of Cauliflower, and Mr. ABBOTT had the best Celery.

Some of the best competition in the show was for the prizes offered by Mr. R. SYDENHAM, of Birmingham, who had ten single-dish classes, beginning with two dishes of Peas; Mr. HORSPOOL being 1st with splendid Gladstone and Captain Cattle. With Runner Beans, Mr. FOLKES was 1st with a very handsome sample. Mr. HORSPOOL had the best Cauliflowers, and was also 1st with six quite beautiful Carrots. Major CLIVE, of Whitfield, had the best Parsnips. Mr. HORSPOOL stood 1st with Onions. Mr. READ had the best Tomatoes, Mr. HORSPOOL the same with Turnips, and Mr. FOLKES took 1st place with two handsome dishes of Potatoes. Then came a collection of eight kinds, made up from the foregoing, five prizes being offered, Mr. HORSPOOL again coming 1st with capital samples, and Mr. FOLKES was 2nd. Beyond the money prizes thus offered, Mr. Sydenham supplemented them with five others in valuable objects, according to the number of points won in his classes by the various competitors. Mr. HORSPOOL was an easy 1st with 60 points, Mr. FOLKES coming 2nd with 49, others being lower down.

There was, as usual, brisk competition in the Cottagers' vegetable classes, some of their exhibits practically equalling those of the gardeners in excellence.

HONORARY EXHIBITS.

We have said already that the non-competitive exhibits from members of the trade were of much importance. The principal collections are referred to below, but there may be others that were overlooked in the adverse circumstances in which these notes were necessarily taken.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea exhibited a group of fine foliage plants, relieved with a few plants in flower, including Orchids. There were finely grown and richly coloured Codiaums, including the varieties Warrenii, Sunshine, Emperor Alexander III., Reidii, etc., also Caladiums in variety, plants of Nephentes Mastersiana, N. Burkei excellens, N. mixta, N. Hookeriana, etc.; small groups of well-flowered Ixoras, greenhouse Rhododendrons, the new variety of Buddleia variabilis, known as Veitchiana, the handsome stove foliage plant Leca amabilis splendens, etc. Among Orchids there were choice examples in flower of Cattleya Dowiana, Lælio-Cattleya Lucelia, L. C. Dominiana var. Langleyensis (a variety with unusually richly coloured lip), Cattleya

Loddigesii, Cattleya Atalanta, Dendrobium fornosum, and Odontoglossums.

Messrs. PRITCHARD & SONS, Shrewsbury, showed a large group of Ferns in pots, including Gymnogrammas, Adiantums, Nephrolepis, and other genera; also a variety of cut flowers, arranged in silvered "Woodland" receptacles.

Mr. L. R. RUSSELL, Richmond Nurseries, Surrey, exhibited a magnificent group of ornamental foliage plants, in which Codiaums (some 3 feet high) were the brightest feature. Other excellent plants included Aralia Chabrieri, A. Veitchii gracillima, Dracæna Doucetii, D. Sanderiana, Anthurium crystallinum, and a number of Cordylines.

Messrs. HEWITT & Co., Solihull, Birmingham, contributed a group of cut flowers in which hardy herbaceous species were largely represented. A few bunches of Carnations, from plants in pots, made a good centre-piece to the exhibit.

Messrs. R. SMITH & Co., Worcester, arranged a very comprehensive collection of cut hardy flowers on the grass in the big plant tent, and at the back of the group were Bamboos, Liliun auratum, &c., in pots.

Messrs. THOS. S. WARE (1902), Ltd., Feltham, Middlesex, exhibited a group of tuberous-rooting Begonias, showing both double and single-flowered varieties of much merit.

From Mr. B. R. DAVIS, Yeovil Nurseries, Somersetshire, came a large number of double-flowered varieties of the same type of Begonia, but in this case cut blooms only were shown. We particularly admired the following varieties:—The Bride (white), The Queen (orange-coloured), Professor Lanciani (reddish-salmon), and Mrs. Moser (salmon-pink).

Messrs. LAING & MATHER, incorporated with Messrs. STUART & MEIN, Keiso, N.B., exhibited a group of flowers of varieties of Carnation.

Mr. J. H. WHITE, Worcester, exhibited a group of hardy flowers in variety, and a number of dishes of Apples.

Mr. H. ECKFORD, Wem, Shropshire, exhibited a grand lot of Sweet Peas arranged tastefully in glasses. All the best varieties were included about fifty—among which was Scarlet Gem, which was shown for the first time last year.

Mr. ROBERT EOLTON, Warton, Camforth, had also a collection of excellent Sweet Peas in great variety.

Mr. JOS. LAMBERT, Westmoreland Road, Southport, exhibited a collection of Carnations as cut flowers arranged in glasses.

Mr. A. F. DUTTON, Bexley Heath, Kent, made one of his splendid exhibits of Carnations; and Messrs. M. CAMPBELL & SON, High Blantyre, N.B., also staged Carnation blooms.

"HOBBIES," Ltd., Dereham, Norfolk, made a very extensive exhibit of Dahlias, arranged in vases built up into cones, with an abundance of Tamarisk mixed amongst them.

Mr. W. ANGUS, The Gardens, Penicuik, Scotland, exhibited Carnations and flowers of the new variety of Chrysanthemum maximum known as King Edward, which has frimbriated petals.

Messrs. JARMAN & Co., Chard, exhibited Roses, Dahlias, zonal Pelargoniums, cut hardy flowers, a few Apples, and a collection of vegetables.

Mr. JOHN FORBES, Hawick, N.E., sent an excellent display of hardy flowers, comprising about sixty varieties of Phloxes, forty of Pentstemons, and a large assortment of show, fancy, and self Carnations.

Messrs. DOBBIE & Co., Rothesay, had a collection of a hundred varieties of Violas and the same of Pansies, arranged in sprays, bunches, and on the orthodox show board. Of the Violas, Maggie Smith, Archie Grant, and Mrs. T. W. R. Johnston were particularly noteworthy.

From "BAKERS," Wolverhampton and Codsall, came a representative collection of show, fancy, and Pompon Dahlias; also sixty varieties of cut zonal Pelargoniums and a rich display of autumn flowers.

Messrs. ISAAC HOUSE & SON, Westbury-on-Trym, showed a large collection of Delphiniums, Kulphofias, Phloxes, and Pentstemons.

Phloxes were grandly shown by Messrs. GUNN & SONS, Olton, Birmingham, who had a hundred choice varieties, each represented by nearly a dozen large spikes, and displayed in large pans and jars. Le Siècle, Iris, Sylphide, Sheriff, Ivory, Adonis, Coquelicot, and Molère were particularly good.

Roses in pots and cut blooms were well shown by Mr. EDWIN MURRELL, Shrewsbury. The same exhibitor also had about two dozen spikes of large, richly-coloured Gladioli.

Messrs. WEBB & SONS, Stourbridge, made an effective display with Gloxinias, tuberous Begonias, Hollyhocks, and Sweet Peas.

Messrs. JONES & SONS, Shrewsbury, showed Sweet Peas largely and well; also Cactus Daldias, Carnations, and floral decorations.

Messrs. FELTON, Hanover Square, London, sent Lilies of the Valley, grown from retarded crowns, Lilliums, Chrysanthemums, Verbena Miss Willmott, and Cactaceous plants were also included in this group.

Mr. BONSKELL, Bosworth, sent a large group of hardy flowers, very crowded and indifferently set up.

Mr. V. SLADE, Taunton, Somerset, staged sixty-eight varieties of single and double zonal Pelargoniums arranged in bold bunches.

Messrs. W. & J. BROWN, Stamford, Peterborough, contributed herbaceous flowers, Carnations, Roses, and zonal Pelargoniums.

Sweet Peas were shown in immense variety and excellent condition by Mr. HAROLD D. GOLDEN, Moberley, and Mr. JOHN DERRBYSHIRE, Hale, Altrincham. The last-named also staged fine varieties of Carnations, and a bedding Lobelia with deep blue double flowers.

Mr. W. L. PATTISON, Cherry Orchard, Shrewsbury, exhibited sprays of a hundred varieties of Violas.

From Messrs. JOHN PEEB & SON, West Norwood, came a large and varied collection of Gloxinias.

Miniature conservatories filled with interesting and curious Cacti were shown by Mr. RICHARD ANKER, Napier Road, Kensington.

Mr. ALBERT MYERS, Sutton Lane, Shrewsbury, exhibited a grand lot of cut zonal Pelargoniums, arranged in bold, loose bunches relieved with ornamental grasses, Gypsophila, Ferns, &c. A number of zonal Pelargoniums in pots, Abutilons, and nicely coloured Colenches were also included in this group.

Messrs. DICKSONS, Chester, set up two large groups, one consisting of stove and greenhouse plants, and the other a representative collection of hardy flowers. Of the latter, Lilies, Gladioli, and Montbretias were unusually good.

A meritorious display of blooms of double Begonias (Tuberous), grown out-of-doors, was made by G. FITZ-HUGH, Esq., Plas Power, Wrexham.

A new zonal Pelargonium, named Souvenir de E. J. Creamer, with purplish-crimson single flowers, was exhibited by Mr. E. J. CREAMER, Station Road, Erdington.

Messrs. CLIBRAN & SON, Altrincham, contributed a very choice strain of Celosia pyramidalis in several colours.

Mr. JOHN E. KNIGHT, Wolverhampton, had a small semi-circular group of Codiaums and decorative Chrysanthemums.

Messrs. REAMSBOTTOM & Co., Geashill, King's Co., Ireland, made another of their characteristic displays of the St. Brigid Anemones.

From the KING'S ACRE NURSERY Co., Hereford, came hardy fruit consisting of Apples, Crabs, Plums, and Damsons. A few Roses and hardy flowers were also included, as well as about two dozen maiden Apple-trees laden with fruit.

Mr. A. J. BRUCE, Chorlton-cum-Hardy, staged a wonderful collection of Sarracenias, Dionæas, Darling-tonias, and Cephalotus follicularis.

The finest exhibit of Cut Roses came from Mr. GEORGE PRINCE, Longworth, Berks, whose varieties Frau Karl Druschki, Gustave Regis, Papillon, and Killarney were particularly good for the season.

OFFICIAL AWARDS.

The following Medals were awarded to contributors of honorary exhibits.

LARGE GOLD MEDAL.

Messrs. Jas. Veitch & Sons, Chelsea, London; Messrs. "Bakers," Wolverhampton and Codsall; Messrs. Dickson, Chester; Messrs. Jones & Sons Shrewsbury; Messrs. Jarmen & Co., Chard.

SMALL GOLD MEDAL.

Messrs. Clibrans, Altrincham; Mr. J. H. White, Worcester; Messrs. Isaac House & Son, Westbury-on-Trym; Mr. Albert Myers, Shrewsbury; Mr. E. Murrell, Shrewsbury; Mr. Geo. Prince, Longworth; Mr. A. J. Bruce, Chorlton-cum-Hardy; Mr. Robert Bolton, Camforth.

SILVER GILT MEDALS.

Mr. J. H. White, Worcester; Mr. L. R. Russell, Richmond, Surrey; Messrs. T. S. Ware, Ltd., Feltham; Messrs. R. Smith & Co., Worcester; Messrs. Hewitt & Co., Solihull, Birmingham; Messrs. Dobbie & Co.,

Rothsay; Messrs. J. Peed & Sons, London; Messrs. Webb & Sons, Wordsley, Stourbridge; The King's Acre Nursery Co., Hereford; Mr. Frank Bouskell, Nuneaton; Mr. Jno. Forbes, Hawick; Messrs. Gunn, Olton, Birmingham; Mr. H. Eckford, Wem; Mr. H. D. Goolden, Moberley; Mr. Vincent Slade, Taunton.

SILVER MEDALS.

Messrs. B. R. Davis & Sons, Yeovil; Messrs. Laing & Mather, Kelso; Messrs. Ian B. Dobbs & Co., Wolverhampton; Messrs. Felton & Son, Hanover Square, London; Messrs. Pritchard & Sons, Shrewsbury; Messrs. Reamsbottom & Co., Geashill, Ireland; Mr. J. Derbyshire, Altrincham; Mr. Jos. Lambert, Southport.

BRONZE MEDALS.

Mr. J. E. Knight, Tettenhall, Wolverhampton; Mr. R. Anker, Kensington; Mr. W. Angus, Penicuik, N.B.; G. Fitz-Hugh, Wrexham.

GARDENERS' DEBATING SOCIETIES.

KINGSTON GARDENERS' ASSOCIATION.—With the kind consent of Leopold de Rothschild, Esq., some thirty members of this newly-formed Society enjoyed a delightful visit to the gardens of Gunnersbury House and Park on the 11th inst. A wet morning was happily followed by a fine afternoon. The party was met by Mr. Hobbs (foreman) at Kew Bridge and conducted through the Potomac, the pleasure-grounds, fruit and plant houses, the Orangery, where Mr. Rothschild kindly provided light refreshments, thence through the grounds of the House-gardens, past the superb specimen plants in tubs on the terrace, the fine collection of Nymphaeas in the lake, and the Japanese gardens.

THE WEATHER.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Wisley, Surrey. Height above sea-level 150 feet. The following are the "mean" readings for the week ending August 13, 1904.

1904.	TEMPERATURE OF THE AIR.					TEMPERATURE OF THE SOIL at 9 A.M.			RAINFALL.	SUNSHINE.		
	At 9 A.M.		DAY.	NIGHT.	LOWEST TEMPERATURE ON GRASS.	At 1-foot deep.	At 2-feet deep.	At 4-feet deep.				
	Dry Bulb.	Wet Bulb.										
	deg.	deg.	deg.	deg.							deg.	deg.
AUGUST 7 TO AUGUST 13.	63	57	70	50					45	65	65	63
MEANS												

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending August 13, is furnished from the Meteorological Office:—

"The weather during this week was fair or fine over the kingdom as a whole, but rain was frequent, and sometimes heavy in the far north and north-west. Thunder and lightning occurred at Marchmont on Wednesday.

"The temperature was below the mean, the deficit ranging from 1° in the majority of districts to 3° in the Midland Counties. The highest of the maxima were registered, as a rule, during the earlier days of the week, and varied from 77° in England, S., to 67° in Ireland, N., and 65° in Scotland, N. The lowest of the minima, which were recorded as the week drew towards its close, were as low as 39° in England, S. (at Swarraton on Saturday), 40° in the Midland Counties, and 41° in Scotland, N., and E. Elsewhere they ranged from 42° in England, E. and S.W., to 45° in Ireland, S., and England, N.E., and to 49° in the Channel Islands.

"The rainfall was again more than the mean in Scotland, as well as in Ireland, N., and the Channel Islands, but less in the south of Ireland and throughout England. In Ireland the fall was just twice as much as the mean amount.

"The bright sunshine exceeded the mean in all districts except the Channel Islands. The percentage of the possible duration ranged from 63 in England, S., 61 in England, S.E., and 59 in England, E., to 39 in Ireland, N., and to 25 in Scotland, N."

THE WEATHER IN WEST HERTS.

One very cold night.—Since the recent spell of warm weather came to an end on the 10th, the temperatures have been generally low for the time of year. The highest reading in the thermometer-screen at no time exceeded 70°, and on the coldest night the thermometer

exposed on the lawn fell to 36°—a very low reading for so early in August. The ground is still slightly warmer than is seasonable at 2 feet deep, but is about 1° colder than the average at 1 foot deep. Rain fell on three days during the week, but the total measurement only amounted to about half an inch. This was not sufficient to affect even the bare soil percolation gauge, through which no measurable quantity of rain-water has now passed for more than a week. The sun shone on an average for 7½ hours a day, or for 1½ hour a day longer than is usual at this season. The winds were, as a rule, of moderate strength, and on one day the highest mean velocity for any hour reached 18 miles—direction W.S.W. The mean amount of moisture in the air at 3 P.M. exceeded a seasonable quantity by about 4 per cent. *E. M., Berkhamsted, August 16, 1904.*

MARKETS.

COVENT GARDEN, August 17.

— Muscat A, lb.	3	0-4			
— B, per lb.	0	9-1			

REMARKS.—The Apple trade for home-grown fruit is very bad, prices ranging as low as 9d. per bushel for some consignments. Ecklinville Seedlings are of very good quality: Warner's King and Lord Suffield 2s. to 2s. 6d. per bushel; Quatrecens, 2s. to 3s. per sieve, Plums—Worcester Egg 1s. to 1s. 3d. per sieve; Victorias, 1s. 6d. to 2s. 6d. do.; Rivers' Czar and Orleans, 2s. to 2s. 6d. do.; Damsons, 1s. 6d. do.; Gages, 2s. to 3s. 6d. do. The supply of good Pears is short. Tomatoes, foreign crates 2s. 6d. each. Valencia Melons, 6s. to 9s. per case. The Carrots in bags, noted above, are washed.

POTATOS.

Various, home-grown, 70s. to 100s. per ton, John Bath, 32 & 34, Wellington Street, Covent Garden.

COVENT GARDEN FLOWER MARKET.

A GOOD supply of pot plants is still maintained. Several growers have started with Chrysanthemums, and some neat, well-flowered plants are coming in, although at present there is little trade for them. Asters in pots are plentiful and good; there are also a good many which have been lifted from the ground and packed in boxes. These latter seem to suit the hawkers, who are now the best customers in the market. Zonal Pelargonium Vesuvius is seen in well-flowered plants; also pink varieties and King of Denmark, but these plants sell slowly. Colons continue to be seen in quantities, but these have commanded a poor trade all the season. Campanula isophylla alba is now very good, and is seen in large quantities. These plants for market are trained in the same manner as Lobelias. The blue variety is not quite so plentiful. Fuchsias, Heliotropes, Verbenas, Hydrangeas, and Marguerites may still be had. Foliage plants are more plentiful. Cyperus alternifolius is seen in large quantities. Ficus elastica is good, also Ficus repens, Eulalia japonica, Asparagus Sprengeri, and Aralia Sieboldi. A good many hardy shrubs are seen, also hardy climbers of various sorts. Ferns are very plentiful in all sizes.

CUT FLOWERS.

Large supplies continue to come in. The supply of Asters from France is now more limited, but it has not yet stopped. English growers are now sending them in large quantities: the variety White Comet is good, and sells fairly well. Chrysanthemums are now coming in in larger quantities. Dahlias are also very plentiful. Carnations hold out well; also Roses. Sweet Peas also continue good. Gladioli, chiefly The Bride and Brencleyensis, continue plentiful; also Liliums and varieties of hardy herbaceous flowers. Statice Gmelini and its white variety, also other sorts, sell fairly well, on account of their lasting qualities. I have not seen Statice Suworowi in the market, but this, with its tall branching spikes of pink, which, when dried, keep a good colour for a long time, should make a useful market-plant. The Scotch Heaths (Erica tetralix and E. cinerea) are now seen in quantities, and seem to be much appreciated. There is little demand for choice flowers, but the trade for all ordinary bloom seems very fair for this season of the year. *A. H., Covent Garden, August 13.*

Obituary.

THOMAS BLAIR.—As we are going to press we receive intelligence of the death, in his eighty-seventh year, of our old correspondent, Mr. Thomas Blair, late of Shrubland.

ENQUIRY.

CAN any of our readers furnish a correspondent with information on the "Planet Junr." wheel hoes as a labour-saving machine for garden walks and kitchen-garden use. [Satisfactory. Ed.]

TRADE MEMORANDUM.

SINNINGIA REGINA.—Mr. Ernst Benary, of Erfurt, informs us that he has acquired the stock of this plant described on p. 87.

ANSWERS TO CORRESPONDENTS.

- AMERICAN OAK:** C. W. Most probably the damage to the trees has been caused by drought, and the fungus has appeared afterwards upon the dead tissue. There are grave doubts about the fungus having killed the trees. Are you sure that there is no white mycelium, like "spawn," at the roots? The black fungus is a black mould, like a *Toxula*, which only grows on dead and decaying wood and bark. M.C.C.
- APPLE ROT:** T. C. No trace of fungi; cause probably climatic.
- ASTER:** Warblington. Your plants are attacked by the Aster-worm, which we found in the interior of the stem near the collar. There is nothing to be done but to burn the plants.
- BILSTERED LEAVES:** J. P. We are puzzled to account for the appearances. Our entomological referee disowns them; our fungus expert will have none of them. We can only advise you to watch. To us they appear to be the work of some leaf-miner.
- BOOK ON APPLES:** R. P. Barron's *British Apples*, published by the Royal Horticultural Society, 117, Victoria Street, Westminster.
- BOOK ON TABLE DECORATION:** W. G. We know of no modern book on this subject. Old works are out of date and useless.
- CARNATIONS:** Woodland. A very good selection.
- CATERPILLAR:** J. S. The caterpillar of one of the Hawk-moths, perhaps *Sphinx ligustri*.
- CHRYSANTHEMUMS:** C. W. Yellow-rust. Burn the affected plants, or it will spread. Spray the healthy ones with liver-of-sulphur, $\frac{1}{2}$ oz. to a gallon of rain-water.
- EICHOENIA CRASSIPES:** A. E. F. A tropical plant floating on the surface of the water by means of its dilated, balloon-like, leaf-stalks. Occasionally the plants throw up a spike of blue flowers remotely resembling that of a Hyacinth, whence the name Water-Hyacinth. It may be grown in a glass-vessel in an ordinary greenhouse, and always attracts attention.
- ELM TREES:** H. R. G. The trees are probably attacked by one of the bark-boring beetles, but without seeing it we cannot say which one; neither can we suggest any remedy.
- GRAPES:** E. J. I. The berries are affected with the spot disease, due to a fungus (*Gloeosporium*). You can do nothing this year, but next season spray with liver-of-sulphur, half an ounce to a gallon of rain-water.
- INJURY TO LETTUCE ROOTS:** W. H. B. Two species of insects were present on the roots of the plants sent: (1) a root-feeding aphid (probably *Trama troglodytes*), (2) the larvæ of a small dipterous fly. But judging from the quantity of white powdery matter secreted by the aphids, we assume that the injury was due to these insects. If dry give the plants a copious supply of water and apply a slight dressing of artificial manure. If this treatment does not stimulate the plants try bisulphide of carbon (poisonous and highly inflammable), at the rate of two teaspoonfuls to each plant. To do this, keep all matches and lights out of the way, then pierce two holes in the soil, on opposite sides of each plant, half-an-inch in diameter and $1\frac{1}{2}$ inch deep, inject the fluid into them with a glass syringe, and close the holes immediately afterwards. The application should be made late in the afternoon, and a copious supply of water should be given the following evening. But seeing that your plants are in a weak condition, we would advise you to treat a few plants with the bisulphide in the first instance, and watch the result, as it is just possible that the plants may not be able to withstand the treatment.
- LILY DISEASE:** G. W. The Lily bulb arrived in such condition that it was impossible to arrive at any conclusion—the soil and bulb-scales all mixed together, so that no trace of fungus in the soil could be found. The scales of the bulbs turned brown in some parts, but no fungus disease could be detected. There was no sign of the Lily mould disease (*Gardeners' Chronicle*, September 10, 1881, fig. 66; August 18, 1888, fig. 21). With better packing some clue might have been discovered. No remedy can be suggested for a disease which cannot be found out. Is there any white mycelium or spawn in the soil? M. C. C.
- MALMAISON CARNATION:** C. T. We think your Carnation, Sir Horace Plunkett, is a very fine one. The colour is a rich deep scarlet, and the flowers have something of the fragrance of the old Clove.
- MILDEW:** X. Y. Z. Dust flowers-of-sulphur over the Vines with a suitable sulphurator, and smear the hot-water pipes with a mixture of sulphur and water. Avoid dusting the fruit as much as possible.
- NAMES OF PLANTS:** Correspondents not answered in this issue are requested to be so good as to consult the following number.—G. T. The shrub is *Lycocystis formosa*. The Orchid is an *Epipactis*, but it is out of bloom.—Belfast. *Melanthus major*.—M. M. *Phytolacca dioica*.—Carnation. We cannot undertake to name them. Perhaps someone who makes these plants a specialty might be able to assist you.—F. C. 1, *Sedum kamtschaticum*; 2, *Spiraea venusta*; 3, *Sedum pulchellum*.—L. F. S. A light form of *Cattleya Warscewiczii*, often called *C. gigas* in gardens.—Dr. B. *Hippeastrum robustum* is a synonym of *H. aulicum*, with which species your specimen agrees.—G. Y. P. 1, *Gongora portoricensis*; 2, *Phyllanthus nivosus*; 3, *Asplenium marinum*; 4, *Polypodium nigrescens*; 5, *Woodwardia orientalis*; 6, *Selaginella Willdenovii*.—A. R. 1, *Adiantum macrophyllum*; 2, *Asplenium lucidum*; 3, *Polystachya pubescens*; 4, *Oncidium candidum*; 5, *Pleurothallis rubens*.—G. B. M. R. *Vincetoxicum officinale*.—B. K. 2, *Sedum spurium*. There are no leaves to the Aconite, but we believe it to be *A. japonicum*. Do not forget its extremely poisonous nature.—A. L. H. 1, *Abelia triflora*.—X. Y. Z. 1, *Asclepias curassavica*; 2, *Calceolaria pinnata*; 3, *Festuca ovina*; 4, *Adiantum macrophyllum*; 5, *Pteris crenata*. The Ferns have probably been injured by thrips.—Iris. 1, *Echinops Retro*; 2, *Gnaphalium margaritaceum*; 3, we cannot name the Rose.—H. M. C. *Saponaria officinalis*.—J. L. G. 1, *Veronica*, next week; 2, *Erica Tetralix*; 3, *Veronica*, next week; 4, *Senecio Jacobaea*; 5, *Calluna vulgaris*.—J. B. *Inula Helenium*.—H. M. 1, *Tsuga Sieboldi*; 2, *Ilex aquifolium* var. *latifolia*; 3, *Berberis*, probably *vulgaris*.—R. A. *Cyananthus lobatus*.—M. C., *Rothsay*. 1, *Veronica virginica*; 2, not recognised; 3, *Gnaphalium orientale*.—R. H. 1, *Spartium junceum*; 2, *Escallonia macrantha*; 3, *Gaultheria Shallon*; 4, *Viburnum opulus*; 5, *Diplopappus chrysophyllus*; 6, *Spiraea callosa alba*; 7, *Hippophae rhamnoides*; 8, *Ruscus racemosus*; 9, *Thuopsis dolabrata variegata*; 10, *Cupressus nootkaensis* var.; 11, *Symphoricarpos racemosus* var.; 12, *Inula Helenium*. You encroach on our good nature by sending more than six; a small contribution to the Gardeners' Orphan Fund would be an acceptable compensation.—J. W. L. 1, *Cyrtomium Fortunei*; 2, *Cyrtomium falcatum*; 3, *Blechnum occidentale*; 4, *Doodia caudata*; 5, *Adiantum Waltoni diffusum*.—Anxious. 1, *Tecoma jasminoides*; 2, *Phyllanthus nivosus*.—E. A. T. 1, *Odontoglossum Hunnewellianum*; 2, a light form of *Oncidium Gardneri*, or a natural hybrid of it.—A. W., Newark. *Crinium giganteum*, but with smaller flowers and longer tube than usual.—A. B. We cannot name garden Coleus; the specimens should be matched with named varieties in other collections.—M. G. Sandford. The red-leaved specimen is *Prunus cerasifera* var. *atropurpurea*; the others are *Prunus cerasifera* (typical). The fruit is edible.
- NECTARINES:** Head Gardener. In the one case the fruits have grown unequally—too fast in the interior, and not in accord with the skin. It is probably a fault inherent in that particular tree. Cut it hard back, and try again next season.
- PEAS:** G. W. The purple-podded Pea. There is no other name for it.
- PITCHER ON CABBAGE-LEAF:** R. D. See our number for July 2, p. 10.
- PLUMS:** G. B. Both fruits are Cox's Emperor.
- POTATO TREATISE:** C. P. Yes, they do. Write to the firm for particulars.
- PRUNUS PISSARDI:** F. C. H. The fruiting is not at all unusual.
- ROSE:** F. W. B. Why address the publisher on such a question? The Rose appears to have died of old age. There is plenty of fungus-spawn on it, which may have accelerated the decease.
- ROSE RUST:** M. H. Spraying with diluted Bordeaux-mixture or ammoniated carbonate of copper solution at intervals during summer will check the disease. See p. 352, May 28, 1904.
- SWEET PEA, BICOLOR:** J. P. sends a specimen with one white flower and one rose-coloured on the same raceme. Such instances are not uncommon in Roses, Carnations, and Chrysanthemums, but we do not remember to have seen such a condition before in the Sweet Pea. Perhaps it is due to a separation of previously mixed features.
- THISTLE:** T. H. Apparently the common Thistle, *Carduus arvensis*, growing very luxuriantly. Nothing but thorough soil-cultivation will get rid of it. Burn every scrap.
- TOMATO: St. Albans.** The truss is certainly very large, but we doubt if it constitutes a record. Send further particulars when you have recorded them.—D. J. Your plants are affected with a fungus, *Cladosporium fulvum*. Burn the affected parts, and syringe those not yet attacked with weak Bordeaux mixture or liver-of-sulphur half ounce, rain-water one gallon.
- TOMATO MOULD:** Constant Reader. The brown mould, *Cladosporium fulvum*, occurs on the foliage of Tomato. It may be cured by application of Bordeaux-mixture and fresh air, or change of temperature. The *Peronospora*, also on the foliage, is a white mould, not so common, but quite distinct, and difficult to treat. The black spot on the fruit is *Macrosporium*, for which there is no remedy when once the fruit is attacked. Destroy all diseased fruits at once to prevent spreading. M. C. C.
- TOMATO-WILT:** W. W. & Co. This is evidently a form of Tomato-wilt, although at present no trace of fungi can be found. The disease appears in the stems, and the plant in time collapses. The roots appear to be perfectly healthy. The ultimate cause has not yet been discovered, and of course no remedy can be suggested until the true cause is made known. Bacteriosis is the only suggested cause, but perhaps that is merely a scapegoat to cover ignorance. M. C. C.
- VERBENA:** Constant Reader. The Verbenas should be wintered on a greenhouse shelf near the glass. It would be better to strike a batch of cuttings now, and winter them in the store pots. Also take up some of the old plants a little later, and pot them up and winter them. This will give two chances of obtaining a sufficient stock to propagate from in spring. The plants should not be watered overhead, and sparingly watered in the pots in cold, dull weather.
- VINES:** Reader, H. McC. We can find no insect nor any fungus. The balance of growth has been upset by some cause which you can tell better than we. Some of the berries are shanked, the shanking being caused by a fungus attacking the stalks.—H. B. The leaves are ripening prematurely. The Vine does not like the conditions that suit the Muscat. Try the Vine next season in some other house. There is no fungus nor any insect.
- VINE WEEVIL:** Perplexed. You can do nothing better than trap them with pieces of Potato, Carrot, &c. Insert the pointed end of a flower-stake into the Potato, &c., and just bury the latter in the soil. The stake indicates the position of the trap, and is useful for withdrawing it. They feed only at night, which is the best time to hunt them.
- COMMUNICATIONS RECEIVED.**—P. W. B., St. Louis—A. H.—A. H., Lewisham—J. O., Hfracombe—W. H.—Wesley & Son—C. B.—G. M.—S. W. F.—C. R.—Messrs. Fradelle & Young—Ben Reid & Co.—J. Rashleigh—J. R. C.—W. THE MANAGEMENT OF
HEDGES.

THOSE who have experienced the advantage of hedges in gardens as wind-breaks and protectors to vegetation generally need not to be reminded of their good qualities. But hedges possess in their roots a possible source of harm to the plants their tops are benefiting, by robbing them of their means of existence; and this supplies a very powerful reason why hedges are less frequently planted in gardens than they might be. This objection is not an insurmountable one. In the gardens wherein these notes are written there are now quite a thousand yards' run, a great part of which affords protection to flowers, and at the same time acts as a screen to the vegetable quarters. It would, of course, be impossible to cultivate either flowers or vegetables to any degree of per-

fection where the roots of, say, a Yew from a tall, broad hedge obtains free access to the soil on either side. But such a condition is altogether unnecessary. The simple process of root-pruning biennially checks soil-exhaustion beyond certain limits. Some may be horrified at the idea of what they consider root-mutilation; but the injury is limited, for if a hedge, say, four feet broad has a protected rooting space on one side of four to five feet, which will be covered by the hedge itself and a necessary alley, it may on the other and more important side have the roots restricted to a space equal in horizontal area to the perpendicular face of the hedge. If the soil is of good quality, vegetation will proceed uninterruptedly in good condition for an indefinite period. Where, however, the soil is poor, an occasional application of cow-manure is beneficial. Some hedges in soil of a satisfactory quality, and in position where root-pruning has not been needed, have made less progress than those that from the first have been regularly root-pruned. Of course it entails labour, as the soil to the depth of a spade has to be completely removed. Beneath that the roots can be cut to their utmost depth by pressing the spade deeply into the soil athwart the direction in which the roots are growing. But to set against that, while the shoots are produced very much more thickly they are less strong, and therefore trimmed more easily and rapidly.

The proper maintenance of hedges under any circumstances entails no small amount of labour, but by cutting at the right season, while the growth is soft, labour is considerably lessened as compared with that which is required to cut hardened growths. Moreover, winter or spring-cut hedges frequently bulge out at the top and look unsightly all the year. The same thing may, of course, happen by cutting in August, but at that time the fault is more easy to remedy, and early autumn trimming produces a neat hedge during the greater part of the year—autumn, winter, spring, and part of summer. This cannot be said to be the case with pruning deferred to winter or spring. The gaps caused by the death of plants are always annoying in connection with hedges newly planted. The cause of death is due either to the employment of badly-rooted plants, or of those that have been left unchecked at the root too long previous to lifting. It is a commendable practice to grow on plants a year or two previous to lifting, when they will be in a condition to transplant without ulterior losses almost any day of the year. Hedges may be as successfully planted in midsummer as at any time, and that is a suitable season to transplant any subject, but especially evergreens, at the moment new growth is commencing.

With regard to pruning hedges that have not acquired their desired proportions, it is a fact that nice young stuff left to itself for some years with the minimum of pruning will progress more rapidly than if closely pruned. In the case of Hollies this does not matter, and is perhaps the preferable method to adopt, but with Yew, which is the best of all hedging material, a hedge allowed to grow largely untrimmed is not so strong, so close, or so pleasant to look upon as one that is pruned regularly. B.

NEW OR NOTEWORTHY PLANTS.

COCHLIODA BRASILIENSIS, Rolfe, n.sp.*

AFTER having been known for upwards of thirty years, this interesting Brazilian species of Cochlioda is now put into commerce by M. Binot, who has imported it from Brazil. It has hitherto been known from a dried specimen collected near Rio de Janeiro by W. Longman, and communicated to Kew in May, 1872. Now a plant from M. Binot's importation has flowered in the collection. It differs from all the other species of Cochlioda in having greenish segments, but agrees in having the stalk of the lip completely adnate to the column and the blade reflexed, and, of course, in habit and other structural details. On account of its modest colour it is much less showy than its allies, but it is interesting as an outlying species of the genus, for the six species hitherto described are all natives of the Andes. A technical description is appended,* chiefly drawn from the living plant, which has much larger flowers than the other, being better developed. R. A. Rolfe.

WISTARIA INVOLUTA, Sprague (sp. nov.)†.

This new Wistaria (Millettia of the *Flora Australiensis*) has been lately in flower in the Temperate-house at Kew, where it has climbed beyond the gallery, and produced its racemes of pale purplish flowers more than 40 feet above the

* *Cochlioda brasiliensis*, Rolfe.—Pseudobulbs tufted, oblong, compressed, 1–1½ inch long, with a pair of short basal sheaths at the base, diphyllous at the apex. Leaves oblong-lanceolate, acute, somewhat recurved, 2½–5 inches long. Scapes borne from the axils of the bracts, erect or arching, and very slender, so that the upper part becomes pendulous when long, 5–10 inches long, simple, or with a side branch at the base when strong, 6–13 flowered. Bracts lanceolate, acute, 3–4 lines long. Pedicels slender, 4–8 lines long, dusky-brown. Sepals spreading, narrowly lanceolate-oblong, acute, at length revolute at the sides, 5–8 lines long, light green with a slight suffusion of olive-brown. Petals lanceolate, acute, slightly shorter and broader than the sepals, but otherwise similar. On the back of the segments the brown is more pronounced, especially along the middle, the colour extending from the pedicels. Lip adnate to the column for nearly 3 lines, the union being an extension of the keels; limb three-lobed, sharply reflexed just beyond the middle; side lobes with reflexed margins, broadening upwards, then abruptly narrowing just beyond the flexure; front lobe deltoid-oblong and apiculate; disc with a pair of fleshy keels, and a small pubescent tooth on either side just above the junction with the column; throat bearing a mass of short yellow hairs. Colour of lip white tinged with green on the front lobe, and with faint purple at the apex of the keels. Column 4 lines long, whitish, with a pair of minute lateral teeth near the apex; anther-case tinged with green; stigma with a bright yellow line in front. Native of Brazil.

† *Wistaria involuta*, Sprague.—Liana lignosa ultra 40-pedalis, basi 1½ poll. diametro, ramis teretibus, novellis ut foliorum rachides inflorescentiaque patenter ferrugineo-pubescentibus. Folia 6–10 poll. longa, 5–6-juga, petiolulis 1–2 lin. longis, lamina elliptico-ovata, retusa, basi rotundata vel subcordata, 1–2½ poll. longa, 8–18 lin. lata, supra nitida minute reticulata, venis pubescentibus exceptis glabrescens, subtus pallidior venis conspicue ceterum sparshusculis pubescente, venis secundariis utrinque circa 5–7. Racemi in axillis 2–3 superioribus orti, 5–6 poll. longi, rachide nodoso, floribus pluris (6–9) nodis fasciculatis. Calyx basi bracteolis 2 oblongis rotundatis ½ lin. longis, obconico-patelliformis truncatus 1½ lin. longus, ore 2 lin. diametro, margine involuto (in gemma campanulatus, 1½ lin. longus), ut pedicelli bracteolæque longe ferrugineo-pubescentes, obsolete 3-denticulatus, denticulis duobus posticis nullis. Corolla albedo-purpurea, apice excepto glabra; vexillum prope basin viride, suborbiculare, 4½ lin. latum, fere 4 lin. longum, margine incurvo, apice extra parce pilosum, ungue crasso incurvo ¾ lin. longo; alæ oblongæ, basi truncatæ, 3½ lin. longæ, 1 lin. latæ, omnino glabræ, carinae leviter adherentes, ungue 1½ lin. longo; carinae petala supra medium antice connata, breviter cymbiformia, basi truncata, 3 lin. longa, vix ultra 1½ lin. lata, apice præcipue extra dense pilosa, ungue 1½ lin. longo. Stamina diadelphica, filamenta vexillari ceteris medio levissime adherente, antheris uniformibus ¾ lin. longis, filamentis alterne inaequalibus. Discus 8-lo-batus, ¼ lin. altus. Ovarium compressum, 3¼–4 lin. longum, sericeum, stylo 1½ lin. longo subglabro, stigmatibus capitato.

ground. It is first branched about 5 feet from the ground and again higher up, some of the branches twining round the parent stem, a not uncommon occurrence in lianes. The plant has been in cultivation at Kew for about twenty years, but has never previously flowered. It comes from the Richmond River district of New South Wales, where *W. megasperma* has also been collected. The present species is the fourth known from Australia, the others being *W. Maideniana*, *W. pilipes* (Bail.), and the above-mentioned *W. megasperma*. That such a large woody climber should have remained unnoticed up till the present time shows how much of the Australian flora is still unknown, even in the older colonies.

It will be noticed that we have departed from the nomenclature of the *Flora Australiensis* in placing all the Australian species under *Wistaria* rather than *Millettia*. This was first done by Baron von Mueller, who has been followed by Moore and Betche in their *Handbook of the Flora of New South Wales*; and there can be no doubt that the Australian species are more nearly allied in floral structure (especially that of the androecium and disc) to the North American, Japanese, and Chinese species of *Wistaria* than to the Indian species (*M. rubiginosa* and *M. splendens*), on which the genus *Millettia* was founded by Wight and Arnott. Whether or not the entire genus *Millettia* will have to be sunk in *Wistaria* must be left for decision to the future monographer of Leguminosæ, but in any case it is to be hoped that Rafinesque's name *Phaseoloides*, revived by Otto Kuntze in a slightly modified form, will not be adopted by botanists.

How nearly many of the genera of Leguminosæ approach one another may be realised by referring to Bentham's descriptions of *Millettia*, *Wistaria*, and *Lonchocarpus*, in the *Genera Plantarum* and *Flora Australiensis*. *Millettia* appears to differ from *Wistaria* only in having a "hard, usually flat or thick pod not opening so readily"; while *Lonchocarpus*, which is actually placed in a different tribe, seems to be nothing but a *Millettia* with indehiscent fruits; but this is one of those defects inseparable from any linear arrangement of living organisms. T. A. S.

THE ST. LOUIS EXHIBITION.

AMONGST the many attractions to horticulturists at the exhibition now being held at St. Louis, not the least is the garden surrounding the French national pavilion. It covers an area of about 13 acres, and is laid out in the semi-formal style followed by many modern French landscapists. The pavilion is a copy of the Grand Trianon, and the garden has been made to harmonise well with the architecture of the building.

Entering on the east through the massive iron gates from University Boulevard, a broad driveway leads direct to the pavilion. Running up the centre of the drive, and dividing it in two are two grass plots, in each of which is a bed planted with *Gladiolus*. Good specimens of *Magnolia grandiflora*, exhibited by Louis Leroy, Angers, are planted on each side of the road, and between the *Magnolias* stand reproductions in plaster of vases in the park at Versailles. To the left of the drive is a figure of a lion in stone, standing in a bed of Tea Roses, shown by Ponce et Fils, Nogent-sur-Seine, and to the right is a human figure in white marble, surrounded by a mass of *Hydrangea paniculata grandiflora*, giving to this part of the garden a very ornate appearance. In the south-east corner of the garden are extensive exhibits of espalier Apple-trees, sent by the well-known houses, Nombrot Bruneau, Bourg la Reine, and Croux et Fils, Chatenay. As trained fruit-trees are not familiar in St. Louis, these attract great attention from the visitors. The last-named firm also has a large exhibit of

ornamental trees and shrubs, including *Rhododendrons*, *Magnolias*, *Bambusa viridi-glaucescens*, *Cornus brachypoda*, and some splendid pyramid specimens, 12 to 14 feet high, of *Prunus Pissardi* and *Ilex Aquifolium marginata alba*. In Conifers, they show nice plants of *Picea pungens glauca Kosteri*, *Abies Regina Amaliae*, and *Cedrus libani compacta*. In other parts of the garden are seen collections of Conifers exhibited by André Leroy, Angers; G. Duval, Lieusaint; and R. Goyer, Limoges. To the south of the pavilion is an artistically arranged water scene, designed and carried out under the direction of V. Tatoux, artificial rock builder, Lille. Large flat rocks shelve out from the side of the hill, and from amongst these bursts forth a stream of water, which flows into a small lake below. At the top of the incline are planted large specimens of *Buxus pyramidalis*, *B. microphylla*, *Carpinus Betulus* var. *pyramidalis*, &c., sent by Moser, Versailles.

MELIANTHUS MAJOR.

THIS Cape plant has long been an inhabitant of our greenhouses, where its peculiar but very handsome grey foliage always attracts attention; of late years it has been made use of for summer bedding, for which purpose it is very effective. Our illustration (fig. 57) was taken from a photograph kindly forwarded by Mrs. Dunbar Buller from Donaghadee, Ireland. The shrub grows there in the open-air, and has attained a height of 7 feet, and is about 24 feet in circumference. The plant has this year produced four spikes of its purplish-brown flowers, which are not only handsome, but structurally very interesting. The bees also find it worthy of notice from the quantities of honeyed nectar formed in the flowers, the conformation of which is so contrived to attract the insect and make it useful in conveying the pollen to other flowers.

FIG. 57.—FLOWERING SPECIMEN OF MELIANTHUS MAJOR IN A GARDEN AT DONAGHADEE.

Another very interesting feature of the garden is supplied by the Rose-beds, planted with material from various French firms. Almost all classes are represented, and nearly all are in good health and blooming well. Amongst the Hybrid Perpetuals, Captain Christy, Baroness Rothschild, and Ulrich Brunner are very noticeable. A bed of the Hybrid Tea Gruss an Teplitz is also very showy. G. Boucher, Paris, exhibits a collection of some 320 varieties on standards; these, however, appear to be suffering from the intense heat of the St. Louis summer. The hot weather, however, seems to agree well with the Cannas, of which there is a magnificent display. The principal exhibitors of these and Dahlias are Vilmorin, Andrieux et Cie., and Cayeux et Leclerc.

The garden was designed and the exhibits arranged by M. Vacherot, who was chief gardener at the Paris Exposition in 1900, and who now holds the position of landscape architect of the Bois de Boulogne. The work of construction was under the immediate supervision of M. Turc, another well-known horticulturist from Paris. M. Turc is now in charge of the garden in the absence of M. Vacherot. T. W. Brown, August 12.

THE COLLECTION OF KAURI GUM.

A REPORT reaches us of what is described as an important experiment which is being made in the collection of kauri gum in New Zealand. It is known to many that next to anime, or copal (which is the produce of *Trachylobium Hornemannianum*, of Zanzibar), kauri, or gum kauri as it is called in commerce, derived from *Agathis australis*, is the best material for varnish-making; but to be of good quality it must be, like other varnish-making gums or resins, dug from the ground, in which it has lain for such a lengthened period as to become semi-fossilised and consequently very hard. The harder the resin the better are its drying qualities and hardness when converted into varnish, consequently the more completely fossilised the resin is, so much greater is the value. Some very fine qualities of anime from Zanzibar have been known to realise as much as 40 per ton. This exceptionally fine quality is that which has lain in the ground for a very long period, and has mostly been dug from some depth beneath the surface, where no trees of the kind from which it originally exuded at present exist. The resin

which exudes from fractures in the trunks and hardens or concretes on the back, though quite brittle, is of comparatively small value for varnish-making. Thus it comes as a surprise when we are told in the report referred to that the new method with the Kauri Pine is to "cut through the bark and make a slight incision on the inner skin. It is then left, and in a few months the tree is ascended, and the

trunks with that dug from the ground, the question, which seems an important one, is whether, instead of increasing the supply or making it more permanent, it will not help to diminish it, notwithstanding that the report which has given rise to these remarks says—"Hitherto it has been generally dug from the ground, and the great drawback has been that the supply might become exhausted; but if the

large forests, growing up to a height of 150 feet to 200 feet. The wood is noted for its straight, even grain, of a light straw-yellow colour, and remarkably free from knots. When properly seasoned, it is not liable to warp or crack, and in consequence of these excellent qualities it is much in demand for engineers' pattern-making; another recommendation being the enormous size of the planks which can be obtained. On many of the trees, however, large wens or burrs are formed, producing one of the most beautiful cabinet woods imaginable, known as mottled kauri. Upon tapping a healthy tree the resin exudes in the form of turpentine, which hardens or concretes on the surface, so that in a forest of living trees kauri gum in almost every stage, from fluid, plastic to brittle, is to be found; but, as before said, that which has fallen from the trees and become buried in the ground, where it may have lain for ages, is by far the most valuable. This fossil resin varies not only in hardness according to the length of time it has been deposited, but also in colour and brilliancy, some qualities being perfectly transparent, and others nearly opaque and even black, due probably to the action of forest fires. It is also seen in commerce in pieces of all sizes, from dust up to blocks of 50 lb. weight. A single lump weighing 220 lb. was shown at one of the Colonial exhibitions. The resin is usually found a few feet below the surface, and it is located by the diggers by a system of probing the ground with a long iron spear, and afterwards digging at such parts where the spear has struck the gum. Gum-digging was originally carried on alone by the Maoris, the gum being exchanged by barter for other goods. At the present time thousands of people of all kinds, mostly those who cannot find any other occupation, are occupied in digging, the work being carried on till the locality is exhausted, the gum being taken to a central store and disposed of to an agent of some merchant. At the stores it is roughly sorted before being sent to Auckland, but on arrival there it is carefully sifted, cleaned and scraped, and packed for shipment in strong cases made of the wood of the Kauri Pine. The industry is said to give employment to about 7,000 persons; the value of the exports in 1899 amounted to £607,619, and in 1901 7,541 tons were exported, valued at £446,114. John R. Jackson, Claremont, Lympstone, Devonshire.

FIG. 58.—ROSE-COLOURED HYBRID ASTILBE.

Shown by Messrs. Van Waveren and Kruijff, of Haarlem, at the Holland House Show, where it received a special prize. (See *ante*, p. 46.)

gum which has flowed and hardened about the wound is chipped off, and is ready for the market." It is further said that the Government has marked off 400 trees for the experiment, and is carefully watching the results, the chief problem being whether the trees so treated will be found injured for the purposes of timber; for it must be borne in mind that the Kauri Pine is one of the most important and valuable of timbers. Besides the comparative small value of the recent resin found concreted on the

experiment now being made is successful the supply of gum may last for many years, and the value of growing kauri will be much increased." It is true that the quality of kauri varies considerably, and in consequence the market value also.

In the province of Auckland, whence the gum was at one time exclusively obtained, it is found only in open bush-land, where no vestiges of the trees are now existent. In other parts of the colony of New Zealand the tree flourishes in

REMARKS ON THE CONDITION OF THE FRUIT CROPS AT THE END OF JULY.

(See *Tables and General Summary, ante*, pp. 70-76.)

(Continued from p. 126.)

4, MIDLAND COUNTIES.

SHROPSHIRE (*continued*).—Apples are over the average in quantity and of good quality. The crop of Pears is rather under the average, also Plums, the trees of the latter being much infested with greenfly. Nuts in the hedge-rows are plentiful. Walnuts are rather scarce. Our soil is strong clay on the limestone formation, situated about 500 feet above the sea level. James Loudon, *The Quinta Gardens, Chirk, Ruabon*.

STAFFORDSHIRE.—Nearly all varieties of Apples set a heavy crop, but many are now dropping owing to the prolonged drought. The trees are clean and healthy, having been winter-dressed with caustic-alkali wash. Pears flowered less freely than Apples, and many of the young fruits having dropped, we have only a thin crop left. Our soil is a poor light loam, resting on a gravelly sub-soil, and is not at all suitable for producing first-class fruit. G. H. Green, *Enville Gardens, Stourbridge*.

— Apples set a heavy crop of fruit, which has necessitated much thinning. Pear-trees, with the exception of a few, are well furnished with fruit. Those trees whose blossom was cut off by

frost last season, and afterwards flowered a second time, have but a medium crop. Cherries, both dessert and "Morello," blossomed well and set freely, but later dropped quite half their fruit. Small fruits have been abundant, but the very scanty rainfall, only 2 inches since May 1, has made it necessary for much watering to bring the crops to perfection. The soil here consists of a stiff clayey loam, very wet in rainy seasons, but extremely dry and hard in such seasons as this. *G. Woodgate, Rolleston Hall Gardens, Burton-on-Trent.*

— The fruit crops throughout are excellent, especially Apples and Pears. Strawberries and Gooseberries are abundant, but Currants are below the average. Our situation is high and exposed to easterly winds. The soil is fairly light, loamy, on a clay subsoil. *E. Gilman, Ingestre Gardens, Stafford.*

— I never saw Apple and Pear trees so full of bloom as they were this year. Apples have set well, and will be rather small in size. Pears did not set well from some unknown cause, although there were no late frosts to injure them. Plums and Damsons are a very thin crop. Gooseberries are very plentiful, Black Currant bushes looked very promising when in bloom, but they were badly infested with fly, and all the fruit on some trees dropped off. Strawberries promised well, but the dry weather we had caused them to be very small, in fact a lot of the late blooms shrivelled up from want of water. *John Wallace, Woore, Newcastle.*

— Strawberries, Raspberries, Black and Red Currants, and Gooseberries are good crops, but the plants are suffering much from want of rain. Apple trees are carrying good crops, but Pears not so good. Morello Cherries are very good, other varieties are not. Plums dropped badly at stoning time. Our soil is the stiffest clay varied with hard rock marl. *W. Bennett, Rangemore Gardens, Burton-on-Trent.*

WARWICKSHIRE.—Apple-trees are very heavily laden, but I fear the fruit will be small, in consequence of the long-continued drought. Pears look well, but are not so abundant as Apples. Of Plums, the varieties Victoria, Kirk's, Autumn Compôte, and Magnum Bonum are carrying heavy crops. The Damson crop is rather under the average. Apricots are clean, and promise well. The same remark applies to Peaches. Strawberries were excellent, but in consequence of the drought the later varieties were soon over. All small fruits are abundant. Filberts are not plentiful, but Walnuts are a heavy crop. *James Rodger, The Gardens, Charlecote Park, Warwick.*

— Most kinds of fruit-trees blossomed profusely, and hopes were entertained that the crops would be abundant; but a spell of north-easterly winds and continued drought have proved disastrous in many instances. *H. T. Martin, Stoneleigh Abbey Gardens, Kenilworth.*

— All our fruit crops are good, but rain is needed to swell the fruit, the six weeks' hot, dry weather having thinned the Plum and Apple crops considerably. It looked at one time as if all the trees would be broken down by the weight of their crops, and consequently many of the trees were propped up. The soil here is a sandy clay resting on gravel. *A. D. Christie, Marriage Hill Farm, Bidford.*

— The flowering season of all out-door fruit promised well, but as setting time approached much of the blossom fell; especially was this the case with Pears and Plums on standard trees, but on walls I have seen some good crops of both Pears and Plums. Although much of the Apple blossom dropped, there will be an abundance of this fruit. As the weather kept continuously dry, we watered many of the best trees. Small fruits have been plentiful and good, but when not

watered and mulched have suffered from the severe drought. At Barston Hall, the seat of John Roderick, Esq., $2\frac{1}{2}$ miles from here, there are $4\frac{1}{2}$ acres of splendid Walnut trees planted about 100 years ago; they are heavily fruited with from two to nine nuts in a cluster. These trees are yearly top-dressed with lime, and this is followed soon after with another dressing of farm-yard manure. At the same place there is a modern orchard of 103 Apple trees of a good selection. They are on grass, but each tree has round it a 12-feet circle of clean earth, which every year receives dressing of well-rotted manure. The fruit on these trees is very promising. My soil is a strongish brown loam on a bed of marly clay, while below that is clean red sand containing water. The soil in the neighbourhood varies from the above to thin, black pebbly soil, on which fruit-trees do not thrive so well. *W. Miller, Berkswell, Coventry.*

5. SOUTHERN COUNTIES.

BERKSHIRE.—The fruit crops in this neighbourhood are in general above the average. Small fruits are a very heavy crop. Strawberries have been abundant, but were quickly over. Morello Cherry-trees have dropped their fruit largely and are generally a light crop. The soil here is of a light, sandy nature, resting on gravel, and crops soon suffer in time of drought. *J. Howard, Benham Park Gardens, Newbury.*

— The outdoor fruit crops this year are somewhat disappointing, considering the wealth of blossom all round, and the early promise of a grand crop in every department. Plums and Cherries dropped largely soon after setting, due probably to the somewhat immature state of the wood following the wet summer of last year. Strawberries have been exceedingly good, especially the varieties Waterloo and Royal Sovereign; Laxton's Latest is a grand addition. The soil here is a clayey loam, much given to cracking in dry weather. *Wm. Pope, Highclere Gardens, Newbury.*

DORSETSHIRE.—This is a grand season for all kinds of fruit, with the exception of Raspberries, which are suffering from the drought. All other fruits are looking well, the trees carrying heavy crops, and only require a good rain in order to swell up the fruit. The soil here is chalky, very shallow, and of a dry nature. *Thos. Denny, Down House Gardens, Blandford.*

— In this district the promise of heavy fruit crops early in the season has only been partially fulfilled. Apricots, Plums, and Pears are very disappointing, the trees bloomed profusely, and set over an average crop of fruit, but much of the latter dropped in the embryo stage. Peaches and Nectarines on the other hand are a good average crop, the trees being healthy and clean. Cherries are only fair, the trees being infested with black aphids. Apples are a heavy crop all round the district. Bush fruits are abundant and good, the same remark applies to Strawberries. There is an average crop of Figs, the varieties Brown Turkey and Brunswick being the best. The soil, a light to medium loam, on loose flinty gravel, requires heavy rain or copious waterings to obtain good results. *Ben. Campbell, The Gardens, Kingston House, Dorchester.*

— We are receiving encouragement this year for the labour and expense expended in our bardy fruit growing, by a generally good and satisfactory crop, Apricots being the only exception; but the bloom on these was so scanty and weak that a crop was not looked for. Apples are not only a heavy crop, but the fruit is cleaner than for many years past. Pears on walls are feeling the excessive heat and drought, and will be small where they cannot be artificially watered. Plums, with a few exceptions, as Coe's Golden Drop, &c., are a full crop,

and such free bearers as Early Prolific, Victoria, Czar, &c., have required heavy thinning. Sweet Cherries have been better than usual, but Morellos are only half a crop. Peach and Nectarine trees after two bad seasons are now making healthy wood again, and the light crop will no doubt finish well. Apricots are almost absent. Small fruits are splendid, Red Currants in particular. Strawberries may be said to have been the crop of the season. Of the newer kinds of the latter, Trafalgar has been excellent, and Climax is also a most valuable late variety. Of Nuts, Cobs give very poor promise, and Walnuts are only mediocre. *T. Turton, Castle Gardens, Sherborne.*

— What promised to be a very good year for the fruit crops in general was disappointing, owing to fogs and blight coming just as the trees were in full bloom. Some of the earlier Pears were saved, but the fruits have fallen twice. Still, what are left on the trees are very good indeed. The soil in general in this district is not conducive to good fruit culture. *H. Kempshall, Abbotsbury Gardens, Dorchester.*

HAMPSHIRE.—After such a promise in the the spring in the blossom on all fruit trees one cannot say now that bountiful crops abound. Apples, on some trees, are fairly good, while others are bare of fruit. Pears are a poor crop, excepting on trees on walls, which are carrying full crops. Peaches and Nectarine trees have a grand crop. The fly is troublesome, although there is not so much blister on the trees as is usual. Small fruits are good, but Gooseberry caterpillars are numerous. Our soil in the orchard is heavy on the clay. That in the kitchen-garden is better, having been under cultivation longer. *Arthur Lee, Palace House Gardens, Beaulieu, Brockenhurst.*

— Speaking broadly, the fruit crop here is a good one, although in some gardens in the neighbourhood the crop generally is thin, especially on light soils, where the bloom opened early. Where the soil is heavy, the crops, except Pears, are heavy. Apple crops have never been so heavy, the only exception being Warner's King, which even in that variety is variable. We have 200 trees of that variety; some have plenty of fruit, others none. The trees on the whole are free from insect-pests; the biting east wind experienced at the end of May crippled much of the foliage in exposed places. Worcester Pearmain, Lady Sudeley, King of Pippins, are most heavy croppers. *Edwin Molyneux, Swanmore Park, Bishop's Waltham.*

— Apples are a heavy crop, and the fruit and trees clean; they are already assuming colour. Pears do not, as a rule, do well on our cold clay soil, but they are so far promising in appearance, but always lack flavour. Plums, with one or two exceptions, are light crops. Cherries, both sweet and Morello, are bad in the extreme; after setting a heavy crop the fruit dropped wholesale. Small fruits, with the exception of Gooseberries, are good, especially Raspberry Superlative. Strawberries have been abundant and good, but the drought setting in the season has been of short duration. *A. G. Nichols, Strathfieldsaye Gardens, Mortimer, R.S.O.*

— Taken collectively the fruit crop here is very satisfactory, and the best known for some years. The trees flowered most profusely and were a grand sight. Raspberries and Strawberries are exceptionally good. Our soil is very light, resting on gravel. *James Wasley, Sherfield Manor Gardens, Basingstoke.*

— The fruit crops in this district are, on the whole, a fair average crop. Apples and Pears have dropped very much, but there still remains sufficient fruit for the trees to ripen. Peaches and Nectarines have been badly blistered. Plums are thin, the varieties River's Prolific, The Czar, Victoria, and Black Imperial are the best.

All bush fruits are good, and Strawberries carried the heaviest crops I have ever seen. Givon's Late Prolific, which I have grown this year for the first time, promises to be a splendid late variety. Our soil here is very stiff and cold, with a clay sub-soil resting on chalk. *J. Bowerman, Hackwood Park Gardens, Basingstoke.*

— We have above the average crop of Apples here this year, the fruit looking very clean and healthy. Pear crops are rather irregular in this district, although we have a good average crop, especially on trees on the walls.

spurs are dying. I cannot account for this. At one time I thought it was a serious attack of red-spider, but this I have proved is not the case; I wonder if any other of your correspondents have noticed the same thing. The one variety standing the heat best is Ecklinville Seedling. This variety is looking green and healthy and carrying really heavy crops on all the trees. I know it is objected to because it is rather soft and is easily bruised, still I consider it one of the best early cooking Apples. Other varieties that I have proved to be good are Newton Wonder,

a failure. I have for years picked the infested fruits off and burnt them, but this year I have the pest worse than ever. It seems to me we are suffering from a want of co-operation in combating noxious insects. *G. Woodward, Barham Court Gardens, Maidstone.*

— The marvellous wealth of blossom has not been followed by the expected heavy crops. I attribute this fact to unripened wood and want of vigour in the reproductive organs. The crop was still further reduced by a cold spell of easterly winds at a critical period. Aphis has

FIG. 59.—*CASTANOPSIS CHRYSOPHYLLA*: THE GOLDEN CHESTNUT.

Leaves golden-yellow on the under surface; bristly involucre, golden-brown. (See p. 152.)

The crop of Strawberries is exceptionally heavy, the fruit being of good size and flavour. Our soil is very heavy, with a clay subsoil. *Thomas Leith, Beaurepaire Park Gardens, Basingstoke.*

— All fruit crops here are bad, the fruit dropping wholesale after setting. Our soil is a strong stiff loam. *Noah Kneller, Malshanger Park, Basingstoke.*

KENT.—Apples at one time gave every promise of being an average crop, but from various causes have dropped badly. Even now, when the fruit is as large as hens' eggs, they continue to drop; consequently the prospects are not so promising as they were at one time. Some of our trees look as if the foliage has been scorched, the leaves being brown; and I notice some of the

Worcester Pearmain, Allington Pippin, Grenadier, Golden Spire, Stirling Castle, Lord Derby, Tower of Glamis, and Irish Peach. Councillor I would recommend to be planted more largely; it is a good grower and a continuous and heavy cropper, of the most beautiful straw colour, with a bright coppery blush on the side exposed to the sun. I am sorry to say that Bramley's Seedling is not a success here, as it drops its fruits even when they are quite large, and having a short stem it is easily blown down by the wind. In some districts I have seen this variety do grandly and have been envious of its success. Byford Wonder, and Chelmsford Wonder produce splendid fruits and are vigorous growers, and in my opinion equal to Newton Pippin. Pears set well, but owing to the midge the crop is nearly

been very abundant on the trees. *George Bunyard, Maidstone.*

— Apple-trees bloomed profusely, but the young fruit being infested with maggot, dropped considerably, and the remainder of the crop is generally small. Pears promising in many places. Plum-trees bloomed sparingly, and the crop is accordingly light. Cherries dropped heavily, owing possibly to the long-continued cold and partial exhaustion of the trees by the exceptional amount of bloom. Strawberries were a record crop and of good quality. Our soil is a mixture of loam and clay. *Geo. Fennell, Bowden, Tonbridge.*

— The most notable features in our gardens this year with regard to fruit are the great

Strawberry crop, and the presence of two pests on the Apple-trees—the Apple-sucker, and a peculiar black mould, noticed more particularly on the varieties Yellow Ingestre and Wellington. The latter pest is doing much harm to the fruit, and as far as I know is incurable. *Grower, Mereworth.*

— Up to the end of May all indications were favourable for a record fruit year. Insect-pests, in addition to cold north-easterly winds in early June, entirely altered the prospects of the Cherry, Plum, and Black Currant crops. Apples, Strawberries, and Gooseberries are most abundant. Raspberries are also a good crop, but suffering from drought. All fruit crops on walls, excepting Cherries, are over the average. Walnuts are a tremendous crop, and Cob-nuts a fair average. The soil here is a light, dry, warm loam of good depth. *Geo. Hutt, Lullingstone Castle, Eynsford.*

To be continued.)

THE RIVIERA IN SUMMER.

SIR THOMAS HANBURY writes:—"Although prolonged drought happens every summer on the Riviera, it is this year of such a determined and persistent character, and so combined with great heat as likely to prove disastrous to many gardens along the coast of the Mediterranean.

Many of those who love their gardens in England, and who flock to the Riviera in winter and spring, express surprise at the absence of plants that are commonly cultivated in England in summer in the open border. Could such persons see a garden on the Riviera before the autumn rains commence they would cease to wonder, and, on the contrary, express astonishment at so many things surviving so terrible a drought.

At La Mortola the last good rain that fell was on June 11, and it is not likely any more will fall before the second week in September, when there is a decided fall in the temperature.

Appended is a list showing what plants are in flower in summer, notwithstanding the heat and drought:—

Agave rigida, elongata.—Greenish.
Asclepias curassavica, L.—Antilles. Orange-red.
Banksia integrifolia, L.—Australia. Flowering since spring.
Bursaria spinosa, Cav.: Pittosporaceae.—Tree, with graceful branches covered with numerous pyramidal drooping panicles of small white flowers.
Burchellia capensis, R. Br.: Rubiaceae.—Cape. Flowers tubular, about 1 inch long; orange-red.
Calodendron capense, Thnb.: Rutaceae.—Cape. Tree. Flowers resembling somewhat the spikes of the Horse Chestnut.
Cereus candicans, Gill; *Spachianus*, Lem.: strigosus, Gill; *cœrulescens*, Salm., and several others—all night-flowering species, some very fine.
Clematis coccinea, Engelm.
Crotopia stapeliiformis, Haw.: Aselepiadaceae.—Cape. Curious succulents; stem thick at base, at the top twining. Flowers white spotted with brown.
Crinum Powellii, Hort.
Cyphomandra fragrans, Sendtn.: Solanaceae.—South Brazil. Evergreen shrub. Buds purplish-blue; flowers green, agreeably scented.
Ebenus cretica, L.; *Papilionaceae*.—Crete. Little shrub, with silvery-white leaves. Flowers resembling those of the common Sainfoin, but showier.
Erythrina caffra, Thnb., and *E. crista-galli*, L.: *Papilionaceae*.—The former with brilliant red flowers much finer than the latter.
Firmiana platanifolia, R. Br.—Large tree. Sterculiaceae.
Grevillea Banksii v. *Forsteri*.—With fine red flower-spikes.
G. juniperina, R. Br.—Yellow.
G. longifolia, R. Br.—Red.
Grewia occidentalis, L.; *Tiliaceae*.—A tall climbing shrub from the Cape, with elegant pink stellate flowers.
G. caffra, Meissn.
Huonia somalica, N.E. Br.—A pretty little *Stapelia* with brown-red flowers.
Hibiscus heterophyllus, Vent.—Queensland, New South Wales. Tall shrub; flowers large, single, 15 cm. across; petals white, rose on the base with dark purple centre and staminal column.
H. Rosa sinensis, L.—Flowering freely, large, deep red.

Jasminum odoratissimum, L.—Madeira. Yellow.
J. gracillimum, Hook. fil., *Botanical Magazine*, t. 6559.—Borneo. White.

Ipomœa bona, Nox. L.—South America. White.
I. Learii, Paxt.—Tropical America. Commonly cultivated on the Riviera. Perhaps the most floriferous of all. Violet-blue.

Jacaranda ovalifolia, R. Br.; *Bignoniaceae*.—Brazil. Tree. Always most beautiful at this time with numerous panicles of violet-blue flowers.

Lagunaria Patersoni, Don: *Malvaceae*.—Tree, with numerous showy pink flowers. Norfolk Island, Queensland.

Leonotis Leonurus, R. Br.—Cape. Shrubby, with numerous whorls of large bright-red flowers. Very showy.

Melaleuca armillaris, stypheloides, &c.

Musa Basjoo.

Nerium Oleander, L.—A great show everywhere, in the garden, and in the valley, along the road, &c. Indigenous.

Oncidium bifolium, Sims.—South America. A little Orchid growing epiphytically on a Fig tree and a Lemon tree. Flowers yellow.

Opuntias, a great number of species, several for the first time, of which the flowers were yet unknown.

Paschanthus Taggii, Schinz.—A curious *Passifloraceae* from German South-west Africa (Dinter.), with a large tuberous rhizome. Male plant only.

Parkinsonia aculeata, L.; *Cæsalpin*.—South America. A graceful tree, with fine foliage and large, pretty yellow flowers.

Pithecoctenium muricatum, Moc.; *Bignoniaceae*.—Guatemala. Tall climber. Flowers white with yellow throat, in large panicles. Fruit known as "Moukey-brush."

Plumbago capensis, Thnb.—Cape. Pale blue or white; very graceful plant, much grown on the Riviera.

Plumiera rubra, L.—Tropical America. Flowers similar to those of *Nerium Oleander*.

Proustia pyrifolia, Lag.; *Compositæ*.—Chili. Climbing shrub; flowers pink.

Pittosporum rhombifolium, A. Cunn.—Queensland; N.S. Wales. A small tree with large umbellate corymbs of small white flowers.

Psidium Cattleianum, Sabine, and *P. Guajava*, L.—Tropical America. With Myrtle-like flowers.

Rosa bracteata, Wendl.—China.

Solanum.—Many species, as *Wendlandi*, *jasminoides*, *bonaviensis*, &c.

Stigmaphyllon ciliatum; *Malpighiaceae*.—Brazil. Climbing shrub. Flowers yellow, resembling an *Oncidium*.

Stereulia diversifolia, G. Don.—A tall tree from Australia. Flowers numerous, campanulate, white.

S. lurida, F. M.—Flowers red.

Streptosolen Jamesoni, D. C.; *Solanaceae*.—Colombia. Little shrub, very free flowering. Flowers changing from yellow to deep orange-red.

Tecoma Ricasoliana, Hort. Ital.—Large climber; rose.

Trachelium cœruleum, L.; *Campanulaceae*.—A very pretty herbaceous, half-wild, with large umbellate corymbs of pale blue flowers. *Thomas Hanbury, La Mortola.*

SOILS AND MANURES FOR SPECIAL CROPS.

(Continued from p. 88.)

THE CHRYSANTHEMUM.—The next plant to which attention will be directed is the Chrysanthemum, which is as great a favourite in the floral world as is the Carnation or the Rose.

Dr. A. B. Griffiths has kindly provided the writer with an analysis of the Chrysanthemum plant which shows the following chemical composition in parts per hundred:—

Potash	16.2
Lime	26.3
Soda	10.4
Magnesia	10.2
Iron oxide	3.7
Phosphoric acid	19.5
Sulphuric acid	4.7
Silica	6.0
Chlorine	3.1

These figures show that lime forms an important constituent in the main structure of the Chrysanthemum plant, comprising as it does more than one-quarter of its total mineral substance. Phosphoric acid is also a conspicuous element, while potash ranges third. Soda and magnesia come fourth on the list, and are nearly equal in their proportions. The element nitrogen forms 2.92 per cent. of the organic substance of the plant.

The chemical composition of the Chrysanthemum seems to point, therefore, to the requirement of a fairly complete manure, of which superphosphate or bone-meal should form a prominent part. The excellence of any crop does not resolve itself entirely into questions of the kind and amount of manure used. This is particularly true of the Chrysanthemum. Consideration must be given to the variety of the plant and the character of the cutting. That a weak cutting or variety must receive different treatment from a hardy one is self-evident.

The physical condition of the soil is of almost as much moment as its chemical constitution. It is of prime importance that the soil should be porous, in order that thorough drainage and aëration be obtained. For this purpose it is well to mix with the soil a certain amount of sharp sand and charcoal, the presence of the latter being particularly desirable. The nature of the soil, too, governs the manner of potting. For a sturdy growth, light soil should be very firmly packed, while heavy soils require only loose packing.

COMPOSTS.

The question of the feeding of the Chrysanthemum resolves itself into two parts, namely, the nature of the compost and of the subsequent feeding which takes place when the flowering-buds appear. It is commonly held that the basis of the compost should consist of a good fibrous loam. The use of a very heavy clay loam brings with it the danger of water-logged roots, while a very light sandy soil permits excessive drainage and consequent root starvation. It is preferable to err on the side of lightness rather than of heaviness.

With the loam, well-rotted stable-manure may be mixed in various proportions, although the ratio of 1 part manure to 3 parts loam will probably give the best results. Horse, cow, and sheep manure can all be used with good results; but cow-manure is usually preferred, as it gives up its fertilising properties gradually.

It is often advantageous to add to the compost 1 part in 4 of good leaf-mould; with the lighter soils this is particularly desirable, not so much because of any addition of nutrient material, but because of its power of retaining water and plant-food.

Various animal as well as mineral fertilisers have frequently been added to the compost, and sometimes even used as substitutes for the stable-manure. Guano has thus been used with good results; so has fish-manure and dried blood. A very good practice is to add to every cubic yard (20 bushels) of compost 40 lb. of finely-ground bone-manure, which not only serves as a source of phosphoric acid and lime, but also furnishes some nitrogen. Soot also has with advantage been made a part of the compost. This furnishes as much as 3 per cent. nitrogen, chiefly as sulphate of ammonia, as well as small quantities of phosphoric acid and potash. It may be used at the rate of 1 to 5 lb. of soot to 100 lb. of the compost. Should the loam be at all deficient in lime, the deficiency should be corrected by the addition of a few handfuls of slaked lime (2 or 3 lb.) per cubic yard of soil. A lack of lime will cause soft stems and flabby leaves. Its importance is shown by the foregoing chemical analysis.

Nitrate of soda and sulphate of ammonia have been recommended by some growers as a part of the compost. The evidence in favour of this practice is at present insufficient to commend it. It seems an unnecessary addition, with danger of a too concentrated soil solution, and waste of nitrogen through rapid drainage. Excessive concentration of nutrients in the soil solution is more injurious than a deficiency, because of the inability of the roots to absorb solutions above a certain degree of concentration. The result is that the plant starves. This fact has been very

strikingly shown by some *Chrysanthemum* cultures seen by the writer within the past few weeks. Again, in the presence of an excess of nutrients a good ball of roots is not produced, even though the concentration of the soil solution is not too great for absorption by the roots; and, further, the roots are not in a condition to take up the subsequent liquid-manure. The best plan is to have a moderately rich compost, thereby obtaining healthy roots, stems, and leaves, and then, when flowering buds appear, to apply the rich liquid-manures. Experiments have shown that nitrate of soda and sulphate of ammonia may be used as a substitute for stable-manure, although not as an addition to it. Still, this

the typical *Iris Saari*. I travelled twice in Eastern Cilicia, into the Rassan Oghlon district, the eastern boundary of the plains, and there found, on the classic ground mentioned by Kotschy, an *Iris* of the *Oncocyclus* group, which has absolutely nothing to do with that incorrectly named *Iris Saari Nazarena*. Herr van Tubergen, of Haarlem, takes it for *Iris Kaniss adjani*, Freyn; but Herr Sprenger has now decided that the plant is different from that species. The original plants of Herr Theodor Kotschy are in the Hof-museum at Vienna. From there I received in a most courteous manner the information that there is no material of this species existing in the herbarium. In Boissier's *Flora Orientalis*

Further, according to the distinguishing characteristics mentioned by Herr Leichtlin (especially that the flower is not considerably larger than *Iris Bismarkiana*), the plant here figured is to be accepted as the true *Iris Saari*, Schott.

Iris Bismarkiana, Regel, has nothing at all to do with *Iris Saari*, Schott. The plant figured in the *Botanical Magazine* as *Iris Saari* is *Iris Bismarkiana*. *Iris Kaniss adjani*, Freyn, is to be considered only as an inferior horticultural variety of *Iris Saari*.

Iris Saari, Schott, is a strong-growing plant, which I found up to an altitude of 6,175 feet. It is the hardiest and the most easily cultivated of all the species of *Oncocyclus*. It flourishes on a

FIG. 60.—IRIS SAARI.

does not at present seem practicable, the better plan being to reserve these for the subsequent feeding as liquid fertilisers. J. J. Willis, Harpenden.

(To be continued.)

IRIS SAARI, SCHOTT.

IRIS SAARI was described in the *Gardeners' Chronicle*, June 17, 1876, p. 788. It was discovered by Theodor Kotschy in Eastern Cilicia in 1854. According to Boissier it has lilac-blue flowers. In the *Botanical Magazine* *Iris Saari lurida* is figured; this is nothing more than *Iris Bismarkiana* of Regel, which in due time was placed on the market by Carl Sprenger. It was natural that I, who have for the past ten years been accustomed to travel in Asia Minor for botanical purposes, should have discovered what constitutes

Iris Saari lurida is mentioned as having been obtained from Herr Leichtlin. He wrote to me as follows:—

"April 28, 1904.

"I received *Iris Saari* from the Hotsch collection. Baker has, I know not why, attached the name *lurida* to it, but, to be sure, my *Saari* is somewhat differently coloured. It was not Regel, but Sprenger, who first named it. *Saari* was discovered by Kotschy but it is [different] from *Bismarkiana*, which is much larger and of a totally different habit. The flowers of *Saari* are considerably larger, while its habit is more dwarfed, something like that of *Iberica*.

MAX LEICHTLIN."

Consequently, *Iris Saari Nazarena* has been happily omitted in all garden catalogues. But as in this district no other *Oncocyclus* *Iris* grows, Theodor Kotschy could only have collected the plant that I myself re-discovered.

limestone soil, with great dryness in summer. In habit the plant recalls *Iris iberica*, and grows about 1 foot in height. The leaves are greyish-green, $\frac{1}{2}$ -inch wide, and from 6 to 8 inches long. The tips are rounded, folded together, and curved backwards in sickle fashion.

The flower-spike grows up to 1 foot in height (above the leaves). It bears the flowers singly, provided with a bi-partite spathe which is of a yellowish-green colour and encloses the pistil. The flowers are sweetly perfumed with honey and are very variously coloured. They only occasionally show the lilac-blue colour mentioned by Boissier; besides, there exists such an abundance of shades in blue, brown yellow, that it is surprising that it should be a wild plant. Most of them are very beautiful and peculiar. The colouring most frequently met with is as follows:

the lower petals pale to citron-yellow, with purple or purplish-brown veining, great purplish-brown spots, in the middle fully bearded with bright yellow, the inner petals are white with lilac-violet, or slaty-blue, or purplish-brown, and more often still chestnut-brown shadings and markings. Very likely it may also have lilac-coloured flowers. *W. Sicke, Mersina, Turkey in Asia.* [We publish this communication with some hesitation, as we are not sure of the author's meaning in all cases. The manuscript is not only written in German, but in German script, which we are not sure that we have correctly deciphered. The photograph (fig. 60) tells its own tale. Ed.]

CULTIVATION OF MELONS.

A LOW-BUILT house, 10 or 12 feet in width, with a south aspect, is the most suitable structure for Melon cultivation, and will allow a border 4 feet 6 inches wide, facing south, for the Melon quarter, with a border 3 feet wide at the back, which can be utilised for growing Cucumbers, which do not require such an amount of sunshine as Melons. This allows 2 feet 6 inches for the pathway. A single brick wall should be built by the side of the pathway, on which to carry iron stays to the outer wall, upon which planks or corrugated iron is laid, on which to grow the Melons. A flow and return pipe should be laid beneath this staging to allow a suitable bottom-heat to be maintained. The plants can be trained either upon removable wire trellises or on permanently fixed wires, the former being more convenient when washing and cleansing the house. The first batch of seed may be sown early in January, placing one good seed in a well-drained thumb-pot, in a mixture of three parts loam and one part leaf-mould. Plunge the pots in cocoanut fibre in a propagating frame with a bottom heat of 75°. Air should at first be given cautiously, and when they are sufficiently hardened off they should be taken out of the frame and placed well up to the light in a house having a temperature of about 70°. As the first rough leaf appears, pot them into 4½-inch pots, using less leaf-mould than before; no consolidation of the soil is needed beyond a gentle pressure with the fingers. When the third or fourth rough leaf makes its appearance they are ready to plant in their fruiting quarters, which should have been prepared two or three days in advance of planting. A layer of stable-litter and leaves should be spread evenly on the planks or corrugated iron to form a suitable drainage. The soil should consist of good old loam of a rather heavy nature; the use of leaf-soil is not advisable, as it induces too much growth. The more lumpy the soil is and the firmer it is made, the stronger will be the growths obtained. The soil can be placed either in the form of a ridge, or in mounds about a foot in height, allowing one plant for each mound; the last mentioned is preferable. Too much soil should not be allowed, as it will get sour before the roots penetrate it, and more can always be added. When the soil is at the temperature of the house, it is ready for use. A neat stake should be placed to each plant to support it until it reaches the first wire. The presence of slugs must be carefully guarded against. Air should be given freely on mild sunny days, always avoiding cold draughts. Syringe the plants and damp the walls and floor twice a day; this will check red-spider. The plants will require stopping when they have grown three-fourths of their allotted distance, pinching the lower laterals at the same time. The growths that are showing fruit should be stopped to one joint above the fruit, so as to keep the sap moving onwards. The laterals that are not showing female flowers may be stopped at two joints, and the sub-laterals at one. Artificial pollination is necessary, and should be performed on a sunny

day, when the petals are well expanded, stripping the male flower of its petals and applying the pollen to the stigma of the female flower. Meanwhile it is best to keep the house in a drier condition. Fire-heat should always be kept back whenever possible, as natural heat is much preferable. The soil must be kept in a moist condition until the fruits are ripening, when the plants need little water. Never allow the water to be poured on the stems of the plants, as this is one of the chief causes of canker. Should canker appear, dust the affected parts with powdered lime or charcoal directly the disease is noticed; this will probably check it. As soon as the roots appear through the surface, a top-dressing of lumpy loam is needful. If medium-sized fruits are required, three or four are quite sufficient for one plant to support. When they are swelling nicely they will be greatly benefited by a watering of weak liquid-manure or some artificial manure, washed into the soil. When the fruits are about three-parts grown they will require supporting, which can be done either with soft string or pieces of board 4 or 5 inches square, suspended from the wires, or with net bags which are made especially for the purpose. *W. B., Risholme Hall.*

PLANT NOTES.

TWO NEW HARDY NYMPHÆAS.

NYMPHÆA TETRAGONA VAR. *HIMALAYENSIS*.—This is the smallest *Nymphæa* yet seen, smaller than the well-known tetragona or pygmæa of the gardens. In the garden of Mr. Sprenger it is grown in small pots, and flowers very well, two-year-old plants producing bloom from May till November uninterruptedly. The flowers float, are only 3–4 cm. in diameter (1½ inch), snow-white with yellow anthers. The leaves are small, dark-green, sometimes marbled with brown. Seed is produced abundantly, the seedlings flowering in the second year. This is a welcome addition to the collection of aquatic plants for pot or tub culture.

N. vomerensis × (new hybrid).—A new hybrid raised here between the Italian *N. alba* and *N. tetragona himalayensis*. It is suitable for pot-culture, and also for culture in the open in basins. It grows luxuriantly; the leaves are intermediate between those of the parents. The flowers float on the surface of the water, and are produced abundantly. They are snow-white, fragrant, and in general character intermediate between those of the parents. Fertile seed is only sparingly produced. *William Müller, Naples.*

The Week's Work.

THE KITCHEN GARDEN.

By JOHN PENTLAND, Gardener to C. H. B. FIRTH, Esq., Ashwicke Hall, Marshfield, Chippenham.

Parsley-beds that are coming on in successive stages of growth for the winter and spring supply should have the older beds or any that are growing too rank cut level with the ground, afterwards giving them a good top-dressing of soot and wood ashes. Beds thus treated will make fresh growth and keep up a supply longer than if left as they are.

Potatoes should be harvested as they ripen, and stored as advised in a previous Calendar. Northern Star, Evergood, and Up-to-Date are with us in full growth, but some of the haulms are slightly spotted with disease.

Lettuce.—A sharp look-out must be kept on plants coming through the ground, or the slugs, which are now favoured in their travels with heavy night dews, will eat the young plants off as they come through the soil. Dust the rows early in the morning with air-slaked lime or soot, and run the hoe through the ground occasionally

to keep down weeds, and work up a fine tilth to prevent the slugs from finding a hiding-place.

Peas.—In this neighbourhood haw-finches, blue-caps, and sparrows are so plentiful that we have had the greatest difficulty in keeping up the required supply, owing to their predatory habits, and as a last resort to check their depredations we have had to cover the rows with nets. Mildew has also made its appearance, and so far as our experience goes, chemicals as a preventative and cure are of but little use in saving the crop. A copious supply of water at the roots to encourage growth and help the plants to resist the attack, which we believe is favoured to a certain extent by insufficient moisture at the roots, would be beneficial. The disease always commences here about the middle of August after showery weather and during heavy night dews, before the soil is sufficiently saturated to encourage growth. The varieties Duchess and Sutton's Peerless Marrowfat are much infested with the fungus, while Ne Plus Ultra and Sutton's Imperial Marrowfat are almost free from the disease. The latter variety, on account of its dwarf nature, requires careful protection from the attacks of slugs, which destroy not only the lower leaves, but also the flowers as they open.

Turnips.—Late sowings are now making good progress, and early thinning must not be neglected.

Endive.—The most forward plants require tying up and blanching, and the hoe must be kept at work if weeds appear.

Tomatos.—Take cuttings of the best varieties, which will soon strike if placed in a sandy compost and put in a cold frame or on a shelf indoors. Tomatos do not always come true to seed, and any of special merit should be propagated by cuttings.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

Dendrobiums.—Most of these are now completing their season's growth, and the plants should be frequently looked over. Those that have finished making their growth, and have the terminal leaf at the apex of the bulb expanded, should be placed on one side or at one end of the house, where more light and air can be admitted, but less atmospheric moisture. Where a house with a southerly aspect can be conveniently set apart for them, the ordinary shadings may be dispensed with altogether, and the roof-glass thinly whitened over, using a mixture of ordinary flour and water, which as the season advances will gradually wear away, and allow of the passage of the proper amount of sunshine that is necessary thoroughly to ripen the newly-made growths. Ainery from which the Grapes have been gathered is also an excellent place for these plants while at rest. A position can be selected where the plants can be gradually removed from moderate shade to clear sunshine, carefully avoiding cold draughts. To expose these plants suddenly to full sunshine is a mistake, as is also the practice of entirely withholding water at the roots immediately the growths are made up. Examine the plants from day to day, and water in moderate quantities those that are dry or that show signs of shrivelling. Plants growing in small pots or shallow pans should be taken down and thoroughly watered, but they must not be watered again until the whole compost has become dry. Careful judgment is necessary in watering the plants when exposing them to the full glare of the sun, as frequently the moss on the surface appears to be quite crisp and dry, while underneath the soil is very wet, and if kept in a constantly saturated condition will cause the roots to decay. Ventilate freely on all favourable occasions, plenty of fresh air being very essential for the proper maturation of growth.

Plants of Miltonia vexillaria that have commenced to grow may now be repotted should they require it. Instead of placing them in large pots at this season, I find it is better to repot them into small pots and to repot them again into large ones about January or February, at which time the roots from the new growths become active in not only lengthening themselves, but also

in sending out many lateral rootlets. When repotting a plant, turn it carefully out of the pot, pick out all the decayed compost, and cut off all dead roots. A moderate quantity of well-dried Fern rhizome may be used for drainage, working among the roots the following compost well mixed together—one-fourth fibrous peat, one-fourth leaf-soil, and one-half sphagnum moss, also a small quantity of coarse silver sand. Surface the compost with about half an inch of living sphagnum moss. The rare *M. Bleuana* and its variety *nobilior*, which are now in full growth, may also be repotted, *M. v. rubella*, *M. v. r. superba*, and *M. v. Leopoldii* will not require repotting until the new growths have well started. The cool house will suit these *Miltonias* for the present, but about the end of September they should be removed to the intermediate house. Afford them plenty of fresh air at all times. Some of the Brazilian *Miltonias* are fast sending up their flower-spikes, and will require plenty of water at the roots. A slight spraying overhead occasionally until the flowers open is beneficial, it also prevents red spider, to which these plants are liable to be infested.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gr., Wrotham Park, Barnet.

Preparation for Planting.—Although it is too early at present to plant fruit trees it is not too soon to arrange to what extent planting is to be carried out, and to prepare the land for the reception of the trees and bushes by trenching, draining, and getting together suitable material, such as old dried mortar-plaster, wood ashes, road scrapings, &c., for mixing with the soil, so that there shall be no delay when the season arrives in getting the planting done.

Gooseberries sometimes occupy the same plot of land for many years and fruit well, provided proper attention is given to pruning, feeding, and top dressing. Still they may be left too long in one position, and a change becomes necessary for the production of heavy crops of large berries. The land intended for planting should be well worked and enriched to a good depth. It is not necessary when trenching the plot to bring up the inferior sub-soil, but this should thoroughly be broken up to allow the water to pass through freely in very wet weather. *Gooseberries* delight in a deep loam, and although they will sometimes succeed with rough treatment it is better, when making new permanent plantations, to bestow extra care and attention when preparing the land for the reception of young bushes. In open fields where trenching is not practicable, the plough should be used for stirring the land as deeply as possible, afterwards working it well with the harrow, &c., until it is thoroughly clean, friable, and fit for planting when the proper time arrives.

Black Currants.—Where these are very thick, some of the branches may be cut out to admit light and air into the interior of the bushes to encourage the growth of young, strong, fruiting wood, as it is from these that the finest fruits are produced. In the case of large bushes I frequently cut them down to within a few inches of the ground early in the spring, and the new growths the following season have produced excellent crops of large berries. *Black Currants* delight in a rich, moist soil, and will grow and fruit well where other kinds of fruit will not succeed. The gall-mite (*Phytoptus ribis*) gave us a lot of trouble last spring, especially in one part of the garden, where the bushes were terribly infested. Picking off the large buds was more or less practised. I know of no remedy for the pest except hand-picking and liberal feeding, to encourage plenty of young, healthy growths.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Early Forced Vines planted out in the borders, that were started during the month of November, will by now have the wood brown and hard, and the leaves turning yellow. These Vines should now be pruned without waiting for all their leaves to fall; this treatment will cause the Vines to enter their resting period sooner—a condition

from which they derive considerable benefit. When pruning permanent Vines upon the spur system for early forcing, it is well not to practise a too restricted system, and if space is available, instead of allowing one shoot to the spur, encourage two or even three, which tends to invigorate the Vines by the extra foliage and the corresponding development of roots.

Pruning Early Vines.—*Black Hamburgh* is the recognised favourite for early work, and in this variety the laterals should be pruned to within a couple of buds from the base, when bunches of sufficient size and quality will be produced. The same treatment applies to *Foster's Seedling* and *Madresfield Court*; but in the case of *Buckland Sweetwater*, the third bud should be chosen. Where the practice of leaving two or three shoots is followed, prune each shoot to a different bud, one, two, or three respectively from the base. Vines in an unsatisfactory condition at the roots should have the soil removed down to the roots, and fresh loam, &c., substituted, as advised in the Calendar of January 23.

Black Hamburgh Vines appear to have revelled in the intense heat recently experienced, judging from the superb colour and finish of the fruit and the present condition of the foliage. This has been assisted in a measure, no doubt, by the abundant ventilation and fairly cool nights experienced, giving rest to the Vines. To induce these Vines to fruit much earlier next year, we have been removing all laterals, and gradually shortening the principal shoots. The final pruning will be deferred until the end of September.

Vines with fruits colouring should be assisted with fire heat, accompanied by a free circulation of air. Late Grapes require time and liberal supplies of stimulants to attain that fullness of berry and finish so necessary to secure good keeping qualities. Provide a temperature from artificial heat of 70°, rising 10° or 15° with sun heat; the night temperature should not be allowed to fall below 65°.

THE FLOWER GARDEN.

By A. B. WADDS, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

The Wild Garden.—*Liliums* and other flowering bulbs that have been in the houses, and are not required for that purpose another season, may be at once planted-out in the wild garden. *Hydrangeas* may also be planted-out. These plants have done exceedingly well outside this season. *Camellias* that are planted-out should have plenty of water to swell their buds, and some fresh mulching should be applied. *China Roses* should be kept clear of weeds and rubbish, and the ground around them forked occasionally. Ground that is intended for the reception of bulbs in a few weeks' time should be prepared by trenching or deeply digging. A good mulching of rotten dung should be given to *Rhododendrons* and *Azaleas*; this will keep down the weeds and greatly benefit the plants. Keep all creepers tied up. Some of these may be thinned now if the growth is too thick. These plants should be given plenty of water; the same applies to shrubs that are suffering from the prolonged drought. The seed-vessels of *Foxgloves* should be cut off, and laid on any bare bank or place that requires furnishing; the same remark applies to *Sweet Rocket*, *Honesty*, and seed-vessels of any other wild flowers. *Snowdrops*, *Aconites*, and *Scillas* may now be planted in good large masses or clumps in some clean ground, adding fresh soil if necessary. *Water-rats* are very troublesome where there are *Tulip*-bulbs. Snaring them with a wire noose or shooting them are the most successful ways of destroying them.

Propagating.—Cuttings of *Pelargoniums*, *Heliotropes*, and other plants used for summer bedding should now be taken. Boxes may be used for the purpose of rooting them in. See that the soil is free from grubs and wireworms. Place the boxes containing the cuttings in the sun, give one good watering to settle the soil, after which they will not require watering for some days. The cuttings, if care be taken, may be taken off without disfiguring the beds. Plants of *Lobelia* to be

kept through the winter should be taken up and potted; if cut back and allowed to break they will furnish good cuttings in the spring. Cuttings of sweet-scented *Verbena* should be inserted round the sides of pots.

Pentstemons and *Antirrhinums*.—Cuttings of these should now be taken and inserted round the sides of pots, or placed in a frame where there is a little artificial heat. The weather having been very dry, these plants have made but little growth; if the old flower-stems be now cut off, they will send up some good cuttings for a later batch, and can be lifted for storing during the winter.

Pansies and *Violas*.—Cuttings of these plants will require attention with regard to damping and shading; pull the weeds out before they become too large. Slugs must be kept in check. Old plants can be lifted as soon as they break into growth, divided up, and planted for stock next spring in a shady border. If the weather is bright they should be shaded with a few boughs.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. BURNS, North Mymms Park, Hatfield, Hertfordshire.

Hippeastrum (Amaryllis). Plants which flowered early will now have completed their growth, and all shading should be discontinued, and the plants exposed to the full sunshine in order to thoroughly mature the bulbs. Although the plants should not be dried off prematurely, it is necessary to note at once when a plant has quite completed its growth, and is preparing to rest. This is indicated by the oldest leaves beginning to turn yellow, and also by the absence of young leaves in the centre of the plant. When these signs are observed, the amount of water afforded to the roots should be gradually reduced, withholding it altogether when the foliage dies down. Later plants and seedlings which are still in full growth should be afforded plentiful supplies of water and an occasional application of liquid manure. Seedlings should be kept growing on without any rest until they flower, the after treatment being the same as that recommended for the older bulbs. *Thrips* are very partial to *Amaryllis*, and cause much injury to these plants unless they are kept well in check by sponging and fumigating. Now that the old plants have completed their growth, they may be placed in a cool frame or pit until the end of the autumn. When the bulbs are dried off and quite at rest, they may be wintered in any structure where the temperature does not fall below 38°. This may be considered a safe limit, although once in my experience a batch of bulbs which had commenced to throw up their young leaves were accidentally subjected to a temperature which was one or two degrees below freezing point, without apparent injury to either leaves or bulbs.

Richardia africana. Plants in pots, which have been dried off and rested during the summer, may now be repotted. Turn the plants out of their pots, and shake the whole of the soil from the roots. It is a good practice to sort the rhizomes into three sizes and pot the largest into 7-inch pots, the second size into pots 5 or 6 inches in diameter; if required the smallest rhizomes may be placed to the number of three or four in 6-inch pots, and grown on to increase the stock. If large specimens are required, three or more of the best rhizomes may be placed in pots of a correspondingly larger size. A suitable compost consists of three parts loam, and one part well-rotted manure. After being potted, the plants should be placed in a cool house or pit. At first, only sufficient water should be given to keep the soil slightly moist, but when the plants are rooting freely liberal supplies may be afforded. If a long succession of flowers is required, some of the best rooted plants, after they have been potted two or three weeks, may be placed in a temperature of 55° to 60°, where they will make rapid progress. Batches of plants for succession should be placed in heat as required. If plants are required to be in flower at Easter the necessary number should be wintered in the coolest house available, provided the temperature be not allowed to fall to freezing point.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, AUG. 31—Bath Floral Fête (2 days).

THURSDAY, SEPT. 1 { Paisley Horticultural Society's Show (2 days).
Arundel Agricultural and Horticultural Show.

FRIDAY, SEPT. 2 { National Dahlia Society's Show, at Crystal Palace.

SATURDAY, SEPT. 3 { German Gardeners' Club Meet.
Soc. Franç. d'Hort. de Lourdes Meet.

SALES FOR THE WEEK.

MONDAY NEXT—

3,000 lots of Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 10.

WEDNESDAY NEXT—

2,500 lots of Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 10.

THURSDAY and FRIDAY NEXT—

Large consignments of Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—60.4°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 24 (6 P.M.): Max. 64°; Min. 40°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, Aug. 25 (10 A.M.): Bar., 30.2; Temp., 61°. Fine.

PROVINCES.—Wednesday, August 24 (6 P.M.): Max. 60°, S.E. Coast of England; Min. 53°, East Coast of Scotland.

Vallota purpurea alba. THAT a white variety of *Vallota purpurea* has existed is well known, and it is interesting to record its re-appearance as evidenced by living flowers, and a photograph (fig. 61) kindly sent by Mr. JAS. WHITTON, Superintendent of Parks, and Curator of the Botanic Gardens, Glasgow, who, in reply to our enquiries as to its origin, states:—"The bulbs were purchased by a local seedsman from a wholesale firm in London, who say that the bulbs came from Cape Colony (the Knysna Forest district). We purchased two hundred bulbs, and sent fifty to each of the following places—viz., Botanic Gardens, Queen's Park (Camphill), Springburn Park, and Toller-cross Park. It was in the last-named park that the white one appeared. The bulbs have generally bloomed, but this is the only white one in the lot. There was not the slightest apparent difference in the bulb, foliage, or flower-stems. In fact, the buds were well developed when our foreman noticed the paleness, and this abnormality made him observe the plant more carefully, and call my attention to it when I visited the park." Reference has been made to a white variety of *Vallota purpurea* on several

occasions in the *Gardeners' Chronicle*. In the issue of August 5, 1893, p. 160, is a note: "*Vallota purpurea*.—Messrs. VERTEGANS send us flowers from a bulb received from the Cape as a white variety. The colour, however, is a delicate warm pink, and very beautiful."

In the *Gardeners' Chronicle* (report of the Scientific Committee of the Royal Horticultural Society), August 14, 1897, p. 112:—"Cream-coloured *Vallota*.—Dr. MASTERS exhibited blossoms of this variety (received from a correspondent). A white one is known to have existed, but is apparently lost to cultivation. It was suggested that crossings should be made with the present one, so that possibly the white may re-appear." Without differing specifically from the coloured type except in the matter of colour, there is still in all these light forms

which has fortunately become the property of the Corporation of the city of Glasgow.

It is probable that Mr. WHITTON's skill may increase the plant and secure its establishment in gardens.

A World-wide Gardeners' Association.

THE formation of a gardeners' association in this country may now be looked on as an established fact.

We earnestly hope it may be conducted on right lines, and go on and prosper. Experience will show what amendments, if any, may be necessary in the programme, and the Executive Committee may be trusted to consider and act on any practicable suggestion. In the meantime the same idea has "caught on" in the United States, and we are glad to find our American contem-

FIG. 61.—VALLOTA PURPUREA ALBA: REAL SIZE.

a something which suggests the notion that hybridity not sufficiently potent to affect the shape of the flower or general habit of the plant might have originated the white, as it has been known to produce the light forms.

In the *Gardeners' Chronicle*, November 10, 1900, interesting particulars are given of the origin of a remarkable batch of seedlings, on which we had previously remarked, "with flowers of a distinct pleasing shade of cerise," and which were raised by Mr. ARTHUR RIX, of the Miner's Bank, Truro. These had been obtained by crossing *Vallota purpurea* with *Amaryllis Belladonna*. Of the batch raised, ninety per cent. were identical with the ordinary *Vallota purpurea*, but many of the others showed variation towards the white form by colour suppression.

Both *Vallota purpurea* and *Amaryllis Belladonna* grow in close proximity in some parts of the southern provinces of Cape Colony, and it is possible that in a state of nature intercrossing may have resulted in an occasional but very rare albino, one of

porary, *American Gardening*, edited by Mr. LEONARD BARRON, the son of "BARRON, of Chiswick," pushing the matter vigorously. From the same country we have received a further suggestion, good in itself, but of doubtful practicality. We prefer, however, to defer comment on the proposal, and to let the writer express his own ideas freely:—

"A SUGGESTION TO FORM A GARDENERS' WORLD-FRATERNITY."

Encouraged on several sides, I venture to bring the above proposition before the public, trusting that it may lead towards the realisation of the plan. The achievement of the aim would certainly be a great step forwards, and the helpful conditions of our time favour more than ever such a move. It can only be wished for that one of the oldest and noblest callings should gain a still greater influence in accordance with its important rôle. Especially recently great efforts have been made to advance horticulture, and make the general public more acquainted with it; the many good results arrived at ought to encourage strongly a larger move.

The very character of our profession demands more or less an international exchange of ideas; does this fact not naturally point towards the formation of a great world-embracing brotherhood, which can serve itself twofold by creating an interest for plants all over the globe?

The outlook to accomplish the object is favourably assisted by the total absence of those questions which so often make the best intentioned international enterprises a failure. Of course, nevertheless many difficulties will be encountered, but hardly any of a stubborn nature.

The this year's 'World-Exhibition' in St. Louis may perhaps be a good assemblage field to start the project. In a few words I wish to give my opinion of how to form such a 'Fraternity': To have a basis as well as a medium of constant communication a paper should be issued, called perhaps the *World Gardener*, to be printed monthly, and in as many languages as subscribers warrant editions.

All branches of gardening ought to be treated in separate divisions, to make the finding of material, comprising every quarter of the globe, an easy matter. Illustrations ought to be very carefully selected.

Advertisements and market reports from all the main points should form a detachable appendix. It is also very important to have a trial-ground in connection with the paper.

Out of the many problems which could be taken up for the common benefit, a few may follow here:—

The introduction of a 'Standard Plant-Nomenclature' for gardeners, which at the present is much confused.

Publication of a 'Garden Dictionary' containing a catalogue of all plants in cultivation possessing practical value, including their synonyms.

Registration of all new plants, discovered or bred at the 'central office' of the fraternity, if they seem worthy of cultivation, and a possible trial as to their merits. The laying down of general rules regarding newly-bred plants, concerning the rights of breeders, &c. A multitude of other questions may be taken up as the work advances.

An excellent locality for a central office of such an undertaking seems to be Switzerland, as that is a small neutral country composed of various nationalities. Also as a trial-ground for plants offering many good points; and taken into consideration the marvellous natural scenery, it is almost bound to make an ideal 'centre-place.'

I should regard it with great satisfaction if the above lines would cause also others in their turn to give the project a thought and possibly improve upon it. A. L. Schwöerbel, *Landscape Architect, Boston, Mass.*"

LONICERA TRAGOPHYLLA* (see Supplementary Illustration).—This is one of Mr. WILSON's introductions to the nurseries of Messrs. JAMES VEITCH & Sons, at Coombe Wood. In that most interesting

establishment we saw it in the course of the summer, and were struck by its fine masses of yellow flowers set off by the glossy foliage. As it is in all probability quite hardy, having proved to be so up till now, it will, when distributed, be a great addition to our hardy climbers, suitable for clothing pergolas, covering walls or sheds, and for similar purposes. As the plant is new to cultivation, we append in a foot-note the technical description drawn up by Mr. W. B. Hemsley.

BULBS FOR THE ROYAL PARKS.—We understand that Messrs. CARTER & Co. have been requested by H.M. Office of Works to supply the bulbs required for the Royal Parks, and for the gardens at Buckingham Palace and Hampton Court.

THE NEW HALL.—Messrs. FRADELLE & YOUNG, 283, Regent Street, London, announce that they are now publishing a most interesting picture commemorating the above important event in the history of the Society. It is prepared from a photograph taken at the time His Majesty is declaring the Hall open, and the portraits of the KING and QUEEN, together with the President and prominent members of the Society, grouped near their Majesties, are rendered clearly and in good size. The following photographs are also published, in uniform size, 14 by 9 inches:—1. General view of ceremony (includes most of Hall, distant view of Royal group); 2. Sir TREVOR LAWRENCE reading the address (platform group only); 3. His Majesty the KING declaring the Hall open (platform group only); 4. Exterior view of the building; 5. Interior view of the Hall, showing the annexes; 6. General view of the first flower show; 7 to 12. Six views of chief exhibits at first flower show.

ROSE SHOW AT THE CRYSTAL PALACE.—We are informed that the Directors of the Crystal Palace Company intend to hold a Rose Show at the Crystal Palace next year (1905), at a date to be fixed later on.

ACADEMIC HONOURS FOR BOTANISTS.—Among those members of the British Association who were selected by the University of Cambridge to receive the honorary degree of Doctor of Science on the occasion of the recent meeting of the British Association were: Professor ADOLF ENGLER, Professor of Botany in the University of Berlin, the founder of an important botanical periodical, which he has edited for the last twenty-three years. He is the author of a comprehensive system of botany; he has given proof of his interest even in palaeontological botany; he has explored the flora of East Africa and of South America; has contributed to the revision of the latest edition of the classic work of VICTOR HEHN on the migration of plants from Asia into Europe, and commemorated the centenary of HUMBOLDT by an able work on the recent history of the geographical distribution of plants throughout the world, and is the author or editor of numerous first-class periodicals and monographs. Sir WILLIAM TURNER THISELTON-DYER, Director of the Royal Botanic Gardens at Kew, *Flora in studiis insignis*, was welcomed as the son-in-law of another distinguished botanist, Sir JOSEPH HOOKER, who had received an honorary degree at Cambridge thirty-eight years before. His name is associated with much excellent administrative work at Kew, with work on the Flora of Middlesex, and, as editor, with that of South and Central Africa.

THE LATE MR. THOMAS BLAIR, whose death was announced in our last issue, was born in the year 1819 at Aberdour, Fifeshire. After passing by various stages the different departments of the garden establishment, he at length found himself called upon to take charge of the exotic department at the Royal Gardens, Claremont. From there he removed to Largo House, Fifeshire, remaining for nine years. In the spring of 1862 he was recommended by Dr. LINDLEY to Admiral Sir GEORGE N. BROKE MIDDLETON, Bart., as head gardener at Shrubland Park, where the gardens under BLAIR were so excellent that their keeping was admired by all who saw them. An account of Mr. BLAIR, together with a portrait, was given in the *Gardeners' Chronicle*, p. 393, Sept. 25, 1875.

NETTING FOR FRUIT-TREES.—Messrs. Rushforth & Co., of Loughborough, have submitted to us a sample of their fruit-tree netting, which is well adapted not only to protect fruit trees from spring frosts, but also from wasps and other pests at this season, and for covering vineries and other structures.

DÜSSELDORF.—The Directors of the International Horticultural Exhibition which is being held this year at Düsseldorf have now issued their programme and schedule for the International Fruit Exhibition, which will be held from October 8 to 16 next, in conjunction with the Congress of the German Pomological Union, and in addition to these two important events a German show of market fruit and nursery garden goods. The last day of entry is September 15; no dealers are allowed to compete; no charge is made for entry or for space; and the exhibition authorities pay the cost of carriage of goods to Düsseldorf. The schedule is at once large and comprehensive, and is divided into 147 classes, over 100 of which are reserved for the thirteen sections into which the International Exhibition is divided. Collective exhibits are invited from countries, states, associations, and unions. There will be instructive educational exhibits, including specimens of the best early and late fruits from different parts, arranged according to the local dates of ripening; classes in which size and beauty or recent introduction will be determining factors in the awards. Fourteen classes each will be reserved for named varieties of Apples and Pears. Besides Apples, Pears, Nuts, and stone-fruits, there promises to be a great show of wine and dessert Grapes. Fruit in pots and table-decorations have also special sections devoted to them. Makers of boxes, baskets, and other packing methods have seven classes for their wares, and the exhibits of pictures, models, photographs, books, periodicals, and plans, all relating to pomology, should prove of great interest to the public as well as those for whose special benefit they will be gathered together. Schedules and forms of application may be had on application to FREIHERR A. VON SOLEMACHER, Burg Namedy, near Andernach-on-Rhine.

BOTANICAL EXPLORERS IN THIBET.—The opening out of hitherto unexplored ground in Thibet may result in the discovery of some new or rare plants. A botanical survey has already been made into Independent Sikkim and Thibet by the Superintendent (Major PRAIN) of the Royal Botanic Garden, Calcutta, and we hear that the results are satisfactory. Readers will recall the Abbé HUC's book—*Recollections of a Journey through Tartary, Thibet, and China, during the years 1844, 1845, and 1846*, and in the light of more recent expeditions the accounts of this early traveller have been confirmed. One of his botanical discoveries was the tree of Ten Thousand Images, said to have sprung from the hairs of Tsong-Kaba, the great Buddhist reformer. The Abbé says:—"This tree is still to be seen (in Kounbourn), at the foot of the mountain on which the principal Buddhist temple stands, and in a large square enclosure formed by four brick walls. Within this stands the wonderful tree, which appears of great antiquity; and though now not more than eight feet high, three men could hardly embrace its trunk. The wood is of a reddish colour and exquisite odour very much

* *Lonicera* (§ *Caprifolium*) *tragophylla*, Hemsley, n.sp.—Frut. scandens vel vagans, fere undique glaber vel cito glabrescens, ramulis floriferis gracilibus. Folia breviter petiolata vel sessilia (paria 3—1 superiora connata rotundata vel deltoidea) papyracea, oblonga, usque ad 4 poll. longa, rotundata obtusa vel interdum subacuta, basi cuneata, supra glabra, subtus glauca simul primum præcipue secus costam venasque puberula. Flores lutei 2½—3 poll. longi, pauci in capitulis terminalibus breviter pedunculatos dispositi; calycis dentes minuti, persistentes corollæ tubus angustus, leviter curvatus, limbo plus quam duplo longior, intus, basin versus, parissime puberulus; labiorum lobi rotundati; labium anticum, et videtur, incurvatum; stamina glabra; stylus glaber. Bacce non vise.

Hupch: Patung district, rare (A. Henry). Herb. Kew.—Closely related to *L. caprifolium*, Linn., differing in the longer, narrower leaves, fewer larger flowers, and other small details. So far as we know there is no allied species nearer than the Caucasus, the American species of this group being less like the present plant. *Journal of the Linnean Society*, 1888, p. 367, vol. xxiii.

resembling Cinnamon. We were told that during the summer, towards the eighth moon, it produces superb large red flowers; but what most excited our astonishment was really, as we had been before told it was, distinctly marked with a Tibetan character, sometimes lighter, sometimes darker than the leaf, but quite plain. After the most minute investigation, we could discover no traces of fraud on the part of the Lamas; and though, doubtless, people will smile at our ignorance, that will matter little if they do not suspect the veracity of our account." The markings on the leaves are now known to be caused by the growth of a lichen. The intrepid voyager arrived after many adventures at Lla-Ssa, "the metropolis of the Buddhist world, encircled by a multitude of grand old trees which form with the foliage a girdle of verdure around it. Two fine avenues bordered with magnificent trees lead to the temple." After but a brief stay the traveller and his companions were dismissed from the country and returned to the better known districts of China.

PLANTS IN SEASON.—We have received a fruiting branch of the interesting "Californian Chestnut," *Castanopsis chrysophylla* (see fig. 59, p. 145), kindly forwarded by Mr. R. LINDSAY, Kaimes Lodge, Murrayfield, Midlothian, who mentions that the fruits were taken from a small shrub about 2 feet in height, growing on the rockery at Kaimes Lodge. The Golden-leaved Chestnut attains its greatest size and beauty in the coast valleys of northern California, where it is one of the noblest and most beautiful inhabitants of the forests. The genus *Castanopsis* is intermediate in character between the Oak and the Chestnut.

— From Messrs. WARE's nurseries, Feltham, Middlesex, we have received three interesting plants:—

CASSIA MARYLANDICA.—A hardy perennial species, native of North America. It is plentifully covered with its yellow racemes of flowers, typical of the genus. The plants were raised from seed sown three years ago, and are now flowering for the first time. It requires a sheltered position, which accounts for the fact of Messrs. WARE's plant having been cut down annually.

SIDALCEA "ROSY GEM," a garden form of *S. malvifolia*. The flower-spikes are nearly a foot in length, carrying numerous deep lilac-coloured flowers. It should prove a useful addition to the herbaceous border.

PENTSTEMON SPECTABILIS.—A highly glabrous form of *Pentstemon*, which gives it a pronounced character from our other garden forms of the genus. The flowers are bluish-purple, the corolla being about 1 inch in length.

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM × URANIA, REHDER'S VAR.

THE original form of this fine hybrid between *C. × Io grande* and *C. Charlesworthii* was shown by Messrs. Jas. Veitch & Sons at the Royal Horticultural Society on June 4, 1901. A very large and showy form of it is now in flower with Frank A. Rehder, Esq., The Avenue, Gipsy Hill (gr., Mr. Norris). It is one of the best of the *C. Charlesworthii* crosses, like the other hybrids, showing much of the purplish-rose veining of *C. Charlesworthii* in the upper sepal, but with distinct evidence of both *C. Argus* and *C. Lawrenceanum*, which were the parents of *C. Io grande*, the latter giving fine size and substance to the flower. The broad dorsal sepal is white with a small green base, its surface bearing a showy network of dark rose-purple, the spaces between being flushed with rose. The broad petals are yellowish-green at the base and brownish-rose outward, the base and centre bearing dark chocolate spots; lip brownish-rose, staminode cream coloured, with purple in front and slight rose tint. The same cross has also been named *C. × Martin Calmzac*.

ROSA MOSCHATA.

AMONG the hardy climbing Roses this takes a pre-eminent position. It is entitled to this rank in virtue of its foliage, and especially of the profusion of its white flowers. Londoners need go no further than Kew to see it in perfection, but our figures were taken from a plant at Arundel Castle. Mr. Burbury tells us it has been planted about fifty-five years, and that it reaches to a height of 35 ft. on a Yew-tree, of which it has taken possession. It is sometimes called *R. Brunonii*, and is a native of the Himalayas.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

JUDGING GRAPES BY POINTS.—Long experience in judging exhibits by points or marks has shown me the inconvenience of being too liberal in granting marks under any circumstances. When the greatest number of points are granted, and there presently crops up something that is even better, the door is closed against increasing

bunch a peculiar shading, such as never obtains in well-finished bunches. Judging by one's remembrance of what really good bunches of this Muscat have been, and comparing that with the bunches in Mr. Shingler's collection, I should have given each bunch nine points. Apart from their imperfectly finished condition, good form, too, was lacking. However, no diverse pointing would have altered the ultimate decision. *Looker-on.*

PROFITABLE PEACH GROWING.—From time to time we hear of the most wonderful successes in fruit growing, &c., but I had the pleasure the other day, at the luncheon of a famous North of England flower-show, to hear of one feat which I think will take some beating. A well-known gardener from the county of York told his hearers he had a Peach-tree, Goshawk, four years old carrying fifty dozen fruits, or in other words 600 fruits. I must admit that my efforts as a fruit grower for thirty years have been poor indeed, as compared to this. *J. C. C.*

SCARLET-RUNNERS AND BUMBLE-BEES.—From many reports received this appears to be one of the worst seasons for Scarlet-Runners on

FIG. 62.—ROSA MOSCHATA AT ARUNDEL CASTLE: FLOWERS WHITE.

the marks because the maximum has already been given. I do not know what is the rule adopted at Shrewsbury in relation to the Grape pointing, but my practice, when pointing collections of vegetables, is to take each dish separately, starting with the best dish of any one kind in each collection, begin by giving to it the number of points to which it is entitled, though not necessarily the maximum number, unless the quality is of the highest. Then other dishes of the same kind are pointed lower, just as their merits require. Were that practice adopted at Shrewsbury, taking Muscat of Alexandria first, then Madresfield Court, Black Hamburg, Mrs. Pince, and so on, mistakes could not possibly occur. But even then it would be improper to put to the best dish of any kind the maximum number of marks which it was capable of obtaining, unless it was of the highest excellence. It is not enough that a bunch of any variety should be even the best of its variety in the show, because the standard for the year may be comparatively low. That was peculiarly the case with Muscat of Alexandria at Shrewsbury, the outer berries being very good and well coloured, but the inner and less exposed berries were still green, thus giving to each

record. As far as my own observation goes it is also a record season for bumble-bees, which I have never before seen in such numbers. Whether the one fact has any bearing on the other, I must leave others to decide; but there is a general idea, not a new one, that bumble-bees injure the Scarlet-Runner crop; and they pierce the calyx to reach the nectary instead of doing so in the legitimate way, by which fertilisation would most certainly be effected. I have to-day examined some hundreds of flowers, and in every case but one, and that a newly-opened flower, the calyces were pierced; but I have not been able to detect the slightest injury to the embryo pods. It may be that the injury to the calyx and flower prevents in some way the production of potent pollen, the result of which would be a failure of the crop. It almost invariably happens that the first few flowers of this crop fail to set their pods, but the growth is so rapid that with only a normal number of the bees about there would be scarcely time for them to do wholesale mischief, and fertilisation would be brought about by smaller visitants in the meanwhile. The idea that drought is wholly responsible is incorrect, for

robust and free-grown plants that have been well watered, mulched, and grown in well-manured ground are just as unfruitful as others that have had no special care. I heard from a friend of mine a few days ago that from five rows, or, in all, about 200 yards, he had not up to the middle of August picked a pod, and this in a most productive garden and from early-sown plants that had never received any check to growth, and which, except for lack of pods, looked as well as could be wished. Here we are not quite so badly off, but the crop can only be regarded as very poor, in spite of all, presumably, necessary attention. *J. C. Tallack.*

GRADUS PEA.—In answer to your correspondent "Devonian No. 2," I sowed Gradus Pea alongside of William the First, and it came into use just three days after the latter. There is no comparison between the flavour of the two. With regard to the question as to whether short-haulmed Peas give such heavy and continuous crops as tall-growing varieties, in my opinion tall-growing Peas produce by far the greatest

of your readers experienced anything similar with Peas this season, and if they can suggest any other cause for this disastrous effect. *G. F. T., Ryde.*

THE COLORADO DOUGLAS FIR.—Absence from home has prevented my writing before to say that the Douglas Fir figured in your pages on July 23 is not the typical Colorado variety. The photograph sent by Mr. Richardson for your illustration was taken from a tree sent by me from Dorset to Messrs. Dickson & Co., Edinburgh, to see if they could identify it with any form of the Colorado or some other species, and the reply I had from Mr. Massie was to the effect that it was either a variety of the Colorado or another Fir altogether, which he named, but which I forget, as his letter was sent to the owner of the plantation where the tree came from. Out of a whole plantation of supposed Douglas Fir, as supplied by a nurseryman, not more than fifty trees were true to name, and these average about 12 feet, while the spurious ones, as figured in your pages, hardly exceed 5 feet. The true Colorado Douglas

house carrying about 84 bunches, mostly averaging from 1½ to 3 lbs. in weight, and of first-rate quality. Any of your numerous enquirers who are troubled with the spot would be well repaid for their trouble in treating their Vines as stated. *A. King, Hurstwood Gardens, Haywards Heath.*

POTATO "QUEEN ALEXANDRA."—I wrote you last autumn about this promising Potato, raised by Mr. Coleman, of Bishop's Down Farm, Tunbridge Wells. It is a cross between Up-to-Date and Windsor Castle. The haulm is of a dwarf, sturdy character, evidently indicating a strong constitution. It was raised three years ago, and no diseased tubers of this variety have up to the present been seen. A Potato that was free from disease in 1903, with its excessive rainfall, may be considered disease-proof. One particular feature of this Potato is its fine keeping qualities, the eyes remaining perfectly dormant late in the spring. Some tubers sent me at the end of May cooked as white as they did at Christmas. I believe there is a great future for this Potato; it may possibly be the fore-runner of a race that will be strong enough in constitution to resist disease. *W. F. Bowman, 25, Cambridge Street, Tunbridge Wells.*

HERBACEOUS BORDER.

CAMPANULA MACROSTYLA.

ONE of the more distinct Bellflowers is *C. macrostyla*, a native of Asia Minor, which although only of annual duration, is sufficiently desirable as a garden plant to warrant its use in the herbaceous border. The plant forms a tuft a foot or more through, crowded with lovely white flowers, the segments of which reflex as the flower expands, with blue margins and the surfaces heavily netted with blue. The most remarkable feature is the torpedo-like style, which projects from 3 to 4 inches beyond the face of the flower. The leaves, stems and calices are sparsely hairy. It was exhibited at a meeting of the Royal Horticultural Society last July from the Burford collection. One can raise thousands of plants from seeds with little or no trouble, by simply treating them in the same manner as one would Canterbury Bells. In light soils they may last for two seasons.

KNIPHOFIA (TRITOMA) EXCELSA.

This is a new hybrid form of *Kniphofia*, remarkable for its enormous size and great vigour. It is one of the best of its kind so far introduced for waterside planting. For a small border it is too vigorous a grower. A few single crowns planted two seasons ago have made tufts a yard through, and each clump has borne a dozen spikes of flowers from 6 to 7 feet in height. In habit it closely resembles the equally vigorous Star of Baden-Baden, but *K. excelsa* is much more refined both in form and colouring. The flowers of the latter are of a vivid pale-crimson at the upper portion of the spike, changing to an orange colour as time goes on. The variety is of French origin, and is distinct from all others in its widely distended throat, so that the flowers may be described as narrowly bell-shaped. There are many sites in large gardens where a vigorous Torch-Lily such as this would be found useful, particularly where the plant is needed to give a long-distance effect.

KNIPHOFIA (TRITOMA) BREVIFLORA.

The majority of *Kniphofias* are valued more as stately garden plants for bold effect than as neat border subjects; but this pretty slender-growing species more closely resembles *K. Nelsoni* and *K. rufa*, in all save colouring, and is distinctly *Laehenalia*-like in its inflorescence. It is a rare species, but so delicately beautiful that it should become highly popular. Its roots, which are unusually thick for a small *Kniphofia*, suggests its requirements—a light dry soil and open situation. The leaves are grass-like and disposed in

FIG. 62. — ROSA MOSCHATA AT ARUNDEL CASTLE. (SEE P. 152.)

crops. In this garden for the last two seasons Alderman has been the best Pea I have had, and in each season I make it a second early. *T. M. Nelson, Lancashire.*

FAILURE IN GARDEN PEAS.—Since the beginning of June I have made three sowings of culinary Peas of three different varieties, and they have all rotted in the ground, so that now I am without Peas for use. I have never experienced anything like it before. They were all sown in the ordinary manner, the drills when drawn being well soaked with water before the Peas were sown. Until now I have been unable to account for this extraordinary failure, but thought perhaps that the wet season of last year was to blame for not sufficiently ripening the seed. However, that could not have been the cause, for at the ends of the rows, which were partially shaded by some trees, and consequently cooler, the Peas came through all right. I believe the excessive sun-heat which we have lately experienced, combined with the moisture in the drills, has had the effect of partially cooking the Peas before they had time to germinate, and hence the rotting. I made the fourth sowing, and have covered them with loose litter until they came through. I should like to know if any

has more or less glaucous leaves, and the habit of the branches is not erect, but somewhat horizontal, and the tree is squat. There was recently a whole quarter of this type of Fir in Messrs. Dickson's nursery, but it is not recommended for timber by that firm. *J. Simpson, Studfield, Sheffield.*

GRAPE SPOT, GLÆOSPORIUM.—For the past season or two our two houses of Muscat of Alexandria have been badly affected with the Grape spot, so often described in the *Gardeners' Chronicle*. When I came here last season a good half of the bunches were affected with spot and shanking, the first trace of the spot occurring about two or three weeks after thinning, and completely spoiling the appearance of the berries and bunches. In the early part of last autumn I removed 18 inches to 2 feet of the borders, and carefully preserved the roots, and filled up with fresh compost, as often recommended in your *Calendars*. I spread out the roots and covered them over with 9 inches of compost and kept them on the dry side till starting time in January; of course they started a trifle later than usual. This season we have not had more than three dozen berries affected, and shanking has disappeared. We cropped lighter this year, each

elegant tufts, from the centre of which a quantity of spikes arise to a height of from 2 to 3 feet, each bearing a dainty inflorescence of lemon-yellow *Lachenalia*-like flowers, rather densely packed together. In older tufts the flowers are fewer and more daintily disposed in looser spikes, and it is then that one sees the plant at its best. In all general characters it is the yellow counterpart of *K. Nelsoni*, with more flowers on a spike and longer stems. In *K. breviflora* the flowers are tubular, the lobes alone being reflexed, whilst the anthers and styles are at the throat. It is figured in *Botanical Magazine*, t. 7570.

HELIOSYSSON COOPERI.

Seeds of this handsome "Everlasting" were received for purposes of test from the Orange River Colony, and the plants, which flowered in the same year as sown, are probably of annual duration only. It has broadly lance-shaped leaves, sheathing at the base, about 6 to 8 inches long. The stems are freely branching, hard, woody, from 3 to 4 feet in height, bearing great quantities of golden-yellow, globular flowers, $\frac{3}{4}$ inch across. The petals are persistent and harsh to the touch, as in most of its kindred. The whole plant is covered with a thick, loose, woolly tomentum, which is also persistent. This species is well in advance of the more familiar annual "Everlasting" of gardens, forming a roundish bush a yard across, each branch bearing at least a dozen flowers. It does not appear to be in cultivation so far as I can determine.

MONTBRETIA "Geo. Davison."

There are few Montbretias that can vie with that called "Geo. Davison." There is not much to choose between the flowers of this new variety and some of the older ones, but the value of a border plant lies in its habit, its vigour, and its freedom, and here this Montbretia shows a great superiority over all others. The stems are freely produced from each corm, generally in clusters of three or four, and bear quantities of lovely pale orange flowers. The original plant was the only one of many hundreds that the raiser could consider a real break. In *M. Germania*, the next best Montbretia, the flowers lose much of their beauty, owing to the nodding habit, but in Mr. Davison's variety the flowers are held at right angles with the stem, and are thus much more effective. G. B. M.

BRITISH ASSOCIATION.

HEREDITY AND THE MENDELIAN HYPOTHESIS.

MR. WILLIAM BATESON, F.R.S., took for his address to the section of Zoology the facts of heredity and of variability of species as exhibited by the practical examination and experiment of "breeding." The breeding pen was to the zoologist, said Mr. Bateson, what the test tube was to the chemist, and he insisted that the investigation of the problems of heredity by experimental methods offered the sole chance of progress with the problems of evolution. When Darwin wrote his *Origin of Species*, that work, which crowned the great period in the study of the phenomena of species, seemed to be, paradoxically enough, the signal for a general halt. The treatise brought the origin of species fairly within the grip of human intelligence for the first time, but, perhaps because it seemed to imply that the specific differences in species were brought about only by the lapse of immense periods of time, it turned men's thoughts to other subjects that were more amenable to the limits of a human life's investigation, and so the wide field from which Darwin drew his store of facts had remained for some forty years unexplored.

HEREDITY IN STOCKS.

The first paper was by Miss E. R. SAUNDERS, on "Heredity in Stocks." She said that since the re-discovery of Mendel's work, experimental evidence of the purity of the germ-cells had been found in a rapidly increasing number of examples. Much of this evidence was derived from cases like those studied by Mendel, where the differentiating characters were related to each other as dominant and recessive. In other cases the results might be complicated by such phenomena as reversion, gametic coupling of distinct characters, interaction between characters in zygote (such that the second character was

not manifested unless the first were also present), resolution, disintegration, &c. Such cases required minute analysis, and several generations might be needed to elucidate them. In tracing the laws of heredity in garden stocks several such complications were met with. As a surface character, hoariness was dominant, glabrousness recessive. In other cases the result as regards hoariness and glabrousness was more complex owing to the different behaviour of various glabrous strains, which, as far as could be seen, differed only in flower colour. As to flower colour, various combinations of colours gave reversionary purple in the first generation. Purple might also be produced by two white parents if they belonged to strains differentiated by leaf-surface. Such purple cross-breeds might give a simple Mendelian result in the second generation, or a variety of new-colour forms might appear. This latter result was commonly seen when cream was one of the parental colours. Whether the appearance of these new forms indicated disintegration or simply recombination of pre-existing characters was still uncertain. Creams bred pure at once. Some whites were pure, others were heterozygotes with cream. The number of extracted recessive types resulting from a given union and their specific behaviours were not yet known. Experiment showed that one had to deal with—(1) reversion in colour; (2) reversion in a distinct character, leaf-surface; (3) interaction of the two characters in the zygote; (4) conceivably disintegration. The regularity with which all these phenomena occurred plainly indicated that even these complex appearances result from a fundamentally simple system of Mendelian segregation.

MR. A. D. DARBISHIRE gave some account of his experiments with mice. He showed that the so-called Mendelian phenomena were in rough outline describable equally well by the Mendelian and Galtonian formulae; that merely by applying the method of observation no definite result was to be expected; and that it was only by experiment that we could hope to attain definite knowledge of the particular theory of gametic purity, and the general doctrine of discontinuity.

HEREDITY IN RABBITS.

MR. C. C. HURST next described some experiments on heredity in rabbits. He said that an inbred pair of albino Angoras was crossed reciprocally with an inbred pair of Belgian hares, and the hybrid progeny were bred with one another for two generations. Four characters were under observation, each of which was inherited independently of the other.

DISCUSSION.

PROFESSOR WELDON, in opening the discussion, said that the points at issue, between the conception of alternative inheritance attributed to Mendel, and that formed by Galton, Pearson, and others, might best be illustrated by referring to the description Miss Saunders had given that day of one of Mendel's experiments. Mendel took a Pea of a race producing only seeds with green cotyledons, and crossed an individual of this race with an individual of another race, producing only seeds with yellow cotyledons. The seeds resulting from this cross produced plants of three kinds—a quarter of them produced green seeds only, a quarter produced yellow seeds only, and each of these sets of individuals was said to breed true. The remaining half of the plants of this generation produced seeds with the hybrid properties of their immediate cross-bred parents. Now, considering the way in which Mr. Galton had found that reversion occurred in other cases, we might regard the hybrids which made up half the segregation generation as reverting directly to their parents; of the remaining half, we might regard one series as reverting to the characters of the various green-seeded ancestors in various proportions, the other as reverting in a similar way to the various yellow-seeded ancestors, so that every generation of ancestry was represented, to a greater or less extent, the nearer ancestors more frequently, the remoter more rarely. Mendel's own view was a little obscure. He was translated by Mr. Bateson as saying that the yellow-seeded individuals reproduced the character of the yellow-seeded "parent form," and neither from these words nor from the German text could it be certain whether Mendel understood by "parent form" the typical condition of cotyledon-colour in the yellow-seeded race, or the seed-colour of one individual of that race. Mr. Bateson, however, and most modern followers of Mendel, adopted the view which Mr. Bateson expressed two years ago in a report to the Evolution Committee of the Royal Society, that so far as colour character was concerned, the green-seeded descendants of the hybrid, and the apparently true-breeding yellow-seeded forms, were not merely like, but identical with the pure individuals of green-seeded or yellow-seeded race used in making the original cross. The view attributed to Mendel paid attention to the last two only of the series of pure-bred ancestors. That of Galton and others considered that all the ancestors contributed, in various proportions, to the characters of the subsequent generations. If the description of the seed-colours observed were made with sufficient accu-

racy we might easily decide between these two hypotheses; but since the description "yellow" was purposely made so vague that it included all the yellow-seeded ancestors and all their yellow-seeded descendants, we could say, from the data given, that the descendants were like one ancestor only, to the exclusion of others. Each human being had almost certainly seven cervical vertebrae, so had each of his parents, and each of his grandparents. Surely he had no right for this reason to say that they were exactly like their fathers, and that their grandfathers had no share in determining their characters. In a case described by Mr. Bateson the looseness of the Mendelian descriptions was still more obvious. Each of the species included as *Lychnis dioica* had a hairy and a glabrous form. If these were crossed, the resulting plants were hairy; and the offspring of such hybrids were hairy or glabrous in Mendelian proportions. Now those hairy plants which were apparently "pure" bred, were said to be like the hairy plant used in making the original cross; but we were not told how hairy either plant was. He had himself counted the hairs on the leaves of pure-bred hairy plants, and found that the number per square centimetre of leaf surface might vary from about a dozen to 1,300. Now, if a pure-bred plant with 1,300 hairs per square centimetre were crossed with a glabrous plant, and if the offspring had on an average 500 hairs per square centimetre, were they "hairy" like their hairy parent, or were they completely intermediate between the hairy and the smooth parents used? Questions of this kind, which were vital to the Mendelian hypothesis, could not be answered without the adoption of finer methods of description and observation than any to which Mendelians at present condescended. The only kind of Mendelian statement which did directly answer some of the questions raised was the statement that some, at least, of the characters of hybrids must be regarded as reversions to the characters of fairly remote ancestors. The frequent existence of such reversion was, of course *prima facie* completely inconsistent with the idea that the characters of such hybrids might be regarded as due to the combination of "pure" determinants derived from their immediate parents. But it had been said that the numerical conclusions drawn from the Mendelian hypothesis agreed so closely with the observed distribution of the descendants of hybrid individuals, that these alone justified the conception of gametic purity. It was very easy with small series of results to devise a dozen hypotheses which fitted the observations sensibly as well as one another. He would give the expression which Professor Pearson has supplied for a particular case of colour inheritance in mice, studied by Professor Cuénot. Crossing albino and yellow mice, each of known ancestry, Cuénot obtained 81 albino mice, 34 yellow mice, 20 black mice, and 16 grey mice. The remarkable modification of Mendel's hypothesis which he had put forward to describe this result led him to predict 76 white, 38 yellow, 19 black, and 19 grey mice. This was in accord with observation; but Professor Pearson's prediction—82½ albinos, 31 yellows, 20½ blacks, and 17 greys—was still closer. In the great majority of cases the Mendelian expectation and that to which we were led by the work of Galton and Pearson were the same; and in those cases in which the expectation indicated by the two lines of thought was different, the evidence was not yet conclusive. What was wanted was more experiment, and, above all, a description of results so careful that the questions raised by the Mendelian hypothesis could be answered, instead of being masked and evaded by the adoption of loose and vague descriptive categories. Till such work had been done it was surely better to use only the purely descriptive statements of Galton and Pearson, without invoking the cumbrous and undemonstrable gametic mechanism on which Mendel's hypothesis rested.

MR. BATESON replied in detail to Professor Weldon's criticisms, maintaining that by the Mendelian hypothesis alone was it possible to draw together the vast number of observed facts which had seemed utterly incoherent. The Mendelians, on the one hand, claimed that Mendel's discovery was of supreme importance, bringing clearness into phenomena previously obscure. On the other hand, the Ancestrians declared this importance to be grossly exaggerated, asserting that laws based on Ancestry could cope with the same facts. To the Mendelians it appeared that the hypothesis of the Ancestrians were disposed of, and that the voluminous works based on those hypotheses had no scientific value. The matter was readily put to experimental proof. Professor Weldon had passed very lightly over the critical fact which finally settled the question—the purity of the characters of the segregated types. None of the various schemes of the Ancestrians had ever contemplated such purity, and all were totally unable to deal with it. Mendelian facts had first been disputed, and when their truth was admitted, it was sought to explain them away. The last attempt thus to explain away the fact of purity of type was that enunciated by Professor Weldon. He regarded it as "reversion." But if the "reversion" was so complete as to include even the purity of the parental type, such reversion was Mendelian segregation by another name. The second fact with which

the Ancestrians could not deal with the condition of those hybrids or heterozygotes, which though again and again crossed back with pure types, had always the same gametic constitution undiluted. The speaker illustrated this from the work of Mr. R. H. Lock on maize; using mongrel materials he had shown that as regards yellow and white grains the inheritance was of a normal Mendelian order. Further illustrations of the applicability of Mendelian principles to complex cases were given regarding Sweet Peas. These included one significant case in which sterility of the anthers behaved as a Mendelian character, and made it possible to discriminate two types of extracted whites almost certainly dissimilar in their powers of transmitting colour. Professor Weldon had asked whether the extracted types showed parental characters unchanged. It was astonishing that such a question could now be asked. Frequently the extracted types were identical with the pure. The question was entirely one to be answered case by case, according to the special sort of segregation which took place in each case. There were young men present who would look back on this discussion as a critical moment in the history of biology. It was said that other theories would cover the facts. He had been told in his day that antiseptics were all very well, but that the same results could be produced by "a good healthy suppuration." Without doubt in the old Regent House of the University disputants in the past had maintained the flatness of the earth before applauding crowds, much as Professor Weldon had to-day upheld the view of the Ancestrians. The paths of the heavenly bodies had been harmonised with the theory of a flat earth, as some of the facts of heredity had been with the law of Ancestry; but as the theory of gravitation had brought together great ranges of facts into one coherent whole, so had Mendelian theory begun to co-ordinate the facts of heredity, till then utterly incoherent and apparently contradictory.

PROFESSOR KARL PEARSON said that the great revolution which Francis Galton introduced into biological study was purely a difference of method. He taught biologists to look at the subject exactly. The introduction of methods of precision had nothing to do with Mendelism or Ancestral law. As a mathematician, he had seen the Mendelians produce figures without any attempt being made to show that the figures were consonant with the theory which they were supposed to illustrate. He believed that he had elaborated the most complete Mendelian system ever yet worked out. It was an extremely complete system, for when one came to consider a very large number of competing couplets, much mathematical knowledge was needed to work out the result. But what was the result? It led to general principles which were singularly like those proposed by Francis Galton from observation. But what he asked from the Mendelians was some definite theory that could be worked out. At present their theories could not be grasped; they were always changing in form and definition. If he could get hold of anything definite he would be perfectly ready to test it impartially, as a mathematician should when approaching biological problems. There was a great deal of work to be done on the Mendelian side, for that system was in a state of flux. This controversy could only be settled by investigation, not by disputation.

(Report of Discussion condensed from "The Times," August 20.)

(To be continued.)

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 23.—The fortnightly meeting of the Society was small, both with regard to the number of exhibits and the attendance of visitors. We have yet to see the resources of the fine Hall called upon to accommodate a large show, though doubtless the exhibitions in the autumn of British-grown fruit, &c., will afford an opportunity of doing so. The day was dull; notwithstanding this fact, the light in the building was excellent. The approach of autumn was evinced by several large exhibits of fruit; although still very immature, they portend the approaching season. Hardy flowers were again largely in evidence, and growers were reminded to look ahead by interesting exhibits of models of Narcissus cleverly executed in wax. Several large exhibits of tuberous-rooting Begonias were shown, the flowers being very brilliant. One of the most pleasing contributions was a fine display of Cactus Dahlias, arranged with such taste that they reminded one of an extensive table decoration. The Committees had little to adjudicate upon.

The FLORAL COMMITTEE recommended two Awards of Merit and one Botanical Certificate, the latter to a tall-growing Gladiolus, the species of which was not determined, though it was probably *G. primulinus*,

first described by Mr. Baker in the *Gardeners' Chronicle*, p. 122, August 2, 1890.

In the afternoon a lecture was given by Professor BOULGER on "The Preservation of Wild Plants."

Several new Fellows were proposed and elected as members of the Society.

Floral Committee.

Present: W. Marshall, Esq. (Chairman); and Messrs. H. B. May, Richard Dean, James Hudson, John Green, G. Renthie, Chas. Dixon, Chas. Jeffries, Chas. Blick, J. W. Barr, Charles E. Pearson, W. P. Pearson, E. H. Jenkins, Chas. E. Shea, Robt. W. Wallace, Geo. Gordon, Amos Perry, and E. T. Cook.

An interesting group of plants, principally new introductions, was staged by Messrs. J. VEITCH & SONS, Chelsea. *Buddleia variabilis* Wilsoni, occupied the background, a handsome plant 15 or more feet in height, also *Senecio clivorum*, better flowered than at the last meeting, and *Aconitum scaposum pyramidale*, carrying numerous spikes of heliotrope flowers, greenish-yellow at the entrance to the throat. *Lilium Brownii* was flowering well in a basket, also the white variety *L. B. Colchesteri*.

Messrs. VEITCH & Co. also exhibited a group of *Dædalacanthus parvus* with corymbs of bluish-purple flowers, and a few plants of *Begonia* "Washington," which was given an Award of Merit at the last meeting.

A large exhibit was staged by Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, consisting of Ferns, Veronicas, *Campanula isophylla*, *Bouvardias*, &c., tastefully interspersed with small Palms and trained plants of *Lygodium japonicum*. The pleasing dwarf Rose Madame N. Levassieur was well shown in pots. *Pteris Childsii*, *Adiantum Farleyense*, and *Nephrolepis Piersoni* were displayed in groups of well-grown plants. A number of plants of *Veronica Hendersoni*, in varieties with white and purple flowers, made a pleasing show. A batch of *Lobelia cardinalis* var. *Victoria* was nicely in flower (Silver Banksian Medal).

Mr. CHAS. TURNER, The Royal Nurseries, Slough, sent a collection of thirteen vases of *Hibiscus syriacus*, in several varieties of colour; a vase of the autumn-flowering Rose, *Belle Vichysoise*, a useful climbing variety; *Clerodendron Bungei*, with its dense heads of crimson flowers; *Tamarix hispida æstivalis*, and *T. odessana*, the former receiving an Award of Merit; and a dish of fruits of *Rubus sorbifolia*, the "Strawberry-Raspberry," whose appearance was much in advance of its flavour.

One of the prettiest groups in the Hall was that displayed by Messrs. T. S. WARE, Ltd., Hale Farm Nurseries, Feltham, London. The exhibit was composed of Cactus Dahlias tastefully arranged in vases, *épergnes*, and on fancy stagings. A white table ground was used, and set off by such graceful plants as *Asparagus plumosus*, *Bamboos*, *Miscanthus*, &c. An edging of *Isolepis gracilis* gave a pretty finish to the display (Silver Banksian Medal).

Mr. H. SHOESMITH, Westfield, Woking, exhibited several fine varieties of Cactus Dahlias in vases. Mrs. Frances Wellesley (creamy-white), F. Stevenson (dark scarlet), Mrs. S. T. Wright (rosy-pink merging to a lighter centre), and W. Hopkins (blood-red), were the more commendable of this small collection.

Messrs. JOHN PEED & SON, West Norwood, London, set up a group of plants of *Gloxinias* in pots, and individual flowers in exhibition boxes. They were very meritorious considering the lateness of the season, and the blooms were of very pleasing colours. Small Palms and an edging of *Sibthorpia europæa* set off the group to advantage. Messrs. PEED also staged a collection of *Achimenes* adjoining the latter group (Silver Banksian Medal).

Mr. S. MORTIMER, Farnham, Surrey, brought several seedling Dahlias of the Cactus type, all of first-class quality—Mrs. M. A. Mortimer, Vivid (fiery red), Mrs. J. S. Brunton (fine deep yellow and good shape), Edith (dark purple), Royal Scarlet (a rather large and straggling flower of the colour indicated), and Blush Queen (rosy-pink). (See Awards.)

One of the large centre tables was almost filled with choice flowers of tuberous-rooting Begonias, staged by Mr. A. L. GWILLIM, Cambria Nurseries, New Eltham, Kent. The flowers were displayed in exhibition boxes, and were of the most lovely shades of colour, some of scarlet being especially fine. The collection consisted principally of double-flowering varieties, with a number of single flowers staged at one end of the group. All the varieties were unnamed. A suitable grouping of pot-plants of Begonias, Maidenhair Ferns, &c., at either end, and an edging of small Ferns and *Isolepis gracilis*,

gave a pleasing finish to this collection (Silver-gilt Banksian Medal).

A large group of tuberous-rooting Begonias was set up by Messrs. JOHN LAING & SONS, Forest Hill. The plants were arranged on the floor of the hall and staged with good effect, with a taller background sloping to the front of the group, which was finished off with a suitable edging of small foliage plants. The plants were carrying some commendable blooms, considering the lateness of the season, and Palms and other plants worked in for effect gave a pleasing finish to the group (Silver Flora Medal).

HARDY PLANTS.

Mr. M. PRITCHARD, Christchurch, Hants, set up a group containing many pleasing hardy flowers, prominent among which were a collection of *Gladiolus* spikes, a good batch of *Montbretias*, and fine spikes of *Tritomas* (*Kniphofia*). *Gaillardias*, *Phloxes*, *Campanula hybrida* var. *Isabel*, *Eriacas*, *Heleniums*, &c., were the principal members. *Clematis Davidiana*, *Alstromeria psittacina*, and *Hemerocallis* "Dr. Regel" were among the more interesting plants in this collection (Silver Flora Medal).

MESSRS. BARR & SONS, 11, 12, and 13, King Street, Covent Garden, W.C., staged a collection of herbaceous flowers in vases, and an interesting collection of models of Daffodils in wax. *Gladioli* were shown well. We noticed *Silphium laciniatum*, a tall-growing Composite. Two interesting plants were shown in fruit, *Actæa alba* and *Podophyllum Emodi*, the latter with its Tomatolike fruits adnate to the petioles. Trays of hardy *Nymphaeas* occupied the centre of this group (Silver Banksian Medal).

Mr. AMOS PERRY, Hardy Plant Farm, Winchmore Hill, London, N., set up a group of hardy flowers in season. Some good forms of *Pentstemon barbatus* were included; several trays containing hardy *Nymphaeas*, *Montbretias*, *Tritomas*, *Chelone obliqua*, *Phloxes*, *Liliums*, and a host of members of the order Composite—*Rudbeckias*, *Chrysanthemums*, *Senecio clivorum*, &c. (Silver Banksian Medal).

MISCELLANEOUS.

A very pretty basket of wild flowers was arranged by Miss EASTERBROOK, Fawkham, Kent, in which were many of our familiar native flowers—*Teasle*, *Toadflax*, *Harebell*, *Clematis vitalba*, *Water Mint*, &c. (Vote of Thanks).

A seedling *Lobelia* named "oculata" came from Mr. G. KENT, Norbury Park Gardens, Dorking.

Two seedling *Gladioli* came from Mr. W. C. BULL, Ramsgate. *Iona* has pleasing soft pink flowers splashed with a deeper red at the margins; *Valerie* has large creamy-coloured flowers with a darker, almost yellow, throat.

FRANCIS FOX, Esq., Alyn Bank, Wimbledon, exhibited *Gladiolus primulinus* (?). The plant's natural habitat is in the regions of the Victoria Falls, on the river Zambesi, the spray of the water covering the plant at times, from which the pollen and stigma are said to be protected by the posterior segment of the perianth, which hangs in such a manner as to conceal the essential organs. The plant has received the name of "Maid of the Mist." (See Awards.)

Messrs. FELTON & SONS, 7, 8, and 9, Hanover Square, W., staged a group consisting of early-flowering *Chrysanthemums*, several pleasing vases of border *Carnations*, and an *épergne* filled with *Chrysanthemum maximum*, variety King Edward.

AWARDS.

Tamarix hispida æstivalis.—A pleasing shrub, with long, feathery racemes of delicate pink colour and light, feathery foliage, the inflorescence reminding one somewhat of a loose-panicked *Astilbe*. An excellent plant for gardens near the coast. Exhibited by Mr. CHAS. TURNER, Slough (Award of Merit).

Dahlia Blush Queen.—A Cactus variety with pleasingly-quilled petals of striking rosy-pink colour merging to a lighter centre; flower of large substance. Exhibited by Mr. S. MORTIMER, Farnham, Surrey (Award of Merit).

Gladiolus primulinus (?). A tall-growing species above alluded to, with peduncles 2 to 3 feet in height, bearing six or more primrose-yellow-coloured flowers, the posterior segment forming a hood covering the stamens. The segments on either side are reflexed, and the anterior segment is also reflexed. Bracts lanceolate green and sheathing. Leaves long, linear, 2 to 3 feet in length, an inch in width, with one or more prominent veins running the entire length to the apex. Shown by FRANCIS FOX, Esq., Alyn Bank, Wimbledon (Botanical Certificate).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; Jas. O'Brien (Hon. Sec.), De E. Crawshaw, J. Gurney Fowler, H. A. Tracy, H. Little, F. Wellesley, F. J. Thorne, G. F. Moore, W. Boxall, J. Douglas, A. Hislop, J. W. Odell, J. Charlesworth, M. Gleeson, W. Cobl, and T. W. Bond.

Only one group was staged, and although several good things, over which there was some deliberation, were shown, no award was made. The group, which for the season was very creditable, was staged by H. S. Goodson, Esq., Fairlawn, West Hill, Putney (gr., Mr. G. E. Day). The best plants in it were *Laelio-Cattleya* × *Massangiana* var. *Harry Goodson* (*L. tenebrosa* × *C. Schilleriana*), a great improvement on that previously shown. The sepals and petals were of a bronzy hue, the showy, circular-fronted labellum bright ruby-purple; and *Cattleya Harrisoniae* H. S. Goodson, a very fine bright rose-coloured flower with reddish-claret spots on the sepals and petals. Among the *Cypripediums* were *C. Curtisii*, *C. × superciliale*, a very singular narrow form of *C. Dayanum*, *C. Chamberlainianum*, *C. Mastersianum*, *C. Lawrenceanum*, *C. × Evadne*, &c. *Epidendrum prismatocarpum* and *Oncidium crispum* were also shown.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr., Mr. Hopkins), showed *Cypripedium* × *Bella* (*vexillarium* × *philippinense*), a pretty hybrid with the graceful form and delicate colour of *C. × vexillarium*, enlarged by the other parent used. Upper sepal white flushed with rose, and bearing dark purplish lines; petals broad and long, decurved, ciliate, with chocolate-coloured spots on the upper edge; rose-coloured and whitish at the base. Lip and staminal greenish, with obscure darker markings. Lower sepals whitish, with green lines.

Captain G. L. HOLFORD, C.I.E., C.V.O., West-birt, Tethury (gr., Mr. H. Alexander), again showed the beautiful *Cypripedium* × *Milo*, Westbirt variety, for which an Award of Merit had previously been given. The upper sepal is green on the lower half, white above, and with dark chocolate spots. Petals and lip reddish-brown, all the surface being glossy. Also *Cattleya* × *Germania superba* (*granulosa* Schofieldiana × *Hardyana*), a fine hybrid, with rose-purple flowers, the front lobe of the lip being purplish-ruby-red.

C. L. N. INGRAM, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), showed *Cattleya* × *Admiral Togo*, a fine hybrid of *Cattleya Schilleriana*, with some resemblance to *C. × Miss Harris* (*Schilleriana* × *Mossiae*). The flowers bore strong traces of *C. Schilleriana* and were of a bright lilac-rose, the fine labellum having purple veining, a narrow margin of lavender colour, and a tinge of yellow in the centre.

R. I. MEASURES, Esq., Cambridge Lodge, Camberwell (gr., Mr. Smith), showed his new *Masdevallia* × *Veitchiofragrans* (*Veitchiana* × *fragrans*). The seed-bearing parent was *M. Veitchiana*, and much of its habit remains in the hybrid, which has thicker leaves than those of *M. Veitchiana*, and traces of the *M. coriacea* section, to which *M. fragrans* belongs, in both leaves and flowers. The scape is ascending, 4 inches in length, green spotted with purple. The flower is of thick texture, the perianth yellow, the outside of the tube bearing purple lines, and the face of the flower numerous purple papillae. The upper segment has an erect yellow tail 1 inch in length, and the lower slightly shorter ones, which are crossed in front.

Fruit and Vegetable Committee.

Present: Jas. Cheal (Chairman), and Messrs. W. Bates, S. Mortimer, Alex. Dean, R. Lewis Castle, J. Lyne, G. Norman, F. Q. Lane, J. Jaques, and W. Pompart.

Messrs. H. CANNELL & SONS, Swanley, Kent, staged a collection of Apples, Pears, and Plums in dishes, with a number of well-fruited trees at the background. The group was relieved with epergnes of fruit and small foliage plants, several vases of *Rubus phoenicolasius* (the Wineberry) being worked in the exhibit. Among the Apples *Lady Sudeley* was good, *Beauty of Bath* finely coloured, *Peasgood's Nonsuch* of large size; *Red Astrachan* was also shown in good form; *Lord Grosvenor*, *Duchess of Oldenburgh*, and *Beauty of Bath* were also commendable; several seedling varieties were included. Plum *Gisborne's Yellow* was well finished. Among the Pears were good specimens of *Beurré Giffard* and *Madame Tréve* (Silver Knightian Medal).

Another collection of Kentish-grown Apples came from the well-known grower, Mr. G. HUNYARD, Maidstone. Considering the earliness of the season, the

fruit was excellent and indicative of the splendid crops promised this season. Baskets and dishes were utilised to display the varieties, which, among others, included *Lady Sudeley* (large fruits of good colour), *Stirling Castle*, *James Grieves*, *Duchess of Oldenburgh*, *Worcester Pearmain*, *White Transparent* (large light-coloured fruits); well-coloured fruits of *Gladstone*, *Langley Pippin*, *Ecklinville Seedling*, *Yellow Ingestre* (almost ready for the table), and *Cardinal*. A seedling Apple of much promise, named *Bielo Borodawka*, was shown. It is said to be a splendid cropper and of good quality (Silver Knightian Medal).

Messrs. SPOONER & SONS, Hounslow, also set up a meritorious collection of hardy fruit, including Apples, Pears, and Plums. The exhibits were arranged in baskets, boxes, and dishes, and contained well-grown members, forecasts of still finer produce later in the season. Of Apples, *Stirling Castle* were good, as were also *Grenadier* and *Worcester Pearmain*. *Red Quarrenden* was of large size, although somewhat lacking in colour; *Lady Sudeley* was finer coloured than the latter, and the size of the fruit was also excellent. A large box of *Early Transparent* Gage contained excellent fruits of this delicious Plum (Silver Banksian Medal).

Messrs. JOHN PEED & SONS, Roupell Park Nurseries, West Norwood, showed six dishes of Apples and five dishes of Pears. *Pears Clapp's Favourite* were good, and *Lawson's July* well coloured.

MISCELLANEOUS.

From the Royal Horticultural Society's gardens at Wisley came fruiting branches of *Prunus cerasifera* in several varieties.

New Tomatoes were brought by Mr. J. B. OLDHAM, Easingwold, and Colonel SIMPSON, Shirley House, Croydon (gr., Mr. Cook).

W. ROUPELL, Esq., Harvey Lodge, Roupell Park, sent a fine basket of *Lady Sudeley* Apples, of good colour and size (Cultural Commendation).

A dish of *Peach Sea Eagle* of large size was shown by Colonel SIMPSON, Shirley House, Croydon (gr., Mr. Cook). Lack of colour detracted from the appearance of the fruit. Several Melons were presented for the consideration of the Committee, but none were equal to the standard required for an award.

Mr. WM. DEAL, Brooklands, Kelvedon, brought dishes of *Potato Excelsior*, and of a new Runner Bean named *Brooklands Scarlet*.

The Lecture.

THE PRESERVATION OF WILD PLANTS.

Dealing first with natural causes of loss to our indigenous flora, Prof. BOULGER touched on climatic change and encroachment by the sea, the latter strikingly illustrated in East Kent. He then passed on to such artificial causes as appear inevitable from increase of population, viz., forest clearing, wastefully carried out as it has been, the wholesale sacrifice of economic plants such as the *Sandalwoods* and *Gutta-percha* trees, drainage and fen-reclamation, the extension of the area under cultivation, the extermination of weeds, the growth of buildings, and quarrying. Losses due to each of these causes were specified. Among avoidable causes of loss he then discussed the artificialising of our country lanes, golf, the smoke nuisance, collectors of plants for sale (with special reference to the *Primrose*, *Ferns* and *terrestrial Orchids* in England, and to *Lygodium*, *Galax*, *Kalmia*, and *Epigaea* in the United States), children, excursionists, school-teachers, and botanists. Among protective measures the concealment of habitats, their enclosure, the cultivation of wild forms, transplanting rarities, re-introductions, education and legislative action were then discussed, the lecture concluding by urging the promotion of an Act of Parliament on the lines of those for the protection of birds.

In the discussion which ensued, Mr. E. A. MARTIN doubted whether anything could be effected by legislation; and Professor L. H. BAILEY spoke of the success of the legislative protection of individual species in the United States when backed by popular sentiment.

EDINBURGH SEED TRADE ASSISTANTS'.

AUGUST 13.—By the kind invitation of Messrs. Bell & Bieherstedt, Leith, the Seed Trade Assistants were on the above date afforded an opportunity of visiting the trial grounds, and were there received by the manager of the garden-seed department, Mr. William Smith, in the absence of the principals. One of the principal features of the trials was upwards of 260 rows of Sweet Peas, which were arranged according to colour.

SHEFFIELD FLORAL AND HORTICULTURAL.

AUGUST 6.—The fifth annual exhibition of this Society was held on the above date in the charming grounds of Holly Court, Sheffield, by kind permission of F. A. Kelly, Esq. The exhibits were arranged in two spacious tents. The Roses were good. Groups of plants were very fine, vegetables meritorious (particularly Onions), whilst the floral devices and table decorations were excellent. Some fine Grapes were shown, also Peaches, Melons, and collections of fruit. Trade exhibits of herbaceous flowers were numerous, while groups of plants not for competition were arranged down the centre of the vegetable tent. On the whole the show was excellent, and reflected the greatest credit on the Society's energetic Secretary (Mr. Lewendon) and his committee.

SCOTTISH PANSY AND VIOLA ASSOCIATION.

(HELD AT GLASGOW.)

AUGUST 10.—The usual monthly meeting of the above Society was held on the above date. The following were the awards:—

Fancy Pansies.—First-class Certificates: Mrs. W. Sinclair (DOBBIE & Co.), Einnie Bateman (DOBBIE & Co.). Certificates of Merit: Peggie Smith (DOBBIE & Co.), Dr. McDermott (KAY), Jessie L. Arbuckle (KAY), A. K. Brown (KAY), and Miss Turnbull (McLAUCHLAN).

Show Pansies.—First-class Certificate: Mrs. Fife (DOBBIE & Co.), white self. Certificates of Merit: Katie (DOBBIE & Co.), yellow self; A. W. Paterson (DOBBIE & Co.), white self; Jane Stirling (DOBBIE & Co.), primrose self; Jessie Findlayson (KAY), white-ground.

Violas.—Certificates of Merit: Lady Grant (FRATER), Mrs. James Lindsay (CAMPBELL), Effie (DOBBIE & Co.)

Chrysanthemum.—Certificate of Merit: Thomas Cullen (JOHNSTONE), a sport from Mytchett White.

Lobelia.—First-class Certificate: Blue Jacket (R. & A. AITCHISON).

LUTTERWORTH GOOSEBERRY SOCIETY.

THE eighty-sixth annual show was held at the Greyhound Hotel, Lutterworth, recently. Mr. F. W. Bottrill officiated as weigher, and declared the following awards:—

Open Class.—Heaviest berry, any colour, Mr. W. C. Payne's Ringer, 22 dwt. 2 gms. Steward's prize for second heaviest berry, Mr. W. Granger's Ringer, 21 dwt. 13 gms.

Class Colours.—Reds: Mr. W. Granger's Bobby, 20 dwt. 9 gms.; Mr. W. C. Payne's London, 20 dwt. 5 gms.; Mr. C. Payne's Jumbo, 20 dwt.; Mr. F. Knight's London, 17 dwt. 5 gms.; Mr. T. C. Bodycote's Bobby, 17 dwt. 5 gms. Yellows: Mr. W. C. Payne's Ringer, 22 dwt. 11 gms.; Mr. W. Granger's Garibaldi, 19 dwt.; Mr. T. C. Bodycote's Leveller, 18 dwt. 3 gms.; Mr. C. Payne's Lady Howard, 16 dwt. 5 gms. Greens: Mr. W. Payne's Surprise, 21 dwt.; Mr. W. Granger's Surprise, 16 dwt. 22 gms.; Mr. C. Payne's Surprise, 17 dwt. 1 gm.; Mr. T. C. Bodycote's Surprise, 17 dwt. Whites: F. Knight's Hero-o'-Nile, 20 dwt. 12 gms.; Mr. W. C. Payne's Fascination, 19 dwt.; Mr. W. Granger's Fascination, 18 dwt. 7 gms.; Mr. C. Payne's Transparent, 17 dwt. 23 gms.

Twins.—Mr. W. C. Payne's Surprise, 32 dwt. 3 gms.; Mr. C. Payne's Surprise, 25 dwt. 12 gms.

Mr. T. C. Lawrie's special prize for four dishes of berries, not less than three colours (eight berries on each dish).—1st, Mr. W. Granger; 2nd, Mr. C. Payne; 3rd, Mr. W. C. Payne. *Leicester Post*.

DUTCH HORTICULTURAL AND BOTANICAL.

FLORAL COMMITTEE—JULY, 1904.

FIRST-CLASS CERTIFICATES

were awarded to *Chrysanthemum maximum* King Edward, as a newly imported plant, from M. W. v. VEEN, of Leiden; *Rosa Farquhar*, as a newly imported plant, from Messrs. M. v. WAVEREN & SONS, of Hillegom; *Dianthus caryophyllus* fl.-pl. Kaiserin Friedrich, as a newly imported plant, from Messrs. WEZELENBURG & HASJEN, of Leiden; *Disa grandiflora splendens*, from Mr. C. J. KIKKERT, of Haarlem; *Rosa Souvenir de Pierre Notting*, as a new plant, from Mr. J. ABING, at de Bildt; *Rosa Madame Jules Crolez*, R. Johanna Sebus, R. Farben koningin, from Messrs. GRATEMA BROTHERS, of Hoogeveen; and *Stock Dresdener Pyramide*, as a new plant, from Mr. F. PIET, Jr., of Apeldoorn.

CERTIFICATES OF MERIT

to *Phlox decussata* Marie Wilkens, as a newly imported plant, from Mr. W. v. VEEN, at Leiden;

P. d. Madame Neera, P. d. Edmond Aniran, *Coleus Kniperi*, as a new plant, from Mr. W. KNIPER, of Apeldoorn; *Lathyrus latifolius roseus superbus*, as a new plant, from Mr. W. v. VEEN, of Leiden; *Dianthus caryophyllus fl. pl. Malmaison* (red) and *Standard Jeanne d'Arc* (pure white), from Messrs. V. NAMEN BROTHERS, at Zwijndrecht; and *Pelargonium peltatum* Paden-Powell, as a newly imported plant, from Mr. J. G. BALLEGO, of Leiden.

BOTANICAL CERTIFICATES

to *Dierama pulcherrima*, as a new introduction, from Messrs. DE GRAAFF BROTHERS, Ltd., of Leiden; *Gladiolus colvilloides*, as a new plant, from the same firm; *Codonopsis viridiflora*, as a new introduction, from Mr. W. v. VEEN, of Leiden.

A SILVER MEDAL

to a collection of *Gladiolus nanus* (cut blooms), from Messrs. H. ROOZEN & SONS, at Sassenheim; and to a collection of annuals from Messrs. GROENEWEGEN & Co., of Amsterdam.

A BRONZE MEDAL

to a collection of cut blooms from herbaceous plants, from Mr. W. v. VEEN, of Leiden; and to a collection of annuals, from Messrs. SLUIS & GROOT, of Enkhuizen.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

AUGUST 11.—At the meeting held on this date, G. W. LAW-SCHOFIELD, Esq., Rawtenstall (gr., Mr. Shill), was awarded a First-class Certificate for *Cypripedium* × *Sanderiano-superbiens*, a fine and striking hybrid, which shows its parentage very distinctly.

S. GRATRIX, Esq., Whalley Range, Manchester (gr., Mr. Cypher), exhibited a hybrid between *Cypripedium Mastersianum* × *Lawreanum*.

NORMAN C. COOKSON, Esq., Wylam-on-Tyne, exhibited *Odontoglossum crispum* var. *Munyanum*, a well-known and valuable variety; this plant was voted a First-class Certificate and a Silver Medal. *Cattleya* × *Atalanta*, *Oakwood* var., from the same collection received a First-class Certificate.

PHILIP SMITH, Esq., Sale (gr., Mr. Kitchen), exhibited *Cypripedium* × *May Proctor*, a cross between *C. Charlesworthii* × *C. Curtisii*.

T. STATTER, Esq., Whitefield, obtained an Award of Merit for *Cypripedium* × *calloso-Lawreanum*.

Messrs. CHARLESWORTH & Co., Bradford, Yorks, staged a good group of hybrid Orchids, to which a Silver Medal was awarded. Noticeable in the group were *Cattleya* × *Iris*, *Cypripedium* × *Io maximum* var. *magnifica*, *Cattleya* × *Germania*, *C.* × *Mary Gratrix*, *C.* × *Lord Rothschild*, *C.* × *Hyades*, *Laelio-Cattleya* × *luminosa*, *L. C.* × *callistoglossa*, a fine form.

The next meeting will be held in conjunction with the Dahlia show at Old Trafford on September 9 and 10. P. W.

FELLING.

AUG. 15, 16.—The twenty-fifth annual exhibition of the Felling Floral and Horticultural Society was opened at Felling. The entries were from all parts, and were as numerous as in previous years, and exhibits were of the highest quality.

The exhibits of Messrs. HARKNESS & SONS, of Bedale, in the open class, were remarkable, they having won the Higginbottom Challenge Bowl for twenty-four cut Roses, defeating R. GARDNER of Whickham, the holder. Equally remarkable were the table decorations exhibited by JAMES SUMMERS of Sunderland, for which he was awarded the Members' Silver Challenge Bowl for the third successive year. THOMAS BATTENBY, of Blaydon, was awarded the Tradesmen's Silver Challenge Bowl, for eighteen Dahlias, twelve dissimilar, he defeating Messrs. HARKNESS & SONS of Bedale, the holders. Other principal prize takers were:—F. EDMUNDSON, Nurseryman and Florist, Newcastle; JOHN ARKLESS, Gateshead; J. ELLISON, Shankhouse; R. GARDNER, Whickham; A. WINTER, Corbridge, &c.

ENGLISH ARBORICULTURAL SOCIETY.

ANNUAL MEETING.

ON Tuesday evening the 16th inst., the twenty-third Annual Meeting of the members of the Society was held in the Palace Hotel, Aberdeen.

The Secretary reported that the number of members at the commencement of the year was 675. During the year there had been twenty-one resignations and four deaths. The new members elected for the year numbered 91, bringing the total membership of the Society to 741.

The Treasurer reported that the receipts for the year amounted to £347 10s. 4d., and the expenditure to £209 5s. 3d.

The Chairman proposed that Prof. Fisher, Cooper's Hill, be elected his successor as President of the

Society. Those members who went to France two years ago to the annual meeting knew how very successfully Prof. Fisher had arranged those proceedings.

The President proposed a very cordial vote of thanks to the Hon. Mark Rolle, Stevenstone, Torrington, Devon, for the very handsome gift he had presented to the Society in a collection of forest and ornamental seedlings and transplanted Fir-trees, which were exhibited in the forestry section at the Park Royal Show, Willesden.

Wednesday, Thursday, Friday, and Saturday were devoted to excursions to Durris House Estate, Haddo House, &c.

EASTBOURNE.

AUGUST 17.—The flower show held in the beautiful grounds of His Grace the Duke of Devonshire is an important local event. The exhibits on this occasion were displayed in three large tents, all of which were well filled, and it may be said of the exhibits as a whole that they were of excellent quality.

In the open class for groups the competition was close. Mr. G. T. SCOTT took 1st prize with a pleasing arrangement, in which were used some very fine Lily of the Valley in pots, Lilliums, *Verbena Miss Willmott*, *Celosias* of a fine strain; the foliage consisted of some good *Eulalias*, green and variegated; a pair of *Dicksonia antarctica* stood in the foreground. The 2nd prize went to Mr. W. E. HOLLANDS, of Tunbridge Wells, who had a novel arrangement, the background being made up as a wall of choice Ferns and flowers, and the foreground had a good base of Ferns with fine *Codiaeums*, *Caladiums*, and other foliage and flowers standing up. Mr. DURRANT YOUNG, who came in a good 3rd, had good foliage plants, and *Begonias* of a good type were prominent, together with *Tuberoses*, and *Oranges* with ripe fruit.

For group of Ferns, Mr. SCOTT was again 1st, having a pretty arrangement, *Adiantum Farleyense*, *Nephrolepis Piersonii*, *Davallia Veitchii*, *Adiantum macrophyllum bipinnatum*, and *Gymnogrammas*, with good Tree Ferns in the background.

Near these was a grand group from the Duke's garden. Mr. May, the gardener, had a beautiful arrangement of three semi-circular groups, with a continuous background. The grand plants of *Campanula pyramidalis* constituted the chief feature, together with well coloured *Codiaeums*, *Caladiums*, *Fraxinea ramosa*, *Achimenes*, and other flowers with a good setting of foliage, in which *Vitis heterophylla* was effectively used. This group was not for competition.

From the gardens of JOHN WARREN, Esq., Hand Cross Park, Sussex, came some splendid exhibits. The six Ferns which took the 1st prize were of immense size and very fresh and healthy, the *Davallias polyantha* and *D. Mooreana* being specially fine. The six foliage plants were equally fine—*Cycas revoluta*, *Phyllotanium Lindeni*, and large specimens of *Kentia australis*. In flowering plants the same exhibitor was equally strong. It is some time since we have seen such fine plants of *Ixoras*, *Bougainvilleas*, *Allamandas*, and *Lapagerias*.

Cactus Dahlias were well shown by trade growers. Mr. F. W. SEALE, Sevenoaks; Messrs. J. CHEAL & SON, Crawley; and Messrs. STREDWICK & SON, of St. Leonards, all having good blooms, including several new sorts.

Pompon and single Dahlias were well shown by Mr. SEALE and Messrs. CHEAL & SON, the honours being divided, each gaining a 1st and 2nd.

Messrs. GEO. BUNYARD & Co., of Maidstone, staged a large collection of hardy flowers, including a fine lot of *Kniphofias* (*Tritomas*), herbaceous *Phloxes*, *Statice*, *Liliums*, and others. From the same firm came twenty-five dishes of Apples, all good examples of the early varieties.

Messrs. A. CHARLTON & SON, of Tunbridge Wells, showed a good collection of Cactus Dahlias and hardy flowers.

In the competitive classes for hardy flowers, Sweet Peas in twelve sorts were well shown by four exhibitors, and *Phlox Drummondii* by six exhibitors.

Table Decorations were a great feature; also bouquets.

Roses from Mr. W. J. WOOLLARD and WILL TAYLER, of Hampton, were good.

Grapes.—In these there was a good competition. The 1st prize for a single bunch, also for three bunches of Black, went for Black Muscat; but Madresfield Court was equally fine, some bunches of it being shown in a collection of fruit from Polegate. Muscat of Alexandria was best finished and a good 1st. Some fine bunches of Canon Hall Muscat were not quite ripe enough. Melons were very numerous; the 1st prize went to Frogmore Scarlet, a very fine Melon. Of Nectarines, Pineapple was the best shown; and Dymond the best Peach. Apples and Pears were numerous. In the 1st prize for three dishes, dessert, Irish Peach, Lady Sudeley, and Red Astrachan were the sorts shown. In culinary varieties the best were The Queen, Ecklinville, and Peasgood's Nonsuch. Tomatoes were shown in many varieties, the best being Improved Comet, Prince of Wales, and The Cropper. Cucumbers were equally numerous, Sutton's A 1 being the best seen.

In Potatoes the best round was White Globe, and the best kidney Up-to-date. Collections of vegetables were remarkably good.

Altogether the show was a very attractive one, and the private gardens of His Grace being open to visitors formed an additional attraction.

TROWBRIDGE HORTICULTURAL.

TROWBRIDGE can boast that it has held an annual flower-show for the space of fifty five years. It can also boast that local cultivators can turn out some of the finest specimen Fuchsias seen in the country, and also that the greater part of the plants and cut flowers seen at its shows are grown in the locality. Its fifty-fifth exhibition was held on the 17th inst., in the show field, and it was in all respects a thoroughly good one, but the drenching rain much interfered with the attendance. Happily the Society has a good reserve fund.

The *Fuchsias* always have the place of honour in the schedule of prizes, and they were as finely exhibited as usual. The best six specimens were shown by Mr. F. T. FOXCROFT, Hinton Charterhouse (gr., H. Chislett), the dark and light varieties being alike finely grown and bloomed; Mr. H. POCCOCK was 2nd. *Western Beauty* was one of the finest late varieties. With four specimens Mr. CHISLETT was again 1st, and Mr. GEO. TUCKER, 2nd. Some well grown and bloomed plants were shown by working men.

Store and Greenhouse plants were a good feature; there were three collections of nine specimens, all locally grown. Mr. GEO. TUCKER came 1st; Mr. W. J. MANN, Trowbridge (gr., H. Matthews), was 2nd. With six specimens, Mr. Matthews came 1st, having among them a fine piece of *Erica Eweriana*; Mr. E. H. ATCHERLEY, Trowbridge, was 2nd. With three specimens, Mr. GEO. TUCKER won the 1st prize, Mr. H. MATTHEWS, 2nd. All the specimens showed good culture. Single specimen plants were also shown, and other flowering plants consisted of admirably-grown specimen zonal *Pelargoniums*, also single and double *Begonias* in excellent character, &c.

Groups arranged for effect filled a tent; in both classes Messrs. J. CRAY & SON, Frome, were placed 1st.

Fine foliaged Plants were shown in nines, Mr. W. STRUGNELL, The Gardens, Rood Ashton, came 1st with very good examples. Messrs. W. J. STOKES & SON, Trowbridge, took the 1st prize with twelve excellent Ferns. *Coleus* and *Caladiums* were also in good character.

Cut Flowers are always in fine character at Trowbridge, the display of Roses was one of the best seen for years. Mr. JOHN MATTOCK, Oxford, was 1st with twelve trebles; but with thirty-six blooms, twenty four and twelve, and twenty-four and twelve blooms of Tea-scented, Messrs. J. JEFFERIES & SON, Cirencester, were in such good form that they were placed 1st in all the foregoing classes. Messrs. J. MATTOCK and H. DREW took most of the 2nd prizes. Mr. J. MATTOCK was 1st with twelve bunches of garden Roses. Asters were very fine; they were shown in three classes viz., quilled, flat petalled, and Comet, the last especially were numerous and very fine.

Store and Greenhouse Cut Flowers were not only very good, but generally nicely staged; the 1st prize was taken by Mr. CHISLETT.

Hardy Flowers were well shown in collections of twenty-four bunches by Messrs. W. D. PORTER and STOKES & SON. Dahlias were very well represented; Messrs. CRAY & SON had the best twelve show; Mr. G. HUMPHRIES the best twelve fancies. Mr. J. WALKER was 1st with twelve bunches of singles; Messrs. CRAY & SON with twelve bunches of Pompons; and Mr. G. HUMPHRIES with twelve bunches of Cactus.

The best twelve spikes of *Gladioli* came from Mr. J. MATTOCK. Sweet Peas were numerous, and zonal *Pelargoniums* and *Carnations* were in good character.

Floral decorations were shown in several classes; charming epergnes were staged, also bouquets. Mrs. COLSTON HALE had the best dinner-table arrangement; Messrs. E. S. COLE & SONS taking the 2nd prize.

There was a good display of *Fruit*. Mr. STRUGNELL, Rood Ashton, was placed 1st with ten varieties; he had Black Hamburg and Foster's Seedling Grapes, Royal George Peaches, Stanwick Elruge Nectarine, Melons, Plums, Apricots, &c. Mr. W. OLIVER, The Gardens, Littleton Panell, was 2nd.

With six dishes, Mr. W. MITCHELL, gr. to Mr. J. W. FLEMING, Romsey, was 1st; he had Black Hamburg and Muscat of Alexandria Grapes, Peaches, Nectarines, Apricots, and Melons. Mr. STRUGNELL was 2nd.

Mr. MITCHELL was 1st with two bunches of black Grapes, showing fine Gros Maroc; and he was also 1st with white, having good Foster's Seedling; and again 1st with two bunches of black Muscats, having Madresfield Court. Mr. A. R. BAILY, Frome, was 1st with two bunches of white Muscats.

Melons, Apricots, Plums, Cherries, Peaches, and Nectarines were well shown in several classes.

Mr. T. WAIT, Bath, had the best two dishes of dessert Apples, staging Beauty of Bath and Gladstone;

Lady Sudeley and Beauty of Bath took the 2nd prize. Mr. WAIT was also 1st with two bunches of culinary Apples, having Peasgood's Nonsuch and Hants Seedling; The Queen and Peasgood's Nonsuch came 2nd. Mr. WAIT was also 1st with two dishes of Peas, having Jargonelle and Windsor.

Vegetables were well shown in several classes. Mr. CHISLETT took the 1st of Messrs. SUTTON & SONS' special prizes for six dishes. The cottagers' produce was very good. Honey was also shown.

ABERDEEN.

AUGUST 18, 19, 20.—On these dates the members of the Royal Horticultural Society of Aberdeen held one of the most successful shows yet held under their auspices, financially and otherwise. This year the entries numbered 1,700, a slight decrease as compared with those last year, which was a record one. Three large marquees and one small one were erected in the northmost portion of the Duthie Public Park, the use of which the Town Council very kindly gave free of charge. Several attractive novelties were added this year, the most interesting being a competition open to school children, for the best collection of wild flowers, garden flowers, and leaves, mounted on cards. This proved a most successful venture, and Professor Trail, Aberdeen University, who was judge, declared it creditable in every way.

Coming to the exhibition itself, it may be said generally that the quality was exceedingly fine, the cut-flower classes being the outstanding feature of the exhibition. Pot-plants were scarcely up to the standard in numbers usually seen here, but the quality was very good. Fruit formed a good exhibition, everything, in fact, being above average. Vegetables were a good average show, and fully better than last year; indeed one could not say there was a mediocre section in the lot. The judges were:—Cut flowers, Mr. Andrew Reid, Durris, and Mr. James McLeod, Aberdeen; fruit and pot-plants, Mr. J. McDonald, Montrose, and Mr. J. Forrest, Haddo House; vegetables, Mr. Ogston, Inverurie, and Mr. W. Smith, Aberdeen; children's competitions, Professor Trail, Aberdeen.

Pot Plants.—These occupied the first place in the schedule, and were excellently displayed in a large marquee. The specimens were better in quality but fewer in number than last year. For a table of Begonias, Mr. H. SKENE, gr., Garthdee, Aberdeen, was an easy 1st with good plants of fine varieties; Mr. A. GRIGOR, gr., Fairfield, making a good 2nd.

The Society's Silver Medals for the best specimen plant in flower and the best foliage plant, were worthily gained by Mr. WILLIAM SCORGIE, gr., Springhill, Aberdeen, and Mr. A. DUNCAN, gr., Albyn Place, Aberdeen, respectively, while the Medals for Ferns and Pelargoniums were awarded to Mr. A. GRIGOR, Fairfield. For Pelargoniums, which were an excellent display, Mr. GRIGOR again came to the front, as also for Fuchsias, which included some exquisite specimens.

Plants for Table Decoration formed a feature, the Medal being most deservedly won by Mr. A. DUNCAN, gr. to Mr. ADAM MAITLAND, Albyn Place, Aberdeen.

Single Begonias were specially good, and Mr. James Jamieson, gr. to Mr. JOHN RUST, Hawhill, Aberdeen, secured 1st place. The classes filled by Dracænas, Gloxinias, and Petunias, were all well represented.

Cut Flowers.—Cut flowers formed a grand show. There could not have been a better season for them, and the results in rich and varied colouring were charming. The 1st prize for 24 Rose blooms—a beautiful Silver Cup—was gained by Mr. JAMES ANDERSON, Mealmarket Street, Aberdeen; while the Society's Silver Medal for twelve Rose blooms was worthily taken by Mr. GEORGE MACLENNAN, gr., Fetteresso Castle, Kincardineshire.

In Dahlias the chief honours were divided by Mr. A. GRIGOR, Fairfield; Mr. GEORGE MACLENNAN, Fetteresso Castle; and Mr. JAMES JAMIESON, Hawhill.

In the class for spikes of Gladioli, eight varieties, the Medal went to Mr. PETER TAYLOR, Constitution Street, Aberdeen.

The premier honours for Marigolds were taken by Mr. JOHN GRIEVE, Woodside, Aberdeen, with an excellent entry. Herbaceous and annual plants were a good display, as were also the collections of cut flowers. For herbaceous plants, Mr. JOHN YULE, gr., Fae-me-Well, Aberdeenshire, and Mr. A. DOUGLAS, gr., Kepplestone, Aberdeen, secured the leading places; and the latter exhibitor was the winner for the best collection, closely followed by Mr. A. GRIGOR, and Mr. WILLIAM SCORGIE, Springhill.

Pelargoniums were a magnificent show, and in these classes Mr. A. GRIGOR again distinguished himself.

The display of Orchids was very good, premier place once more going to Mr. GRIGOR; as was also the case in the classes for greenhouse plants.

Pansies have been seen here in greater numbers, but certainly not much better in quality. Mr. JAMES ANDERSON, Aberdeen, took the chief places with excellent entries.

Stocks, although somewhat affected by the rains which prevailed during the opening weeks of August,

were a very good show, and in these classes Mr. WILLIAM SCORGIE, Springhill, proved the best man.

Sweet Peas were uncommonly fine, the display by Mr. A. GRIGOR earning chief honours.

The sprays, bouquets, &c., were well shown, the chief prize-takers being Mr. STRACHAN, Botanic Gardens, Old Aberdeen; Mr. A. GRIGOR, and Mr. A. DOUGLAS, Kepplestone.

Fruit.—Here there was a specially good show, the chief features being the green Gooseberries, Strawberries, Black Currants, and collections of fruit. For the best collection of fruit, nine dishes distinct varieties, Mr. A. HOWIE, gr., Drumtochty, Forloun, came 1st with a fine entry. For hardy fruit Mr. HOWIE again took premier honours.

Vegetables.—The classes here were very worthily filled, and above the standard of the last few years. The leading honours were excellently won by Messrs. FRANK KINNAIRD, Broomhill, Aberdeen.

Nurserymen and Florists.—The show made by these gentlemen was one of the outstanding features of the exhibition. Bouquets and wreaths were an exhibition in themselves. For twelve varieties of Cactus Dahlias Mr. W. A. DUSTAN, Holburn Street, Aberdeen, secured 1st place with exceedingly fine specimens.

Messrs. KNOWLES & SONS carried everything before them in the classes for wreaths and bouquets.

Amateurs and Working Classes.—The portion devoted to these classes was meritorious in the extreme. In cut flowers the Roses were very good. Pansies were only fair, Dahlias good for the season, and annuals very fine. The fruit and vegetables in these sections also made a brave show, and reflected much credit on all concerned. Amongst the working men the competition was very keen, the quality over all being wonderfully good.

Miscellaneous.—An outstanding feature of the show which cannot be overlooked was the magnificent displays for exhibition only made by Messrs. BEN. REID & CO., Aberdeen; Messrs. JAMES COCKER & SONS, Aberdeen; Messrs. SMITH & SONS, Aberdeen; Messrs. DOBBIE & CO., Rothesay; and Mr. W. DUSTAN, Aberdeen. These were all very beautiful.

DEVON AND EXETER HORTICULTURAL.

AUGUST 19.—The 199th exhibition of the Society was held in Northernhay Park, and was one of the best held for many years, a high level of excellence being reached in nearly all the classes, while the entries were considerably in advance of last year.

FRUIT.

Fruit was much better than usual both as regards size and colour. The principal prize for a collection consisting of eight varieties was awarded to Justice SWINFEN-EADY (gr., James Lock), the sorts being Muscat of Alexandria and Alnwick Seedling Grapes, Crimson Galande Peach, Moor Park Apricot, Kirke's Plum, Lady Sudeley Apple, Rivers' Early Nectarine and Sutton's Al Melon. The collection was a strong one throughout, colour being a predominant feature. The 2nd prize went to Sir DUDLEY DUCKWORTH KING (gr., S. Baker), and this collection also was of high merit. A competitor who would have been a winner, was disqualified for having two kinds of Apples (Beauty of Bath and Irish Peach) in the same dish.

In Grapes, Mr. J. F. G. BANNATYNE (gr., J. Elliott) was 1st for Black Hamburgh; and Rev. HAMILTON GELL (gr., J. Barnes) 1st for Muscat of Alexandria, both exhibits being heavy bunches of well-coloured fruit.

For Peaches and Melons, Sir DUDLEY KING was 1st, Walburton Admirable Peach being admirable; Jargonelle Peas, Moor Park Apricots, and Elrue Nectarines were the winning kinds in these fruits; Morello Cherries, transparent white, and The Comet Red Currants were splendidly shown. In Plums, Victoria and Dennyson's Superb were first, and in Apples, Beauty of Bath and Peasgood's Nonsuch. A dish each of Japanese Wineberry, the Loganberry, and Portuguese Oranges were shown.

FLOWERS.

For twelve specimen stove and greenhouse plants there was no competition, but the collection to which the 1st prize was awarded, Mr. W. BROCK's (gr., W. Rowland), was a good one, the chief plants being Ixora Dixiana, Dipladenia amabilis, and Allamanda nobilis, all well-grown and well-flowered specimens.

Mr. BROCK was also 1st for a group of plants arranged for decorative effect, for six stove and greenhouse Ferns, for six Coleus, and for six Fuchsias, as also for table decoration. Mr. W. B. HEBERDEN, C.B. (gr., E. Cole), was awarded 1st prize for Caladiums with a very nice collection of plants, although in this class there was no other competitor.

There was no special feature in the cut flowers, excepting that Sweet Peas were well shown, Mr. B. H. HILL (gr., G. Lock) being 1st. One of the best varieties was Scarlet Gem.

VEGETABLES.

There was, as is usual in these classes, keen competition and a large number of entries. For the principal prize, the collection of twelve, Sir JOHN SHELLEY (gr., R. Mairs) just managed to win, there being little to choose between him and Sir DUDLEY KING, who was 2nd. The kinds staged were very similar, and much the same as in former years.

In Onions, always a strong class at this show, these two gentlemen reversed places in the prize-list. Throughout the Onion classes Cranston's Excelsior and Ailsa Craig were the only two kinds which scored. In Carrots the New Intermediate and the Model carried all before them. The two kinds of Leeks shown in the winning exhibits were The Monarch and Dobbie's Champion—both splendidly staged. In Potatoes the majority were of the well-known sorts.

MISCELLANEOUS.

The honorary and trade exhibitors were Messrs Robert Veitch & Son, Exeter; Geo. Kerswell, St. Thomas; Curtis, Sanford & Co. (Devon Rosery Co.), Torquay; W. B. Smale & Son, Torquay; Jarman & Co., Chard; Ware's Nurseries, Feltham; G. Penwill, Totnes; W. J. Godfrey, Exmouth; Tuplin & Sons, Newton Abbot; Sanders & Biss, Horticultural Builders, Exeter; and Robert Sydenham, Birmingham.

A stand of Groff's Canadian Hybrid Gladioli, comprising blue and other unusual combinations of colour, was put up by Messrs. ROBERT VEITCH & SON, A. H., Exeter.

PRUDHOE JUBILEE EXHIBITION.

AUGUST 20.—The fiftieth annual show of the Prudhoe and West Wylam Floral and Horticultural Society was held on the above date. This being the Jubilee of the Society, special attention has been paid to the prize list. Prudhoe show has a reputation for vegetables second to none in the kingdom, and those exhibited were enormous in size. The entries in classes for greenhouse and stove plants were large, and aroused much enthusiasm amongst plant lovers. In this section Mr. T. SUFFIELD, of Darlington, made his first appearance at the show, and certainly made his presence felt. The handsome Silver Challenge Cup, Gold Medal, and £6 in cash were carried off by him. Other prominent prizetakers in this class were:—J. ELLISON and J. HARRIS, Cramlington; J. DIXON, Addison; J. JUDSON, Shotley Bridge; W. ANDERSON, Farnley Grange; L. CAMPBELL, West Wylam, &c.

A special feature of the show was an exhibition stand of Orchids in bloom sent by N. C. COOKSON, Esq., of Oakwood Hall, Wylam.

Messrs. WM. FELL & CO., Hexham, had an exhibition stand of Sweet Peas and herbaceous plants, &c.

GARDENERS' DEBATING SOCIETIES.

CROYDON AND DISTRICT HORTICULTURAL.—AUGUST 16.—This Society held its usual meeting on the above date, the subject for the evening's debate being "A Discussion on Insects Injurious and Beneficial to Gardeners." The Gooseberry caterpillar came in for lengthy discussion and one member observed how he had always succeeded in keeping this injurious insect at bay by sowing a few Broad Beans amongst the bushes. The use of gas lime dug into the soil during the winter is a splendid remedy against most of these formidable enemies, for in this way the cocoons lying dormant in the ground are destroyed. Amongst the "friends" spoken of were the lacewing fly and ichneumon flies. The meeting's vote of thanks was accorded the exhibitors of plants, also to Mr. J. Gregory, who illustrated the talk with microscopic views and a collection of moths and larvae.

TRADE MEMORANDUM.

CHINA.—At the beginning of this year a branch business of the German firm of L. Boehmer & Co., of Yokohama, was opened at Shanghai, under the management of Mr. Theodor Eckardt. As an important demand for such goods has lately arisen in China, this branch has been founded with, amongst other objects, that of acclimatising Japanese plants in China. Messrs. Boehmer have started a school of horticulture, and glasshouses with all modern improvements are in process of erection in order that Shanghai may be well supplied with the flowers it requires. Hitherto the demand has been met by the Chinese, who know little or nothing of latter-day horticulture; and the firm of L. Boehmer & Co. is the pioneer in this direction in China as it was in Japan twenty-two years ago. Already Mr. Alfred Unger has worked up a large stock of seedlings and young plants ready for exportation to China.

Obituary.

JOSEPH BURGESS.—The death of Mr. Joseph Burgess occurred at Stetchworth Park on August 7. Deceased had been head gardener at Stetchworth Park for twenty-nine years, and was regarded as one of the ablest practical horticulturists in the district, his services for judging at horticultural shows being often in request. A man of a kindly and genial temperament, he made many friends wherever he went, and his death will be much lamented at Stetchworth, where he was exceedingly popular. Deceased was a widower, his wife having died only a short time since.

THOMPSON.—On August 19, 1904, at 18, St. Mary's Road, Leamington, Rev. Edmund Thompson, late Fellow of Christ's College, Cambridge, and Rector of Clipston, Northamptonshire, from 1867 to 1883, aged eighty-seven years. Deceased was formerly an occasional contributor to the *Gardeners' Chronicle*.

THE WEATHER.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Wisley, Surrey. Height above sea-level 150 feet. The following are the "mean" readings for the week ending August 20, 1904.

AUGUST 14 TO AUGUST 20.	TEMPERATURE OF THE AIR.				TEMPERATURE ON GRASS.			TEMPERA- TURE OF THE SOIL AT 9 A.M.			RAINFALL.	SUNSHINE.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending August 20, is furnished from the Meteorological Office:—

"The weather during this period was very unsettled over the kingdom generally, but rain was less frequent in the east and south of England than elsewhere. Thunderstorms were experienced on Sunday in many parts of Scotland, and on Wednesday over the northern half of England and at Dublin.

"The temperature was again below the mean, the deficit ranging from 1° in England, E., to 3° in England, N.W., and Ireland, N. The highest of the maxima were recorded early in the week, and ranged from 75° in the Channel Islands, and 74° in England, S. and E., to 66° in Ireland, N., and to 65° in Scotland, W. The lowest of the minima, which were registered either at the middle or end of the period, ranged from 36° in Scotland, E., and Ireland, N., to 45° in England, E., to 51° in the Channel Islands.

"The rainfall exceeded the mean in Scotland, the north of Ireland, and the western and north-eastern districts of England, but was less elsewhere. More than an inch fell at Plymouth, Leith, and at several stations in the north and east of England on Wednesday. The largest amounts were 1.3 inch at Scarborough and Spurn Head, 1.4 inch at Lincoln, and 1.9 inch at Cheadle.

"The bright sunshine was more than the mean except in England, E., and the Midland Counties. The percentage of the possible duration ranged from 66 in the Channel Islands, and 53 in England, S.W., to 37 in the Midland Counties and Ireland, N., and to 32 in Scotland, N."

THE WEATHER IN WEST HERTS.

Another cool week.—Throughout the past fortnight the days have remained more or less unseasonably cold, while only three of the nights have been at all warm for the time of year. On the two coldest nights during that period readings within 4° of the freezing-point were registered by the exposed thermometer. At 2 feet deep the ground is at the present time about 2° colder, and at 1 foot deep about 3° colder, than is seasonable. Rain fell on four days during the week, but to the total depth of only about half an inch. These light falls of rain, however, caused small quantities of rain-water to come through the bare soil percolation-gauge on all but two days. The record of bright sunshine fell short of a seasonable duration by about one and a half hour a day. Calms and light airs mostly prevailed, the average rate of movement of the

air on the calmest day being less than a mile an hour. The mean amount of moisture in the atmosphere at 3 o'clock in the afternoon was about 5 per cent. in excess of a seasonable quantity. E. M., *Berkhamsted*, August 23, 1904.

MARKETS.

COVENT GARDEN, August 24.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

REMARKS.—The prices of fruit remain much the same as obtained last week. English Plums are now coming in — Prince of Wales, Victorias, &c. The large well-coloured fruit are sold at 2s., 2s. 6d., and 3s. per sieve; green ditto, 1s. 3d. to 1s. 6d. per sieve. Green Gages, 2s. 6d., 3s., and 3s. 6d. ditto; Damsons, 2s. ditto. Cape Oranges of good flavour in cases with two layers of fruit, 9s. by 10s. by 12s. 10s. per case. Corn Cobs, 1s. 6d. per dozen. Some good outdoor-gathered Mushrooms, 5d. to 8d. per lb.

POTATOES.

Various, home-grown, 70s. to 90s. per ton, *John Bath*, 32 & 34, Wellington Street, Covent Garden.

COVENT GARDEN FLOWER MARKET.

IN August there is less trade for pot plants than at any other time of the year; still there is a good supply in the market, and the trade is quite up to what could be expected. Already we have indications that the autumn is upon us, *Solanum capsicastrum* with ripe berries being seen, but they are not much in demand at present. *Chrysanthemums* too are very plentiful. The *Madame Desgranges* that have been disbudded are the best whites; the yellow variety is also good. Some of the varieties from *Madame Marie Masse* are good, but others are not decided enough in colour. The plants which have been grown in pots show a decided advantage over those taken from the ground. Some good plants of *Solanum esculentum* (the Egg-plant) are seen. It is a little remarkable that we rarely see any of the *Capsicums* in the market, which are both useful and ornamental. Some fine plants of both red and yellow varieties in a private garden seen lately were certainly very attractive, and I believe they would sell well in our market. Asters in pots are very abundant. *Lilium lancifolium* album and roseum are good, also *longiflorum*, but the latter are not quite so plentiful as a few weeks ago. *Hydrangea paniculata* is still good; *Hortensia* is now almost over. *Fuchsias* still hold out, and one stand filled with *Verbena Miss Willmott* has a very bright appearance. Foliage plants of all kinds are more plentiful. In Ferns small plants are very good, among them *Adiantum tinetum*, *Asplenium nidus*, *A. Hilli*, *A. bifforme*, *Pteris tremula*, *P. Wimsetti*, *Adiantum cuneatum*, also many of the choicer sorts in larger plants. The *Nephrolepis* include *exaltata*, *ensifolia*, *Zollingeriana*, *cordata*, also *Duffi*, but the latter can hardly be considered a good market Fern. *Polypodium aureum* is very good, also *Asplenium bifforme*. *Adiantum cuneatum* has not been over plentiful, but just now some very good plants in 4s. are seen. *Pteris Wimsetti*, *P. erecta* major, and *P. tremula* are good. Those persons who have the convenience to keep them, can buy Ferns to advantage now. Palms are also more plentiful. Small *Keutias* are offered very cheaply. *Aralia Sieboldi* and *Ficus elastica* in short, well furnished plants. *Asparagus Sprengeri* in various sizes, *Eulalia japonica variegata*, in useful plants for autumn work, and green *Aspidistras* are all plentiful, but well variegated plants are scarce, and none of the growers seem to have a largestock.

CUT FLOWERS.

Chrysanthemums are now a leading feature. The best blooms sell fairly well, but it is too early for really good trade. Dahlias are very plentiful in Cactus varieties, the large doubles and pompons less so. Growers who raise large quantities of decided colours do better than those marketing a great variety of mixed colours. Asters are also very abundant. The quality varies considerably. The best sell fairly well, but there must be a good many of ordinary qualities left over after market. Salesmen having French-grown Asters do not appear to be doing much trade. Lily of the Valley had been scarce, and had gone up to 21s. per dozen, but it is now more plentiful, and the price is down again. *Calliopis grandiflora* (clear yellow) is very showy, while the Iceland Poppies are still to be seen. The blue *Statice* is very plentiful; there are also some of the yellow and the white varieties. *Mignonette* is good. Roses are not quite so plentiful now, and Sweet Peas are less numerous. Tuberose still command a bad trade. *Gardenias* and *Eucharis* are fairly plentiful. *Gladiolus "The Bride"* is small, but very plentiful. *Brenchleyensis* is good, and sells fairly well. *Smilax*, *Asparagus*, and cut Fern are very plentiful; there is also other good foliage. Small branches of Oak with bronzy-red tinted leaves are very pretty. There is also other good hard foliage present. *A. H.*, *Covent Garden*, August 20.

FRUITS AND VEGETABLES.

GLASGOW, August 24.—The following are the averages of the prices during the past week:—Apples, American, 12s. to 16s. per barrel; English do., 8s. to 12s. per cwt.; Dutch Apples, 11s. per barrel; Dutch Pears, 2s. 6d. per sieve; Bananas, 5s. 6d. to 11s. per bunch; Lemons, 3s. to 10s. per case; Grapes, English, 9d. to 1s. 9d. per lb.; do., Almeria, 11s. to 17s. per barrel; Melons, 24s. 5s. 6d. to 6s. 6d. per case; do., 36s. 6s. 6d. to 7s. 6d. do.; Green-gages, 4s. to 6s. per half-sieve; Plums, 4s. to 6s. do.; do., common, 1s. 6d. to 2s. 6d. do.; Currants, black, 4d. and 6d. per lb.; do., red, 3d. to 4d. do.; Tomatoes, English, 3d. to 5d. per lb.; do., Scotch, 3d. to 5d. do.; Mushrooms, 10d. to 1s. 2d. per lb.; Shallots, 8s. per bag.

LIVERPOOL, August 21.—Wholesale Vegetable Market (North Hay).—The following are the averages of the current prices during the past week—prices varying according to supply:—Potatoes, per cwt., Early Regents, 2s. 10d. to 3s. 3d.; Kidneys, 3s. 9d. to 4s. 6d.; British Queen, 3s. to 3s. 6d.; Conquest, 2s. 10d. to 3s. 3d.; Turnips, 6d. to 8d. per dozen bunches; Swedes, 2s. 6d. to 3s. 3d. per cwt.; Carrots, 6d. to 8d. per dozen bunches; Parsley, 6d. to 8d. do.; Onions, foreign, 3s. 6d. per bag; Lettuces, 4d. to 8d. per dozen; Cucumbers, 1s. 6d. to 2s. 6d. do.; Cauliflowers, 10d. to 1s. 9d. do.; Cabbages, 6d. to 9d. do.; Celery, 1s. 6d. to 2s. 3d.; Peas, 6s. to 7s. per hamper; Beans, 2s. 6d. to 3s. do.; Kidneys, 9d. to 10d. per peck; do., Scarlet-Runners, 9d. to 1s. do. Fruit: Oranges, Naples, 9s. to 12s. 6d. per box; do., Valencia, 16s. to 23s. 6d. per case; do., green and pale fruit, 6s. 6d. to 13s. 6d. do.; Grapes, Almerias, 4s. to 6s. per barrel; superior do., 7s. to 9s. 6d. do.; do., Lisbon, 6s. 6d. to 7s. 6d. do.; Apples, Lisbon, 4s. 6d. to 7s. per box; do., Oporto, 4s. to 5s. 6d. per case; Melons, Valencia, 5s. to 5s. 6d. for 24s. and 6s. 9d. to 7s. 6d. for 36s.; Lemons, Naples, 4s. 6d. to 7s. for small boxes, and 8s. to 14s. for larger descriptions; do., Palermos, 2s. 9d. to 5s. 3d. per case; superior, 6s. to 8s. do.; Tomatoes, Lisbon, 5s. to 7s. per box. *St. Johns*.—Potatoes, 10d. to 1s. 2d. per peck; Peas, 10d. to 1s. do.; Cucumbers, 3d. and 6d. each; Filberts, 8d. per lb.; Apricots, 1s. per dozen; Grapes, English, 1s. 6d. to 2s. 6d. per lb.; do., foreign, 6d. to 10d. do.; Pine-apples, foreign, 3s. to 5s. each; Mushrooms, 8d. to 1s. per lb. *Birkenhead*.—Potatoes, 8d. to 1s. per peck; Cucumbers, 2d. and 3d. each; Filberts, 8d. per lb.; Peas, 8d. to 1s. 2d. per peck; Grapes, English, 3d. to 2s. per lb.; do., foreign, 4d. to 6d. do.; Mushrooms, 10d. to 1s. 4d. do.

ANSWERS TO CORRESPONDENTS.

ACALYPHA: Lancashire. Certainly the Acalypha is a flowering plant, and quite in order in a class for stove or greenhouse plants in bloom. The objectors have forgotten their botany.

BEGONIAS: T. D. M. Your plants are affected with mites. Wash the plants with tobacco water and cultivate them with more care.

CARNATION: W. S. It is certainly unusual to see five flowers from one stem. Form and colour are good.

CATERPILLAR: J. G. The caterpillar is that of the Privet-moth, *Sphinx ligustri*.

EAST GRIQUALAND: S. F. & Co. Practically all our own vegetables, flowers and bulbs will succeed in this colony in their season, provided the necessary amount of water be obtainable.

FUNGUS ON FERN-ROOTS: Ophir, Bradford. No fungi found either with lens or microscope about the roots. You should have sent fungus from the wood of the stage. If wood is decaying, it is perhaps some form of dry rot. There is no "spawn" or mycelium in the soil about the roots sent. The fungus theory must be a hallucination. M. C. C.

GARDENER AS A DOMESTIC SERVANT: J. M. We are not lawyers, and gave our opinion from our experience of the general custom. A "domestic" and a "menial" are, we believe, synonymous, and strictly entitled to a "month's wages or a month's warning." A head gardener is a "domestic servant." But in some circumstances the hiring is for a year, and then a longer notice is required. Follow your lawyer's advice.

GLADIOLUS, & C.: H. B. Gladioli are increased from the young corms which are produced on the old corms at the end of the season's growth. The flower spike should not be allowed to develop, but all the energies of the plant directed to root development. All varieties are increased in this manner. "Heal All" is applied to both *Colilinsonia canadensis* and *Rhodolia rosea* respectively. *Prunella vulgaris* of the meadows is the "Self-heal"; "Cutleaf" is *Valeriana pyrenica*.

GRAPES: Mackereth. Your Grapes are rusted from injury during thinning. The leaves sent are covered with red-spider and thrips.—A. G. The berries were reduced to pulp when we received them. Perhaps Alicante.

JUDGING: Moorpark. If the word "hardy" was not prefixed to "herbaceous," the competitor should not have been disqualified for including Cannas, Lilies, and Tuberoses. If the framers of the schedule wished to exclude these plants, they should have said so. On the contrary, they expressly permitted bulbs and tubers.

LAWN SAND: M. T. Lawn sand will be found sufficient for the purpose without the addition of any sulphate of ammonia. Be prepared for a temporary brown appearance of the grass after using the sand.

MARKET GARDEN LAND: W. C. The rent of market garden land varies according to the locality. Enquire locally from the agents.

NAMES OF FRUITS: We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, and cannot be allowed to encroach upon time required for other matters. Correspondents should never send more than six plants or fruits at a time; they should be very careful to label them properly, to give every information as to the county the fruits are grown in, and to send ripe or nearly ripe specimens which show the characters of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations.—S. C. 1, Duchess of Oldenburgh; 2, not recognised, send again October or later.—J. S. Juneating.—T. H. Mr. Gladstone.—Constant Reader. Apples: 1, Withington Fillbasket; 2, Cox's Orange Pippin; 3, Wyken Pippin. Pears: 1, Bellissime d'Hiver; 2 and 3, not fully developed—send when in season or fully grown.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—W. T. *Aster macrophyllus*.—W. J. G. *Asparagus racemosus* var. *tetragona*.—A. L. H. 1, *Abelia chinensis*; 2, *Aster macrophyllus*; 3, *Syringa persica* var. *laciniata*.—J. L. G. 1, *Veronica cupressoides* var. *salicornoides*; 3, *V. cupressoides*; 6, *V. carnosula*.—F. C. 1, *Mimulus cardinalis*; 2, *Geranium striatum*.—T. B. 1, *Tecoma jasminoides*; 2, a *Bromeliad*, but of which species cannot be determined without flowers; 3, *Adiantum concinnum latum*; 4, *Adiantum cuneatum* variety; 5, *Dictyogramma japonica*; 6, *Blechnum occidentale*.—J. S. You send more than six; in compensation you should send a small donation to the Gardeners' Orphan Fund. 1, *Spiraea Douglasi*; 2, *Lythrum virgatum*; 3, *Veronica salicifolia*; 4, *Veronica Hendersoni*; 5, *Veronica*, not recognised; 6, *Veronica Hendersoni* var.; 7, *Veronica Hendersoni* variegata; 8, *Scrophularia nodosa* variegata; 9, *Epilobium hirsutum*; 10, 11, labels detached, one is *Saponaria officinalis*, the other is *Veronica Traversi*.—L. H. G. *Elymus arenarius*.—R. W. 1, *Cereus* species; 2, *Mesembryanthemum eordifolium* variegatum; 3, *Nepeta Glechoma* variegata; 4, *Tradescantia zebrina*; 5, *Begonia corallina*; 6, *Anthericum lineare* variegatum; 7, *Rosa rugosa*.—C. M. B. 1, *Ligustrum lucidum*; 2, *Pulmonaria officinalis*, leaf only; 3, *Ceanothus azureus*; 4, *C. Gloire de Versailles*; 5, *Bignonia radicans*; 6, *Abelia rupestris*.—P. J. W. 1, *Adiantum hispidulum*; 2, *Doodia candata*.—A. B. E. *Salvia Horminum*.—A. W. *Solanum jasminoides*, an evergreen. *Japonica*, Durham. 1, *Ruellia Portella*; 2, specimen insufficient; 3, *Campylobotrys regalis*, so far as we can judge by leaf only; 4, send better specimen; 5, *Stenotaphrum variegatum*; 6, *Dendrobium macrostachyum*.—B. C. 1, 2, 3, 4, all garden Philoxera. Send to some cultivator; 5, *Montbretia Pottii*; 6, not found; 7, *Helianthus decapetalus* (?); 8, *Rudbeckia speciosa*.—R. A. F. 1, *Masdevallia tridactylites*; 2, *Bulbophyllum triste*; 3, *Restrepia maculata*; 4, *Oncidium* (*Palumbina*) *candidum*; 5, *Pteris longifolia*; 6, *Dendrobium Macraei*.—E. A. T. The *Oncidium* closely resembles *O. x Mantinii*.—G. E. *Clerodendron Bungei*.

NECTARINES: J. W. P. Both fruits partially decayed, but the stones sound. No trace of

fungoid disease, any mouldy appearance probably following, and not causing decay. The isolated fruits give no clue to the disease. Probably faulty treatment, as the trees and foliage are sound. M. C. C.

PEONY ROSE: B. M. H., Joppa. The fruit is that of *Podophyllum Emodi*, a native of India. The plant thrives in moist, marshy peat borders in a shady situation. Propagated by division and by seed.

PEACH-STONES: S. P. Due to an excess of water at the root.

PLANT FROM SOUTH AFRICA: S. A. We do not recognise the plant, the leaves of which are attacked by greenfly and other insects, to the puncture of which the appearances are due.

PLUM: T. W. O. We will endeavour to find out what the grub is that is causing your fruits to gum.

SAP: Moor Park. This is a very vague and inaccurate term. Watery fluid is absorbed by osmosis through the roots, is forced up the stem, being aided by transpiration from the leaves. Leaf action is dependent on heat, sunlight, and a supply of water from the root. By the inter-action of these agencies food is formed in the leaves, and when rendered soluble by the action of certain ferments, is then in a condition to be transmitted in any direction to any part of the plant where it is required for the requirements of growth and development. Exactly what are the causes which induce these movements of fluid in plants is a matter of conjecture.

SHEWESBURY SHOW: Omissions. It is impossible for us to mention all the exhibits, and we make no pretence of doing so; moreover, the conditions for note-taking were exceptionally bad. Messrs. Tom B. Dodds & Co. obtained a silver medal for table decorations and bouquets. Mr. W. A. Watts, of St. Asaph, was 1st for a collection of cut Carnations, and obtained Certificates for Chiryo (?), The Master, Pied Piper, and Mrs. Kearley respectively. Mr. Vernon was 1st in the Amateur Class. Messrs. Pope & Sons, of Birmingham, say that they obtained the 1st prize for a bouquet (Orchids excluded), besides five others prizes for flowers not mentioned in our report. The mention of sundry Orchids was therefore a mistake on our part.—Mr. H. D. Goolden writes to state that he was the exhibitor of the new double *Lobelia* mentioned, and called Mrs. Goolden. J. D. C.

TOMATOES, TO PRESERVE: Tomato. Tomatoes are often so juicy that they are difficult things to preserve. They require so much spice and vinegar that the flavour of the Tomatoes is often lost. Here is a recipe, however, which you may like to try:—Put the Tomatoes into earthen jars; place them in a slow oven, and let them bake gently until quite soft. Rub them through a fine sieve, and weigh the pulp. With every pound of pulp put an ounce of white Pepper, an ounce of salt, half an ounce of minced Shallot or Onion, and a quart of vinegar; half a small teaspoonful of mild Cayenne Pepper if liked. Boil until the mixture is as thick as cream; let it get cool, cork well, and store in a cool, dry place. Exact quantities cannot be given, as the flavour of Tomatoes, spice, and vinegar vary so much. The Tomatoes keep best when there is more pulp than juice in them.

TRENCHING: An Old Reader. The depth depends on the nature of the soil and subsoil. We cannot give you any definite advice. As a general rule, trenching to the depth of two "spits" or spades is sufficient. Get the *Calendar of Garden Operations*, post-free 7½d., from our publisher, and read p. 70.

VILMORIN MEMORIAL: The Editor acknowledges with thanks the receipt of a cheque for £5, from Messrs. Hurst & Son, Houndsditch, for the purposes of this memorial.

THE SEGREZ ARBORETUM.

A QUARTER of a century ago the arboretum at Segrez, in France, contained probably the most comprehensive as well as the most interesting collection of trees and shrubs on the Continent. It was planned and planted by the late Mons. Alphonse Lavallée, the proprietor of Segrez, and the author of several useful botanical works, amongst which may be mentioned *L'Arboretum Segrezianum*, an enumeration of all the ligneous plants he grew; *Clématites à Grandes Fleurs*, an illustrated work, and various essays. Unhappily, M. Lavallée died in May, 1884, at the early age of forty-nine, and since that time the plantations he made at Segrez have been allowed to run wild. But although many of the shrub collections, untended and uncared for, are now merely jungle, the place is still full of interest to anyone, like myself, specially concerned with hardy ligneous plants.

Segrez is about 30 kilometres from Paris, and is in the department of Seine-et-Oise. The mansion, which is still occupied by Madame Lavallée, is near Saint Sulpice-de-Favières, an interesting village clustered

round a fine thirteenth-century church. The park covers 30 hectares, and is not only beautiful in itself, but is beautifully set amidst surrounding hills.

The chief interest of the place as it now is lies in the trees and in such shrubs as are big enough to take care of themselves. Many of the dwarf things have succumbed to the native vegetation, or to grosser species growing near; but some of the rarer exotic trees are still probably amongst the finest of their kind in Europe. I spent a day in the latter part of July inspecting the place, and possibly a few of the notes I made then may interest some who knew the arboretum at Segrez—in reality or by repute—in early and more palmy days.

Whilst M. Lavallée kept his chief botanical collections in areas (*écoles*) specially devoted to them, he also planted interesting trees as isolated specimens in the park, after the English fashion. Some of the Conifers especially, unhampered by rivals near, are now fine, well-grown specimens. Near the entrance-gate is a large specimen of the Weeping Gleditschia, generally known as *G. Bujoti pendula*. It is probably a form of *G. triacanthos*, the "Honey Locust," but although quite hardy in England is not well known here. It is a very elegant tree, with long, slender branches clothed with Fern-like leaves. The tree at Segrez has a trunk about 1 foot in diameter, and is the largest I have seen.

Among the Conifers planted in the park and rising from the grass, I noted a fine *Picea orientalis* laden towards the top with its slender purple cones. It was 60 feet high. I do not think this Spruce is planted so abundantly as it deserves to be in the British Isles. It is decidedly one of the most elegant of the Piceas, and thrives better on poor dry soils than the common Spruce. A beautifully-grown example of *Abies brachyphylla*, 40 feet high, was also laden towards the summit with its handsome violet-purple cones. *Abies cephalonica*, so easily recognised among the Firs by its pungent leaves set all round the branch, was 58 feet high, and this, too, was bearing a full crop of its rich-brown cones. *Tsuga Sieboldii* thrives well, and cones freely. *Pinus koraiensis*, which is not frequently seen in Britain, especially grown to any size, is represented at Segrez by a tree 30 feet high, with a trunk 2 feet 6 inches in girth. A very striking variety of the common Silver Fir is *Abies pectinata* var. *pyramidalis*. I think this tree, which has quite the habit of a Lombardy Poplar and is 30 feet high at Segrez, is very rare in this country. In localities where the Silver Fir thrives, it would make an interesting addition to fastigate evergreen trees of the Irish Yew stamp. At present there is not a great variety of them.

There are comparatively few trees and shrubs that flower towards the end of July, in France just as in England. My interest therefore was excited by the sight of a tree near the château covered with yellow flowers. It proved to be *Kolreuteria paniculata* (*Gardeners' Chronicle*, 1887, ii. fig. 3), a beautiful object as seen here. In Britain this tree is quite hardy, and flowers occasionally during August, but it evidently requires the brighter sunlight of the South to develop its beauties to the full.

Euptelea polyandra is a tree of great interest botanically. It is a native of Japan

and the genus to which it belongs used to be placed amongst the Magnoliaceae. It has lately been transferred to a new Natural Order—Trochodendraceae—along with *Trochodendron*, *Cercidiphyllum*, *Eucommia*, and other genera. At Segrez it is 15 feet high, and has flowered during the summer; in July it was carrying plenty of its small flat fruits.

A good deal of attention has in late years been given to the magnificent long-leaved Walnuts of Japan—*Juglans cordiformis* and *J. Sicboldiana*. They are nearly related, and both are remarkable for the size of their leaves, especially when young. At Kew, I have measured leaves of *J. cordiformis* 3 feet 6 inches in length. Only small trees exist in Great Britain, so far as I know, but at Segrez there is perhaps the finest specimen in Europe. The trunk is 3 feet 3 inches in girth, and it supports a spreading head of branches 40 feet in diameter. As usually happens with big-leaved trees, the foliage is much smaller in adult trees. This species is figured in the supplement to the *Gardeners' Chronicle* for October 19, 1901.

The collection of Oaks is fairly extensive, but the trees are only moderately well-grown. I was interested to see a specimen of the true Valonia Oak (*Quercus Ægilops*), whose large acorn-cups are so remarkable. I do not know that they are produced in Britain, but the tree, although difficult to get true to name, is hardy in the South of England. There was also a good specimen of its variety *Pyrami* (the *Quercus Pyrami* of Kotschy). This is a dwarf sturdy tree, with a striking rough bark and very characteristic habit. It is represented at Kew by a healthy tree 12 feet high.

Of the interesting genus *Pterocarya*, three species are at present in cultivation. They are *P. caucasica*, *stenoptera*, and *rhoifolia*, and all three are in good condition at Segrez. *P. stenoptera* I had not seen in fruit before, but it was bearing an abundant crop here. It is, of course, easily distinguished from the other two by its winged midrib, but the wings on the nuts are also distinct in being longer and scimitar-shaped. In England *P. caucasica* is represented by very good specimens—notably in the Cambridge Botanic Garden and at Claremont. There is also a nice tree at Syon House. Mons. Lavallée divided *P. caucasica* into three species, relying on the size of the nuts, the different shape of the wings, and the shape of the leaflets, to differentiate them. The differences between what he termed *P. Spachiana* and *P. fraxinifolia* were easily discernible in the trees at Segrez, both being in fruit, but botanists have not followed him. Probably the two are united by intermediate forms. A third and dwarfer form he named *P. dumosa*.

Rhus vernicifera, the Lacquer-tree of Japan, is represented at Segrez by a magnificent specimen 40 feet high. This tree is proving hardy in England, but I do not know of a tree half so large as the one at Segrez. *Carpinus japonica* is one of the Hornbeams, which some botanists place in a separate genus called *Distegocarpus*. It was abundantly in fruit. *Cladrastis amurensis*, an uncommon tree in Britain, is here 20 feet high.

For some years past Continental nurserymen have offered in their catalogues *Sophora Korolkowi*, of Cornu, with the information that

it was a native of Central Asia (Turkestan). Little has been known of it in this country, however, and I was particularly interested to see a fine tree of it at Segrez 30 feet high, with a large rounded head like that of *S. japonica*. The trunk was 1 foot in diameter. Although the tree was showing a good deal of flower, none as yet were open, but I was told they were violet-coloured. The leaflets are larger and longer than those of *S. japonica*. The species, flowering as it does in August, is evidently worth the notice of tree-lovers in this country. There are small trees at Kew, but probably some years from the flowering stage.

There are, of course, many more trees worthy of note at Segrez—many indeed one would be apt to pass by in a hurried visit unless they were pointed out. In places they are very crowded, and but few labels are left to help one. There is a comprehensive collection of Hickories for instance, specimens of such fine species as *Carya sulcata* and *C. tomentosa* being of good size but wanting room to develop. Segrez, even now, is intensely interesting, but twenty years' neglect has made the interest often a melancholy one. *W. J. B.*

NEW OR NOTEWORTHY PLANTS.

CRASSULA "JUSTUS CORDEROY," N. HYB.

HITHERTO very few hybrids of the genus *Crassula* have been raised, and none of a more interesting character than the one here dedicated to Mr. Justus Corderoy, of Blewbury, Didcot, by whom it was raised, and who is a great lover and very successful cultivator of all succulent plants.

The female parent is *C. Cooperi*, a very dwarf tufted species with crowded narrow leaves not more than $\frac{1}{2}$ inch long, green or reddish, marked with impressed dull red or dark green spots, and ciliate on the margin, but without papillae on the surface; the flowers are white, in small compact cymes. The male parent is *C. falcata*, a tall species with large falcate-oblong leaves, whose whitish surface is formed of peculiar, closely contiguous papillae; the flowers are red, in large cymes.

The hybrid result is a small plant about 6 inches high when in flower, with a moderately stout, erect, red stem, covered with short spreading hairs on the leafy part, and with whitish papillae on the flowering stems. Leaves opposite, crowded or separated here and there by an elongated internode, widely spreading, $1\frac{1}{2}$ — $2\frac{1}{4}$ inches long, 5—7 lines broad and 2—3 lines thick, lanceolate, acute, flat or slightly concave above, very convex beneath, thickly sprinkled with small globose, whitish papillae on a green ground, producing a greyish-green colour, marked on both sides with darker, slightly impressed spots. Flowering branches red, with a few pairs of distant, reduced leaf-like bracts. Cymes somewhat lax, $1\frac{1}{2}$ — $2\frac{1}{2}$ inches in diameter, many-flowered. Pedicels $\frac{1}{8}$ — $\frac{1}{4}$ inch long. Sepals about 1 line long, $\frac{3}{4}$ — $\frac{1}{2}$ line broad, ovate, acute, ciliate, and with a few spreading hairs on the back. Corolla about $2\frac{1}{2}$ lines in diameter, glabrous, pinkish, with lanceolate acute, spreading petals. Anthers greenish-black, pollen yellow. Filaments and carpels light carmine.

The impressed spots on the leaves of the female parent are preserved in the hybrid, but the cilia are absent, whilst the thickly-scattered (not contiguous) papillae on the leaves represent the large contiguous papillae which form the leaf-surface of the male parent. *N. E. Brown.*

IRIS SOFARANA VAR. MAGNIFICA, SIEHE.

THE original stock of this beautiful Iris grew abundantly near the station Ain Sofra, on the main line between Damascus and Beirut. Unprincipled collectors, however, have rooted up all the stock, a fate which will befall nearly all the beautiful *Oncocyclus* Irises in Palestine, if the dealers there do not arrange for a reasonable plan of cultivation of these plants. The fine Iris *Lortetii*, discovered by Barbey, is already growing freely, thanks to judicious culture.

Iris *Sofarana*, of Foster, was first collected by

group successfully; but they will have no failures to fear if, as with other plants, Orchids for example, they carefully study their natural habit. In the English climate this plant can best be grown in large pots with good drainage, in which it can be kept perfectly dry during the summer. *W. Siehe, Mersina, Turkey-in-Asia.*

KEW NOTES.

DERRIS FORDII, Oliver.—This is a new and good garden plant belonging to the order Leguminosae, and has borne a profusion of flower in the Pa'm-

FIG. 64.—IRIS SOFARANA, FOSTER, VAR. MAGNIFICA. (Natural size.)

Mr. Hartmann, and with him I made an excursion some time ago to the higher Lebanon to collect other varieties discovered by him which grew at an altitude of about 6,500 feet. I have placed this fine plant in the market under the name of *Iris Sofarana magnifica*. Both habit and colour are striking—silvery-white with purplish-red markings, which almost overpower the tint of the background.

The plant grows readily in limestone soil where, in summer, there is absolute freedom from moisture. This condition must be duly noted by those who wish to cultivate any Irises of the *Oncocyclus*

house at Kew. It was received from the Hong Kong Botanic Garden in 1900, the plant being then a very small one, contained in a Wardian case amongst various other plants; it has now twining woody stems some 18 feet long, which are trained up the roof. The leaves are alternate and impari-pinnate, having usually five ovate leaflets, varying from 2 to 5 inches in length; the inflorescences are produced both on the old and new growths; the papilionaceous flowers are borne on a loose raceme, which is from 9 to 15 inches in length, the inflorescence very much resembling that of a *Lonchocarpus*. The flowers.

are white and sweetly-scented, rather less than $\frac{1}{2}$ -inch in length. The slender pedicel and the calyx are brown-red in colour, making a pretty contrast with the white corolla. It is a native of the province of Kwangtung, China, and is figured in *Icones Plantarum*, t. 1771. A plate is also being prepared for the *Botanical Magazine*. The genus

ANGRÆCUM EICHLERIANUM, *Krincin*.

This fine Tropical West African species has just flowered freely in the warm Orchid-house. The plant is a large specimen with seven growths, some of which are 3 feet in length; the leaves are leathery, each measuring about 5 inches in length and 2 inches in breadth. The plant is

at the Royal Horticultural Society's meeting on August 9. The plant is figured in the *Botanical Magazine*, t. 7813.

ROMNEYA TRICHOCLALYX.

This new species has been in flower for the past two months in a recess outside the Palm-house. It is the first time it has flowered at Kew, and the early date of its flowering is due to the protection afforded by its sheltered position. In addition to this an old light was placed over it during the winter. The seeds were sent to Kew by Miss A. Eastwood, Academy of Science, San Francisco, in November, 1902. They were sown at once, and the young plants, after being wintered in a cold frame, were planted in their present position in the spring of last year. They are now 5 feet high, and have a diameter of about 3 feet. These dimensions show that the species is a very free grower, and it is certainly very free in flowering, probably more so than the well-known *R. Coulteri*. The terminal flowers of the main branches were fully 6 inches in diameter, and white. In the *Gardeners' Chronicle* for Sept. 13, 1902, p. 191, Mr. Nicholson made the following reference to this species: "I have received from Mr. H. C. Baker, Oaklands, Almondsbury, Gloucestershire, flowers of this species, which from a garden point of view is abundantly distinct from the plant I have always seen cultivated under the name of *R. Coulteri*. It differs from *R. Coulteri* in its setose calyx, in its thinner, weaker suffruticose, easily spreading, more leafy stems, and its pinnately three to five parted leaves, which closely surround the bud." W. H.

EXPERIMENTAL CULTIVATION.

(Continued from p. 125.)

EXPERIMENTS WITH MANURES.—This division of experimental work presents a wide field for investigation, and its importance has naturally led many to engage in it. The problems are so numerous and so complex that with all that has been done (and the recorded results are now voluminous in some directions), a large proportion still awaits solution. Here, as in other departments, it is essential to start with a clearly defined scheme, and the questions to which answers are desired should be as few and direct as possible at one time. It may be wished to determine the fertility of the soil and the manures most useful to general crops, in which case several kinds of plants can be subjected to a series of simple tests. The comparison of stable or farmyard manure with artificials alone and in combination may form another course of experiments. The determination of the special requirements of particular crops will constitute a useful and interesting investigation when well planned. It is also important to ascertain in what form or from what source the essential elements of plant growth can be applied with the best economic results, both as regards cost of the manures and the amount or quality of the produce. Such distinct subjects are best studied separately, and attempts to provide for them all in one series of experiments lead to serious complications and endless difficulties in determining the results. Questions regarding the amount of manures and the time of application can however usually be dealt with in either of the series without involving much additional trouble; or if more convenient they may be treated separately in an extension of the general experiments.

To facilitate comparison between the work in different institutions and districts, it has been suggested that whatever manures may be employed the proportions of nitrogen, phosphoric acid, and potash they contain should be stated in pounds, rather than the total weight of manure only. Further, that all these essential substances should be supplied in multiples

FIG. 65.—IRIS SOFARANA VAR. MAGNIFICA GROWING IN MR. SIEHE'S NURSERY IN MERSINA. (SEE P. 162.)

Derris is one that is practically unknown in gardens, and *D. elliptica* is the only other species in cultivation at Kew. Although the plant under notice is flowering under stove conditions, it is quite possible that much cooler treatment will be found to suit it equally well. It should be grown in a rich, loamy soil, either in pots or planted in a border. Occasional thinning-out the weak growths is all the pruning it requires.

carrying twenty-five large flowers, produced singly and in pairs; the sepals and petals are greenish-yellow, about $1\frac{1}{2}$ inch in length; the lip is also about the same size in diameter, greenish in the upper part and ivory white in the broad lower part; the spur is short, dark green, and slightly inflated. It was sent to Kew from Old Calabar in 1899, and again in 1900, since which time it has flowered each year. Several small plants were exhibited by Messrs. Sander & Sons

of 5 lb. instead of in the percentages found in 1 cwt. or 2 cwt., &c. It is only by such means that the diversified work now being carried on can be rendered generally serviceable; and it is satisfactory to note that these suggestions have been officially approved, and the principle adopted in many places. How far equal amounts of an essential substance in different manures may be available to plants is one of the questions upon which experiments may throw a light, but if plants have been treated alike in at least one respect, there should be something upon which to found a reliable judgment. It is not difficult to state the amounts of manures used as well as the proportion of the essential substance; and in any case it is easy to express the quantities in definite weights of the compound manures.

As an example of the method of dealing with an enquiry concerning the manurial requirements of soils, the following scheme, as set out by the Agricultural Education Association, is instructive. The first question is, "What does the soil most require?" To this are devoted five plots—1, receiving no manure; 2, a complete artificial manure supplying nitrogen, phosphoric acid, and potash; 3, an incomplete manure, omitting the potash; 4, an incomplete manure omitting the phosphoric acid; and 5, an incomplete manure omitting the nitrogen. The last three provide two of the essential substances only in each case, and the effects on the crop produced by the omission of each or in turn must be carefully watched.

IS FARMYARD-MANURE ESSENTIAL?

The second question bearing upon the same subject is: "Must the soil have farmyard-manure?" And this is attacked by devoting two plots to the matter, one in which farmyard-manure only is employed, and another in which that is used in conjunction with the complete artificial manure of plot 2.

A third question to be answered is the following: "Is the artificial manure for plot 2 sufficient as well as complete?" And to this three plots are allotted, in one of which the nitrogen is increased by 33 per cent., in another phosphoric acid is increased in the same proportion, and in a third potash is similarly increased.

To still further exhaust the enquiry, a fourth question is proposed, namely, "Can the soil supply any two of the three constituents of a complete artificial manure?" And this is disposed of in three plots, one having nitrogen only, and the others phosphoric acid and potash respectively. Thus in one subject of a general character, thirteen plots are set out, and if these are duplicated, or the no-manure plot repeated, both of which courses are desirable in many cases, it may be necessary to have about thirty plots to ensure that the matter is disposed of in a thorough manner. But it may not be essential that the whole of the four sections be investigated at once; they can be taken in pairs or grouped according to the particular requirements of the crop, the district, or the inquirer; but in each the plots named must be undivided, though No. 1 (no manure) and No. 2 (complete artificial manure) must be repeated for comparison with the other sections.

In some soils where certain constituents are known to be deficient in quantity, such as lime, for instance, a section framed upon the same lines could be introduced, either in addition to the others or as a substitute for one of them. Again, on the question of sufficiency of manures in section 3, the 33 per cent. increase above the normal may not prove adequate as regards one or more of the substances, and extended experiments would be needed to determine how far 50 per cent., or an even greater increase, may be requisite and profitable.

No particular crop is named in connection with this scheme, because it is specially directed to

ascertaining the requirements of the soil. It might be regarded as a preliminary to the investigation of the needs of any plants, and one or several different kinds could be tried. But the plots should be so planned that they may be retained for similar experiments. The actual quantities and the proportions of each substance in the mixed manures will have to be regulated by the crops under trial, and to this reference will be made as we proceed. *R. Lewis Castle.*

(To be continued.)

ORCHID NOTES AND GLEANINGS.

LÆLIO-CATTLEYA × CALLISTOGLOSSA.

A FINE form of this showy hybrid between *Lælia purpurata* and *Cattleya Warscewiczii* is in bloom with Mr. H. A. Tracy, Orchid Nursery, Twickenham. The sepals and petals are white delicately veined with rose, and the large labellum ruby-crimson. Of the many hybrids which have bloomed in his nursery this year, Mr. Tracy considers the forms of *L.-C. callistoglossa* the most satisfactory, as they have bloomed more or less for the past four months; and although all have been beautiful, no two have been alike, except in the case of some large specimens which he had divided. Among those which have flowered, some have pure white petals and sepals and carmine-crimson lip, while others had rose-coloured sepals and petals with maroon-purple labellums. The variety *excelsa*, raised at St. Albans, was one of the best.

Since the original flowered with the raisers, Messrs. Jas. Veitch & Sons, Chelsea, described in the *Gardeners' Chronicle*, January 21, 1882, many other batches have been raised, each exhibiting variation, and probably no hybrid has retained popularity as this has done. Records of the dates of flowering also show that this hybrid may flower at any season, several of the certificated varieties having been shown in January, others in November, though summer produced most.

A circumstance may be mentioned in connection with Mr. Tracy's experience. Last year he had some large specimens of this Orchid which had degenerated in the quality of the flowers. He decided to divide them, but they were dense masses, and a large pruning-knife had to be used to separate the parts. The roughly-handled pieces were potted separately, and have given the best show of flowers this year, the blooms having returned to the original fine type.

ST. LOUIS EXHIBITION.

THE JAPANESE EXHIBITS.—The Japanese site is situated a little to the south-east of the French section, on a hill overlooking the machinery hall, and perhaps no greater change could be imagined than that experienced by the visitor in stepping from the French garden, with its broad straight avenues, or from the old English garden where strict formality is the rule, to that of Japan, in which an air of studied irregularity and rusticity reigns everywhere. A winding gravel walk leads from the main entrance at the north-west corner of the garden to the main pavilion, and around the brow of the hill, where an extremely pretty picture presents itself to the view, a lake, fed at one end by a miniature waterfall, has been excavated in the side of the hill. The banks have been built up with natural rock, old wooden piles, &c., and suitably planted with trees and shrubs to accentuate the irregular form of the lake. At different points in the water are planted Japanese Iris, which gave a magnificent display of bloom in June. On an island in the centre of the lake is an artificially dwarfed but perfectly healthy plant of *Acer palmatum dissectum*. It is about 6 feet high, and about 250 years old.

Scattered about in various parts of the garden is an interesting collection of Japanese Conifers, including several dwarf plants of *Chamaecyparis obtusa*, ranging from 80 to 350 years old. The gnarled stems and quaint forms of these greatly excite the curiosity of the visitors. There are also plants showing it in its natural form.

The Umbrella Pine, *Sciadopitys verticillata*, and the Chinese Yew-tree, *Podocarpus chinensis*, are used with good effect in groups at prominent points, as is also *Juniperus procumbens* amongst the rocks on the hillsides. The lawns are furnished with good specimens of *Pinus densiflora*, *P. parviflora*, *Chamaecyparis filifera*, and *Juniperus chinensis*, planted singly. A group of *Cycas revoluta* with 4 feet stems is a prominent feature at the top of the hill. Mention must also be made of the bush plants of *Wistaria chinensis*, which produced a mass of bloom in May. Some interesting details of the cultivation of these are given by Mr. Yukio Itchikawa, superintendent of the garden. Like the dwarfed Conifers, these *Wistarias* undergo a course of "stunting," but whereas with the Conifers the process commences when the plants are quite young, the *Wistarias* are allowed to grow naturally for seven or eight years before anything is done. They are then taken up, cut back to the required dimensions, and root-pruned, after which they are replanted in the open ground for two years to recover. At the end of two years they are again lifted and root-pruned and put into pots just large enough to receive the balls. Plants treated in this manner produce much shorter growths and more flowers. The characteristic appearance of the Japanese garden is kept up by lanterns scattered amongst the trees, some of them 5 or 6 feet high, and richly worked in bronze life-sized figures of deer, storks, &c., also adorn the garden. Amongst the flowering plants a large bed of *Lilium speciosum albidiflorum* is very conspicuous. Although there are six pavilions on the ground, all are so well disposed and screened with heavy foliage plants that there is no appearance of crowding whatever. The garden was designed by Mr. H. Foukoubu, Director of the Imperial Japanese Gardens at Tokio, and the work has been carried out by Mr. Y. Itchikawa, who also had charge of the Japanese display at the Paris Exposition of 1900. *T. W. Brown, St. Louis.*

CULTURAL MEMORANDA.

PEACH AND NECTARINE TREES.

SHOULD the trees be making any very strong growths, these should be cut out when summer pruning is done, as the flowers from such wood seldom set well, and the shoots are liable to "gumming" or to "bark-binding." If the trees are growing too strongly throughout, the roots should be pruned about a fortnight or three weeks after the trees have completed their growth, which will allow the buds time to develop. Take out a trench 2 feet deep and 2½ feet from the trunk of the tree; then carefully work all the soil into the trench with a hand-fork and a large wooden plant-label, keeping it well away from the bottom. Take great care not to break or injure the fibrous roots, but tie them back to the trunk with raffia as they become free. When the soil has all been removed, then with a sharp knife prune the large rough-looking roots hard back to the stock, as they would undoubtedly throw suckers sooner or later. There is generally a "tap-root" (which is one that grows directly down into the ground) when growth has been very strong. This should be severed. Cut off any roots that may have been injured whilst removing the soil, as roots so injured would produce suckers. When this has been done, fill up with the old soil to the required depth for the reception of the

tree, tread it firm and apply a thin layer of loam, then place the tree in position, lay the roots out quite straight in layers, covering each layer with a mixture of loam and mortar-rubble containing a 5-inch potful of Clay's Fertiliser to each barrowful. Then continue to fill up with the old soil, or loam if it is plentiful, still adding mortar-rubble liberally. Tread the ground a little when the work has been finished, and apply a little water but not sufficient to saturate the soil. Tie the main branches up loosely, allowing room for the trees to settle. Afford shade on bright days, and syringe the trees frequently; they will thus retain their foliage longer, and consequently make fresh fibrous roots. If trees are treated in this way a moderate crop of fruit may be expected from them next season. Should the soil at the bottom of the border be wet and waterlogged, proper drainage should be provided at once, as this is very essential. *F. G. Brewer, 11, Ray Lodge Road, Woodford Green, N.E.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS AT THE END OF JULY.

(See Tables and General Summary, ante, pp. 70-76.)

(Continued from p. 146.)

KENT (continued).—Strawberries have yielded a heavy crop of fruits of fine quality. Gooseberries are especially fine, but Black Currants are more or less a failure, chiefly owing to the mite. Aphis this year is very prevalent, and is not easily destroyed. Apples and Pears are both very promising, the leafage being extra luxuriant, some recompense for the wet season last year. All vegetable crops look very promising in this neighbourhood. Potatoes all round look very healthy, but spraying has been commenced as a precaution against disease. Soil varies from gravelly to good deep loam. *W. E. Humphreys, Blendon Hall, Bexley*

MIDDLESEX.—The season opened with every prospect of splendid fruit crops, and a few varieties of early Apples and Pears have set well, but mid-season and later kinds are very poor. Plums are a total failure in the open, trees on sheltered walls only having a crop. All kinds of Cherries, since the fruits formed, dropped wholesale. Apricots, though a good set, also failed. Both Peaches and Nectarines are fine. Strawberries are both good and abundant. Raspberries, though plentiful, are smaller than usual. Other small fruits are good. Our soil is very light, resting on gravel—by no means a good fruit soil. *Geo. Wythes, Syon House Gardens, Brentford.*

— Apple-trees of all varieties are bearing very heavy crops of fruit. Soft fruits have been good—Strawberries excellent. Pears bloomed well, but the fruits of several varieties dropped early, so that the crop left to mature is somewhat thin. Plums are very good. On the whole, 1901 may be said to be a very good all-round fruit year. The soil at Wrotham is light, resting on a gravelly subsoil; notwithstanding, fruits do exceptionally well in most seasons. *H. Markham, Wrotham Park, Barnet.*

— The fruit crops this year are not so good as we were led to anticipate. Strawberries did well, but Cherries disappointed us greatly—so many dropped after the long continuance of easterly winds. Our soil is a light loam resting on gravel, and we succeed better in a wet season than in a dry one. *James Hudson, Gunnersbury House Gardens, Acton, W.*

— There were good prospects of fruit crops generally, with the exception of Plums, the bloom on the latter trees being scanty. Cherries bloomed and seemed to have set well, but the

continuous cold winds and frosts in May, with the accompaniment of blight, caused the fruits to drop wholesale. Black-fly is more plentiful this year than usual. Aphis almost ruined the Currants. Gooseberries and Strawberries are clean and good, also Apples, Pears, and Peaches. *W. Watson, Harefield Place Gardens, Uxbridge.*

— The fruit crops in this district are good, but the blight is doing great damage. Absence of rain is becoming serious for the later fruits. The soil is a good loam on gravel, moderately retentive. *W. Bates, Cross Deep Gardens, Twickenham.*

SURREY.—Fruit trees and bushes never promised better than did those in these gardens in the flowering season, and with the exception of some of the finer varieties of Plums these promises are so far being fulfilled. We have had to thin the crops of Apples and Pears, especially the latter, for despite the natural dropping, which was more noticeable than usual this year, the fruit was much too plentiful to permit of high-class finish being attained. *J. F. McLeod, Dover House Gardens, Roehampton.*

— The fruit crops in this neighbourhood are very satisfactory, with the exception of Plums, standard trees of which are almost a failure, although trees trained on a north wall have a satisfactory crop. The Apple crops are good, many of the trees having had to be well thinned. Strawberries were very good, "Leader" being the heaviest cropper. Cherries were also good, but required protection from birds. Gooseberries, Currants, Raspberries, and Loganberries are all good; in gardens where Raspberries fail, Loganberries should be given a trial, jam made from them being excellent, both with regard to flavour and colour. The soil here is of poor quality, well known as Bagshot Sands. *C. W. Knowles, Bagshot Park Gardens, Bagshot.*

— With the exception of Plums and Apricots, the fruit crops in this district are abundant. The east wind, which in so many districts proved fatal to the Cherry crops, was responsible for the partial failure of our Plums and Apricots. Strawberries Royal Sovereign, Trafalgar, and The Laxton have been both plentiful and fine. *W. Honess, Cobham Park Gardens, Cobham.*

— Apple-trees are carrying heavy crops, and the fruit promises to be of good quality. Pears are a medium crop. Plums are very disappointing; the trees flowered well, but there is very little fruit. Strawberries have never been better. The soil here is of the greater part sand, and almost sterile; in some parts the subsoil is purely sand, which dries quickly, and manure when used soon disappears. *E. J. Salter, Woodhatch Lodge Gardens, Reigate.*

— The nature of the soil seems to have little to do with the fruit crops, as generally it suits some kinds and is unsuitable to others. This applies to all soils alike. Our chief fruit-tree crop is the Apple, which promises to be very good. Pears, Plums, and Cherries thinned so greatly after setting that these have very poor crops as a rule, although here and there some trees are good. Bush fruits and Strawberries bore generally splendid crops. Peaches and Nectarines have fruited well, but Apricots are thin. On the whole, the fruit crops this year are fairly satisfactory. *A. Dean, 62, Richmond Road, Kingston-on-Thames.*

— Hardy fruits in general are most satisfactory this year. Apples are a heavy crop; three-fourths of the fruits required to be taken off. Pears have dropped largely, but still remain a good average crop. Plums are good, but Aphis is unusually troublesome on the trees. Cherries are first-rate in quality, although red spider is very troublesome. Peaches and Nectarines set a good crop, but the check caused by cold winds produced "blister," hence the fruit is dropping

freely. Apricots are a clean crop, but the fruits dropped freely during stoning, insufficiently ripened growth no doubt accounting for this. Small fruits are first-rate in quality, and much cleaner than last year. Strawberries were the heaviest crop in my experience and the quality perfect. Walnuts and Filberts are an abundant crop. The soil here is a light porous loam on a gravelly sub-soil. *Geo. Kent, Norbury Park Gardens, Dorking.*

— With the exception of Pears, Apricots, and Plums, all fruit crops are good. Small fruits are all fine crops; Black Currants are grand here, but caterpillars have caused great loss in many places. The birds destroy thousands of grubs and caterpillars, but in getting them they partly destroy the fruit as well. *W. C. Leach, Albury Park Gardens, Guildford.*

SUSSEX.—The wet and comparatively sunless autumn of last year caused the wood to be not quite so firm as usual, but fruit-trees of all sorts were a perfect picture when in bloom this spring. The bad set of Pears and Plums I attribute to gales of wind when the trees were in flower. We had no late spring frosts this year to damage the blossom, as a result of which the crop of Strawberries was excellent. Our soil is of a clayey nature with a subsoil of sandstone impregnated with iron. *Alex. Reid, Possingworth Gardens, Cross-in-Hand.*

— The promise in the spring for fruit of all kinds was exceptionally good, but a spell of easterly winds in May caused a large quantity of the flowers to drop, and also in some cases injured the foliage. Our soil is of a light character. *E. Burbury, Castle Gardens, Arundel.*

— Apples here are a full and good crop, the trees being very clean, owing in a measure to the rain, and their being frequently sprayed with concentrated alkali (caustic soda). Pears are a medium crop, but of good quality. Plum crops are very thin, excepting on old trees on walls. Cherries all dropped, owing, I think, to the cold rains and wind. Bush fruits are good. Black Currant-bushes have greatly improved from the mite, the attacked buds having been kept picked off, and the bushes sprayed with an alkaline solution (caustic soda). We have as the result a fair crop of fruit. Last year they were a failure; I was advised to pull out the bushes and burn them, but gave them another trial, with the above result. Strawberries are abundant and good. The soil here is very stiff, hungry, and in winter unworkable; the subsoil is stiff clay. *A. B. Wadds, Paddockhurst, Worth.*

— It was stated that the fruit crop in this country was going to be a good one this year. Some Pear-trees which showed abundant bloom have not set a single fruit. The one variety that has fruit on is Conference. This variety usually sets fairly well here; unfortunately the fruits will not keep, but soon begin to decay in the centre. Plum-trees have scarcely any fruit, nor have our Peach-trees on a south wall. Fig-trees made a show for a good crop, but they soon turned yellow, shrivelled, and dropped off, although this is supposed to be a specially good place for growing Figs. A large Williams's Bon Chrétien Pear-tree, while in full bloom one sunny day, had hundreds of bees humming about its flowers, so I thought this year I should have a fine crop, but although the quantity of bloom was phenomenal, the result is almost a total failure. Many perhaps may have anticipated a full crop from the abundance of bloom in their fruit orchards, but judging from my own trees I think the fruit crop this year is not a good one. There appears to have been something wrong with the flowers, as few were fertilised, and in cases none at all; even Apple-trees show a very poor crop. It

is not only the bloom of fruit-trees that has been strangely affected, my early-flowering Laburnums have every year been covered with seed-pods after the petals had dropped. This year, although they bloomed profusely there is scarcely a single seed-pod on them. *E. Bonavia, M.D., Westwood, Richmond Road, Worthing.*

— Apples are an abundant crop, the fruit being of good quality and free from blemish. Pears, which at one time promised favourably, are in cases disappointing; varieties on pyramids in the open, although they set well, have dropped many of their fruits, some varieties practically carrying no crop at all. On walls the crop is generally large and of good quality, notably Marie Louise, Pitmaston Duchess, Williams' Bon Chrétien, Doyenné Boussoch, Beurré Hardy, &c. The crops of Cherries are variable; trees in warm situations on walls are carrying abundant crops of fruit of good quality, while from bushes in the open in some cases the whole of the fruits have dropped. The same remarks apply to Plums. Trees on walls of Victoria, Monarch, Jefferson's, Czar, Kirk's, &c., are carrying good crops of fruit; in the open ground many are left bare. Strawberries were a fine crop, both for quality and quantity, notably Royal Sovereign, Noble, A. Nieaise, Waterloo, Latest-of-All, &c. Gooseberries and Currants were plentiful. Raspberries are a thin crop, many of the canes not breaking this season, owing to immature wood. Our soil is a heavy loam overlying stiff clay. *Charles Jones, Ote Hall Gardens, Burgess Hill.*

WILTSHIRE.—The prospects at the flowering period were excellent, and with the exception of Plums all other crops are good. Aphis and other insects that affect fruit-trees have been very destructive, and those gardeners who did not take preventive measures in time have in many instances lost nearly the whole of their crops, especially those of Cherries, Apples, Gooseberries, and Currants. The soil here is composed of chalk marl intermixed with flint. *T. Challis, Wilton House Gardens, Salisbury.*

— The fruit crops in this district are extremely good. Old Apple-trees that have carried little or nothing for the last two or three years have full crops. Pears are thin. They seemed to have set well, but since then a great many have fallen, probably owing to the dry weather. Gooseberries have suffered badly from the attacks of caterpillars. Our land around here is mostly of a medium friable loam, with either a chalky or gravelly subsoil. *S. W. Tucker, Longford Castle Gardens, Salisbury.*

7, ENGLAND, N.W.

LANCASHIRE.—We have a heavy crop of Apples and Pears, also Morello Cherries; Plum-trees flowered well, but have a very light crop. Small fruits are good. I have always contended that there is too much importance given to the necessity for the wood to be perfectly ripened. The recognised conditions were entirely absent last year, but we have now one of the best of fruit crops. The subsoil in this garden is of clay. *W. P. Roberts, Cuerdon Hall Gardens, Preston.*

— The fruit crops generally are not realising the promise there was in early spring. Green and black-fly have been very troublesome, and the Gooseberry-caterpillar numerous. The soil is a rather tenacious loam on a heavy clayey subsoil. The garden site slopes to the north-west. *E. F. Hasleton, Knowsley Gardens.*

— Peaches, Nectarines, and Apricots are not grown in any quantity out-of-doors in this part of Lancashire. Apples and Pears succeed fairly well, and are remunerative to the farmers and market gardeners; good markets, such as Liverpool, Preston, Blackburn, and Wigan, being within easy reach. Black Currants are always in

great demand, but we have been troubled with the mite these last few years. There are some grand crops on the variety Boskoop Giant; the trees are quite free from mite, and the variety appears to be the very thing that was wanted in this neighbourhood. *W. Ashton, W'rightington Hall Gardens, Wigan.*

WESTMORELAND.—Our garden is on a hill composed of thin gravelly soil; and we have generally light crops, except in a wet season. It is a pleasant surprise to have plenty of fruit after last year's cold, wet weather. *W. A. Miller, Underley Gardens, Kirkby Lonsdale.*

(To be continued.)

GOLDER'S HILL, HAMPSTEAD.

LONDONERS should feel happy in the number of open spaces, parks, and pleasure resorts set apart for their enjoyment, not the least beautiful of which is the fine house and grounds of Golder's Hill, Hampstead, acquired some time since by the London County Council. Directly adjoining and entered at several points from the Hampton Heath, it reminds one of a miniature Hampton Court, with its walks and lawns, pleasure gardens and borders, lakes with wild fowl and water plants, vineries filled with crops of luscious Grapes, and a beautiful flower-garden now a blaze of colour. The beauty of the place is enhanced by reason of the undulating nature of the ground, which adds variety and charm to its character. The mansion is utilised for the purposes of a refreshment resort, and scattered on the lawn beneath the trees are cosy chairs round small tables, where one can partake of *al fresco* tea and listen to music from a first-rate band. Well-kept paths lead one through avenues of trees and past shrubberies which include many interesting plants, while at points of vantage numbers of small summer-houses are erected, where one can rest and enjoy most pleasing scenes.

What appears to have formed the old kitchen garden has been converted into a flower garden, above alluded to, and this spot is now at its height of beauty. It is a blaze of bright colour; plants, principally herbaceous species, are in full flower and luxuriating, the colours being judiciously blended and having a fine effect. A fountain throws its stream of water into a small pond, around whose banks are planted aquatics, and where the Heather seems quite at home. Pergolas have been made, and trailing Roses, Vines, the pretty variegated Hop, Wistarias, &c., have been planted to furnish a canopy of greenery and flowers. We noticed a handsome specimen of the purple Loosestrife, *Lythrum Salicaria*, quite 4 feet in height, with several dozen spikes of its showy inflorescences. Not many visitors would recognise in this plant a native of their own woods and river banks. *Phlox decussata* was especially fine in many of the handsomer varieties, *Campanulas*, *Pentstemons*, *Abutilon Thomsoni*, *Zinnias*, *Eschscholtzias*, *Fuchsias*, *Tagetes*, *Dahlias*, *Begonias*, *Gladioli*, and numerous similar flowers, with foliage plants, *Dracenas*, *Ophiopogons*, &c. suitably interspersed.

Around the mansion are well-filled beds of summer bedding plants, and one can peer into a conservatory which adjoins the residence and view the pleasing display.

The Heath at Hampstead, so long associated with a motley crowd, is really most charming, and in places one can fancy oneself miles away from any human habitation. The natural features of the Heath have been carefully conserved, and have often excited the admiration of strangers when visiting it for the first time. The ground being so broken and undulating, it possesses those features which are so pleasingly associated with wild places of this

character. The yellow Gorse and Broom abound, Bracken Fern forms a tangled undergrowth everywhere, while in spring-time the Gean Crab-Apple and Hawthorn are crowded with their snow-white flowers. Plant life is religiously guarded by the custodians of the Heath, and no one may pluck the wild flowers or blossom without involving dire penalties, a very necessary precaution in view of the numerous visitors. The Drosera and other rare plants that could be found on the Heath in former times are now unhappily exterminated. The Harebell is, however, still a charming denizen of the heath, also the Bell-Heather and the Ling. Wood-sage is plentiful everywhere, in company with the yellow and white Goosegrass or Bedstraws, and numerous other members of the native flora.

A straggling stream empties itself into one of the many ponds on the Heath, and here again is seen a touch of natural beauty—the yellow Flag, Arrow-head, Reed-mace, Bulrush, and other water plants forming cover and nesting-places for the moorhen and other water-loving birds.

A sum of £36,174 has already been subscribed towards the £40,000 which the Hampstead Heath Extension Committee is endeavouring to obtain for the extension of the Heath by 80 acres. The acquisition of this land will prevent a fine view from being spoiled, and remove the chances of the builder encroaching in that direction.

COLONIAL NOTES.

NEW ZEALAND.

We have received, through the courtesy of Mr. Kirk, a copy of the Annual Report of the Department of Agriculture in New Zealand for 1903. It forms a bulky and comprehensive record of work done. In the biological section, which is the one that is of most interest to us, we find illustrated articles on the packing and grading of fruit, and the means to be taken to develop the fruit industry of the colony; report on a visit to the Cook Islands, where the tropical or sub-tropical climate is favourable to the growth of Oranges, Cocoa, Cocoa-nuts, Bananas, and other tropical products, if the facilities for export were adequate and the natives could be persuaded to exert themselves; but having sufficient for their own very limited requirements, they have, it appears, no fancy for work for work's sake. The culture of Cotton is not recommended, on the ground that it entails too great exhaustion of the soil to be profitable.

Penny-royal (*Mentha Pulegium*) has become a noxious weed in New Zealand. To get rid of it, it is recommended that the land be kept fallow for a time, and the harrow used often enough to prevent seeding.

A valuable report, embodying the details concerning the life-history of the Phylloxera, is given. The treatment found successful was to " (1) cut off the Vines [level with the ground] and burn them; (2) to pour a little kerosene on the stump, then inject at intervals 1 oz. doses of carbon-bisulphide, 4 to 5 oz. to the square yard; (3) then after two to three weeks dig up and burn the roots; (4) firm the ground and again inject carbon-bisulphide as an additional precaution."

MR. G. H. KERSLAKE.

In a letter from a friend in Sydney, received by last mail, I am informed that at the last annual meeting of the Horticultural Society of New South Wales, this body conferred an honorary life membership on Mr. Geo. H. Kerslake, of Rookwood, N.S.W., the raiser of several well-known varieties of Chrysanthemums, the Bouvardia known as King of Scarlets, and numerous fine Cactus Dahlias and other flowering plants, at the same time presenting him with a Gold Medal in recognition of eminent services

rendered to horticulture. My personal knowledge of the man and his methods enables me to say that the honour is well merited. *C. Bennett, Hale, Cheshire.*

a flower in the direction favoured by popular appreciation.

The illustration at fig. 66 shows a first-rate specimen in a pot, cultivated by Messrs. E.

a good strain of this type of Begonia, though from the florist's point of view the Camellia-shaped flowers should be a little more regular in outline.

FIG. 66.—TUBEROUS-ROOTING BEGONIA SELECTED FROM A GROUP OF PLANTS EXHIBITED BY MESSRS. WEBB AND SONS AT THE WOLVERHAMPTON HORTICULTURAL SHOW, 1904.

TUBEROUS-ROOTING BEGONIAS.

THERE are few summer-flowering plants that are more popular for conservatory decoration and for bedding purposes in the open-air flower-garden than the tuberous-rooting Begonia, and certainly no plant better shows the influence of well-directed efforts on the part of florists to develop

Webb & Sons, Wordsley, and included by them in a group of plants which the firm exhibited at the Wolverhampton show in July. It will be seen that the plant has an erect habit, and the large double, pale-coloured or white flowers are borne well above the foliage. We do not know that the plant bears a name, but it shows

ALPINE GARDEN.

ANEMONE ROBINSONIANA.

THE beautiful cobalt-blue of this pretty Anemone renders it one of the most attractive of cool Alpine plants flowering at the present time. It

is a selected and cultivated form of the white *A. nemorosa*, the familiar Wood Anemone, with flowers measuring nearly 2 inches across the petals, nearly twice as large as the wilding, the plant attaining to 9 inches or more in height. The plant is somewhat difficult to cultivate owing to a tendency to decay at the growing points of the curious twig-like underground stems. It should be grown in a cool shady situation almost solely in leaf-soil, preferably the wind-collected, half-decayed leaves that are found in woods. No sand should be used about the roots. It is by no means a common plant. When seen in full flower it is most charming, and well worth the trouble that may be required to establish it in the garden. *G. B. M.*

PLANT NOTES.

CENTROPOGON LUCYANUM.

Of stove plants the *Centropogon* is one of the showiest and most beautiful. It is useful for general decorative purposes when carefully hardened off. It lasts well, and when properly grown will retain its flowers in good condition for a considerable time. As a market plant I believe there is a great future for this species, and it should be more widely known than at present. Some growers seem to experience great difficulty in growing the plant. The greatest difficulty appears to be in its propagation. The method which I find best is to take cuttings, about 3 or 4 inches long, of fairly well ripened wood, cut immediately below the joint, and insert them at once into 2½-inch pots, in a compost of peat and sand. It is important to prevent the cuttings, or the atmosphere around them, from becoming dry. Plunge the pots in a case with an even, moist atmosphere, where they will root in from two to three weeks' time. After they have become established they may be potted on. Plants for exhibition purposes should be grown on in 6 or 8-inch pots. Careful attention should be given to stopping the shoots, as the best and strongest flowering shoots come from the base of the plant; about six breaks will be sufficient to get good heads of bloom. The plants should be grown under a very thin shade, with plenty of moisture, and be given a little weak soot-water when well established. Plants grown as described above will produce large heads of carmine-coloured flowers. This plant remains remarkably free from insect pests. *S. B.*

OREOCOME CANDOLLEI.

Described in several catalogues as being "hardy," and belonging to the natural order Umbelliferae, this herbaceous perennial is one of the most attractive foliage plants that can be grown in beds or borders. Good examples bearing numerous heads of seed are to be seen in one of the flower-beds in Hyde Park, where it is used as a dot plant. The graceful fern-like foliage which this plant possesses should render it invaluable when better known. As a pot plant for indoor decoration it would undoubtedly prove far more attractive than many species, although its powers to resist unsatisfactory conditions would be limited on account of the succulent character of its foliage. It is a native of the Himalayas, but the date of its introduction to this country appears uncertain. Propagation is readily effected by seeds, or by division of the roots in October or March. *F. James.*

TORQUAY.—The KING has been pleased to accept some photographs of Dr. HAMILTON RAMSAY'S unique gardens at Duncan House, Torquay, which have often been the subject of illustration in these columns.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

Masdevallias.—Where a representative collection of these plants is grown there are always some in flower, and together with their dark leathery foliage the flowers form a prominent feature in the cool-house during the whole year. Many of the species, as *M. Veitchiana*, *M. amabilis*, *M. Barleana*, *M. coccinea*, and its numerous varieties of the *Harrya* section, are characterised by flowers of brilliant colouring, and have a splendid effect during the late spring months when arranged with *Odontoglossums* of the crispum type. The orange-scarlet coloured *M. ignea* and its varieties are very desirable Orchids, flowering in the winter and remaining in good condition a long time. The yellow-flowered *M. Davisii*, and the pure white *M. tovarensis* should be included in every collection, the latter species being especially valuable for cutting purposes. In most collections there are sure to be some plants that require repotting or top-dressing. Large overgrown specimens which have become bare of foliage in the centre may be divided and potted up afresh, or may be carefully separated and put into small pots and grown on into vigorous specimens, which in time will be available to take the place of plants that have deteriorated.

Potting.—The best months for potting or repotting the plants are September and February. Previous to disturbing them it is important that water should be withheld from them for a few days, as the roots are less liable to receive injury when dry. All the strong-growing *Masdevallias* make many roots, and accordingly require plenty of room for their development. The pots or pans should be nearly half filled with pieces of Fern-rhizome as drainage, while the potting-mixture should consist of one-fourth fibrous peat, one-fourth leaf-soil, and one-half chopped sphagnum-moss, adding a moderate quantity of broken crocks and coarse silver-sand. Keep the base of the plants on a level with the rim of the pot, and carefully work the compost between the roots. Fill up to within 1½ inch of the rim, and surface the whole with a mixture of peat and moss in equal parts. I prefer this method instead of using all moss, because I find when moss alone is used for covering the compost the roots invariably remain on the surface instead of penetrating into the soil towards the bottom of the pot. When *Masdevallias* root deep into the soil the leaves become strong, and have a fine, green, healthy appearance, and the size and brilliance of the flowers leave nothing to be desired.

Watering.—The critical time with *Masdevallias* is just after repotting, it being an easy matter to over-water them, and thus cause the loss of many leaves and roots. During the first few weeks afford water very carefully, merely sprinkling the soil around the edge of the pot; and as each plant becomes re-established, the quantity should be gradually increased. During late autumn and winter no plant should be given water unless the soil is really dry, for if the plants are kept in a saturated condition the leaves will soon become spotted and unsightly.

The dwarf-growing varieties, as *M. caudata*, *M. Shuttleworthii*, *M. Estradae*, *M. Wageneriana*, *M. Arminii*, *M. ionocharis*, *M. hieroglyphica*, *M. muscosa*, *M. xiphoides*, &c., are always interesting, and a nice plant of either of the above species when covered with its small and pretty flowers forms a lovely object. These dwarf *Masdevallias* succeed in comparatively small pots or shallow pans, and should be placed near to the roof glass. Such species as *M. platyglossa*, *M. leontoglossa*, and several others that produce their flowers in a downward direction should be placed in baskets. Shade the *Masdevallias* from all sunshine, and maintain a moist atmosphere by damping the house down two or three times a day, but whenever the weather becomes cold one damping will be sufficient. *Masdevallias* delight in plenty of fresh air, and whenever the air outside stands above 50° ventilate the house freely.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gr., Wrotham Park, Barnet.

Peaches and Nectarines.—The amount of rain that has fallen has not been sufficient to penetrate the soil sufficiently to reach the roots of wall-trees generally. Peach-trees and others bearing heavy crops of fruit need thorough waterings and applications of liquid-manure to improve the size and quality of the fruit. Any trees that are watered should be given sufficient water thoroughly to moisten the soil to a sufficient depth. The varieties of Peaches Dymond, Goshawk, Bellegarde, Stirling Castle, and Noblesse are of the best quality, and should be grown in all gardens where Peaches are cultivated. Where trees have made growth sufficient to warrant it go over these once more and secure the growths to the walls, trellises, &c., so as to expose the fruits as much as possible. Leaves overhanging and shading the Peaches may be slightly shortened; this will do the trees no harm and will increase the colouring and flavour of the individual fruits. Any of the trees which have so far borne little fruit, and which are making strong growth should not be watered, but should rather be lifted and replanted, which is the best and surest method of encouraging fruitfulness; this work, however, must not be taken in hand for a few weeks. Do not neglect the very late varieties; these in favourable seasons and in warm localities ripen their fruit very satisfactorily, but in late districts I question whether it is worth attempting to grow them except under glass.

Plums are with us bearing very satisfactory crops. Victoria, Monarch, and Coe's Golden Drop are bearing heavily; the last-named variety is one of the very best late dessert Plums grown, and should be fed at the roots to develop the size of the fruits. Should blackbirds be troublesome, net the trees to protect the fruit, which, if thoroughly ripe and gathered perfectly dry, will keep sound and good for several days if placed in a dry fruit-room. I have rolled the individual fruits in tissue-paper, and in this way have kept them for some time. Lose no time in making preparation for the planting of fresh wall-trees where any are required. Old worn-out trees should not be allowed to remain, but should be grubbed out. The borders should be overhauled, and if possible the walls too; and when planting time arrives only trees of good quality and whose fruit is useful for keeping up a long supply should be planted. Growers not well acquainted with the best varieties would do well to pay a visit to some first-class fruit-nursery before deciding on which to plant.

THE FLOWER GARDEN.

By A. B. WADDS, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

Tuberous-rooting Begonias.—Plants grown as self-coloured varieties for bedding that are not true to colour should be marked, with a view to prevent mistakes another season. If *Begonias* are kept well watered, the plants will make a good display for some time to come. Plants grown from seeds sown in the spring will now be getting to a good size, and should also be supplied with water, and have the surface of the soil around them stirred. These should also be marked with regard to their colours. Any plants that have a drooping habit should be rejected, erect-flowering ones being preferable.

Fibrous-rooting Begonias.—A good batch of cuttings of these should now be put in. They will root readily round the sides of pots if placed in gentle heat, without too much moisture, and kept well shaded from the sun.

Herbaceous Plants.—As soon as the rains have sufficiently soaked the ground, a few of the early-flowering varieties may be transplanted or parted to fill up gaps. *Doronicums*, *Delphiniums*, and *Stenactis* (*Erigeron*) *speciosa* can be used for this purpose; the last-named is one of the most useful varieties, and requires no staking, while its flowers last for a long time. The ground should be manured well. It is not necessary if the ground is trenched or dug deeply to have

a fresh site, and trenching will to a certain extent save watering in summer. The plants in the borders will require a lot of staking now that tall Asters, Solidagos, Haipaliums, &c. are in flower. Aster amellus var. bessarabicus, now in full flower, is a variety that should be largely grown, both for its colour and habit of growth; Aster horizontalis is a good species, but is rather stiff in growth and appearance. Antholyzas are very bright and useful for tall vases; they are hardy here, and like plenty of moisture and freedom from disturbance at the roots. All varieties of Lychnis have done well; they are very bright and useful as cut flowers, especially Lychnis viscaria splendens plena. Hardy Statice are worth growing, if only for decorative purposes in the winter-time; when cut before they lose their colour, and gradually dried, they are very useful. Eryngiums may be used in the same way. The weather being dry, all late-flowering plants will require plenty of water to keep them fresh and green. The ground should be well mulched where it is cracking. All plants should be labelled; this saves a lot of time and prevents disappointment.

English, Spanish, and German Irises are now dormant and may be lifted. They should be sorted and placed in boxes in a cool place. The ground that is to be planted with them should be dug deeply, and if it is of a stiff nature some sand and old potting soil may be incorporated with it.

Trees and Shrubs.—The continued dry weather is causing great injury to trees and shrubs, any that can be watered, especially valuable specimen trees, should be watered regularly.

THE KITCHEN GARDEN.

By JOHN PENTLAND, Gardener to C. H. B. FIRTH, Esq., Ashwicke Hall, Marshfield, Chippenham.

Mushroom-beds.—New beds should now be formed and material collected and prepared for succession-beds. The spawning should be done when the temperature of the bed falls below 80°. Where beds are to be formed indoors, particular attention should previously be given to clearing the house of beetles and woodlice. Fill every crevice in which they are likely to find a home with cement or mortar, and place traps in the house to catch any that may find their way in.

Beetle-traps can be purchased cheaply and are very useful, but for an all-round trap for catching beetles, wasps, and flies, we prefer one made from a carboy. This should be fitted with a perforated top connected with a tube the width of the inside of the neck at the top, tapering to about an inch in diameter, and 5 or 6 inches in length. The pests go down this tube in pursuit of beer, or vinegar and sugar, and few that enter ever return. In arranging this trap for cockroaches, sink it in the ground near their runs, or place some rough boards from the ground to the neck of the bottle. When placed in a good position it will serve for twelve months without being interfered with, other than dropping in some fresh bait.

Hoeing.—When the ground is dry work the hoe between the growing crops, and afterwards rake the surface of the soil. If the seedling weeds are killed now it will be almost sufficient for this season.

General Work.—In gardens where labour is scarce, the press of work during summer causes parts of the garden to become neglected, hedges, edgings, odd corners, &c., being left to grow as they will. Where such is the case, no better time than the present can be selected for remedying this. The clipping of hedges is not a difficult task, and to the man who understands and takes a pride in it the work is most interesting. That few do understand it properly is evident from the appearance of many garden hedges, for there are excellent boundaries being spoiled for the want of the exercise of a little judgment when cutting. The operator should recognise it is necessary to cut in hard on the stronger-growing apex, but only to take the tops of the growths in hollow places so as to obtain an uniform breadth and height in

the hedge. Many gardeners are inferior in this work to some farm labourers, many of whom can dress a hedge perfectly. Decayed and decaying rubbish, which usually increases in bulk and smell at this season of the year, is best disposed of by burning. If a sheet of galvanised-iron or of some other non-inflammable material is constructed in some out-of-the-way place on which to burn the rubbish, so much the better, as the ashes can then be kept dry, in which state they are valuable to mix with soot or lime for dusting amongst young plants to prevent the attacks of slugs. Wood-ashes washed into the soil act as a stimulant to the plants themselves.

FRUITS UNDER GLASS.

By W. FIFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Planting of Peach and Nectarine Trees.—Where houses are to be planted with trees prepared for that purpose, or with what may be termed "home-grown" trees, that have been lifted each year, or every alternate year, such trees will be well furnished with fruit-bearing wood and fibrous roots in proportion. By the end of September the wood and foliage will be ripe, and the buds sufficiently developed for the trees to be moved. They should be lifted with fairly good balls of soil, and if given careful treatment they will render good service in supplying second early fruits next season. The borders having been prepared as advised in the Calendar for July 16, spread out the roots regularly, and avoid deep planting, so that during the time the roots are active they may readily reach the mulch that will be applied to the surface. When the work is completed, cover the border lightly with droppings from the stables, and afford sufficient water to well moisten the mulching. Afford moderate shade from strong sunshine, and in the event of drying winds close the top ventilators. Syringe the trees frequently with clear water.

Melons.—During September, Melons are much appreciated for luncheon parties, but fruits ripened afterwards have poor flavour, unless grown in structures in which a fairly dry, warm atmosphere can be maintained, with only sufficient moisture to keep the plants in good health. To prevent canker, low temperatures and damp atmospheres must be avoided; and air should be afforded at every favourable opportunity—even by night if a temperature of 70° can be maintained. As the plants approach maturity, water must be supplied with great care, especially if the plants are grown upon beds of fermenting materials. In any case a warm, dry atmosphere must be maintained in order to obtain fruits of good flavour.

Cucumbers.—Give every encouragement to plants that will fruit in autumn and winter. When they have become established apply top-dressings of loam, leaf-soil, and stable droppings, and afford moderate supplies of water to the roots. Let the atmosphere be kept moist, and do not allow the temperature to fall below 65° at night, and 70° to 75° by day. Should mildew appear upon the plants, dust the leaves with flowers-of-sulphur, and maintain less atmospheric moisture. Thin out the old growths from plants now fruiting to secure a succession of young wood likely to bear fruits. Fumigate the structure with the XI-All vaporiser.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. BURNS, North Myms Park, Hatfield, Hertfordshire.

Euphorbia (Poinsettia pulcherrima) and E. jacquiniiflora—These plants should be fully exposed to the sunshine from the present time onwards in order to mature the growth. Let the latest plants be placed in their flowering pots, which for the strongest plants need not exceed 6 inches in diameter. Unless very tall plants of *E. jacquiniiflora* are required, the pots for this species need not be more than 5 inches in diameter, while very useful little plants for decorative purposes may be grown in still smaller pots.

Zonal Pelargoniums.—Plants for flowering in winter should now be well established in the pots in which they are to bloom. During the summer they succeed best in the open-air, but care should be taken to transfer them to cold frames before the autumn rains commence. These frames need be covered with lights only during rain, or when frost is anticipated. Continue to remove all flower-buds from the plants until the end of September, unless it is desired to have them in flower during early autumn, in which case the dis-budding should cease at once. With a view to assisting the flowering of these and other winter-blooming plants, such as Bouvardias, Salvias, Libonias, Linums, Eranthemums, &c., weak liquid-manure should be afforded to such as have filled their pots with roots.

Roses in Pots.—Attend to the repotting of these without delay. If the plants are already in as large pots as is desirable, they should be turned out, and after carefully removing as much of the old soil as possible without injuring the roots, replace them in pots of the same size as the last, using a compost consisting of three parts good fibrous loam and one part leaf-soil, adding a little well-rotted manure and some coarse silver-sand. To this may be added a 6-inch potful of bone-meal to each barrow-load of compost. Throughout the summer all flower-buds should be promptly removed from plants which are required to flower during the late autumn and early winter months. For this purpose Teas and Hybrid Teas are the most suitable. Before subjecting the plants to heat, they should be pruned sufficiently to remove the weakest wood. Teas and Hybrid Teas may be grown in a temperature of about 55°, and Hybrid Perpetuals in one of 45° to 50°.

THE APIARY.

By EXPERT.

Seasonable Hints.—All skeps from which the honey is intended to be taken should have this done without delay, as the honey season being over the bees will be feeding on the stores, and thus reduce the amount of honey available. The bees when driven will realise from 3s. to 5s. for a good colony, while the small stocks can be united and sold, or can be kept in a bar-frame hive and fed with a rapid feeder to increase the stock for next season, or united with a weak stock in a bar-frame hive which has given no return during the past season. If the last-named plan is adopted, the bars should be pulled back, allowing eight frames to remain, and leaving a space of about 1½ or 2 inches. Examine each frame to see if the stock is healthy, taking away the queen at the same time, and removing the bees from the skep on to the bars of the stock. Sprinkle a little flour over the bees to prevent them fighting, and as soon as the bees are all below give them a little smoke, after which close up the frames into their proper places, and cover the hive down. Commence feeding if stores are short. Another plan is to take away the queen from the bar-frame two or three days previous to uniting the stocks, afterwards proceeding as described above; or again, to take away the queen from the hive in addition to the one from the skep, and introduce her in the bar-frame hive after an absence of about twenty-four hours. Another plan, if the bee-keeper has more time at his disposal, is to put the queen into a cage with a few worker bees and a little honey, and place them on the top bars for the time mentioned and then release them; the bees by this time will have missed her from below, and take more readily to the new queen without balling her. Any brood in the skep should also be placed in the bar-frame in order to hatch out. Bees at this time of the year are valuable because they live through the winter, and are ready for the following season's work; also the more bees in the hive the warmer will the stock be in the cold weather. Examine and destroy all wax-grubs and moths. All entrances to the hive should be closed up, allowing only a space of about 2 inches for the doorway, and where robbing is going on close up still more severely. Keep all honey away from the apiary. Feed without delay all weak colonies.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Appointments for September.

- TUESDAY, SEPT. 6—
 { Royal Hort. Soc. Comms. meet;
 { also Com. of Nat. Dahlia Soc.
 { meet in the Royal Horticultural Hall.
 { Scottish Hort. Assoc. meet.
- WEDNESDAY, SEPT. 7—
 { Glasgow and West of Scotland
 { Show (2 days).
- THURSDAY, SEPT. 8—Dahlia Show at York.
- FRIDAY, SEPT. 9—
 { Dahlia Show at Manchester
 { Botanic Gdns. (2 days).
- MONDAY, SEPT. 12—
 { United Hort. Ben. and Prov.
 { Soc. Com. meet.
- WEDNESDAY, SEPT. 14—
 { Roy. Caledonian Hort. Soc.
 { Show at Edinburgh.
- THURSDAY, SEPT. 15—Brighton Hort. Soc. meet.
- SATURDAY, SEPT. 17—German Gardeners' Club meet.
- MONDAY, SEPT. 19—
 { Nat. Chrys. Soc. Flor. Com.
 { meet, Essex Hall, Strand.
- TUESDAY, SEPT. 20—
 { Roy. Hort. Soc. Comms. meet.
 { and Nat. Rose Soc. Show in
 { Hort. Hall.
- FRIDAY, SEPT. 23—Roy. Bot. Soc. Gen. meet.

SALES FOR THE WEEK.

- MONDAY to FRIDAY NEXT—
 Large consignments of Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.
- MONDAY, SEPTEMBER 5—
 Flowering Bulbs and Lilies at Stevens' Rooms at 12.30.
- WEDNESDAY, SEPTEMBER 7—
 Flowering Bulbs, &c., at Stevens' Rooms at 12.30;
 Orchids at Stevens' Rooms at 4 P.M.
- FRIDAY, SEPTEMBER 9—
 Unreserved Clearance Sale of the entire Collection of Messrs. B. S. Williams & Son's Orchids, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12.30.
- (For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced from observations of Forty-three Years at Chiswick—59.3°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 31 (6 P.M.): Max. 63°; Min. 55°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, Sept. 1 (10 A.M.): Bar., 30.1; Temp., 58°. Weather—Fine rain falling continuously.

PROVINCES.—Wednesday, August 31 (6 P.M.): Max. 63°, S.E. Coast of England; Min. 57°, N.E. Coast of Scotland.

calculated to afford pleasure, brighten the labours of life, or alleviate its sorrows. Fully cognisant of human infirmity, he was ever ready to put a charitable interpretation upon matters which others would have treated with cold aversion or perhaps resentment. Was there ever one, for instance, who could turn aside the wrath of a discontented exhibitor as he could do? Was there ever a public speaker who could, on fitting occasion, more fully attract the sympathy of his

by his *Book about Roses* can never be adequately estimated. It is not scientific, it is not technical, one would not turn to it as a book of reference; but it is literary, and it has the inestimable quality of sympathy. It is almost impossible to read it without sharing the writer's enthusiasm. How many were tempted to become Rose-growers from reading his pages is beyond computation.

SAMUEL REYNOLDS HOLE was born at

THE REV. S. R. HOLE, M.A., VICAR OF CAUNTTON, IN 1870.

Dean Hole. It may be doubted whether among the great army of horticulturists there was ever one more truly popular than Dean HOLE. Alile in the palace and in the bothy, the same genial smile, the same ready wit were manifest. It mattered not whether he was addressing an audience of patricians or a gathering of his "horny-handed friends" the gardeners. His sympathies were human, they were manly. Dignified ecclesiastic though he was, he could share in the relaxations and the pleasures of the humblest. Averse from all that was vicious, he was more than tolerant of what was harmless and

audience by his playful banter and droll humour than he could?

As to his career, we all know what it was, and the daily papers have instructed the outside public who were not familiar with it. Apart from his ecclesiastical duties, which by the way were performed with a zeal and earnestness which were novel when he entered the Church, he was a good example of the English country gentleman—cultured but not pedantic, fond of country life, addicted to sport, passionately fond of his garden, and of Roses in particular. How much pleasure he bestowed on his fellows

Cauntton Manor, Newark, in 1819. In due time he proceeded to Brasenose College, Oxford. Oxonians will remember with relish his humorous stories of Oxford in the early forties. He took orders, and became first of all Curate, afterwards Vicar of Cauntton, and at the same time squire, fulfilling both secular and ecclesiastical duties in such a way as to secure the respect of those who witnessed his efforts.

His passion for the Rose led him to take a most active part in the famous Rose show held in St. James's Hall on July 3, 1858; and when on one particularly dismal day in

December, 1876, he walked into the rooms of the Horticultural Club, then in Adelphi Terrace, where a meeting was being held, at the instigation of the veteran Rev. H. H. D'OMBRAIN, for the purpose of considering the proposal to form a National Rose Society, it was felt that with the active sympathy of REYNOLD HOLE the cause was secure. To the last he extended his active sympathy to the National Rose Society, and the present success of that body may be in large measure attributed to him. At the National Rose Conference at Chiswick in 1889, a meeting specially important in the eyes of the more serious rosarians, using the adjective in the French sense, the Canon—for he was then Canon of Lincoln—presided; and no Rose-meeting of any importance was complete without his stirring presence.

congenial friendships, and have found the happiest enjoyment of my life. Will you tell them that, with an old man's blessing and from a brother's heart? I pray that they may ever cherish in themselves and may communicate to others that love of a garden which brings health to the body, peace to the mind, and thankful worship to the soul. May the words spoken to me more than fifty years ago by my beloved friend, Thomas Rivers, of Sawbridgeworth, be as true to them as they have been to me—"Your delight in the flowers will never leave you." *S. Reynolds Hole.*"

Alpine-Garden Congress.

THE first Alpine-Garden Congress was held recently at the Rochers-de-Naye, above Montreux. It was attended by forty-six persons, representing sixteen gardens and associations, such as the Italian

Tyrolese, and Swiss Alps, and from those among the Cevennes, Vosges, and Jura mountains, as well as from that on the slopes of Etna. The most satisfactory are those in connection with a University, such as those of Caunteret and Chamrousse (University of Grenoble), Aigonal, Cevennes (connected with Montpellier), Pont-de-Nant, Bex (an offset of the University of Lausanne), Linnaea and Rambertia (at which last the Associates were received), which are managed by special Committees; and those in Germany and Austria, in connection with the Universities of Munich and Vienna.

Many gardens have been started merely as a fancy; almost all have been more or less neglected. Some, such as that on Etna, subsidised by the Catania University, and that of Rostania, among the Cottian Alps dependent upon the Protestant schools of Torrè Pellice, are still new. Two exist now merely upon paper, and their representatives came for consultation. These are the Botanic Gardens of Pilatus and of the Rigi-Scheideck, both of which were started by the Lucerne Museum authorities.

Dr. FLAHAULT, Professor of Botany at the Montpellier University, presented reports from four Alpine gardens founded in Bavaria and Austria by the German Association for the Protection and Cultivation of Alpine Plants. These gardens are under the presidency of Dr. VAN WETTSTEIN (Vienna) and of Dr. GOEBEL (Munich), and the general superintendence of Dr. SCHMOLZ, of Bamberg.

The idea of establishing Alpine gardens *in situ* was started in 1875 by Professor KERNER, then at Vienna, and in 1884 by Professor NAEGLI, of Munich, and both these botanists began the experiment; but all was given up until, in 1900, after much correspondence between Dr. SCHMOLZ and the President of the Geneva Association for the Protection of Plants, there was founded in connection with the Congress of German and Austrian Alpine Clubs, a society to further the cultivation of Alpine plants on the German Alps. This association made rapid progress; it included 361 members, 87 sections of the Alpine Club contributed a regular subscription, and further it received annually a subsidy of 1,250 francs from the Central Committee of the Austrian German Alpine Club.

The four gardens above mentioned are those of Schachen (1,800 m.), in the Bavarian Highlands; of Gschnitzthal (2,390 m.), in Tyrol; of Rex Alp (1,770 m.), in Styria; and of Neurent (1,200 m.), in Bavaria. The aim of the Society is to increase the interest of the public in Alpine plants. The gardens are well kept and thriving, the plants are well labelled, and scientific observations are conducted by the two Universities represented by their professors. Further, the most interesting plants are dried and shown under glass in Alpine Club buildings or in mountain hotels.

M. FLAHAULT presented the results of his own work in the Cevennes, where he has established, near the Mont Aigonal (1,565 m.), three different gardens, covering about thirteen acres, one acre of which is turf and devoted to turf and bog plants and sphagnum. There are also about forty species of Ericaceae of the Northern Hemisphere. *Primula farinosa*, sown last autumn, has already flowered freely, which is unusual. This garden is only three years old, but Professor

THE VERY REV. S. R. HOLE, D.P., DEAN OF ROCHESTER FROM 1887.

At the Deanery, Rochester, his garden was, as at Caunton, a special delight, although the fumes from the adjacent cement works, which are allowed to deface and befoul one of the fairest landscapes in our isle, are ill suited for the cultivation of the Rose. But here at Rochester, beneath the grey castle walls and in the shadow of the ancient cathedral, died, on August 27, SAMUEL REYNOLDS HOLE, Dean of Rochester, in his eighty-fifth year, mourned and beloved by "all manner of men." *Requiescat in pace!*

The following extract from a letter, written from a sick-bed at Mold, North Wales, by the late Dean HOLE to Mr. A. DEAN, read at the Gardeners' Dinner of last Michémas day, is worth reproducing:—

"I have been anticipating long and anxiously a meeting with a representative body of those men among whom I have formed the most

Alpine Club, the Italian Association for the Protection of Plants and Trees, known as "Pro Montibus"; the Swiss Association for the Protection of Plants, and the "Ligues Scolaires pour les Arbres." Congresses at Grenoble, Berne, &c., and the meeting of the British Association were synchronous, and prevented many from attending the Swiss meeting.

For some years past the need has been felt for such a Congress to bring together those interested in alpine gardening. In the absence with the British Association of M. CASIMIR DE CANDOLLE, Prince ROLAND BONAPARTE accepted the presidency of the meeting. Many well-known botanists and horticulturists were present; among them were M. MAURICE DE VILMORIN, Professors FLAHAULT and WILZCEK. Reports were handed in by the representatives of the sixteen gardens on the French, Italian,

FABRE has for twenty years been studying Conifers and the forestry of different altitudes.

Experiments with vegetables and with fruit trees at three different elevations have also been made by him, and observations concerning the variability of species and the improvement of pastures. But it is the Montpellier University that is especially connected with this garden, as the students visit it and make experiments in vegetable biology, &c. A laboratory will shortly be established there.

Dr. VOGLINO, of Turin, reported concerning two gardens in the Valley of Aosta (Chamoussia and Jardin Henry), and Professor WILZHECK on a garden and laboratory started by the Lausanne University in the Alps of Vaud. Professor MONNET, of Pinerolo in the Vaudois Alps, explained the purpose of the Rostania, which is situated at an altitude of 1,230 m., in a country rich in rare plants. It is desired to collect and make available in one place all the treasures gathered by the botanist Rostan in this district. The Protestant schools of Torre Pellice are alone responsible for this institution, which the English have assisted.

DE ANTONIOTTI spoke as a representative of the Italian Alpine Club and of the garden called Allionia, established by this Society for the cultivation of alpine plants, at the Monte dei Capucini, near Turin.

Professor HOOL, of Lucerne, showed plans for two intended gardens on Pilatus (2,100 m.) and the Righi (1,600 m.); and the Director of the Linnæa (1,670 m.) and of the Rambertia (2,045 m.), spoke of the work accomplished by these two gardens, which are those most visited, each by its special supporters. The Linnæa, the oldest of existing alpine gardens, receives assistance from the Federal Government, and includes an observatory and laboratory. The late Professor ROMANES contributed to the foundation of this garden by presenting 1,350 fr. to the Managing Committee.

Rambertia, where the Congress was held, needed no description, as it was then in full beauty; and *Papaver alpinum* and *nudicaule* in all varieties and colours ran wild over all the paths and even along the edge of the railway, making the most beautiful of decoration.

A discussion followed the Congress, and the following resolutions were passed unanimously:—

First, that this International Congress shall be followed by similar meetings, in which the Swiss will take the initiative.

Second, that if possible a publication is to be issued, the first part to consist of the Report of this Congress.

Third, that seeds gathered in the different gardens are to be interchanged, and correspondence established between the several institutions represented at the Congress.

Prince ROLAND BONAPARTE then declared the Congress closed, and made a special inspection of the Rambertia. The next day most of the members mounted to Bourg St. Pierre, near the Saint Bernard, to see the garden of the Linnæa, which was in its full beauty.

It would be a grave omission if, in connection with these alpine gardens, we failed to mention the name of HENRY CORREYON, to whose zeal and energy is largely due whatever has hitherto been accomplished.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will be held on Tuesday, September 6, in the Society's Hall, Vincent Square, Westminster. On this occasion the National Dahlia Society's Committee will meet for the purpose of awarding Certificates to new seedling Dahlias [In the book of "Arrangements" this meeting is announced for September 20. Ed.], entries of which must be made to the Hon. Sec., National Dahlia Society, Royal Horticultural Hall, Vincent Square, S.W. A lecture on "Gourds," illustrated by lantern slides, will be given by Mr. J. W. ODELL, at 3 o'clock, and exhibits of Gourds will be welcome.

— The Society will hold, in conjunction with the National Rose Society, an exhibition of autumn Roses, on Tuesday, September 20, in the Royal Horticultural Hall, Vincent Square, S.W. Intending exhibitors can obtain a copy of the prize schedule on application to the Secretary, Royal Horticultural Society's Office, Vincent Square, Westminster, and are requested to note that entries for prizes cannot be accepted after Thursday, September 15. Prizes are confined to Fellows of the Royal Horticultural Society and members of the National Rose Society.

— The Council has been requested to erect "lockers" in the basement of the Hall, in order that exhibitors may rent the same for leaving in them various articles required from time to time for their exhibits. The Council is willing to do this if a sufficient number of exhibitors will signify their wish for such a convenience, and will also give some idea of the size of the "locker" they would require. *W. Wilks, Secretary.*

THE WHITE VALLOTA.—In respect to the white Vallota, illustrated in these pages last week, Messrs. R. VEITCH & SON, Exeter, write as follows:—"In your interesting article on Vallota *purpurea alba* you omit to mention that we obtained an Award of Merit at a meeting of the Royal Horticultural Society on May 25, 1893, for Vallota *purpurea delicata*. At that time we exhibited several plants with flowers ranging from the faintest blush to a clear shade of pink colour. We fear these albino forms are not very strong in constitution, for the few bulbs left over unsold from the importation of 1893 have not flowered since, and are in fact smaller now than when originally imported." Messrs. W. BULL & SONS also write to us, stating that on two separate occasions they have flowered a pure white variety, but in each case the bulb after flowering gradually dwindled and died, although other bulbs of the same importation succeeded well. In the same article, the name Mr. ARTHUR P. RIX should have read "Nix."

NATIONAL CO-OPERATIVE FESTIVAL FLOWER SHOW, CRYSTAL PALACE.—The Festival authorities, assisted by contributions from the various provincial co-operative societies, have for the last three years continued the flower show formerly held by the Agricultural and Horticultural Association, and it promises to grow to the dimensions of former years. The schedule of prizes on this occasion contained just over 100 classes, and the competition was very keen in most of them. One moiety of the classes was open to professional gardeners who, themselves or their employers, are members of co-operative societies; and this afforded opportunity for such well-known growers as Mr. A. BASILE, of Weybridge; and Mr. W. T. STOWERS, of Sittingbourne, among others to stage exhibits of a high order of merit. The other classes were open to members of co-operative societies not professional gardeners; in this division, plants, cut flowers, fruits, and vegetables came from distant parts of the country, and most of these exhibits were of fine quality. The entries were in excess of those of last year, and, as the flower show was such an important part of the week's proceedings, the schedule of prizes is to be extended in the future.

Unfortunately the show lost much of its attractiveness and importance from having to be distributed over several courts, the nave of the building being fully occupied. The interest in the show was considerably enhanced by the presence of an excellent display of Dahlias from Messrs. J. CHEAL & SONS, Crawley.

AN IMPROVEMENT IN GREENHOUSE BUILDING, NEW PATENT.—MR. ALFRED THOMAS GOODWIN, Roscholme, Maidstone, horticultural builder and fruit-grower, claims that his invention enables a cement sill to be used on the brickwork. By means of its attachments to the rafters, the rafters not touching the sill, but leaving a clear air-space, all draught is excluded by the brass plates, allowing water to drip clear and not soak up the rafter, and rot both rafter and sill, as is always the case where wooden sills are used. This invention can be used for renovations and repairs as well as in new work. Mr. GOODWIN tells us he has adopted it in his Rose and Peach-houses with much success.

POTATO "THE PEARL."—Recently a party of Potato experts were visiting the experimental grounds of Messrs. W. W. JOHNSON & SON, Ltd., of Boston, and after seeing one root of "The Pearl" lifted, one of the company offered 5 gs. for the next root before it was dug. The novelty of the situation induced Mr. DEAL, the General Manager of the Company to accept the bid, and this was followed by other bids of a like amount. While this interesting event was taking place, a photographer was sent for, who took several pictures of the party while the sale was in progress. One acre of Potatoes would contain about 9,000 plants, and on this basis the enormous sum of £47,000 per acre would be realised. A sale of tubers of this variety is announced by Messrs. JOHNSON for September 7.

AN INDUSTRY FOR FLORISTS.—A recent experience in a country town within tram ride of London (Uxbridge) has proved that florists need not depend solely on their trade for profit. "Tea and Fruit in the Garden" was found to mean the ordinary necessities of the meal accompanied by Plums and Melon - Pears. These Solanums were a novelty to many customers, but quickly found favour. The garden was but a small paved yard, but made really attractive by hanging baskets and Japanese Fern-frogs, &c., the walls being also covered with boxes and stages filled with plants in flower. The thriving business being done from 4 to 5 o'clock on a fine Saturday afternoon suggests that in other towns florists might add a secondary industry to their chief occupation.

CUCUMBER AND MELON MOULD.—Our correspondent, "G. B.," has sent us Cucumber leaves with circular spots, not to be distinguished from those caused by *Cercospora melonis*, and he claims to have succeeded in killing the spawn by a treatment of manuring, in which potash enters largely. We have submitted these leaves to the authority who first recognised and described this disease (*Gardeners' Chronicle*, September 5, 1896, p. 271), and the following is his report:—"The leaves of Cucumber present just the appearance of those attacked by *Cercospora melonis*, in fact, could not be distinguished from them, save that the spots are entirely barren, and do not bear either the hyphæ (spawn threads) or conidia (spores) of the mould. There is every reason to believe that the mycelium has been affected in some way, and the development of the mould arrested, and there are strong grounds for believing that your correspondent is right, and that by his treatment he has succeeded in checking the development of the mould. We cannot call to mind any record of a similar instance in the history of leaf parasites, but that is no reason why such a hypothesis should be discarded without fair and reasonable trial and experiment. We are

unable to account for the peculiar spots on the leaves sent, other than that they are sterile spots caused by *Cercospora melonis*." M. C. C.

THE FRUIT INDUSTRY.—The Departmental Committee appointed by Lord ONSLOW to enquire into and report upon the Fruit Industry of Great Britain, made a tour through some of the principal fruit districts of England from August 22 to 26. On the 22nd a visit was paid to the National Fruit and Cider Institute situated at Long Ashton, Somerset. On the 23rd the Committee visited the fruit plantations on the Toddington Estate in Gloucestershire, and on the 24th those of the Evesham district. On the 25th a visit was paid to the Duke of BEDFORD'S experimental fruit farm situated at Ridgmont, Bedfordshire, and on the 26th to the Sussex County Council fruit station, situated at Uckfield. The Committee visited the Swanley district of Kent earlier in the year.

LUSKERPORE VALLEY SYLHET.—We have received a copy of the Journal of this Society, including original communications on planting and kindred subjects. The Society is a comparatively new one, and we have not previously seen a copy of its Proceedings. Judging from the number before us, the Society is doing excellent work among the Tea-planters, and it has made so good a beginning that there is every reason to hope that its progress will be satisfactory. Mr. J. E. AIRD is the Hon. Secretary.

FLOWER STEALING.—A correspondent writes that he sent to one of the recent meetings of the Royal Horticultural Society a flowering plant not yet in the hands of the public. When the plant was returned to him it was found that the blooms had been removed, and on enquiry it was ascertained, according to our correspondent's statement, that they were taken by a "lady" before the close of the meeting. The lady on being remonstrated with gave the professor "a sweet smile, and drove off in her carriage." This is so serious a statement that we enquired of the officials whether any complaint had been made to them, but this was not the case, and in the absence of more definite information it is not possible to trace the offender. It is a pity that the recipient of the sweet smile did not immediately make his loss known to one of the attendants, or at least request the restoration of the flowers.

PUBLICATIONS RECEIVED.—*The Bystander*, August 17. This includes among its shorter articles a note on Lhasa, and a picture of the city, reproduced from the *Journey to Lhasa and Central Tibet*, by Sarat Chandra Das (John Murray, Albemarle Street).—*Cassell's Popular Gardening*. The eleventh part of this useful publication is now ready.—From the Midland Agricultural and Dairy Institute, Kingston-on-Soar: *Reports on Experiments with Crops and Stock*, carried out in Contributing Counties in the year 1903-1904. Useful work was done at the Institute Farm and at various centres in the counties of Notts, Derby, Leicester, and Lindsey Division of Lines.—*Bullettino della Societa Botanica Italiana*, May and June.—*Nuovo Giornale Botanico Italiano*, Nuova Serie: *Memorie della Societa Botanica Italiana*, July, 1904.—John Dick's Threepenny Standard Library: *Nights at Sea*, by H. M. Barker, illustrated by George Cruikshank; *The Last of the Mohicans*, Fenimore Cooper; *Rattlin the Reefer*, Captain Marryat. These are wonderfully cheap editions.—*Roses and Rose Culture*, by William Paul, 10th edition (Simpkin, Marshall & Co., 1s.).—*Trees, A Handbook of Forest Botany for the Woodlands and the Laboratory*, by H. Marshall Ward, Sc.D. Vol. i., "Buds and Twigs"; Cambridge University Press; London: Clay & Sons, 4s. 6d.—*The Timbers of Commerce and their Identification*, by Herbert Stone (Rider & Son.)

COLONIAL REPORTS AND BULLETINS.—We have received the following:—From the Experiment Station, Peradeniya: *Cacao Spraying*, *Cocoa Manures*, *Green Manures*, and *Catch Crops*. Mr. Ivor Etherington publishes under this title his notes made during a recent visit for the purpose of investigating the work done at Peradeniya. He speaks in the highest terms of the valuable services rendered by the Experiment Station under the superintendence of Mr.

H. Wright. *Proceedings of the Agri-Horticultural Society of Madras*, January to March, 1904. Reports a meeting and a successful flower show held in February.—*Annual Report of the Royal Botanic Garden, Calcutta*, for the year 1903-1904. Details much good work accomplished, and mentions the fall of a large portion of the central section of the great Banyan-tree in March—it is to be feared owing to natural decay. The botanical explorations made during the year included a visit by the Superintendent to Independent Sikkim and Tibet, by the invitation of Colonel Younghusband, in order to organise botanical survey operations in Tibet in connection with the frontier mission. The results of the visit were very satisfactory.—*Annual Report on the Government Cinchona Plantation and Factory in Bengal* for 1902-3. This records an increase in the actual numbers of trees and continued improvement in methods of growth and preparation of Cinchona.—*Journal of the Luskerpore Valley Society of Planters*, season 1903. Sylhet, India. This also includes original communications on planting and kindred subjects, and minutes of meetings of an energetic and useful society.—*Bulletin of the Department of Agriculture, Jamaica*, July. The most important articles are those on School Gardens, by Mr. T. J. Harris; Arbor Day, Breadfruit, and Central American Rubber-tree.—*Botanical Department, Trinidad: Annual Report for Year ended March 31, 1904*. The herbarium work has made good progress; agricultural instruction is increasing and found to be well appreciated.—*Annual Report of the Botanic Station, Tokyo*, 1903-4. The general state of the Station is satisfactory; agricultural teaching in schools has made good progress; experiments in destroying parasolants by the liquid known as carbon-bisulphide, or "Fuma," proved successful.

PLANT PORTRAITS.

BALOGHIA LUCIDA, Endl.—Maiden, *Forest Flora of New South Wales*, pl. 28.

CASTANOSPERMUM AUSTRALE, A. Cunn.—Maiden, *Forest Flora of New South Wales*, pls. 25 and 26.

CERATOPETALUM APETALUM, D. Don.—Maiden, *Forest Flora of New South Wales*, pl. 21.

EUCALYPTUS HEMIPHILLOIA, F. v. M.—Maiden, *Forest Flora of New South Wales*, pl. 22.

EUCALYPTUS INCRASSATA, Labillardiere, and E. REICUNDA, Schauer.—Maiden, *Critical Revision of Genus Eucalyptus*, pls. 13-24.

EUCALYPTUS MACULATA, Hook.—Maiden, *Forest Flora of New South Wales*, pl. 27.

EUCALYPTUS MELLIODORA, A. Cunn.—Maiden, *Forest Flora of New South Wales*, pl. 35.

EVODIA ACEDENS, Blume.—Maiden, *Forest Flora of New South Wales*, pl. 36.

GMELENA LEICHHARDTII, F. v. M.—Maiden, *Forest Flora of New South Wales*, pl. 33.

PANAX ELEGANS, F. v. M.—Maiden, *Forest Flora of New South Wales*, pl. 24.

STENOCARPUS SALIGNUS, B. Br.—Maiden, *Forest Flora of New South Wales*, pl. 23.

VENTILAGO VIMINALIS, Hook.—Maiden, *Forest Flora of New South Wales*, pl. 34.

ROSE COMITISSA CECILIA LURANI, H.T.—A cross between Kaiserin Augusta Victoria and Principessa di Napoli, raised by M. Brauer, of San Remo. Flowers rose-pink.—*Journal des Roses*, June.

CYMRIDIUM ECKNEUM,—*Moniteur d'Horticulture*, August 10.

RASPBERRY SUPERLATIVE.—*Bulletin d'Arboriculture*, &c., August. Bears fruit on the old wood, and is superior in quality to those varieties which bear fruit on the wood of the year also.

PYRUS SCHNEIDERERI, HORT.—*Garten Flora*, August 15. Considered to be a cross between *P. floribunda* and *P. prunifolia*.

BRITISH ASSOCIATION.

(Continued from p. 155.)

SECTION K.—BOTANY.

THE address in this section was delivered by the President, Mr. Francis Darwin, F.R.S., on "The Perception of the Force of Gravity by Plants."

He proposed to summarise the evidence, still far from complete, which might help to form a conception of the mechanism of the stimulus which called forth one of these movements—namely, geotropism. The modern idea of the behaviour of plants to their environment had been the growth of the last twenty-five years, though, as Pfeffer had shown, it was clearly stated in 1824 by Dutrochet, who conceived the movements of plants to be "spontaneous"—i.e., to be executed at the suggestion of changes in the environment, not as the direct and necessary result of such changes. He had been in the habit of expressing the same thought in other words, using the idea of a guide or signal, by the interpretation of which plants were able to make their way successfully through the difficulties of their surroundings. In the existence of the force of gravity we had one of the most striking features of the environment, and in the sensitiveness

to gravity which existed in plants we had one of the most widespread cases of a plant reading a signal and directing its growth in relation to its perception. He used the word perception not of course to imply consciousness, but as a convenient form of expression for a form of irritability. It was as though the plant discovered from its sensitiveness to gravity the line of the earth's radius, and then chose a line of growth bearing a certain relation to the vertical line so discovered, either parallel to it or across it at various angles. This, the reaction or reply to the stimulus, was, in his judgment, an adaptive act forced on the species by the struggle for life. They were not concerned with why the plant grew up into the air or down into the ground, but with the question of how the plant perceived the existence of gravitation. Or, in other words, taking the reaction for granted, what was the nature of the stimulus? If a plant was beaten down by wind or by other causes into a horizontal position, what stimulative change was wrought in the body of the plant by this new posture? At the end of the address Mr. Darwin reiterated his belief in the general, though not the universal, applicability of the "statolith" theory. He found it impossible to doubt that, in the case of the higher plants, sensitiveness to the pressure of heavy bodies would be found to be by far the most important, if not the exclusive, means by which gravity was perceived.

SUB-SECTION—AGRICULTURE.

In an introductory review, Dr. Somerville pointed out that although agriculture had only now been elevated to a position of semi-independence in the programme of this association, it had, in the aggregate, received much attention at the meetings inaugurated with that at York in 1831. In the account of the first meeting in Cambridge in 1833 they found a report by Lindley on the Philosophy of Botany, two of the items in which were of interest to students of rural economy. Apparently at that time much attention was being given to the mode of the formation of wood. Two theories appeared to have divided botanists—the one that wood was organised in the leaves, and sent down the stem in the form of embryonic but organized fibres, to be deposited on the surface of wood already formed. The other theory was that wood was secreted *in situ* by the bark and older wood. It was to the former of these theories that Lindley gave his adherence. Although this problem had ceased to interest, the same could not be said of another subject discussed in the same report—namely, the so-called "faecal excretions" of plants. Lindley attributed to Macaire the demonstration of the fact that all plants parted with a faecal matter by their roots. These excretions he held to be poisonous, maintaining that, although plants generated poisonous secretions, they could not absorb them by their roots without death, concluding that "the necessity of the rotation of crops was more dependent upon the soil being poisoned than upon its being exhausted." He indicated the lines along which investigation might with advantage proceed, one of the questions put forward being "the degree in which such excretions are poisonous to the plants that yield them, or to others." The subject of harmful excretions had recently obtained renewed attention through the work being done at the Woburn Fruit Station. No point had received more striking demonstration there than the harmful influence that growing grass exerted on fruit trees. It had been shown that this prejudicial influence was not due to the withdrawal of moisture, to the curtailment of supplies of plant-food, to interference with aeration, or to modifications of temperature. In Mr. Pickering's opinion, "the exclusion of all these possible explanations drives us to believe that the cause of the action of grass is due to some directly poisonous action which it exerts on the trees, possibly through the intervention of bacteria, or possibly taking place more directly."

ARTIFICIAL MANURES.

In the early forties attention was being directed to a subject that even now had a great attraction for agriculturists—namely, the stimulating and exhausting effect of artificial manures, especially nitrate of soda. Daubeny suggested that manuring should be undertaken on a system of book-keeping—on the one side being entered all the items of plant-food taken out by crops, and on the other all that applied in the form of manures, the two sides of the account being made to balance. This theory of manuring was distinctly suggestive, and often fitted in rather remarkably with actual practice. But they now knew that much of the plant-food offered in manure never entered the crop at all, so that the balancing of the account was due almost as much to chance as to calculation. During the fifties the volumes of the Association contained several important contributions from the two distinguished Englishmen to whom the world's agriculture owed so much, Lawes and Gilbert. Their first contribution was made in 1851, and dealt with Liebig's mineral theory. They drew upon their rich store of experimental data to prove that the yield of Wheat was much more influenced by ammonia than by minerals, and they gave it as their deliberate opinion that the analysis of the crop

was no direct guide whatever as to the nature of the manure required to be provided in the ordinary course of agriculture. Field experiments or demonstrations, which had been such a prominent feature of the educational work of the past decade, appeared to have been first introduced at the meeting of the Association in 1831 by Dr. Voelcker.

FORESTRY.

While agricultural subjects had claimed a considerable share of the time of the Association, FORESTRY had not altogether been overlooked. As early as 1838 they found attention being directed to what had of recent years come to be a question of prime importance—namely, the maintenance of our timber supplies. Captain Cook estimated that “100,000 acres of waste taken from the Grampian Hills for the growth of Larch would in two generations not only supply the ordinary wants of the country, but enable us to export timber.” Assuming a rotation of eighty years, this estimate postulated that the produce of some 1,200 acres, of a value of about £120,000, was sufficient to make us independent of foreign supplies. Such was the estimate of 1838. In 1904 Dr. Schlich, in his volume on *Forestry in the United Kingdom*, after making allowance for woods like mahogany, teak, &c., which could not be grown here, came to the conclusion that “if all these items are added up we find that we now pay for imports in timber . . . the sum of £27,000,000, all of which could be produced in this country.” Assuming as before that the value of an acre of mature forest was £100, this meant that our imports were drawn from 270,000 acres, and to maintain our supplies merely at their present level a forest area of more than 20,000,000 acres, worked on an eighty years’ rotation, was necessary.

FARMYARD MANURE.

Those who had followed the progress of agricultural science in Germany must have noticed how much attention had been given during the past ten years to investigating the changes that took place in farmyard manure during storage under varying conditions. The stimulus and funds for this work had for the most part been supplied by the German Agricultural Society, which in 1892 resolved to carry through an exhaustive inquiry. For this purpose it enlisted the co-operation of several of the most fully equipped stations in the Empire, and the reports that had appeared bore testimony to the industry and analytical ingenuity that had been brought to bear on this important subject. The experiments were originally designed to extend over four years, the first, 1892–93, being devoted to preliminary, chiefly laboratory, experiments; the others to work on a scale more in accordance with farm practice. The subject had been found to bristle with difficulties, and the results obtained with small quantities of manure, or in summer, had not always been confirmed with large quantities of manure, or in winter. In 1897 he published an account of the more important results obtained up to that time, confining himself chiefly to questions of temperature and the loss of organic matter, and the conclusion arrived at was that “none of the conservation agents usually employed appears to have any very important influence on the decomposition of farmyard-manure.” Since then several important reports had appeared. The general conclusion arrived at, and clearly expressed by Pfeiffer, was that excessive loss in manure could be best avoided by storing it in a deep mass in a watertight dung-stand placed in a well-shaded situation, in which the material was firmly compressed. The necessary compression could be secured in various ways, perhaps most conveniently and effectively by means of the treading of cattle. The use of a considerable proportion of moss-litter was strongly recommended. This substance not only absorbed and retained the liquids, but, being acid, it fixed ammonia. In the absence of moss-litter, loamy soil rich in humus would prove a useful substitute.

CHEMICAL FIXATION OF ATMOSPHERIC NITROGEN.

It had for long been the dream of chemists to discover, or welcome the discovery of, a chemical process, capable of industrial application, by which the nitrogen of the air could be made available to replace or to supplement the rather limited supplies of nitrogenous manures. Sir William Crookes looked hopefully to electricity to solve the problem. He pointed out that with current costing one-third of a penny per Board of Trade unit a ton of nitrate of soda could be produced for £26; while at a cost of one-seventeenth of a penny per unit—a rate possible when large natural sources of power, like Niagara, were available—the cost of such artificial nitrate of soda need not be more than £5 per ton. Dr. von Lepel, in giving an account of recent work on this subject to the winter meeting of the German Agricultural Society in February of this year, put the cost of electric nitrate, as compared with Chile nitrate, in the proportion of 24 to 30. Good progress would also appear to have been made in another direction in the commercial fixation of atmospheric nitrogen, and a short account of the results was communicated by Professor Gerlach, of Posen, to the meeting of the German Agricultural Society already referred to, and was published in the same issue of the

Mittheilungen. So far as one might judge from the information available, it would appear that agriculture would not have long to wait till it was placed in the possession of new supplies of that most powerful agent of production, nitrogen, and Sir William Crookes would see the fulfilment of his prediction that “the future can take care of itself.”

(To be continued.)

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

MUSHROOM GROWING EXTRAORDINARY.—I have just seen in a stationer's shop window in Copthall Avenue, a dish of fine Mushrooms, picked in the underground playground of Coleman Street Schools. The concrete on which they were picked is 8 inches thick, and I examined this floor after I had seen the Mushrooms. R. J. Shebbeare, 39, King William Street, London Bridge.

NEPENTHES AT SHREWSBURY.—The six beautifully “pitchered” plants which gave such a finishing touch to the excellent group of new and rare plants which Messrs. James Veitch & Sons arranged in the large marquee at the recent Shrewsbury Show consisted of *Nepenthes Burkei*, bearing six large, well-developed pitchers; *N. Burkei* excellens, furnished with nine large, well-formed, green-purplish pitchers; *N. Mastersiana*, bearing thirteen fine purple-coloured pitchers; *N. mixta*, ornamented with five large pitchers; and two plants of *N. Hookeriana*, furnished with eighteen pitchers each. The plants were in the best possible condition, and bore ample evidences of high cultural skill. Elevated 6 feet from the ground-line on almost imperceptible green-painted supports inserted firmly in the earth, they were massed round with choice foliage and flowering plants, thus forming effective floral mounds, each surmounted by a *Nepenthes*. This group of new and rare plants was arranged on a quadrant space 3½ feet in length and 12 feet across the middle portion. H. W. W.

THE HOE “PLANET JUNR.”—In answer to the enquirer in the *Gardeners' Chronicle* for August 20 respecting the “Planet Junr.” wheel hoe for walks and kitchen-garden use, my experience shows that one man will do as much work with the “Planet Junr.” as five men could do with ordinary hoes in a stated time, in and about kitchen-garden crops, such as Onions, Beet, and similar crops sown in drills; but I prefer the single hoe for this purpose. If the inquirer intends the hoe for use on gravel-walks I would advise him to get the two-wheeled hoe, as it would prove more satisfactory in every respect, being a little stronger and much steadier with two wheels. I do not think the single-wheel would give satisfaction for gravel-walks. I have a single-wheel hoe, also two double-wheel hoes here, and am speaking of my own experience only. Should enquirer wish any further particulars through the medium of your paper, I would be pleased to answer them. A. F. Grubb, *Seaforde Gardens, co. Down*. [These hoes may be obtained from garden-implement merchants. Ed.]

POINTS AND PRIZES.—An interesting illustration of the very wide differences frequently found between the point-values of exhibits, and the values of the prizes offered for them, was seen recently at Reading. There Messrs. Sutton & Sons annually offer a sum of 21 guineas in five prizes for collections of twelve dishes of vegetables, the 1st prize being 10 guineas, the 2nd 5 guineas, and so on. As a rule, quality is very high and competition exceedingly keen. The recent competition brought fine collections, and when pointing, as required by the firm, on the basis of the Royal Horticultural Society's code of judging was completed, it was found that the 1st prize collection gained 67 points, the 2nd coming with 65; two others had 63 and 62½ points. Between the 1st prize collection (Mr. Bowerman's) and the 2nd prize one (Mr. N. Kneller's), there were only 2 points, yet was there in the value of the prizes no less than 100 per cent. difference, the 1st being in fact just double that of the second. That is not a just arrangement, having regard to the respective merits of the two exhibits, and should have, with a view to

more complete equalisation of prize values, the fullest consideration. At Carshalton, in a class established by the late Mr. A. H. Smee many years since, and with which point values and prize values exactly accord, not only does the method of dividing the prizes according to point-value give complete satisfaction, but good competition is always well maintained. Mr. Bowerman obtained in his twelve dishes at Reading five maximums, and Mr. Kneller but three maximums, but the latter was a little better in Cauliflowers, Tomatos, Turnips, and Carrots; whilst weaker in Peas, Celery, Leeks, Beets, and Parsnips. The quality in four collections was really excellent, and well maintained the Reading reputation for high-class vegetables. D.

FRUIT GROWING.—Under this heading in the *Gardeners' Chronicle*, p. 114, Mr. Crump, V.M.H., gives a rather doleful account of the indifference amongst some of the tenantry on Lord Beauchamp's Madresfield Court Estate to reciprocate his lordship's very considerate generosity in granting to them fruit-trees free of charge. I should hardly have expected to hear of such indifference, especially in a county which, as regards fruit-growing, we always thought more highly favoured than most others of the Midland Counties. Before parting with the fruit trees, one would have thought his lordship would have taken care to see that his own interests were safeguarded by sending an expert from amongst his own employes to see that the proposed site for planting was not only well chosen, but that the land itself was thoroughly well prepared for their reception, and subsequently to see that year by year those trees or orchards were properly cultivated. If a thing is worth doing, it ought to be done well. This supervision would eventually result to the interest of the landlord and also that of the tenant. The tenant's interest would of course centre in the early fruiting of the trees, that of the landlord in maintaining the trees in a healthy condition as a valuable asset for the benefit of the estate. We are informed that, according to the estimate of a Worcester fruit-tree valuer, “trees of ten years of age and upwards are worth from £6 to £10 per tree” [we presume annually], but it is not stated whether during some ungenial seasons those trees might be altogether or partially without fruit. Mr. Crump puts it that 10,000 trees at the rate of £5 per tree would represent a total value of £50,000. Mr. Crump does not say that this would be the amount yearly, and in the absence of such qualifying information we presume that we are right in putting that interpretation upon it; thus yielding a most princely income, equal to the rental of an estate of about 33,000 acres at the very moderate rent of 30s. per acre. But it may be noted that the Worcester valuer's maximum estimate puts the figures up to £100,000. If Mr. Crump gives it as his opinion that the above-mentioned handsome amount is realisable from fruit-trees when skilfully cultivated, the announcement is one which almost staggers the credulity of an ordinary individual, and compels us to ask, What have our so-called fruit-growers been doing during all these years? and being in possession of such knowledge, our surprise is that Lord Beauchamp and his tenantry did not keep the secret all to themselves, and obtain an enormous advantage before the outside world had got aware of it. Well, let us hope that all this will come true; for my own part I am pleased that I have already planted some trees. It is more than probable that the cause of the want of interest in fruit-tree planting amongst tenant-farmers generally may be found in the want of “fixity of tenure.” Farmers are a nomadic class of people, and especially so of late years. When their occupation has become so unremunerative and so uncertain, they may think, and not perhaps without some reason, that after being at the expense and pains of planting an orchard, whilst the land during the unfruitful period brought them little or nothing, they might, through some unforeseen circumstances, have to give up the occupation before they have had time to recoup themselves for all their labour and outlay. The outgoing tenant might probably obtain some modicum of tenant-right, but the most valuable part of the asset would be left behind for the

benefit of the estate. If tenant-farmers are to hold their own against competition from all parts of the world, by all means let them have fixity of tenure; then, and not until then, will fruit-trees, and much more besides for the benefit of the country, spring into existence, metaphorically speaking, with something like magic quickness. Such an arrangement would do more than anything else to hold and secure the yeomen on to holdings in their own country, and bring the peasantry which have already migrated to the towns back to their cottage homes, where I believe it is being arranged that small holdings will eventually be provided for them. Evidently the time has arrived which demands that something should be done. We cannot expect to continue in this country a grand and noble aristocracy to stand around and support our much-loved King, unless they in turn are supported by an equally grand representation of the muscle of the British yeomen and peasantry who have stood through many ages as a "wall of fire around their much-loved isle." *W. Miller, Berkswell, August 22.*

RUNNER BEANS.—In regard to the point raised by your correspondent, "J. Tallack," I can say that the high temperatures recorded this season are the cause of Runner Beans failing to "set." I have observed that when the shade temperature exceeds 75° to 80° Fahr. the blossoms drop as quickly as they open, but during a few days' dull weather it is astonishing how quickly the young legumes form. As the result of the cool weather last week the Beans in this garden are looking very promising, but the flowers that have opened during the hot weather this week are failing to "set." Watering and mulching, although of great benefit to those already set, seem to have no effect upon the actual setting of the Beans if the temperature exceeds 75° F., for I have had them well attended to in this way, and yet whole racemes of flowers have dropped. Regarding Bumble-bees' piercing the calyx, I have examined many flowers, but fail to find any that have been pierced. *J. W. Miles, Manderhill House Gardens, Isleworth, August 30.*

— While our crop of Runner Beans is not so good as usual, I do not attribute this to the Bumble-bee. I have noticed, like Mr. Tallack, that there is an unusual number of these bees this season, but if our partial failure of a crop of Beans is due to the agency of bees, with us it is the Honey-bee, as I have noticed that they have been unusually busy among the flowers of the Runners; even when the flower is fully open, they all pierce the under side of the calyx. I am inclined to think that the poor crop is due to some local influence, for on visiting a friend some few miles distant, I remarked on the luxuriance and quantity of Beans which his Runners were carrying. I was particularly struck with his row of the variety Hackwood Park, distributed this year, which was so totally different in quantity and condition to mine. My friend mentioned a gardener, some four miles from him, who had also complained of the poor crop. This not only applied to the Hackwood Runner, but to other varieties as well. I think this shows that local influences other than bees are responsible for the unsatisfactory crop of Runner Beans this season. *T. H. Slade, Pollimore Gardens, Devonshire.*

PINUS LEIOPHYLLA.

This is one of the more accessible Pines of Mexico. It is found within easy reach of the metropolis, and thence in all directions as far as the States of Vera Cruz, Oaxaca, Durango, and the Territory of Tepic. Further investigation may extend these limits along the Sierra Madre mountains, but the eastern and western specimens have reached the borders of the temperate altitudes. Although there is a large amount of good material available, all of the characters of this Pine are not yet recognised. The tardy development of the cone seems to have been entirely overlooked, while the invariably deciduous sheath of the leaf-fascicles has been forgotten in the determination of some specimens from Guatemala and Mexico.

The earliest figure of *P. leiophylla* was published

by Lambert from specimens furnished by the original discoverers of the species. The length of the leaf, the size of the cone, and other particulars are faithfully drawn, and Lambert's description would have been complete for all purposes of identification had he recognised in

shown on Lambert's plate, and may be easily detected on the ripe cones of this species, as well as on those of *P. pinea* and *P. Chihuahuana*.

P. leiophylla has been associated with *P. Montezumae* in recent arrangements of the genus *Pinus*, but it is clear from the above considerations that its nearest relative is *P. Chihuahuana*, whose short leaf with deciduous sheath and small triennial cone ally it very closely with *leiophylla*. Indeed, specimens of both Pines in the National Museum at Washington, collected by Dr. Rose along the borders which separate Sinaloa, Tepic, Durango, Zacatecas, and Jalisco, show variations in the number of leaves and other points of convergence which suggest the possibility that *P. Chihuahuana* may prove to be a northern form of *P. leiophylla*. It has not yet been found in Guatemala, but there are fictitious *leiophyllas* among the Guatemala specimens, such as Heydes No. 545, and Donnell Smith's No. 3156 and No. 2633. The first two belong to the section *Strobilus*, and are probably Ayacahuite; the third has a leaf section identical with Hartweg's No. 620, which is the type specimen of *P. tenuifolia*, Benth. Further north, Pringle's No. 8054 of Esclava, is one of the *Montezumae* group, but his No. 8182 of Las Vigas is correctly labelled and is a true *leiophylla*. *George Russell Shaw, 9, Park Street, Boston, U.S.A.*

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

AUGUST 23.—*Present*: Dr. M. C. Cooke, in the Chair; Messrs. Holmes, Odell, Saunders, Hooper, Douglas, Rev. W. Wilks, and Dr. Masters. Professor Liberty Bailey, of Cornell University, and Professor L. J. Jones, of Vermont University, Burlington, U.S.A., attended as visitors.

Discussed Potentillas.—Mr. SAUNDERS reported as follows on some specimens submitted to him:—"The diseased blossoms of a *Potentilla*, exhibited by Mr. Bowles at the last meeting, were attacked by eelworms, and probably by the species which is the cause of the 'Cauliflower disease' in the cultivated Strawberry (*Aphelenchus fragariae*), a disease that has been known to ruin nearly half the crop by rendering the flowers abortive. I am afraid that there is no real cure for this infestation, and that the best thing to do is to burn the affected plants and the soil round their roots. If the plant be a valuable one, it might be of use to cut away all the parts which show any sign of being infested, and to remove as much as possible of the soil round the roots. The following dressings have been found very useful in the case of Clover which was attacked by the 'stem eelworm' (*Tylenchus devastatrix*)—three parts of sulphate of potash, and one of sulphate of ammonia or sulphate of iron."

Leaf-miner in Lilacs, &c. The leaves of the common Lilac, exhibited by Mr. HOLMES, are attacked by the caterpillars of the "Lilac-moth" (*Gracillaria syringella*). The caterpillars had, however, all left the leaves to pupate. The Willow-leaves also shown by him were attacked by a small beetle, *Phratora vitellinae*; and some other Willow-leaves by the grubs of one of the saw-flies belonging to the genus *Nematus*. The leaves of the shoots of Black Currant, also submitted to Mr. Saunders, are covered with small transparent blister-like pustules, the cause of which he could not determine. On examining them under a microscope he could find no trace of insects, mites, or fungi in them. There were a few acari and thrips on the leaves, but they were not the authors of the pustules, nor of the injury to the leaves. Mr. Saunders suggested that the pustules may be of bacterial origin. Cut off and burn all the shoots bearing leaves which are affected.

Fungus on Charred Gorse.—Some specimens of fungi observed on Gorse after being burnt were submitted to Dr. Cooke.

Fungus on Cypripedium Leaf.—A leaf attacked by a fungus was submitted by Mr. DOUGLAS, and referred to Dr. Cooke for examination.

Variation in Ferns.—Mr. DRURY sent a unique and interesting example of symmetrical variegation in a British Fern in the form of a frond of *Polystichum angulare* var. *pulcherrima*, Moly., found many years ago in

FIG. 19.—*PINUS LEIOPHYLLA* SHOWING THE THREE ANNUAL STAGES OF GROWTH IN THE CONES, ETC.

his text the triennial cycle of growth that he clearly indicated on the drawing of the cone-scales.

In common with *P. pinea* and *P. Chihuahuana*, this Pine does not ripen its fruits until the third season. The growths of the first two years of these Pines are relatively very small, but they leave their imprint on the umbo that crowns the mature apophysis in the form of two distinct annual layers. This double umbo is clearly

Dorsetshire. The plant is perfectly constant, and curiously enough perfects its fronds as purely green ones, the variegation appearing subsequently as they ripen. The Fern is furthermore interesting as being the only known example of a constant asporous form of *P. angulare*, the sickle-shaped, inferior pinnules developing prothalli from their tips when layered. The resulting sexual plants, however, are irregular and depauperate, with extremely rare exceptions. Mr. Drury was indebted for this plant to Dr. Stansfield, of Reading.

Rare Plants from M. Henkel, of Darmstadt.—Dr. MASTERS exhibited fruiting specimens of *Ribes pinetorum*, a native of New Mexico, bearing globular, purplish-brown berries thickly studded with long, stiff, bristly hairs. Also flowers of *Scutellaria (Dracoecephalum) baikalensis* with large bluish flowers like those of our Skull-cap, but larger. It is described as a fine hardy herbaceous plant flowering continuously in summer and autumn, and suitable for a warm and sunny place on the rockery or front row of the herbaceous border. With these came a plant of *Cyperus fertilis*, said to be a native of tropical Africa, with long green stems bearing close spikes of whitish bracts and flowers. It thrives in a partially shaded, moist situation, in a warm temperature. It makes a good plant for hanging baskets. The specimens were forwarded, at Mr. Henkel's request, to the gardens of the Society at Wisley.

Pitcher-like Leaf of Polyrhynchium.—Mr. MALCOLM BALL sent a leaf with a funnel-like outgrowth, such as is not uncommon in Cabbages, &c.

Syncarpy in Apples.—Mr. HUGH ALDERSEY sent specimens of two Apples partially fused together at their base.

Variegated Maple.—Mr. F. LLOYD sent specimens of crippled foliage of *Acer Negundo variegatum*, which had suffered some check to growth, and was attacked by aphides and other pests.

Fungus on Grass.—Rev. W. WILKS showed specimens affected with rust *Uredo rubigo vera*.

Diseased Oats.—Mr. HOOPER showed specimens of Oats apparently attacked with eel-worm. The specimens were referred to Mr. Saunders for examination and report.

Cuscutopsis chrysophylla.—Dr. MASTERS showed fruiting specimens of this handsome Californian Chestnut. It has the lower surface of the leaves of a golden yellow colour, and the bristles of the husk are of a rich purplish brown. The specimen was received from Mr. Lindsay, of Edinburgh.

Twofold Nepenthes.—Dr. MASTERS exhibited from Messrs. JAS. VEITCH & SONS a specimen in which two leaves were joined at the base, so that the specimen had the appearance of a single leaf branched below the middle and each branch bearing a pitcher.

BRIGHTON AND SUSSEX HORTICULTURAL.

AUGUST 23, 24.—This resuscitated and important Society held its annual summer show in the Dome and adjoining Corn Exchange, Brighton, the first-named commodious building accommodating chiefly cut flowers of hardy plants, Roses, Gladioli, Dahlias, tuberous-rooted Begonias, and ornamental tables of stove and greenhouse plants, arranged with the idea of affording agreeable effects, and of testing the artistic capacity of professional gardeners in what has become an essential part of a gardener's every-day work. The Corn Exchange was filled with dinner-table decorations, the work chiefly of ladies residing in Brighton and adjacent places; with fruit both indoors and forced, vegetables, hardy cut flowers, table plants, and florists' flowers. At one end of this building Messrs. BALCHIN & SONS, nurserymen, Brighton and Hassoeks, set up an imposing group of Palms, and a foreground of *Codiaeums* in variety, a few Palms, &c. Beneath the Lilies a setting of *Caladiums* having chiefly red leafage was placed, interspersed with Ferns and *Isolepis*; while *Caladium argyrites* was used for bordering the whole. We can only mention a few of the principal exhibits.

Collection of cnynt dishes of Fruit fit for Table Use.—There were six exhibits in all, and the 1st prize was taken by Mr. J. GORE, fruit-grower, Polegate, with fine large bunches of Grapes *Madresfield Court* and Muscat of Alexandria, Brown Turkey Figs, Pineapple Nectarine, Harrington Peaches, Clapp's Favourite Pear, Perfection Melon, and Worcester Pearmain Apple; Mr. E. Neal, gr. to J. A. NIX, Esq., Tilgate, Crawley, was 2nd, with fine bunches of Black Alicante Grapes, medium-sized bunches of Muscats, very choice Bellegarde Peaches, Beauty of Bath Apples, Beurré Giffard Pears, and Jefferson Plums.

Three bunches of Muscat of Alexandria Grapes.—The last-named exhibitor was placed 1st in this class with ripe, well-coloured, moderate-sized bunches. There were eight exhibits in this class.

Three bunches of Black Hamburgh Grapes, of which only five lots were shown, 1st, Mr. C. EARL, gr. to C. E. D'AVIGNOR GOLDSMID, Esq., Somerhill, Tonbridge, with neat, compact bunches, jet black and perfect in every point.

Grapes, two bunches of any variety.—1st, Mr. CHAS. EARL, gr., Somerhill, Tonbridge, with Muscat of Alexandria.

Pair of Melons.—The best were shown by Mr. J. GORE, Polegate, the varieties being Hero of Lockinge and Sutton's Perfection.

The winner in the single fruit class was Mr. C. BLURTON.

Pears in season were not numerous, and the best in appearance were Clapp's Favourite, shown by Mr. F. W. THOMAS, Wannock Gardens, Polegate, 1st; and Windsor, shown by Mr. A. H. PARSONS, Lewes, 2nd. Immature fruits of late and long-keeping and culinary varieties were likewise shown, but it is yet too early to test these.

Apples were largely shown, both dessert and culinary, and were generally of good quality; and such early dessert varieties as Beauty of Bath, Lady Sudeley, Worcester Pearmain, Irish Peach, Mr. Gladstone, Juneating, and Princess of Wales, were remarkable for high colour.

Plums in dishes of four were few, but the specimens observed were of great excellence. The 1st prize, taken by Mr. J. Dedman, gr. to Mrs. PARSONS, The Wallands, Lewes, consisted of dishes of Washington, Denyer's Victoria, Purple Gage, and Oullin's Golden Gage. The 2nd prize fell to Mr. F. W. THOMAS, fruit grower, Polegate, his Kirke's and Oullin's Gage being very fine fruits.

The 1st prize in the single dish class was taken by Green-gage, shown by Mr. A. H. PARSONS, market gardener, Lewes.

Four dishes Culinary Apples.—1st, Mr. A. H. PARSONS, Lewes, with New Hawthornden, Warner's King, Peasgood's Nonsuch, and an unknown variety.

The best four dessert Apples were shown by Mr. F. W. THOMAS, and consisted of Beauty of Bath, Irish Peach, Kerry Pippin, and Lady Sudeley.

Open Collections of Vegetables, nine kinds.—1st, Mr. W. MANTON, with an altogether very fine exhibit, including Best-of-All Runner Beans (about 10 inches in length), Solid White Celery (well blanchd), large Carrots Intermediate, Gladstone Peas, Blood-red Beet, Perfection Tomatoes, Ailsa Craig Onions. This exhibitor took the Society's Silver Medal in addition to the money prize; 2nd, Mr. A. B. WADDS, gr., Paddockhurst. This lot contained large Up-to-Date Potatoes, large, solid Autumn Giant Cauliflowers, l'raguel's Exhibition Beet, Best-of-All Runners, and fairly well blanchd Celery; 3rd, Mr. Dancy, gr. to Mrs. CREYKE, Holbrook, Horsham. The Celery Satisfaction, Potatoes, Runner Beans, and Peas were good. In this class competition was very keen, and the exhibits numerous.

Collection of Potatoes, six varieties.—1st, Mr. M. TOURLE, gr. to F. BARCHARD, Esq., Horsted Place, Uckfield, with General Roberts, L'Idéal, Sensation, Snowdrop, The Factor, Duke of York, all clean skinned, well-grown kidney varieties; 2nd, Mr. J. ROGERS, gr. to C. E. F. STANFORD, Esq., Rottingdean; his exhibit including King Edward VII., Royal Kidney, Peach Blossom, and others; 3rd, Mr. A. B. WADDS, Paddockhurst, whose exhibit included Findlay's Challenge, Evergood, and Sutton's Favourite. In every instance the tubers were fully grown and of large size.

Cut Flowers, Annuals (open).—1st, Mr. J. DAVIS, gr. to Major THURLOW, Buckham Hill House, Uckfield, with a very fine selection, among which we remarked *Salvia Horminum*, *Rudbeckia bicolor*, *Cosmos*, fine large and full African Marigold, *Viscaria cardinalis*, German Asters, Tenweek Stock, *Chrysanthemum Burdigianum*, double-flowered Zinnias, *Phlox Drummondii*, Sweet Peas, &c.

Tables of Carnations (open).—1st, Miss SKIFFNER, Coombe, Lewes. With this prize there was included a Silver Cup, to be held by the winner for one year only, but to become the property of the winner during three consecutive years. Miss SKIFFNER won it in 1903, and she now takes the Society's Silver Medal also. The table was brightened with Carnations in many varieties, and some few Picotees, but none were under name.

Decorated Dinner Tables.—Of these there were ten of various degrees of excellence. Mrs. RAPPLEY, East Grinstead, was 1st. This lady's exhibit consisted of pink Carnations and blooms of a pink-flowered Ivy-leaved Pelargonium. The Society's Silver Medal accompanied the money prize in this case.

Stove and Greenhouse Cut Flowers.—1st, Mr. J. DAVIS, with a fine selection, including *Gloriosa superba*, *Dipladenia amabilis*, *Rochea falcata*, *Lapageria rosea* var. *alba*, *Allamanda Hendersoni*, *Lasiandra macrantha*, *Kalanchoe flammea*.

Collections of Hardy Flowers.—1st and Bronze Medal Mr. J. DAVIS, with *Lilium auratum*, *Phlox Coquelicot*,

Crocusma aurea, scarlet *Pentstemon*, *Solidago*, *Saponaria officinalis*, *Kniphofia uvaria*, *Gladiolus*, *Helianthus* "Miss Mellish," *Echinops Ritro*, *Phygelius capensis*, &c.; 2nd, Mr. HUGH MACFADYEN. Very fine were his bunches of *Lilium auratum*, *Gladiolus brechevleyensis*, *Achillea Ptarmica*, *Kniphofia*, *Helenium grandiflorum*, *Hyacinthus candicans*, *Lilium tigrinum*, *Dracocephalum*, &c.

Twelve vases Cactus Dahlias, distinct varieties.—1st, Messrs. J. STREDWICK & SONS, with Geo. Gordon, Columbia, Pearl, Fairy, Ivanhoe, Ella Kraemar, Radium, Antelope, &c.; 2nd, Messrs. J. CHEAL & SONS, including Raymond Parkes, F. M. Stredwick, Conrad, J. H. Jackson, H. P. Robertson, Mrs. Clinton, &c.

Twelve spikes of Gladiolus.—1st, Messrs. J. CHEAL & SONS, with varieties of the Childsli strain, fine large blooms and clear tints.

Dahlias, Pompons and Twenty-four Show varieties.—1st, Messrs. J. CHEAL & SONS.

Tables of Flowering and Foliage Plants.—1st, Mr. H. HEAD, The Drive Nursery, Hove, a bright-looking table, on which were disposed *Phygelius capensis*, *Plumbago capensis*, *Gloxinias* in variety, *Begonia Dregei*, *Lilium lancifolium album*, Palms and grasses, and *Campanula fragilis*.

Table of Plants (Gentlemen's Gardeners).—1st Mr. W. ADAMS, for a moulded-up table on which the exhibitor had *Lilium rubrum*, *L. auratum*, *Zonal Pelargoniums*, *Begonia floribunda*, *Campanula fragilis*, *Coleus*, *Maidenhair Ferns*, &c.; 2nd, Mr. W. E. ANDERSON, gr. to B. PARISH, Esq., Melodia, Preston Park Avenue. This table consisted of *Adiantums*, *Lilies*, *Coleus*, *Celosia pyramidalis*, small-flowered *Begonias*, *Burmanna Caladiums*, &c.

Miscellaneous Group of Plants (Gentlemen's Gardeners).—1st and Bronze Medal, Mr. W. E. ANDERSON, with a light, graceful arrangement in which *Lilies* of different species, *Dracenas*, *Codiaeums*, *Celosia pyramidalis*, *Campanula pyramidalis*, formed the greater part. Greenery was furnished by *Adiantums* and small Palms.

There were eight floral groups.

Miscellaneous Group (open).—1st and Silver Bowl presented by J. W. Howlett, Esq., which he has finally won, having taken it for three years in succession, and the Society's Silver Medal. The group was a rich one, containing several plants of *Hydrangea paniculata*, *Lilium auratum*, *L. lancifolium rubrum*, and *L. l. album*; a few *Codiaeums*, *Begonias*, *Pandanus Veitchii*, *Caladiums*, *Gloxinias*, with just as many *Adiantums* as gave a foil to the bright colours of the flowers.

SPECIAL PRIZES.

For Messrs. Tilley Bros.' prizes for a collection of vegetables, 1st, Mr. J. DURRANT, Pakyns Lane, Hurstpierpoint, including fine Onions and Peas; 2nd, Mr. H. BRADSHAW, Itchingfield, with fine, short, stumpy Carrot Favourite, Best-of-All Runner Beans, &c.

Messrs. Cheals' prizes, for six vases Cactus Dahlias, 1st, Mr. W. MANTON (Gold Medal); 2nd, Mr. T. DANCY (Silver-gilt Medal).

Non-competitive Exhibits.—Mr. L. R. RUSSELL, Richmond Nurseries, Richmond, Surrey, showed tree-*Ivies*, *Skimmia fragrans*, *Polygonum baldschuanicum* in flower, *Eurya latifolia*, Sweet Bays, *Bambusa aurea*, *B. anceps*, *Clematis*, and *Vitis heterophylla* (Silver-gilt Medal).

A table of Roses, the majority Teas, shown by Mr. G. W. PIPER, Nurseries, Uckfield—a fresh-looking collection of new and old varieties, to which the Society's Silver Medal was awarded.

Carnations in tall glasses, viz., Royalty, Fair Maid, Harry Fenn, Enchantress, Floriana, were shown in profusion by Mr. A. F. DUTTON, The Nurseries, Bexley Heath, Kent.

Messrs. CHEAL & SONS had a long table filled with cut blooms of Cactus and Pompon Dahlias, Herbaceous plants, Ferns, Palms, together with dishes of Apples and Pears, set along the edge.

Mr. W. J. WOOLLARD, Cooksbridge Nurseries, Lewes, showed a table filled with cut flowers—Roses in threes, a handsome lot of *Souvenir de la Malmaison*.

In a recess in the Dome, Messrs. TILLEY BROS., Seed and Bulb Merchants, London Road Brighton, had arranged a quantity of bulbs of Hyacinths, Tulips, Scillas, Lilies, Daffodils, Crocus, &c.

BLYTH HORTICULTURAL.

AUGUST 27.—The eighteenth annual show of the Blyth (Northumberland) Floral and Horticultural Society was held in the Bath Terrace Grounds. The entries were as numerous in the Open class as in previous years. That the show fully maintained its standard was to be seen in many ways. Plants were magnificent in bloom. Table decorations made an extensive display. The Roses and Dahlias formed two features of the show. The principal prizewinners were as follows:—Messrs. Harkness, Thos. Battensby, J. Cawthorne, M. Allison, G. Gardner, J. Robson, S. Bewick, T. Coxon, W. Taylor, M. Young, J. Marshall, E. Nicholson, W. Forster, J. Swann, A. Allen, W. Brown, R. Nelson, &c.

ENGLISH ARBORICULTURAL.

MEETING IN ABERDEEN.

AUGUST 24-26.—When the members of the English Arboricultural Society chose Aberdeen as headquarters for their summer gathering, they knew full well that they would have the opportunity of seeing some splendid examples of forestry, and in this they were not disappointed.

DURRIS.

The first of the series of excursions took place on Wednesday, the destination being the beautiful estate of Durrus, the property of Mr. H. R. Baird, whose policy of advanced estate improvement in all departments is well known. Under the presidency of Mr. George Marshall, Frimstone, Liphook, Hants, the company, to the number of about 130, left the Palace Hotel, Aberdeen.

Near the east entrance lodge of Durrus, the party was met by Mr. Baird, the proprietor, Mr. Baird, factor on the estate, and Mr. John Crozier, the head forester, &c. On entering the gateway, the prospect presented by the avenue was magnificent, the various Douglas Firs and stately specimens of *Abies Fraseri* attracting special attention. The Larch, Spruce, Douglas, and Menzies Fir, all of them splendid specimens, were seen to the greatest advantage, and the prospect was varied by graceful Birch-trees, lordly Sycamores, tall, wide-spreading Beech, sturdy Oak, and beautiful Lime-trees. In front of the mansion several fine Cedars were greatly admired, as also a very healthy specimen of Fir, which is known as the Tulip-tree (?).

In describing the policies, Mr. John Crozier, head forester, said:—"The grounds have been laid out with great taste, and contain an extensive collection of deciduous and evergreen trees and shrubs; many of these, however, have proved unsuited to our northern climate, and with the exception of the North American imports, few others of the former are likely to be of much practical benefit to British planters. The Douglas Fir of Oregon takes precedence of all others, and owing to its free growth, freedom from disease, and wonderful adaptability to a wide range of soils, subsoils, and elevations, has proved to be a valuable asset to our limited number of commercial timber trees. Its timber, when sylviculturally grown and matured, is of excellent quality, takes on a beautiful polish, and is especially suited for house construction. Menzies Fir takes the second place, and resembles the Douglas Fir in its adaptability to soils, &c. It braves the elements on the lower slopes of the Grampian Hills, where Spruce and Scots Fir refuse to make headway; but its timber is much inferior to that of the Douglas. Amongst the varieties of the Silver Fir, the following all do well here, and form clean, cylindrical boles: *Abies nobilis*, *A. magnifica*, *A. concolor*, and *A. grandis*, and, like the exotic Spruces, yield large quantities of fertile seed.

The commercial woods cover an area of nearly 4,000 acres, and are composed chiefly of Larch, Scots Pine, and Spruce, while Douglas Fir and Menzies Fir have been freely planted in the younger plantations. Hardwoods have not been planted extensively, and the result attained generally is not encouraging. With the exception of the plantations in the Dee Valley, the soil here is composed of light sandy loam, resting on gravel; all the remainder of the estate rests on gneiss, the soil alternating from a rather light loam on the low ground to a stiff boulder clay at higher elevations. Larch, Spruce, Douglas, and Menzies Fir all do well on the cool bottom, but Scots Fir, although making rapid growth in its younger stages, does not continue its growth, and may be said to have attained its maximum of value by the time it has reached its seventieth year. Clear felling is adopted in all mature woods, but in several of the immature woods, which have become broken in canopy through various causes, a further thinning out of the weaker stems was considered advisable, and the ground afterwards filled up with Douglas Fir, forming a two-storeyed combination. The parts at first operated on were under Larch and hardwoods, and these have turned out successfully. It is now intended to extend the practice to the Scots Fir plantations of the same class. Owing to the prevalence of Pine-weevil it is necessary to allow the old roots to decay, and an interval of not less than four years must elapse before the ground can safely be restocked.

Aberdeen is the chief market for soft woods, and there is a steady demand for all classes of timber. The box-making, fishing, granite and other industries absorb almost the entire output of wood in the north-eastern counties, and wood merchants experience an increasing difficulty in procuring Scots Fir of sufficient size for the requirements of their trade. Prices generally range as follows where the wood is within reasonable distance of a railway, and the trees sold standing: Larch, 10d. to 1s. 2d.; Scots Fir, 6d. to 8d.; and Spruce and Silver Fir, 5d. and 6d. per cubic foot.

Pine woods on this estate have proved a remunerative investment, and recent sales show a net return in ground rental far in excess of the actual returns from cultivated lands in their immediate vicinity."

The delegates were particularly interested in the beautiful golden-tipped variety of the Sequoia (Wel-

lingtonia) gigantea, and also in the somewhat rare tree *Athrotaxis laxiflora*, a relation of the Yew family. Mr. Crozier stated that on one tree he had counted no fewer than 16,000 cones. The Weeping Beech-trees were greatly admired, as were also the *Nobilis* and President (?) Firs. Much admired also were the many fine specimens of *Thuja gigantea*.

A visit was paid to the sawmill on the estate, where operations were seen in progress in cutting large planks of the Douglas Fir.

Thereafter the party skirted a plantation of Japanese Larch and another of the Douglas Fir five to six years old, several of the trees in the latter showing 3 to 4 feet of growth for a single year. The trees are all reared from seeds at the nursery on the estate, which was also visited. It was explained that three to four generations of the Douglas Fir had been reared on the estate, so that it was now thoroughly acclimatised. The nursery was acknowledged to be one of the finest which the practical men had ever seen, admirably sloped, drained, and arranged, and presenting a very neat appearance.

At the luncheon which was most courteously provided for the members, Mr. McGibbon, head forester to Lord Fitzwilliam, Rotherham, accurately voiced the feeling of those present when he said that that day they had been taken through some of the finest woods he had ever seen, whether looked at from an ornamental or a timber point of view.

BALMORAL CASTLE.

The second excursion was to his Majesty's Highland home, Balmoral Castle, and the adjoining forests. There was another large turn-out, over 100 leaving with the special train that took the party from Aberdeen to Ballater, the terminus of the Deeside Line. The railway journey commenced in beautifully bright weather, and the scenery on the river, the hills, and along the valley was much admired, and provided a great attraction for the members of the Society. On arriving at Ballater coaches were in waiting, and they were met by Mr. John Michie, than whom no better guide, philosopher, and friend could have been found for such a party, seeing that he was head forester at Balmoral for many years previous to his appointment as H.M. factor on the Royal Deeside estates. During the drive to Balmoral deep fringes of English Oak on the left and the Birches stretching away into the hills on the right were admired and commented upon. As the char-a-bancs rose higher and higher up the hilly highway, glimpses of the silvery Dee were obtained through the pretty foliage. By-and-by, Lochnagar came into full view, and the admiration by the English visitors of the hills was most marked. The cloud-capped heights were, on a nearer view, seen to have retained snow in their rocky clefts. Surprise was expressed at the great altitude at which Scots Fir grew and flourished. The Junipers, which grow in abundance on the barest of the roadside slopes, were noticeable, in the view of the arboriculturists, from the fact that they had apparently grown from seeds strewn by birds.

Crossing the Dee by the substantial bridge on the south road, the party drove up the avenue to Balmoral Castle. In this avenue there are many fine examples of ornamental trees, several of them planted by members of the Royal Family and other distinguished personages to mark special occasions. One tree, which thrives well in the policies, and is seen to great advantage in the avenue and elsewhere is the *Abies nobilis*, a very effective Fir from a sylvicultural point of view.

Alighting in front of the Castle the party, under the leadership of Mr. Michie, proceeded to inspect several of the trees on the lawns to the west, which include many planted by members of the Royal Family from Queen Victoria downwards. All those trees, as also a number of others planted on commemorative occasions, show vigorous growth. Going down the stone Pine avenue, the company visited the stables and coach-houses, then returned across the lawn to the hothouses, where Mr. Troup, the head gardener, has at present an excellent display of blossom, Begonias and Pelargoniums being prominent, while the flower-beds present a bright appearance of harmonious colour. Proceeding, the party, led by Mr. Michie, commenced the ascent of Craig Gowan, at the top of which there have been several noted bonfires to mark important rejoicings in the history of the nation. The footpath leading along the slope of this hill is known as Michie's Walk, a compliment to the factor who laid it out during a portion of the twenty-one years he occupied the important position of head forester on the estate. This walk was a great favourite with Queen Victoria, who frequently passed along it in her pony or donkey chaise, and from which she loved to look on the beautiful scene in the valley. The great beauty of the walk is the way in which nature has been left undisturbed so far as the undergrowth is concerned. The Juniper grows luxuriantly; there are numerous Oaks, Ferns, and Cranberries; Blackberries and Cranberries are seen in patches amongst the mountain Heather, and the mountain Pine, Spruce, Fir, and Birch-trees present a charming sight.

The party once more entered the conveyances and drove through the famous forest of Garmadie and

Ballochbuie, where the *Pinus montana* (? *silverstris*) is seen to so much advantage, the trees, with their tall, stately trunks, being the finest which many of the members of the Society had ever seen. Leaving the conveyances near the Gardwail Burn, the delegates walked by the side of the picturesque mountain torrent amidst typical Highland scenery to the Garawalt Falls, where the stream leaps over the rocks and rushes along with great force. Crossing the bridge to the other side of the stream, they reached the higher ground, from which a splendid view of the valley and of Balmoral Castle is obtained. Photographs were taken of several tall, thick, stately mountain Pines at this place, while other members found interest in inspecting the clumps of Cranberries, Blaeberrys, Crowberries, and mountain Heather. After a walk through the wood to the road, the party re-entered the conveyances and drove to Braemar, the Spruce and Larch-trees by the roadside being greatly admired. At Braemar luncheon was served in the Invercauld Arms and Fife Arms Hotels.

HADDO HOUSE.

Once again favoured with the most charming weather, Friday was devoted to inspecting the woods and policies of Haddo House, the Earl of Aberdeen's principal Scottish seat. Here much was found to admire; but of course in this bleak district—bleak in comparison with Deeside—the specimens of trees seen were not to be compared to the fine woods growing in the valley of the Dee. An item of interest imparted to the company by Mr. Smith, Lord Aberdeen's factor, to the effect that during the great storms of 1894 and 1900 some 160,000 trees were blown down on the Haddo House estate, created some surprise. The party were hospitably received.

The members were received cordially wherever they went, and expressed their great delight with all they saw during their stay in Aberdeenshire.

We understand the Scottish Arboricultural Society are to make Aberdeen their chief rendezvous during their next year's annual excursion.

READING HORTICULTURAL.

AUGUST 24.—In brilliant weather the annual summer exhibition of this Society was held in the Forbury Gardens, the keeping of which reflects great credit on Mr. G. Phippen, turf, borders, and beds being in the best condition. Unfortunately, owing to the restricted size of the patches of turf, a number of medium-sized tents have to be employed, which decreases the general effect. The exhibits were generally good, and the arrangements made by Mr. W. L. Walker (the Secretary), and Mr. J. Woodford (the Superintendent), excellent. The fruit and vegetables occupied a long, narrow tent placed over one of the main walks.

There were two classes for groups of plants. In the Open division Mr. D. H. EVANS, Shooter's Hill, Pangbourne (gr., Mr. Tugwood), was 1st with a tasteful arrangement of plants of good quality; and Mr. W. POLE ROUTH, Oakfield, Reading, 2nd.

In the Amateurs' division the Misses CRISP, Preston, Reading (gr., Mr. Durrant), were 1st; and Mr. W. J. BRAIN, Reading (gr., Mr. Froad), 2nd.

Mr. J. B. TAYLOR, Sherfield Manor, Basingstoke (gr., Mr. Wasley), was 1st in the Open division with four exotic Ferns, having fine examples of *Davallia filix-foemina* and *polyantha*, *Adiantum cardiolobum*, and *Woodwardia radicans*; Mr. H. WELCH-THORNTON, Beaurepaire Park, Basingstoke (gr., Mr. Leith), was 2nd, also with good specimens. In the Amateurs' division for the same number, Mr. R. MOSS, Blackwater (gr., Mr. Hunt), was 1st; and Mr. J. O. TAYLOR, Cravenhurst, Reading (gr., Mr. Ellis), 2nd.

Mr. J. B. TAYLOR had the best four specimen stove and greenhouse plants; Mr. H. WELCH, Thornton, was 2nd.

Some fine specimen *Fuchsias*, admirably grown and flowered, came from Mr. J. FREELANDER, White Knights Park (gr., Mr. Bright). Of dark varieties, he had Brilliant, Wiltshire Giant, and Elegance; light varieties, Mrs. Bright, Amy Lye, and White Queen—a very good selection. Mr. R. HEWETT, Reading (gr., Mr. Alexander), was 2nd. In the Amateurs' division, the best three were from Mrs. BLAND-GARLAND, Lower Redlands (gr., Mr. Wilson).

Some good double zonal Pelargoniums were shown, also Begonias.

Cut flowers were remarkably good. Mr. JOHN WALKER, Thane, won the 1st prize for twenty-four Dahlias, showing good blooms; Mr. J. R. TRANTER, Henley, was 2nd.

Messrs. J. CHEAL & SONS, Crawley, won the 1st prize with twelve blooms of fancy Dahlias, and also for twelve bunches of single Dahlias; Mr. J. WALKER was 2nd, both showing in excellent character.

For twelve Cactus Dahlias, three blooms of each, Mr. J. WALKER was 1st with very good blooms; Mr. L. McKENNA, Honeys, Twyford (gr., Mr. Nye), was a close 2nd; Mr. W. BAXTER, nurseryman, Woking, being 3rd. With twelve bunches of Pompons, Mr. C. TURNER came 1st with model blooms; Mr. J. WALKER was 2nd, and Messrs. J. CHEAL & SONS, 3rd.

With eighteen blooms of Roses, Messrs. J. JEFFERIES & SONS, Cirencester, came 1st, and Mr. GEO. PRINCE, Longworth, 2nd, both with good late-summer flowers. Mr. TRANTER, Henley, had the best twelve blooms. Mr. JOHN WALKER took the 1st prize with twelve spikes of Gladioli; Mr. W. C. BULL, Ramsgate, was 2nd. The best nine vases of Sweet Peas came from Mr. L. McKENNA.

In the Amateurs' division cut flowers were generally well exhibited: Mr. J. B. FORTESCUE, Drogheda (gr., Mr. Page), was 1st with six Roses, and Mr. D. H. EVANS, 2nd. Mr. J. B. TAYLOR came 1st with six pretty vases of cut flowers; Mrs. P. HAMRO, Sedgell (gr., Mr. Smith), was 2nd. Mrs. HAMRO was 1st with six blooms of show Dahlias; Mr. H. A. NEEDS, Woking, with six Cactus varieties; Mr. R. MOSS with six bunches of single, and Mr. C. WALKER, Reading, with six bunches of Pompon varieties. Sweet Peas and Gladioli were also shown.

Mr. L. McKENNA came 1st with six vases of Cactus Dahlias, very nicely staged; Mr. H. A. NEEDS won the 1st prize with twelve excellent blooms of Cactus Dahlias on boards. The prizes in the two foregoing classes were offered by Messrs. Cheal. Mr. H. W. DUNLOP, Earley (gr., Mr. Giles), was a close 2nd.

Messrs. R. H. BATH, Ltd., Wisbech, offered special prizes for twelve bunches of Cactus Dahlias; Mr. J. WALTER was 1st with good blooms.

FRUIT AND VEGETABLES.—The best six dishes of fruit came from Mr. J. B. TAYLOR, Mr. WASLEY staging good Muscat of Alexandria and Madresfield Court Grapes, Barrington Peaches, Pineapple Nectarine, Plums and Melons, 2nd. Mr. C. T. D. CREWS, Billingbear Park (gr., Mr. Ashman), who had Black Hamburgh and White Muscat Grapes, Nectarines, Apricots, Figs, and Melon.

Mr. ASHMAN was 1st with three excellent bunches of Black Hamburgh Grapes. The Earl of CARNARVON (gr., Mr. Pope) was 2nd. With two bunches of any other black variety, Mr. WASLEY was 1st with Madresfield Court; Colonel BASKERVILLE, Crouslay Park (gr., Mr. Tubb), was 2nd with Alicante. With three bunches of white Grapes, Mr. C. E. KEYSER, Aldermaston Court (gr., Mr. Galt), was 1st; and Mr. TUBB 2nd, both with Muscat of Alexandria.

Some good Peaches were shown by Mr. G. A. INGLEFIELD, Andover, who took the 1st prize with six fruits. Mr. A. F. WALTER, Bearwood (gr., Mr. Barnes), was 1st with the same number of Nectarines.

Mr. BOWERMAN, The Gardens, Hackwood Park, was 1st with three dishes of Plums, having Oullin's Golden Gage, Imperial, and Washington; Mr. WASLEY was 2nd, with Angelina Burdett in the place of Imperial.

Mr. WILL TAYLER, The Nurseries, Hampton, took the 1st prize with three dishes of dessert Apples.

Mr. BOWERMAN was 1st with three dishes of culinary Apples.

Mr. W. B. MONCK, Coley Park (gr., Mr. Booker), was 1st with three dishes of dessert Pears. Melons were numerous. Cucumbers and Tomatoes were in good character.

The special prizes for vegetables offered by Messrs. Sutton & Sons and Messrs. J. K. King & Sons brought excellent competitions and very fine vegetables, and in all the dozen or so classes very good quality prevailed.

Several miscellaneous exhibits not for competition were staged. Foremost was a series of illustrations in floral decorations from Mrs. PHIPPEN, Court Florist, Reading, all of the best quality; Gladioli from Mr. W. C. BULL, of Ramsgate; Roses from Mr. GEO. PRINCE, Longworth; plants, &c., from Mr. HOLDEN, Church Road, Ereleigh; and Roses from Mr. W. TAYLER, Hampton.

DUMFRIESSHIRE AND GALLOWAY HORTICULTURAL.

AUGUST 26, 27.—This Society held its annual show in large marquees at Cresswell Park, Dumfries, on the above dates. The show was the largest and best ever held in the South of Scotland, surpassing in extent that of the Jubilee of the Society, hitherto considered the finest held since the inception of the Society in 1862. A feature of the show was the non-competitive exhibits of the nurserymen, who showed in unusual numbers. Mention may be made of the exhibit of Messrs. Dobbie & Co., Rothesay, which was much admired; that of Messrs. James Service & Sons, Dumfries; that of Messrs. Little & Ballantyne, Carlisle; and those of Messrs. T. Kennedy & Co., Dumfries; Mr. James Kennedy, Dumfries; and Fotheringham & King, Dumfries; while Roses were admirably exhibited by Messrs. Palmer & Son, Ltd., Annan, and Messrs. T. Smith & Sons, Stranraer. Three tables entered for the Burgh of Dumfries Challenge Cup, with a money prize added, and the Trophy was ultimately awarded to Messrs. James Service & Sons for a tastefully-arranged table of good plants. Mr. J. M. Stewart, Mollance, was 2nd with a skilfully arranged table, which some preferred to that of Messrs. Service.

The class for a circular group of plants brought out two competitors, Mr. W. Muir, gr. to Mr. Jas. Davidson, Summerville, being 1st, closely followed by Mr. C. Melver, gr. to Mrs. Young, Liddellullen.

The class for table decorations created much interest, seven competitors showing some charming decorations. The 1st prize was won by Miss Pulford, Netherwood Bank; the 2nd by Miss L. Rutherford, Crichton House.

The various florists' classes were well contested, the leading winners being Mr. Jas. Kerr, Mr. W. Byers, W. Middleton & Son, and Mr. J. Henderson, Elmbank.

Roses were good for the season, Messrs. Palmer & Son being 1st for twenty-four in the open class; Mr. K. Mackenzie, Conneath, being 1st for Teas.

Herbaceous flowers were excellent, Messrs. T. Kennedy & Co., W. Middleton & Son, and Mr. K. Mackenzie, being among the leading prize-winners.

Pot plants were the weakest section in the show, Mr. J. M. Stewart being the leading winner. Cut flowers were remarkably good in the gardeners' classes, and this, formerly one of the weakest sections, was really highly creditable. Sweet Peas were a strong class, Mr. J. Duff, gr. to Col. Gordon, Threave, being 1st, and the other classes were well competed and the prizes well distributed. Mr. J. M. Stewart, Mr. J. Duff, Mr. J. Austin, Hardgate; Mr. R. A. Austin, Mainsridge; Mr. R. A. Grigor, Dalswinton; Mr. D. Whitelaw, Lochbarbriggs, and others being among the prize-winners.

FRUIT was considerably better represented than last year, and Grapes were well shown. The 1st prizes in these were won by Mr. J. M. Stewart, Mr. J. Henderson, Mr. W. Thomson, Cally; Mr. J. Duff, and Mr. R. A. Grigor. Mr. J. M. Stewart led in the Apple and Pear classes. Peaches were capital, Mr. W. Currie, Drumlyer, leading with these.

The competition with VEGETABLES was very keen, some classes having as many as fifteen entries. Leading exhibitors in these were Mr. J. Duff (who had the best collection), Mr. K. Mackenzie, Mr. R. Young, Gracefield; Mr. C. Melver, Mr. R. A. Grigor, Mr. W. Dickson, Mr. J. Henderson, Mr. J. M. Stewart, Mr. J. Duff, Mr. R. Stobo, Marchmont, and Mr. E. Rutherford, Glenlair.

It is to be regretted that the attendance of the public was not encouraging to the management, nor commensurate with the fine display of horticultural produce.

GARDENERS' DEBATING SOCIETIES.

READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.—The members of the above Society recently held two enjoyable outings. The first was to Tynley Hall, Winchfield, by kind permission of Mr. and Mrs. Lionel Phillips. The party journeyed from Reading by brakes, and on arrival were received by Mr. Foster, the head gardener. After luncheon the members inspected the glass-houses, twenty in all, the flower-gardens, the pleasure-grounds, Lily-ponds, and the "Italian" garden. The fruit-trees in pots claimed special attention. The whole of the buildings connected with the garden have been erected on the most approved style regardless of expense. A vote of thanks proposed by the President to Mr. and Mrs. Phillips for their kindness was unanimously carried. The second visit was to Wokefield Park, the residence of Mr. and Mrs. Alfred Palmer, who conducted the party to the "terrace" garden, the greenhouses, the corridor, vineries, and Peach-houses, which were all in excellent condition. The feelings of the members were suitably expressed by Mr. Arthur W. Sutton in proposing a hearty vote of thanks to Mr. and Mrs. Palmer for their kindness.

CROYDON AND DISTRICT HORTICULTURAL.—On Wednesday, August 21, the members visited the gardens of Mr. J. P. Morgan, Dover House, Roehampton. The visitors were taken through the range of greenhouses, and several features were noticed and commented on. The principal interest was centred on the Carnations out of doors and in frames. In the afternoon a representative eleven from the society played a friendly cricket match with an eleven from the garden staff, the visitors scoring 39 runs against the home team's 116 in the first innings. Tea was served in the cricket field.

BRISTOL AND DISTRICT GARDENERS'.—The monthly meeting was held at St. John's Rooms on the 25th ult. Mr. P. Garnish in the chair. Mr. Sease, gardener to Henry Derham, Esq., Sneyd Park, gave a lecture on "Tomatoes." He described the best method of cultivation, including the mixing of soils, the maintenance of a suitable atmosphere, feeding, &c. The common diseases were also discussed. A discussion followed, during which the lecturer was asked several questions, all of which were answered. Prizes for a dish of Tomatoes were awarded to Mr. COLMAN (gr., Mr. Spry), Mr. A. BAKER (gr., Mr. Orchard), and Mr. FRANCIS TAGART (gr., Mr. Binfield).

REIGATE, REDHILL, AND DISTRICT GARDENERS'.—The annual outing took place recently, the place selected being Messrs. Sutton & Sons' nursery at Reading. About eighty members availed themselves of the opportunity of looking over this world-famed seed establishment. On arriving at Reading about 2 p.m. they were met by Messrs. Cox and Dean on behalf of Messrs. Sutton & Sons. The visitors were conducted to the trial grounds and glass department, where a very careful inspection was made, after which the whole party were entertained at a meat tea provided by Messrs. Sutton.

SCHEDULES RECEIVED.

NORTH MIDDLESEX DAHLIA AND HORTICULTURAL SOCIETY'S Annual Exhibition to be held in the Alexandra Palace, on Wednesday and Thursday, September 7 and 8, 1904.

REMARKS.—The prizes for Plums are now much lower, the average prices per sieve being for Downshire 1s. 9s. to 2s.; Gages, 2s. 6d. to 3s. 6d.; Victorias, 1s. 3d. to 2s.; Diamonds, 1s. 6d. to 1s. 9d. The best cooking Apples realise 2s. 6d. per bushel; Quarrendens and Worcester Pearmain 2s. per sieve, or 1s. per bushel. Blackberries are arriving in the market in quantity; average price, 2d. per lb.; "William" Pears, 2s. to 2s. 6d. per sieve.

Hessle, 2s. 6d. to 3s. per bushel. Peas are practically over. Out-door Mushrooms, 3d., 4d., or 5d. per lb., according to sample; Corn-cobs, 1s. per doz.; Grape fruits, 18s. per case. The Oranges quoted above are from Jamaica.

POTATOS.

Various, home-grown, 65s. to 90s. per ton, John Bath, 32 & 34, Wellington Street, Covent Garden.

COVENT GARDEN FLOWER MARKET.

THE market presents a very desolate appearance, and persons accustomed to visiting it only in the busy spring season would be surprised to find so great a difference. Chrysanthemums are the most important feature, of which good flowering plants are now coming in. The best white variety, Lady Fitzwigram, in 6in. pots, with eight or nine good flowers on each, make 24s. per dozen. The same grower (Mr. H. Billingshurst, of South Norwood) also has the Madame Masse varieties in white, pink, yellow, and bronze. The plants, dwarf and well-flowered, have been grown in pots, and fetch from 12s. to 18s. per dozen. Asters are very prominent and remarkably good this season. Solanums do not sell well, although covered with ripe berries; the plants are rather small. A few good white Marguerites are still seen, and this morning I noticed quite a lot of excellent plants of Zinnia elegans flore pleno. Campanula isophylla alba is plentiful, and some very good plants of Campanula Balcanica are present, but this is prettier as a foliage plant early in the summer, before it begins to flower. Pelargoniums of all sections are now past, but we expect some good Zonals again later on. Lilies are again very abundant, especially L. laucofolium, rubrum, and album. There are a few good Auratums. Longiflorums are also good. The main supply of Verbenas is now over, but there are still a few good plants of the variety Miss Willmott, and I noted a few good bushy well-flowered plants of yellow Calceolarias rather out of season, but very good. Most foliage plants are plentiful. Aralia Sieboldi is very good in 4s's and 3s's. The imported plants of Dracaena Brantii are good. The variegated Aspidistras maintain a good price. Ficus elastica is much cheaper than it was formerly. Palms have also a tendency to fall in price. Codieums (Crotons) in well-coloured plants may be had at low prices. In Ferns there are now some nice collections of choice sorts in 6-size pots, which include such varieties as Adiantum trapeziforme, Gymnogramma chrysophylla, Pteris tricolor, Asplenium lucidum, and other good things, which are sold at about 1s. per doz. Asplenium nidus is very fine in all sizes; good Adiantums are plentiful. Of Montbretias, Rayon d'Or is a good yellow, and Germania the best of the darker shades. Roses are now on the wane, but some fairly good blooms are seen; Perle des Jardins, C. Mermet, Bridesmaid, Madame A. Chateau, Niphotos, Sunrise, and of the plunks from the open, Mrs. J. Laing and La France; General Jacqueminot also continue, but the flowers are small. The autumn Cattleyas are now coming in, but the trade for them is very uncertain. Stephanotis, Gardenias, and Eucharis are good, also Lily of the Valley, Tuberoses, and Lilies laucofolium album and roseum.

CUT FLOWERS.

Chrysanthemums increase in quantity. The yellow Madame Desgranges is very good; of whites, Lady Fitzwigram is the best. Goacher's Crimson quite super-seded Harvest Home; Nellie Blake is another good red variety. Asters are seen in large quantities, but large blooms are not over plentiful. The best market varieties are those of the "Comet" section, the white being particularly appreciated. Gaillardias are plentiful, also Calliopis grandiflora (or C. lanceolata), which is one of the prettiest yellow flowers for light floral arrangements. Yellow Marguerites (English grown) are very good, although in excess of the demand. A few Sweet Peas are still seen. Dahlias are prominent. Carnations are fairly plentiful, but the blooms are not quite so good as they were a little earlier in the season. Statice Gmelini and S. latifolia are very plentiful; also Gypsophila paniculata; G. elegans, the annual, is still marketed in large quantities. Iceland Poppies still hold out. All kinds of foliage and cut Fern continue plentiful. A. H., Covent Garden, August 27.

FRUITS AND VEGETABLES.

GLASGOW, August 31.—The following are the averages of the prices during the past week:—Gages, 4s. to 6s. per half sieve; Plums, 4s. 6d. do.; common, 1s. 6d. to 2s. 6d.; Melons, 24s. 5s. 6d. to 6s. 6d. per case; do., 36s. 6s. 6d. to 7s. 6d. do.; Lemons, 8s. to 10s. per barrel; Grapes, Almeria, 11s. to 17s. per barrel; do., home, 9d. to 1s. per lb.; Apples, American, 12s. to 16s. per barrel; English do., 8s. to 12s. per cwt.; Bananas, 5s. 6d. to 11s. per bunch; Currants, black, 4d. and 6d. per lb.; do., red, 3d. to 4d. do.; Tomatoes, 4d. to 5d. per lb. In Scotch fruit, Greengages made 14s. to 16s. per cwt.; Blue Plums, 7s. do.; Gisborne do., 5s. 6d., and Cherry do., 8s. and 9s. do.; Pears made 2s. to 2s. 6d. per sieve; Apples, 8s. per hamper, and 1s. 9d. to 2s. per sieve, also 10s. per cask; Shallots, 8s. per cwt.

LIVERPOOL, August 31.—Wholesale Vegetable Market (North Hay).—The following are the averages of the current prices during the past week—prices varying according to supply:—Vegetables: Potatoes, per cwt., Early Regents, 3s. 8d. to 5s. 4d.; Kidneys, 3s. to 4s. 3d.; British Queen, 2s. 9d. to 3s. 6d.; Conquest, 2s. 8d.

to 3s. 4d.; Turnips, 6d. to 8d. per dozen bunches; Swedes, 1s. 6d. to 2s. per cwt.; Carrots, 6d. to 10d. per dozen bunches; Cucumbers, 1s. 6d. to 2s. per dozen; Onions, foreign, 3s. 6d. to 4s. 1d. per bag; Parsley, 6d. to 8d. per dozen bunches; Lettuces, 6d. to 10d. per dozen; Cauliflowers, 10d. to 2s. per dozen; Cabbages, 6d. to 9d. do.; Celery, 1s. 6d. to 2s. do.; Peas, 6d. to 7s. 6d. per hamper; Beans, 2s. 6d. to 3s. do.; do., Kidney, 8d. to 10d. per peck. Fruit: Melons, Valencia, 24s. 3s. 9d. to 4s. 3d.; 36s. 4s. 6d. to 5s.; Grapes, black Lisbons, 5s. to 6s. per box; Almerias, 3s. to 5s. 6d. per barrel; superior do., 6s. 6d. to 9s. do.; a few lots at 12s. to 13s.; Oranges, Brazilian, 4s. 6d. to 9s. per box; Naples, 9s. to 12s.; Tomatoes, Lisbon, 4s. 3d. to 5s. 6d. per box; Apples, Lisbon, 2s. 6d. to 4s. per box; do. Oporto, 1s. to 5s. 9d. do.; Lemons, Palermo, 5s. to 7s. per case, and 2s. 6d. to 3s. 6d. per box. St. Johns.—Potatoes, 10d. to 1s. per peck; Cucumbers, 3d. to 6d. each; Filberts, 8d. per lb.; Apricots, 1s. per dozen; Grapes, English, 1s. 6d. to 2s. 6d. per lb.; do., foreign, 6d. to 8d. do.; Pine-apples, foreign, 3s. to 5s. each; Mushrooms, 8d. to 1s. per lb. Birkenhead.—Potatoes, 10d. to 1s. 2d. per peck; Cucumbers, 1s. to 3s. per dozen; Filberts, 6d. to 8d. per lb.; Gooseberries, 3d. do.; Peas, 1s. to 1s. 4d. per peck; Grapes, English, 3d. to 2s. per lb.; do., foreign, 3d. to 6d. do.; Tomatoes, English, 2d. to 6d. do.; Mushrooms, 8d. to 1s. do.

THE WEATHER.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Wisley, Surrey. Height above sea-level 150 feet. The following are the "mean" readings for the week ending August 27, 1904.

1904.		TEMPERATURE OF THE AIR.				TEMPERATURE ON GRASS.		TEMPERATURE OF THE SOIL AT 9 A.M.			RAINFALL.	SUNSHINE.

		58	55	67	47	41	deg.	deg.	deg.			
		60	61	60	0.09	6	25					

Remarks.—There was a slight thunderstorm on August 22.

GENERAL OBSERVATIONS.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending August 27, is furnished from the Meteorological Office:—

"The weather during this week was unsettled very generally, rain falling on several days, and thunderstorms occurring in many localities over the eastern and northern counties of England between the 21st and 23rd, and at a few north-western stations on the 24th.

"The temperature was considerably below the mean, the deficit amounting to between 3° or 4° in most districts, and to as many as 5° in the Midland Counties and England, N.W. The highest of the maxima were recorded on the 27th, and ranged from 75° in England, S., and 73° in the Midland Counties and England, S.W., to 65° in Scotland, W. The lowest of the minima, which were nearly all registered on the 25th, were as low as 32° in Scotland, N., and 33° in Scotland, E. (at Lairg and Nairn), while elsewhere they varied from 36° in England, S., the Midland Counties, and England, N.W., to 40° in England, E. and S.W., and Ireland, N., and to 50° in the Channel Islands.

"The rainfall was more than the mean over England, but rather less in Ireland, Scotland, and the Channel Islands.

"The bright sunshine was deficient in all parts of the Kingdom, except Scotland, N., and England, E. and S. The percentage of the possible duration ranged from 47 and 45 respectively in England, S. and E., to 29 in England, N.E., 27 in Ireland, N., 23 in England, N.W., and to 21 in Scotland, W."

THE WEATHER IN WEST HERTS.

Thirteen consecutive cold nights.—The recent cold period, which came to an end on August 25, lasted fifteen days. During that time there did not occur a single unseasonably warm day, and but three warm nights, while on four nights the thermometer exposed on the lawn indicated readings within four degrees of the freezing-point. The last three days, on the other hand, have been very warm, the highest reading in the thermometer screen on each of them rising to or above 77°. The nights however still remain cold for the time of year, in fact, the last thirteen nights have all been more or less unseasonably cold. Both at 1 foot and 2 feet deep the ground is now slightly warmer than is seasonable. Some rain fell on two days during the week, but the

amount deposited on each of the days was only sufficient to wet the surface of the ground. No measurable quantity of rain-water has now come through the bare soil percolation gauge for more than a week. The sun shone on an average for eight and a half hours a day, or for two and a half hours a day in excess of the mean daily duration for August. Calms and light airs again prevailed, the direction of these light airs being very variable. The mean amount of moisture in the air at 3 p.m. was about six per cent. below a seasonable quantity. E. M., Berkhamstead, August 31, 1904.

GARDENING APPOINTMENTS.

MR. W. H. VEE, for the past thirteen years Gardener to W. H. STEWART, Esq., Milnthorpe House, Sandil, Wakefield, as Gardener to His Honour Judge CADREAU, Rhydding House, Aekworth, Pontefract.

MR. T. ROBERTS, for the past six years General Foreman at The Firs, Malvern, Worcestershire, formerly Foreman at Wrotham Park, Barnet, Herts, as Gardener to G. L. LOPES, Esq., Northleigh, Bradford-on-Avon, Wilts.

MR. M. W. COOPER, for the past five years General Foreman in the Gardens, Worsley Hall, Manchester, previously General Foreman at Luton Hoo, as Gardener to the Earl of ELLESMERE, Stetchworth Park, Newmarket.

MR. JOHN TURTON, Stockeld Park Gardens, Wetherby, late of Becca Hall, Aberford, has been appointed Gardener to Col. GASCOIGNE, of Lotherton Park, Aberford. His duties to date from the first week in September.

MR. F. MILSON, Gardener to F. G. GLEDSTANES, Esq., of Old Manor House, Gunnersbury Lane, W., as Gardener to the same Gentleman at Berry Hill, Taplow.

MR. J. TUCKER, for upwards of twelve years Gardener at the City Asylum, Birmingham, has been appointed by the same Committee to lay out the Grounds of their New Asylum at Hollymoor, near Birmingham.

MR. A. PARRY, late of Anglem, Cathedral Road, Cardiff, as Gardener to Col. J. A. BRADNEY, Taly-Coed Court, near Monmouth.

MR. THOMAS IRELAND, late Head Gardener, Bank Dale, Bromborough, has been appointed Gardener to Lady CHELMSIDE, Newstead Abbey, Notts, and entered on his duties August 10.

MR. F. BENNETT, for the past six years Gardener to Colonel BAIRD, Ewing House, Newmarket, has been appointed Gardener to J. DE PASS, Esq., Middleton Hall, Lynn, Norfolk, the appointment dating from July 28.

MR. A. SMIT, for the past four and a half years Gardener to Col. P. T. H. TAYLOR, Newton Priory, Tetbury, as Gardener to JAMES V. GODSELL, Esq., Stratford Court, Stroud.

MR. S. CARON, for over three years as Foreman at Elvetham Park Gardens, Windfield, Hants, has been appointed Gardener to Lieut.-Gen. the Hon. SOMERSET GOUCH CALTHORPE, at Woodlands Vale, Ryde, Isle of Wight. Commences duties September 2.

MR. A. J. PITMAN, late Gardener to F. G. VINCENT, Esq., The Pines, Beckenham, as Gardener to F. WALTERS, Esq., Vodin, Pyrford, Woking, Surrey.

MR. G. ALLEN, for four years Gardener at Hasebeck Hall, Northampton, as Gardener to J. A. LEVY, Esq., The Mount, Maidenhead.

MR. HENRY GRAY, for the last ten months Gardener to the late MAJOR H. FOSS, Esq., Woldingham, Surrey, as Gardener to S. BOUTLER, Esq., Garston Park, Godstone, Surrey.

MR. WILLIAM EARR, for the past six and a half years Gardener at Woodlands Vale, Ryde, as Gardener to Col. J. R. P. GOODDEN, Compton House, Sherborne, Dorset.

MR. A. WEATHER, late Gardener at Crosley Cote, North-lyerton, and Smelt House, Howden-le-Wear, Durham, as Gardener to Mrs. WORMALD, Acomb Hall, Acomb, York.

ENQUIRIES.

CEREUS TRIANGULARIS.—1. At what age does *Cereus triangularis* fruit? 2. Is the fruit grown in England eatable? 3. Would it pay for market growers (Channel Islands) to grow the plant for producing fruit? [More than doubtful. Ed.]

WHAT are the chemicals used in the manufacture of a "brick" burnt on the Californian fruit plantations, and in what proportion are the ingredients used? I have been informed that the so-called bricks are placed individually at intervals, and that after being lighted they burn for eight hours without attention. My informant said they caused a very dense smoke, were non-injurious to trees, were fatal to all insect pests, and were a good preventive from frost. *Constant Reader*.

ANSWERS TO CORRESPONDENTS.

ASTER WILT: *J. R. P.* The wilted Asters sent exhibit no sign of the Aster worm, nor any perceptible trace of fungoid disease. The cause of their going off cannot be found in the plants themselves. We are reminded that in 1901 there were grave complaints in the United States (U.S.A., Exp. Stn. Hatch reports, 12 and 13) of the trouble of growing Asters on account of disease. The most prominent was one of obscure nature, which experiments indicated to be due to a disturbance of the assimilative functions of the plant. This has great resemblance to the case before us. Three other fungoid diseases are alluded to, but none of these can be traced in connection with the present disease. *M. C. C.*

BEGONIAS: *G. H.* Certainly the old tubers will be affected. Tobacco-water is the best remedy to apply.

BOOK: *A. H. S.* The number has been mislaid. Apply to Mr. W. T. Macoun, Botanic Gardens, Ottawa, who can probably furnish you with the address.—*J. B.* *British Trees*, by Hon. Stanhope Tolemache (Sampson Low, Marston, & Co.); good illustrations. *Trees and Shrubs for English Gardens*, by E. T. Cook (Country Life Office). *Beautiful Flowering Trees and Shrubs*, by John Weathers (Simpkin, Marshall & Co.); coloured figures.

CLUB IN BRASSICAS: *A. H., Wimbledon.* It has been proved that young Brassica plants are most susceptible to the attacks of the slime-fungus (*Plasmidiophora brassicæ*) during the first three weeks after the plants have germinated from the seeds. Every precaution should therefore be taken to ensure that the soil of the seed-beds is free from contagion. Quicklime is the best cure, and in bad cases it has been applied at the rate of 75 bushels to the acre of ground with good results. All this is described, and illustrations of "Club-root" are given, in the *Calendar of Garden Operations*, obtainable from our Publishing Department, price 7½d., post free.

CRICKET GROUND: *A. W.* The top-dressing will not be likely to kill the Clover. The only thing you can do is to apply freely nitrogenous manures that will encourage the grasses to outgrow the Clover.

CROSSING OF BEGONIAS: *J. R.* Remove all the male flowers from the plant you wish to pollinate, then take a camel's-hair brush, and with it take the pollen from a male flower of another plant, and transfer such pollen to the stigma of one of the female flowers. It is better to do this before the female flower is fully open, and to remove with a finely-pointed pair of scissors one of the flower segments. The female flowers of Begonias may be easily distinguished from the male flowers because they possess an ovary at the base of the flower. You could not do better than procure *Plant Breeding* (Bailey) from the Publisher of this journal.

CYPRESSES: *G. H. & Sons.* "Benthami," uncertain; "torulosa Corneyana," probably correct; "Knightiana," correct; "Knightiana chamaecyparissoides" is Corneyana; "Benthami arizonica," doubtful—we do not think it is arizonica; "Goveniana," correct; "torulosa majestica," correct; "ambigua" is Corneyana.

It is excessively difficult to name Cypresses owing to their great variability.

DISEASED APPLE-LEAVES: *REV. G. H. E.* The spots on the leaves appear to be those of *Septoria pyricola*, but are absolutely barren, and in the absence of sporules cannot be positively identified. It would seem, however, by the appearance, that the development of the fungus has been checked by the application of ammoniated copper carbonate, and the formation of fruit prevented. Hence the means for its dispersion have been destroyed, and although nothing more can be done this year, it is highly probable that with spraying in the spring about once a week with a diluted copper solution, the disease would not reappear, or in a very modified form. A few of the leaves exhibit the work of the larvæ of a mining leaf insect. *M. C. C.*

FERN: *C. B. C.* Your plants are badly infested with thrip and red-spider. Treat them moderately with a vaporiser, remembering that Ferns may be very easily injured by tobacco fumes.

FOUNTAINS: *J. W.* We believe there are fountains to be obtained, by the use of which the supply of water is used over and over again. Apply to the makers of garden implements, or advertise.

FRUIT-GROWING: *H. O'B.* As you have everything to learn, you could not expect a salary to begin with. You should enter at one or other of the horticultural colleges for say two years, and then get a situation in some good fruit nursery.

HARDY HERBACEOUS PLANTS: *R. B.* All the species you mention are herbaceous perennials, and the schedule does not appear to exclude them, unless it can be shown that they are not hardy. *Lobelia cardinalis* is scarcely likely to be quite hardy in your district of Cheshire, although plants have lived out of doors in a Surrey garden during the past winter.

HEDGE DAMAGED BY FIRE: *Privet Hedge.* If the plants are not killed cut them back as far as is necessary to remove all the scorched wood, and they will make fresh growth. Privet may be cut back to almost any degree, and still continue to live.

HONEYSUCKLE: *In a Maze.* The Dutch Honeysuckle is *Lonicera periclymenum helgica*. The early and late respectively we presume are but varieties of it.

LILY DISEASE: *G. W.* The soil contained plenty of fungus, which was probably the cause of your Lilies failing. You should sterilise the soil by baking it.

MAGGOTS IN PLUMS: *T. W. O.* A somewhat late brood of the larvæ of the Codlin moth, *Carpocapsa pomonella*. The Plum is rarely attacked by this insect, so also are Quince, Peach and Apricot, and still more rarely Walnuts. You should take immediate steps to destroy all the injured fruit.

MUSCAT GRAPES: *Norton.* There is no fungus present in the berries, the colouring appears to be due to the development of a black pigment, probably a reversion to a darker type.

NAMES OF FRUITS: We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, and cannot be allowed to encroach upon time required for other matters. Correspondents should never send more than six plants or fruits at a time; they should be very careful to label them properly, to give every information as to the county the fruits are grown in, and to send ripe or nearly ripe specimens which show the characters of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations.—*R. W.* Apples: 1, Duchess of Oldenburgh; 2, Mr. Gladstone. Pear, Jargonelle. Plums: 1, Overall; 2, Belgian Purple; 3, Dennison's Superb; 4, Victoria; 5, not recognized; 6, Purple Prolific.—*B.* Apples: 1, Eckinville; 2, Sweet Lading; 3, not recog-

nised; 4, Lord Suffield; 5, Lane's Prince Albert; 6, Fearn's Pippin.—*A. B.* Plum, rotten when received. Apples: 1, Astrachan; 2, Domino.—*G. H. H.* The fruits did not arrive in good condition. Peaches for despatch by post or rail should be gathered when only half ripe and quite hard, and even then should not be placed one on the top of another. You did not use nearly sufficient material between the fruits and the sides of the box. You did right in sending leaves, and from them we might have ventured to name the fruits, but think it best to see both fruit and leaves before deciding. *A. G.* When sending Grapes for identification, you should send a whole bunch. We believe the variety to be that known as Black Prince.—*B. & W.* Pear Green Chisel.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—*H. T.* 1, wild Chicory, *Cichorium Intybus*; 2, Hyacinthus (*Galtonia*) *candicans*; 3, *Vinca major*, variegated form; 4, send when in flower.—*M. B.* *Atriplex hortensis*.—*H. W.* *Lotelia syphillica*.—*J. F. S.* 1, *Olearia Haastii*, cuttings from the half-ripened wood; 2, wretched scrap, perhaps *Berberis Darwinii*; 3, *Cassinia fulvida* cuttings; 4, *Potentilla fruticosa* cuttings; 5, *Aconitum napellus*, very poisonous; divide the roots.—*G. H. S.* 1, a crested form of the common Male Fern, *Nephrodium filix-mas*; 2, *Aspidium aculeatum*; 3, *Polypodium vulgare*; 4, *Nephrodium filix-mas*; 5, *Hieracium aurantiacum*; 6, *Achillea ægyptiaca*; 7, *Kolreuteria paniculata*; 8, *Pyrus Aria latifolia*.—*Constant Reader.* *Justicia carnea*.—*J. H.* We do not undertake to name varieties of Fuchsias.—*Constant Reader.* The garden varieties of *Caladium* are so numerous, and the variation of each kind so great, that we cannot undertake to settle the point in question.—*B. W.* 1, *Clerodendron Balfourii*; 2, *Lantana hybrida*; 3, *Clerodendron fallax*; 4, *Statice latifolia*; 5, *Geenera cardinalis*; *Ruellia Portellæ*.—*G. H. B.* sends double the number. See our note under "Names of Fruits" published weekly. To compensate for the extra trouble, a small donation for the Gardeners' Orphan Fund will be acceptable. 1, *Actæa spicata*; 2, *Lycasteria formosa*; 3, *Linaria vulgaris*; 4, *Solidago virga aurea*; 5, *Veronica longifolia incarnata*; 6, *Veronica spicata*; 7, *Tanacetum vulgare*; 8, *Helianthus multiflorus*, double; 9, *Geranum*, perhaps *pratense*; 10, *Impatiens Roylei*; 11, *Polygonum*; 12, *Hypericum androsæmum*.—*D. T.* *Polygonum orientale*.

OAK LEAVES: *A. S.* Oak-spangles—a gall caused by an insect, *Neuroterus lenticularis*.

THE VOLUME FOR 1852: *H. W. R.* The only way of disposing of it is by advertisement, when some book-buyer may see the announcement.

VARIEGATED POTATO LEAVES: *H. S. S.* We think the variety Royal Gold very pleasing, but with regard to its commercial value we prefer not to express an opinion.

TOOLS: *J. B.* Consult our advertising columns.

VINES: *Mespilus.* The circumstances may be those described by your gardener. In any case he should be better able to judge the cause of the berries failing to colour than we can be, without knowing a single particular in regard to the construction of house or border, or of the cultivation that has been practised. Do as your gardener has suggested.

WATER-PEPPER: *R. E.* If by this you mean *Polygonum hydropiper*, it is a weed that probably grows in Hackney Marshes, or in that neighbourhood. We do not know where you could procure it, unless from some herbalist; but we should advise you to exercise great care in its use, or, better still, to refrain altogether.

WEIGHTS AND MEASURES: *Cymra.* A useful book with the market terms in their imperial equivalents is that published by Messrs. Geo. Newnes, Ltd., called the *Monster Table Book*, price 1d., obtainable at any bookstall.

COMMUNICATIONS RECEIVED.—*W. T. E. A. H.*—*J. S.*—*R. J. B.* & *W. D. S.*, Hereford.—*R. S. E. A.*—*W. Wells & Co.*—*W. Waller.*—*W. E. B.*—*H. Smith.*—*G. Upton.*—*A. H.*—*R. D.*—*J. Y.*—*Old Reader.*—*Income-Tax Adjustment Agency, Ltd.*—*J. H.*—*C. S. R.*—*H. W. W.*—*Rev. D. R. W.*—*S. W. N.* (accepted with thanks).—*T. B. D. & Co.*—*King's Acre Nursery Co.*

THE LARCH COLEOPHORA OR LEAF MINER

(COLEOPHORA LARICELLA, Hübner).

SEVERAL enquiries have been received this year concerning the curious diseased appearance of Larches. The young delicate needles have turned brown and died away at their tips in such numbers that the trees looked as if they had been badly scorched.

Besides this dying away at the tips some of the needle-tufts appear as quite dwarfed contorted masses, and many of the needles are bent or elbowed over. This latter appearance, the bending of the needles, is due to a great

FIG. 70.—THE LARCH COLEOPHORA

B.—Imago or adult insect.

abundance of the Larch form of the Larch and Spruce gall Aphis* (Chermes abietis laricis), which occurred early in the year, and which, judging from the number of eggs laid in the early part of June, will cause still further loss.

* Second Report Economic Zoology, p. 86, 1904, F. V. Theobald.

The first-mentioned appearances are due to one of the "case-bearing" Tineid moths, belonging to the Coleophoridae, and known as the Larch Coleophora, Larch Miner, or Larch Cigar-Case Bearer (Coleophora laricella). The only record I know in economic literature of this pest is in Schlich's *Manual of Forestry*,† where a short account and figure may be seen. Stainton‡ also records its life-history.

The larvæ of this small moth do very much damage to the trees in certain years by destroying the needles; and it is noticed that trees attacked by this pest are particu-

very much in shape; some are of pistol-like form (the Pistol Case Bearer of the Cherry, Coleophora anatipenella), the majority of a cigar-shape, as seen in the Larch pest dealt with here.

Notes regarding this insect injury have been sent me from Surrey, Hampshire, and Sussex. The insects have been very destructive around Wye and in other parts of Kent, but had escaped notice until the present season. Stainton records them at York, Manchester, Lancaster, Stockton-on-Tees, Bowness, and Renfrew. I have noticed them in North Wales, particularly one year at

B.—Shoot showing damage on the right-hand side only.
C.—The larval cases. (Half natural size.)

larly prone to be invaded with Larch canker. There seems to be no particular age of tree attacked, but I have not seen it on trees of any great size, and certainly the pest appears most often on trees about ten years old.

The Coleophoridae, or family to which this insect belongs, contains a number of small moths with narrow pointed wings with dense fringes. The larvæ are all provided with a definitely-formed case, which they construct as a rule from the material upon which they feed. These cases vary

† *Manual of Forestry*, Vol. IV., p. 311, 1895, Dr. Schlich.

‡ *Natural History, Tineina*, Vol. IV., p. 68, 1859, H. T. Stainton.

Aberglaslyn. They probably occur in most districts where the Larch grows. In continental Europe the insects have also a wide distribution, being especially common in Germany, and I have seen them in abundance in the Bernese Oberland and at Lucerne. They are also found in France and Finland.

LIFE-HISTORY AND HABITS.

The adult moth is of a uniform dusky grey, the hind wings being paler than the fore wings; both pairs are fringed with pallid hairs. The head and palpi are shiny grey; the male antennæ dusky, the female banded with fuscous and white stripes. The thorax is grey, and the abdomen dusky-grey with a dusky-yellow tuft at the apex. Legs grey,

the tarsi with traces of dusky bands. When the wings are expanded they measure about one-third of an inch, some specimens rather more, some rather less. This year the moths began to hatch out on June 9, somewhat earlier than usual.* They keep on appearing into July. When at rest, they lodge both on the needles and stem, keeping their antennæ stretched out straight in front of them. They fly chiefly at daytime, and readily move if the Larches are shaken even slightly. The female places her little roundish, yellow eggs on the needles, a single egg on each needle. Later they become grey, and in July they hatch out into small dusky-reddish larvæ. The young larvæ at once bore into the Larch-needles, and tunnel them out for about half their length, the tunnelled area being pale. These tunnelled ends shrivel up and are very conspicuous. The larva then forms a case, cutting off the mined portion, and carries it to a sound needle. At first the case is almost white, but it becomes dirty-grey, and then almost brown. It is lined with silk. The larva inside eats away a piece of the epidermis of the Larch needle and forces its head and anterior segments into the soft parenchyme. The larva leaves the case, and tunnels some way into the leaf, fixing the case on to the leaf meanwhile, and returning to it when it has finished feeding or is alarmed. The larvæ go on living in this way as long as any nourishment remains in the Larch leaves, and then they fix their cases on to the twigs and stems of the trees and remain dormant all the winter. Very often they may be found in cracks and crevices of the bark, and amongst Lichens growing on the Larches. By this time they are about one-fourth to one-half grown. When the young Larch-needles come forth in spring the larvæ carry their cases back to the needles and at once commence feeding, and cause the needles to wither away at the tips in characteristic fashion. The larvæ now grow rapidly, and the cases, originally formed out of cut-off pieces of needles, become too small; they then cut a slit up one side of the case and weave in another piece of leaf, and so increase the accommodation of the house.

The larva when mature is brown to dull reddish-brown in colour; the first segment has a black thoracic spot or shield more or less divided into two by a pallid median line; the second segment has two black spots, and all the three thoracic segments have a black spot over the legs. The anal segment has also a dark dorsal shield. When quite mature, the cases are firmly fixed to the needles or twigs, usually towards the end of May. The larvæ then cast their skin and change into long, narrow, dark-brown pupæ, about one-sixth of an inch long, covered with a few fine bristles. The moth emerges during the daytime as a rule, and soon flies about.

One brood only occurs during the year. It is said that the larvæ are very susceptible to injury from late frosts, wet and cold rainy weather, and hail; but this hardly agrees with recent observations, for the pest is more abundant this year than usual, and last year certainly was wet enough, and also the past winter.

Isolated Larch-trees are seldom much harmed; the pest is usually most destructive

where Larches are grown in dense masses together, but observations made this year show it to be harmful in mixed plantations, the trees inside the plantations being attacked just as much as those growing on the borders. According to *Schlich* the pest has been observed up to an altitude of 2,000 feet. It certainly seems most harmful where the trees are planted closely together, probably because the delicate moths get more shelter.

PREVENTIVE AND REMEDIAL MEASURES.

In plantations when this pest first makes its appearance, the infested trees should be thinned out in May and burnt. When the attack is more general, some good may be done by pruning the lower branches, where the larvæ mostly congregate. In small plantations, nurseries, and in gardens, the cases may be picked off in winter and destroyed. As far as possible mixed plantations should be put down, so that the pest does not obtain complete domination in the plantation. Suitable locality, soil, and open growth are also essential. *Fred. V. Theobald.*

THE STATICES.

DURING the past few weeks *Staticee* have been very prominent in markets. Many of the varieties are serviceable for supplying flowers for cutting. The florists like them because they are capable of lasting a long time in good condition. The slender form of *Staticee Gmelini* may be used in place of *Gypsophila*, and will keep much better. Most of the *Staticee* vary considerably. In varieties of *S. Gmelini* there are several shades of colour, but it is the soft blue and the white which are most serviceable.

Staticee Limonium, our British species, known as the "Sea Lavender," is one of the best, and of this there is quite a number of distinct varieties. *S. latifolia*, the broad-leaved species, is one of the most useful, the flowers being larger in size, and they vary from white to deep blue colour. I believe the yellow variety also belongs to this species, although I have seen it named *S. siuensis*. The blue, white, and yellow varieties are most appreciated, for the pink form is hardly decided enough in shade; yet by careful selection a pink variety worth growing for market might be obtained.

The yellow variety seen may be the Siberian species, *Staticee aurea*; but for market work names are not of much consequence, the thing is to obtain the best form of each variety, and these who can select stock while the plants are in flower have the best chance of getting what they want.

Staticee when once established give little trouble, and produce a large quantity of flowers. They succeed best in a good loamy soil that is not too heavy. Many of them may be raised from seeds, which should be sown in warmth early in the spring, and planted out after they are well established. In order to get extra strong plants, sow seeds in the autumn and keep the young plants in a light position in an intermediate-house, planting them out early in spring. Re-planting may be done at any time after they have finished flowering, but if it is intended to divide them, this should be done early in the spring. A little care is required to re-establish them after the roots have been much disturbed. When planting in heavy ground a good dressing of sea-sand will be beneficial, and if the sand is fresh from the shore all the better.

S. Halfordi (or *macrophylla*) is a fine plant, and the smaller-growing *S. Butcheri* is useful either for affording flowers for cutting or for use as a pot plant. During the past year or two flowers of these shades of colour have been more used than formerly. *Staticee Suworowi*, treated as an annual, is a pretty species for bedding, the tall branching

spikes of pink flowers being very attractive. If seeds be sown early in spring under glass, and the seedlings be planted out later, they will flower well the same season. The inflorescences should be cut before they are too far advanced, and dried without being exposed to the sun, the flowers will then retain their colour throughout the winter. *A. Hemsley.*

NEW OR NOTEWORTHY PLANTS.

LOTONONIS WYLIEI, J. M. Wood (*n. sp.*).

This is a much-branched, densely leafy under-shrub, reaching to 1 or 5 feet in height, and bearing a profusion of blue flowers. Stem and branches finely and closely silky pubescent, with minute whitish hairs. Leaves trifoliate, petiolate, stipulate; leaflets oblanceolate, mucronate, entire, subsessile, $\frac{1}{2}$ to 1 inch long, 1 to 2 $\frac{1}{4}$ lines wide in centre, pubescent, with silky white hairs above, more densely so beneath; petiole $\frac{1}{4}$ to $\frac{3}{4}$ inch long, pilose; stipules in pairs, resembling the leaflets, oblong, 2 to 4 lines long. Flowers axillary or terminal on the short branchlets, in four or five-flowered racemes, or solitary; peduncles $\frac{1}{2}$ to 1 inch long, pubescent, pedicels 2 to 3 lines long. Calyx gamosepalous, silky, tube campanulate, limb unequally 5-fid, the lowest segment longer than the others, equalling the calyx tube, the four upper ones connate, in two 2-fid pairs; all acute. Corolla papilionaceous, vexillum broadly retund, silky, pubescent externally; alæ oblong, auricled, cross-ridged on face, shorter than vexillum; carina obtuse, equalling the vexillum. Stamens monadelphous in a split tube; anthers dissimilar, alternate ones shorter and versatile, others longer and basifix. Ovary subsessile, pilose, many-ovuled; style curved, stigma oblique, capitate. Legume narrowly linear, pilose, acute, straight, 1 inch long, slightly compressed, subtended by the persistent calyx; seeds glabrous, subglobose, light brown.

Habitat, Natal, Zululand, Entumeni; altitude 2,000 to 3,000 feet, April. J. Wylie (Wood 8962); same locality, March, J. Wylie (Wood 9442).

This plant was first collected by Mr. J. Wylie, now Curator of the Durban Botanic Gardens, and so far as at present known it is confined to the locality given above. The aspect of the plant is very much that of a *Crotalaria*, but the legume is not inflated, and the flowers are blue, not yellow, as in most of the Natal species of *Crotalaria* known to us. It is very floriferous, and well worth cultivation. *J. Medley Wood, Natal.*

KEW NOTES.

PERISTERIA ELATA, Hook.—A good specimen of this plant is now flowering in the warm Orchid house. The form of its beautiful white flowers so resembles that of a dove, as to gain for the plant the popular name of "Dove Orchid." Few people succeed in growing this Orchid to perfection, though occasionally it is found flourishing in the conditions of an ordinary plant-stove, and receiving no special attention. It is several years since the species flowered at Kew, and until recently it has grown there very indifferently. The plant now flowering was grown in the Victoria-house, in a mixture of equal parts peat, sphagnum-moss, and leaf-mould, into which it has rooted vigorously, making pseudo-bulbs as large as swan's eggs, and leaves over 3 feet in length and $4\frac{1}{2}$ inches in breadth. The plant is now carrying four stout, erect spikes of flowers, the spikes averaging 4 feet in height, each carrying from twenty to twenty-five flowers and flower-buds, with usually five freshly-opened flowers, each of which remains fresh for about three days.

PELAGONIUM ZEYHERI.

This species is totally distinct from all others in the extensive collection of *Pelargoniums* at

* Mr. Willcocks, of the South-Eastern Agricultural College, Wye, tells me those he kept came out on June 4.

Kew. The plant is not merely of extraordinary form, but also of much elegance, as may be seen by the specimen now flowering in the division of

arise a number of leaves, having very slender petioles, some of which are of the exceptional length of 2 feet, making it necessary to fix a tie

more the appearance of a *Ferula* than that of a *Pelargonium* leaf. The large umbel of delicate, somewhat pellucid, pink flowers are borne on a stipe 3 feet in height, and contain from thirty to thirty-five flowers, borne on pedicels 3 inches in length. It is a native of South Africa, and is a rare species in this country, even in botanical gardens. W. H.

LITTONIA MODESTA.

ALLIED to the *Gloriosas*, among which there has been quite a revival in gardens during the last few years, the more modest *Littonia* merits notice on account of its graceful and free-flowering habit.

Our illustration represents a spray of a plant which had been cultivated in a cold greenhouse, and which has flowered regularly with Mr. James O'Brien at Harrow. As will be seen by reference to the illustration, the plant is a trailer of similar habit to the *Gloriosas*, and it requires the same treatment under cultivation, that is to say, it requires to be rested in a dry state, water being entirely withheld after the flowers are past, the growths completed, and indication given that the resting season has arrived by the leaves turning yellow.

Littonia modesta is a native of Natal and other parts of South Africa, and although three other species have been described, this appears to be the only one in cultivation. The flowers are of bright yellow colour, and being produced in succession as the plant grows, the flowering is continued until growth is completed.

REMARKS ON THE CONDITION OF THE FRUIT CROPS AT THE END OF JULY.

(See *Tables and General Summary*, ante, pp. 70-76.)

(Concluded from p. 166.)

S, ENGLAND, S. W.

CORNWALL.—This is another disappointing season. There was an abundance of bloom on all wall and bush trees, but a poor set followed. Peaches and Apricots set a moderate crop, but the cutting winds soon dispelled our hopes. The Peach-leaves were so badly blistered that for a time I feared the trees would not recover. Small fruits are nearly a total failure. Although they made vigorous growths last year, Raspberry-canes only grew for half their length—no doubt due to the sodden state of the ground during last winter and early spring. Our soil is poor and shallow. A. C. Bartlett, Pencarrow Gardens.

DEVON.—Many of the Apple trees are so thickly set with fruit as to require thinning, both bushes and standards being far too heavily laden with fruit. Lord Suffield and a few other varieties suffered from blight and fog. Pears are a light crop on wall and pyramidal trees. Cherries have dropped largely. Peaches and Nectarines are a light crop; the trees are also very much blighted and the foliage blistered. Strawberries and Gooseberries were an enormous crop. Both Red and Black Currants are small, and the foliage very much blighted. The soil here rests on the Devon waterstone, and is of a very light nature. Most vegetables and fruit trees thrive well with the exception of Plums. Geo. Baker, Membland Gardens, near Plymouth.

— With the exception of Apricots we have a good fruit crop. Apples are abundant on most trees, although there are complaints locally that some trees which were a mass of flower have not borne a single fruit. Pears are much better than they have been for the past two seasons. Peaches, Nectarines, and Plums are cropping well. Strawberries, Raspberries, Currants, and Gooseberries

FIG. 72.—LITTONIA MODESTA.

the T-range containing Cape plants. The plant has an erect, unbranched, woody stem some 6 inches in height, from the crown of which

to each leaf. The blade of the leaf is trichotomously divided into very numerous grass-like divisions, from 6 to 9 inches in length, giving it

have never been better. Our soil is a sandy loam of good depth, resting on the old red sandstone. *Jas. Mayne, Bilton Gardens, East Budleigh*

— Fruit-trees blossomed freely, with the exception of Plums, and the fruit set well; but with the continued east and north-east winds, together with low night temperatures, growth was retarded, and many fruits dropped. The Apple and Pear crops in this district promised to be above the average, especially the former; but it is not the phenomenal crop we anticipated. *Geo. Foster, Glendaragh Gardens, Teignmouth.*

— There was never a better prospect for a good Apple crop than when the trees were in blossom in April; when setting however they were badly blighted, and only a moderate crop now remains. Bush fruits are about the average quantity. Our soil is light in texture on the chalk, with clay in places. *C. W. Bloye, The Gardens, Pinhay, Lyme Regis.*

— Both Apple and Pear-trees carried a wealth of blossom, but early expectations of a heavy crop will not be realised. I think the soft condition of the wood is responsible for so much fruit dropping. Early varieties of Apple-trees are generally carrying good crops, the heaviest crops being Lord Suffield, Lord Grosvenor, Irish Peach, Warner's King, Cox's Pomona, &c. Varieties of Pear-trees carrying most fruits are Louise Bonne of Jersey, Pitmaston Duchess, Doyenné du Comice, Catillac, Uvedale's St. Germain, and General Todleben. Our soil is a heavy loam over sand and clay. *T. H. Slade, Poltimore Gardens, Exeter.*

GLoucestershire.—The fruit crops in this locality are better than they have been for the past two years. All kinds of fruit trees gave great promise at the blooming period, but the cold nights during the latter part of April and early in May, caused some varieties of Pears, notably Williams' Bon Chrétien, to set badly. At the present time the trees are suffering from want of rain. Strawberries have supplied a marvellous crop of fruits of good quality. *Geo. W. Marsh, St. George's Nursery, Cheltenham.*

— The Strawberry-crop was the best we have had for many years, both in quantity and quality. Raspberries are a very heavy crop, and of fine quality. Plum-trees have not half a crop in gardens this side of Gloucester. Good Pears are very scarce. Our soil here is heavy on the blue lias. *William Keen, The Gardens, Bowden Hall, near Gloucester.*

— Apples are abundant and good; Pear-trees did not produce much bloom, consequently they have little fruit. Cherry-trees bloomed profusely, but much of the fruit dropped, especially the variety May Duke. Bush fruits have done well, but Gooseberries on unprotected trees had many buds destroyed by bullfinches in the spring. Plum-trees did not bloom freely; still, we have a moderate crop of fruit. Peach and Nectarine crops are very good, and the trees healthy. Apricots are poor. Filberts are not quite as good as usual. The top spit of our soil is fairly stiff, and when dry is hard; it works better after a shower. The subsoil is clay in some places, sandy marl in others. *John Banting, Tortworth Gardens, Falfield.*

HEREFORDSHIRE.—The fruit crops on the whole never promised better at blossoming time than they did this spring, but with the exception of Apples the crops have turned out very disappointing. Even the Apple crop is light and variable in places. Our soil is a stiff loam. *John Watkins, Pomona Farm, Wittington.*

— The fruit crops in this district are, taken as a whole, very good. Apple-trees are heavily cropped, and the fruit is clean. Pears are an average crop. Cherries, both sweet and Morellos, are very poor. The Apricot crop is thin. Straw-

berries produced enormous crops, the best with us being Royal Sovereign, Laxtons' Fillbasket, Trafalgar, and Sir Joseph Paxton. Raspberries are carrying excellent crops of fine fruit. Currants are abundant and good. Gooseberries are excellent crops. The growth on the fruit-trees this season is very clean and good. It is the best season we have had for years past, but rain is much needed. *Thos. Spencer, Goodrich Court Gardens, Ross.*

MONMOUTHSHIRE.—All fruit crops in this district have been badly affected with blight, and in gardens lacking sufficient labour to combat the pest the trees have given most unfortunate results. The soil here is not favourable to fruit-growing, being of too light a nature and on a bad subsoil. *John Lockyer, Pontypool Park Gardens.*

— The Apple crop is a record one and of good quality. Most of the fruit-trees are growing in grass orchards on standard trees, pyramid or bush trees with few exceptions are confined to private gardens, although I consider the latter far more profitable trees for market purposes. Pears early in the season promised well, but unfortunately a few cold nights caused many of the fruits to fall. The same remark applies to Plums and Cherries. Small fruits have been very heavy crops of good quality. The soil in our district is partly on red sandstone and partly on alluvial heavy clay. *John Basham, Fair Oak Nurseries, Bassaleg, near Newport.*

— The crop of Apples and Plums is not an average one in this district. A few standard trees of the former, such as the varieties Duchess of Oldenburg, Lord Grosvenor, King of the Pippins, and Hawthornden, are carrying heavy crops, while Cox's Orange Pippin and Scarlet Nonpareil do well as pyramids in the garden, but are a failure as standards in the orchard. Pears are good, especially the varieties Durondeau, Madame Treyve, Marie Louise d'Uccle, Louise Bonne of Jersey, and Doyenné du Comice. Peaches and Nectarines set well, and required much thinning. Gooseberries, Raspberries, and Currants have yielded an enormous crop. Strawberries have also been abundant, and good in flavour. *W. F. Wood, Llanfrechfa Grange Gardens, Caerleon.*

— Bush Apple-trees, planted in 1893, are carrying heavy crops which have been much thinned, and varieties that have hitherto not borne heavily are especially prolific this year, viz., Annie Elizabeth, Blenheim Orange Pippin, Striped Beefin, and Gascoigne's Scarlet Seedling. Amongst light croppers, Lord Burghley, Scarlet Nonpareil, Egremont Russet, Beauty of Bath, and Ecklinville Seedling, may be noted. Of varieties that usually carry good crops, the following have required much thinning, viz., Seaton House, Lane's Prince Albert, Frogmore Prolific, Belle du Pontoise, Worcester Pearmain, Duchess of Oldenburgh, Grenadier, Cellini, King of the Pippins, Schoolmaster, The Queen, Sturmer Pippin, and Warner's King. Pear-trees on walls, are carrying good crops, but the fruit is thin upon Pyramids. Strawberries are exceptionally good, both with regard to quantity and size. The soil here is a cold, red, clayey loam, but that upon which the Apples referred to are planted was bastard trenched and properly drained. *Thos. Coomber, The Hendre Gardens, Monmouth.*

SOMERSETSHIRE.—The fruit crops in the spring were promising, but later they were much damaged by cold winds and rain. The soil in this neighbourhood is of a heavy nature, being on the blue lias stone; it cracks very much in dry weather, from which the crops suffer. *William Hallett, Cossington, Bridgwater.*

WORCESTERSHIRE.—The fruit crops on the whole are wonderfully good. Apples are plentiful and of good quality. The same may be said

of Pears, Plums, and small fruits. Pears, Plums, and Apples have had to be thinned heavily. All fruit-trees are summer-pruned, but not to any hard-and-fast rule. Our soil is a medium loam overlying the new red sandstone formation. *A. Young, Witley Court Gardens, Stourport.*

— Taking the district generally, we have moderate crops of hardy fruit. The crops are certainly not so heavy as they promised to be at one time, for quantities of fruit have dropped off, doubtless owing to the immature condition of the wood and buds last autumn, entailing imperfect development of the organs of the flower, followed by imperfect fertilisation. It was apparent that many flowers failed to open properly, the petals remained incurved, and the other organs looked weakly and deformed. These remarks apply chiefly to Apples. The Pear-midge is answerable for the loss of the bulk of the Pear-crop, and this insect has spread rapidly and widely during the last few years, for which I know of no positive remedy. Royal Sovereign and Leader have been the two best Strawberries this year. We have suffered considerably from drought. *W. Crump, Madresfield Court Gardens, Malvern.*

— All bush fruits are good and plentiful. Strawberries have been very fine, but were quickly over, the plants being much affected by drought. Raspberries were very good. Apples are a good crop, free from caterpillars and clean in growth. Young trees of Lane's Prince Albert, Peasgood's Nonsuch, Bramley's Seedling, Golden Noble, Cox's Orange Pippin, Newton Wonder, The Queen, and Allington Pippin are very good. Pears and Plums are an irregular crop, the best crops being upon wall-trees. Louise Bonne of Jersey, Pitmaston Duchess, Beurré Diel, Doyenné du Comice, and Winter Nelis are all good. Kirk's Plum, Coe's Golden Drop, Monarch, Early Transparent Gage, and The Czar are good. Our soil is a very heavy loam, with clay subsoil. *F. Jordan, Impney Gardens, Droitwich.*

WALES.

CARDIGANSHIRE.—Taken on the whole in this county, the fruit crop this year is far above the average, both in the light soil (which is general) and also in the heavy soil of the valleys. *Geo. Wright, Bronwydd Gardens, Maeslyn R.S.O.*

DENBIGHSHIRE.—The Apple crop in this district is fairly good, but standard Pear-trees, owing to the wet weather last year, did not ripen their wood. On wall-trees there is a good crop of Pears. The Strawberry crop has been a very good one. *Walter Weir, Rhosnessney Gardens, Wrexham.*

GLAMORGANSHIRE.—I do not recollect fruit-trees appearing so promising when in bloom as they did this year, for without exception every kind was literally covered with blossom, and with the exception of Cherries and Plums, which are practically a failure, all fruit-trees are carrying heavy crops of fruit. Apples are exceptionally good and clean, also Peaches and Nectarines. Plums and Cherries have been badly affected with blight, but the trees have improved greatly. Pears are rather partial, but clean and healthy. Strawberries, Black and Red Currants, Gooseberries, and Raspberries have record crops, the fruits being large and clean. Our soil is a light loam, with a subsoil of gravel. *Richard Milner, Margam Park Gardens, Port Talbot.*

MERIONETHSHIRE.—The fruit crops in this district are very plentiful. Cherries, after an abundance of bloom, failed to "stone," and the fruit dropped freely. Black Currant-bushes are rather badly affected with fly, but are carrying an excellent crop of fruit. Gooseberries have an enormous crop of fruits of good size and quality. *J. S. Higgins, Rhug Gardens, Corwen.*

PEMBROKESHIRE.—The geological formation is very singular, consisting in places of millstone grit overlying limestone, in another part of old silurian, and another of deep beds of marshy peat with loam on the surface. It is impossible to say on which soil the fruit-trees succeed best. All have the same aspect, which is sheltered from cold winds. We have about 100 of the leading varieties of Apples, and they all do well. *George Griffin, Slebeck Park Gardens, Haverfordwest.*

9, IRELAND, N.

ARMAGH.—Fruit crops in general are very good this year. There was a wealth of bloom, but strong westerly winds prevailed during and after the setting period of stone fruits, crops of which are in consequence not so heavy as they would have been. Damsons are a very light crop. Black Currants set extremely well, and promised an extraordinary crop, but greenfly destroyed the bushes all over the county. Our subsoil is a stiff, heavy red clay, the top spit a very good loam. *W. R. Spence, The Manor Gardens, Loughgall.*

the flowers, however, set very thinly, and the crop of Plums and Cherries is now very light, except where the trees were favourably situated. Pears are rather better, some of the trees carrying full and even heavy crops. Small fruits are all good, with the exception of Black Currants. The soil is a cold, heavy clay. *Fred. W. Walker, The Gardens, Sion House, Sion.*

— The fruit crops in this district are above the average; those of Gooseberries and Strawberries are exceptionally heavy. Black Currants in some gardens suffered severely from aphides. Pears, although the trees flowered well, have only set an average crop. Apple crops are above the average, the fruit on most trees requiring to be thinned. *Jas. Small, Caledon Castle Gardens, Caledon.*

10, IRELAND, S.

CORK.—Strawberries of early, mid-season, and late varieties were all of excellent quality, of enormous size, and an abundant crop. Gooseberry bushes are carrying large crops of fruit of good size. Black, Red, and White Currants, and

CHANNEL ISLANDS.

GUERNSEY.—Our soil may be described as light to medium loam. The northern portion of the island contains a good deal of sandy soil. Fruit crops are very irregular this season, much more so than we have ever known them to be. In some gardens they are good, whereas in others they are scarcely average. Plum crops generally are light, probably owing to the immature condition of last year's wood; still there was an enormous display of bloom. *C. Smith & Son, Caledonian Nursery.*

JERSEY.—The fruit crops, with the exception of small fruits and Strawberries, are below the average. No doubt the cold, wet season of 1903 was responsible for immature fruit-buds, which caused the failure in the setting of the blossom. Pear-midge has destroyed the bulk of the Pears, particularly the variety William's Bon Chrétien. When the abnormal swelling of the affected fruit shows the presence of the grubs, the diseased Pears are gathered and burnt. *H. Becker, Caesarean Nurseries, St. Saviours.*

BUDS: ADVENTITIOUS OR OTHERWISE.

THE production of buds from any part of a plant, almost without exception, is an occurrence which ought not to occasion surprise. Nevertheless, when an Apple is seen protruding from the trunk of the tree far away from the branches, it is not wonderful that some astonishment is felt. But the phenomenon, if unusual, is not strictly abnormal. A bud may be superficial in its origin, or it may start from the central wood of the branch and force its way outwards. There are many plants which naturally produce their flowers from the trunk in this manner—the Cacao (chocolate) is one of them; *Grias cauliflora* is another. Various Browneas and Theophrastas supply other illustrations; indeed, they are numerous. For our illustration we are indebted to the courtesy of the Editor of the *South Eastern Gazette*. The Apple shown in the photograph (fig. 73) is growing on the trunk of a tree on the Frant Fruit Farm, Maidstone, in the occupation of Mr. Edmonds. We have not ourselves seen a similar case in the Apple, but have more than once seen a fully formed bunch of Grapes proceeding from the main trunk of a Vine. In all these cases it would be desirable to make a cut lengthwise through the stem and the inflorescence in order to trace its real origin. Unless this is done some doubt may be experienced as to the source and nature of the adventitious growth.

FIG. 73.—APPLE PRODUCED FROM THE TRUNK OF A TREE OF "POTTS'S SEEDLING," 14 YEARS OLD.

GALWAY.—The soil in this district is of a light nature and shallow, with little or no fibre, resting on limestone, which appears through the surface in several places, therefore in dry seasons we suffer from drought, with consequent loss of fruit crops, Strawberries especially. We have this year fruit in abundance, excepting Cherries. *Thos. Dunne, The Gardens, Lough Cutra Castle, Gort.*

— I never before saw such good fruit crops in this district. The following three Strawberries I find to be best here in the order named—Leader, Monarch, and Royal Sovereign. The soil is heavy stiff clay, resting on a cold subsoil. *And. Porter, The Gardens, Woodlawn.*

LONGFORD.—Our soil generally is a heavy cold clay, resting on a yellow subsoil. We find it suits small fruits; but Apples and Pears are liable to American blight and canker. *John Rafferty, Castle Forbes, Newton Forbes.*

SLIGO.—Apples, also most of the stone-fruits, succeed well with us, and small fruits and Strawberries particularly so. The Laxton Strawberry has this year produced a very heavy crop of well-coloured, medium-sized berries. The soil here is a rich retentive yellow loam resting on a limestone subsoil. *J. Sangster, The Gardens, Lissadel, Sligo.*

TYRONE.—Apples are an enormous crop. Pears, Plums, and Cherries have been disappointing, considering the splendid show of bloom they gave,

Raspberries also have heavy crops; the fruits are of large size, good colour, and flavour. Our soil is of a rich nature, with a sub-stratum of limestone. *C. Price, The Gardens, Mitchelstown Castle.*

KILDARE.—The fruit crops here are very abundant, with the exception of Apricots and Peaches, not many of which are grown outside. The quality all round is superior. The soil is a stiff clay on a retentive subsoil of bluish clay, which if brought to the surface will not even grow weeds. We obtain splendid flavour in all fruits. *Fredk. Bedford, Straffan House Gardens, Straffan Station.*

KILKENNY.—Gooseberries are a splendid crop, and where the fruits have been thinned out, are of fine quality and much prized for dessert. Of Strawberries, Royal Sovereign carried grand crops on young plants; Givon's Late Prolific was exceptionally good, having an immense crop of fine fruits of good flavour. This variety is an acquisition in these gardens. Apples look exceedingly promising, especially on young trees which have had the fruit thinned. Lord Grosvenor, Bismarck, Royal Jubilee, Tower of Glamis, Golden Spire, Schoolmaster, all do exceedingly well here. The soil is a warm, sandy loam, receiving an average yearly rainfall of nearly 40 inches. *J. G. Weston, Bessborough Gardens, Piltown.*

ST. LOUIS EXHIBITION.

THE GERMAN PAVILION.—The German National Pavilion at the World's Fair, St. Louis, occupies a very prominent position on Art Hill, to the east and overlooking the Cascades Gardens, which form the main picture of the exposition grounds. The building, which has a very imposing appearance, represents the Royal Castle of Charlottenburg, near Berlin. It was the original intention of the German Commission to have a beautiful terrace-garden around the pavilion. This, however, owing to the unstable nature of the hill-sides, had to be abandoned, and the ground treated quite plainly. A hedge of *Ligustrum ovalifolium* forms the boundary of the section, and this has succeeded remarkably well, being probably the best hedge within the exposition. Good-sized trees of the soft Maple, *Acer dasycarpum*, have been planted on the east side of the building for shade. The only exhibit on the ground is a collection of *Rhododendrons* sent by Paul Seidel, of Dresden. An excellent lot of some ninety specimen Bay-trees imported by the Commission

from Düsseldorf are placed around the building, and add greatly to its imposing aspect. Mr. Ludwig Baumann, sometime student at the Royal Gardens, Kew, is in charge of the pavilion and grounds.

In the buildings of Forestry and Agriculture Germany exhibits somewhat more extensively than in horticulture. Amongst the forestry exhibits is a very interesting series of sections cut from the trunk of a Scotch Fir, showing the influence of prevailing winds, the weight of heavy branches, &c., on the deposition of the wood tissues. There is also a very interesting series of photographs showing the routine of work in the German Pine-forests from the time that the tree is planted until it is ready for cutting.

In the Agricultural Hall the most interesting exhibit to gardeners is that of the German Kali works. Practically all the world's supply of potash is derived from the mines belonging to this company, and here are shown samples of the crude minerals and the refined salts used as fertilisers; also samples of Corn and Potatoes, with photographs showing experiments with fertilisers at various experiment stations. *T. W. Brown, St. Louis.*

EARLY FORCING OF DAFFODILS.

THE comparative ease with which some varieties of *Narcissus* may be forced into bloom has rendered this popular class of bulbous plants indispensable for early forcing purposes. As one of your readers and contributors who can look back upon the advent of the early forcing of these bulbs, I regard the popularity of the race at the present day to be due in a great measure to the suitability of some *Narcissi* for early forcing. As a forced flower, appearing in not a few of the most fashionable floral decorations of the last decade, the common double Daffodil has played the part of pioneer in what is now a great industry, giving employment to many thousands of persons. Twenty years ago the fact that *Narcissus Telamonius plenus* [*N. Pseudo-Narcissus*] could be forced into bloom was not discovered, yet to-day many hundreds of thousands of these plants are grown and prepared specially for this work.

At the start many kinds were tried—for not all the varieties of *Narcissus* will force, or even succeed if placed in glass structures at all—and of these it was obvious that for forcing very early a few kinds only would be suitable. Some varieties indeed are so impatient to heat or even warmth that they remain under ground, only to appear when once again placed in the open, to flower perhaps a little later than is their wont. Quite an interesting chapter might be written on this phase of the subject, and it would be interesting to know why large bulbs of certain kinds possessing abundant roots refuse to grow when placed in heat.

Of the kinds that force well, none give more satisfaction than the old double yellow *N. Telamonius plenus*. Indeed this is the only reliable double variety for early work. Of single kinds, Van Sion is the best variety for forcing earliest, closely followed by the Tenby Daffodil and Ard Righ in the order given. Next to these in period of flowering are Horsefieldi and princeps, mid-January being counted fairly early for either in quantity. The single varieties first named may be had in good condition by Christmas. I should have mentioned Golden Spur, which with care may be had in flower before Horsefieldi. Single-flowered varieties of the incomparabilis type are numerous, and will flower about the third week in January, when many other good sorts are also obtainable in bloom. Growers who prefer dainty to showy varieties should obtain *N. Leedsii* (type) and *N. L. superba*, the latter being exquisite in the pale biscuit-colour of its drooping cup.

A very precarious variety is the beautiful

single form of *N. Poeticus* known as *ornatus*. Heat has a distinctly retarding influence over this variety, and this influence is not of a temporary nature. Too early housing of the plants has a similar retarding influence. The way to overcome this difficulty is to pot the bulbs early in September, plunge the pots in ashes outside till about Christmas, then place them in gentle heat indoors, when they will grow quickly and develop good flowers. If planted early, most of the other varieties named may be introduced to slight heat early in December, a temperature of 45° to 50° being sufficient at the start. Good bulbs, early planting, and plenty of healthy root-fibre are essential to success in the forcing of Daffodils. Ample supplies of moisture to the soil are required, especially when the bulbs are growing freely and the flowers are appearing. Another essential feature is that of maintaining a suitable atmospheric moisture. Bottom-heat is quite unnecessary; it may prove disastrous in the hands of the beginner, and is best dispensed with altogether. By adopting the practice described above, forced flowers may be had in January as good as those that appear in the open in April. When the flowers are in the bud state use the syringe freely; do not maintain a fierce fire-heat during the prevalence of London fogs. Sunlight is the greatest of all stimulants to successful forcing. *E. H. Jenkins, Hampton Hill.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gr., Wrotham Park, Barnet.

The gathering and storing of Apples and Pears.—If the fruit-room has not already been thoroughly cleaned and put in good order for the reception of Apples and Pears, let this work be done at once. It is essential that the atmosphere of this room should be perfectly sweet and fresh in order that the fruits may keep good and retain their good flavour for as long a period as possible. Nothing is likely to impart bad flavour to ripe fruits more so than musty hay and straw; the effects may be frequently detected in late fruits at exhibitions, though the fruits are perfectly sound. The crop of Apples this year is a plentiful one, and as some of the trees are bearing very heavily a great quantity of Apples will be brought down in the event of a severe gale. Such fallen fruits will be of little use except for present consumption, and should for that reason be kept apart from gathered fruits. Apples should be left on the trees until the seeds begin to turn a dark brown colour, and the fruits will part with ease from the branches. Some of the earlier varieties must be given attention at once, otherwise the fruits will drop and receive damage. In removing the fruits from the trees to the store-room, handle them with every care, and when they are perfectly dry. If there are plenty of shelves, store the fruits in single layers, otherwise they may be placed three or four layers deep. Put aside all speckled or damaged fruits, and examine at intervals the sound ones that have been stored, removing any that show signs of decay.

Strawberries.—Examine plants that after being forced in the spring were hardened off and planted-out on a border for the production of late fruits, and remove the runners. If the surface of the beds has not been treated already, remove any weeds there may be in the rows, being careful not to damage any of the berries, and then apply a little clean straw, raising the clusters of fruit gently with the hand before placing the straw under them. Viscountesse Héricart de Thury and Keen's Seedling are very useful varieties for cultivating in the manner described above. The first-named variety is also an excellent one for preserving purposes, and it crops very freely.

Morello Cherries.—Where these fruits are required for preserving in bottles or as jam, examine them at intervals and gather the darkest-coloured Cherries when they are in a perfectly

dry condition. In the case of fruit required for the making of Cherry brandy leave the stalks on the fruits, each one about half an inch in length. Morello Cherries, in addition to being useful for these purposes, are appreciated by some for their pleasant acidity and attractive appearance, and are used for dessert.

THE KITCHEN GARDEN.

By JOHN PENTLAND, Gardener to C. H. B. FIRTH, Esq., Ashwicke Hall, Marshfield, Chippingham.

French Beans.—The temperature at night has fallen as low as 40° here, and therefore no time must be lost in getting the frames into position over late-sown French Beans. Mats or other covering material should also be got ready for use, as a sharp frost may occur any night, especially in northern districts. Make another sowing of Beans in pots for forcing, and unless there is a special demand for them at a certain date, it will be best to place them in a cold frame well exposed to the sun, where they will grow slowly and produce sturdy plants for removing to a warm temperature at a later date. It will be found that plants so treated will produce a better crop than others that are placed in heat at once, and so become "drawn" and weakly. Beans which were sown in pots and put into frames some time ago may now be through the surface, and should therefore be afforded as much light and air during favourable weather as possible, and it will be necessary to prepare the forcing-pits for their reception. This work cannot be carried out too carefully, and if the pits at present contain any other plants let them be removed, and then thoroughly fumigate the pit with sulphur, and afterwards wash the glass and woodwork with soft-soap and water, finally syringing all down with clean water, or the soap if left on for any length of time will loosen the paint. Where the walls are lime-washed, let this be done afresh with some lime direct from the kiln, and mix with it sufficient soft-soap to make the brush run smoothly, and $\frac{1}{2}$ lb. of flowers-of-sulphur to 5 gallons of wash, with which it should be well mixed. Work this thoroughly by means of a brush into every hole and crevice upon the wall. If the wash is used upon the walls of passages where clothing is likely to come in contact with it, melt some fat and mix this with the lime, applying it whilst hot by means of a brush. When all has been finished, and the walls have dried, syringe the whole of the interior of the house or pit with water and paraffin, at the rate of half-a-pint of paraffin to each gallon of water. When the surfaces have again dried, the house will be ready for the Beans. If proper care be afterwards taken in regard to watering, damping, and ventilating, but little trouble is likely to arise from the ravages of insects.

Tomatoes that are growing in pots out-of-doors, and have a crop of unripened fruits, should now be removed inside, and fastened to the back walls or the roof of pits that have been thoroughly cleaned and prepared for them. Maintain a buoyant atmosphere for these plants by employing a moderate amount of heat in the water-pipes, and by admitting air when the weather is favourable. Fungoid diseases are more liable to attack the plants if the atmosphere becomes damp or stagnant. Any fruits which are commencing to change colour on plants out-of-doors should be gathered and placed indoors to ripen. Have everything ready for covering up these plants in case of frost. Plants indoors that are past bearing should be cleared out and burned, and the house prepared for another crop in the same way that has been advised for the house to contain Beans. Some of those plants in pots out-of-doors which are just beginning to fruit, if turned out of their pots and planted into a border indoors without unduly disturbing the roots, will grow away freely and maintain a supply of fruits well into the winter. Expose all fruits to the sun as much as possible by shortening the leaves by which they are shaded, and by cutting out all superfluous growths.

Double Cropping.—Where Savoys and other such plants have been planted between the lines of Peas, have the Peas cleared off the ground as soon as they are past bearing, so as to allow a

greater degree of air and light to circulate among the plants that remain.

* * In last week's Calendar, under "General Work," sheet of galvanised iron should have read *shed* of galvanised iron.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to Mrs. BURNS, North Myms Park, Hatfield, Hertfordshire.

Hydrangea Hortensia.—Cuttings should be inserted at the present time to form plants for flowering in the late spring and early summer months. These plants are very valuable for conservatory and house decoration, for dwarf plants, carrying a good truss of bloom, may be grown in 5-inch pots. The tops of strong, short-jointed shoots should be chosen for the cuttings, and the shorter these are made, so long as they can be fixed in the soil with a peg, the better the cuttings will make roots. Generally speaking, the cuttings may be cut back to the base of the second pair of leaves, so that when the cutting is inserted, the centre bud, containing the dormant flower-truss, will be only just above the surface of the soil. If the cuttings are too hard at the base, they frequently fail to make roots, or at the best the process is much delayed. Let the cuttings be inserted singly in 3-inch pots, which have been previously filled with a sandy soil, and place them under a hand-light in an intermediate-house, or plunge them in a hotbed with a moderately low atmospheric temperature. When propagating *Hydrangea Hortensia* and its varieties at this season the chief object aimed at is to induce the cutting to make roots without starting the flower-buds into growth, and in order to effect this it is necessary to gradually harden the plants off directly it is seen that the cuttings are rooted. The plants should then be placed in a coolhouse or pit, and when the leaves begin to turn yellow, water should only be afforded occasionally. In January or February repot the plants into 5-inch pots, and afford them the temperature of an intermediate-house, where they will quickly commence to make growth, and ultimately flower when from 12 to 18 inches high. A suitable compost for *Hydrangeas* may consist of three parts loam and one-half part well-rotted manure.

Centropogon Lucyanum.—As this useful winter-flowering plant completes its growth it should be afforded more air and as much light as possible; the plant will then freely produce its flowers along the greater portion of the gracefully arched branches. When well grown the flower-stems are sufficiently strong to support themselves, and the plants are most effective when thus grown. If, however, staking is unavoidable, it should be confined to a single stake in the centre of the plant, to which the stems should be loosely slung with thin strands of raffia. When the plants have filled the pots with roots, manure-water may be afforded with advantage. When in full flower the plants should be placed in the driest part of the house, as the flowers are inclined to damp off in a close and moist atmosphere, or if the water from the syringe be allowed to fall upon them.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Dorking.

Chysis and Pleione.—Remove such Orchids as *Chysis bractescens*, *C. aurea*, *C. lavis*, *C. Chelsonii*, and *C. Sedenii* from the Cattleya-house, and suspend them close up to the roof-glass on the lighter side of the East Indian-house. The extra warmth of this house, with increased supplies of water, will enable the plants to complete their growths quickly. As soon as the leaves commence to turn yellow in colour the plants should be exposed to full sunshine so that the new pseudo-bulbs may become properly matured. The *Pleiones* having now completed their pseudo-bulbs should be removed to the cool greenhouse, and suspended with the *Dendrobiums* now maturing their growths. Water must be afforded them occasionally until the leaves have fallen and the first flowers open, but it should afterwards be withheld, or the flowers will quickly damp off.

Catasetums, *Cynoches*, *Mormodes*, &c., now forming their new pseudo-bulbs, should be placed

where they may obtain uninterrupted sunshine, and a drier and more frequently renewed atmosphere than they have had hitherto, in order that the pseudo-bulbs may become sufficiently ripened to pass safely through the long resting season. While the leaves remain fresh, give the plants abundance of water at the roots, but so soon as they commence to turn yellow the amount of water must be gradually reduced, and when they fall it should be discontinued altogether. Other species which now require similar treatment are *Thunias*, *Cyrtopodiums*, *Cyrtopera*, *Lissochilus*, and the deciduous *Eulophias*. The deciduous *Calanthes* should now be elevated well up to the roof-glass, and arranged so that each plant will obtain its full share of sunlight. They will need to be thinly shaded only for a hour or two during the middle of the day, when the sun is very bright. The plants will become dry more quickly under these conditions than they have done during the growing season, therefore frequent supplies of water will be required. Weak liquid cow-manure may be afforded alternately with clear water, and will strengthen the plants.

Laelia elegans and its varieties are now producing their flowers, and at this period the new pseudo-bulbs are especially tender, and are liable to decay away if too much water be afforded to the roots, or if the temperature of the house falls too low at night, particularly if the atmosphere is very damp. When the new growths are completed, place the plants in a dry, warm corner of the Cattleya-house, where air is admitted freely, and afford water with extra care. After the flowers have faded the plants may be repotted, the young roots which are emitted from the base of the flowering growths will soon enter the new soil, and the plants become quickly re-established. Use a compost of the best fibrous peat, leaf-soil, and sphagnum-moss in equal parts, with plenty of broken crocks and a little coarse sand mixed with it. Apply a surface dressing about 1½ inch deep with clean, picked living sphagnum-moss. It is important, after repotting the plants, that they should be made thoroughly firm in position by tying several of the strongest pseudo-bulbs to neat, strong stakes.

FRUITS UNDER GLASS.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Wantage.

Figs.—As the first crop is now ripening in the latest house, the conditions of the house should be modified in order to secure a long succession of fruits. The fruits being in several stages of development, the roots of the trees must be supplied with abundance of water. Discontinue the use of the syringe, but keep the atmosphere from becoming dry by frequently damping the surfaces in the house. This is necessary in order that the fruits shall swell freely and the foliage remain healthy. Admit abundance of air during the day and a little at night, and employ sufficient fire-heat to cause a good circulation of warm air. Much care is necessary when gathering *Figs*, as the unripened fruits are extremely insipid. If the skin is cracking and there is a "honey drop" in the open eye of the fruit, it is in perfect condition for gathering. Nothing contributes more to high quality in the fruits, or to securing a heavy crop, than keeping the points of the shoots well up to the light; indeed, the nearer the points of the shoots are to the glass the better, so long as there is sufficient space between the foliage and the glass for a circulation of air. The training of *Fig*-trees to represent the natural habit of the *Fig* in the open is good practice.

Late Muscat Grapes.—Afford sufficient moisture to the roots to keep the berries plump, and employ the necessary amount of fire-heat during the day to cause a free circulation of warm air. Do not allow the temperature at night to fall below 65°, and take care that there is enough fire-heat to prevent the condensation of moisture upon the berries; a moderately dry atmosphere is necessary. Admit air to the house when the weather is favourable. Shorten or cut away sublaterals, and thus admit as much light and air among the Grapes as possible. When the Grapes have become thoroughly mature, gradually reduce the atmospheric temperature to about 50° at night.

Strawberries in Pots should be standing in a warm position, with plenty of space between the pots to allow the sun and air to circulate freely around them. Plants intended for forcing early will have filled their pots with roots by this time, and if they are in the least degree weakly, they should be afforded liquid-manure, the most suitable for this purpose being diluted drainings from the stables. In some varieties the plants produce more than one crown each. In such cases they should be reduced to one, choosing the strongest or central one. This work should be done as soon as the young crowns can be taken between the finger and thumb, at which stage they can be removed quite easily. This thinning out will naturally increase the strength of the main crowns. Remove all runners as fast as they appear, and should earth-worms obtain access to the pots, weak lime-water will expel them.

THE FLOWER GARDEN.

By A. B. WADDS, Gardener to Sir W. D. PEARSON, Bart., Paddockhurst, Sussex.

Moutan and Herbaceous Pæonies.—Any ground it is intended to plant with *Pæonies* should be trenched as soon as it is vacant, affording a good dressing of rotten manure at the same time. If the ground is of a very heavy nature, some lime or old mortar-rubble may be dug in afterwards for the herbaceous varieties, but for the moutan varieties some fine peat or good leaf-mould is better. Both sections may be planted as soon as the roots have been afforded a good soaking with water.

Propagating.—All cuttings of bedding plants ought to have been inserted ere this. Place them in cold frames, or in some structure where they will be protected from heavy rains. At this date cuttings should not be placed in the boxes very thickly, especially if they have strong foliage and the wood is unripe, or "damping" will occur. A few hundred cuttings of each variety should be inserted beyond what it is expected will be required, to allow for failures. Any old plants that are required to be kept through the winter may be cut over, and by the end of the month will have made nice bushy plants for potting-up, or they may be planted out in a warm frame where they will take up less room. Some old plants of *Alternanthera* should be lifted now if they can be spared, and when potted-up be placed on a shelf in a warm, moderately dry atmosphere. Plenty of all varieties should be thus saved, as they are very liable to damp off.

Shrubs.—The clipping of Yew hedges should have been finished, and in northern districts the work should have ceased a few weeks earlier. The snow does not break and bend them about as it would if the work of clipping was left till spring, especially in cases of large Yew hedges. The wounds get callused over before frost occurs, and in August more time can be spent upon the work than could be spared in spring. If they are cut early in spring and late frosts occur, the growths turn brown and have a bad appearance for several weeks. Similar remarks apply to Box-edgings in the kitchen-garden, which are also best trimmed in autumn. Before cutting Yews, branches will have been tied down to fill up gaps, but plain wire should not be used for this; strong, well made tar-string is preferable, or old disused electric wire cased with rubber may be used. It will last some time before the rubber becomes worn off. Great care should be exercised in clipping, as unskilled hands will soon spoil several years of work and training. Laurels and other shrubs may be cut, but not with the shears. Use a sharp knife or a pair of sécateurs, taking out the points and long ends. The mutilation of Laurels and other shrubs by the use of shears is to be condemned. Ivy should not be cut now excepting the long ends that would be blown about by the wind.

Early-flowering Chrysanthemums.—These are now at their best, and if the weather continues to be dry, they will require repeated applications of clear water alternated with liquid-manure. Make each plant secure against the action of winds.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, SEPT. 14—
 { Roy. Caledonian Hort. Soc.
 Show at Edinburgh (2 days).
 Derbyshire Agric. and Hort.
 Society's Show at Derby
 (2 days).
 THURSDAY, SEPT. 15—Brighton Hort. Soc. meeting.
 SATURDAY, SEPT. 17—German Gardeners' Club meet.

SALES FOR THE WEEK.

MONDAY to FRIDAY NEXT—
 Dutch Bulbs, at 67 and 68, Cheapside, E.C., by
 Protheroe & Morris, at 10.30.
 MONDAY, SEPTEMBER 12—
 Flowering Bulbs and Lilies at Stevens' Rooms,
 at 12.30.—Nineteenth Annual Trade Sale of Pot
 Plants at Dysons Lane Nurseries, Upper Edmonton,
 by order of Mr. H. B. May, by Protheroe & Morris,
 at 11.
 TUESDAY, SEPTEMBER 13—
 Annual Trade Sale of Winter Blooming Heaths, &c.,
 at Burnt Ash Road Nurseries, Lee, S.E., by order of
 Messrs. B. Maller & Sons, by Protheroe & Morris,
 at 11.
 WEDNESDAY, SEPTEMBER 14—
 Flowering Bulbs, &c., at Stevens' Rooms at 12.30.—
 Annual Trade Sale of Winter-flowering and other
 Plants, at The Nurseries, South Woodford, by order
 of Mr. John Fraser, by Protheroe & Morris, at 11.
 163 cases of L. Harrisii, Roman Hyacinths, Nar-
 cissus, Palm Seeds, &c., at 67 and 68, Cheapside,
 E.C., by Protheroe & Morris, at 4.
 THURSDAY, SEPTEMBER 15—
 Thirty-sixth Annual Trade Sale of Stove and Green-
 house Plants, at Brimsdown Nurseries, Enfield
 Highway, by order of Mr. J. H. Thompson, jun., by
 Protheroe & Morris, at 11. Twenty-third Annual
 Trade Sale of Winter-blooming Heaths, at The
 Longlands Nursery, Sidcup, by order of Messrs.
 Gregory & Evans, by Protheroe & Morris, at 11.
 FRIDAY, SEPTEMBER 16—
 Unreserved Clearance Sale of the whole of the
 Greenhouse Plants and Effects at Homefield Nur-
 sery, Meopham, Kent, by Protheroe & Morris, at 11.
 —Unreserved Clearance Sale of the final portion
 of Messrs. B. S. Williams & Son's Collection of
 Established Orchids, at 67 and 68, Cheapside, E.C.,
 by Protheroe & Morris, at 12.30. Also 4,000 *Odonto-
 glossum luteo-purpureum* and *sceptrum*.

(For further particulars see our Advertisement columns.)

AVERAGE TEMPERATURE for the ensuing week, deduced
 from observations of Forty-three Years at Chiswick
 —58°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, Sept. 7 (6 P.M.): Max. 66°;
 Min. 50°.

Gardeners' Chronicle Office, 41, Wellington Street,
 Covent Garden, London.—Thursday, Sept. 8
 (10 A.M.): Bar., 30.2; Temp., 59°. Weather—
 Rain falling continuously.

PROVINCES.—Wednesday, Sept. 7 (6 P.M.): Max. 63°,
 East Coast of England; Min. 51°, North of
 Scotland.

"The
 Organisation
 of
 Agriculture."

A BOOK has been lately published, through Mr. MURRAY, by Mr. E. A. PRATT, under this title, at a cost of five shillings, to which, in view of the general depression, we desire to call the attention of our readers,* as it concerns the market gardener and the small cultivator quite as much as the agriculturist proper. This work comprises a reprint of sundry articles contributed to the *Times*, with several additions. In their original form the articles attracted much attention, and we venture to think that in their expanded state they will be even more impressive. They deal with a variety of subjects, but all more or less connected by a leading idea common to them all. That idea is the necessity that exists in British agriculture, and we may add market-gardening generally, for combination and organisation of effort. Individual enterprise, under present conditions, is often wasteful and unremunerative.

It is unreasonable to complain of the railway companies because they have to look after their own interests, and cannot

deal with small parcels at the same rates that they do with large consignments. If growers would co-operate one with another, and so arrange their affairs that the railway companies could handle their produce in large quantities, at regular intervals, so as to secure economy of manipulation and adequate remuneration for their trouble, the companies would gladly undertake the transport of the goods from the grower to the markets. How this can be done is told in a very interesting manner in the book before us. We see there how little Denmark can afford to send us weekly huge consignments of butter, how enormous numbers of eggs are regularly sent from various Continental countries, and even from far-off Siberia; how Germany educates her people, establishes co-operative credit banks for the benefit of the farmers, and fosters every means of securing co-operation among the growers, and consequently at a much diminished outlay. A higher average in quality is secured by a system of inspection, by means of which inferior samples are eliminated and a general good average constantly maintained. By these means Denmark has outgrown the losses inflicted by the war with Germany, and is flourishing while our farmers are wringing their hands in despair.

From St. Malo, in the autumn of last year, no fewer than 773 tons of Blackberries were imported into this country. The fruits are collected by the women and children, brought into St. Malo, and sold to the exporter. About eight centimes per pound are paid to the pickers, the total sum accruing to them being estimated at no less than £5,541. At the lowest estimate a sum of £7,730 was paid for Blackberries brought to England from a single French port. We may well wonder whether Blackberries grow in England, Wales, Scotland, or Ireland; and if so, why our peasantry do not turn them to the same account that their French neighbours do. "Oh, it would not pay!" would doubtless be the answer; but if the figures and statistics quoted in this volume be correct, this reply is not adequate. A comparison of the rates charged from St. Malo to London, and from Devonshire and Cornwall, shows that, if sent in sufficiently large quantities, the railway charges are even more favourable than they would be from St. Malo.

Gooseberries are treated in like manner, and early Potatoes are grown to such an extent that in 1902 from the port of St. Malo alone Potatoes to the value of over £200,000 were exported, 1,000 tons a day being shipped during the season. The climate is not materially better than in our south-western counties or in south-west Ireland. Cauliflowers are in like manner exported in enormous quantities. Wheat-growing has largely been given up as unprofitable, but instead every imaginable source of profit is turned to account. One grower, we are told, exported to England in the year 1901 100 parcels of Parsley daily, each parcel being of the weight of 20 lb.

To show further how the French growers co-operate to capture the British market, the author gives a list of ten or a dozen syndicates formed for the express purpose of growing, collecting, and exporting to the British markets such produce as Strawberries (from Vauclose), Cherries, Pears,

Black Currants, Chasselas Grapes, Tomatoes, fruit and vegetables generally, Onions, Walnuts, flowers, Olives; and no doubt the list could very largely be extended. The syndicates combine to purchase seeds, manures, implements, at lower rates and of better guaranteed quality than they could obtain as individuals. They baffle the money-lender by establishing credit banks, from which they can obtain loans on reasonable terms; they help one another in cases of sickness or accident, they provide medical aid, old age pensions, and assistance for orphans; and in these and other ways they help one another, and do not burden the rates or live on charity.

Travelling teachers have done a great deal in stimulating the people and pointing out to them fresh sources of profit when circumstances have rendered the old ones no longer available. When the teacher is a well-educated, practical man, and has the opportunity of demonstrating the soundness of his teaching, the results, even in the most sluggish of villages, are satisfactory. From casual observations in Belgium we were enabled to judge of the value of this method of instruction long before our County Councils took up the subject; but it is evident success must depend especially on the qualifications of the teacher. A young scientist fresh from college is not likely to be listened to with respect; an ill-informed practical man is soon found to have few or no advantages that his auditory do not already possess. Education, instruction, combination of effort, energy, and enterprise seem to have very materially lessened in other countries the effects of the depressed condition of agriculture. There seems no reason why a similar conjunction should not have like effects here. Indeed, when we compare the state of horticulture in general with that of agriculture, it would seem as if the farmers had much to learn from the gardeners.

GLORIOSA GRANDIFLORA (see Supplementary Illustration).—Under its synonym, *G. Leopoldi* (*Methonica Leopoldi*), Mr. C. G. van Tubergen, Jun., Zwanenburg, Haarlem, sent a specimen of *Gloriosa*, from which our Supplementary Illustration was taken, and which is said to have been imported from the Congo, Africa. It has flowered in various gardens in this country of late years, and flowers of several forms of it have been received, all exhibiting the same light-yellow colour which as the flowers pass off is tinged more or less with pale purple. In the undulation of the segments also there is considerable variation. Most authorities include *G. grandiflora* under *G. virescens* (*simplex*), but for garden purposes it is desirable to separate it. All the species thrive well in a warm greenhouse or plant-stove if potted into large pots in spring and trained round stakes or to supports on the roof of the house. After growth is matured and the foliage has turned yellow, the plants should be dried off, and kept in their pots in a rather lower temperature than they have been grown in, receiving no water until growing time again comes round, when they should be turned out and potted into comparatively small pots. When growth commences an ample shift into the flowering-size pots should be given, and the plants placed in the positions they are to occupy. This species recently flowered at Kew, where it is known as *G. virescens* var. *grandiflora*. The form of the flower, however, is intermediate between *G. superba* and *G. virescens*, and its yellow colour gives another distinguishing feature. J. O'B.

* *The Organisation of Agriculture*. By Edwin A. Pratt. (John Murray.)

THE DAHLIA SHOW AT THE CRYSTAL PALACE.—By reference to an article in the *Gardeners' Chronicle* for May 28, 1904, p. 344, it will be seen that the Dahlia has been generally cultivated in English gardens for one century. On May 20, 1804, seeds of Dahlias were received in London by Lady HOLLAND, and these were raised and flowered the same year. Since that date Dahlias have been uninterruptedly cultivated in this country. The type most popular at the present time is that known as the "Cactus-flowered," all the varieties of which have been raised since the introduction of the variety *Juarezii* from Japan a quarter of a century ago. More than ordinary interest therefore attaches to the recent show, taking place as it did immediately after the plants have been subjected to one hundred years' cultivation in Britain. The first English-raised double-flowered variety appeared in 1805, and afterwards there began the development of the type we now know as the "Show" Dahlia, which for gardens and decorative purposes at least is rapidly losing favour. A detailed report of the exhibition will be found on p. 193; but it may be added here that of the eleven awards granted by the Society to new varieties nine were conferred on members of the Cactus-flowered type.

WASP STINGS.—Wasps are so numerous in some gardens this season it may be well to remind our readers of a very effective and old-fashioned means of overcoming the sensation of smarting left by the sting of these insects. We refer to the juice of an Onion, the application of which is of the simplest character. As soon as the sting is felt, procure an Onion, and having cut off a slice, rub it upon the affected part.

MIDLAND DAFFODIL SOCIETY.—We have received a copy of the Annual Report of this Society for 1904, and the schedule of prizes it is intended to offer at the exhibition to be held in the Edgbaston Botanical Gardens in 1905. The balance-sheet shows that the Society's finances are satisfactory. A very successful exhibition was held on April 26 and 27, at which there were 143 entries, made by thirty-six exhibitors. The pamphlet includes a report of the speeches made at the dinner, and of an interesting discussion that took place upon the "Classification of Daffodils." Copies can be obtained on application to Mr. H. SMITH, Tenby Street, Birmingham.

SIR JOSEPH DALTON HOOKER.—An excellent photograph of this eminent botanist, who, as stated on p. 10, attained to his eighty-seventh birthday on June 30, is issued as a supplement to the September number of the *Journal of Botany*.

WEBSTER'S "PRACTICAL FORESTRY."—The third edition of *Practical Forestry*, by Mr. A. D. WEBSTER, has been exhausted, and a fourth will soon be issued by the publishers, WILLIAM RIDER & SON, of the *Timber Trades Journal*. The whole work will be carefully revised and brought up to date, and several important chapters added, particularly with reference to afforesting waste lands, and the education of foresters, on both of which subjects Mr. WEBSTER gave important evidence last year before the Departmental Committee on Forestry of the Board of Agriculture.

GARDENERS' OUTING.—On Saturday, September 3, members of the Walsall Horticultural Society and the Cheslyn Hay and Great Wyrley Horticultural Society visited the Nurseries of Messrs. BAKER, Ltd., Codsall, near Wolverhampton. Altogether there were 120 persons; and the party was shown over this new establishment by Mr. T. G. BAKER, after which a luncheon was served on the upper floor of the seed warehouse. On September 5 members of the Wolverhampton Horticultural Club visited the same nurseries.

"BOTANICAL MAGAZINE."—The September number contains coloured figures and descriptions of the following plants:—

Rosa gigantea, Collett, t. 7972, see *Gardeners' Chronicle*, 1889, II., p. 12, f. 4. Flowered in the Duke of Northumberland's garden at Albury.

Dischoriste Hildebrandtii, Lindau, t. 7973, a tropical African Acanthaceous shrub with greyish ovate, shortly-stalked leaves and lilac two-lipped flowers; the lower lip is marked with purplish streaks. Kew.

Dendrobium Williamsoni, Day and Reichenbach fil., in *Gardeners' Chronicle*, 1869, p. 78. Identified by M. Rolfe, by comparison with the drawing from the type specimen in Mr. DAY's collection now at Kew, so that it is not necessary in this case to await the opening of Reichenbach's collection now, according to the extraordinary dispositions of the testator, sealed up in Vienna! The flowers are fawn-coloured, the lip having an orange blotch. Native of Assam.

Pyrus Niedzwetzkyana, Hemsley, t. 7975; see also *Gardeners' Chronicle*, 1891, I., p. 461, as *Malus Medwetzkyana*. A native of South-western Siberia, with deep rosy-lilac-coloured flowers, and conical, crimson fruit of medium size, the flesh also being red. Kew and hort., Ellacombe. The variation in the spelling is due to the author himself.

Moraea Thomsoni, Baker, t. 7976. Native of tropical East Africa; flowers stellate, pale lilac, leaves linear. Kew.

ADMIRAL G. PARKER, whose death took place at Delamore, Cornwood, S. Devon, on the 30th ult., at the age of seventy-seven, was an enthusiastic horticulturist. He was an exhibitor of Chrysanthemums at the London shows, and helped by subscribing liberally and by exhibits to make many local shows in Devonshire successful. He was also a generous supporter of the Devon Daffodil and Spring Flower Show.

GARDEN CITY ASSOCIATION.—Many of our readers may be interested in the following letter:—

"Allow me to draw the attention of your readers to a Conference on Small Holdings, which will be held under the joint auspices of the Garden City Association and First Garden City, Ltd., on the latter's estate near Hitchin, on Saturday next the 10th inst. Mr. H. RIDER HAGGARD has consented to preside, and will be supported by Mr. Alderman WINFREY, of Peterborough, whose interest in small holdings is well known. A paper will be read by Mr. THOMAS ADAMS, manager of the Garden City Ltd., on 'The Garden City Movement in Relation to Agriculture,' and a discussion will follow, in which it is hoped many who are experts upon this subject will take part.

"It is perhaps not generally realised that this is an important feature of the Garden City undertaking, whose object it is not only to arrest urban overcrowding, but also rural depopulation. The subject is too large a one for even brief treatment in a letter such as this, but we shall be greatly obliged if you will give publicity to the fact of the forthcoming Conference, in order that we may have the pleasure of sending a detailed programme and full information as to train service, &c., to those of your readers who may desire to attend. I shall be pleased to receive any enquiries at this address, and to furnish all further particulars.

"G. J. H. NORTHCROFT, *Secretary*,
"345, Birkbeck Bank Chambers, Holborn, London, W.C.
"September 2."

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his Correspondents.)

VALLOTA PURPUREA.—With reference to the remarks at p. 172, in the issue for Sept. 3, that the light-coloured and white forms of *V. purpurea* have been found to be very delicate, it may be said that in many gardens where the ordinary form is grown in quantity as decorative plants and for cutting (for both of which purposes the plant is eminently suited), it has acquired a reputation for dying out in the course of three or four years, the bulbs gradually degenerating after the second year. When first my attention was called to the matter, I could not understand why in certain gardens there were large specimens of *Vallota*

purpurea which had been there many years, blooming well annually, and with no trouble taken with them, while in others the much-desired stock degenerated. I came to the conclusion that in the case of the healthy specimens the neglect of the annual repotting to which the large batches of plants in the gardens where they were grown for decorative purposes were subjected was the chief point of difference, and as I knew from experience that frequent repotting caused the loss of many other African bulbs, surmised that this, to a great extent, was the explanation. I referred the matter to a friend in South Africa, and he informed me that *Vallota purpurea* when cultivated there invariably died if disturbed often at the root, but was always safe when kept in the same pots for as long as possible. In borders too he said they generally disappeared after a time, but if planted in confined spaces in rockeries they formed dense masses. Now that the white variety has again appeared these remarks may be useful. I advise that it be not "nursed" or repotted. Let it get pot-bound and off-sets will form. Another source of weakness in African bulbs of this class is the neglect of a dry resting season. The deciduous bulbs want no water after the leaves turn yellow, and the evergreen species but little. A period in the open-air in summer is also very beneficial. Finely sifted soil is bad for any of these bulbs, fibrous loam and peat mixed with sand are best for them. *Vallotas* are cool greenhouse plants, and any attempt to grow them in a warm, moist house or frame must result in their loss. James O'Brien.

HAWFINCHES.—Noticing Mr. J. Pentland's remarks in the issue for August 27 on the trouble caused by hawfinches and bluecaps, I have pleasure in recommending an easy and most effectual remedy. No man could have been more worried with them than I was for many years, but this is not the case now. I constantly keep among the rows of Peas some steel rat-traps, sinking them just level with the soil, but not covering them, and place some shelled Peas under the plate. Every hawfinch that visits the Peas is sure sooner or later to find the bait, and be caught, generally alive, by their strong bills. For the smaller birds, such as tits and sparrows, the smaller mouse-trap is more suitable. Half-a-dozen traps, if watched and re-set frequently, will catch scores in a week or two, and the great annoyance of seeing rows of Peas with empty shells hanging will occur no more. F. S., *Leyburn R.S.O.*

NEW VARIETIES OF HEMEROCALLIS.—Towards the end of last year I received from Herr Carl Sprenger, of Vomero, near Naples, his set of four new hybrid *Hemerocallis*, which were described by him at length in these columns on August 15 of last year, the reading of which descriptions made me desire to acquire and grow them. I have now seen them all bloom well in my own garden, and am greatly disappointed with them in every way. They may be divided into two distinct lots—one consisting of the variety named *Parthenope* (of which, if I remember rightly, the raiser seemed to have the highest opinion, and of which I think the least of the lot, as it has nothing novel about it, and is, in fact, indistinguishable from another hybrid received from Lemoine, of Nancy, under the name of *luteola*), and three named respectively *Mulleri*, *Baroni*, and *ochroleuca*, which are so like one another as in my opinion to be unworthy of separate names. They are all of pale straw-colour, like one of their parents, *H. citrina*, and show little or no trace of the other parent. W. E. Gumbleton.

FRUIT-GROWING.—Mr. Miller, on p. 174, has criticised an article of mine which originally appeared in the *Madresfield Club's Quarterly Magazine*. Everyone can appreciate criticism, provided that such is based upon facts that I have been previously plainly stated. Mr. Miller's criticisms are unfair, for he has misconstrued the facts that I stated and substituted inferences. Least of all did I say that £100,000 is annually realisable from fruit-trees when skilfully planted, &c. I cannot for one moment imagine that Mr. Miller thought so when he wrote, "In the absence of such qualifying information we presume we are right in putting that interpretation upon it,

thus yielding a most princely income," &c. Now it is this very absence of qualifying information that proves the distinction and the difference. I believe that if Mr. Miller was sent for professionally to assess the actual current value of growing trees as they stood, whether timber or fruit-trees, his judgment would be based upon both a present and a prospective estimate, but certainly not by any form of multiplied returns. The object of my original letter was to show that our experiment to convert ordinary farmers into successful fruit-growers had absolutely failed; which is much to be regretted, seeing that the interests of all parties were made as nearly mutual as possible. Besides, there was no question of "fixity of tenure" or other obstacle in the way. In this particular we are, like Mr. Miller, "wiser after the event." A different scheme is now in perspective, and we hope for better results; but time will prove. When the project is fully matured and in working order, we shall be pleased to give Mr. Miller some more statistics, for I am sure Earl Beauchamp or his tenantry will not have any desire to keep any fruit-growing secrets to themselves, so as to selfishly obtain the enormous advantage referred to by Mr. Miller. It is often said, and evidently with much truth, that anything that costs one nothing is not appreciated, and seldom succeeds. This has doubtless been one of our greatest stumbling-blocks in the past in the matter of giving trees gratuitously. *William Crump, Madresfield Court.*

POTATO ELDORADO.—In the spring of the present year, Mr. Henry Drew, of Peamore, near Exeter, planted in good Potato soil in his garden three sets made out of a tuber which weighed 5 oz. He put out the plants at distances of 3 feet from each other. On August 25 the crop was lifted. There were 18 lb. of good saleable-sized tubers, many of them large, some weighing over half a pound each; also 2 lb. of small tubers. There was not a diseased tuber in the lot, nor was there any sign of disease in the haulm, which was strong and tall. The crop works out at 64 lb. return for 1 lb. planted. The tubers were oval kidney-shaped, some slightly rough in the skin, white, and to all appearance of fine quality. Near the Eldorados were some Northern Star Potatoes. On digging a trial plant or two, it was noticed that the proportion of small tubers was considerable, much exceeding the proportion prevailing in the Eldorado. *A. H.*

A WONDERFUL PEAR-TREE.—In my garden there is an old tree of the variety Williams' Bon Chrétien. It is at least fifty years old. A foot from the ground it has a girth of 4 feet 2 inches. This Pear-tree has never failed to fruit abundantly, excepting last year, when a late frost destroyed the Pear bloom almost everywhere. During my occupation of this place, up to and including 1902, the yield of fruit was abundant. It sufficed for the house and for friends, and also for blackbirds and starlings. This year the show of bloom was phenomenal, yet the crop of fruit is a very poor one. *E. Bonavia, M.D., Worthing.*

NECTARINE HUNT'S TAWNY.—Being in the neighbourhood of East Grinstead last week, I called on Mr. Clarke, fruit-grower and nurseryman. Mr. Clarke has some fine Peach-trees under glass; he has sent to Covent Garden this season 11,000 Peaches. In his long span-roofed Peach-house are two trees of Hunt's Tawny Nectarine. The crop of these two trees has realised £33. Anyone about to plant for market purposes ought to make a note of this fine Nectarine, the demand for the fruit being unlimited. *W. F. Bowman, 25, Cambridge Street, Tunbridge Wells, Aug. 29.*

SCARLET RUNNER BEANS AND BEES.—Your correspondents, on p. 175, believe that bees have spoilt their crops of Scarlet Runner Beans. I think they will have to seek another cause. During this season we have had about fifty strong stocks of bees in various parts of the gardens, and being an agricultural rural district, bumble-bees are also very numerous, yet in spite of these facts we never had better Scarlet Runners. Our principal row was 70 yards in length, and the plants are 10 feet in height. Half the row was planted with Sutton's A1, and the remaining half with Sutton's Scarlet. We have had and still have an abundance of Beans. The seeds were sown on April 7, and on the approach of the

great drought I mulched them with manure from a spent hot-bed. I think the cause of failure in the cases mentioned on p. 175 were those thirteen consecutive cold nights recorded by your West Herts correspondent, Runner Beans being very sensitive to cold nights. *R. M., Newbury, Sept. 6, 1904.*

— I was surprised to see in last week's issue such poor accounts of Runner Bean crops. I think if gardeners would syringe their Beans each night and morning in hot weather, in addition to applying plenty of water at the roots, they need not fear bumble or other bees. Although the flowers on my Beans have been riddled with holes made by bees, I have never failed to get good sets. Beans, Celery, and Tomatos should never be allowed to have their roots dry, from the time the seeds are sown until they are gathered. I enclose a sample of Beans for inspection. The variety is Cannells' Exhibition. *A. M. P., Chesham.* [A very fine sample showing that almost all the flowers set well. *Ed.*]

— With reference to Mr. J. W. Miles' remarks on p. 175 concerning Runner Beans, "that the high temperatures recorded this season are the cause of their failing to set," and that this is not due to bumble-bees piercing the calyx, I am forwarding a few flowers for your inspection; and you will find that almost every flower, except those in the early stages of growth, are pierced close to the calyx. I have watched very closely, and find that the bumble-bees make no attempt to get into the centre of the flower, but make for the same part on the outside of every flower they alight on. *T. Rennie, Hopwood Hall Gardens, Middleton.* [Many of the flowers were undoubtedly pierced in this manner. *Ed.*]

BOWKERIA TRIPHYLLA.—There is now in flower, in a garden on the undercliff of the Isle of Wight, the very rare and interesting Cape shrub *Bowkeria triphylla*. The flowers in form are somewhat like a *Calceolaria*. The plant is figured by Harvey in the first volume of his *Thesaurus Capensis*, on plate 37. *W. E. Gumbleton.*

GLADIOLUS PRIMULINUS.

This tall-growing species of *Gladiolus* (fig. 74) was shown by Francis Fox, Esq., Alyn Bank, Wimbledon, at a meeting of the Royal Horticultural Society on the 23rd ult., where it attracted considerable attention. The peduncles are from 2 to 3 feet in height, bearing six or more primrose-yellow-coloured flowers, the posterior segments of which forms a hood over the essential organs. The plant is found in the immediate neighbourhood of the Victoria Falls, on the River Zambesi, the spray of the Falls completely covering the plant at times, and obtaining for it the name of "Maid of the Mist." The species was first described by Mr. J. G. Baker in the *Gardeners' Chronicle* for August 2, 1890, p. 122, and only differs from *G. Quartianus*, figured in the *Botanical Magazine*, t. 6739, in the colour of the flowers. Further particulars were given in the *Gardeners' Chronicle*, August 27, 1904, p. 155.

PUBLICATIONS RECEIVED.—*Journal of the Department of Agriculture of Western Australia*, July. Contents: Silver Eyes (*Zosterops Gouldi*); these birds seem doomed to extinction for their alleged ravages upon Grapes; Report on State Farm, Hamel; Trial Shipment of Grapes to England (not very satisfactory); Ear-cockle (*Tylenchus tritici*) in Wheat, &c.—*Agricultural Bulletin of the Straits and Federated Malay States*, June. Contents: Introduction of the Cotton Industry into Netherlands-India, by Dr. K. W. Tromp de Haas; Market Reports, Meteorological Returns, &c.—*The Agricultural Journal of the Cape of Good Hope*, August. Contents: Rural Cape Colony, illustrated (continued); Codlin Moth, Grasses for Trial in Cape Colony.—*The Agricultural Gazette of New South Wales*, July. Contents: Work with the Peach aphid (*A. persicae niger*); W. Froggatt; Useful Australian Plants (*Eragrostis Brownii* and *E. diandra*); J. H. Maiden; A New Weed (*Collomia grandiflora*); Notes on Forestry, Orchards, &c.—*Transactions of the Massachusetts Horticultural Society* for 1903, Part II. Notices the exhibitions held under the Society's auspices, and much useful work done with regard to School Gardens.—From the United States Department of Agriculture, Bureau of Plant Industry, Bulletin No. 61: *The Avocado in Florida*, its Propagation, Cultivation, and Marketing, by P. H. Rolfs; Bulletin No. 62, *Investigations of Rusts*, by Mark Alfred Carleton, and Bulletin No. 63, *Notes on Egyptian Agriculture*, by George P. Foaden. All these three are well illustrated.

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 6.—The usual fortnightly meeting of the Committees was held on Tuesday last in the Royal Horticultural Hall, Vincent Square, Westminster. A better display was made than that on the previous occasion, and the Hall was moderately furnished with exhibits throughout. At the same time there were obvious indications that the holiday season still reigns, and the number of visitors to the Hall was therefore comparatively small.

THE FLORAL COMMITTEE recommended seven Awards of Merit to new varieties of flowering plants, including four varieties of Dahlia, a double-flowered tuberous-rooting Begonia especially valuable for massing in beds, a variety of Pink, and a hybrid Campanula obtained from *C. pyramidalis* and *C. carpathica*. The principal groups before this Committee were composed of Cannas, Roses, herbaceous Phlox, tuberous-rooting Begonias, Ferns, and hardy flowers.

THE ORCHID COMMITTEE recommended one Botanical Certificate and one Award of Merit.

The only novelty that gained an Award from the FRUIT AND VEGETABLE COMMITTEE was a new variety of Raspberry.

At a meeting in the afternoon there were eighteen new Fellows admitted to the privileges of the Society, and a Lecture on "Gourds" was given by Mr. ODELL.

Floral Committee.

Present: W. Marshall, Esq. (Chairman); and Messrs. C. T. Drury, H. B. May, R. Dean, J. F. McLeod, R. Hooper Pearson, Jno. Jennings, Jas. Hudson, C. R. Fielder, Chas. Dixon, W. Bain, C. E. Shea, A. Perry, W. Cuthbertson, Geo. Nicholson, C. E. Pearson, J. W. Barr, R. C. Notcutt, H. J. Jones, W. P. Thomson, E. H. Jenkins, W. J. James, Ed. Mawley, Geo. Paul, Chas. Bick, and W. Howe.

Messrs. H. CANNELL & SONS, Swanley, Kent, set up a magnificent group of Cannas in all the newer and finer varieties, arranging the plants in a semi-circular group. The variety J. B. van der Schoot has large yellow flowers, pleasingly marked with scarlet spots; Oscar Dannecker has large flowers of a reddish-orange colour, merging to yellow at the margins. C. Molin, Niagara, Miss Amy Ker, Comte Reine Claude Brailles, Duke Ernest, R. Wallace, and Jean Tissot are but a few of the best varieties in this commendable collection. (Silver-gilt Flora Medal).

Although it is late in the season for Roses, a very charming display of these flowers was shown by Mr. GEO. PRINCE, Longworth, Berks, in vases, epergnes, trays, &c. The varieties White Maman Cochet and Mildred Grant were shown well. *Rosa pomifera* was shown in fruit; the fruit resembles ripe Gooseberries. Fruits of *Rosa rugosa* were used as an edging (Silver-gilt Banksian Medal).

Messrs. J. HILL & SON, Barrowfield Nurseries, Lower Edmonton, staged a collection of Ferns running the entire length of one of the outer tables. This exhibit contained well-grown specimens of many of the rarer and more interesting species, including several of the coloured section—*Gymnogrammas*—gold and silver forms; *Adiantum macrophyllum*, *A. m. albostratum*, *A. Farleyense*, *Lomaria L'Herminieri*. Among the more noticeable plants were *Platyterium Hillii*, *P. Veitchii*, &c. (Silver Banksian Medal).

Mr. H. B. MAY, Dysons Road Nursery, Upper Edmonton, staged a miscellaneous group of Ferns, various greenhouse plants, *Bouvardia*, *Veronica Hendersonii*, &c. *Gymnogrammas* were shown well—*G. grandiceps superba*, *G. Wettenthaliana*, *G. Mayii*, &c.

Messrs. W. M. BULL & SONS, King's Road, Chelsea, exhibited foliage plants, including *Cyanophyllum magnificum*, *Talisia princeps*, *Davidsonia puriens*, *Phyllostenium Lindenii*, *Dracaena* in variety, &c.

Tuberous-rooting Begonias were shown by Messrs. BLACKMORE & LANGDON, Twerton Hill Nurseries, Bath. Several baskets contained the free, smaller-flowering varieties used for bedding purposes (see "Awards"). A number of flowers of the larger type, in single and double varieties, of the most beautiful shades of colour were also staged by the same firm. (Silver Flora Medal).

Mr. AMOS PERRY, Winchmore Hill, London, N., staged an extensive collection of hardy flowers,

comprising most of the showier members in flower at this season.

Messrs. JOHN PEED & SON, West Norwood, London,

Messrs. R. WALLACE & Co., Kilnfield Gardens, Colechester, staged several species of Liliums, vases of Tritomas, Gladioli, Asters, Colchieums, Gazanias, &c.

Messrs. BARR & SONS, 11, 12, and 13, King Street, Covent Garden, London, set up a collection of herbaceous flowers — Gladioli, Antirrhinums, Liliums, Kniphofias, &c. We noticed a fine batch of Vallota purpurea. A number of pot plants of the Chinese Aster included many pretty and useful forms of these summer bedding plants. Several hardy Nymphaeas were displayed in trays.

Messrs. R. & G. CUTHBERT, Southgate, staged an extensive exhibit of Liliun longiflorum, arranging their plants on the floor of the Hall.

Messrs. GUNN & SONS, Olton, Birmingham, staged vases of bloom of Phlox decussata, massing the bunches to form literal banks of colour. The size of the individual flowers was good, and the colours were well developed. The group would perhaps have been more effective if displayed in a lighter and more artistic manner (Silver Flora Medal).

Mr. B. LADHAMS, the Shirley Nurseries, near Southampton, presented vases of hardy Lobelias, perpetual-flowering Pinks (see Awards), and Gaillardias. The Gaillardias were shown in fine character, and of various shades of yellow colour, &c.

DAHLIAS.

Several new Pompon Dahlias were presented by Mr. CHAS. TURNER, Royal Nurseries, Slough. The variety Queen of Whites is a good one, San Toy (having petals tipped with magenta), and others were attractive.

Mr. H. SHOESMITH, Westfield, Woking, Surrey, also sent several seedling Cactus Dahlias, including Jeanette (a pleasing yellow), W. Hopkins (see Awards), F. Wellesley (white), &c.

Messrs. J. STREDWICK & SONS, Silver Hill Park, St. Leonards, staged nine new Dahlias, all of the Cactus type, including J. B. Riding (see Awards), Ella Kraemar (pleasing refined flower of rosy-pink colour), Fairy (white) (see Awards), Thomas Parkin, &c.

Mr. S. MORTIMER, Farnham, Surrey, exhibited several new Cactus Dahlias. Vivid is a very bright scarlet flower, Alexander is also a good flower (dark-crimson), Starlight is of pleasing pink colour, the flower standing well above the foliage.

Messrs. CHEAL & SONS, Crawley, exhibited Dahlias of Pompon, Cactus, and Single-flowered types. Of the Pompon varieties, Madeline, Nerissa, Cyril, and Queen of Whites were commendable. Several stands contained flowers of the Cactus type—Dainty (a pleasing flower), H. F. Robertson (good yellow), Orion (new), &c. A tray of single Dahlias also contained some effective flowers (Bronze Flora Medal).

MISCELLANEOUS.

Three new varieties of Begonia Rex were shown by Messrs. SANDER & CO., St. Albans. That named Mrs. H. G. Moon has very pleasingly marked leaves.

Sir TREVOR LAWRENCE, Burford, Dorking, sent three large inflorescences of Ixora macrothyrsa (Duffi). The heads of flowers were nearly 18 inches in diameter, and the colour bright scarlet (Cultural Commendation).

Messrs. W. WELLS & Co., Ltd., Earlswood, Redhill, set up a number of vases of early-flowering Chrysanthemums in many pleasing colours. September Gold, a new variety, is commendable, being of a deep yellow colour, and having large, compact blooms.

Messrs. JAMES CARTER & Co., High Holborn, London, exhibited flowers of their Empress strain of Petunias on boards, relieved with sprays of Maidenhair Fern.

Mr. DAVID RUSSELL, The Essex Nurseries, Brentwood, staged a collection of Erias in pans and baskets, together with well-berried plants of Berberis vulgaris, Cotoneaster microphylla, &c.

G. BAXTER, Esq., Hutton Park, Brentwood (gr., Mr. H. Holloway), exhibited a grand specimen plant of Davallia fijiensis, growing in a large tub (Cultural Commendation).

Messrs. J. VEITCH & SONS, Chelsea, staged a well-flowered batch of Dedaalacanthus parvus.

AWARDS OF MERIT.

Tuberous-rooting Begonia Argus.—A bright scarlet-coloured Begonia of compact and free-flowering habit. The plants throw their double flowers well up to view, and hold them erect without any support. It will make a very effective variety for planting in beds. The female flowers, as is usual, are single. From Messrs. BLACKMORE & LANGDON, Twerton Hill Nursery, Bath.

Campanula × *Fergusonii*.—This is a garden hybrid between *C. pyramidalis* and *C. carpathica*, and resembles the former in habit, but is dwarfier in growth, being about 18 inches in height. The flowers are of bright but rich lilac colour, being intermediate between those of the two parents. The petals are more pointed

FIG. 74—GLADIOLUS PRIMULINUS: COLOUR OF FLOWERS PALE YELLOW. (SEE P. 190.)

also staged a large group of herbaceous flowers, and presented several trays containing pot plants of dwarf succulents, Saxifragas, Herniaria glabra, &c., suitable for the rockery and for bedding purposes.

A basket of Sternbergia lutea major, with flowers of deep yellow colour, was very noticeable. A fine spike of Watsonia rosea, and flowers of Crinum Powellii were prominent (Silver Banksian Medal).

than those of *C. carpathica*. From G. FERGUSON, Esq., Weybridge.

Dahlia (Cactus) Fairy.—A white flower with slight greenish-yellow centre; small in size, of excellent shape, and true cactus character.

Dahlia (Cactus) J. B. Riding.—One of the most distinct of the new varieties of the present year; colour bright orange-salmon with yellow centre; a large and attractive flower. The two foregoing varieties were from Messrs. J. STREDWICK & SON, Silverhill, St. Leonards.

Dahlia (Cactus) Wm. Hopkins.—One of the best dark-coloured varieties of the season; colour bright crimson slightly shaded in the centre with maroon. A highly refined flower of true Cactus shape, in which all the florets are handsomely quilled. From Mr. H. SHOESMITH, Florist, Woking.

Dahlia (Pompon) Edina.—A small, compact, and finely-formed flower, of a rich and bright yellow colour with slightly darker shading in the centre. From Mr. C. TURNER, Royal Nurseries, Slough.

Pink, Florence.—A variety of Pink which is said to bloom through several months of the year. The flowers are white, with a dark crimson centre; the florets are slightly toothed, fragrant. The variety is described as of very free-blooming habit, but only cut specimens were shown. From Messrs. B. LADHAMS & SON, Shirley Nurseries, Southampton.

Orchid Committee.

Present.—Harry J. Veitch, Esq., in the Chair, Baron Shroeder, Jas. O'Brien (Hon. Sec.), De B. Crawshaw, H. Ballantine, J. W. Potter, W. Boxall, W. H. Young, J. W. Odell, H. A. Tracy, T. W. Bond, G. F. Moore, J. Douglas, H. Little, and W. A. Bilney.

Messrs. JAS. VEITCH & SONS, Chelsea, were awarded a Silver Flora Medal for an interesting and effective group of showy hybrid *Laelio-Cattleyas*, *Laelias*, &c. made up of several good forms of *L.-C.* × *blechleyensis* and *L.-C.* × *callistoglossa*, the handsome light-rose, fringed-lipped *L.-C.* × *Mad. Chas. Maron* (*C. Warscewiczii* × *L. Digbyana*), *L.-C.* × *splendens*, *L.-C.* × *Bryan*, *L.-C.* × *Nysa*, *L.-C.* × *Haroldiana*, *L.-C.* × *Parysatis*, *Cattleya* × *Pittiana*, *Laelia* × *Pacavia*, *Cypripedium* × *H. Ballantine*, &c.

Messrs. SANDER & SONS, St. Albans, secured a Silver Flora Medal for a varied group of hybrids and species. Among the latter were four good specimens of *Phalenopsis Esmeralda*, bearing collectively a dozen elegant spikes of rose-coloured flowers; a singular *Lycaste*, with long, narrow, brownish sepals and cream-white petals and lip, allied to *L. Schilleriana*; the fringed-lipped *Chondrorhyncha Chestertoni*, *Brassia verneosa*, *Calanthe veratrifolia*, and several forms of *Cypripedium* insigne, that named "Emerald" having a distinct apple-green-coloured upper sepal, with large purplish-brown blotches. The hybrids included several varieties of *Laelio-Cattleya* × *callistoglossa*, *L.-C.* × *Hy. Greenwood*, *L.-C.* × *blechleyensis*, *L.-C.* × *blesensis*, *Cypripedium* × *Memnon*, and an effective unnamed hybrid resembling *C.* × *Harrisianum*, but with the bright rose-tinted dorsal sepal of *C.* × *enanthum*.

The Hon. WALTER ROTHSCHILD, M.P., Tring Park (gr., Mr. A. Dyre), was awarded a Silver Banksian Medal for a group of pretty and curious *Masdevallias*, &c., including *M. maculata superba*, a decided improvement, if not specifically distinct from the smaller type; the velvety-purple *M. melanoxantha*, *M. intraeta*, *M. vespertilis*, *M. Peristeria*, *M. Burbridgeana* (see Awards), *Restrepia leopardina rosea*, *R. striata*, *R. elegans*, *Aëranthus zygopetaloides*, the bright reddish-scarlet form of *Laelia flava*, the very extraordinary *Nanodes Mantinii*, and an inflorescence of the rare and showy *Bulbophyllum Ericssonii*.

Messrs. HUGH LOW & CO., Enfield, secured a Silver Banksian Medal for a good group, including *Phalenopsis violacea* Low's variety, in which the labellum is almost entirely of a bright violet colour; *P. denticulata*, cream-white barred with cinnamon-brown; the pink *P. Sanderiana*, and *P. Esmeralda*; a good, slightly spotted *Odontoglossum crispum*, with twenty flowers on a spike; *Cattleya Gaskelliana alba*, *C. eldorado enfieldensis*, *C. granulosa*, and two forms of *C. Grossii*, the larger being a fine flower with dark brown sepals and petals spotted with purple on the tips, and very broad rose-purple labellum. Also in the group were *Dendrobium Phalenopsis Schroederianum*, and a very distinct bluish-white form of it; *Aerides Lobbi*, *Laelio-Cattleya* × *Ingramii*, &c.

J. GURNEY FOWLER, Esq., Glebeclands, South Woodford (gr., Mr. J. Davis), showed *Cypripedium* × *Transvaal superbum* with very fine and richly-marked

flowers, and cut examples of the very handsome *C.* × *l'Ansonii*, *C.* × *Veitchio-Morganie*, and *C.* × *callo-Rothschildianum*.

GURNEY WILSON, Esq., Glenthorne, Haywards Heath, showed an imported piece of *Cattleya Loddigesii* with two pseudo-bulbs, the leading one of which had produced a splendid inflorescence of ten large, bright rose-pink flowers.

C. L. N. INGRAM, Esq., Elstead House, Godalming (gr. Mr. T. W. Bond), showed *Cattleya* × *Pittiana* "Marshal Oyama" (*granulosa* × *Dowiana aurea*) with cream-white flowers tinted with rose and with a rose-purple labellum.

R. I. MEASURES, Esq., Camberwell (gr. Mr. Smith), sent *Zygopetalum* × *Max-Jorisi* (*Maxillare* × *Jorisanum*), the flowers of which have narrow segments; the sepals, petals, and column are green marked with brown; lip white, with blue at the base.

Captain G. L. HOLFORD, Westonbirt (gr., Mr. Alexander), showed the fine *Zygo-Colax* × *Wiganianus*, Westonbirt variety, similar to *Z. W. superbus*, illustrated in the *Gardeners' Chronicle*, March 8, p. 156. Sepals and petals finely marked with chocolate-purple; lip violet-blue with some white markings.

AWARDS.

AWARD OF MERIT.

Cattleya × *Iris*, Westonbirt variety (*bicolor* × *Dowiana aurea*), from Captain G. L. HOLFORD, C.I.E., Westonbirt, Tetbury (gr., Mr. Alexander). A very distinct form of this favourite hybrid, three varieties of which, all with bronzy sepals and petals, have previously received awards. In the Westonbirt variety the sepals and petals are greenish-white, delicately tinged and slightly veined with rose. The showy labellum, which, as in the other forms, shows strong indications of *C. bicolor*, is bright rose-purple.

BOTANICAL CERTIFICATE.

Masdevallia Burbridgeana, Rolfe, from the Hon. WALTER ROTHSCHILD, M.P.—A distinct and pretty species, first flowered with Mr. F. W. Moore, A.L.S., in the Royal Botanic Gardens, Glasnevin, Dublin, and named in honour of Mr. F. W. Burbridge, M.A., Curator of Trinity College Garden, Dublin. The habit of the plant is that of a small *M. chimera*; its flowers are nearest to those of *M. Chestertoni*. The perianth is greenish-yellow irregularly marked with chocolate-purple, and studded with yellowish-white hairs, each segment being terminated by a purple tail an inch long. The ovate, saccate labellum is yellowish-white, with thickened, raised yellowish lines in the interior. It is a well-defined species, much stronger than *M. Chestertoni*, and producing an inflorescence as in *M. chimera*, from which, however, the flowers differ widely.

Fruit Committee.

Present: A. H. Pearson (in the Chair); and Messrs. F. Q. Lane, J. Jaques, Owen Thomas, E. W. Gilbert, H. J. Wright, G. Kelf, J. Basham, W. Pope, A. Dean, S. Mortimer, W. Bates, J. McIndoe, and Jos. Cheal.

Messrs. WM. PAUL & SON, Waltham Cross, brought an extensive collection of fruiting trees in pots, comprising Apples, Pears, Plums, Peaches, and Nectarines. The trees were well cropped and of clean appearance, forming altogether a meritorious group, although the fruits were a little lacking in colour, due probably to many of the varieties being somewhat immature. A collection of Apples was also displayed in dishes, in which were fine examples of Warner's King, Bramley's Seedling, Tyler's Kernel, Wealthy, Cox's Pomona, Bismark (excellent), The Queen, &c. (Silver-gilt Knightian Medal).

Twelve good dishes of early Apples came from the Castle Gardens, Highclere, Newbury (gr., Mr. POPE); also some grand specimens of Peasgood's Nonsuch, large and well coloured, with a fine bloom on the fruits. Among the dessert Apples were good examples of Duchess of Oldenburgh, Lady Sudeley, Beauty of Bath, Irish Peach, Quarrenden, &c.

In anticipation of the lecture several persons staged collections of Gourds, one from Mrs. BRIGHTWEN, The Grove, Stanmore (gr., Mr. Odell), being a very representative collection, including *Trichosanthes cucumeris*, *Lagenarias*, *Momordica* in several species, the interesting *Benincasa cerifera* with its white coating of wax, the *Luffa aegyptiaca*, *Cucumis myriocarpus*, the Gooseberry-Gourd, &c. (Silver Knightian Medal).

Another interesting exhibit of these fruits came from the gardens of HARRY J. VEITCH, Esq., East Burnham Park, Slough; also one from Captain SPEER, Sandown Lodge, Esher (Bronze Knightian Medal); and a small collection from the HORTICULTURAL COLLEGE, Swanley, Kent.

Adjoining the last-named exhibit was a very extensive collection of these curious fruits, shown by F. FERGUSON, Esq., The Hollies, Weybridge (gr., Mr. F. W. Smith) (Silver Banksian Medal).

Mr. GEO. KENT, Norbury Park Gardens, Dorking, sent a red-fleshed Melon named Norbury Park Hero.

A dish of Apples "Ottaway's Pippin" was shown by Mr. ARTHUR OTTEWAY, Swanley. The fruits are pale-coloured, medium sized, juicy, with a very crisp, sharp flavour.

Mr. GEO. PENWILL staged fruits and photographs of his new Raspberry "Penwill's Champion."

Mr. J. B. COLWILL, Sidmouth, presented a box of fruits and fruiting branches of Raspberry "Red Diamond" (see Awards).

Two new white Grapes came from Mr. W. ALDRIDGE, Teddington, and from Mr. E. W. GILBERT, Potsdam, Germany, respectively. That from Mr. ALDRIDGE, named "Edith Seedling," had small berries somewhat resembling those of Chasselas Napoleon, but possessed little flavour. The other Grape exhibited, "Drachenberger Seedling," was also poor in flavour, and in appearance was somewhat like the variety Buckland Sweetwater.

Mr. CHAS. ROSS, Welford Park Gardens, Newbury, presented two seedling Apples, and a Seedling Plum named Triumph. Of the Apples, the variety aptly named Ruddy is a large-sized fruit with strikingly high colour. This will be a useful variety for early purposes, as the fruits even at this early period were over-ripe and passed their best. Providing it has good cropping qualities, this variety should prove a valuable addition for early market purposes; its fine appearance would ensure for it a ready sale.

Mr. W. ROUFELL, Roupell Park, Norwood, showed a basket of Bietigheimer Apples. The large irregular fruits are of an unique pale rose colour (Cultural Commendation).

Messrs. JAS. VEITCH & SONS, Chelsea, staged a new Tomato, Gilbert's Seedling. The variety is a prodigious cropper, as was seen from the bunches exhibited, but the colour was not attractive, being dull red.

Another variety of Tomato was shown by Mr. H. SEWARD, Hanwell, named Hanwell Victory. This is an admirable type of this popular fruit, being of rich colour, good shape, desirable size, and a free bearer.

A dish of Runner Beans named Sydmonton Exhibition, was brought by Mr. LYE, Sydmonton Court, Newbury. This was an excellent type of Bean, the pods measuring 12 inches or more in length (Cultural Commendation).

AWARD OF MERIT.

Raspberry "Red Diamond."—A large conical fruit, of a deep-red colour, good in flavour, and useful for affording late supplies; a prolific cropper. Shown by Mr. COLWILL, Sidmouth.

LECTURE ON "GOURDS."

THE lecture on this occasion was one by Mr. J. W. ODELL, on the subject of "Gourds." The lecturer commenced by alluding to the mention of Gourds in Biblical history, and proceeded to speak of various interesting characteristics of these plants, particularly their apparent mimicry of other fruits, such as the Gooseberry, Apple, Orange, &c., the fruits of some of the Cucurbits being exceedingly similar in superficial appearance to the fruits named. Mr. Odell remarked that all the species and varieties of Cucurbitaceae cross with each other very readily, but he had been unable to obtain fertile seeds from any bigeneric cross, showing that if the genera are capable of crossing with each other it is a very difficult process.

The lecture was abundantly illustrated by thirty-six lantern-slides. Some of the first of these that were shown illustrated the manner in which Gourds are ornamented by dwellers on the South Coast of Europe, and in a different manner by the natives on the West Coast of Africa. The economic value of Gourds was shown by reference to the great variety of utensils made from them, and to the culinary uses they are put in America and other countries. Mr. Odell said since the new American and French varieties had been introduced, he thought that some of the Pumpkins and Squashes might be cultivated more commonly in England for the purpose of drying for consumption in winter. But the main purpose of the lecture was to draw attention to the value of Gourds for the decoration of the kitchen-garden, where they have a very attractive appearance, if trained over a pergola. Some species are suitable for cultivation in the stove, as may be seen in the warm Nymphaea-house at Kew. The fruits were recommended for use at Harvest Festival decorations, and Mr. Odell said that a few selected fruits arranged on a metal dish, and placed on the side-board in the hall of a dwelling-house, had a good effect. For the purpose of furnishing a pergola,

seeds should be sown in the first or second week in April. Pot off the seedlings into light soil, and after hardening them gradually, plant them into their permanent positions early in June, preferably in soil that is very rich and moderately light in character. If strong, sturdy plants are obtained by the commencement of June, it is possible to furnish completely a pergola of considerable size during the season, and the variety in colour and form exhibited by the suspended fruits will be most attractive. Mr. Odell showed a number of lantern slides prepared from photographs, in order to illustrate the effect the plants have in the positions for which he recommended them. One of these was similar to the illustration at fig. 75, which is reproduced from a photograph taken in the Cambridge Botanic Gardens.

ment of the flowers. No fewer than eleven novelties were recognised by the Committee, and of these nine were of the Cactus type.

The attendance on the first day was very small, and it is to be regretted that greater support is not given to the Society, whose influence is exerted towards the development and improvement of this showy flowering plant.

NURSERYMEN'S SECTION.

Show Dahlias.—In the Class for forty-eight distinct varieties of *Show Dahlias* there were three entries. Mr. S. MORTIMER, Swiss Nursery, Farnham, Surrey, winning 1st prize with a splendid collection of blooms, including the varieties Perfection, Standard, Reliance, Chieftain, Miss Cannell, Geo. Rawlings, Jos. B.

crimson), Countess, T. S. Ware, Mr. John Down (an unique scarlet sport, tubes of the petals very restricted), Duchess of York, Diadem, Maud Fellowes, Excellent, Southern Queen, Shirley Hibbard, &c. Mr. G. HUMPHRIES, Kingston Langley, Chippenham, was 2nd, prominent among whose collection were Mrs. Gladstone, Diadem, Perfection, Duchess of York, and Arthur Rawlings. Mr. M. V. SEALE, Vine Nurseries, Seven-oaks, was 3rd. There were five exhibitors in this class.

FANCY DAHLIAS.

For Eighteen distinct Blooms of "Fancy" varieties there were only two competitors, Mr. S. MORTIMER, Farnham, Surrey, and Mr. JOHN WALKER, Thame, Oxon, who were placed 1st and 2nd respectively. Mr. MORTIMER's collection included Dorothy, Mrs. Mortimer, Henry Glassecock, Duchess of Albany, John Forbes, Edmund Boston, Mrs. John Downie, Dandy (a good bloom), Henry Clark, Frank Pearce, Dazzler, Professor Fawcett (of excellent shape), Mrs. Reggie Green, Rev. J. B. McCamm, Chas. Turner, Buffalo Bill, Novelty (a pleasing bloom, light rosy ground and claret-coloured stripings), and Plutarch. Mr. WALKER's exhibit was not much inferior to the 1st prize collection and contained some excellent flowers.

Twelve distinct Fancy Blooms.—There were four exhibitors, 1st honours falling to Mr. WILLIAM TRESEDER, Cardiff, who staged, among others, Prince Henry, Comedian, Mrs. Saunders, Frank Pearce, Sunset, Dorothy, &c. Mr. G. HUMPHRIES, Kingston Langley, Chippenham, was 2nd; and Messrs. KEYNES, WILLIAMS & Co., Salisbury, 3rd.

Show and Fancy intermixed. There were seven exhibitors in this class, and 1st prize was won by Mr. WILLIAM TRESEDER, whose blooms were of fine form, colour, and substance, and included Mrs. W. Slack, Mrs. David Sanders, Excellent, Norma, Daniel Cornish, Mrs. Saunders, Shottesham Hero (grand flower), Rebecca (a dark magenta-coloured sport), Duchess of York, Standard (a new dark scarlet), Goldfinder, and Gracchus. Messrs. F. TAYLOR & SONS, Kingham Nurseries, Chipping Norton, were 2nd, whose blooms of Marjorie and Prince of Denmark were excellent. 3rd, Mr. WM. TRESEDER.

CACTUS DAHLIAS.

The leading feature in this popular section, and that for which one of the most valuable and coveted trophies of the Society is presented, was the class for eighteen varieties, with six blooms of each variety. The 1st prize included a valuable Silver Challenge Cup. There were three competitors, and competition was keen, but the judges awarded Messrs. J. STREDWICK & SON, Silverhill Park, St. Leonards, 1st honours, whose varieties were all of lighter shades, with the exception of Alfred Morgan (rich scarlet). The other varieties were H. J. Jones, Rainbow, Geo. Gordon, Thomas Parkin, Radium, England's Queen, Mrs. H. L. Brousson, Tricolor, J. B. Riding (one of the finest new Dahlias exhibited at the show), H. F. Robertson, Comet, Columbia, Lady Colin Campbell, Ella Krammar, Florence M. Stredwick, Pearl, and Antelope. Messrs. J. CHEAL & SONS, Crawley, were 2nd; and Messrs. KEYNES, WILLIAMS & Co., Salisbury, 3rd.

Twelve distinct varieties, six Blooms in each bunch.—Competition was keen among seven exhibitors in this class, but the final decision was given in favour of Mr. H. SHOESMITH, Westfield, Woking, he having excellent examples of Ben Nash, T. Stevenson, Mrs. E. Mawley, W. E. Dickson, H. W. Sillem (grand flowers, rich scarlet), W. Hopkins, J. W. Wilkinson (a very fine bunch), Mrs. S. T. Wright (new), Phyllis, Amy, Mrs. Frances Wellesley, and Miss Dorothy Oliver. Mr. G. HUMPHRIES, Kingston Langley, Chippenham, was 2nd; Mr. S. MORTIMER, Farnham, 3rd.

For forty-eight Blooms, distinct. There were but two exhibitors, Messrs. JAMES STREDWICK & SON and Messrs. KEYNES, WILLIAMS & Co., who won 1st and 2nd prizes in the order named; although there was but little to choose between their respective groups, the winner had somewhat brighter and more refined flowers; Vulture, Violetta, Mrs. Keith, J. H. Jackson, Mrs. H. L. Brousson, Rainbow, W. P. Wright, The Czar, Marconi, Comet, Wheatear, J. W. Wilkinson, Columbia, and Apriote, were the more commendable of the flowers in the premier group. The flowers were arranged on exhibition boards.

Twenty-four Blooms distinct.—No fewer than seven growers entered. Mr. WILLIAM TRESEDER won 1st prize after a close struggle with Mr. J. WALKER, Thame, who was placed 2nd; Mr. S. MORTIMER, Farnham, being 3rd. The 1st prize exhibit included Mrs. J. J. Crowe, Mrs. Wilkinson, J. H. Jackson, Imperator, Phineas, Ianthe, Mrs. Carter Page, Mrs. E. Mawley, Mrs. Clinton, Mrs. Winstanley, Vesta, Violetta, W. F. Balding, Sheriff Henderson, T. G. Stredwick, Princess, H. T. Robertson, Etna, Decima, Columbia, F. M. Stredwick, Ringdove, Gladiator, and Minnie West. Mr. WALKER's collection contained many refined flowers.

Twelve Varieties, six Blooms of each.—These were to be arranged with any suitable foliage, grasses, or berries, and the display was pretty. The 1st prize group was set up by Mr. M. V. SEALE, Vine Nurseries, Seven-

FIG. 75.—A PERGOLA FURNISHED WITH GOURDS.

NATIONAL DAHLIA.

Centenary of Dahlia Cultivation in Britain.

SEPTEMBER 2 and 3.—The annual exhibition of the National Dahlia Society this year marks the centenary of Dahlia cultivation in Britain, see p. 189. It was held at the Crystal Palace, the large recess opposite the grand organ being filled with choice exhibits of this popular flower. The show perhaps was not quite so extensive as that of last season, but the quality of the flowers was of a high standard, and there was keen competition in most of the classes.

The season has favoured the plants in certain districts, while in other places growers complain that they have not been able to obtain the best results. The Cactus type was exhibited in the greatest number. Several extensive non-competitive groups were arranged on side-tables, the central tables being wholly occupied with competitive exhibits.

The amateurs quite held their own in comparison with the trade growers, and the enthusiasm of the former over their favourite flowers was remarked in the eager comparison of their blooms and their critical remarks as to the form, substance, depth, and refine-
